How to use the MICROPAEDIA

The 12 volumes of the MICROPAEDIA contain tens of thousands of shorter articles on specific persons, places, things, and ideas, arranged in alphabetical order. The MICROPAEDIA can be used as an information resource on its own; and it can function as support for the longer articles in the MACROPAEDIA (to which it refers whenever appropriate). The MICROPAEDIA in turn is supported by references in the INDEX and by the lists of suggested readings in the PROPAEDIA. Finally, the MICROPAEDIA is the portion of the *Encyclopadia Britannica* best suited for the reader who wishes to browse among the countless subjects in all fields of human learning and history in all times and places.

Alphabetization

Entry titles are alphabetized according to the English alphabet, A to Z. All diacritical marks (such as in ö, ł, or ñ) and foreign letters without parallels in English (such as ayin ['] and hamza [']) are ignored in the alphabetization. Apostrophes likewise are ignored. Titles beginning with numbers, such as 1812, War of, are alphabetized as if the numbers were written out (Eighteen-twelve, War of).

Alphabetization proceeds according to the "word-by-word" principle. Thus, Mount Vernon precedes mountain; any John entry precedes John Henry, which in turn precedes Johne's disease. Any character or string of characters preceding a space, hyphen, or dash is treated as a word and alphabetized accordingly. Thus, De Broglie precedes debenture, and jack-o'-lantern precedes jackal. Titles with identical spellings are arranged in the following order: (1) persons, (2) places, (3) things.

For many rulers and titled nobility, chronological order, as well as alphabetical order, governs placement. Rulers of the same given name (e.g., William) may be grouped together, separate from other entries, and indicated by the symbol •. They may be subgrouped alphabetically by country and, within each country, arranged chronologically (William I, William II, etc.). Nobility or peers of the same titled name (e.g., Essex, EARLS OF) are similarly grouped together, separate from other entries; they are indicated by the symbol • and arranged chronologically.

Places with identical names are arranged in the alphabetical order of the countries where they are located. Identical place-names in the same country are alphabetized according to the alphabetical order of the state, province, or other political subdivision where they are found.

Entry arrangement

The titles of entries are arranged according to the forms commonly found in indexes and dictionaries, with some special conventions. Entry titles for certain physical features, institutions, structures, events, and concepts are ordinarily inverted to place the substantive word first. Thus, the Bay of Bengal is entered as **Bengal**, **Bay of**; the Bank of England as **England**, **Bank of**; the Tower of London as **London**, **Tower of**; the Siege of Vienna as **Vienna**, **Siege of**; and the balance of power as **power**, **balance of**. If the name of a physical feature, institution, structure, event, or concept has two or more descriptors, it is entered under the descriptor appearing first. Thus, the Episcopal Church in Scotland is entered as **Episcopal Church in Scotland** (not **Scotland**, **Episcopal Church in**); the Leaning Tower of Pisa as **Leaning Tower of Pisa**; and the kinetic theory of gases as **kinetic theory of gases**.

The entries for most Western persons are arranged so that one can read a name in correct order by beginning after the first comma, proceeding to the end of the boldface type, returning to the beginning word or words, and proceeding forward to the first comma. Thus, the entry March, Patrick Dunbar, 2nd Earl of, is read "Patrick Dunbar, 2nd Earl of March"; the entry Orléans, Louis, duc d'Orléans." Names of Far Eastern origin are given in Oriental order, with the surname preceding the personal name (e.g., Tōjō Hideki, Deng Xiaoping, Nguyen Cao Ky).

Cross-references

Some cross-reference entries appear in the MICROPAEDIA for the purpose of leading a reader from names that are familiar to alternate names that may not be. Cross-references also appear frequently within or at the ends of standard entries, where they are identified by see, see also, see under, q.v. (quod vide, "which see"), or qq.v. (quae vide, "which see," plural).

Certain entries serve both as relatively brief essays on general subjects and as cross-references to the same subjects treated at greater length and in greater depth in the MACROPAEDIA. Such an entry (e.g., igneous rock) begins with a definition of the subject and then provides the following cross-reference: "A brief treatment of igneous rocks follows. For full treatment, see MACROPAEDIA: Minerals and Rocks.

Entries on certain broad subjects (e.g., music) direct the reader to several relevant articles in the MACROPAEDIA and also to the PROPAEDIA for listings of related articles in the MICROPAEDIA.

Abbreviations

Abbreviations used in the MICROPAEDIA are given in a list that appears at the end of every MICROPAEDIA volume.

Territorial boundaries

In articles and maps indicating disputed geopolitical boundaries and territories, the attribution of sovereignty or administrative subordination to any specific area does not imply recognition of the status claimed by an administering power. Trudeau, Pierre Elliott (b. Oct. 18, 1919, Montreal), Liberal politician and prime minister of Canada (1969-79; 1980-84). His terms in office were marked by the establishment of diplomatic relations with China (1970) and improved relations with France, the defeat of the French separatist movement, independence from the British parliament, and the formation of a new Canadian constitution with the principal additions of a bill of rights and an amending formula.

Trudeau grew up in a family of French and Scots-French descent, in the affluent Montreal suburb of Outremont. He studied at Jean-de-Brébeuf, an elite Jesuit preparatory school, and at the University of Montreal, from which he received a law degree in 1943. He served on the Privy Council for three years as a desk officer, and in 1950 he helped found the *Cité Libre* ("Free City"), a monthly critical review. He practiced law from 1951 to 1961, specializing in labour and civil liberties cases.

Trudeau was assistant professor of law at the Université de Montréal from 1961 to 1965, when he was elected as a "new wave" Liberal to the House of Commons. In 1967 he toured the French-speaking African nations on behalf of the prime minister, Lester B. Pearson, who had appointed him parliamentary secretary (1966) and minister of justice and attorney general. As minister of justice, Trudeau won passage of three unpopular social welfare measures—stricter gun-control legislation and reform of the laws against abortion and homosexuality.

On Pearson's announcement of his plan to retire, Trudeau campaigned for the leadership of the Liberal Party. His colourful personality and disregard of unnecessary formality, combined with his progressive ideas, made him the most popular of the 20 candidates. He became party leader on April 6, 1968, and prime minister two weeks later. As a determined anti-separatist, Trudeau in 1970 took a strong stand against terrorists from the Front de Libération du Québec.

The elections of October 1972 left Trudeau and the Liberals much weakened, with a minority government dependent on the coalition support of the New Democratic Party (NDP). During the next year and a half the Prime Minister faced a series of no-confidence votes in Parliament, but in the national elections on July 8 the Liberal Party won a clear majority and an increased number of seats in Parliament.

Throughout the 1970s, Trudeau struggled against increasing economic and domestic problems. In the national general elections of May 22, 1979, his Liberal Party failed to win a majority (although Trudeau maintained his seat in Parliament), and the Progressive Conservative Party won power as a minority government.

The Liberal Party was returned to power in the general election of Feb. 18, 1980, and Trudeau began his fourth term as prime minister on March 3. The proposal of French separatism in Quebec was defeated in a provincial referendum on May 20, 1980, and Trudeau then began work on his plans to reform Canada's constitution. Proposed reforms included "patriation" (i.e., that the British Parliament transfer the authority to amend Canada's constitution to Canada), a charter of human rights, broadened federal economic powers, and institutional changes in federal structures such as the Supreme Court.

On Dec. 2, 1981 the Canadian House of Commons approved Trudeau's constitutional reform resolution with a vote of 246 to 24 (only the representatives from Quebec dissented), and on April 4, 1982, Queen Elizabeth II of England declared Canada's independence from the British Parliament. With these major political aims realized, Trudeau spent his final years in office seeking greater economic in-

dependence for Canada, forming better trade relations between industrialized democracies and Third World nations, and urging further international disarmament talks. On Feb. 29, 1984, Trudeau resigned from the leadership of the Liberal Party, but he remained in office until a successor could be chosen at the party leadership convention in June of that same year.

Trudeau's publications include La Fédéralisme et la société Canadienne-Française (1967; Federalism and the French Canadians 1968), Les Cheminements de la politique (1970; Approaches to Politics), and Conversations with Canadians (1972).

True Cross, Christian relic, reputedly the wood of the cross on which Jesus Christ was crucified. Legend relates that the True Cross was found by St. Helena, mother of Constantine the Great, during her pilgrimage to the Holy Land about 326.

The earliest historical reference to veneration of the True Cross occurs in the mid-4th century. By the 8th century the accounts were enriched by legendary details describing the history of the wood of the cross before it was used for the Crucifixion.

Adoration of the True Cross gave rise to the sale of its fragments which were sought as relics. John Calvin pointed out that all the extant fragments, if put together, would fill a large ship, an objection regarded as invalid by some Roman Catholic theologians who claimed that the blood of Christ gave to the True Cross a kind of material indestructibility, so that it could be divided indefinitely without being diminished. Such beliefs resulted in the multiplication of relics of the True Cross wherever Christianity expanded in the medieval world, and fragments were deposited in most of the great cities and in a great many abbeys. Reliquaries designed to hold the fragments likewise multiplied, and some precious objects of this kind survive.

The desire to win back or obtain possession of the True Cross was claimed as justification for military expeditions, such as that of the Byzantine emperor Heraclius against the Persians (622-628) and the capture of Constantinople by the crusaders in 1204.

The Feast of the Finding of the Cross was celebrated in the Roman Catholic Church on May 3 until it was omitted from the church calendar in 1960 by Pope John XXIII.

Truffaut, François (b. Feb. 6, 1932, Paris—d. Oct. 21, 1984, Neuilly-sur-Seine, near Paris), French film critic and producer whose attacks on established filmmaking techniques paved the way for the movement known as the Nouvelle Vague (New Wave). His major films include Les Quatre Cents Coups (1959; The 400 Blows), Tirez sur le pianiste (1960; Shoot the Piano Player), Jules et Jim (1961; Jules and Jim), Baissers volés (1968; Stolen Kisses), L'Enfant sauvage (1970; The Wild Child), L'Histoire d'Adèle H. (1975; The Story of Adèle H.), and Le Dernier Métro (1980; The Last Metro).

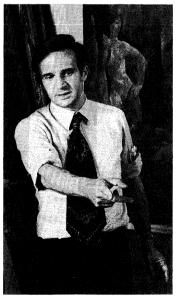

Early works. Truffaut was born into a

Early works. Truffaut was born into a working-class home. His own troubled childhood provided the inspiration for Les Quatre Cents Coups a semi-autobiographical study of a working-class delinquent. It is the first of the Antoine Doinel trilogy, tracing its hero's evolution from an antisocial anguish to a happy and settled domesticity. When it won the "best direction" prize at the 1959 Cannes Festival, Truffaut was established as a leader of the French cinema's Nouvelle Vague (New Wave)—a term for the simultaneous presentation of first feature films by a number of French directors—a tendency that profoundly influenced the rising generation of filmmakers around the world. The New Wave marked

a reaction against the commercial production system: the well-constructed plot, the limitations of a merely craftsmanlike approach, and the French tradition of quality with its heavy reliance on literary sources. Its aesthetic theory required every detail of a film's style to reflect its director's sensibility as intimately as a novelist's prose style retraces the workings in depth of his mind—hence the phrase le camera-stylo ("camera-pen"). The emphasis lay on visual nuance, for, in keeping with a general denigration of the preconceived and the literary, the script was often treated less as a ground plan for a dramatic structure than as merely a theme for alfresco improvisation. Improvised scenes were filmed, deploying the visual flexibility of newly developed television equipment (e.g., the handheld camera) and techniques (e.g., extensive postsynchronization of dialogue). The minimization of costs encouraged producers to gamble on unknown talents, and the simplicity of means gave the director close control over every aspect of the creative process, hence Truffaut's term auteur, or film author.

Outside his art, Truffaut was reticent about his private life, although it is known that he was sent to a reformatory before leaving school at the age of 14 to work in a factory. His interest in the cinema, however, brought him to the attention of the critic André Bazin. doven of the monthly avant-garde film magazine Cahiers du Cinéma, who incorporated him into the staff. For eight years Truffaut asserted himself as the most truculent critic of the contemporary French cinema, which he considered stale and conventional, and advocated a cinema that would allow the director to write dialogue, invent stories, and, in general, produce a film as an artistic whole in his own style. Thus, he was influential in the cinema world before he actually made a film. Like his leading character in Baisers volés. another film in the Doinel series, he deserted from his military service, being committed to various prisons until he was able to resume his journalistic career and, eventually, put his ideas into creative practice. Again like Doinel in Domicile conjugale (1970; Bed and Board), he married and became the father of two daughters.

Truffaut's initial creative effort, the short piece Les Mistons (1958; The Mischief Makers), depicted a gang of boys who thought-

Truffaut on the set of Les Deux Anglaises et le Continent, 1971

By courtesy of Les Films du Carrosse

lessly persecute two young lovers. His second short, Une Histoire d'eau (1959; "A Story of Water"), was a slapstick comedy for which Jean-Luc Godard developed the conclusion. Both films met with sufficient appreciation to facilitate his first feature-length film, Les Quatre Cents Coups. An evocation of the adolescent's pursuit of independence from a staid adult world of conformity and protocol, for which Truffaut evinced a romantic sympathy, the film proved to be one of the most popular New Wave films, especially in England and the United States. Two tenderly pessimistic studies in sexual tragedy followed, Tirez sur le pianiste, adapted from the U.S. thriller Down There by David Goodis, a genre for which Truffaut evinced great admiration, and Jules et Jim.

Later works. After this burst of creativity he seemed to have a period of hesitation. All of his later works, however, were intensely personal and explored one of two themes: studies in forlorn childhoods—e.g., The Doinel trilogy and L'Enfant sauvage, the chronicle of an 18th-century doctor who attempts to domesticate an uncivilized child-and sensitive melodramas sadly celebrating disastrous confrontations between shy heroes and boldly emancipated or possessive women. The first theme shows the influence of filmmaker Jean Vigo, in its uncompromising stance against authority of any kind, and of Jean Renoir, in its feeling for place and atmosphere and its mingling of the nostalgic with sudden outbursts of blatant humour, as well as of Truffaut's personal experience. The second owes much to the American roman noir, or "black novel," the diverse manifestations of which, from the morally disintegrated heroes of William Faulkner to the sadistic gangsters of Mickey Spillane, have fascinated French novelists from Jean Paul Sartre to the present. certain hero worship, also, is discernible in Truffaut's long, published conversations with the veteran British-American filmmaker Alfred Hitchcock, whose work he admired in complete defiance of his earlier theories. Of Truffaut's features only Fahrenheit 451 (1966), a film version of Ray Bradbury's science-fiction novel, falls outside these categories, though it relates to the American style and the poetic-melodramatic form. Through his production company, Les Films du Carrosse, Truffaut coproduced, among other films, Godard's first feature and Jean Cocteau's last. His own later films include Domicile conjugale; La Nuit américaine (1972; Day for Night), for which he was awarded an Oscar by the Academy of Motion Picture Arts and Sciences; and Le Dernier Métro and Vivement Dimanche (1983; "Lively Sunday").

For Truffaut, the cinema had to be, on the one hand, personal and, on the other, a splendid spectacle. The style of his first three films, at once delicate, lyrical, and exceptionally fertile in cinematographic invention, has become, partly by choice, more prosaic and conventional. Controversy has centred on the extent to which his films involve a militant conservatism-whether, for example, Truffaut in L'Enfant sauvage deplores, documents, feels nostalgic for, or positively and without reservation approves the narrow, strict rigidities with which its psychologist (played by Truffaut himself) sets about civilizing the abandoned, autistic child. It may be that Truffaut's earlier inspiration was rooted in the nostalgias and despairs of his childhood, and as with success he matured into adult and father, so his films lost in lyricism, while maintaining their fidelity to life's prosaic side. But life's grayness and flatness was recorded with a sense of resignation and quiet achievement quite distinct from platitude or petulant nihilism.

(R.Du./Ed.)

BIBLIOGRAPHY. Graham Petrie, The Cinema of François Truffaut (1970); C.G. Crisp, François Truffaut (1972); James M. Wall (ed.), Three European Directors (1973); Don Allen, François Truffaut (1974); and Annette Insdorf, François Truffaut (1978), are interesting book-length studies. See also Truffaut's Hitchcock (1967), and The Films in My Life (1978). Scripts that have been translated into English include Jules and Jim (1968), The 400 Blows (1969), The Wild Child (1973), Day for Night (1975), and The Story of Adele H. (1976). Small Change (1976) is a novelization of the film L'Argent de poche (1976; Small Change).

truffle, edible, subterranean fungus prized as a food delicacy from classical times. Truffles are in the genus *Tuber*, order Tuberales, of the class Ascomycetes (division Mycota). They are native mainly to temperate regions. The different species range in size from that of a pea to that of an orange.

A section of a young specimen shows a whitish homogeneous flesh that with age becomes a rich dark colour showing a lighter marbling. Truffles flourish in open woodland on calcareous soil. They are saprophytes, usually associated with the roots of trees, possibly

English truffle (*Tuber aestivum*) S.C. Porter—Bruce Coleman Inc.

in a mutually beneficial association (see mycorrhiza). The spores of *Tuber* are large; from one to four may be seen in a spore sac, or ascus. (These, the first ascospores to be observed, were described by the French botanist Joseph Pitton de Tournefort in 1701-11.)

The most valued truffle in French cookery is the Périgord (T. melanosporum), which is said to have first gained favour toward the end of the 15th century. It is brown or black, rounded, and covered with polygonal warts having a depression at their summit; the flesh (gleba) is first white, then brown or gray, and when mature becomes black with white veins having a brown margin. The odour is well marked and pleasant. The main French truffières (truffle grounds) are in Périgord and the département of Vaucluse, though truffles are gathered throughout a large part of France.

The truffle industry is an important one in France, and about one-third of the gatherings are exported. The French government undertook the reforesting of many large and barren areas, for many of the best truffle regions become productive by the planting of trees, particularly oaks. Because truffles often occur at depths of up to about 30 centimetres (12 inches), it is difficult to detect them unaided. Truffles, when occurring near the surface of the ground, crack it as they reach full size, and experienced gatherers can detect them. Furthermore, in the morning and evening columns of small yellow flies may be seen hovering over a colony. Occasionally an individual is sufficiently sensitive to the scent of truffles to locate them, but truffle hunting is usually carried on with the aid of trained pigs and dogs.

Although truffles are much desired as food, direct cultivation of truffles for commerce is difficult. Calcareous ground is dug over and acorns or seedlings planted. Soil from truffle areas is usually spread about, and the ground

is kept in condition by light plowing and harrowing. After three years, clearings are made and the trees pruned. If they are to appear, truffles do so only after about 5 years; gathering begins then, but is not very profitable until 8 or 10 years have passed. The yield is at its maximum from 5 to 25 years later.

The English truffle, *T. aestivum*, is found

The English truffle, *T. aestivum*, is found principally in beech woods. It is bluish black, rounded, and covered with coarse polygonal warts; the gleba is white when immature, then yellowish, and finally brown with white branched markings.

Truffles are rare in North America, being found most often in Oregon and California. False truffles (*Rhizopogon*), form small, underground, potato-like structures under coniferous trees, in parts of North America.

Consult the INDEX first

Trujillo, capital, Colón department, northeastern Honduras, on Trujillo Bay, sheltered from the Caribbean Sea by Cape Honduras. Founded in 1524, the historic city was the first capital of the Spanish colonial province of Honduras, flourishing especially in the early 17th century. In 1531 it was made a bishop's see, but that office was removed to Comayagua in 1561. Dutch pirates sacked Truillo in 1643; it lay in ruins until it was resettled by Galicians in 1787. William Walker, the U.S. filibuster who attempted to conquer Honduras, was shot nearby in 1860. The town never regained its 17th-century prominence, though it is a commercial centre and exports bananas, coconuts, mahogany, and hides. Since 1920 it has lost most of its port trade to Puerto Castilla to the north. In the 1970s a fishing industry developed, and a packing and refrigeration plant was built. A sawmill also has opened, processing lumber for export. Tourism has grown in importance because of fine beaches nearby. Trujillo is accessible by air, and highways link the city with the north-coast cities and also with Olancho department. Pop. (1983 est.) 34,835.

Trujillo, capital of Trujillo province and La Libertad department, Peru, lying in the coastal desert, 343 mi (552 km) north-northwest of Lima.

The second oldest Spanish city in Peru, Trujillo was founded in 1534 by Diego Almagro;

The cathedral at Trujillo, Peru Walter Aquiar—EB Inc.

the following year it was elevated to city status by the conquistador Francisco Pizarro, who named it after his birthplace in Spain. It sustained heavy damage from an earthquake in 1612. Following 19th-century foreign investment in sugarcane plantations, Trujillo's population swelled, until it became one of Peru's largest cities.

The irrigated lands of the surrounding Río Moche Valley produce sugarcane and rice. The city's industries include sugar refineries, knitting mills, and breweries. Trujillo is on the Pan-American Highway and is linked by

road to inland communities and nearby beach resorts. The city has an airport and is connected to major agricultural areas and its seaport of Salaverry by rail. Trujillo is the site of the Universidad Nacional de Trujillo (1824) and an archaeological museum. The ruins of Chan Chan, capital of the pre-Inca Chimú empire, are situated 4 miles (6 km) west. Pop. (1985 est.) city, 438,700; (1981 prelim.) province, 539,535.

Trujillo, state, northwestern Venezuela. It is bounded on the west by Lake Maracaibo and by the states of Portuguesa on the east, Mérida on the southwest, Barinas on the south, and Zulia on the north. Covered with mountains over most of its area of 2,857 square miles (7,400 square km), Trujillo is one of the truly Andean states of Venezuela and ranks high agriculturally despite the restriction of cultivation largely to narrow valleys and alluvial terraces. The principal crops produced in the state include coffee, corn (maize), garlic, sesame, sugarcane, wheat, and cassava. The state capital, Trujillo, is a regional market centre for the agricultural products of the surrounding area, although in the 20th century Valera (q.v.) has become more important commercially and is the state's largest city. The state is served by both the Pan-American and the trans-Andean highways. Pop. (1987) est.) 526,183.

Trujillo, city, capital of Trujillo state, northwestern Venezuela. The city lies on a northern outlier of the Cordillera de Mérida, 2,640 feet (805 m) above sea level. Founded in 1556, Trujillo was the site of the 1813 proclamation by the liberator Simón Bolívar, which promised a "fight to the death" for independence from Spain. In colonial times a thriving way station between Táchira and Mérida, it has been outstripped in size and commercial importance by Valera, which lies 12 miles (19 km) to the west-southwest. Trujillo is a market centre for a fertile agricultural region in which cacao, corn (maize), coffee, sugarcane, tobacco, and fruit are cultivated. Flour mills are among the city's industries. The Pan-American Highway passes near the city. Pop. (1987 est.) 39,387.

Trujillo (Molina), Rafael (Leónidas) (b. Oct. 24, 1891, San Cristóbal, Dominican Republic—d. May 30, 1961, Ciudad Trujillo, near San Cristóbal), dictator of the Dominican Republic from 1930 until his assassination in 1961.

Trujillo entered the Dominican Army in 1918 and was trained by U.S. Marines during the U.S. occupation (1916-24) of the country. He rose from lieutenant to commanding colonel of the national police between 1919 and 1925, becoming a general in 1927. Trujillo seized power in the military revolt against President Horacio Vásquez in 1930. From that time until his assassination 31 years later, Truillo remained in absolute control of the Dominican Republic through his command of the Army, by placing family members in office, and by having many of his political opponents murdered. He served officially as president from 1930 to 1938 and again from 1942 to 1952.

Competent in business, capable in administration, and ruthless in politics, Trujillo brought a degree of peace and prosperity to the republic that it had not previously enjoyed. However, the people of the country paid for this prosperity with the loss of their civil and political liberties, and the benefits of economic modernization were inequitably distributed in favour of Trujillo and his favourites and supporters. In spite of the harsh measures Trujillo took to protect his power, domestic opposition continued to grow during the later years of his regime, and he also came under considerable foreign pressure to liberalize his rule. He began to lose support in the Army, and this led

to his assassination by machine-gun fire as he was driving to his San Cristóbal farm. Many of the supposed assassins, including General J.T. Díaz, were subsequently captured and executed.

Truk Islands, formerly HOGOLEU, cluster of 11 much-eroded high volcanic islands enclosed within an encircling barrier bank composed of some 69 sand and coral islets, in the eastern Caroline Islands and part of the Federated States of Micronesia, in the western Pacific. The bank (often referred to as a reef) encloses a lagoon of 822 square miles (2,129 square km) in area and has a diameter of more than 40 miles (65 km). Chief islands of the group are Moen, Dublon, Fefan, Uman, Udot, and Tol, and the total land area is 38.5 square miles (100 square km).

Observed by the Spaniard Álvaro Saavedra in 1528, Truk was visited occasionally by 19th-century traders and whalers and was included in the German purchase of parts of Micronesia from Spain (1899). Annexed by Japan (1914) and strongly fortified for World War II, the islands were heavily attacked, bypassed, and blockaded by the Allies during the war. Truk, along with the other islands in what are now the Federated States of Micronesia, was part of the U.S.-administered United Nations Trust Territory of the Pacific Islands from 1947 to 1986.

The high islands of the Truk group have mangrove swamps along their coasts and rain forests in the central mountainous areas. The native people are Micronesians, living mostly in traditional villages, who fish and raise pigs, poultry, taro, breadfruit, yams, and bananas. Copra is the chief cash crop. Truk has a commercial dock at Moen and an international airport. Pop. (1980) 28,328.

trullo, plural TRULLI, conical, stone-roofed building unique to the region of Puglia (Apulia) in southeastern Italy and especially to the town of Alberobello, where they are used as dwellings. Upon a whitewashed cylindri-

Trulli in Alberobello, Italy

cal wall, circles of gray stone, held in place by lateral opposition and gravity and without mortar, were piled to a pinnacle. Probably originating with a local Stone Age culture, the trulli have been perpetuated as a folk tradition, possibly because of the local shortage of lumber and the abundance of stone fragments that must be removed to permit land cultivation. Trulli are protected by Italian law as national monuments.

Trullo, Council in (692): see Quinisext Council.

Truman, Harry S. (b. May 8, 1884, Lamar, Mo., U.S.—d. Dec. 26, 1972, Kansas City, Mo.), 33rd president of the United States (1945–53), who led his nation into international confrontation with Soviet and Chinese Communism and defended the New Deal reforms.

Early life and career. Truman was the son of a mule trader and farmer. His paternal forebears were English and first came to America in 1666. Truman attended school in Independence, Mo. He completed high school in

Truman, 1945

By courtesy of the U.S. Signal Corps

1901, but he could not go to college because of family financial reverses, nor could he attend West Point because of an eyesight impairment. He became a bank clerk in Kansas City; then in 1906 he took over management of his maternal grandmother's farm at Grandview. He also served as local postmaster, road overseer, and national guardsman. He became a partner in a lead mine (1915) and in an oil-prospecting business (1916); both failed.

Truman distinguished himself in heavy action as a captain in World War I, showing bravery and other qualities of leadership. On June 28, 1919, he married Elizabeth (Bess) Wallace, an Independence girl he had known since childhood. He became a partner in a Kansas City haberdashery store, and, when the business failed, he entered politics with the help of Thomas Pendergast, a Democratic boss of Jackson County.

With the support of Pendergast's political machine and of World War I veterans, Truman won a seat as county judge in 1922. But despite excellent work, in 1924 (the same year his daughter, Margaret, was born) non-Pendergast Democrats combined with the Ku Klux Klan to defeat him. Truman then sold memberships in the Kansas City Automobile Club and attended night classes for two years at the Kansas City Law School. A state bank in Englewood in which he became a partner went into bankruptcy because of the fraudulent activities of its former owner, but Truman enjoyed his first business success following his organization of the Community Savings & Loan Association in Independence.

With Tom Pendergast's backing, in 1926 he became presiding judge of the county court. As a two-term, eight-year county administrator, Truman's reputation for honesty and good management gained him Republican as well as Democratic support. Meanwhile, Pendergast was gaining dictatorial control over Jackson County; he achieved statewide power in the early 1930s, determining who would serve as Missouri's governor and as its members of the U.S. House of Representatives. That Truman was not in his inner circle was revealed in 1932 when Pendergast stifled Truman's ambition to become governor and refused to name him to the Missouri delegation to the Democratic National Convention.

In 1934 Truman's political career seemed ended because of the two-term tradition attached to his job. But the machine's gangsterism in the March municipal election, in which four persons were killed at the polls, had a direct bearing on his future. After three indi-

viduals rejected Pendergast's subsequent offer of support in the coming U.S. Senate primary contest, Truman, his fourth choice, quickly accepted. Truman was elected with the help of a suspicious machine vote in Jackson County.

Truman entered the U.S. Senate in 1935 under the cloud of being the puppet of a crooked boss. But his attention to duties and his friendly personality soon won over his colleagues. He was the author of the Civil Aeronautics Act of 1938, and his two-year committee investigation led to the Transportation Act of 1940. The outlook for Truman's reelection in 1940, however, was gloomy; the Pendergast machine lay in shambles, with Tom Pendergast in prison for having taken bribes. President Roosevelt offered Truman a face-saving place on the Interstate Commerce Commission, but he stubbornly ran for another term even though newspapers rated him a distant third in a three-man primary race. Yet because of the last-minute support of Robert E. Hannegan, a young St. Louis Democratic subboss, Truman won by a slender margin.

The nation's growing defense and then war production programs soon launched Truman into his major senatorial endeavour. His Special Committee Investigating National Defense exposed a long list of graft, waste, and product deficiencies and brought him public praise. At the same time, he used his expanding patronage power to reward Hannegan with a series of appointments. The advancement of Hannegan to chairman of the Democratic National Committee in January 1944 led to a successful effort to have Pres. Franklin D. Roosevelt replace Vice Pres. Henry A. Wallace with Truman on the victorious 1944 presidential ticket. Truman's vice presidency lasted only 82 days, during which time he met with Roosevelt only twice and had little knowledge of the administration's programs and plans.

Succession to the presidency. Roosevelt died on April 12, 1945. Truman was a month away from his 61st birthday when he took the presidential oath of office. Vital decisions had to be made at a relentless pace, despite his lack of tutelage. In swift order he made final arrangements for the San Francisco charter-writing meeting of the United Nations (UN), helped arrange Germany's unconditional surrender on May 8, and went in July to his first and only summit meeting, at Potsdam, Ger., for inconclusive talks about a peace settlement. The Pacific war ended officially on September 2, after atomic bombs had been dropped on the Japanese cities of Hiroshima and Nagasaki following Truman's orders. His justification for the bombings was a report from advisers that 500,000 Americans would be lost in an invasion of Japan.

Truman enjoyed a five-month honeymoon with Congress, which ended in September 1945 when he submitted his "Economic Bill of Rights," which included social reforms that he hoped would head off a return to economic depression. The developing vocal opposition, added to public weariness over meat shortages and inflation and the defection of Roosevelt admirers when Truman installed his own choices in his Cabinet, combined to give Republicans control of Congress in 1946.

Two years later many Democratic leaders believed Truman could not win election and demanded that he retire. But the 1948 convention nominated him, with Sen. Alben W. Barkley as his running mate. All public opinion polls showed that the New York governor Thomas E. Dewey, the Republican nominee, would be an easy winner. Undaunted, Truman carried out a "give 'em hell" campaign, repeatedly denouncing the "Republican and the state of the control of the con do-nothing 80th Congress." In November he upset a complacent Dewey by a 114-electoralvote margin.

In his State of the Union message in 1949, Truman proposed the Fair Deal, a liberal 24plank domestic program. But despite his efforts, only a single plank was enacted into law—a low-cost public housing measure. He fared much better in foreign affairs, however, where he considered the Soviet Union the principal roadblock to world peace. To restrict Soviet territorial advances and spreading spheres of influence, he developed a "containment" policy, thus setting the course of U.S. foreign policy for decades to come.

Among his Cold War moves were the Truman Doctrine of economic and military aid to Greece and Turkey in 1947 to reduce Communist pressures on their governments; the four-year \$17,000,000,000 Marshall Plan of 1948 for economic recovery in western Europe; and the North Atlantic Treaty Organization (NATO) pact of 1949, a collective security agreement with non-Communist European nations. When China came under Communist control in 1949, Truman's containment policies were extended to include that giant nation. He also established the Central Intelligence Agency (CIA) in 1947, initiated the Berlin airlift of 1948 to bring supplies into the former German capital when the Soviets blocked surface entrances, instituted the Point Four Program of 1949 to provide aid to underdeveloped countries, and decided in 1950 to construct the hydrogen bomb in order to maintain an arms lead over the Soviets, who had recently exploded an atomic bomb.

Outbreak of the Korean War. In June 1950 Communist North Korea crossed the 38th parallel boundary and attempted to seize South Korea. Truman sent U.S. forces to Korea under Gen. Douglas MacArthur with UN sanction. Once MacArthur had liberated the south, the administration ordered the capture of North Korea; but MacArthur's advance to the Yalu River boundary with Manchuria brought hundreds of thousands of Chinese Communist troops into the fighting. MacArthur's insistence on attacking China as well forced Truman to fire him.

The unpopularity of the continuing war and the uncovering of unsavoury and fraudulent activities by several federal officials made Truman's last two years in office appear chaotic. A further decline of confidence in the government was brought on by the charges of Sen. Joseph R. McCarthy of Wisconsin that the State Department and other agencies were Communist-controlled.

After Truman left office in January 1953 and returned to Independence, his popularity soared. And with the perspective of passing years the haze surrounding his presidency lifted. What remained was a man who had generally succeeded in his foreign policy and a president who, as Harry Truman himself once put it, had "done his damndest." His life in retirement was modest but active, perhaps epitomized by his habit of the brisk morning walk, or "constitutional," which he maintained for as long as his health permitted.

In a comparison of U.S. presidents, Harry S. Truman must be judged one of the strongest. Yet during his term of office his reputation was that of a man far too small for his job. Compared unfavourably by northern Democrats with his popular predecessor, Franklin D. Roosevelt, condemned by Southern Democrats for his liberal civil rights program, and at war with Republican isolationists and economic conservatives, Truman spent a turbulent period in office. But after his term, the significance of his efforts slowly became evident, especially his foreign policy goal of containing Communist expansion and his largely unsuccessful programs of social and economic reforms to raise standards of living for workers and farmers and to broaden civil rights for minorities; his continual pursuit of these goals kept them viable for future action.

He died in 1972 in Kansas City, Mo., and

was buried at the Truman Library grounds in Independence.

BIBLIOGRAPHY. Alfred Steinberg, The Man from Missouri (1962), covers Truman's life and activities through his presidency. Other biographies are Jonathan Daniels, The Man of Independence (1950), which contains a good account of Truman's early career; and Cabell Phillips, The Truman Presidency (1966), a complete study. William Hillman, Mr. President (1952), has letters and excerpts from Truman's diaries. Merle Miller, Plain Speaking (1974), is a popular work compiled from tapes of interviews conducted with Truman and others during 1961-62. See also Harry S. Truman, Memoirs, 2 vol. (1955-56); Public Papers of the Presidents: Harry S. Truman, 1945-53, 8 vol. (1961-66), the best collection of source materials; and Margaret Truman, Harry S. Truman (1973), a candid, readable account that was written by his daughter. Robert J. Donovan, Conflict and Crises (1977), is a detailed examination of Truman's first term in office. Harold Foote Gosnell, Truman's Crises (1980), analyzes the subject's entire political career.

Truman Doctrine, pronouncement by U.S. Pres. Harry S. Truman on March 12, 1947, declaring immediate economic and military aid to the governments of Greece, threatened by Communist insurrection, and Turkey, under pressure from Soviet expansion in the Mediterranean area. As the United States and the Soviet Union struggled to reach a balance of power during the Cold War that followed World War II, Great Britain announced that it could no longer afford to aid those Mediterranean countries, which the West feared were in danger of falling under Soviet influence. The U.S. Congress responded to a message from Truman by promptly appropriating \$400,000,000 for this purpose.

Trumbić, Ante (b. May 27, 1864, Split, Dalmatia, Austria-Hungary-d. Nov. 18, 1938, Zagreb, Yugos.), Croatian nationalist from Dalmatia who played a leading role in the founding of Yugoslavia.

Trumbić entered political life under the Austrian crown, first as a member of the Dalmatian Diet from 1895 and then as representative in the Reichsrat (federal assembly) in Vienna from 1897. In 1905 he was elected mayor of Split. As an advocate of South Slav unity opposed to Habsburg supremacy, Trumbić helped to draft the Rijeka Resolution (1905), by which it was hoped to win the support of anti-Habsburg Hungarians. The scheme failed.

After the beginning of World War I, Trumbić fled, along with other South Slav patriots, to Rome. In 1915 he became president of the Yugoslav Committee, with headquarters in London, which sought the support of the Allies in establishing an independent and united South Slav state. In July 1917 he successfully negotiated with leaders of the Serbian government the Declaration of Corfu, an affirmation of unity that laid the foundation for the future Yugoslav state.

At the conclusion of the war, in December 1918, Trumbić became the first foreign minister of the newly formed Kingdom of Serbs, Croats, and Slovenes and represented his country at the Paris Peace Conference. Formidable difficulties arose over the Italian government's demand for Fiume and extensive territories on the eastern Adriatic coast (promised to it by the British and French in the secret Treaty of London of 1915) as well as with the more independence-minded Croatian nationalists at home. Trumbić's diplomatic skill went far in gaining most of the disputed lands for Yugoslavia and preserving unity at home. He retired from politics in 1929.

Trumbo, Dalton (b. Dec. 9, 1905, Montrose, Colo., U.S.—d. Sept. 10, 1976, Los Angeles), screenwriter and novelist who was probably the most talented member of the Hollywood Ten, one of a group who refused to testify before the 1947 U.S. House Committee on Un-American Activities about alleged communist involvement. He was blacklisted and in 1950 spent 11 months in prison.

Trumbo got his start in movies in 1937; by the 1940s he was one of Hollywood's highest paid writers for work on such films as Kitty Foyle (1940), Thirty Seconds over Tokyo (1944), and Our Vines Have Tender Grapes (1945). After his blacklisting, he wrote 30 scripts under pseudonyms. He won an Oscar for The Brave One (1956), written under the name Robert Rich. In 1960 he received full credit for the motion-picture epics Exodus and Spartacus, and thereafter on all subsequent scripts, and he was reinstated as a member of the Writers Guild of America. Trumbo's vivid antiwar novel, Johnny Got His Gun, won an American Booksellers Award for 1939. He filmed the movie of the novel himself in 1971.

Trumbull, John (b. April 24, 1750, Westbury, Conn. [U.S.]—d. May 11, 1831, Detroit, Michigan Territory), American poet and jurist, known for his political satire, and a leader of the Hartford Wits (q, v).

While a student at Yale College (now Yale University), Trumbull wrote two kinds of poetry: "correct" but undistinguished elegies of the Neoclassical school, and brilliant, comic verse that he circulated among friends. His burlesque "Epithalamium" (1769) combined wit and scholarship, and his essays in the style of Joseph Addison were published in *The Boston Chronicle* in 1770. While a tutor at Yale he wrote *The Progress of Dulness* (1772–73), an attack on educational methods.

He passed the bar examinations in 1773 and moved to Boston. His major work was the comic epic *M'Fingal* (1776–82). Despite its pro-Whig bias, its reputation as anti-Tory propaganda has been exaggerated.

His literary importance declined after 1782, as he became increasingly interested in law and politics. He first held office in 1789 as a state's attorney and subsequently as a state legislator and a judge until 1819.

Trumbull, John (b. June 6, 1756, Lebanon, Conn. [U.S.]—d. Nov. 10, 1843, New York, N.Y.), American painter, architect, and author, whose paintings of major episodes in the U.S. War of Independence form a unique record of that conflict's events and participants.

Trumbull was the son of the Connecticut governor Jonathan Trumbull (a first cousin to John Trumbull the poet). A boyhood injury to his left eye made him virtually monocular, with the consequence that his small-scale work is finer than his large. He attended Harvard College and then taught school. During the American Revolution he served as an aide to General George Washington, achieving the rank of colonel.

In 1780 he went to London via France, but, as a reprisal for the hanging by the Americans of the British agent Major John André, he was imprisoned there and used the time to study architecture. Released, he returned home but was back in London to study with the painter Benjamin West by 1784.

At the suggestion of West and with the encouragement of Thomas Jefferson, Trumbull in about 1784 began the celebrated series of historical paintings and engravings that he was to work on sporadically for the remainder of his life. From 1789 he was in the United States, but he returned to London in 1794 as secretary to John Jay, remaining for 10 years as a commissioner for the implementation of the Jay Treaty. In 1800 he married an Englishwoman, Sarah Hope Harvey, an amateur painter. He lived in the United States from 1804 to 1808, and in 1808 he attempted portrait painting in London but with little success. From 1815 to 1837 he maintained a rather unsuccessful studio in New York City. In 1817 Trumbull was commissioned by the U.S. Congress to paint four large pictures in the rotunda of the Capitol at Washington ("Washington Resigning His Commission," "The Surrender of Cornwallis," "The Surrender of Burgoyne," and, best known of all, "The Declaration of Independence"; series completed in 1824) from the small and far superior originals of these scenes that he had painted in the 1780s and '90s, now in the Yale University Art Gallery. In 1831 Benjamin Silliman, a professor at Yale, established the Trumbull Gallery at Yale, the first art gallery at an educational institution in America. Trumbull gave his best works to this gallery in exchange for an annuity.

Trumbull, Lyman (b. Oct. 12, 1813, Colchester, Conn., U.S.—d. June 25, 1896, Chicago, Ill.), U.S. senator from Illinois whose independent views during the Civil War and Reconstruction eras caused him to switch from the Democratic Party to the Republican to the Liberal Republican and back to the Democratic Party in his long political career.

Trumbull grew up in Connecticut, and, after studying law and gaining admission to the bar, settled in Illinois. His career in public life began in 1840, when he was elected to the state legislature as a Democrat.

In 1854 Trumbull ran as a Democrat for the U.S. House of Representatives. Although elected, he never served, because in 1855 the state legislature made him a U.S. senator. By 1856 he had become a Republican; his opposition to slavery had made it impossible for him to remain among the Democrats. With the coming of the Civil War, Trumbull staunchly supported President Abraham Lincoln's efforts to suppress rebellion.

Trumbull pressed for making the emancipation of the slaves a Northern war aim, and, as chairman of the Senate Judiciary Committee in 1864, he helped draft the Thirteenth Amendment. He aligned himself with the Radical Republicans in advocating vigorous prosecution of the war and an early end to slavery. Following Lincoln's assassination, he at first supported President Andrew Johnson but then broke with the president over Reconstruction policy. He supported Radical Reconstruction, yet in 1868 he was one of just seven Republican senators voting to acquit Johnson of impeachment charges.

His waning enthusiasm for Radical Reconstruction, his break with the Republican leadership in the trial of Andrew Johnson, and his revulsion at the corruption rampant in the administration of President Ulysses S. Grant led Trumbull to back the Liberal Republican Party in 1872. When party presidential nominee Horace Greeley lost and the party collapsed, Trumbull finished out his third term as senator and then retired to his Chicago law practice. By 1876 Trumbull had returned to the Democratic Party, serving as counsel for Samuel J. Tilden in the disputed presidential election.

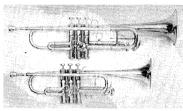

Trump, Donald J(ohn) (b. 1946, New York, N.Y., U.S.), American real-estate developer who amassed vast hotel, casino, and other real-estate properties in the New York City area.

The son of a wealthy apartment-building developer in the Queens borough of New York, Trump graduated from the University of Pennsylvania's Wharton School of Finance in 1968. He went to work in his father's company, the Trump Organization, and worked to expand its holdings of rental housing. In the 1970s he made a series of shrewd property purchases in Manhattan, obtaining generous tax concessions on his land and building purchases from New York's city government. which was eager for new investment at a time when it confronted a severe fiscal crisis. Trump bought and renovated several aging hotel complexes and apartment towers in Manhattan and built new ones there as well. By the 1990s Trump's business empire encompassed a number of glamorous high-rises, hotels, and condominiums, including Trump Tower (opened 1983); more than 25,000 rental and co-op apartment units in Queens and Brooklyn; and several hotel-casino complexes in the nearby gambling centre of Atlantic City, N.J. In 1988 Trump bought the Boston-New York-Washington, D.C., shuttle service from failing Eastern Airlines.

trumpet, in zoology, any of certain snail species, including members of the conch (q.v.) and triton groups (*see* triton shell).

trumpet, French TROMPETTE, German TROMPETE, in music, brass wind musical instrument sounded by lip vibration against a cup mouthpiece. Ethnologists use the word trumpet for any lip-vibrated instrument, whether of horn, conch, reed, or wood, with a horn or gourd bell, as well as for the modern brass instrument.

The metal trumpet dates from the 2nd millennium BC in Egypt, when it was a small ritual or military instrument sounding only one or

Modern trumpets in (top) Bb and (bottom) D

two notes. Used in various forms as a military and sometimes civilian signal instrument—as the straight Greek salpinx, the similar Roman tuba, and the Roman lituus, straight with an upturned bell-it came into prominence as a musical instrument in the Middle Ages. Later forms included the natural trumpet of the 16th-18th century and, following the invention of valves (c. 1815), the modern valve trumpet. The valve trumpet, ordinarily built in Bb, maintains the traditional trumpet bore, cylindrical with a terminal bell flare, though usually the bore tapers toward the mouthpiece to provide additional flexibility of tone. The bend near the bell incorporates a tuning slide. The compass ranges from F# below the treble staff to well above the staff, depending on the player's skill. The music is notated a major second higher than the actual sound.

Mouthpieces vary; orchestral players usually prefer a wider and deeper mouthpiece than dance-band and jazz players, who favour a narrower and shallower mouthpiece to produce a sustained forte in the high register. The tone quality may be changed by inserting a mute into the bell: either a conical straight mute of fibre or various aluminum mutes.

Instruments in keys other than Bb are frequently used. The "piccolo" trumpet in D, also known as the Bach trumpet, was invented in about 1890 by the Belgian instrument-maker Victor Mahillon for use in the high trumpet parts of music by J.S. Bach and George Frideric Handel. Other forms include the older Eb trumpet, the trumpet in C, piccolo trumpets in F and high Bb, and the bass trumpet in Bb.

On a natural (valveless) trumpet the possible notes (*i.e.*, the harmonic series) include (c' = middle C):

	- /				
(c)	g	c'	e'	g'	(b b ')
(2)	3	4	5	6	7
c"	d"	e"	(f#")	g"	(a")
8	9	10	11	12	13
(bb") 14	b" 15	c‴ 16			

The 2nd harmonic is not producible; the 7th is badly out of tune with the musical scale; the 11th, 13th, and 14th, also out of tune, can with skill be sounded as F or F# and A or G#, respectively. Modern valve trumpets generally use notes 2-12 of this series but pitched an octave lower; depression of the valves lengthens the tubing and allows the production of the intervening notes of the chromatic (12-

The most ancient trumpets had straight tubes barely 2 feet (60 centimetres) long, but the medieval buisine, a straight instrument retaining the trumpet's traditional association with royalty and pomp, reached a length of about 6 feet (almost 2 metres). Increased length allows a correspondingly greater number of natural harmonics, though the range is also determined by the nature of the player's lips. By c. 1400 the tube had been lengthened to the extent that the trumpet was bent in an S-shape for manageability. By about 1500 it acquired the elongated loop now associated with the instrument. By 1600 court and guild trumpeters, accompanied by kettledrums, were able to play melodies in the higher, or clarino, register, where the natural notes form approximately a major scale.

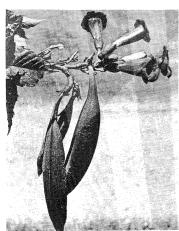

The tonality, or key, of the instrument could be changed by the use of a crook, an extra coil of tubing inserted next to the mouthpiece. The commonest orchestral crook in Bach's era produced the trumpet in D, but toward 1800 trumpets were crooked from F down to low Bb as specified by the composer. Social and musical changes brought a decline in clarino playing, and trumpet parts were written mainly in the easier lower registers.

In order to play notes outside the natural series, trumpets with a sliding section of the tube appeared from the Renaissance onward, the most important being the trombone. A German trumpet with a sliding mouthpipe, the tromba da tirarsi, was sometimes used in the music of Bach. The English flat trumpet (c. 1695), which had a sliding upper bend near the mouthpiece, reappeared as the slide trumpet found in many 19th-century English orchestras. In Austria and Italy after 1801 there was a vogue for the keyed trumpet, with side holes covered by padded keys.

The valved trumpet appeared in Germany

in about 1828, usually pitched in F; its acceptance was delayed in the U.S. and Great Britain because players preferred the cornet in orchestral trumpet parts. In the 20th century, use of the smaller Bb trumpet became almost universal.

trumpet creeper, either of two species of ornamental vines of the genus Campsis (family

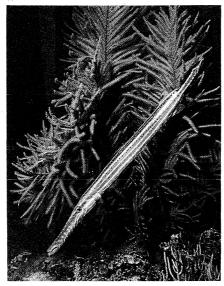

Trumpet vine (Campsis radicans) John H. Gerard-EB Inc

Bignoniaceae, q.v.). Both are deciduous shrubs that climb by aerial rootlets.

Campsis radicans, also called trumpet vine and cow itch, is a hardy climber native in eastern and southern United States; it produces terminal clusters of tubular, trumpet-shaped orange to orange-scarlet flowers. The Chinese trumpet creeper (C. grandiflora) of eastern Asia is a poor climber but produces spectacular bunches of brilliant scarlet flowers.

trumpet fish, also called FLUTEMOUTH, any of the marine fishes that constitute the family Aulostomidae (order Gasterosteiformes). found along shores in tropical waters. Trumpet fishes have elongated, slender bodies and stiff, tubelike snouts ending in small, weak jaws. The body is covered with small scales, the back bears a row of spines that can be raised in defense, and the chin is provided with a short barbel. West Indies species may attain lengths of up to 180 centimetres (6 feet); northern species, however, are usually less than 30 centimetres (1 foot).

They eat small animals, and they sometimes rest head downward among certain corals (gorgonians), blending with the surroundings. They have also been noted to align themselves along the backs of larger fishes, possibly to obtain protection and transportation from one place to another. Species include Aulostomus maculatus, a pale-striped, reddish

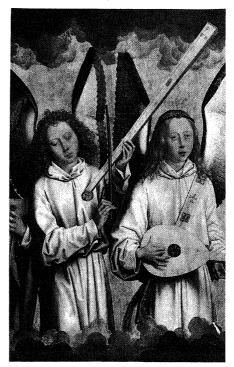

Trumpet fish (Aulostomus maculatus) Douglas Faulkne

or brown Atlantic species, and the painted flutemouth (A. chinensis), a variably coloured Pacific form.

Articles are alphabetized word by word, not letter by letter

trumpet marine, also called TROMBA MA-RINA, or TRUMSCHEIT (German: "drum log"), stringed musical instrument of medieval and Renaissance Europe, highly popular in the 15th century and surviving into the 18th century. It had a long narrow body and one or two strings, which the player's left thumb touched lightly to produce the notes of the harmonic series, as on a natural trumpet. The strings, originally plucked, were by the 15th century sounded by a bow played between the fingering and the tuning pegs.

The tone of the trumpet marine was brassy and substantial. One foot of the bridge was free and rattled loosely on the belly when the strings vibrated. The stationary bridge foot served as a sound post, extending through the belly to the instrument's back and transmitting the string vibrations to it. In the 17th cen-

Angel playing a trumpet marine (left), detail from "Angel Musicians," panel by Hans Memling; in the Koninklijk Museum voor Schone Kunsten, Antwerp By courtesy of the Koninklijk Museum voor Schone Kunsten, Antwerp

tury seven or eight sympathetic strings were set inside the body.

trumpeter, also called TRUMPET BIRD. anv of three species of long-legged, round-bodied birds comprising the family Psophiidae (order Gruiformes). All are about 50 centimetres (20 inches) long, inhabit northern South America, and are named for their strident calls, uttered as they roam the jungle floor searching for berries and insects. Trumpeters are small-headed and thin-necked, with short, rounded wings, a short bill, and a characteristic hunched posture. Their plumage is dark, with lighter wing patches. Unwary, they are easily killed for their excellent flesh.

The most widespread species is the common, or gray-winged, trumpeter (Psophia crepitans). The others are the pale-winged, or white-winged, trumpeter (P. leucoptera), and the dark-winged, or green-winged, trumpeter (P. viridis), of Brazil.

Gray-winged trumpeter (Psophia crepitans)

The name trumpet bird is also applied to certain birds of paradise of the genera Manucodia and Phonygammus (see bird-of-paradise).

Trumpler, Robert Julius (b. Oct. 2, 1886, Zürich-d. Sept. 10, 1956, Berkeley, Calif., U.S.), Swiss-born U.S. astronomer who, in his extensive studies of galactic star clusters, demonstrated the presence throughout the galactic plane of a tenuous haze of interstellar material that absorbs light generally and decreases the apparent brightness of distant clusters. The presence of this obscuring haze explained why spiral nebulae are observed to be concentrated at the galactic poles

Trumpler was educated in Switzerland and Germany, went to the United States in 1915, and joined the staff of Lick Observatory, Mount Hamilton, Calif., three years later. In 1922 he went to Wallal, Australia, on a solar-eclipse expedition to test experimentally Einstein's general theory of relativity by observing whether the Sun's gravitational field indeed would bend the light from nearby stars. His observations confirmed Einstein's theory. Trumpler transferred to the astronomical department of the University of California, Berkeley, in 1938 and retired in 1951.

Trumpler's independent observations of galactic star clusters and the differences in them, which indicate their age, helped to provide the foundation of the present theory of stellar evolution. Probably the most successful scheme of classification of galactic clusters by appearance is Trumpler's. He also devised a method of classification in terms of magni-

tude and spectral type.

His works include "Observations on the Deflection of Light in Passing Through the Sun's Gravitational Field," with the U.S. astronomer William Wallace Campbell (1923); "Spectral Types in Open Clusters" (1925); "Observations of Mars at the Opposition of 1924" (1927); "Preliminary Results on the Distances, Dimensions, and Space Distribution of Open Star Clusters" (1930), all in *Lick Observatory Bulletins*; and "Observational Evidence of a Relativity Red Shift in Class O Stars" (1935), in Publications of the Astronomical Society of the Pacific

trumscheit (musical instrument): see trum-

trundle bed, also called TRUCKLE BED, a low bed, so called from the trundles, or casters, attached to the feet so that it could be pushed under the master bed when not in use. It was intended for servants, who used to sleep in their employer's room so as to be near at hand. The framework was usually oak, and suspension was provided by leather or canvas straps looped through holes in the sides.

The first references to the trundle bed occur in the 16th century, and the bed remained in use until the late 18th century. The phrase is still used in some rural areas to describe a small bed of any kind, and the concept survives in the metaphor "to truckle under," or to be subservient.

Trung Sisters, byname of trung trac and TRUNG NHI (fl. AD 39-43), heroines of the first Vietnamese independence movement, heading a rebellion against the Chinese Handynasty overlords and briefly establishing an autonomous state. Their determination and apparently strong leadership qualities are cited by scholars of Southeast Asian culture as testimony to the respected position and freedom of women in Vietnamese society, as compared with the male-dominated societies of China and India.

Trung Trac, the elder sister, was the widow of Thi Sach, lord of Chau Dien, in northern Vietnam, who had been assassinated by a Chinese general for plotting with other lords to overthrow the Chinese. Trung Trac thereupon assumed leadership of the movement. In AD 39 she, with her sister Trung Nhi and other members of the aristocracy, marched on Lien Lau, forcing the Chinese commander to flee. Within a year the sisters and their allies held 65 northern citadels. At Me Linh, in the lower Red River delta, the Trung Sisters jointly proclaimed themselves queens of an independent state (of unknown name) extending from southern China to the present site of Hue.

The Trung Sisters' revolutionaries—without peasant support, without supplies, and with untrained forces—were no match, however, for the seasoned Chinese troops of General Ma Yüan (Ma Vien). He defeated them first at Lang Bac, near the present site of Hanoi. The Trung Sisters then retreated to Hat Mon, now Son Tay, where they were decisively beaten. Unable to face defeat, they committed suicide, drowning themselves at the juncture of the Day and Red rivers in AD 43. The Hai Ba ("Two Sisters") pagoda at Hanoi and the pagoda of Hat Mon, in the province of Son Tay, are dedicated to the Trung Sisters, and an avenue in downtown Ho Chi Minh City is named for them.

trunkfish: see boxfish.

Truong Chinh, original name DANG XUAN кни (b. Feb. 9, 1907, Ha Nam Ninh province, Vietnam-d. Sept. 30, 1988, Hanoi), Vietnamese scholar and statesman, a leading North Vietnamese communist intellectual.

While a high school student at Nam Dinh. Truong Chinh became an activist in the anticolonialist movement; he joined Ho Chi Minh's organization, the Vietnamese Revolutionary Youth Association, in 1928, taking part in student demonstrations against the French. Arrested and expelled from the local high school, he continued his education in Hanoi, where he received his degree and supported himself as a teacher while pursuing a political career within the recently formed Indochinese Communist Party (PCI). While editing a Communist Party newspaper in Hanoi, he was arrested by the French in 1932 and spent the next four years in prison. Paroled in 1936, he was a well-qualified candidate for command in the PCI, most of whose earlier leaders had been executed or exiled. About this time he adopted the name Truong Chinh ("Long March"), after Mao Zedong's famous march.

The Communist Party was banned in Indochina during World War II, and Truong Chinh and his associates continued their work underground. In 1941 Truong Chinh became secretary-general of the PCI, in charge of the dissemination of communist doctrine in Vietnam. With General Vo Nguyen Giap, Truong Chinh planned the tactical strategy that led to victory by the Vietnamese over Japanese occupation forces in August 1945 and to the establishment of the Democratic Republic of Vietnam, headed by Ho Chi Minh. Truong Chinh described these events in his book The August Revolution. The PCI was disbanded but reemerged as the Alliance for the Dissemination of Marxism, with Truong Chinh as its chairman and leading theoretician. In 1951 the Vietnam Workers' Party (Dang Lao-Dong Viet-Nam) was born, with Truong Chinh as secretary-general.

Truong Chinh's power was eclipsed briefly in 1956, when he was held responsible for failures of the Central Reform Committee. He lost his post as secretary-general of the party, but by April 1958 he had again become a public figure and was appointed vice premier of North Vietnam and president of the Scientific Research Council. Following the death of Ho Chi Minh in 1969, Truong Chinh, Le Duan, and Pham Van Dong formed the controlling triumvirate of North Vietnamese politics. He was chairman of the Standing Committee of the National Assembly from 1960 to 1981 and was president of the State Council from 1981 to 1987.

Truong Chinh sought to organize North Vietnam along lines similar to those of the People's Republic of China. He won recognition as a writer and poet and as a leading dialectician; he wrote The Resistance Will Win (1947), an explicit set of directives for guerrilla warfare. A biographical account of Truong Chinh is given in the preface to Primer for Revolt (1963), a collection of his writings by Bernard B. Fall.

Truong-son (Southeast Asia): see Annamitique, Chaîne.

Truong Vinh Ky: see Petrus Ky.

Truro, town, seat of Colchester county, central Nova Scotia, Can., on the Salmon River, near the head of Cobequid Bay, an eastern arm of the Minas Basin, 61 miles (98 km) north-northeast of Halifax. The site was originally settled in the 1670s by Acadians, who were expelled in 1755. They were followed in 1761 by New Englanders and Scots-Irish from Ulster, and the original name, Cobequid (Micmac Indian: "end of flowing water"), was changed to Truro, for the town in Cornwall. The township of Truro was created in 1765, and the town was incorporated in 1875. Now a commercial centre in a farming and lumbering area, it also is an industrial town with dairy processing, printing, and the manufacture of building materials, textiles, and clothing. It is the site of provincial agricultural, business, and teachers' colleges. A provincial exposition is held annually. Victoria Park (1,000 acres [405 hectares]), noted for its scenery, has two picturesque waterfalls in a deep gorge. Pop. (1981) 12,552.

Truro, city, Carrick district, county of Cornwall, England. It is centrally situated in the county on the River Truro at the head of the tidal estuary of the River Fal. Truro's first charter dates from 1130 to 1140, but the borough was not created a city until 1877. Truro shares some administrative functions with neighbouring Bodmin, the county town (seat) of Cornwall. The Anglican diocese of Truro, centred on the Cathedral of St. Mary (1880-1910), covers Cornwall and part of the county of Devon. Industries in the city include timber, food processing, and light engineering. Dredging enables small vessels to reach the quays, but the harbour is dry at low tide. China clay is the chief export. Pop. (1981) 16,348.

Truro, town (township), Barnstable county, southeastern Massachusetts, U.S., near the northern tip of Cape Cod. Settled in 1700, it was incorporated in 1709 and named for Truro, in Cornwall; it soon became a bustling fishing centre. Futile attempts at farming and failure to continue successful fisheries (owing to the silting of harbours and marine disasters offshore) led to the town's decline, but an artists' and writers' colony developed there in the early 20th century and has survived. The Highland (Cape Cod) Light (5 miles [8 km] north) was originally established in 1797. The Pilgrims spent their second night in the New World (1620) at Pilgrim Spring (7 miles [11 km] northeast), where they found fresh water. Summer tourism is the economic mainstay. Pop. (1984 est.) 1,464.

truss, in engineering, a structural member usually fabricated from straight pieces of metal or timber to form a series of triangles lying in a single plane. (A triangle cannot be distorted by stress.)

A truss gives a stable form capable of supporting considerable external load over a large span with the component parts stressed pri-

Triangular wooden truss

marily in axial tension or compression. The individual pieces intersect at truss joints, or panel points. The connected pieces forming the top and bottom of the truss are referred to respectively as the top and bottom chords. The sloping and vertical pieces connecting the chords are collectively referred to as the web

Trusses were probably first used in primitive lake dwellings during the early Bronze Age, about 2500 BC. The first trusses were built of timber. The Greeks used trusses extensively in roofing, and trusses were used for various construction purposes in the European Middle Ages. Andrea Palladio's I quattro libri dell'architettura (1570; Four Books on Architecture) contained plans for timber trusses. A major impetus to truss design came in the development of covered bridges in the United States in the early 19th century. Cast iron and wrought iron were succeeded by steel for railroad truss bridges. The two systems most commonly used are the Pratt and the Warren; in the former, the sloping web members are parallel to each other, while, in the latter, they alternate in direction of slope. Trusses are also used in many kinds of machinery, such as cranes and lifts, and in aircraft wings and

truss, in medicine, device for holding a reduced hernia in place. In treating infants, an interlacing of yarn forms a supportive pad that is placed over the herniated area. In adult treatment, a pad of heavier material is placed over the hernia to prevent protrusion. A truss is usually a temporary expedient and seldom used as a substitute for surgical repair. A nasal truss is a trusslike device used to hold bones of the nose in place after a fracture.

trust, in Anglo-American law, a relationship between persons in which one has the power to manage property and the other has the privilege of receiving the benefits from that property. There is no precise equivalent to the trust in civil-law systems.

A brief treatment of trusts follows. For full treatment, see MACROPAEDIA: Property Law.

The trust is of great practical importance in Anglo-American legal systems. Consciously created trusts, usually called "express trusts, are used in a wide variety of contexts, most notably in family settlements and in charitable gifts. Courts may also impose trusts on people who have not consciously created them in order to remedy a legal wrong ("constructive

Fundamental to the notion of the trust is the division of ownership between "legal" and "equitable." This division had its origins in separate English courts in the late medieval period. The courts of common law recognized and enforced the legal ownership, while the courts of equity (e.g., Chancery) recognized and enforced the equitable ownership. The conceptual division of the two types of ownership, however, survived the merger of the law and equity courts that occurred in the 19th and 20th centuries. Thus, today, legal and equitable interests are usually enforced by the same courts, but they remain conceptually distinct.

The basic distinction between legal and equitable ownership is quite simple. The legal owner of the property (the "trustee") has the right to possession, the privilege of use, and the power to convey those rights and privileges. The trustee thus looks like the owner of the property to all the world except one person, the beneficial owner ("beneficiary"). As between the trustee and the beneficiary, the beneficiary receives all the benefits of the property. The trustee has the fiduciary duty to the beneficial owner to exercise his legal rights, privileges, and powers in such a way as to benefit not himself but the beneficiary. If the trustee fails to do this, the courts will require him to account to the beneficiary and may, in extreme cases, remove him as legal owner and substitute another in his stead.

The divisions between legal and beneficial ownership are normally created by an express instrument of trust (usually a deed of trust or a will). The maker ("settlor") of the trust will convey property to the trustee (who may be an individual or a corporation, such as a bank or trust company) and instruct the trustee to hold and manage the property for the benefit of one or more beneficiaries of the trust.

While trusts are normally created by an express instrument of trust, courts will sometimes imply a trust between people who have not gone through the formal steps. A simple example would be the situation in which one member of a family advances money to another and asks the second member to hold the money or to invest it for him. A more complicated example of an implied trust would be the situation in which one party provides money to another for the purchase of property. Unless such provision was explicitly made as a gift or as the natural expression of a close relationship (e.g., parent-child), the acquired property is held in trust for the person who provided the money even though the second party holds the legal title. (This type of trust is frequently called a "resulting trust.") Finally, courts will sometimes impose a trust relationship upon parties where there is no evidence that such a relationship was intended. For example, where one party obtains property from another by making fraudulent representations, the defrauding party is frequently required to hold the property in trust for the defrauded party. (This type of trust is a constructive trust.)

Private express trusts are probably the most common form of trust. They are a traditional means of providing financial security for families. By will or by deed of trust, a testator or settlor places property in trust to provide for his family after he is deceased. The trustee may be a professional or may be a member of the family with experience in managing money, or a group of trustees may be chosen. The trustees will invest the property in a way that allows them to make regular payments to the deceased's survivors. In some situations, such as where the deceased left minor or incompetent survivors, a court may create a trust for such persons' benefit, even if the deceased did not do so. Hence, statutory guardianships for minors and incompetents are sometimes called "statutory trusts."

Public express trusts are created to benefit larger numbers of people, or, at least, are created with wider benefits in mind. The most common public trusts are charitable trusts, whose holdings are intended to support religious organizations, to enhance education, or to relieve the effects of poverty and other misfortunes. Such trusts are recognized for their beneficial social impact and are given certain privileges, such as tax exemption. Other public trusts are not considered charitable and are not so privileged. These include holdings for public groups with a common interest, such as a political party, a professional association, or a social or recreational organization.

In the commercial sector, trusts have come to play important roles. Trusts may be established to manage various funds designated for special purposes by businesses and corporations. Such designations might include funds deposited against bonds issued by the company or liens on property that are being used as collateral against bonds. Money for employee-pension funds or profit-sharing programs is often managed through trust arrangements. Such commercial trusts are almost always managed by corporate trustees.

Some modern civil-law systems, such as that of Mexico, have created an institution like a trust, but this has normally been done by adapting trust ideas from the Anglo-American system rather than by developing native ideas. In civil-law jurisdictions, many of the purposes to which the Anglo-American trust is put can be achieved in other ways. For example, the charitable trust of Anglo-American law has a close analogy in the civil-law "foundation" (French fondation, German Stiftung). Regarding the purposes for private express trusts mentioned above, lawyers in European countries get professional management for assets by turning them over to managers who are paid a fee for their services. There is however, a greater preference in civil-law countries than there is in Anglo-American ones for the administration of property by the person who owns and benefits from it.

trust company, corporation legally authorized to serve as executor or administrator of decedents' estates, as guardian of the property of incompetents, and as trustee under deeds of trust, trust agreements, and wills, as well as to act in many circumstances as an agent. Trust companies may have commercial banking departments, and commercial banks may have trust departments. In some countries, trust companies and commercial banks, though separate institutions, are often affiliated. Because the United States pioneered in the development of incorporated trust institutions, legislation and practices of other countries often have been modeled upon American patterns. State laws in the United States generally prescribe minimum capital and surplus requirements for trust operations and require the segregation of trust assets from bankingdepartment assets, the segregation of and separate accounting for the assets of each trust estate, and the specific allocation of managerial responsibility for trust operations.

Trust companies serve as trustees for individuals, business corporations, nonprofit institutions, and governmental bodies. They distinguish between personal trusts and corporate trusts, often having separate departments for the two classes. In serving as trustee, the company usually takes legal title to property conveyed to it and manages it according to the instructions of the creator of the trust, the prescriptions of state law, or the directions of a court having jurisdiction, depending upon the circumstances by which the trust originates. When trust companies accept various managerial duties on an agency basis, they do not take title to property.

Trust services for individuals tend to centre on the administration of estates. Other personal trust work of trust companies is concerned chiefly with living trusts and testamentary trusts. Any person during his lifetime may convey property in trust to a trust company with instructions as to the disposal of the income from the property and eventually of the property itself. Such living trusts are used especially by the wealthy who seek to reduce the burden of estate taxes. Testamentary trusts, which originate in wills, arise when a person stipulates that his estate is not to be distributed but is to be held in trust for a certain period of time.

Their principal service to business corporations is to serve as trustees under corporate bond indentures. In this capacity, a trust company takes title to or a lien upon any property put up as security and verifies the performance of requirements imposed by the loan contract. This function is a matter of rather rigid verification and involves little discretionary action. A service involving more discretion on the part of the trust company is the management of corporate pension funds. Companies seeking higher returns on such funds than can be offered by group insurance plans may transfer these funds to a trust company for management. Trust companies may also serve as transfer agents (keeping records of

a corporation's stockholders or bond owners), as corporate stock registrars (responsible for the proper issuance of new stock certificates when additional stock is sold or outstanding stock is transferred), and as paying agents for the distribution of dividends.

Trusteeship Council, one of the principal organs of the United Nations, responsible for supervising the government of trust territories and for leading them to self-government or independence. The council consists of member states administering trust territories, permanent members of the Security Council that do not administer trust territories, and other members elected by the General Assembly for three-year terms. The council meets once a year; each member has one vote, and decisions are made by a simple majority of those present.

The concept of international supervision of colonial territories was introduced by U.S. president Woodrow Wilson at the Paris Peace Conference in 1919; his assertion that there should be "no annexations" resulting from the victory over Germany and Turkey eventually produced the mandate system of the League of Nations.

The trusteeship system of the UN, like the mandate system of the League of Nations, was established on the principle that colonial territories taken from defeated enemies should not be annexed by any victorious nation but should be administered by a mandatory, or trust, power under international supervision until they were able to determine their own future status. The trusteeship system differed from the mandate system in its provision for the submission of petitions and for periodic visits to the trust territories by UN missions.

In 1945 only 12 League of Nations mandates remained: Nauru, New Guinea, Ruanda-Urundi, Togoland and Cameroon (French administered), Togoland and Cameroon (British administered), Pacific Islands (Carolines, Marshalls, and Marianas), Western Samoa, South West Africa, Tanganyika, and Palestine. All of these became UN trust territories except South West Africa, which South Africa refused to enter into the trusteeship system, despite vigorous international criticism over the years. By 1975 self-government had been achieved by all trust territories except three of four island groups—the Federated States of Micronesia, the Republic of Palau (Belau), and the Marshall Islands—in the Trust Territory of the Pacific Islands, which were administered by the United States. See also mandate.

Truth, Sojourner, legal name ISABELLA VAN WAGENER (b. c. 1797, Ulster county, N.Y., U.S.—d. Nov. 26, 1883, Battle Creek, Mich.), American black evangelist and reformer who

Sojourner Truth

By courtesy of the Burton Historical Collection, Detroit Public Library

applied her religious fervour to the abolitionist and women's-rights movements.

Isabella was born into slavery and spent her childhood as an abused chattel of several masters. Her first language was Dutch. Between 1810 and 1827 she bore at least five children to a fellow slave named Thomas. Just before New York state abolished slavery in 1827, she was sold to Isaac Van Wagener, who set her free. With the help of Quaker friends, she waged a court battle in which she recovered her small son, who had been sold illegally into slavery in the South. In about 1829 she went to New York City with her two youngest children, supporting herself through domestic employment.

Since childhood Isabella had had visions and heard voices, which she attributed to God. In New York City she became associated with Elijah Pierson, a zealous religious missionary. Working and preaching in the streets, she joined his Retrenchment Society and eventually his household

In 1843 she left New York City and took the name Sojourner Truth, which she used from then on. Obeying a supernatural call to "travel up and down the land," she sang, preached, and debated at camp meetings, in churches, and on village streets, exhorting her listeners to accept the biblical message of God's goodness and the brotherhood of man. In the same year she was introduced to abolitionism at a utopian community in Northampton, Mass., and thereafter spoke in behalf of the movement throughout the state. In 1850 she traveled throughout the Midwest, where her reputation for personal magnetism preceded her and drew heavy crowds. She supported herself by selling copies of her book, The Narrative of Sojourner Truth, which she had dictated to Olive Gilbert.

Encountering the women's-rights movement in the early 1850s, and encouraged by other women leaders, notably Lucretia Mott, she continued to appear before suffrage gatherings for the rest of her life.

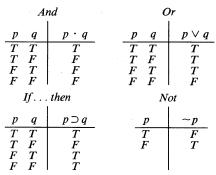

In the 1850s Sojourner settled in Battle Creek, Mich. At the beginning of the American Civil War, she gathered supplies for Negro volunteer regiments and in 1864 went to Washington, D.C., where she helped integrate streetcars and was received at the White House by President Abraham Lincoln. The same year she accepted an appointment with the National Freedmen's Relief Association counseling ex-slaves, particularly in matters of resettlement. As late as the 1870s she encouraged the migration of freedmen to Kansas and Missouri. In 1875 she returned to Battle Creek, where she remained until her death.

BIBLIOGRAPHY. Two reliable biographies are Arthur H. Fauset, Sojourner Truth (1938, reprinted 1971); and Hertha E. Pauli, Her Name Was Sojourner Truth (1962, reissued 1976).

Truth or Consequences, formerly (until 1950) HOT SPRINGS, city, seat (1937) of Sierra county, southwestern New Mexico, U.S. It lies along the Rio Grande, east of the Black Range in Gila National Forest, 60 miles (97 km) north-northwest of Las Cruces. The locality by the Springs of Palomas (now called Hot Springs) was first settled in the mid-19th century. The community was named Hot Springs, attained a reputation as a mineral spa, and became a service point for the surrounding stock-raising, mining, and farming areas. Its present controversial place-name was adopted in 1950 when the city council cooperated with radio (later television) personality Ralph Edwards, master of ceremonies of the quiz show called "Truth or Consequences," in a promotion effort to hold a yearly program and fiesta there. The city lies between two state parks—Elephant Butte Lake (northeast) and Caballo Lake (south)—and tourism, aided by the medicinal springs, is important. Pop. (1988 est.) 6,110.

truth-value, in logic, truth (T or +) or falsity (F or 0) of a given proposition or statement. Logical connectives, such as disjunction (symbolized \vee , for "or") and negation (symbolized \sim), can be thought of as truth-functions, because the truth-value of a compound proposition is a function of, or a quantity dependent upon, the truth-values of its component parts.

The truth-value of a compound statement can readily be tested by means of a chart known as a truth table. Each row of the table represents a possible combination of truth-values for the component propositions of the compound, and the number of rows is determined by the number of possible combinations. For example, if the compound contains just two component propositions, there will be four possibilities and thus four rows to the table. The logical properties of the common connectives may be displayed by truth tables as follows:

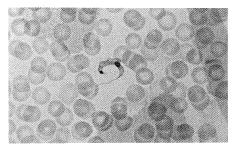

in which · signifies "and" and \supset signifies "if ... then." (In the "or" table, for example, the second line reads "If p is true and q is false, then $p \lor q$ is true.") Truth tables of much greater complexity, those with a number of truth-functions, can be constructed by means of a computer. Abstract systems of logic have been constructed that employ three truth-values (e.g., true, false, and indeterminate), or even many, as in the logic of electronic switching circuits.

TRW Inc., formerly (1958–65) THOMPSON RAMO WOOLDRIDGE INC., major American manufacturer of advanced equipment and systems for industry and government. Headquarters are in Cleveland. Ohio.

The company began as the Cleveland Cap Screw Company, with 29 employees, in 1901. It later changed its name to the Electric Welding Products Company and in 1916 incorporated as the Steel Products Company, acquiring the Michigan Electric Welding Company and the Metals Welding Company. The name was changed to Thompson Products, Inc., in 1926. In 1958 it merged with Ramo-Wooldridge Corporation, of which it owned the majority of stock, becoming Thompson Ramo Wooldridge Inc. The name was changed to TRW Inc. in 1965.

Throughout its history the company has expanded and diversified through the acquisition of other technical companies. Through its various divisions and subsidiaries, TRW designs and manufactures a wide range of parts for cars, trucks, and other vehicles and offers advanced engineering and research services. Its largest segment is the manufacture of automotive components. The electronicand space-systems segment manufactures electronic components and communications systems for defense, space, commercial, and retail applications; provides computer software and analytical services; and designs and builds spacecraft and spacecraft subsystems. Its industrial and energy segment makes tools and machine parts; manufactures components for commercial and military aircraft; and develops, builds, and manages energy services. The company has manufacturing facilities both in the United States and abroad.

trypanosome, any member of a genus (*Trypanosoma*) of parasitic zooflagellate protozoans belonging to the order Kinetoplastida. Adult trypanosomes are mainly blood par-

Trypanosome with human red blood cells (highly magnified)

John J. Lee

asites of vertebrates, especially fishes, birds, and mammals. Most species require an intermediate host (often an insect or a leech) to complete their life cycle. Sleeping sickness (q.v.; also called African trypanosomiasis), for example, caused by T. gambiense or T. rhodesiense, is transmitted by tsetse flies. In South and Central America, T. cruzi, the agent of Chagas' disease (q.v.), and the harmless T. rangeli are transmitted by bloodsucking insects. Other species of trypanosomes induce economically important diseases of livestock: nagana, surra, mal de caderas, and dourine.

trypanosomiasis, either of two parasitic diseases caused by flagellate protozoa of the genus *Trypanosoma*, specifically (1) American trypanosomiasis, or Chagas' disease (q.v.), which occurs in the Central and South American tropics, and (2) African trypanosomiasis, or sleeping sickness (q.v.), which occurs in equatorial Africa and is transmitted by tsetse flies.

tryparsamide, synthetic drug that is used in the treatment of African sleeping sickness (African trypanosomiasis), which is an infestation by the protozoan *Trypanosoma*. Tryparsamide is an organic arsenical—i.e., a compound made by incorporating arsenic into an organic molecule. Administered by intravenous injection in the form of an aqueous or saline solution, it attacks the protozoan during the stage in which it circulates in the bloodstream and concentrates in the lymph nodes. Tryparsamide also is effective in the treatment of syphilis of the central nervous system.

tryptophan, an amino acid obtainable in small quantities (often less than two percent) by hydrolysis of most proteins. First isolated from casein (1902), it is important in the biosynthesis of the vitamin niacin (nicotinic acid), the lack of which causes pellagra (q.v.) in humans. Tryptophan is one of several so-called essential amino acids; i.e., animals cannot synthesize it and require dietary sources. (It is produced from carbohydrates in microorganisms.) Diets poor in tryptophan and niacin thus lead to pellagra.

tsaddik (Judaism): see tzaddiq.

Tsai-ch'un (Chinese emperor): see T'ung-chih.

Ts'ai Lun, Pinyin CAI LUN, courtesy name (tzu) CHING-CHUNG (b. c. AD 50, Ch'en-chou [in modern Hunan province], China—d. 121, China), Chinese court official who is traditionally credited with the invention of paper. Ts'ai Lun was a eunuch who entered the service of the imperial palace in 75 and was

made chief eunuch under the emperor Ho-ti (reigned 88–105/106) of the Eastern Han dynasty in the year 89. In about the year 105 Ts'ai conceived the idea of forming sheets of paper from the macerated bark of trees, hemp waste, old rags, and fishnets. The paper thus obtained was found to be superior in writing quality to cloth made of pure silk (the principal writing surface of the time), as well as being much cheaper and having more abundant sources.

Ts'ai reported his discovery to the emperor, who commended him for it. Important improvements were subsequently made to Ts'ai's papermaking process by his apprentice, Tso Po, and the process was rapidly adopted throughout China, from which it eventually spread to the rest of the world. Ts'ai himself was named a marquess in 114.

Ts'ai Shen, Pinyin CAI SHEN, also called (Wade-Giles romanization) TS'AI PO HSING CHÜN, the popular Chinese god (or gods) of wealth, widely believed to bestow on his devotees the riches carried about by his attendants. During the two-week New Year celebration, incense is burned in Ts'ai Shen's temple (especially on the fifth day of the first lunar month), and friends joyously exchange the traditional New Year greeting "May you become rich" (Kung hsi fa ts'ai).

Ts'ai Shen, wood figurine; in the Musée Guimet, Paris

By courtesy of the Musee Guimet, Paris

A Ming-dynasty novel (Feng Shen Yen I) relates that when a hermit, Chao Kung-ming, employed magic to support the collapsing Shang dynasty (12th century BC), Chiang Tzuya (supporter of the subsequent Chou-dynasty clan) made a straw effigy of Chao and, after 20 days of incantations, shot an arrow made of peach-tree wood through the heart of the image. At that moment Chao became ill and died. Later, during a visit to the temple of Yüan Shih, Chiang was rebuked for causing the death of a virtuous man. He carried the corpse, as ordered, into the temple, apologized for his misdeed, extolled Chao's virtues, and in the name of that Taoist god canonized Chao as Ts'ai Shen, god of wealth, and proclaimed him president of the Ministry of Wealth. (Some accounts reverse the dynastic lovalties of Chao and Chiang.)

Another account identifies Ts'ai Shen as Pi Kan, put to death by order of Chou Hsin, last Shang emperor, who was enraged that a relative should criticize his dissolute life. Chou Hsin is said to have exclaimed that he now

had a chance to verify the rumour that every sage has seven openings in his heart.

Tsai-t'ien (Chinese emperor): *see* Kuang-hsü. **Ts'ai-tien** (China): *see* Han-yang.

Ts'ai Yüan-p'ei, Pinyin CAI YUANPEI (b. January 1863, Shanyin, Chekiang province, China—d. March 5, 1940, Hong Kong), educator and revolutionary who served as head of Peking University from 1916 to 1926 during the critical period when that institution played a major role in the development of a new spirit of nationalism and social reform in

China. Ts'ai passed the highest level of his civilservice examination in 1890, becoming one of the youngest successful candidates in the history of the imperial examination system. In 1904 he helped organize and became the first president of the Restoration Society (Kuangfu hui), a revolutionary group dedicated to the overthrow of the Manchu dynasty. Most of this group later became affiliated with the United League (T'ung-meng hui), formed in 1905 by the revolutionary leader Sun Yatsen, and Ts'ai became head of the party's Shanghai branch. As provisional president of the Chinese republic, Sun Yat-sen appointed Ts'ai minister of education in January 1912, following the overthrow of the 2,000-year-old Chinese imperial system. Six months later, shortly after the presidency passed to the military dictator Yüan Shih-k'ai, Ts'ai resigned his post and went to Europe, where he remained. except for a brief interval in 1913, until late in 1916. During this period, Ts'ai organized a work-study program in which more than 2,000 Chinese students and labourers traveled to France to study in the schools and work in the factories. Many future Chinese leaders were trained in this program, including Zhou Enlai, who helped organize one of the first Chinese Communist cells while in Paris.

In 1916, after first declining a post as governor of the central Chinese province of Chekiang, Ts'ai was made chancellor of China's most prestigious school, Peking University. The university served as a centre of the May Fourth Movement, which began in 1919 as a student demonstration against imperialist exploitation of China and ended as a nation-wide movement. Most of the future leaders of China—including the young Mao Zedong, who worked as a clerk in the library—were associated with the university at this time.

In 1926 Ts'ai left Peking to participate in revolutionary activities against Chiang Kaishek's Northern Expedition to unify China. After the failure of these efforts, Ts'ai continued to work for the cause of higher education, accepting positions in Chiang Kai-shek's government. In 1928 he helped found and served as the first president of the Academia Sinica, China's highest institution of academic study and research. In 1935 Ts'ai resigned all official posts and retired to Shanghai.

Tsaidam Basin, Wade-Giles romanization CH'AI-TA-MU P'EN-TI, Pinyin QAIDAM PENDI, northeastern section of the Plateau of Tibet, occupying the northern and western parts of Tsinghai province, China. The basin is bounded on the south by the towering Kunlun Mountains, with many peaks in the western part more than 20,000 feet (6,000 m) above sea level, and in the north by the A-erh-chin and Nan mountain systems, across which there is only one practicable pass into the western extremity of Kansu province, the Tang-chin Pass. The main access to the basin is through the area around Koko Nor (Blue Lake). The basin is considerably lower than other sections of the Plateau of Tibet, being at an average height of between 8,000 and 10,-000 feet (2,400 and 3,000 m) above sea level.

The Tsaidam Basin is almost entirely an area of interior drainage, with rivers discharging either into Koko Nor or into one of the numerous salt lakes and saline swamps in the basin's central area. In the northwest of the basin is an area of true desert. Another area of true desert occurs in the subsidiary basin in the north, around the Su-kan Lake (a salt lake). The Charhan Salt Marsh in the centre of the basin is China's largest surface rocksalt bed, with an area of 618 square miles (1,600 square km) and solid salt deposits up to 50 feet (15 m) thick. The area has a climate marked by long and extremely cold winters, great temperature variations, and minimal rainfall—the total precipitation of the area is less than 4 inches (100 mm) a year. Outside the desert and salt-marsh areas in the centre of the basin, the land is rolling plain covered with poor grass, but the slopes of the surrounding mountains have areas of good grassland, particularly in the north, where the A-erh-chin and Nan mountains have some forested areas, especially near Koko Nor.

Until recent times the Tsaidam area was sparsely peopled, and the population was for the most part composed of pastoralists noted for their horse breeding; the region is also renowned for its sheep. Since World War II, however, the mineral riches of the area have attracted attention. These include vast deposits of salt, potash, various borate minerals, and boron. In the 1950s extensive geologic surveys of the area revealed rich reserves of coal, oil, and asbestos. Oil fields are in operation, including several around Mang-ya. A large oil refinery has been constructed at Leng-hu, southeast of the Tang-chin Pass, and another has been built at Mang-ya. Very large iron deposits have also been found at Golmud, which has developed a chemical industry using local materials and which produces fertilizer on a considerable scale. In the late 1970s the railway from Lan-chou in Kansu to Hsi-ning in Tsinghai was extended to Golmud, and a network of highways had been constructed. The area has also been the scene of experiments in agriculture. With intensive irrigation, some of the marginal areas in the north and east are used to grow wheat.

Tsamkong (China): see Chan-chiang.

Tsan-Usdi (Cherokee Indian chief): see Ross, John.

Ts'ang-chou, Pinyin CANGZHOU, city in Hopeh sheng (province), China. Ts'ang-chou is situated on the low-lying coastal plain about 60 miles (100 km) south of Tientsin on the Grand Canal and on the Tientsin-P'u-k'ou railway. The coastal plain there is very low, and in historical times the coastline was much farther inland than at present.

The Han dynasty (206 BC-AD 220) first established a county there, Fou-hai, some 25 miles (40 km) northeast of the present city. The first town of Ts'ang-chou was established in the 5th century, some 15 miles (24 km) southeast of the present city. The area became important in the late part of the Sui dynasty (581-618) and in the early part of the T'ang dynasty (618–907), after the completion of the Yung-chi canal linking the area of Tientsin with the Huang Ho (river) and Lo-yang in Honan province. Because the city was in an area of poor natural drainage traversed by several large rivers, the T'ang dynasty, in the late 7th century, constructed a canal to give the city better drainage and direct access to the sea. After the 8th century the Yung-chi canal was abandoned, and Ts'ang-chou's role as a transport centre declined. Under the Yüan (1206-1368) and Ming (1368-1644) dynasties, however, the new Grand Canal linking the Peking area to Yang-chou passed through this area, and Ts'ang-chou became an important port for merchant shipping on the canal.

Ts'ang-chou is a collecting centre for the agricultural produce of the surrounding area, particularly for the land west of the Grand Canal. The eastern area has suffered from repeated

inundations and from the consequent salinity of the soil and is sparsely peopled in comparison with most of the North China Plain. The coastal area produces a good deal of salt. Since 1963, however, the area has been subjected to intensive flood-control measures, drainage, and irrigation works as part of the Hai River project. Although Ts'ang-chou's population has grown considerably since 1949, it remains a transportation and commercial centre, with negligible industrial development. Pop. (1985 est.) 190,800.

Tsang-po (Asia): see Brahmaputra River.

Ts'ang-wu (China): see Wu-chou.

Tsankov, Aleksandŭr (b. 1879, Oriakhova, Bulg.—d. July 17, 1959, Belgrano, Arg.), politician, prime minister of Bulgaria (1923–26) during years of great domestic unrest and violence.

Tsankov studied law at Sofia University, where in 1910 he became professor of economics. Originally a social democrat, he had by 1922 moved considerably to the right politically, becoming in that year leader of the conservative group National Concord (Naroden Zgovor), which conspired to overthrow the radical peasant dictatorship of Aleksandur Stamboliyski.

After the military coup of June 9, 1923, Tsankov replaced Stamboliyski as premier; but resistance to his regime claimed thousands of lives during the following months. His new political coalition, the "Democratic Entente," secured a large majority in the November 1923 elections, but civil disturbances nonetheless continued practically unchecked through the end of his ministry (January 1926). During the 1930s Tsankov headed the Bulgarian fascist movement, and in September 1944, after the Soviet occupation of his country, he formed a short-lived Bulgarian governmentin-exile in Austria under German auspices. For several months following World War II, he was interned in Austria by U.S. forces. On his release he emigrated to South America.

Ts'ao Chan, Pinyin CAO ZHAN, also called (Wade-Giles romanization) Ts'AO HSÜEH-CH'IN (b. 1715?, Chiang-ning, China—d. Feb. 12, 1763, Peking), author of *Hung lou meng (Dream of the Red Chamber*), generally considered China's greatest novel. A partly autobiographical work, it is written in the vernacular and describes in lingering detail the decline of the powerful Chia family and the ill-fated love between Pao-yū and his cousin Lin Tai-yū.

Ts'ao was the grandson of Ts'ao Yin, one of the most eminent and wealthy men of his time. In 1728, however, his family, which held the hereditary office of commissioner of imperial textiles in Nan-ching, suffered the first of a series of reverses and moved to Pei-ching. By 1742 Ts'ao's contemporaries reported him to be living in reduced circumstances and engaged on a work that could hardly be anything other than the *Dream*. The author had finished at least 80 chapters of the novel before his death. The work was completed by Kao Eh, about whom little is known.

Ts'ao Chih, Pinyin CAO ZHI, also called (Wade-Giles romanization) CH'EN SSU WANG, or PRINCE SSU OF CH'EN (b. 192, China—d. 232, China), one of China's greatest lyric poets and the son of the famous general Ts'ao Ts'ao.

Ts'ao Chih was born at the time his father was assuming command over the northern third of China, later to be named the Wei kingdom by his successor, Ts'ao P'ei, Ts'ao Chih's older brother and bitter rival.

In a family of poets—the verses of Ts'ao Ts'ao and Ts'ao P'ei were also widely known—Ts'ao Chih's talents quickly surpassed those of his father and elder brother. Indeed, Ts'ao Ts'ao was so impressed with the poetic skill that

Ts'ao Chih displayed from his earliest years that he once considered making him crown prince over the head of Ts'ao P'ei. Added to Ts'ao P'ei's resentment of Ts'ao Chih was the fact that as a young adolescent Ts'ao Chih had fallen in love with the Lady Chen, the woman who later became the consort of his elder brother. Thus, when Ts'ao P'ei ascended the throne as Emperor Wen of Wei in 220, he took pains to make his younger brother's life as difficult as possible.

Ts'ao Chih's resulting frustration and misery can be seen as a theme of much of his poetry. Writing in the then-standard five-word line, Ts'ao Chih extended and strengthened its use to make it a flexible and yet precise vehicle for the expression of his wide-ranging emotions.

Tsao-chuang, Pinyin ZAOZHUANG, city, southern Shantung *sheng* (province), China. The city includes an extensive area on the western flank of the southwestern spur of the Shantung Hills, to the east of the Grand Canal, that contains one of the most important coalmining districts of eastern China. The coal deposits, which are of high-quality bituminous coal, suitable for coking, are connected with those of Chia-wang and Suchow in northern Kiangsu *sheng*.

The mines were developed before World War II, and much of the production was distributed by rail and the canal to the Yangtze River valley. Under the Japanese occupation, coal production was increased, but, during the latter part of World War II, the mines were seriously damaged and ceased production.

The Tsao-chuang mines were not brought back into production until 1954. They were then extensively modernized and mechanized, and by 1957 they had equaled prewar production and later exceeded it. The nearby city of Han-chuang, which has also been a mining centre since the early 1960s, lies south of Tsao-chuang on the Grand Canal. There has been some industrial development in the region, in addition to mining. Pop. (1985 est.) 269,400.

Consult the INDEX first

Tsao Chün, Pinyin zao Jun, in Chinese mythology, the Furnace Prince whose magical powers of alchemy produced gold dinnerware that conferred immortality on the diner. The Han-dynasty emperor Wu-ti was reportedly duped by Li Shao-chün, a self-styled mystic, into believing that this new deity was capable of conferring immunity from old age. Accordingly, Wu-ti offered the first sacrifice to Tsao Chun in 133 BC. A year after Li was brought to the palace, he secretly fed a piece of inscribed silk to a bull, then informed the emperor that the animal's stomach contained mysterious sayings. When Li's handwriting was recognized, the emperor ordered his execution. At that time, it was believed that Tsao Chun's chief duty was to watch over the furnace that produced gold, the means to immortality.

Han emperor Hsüan-ti (reigned 74–48/49 BC) is said to have seen Tsao Chün in human form: he called himself Ch'an Tzu-fang, wore yellow garments, and had unkempt hair cascading to his shoulders. The emperor, much impressed, sacrificed a lamb in his honour. In about the 7th century AD the similarity of names caused Tsao Chün to be identified with Tsao Shen, god of the kitchen (or hearth), who in turn was later confused with Ho Shen, the god of fire.

Ts'ao Hsüeh-ch'in (Chinese novelist): *see* Ts'ao Chan.

Ts'ao Kuo-chiu, Pinyin cao guojiu, in Chinese mythology, one of the Pa Hsien, the Eight Immortals of Taoism, sometimes depicted in official robes and hat and carrying a tablet indicative of his rank and of his right to palace audiences. He was a man of exemplary character who often reminded a dissolute brother that though one can escape the laws of man, one cannot avoid the nets of heaven. In another tradition, however, Ts'ao is said to have been in conflict with the law but mended his ways after his release from prison was arranged by an imperial mandate.

Ts'ao Kuo-chiu, wood sculpture, 18th century; in the Musée Guimet, Paris By courtesy of the Musee Guimet, Paris

A legend reports that Chung-li Ch'üan and Lü Tung-pin (two of the Pa Hsien) welcomed Ts'ao into their company after a visit to his mountain hideaway. See also Pa Hsien.

Ts'ao P'ei, Pinyin CAO PEI, posthumous name (shih) WEN-TI, courtesy name (tzu) TZU-HENG (b. AD 187, Po-hsien [now in modern Anhwei province], China—d. 226, China), founder of the short-lived Wei dynasty (AD 220-265/266) during the Three Kingdoms period of Chinese history.

The son of the great Han general and warlord Ts'ao Ts'ao, Ts'ao P'ei succeeded his father as king of Wei upon the latter's death in 220. At the same time, Ts'ao P'ei formally proclaimed the end of the Han dynasty (206 BC-AD 220) and the inauguration of the Wei dynasty, of which he was the first emperor. He retired the last Han emperor with great honours and married the emperor's two daughters. He then undertook administrative reforms in his domains. Ts'ao P'ei's Wei dynasty never controlled more than the northern part of China and lasted less than 50 years.

Tsao Shen, Pinyin zao shen, in Chinese mythology, the god of the kitchen (god of the hearth), who is believed to report to the celestial gods on family conduct and to have it within his power to bestow poverty or riches on individual families. Because he is also a protector of the home from evil spirits, his periodic absences are thought to make the house especially vulnerable to becoming haunted at such times. Tsao Shen's identity in life and in the history of his cult are uncertain. The god of the kitchen has also been confused with Ho Shen (god of fire) and with Tsao Chün (Furnace Prince).

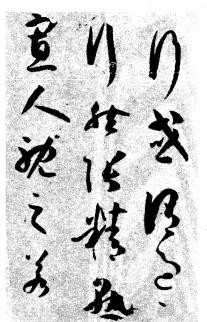

One belief was that at least once each month Tsao Shen departs from his place above the kitchen stove to relate to the celestist, or to

Tsao Shen and his consort, paper image designed to be fixed over the kitchen stove; in the Horniman Museum and Library, London By courtesy of the Horniman Museum and Library, London

the city's spiritual magistrate, Ch'eng Huang (god of the wall and moat), what he has seen. It was also believed that toward the end of the 12th lunar month Tsao Shen must make an annual report to the ruler of heaven. Before the time of his departure, honey or sweet food is ceremonially smeared over the lips of the god's paper image so that only pleasant words may issue from his mouth. Offerings of food and wine are placed before the image, which is then burned along with figures of chariots, horses, money, and household utensils, all made of paper. As the new year begins, a fresh image is placed above the stove to welcome the returning deity.

ts'ao-shu, Pinyin CAOSHU (Chinese: "draft script," or "grass script"), in Chinese calligraphy, a cursive variant of the standard Chinese scripts *li-shu* and *k'ai-shu* (*qq.v.*) and their semicursive derivative *hsing-shu*. The script developed during the Han dynasty (206 BC-AD 220), and it had its period of greatest growth during the T'ang dynasty (618–907). In ts'aoshu the number of strokes in characters are

Ts'ao-shu by Sun Kuo-t'ing (d. AD 688); in the National Palace Museum, Taipei By courtesy of the National Palace Museum, Taipei, Taiwan, Republic of China

reduced to single scrawls or abstract abbreviations of curves and dots. Strokes of varying thickness and modulation show a great variety of shapes. Ts'ao-shu is not bound by rules for even spacing, and characters need not be of the same approximate size; the calligrapher thus has the fullest freedom of expressive movement of line. K'uang ("crazy") ts'ao-shu is an extremely wild and illegible form.

Ts'ao Ts'ao, Pinyin cao cao, courtesy name (tzu) MENG-TE (b. AD 155, Po-hsien [in modern Anhwei province], China—d. 220, Loyang [in modern Honan province]), one of the greatest of the generals at the end of the Han dynasty (206 BC-AD 220) of China.

Ts'ao's father was the adopted son of the chief eunuch of the imperial court. Ts'ao was initially a minor garrison commander and rose to prominence as a general when he suppressed the Yellow Turban Rebellion, which threatened the last years of Han rule. The dynasty, however, was greatly weakened by the rebellion, and in the ensuing chaos the country was divided among the major generals into three kingdoms. Ts'ao occupied the strategic northern section around the emperor's capital at Lo-yang and gradually assumed all imperial prerogatives. His domain was known as the

kingdom of Wei.

Ts'ao's large armies—at one time he is said to have had a million men under arms—and his skillful maneuvering have long been notorious in Chinese history. He was described by Confucian historians and in popular legends as the archetypal shrewd, bold, unscrupulous villain. He was portrayed in this role in the great 14th-century historical novel San Kuo chih yen i (Romance of the Three Kingdoms), and since then he has been one of the most popular figures of Chinese legend and folklore, with various evil magic powers ascribed to him. Modern historians tend to view Ts'ao as a skillful general and pragmatic politician. After Ts'ao's death the last Han ruler, Hsienti, ceded the throne to Ts'ao's son Ts'ao P'ei, who proclaimed the Wei dynasty (220-265/

> A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

tsar, also spelled TZAR, or CZAR, English feminine TSARINA, TZARINA, Or CZARINA, title associated primarily with rulers of Russia. The term tsar, a form of the ancient Roman imperial title caesar, generated a series of derivatives in Russian: tsaritsa, a tsar's wife or tsarina; tsarevich, his son; tsarevna, his daughter; and tsesarevich, his eldest son and heir apparent (a 19th-century term).

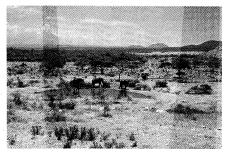

In medieval Russia the title tsar referred to a supreme ruler, particularly the Byzantine emperor and, after about 1240, the Mongol khan. Ivan IV the Terrible, grand prince of Moscow, assumed the title in 1547; as tsar, theoretically he held absolute power, but in practice he and his successors were limited by the traditional authority of the Orthodox church, the Boyar Council, and the legal codes of 1497, 1550, and 1649. In 1721 Peter I officially changed the title to imperator (Latin: "emperor"), the traditional epithet of victorious Roman generals, to reflect his successful efforts to expand Russian domination. The rulers of Russia, however, continued to be called "tsar" in popular usage until the imperial regime was overthrown by the Russian Revolution of 1917. The early Bulgarian emperors (10th to 14th century AD) and the 20th-century kings of Bulgaria (from 1908 to 1946) also called themselves tsars.

Tsatsos, Anthimus VII: see Anthimus VII.

Tsavo National Park, national park, southeastern Kenya, East Africa, east of Kilimanjaro. It was established in 1948 and is the largest (8,069 sq mi [20,899 sq km]) of Kenya's national parks. Drained by the Tsavo and Galana rivers, and the Tiva River in the

Elephants at water hole in Tsavo National Park, Kenya

Carl Purcell

north, the park comprises semiarid plains covered by dormant vegetation (which bursts into luxuriant bloom after a light rain) and acacia and baobab trees. It is divided into two areas: the relatively flat Tsavo East and the volcanic Tsavo West, which is dotted with springs and water holes. Wildlife includes elephants, as well as lions, rhinoceroses, buffalo, hippopotamuses, hartebeests, several species of antelope, and hundreds of birds. Many elephants are destroyed each year to prevent overpopulation. Poaching, particularly for rhinoceroses, and brush fires are constant problems. The park is bisected by the Nairobi–Mombasa highway and railway line.

Tschaikovsky, Pyotr Ilyich (composer): *see* Tchaikovsky, Peter Ilich.

Tschermak von Seysenegg, Erich (b. Nov. 15, 1871, Vienna—d. Oct. 11, 1962, Vienna), Austrian botanist, one of the co-discoverers of Mendel's classic papers on his experiments with the garden pea.

Tschermak interrupted his studies in Vienna to work at the Rotvorwerk Farm near Freiberg, Saxony. He completed his education at the University of Halle, receiving his doctorate in 1896. After working a few years at several seed-breeding establishments, he joined the staff of the Hochschule für Bodenkultur in Vienna in 1901. There he spent practically his

entire teaching career.

In the spring of 1898 Tschermak began breeding experiments on the garden pea in the Botanical Garden of Ghent. The next year he did volunteer work at the Imperial Family's Foundation at Esslingen near Vienna and continued his experiments on peas in a private garden. While writing the results of his experiments, Tschermak saw a cross-reference to Mendel's work and had the papers sent to him from the library of the University of Vienna. He found that Mendel's work with the garden pea duplicated and in some ways superseded his own. In the same year (1900) that Tschermak reported his findings, Hugo de Vries and Carl Erich Correns also reported their discovery of Mendel's papers.

An outstanding plant geneticist, Tschermak applied Mendel's rules of heredity to the development of new plants such as Hanna-Kargyn barley; wheat-rye hybrids; and a fast-growing, disease-resistant oat hybrid.

Tscherning, Anton Frederik (b. Dec. 12, 1795, Frederikswærk, Den.—d. June 29, 1874, Copenhagen), military reformer and radical champion of democracy in mid-19th-century Denmark.

While still an artillery officer in the Danish Army, Tscherning developed a hatred for his country's absolutist regime. Leaving the military in the early 1840s, he became a founder in 1846 of the Bondevennernes Selskab (Society of Friends of the Peasant), a political reform organization of urban and agrarian intellectuals; he served as its chairman from 1846 to 1856. Following the liberal nationalist demonstrations of March 1848 that forced the King to call for a limited constitutional monarchy, Tscherning was named war minister in the new government. Reflecting popular demand, it immediately engaged Denmark in the Schleswig War (1848-50) for the annexation of the duchy of Schleswig. Serving as war minister until November 1848, Tscherning successfully reorganized the army, though he was less fortunate in directing field operations. He sat in Parliament from 1849 to 1866 and in the State Council from 1854 to 1864, at all times urging greater democratic participation. agrarian reform, free trade, and reduction of civil service expenditure.

In the early 1860s Tscherning spoke out against the National Liberal government's chauvinistic policy of incorporating Schleswig into the state, breaking with most of the peasant party on that issue. After the disastrous Danish-German War (1864) he again led the democratic forces in unsuccessful agitation against the restrictive 1866 reform of membership in the upper chamber of Parliament.

Tschudi, Gilg, also called AEGIDIUS (b. Feb. 5, 1505, Glarus, Switz.—d. Feb. 28, 1572, Glarus), Swiss humanist and scholar, the author of a chronicle of Swiss history that was used as a source by many subsequent writers, including Friedrich Schiller.

Though a pupil of the religious reformer Huldrych Zwingli, Tschudi remained a convinced and militant Roman Catholic; and his efforts to eliminate the Zwinglians came to be known as the *Tschudikrieg* ("Tschudi's War"; 1558–64). After holding several administrative posts, he became chief magistrate of Glarus.

Tschudi's enduring importance rests especially on the *Chronicon Helveticum*, 2 vol. (1734–36), a "Swiss Chronicle" covering the years 1000–1470. Many assiduously collected documents were incorporated in it; others were fabricated, in an attempt to give a coherent and comprehensive chronology. His chronicle was the leading authority until the 19th century, when much of his work was found to be spurious. Consequently, his reputation as a historian suffered, but the literary aspect of his work is still justly admired.

Tsederbaum, Yuly Osipovich: see Martov, L.

Tsegaye, Gabre-Medhin (b. Aug. 17, 1935, Ambo, Eth.), African playwright and poet who wrote in Amharic and English.

Tsegaye earned a degree from Blackstone School of Law, Chicago, and studied stagecraft at both the Theatre Royal, Windsor, and the Royal Court Theatre, London. In Ethiopia he was director of the Haile Selassie I Theatre (now the National Theatre).

Tsegaye wrote more than 20 plays, most of them in Amharic, and translated a number of plays of Shakespeare and Molière into that alnguage as well. His Amharic plays deal primarily with contemporary Ethiopia, especially with the plight of youth in urban settings and the need to respect traditional morality, as in Crown of Thorns (1959) and The Future Man (1965). Fire or Flower (1973) is a collection of his Amharic poems.

Oda Oak Oracle (1965) is Tsegaye's best known verse play in English. Like his other English plays, it is based on Ethiopian history and focusses on religious conflict. Collision of Altars (1977) is an experimental play that includes mime, incantation, dance, and masks. Tsegaye's English poetry appeared in Ethiopian journals and was included in several anthologies of African poetry, including New Sum of Poetry from the Negro World (1966).

Tselinograd, also spelled CELINOGRAD, oblast (administrative region), northern Kazakh Soviet Socialist Republic, with an area of 48,100 sq mi (124,600 sq km). Known as Akmolinsk oblast until 1961, it lies in the steppe zone in the northwest Kazakh Upland and is drained by the Ishim and Nura rivers. In the southwest are Lakes Tengiz and Kurgaldzhin. The terrain is mainly rolling plain, with black earth and chestnut soils in the north and centre and saline brown soils in the extreme southwest and east. The climate is continental and dry, with an average annual precipitation of only 12 in. (300 mm).

The *oblast* is a major producer of grain (wheat, oats, and barley) and livestock products, with animal husbandry, particularly sheep raising, dominant in the drier southwest and northeast and crop cultivation in the centre. The chief industries are engineering, mining, building materials, and food processing. Urban communities include Tselinograd city, the capital, Atbasar, Makinsk, Stepnogorsk, and Alekseyevka. The All-Union Scientific Research Institute for Grain Farming is located at Shortandy. The population consists mainly of Russians, Kazakhs, Germans, and Ukrainians. Pop. (1983 est.) 837,000.

Tselinograd, also spelled CELINOGRAD, formerly (until 1961) AKMOLINSK, city and administrative centre of Tselinograd oblast (administrative region), Kazakh Soviet Socialist Republic, on the Ishim River at the junction of the Trans-Kazakhstan and South Siberian railways. Known as Akmolinsk (Kazakh akmola, "white tomb") until 1961, it was founded in 1824 as a Russian military outpost and became an administrative centre in 1868. Its population had reached 33,000 when it was made an oblast centre in 1939.

The Soviet Virgin and Idle Lands Campaign in the mid-1950s—Tselinograd is Russian for Virgin Lands City—and the city's role as capital of a kray (territory) that united the five northern oblasti of Kazakhstan in 1960–65 greatly enhanced its importance and led to much new construction and the setting up of various research and higher educational institutions (teacher training, agriculture, medicine, and engineering and construction). Most of the population is employed in transport, particularly by the railways. Various types of agricultural machinery are also produced. Pop. (1983 est.) 253,000.

Ts'en Shen, also called Ts'EN CHIA-CHOU, Pinyin CEN SHEN, or CEN JIAZHOU (b. 715, Nan-yang [Chiang-ling], China—d. 770, Ch'eng-tu, Szechwan), one of the celebrated poets of the T'ang dynasty of China.

Because of the decline of his aristocratic family, Ts'en had to rely upon his literary skill to secure government appointment through the examination system. During the 750s he held several assignments in the Central Asian outposts of the far-flung T'ang Empire until the eruption of the An Lu-shan Rebellion of 755 forced his return to China. Having supported the loyalist cause, he succeeded to a number of provincial posts under the restoration until his retirement in 768.

A member of the second generation of High T'ang poets, which included such masters as Li Po and Tu Fu, Ts'en participated in the effort to reinvigorate the *lū-shih*, or "regulated poem," through innovations in diction and metre. Contemporaries praised him for his stylistic craftsmanship, particularly his skill at creating unconventional metaphors and imaginative phrases. But he came to be best known as a "frontier poet" because he so frequently set his poems in the exotic Central Asian locale that he had experienced firsthand in the midst of his career.

Tseng Kuo-fan, Pinyin zeng guofan, canonized name (Wade-Giles romanization) WEN-CHENG (b. Nov. 26, 1811, Hsiang-hsiang, Hunan Province, China—d. March 12, 1872, Nanking), Chinese administrator, the military

Tseng Kuo-fan, detail of a portrait; in the National Palace Museum. Taipei By courtesy of the National Palace Museum, Taipei, Taiwan, Republic of China

leader most responsible for suppressing the Taiping Rebellion (1850-64)—thus staving off the collapse of China's Imperial regime.

Early career in civil service. Tseng Kuo-fan was born into a prosperous family dominated by his grandfather Tseng Yü-p'ing, a farmer with social ambitions. Tseng Kuo-fan passed the prefectural examination in 1833, one year after his father had succeeded at his 17th attempt. The next year, he passed the provincial examination and, after failing the metropolitan examination at the capital in 1835, finally passed in 1838.

The chin-shih ("doctorate degree") led to appointment to the Hanlin Academy, a body of the most outstanding scholars in the country, which performed literary tasks for the court; and Tseng served continuously in the capital for more than 13 years. He was introduced to the writings of such philosophers of the Sung dynasty as Ch'eng Hao, Ch'eng I, and Chu Hsi, and he always remained devoted to interpreting the Confucian Classics.

Tseng's intellectual progress helped his political career. He was soon appointed junior vice president of the Board of Ceremonies, serving later as vice president of the boards of Defense, Works, Justice, and Finance. Tseng was, nevertheless, bored with his routine life and wanted to help the people more substantially. In 1850, 1851, and early in 1852, he repeatedly criticized the Emperor's behaviour, the government's financial policy, and Imperial treatment of an outspoken official.

Military exploits. In 1852, Tseng Kuo-fan's mother died, and, in accordance with prevailing custom, he asked permission to observe the three-year mourning period at home. This granted, he was soon called into service again when the Taiping rebels, who had taken up arms in 1850, had by 1852 reached the fertile Yangtze River Valley in south central China, seriously threatening the Ch'ing dynasty's survival. The rebellion, a great religious-political upheaval, eventually caused the loss of some 20,000,000 lives and was the greatest threat the Ch'ing dynasty had ever faced. Tseng joined the local defense forces in Hunan early in 1853, gradually shouldering more and more responsibility for the rebellion's suppression.

This was accomplished in 1864, owing largely to the intense conflicts among the Taiping leadership but also partly to Tseng's own leadership and perseverance. He had suffered two serious naval defeats in 1854, had been surrounded by enemy troops at Ch'i-men (some 130 miles west of the coast at Hang-chou) in 1861, and had frequently lacked adequate finance and staff, but, nonetheless, he fought on for 12 years.

During his campaign Tseng concluded that ethics alone were insufficient for politics and that leadership necessitated compromise with subordinates' vainglorious greed. Thus, on resuming military responsibilities in July 1858, having stayed at home for a mere one and one-half years—this time to mourn his father—he conscientiously answered letters, received petitioners, and magnanimously. though selectively, recommended subordinates for promotion. Consequently, he became very popular with his army, though still maintaining discipline.

Later administrative activity. Victory over the Taiping rebels in 1864 was the climax of his career. Thereafter, he was mainly an administrator, serving twice as governor general of Chiang-nan and Chiang-hsi (about 100 miles inland from the southeast coast) and once as governor of Chihli. Between May 1865 and October 1866 he again assumed military command in order to quell the Nien Rebellion that took place in northern China but was compelled to resign after criticism by government censors.

Tseng never had an opportunity to work at the capital again after 1864, but his prestige, power, and open-mindedness enabled him to make important changes. Li Hung-chang, his protégé, gained tremendous power in the government, power that few other Chinese officials ever held and that, when passed on to the official Yuan Shih-k'ai, finally led to the collapse of the Ch'ing dynasty. (When the dynasty fell, Yüan Shih-k'ai served as president of the Republic of China.) With Tseng's support, Jung Hung, a graduate of Yale University in the United States, established an ironworks in Shanghai that later became the Chiang-nan Arsenal and is still a shipbuilding centre. It was upon Tseng's recommendation, too, that the government introduced student education overseas.

Tseng had four younger brothers, four sisters, two sons, and five daughters. He treated them affectionately and frequently wrote them letters relating his experiences. Despite his contributions to the modernization of China, his views toward women were rather oldfashioned: family harmony was to be achieved by women's tolerance of masculine supremacy.

Tseng was given the posthumous title of Wen-Cheng, the highest title given to civil officials under the Ch'ing dynasty.

Assessment. Since the 1920s, Tseng's role in history has caused controversy. Conservatives, such as the Kuomintang (кмт), or Nationalist Chinese, leaders, after 1928, hailed him as a symbol of Confucianism and a model of moral cultivation, while revolutionaries, including several founders of the Kuomintang and most of the Communist leaders, bitterly criticized him for nationalist reasons. He was essentially a Confucian without being dogmatically conservative in policy, and it was with the philosophy of the ancient reformer that his deepest loyalties lay. (S.-y.H.) BIBLIOGRAPHY. William James Hail, Tseng Kuo-fan and the Taiping Rebellion (1927), helpful in understanding Tseng Kuo-fan's career—very critical toward the Taiping rebels and outdated in many respects; Teng Ssu-yu, "Tseng Kuo-fan," in Arthur W. Hummel (ed.), Eminent Chinese of the Ch'ing Period (1644–1912), vol. 2, pp. 751–

756 (1944), a succinct but very useful biography; Shen Chen Han-yin, "Tseng Kuo-fan in Peking, 1840-1852: His Ideas on Statecraft and Reform, Journal of Asian Studies, 27:61-80 (1967), a detailed description and analysis of Tseng Kuo-fan's political career in Peking and the development of his thought during that period.

Tseng Ts'an (Chinese philosopher): see Tseng-tzu.

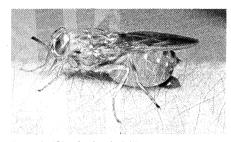

Tseng-tzu, Pinvin zengsi, also called (Wade-Giles romanization) TSENG TS'AN (b. 505d. c. 436 BC), Chinese philosopher, disciple of Confucius, believed to be the author of the Ta hsüeh ("Great Learning"). In this classic, a part of the Li Chi ("Record of Rites") and one of the Four Books, he discussed the great importance of the Confucian virtues *chung* ("loyalty") and *shu* ("reciprocity").

He was highly influential in reaffirming the Confucian emphasis on the virtue of hsiao ("filial piety"). He enumerated the three degrees of filial piety: honouring father and mother, not disgracing them, and being able

to support them.

Tsesis (Latvian S.S.R.): see Cēsis.

tsetse fly (Glossina), any of the approximately 21 species of African bloodsucking flies of the family Muscidae (order Diptera). which transmit sleeping sickness in humans and a similar disease called nagana in domes-

Tsetse fly (Glossina brevipalpis)

tic animals. In Africa these insects are known either as tsetse, a name that means a fly that destroys cattle, or as fly.

They are robust, have some bristles, and are usually larger than their relative, the housefly, ranging from 6 to 16 millimetres (0.2 to 0.6 inch) in length. Their colour varies from yellowish brown to dark brown. The gray thorax often has dark markings, and the abdomen may be banded. The stiff, piercing mouthparts, directed downward as the fly bites, are held horizontally at other times. While resting, the wings are held flat over the back. A bristle-like appendage (arista) on each antenna bears one row of long, branched hairs and differentiates the tsetse fly from all other flies.

The tsetse fly may live from one to three months. The larva hatches from an egg within the female and feeds on a nutrient fluid secreted by paired milk glands on her uterine wall. Without a sufficient blood meal the female fly will produce a small, underdeveloped and nonviable larva; when adequately fed she will produce a fully matured larva about every ten days throughout her life. The larva burrows into the ground and pupates within an hour; after several weeks the adult emerges.

The tsetse fly is found wherever the trees and shrubs required in its environment occur. Both sexes suck blood almost daily, usually during the warmest part of the day. Of the tsetse flies that attack man, 80 percent or more may be males; the females usually attack larger animals.

The most effective controls have been environmental ones-destruction of wild game, clearing of woodlands, and periodic burning to prevent growth of brush. Trapping of flies, control by natural parasites, and application of insecticides to livestock have not had great success; aerial sprays using residual insecticides have produced inconclusive results.

Tsetserleg, also spelled TSETSERLIK, OF TSETserlig, town, administrative headquarters of Arahangay aymag (province), central Mongolian People's Republic. It lies on the northeastern slopes of the Hangayn Mountains, 250 mi (400 km) from Ulaanbaatar, the capital. Once the seat of a monastery, the town is an ancient

cultural and commercial centre; it now has a theatre, hotel, hospital, and an agricultural college. The main industry is food processing. Pop. (latest est.) more than 2,000.

Tsévié, town, Zio préfecture in Maritime economic région, southern Togo, West Africa, located about 20 mi (32 km) north of Lomé, the national capital. The town constitutes an important centre for palm oil processing and a major market for commercial trade among Togo's régions. Tsévié has road and railway links with Notsé, Atakpamé, and Blitta to the north and with Lomé to the south. The Ewe people inhabit Tsévié and the surrounding area. Pop. (1977 est.) 15,900.

Tshaka (Zulu leader): see Shaka.

Tshangs-pa Dkar-po, in Tibetan Buddhism, one of the eight fierce protection deities. *See* dharmapāla.

Tshikapa, village, Kasai-Oriental region, Zaire, on the Kasai River, about 30 mi (50 km) north of the Angolan border. The noted diamond mining (arising after the first diamond was discovered in the area in 1907) fell off in the 1970s, but gravel quarrying remained important. The site has boat landings and an airport.

Tshombe, Moise(-Kapenda) (b. Nov. 10, 1919, Musumba, Belgian Congo—d. June 29, 1969, Algiers), politician, president of the secssionist African state of Katanga, and premier of the united Congo Republic (now

Tshombe

AP/Wide World Photos

Zaire) who took advantage of an armed mutiny to announce the secession of mineral-rich Katanga (now Shaba) province in July 1960. With covert military and technical assistance from Belgium and the aid of a white mercenary force, Tshombe maintained his independent Republic of Katanga for three years in the face of combined United Nations and Congolese efforts to end the secession of the province. Often accused of being a pawn of foreign commercial interests, Tshombe was an adroit politician, who used his foreign supporters to help him achieve his personal ambitions in the Congo.

Tshombe came from a wealthy family and at his father's death inherited sizable business holdings. After the businesses began to fail, however, Tshombe turned to politics. From 1951 to 1953 he was one of the few Congolese to serve on the Katanga Provincial Council. In 1959 he became president of Conakat (Confédération des Associations Tribales du Katanga), a political party that was supported by Tshombe's tribal group, the powerful Lunda, and by the Belgian mining monopoly Union Minière du Haut Katanga, which controlled the province's rich copper mines. At a conference called by the Belgian home government in 1960 to discuss independence for the Congo, Tshombe presented Conakat's proposals for an independent Congo made up of a loose confederation of semiautonomous provinces. Tshombe's proposals, as well as those of other federationists such as Joseph Kasavubu, were rejected in favour of Patrice Lumumba's plan for a strongly centralized republic. Conakat won only 8 of 137 seats in the Congolese Parliament in the first national elections of May 1960, but Tshombe's party and its allies won a majority in Katanga's Provincial Assembly, and Tshombe became president of the province. Although he appeared to accept Lumumba's national government, with the mutiny of the Force Publique (militia) two weeks after independence, Tshombe declared Katanga independent.

After the ouster of Congolese Premier Lumumba by President Kasavubu and the army in September 1960, Tshombe opened negotiations with Kasavubu toward a possible end to Katanga secession but later abandoned the talks. He may have been implicated in the subsequent death of Lumumba. Tshombe failed to win diplomatic recognition for his state, and after the United Nations intervened with force in Katanga in January 1963 and defeated his troops, Tshombe fled to Spain. Recalled from exile in 1964 by President Kasavubu to assume the post of premier to quell a rebellion in the eastern Congo, Tshombe was dismissed in 1965, ostensibly for using white mercenaries against the rebels, though it is also contended that he was attempting to oust Kasavubu. Tshombe returned to Spain. In 1967, when there were rumours that he planned to return to the Congo, Tshombe was kidnapped and taken to Algeria. Algerian officials refused Congolese Pres. Joseph Mobutu's demands for Tshombe's extradition to stand trial for treason. Tshombe remained under house arrest near Algiers, where he died of a heart attack.

Ts'iao-tso (China): see Chiao-tso.

Tsimihety, a Malagasy people living in mountainous north central Madagascar. The Tsimihety ("Those Who Never Cut Their Hair") were originally sedentary mountain people living in extended families organized through patrilineal descent. They succeeded in remaining independent of the early Sakalava and Betsimisarake kingdoms but submitted to Merina rule in the 1820s and to French rule at the turn of the 20th century.

Tsimihety speak a dialect of Malagasy, the Austronesian West Indonesian language common to all Malagasy peoples. The Tsimihety have traditionally never been politically unified but are now one of the most mobile and dynamic peoples of Madagascar. A high birth rate and strict rules for exogamous marriage obliged them to penetrate neighbouring areas in search of pastures for their cattle and land on which to grow their staple food, rice. The main area for Tsimihety expansion was toward the west, among the lands of the Sakalava people. Many Tsimihety sons also work as seasonal wage labourers on coffee or tobacco plantations throughout northern Madagascar.

Tsimlyansk Reservoir, Russian TSIMLYAN-SKOYE VODOKHRANILISHCHE, reservoir created by a giant barrage (dam) at the great bend of the Don River, near the town of Tsimlyansk in Rostav *oblast* (administrative region), southern Russian Soviet Federated Socialist Republic. The reservoir, about 160 miles (257 kilometres) long, was constructed in 1950–51 in connection with the building of the Volga-Don Shipping Canal. It provides hydroelectric power and irrigation water for the extensive vineyards and market gardens along the lower Don.

Tsimshian, also spelled CHIMMESYAN, Indians of the North Pacific Coast of North America, inhabiting the mainland and islands around the Skeena and Nass rivers and Milbanke Sound in what is now British Columbia and Alaska. They speak any of three Tsimshian dialects: Niska, spoken along the Nass River; coastal Tsimshian, along the lower Skeena and the coast; and Kitksan (or

Gitksan), along the upper Skeena. Tsimshian is classified as a Penutian language.

Like the economy of the Tlingit and Haida (qq.v.), that of the Tsimshian was based on fishing. Land animals were hunted during the winter; in summer, groups settled at permanent sites to trap migrating salmon and eulachon (candlefish). Eulachon were particularly valuable for their oil, which was made into a food highly regarded by many peoples of the area. Large, permanent winter houses, made of wood and often carved and painted, symbolized the wealth of Tsimshian families.

The coastal Tsimshian and the Niska were divided into four major clans, or kin groups; the Kitksan into three. These were further divided into local segments or lineages, descent being traced through the maternal line. Each lineage had its own fishing and hunting areas, berry grounds, house or houses, and heraldic crests representing events in the family history, as well as its own chiefs. It was generally an independent social and ceremonial unit. Local groupings, or tribes, were composed of several lineages; each lineage was ranked relative to the others, and the chief of the highestranked lineage was recognized as chief of the tribe. The tribe as a whole held properties such as the winter village site and participated in ceremonies and warfare.

The Tsimshian were known for their highly conventionalized applied art. Carved and painted columns (popularly known as "totem poles") were erected, primarily as memorials to deceased chiefs. The major Tsimshian potlatches, ceremonial distributions of gifts, had as their purpose the announcement and validation of the position of the new chief. Potlatches sometimes marked a series of events several years apart, such as house building, totem-pole raising, and dramatizations of privileges and crests.

Tsinan (China): see Chi-nan.

Tsing Hai (lake, China): see Koko Nor.

Tsinghai, Wade-Giles romanization CH'ING-HAI, Pinyin QINGHAI, sheng (province) of northwestern China in the Tibetan highlands, bounded on the north and east by Kansu, on the southeast by Szechwan, on the south and west by the Tibetan Autonomous Region, and on the west and north by the Sinkiang Uighur Autonomous Region.

A brief treatment of Tsinghai follows. For full treatment, see MACROPAEDIA: China.

Tsinghai was a remote region of China, lying to the west of the historic provinces that made up China proper. Parts of it came under Chinese control in the 3rd century BC. For centuries it was sparsely occupied by nomadic herdsmen, chiefly Tibetans and Mongols, plus a few Chinese settlers on farms around the northeastern corner of Koko Nor (lake). The Chinese population increased over the years, and Tsinghai was made a Chinese province in 1928. Its capital is Hsi-ning.

Most of Tsinghai consists of mountains and high plateaus. Between these mountain ranges are broad valleys, rolling hilly areas, and extensive flat tablelands. The Tsaidam Basin, an immense, low-lying area, is in the northwestern part of the plateau. The basin's southeastern part forms a broad swamp which is in turn formed by several rivers flowing from the snowcapped T'ang-ku-la-shan-mo (mountain range). Tsinghai's climate is typically continental, influenced by the region's remoteness from the sea and its protection from sea winds by its mountain masses. Most rainfall occurs in the summer. Winters are dry, cold, and windy; summers are hot. Strong winds from the Mongolian Plateau blanket the region with sand, causing serious agricultural problems. The plateau thrives with grass, nevertheless,

and Tsinghai possesses some of China's best pasturelands for sheep, horses, and yaks. The region is a historic home of nomadic herdsmen and is noted for its horse breeding. Also found in the region are antelope, wild horses, wolf, fox, bear, and some exotic birds.

Besides the Han (Chinese), many national minorities live in Tsinghai, including Tibetan, Mongol, and Hui (Chinese Muslims). Although Tsinghai is China's third largest polit-

ical unit, it is sparsely populated.

Economically, Tsinghai is divided into two parts by the Jihyneh Mountains. The eastern side takes advantage of drainage from the Huang Ho and has large tracts of farmland crisscrossed by irrigation canals and dotted with settlements. Principal crops raised are spring wheat, barley, and Irish potatoes. The western side is the plateau basin, where herds of cattle, yaks, horses, and sheep graze on the vast stretches of grassland. Most of the Tibetans and Mongols have long engaged in herding there. In the pastoral areas, large tracts of land have been opened up for cultivation, which has enabled the introduction of a farming-livestock economy. The Kunlun and Ch'i-lien mountains are well forested; among the timber products are spruce, birch, Chinese pine, and Chinese juniper. In nearby farming areas are found peach, apricot, pear, apple, and walnut orchards.

Crude oil is produced in the Tsaidam Basin oilfield. The basin also has deposits of coal, iron ore, and other minerals, including potassium, which supplies a large fertilizer plant located there. The big salt lakes offer large reserves of borax and especially of salt—so much that blocks of salt are used to pave roads, build bridges, and construct houses. Industrial enterprises in Tsinghai, mostly in Hsining, include tanneries, match factories, and woollen textile and dairy facilities.

The province's first rail link with the rest of China was established in 1959. Truck transportation is important and there are several main highways in the region. Area 278,400 sq in (721,100 sq km). Pop. (1983 est.) 3,930,-000.

Tsinghai-Tibet Plateau (China): see Tibetan Highlands.

Tsingtao, Wade-Giles romanization CH'INGTAO, Pinyin QINGDAO, port city, eastern Shantung Province (sheng), China. It is a prefecture-level municipality (shih). Tsingtao is located on the south coast of the Shantung Peninsula at the eastern entrance to Chiao-chou Wan (Kiaochow Bay), one of the best natural harbours in northern China. Although the bay sometimes freezes in severe winters, it is always open for large ships.

Originally a minor fishing village in Chi-mo County (hsien), Tsingtao developed a large junk trade in Ch'ing times (17th-20th century), when a customs station called Ch'ing-tao K'ou was established. With the establishment of the Peiyang (North Ocean) fleet in the 1880s, the Chinese government realized the strategic importance of Tsingtao, setting up a minor naval station and building fortifications there. In 1897 the German government, which had ambitions in this area, dispatched a force to occupy Tsingtao; in 1898 it forced the Chinese government to pay an indemnity and to grant Germany a 99-year lease on Chiao-chou Wan and the surrounding territory, together with railway and mining rights in Shantung. Tsingtao was declared a free port in 1899, modern port facilities were installed, and a railway was built to Chi-nan (Tsinan). A modern European-style city was laid out, and a variety of industries were founded. A branch of the Imperial Maritime Customs was established to control the trade of the coast as far south as the new port of Lien-yun-kang (Kiangsu Province). In 1914, when Japan declared war on Germany, its prime purpose was the capture of Tsingtao. The port capitulated after a blockade in November 1914. The Japanese continued to occupy the city until the Washington Conference of 1922, when the port was returned to China. During this period, however, the Japanese built up a strong position, both in Tsingtao itself and in the Shantung hinterland.

Tsingtao came under the effective control of the Nan-ching (Nanking) government in 1929 and became a special municipality. Port development continued, and its trade overtook that of its rival, Tientsin, in about 1930, after which it continued to expand at the expense of Tientsin. The Japanese occupied the city in 1938 and held it until 1945. During this period, considerable industrial development occurred. By 1941 Tsingtao had major modern cotton mills, locomotive and railway car works and repair facilities, engineering shops, and factories manufacturing rubber, matches, chemicals, and dyestuffs. Its brewing industry produces one of the best known beers of China. Since 1949 it has developed as a major base for heavy industry, and by the 1970s textiles, formerly the preeminent manufacture, were rivalled by the growth of the engineering industry. In the late 1950s a major primary iron and steel industry was established there. The city is the terminus of an east-west railway line and is linked by rail with the port of Yen'tai (Chefoo). It is also a large fishing

Tsingtao, an important cultural centre, is the seat of Shantung University, Tsingtao Institute of Technology and Tsingtao Engineering College, an oceanographic institute, and other institutions of higher education. Pop. (1983 est.) 1,180,000.

Tsining (China): see Chi-ning.

Tsinling Mountains, Wade-Giles romanization CH'IN LING, Pinyin QIN LING, mountain range in North China, extending east-west from southeast Kansu Province into Shensi and Honan provinces. It is considered to be an extension of the Kunlun Mountains. It constitutes a watershed between the Wei and Han rivers and reaches a height of 12,359 ft (3,767 m) at T'ai-pai (mount). The range forms a sharp physical divide, of climatic as well as topographic significance, separating the dry loess lands of the north from the green, forested hills of the south.

Tsiolkovsky, Konstantin Eduardovich (b. Sept. 17 [Sept. 5, old style], 1857, Izhevskoye, Russia—d. Sept. 19, 1935, Kaluga, Russian S.F.S.R.), Russian research scientist in aeronautics and astronautics who pioneered rocket

Tsiolkovsky
Tass—Sovfoto

and space research and the development and use of wind tunnels for aerodynamic studies. He was also among the first to work out the theoretical problems of rocket travel in space. Tsiolkovsky was from a family of modest means. His father, Eduard Ignatyevich Tsiolkovsky, a provincial forestry official, was a Polish noble by birth; his mother, Mariya Ivanovna Yumasheva, was Russian and Tatar. The boy lost his hearing at age nine as a result of scarlet fever; four years later his mother died. These two events had an important bearing on his early life in that, being obliged to study at home, he became withdrawn and lonely, yet self-reliant. Books became his friends. He developed an interest in mathematics and physics and, while still a teenager, began to speculate on space travel.

At 16 Tsiolkovsky went to Moscow, where he stayed for three years, studying chemistry, mathematics, astronomy, and mechanics, attending lectures with the aid of an ear trumpet, and expanding his grasp of the problems of flight. But the elder Tsiolkovsky understandably wanted his deaf son, notwithstanding his growing ability to deal with abstruse questions in physics, to achieve financial independence. After discovering that the youth was going hungry and overworking himself in Moscow, his father called him home to Vyatka in 1876.

The future scientist soon passed the teachers examination and was assigned to a school in Borovsk, about 60 miles (100 kilometres) from Moscow, where he began his teaching career, married Varvara Yevgrafovna Sokolovaya, and renewed his deep interest in science. Isolated from scientific centres, the deaf teacher made discoveries on his own. Thus, in Borovsk, he worked out equations on the kinetic theory of gases. He sent the manuscript of this work to the Russian Physico-Chemical Society in St. Petersburg but was informed by the chemist Dmitry Ivanovich Mendeleyev that it already had been done a quarter century before. Undaunted and encouraged by Mendeleyev, he continued his research. Impressed by the intellectual independence of this young provincial schoolteacher, the Russian Physico-Chemical Society invited him to become a member.

In 1892 Tsiolkovsky was transferred to another teaching post in Kaluga, where he continued his research in astronautics and aeronautics. At that time he took up the problem that occupied almost all his life: the problem of constructing an all-metal dirigible with an adjustable envelope. In order to demonstrate the validity of his experiment, he built a wind tunnel, the first in Russia, incorporating into it features that would permit testing the aerodynamic merits of various aircraft designs. Since he did not receive any financial support from the Russian Physico-Chemical Society, he was obliged to dip into his family's household budget in order to build the tunnel; he investigated about 100 models of quite diverse designs.

Tsiolkovsky's experiments were subtle and extremely clever. He studied the effects of air friction and surface area on the speed of the air current over a streamlined body. The Academy of Sciences learned of his work and granted him modest financial aid of 470 rubles, with which he built a larger wind tunnel. Tsiolkovsky then compared the feasibility of dirigibles and airplanes, which led him to develop advanced aircraft designs.

While investigating aerodynamics, however, Tsiolkovsky began to devote more attention to space problems. In 1895 his book *Gryozy o zemle i nebe (Dreams of Earth and Sky)* was published, and in 1896 he published an article on communication with inhabitants of other planets. That same year he also began to write his largest and most serious work on astronautics, "Exploration of Cosmic Space by Means of Reaction Devices," which dealt with theoretical problems of using rocket engines in space, including heat transfer, a navigating mechanism, heating resulting from air friction, and maintenance of fuel supply.

The first 15 years of the 20th century un-

doubtedly were the saddest time of Tsiolkovsky's life. In 1902 his son Ignaty committed suicide. In 1908 a flood of the Oka River inundated his home and destroyed many of his accumulated scientific materials. The Academy of Sciences did not recognize the value of his aerodynamic experiments, and, in 1914, at the Aeronautics Congress in St. Petersburg, his models of an all-metal dirigible

met with complete indifference.

In the final 18 years of his life, Tsiolkovsky continued his research, with the support of the Soviet state, on a wide variety of scientific problems. His contributions on stratospheric exploration and interplanetary flight were particularly noteworthy and played a significant role in contemporary astronautics. In 1919 Tsiolkovsky was elected to the Socialist Academy (later the Academy of Sciences of the U.S.S.R.). On Nov. 9, 1921, the council of the People's Commissars granted him a pension for life in recognition of his services in education and aviation. (M.S.A.) BIBLIOGRAPHY. A.A. Kosmodemvanskvi, Kon-

is the only book-length study of the scientist in English. Tsitsihar, Wade-Giles romanization CH'I-CH'I-HA-ERH, Pinyin QIQIHAR, city, western Heilungkiang sheng (province), China. It is

stantin Tsiolkovsky: His Life and Work (1956),

situated in the middle of the fertile Nen River plain, a part of the Manchurian Plain.

The site was originally settled by nomadic Tungus and Daghur herdsmen, who called it Pu-k'uei (a Daghur word meaning "frontier"). A settlement was also said to have been established there under the Mongols in 1333, but the town remained small until the 17th century. The Heilungkiang region then became important both because of the Russian eastward advance to the Pacific and because of increasing Chinese interest in the Amur River valley. Later its importance also grew because of the Manchu government's campaigns against the Mongols. Tsitsihar became the communications centre of Heilungkiang province, which was still sparsely inhabited, as well as a major garrison centre. The military government of Heilungkiang was transferred to the village of Tsitsihar in 1699. A military depot with barracks and arsenal was set up there, and many convicted criminals, both

Chinese and Manchu, were exiled to the area. In the 18th century Tsitsihar was a frontier town renowned for its gambling and sexual license. Nonetheless, it was also a centre of Chinese influence. Schools were established there for the Manchu garrison in 1744 and for the Chinese in 1796. Despite the ban on Chinese settlement, Chinese immigrants soon swamped the Manchus, so that by the end of the 18th century almost the entire urban population was Chinese-speaking. In the 1860s, after the territory north of the Amur had been ceded to the Russians, the Chinese government gradually opened up more and more land in the area to Chinese settlement.

By then Tsitsihar had become a city of some size, and by the end of the 19th century some industry had also been established. The completion of the Chinese Eastern Railway in 1903 made the city a centre for communications, and in the late 1920s and '30s a network of lines radiating from the city was extended into the northern part of Heilungkiang. By 1932 the city had a great concentration of handicraft industries.

Under the Japanese, who occupied the region from 1931/32 to 1945, Tsitsihar became a major military base, and its economic importance grew rapidly. Tsitsihar has become a large and important industrial city with an engineering industry producing heavy machinery, railroad equipment and rolling stock, machine tools, diesel engines, cranes, and other products. It has a large woodworking and timber industry, using timber from the Greater Khingan Range. There is a large paper mill, installed in 1954, which produces newsprint. Food processing is also important and includes the production of milk powder and other dairy produce (the Nen River plain is a dairy farming district), and there is sugar refining from local sugar beets. Pop. (1985 est.) 955,200.

Tskhinvali, also spelled CCHINVALI, formerly (1934-61) STALINIRI, city, capital, Yugo-Osetinskaya autonomous oblast (province), Georgian Soviet Socialist Republic, on the Bolshaya Liakhvi River. Tskhinvali has varied industries, including electrical and mechanical engineering and food-processing and woodworking concerns. It also has a local museum, a teacher-training institute, and a medical school. Pop. (1974 est.) 33,000.

Tso chuan (Chinese: "Tso's Commentary"), Pinyin zuo zhuan, ancient commentary on the Ch'un-ch'iu, and the first sustained narrative work in Chinese literature. The Ch'unch'iu, the first Chinese chronological history, chronicles events during the Spring and Autumn period (770-476 BC) of China's history. The Tso chuan is a detailed commentary on this work and provides extensive narrative accounts and ample background materials concerning the events chronicled in the Ch'unch'iu. The Tso chuan also provides authentic historical documents and written evidences (though fragmentary) of the philosophical schools of the time. As such, the Tso chuan is a comprehensive account of the principal political, social, and military events of the entire Spring and Autumn period. The commentary also occupies a seminal place in the history of Chinese literature because of its influential narrative style. Historical events and personages are presented directly through action and speech, and the book's third-person narrative is notable for its orderly structure and clear and laconic presentation.

The Tso chuan was once believed to have been written by Tso, an ancient historian about whom virtually nothing is known (his last name may have been Ch'iu-ming). The Tso chuan is now believed to have been compiled by an anonymous author during the early part of the Warring States period (475-221 BC). The *Tso chuan* is listed among the Nine, Twelve, and Thirteen Classics. See also

Tso Tsung-t'ang, Pinyin zuo zongtang (b. Nov. 10, 1812, Hsiang-yin, Hunan province, China—d. Sept. 5, 1885, Foochow, Fukien), Chinese administrator and military leader, one of the scholar-officials who worked to suppress the great rebellions that threatened the imperial government during the second half of the 19th century. Tso's efforts helped revive the declining Ch'ing dynasty (1644-1911/12) and reestablished the Chinese position in Central Asia.

Born into a well-connected, scholarly family, Tso passed his preliminary civil-service examinations and devoted himself to geographic and agricultural studies. Around 1850, when the Taiping Rebellion began to spread through South China, Tso helped organize local defense forces, and he soon became one of the top imperial commanders. By 1863 he was governor-general of Chekiang and Fukien and one of the most powerful figures in China.

In 1866 he was made governor-general of Shensi and Kansu to quell the Muslim rebels there. Tso slowly and systematically defeated the rebels, using a combination of effective taxation, encouragement of economic production, and Western technology. Following this campaign, he successfully argued in favour of attempting the reconquest of Chinese Central Asia (now Sinkiang Uighur Autonomous Region) from other Muslim rebels. Tso helped finance and supply his troops by building his own arsenal and woolen mill and forcing his troops to grow grain and cotton in their spare time. He succeeded not only in destroying the rebels but also in reestablishing Chinese power so convincingly that China regained, by the Treaty of St. Petersburg in 1881, the important border passes that Russia had occupied during the Muslim rebellion. A sick old man, blind in one eye, Tso was still not allowed to retire. In 1884 he was sent to South China and placed in charge of defenses in the war with France. He died soon after the peace settlement.

Tsong-kha-pa (b. 1357—d. 1419), Tibetan lama who founded a new Tibetan Buddhist sect known as the Dge-lugs-pa (q.v.), literally "Model of Virtue" but more commonly referred to as the Yellow Hat sect to distinguish it from the older Red Hat sect. Hoping to restore monastic discipline, Tsong-kha-pa enforced celibacy, required the wearing of yellow robes, and insisted on adherence to a rigorous routine. The sect eventually gained considerable influence in Mongolia; with Mongol aid, Tsong-kha-pa's successors were eventually (1642) installed as the rulers of Tibet with the title Dalai Lama.

Tsonga, also spelled THONGA, culturally similar Bantu-speaking peoples inhabiting the southern coastal plain of Mozambique, parts of Zimbabwe and Swaziland, and the Transvaal of South Africa. They numbered some 4.6 million in the late 20th century.

The Tsonga were formerly organized as independent peoples, each occupying its own territory and named for a powerful, dominant patrilineage. Early in the 19th century, however, they were conquered by the Nguni peoples.

Tsonga economy is based on mixed agriculture and pastoralism. Cassava is the staple; corn (maize), millet, sorghum, and other crops are also grown. Women do much of the agricultural work, although some men grow cash crops. Most Tsonga now depend on wage labour for cash, many migrating to Zimbabwe or South Africa to find work.

The settlement pattern is characterized by scattered villages of mud and wattle huts, each village being occupied by members of a patrilineage; descent, succession, and inheritance are also patrilineal. Polygyny is common, and a bride-price is paid. A man's livestock is apportioned among his wives for their support and for eventual inheritance by the children of each household. Widows are inherited by males of the dead husband's lineage.

Although many Tsonga are Christian, many also adhere to their own traditional religion. which entails constant attention to the propitiation of ancestral spirits. Illness and other misfortunes are usually attributed to the breaking of a taboo, to the anger of an ancestor, or to sorcery

Tsou Yen, Pinyin zou yan (b. 340—d. 260? BC), Chinese philosopher of the ancient state of Ch'i (present-day Shantung), and leading exponent of the Yin-Yang school. The only account of his life is a brief one in the Shih chi ("Historical Records"). To him is attributed the association of the Five Agents theory with the Yin-Yang doctrine. Nature was thought to consist of changing combinations of the Five Agents (metal, wood, water, fire, earth), which were governed by the basic dualism of the cosmic principles of Yin (Earth, female, passive, absorbing) and Yang (Heaven, male, active, penetrating).

Tsu, capital, Mie ken (prefecture), Honshu, Japan. It lies along the mouth of the Ano River, facing Ise Bay. Tsu developed around a 16th-century castle and served as a post town and trade centre for cotton during the Tokugawa era (1603-1867). A modern cotton mill established in Tsu in 1898 was followed after World War II by factories producing electrical machines, glass, and appliances. During the 1960s shipbuilding facilities were expanded. Rice and wheat are produced in the surrounding area.

Tsu is an educational centre, containing Mie National University and Mie Prefectural University. The city has two large temples and a shrine. Tsu Park contains a museum, and the castle site is occupied by a library and a reconstructed (1958) castle turret. Pop. (1987 est.) 151,942.

Tsubouchi Shōyō, pseudonym of Tsubouchi Yūzō (b. June 22, 1859, Ōta, Fukui prefecture, Japan—d. Feb. 28, 1935, Atami), playwright, novelist, critic, and translator who occupied a prominent position in Japanese letters for nearly half a century. He wrote the first major work of modern Japanese literary criticism, Shōsetsu shinzui (1885–86; "The Essence of the Novel"), translated the complete works of William Shakespeare, helped found the modern Japanese theatre, and was the most famous lecturer at Waseda University in Tokyo.

Tsubouchi Shōyō

By courtesy of the International Society for Educational Information, Tokyo

Born near Nagoya, the youngest son of a large samurai (warrior class) family, Shōyō graduated from Tokyo Imperial University in 1883. He achieved fame in the 1880s as the translator of Sir Walter Scott, E.G.E. Bulwer-Lytton, and Shakespeare and as the author of nine novels and many political allegories advocating parliamentarism.

In Shōsetsu shinzui, Shōyō attacked the loosely constructed plots and weak characterizations of contemporary Japanese novels and urged writers to concentrate on analyses of personality in realistic situations. His own best-known novel, however, Tōsei shoseikatagi (1885–86; "The Character of Present-Day Students"), depicting the foolish adventures of a group of contemporary university students, suffered from the same weaknesses that he decried.

In 1883 Shōyō began teaching social science at the school that later became Waseda University. In 1890 he helped organize its faculty of letters and then helped establish Waseda Middle School, which he later headed. He founded (1891) and edited the literary journal Waseda bungaku. Shōyō was also one of the founders of the shingeki ("new drama") movement, which introduced the plays of Henrik Ibsen and George Bernard Shaw to Japan and provided an outlet for modern plays by Japanese authors. In 1915 he retired from Waseda University to devote his time to his translation of Shakespeare.

Tsuchiura, city, Ibaraki ken (prefecture), Honshu, Japan, on the western shore of Lake Kasumi. A castle was constructed on the city site during the Muromachi era (1338–1573), and Tsuchiura grew to be a flourishing centre of land and sea transportation. Fishing was also highly developed. The Jōban Line (rail-

way) was opened through Tsuchiura in 1896, and in 1920 a Japanese naval base and related machinery and construction industries were established. The city's importance declined somewhat after World War II, but it has since regained its status as a prominent administrative, commercial, and cultural centre. Improved transportation has led to its development as a suburb of the Tokyo-Yokohama Metropolitan Area. The Tsukuba University (1973) and governmental research institutions are located there. Pop. (1987 est.) 121,815.

Tsugaru Strait, Japanese TSUGARU-KAIKYŌ, strait of the northwest Pacific extending east from the Sea of Japan to the open ocean between the Japanese islands of Honshu (south) and Hokkaido. It is 15 to 25 miles (24 to 40 km) wide. The strait takes the Tsugaru Current, a warmer and saltier flow that is an extension of the Tsushima Drift, and carries it into the Pacific. Hakodate is a port city on Hokkaido; Aomori is its complement on Mutsu Bay, Honshu. The Seikan Tunnel linking Aomori and Hakodate cities runs beneath the strait.

Tsumeb, company town, north-central Namibia. At an elevation of 4,232 feet (1,290 m), the town is a northern terminus of the country's north-south railway and lies on a main trunk highway about 275 miles (440 km) north of Windhoek, the capital.

In 1851 Sir Francis Galton, a British explorer, made note of copper ore deposits in the vicinity of what later became the town of Tsumeb. An Anglo-German company acquired mining rights for the Tsumeb area in 1903. Southwest of Tsumeb is the site of the final German troop surrender to South African forces in World War I. The town remained a small copper-mining centre until the Tsumeb mine was purchased in 1947 by the largely U.S.-based Tsumeb Corporation, Ltd. It has since been developed as a planned company town, exploiting mineral deposits that include significant amounts of lead and copper as well as zinc, cadmium, silver, and germanium (a metalloid element used as a semiconductor). An integrated copper and lead smelter treats concentrates from Tsumeb and other mines. Owambo labourers are the chief contract workers. Pop. (1988 est.) 13,500.

tsun (Chinese: "sacrificial vessel"), Pinyin ZUN, any of a wide range of Chinese vessel types, generally of the Shang dynasty (18th–12th century BC) and early Chou dynasty (1111–c. 900 BC), all of which have an ample interior volume probably meant for containing wine. There are two essential varieties of *tsun*. One is shaped like a much enlarged ku (q.v.)—that is, tall and somewhat trumpetshaped. The other variety consists of various animal shapes, often densely embellished with animal decoration.

ts'un (Chinese: "wrinkles"), Pinyin CUN, in Chinese painting, brushstrokes or dabs that give texture, or surface, to the pictorial elements. The Chinese artist does not strive for illusionistic modeling dependent upon the manipulation of light and shade; rather, after the forms are outlined, texture strokes are used to give character to the form, ranging from a suggestion of its tactile surface to a summary visual impression.

Over the ages, Chinese painters and critics have codified ts'un into many different types—including 25 basic ones; there are texture strokes for trees, rocks, raindrops, mountains, and virtually every other kind of natural phenomenon. Various painters are noted for having either invented or specialized in certain types; the artist's personality and expressive intent is thus specified by the "texture method" (ts'un-fa) that he employs.

Tsun-i, Pinyin ZUNYI, city in northern Kweichow sheng (province), China. Tsun-i is situated on the main route from Kuei-yang in the south to Chungking in the north.

The city was brought under regular Chinese administration only in the early 7th century AD. A county was set up there in 640, and its present name, Tsun-i, was given in 642. It has remained the seat of Tsun-i hsien (county) ever since, but the area did not begin to be developed until Ming times (1368–1644). The county seat, originally to the west, was established on its present site under the Sung dynasty (960–1279). Tsun-i achieved fame as a result of the Long March (1934-35) of the Communist armies from their bases in Kiangsi to the northwest, which took them through Tsun-i. In 1935 the Central Political Bureau of the Chinese Communist Party held a conference there at which Mao Zedong, the future founder of the Chinese Communist state, finally established his dominance in the party over rival leaders in it who did not share his views on revolutionary strategy.

Until 1949 Tsun-i was not much more than a local market town dependent upon Kueiyang. During the period of the First Five-Year Plan (1953–57), Tsun-i expanded considerably, was designated a city, and became an industrial centre. The old town, primarily administrative, was joined by a newer area containing the commercial and industrial quarters. A silk textile mill, rice and flour mills, small engineering works, and a chemical industry producing phosphates were established. The surrounding area also became important for the production of manganese. In the late 1950s large iron- and steelworks were built at Tsun-i. Pop. (1985 est.) 233,700.

tsunami, also called SEISMIC SEA WAVE, or TIDAL WAVE, catastrophic ocean wave, usually caused by a submarine earthquake occurring less than 50 km (30 miles) beneath the seafloor, with a magnitude greater than 6.5 on the Richter scale. Underwater or coastal landslide or volcanic eruptions also may cause a tsunami. The term tidal wave is more frequently used for such a wave, but it is a misnomer, for the wave has no connection with the tides

After the earthquake or other generating impulse, a train of simple, progressive oscillatory waves is propagated great distances at the ocean surface in ever-widening circles, much like the waves produced by a pebble falling into a shallow pool. In deep water, the wavelengths are enormous, about 100 to 200 km (60 to 125 miles), and the wave heights are very small, only 0.3 to 0.6 m (1 to 2 feet). The resulting wave steepness, or ratio of height to length, ranges between 3/2,000,000 and 6/ 1,000,000. This extremely low steepness, coupled with the waves' long periods that vary from five minutes to an hour, enables normal wind waves and swell to completely obscure the waves in deep water. In any progressive oscillatory wave, the actual water motion at

the surface consists of a vertical orbit with a diameter equal to the wave height, coming full circle during the period of the wave. Thus, a surface-water particle or a ship in the open ocean experiences the passage of a tsunami as an insignificant rise and fall of only 0.3 to 0.6 m. lasting from five minutes to an hour.

The surface orbital motion of any progressive oscillatory wave is transmitted diminishingly downward through the water, becoming insignificant at a depth below the surface equal to approximately half the wavelength. Tsunamis, however, being enormously longer than even the greatest ocean depths, experience significant retardation of orbital motion near the seafloor and behave as shallow-water waves regardless of the depth of the ocean the waves are propagated across. The velocity of shallow-water waves is controlled by this friction with the bottom, obeying the formula $c = \sqrt{gD}$ in which c is the wave velocity, g is the acceleration of gravity, and D is water depth. This relationship was used to determine the average depth of the oceans in 1856, long before many deep-sea soundings had been taken. Assuming an average velocity for seismic sea waves of about 200 metres per second (450 miles per hour), an average oceanic depth of about 4,000 m (13,000 feet) is obtained; this figure compares very well with the modern estimate of 3,808 m (12,490 feet). The relationship has enormous practical value, enabling seismologists to issue warnings to endangered coasts immediately after an earthquake and several hours before the arrival of the tsunamis.

As the waves approach the continental coasts, friction with the increasingly shallow bottom reduces the velocity of the waves. The period must remain constant; consequently, as the velocity lessens, the wavelengths become shortened and the wave amplitudes increase, coastal waters rising as high as 30 m (100 feet) in 10 to 15 minutes. By a poorly understood process, the continental shelf waters begin to oscillate after the rise in sea level. Between three and five major oscillations generate most of the damage; the oscillations cease, however, only several days after they begin.

Tsunamis are reflected and refracted by nearshore bottom topography and coastal configurations as any other water waves. Thus, their effects vary widely from place to place. Occasionally, the first arrival of tsunami at a coast may be a trough, the water receding and exposing the shallow seafloor. Such an occurrence in Lisbon, Port., on Nov. 1, 1755, attracted many curious people to the bay floor; and a large number of them were drowned by the succeeding wave crest that arrived only minutes later. Perhaps the most destructive tsunami was the one that occurred in 1703 at Awa, Japan, killing more than 100,000 people. The spectacular underwater volcanic explosions that obliterated Krakatau (Krakatoa) Island on Aug. 26 and 27, 1883, created waves as high as 35 m (115 feet) in many East Indies localities, killing more than 36,000 people.

ts'ung, Pinyin cong, Chinese jade form found primarily in the Shang (18th–12th century BC) and Chou (1111–255 BC) dynasties. A hollow cylinder or truncated cone enclosed in a rectangular body, the ts'ung varies in proportion from squat to quite tall.

The outer flat surfaces are usually embellished with horizontal segments at the corners; the planar surfaces, with lines and other abstract designs. The ts'ung may have been used as an astronomical instrument, or it may have been a symbol for the "earth" (a counterpart to the symbolic "heaven" of the pi[q,v]), or

Brown and black jade ts'ung, Han dynasty (206 BC-AD 220); in the Field Museum of Natural History, Chicago By courtesy of the Field Museum of Natural History, Chicago

it may have served an entirely different, unknown function.

Tsuruga, city, Fukui ken (prefecture), Honshu, Japan. It faces Tsuruga Bay of the Sea of Japan. A flourishing port since early historic times, it was one of the main centres of communication with the Asian mainland and a major shipment centre for the former national capitals of Nara and Kyōto. Industry was developed after World War II, the factories producing synthetic fibres, chemicals, and cement. Pop. (1985) 65,670.

Tsuruoka, city, Yamagata ken (prefecture), Honshu, Japan, in the Shōnai Plain. Tsuruoka developed as a castle town during the Tokugawa period (1603–1867), and most of its buildings are of that period. Traditional industries produce candles, silk textiles, and

Chido Museum, Tsuruoka, Japan Photos Pack—FB Inc.

sake (rice wine). After the Meiji era (1868–1912), large textile and agricultural machinery factories became established. The city is also a distribution centre for rice and timber produced in the surrounding region.

Tsuruoka Park, on the old castle site, contains the Shōnai Shrine dedicated to the god of war. The city houses the Chido Museum, known for its collection of folk art, and the home in which the novelist and literary critic Takayama Rinjirō (1871–1902) was born. Pop. (1985) 100,200.

Tsuruya Namboku IV, original name EBIYA GENZŌ, also called DAI NAMBOKU (b. 1755, Edo [now Tokyo], Japan—d. Dec. 23, 1829, Edo), Japanese Kabuki playwright of the late Tokugawa period (1603–1867), known for his plays with supernatural themes and macabre and grotesque-looking characters.

Little is known of his early years, but in 1755 he became an apprentice of the dramatist Sakurada Jisuke I. About 1780 he married the daughter of Tsuruya Namboku III, a well-

known Kabuki actor of the time. After a long apprenticeship he finally became the chief playwright for the Kawarazaki Theatre in Edo in about 1801. He took the name Tsuruya Namboku IV in 1811.

His first major success was Tenjiku Tokubei ikoku-banashi (1804; "Tokubei of India: Tales of Strange Lands"), written for the leading actor of the day, Onoe Matsusuke I. Namboku wrote for the virtuoso performer, and his originality and stagecraft were immensely popular among the Kabuki patrons of Edo. In all he wrote some 120 plays. Using his specialty, ghostly themes, he vividly portrayed the lives of commoners, interweaving cruelty, humour, and pathos. His most popular works include Osome Hisamatsu ukina no yomiuri (1813; "Osome and Hisamatsu: a Scandal Sheet") and Tōkaidō Yotsuya kaidan (1825; "Ghost Story of Tōkaidō Yotsuya").

Tsushima, archipelago, Nagasaki ken (prefecture), Japan. It lies in the Korea Strait separating Japan and Korea. The five rocky islands, the largest of which are Kami and Shimo, have a total land area of about 274 square miles (709 square km). The principal towns are Izuhara, the administrative centre, and Kechi. Most of the population are fishermen

The archipelago served a critical part in history as a stepping-stone between Korea and Japan. Throughout its early history, Tsushima was raided by Korean and Japanese pirates. From the 12th century to 1868 the islands were the fief of the Sō daimyo family. During Mongol attempts to invade Japan in 1274 and 1281, the islands' population was massacred. In 1905 a Russian fleet was defeated in the Battle of Tsushima Strait, north of the islands. Pop. (1980) 50,810.

Tsushima, Battle of (May 27–29, 1905), naval engagement of the Russo-Japanese War, the final, crushing defeat of the Russian navy in that conflict.

The Japanese had been unable to secure the complete command of the sea because the Russian naval squadrons at Port Arthur and Vladivostok made sorties and both sides suffered losses in the ensuing engagements. Meanwhile, the Russian government decided to send the Baltic Fleet all the way to the Far East under the command of Admiral Zinovy Petrovich Rozhestvensky to link up with the Pacific Squadron at Port Arthur, upon which the combined fleets would overwhelm the Japanese navy. The Russian Baltic Fleet, having spent the whole summer fitting out, sailed from Liepaja on Oct. 15, 1904. Off the Dogger Bank (in the North Sea) on October 21, several Russian ships opened fire on British trawlers in the mistaken belief that they were Japanese torpedo boats, and this incident aroused such anger in England that war was only avoided by the immediate apology and promise of full compensation made by the Russian government. At Nossi-Bé, near Madagascar, Rozhestvensky learned of the surrender of Port Arthur to Japanese forces and proposed returning to Russia; but, expecting naval reinforcements, which had been sent from the Baltic via Suez early in March 1905 and which later joined him at Camranh Bay (Vietnam), he decided to proceed. His full fleet amounted to a formidable armada, but many of the ships were old and unserviceable and their crews were poorly trained. Early in May the fleet reached the China Sea, and Rozhestvensky made for Vladivostok via the Tsushima Strait. Admiral Togō Heihachiro's fleet lay in wait for him on the south Korean coast near Pusan, and on May 27, as the Russian Fleet approached, he attacked. The Japanese ships were superior in speed and armament, and, in the course of the twoday battle, two-thirds of the Russian Fleet was sunk, six ships were captured, four reached Vladivostok, and six took refuge in neutral ports. It was a dramatic and decisive defeat; after a voyage lasting seven months and when within a few hundred miles of its destination. the Baltic Fleet was shattered, and, with it, Russia's hope of regaining mastery of the sea was crushed.

Tsutsumi FAMILY, family of Japanese businessmen who built two vast corporate empires as Japan made the transition from a manufacturing-based to a service-based economy in the late 20th century.

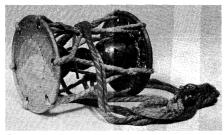

Born into a peasant family, Tsutsumi Yasujiro (b. 1889, Shiga prefecture, Japand. April 26, 1964) graduated from Waseda University in 1913. He founded the Kokudo Keikaku land-management company in 1918 and began buying real estate on a significant scale in the 1920s. He also entered politics, being elected to the House of Representatives in 1924 and reelected 12 times after that. Yasujiro laid the basis of his fortune in the years immediately following World War II, when he was able to buy large tracts of land in Tokyo and other important locations at bargain prices from ruined aristocrats and others who had been impoverished by the war. He then began building suburban railways, resorts, hotels, department stores, and golf courses. His various business concerns were unified under the Seibu Railway Co., Ltd. His political career climaxed when he served as speaker of the House of Representatives in 1953-54. At his death in 1964 he was one of the wealthiest men in Japan.

Yasujiro fathered numerous children by three successive wives and various mistresses. Tsutsumi Yoshiaki (b. May 29, 1934) inherited the bulk of his father's fortune, becoming president of Seibu Railways and the principal shareholder in Kokudo Keikaku. The owner of the largest private railroad company in Japan, Yoshiaki built many hotels, amusement parks, resorts, golf courses, and sports centres adjacent to his network of railway lines radiating from Tokyo. By the early 1990s he was the largest private landowner in Japan and, owing to the spectacular rise in Japanese real-estate values, one of the world's wealthiest men.

The other prominent son of Yasujiro was Seiji (b. March 30, 1927), who in 1964 received only a single department store as his share of his father's inheritance. But Seiji was able to parlay this property into a chain of luxury department stores that by 1990 had become Japan's largest department store chain. Seiji subsequently diversified into a vast array of other retailing, financial, and leisure-time services. His more than 100 companies were unified in the Seibu Saison Group conglomerate, which in 1988 purchased the Inter-Continental Hotel chain of luxury hotels in the United States, Europe, and the Middle East. An unconventional and artistically inclined businessman, Seiji was also a well-known author of poems and short stories under the pen name of Tsuji Takashi. Yoshiaki and Seiji kept their corporate empires separate and in fact were said to be intensely competitive rivals of one another.

Tsuyama, city, Okayama ken (prefecture), Honshu, Japan. It lies along the upper Yoshii River, in the centre of the Tsuyama basin. A castle was built there in 1442. An important post town during the Tokugawa period (1603-1867), Tsuyama is still a centre of traditional home industries, producing tabi (socks), sickles, and silk gauze textiles. The remains of the castle and old buildings around it attract tourists. In the suburban agricultural area, rice, wheat, and dairy cattle are raised. Pop. (1985) 86,837.

tsuzumi, any of various Japanese two-headed drums with hourglass-shaped (waisted) bodies. Ancient Japanese court orchestra music had three types of these drums, of which only the san no tsuzumi form survives in

Ō-tsuzumi, a large, Japanese two-headed drum with hourglass-shaped body

K.B.S. Photo by Hisao Maejima

komagaku style (courtly music of Japanese, Korean, and other non-Chinese, non-Indian ancestry). Better-known tsuzumi are found in the music of No and Kabuki theatres. The smaller ko-tsuzumi is held on the player's right shoulder and hit with fingers of the right hand, producing four soft sounds by changing encircling rope tensions with gentle left-hand squeezes. Resonance is altered by thin paper (choshigami) applied to the centre of the rear horsehide skin. By contrast, the cowhide skins of the large ō-tsuzumi are heated before being tied tightly against the body. The instrument, held on the left hip, produces a cracking sound when one head is struck with the central fingers of the right hand, which sometimes are covered with hard paper thimbles to intensify the sound.

Related to these drums is the changko, a large hourglass-shaped drum with two heads, prominent in much Korean music. Their kinship is seen in their construction: the skins are sewn to hoops wider in diameter than the instrument body and are held tightly against it by the bracing ropes.

tsuzure, Japanese tapestry, the full name of which is tsuzure-nishiki ("polychrome tapestry"). They were usually woven of silk on cotton warp covered with silk, gold, or silver threads. Tsuzure techniques reached Japan from China in the late 15th or early 16th century during the Muromachi (Ashikaga) period (1338-1573). Production was at its height in the Tokugawa period (1603-1867), particularly early in the 17th century and throughout the 18th century. Tsuzure was used mainly for robes and gift wrapping.

Tsvet, Mikhail Semyonovich, Tsvet also spelled TSVETT, or TSWETT (b. May 14, 1872, Asti, Italy—d. June 26, 1919, Voronezh, Russian S.F.S.R.), Russian botanist who developed the adsorption chromatography technique of separating plant pigments by extracting them from leaves with ether and alcohol and percolating the solution through a column of calcium carbonate.

Tsvet studied in Geneva, Switz., receiving his doctorate in 1896, and in 1901 received a degree from the University of Kazan in Russia. In 1902 he became a laboratory assistant at the University of Warsaw, and in 1908 he began teaching botany and microbiology at the Warsaw Technical University. He took part in the university's removal to Moscow and then to Nizhni Novgorod (later renamed Gorky) during World War I. In 1917 he became professor and director of the botanical garden at Yuryev (later Tartu) University in Estonia, which in 1918 was transferred to Voronezh.

Tsvet was noted for his research on plant pigments, especially chlorophyll, of which he discovered several new forms, and the carotenoids, a term he first coined.

Tsvetaveva, Marina Ivanovna, married name marina ivanovna efron (b. Oct. 8

[Sept. 26, Old Style], 1892, Moscow, Russia Inow Russian S.F.S.R.]—d. Aug. 31, 1941, Yelabuga), Russian poet whose verse is distinctive for its staccato rhythms, originality, and directness and who, though little known outside Russia, is considered one of the finest 20th-century poets in the Russian language.

Tsvetayeva spent her youth predominantly in Moscow, where her father was a professor at the university and director of a museum and her mother was a talented pianist. The family traveled abroad extensively, and at the age of 16 she began studies at the Sorbonne. Her first collection of poetry, Vecherny albom ("Evening Album"), appeared in 1910. Many of her best and most typical poetical qualities are displayed in the long verse fairy tale *Tsardevitsa* (1922; "Tsar-Maiden").

Tsvetayeva met the Russian Revolution with hostility (her husband, Sergei Efron, was an officer in the White counterrevolutionary army). and many of her verses written at this time glorify the anti-Bolshevik resistance. Among these is the remarkable cycle Lebediny stan ("The Swans' Camp," composed 1917-21, but not published until 1957 in Munich), a moving lyrical chronicle of the Civil War viewed through the eyes and emotions of the wife of a White officer.

Tsvetayeva left the Soviet Union in 1922, going to Berlin and Prague, and finally, in 1925, settling in Paris. There she published several volumes of poetry, including Stikhi k Bloku (1922; "Verses to Blok") and Posle Rossii (1928; "After Russia"), the last book of her poetry to be published during her lifetime. She also composed two poetical tragedies on classical themes, Ariadne (1924) and Phaedra (1927), several essays on the creative process, and works of literary criticism, including the monograph Moy Pushkin (1937; "My Pushkin"). Her last cycle of poems, Stikhi k Chekhii (1938-39; "Verses to the Czech Land"), was an impassioned reaction to Nazi Germany's occupation of Czechoslovakia.

In the 1930s Tsvetayeva's poetry increasingly reflected alienation from her émigré existence and a deepening nostalgia for Russia, as in the poems "Toska po rodine" (1935; "Homesick for the Motherland") and "Rodina" (1936; Motherland"). At the end of the '30s her husband—who had begun to cooperate with the communists-returned to the Soviet Union, taking their daughter with him (both of them were later to become victims of Stalin's terror). In 1939 Tsvetayeva followed them, settling in Moscow, where she worked on poetic translations. The evacuation of Moscow during World War II sent her to a remote town where she had no friends or support. She committed suicide in 1941.

Tswana, also called BATSWANA, BOTSWANA, or BECHUANA, westerly division of the Sotho (q.v.), a Bantu-speaking people of South Africa and Botswana. The Tswana comprise several groupings, the most important of which are the Hurutshe, Kgatla, Kwena, Rolong, Thlaping, and Tlokwa. They numbered some 2,550,000 in the late 20th century.

The Tswana live in a grassland environment in which they practice animal husbandry and subsistence agriculture based on corn (maize) and sorghum. There is a seasonal and periodical migration of large numbers of men who work in the mining and industrial centres of South Africa.

material culture reflects the Tswana widespread intrusion of European goods and standards. House forms range from the traditional circular single-roomed dwelling with conical thatched roof to multi-roomed rectangular houses with roofs of corrugated iron. Transport varies from ox-drawn sledges to motor vehicles. European dress prevails.

Every Tswana is affiliated to the descent group of his father, each group being associated with a distinctive symbol that serves as a polite mode of address and sometimes as a surname. In self-administering political units, especially those in Botswana, the basic social unit is the ward, a readily identifiable, self-contained social and administrative entity comprising a number of lineally related families together with their dependents and servants. Its leader is usually the head of the senior family.

senior family.

Although identification with a particular ward is strong, there are also age groups (age sets, or regiments) that cut across ward loyalties. New regiments are formed periodically on a tribal basis and are of importance as organized labour units for public works.

Tribal membership includes alien elements, and Tswana members are often in a minority, so that a Tswana group accordingly lacks cultural and even linguistic uniformity. The chief rules with the assistance of advisers and officials, but at the same time all matters of public policy usually require the approval of a general council open to all adult male members

In 1977, South Africa created an "independent" Bantu homeland for the Tswana, called Bophuthatswana, but it was not recognized by the international community.

Tswett, Mikhail Semyonovich: see Tsvet, Mikhail Semyonovich.

TU-16, also called BADGER, one of the principal strategic bombers of the Soviet Union, designed by Andrei Nikolayevich Tupolev (1888–1972). More than 2,000 of the midwing monoplanes have been built. It was first flown in 1952. Powered by two turbojet engines, its maximum speed is 616 miles per hour (992 km per hour) at 19,700 feet (6,000 m); its ceiling is about 40,350 feet (12,300 m), and with a normal bomb load its range is 3,680 miles (5,925 km).

The TU-16 carries a crew of six and is armed with six or seven 23-millimetre cannons at nose and tail. It carries a maximum bomb load of 19,800 pounds (9,000 kg). The TU-16 is used by the Soviet bomber force and has been made available to the People's Republic of China, Egypt, and Iraq.

Other Tupolev aircraft in the Soviet service are the TU-28P (TU-128) fighter, the TU-95 and TU-142 bombers, and the TU-22M (or TU-26, also called the Backfire Bomber). The TU-144, tested in 1969 and produced from 1971, was the world's first supersonic transport aircraft.

Tu bi-Shevat (Hebrew: "Fifteenth of Shevat"), Jewish festival of the new year of trees, or arbor day. It occurs on Shevat 15 (mid-May), after most of the annual rain of Israel has fallen and when, thereafter, the fruit of a tree is considered, for tithing, to belong to a new year. Tu bi-Shevat is considered a minor holiday: certain penitential prayers are omitted from the liturgy, and fasting is not allowed. Among Ashkenazi Jews, fruits—traditionally, 15 different kinds—are eaten and often accompanied by the recital of psalms. Among Sephardic Jews, Tu bi-Shevat is a significant festival, a "feast of fruits" accompanied by songs called complas. In modern Israel, the day has become popular in symbolizing the reclaiming of land from the desert for agriculture. Schoolchildren, in ceremonies, plant trees and sing songs.

tu-chün: see warlord.

Tu Duc, original name NGUYEN PHUOC HOANG NHAM (b. Sept. 22, 1829, Hue, Vietnam—d. July 9, 1883, Hue), emperor of Vietnam who followed a policy of conservatism and isolation and whose persecution of Christian missionaries foreshadowed the French conquest of Vietnam.

The son of Emperor Thieu Tri, Prince Nguyen Phuoc Hoang Nham was chosen over his older brother to succeed his father. He

ascended the throne in 1847, taking the reigning name Tu Duc. He continued his father's persecution of missionaries and opposition to trading and diplomatic relations with European powers. Executions reached such proportions that the French in 1856 sent a formal letter of protest to the court of Hue.

The decapitation of the Spanish bishop José María Díaz in 1857 brought immediate reprisals: French forces occupied Tourane (Da Nang) in 1858 and defeated the Vietnamese at several key centres in southern Vietnam. As a result, Tu Duc was forced in 1862 to cede to France his three southern provinces in a treaty that later became a source of dispute. The French called this area Cochinchina.

Tu Duc's reign was further disrupted by rebellions in 1865, led by a pretender to the throne from the rival Le dynasty. A French attack on the citadel of Hanoi in 1873 resulted in the granting of trade concessions to France and the opening of the Red River in the north to European commercial shipping. Tu Duc appealed to China for protection, pleading the cause of Vietnam as one of China's vassal states, but the French deployed more forces and gradually secured more territory. Within four years of Tu Duc's death, the French established the Indochinese Union.

Tu Fu, Pinyin DU FU (b. 712, Hsiang-yang, now in Honan Province, China—d. 770, Hunan), Chinese poet, considered by many literary critics to be the greatest of all time.

Born into a scholarly family, Tu Fu received a traditional Confucian education but failed in the Imperial examinations of 736. As a result, he spent much of his youth traveling, during which he won renown as a poet and met the other poets of the period, including the great Li Po. After a brief flirtation with Taoism while traveling with Li Po, Tu Fu returned to the capital and the conventional Confucianism of his youth. He never again met Li Po.

During the 740s Tu Fu was a well-regarded member of a group of high officials, even though he was without money and official position himself and failed a second time in an Imperial examination. Between 751 and 755 he attempted to attract Imperial attention by submitting a succession of literary products in which political advice was offered, couched

Eastfoto

in a language of ornamental flattery, a device that eventually resulted in a nominal position at court. He married, probably in 752, and acquired some farmland; but by then he showed signs of a lung affliction. In 755 during the An Lu-shan Rebellion, he experienced extreme personal hardships. He escaped, however, and in 757 joined the exiled court, being given the position of censor. His memoranda to the emperor do not appear to have been particularly welcome, and he was relieved of his post. Undergoing another period of poverty and hunger, the poet lived to see several of his children die of starvation. Wandering about until the mid-760s, he served a local warlord, a position that enabled him to acquire some landed property and to become a gentleman farmer at Kuei-chou. In 768 he again started traveling aimlessly toward the south. He died in 770, probably at Tan-chou. Popular legend attributes his death to overindulgence in food and wine after a 10-day fast.

Tu Fu's early poetry celebrated the beauties of the natural world and bemoaned the passage of time. He soon began to write bitingly of war and, with hidden satire, of the conspicuous luxury of the court. As he matured, and especially during the years of extreme personal and national turmoil of 755 to 759, his verse began to sound a note of profound compassion for humanity caught in the toils of senseless war.

Tu Fu's paramount position in the history of Chinese literature rests, finally, on his superb classicism and his complete ease in handling the rules of prosody. He was an expert in all poetic genres current in his day, but his mastery was at its height in the *lū shih*, or "regulated verse," which he refined to a point of glowing intensity.

The standard biography in English is *Tu Fu, China's Greatest Poet*, by William Hung (1952).

T'u-lu-p'an, Pinyin TURPAN, conventional TURFAN, city in the Uighur Autonomous Region of Sinkiang, China. It is situated about 95 miles (150 km) southeast of the city of Wu-lumu-ch'i (Urumchi) in a mountain basin between the eastern extension of the T'ien Shan (mountains) and the K'u-lu-k'o-t'a-ko (mountains; also known by the Turkic name Quruq Tagh), on the northern side of the Turfan Depression. It has long been the centre of a fertile oasis and an important trade centre on the main northern branch of the Silk Road from Ha-mi to Kashgar (K'o-shih), with an alternative northern route, via Wu-lu-mu-ch'i, running into the Dzungarian Basin, the I-li River Valley, and Central Asia.

Traditionally, T'u-lu-p'an was on the border between the nomadic peoples of the north and the settled oasis dwellers of Sinkiang. Under the Han dynasty (206 BC-AD 220) the Chinese knew it as the Chü-shih kingdom. In 450 it became the new state of Kao-ch'ang, with its capital at Kao-ch'ang-ch'eng (Kara Khodjo). In 640 T'ang western expeditions, sent by the T'ang dynasty (618–907), destroyed Kaoch'ang and established a prefectural administration there named Hsi-chou. In the late 8th century T'u-lu-p'an was overrun by the Tibetans and in the 830s by the Uighurs, who moved west into the area. Eventually taken in the 13th century by the Mongols (who ruled China from 1279 to 1368), it enjoyed a new commercial prosperity as the Central Asian land routes flourished as never before. When Mongol rule collapsed, the Turfan Depression was divided into three independent states, but in the early 15th century T'u-lu-p'an itself became the most important of these and in 1473 occupied Ha-mi to the east. During the 18th-century wars between the Ch'ing dynasty (1644-1911) and the Dzungars, T'u-lu-p'an was a crucial key point.

In the reign of the emperor Yung-cheng (1723-35), the people of the basin were resettled in Kansu Province but returned after the end of the campaign. In 1759 a Chinese protectorate was established over T'u-lu-p'an.

The area had long been predominantly Muslim, and a second Chinese city was built next to the old Muslim one. In 1912 T'u-lu-p'an was given county status. The city's economy is based on agriculture and fruit farming in the Turfan Depression; principal products are cotton, mulberry trees, apricots, melons, and grapes. A rail line links T'u-lu-p'an with the main line to Wu-lu-mu-ch'i to the northwest and with K'u-erh-le in the Tarim Basin to the southwest. Pop. (mid-1970s est.) 10,000–50,000.

T'u-lu-p'an P'en-ti (China): see Turfan Depression.

T'u-ti, Pinyin TUDI (Chinese: "Place God"), type of Chinese god whose deification and functions are determined by local residents. The chief characteristic of a T'u-ti is the limitation of his jurisdiction to a single place—*e.g.*, a bridge, a street, a temple, a public building, a private home, or a field. In the case of private homes, the T'u-ti is often identified with the god of riches. In all cases, a T'u-ti is subservient to the Ch'eng Huang, the spiritual magistrate of the city.

In most cases, these gods originated as historical persons who in life came to the assistance of their respective communities in times of need. It is supposed that, by deifying such persons and offering sacrifices to them, they will be moved to show similar solicitude after death. If misfortunes visit a locality, the Tu-ti is judged to have lost interest and a new pa-

tron is chosen.

Some Chinese refer to T'u-ti shen ("Spirit God of the Place") and T'u-ti yeh ("Venerable God of the Place"), but there is nothing special about their name or function to distinguish them from any other "Place God."

Consult the INDEX first

Tu-yün, Pinyin DUYUN, town in central Kweichow sheng (province), China. Situated some 60 miles (100 km) southeast of the provincial capital of Kuei-yang, it is a transport centre, with a highway route running eastward into Hunan Province and a main route, followed by a highway and railway, running south to Liu-chou in Kwangsi Province. It is about 25 miles (40 km) south by rail from the junction of a line running eastward from Kweichow to Hunan. The north-south railway, begun during World War II and completed as far as Tu-shan (south of Tu-yün) by 1944, was destroyed in the last stages of the war but was rebuilt in the mid-1950s. Tu-yün subsequently became the economic centre of a large district, which has been considerably developed. There is some small-scale coal mining, and paper, linen textiles, leather, and other goods are produced. In the 1960s a chemical industry, producing large quantities of fertilizers, was developed. Pop. (1985 est.) city centre, 121,100; city, 382,000.

Tuam, Irish TUAIM, chief market town of the northern part of eastern County Galway, Ireland. It is the seat of a Roman Catholic archbishop, the see having been founded by St. Jarlath (c. 550), and the seat of a Protestant bishop. The Protestant cathedral incorporates part of an ancient church built in c. 1130 with the help of Turloch O'Connor, king of Conaught. The chancel is all that remains of the original structure, the rest having been rebuilt in its original style in the 19th century. The Catholic cathedral, in Perpendicular Gothic style, has a square tower, which can be seen from miles around. In the market square is the High Cross of Tuam. There is a dioce-

St. Jarlath's Cathedral, Tuam, County Galway, Ireland

san college for training clergy. Tuam has a racecourse, is a centre of the sugar-beet industry, and manufactures electronic components. Pop. (1981) 4,366.

Tuamotu Archipelago, French îles Tuamotu, also called Paumotu, island group of French Polynesia, central South Pacific. The archipelago comprises 75 atolls, one raised coral atoll (Makatea), and innumerable coral reefs, roughly dispersed northwest–southeast as a double chain for more than 900 miles (1,450 km). The islands, save for Makatea, are completely flat and have little fresh water. The largest atoll is Rangiroa, which consists of a circle of 20 islets surrounding a broad lagoon. Fakarava and Hoa are also important. Raroia is the reef on which the *Kon-Tiki* expedition ended its 4,300-mile drift across the Pacific in 1947.

Pokapuka atoll was sighted by Ferdinand Magellan as he crossed the Pacific in 1521. Iron cannons recovered on Amanu in 1929 and 1969 indicate that the Spanish caravel San Lesmes was shipwrecked on the atoll in 1526. Subsequently visited by the Portuguese Pedro Fernández de Quirós (1606) and others, the islands came under French protection in 1844 and were annexed in 1880 as a Tahitian dependency. They now form, with the Gambier Islands, a circonscription (administrative division) of French Polynesia, with circonscription headquarters on Atoll Apataki, 250 miles (402 km) northeast of Tahiti. Villages are near lagoons where pearl oysters, fish, and coconuts support the population. Since World War II many villagers have emigrated to Papeete, on Tahiti. The uninhabited atolls of Muruoa (q.v.) and Fangataufa have been used by France for nuclear weapons tests since the 1960s. An airstrip on Hoa serves the testing grounds. Pop. (1983) 11,211.

Tuan Ch'i-jui, Pinyin DUAN QIRUI (b. March 6, 1865, Ho-fei, Anhwei Province, China—d. Nov. 2, 1936, Shanghai), warlord who dominated China intermittently between 1916 and 1926.

A student of military science in Germany, he became President Yüan Shih-k'ai's minister of war following the Chinese Republican Revolution of 1911. Shortly before Yüan's death in 1916, Tuan became premier, and he kept the post in the new government. He restored the provisional constitution of 1912, which had been dissolved by Yüan in 1913. In May 1917, when Tuan tried to force the National Assembly to enter World War I on the side of the Allies, he was dismissed by President Li Yüan-hung. Immediately afterward, he sup-

pressed an attempt to restore the emperor and resumed control of the government.

Tuan declared war on Germany on Aug. 14, 1917, and received financial and military aid from the Japanese, who helped him and his warlord allies build a military establishment called the Anfu Clique. Japanese aid created popular anxiety that Tuan was letting the country be dominated by imperialist powers, and these feelings were aggravated by Chinese complicity in the transfer of German rights in China to Japan after the war. On May 4, 1919, a wave of protests and demonstrations swept the country. As Tuan's popularity declined, other warlords formed a coalition against him; in July 1920 his troops were defeated, and he was forced to retire from politics. In the fall of 1924 two rival warlords, Chang Tso-lin and Feng Yü-hsiang, jointly occupied Peking. They called Tuan out of retirement to run the new government and mediate between them. In April 1926 Chang defeated Feng, and Tuan was no longer needed. He devoted the rest of his life to the study of Buddhism and to philanthropic works.

Tuapse, city and seaport of Krasnodar *kray* (territory), southwestern Russian Soviet Federated Socialist Republic, on a sheltered bay of the Black Sea. Founded in 1838 around a fortress established in 1828, it grew in the 20th century as a major ship-repairing, oil-refining, and oil export centre. It is linked by pipeline to Grozny and the north Caucasian oil fields; other industries include food processing and the manufacture of petroleum machinery. Pop. (1985 est.) 63,000.

Tuareg, French TOUAREG, Berber-speaking pastoralists who inhabit an area ranging from Touat, Alg., and Ghudāmis, Libya, to northern Nigeria and from Fezzan, Libya, to Timbuktu, Mali. Their political organizations extend across national boundaries. In the late 20th century there were estimated to be 900,000 Tuareg.

The northern Tuareg live mainly in true desert country, whereas the southerners live primarily in steppe and savanna. The Tuareg consist of confederations including the Ahaggar (Hoggar) and Azjer (Ajjer) in the north and the Asben (Air Tuareg), Ifora, Itesen (Kel Geres), Aulliminden, and Kel Tademaket in the south. The southerners breed zebu cattle and camels, some of which are sold to the northern Tuareg. Raiding of caravans and travelers was important in pre-European times, as was caravan trading, which declined with the introduction of motor vehicles. Droughts across southern Mauritania, Senegal, Niger, Burkina Faso (Upper Volta), and Chad in the 1970s and '80s both reduced the numbers of the southern Taureg and eroded their traditional pastoral way of life.

Tuareg society is traditionally feudal, ranging from nobles, through clergy, vassals, and

Tuareg tribesman, Niger Marc Riboud—Magnum

artisans, to labourers (once slaves). The conventional Tuareg dwelling is a tent of red-dyed skin (sometimes replaced in the later 20th century with plastic), but a barrel-vaulted tent covered with mats is also used in the south. Weapons include two-edged swords, sheathed daggers, iron lances, and leather shields. Adult males wear a blue veil in the presence of women, strangers, and in-laws, but that practice began to be abandoned with urbanization. They have preserved a peculiar script (tifinagh) related to that used by ancient Libyans.

Tuat (oasis, Algeria): see Touat.

tuatara (Sphenodon punctatus), lizard-like animal that is the sole living member of the reptilian order Rhynchocephalia. It is found only on some of the islets of New Zealand.

A brief treatment of the tuatara follows. For full treatment, see MACROPAEDIA: Reptiles.

Tuatara (Sphenodon punctatus)
M.F. Soper—Bruce Coleman Inc.

The animals attain lengths of about 70 cm (about 28 inches) and weigh up to 1 kg (2.2 pounds). They differ little from related forms of the animal that lived 200,000,000 years ago. The tuatara has two pairs of well-developed limbs and a scaly crest down the neck and back. Unlike lizards, they have a third eyelid, the nictitating membrane, which closes horizontally, and a pineal eye, an organ of doubtful function between the two normal eyes.

Tuataras are active at night, live in burrows, and eat insects, other small animals, and birds' eggs. They do well at relatively low temperatures. Eight to 15 eggs are laid in the spring, some distance from the burrow; hatching does not occur until the next spring. Some tuataras may live about 100 years.

Tuatha Dé Danann (Gaelic: "People of the Goddess Danu"), in Celtic mythology, a race inhabiting Ireland before the arrival of the Milesians (the ancestors of the modern Irish). They were said to have been skilled in magic. and the earliest reference to them relates that, after they were banished from heaven because of their knowledge, they descended on Ireland in a cloud of mist. They were thought to have disappeared into the hills when overcome by the Milesians. The Leabhar Gabhála (Book of Invasions), a fictitious history of Ireland from the earliest times, treats them as actual people, and they were so regarded by native historians up to the 17th century. Some scholars believe that the Tuatha Dé Danann are to be viewed as a company of gods. In popular legend they have become associated with the numerous fairies still supposed to inhabit the Irish landscape.

tuba, deep-pitched brass wind instrument with valves and wide conical bore. The word tuba originally was the name of a straight-built Roman trumpet and was the medieval Latin word for trumpet. Valved bass brass instruments for bands are mentioned as early as 1829, but little is now known about them. In 1835 Wilhelm Wieprecht and Johann Gottfried Moritz of Berlin patented the bass tuba (Bass-Tuba) in F, with five valves. Subsequent designs were considerably influenced by the French contrabass saxhorn.

Military brass band tuba

By courtesy of Boosey & Hawkes Ltd.

Modern military and brass band tubas are of two sizes used together: the E-flat bass (or bombardon) and the BB-flat bass, a fourth lower. When these tubas have three valves, their lowest notes are, respectively, the A below the bass staff and the E below that. The E-flat bass generally has a fourth valve that lowers the basic pitch by a fourth to BB-flat, enabling the instrument (with use of valves) to produce the low E, below which the compass can be continued downward in fundamentals (lowest note producible by a length of tubing), E-flat, D, and so on. These basses are coiled vertically and held upright aslant the player's body, with the bell pointing to the right; in the United States the bell may be turned forward. Alternative designs, likewise in E-flat and BBflat but encircling the body, include the circular bass, or helicon (q.v.), with the bell resting across one shoulder, and the American sousaphone, with an extremely wide bell raised above the player's head.

Orchestral tubas vary in different countries. Large instruments in BB-flat or a tone higher, in C, are used in the United States and parts of Europe. The original pitch of F (a tone above the E-flat bass) is preferred in Great Britain and (with rotary rather than piston valves) in Germany. All have the fourth valve and often a fifth valve tuned to a wide semitone for facilitating good intonation in certain fingerings. French orchestras use a small C tuba pitched a fifth above the F tuba. This is a sixvalved development of the earlier French bass saxhorn. The military-band euphonium normally serves as a tenor tuba. Tuba parts are written at actual pitch except in brass bands, where transposed notation allows the parts to be read with cornet fingering.

Wagner tubas are four-valved, small-bored tubas designed in the 19th century for the German composer Richard Wagner for special effects in his four-part music-drama cycle The Ring of the Nibelung. Basically derived from the French horn, they are played by horn players with horn mouthpieces and have a quieter tone colour. The bass and contrabass saxhorns in E-flat and BB-flat are also sometimes referred to as tubas.

Tubalar (people): see Tofalar.

Tuban, also spelled TOEBAN, city, Jawa Timur ("East Java") propinsi (province), Java, Indonesia. It is a fishing port on the Java Sea, about 50 miles (80 km) northwest of Surabaya. Road and railway link it with Babat to the south, and it is connected by road with Rembang and Kudus to the west and Surabaya to the southeast. The population is predominantly Madurese, and there is a large colony of Chinese immigrants. A major centre of trade and transshipment for the surrounding riceand corn- (maize-) growing region, its exports also include fish and copra. Industry includes rice milling and other food processing; crafts

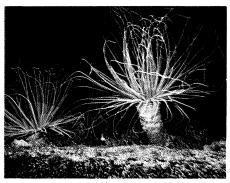

include wood carving, handloom weaving, and batik printing. Tuban was one of several ports that fell to the Muslims in the last decades of the 15th century; in 1619 it was subjugated by Agung, sultan of the Mataram kingdom of Java. It was known as an opium-smuggling centre during Dutch rule. Pop. (1980) city, 65,981.

Tubantian Stage, division of late Pleistocene deposits and time in The Netherlands (the Pleistocene Epoch began about 2,500,000 years ago and ended about 10,000 years ago). The Tubantian Stage is correlated with the Weichsel Glacial Stage of northern Europe and the Würm Glacial Stage of the Alps. The Tubantian follows the Eemian Interglacial Stage; it is the final Pleistocene division.

Tubarão, city, southeastern Santa Catarina state, southern Brazil, on the Tubarão River, at 23 feet (7 m) above sea level. It is the seat of Tubarão municipality, created in 1870. Crops cultivated in the surrounding coastal plain include grains, feijão (beans), coffee, rice, and sugarcane. Iron ore and steel are mined for export. Products are transported by highway to Florianópolis, the state capital, 120 miles (193 km) northeast, and by railway or road to the ocean port at Laguna, 20 miles (32 km) northeast. Pop. (1980) 64,508.

tube (metropolitan transit): see subway.

tube anemone (*Cerianthus*), any of a genus of invertebrate marine animals of the class Anthozoa (phylum Cnidaria) characterized by an elongated polyp (*i.e.*, a hollow stalklike structure with a mouth and tentacles at the

Tube anemone (Cerianthus)
Walter Dawn

upper end); the polyp lives in a tube of slime on the ocean bottom. The genus is widely distributed in tropical and subtropical waters. One species, *Cerianthus americanus*, found in shallow waters from New England to Florida, grows to about 60 cm (24 inches) in length.

tube worm, any of a number of tube-dwelling marine worms belonging to the annelid class Polychaeta (*see* polychaete; feather-duster worm; tentacle worm). Other tube-dwelling worms include the horseshoe worm (q, v, phylum Phoronida) and the beardworm (q, v, phylum Pogonophora).

tuber, short, thickened, mostly underground stem that constitutes the resting stage of certain seed plants. It bears minute scale leaves, each with a bud that has the potential for developing into a new plant. The potato is a typical tuber, as is the Jerusalem artichoke. The term is also used imprecisely but widely for fleshy roots or rhizomes of other plants that resemble tubers—e.g., the "tuber" (actually a tuberous root) of a dahlia.

tuberculin test, procedure for the diagnosis of tuberculosis infection by the introduction into the skin, usually by injection on the front

surface of the forearm, of a minute amount of tuberculin. Tuberculin is a protein substance from the tuberculosis-causing bacillus, Mycobacterium tuberculosis, first discovered and extracted by Robert Koch in 1890. When the test is positive, a swelling, usually accompanied by redness, occurs within 48 hours at the site of injection. A positive reaction indicates that the individual has been exposed to the tubercle bacillus at some time in the past, but it does not necessarily indicate that active clinical tuberculosis is present, or ever existed. The test is a help to the physician in determining the source and time of an infection and in distinguishing tuberculosis from other pulmonary conditions in which the pulmonary lesions, as seen radiologically, resemble those of tuberculosis.

tuberculosis (TB), infectious disease that is caused by several species of Mycobacterium. collectively called the tubercle bacillus. Tuberculosis in humans is usually caused by the human variety of the bacillus, M. tuberculosis, and in fewer cases by the bovine variety of the bacillus, M. bovis. Besides cattle, which are infected by the bovine type of bacillus, other domestic animals susceptible to tuberculosis include swine and fowl, the latter being infected by the avian type of bacillus. The tubercle bacillus is an extremely small, rodshaped bacterium that is extremely hardy; it can survive in a state of dryness for months at a time and can also resist the action of mild disinfectants. The tubercle bacillus was discovered and identified as the cause of tuberculosis in 1882 by the German physician Robert Koch.

Tuberculosis occurs in humans worldwide and in many developing countries is still a chief cause of death. Historically, tuberculosis rates have been notably higher in urban than in rural communities because of cities' greater crowding (hence greater opportunity for transmission of the bacillus) and poorer sanitation and hygiene. Accounts of tuberculosis can be found in the writings of the ancient Egyptians, in those of the Greek physician Hippocrates, and in the medical writings of most urbanized societies since then. The disease reached nearepidemic proportions in the rapidly urbanizing and industrializing societies of Europe and North America in the 18th and 19th centuries. Indeed, tuberculosis was the leading cause of death for all age groups in the Western world from that period until the early 20th century, at which time improved health and hygiene caused a gradual but continuing decline in its mortality rates. The number of deaths caused by tuberculosis is now miniscule in developed nations, but the disease remains a significant cause of death in the developing countries of Africa, Asia, and Latin America. It is generally estimated that the prevalence (or occurrence) of the disease is approximately 20 times the mortality from it in any given period. The death rate is especially high in densely populated countries with poor hygienic standards.

Infection with tuberculosis spreads in two ways, by the respiratory route directly from another infected person or by the gastrointestinal route by drinking milk infected with the tubercle bacillus. In the former case the organism is M. tuberculosis, in the latter M. bovis. Most human tuberculosis is acquired by the inhalation of bacilli from the sputum or other fluid discharges of infected persons. The minute droplets discharged by sneezing or coughing can contain hundreds of tubercle bacilli that may be inhaled by a healthy person. In infections with M. tuberculosis, the tubercle bacilli commonly affect the lungs, in which case the disease is known as pulmonary tuberculosis. By contrast, infections with M. bovis often affect the bones and joints. About 90 percent of all clinically recognized tuberculosis in humans is pulmonary.

The anatomic unit of tuberculosis is a highly characteristic pathological lesion known as the tubercle. It usually consists of a centre of dead cells and tissues, cheeselike in appearance, in which can be found many tubercle bacilli. This centre is surrounded by radially arranged phagocytic (scavenger) cells and a periphery containing connective tissue cells. The tubercle forms as a result of the body's defensive reaction to the bacilli that lodge in bodily tissues. Tubercles are microscopic in size, but most of the visible manifestations of tuberculosis, from barely visible nodules to large tuberculous masses, are conglomerations of such tubercles.

Primary pulmonary tuberculosis occurs mostly in childhood. Often the infection is without symptoms and immunity results. When the primary infection heals, a small scar in the lung is visible on X ray. Sometimes the infection does not heal but spreads into the bloodstream and through the body, causing miliary tuberculosis, a highly fatal form if not adequately treated. Another complication is tuberculous meningitis; before the advent of specific drugs, this was always fatal, but now most cases recover. Bone and joint tuberculosis in childhood has virtually disappeared in areas of the world where all milk is pasteurized; elsewhere it remains a serious disease.

Postprimary pulmonary tuberculosis occurs mainly in young adults but can occur at any age. The onset of the disease is usually insidious, with lack of energy, weight loss, and persistent cough. These symptoms do not subside, and the general health of the patient deteriorates. Eventually, the cough increases, there is much sweating, the patient may have chest pain from pleurisy, and there may be blood in the sputum, an alarming symptom. The lesion in the lung consists of a collection of dead cells in which tubercle bacilli may be seen. This lesion spreads and may erode a neighbouring bronchus or blood vessel, causing the patient to cough up blood (hemoptysis). Tubercular lesions may spread extensively in the lung, causing large areas of destruction, cavities, and scarring. The amount of lung tissue available for the exchange of gases in respiration decreases, and if untreated the patient dies from failure of ventilation and general toxemia and exhaustion. Sometimes the infection extends into other systems of the body, and almost any organ of the body may be affected: lymph nodes, bones and joints, skin, intestines, genital organs, kidneys, and

The diagnosis of pulmonary tuberculosis depends on finding the tubercle bacillus in the sputum, in the urine, in gastric washings, or in the cerebrospinal fluid. An X ray of the lungs may show typical shadows caused by tubercular nodules or lesions. A skin test (see tuberculin test) shows whether a person is susceptible to tuberculosis or whether he has become immune after infection.

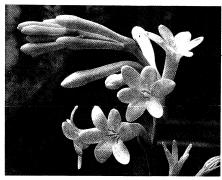

The prevention of tuberculosis depends on good hygienic and nutritional conditions and on the recognition of infected patients and their early treatment. A vaccine, known as BCG vaccine (q.v.), is composed of specially weakened tubercle bacilli. Injected into the skin, it causes a local reaction and, later, immunity to infection. It has been widely used in some countries with success. Its use in young children has helped to control infection in the developing world, but the main hope of ultimate control lies in preventing exposure to infection; and this means treating infectious patients quickly, possibly in isolation until they are noninfectious.

The treatment of tuberculosis now consists of drug therapy and good general care, with good food and plenty of rest. In the 1940s and '50s several antimicrobial drugs were discovered that revolutionized the treatment of

patients with tuberculosis. Streptomycin, isioniazid, and para-aminosalicylic acid were the first three such drugs used; all three are capable of virtually eradicating the tubercle bacillus from the human body. Other such drugs are ethambutol, rifampicin, thiacetazone, and pyrazinamide. One problem with drug therapies, however, is that the bacilli may become resistant to some of the drugs; this is avoided mainly by giving combinations of the drugs. The patient is usually made noninfectious quite quickly, but complete cure requires treatment for several months at least. Before these drugs were available, treatment consisted of long periods, often years, of bed rest and often surgical removal of useless lung tissue. With early drug treatment surgery is now rarely needed.

tuberculous spondylitis, inflammatory disease that is a form of spondylitis (q, v).

tuberose (Polianthes tuberosa), perennial garden plant and only cultivated species of the genus Polianthes of the family Agavaceae, consisting of about 12 species. All members of the genus are native to southwestern North America. The tuberose has long, bright green leaves clustered at the base; smaller, clasping leaves along the stem; fragrant, waxy white flowers in a cluster at the tip of the stem; and

Tuberose (Polianthes tuberosa)
Maurice B. Cook

tuberous roots. The flowers are used in the manufacture of perfumes.

tubinares (bird order): see procellariiform.

Tübingen, Regierungsbezirk (administrative district), southeastern Baden-Württemberg Land (state), southwestern Germany. Tübingen is bordered by Bavaria Land to the east, Lake Constance (Bodensee) to the south, and the Regierungsbezirke of Freiburg and Karlsruhe to the west and Stuttgart to the north. The district occupies an area of 3,443 square miles (8,917 square km) and is coextensive with a portion of the larger historic region of Swabia (q.v.). From the 12th century the Württembergs, a local dynasty of counts, gained control over large sections of Swabia. The Württemberg lands successively became a duchy, a kingdom, and a republic. In 1952 three post-World War II states of West Germany—Württemberg-Hohenzollern, Württemberg-Baden, and Baden—were merged to form the present Land of Baden-Württemberg. Württemberg-Hohenzollern, with boundaries roughly encompassing the current district of Tübingen, became the new Land's southeastern Regierungsbezirk of Südwürttemberg-Hohenzollern. In 1973 an administrative reform altered the borders of Südwürttemberg-Hohenzollern and changed its name to Tübingen, after the district's administrative seat.

Central Tübingen is drained from southwest to northeast by the upper Danube River. South of the Danube is the region of Upper Swabia, the westernmost lands of southern Germany's Alpine Foreland. Glaciers once covered nearly all of the Upper Swabian foreland, their deposits forming a morainic landscape with rolling hills. Meadow is dominant, although spruce and fir forests cover many hilltops, and small lakes and bogs fill depressions where drainage has been interrupted. Dairy farming is the chief source of income in the cool, moist region. Wetland nature reserves and numerous health spas featuring peat and mud baths attract many visitors. The population of Upper Swabia is concentrated in the south of Tübingen district along the shores of Lake Constance, Germany's largest lake. Popular lakefront tourist resorts offer swimming, sailing, and a spectacular view of the Swiss Alps. Vineyards, orchards, hop fields, and market gardens are abundant on warm slopes above the lake. Friedrichshafen, the district's chief city in the lake region, manufactures aircraft and machinery.

The Swabian Mountains (Schwäbische Alb), a dry upland plateau of Jurassic limestones, rise gradually from the Danube valley and extend to Tübingen's northern border. A sparsely populated and economically poor region, the mountains are characterized by karstic features such as sinkholes, caves, dry valleys, and underground watercourses. Forest is scarce on the windy and exposed mountain slopes, where sheep and stall-fed dairy cattle are raised on marginal pastureland. The upland villages and arable land are concentrated in valley troughs that traverse the mountains from north to south. Albstadt, the chief town of the upland, specializes in textile manufacturing. In Tübingen's northwest corner the Swabian Mountains descend abruptly into the Neckar River valley in a steep scarp some 1,300 feet (400 m) high. Many isolated outlier hills of the Swabian Mountains are topped by the castles of past imperial dynasties, among them Hohenzollern Castle, the home of the Prussian ruling family. Reutlingen and Tübingen are the leading cities of the middle Neckar valley and manufacture textiles, machinery, and electrical equipment.

Located on the border with Bavaria at the confluence of the Blautopf and Danube rivers is Ulm, the largest city of Tübingen and an important industrial and transportation centre

The native population of Tübingen are Swabians, descendants of the Suebi, a Germanic people who occupied the territory from the 3rd century AD. They speak Swabian, one of three main German dialects in Baden-Württemberg. Upper Swabia is noted for the wealth of art and architecture in its famous Baroque churches and monasteries. Higher education in the Regierungsbezirk is centred in the old Swabian university town of Tübingen at the University of Tübingen, founded in 1477, and at the University of Ulm, founded in 1967. The population of Tübingen is predominantly Roman Catholic. Pop. (1989 est.) 1,555,262.

Tübingen, city, Baden-Württemberg Land (state), southwestern Germany. The city lies along the Neckar River at its junction with the Ammer and the Steinlach rivers. Originating as Castra Alamannorum around the castle of the counts palatine of Tübingen (first mentioned in 1078) and recorded as a town in 1231, it was purchased by the counts of Württemberg in 1342, and the county became a duchy in 1495. It was captured in 1519 by the Swabian League, and during the Thirty Years' War it fell to Holy Roman Empire troops (1634), the Swedes (1638), and the French (1647). Tübingen's important university was founded by Count Eberhard VI of Württemberg in 1477. The university's Protestant theological seminary, established by Duke Ulrich in 1534, numbered the astronomer Johannes Kepler, the poet Friedrich Hölderlin, and the philosopher G.W.F. Hegel among its students. The poet Ludwig Uhland was born (1787) in Tübingen.

The city's most conspicuous building is the

ducal castle of Hohentübingen, built in the 16th–17th century on earlier foundations and now housing several institutes of the university. The Gothic Stiftskirche of St. George (1470–90) contains fine stained glass and tombs of the dukes of Württemberg. The town hall, dating from 1435, has been much restored.

A publishing centre, modern Tübingen has metal and machinery, textile, woodworking, and paper industries. Pop. (1989 est.) 76,046.

Tübingen, University of, German in full EBERHARD-KARLS-UNIVERSITÄT TÜBING-EN, state-supported university at Tübingen, Ger. It was founded in 1477 by Count Eberhard VI (1445–96), later the first duke of Württemberg, a civic and ecclesiastic reformer who established the school after becoming absorbed in the Renaissance revival of learning during his travels to Italy.

The university has a history of innovative thought, particularly in theology. Philipp Melanchthon (1497-1560), prime mover in building the German school system and a chief figure in the Protestant Reformation, helped establish its direction. Among Tübingen's eminent students have been astronomer Johannes Kepler, poet Friedrich Hölderlin, and philosophers Friedrich Schelling and G.W.F. Hegel. The university rose to its height of prominence in the middle of the 19th century with the teachings of poet and civic leader Ludwig Uhland and the Protestant theologian Ferdinand Christian Baur, whose beliefs and disciples became known as the "Tübingen School." The University of Tübingen also was the first German university to establish a faculty of natural sciences, in 1863

In the 20th century, Tübingen became dominated first by Marxist-Leninist philosophy and then by Adolf Hitler's Nazi regime until the beginning of the Allied occupation in 1945. In 1970 the university was restructured into a series of independent departments of study and research after the manner of French universities

Tubman, Harriet (b. c. 1820, Dorchester county, Md., U.S.—d. March 10, 1913, Auburn, N.Y.), black American bondwoman who escaped from slavery in the South to become a leading abolitionist before the American Civil War. She came to be known as the "Moses of her people" as she led hundreds of bondsmen to freedom in the North along the route of the Underground Railroad—an elaborate secret network of safe houses organized for that purpose.

In 1849 Tubman escaped from a plantation on the eastern shore of Maryland and made her way north by the Underground Railroad. In 1850 she returned to Maryland to guide members of her family north to freedom. She soon became one of the "railroad's" most ac-

tive "conductors," making frequent trips into the South to bring out escaping slaves. Despite huge rewards offered for her capture, she helped more than 300 slaves to escape. She maintained military discipline among her followers, often forcing the weary or the fainthearted ahead by threatening them with a loaded revolver.

A devout Christian who relied on God for her strength and guidance, Tubman became a friend of many of the best-known abolitionists and their sympathizers. John Brown refers to her in his letters as "one of the best and bravest persons on this continent—General Tubman as we call her."

During the Civil War Tubman served as a nurse, laundress, and spy with the Federal forces along the coast of South Carolina. After the war she made her home in Auburn, N.Y., and, despite numerous honours, spent her last years in poverty. Not until 30 years after the war was she granted a government pension in recognition of her work for the Federal Army.

Tubman, William V(acanarat) S(hadrach) (b. Nov. 29, 1895, Harper, Liberia—d. July 23, 1971, London, Eng.), statesman whose 27 years as Liberia's 17th president constituted

Camera Press—Pictorial Parade/EB Inc

the longest tenure in that office in the history of Africa's first republic (proclaimed in 1847). He was responsible for numerous reforms and social policies, including enactment of suffrage and property rights for all female residents of 21 or older; authorization of direct participation in government by all tribespeople, who comprise about 80 percent of the population; and the establishment of a nationwide public-school system.

A descendant of early American immigrants, mostly liberated slaves, Tubman grew up in poverty and under severe discipline. His father, a stonemason, required him and the other four children to attend daily family prayer services as well as church services and the local grade school. The children had to sleep on floor pallets because their father thought beds were too soft and therefore "degrading to character development."

Tubman, the second son, first planned to be a preacher and was accredited, at 19, as a Methodist lay pastor. At about the same time, he received a temporary appointment as a junior collector of customs. His record of competence and honesty led him toward public service. He studied law after hours and at 23 successfully passed the bar examination.

Tubman later won election to the local legislature and then occupied a wide range of public offices, including trial judge, public prosecutor, and arbitration referee. At 35 he won election to the Liberian Senate. At Monrovia, the capital, he undertook the David-against-Goliath task of opposing the entrenched establishment—a self-perpetuating clique of American-descended Liberians who had long dominated the national government. The witty, cigar-puffing Tubman, who gaily labeled himself the "Convivial Cannibal from the Downcoast Hinterlands," moved adroitly to advance the constitutional rights of the ma-

jority tribespeople. His maneuvers were so effective that the leadership of his party (the True Whig) proceeded to "kick him upstairs" to the Supreme Court, where he served as an associate justice until 1943. Then he unexpectedly announced his candidacy for the presidency. He won handily in the ensuing election and six times thereafter. In June 1944 Tubman and his predecessor, Edwin Barclay, were White House guests of President Franklin D. Roosevelt—the first African heads of state to be so honoured.

tubular bells, also called ORCHESTRAL BELLS, or ORCHESTRAL CHIMES, series of tuned brass (originally bronze) tubes of graded length, struck with wooden hammers to produce a sound. They were probably introduced in about 1885 in England by John Harrington.

Tubular bells

By courtesy of Ludwig Industries

Large tubular bells were at first used as a substitute for church bells in towers. Smaller tubes were later built to be controlled from an organ manual or, in the orchestra, to be played directly by a percussionist.

As orchestral chimes, tubular bells can attain greater rhythmic precision than true bells, and their tone is clearer, for it emphasizes fewer higher harmonics. The instrument's compass normally extends 1½ octaves upward from the C above middle C.

Tuchman, Barbara, née WERTHEIM (b. Jan. 30, 1912, New York City—d. Feb. 6, 1989, Greenwich, Conn.), author who was one of the foremost American popular historians in the second half of the 20th century.

She was born a member of a wealthy banking family and was educated at Waldon School in New York City. After four years at Radcliffe College (B.A., 1933), she became a research assistant for the Institute of Pacific Relations (1933–35) and then worked as a writer and correspondent for *The Nation* magazine (1935–39) and other publications. After her marriage to the physician Lester R. Tuchman in 1940, she devoted herself to the duties of a housewife and mother of three children.

Tuchman had had one book, *The Lost British Policy: Britain and Spain Since 1700* (1938), published before her marriage, but it was not until her children were partly grown

that she could once again devote herself to historical research. The result was Bible and Sword; England and Palestine from the Bronze Age to Balfour (1956), a study of the historical background leading up to the Balfour Declaration. She first achieved some recognition with The Zimmerman Telegram (1958), a detailed study of the telegram that Germany sent to Mexico during World War I promising parts of the American Southwest to the Mexican government if the latter would enter the war on Germany's side.

Tuchman
© Jerry Baue

In 1962 Tuchman's The Guns of August (also published as August 1914) was published to widespread critical and popular acclaim. This work is a detailed account of the first month of World War I, and it vividly describes the series of military errors and miscalculations that led to the ensuing stalemate of trench warfare. The book's descriptive analysis of the German offensive into northern France helped win Tuchman the Pulitzer Prize in 1963. Tuchman's next book, The Proud Tower (1966), subtitled A Portrait of the World Before the War, 1890-1914, was a survey of European and American society, culture, and politics in the 1890s. She was awarded a second Pulitzer Prize for Stilwell and the American Experience in China, 1911-45 (1970). This was a study of the United States' relationship with 20thcentury China as epitomized in the wartime experiences of Joseph Stilwell, the general who headed U.S. forces in the China-Burma-India theatre during much of World War II. Tuchman then took seven years to research and write A Distant Mirror: The Calamitous 14th Century (1978). In this book she made exceptionally vivid the historical events, personalities, and texture of life in 14th-century France, taking for her main character a typical French knight and nobleman of the period, Enguerrand de Coucy. Tuchman's last works were The March of Folly: From Troy to Vietnam (1984) and The First Salute (1988).

Tuchman could bring a historical period or personage to life by an accumulation of vivid and concrete details. She combined a masterful literary style with a clear and powerful grasp of complex historical issues.

Tucholsky, Kurt, pseudonyms THEOBALD TIGER, PETER PANTER, IGNAZ WROBEL, and KASPAR HAUSER (b. Jan. 9, 1890, Berlin—d. Dec. 21, 1935, Hindas, near Göteborg, Swed.), German satirical essayist, poet, and critic, best-known for his cabaret songs.

After studying law and serving in World War I, Tucholsky left Germany in 1924 and lived first in Paris and after 1929 in Sweden. He contributed to *Rote Signale* (1931; "Red Signals"), a collection of communist poetry, and to *Schaubühne*, later *Die Weltbühne*, a journal published by the pacifist Carl von Ossietzky. In 1933 Tucholsky's works were denounced

by the Nazi government and banned, and he was stripped of his German citizenship. He committed suicide in 1935.

Tucholsky's output includes aphorisms, book and drama reviews, light verse, short stories, and witty satirical essays in which he criticized German militarism and nationalism and the dehumanizing forces of the modern age. His poetry was set to music and performed widely in German cabarets.

Tuckasegee River, river rising in the Blue Ridge (Pisgah National Forest), west of Brevard, in Jackson county, N.C., U.S. The Tuckasegee flows 50 miles (80 km) northwest past Cullowhee, Whittier, and Bryson City, near which it empties into Fontana Reservoir in the Little Tennessee River. Glenville Dam (1941), on a fork of the Tuckasegee, 22 miles (35 km) southwest of Bryson City, impounds Glenville Reservoir. The river's name probably comes from a Cherokee Indian village, Tsiksitsi (meaning "crawling terrapin," for the sluggish movement of the waters), that once stood on its banks.

Articles are alphabetized word by word, not letter by letter

Tucker, Richard, original name REUBEN TICKER (b. Aug. 28, 1913, Brooklyn, N.Y., U.S.—d. Jan. 8, 1975, Kalamazoo, Mich.), American operatic tenor and cantor who sang roles in more than 30 operas.

As a youth Tucker first sang as a member of a synagogue choir and on radio. He studied voice with Paul Althouse and made his Metropolitan Opera debut in 1945 as Enzo in Amilcare Ponchielli's *La Gioconda*. His European debut was in 1947 at the Verona Arena in the same role opposite Maria Callas in the title role.

Although Tucker sang in opera and recitals in many European cities—London, Milan, Vienna, Barcelona, Florence—his career was centred in the United States. He was a popular performer on radio and television and made a number of highly regarded recordings. Before his sudden death on a concert tour, he had sung with most of the leading American opera companies and orchestras and was highly praised as a cantor.

Tucker, Sophie, original name sophie ABUZA (b. Jan. 13, 1884, Russia—d. Feb. 9, 1966, New York City), American singer billed

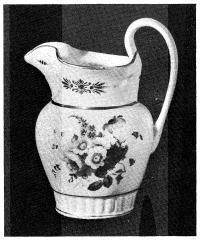

Sophie Tucker in Follow the Boys, 1944

as "the last of the red hot mamas," whose 62-year stage career included American burlesque, vaudeville, and nightclub and English music-hall appearances.

Born while her mother, a Russian Jew, was en route to the United States, Tucker began entertaining as a child singer in her father's restaurant in Hartford, Conn. In 1906 she went to New York, where she performed briefly in the Ziegfeld Follies of 1909. By 1914 she was a leading entertainer, appearing at the Palace Theatre, New York City. Still on stage at 78, Tucker retained her brassy, flamboyant style, applying it with equal effectiveness to sentimental ballads and risqué songs. She stirred audiences particularly with her tough, defiant theme song, "Some of These Days."

Tucker porcelain, pottery ware made from 1826 to 1838 at a factory founded in Philadelphia by William Ellis Tucker, who had found porcelain ingredients at sites near Wilmington, Del., and in New Jersey. At first, trans-

Porcelain pitcher by W.E. Tucker, Philadelphia, 1827–28; in the Newark Museum, New Jersey

fer-printed landscapes and floral patterns were executed on porcelain; from about 1831 ornate pieces, such as vases decorated with overglaze painting in the style of Sèvres porcelain, were produced; cups decorated with the heads of U.S. presidents date from about 1836.

Tuckey, James Kingston (b. August 1776, Greenhill, County Cork, Ire.—d. Oct. 4, 1816, near Moanda, in modern Zaire), British naval officer and explorer who and investigated the course of the Congo River and the kingdoms of the interior of West Africa.

After service in India and the Far East, Tuckey was sent to Australia in 1802 to help found the British colony of New South Wales, where he explored the interior and surveyed the harbour of Port Philip. In 1815 he was appointed commander of an expedition to search for a connection between the Congo and Niger rivers. Though the expedition failed in its primary object and Tuckey himself died of fever during it, he did travel 300 miles up the Congo and sent back ethnographical and geographical information on the interior for his Introduction to the Narrative of an Expedition to Explore the River Zaire (1816).

tuckpointing, in building construction, technique of finishing masonry joints with a fine, pointed ridge of mortar, for decorative purposes, instead of the usual slightly convex finish in ordinary masonwork. The term is sometimes used for pointing (q, v) as in masonary repair.

tuco-tuco (Ctenomys), South American rodent of the family Ctenomyidae (order Rodentia), found from Peru to Tierra del Fuego. Tuco-tucos are named for the sound of their call. They are highly variable animals, and about 50 different forms have been considered species; some authorities, however, recognize only about 25.

Tuco-tuco (Ctenomys)
Painting by H. Douglas Pratt

Tuco-tucos resemble American pocket gophers in appearance and habits, but do not have the cheek pouches characteristic of the latter. Thickset, short-legged rodents, tuco-tucos are 17 to 25 centimetres (7 to 10 inches) long, excluding the short tail, and are pale to dark brown or gray. They dig burrow systems (tucales) that include chambers for nesting and for storing roots, stems, and other food. They breed once a year and the female bears one to five young per litter. The gestation period in one species (*C. torquatus*) was recorded at about 105 days.

Tucson, city, seat (1864) of Pima County, southeastern Arizona, U.S., on the Santa Cruz River. In a broad valley, rimmed by mountains, at an elevation of 2,410 ft (735 m), Tucson is headquarters of the Coronado National Forest. In 1692 a Jesuit, Eusebio Kino, visited the Indians at Stjukshon or Chuk Shon (Tuc-son, meaning "village of the dark spring at the foot of the mountain") and in 1700 established several missions including Mission San Xavier del Bac, which still serves the Papago Indians. By 1776 Tucson was a presidio of the Spanish Army. The "Old Pueblo" has lived under four flags (Spanish, Mexican, Confederate, and U.S.). It served as territorial capital (1867-77). Growth was stimulated by the arrival of the Southern Pacific Railroad (1880), the discovery of silver at nearby Tombstone and copper at Bisbee, and irrigation developments. A dry, sunny climate and a unique desert locale (exemplified by the Arizona-Sonora Desert Museum in the foothills of the Tucson Mountains) have made it a popular tourist and health resort.

The University of Arizona (1885) and Pima County Community College (1970) are in Tucson. Davis-Monthan Air Force Base, Old Tucson (movie location), and Kitt Peak National Observatory are nearby. The two sections of the Saguaro National Monument are east and west of the city. Since World War II there has been remarkable growth (partly due to annexation of suburbs). Mining, manufacturing, and tourism are the economic mainstays. Pop. (1980) city, 330,537; metropolitan area (smsa), 531,263.

Tucumán, province, northwestern Argentina, having an area of 8,697 sq mi (22,524 sq km). It comprises northeast-southwest directed, outlying ridges of the Andes (at 8,000–18,000 ft [2,500–5,500 m] in elevation) on the west, bordered by a piedmont on the east that is flat and particularly productive where irrigated by the many streams flowing out of the mountains.

Tucumán was part of the Inca Empire in the late 15th and early 16th centuries, but by the late 1500s the Spanish had colonized the piedmont with the intent of raising assorted agricultural produce for the silver mining centre of Potosi, in the high Andes, 500 mi (800 km) to the north. Later in the colonial period, Tucumán and Salta (to the north) specialized in trading mules raised in the Pampa to the southeast. The mules were the chief means of transportation for the merchants bringing European products and silver from Peru and Bolivia. Following the creation of the viceroyalty of La Plata (1776) and the development of Buenos Aires as a port for European products, Tucumán decreased in importance.

Sugarcane, introduced in the early 19th century, is the most important agricultural product of the irrigated areas, but beans, lemons, potatoes, and tobacco are also grown. Other activities include stockbreeding and lumbering. There are local railways for transporting sugarcane to the mills, and national railways converge on San Miguel de Tucumán (q.v.), the provincial capital. Many menhirs (prehistoric carved standing stones) are found in the Valle de Tafí in the western mountains. Pop. (1983 est.) 1,048,000.

Tucumán, Congress of, assembly that declared the independence of Argentina from Spain on July 9, 1816. The 32 delegates met in the northwestern Argentine city of Tucumán (now San Miguel de Tucumán) in the midst of disunity in their country and grave reversals for the independence forces all over Hispanic America. The United Provinces of the Río de la Plata (an autonomous federation including modern Argentina, Uruguay, Paraguay, and southern Bolivia) had been formed in 1810. Its government at Buenos Aires, ruling in the name of Ferdinand VII, heir to the Spanish throne then in Napoleon's custody, proved unable to maintain unity. Having proclaimed independence, the delegates to the congress appointed Juan Martín de Pueyrredón as supreme dictator, while they conducted a fruitless search for a monarch. European royal candidates and even an Inca prince were considered. The congress moved to Buenos Aires in 1817; two years later it framed a constitution providing for a strong central government. The breakaway of Paraguay, Uruguay, and Bolivia from the United Provinces was accompanied by separatism between the provinces of Argentina itself, spearheaded by the caudillos (local magnates), who finally forced the congress to disband in 1820. Confusion and disunity reigned in Argentina until the beginning of the dictatorship of Juan Manuel de Rosas in 1829.

Tucumcari, city, seat (1903) of Quay County, eastern New Mexico, U.S., in the Canadian River Valley. It was established as a construction base for the El Paso and Rock Island Railroad in 1901 and named for a mountain (1,000 ft [305 m] above the plains), 1 mi south, associated with an Apache legend about the death of a young brave, Tocom, and his sweetheart, Kari. Growth as a trade centre and shipping point for cattle, cotton, wheat, and broom corn was influenced by the completion of the Tucumcari Irrigation Project in 1940. The city provides tourist services for travellers on major east-west interstate Route 66 and has light diversified industries. Conchas Lake and Ute Lake state parks are nearby. Inc. 1908. Pop. (1980) 6,765.

Tucuna, also spelled TICUNA, or TIKUNA, a South American Indian people living in Brazil, Peru, and Colombia, around the Amazon-Solimões and Putomayo-Içá rivers. They numbered about 16,000 in the mid-1970s. The Tucunan language does not appear to be related to any of the other languages spoken in the region.

The Tucuna live in flat, moist, jungle tracts in the northwest Amazon basin. They cultivate bitter and sweet cassava, yams, and corn (maize). They raise chickens for food and keep a number of wild mammals as pets around their houses. They gather tubers and nuts from the forest and eat some types of frogs, certain larvae, and ants. They enjoy wild honey but do not keep bees. At one time, the Tucuna were skilled hunters, using bows and arrows, spears, blowguns, snares, and traps. In the 20th century, however, the demand for animal hides has depleted the availability of game

in the jungle and has altered old patterns of

The Tucuna manufacture a simple type of pottery but do not weave cloth or practice metallurgy. They are accomplished in the art of making and using bark cloth, out of which they make ceremonial masks and large animal figures. They manufacture many different baskets and other containers out of a variety of plant fibres.

The 20th-century Tucuna are adaptable and successful traders, just as their forebears had been. Traditionally, the Tucuna exchanged certain vegetable poisons of the Amazonian forest for goods brought down from the mountains. In recent years, the Tucuna have provided animal hides and canoes to urbanized South Americans, in exchange for money and manufactured goods.

Tucupita, city, capital of Delta Amacuro territory, northeastern Venezuela, on the Caño Mánamo, a main distributary of the Orinoco River. Founded about 1885, it served as a trading centre for the corn (maize), bananas, cacao, sugarcane, and tobacco grown in the hinterland. The city changed dramatically with the construction, in the mid-1960s, of a dam across the river and the development of the petroleum industry. Much of the oil from Delta Amacuro and neighbouring fields is piped to Tucupita, where a refinery has been constructed. A highway built across the top of the dam made the city accessible by road from Maturín, capital of neighbouring Monagas state. Pop. (1981 est.) 29,000.

Tuda, also called TUDAGA (people): see Teda.

Tudi (in Chinese mythology): see T'u-ti.

Tudmur (town, Syria): see Palmyra.

Tudor, HOUSE OF, an English royal dynasty of Welsh origin, which gave five sovereigns to England: Henry VII (reigned 1485-1509); his son, Henry VIII (reigned 1509-47); followed by Henry VIII's three children, Edward VI (reigned 1547-53), Mary I (reigned 1553-58), and Elizabeth I (reigned 1558-1603).

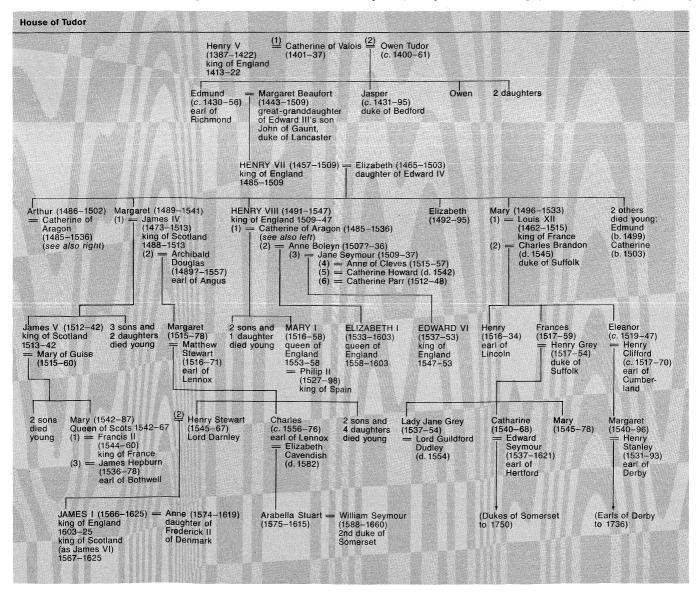

The origins of the Tudors can be traced to the 13th century, but the family's dynastic fortunes were established by Owen Tudor (c. 1400-61), a Welsh adventurer who took service with Kings Henry V and Henry VI and fought on the Lancastrian side in the Wars of the Roses; he was beheaded after the Yorkist victory at Mortimer's Cross (1461). Owen had married Henry V's Lancastrian widow, Catherine of Valois; and their eldest son, Edmund (c. 1430-56), was created earl of Richmond by Henry VI and married Margaret Beaufort, the Lady Margaret, who, as great-granddaughter of Edward III's son John of Gaunt, held a distant claim to the throne, as a Lancastrian. Their only child, Henry Tu-

dor, was born after Edmund's death. In 1485 Henry led an invasion against the Yorkist king Richard III and defeated him at Bosworth Field. As Henry VII, he claimed the throne by just title of inheritance and by the judgment of God given in battle, and he cemented his claim by marrying Elizabeth, the daughter of Edward IV and heiress of the House of York. The Tudor rose symbolized the union by representing the red rose of the Lancastrians superimposed upon the white rose of the Yorkists.

The Tudor dynasty was marked by Henry VIII's break with Rome (1534) and the beginning of the English Reformation, which, after turns and trials, culminated in the establishment of the Anglican Church under Elizabeth I. The period witnessed the high point of the English Renaissance. During Elizabeth's reign, too, through a generation of wars, Spain and the Irish rebels were beaten; the independence of France and of the Dutch was secure; the

unity of England was assured.

By act of Parliament (1544) and his own testament, Henry VIII left the crown to his three children in turn-Edward VI, Mary I, and Elizabeth I-and provided that, in the event that they died without issue, the crown would pass to the descendants of his younger sister, Mary, before those of his elder sister, Margaret. During her reign, Elizabeth refused to choose between Edward Seymour, Lord Beauchamp (descendant of Mary) and King

James VI of Scotland (descendant of Margaret)—the former being the heir under Henry VIII's will and act of succession and the latter being the heir by strict hereditary succession. On her deathbed, however, she selected the king of Scotland—who became James I of Great Britain, first of the English House of Stuart

Tudor, Antony, original name WILLIAM COOK (b. April 4, 1908, London—d. April 20, 1987, New York City), British-born American dancer, teacher, and choreographer who developed the so-called psychological ballet.

He began his dance studies at 19 years of age with Marie Rambert and for her company choreographed his first ballet, Cross-Gartered (1931), based on an incident in Shakespeare's Twelfth Night. In 1938 he founded his own company, the London Ballet, but left the following year to join the newly formed Ballet Theatre (later the American Ballet Theatre) in the United States as dancer and choreographer for 10 years. In 1950 he became associated with the ballet and ballet school of the Metropolitan Opera, and in 1952 he became a faculty member of the dance department of the Juilliard School of Music. He served as an artistic director for the Royal Swedish Ballet in 1963 and 1964.

Antony Tudor as the Friend in *Pillar of Fire*, 1943

Tudor's choreography ranges from the tragic Dark Elegies (1937) to the comic Gala Performance (1938). His reputation, however, rests chiefly on his dramatic psychological ballets, the majority of which were composed in the United States. Jardin aux Lilas (created for England's Ballet Rambert in 1936; later retitled The Lilac Garden), Pillar of Fire (1942), Romeo and Juliet (1943), Undertow (1942), Nimbus (1950), Knight Errant (1968), The Leaves Are Fading (1975), and Tiller in the Fields (1978) explored such themes as grief, jealousy, rejection, and frustration. Although limiting himself to classical techniques, he sought to convey states of emotional conflict and aspects of character and motivation by such means as the elimination of purely decorative choreography, a subtle and painstaking use of gesture, and the symbolic as well as narrative use of the corps de ballet. Tudor danced in several of his own ballets, especially those choreographed in England. Many artists rose to prominence in his works, most notably the ballerina Nora Kaye in his first American-made ballet, Pillar of Fire, and the dramatic danseur Hugh Laing. In 1974 Tudor was appointed associate director of the American Ballet Theatre and in 1977 was joined in that position by Kaye.

Tudor, Henry: see Henry VII under Henry (England).

Tudor, Jasper: see Bedford, Jasper Tudor, duke of.

Tudor, Margaret (queen of Scotland): see Margaret Tudor.

Tudor, Mary: see Mary I under Mary (England and Great Britain).

Tudor style, type of British architecture, mainly domestic, that grafted Renaissance decorative elements onto the Perpendicular Gothic style between 1485 and 1558. The Tudor style in architecture coincides with the first part of the reign of the Tudor monarchs, which commenced in 1485 with the accession of Henry VII to the throne and ended with the death of Elizabeth I in 1603. Elizabeth's own reign, from 1558 to 1603, is sufficiently distinctive to be considered a separate period in the history of English building types.

The characteristic exterior features of the Tudor style as used in secular architecture are: a lavish use of half-timber work; large groups of rectangular windows; rich oriel, or bay, windows; complex roofs with many gables; interesting and sometimes fantastic chimney treatments; and much brickwork, frequently in patterns. The interiors of secular buildings featured richly wood-paneled walls and the lavish use of molded plasterwork to decorate ceilings, cornices, and walls, frequently in a naive imitation of Renaissance ornamental motifs

Tuesday, third day of the week (q.v.).

tufa cave, umbrella-like canopy formed as a calcium-carbonate-saturated stream plunges over a cliff. As the water is aerated, carbon dioxide is released, causing the calcium carbonate to be deposited. Tufa caves may completely bridge a river, forming a natural tunnel. One of the largest such caves is Tonto Natural Bridge near Payson, Ariz.

tuff, a relatively soft, porous rock that is usually formed by the compaction and cementation of volcanic ash or dust. (The Italian term tufa is sometimes restricted to the soft, porous, sedimentary rock formed by the chemical deposition of calcite, or calcium carbonate, or silica from water as sinter.) Tuffs may be grouped as vitric, crystal, or lithic when they are composed principally of glass, crystal chips, or the debris of pre-existing rocks, respectively. Some of the world's largest deposits of vitric tuff are produced by eruptions through a large number of narrow fissures rather than from volcanic cones.

In extensive deposits, tuff may vary greatly not only in texture but also in chemical and mineralogical composition. There has probably been no geological period entirely free from volcanic eruptions; tuffs therefore range in age from Precambrian to Recent. Most of the older ones have lost all original textures and are thoroughly recrystallized; many old basaltic tuffs are represented by green chlorite and hornblende schists and many rhyolitic tuffs by sericite schists.

In some eruptions, foaming magma wells to the surface as an emulsion of hot gases and incandescent particles; the shredded pumaceous material spreads swiftly, even over gentle gradients, as a glowing avalanche (nuée ardente) that may move many kilometres at speeds greater than 160 km (100 miles) per hour. After coming to rest, the ejecta (erupted matter) may be firmly compacted by adhesion of the hot glass fragments to form streaky, welded tuffs (ignimbrites) such as those covering vast areas in New Zealand, Guatemala, Peru, and Yellowstone National Park in the United States. When explosions occur underground, the fragmental material may be forced violently into the surrounding rocks, forming intrusive tuffs (peperites).

tuftybell, any of about 150 species of annual and perennial herbs of the genus Wahlenber-

gia, of the bellflower family (Campanulaceae), mostly native to south temperate regions of the Old World. Ten species of the genus Edraianthus often are included in Wahlenbergia.

Ivy-leaved beliflower (Wahlenbergia hederacea)

The ivy-leaved bellflower (*W. hederacea*), a European annual, has delicate, hairless, creeping stems and small, pale-blue, veined, bell-shaped flowers. *W. marginata*, a hairy, erect perennial from East Asia, now is naturalized in southern North America; it is about 45 cm (18 inches) tall, with blue or white, upward facing flowers.

tug-of-war, athletic contest between two teams at opposite ends of a rope, each team trying to drag the other across a centre line. In some forms of the game, a tape or handkerchief is tied around the center of the rope, and two others are tied six feet on either side. Three corresponding lines are marked on the ground. The game ends when one team pulls the other so that the tape on the losers' side crosses the ground mark on the winners' side. The contest is decided by the best two out of three pulls. A rural pastime in England and Scotland, the tug-of-war was an Olympic event from 1900 to 1920, with five men to a side. It has often been an outdoor contest at Scottish highland games and at other large social gatherings in the 20th century.

Tugaloo River, river formed southeast of Tallulah Falls, Ga., U.S., at the confluence of the Chattooga and Tallulah rivers (which are there dammed to form Tugaloo and Yonah lakes). The river then flows southeast, serving as a portion of the Georgia–South Carolina state boundary. After a course of 45 miles (72 km), the Tugaloo joins the Seneca River to form the Savannah River, which in its upper course is called the Keowee. The name Tugaloo probably derives from an early Cherokee settlement called Dugiluyi, referring to the forks of a stream.

tugboat, small, powerful watercraft designed to perform a variety of functions, especially to

Tugboat J.R. Burns

tow or push barges and large ships. In 1736 Jonathan Hulls of Gloucestershire, Eng., patented a boat to be powered by a Newcomen steam engine to move large vessels in and out of harbours. The first tugboat actually built was the *Charlotte Dundas*, powered by a Watt engine and paddle wheel and used on the Forth and Clyde Canal in Scotland. Screw propulsion for tugboats was introduced in the United States about 1850, the diesel engine about 50 years later. Tugs are still indispensable in berthing large ships. Oceangoing tugs are used for salvage missions.

Tugela River, principal river of Natal, South Africa. It rises as a stream on the 10,000-foot-(3,050-metre-) high Mont aux Sources plateau near the merger point of the Lesotho-Orange Free State borders. Its upper course, which lies within Royal Natal National Park, flows

Tugela River in the highlands of the Drakensburg (Royal Natal National Park), South Africa

Gerald Cubitt

through the Drakensberg range before hurtling down in a series of waterfalls having a total drop of 3,110 feet (948 m). The river then cuts through Tugela Gorge at the foot of the escarpment (about 5,000 feet [1,500 m] above sea level), is quickly joined by many tributaries, passes through the Ladysmith Basin and, below Colenso, becomes narrow and deep. At Jameson's Drift it enters the wide, open Tugela Trough, at the eastern end of which it cuts deeply through a great block of sandstone to issue onto the coastal plain.

The Tugela ends its course of 312 miles (502 km) at the Indian Ocean, about 52 miles (84 km) north of Durban, its mouth almost completely blocked in times of normal flow by a sandbar. The river is navigable only in the lagoon formed behind the sandbar. Its narrow valley and scanty alluvial deposits restrict irrigation. The Spioenkop Dam (1973), west of Colenso and southwest of Ladysmith, regulates flow. Further upstream, water from the Tugela headwaters is diverted across the Drakensberg into the more highly developed Vaal basin.

Historically, the Tugela (in Zulu, Thukela, meaning "Something that Startles") marked the southern boundary of Zululand. Its middle course lies within the black homeland of KwaZulu today. The total drainage basin of more than 11,000 square miles (more than 28,000 square km) includes most of western Natal. The major tributary is the Buffalo.

Tughril Beg: see Toghril Beg.

Tugwell, Rexford Guy (b. July 10, 1891, Sinclairville, N.Y., U.S.—d. July 21, 1979, Santa Barbara, Calif.), American economist and one of the three members of President Franklin D. Roosevelt's so-called Brain Trust. Tugwell, the son of a small-town business-

man and banker, attended the University of Pennsylvania's Wharton School of Finance and Commerce, earning his bachelor's, master's, and doctoral degrees (1915, 1916, 1922). A liberal economist who believed in economic planning, he joined the faculty of Columbia University, New York City, in 1920.

In 1932 Raymond Moley persuaded him and Adolph A. Berle, Jr., to join together in advising Roosevelt during the 1932 presidential contest. After Roosevelt's victory, Tugwell joined the administration as assistant secretary of agriculture (later becoming under secretary). While he was instrumental in formulating farm policy—especially the planning of agricultural output and the initiation of payments to farmers for not growing certain crops—his influence extended into nearly every aspect of New Deal economic reform.

In 1936 he left the Roosevelt administration for private business and in 1938 became chairman of the New York City Planning Commission, but in 1941 he accepted appointment as chancellor of the University of Puerto Rico. Later that year he became governor of the island, where for the next five years he tried to better economic and social conditions—a goal that led to conflict with wealthy sugar planters. From his experiences in Puerto Rico, he wrote *The Stricken Land* (1946).

From 1946 to 1952, Tugwell directed the Institute of Planning at the University of Chicago, where he also served as a professor of political science (1946–57). After several visiting professorships, he eventually settled in Santa Barbara, Calif., where he held the post of senior fellow at the Center for the Study of Democratic Institutions. It was there that he spent his remaining years working on a model for a new Constitution of the United States. In 1968 Tugwell won the Bancroft prize in history for his book *The Brains Trust*.

tui, Pinyin DUI, type of Chinese bronze vessel produced during the late Chou dynasty (c. 600–221 Bc). It is a food container consisting of two bowls—each supported on three legs—that, when placed together, form a sphere.

Bronze tul, originally with inlay, Eastern Choudynasty (770-221 ec); in the Fogg Art Museum, Cambridge, Mass.

By courtesy of the Fogg Art Museum, Harvard University, Grenville L. Winthrop Bequest

There are usually two loop handles on either side of the rim of each bowl. The decoration of the *tui* is characteristic of the late Chou period, when rich, dense patterns, often enhanced with inlays, were common.

Tuileries Palace, French Palais des Tuileries, French royal residence adjacent to the Louvre in Paris before it was destroyed by arson in 1871. Construction of the original palace—commissioned by Catherine de' Medici—was begun in 1564, and in the subsequent 200 years there were many additions and alterations. Among the French architects who worked on the building in the 16th century were Philibert Delorme, who designed the first plans; Jean Bullant; and Jacques du Cerceau. Louis Le Vau, in the 17th century, also contributed to the structure.

Tuira River, Spanish Río TUYRA, stream in eastern Panama, 106 miles (170 km) long. It rises in the Darién highlands (Serranía del Darién) and flows south-southeast past El Real, where it receives the Chucunaque River, and then north to Puerto Darién on the Gulf of San Miguel (Pacific Ocean). It is navigable for about 75 miles (120 km) above its mouth. The basin, which consists of a tropical rain forest with more than 80 inches (2,000 mm) annual rainfall and no appreciable dry season, is the home of the Chocó Indians.

Tukārām (b. 1608, Dehu, near Pune, India—d. 1649), Marathi poet who is often considered to be the greatest writer in the language. His *abhangas*, or "unbroken" hymns, are among the most famous Indian poems.

The son of a shopkeeper, Tukārām was orphaned in childhood. Failing in business and family life, he renounced the world and became an itinerant ascetic. It is believed that he threw himself into a river and drowned.

Tukaroi, Battle of (March 3, 1575), conflict between the forces of the Indian Mughal emperor Akbar under Mun'im Khān and Dā'ūd Khān, the Afghan sultan of Bengal. The battle took place at a village between Midnapore and Jalesar in western Bengal.

The confrontation was decisive in scattering the Bengali army. The conquest of Bengal was completed by the Mughals in 1576, ending Bengali independence from Delhi, which had been maintained since about 1338–39.

Tukhachevsky, Mikhayl Nikolayevich (b. Feb. 16 [Feb. 4, Old Style], 1893, near Slednevo, Russia—d. June 11, 1937), Soviet military chief responsible for modernization of the Red Army prior to World War II.

Tukhachevsky was born to a noble family and graduated from the Alekzanderskoe Military Academy in 1914. He fought in World War I in the Imperial Army and was captured in 1915 but escaped. From 1918 he served as an officer in the Red Army—leading the defense of the Moscow district (1918), commanding forces on the Eastern Front (1918), commanding the 5th Army in the recapture of Siberia from Admiral A.V. Kolchak, and heading Cossack forces against General A.I. Denikin (1920). He also took part in the Russian war with Poland (1920–21) and in the suppression of the Kronshtadt Rebellion (1921).

After the end of the Civil War, Tukhachevsky played a leading role in military reforms and from 1931 directed the rearmament of the Soviet Union. He was responsible for extensive organizational streamlining and technological modernization of the Red Army and for the establishment of a series of modern military schools. He also wrote numerous books and articles on strategic considerations in modern warfare. He served as chief of staff (1925–28) and deputy commissar for defense (after 1931) and received the Order of Lenin for his contributions. In 1935 he was made a marshal of the Soviet Union.

Tukhachevsky was tried together with seven other top Red Army commanders in June 1937, in conjunction with the Stalinist purges, on charges of conspiracy with Germany. All eight were convicted and executed. The purge of the officer corps followed. In 1988 he was cleared judicially and rehabilitated by official decree.

Tuktoyaktuk, formerly (until 1950) PORT BRABANT, hamlet, in the northwestern sector of the Northwest Territories, Can., on the Beaufort Sea. It lies 20 miles (32 km) east of the Mackenzie River delta and 100 miles (160 km) northeast of Inuvik. Tuktoyaktuk (Inuit for "reindeer that looks like caribou") was established in 1936 as a Hudson's Bay Company trading post and transport depot. Its economic base is trapping, whaling, sealing, reindeer herding,

and handicrafts (especially bone and antler carving). It is also a centre for offshore oil exploration and during summer months is a busy transshipment point where cargoes are transferred from riverboats (that navigate the Mackenzie) to seagoing vessels. Pop. (1981) 772

Tukulor, also spelled TUKOLOR, OR TOUCOU-LEUR, a Muslim people, mainly of Senegal. Their origins are complex: they seem basically akin to the Serer and Wolof, and contacts with the Fulani have greatly influenced their development. They speak the Fulani language, called Fulfulde, which belongs to the West Atlantic branch of the Niger-Congo family.

From the 10th to the 18th century the Tukulor were organized in the kingdom of Tekrur, which, until the emergence of a Tukulor Empire (q, v.) in the 18th century, was ruled by a succession of non-Tukulor groups. In the mid-19th century, many Tukulor supported a religious war against other tribes in the area and, unsuccessfully, against the French. Defeated, many fled to present-day Mali, where many continue to live.

The Tukulor embraced Islam in the 11th century and take great pride in their strong Islāmic tradition. Social structure is highly stratified and is based primarily on male lineage (patrilineage) groups, which are usually scattered among several villages. The typical household comprises a segment of a patrilineage (usually a father, his sons, and grandchildren), their wives, children, and sometimes more distant kin. The Tukulor are polygynous, although only some 20 percent of males have more than one wife. A bride-price, often substantial if the bride enjoys high social status, is required. High status attaches to membership in a noble lineage or a prosperous family; low status is associated with membership in certain artisan castes or with slave ancestry. Leadership in Muslim religious brotherhoods has in recent times assumed importance in status rankings.

The Tukulor economy rests equally on stock raising, fishing, and cultivating field crops. A corollary of the hierarchical social structure is a marked inequality in the distribution of land; and this, together with a steadily rising population, has resulted in the emigration of considerable numbers of youth to the cities.

Tukulor Empire, Tukulor also spelled TOKOLOR, or TOUCOULEUR, Muslim theocracy that flourished in the 19th century in the Western Sudan from Senegal to Timbuktu (Tombouctou)

The founder of the empire, al-Haji 'Umar (c. 1795-1864), was a Tukulor cleric of the austere Tijānīyah brotherhood, who, though born in Futa Toro, spent most of his early life elsewhere-notably at Sokoto and at Kanem. Returning to Futa Toro (c. 1838), he removed with his followers 10 years later to Dinguiray, on the borders of Fouta Djallon, to make preparations for the founding of a new state that would conform to the stringent moral requirements of his order. He thus set about training an elite corps in which religious, military, and commercial considerations were combined. Equipped with European firearms, by c. 1850 this force was ready to embark on a jihād, or holy war, against his neighbours. It first came into conflict with the Bambara chiefdoms to the north, then two years later moved northward again across the Upper Sénégal River to conquer the Bambara kingdom of Kaarta. Checked by the French in their westward return down the Sénégal River, the Tukulors quickly overran the Bambara kingdom of Segu (1861) and thereafter conquered Macina. They then extended their dominion to as far north as Timbuktu.

This empire, though almost as large as that of the Sokoto Fulani to the east, was by no means so soundly based. Whatever 'Umar's original motives may have been, his followers seem to have been as much concerned with

amassing riches and power as with converting their subjects to Islām. Numerous risings against Tukulor authority by the conquered Bambara and Fulani continually shook the empire, and in 1864 'Umar himself was killed. His son and successor, Ahmadu Seku, inherited a patrimony disturbed by inner conflicts and rival claims to power. For the sake of internal order, in the 1880s he began to disband his army and put increasing reliance on the loyalty of subject peoples. The policy failed; not only did Ahmadu fail to win new loyalties, but he lost the adherence of the Tukulors themselves as they saw their privileged position erode. The French exploited the situation by constructing forts within Tukulor territory and signing treaties of friendship with Tukulor's neighbours. After 1890, French troops swept the empire, conquering Segu, Macina, and Timbuktu in turn. Ahmadu succumbed in 1893 but lived another five years, long enough to see his former empire firmly incorporated into French overseas territory

Tukulti-apil-esharra (name of Assyrian kings): *see under* Tiglath-pileser.

Tukulti-Ninurta I (reigned c. 1244-c. 1208 BC), king of Assyria who asserted Assyrian

Tukulti-Ninurta I approaching and kneeling before an altar bearing the emblem of the fire god Nasku, relief sculpture from Ashur; in the Staatliche Museen zu Berlin, Germany Bildarchiv Foto Marburg—Art Resource/EB Inc.

supremacy over King Kashtiliash IV, ruler of the Kassites to the southeast (about the Persian Gulf), and subjugated ancient Armenia to the northeast and, for a time, Babylonia.

A promoter of cultic ritual, Tukulti-Ninurta erected a noted ziggurat temple to the goddess Ishtar-Dinitu (Ishtar of the Dawn) that served as a model for Assyrian architecture. He ex-

tended Ashur's fortifications, but, after constructing a new capital, Kar-Tukulti-Ninurta, facing Ashur across the Tigris River, he was slain by his son.

Tukulti-Ninurta Epic, the only extant Assyrian epic tale; it relates the wars between Tukulti-Ninurta I of Assyria (reigned c. 1244–c. 1208 BC) and Kashtiliash IV of Babylonia (reigned c. 1242–c. 1235 BC). Written from the Assyrian point of view, the epic gives a strongly biassed, though poetic, narrative. It is a late example of the primary epic style that was used especially during the late 3rd and early 2nd millennia BC.

Tula, also called TOLLAN, ancient capital of the Toltecs in Mexico; it was primarily important from about AD 900 to about 1200. Although its exact location is not certain, an archaeological site near the contemporary town of Tula in Hidalgo state has been the persistent choice of historians. Some scholars, however, are reluctant to accept this identification, preferring the site of Teotihuacán near Mexico City.

The archaeological remains near contemporary Tula are concentrated in two clusters at opposite ends of a low ridge. Recent surveys indicate that the original urban area covered at least three square miles and that the town probably had a population in the tens of thousands.

The major civic centre consists of a large plaza bordered on one side by a five-stepped temple pyramid, which was probably dedicated to the god Quetzalcóatl. Other structures include a palace complex, two other temple pyramids, and two ball courts. In the centre of the plaza is a platform altar. Another large civic centre stands at the opposite end of the ridge.

The main temple pyramid and its associated structures epitomize the stylistic characteristics of Tula architecture. Though small, the pyramid was highly decorated. The sides of the five terraces were covered with painted and sculptured friezes of marching felines and canines, of birds of prey devouring human hearts, and of human faces extending from the gaping jaws of serpents. A stairway on the southern side led to a highly ornamented, two-room temple at the summit. The front room was supported by four columns in the form of erect, stiffly posed warriors, each 15

Columns that once supported the front room of the main temple at Tula, Mex.

Ursula Bernath-EB Inc

feet (4.58 metres) high and adorned with a series of highly specific body ornaments and accoutrements representative of the Tula style. Attached to the southern base of the pyramid was another feature of Tula architecturegreat colonnaded masonry hallways with flat roofs supported on scores of masonry columns. Separated from the main temple pyramid by a narrow alley are the partial remains of what may have been the palace of the ruler of Tula. The excavated portions consist of three great halls. Each apparently had a low bench placed along the interior walls (with projecting thrones at the midpoints), a central sunken light well, and great numbers of columns for support of the flat wood and masonry roof.

In general, the art and architecture of Tula show a striking similarity to that of Tenochtitlán, the Aztec capital, and the artistic themes indicate a close approximation in religious ideology and behaviour. In fact, many scholars believe that the Aztecs' concept of themselves as warrior-priests of the sun god was directly borrowed from the people of Tula.

Tula, oblast (administrative region), western Russian Soviet Federated Socialist Republic, with an area of 9,925 sq mi (25,700 sq km) in the Central Russian Upland. The rolling hills, much dissected by river valleys and erosion gullies, are covered by both fertile and poor soils, but the natural vegetation of mixed forest or forest-steppe has largely been cleared for agriculture since the intensive settlement of the area in the 16th century. The climate is continental, with precipitation declining from 23 in. (575 mm) in the northwest to 18.5 in. (470 mm) in the southeast. The highly developed farming includes grain cultivation (wheat and rye), dairying, livestock raising, market gardening, and sugar beet and potato growing. Since the 17th century, the area has been noted for its metallurgical industry, which has been joined in the 20th century by engineering and chemicals. Much lignite (brown coal) has been mined there. Pop. (1983 est.) 1,878,000.

Tula, city and administrative centre of Tula oblast (region), western Russian Soviet Federated Socialist Republic, on the Upa River, a tributary of the Oka. First mentioned in 1146 as Taydula, Tula became the principal stronghold on the southern approaches to Moscow in the 16th century and the centre of a series of defensive lines against Tatar attack. A stone citadel of 1530, restored in 1784 and 1824, survives. In 1552 the city successfully resisted a siege by the Tatars. During the 17th century, Tula developed into the major ironworking city of Russia. It was the site of Russia's first armament factory, built in 1712 by Peter I the Great, and remains a large armament producer. Besides iron and steel, modern Tula has a range of engineering industries. Much lignite (brown coal) is mined locally and used in the chemical industry. Samovars are a traditional manufacture. The city has mechanical, mining, and teacher-training institutes and one devoted to coal-mining research. A museum founded in 1724 displays a history of weapons. Yasnaya Polyana, the home of the writer Leo Tolstoy, is located 9 mi (14 km) southwest of Tula. Pop. (1983 est.) 527,000.

Tulagi, also spelled TULAGHI, town and island in the Solomon Islands, southwestern Pacific Ocean, north of Guadalcanal. The island has a circumference of 3 mi (5 km). The town of Tulagi was the administrative seat (from

1893) of the British Solomon Islands Protectorate until it was destroyed by the Japanese (1942), after which the capital was moved to Honiara, a new town built on Guadalcanal. The narrow strait between Tulagi and Florida Island forms a good harbour. Pop. (1981) town, 916; island, 1,353.

Tulancingo, city, southeastern Hidalgo state, north central Mexico, on the Río Grande de Tulancingo, at 7,290 ft (2,222 m) above sea level. It was taken from the Toltec Indians by the Spaniards in the 1520s. The city, which contains several colonial churches, became seat of a bishopric in 1862. It is an agricultural (barley and alfalfa) and industrial centre, and has several woollen mills. Lying east of Pachuca, the state capital, it can be reached by railroad and by air as well as by road. Pop. (1970) 35,799.

tularemia, acute infectious disease resembling plague, but much less severe. Described in 1911 among ground squirrels in Tulare County, Calif., from which the name is derived, tularemia was first reported in humans in the United States in 1914. The causative agent, isolated in 1912, is the very small bacterium Yersinia tularensis. The disease is primarily one of wild animals; human infections are only incidental. It occurs naturally in at least 48 species of birds and mammals. In the United States the rabbit, especially the cottontail, Sylvilagus, is the most important source of human infection (90 percent of cases). Human cases in Sweden and Norway have been transmitted by hares; in the Soviet Union, by water rats. Waterborne epidemics of the disease in man have occurred in the Soviet Union and Turkey. The disease is acquired by humans from the animal reservoir of infection, either directly by handling the carcasses of infected rabbits or indirectly through an insect carrier, the most common of which is a deerfly, Chrysops discalis; the human disease is also known as deerfly fever. Various ticks of the genera Dermacentor, Haemaphysalis, Rhipicephalus, Amblyomma, and Ixodes may be largely responsible for maintenance of the animal infection. In addition, the infection is transmitted from the adult tick to the egg, and both larvae and nymphs are infectious and form an insect reservoir of infection.

The disease in humans occurs in two forms: the more common glandular, or ulceroglandular, form and the less common typhoidal form. Local lesions occur in the first, usually beginning with a papule at the site of initial infection (commonly a finger) that breaks down to form an ulcer. The infection then spreads to the lymph glands in the armpits, which become painful and swollen and may break down and discharge purulent material. Infection of the eye is also common, with swelling of related lymph glands. The general symptoms common to both forms of the disease are headache, bodily aches, and fever. The disease persists for two to four weeks. The fatality rate is less than 5 percent. About 150 cases are reported each year in the United States, and the disease has been encountered in virtually all parts of the country. Preventive immunization is relatively ineffective. The tetracyclines are reasonably effective in treating the disease; streptomycin is the most effective antibiotic, but the bacterium rapidly becomes resistant to it, often within the first two or three days of treatment.

Tulcán, capital of Carchi province, far northern highland Ecuador, just south of the Río Carchi near the Colombian border. It is on the former site of the Cara Indian settlement Tulcanque (Valiant Warrior). The Spanish colonists established the European settlement in the mid-18th century. When Ecuador seeded from Gran Colombia in 1830, the boundary between Ecuador and Colombia was

fixed along the Río Carchi, thus politically dividing a natural economic area—the basin of Tulcán.

In the vicinity are the natural bridge of Rumichaca over the Río Carchi, location of a frontier post between Colombia and Ecuador, and, a few miles northeast in Colombia, the shrine of Nuestra Señora de Las Lajas (Our Lady of the Flagstones), visited by many pilgrims from both countries.

Tulcán is in the centre of a rich agricultural region, processing cereals, sugarcane, and coffee, and is known for its dairy products. Taning and the manufacture of woollen textiles (rugs and ponchos) are leading activities. Tulcán was severely damaged by an earthquake in 1923 and has since been rebuilt. It is the seat of a Roman Catholic diocese. The Pan-American Highway passes through the city. Pop. (1983 est.) 33,635.

Tulcea, judet (district), southeastern Romania, occupying an area of 3,254 sq mi (8,430 sq km), bounded on the north by the Soviet Union. The eastward-draining Danube River forms the district's northern border. Near Tulcea, the Danube branches into the Sulina and Sfintu Gheorghe tributaries, which empty into the Black Sea. The Sulina is navigable by seagoing vessels. An area of scientific investigation, the Danube Delta in Tulcea district has water lilies, among other flora, and fauna including pelicans and minks. The Măcin Massif, the oldest mountain range in Romania, dating from the Paleozoic Era, rises in the western portion of the district, and Lake Razim lies in the southeast. Tulcea (q.v.) city is the district capital. Industrial activities in Tulcea and other towns in the district consist mostly of fish canning and barite and granite mining. Reeds are harvested from the Danube Delta for use in the manufacture of cellulose and paper, and vineyards are cultivated in the northwest. Gorgova, Mila, and Victoria are fishing villages. Chilia Veche was built on a Greek settlement dating from the 5th century BC, and the towns of Sulina and Mahmudia were former Roman settlements. A research station and museum, containing exhibits about the reed industry, are found in Maliuc. Highways and a railway connection extend through Tulcea. Pop. (1982 est.) 263,-

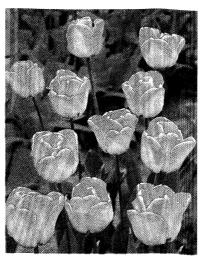

Tulcea, city, capital of Tulcea *judeţ* (district), southeastern Romania, situated on the St. George arm of the Danube River. Tulcea is an ancient city, founded in the 7th century Bc by Greeks from Miletus. The Romans called it Aegissus. It is an important inland port, accessible from the Black Sea via the main channels, and it is a centre for fishing and tourism along the smaller delta channels. Tulcea, with the largest fishing industry in Romania, refrigerates, cans, and packs fish for distribution throughout the country. Factories in the city process other foods and provide the fishing industry with tackle and small craft. Pop. (1982 est.) 72,657.

tule perch, the sole freshwater species of surfperch (q, v).

Tuléar (Madagascar): see Toliary.

tulip, any of the bulbous plants comprising the genus *Tulipa* of the family Liliaceae, consisting of about 100 species, native to the Old World but cultivated in many countries as garden flowers. Most have solitary bell-shaped flowers and thick, bluish-green leaves that are clustered at the base of the plant. The fruit is a capsule with many seeds.

Thousands of colourful horticultural varieties have been developed, many of which can be propagated only by their scaly bulbs. Most older varieties have been obtained by crossing two species, *T. gesneriana* and *T. suaveolens*; newer varieties often have *T. greigi*, *T. kauf-*

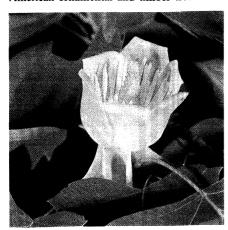

Tulip (Tulipa)

manniana, or T. fosteriana as one of the parents

Tulip Mania, also called TULIP CRAZE, Dutch TULPENWOEDE, a speculative frenzy in 17thcentury Holland over the sale of tulip bulbs. Tulips were introduced into Europe from Turkey shortly after 1550, and the delicately formed, vividly coloured flowers became a popular if costly item. The demand for differently coloured varieties of tulips soon exceeded the supply, and prices for individual bulbs of rare types began to rise to unwarranted heights in northern Europe. By about 1610 a single bulb of a new variety was acceptable as dowry for a bride, and a flourishing brewery in France was exchanged for one bulb of the variety Tulipe Brasserie. The craze reached its height in Holland during 1633-37. Before 1633 Holland's tulip trade had been restricted to professional growers and experts, but the steadily rising prices tempted many ordinary middle-class and poor families to speculate in the tulip market. Homes, estates, and industries were mortgaged so that bulbs could be bought for resale at higher prices. Sales and resales were made many times over without the bulbs ever leaving the ground, and rare varieties of bulbs sold for the equivalent of hundreds of dollars each. The crash came early in 1637, when doubts arose as to whether prices would continue to increase. Almost overnight the price structure for tulips collapsed, sweeping away fortunes and leaving behind financial ruin for many ordinary Dutch families.

tulip tree, also called YELLOW POPLAR, or WHITEWOOD (*Liriodendron tulipifera*), North American ornamental and timber tree of the

Tulip tree (Liriodendron tulipifera)
Karl Maslowski

magnolia family (Magnoliaceae), order Magnoliales, not related to the true poplars.

The tulip tree occurs in mixed hardwood stands in eastern North America. Taller than all other eastern broadleaved trees, it often has a diameter greater than 2 m (7 feet) and a height of 60 m (197 feet). Its longstemmed, bright-green leaves are bilaterally two- to four-lobed, with tips that are straight edged or broadly notched. They turn golden yellow in the fall and have large appendages (stipules) at the base of the leafstalks; the stipule scars encircle the twigs. The large, yellowish-green tulip-like flowers have six petals, orange at the base, and three bright-green sepals. Other characteristics include conelike clusters of terminally winged fruits; aromatic, purplish-brown twigs with winter buds resembling a duck's bill; and a straight trunk with an oblong crown. A tulip tree reaches its full stature in about 200 years.

The light-yellow to yellowish-green wood is used in the manufacture of furniture parts, plywood panels, paper, millwork, boxes, and crates. The tulip tree is relatively free of pests and diseases. It is a useful large shade tree where space is available for it.

Tull, Jethro (b. 1674, Basildon, Berkshire, Eng.—d. Feb. 21, 1741, Prosperous Farm, near Hungerford, Berkshire), agronomist, agriculturist, writer, and inventor whose advanced ideas helped form the basis of modern British agriculture.

Tull trained for the bar, to which he was called in 1699. But for the next 10 years he chose to operate his father's farm in Oxfordshire, on which in about 1701 he invented a horse-drawn seed drill that sowed the seeds in neat rows, saving seed as well as making it easier to keep the weeds down. This was a notable advance over the usual practice of

Jethro Tull, detail of an oil painting by an unknown artist; in the collection of the Royal Society for Agriculture, London

BBC Hulton Picture Library

scattering the seeds by hand. In 1709 Tull bought a farm of his own in Berkshire. While later traveling in France and Italy, he was impressed by the cultivation methods in use in the vineyards. His observations inspired him to loosen the soil around his crops (and thus increase the access of water to plant roots) by means of a horse-drawn hoe. This practice also reduced the amount of fertilizer needed by the soil. The success of the method led to the publication of his The New Horse Houghing Husbandry: Or an Essay on the Principles of Tillage and Vegetation (1731). Tull's methods were initially subjected to violent attack because of their novelty, but they were eventually adopted by the large landowners and laid the basis for more modern and efficient British farming.

Tullahoma, city, Coffee and Franklin counties, south-central Tennessee, U.S. It lies 60 miles (97 km) southeast of Nashville on the site of a Cherokee Indian village. It was settled by 1850 by pioneers from eastern Tennessee.

Originally an agricultural community, the

city developed in the late 19th century as a summer resort. Growth was stimulated during World War II with the establishment nearby of Camp Forrest Infantry Training Center, which later became the site of the Arnold Engineering Development Center (an aeronautical and testing installation) and the University of Tennessee Space Institute (1964). Motlow State Community College opened in 1967. The city's manufactures include aircraft components, shoes, wood products, and sports equipment (notably baseballs). Whiskey distilling and the cultivation of grain, cotton, and tobacco are important. Inc. 1903. Pop. (1984 est.) 16,535.

Tullamore, Irish Tulach Mhór ("Big Hill"), market town, urban district, and the seat of County Offaly, Ireland, situated on the River Tullamore. The High Cross is all that remains of Durrow Abbey, which once stood to the north of Tullamore. The Book of Durrow, an illuminated manuscript of the four Gospels in Irish script, was written there c. 700 and is now in Trinity College, Dublin. The neighbourhood contains Bronze Age and early Christian monuments. Local trade in farm produce is augmented by food-processing industries and by brewing. Pop. (1981) 7,901.

Tulle, town, capital of Corrèze département, Limousin region, central France. It is situated on the western edge of the upland block known as the Massif Central. The town is strung out along the deep, narrow Corrèze Valley, and its streets climb steep hill slopes. Only the 12th-century nave and the belfry remain of its ancient cathedral of Saint-Martin, part of which collapsed in 1796. The town is the site of a national firearms factory. Its name was given to what was once an important regional industry, the making of tulle, a fine silk net. Pop. (1982) 18,033.

Tullius, Servius: see Servius Tullius.

Tullus Hostilius, traditionally, the third king of Rome, reigning from 673 to 642 BC. He was a legendary figure, the legend probably influenced by that of Romulus. Both Tullus and Romulus supposedly carried on war with the neighbouring cities of Fidenae and Veii, doubled the number of Roman citizens, organized the army, and disappeared from Earth in a storm. Such legends are accepted as fact by the historians Livy (59 BC-AD 17) and Dionysius of Halicarnassus (flourished late 1st century BC). It is possible that Alba Longa, about 12 miles (19 km) southeast of Rome, was destroyed during the years in which Tullus is thought to have reigned. His reported policy of incorporating Alba into the Roman state and enrolling its chiefs in the Senate is entirely in accord with the historical fact of Rome's early expansion by amalgamation rather than by subjugation. The founding by Tullus of the Curia Hostilia, an early meeting place of the Roman Senate, may also be regarded as authentic.

Tully: see Cicero, Marcus Tullius.

Tulsa, city, Osage and Tulsa counties, seat (1907) of Tulsa County, northeastern Oklahoma, U.S., situated on the Arkansas River. It originated in 1836 as a settlement of Creek Indian immigrants who named it for their former town in Alabama. White settlement began after the arrival in 1882 of the St. Louis-San Francisco Railway; the city was incorporated in 1898. The discovery of oil in nearby Red Fork (1901) and Glenn Pool (1905) launched the mid-continent oil and gas boom, and phenomenal growth followed. More than 800 major oil companies now have plants and offices in the city, which is the site of the International Petroleum Exposition. The main economic activity is based on

petroleum—exploration, drilling, production, refining, and research. The aviation—aerospace industry also is important to Tulsa's economy, which includes a wide range of manufacturing and wholesale distribution activities. The city serves as the commercial and financial centre of a rich agricultural area and the national headquarters of the U.S. Jaycees.

The municipally owned Spavinaw Water System brings clear water from the Ozark foothills, 70 mi (110 km) away. Surrounded by man-made lakes and reservoirs, Tulsa, with the nearby port of Catoosa on the Verdigris River, is head of navigation for the Arkansas-Mississippi Waterway, with access to the Great Lakes and the Gulf of Mexico and with barge transportation complementing airlines, railroads, and trucklines. Institutions include the Thomas Gilcrease Institute of American History and Art (1949), the University of

The Prayer Tower, Oral Roberts University, Tulsa, Okla.

Tulsa (1894), and Oral Roberts University (1963). Pop. (1980) city, 360,919; (1982 est.) metropolitan area (SMSA), 700,900.

Tulsī Rām (Hindu religious leader): *see* Siva Dayāl Sāheb.

Tulsīdās (b. 1543?, probably Rājāpur, India—d. 1623, Vārānasi), Indian sacred poet whose principal work, the *Rāmcaritmānas* ("Sacred Lake of the Acts of Rāma"), is the greatest achievement of medieval Hindi literature and has exercised an abiding influence on the Hindu culture of northern India.

The Rāmcaritmānas expresses par excellence the religious sentiment of bhakti ("loving devotion") to the Vaiṣṇava avatar, Rāma, who is regarded as the chief means of salvation. Although Tulsīdās was above all a devotee of Rāma, he remained a smārta Vaisnava (a follower of the more generally accepted traditions and customs of Hinduism rather than a strict sectarian), and his poem gives some expression both to orthodox monistic advaita doctrine and the polytheistic mythology of Hinduismthough these are everywhere subordinated to his expression of bhakti for Rāma. His eclectic approach to doctrinal questions meant that he was able to rally wide support for the worship of Rāma in northern India, and the success of the Rāmcaritmānas has been a prime factor in the replacement of the Krishna (Krsna) cult by the cult of Rāma as the dominant religious influence in that area.

Little is known about Tulsīdās' life. He was

Tulsidās, detail of an oil painting by an unknown artist, early 17th century By courtesy of Acharya Vishwanath Prasad Mishra, Professor Navin Chair, Vikram University, Ujjain, M.P., India

probably born at Rājāpur and lived most of his adult life at Vārānasi. The Rāmcaritmānas was written between 1574 and 1576 or 1577. A number of early manuscripts are extant—some fragmentary—and one is said to be an autograph. The oldest complete manuscript is dated 1647. The poem, written in Awadhi, an Eastern Hindi dialect, consists of seven cantos of unequal lengths. Although the ultimate source of the central narrative is the Sanskrit epic Rāmāyaṇa, Tulsīdās' principal immediate source was the Adhyātma Rāmāyaṇa, a late medieval recasting of the epic that had already sought to harmonize the advaita system and the Rāma cult. The influence of the Bhāgavata-Purāṇa, the chief scripture of the Krishna cult, is also discernible, with that of a number of minor sources.

Eleven other works are attributed with some certainty to Tulsīdās. These include *Kṛṣṇa gītāvalī*, a series of 61 songs in honour of Krishna; *Vinay pattrikā*, a series of 279 verse passages addressed to Hindu sacred places and deities (chiefly Rāma and Sītā); and *Kavitāvalī*, telling incidents from the story of Rāma. A prose translation of the *Rāmcaritmānas*, with a useful introduction, is W.D.P. Hill's *The Holy Lake of the Acts of Rama* (1952).

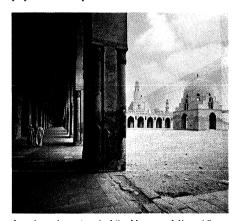

Tulu language, also spelled TULU, language of the Dravidian family, spoken in the southern part of Karnātaka (formerly Mysore) state, India. Although Tulu has borrowed many words from Kannada (q.v.), the official language of Karnātaka, they are not closely related. Tulu has no written tradition and no literature.

Tuluá, city, Valle del Cauca department, western Colombia. The site, originally settled by the Putimáes Indians, was called Villa de Jerez by early explorers. The Indians resisted all Spanish attempts at conquest from that of Bartolomé Giraldo Gil de Estupiñán in 1556 until subdued by Juan de Lemos y Aguirre in 1636. The latter established a large cattle ranch called Tuluá, from which he administered the outlying regions. After constant petitioning, in 1814 Tuluá won municipal status, discarding its former designation as an Indian village, although it retained its Indian name. Its economy has remained basically agricultural; beef, milk, yeast, and foodstuffs are produced. An annual fair is held to display prize cattle and industrial goods. It is located on the Pan-American Highway and the Puerto Berrío-Popayán railroad. Pop. (1973) city, 87,-952; mun., 115,319.

Tulun, city, Irkutsk *oblast* (administrative region), east central Russian Soviet Federated Socialist Republic, situated on the Iya River

and the Trans-Siberian Railroad. Incorporated first in 1922, it changed to a rural settlement in 1924 and was reincorporated in 1927. It is a centre for the Azey lignite (brown coal) field and of the wood and forest industry. Pop. (1983 est.) 53,000.

Tulunid DYNASTY, first local dynasty of Egypt and Syria to exist independently of the Abbāsid government in Baghdad, ruling 868-905. Its founder, Ahmad ibn Tulun, a Turk, arrived in Egypt in 868 as vice governor and promptly (868–872) established a military and financial foothold in the province by organizing an independent Egyptian army and securing the management of the Egyptian and Syrian treasuries. Insufficient payment of tribute brought caliphal troops against him in 877, but Ahmad maintained his position by occupying Syria (878). During his rule (868-884), the most significant in Tulunid history, the provinces developed agriculturally, commerce and industry were encouraged, and the artistic traditions of the 'Abbāsids of Baghdad and Sāmarrā' were introduced into western Islām. A public building program was initiated, in which al-Qatā'ī', the Tūlūnid capital, and the great Mosque of Ahmad ibn Tūlūn were constructed. The mosque, modelled after the Great Mosque of al-Mutawakkil in Sāmarrā'. is made of brick and plaster, materials rarely used previously in Egyptian architecture but popular in Iraq.

Arcade and courtyard of the Mosque of Aḥmad ibn Ṭūlūn, Cairo, completed 879, Ṭūlūnid period Bright—M. Grimoldi

The subsequent Ṭūlūnids, Khumārawayh (884–896), Jaysh (896), Hārūn (896–905), and Shaybān (905), were ineffectual rulers, totally reliant on a Turkish-black military caste. Under the administration of Khumārawayh, Aḥmad's son, the Syro-Egyptian state's financial and military stability was destroyed, and the state finally reverted to the 'Abbāsids in 905.

After the fall of the Tūlūnids, the arts in Egypt deteriorated and did not recover until the Fāṭimids took power. They were strongly influenced by the Tūlūnids and, by the 11th century, had made Egypt the cultural centre of western Islām.

Tum (Egyptian god): see Atum.

Tumaco, city, Nariño department, southwestern Colombia, situated on the Pacific coast, on a small island at the south end of Ensenada (bay) Tumaco. Named for an Indian chief, Tumas, who founded the settlement in 1570, Tumaco experienced prosperity as the point of export for rubber and cinchona bark gathered in the eastern rain forest. After the boom period, Tumaco declined until it became the terminus of a pipeline from the Putumayo oil fields about 100 mi (160 km) to the southeast. There is some light industry in the city, which is a centre of lumbering activity including plywood and molding factories, and gold mines are worked nearby. Tumaco is also a major fishing port with tuna and sardine canneries.

It is accessible by road from Pasto, in the Andes, and has an airport. Pop. (1973) 44,876.

Tumādir bint 'Amr ibn al-Ḥārith ibn ash-Sharīd: see Khansā', al-.

Tuman-gang (North Korea): see Tumen River.

Tumba, Lake, lake, part of the Congo River Basin, northwestern Zaire, 75 mi (120 km) northwest of Lake Mai-Ndombe (formerly Lake Léopold II). It covers 190 sq mi (500 sq km) and is 6-20 ft (2-6 m) deep. The lake empties into the Congo (Zaïre) River by Irebu channel, just opposite its confluence with the Ubangi River. Lake Tumba is shallow, with low shores, and is navigable by river steamer.

Tumbes, also spelled TUMBEZ, smallest and northernmost department (formed 1942) of Peru, bounded on the northwest by the Pacific Ocean and on the north and east by Ecuador. The department is located near the northern end of the Peruvian coastal desert and occupies an area of 1,827 sq mi (4,732 sq km). Tumbes has been an area of strategic military importance in the nearly 150-year-old (intermittent) boundary conflict between Peru and Ecuador. Crops grown in irrigated areas, especially around the departmental capital of Tumbes (q.v.), include corn (maize), rice, and bananas. Some cattle and goats are raised, and there is a small fishing industry. In 1864 oil was discovered at Zorritos; the field is still productive, although it is less important than its southern extension in Piura department. Pop. (1984 est.) 116,800.

Tumbes, also spelled TUMBEZ, city and capital, Tumbes province and department, northwestern Peru, located on the Pacific coastal plain and on high banks overlooking the Río Tumbes, 20 mi (30 km) from the Ecuadorian border.

In 1532 Francisco Pizarro landed at what is now Puerto Pizarro (the port for Tumbes, 12 mi north), to begin his conquest of Peru. The town, which originated as a minor Inca fortress on the road to Quito, Ecuador, did not flourish, however, until after the border conflicts with Ecuador (in this area alone) were resolved in 1942, which made trade with border towns profitable. It became a city in 1942

Irrigated fields around the city yield tobacco, cotton, rice, corn (maize), and bananas. Charcoal burning and rice milling are local activities, and fishing and tourism are additional sources of income. Tumbes has an airfield and is 828 mi (1,332 km) northwest of Lima via the Pan-American Highway. Pop. (1981) city, 47,939; (1981 prelim.) province, 79,520.

tumblebug: see dung beetle.

tumbling, execution of acrobatic movements such as rolls, twists, handsprings, or somersaults on floor mats or on the ground.

The activity goes back to ancient times as that part of acrobatics done without apparatus. Tumbling was performed by travelling bands of entertainers in the Middle Ages and later by circus and stage performers.

Once an international competitive sport, it has been superseded by gymnastics and has gravitated to high-school and age-group competition in the United States, Canada, and some European countries. U.S. competition is governed by the Amateur Athletic Union.

A modern competitive routine consists of three or four series, or "trips down the mat," one of which must demonstrate backward moves, another forward moves, and another twisting skills. The mats are arranged in rows 60 ft (18.2 m) long and 5 to 6 ft (1.5 to 1.8 m) wide. Tumblers may rest briefly between series but may take no more than two minutes for the entire performance, including rests.

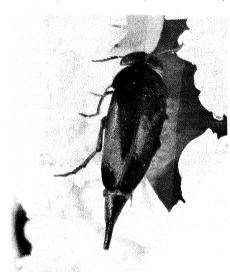

Although competitive activity has diminished, tumbling still enjoys worldwide popu-

larity as a gymnastic developmental exercise and forms an integral element of gymnastic floor exercises.

Consult the INDEX first

tumbling flower beetle, any member of the approximately 650 species of the insect family Mordellidae (order Coleoptera). The name derives from the jumping, turning, and tumbling motion of the beetles when disturbed or caught.

These black beetles are small, usually between 3 and 7 millimetres (1/10 to 3/10 inch)

Tumbling flower beetle (Mordella)
William E. Ferguson

in length, and are most often seen on flowers. They are covered with fine hairs and are humpbacked and wedge-shaped, with a broad anterior end tapering to a pointed abdomen that extends beyond the forewings. The larvae live in rotten wood and plant stems and feed on moth or beetle larvae.

tumbrel, also spelled TUMBRIL, French two-wheeled dumpcart or wagon designed to be drawn by a single draft animal. Originally used to carry agricultural supplies, it was most often associated with the cartage of animal manure. It was also used, however, by artillery units to carry tools and ammunition, and during the French Revolution it gained wide celebrity as the vehicle used to bear prisoners to the guillotine.

Tumbuka, also spelled TUMBOKA, also called KAMANGA, or HENGA, a people who live on the lightly wooded plateau between the northwestern shore of Lake Nyasa (Lake Malaŵi) and the Luangwa River Valley of eastern Zambia. They are found principally in Zambia's Lundazi district and the Karonga, Rumphi, and Mzimba districts of northern Malaŵi. They speak a Bantu language closely related to those of their immediate neighbours, the lakeside Tonga, the Chewa, and the Senga.

Contemporary Tumbuka are the offspring of a complex intermingling of people of diverse origins. The original inhabitants of the area, mostly matrilineal in descent, lived in highly scattered homesteads and had a weak, decentralized political organization. In the late 18th century a group of traders involved in the East African ivory trade arrived in the area. They were known collectively as the Balowoka ("those who crossed the waters [of Lake Nyasa]"), and they made efforts to secure access to the valuable ivory resources of the Luangwa River Valley by establishing a string of politically centralized chiefdoms. The inability of the newcomers to establish and maintain an

effective monopoly over this trade rendered these efforts largely abortive.

Around 1855 the Tumbuka area was subjugated by a group of Ngoni under Mbelwa, a highly militarized refugee people from South Africa, who had left Natal some 30 years earlier and who had wandered through East and Central Africa raiding others for cattle, food, and women and children. After defeating the Tumbuka, the Ngoni settled in the Kasitu River Valley, in northern Malaŵi, occupying Tumbuka land and incorporating the Tumbuka within the new Ngoni polity. The intermingling of the two groups resulted in great cultural changes for both. The Tumbuka adopted the customs of patrilineal descent and virilocal residence and the system of solemnizing marriages through the transfer of a large bridewealth payment to the wife's family that characterized Ngoni culture, while the Ngoni adopted the Tumbuka agricultural system and the Tumbuka language. By 1900 the Ngoni language was effectively dead, and the Tumbuka-speaking group was substantially different from what it had been 50 years earlier.

During the latter half of the 19th century two events occurred that have had a major impact upon the Tumbuka. The rapid overpopulation of Tumbuka territory, coupled with overgrazing of the land by livestock, resulted in a marked decline of the land's ability to sustain the people; and in 1879 a group of Scottish Presbyterians established the Livingstonia Mission in the area. The mission's work spread rapidly, and in its schools excellence of education and literacy in English were stressed.

The establishment of British colonial administration in the early 20th century led to the imposition of tax demands that could not be met locally. Local poverty, along with the need for money to pay taxes and school fees and to purchase cattle for the payment of bridewealth, led to a quick, widespread, and sustained emigration of adult males searching for work elsewhere in southern Africa. Most found employment on farms in Southern Rhodesia (now Zimbabwe) or in the gold mines of South Africa's Witwatersrand. Typically, as many as 65 or 70 percent of the adult males were absent at any one time. Because of their relatively superior level of education, Tumbuka speakers were widely employed as clerks, bureaucrats, and in other white-collar positions in the colonial economy and civil service

The Tumbuka-speaking elite, with their experience in white-dominated southern Africa, were among the first to establish political organizations to oppose the colonial system. Under the leadership of such men as Levi Mumba and Charles Chinula, Tumbuka speakers were in the fore of early nationalist movements, which in the 1940s coalesced to form the Nyasaland African Congress.

Since the independence of Malaŵi in 1964 the political power of the Tumbuka speakers has been eclipsed. Northern Malaŵi and eastern Zambia remain poverty-stricken and lack exploitable natural resources. The people still practice subsistence hoe agriculture, and their incomes are supplemented by the earnings sent home by migrant workers outside the Tumbuka area.

T'umen' (Russian S.F.S.R.): see Tyumen.

Tumen River, Korean TUMAN-GANG, river, forming the northeastern frontier of Korea with China and the U.S.S.R. It originates in the frontier mountain of Paektu-san (Chinese Pai-t'ou Shan; 9,003 ft [2,744 m]), the highest mountain in Korea, and flows with its short tributaries through narrow gorges east-northeast to Hoeryong, north to Onsong, and south-

Tumkūr, town, administrative headquarters of Tumkūr district, eastern Karnātaka (formerly Mysore) state, southern India, at the foot of Devarayadurga Hill, a picturesque health resort at about 3,900 ft (1,190 m). The town, a road and rail centre, has a cluster of small-scale industries, which include a tool factory, soap works, and rice and oil mills.

banks are many historic battle sites.

Tumkūr district on the Deccan Plateau has an area of 4,095 sq mi (10,606 sq km). A range of hills, which divides the Krishna and Cauvery river basins, forms its eastern border. Drained by the Shimsha River and irrigated by local springs, its primary crops are millet, rice, and oilseeds. Tiptūr and Chiknāyakanhalli are noted for coconuts. Mineral resources include iron ore, limestone, and corundum. Population centres, besides Tumkūr town, include Madhugiri and Kunigal. Pop. (1981) town, 108,670; district, 1,977,854.

Tummel, river and lake, Central region, Scotland. The River Tummel rises on Rannock Moor and drains via Loch Laidon through the heavily glaciated east-west valley containing the ribbon lakes (Lochs Rannoch and Tummel) until it joins the Tay just northwest of Pitlochry. The extensive Tummel-Garry Hydroelectric Scheme, comprising eight main power stations, is a major feature of the river basin. Loch Tummel is a popular scenic spot, as are the Falls of Tummel near the confluence of the Tummel and Garry.

tumour, also spelled TUMOR, in the widest sense, any localized swelling irrespective of origin, location, or composition; in a restricted sense, an abnormal growth of new tissue, arising by unknown cause from preexisting body cells, having no purposeful function and being characterized by a tendency to autonomous and unrestrained growth. Thus, there are two main groups of swellings: (1) false tumours and (2) true tumours. Swellings may be composed of normal body cells, abnormal body cells, or foreign cells (those introduced from without the body). Abnormal cells—the kind that generally make up true tumours-differ from normal cells in having undergone one or more of the following alterations: (1) hypertrophy, or an increase in the size of individual cells; this feature is occasionally encountered in true tumours but occurs commonly in other conditions; (2) hyperplasia, or an increase in the number of cells within a given zone; in some instances it may constitute the only criterion of tumour formation; (3) anaplasia, or a regression of the physical characteristics of a cell toward a more primitive type; this is an almost constant feature of malignant tumours, though it occurs in other instances both in health and in disease.

True tumours are composed of masses of tissue developed from preexisting body cells. In some instances the tumour cells are normal in appearance, faithful reproductions of their parent types; such tumours are generally benign. Other tumours are composed of cells slightly different from normal adult types in

size, shape, and structure; these tumours are usually malignant.

Malignancy refers to the ability of a tumour to ultimately cause death. Any tumour, of any type, may produce death by local effects if appropriately situated. The common and more specific definition of malignancy implies an inherent tendency of the tumour's cells to metastasize (invade the body widely and become disseminated by subtle means) and eventually to kill the patient unless all the malignant cells can be eradicated.

The outstanding gross characteristic of malignancy is the tendency of tumour cells to wander from their site of origin by way of the circulatory system and other channels, which may eventually establish these cells in almost every tissue and organ of the body. In contrast, the cells of a benign tumour invariably remain in contact with each other in one solid mass centred on the site of origin. Because of the physical continuity of benign tumour cells, they may be removed completely by surgery if the location is suitable. But the dissemination of malignant cells, each one individually possessing the ability to give rise to new masses in new and distant sites, precludes complete eradication by a single surgical procedure in all but the earliest period of growth.

A benign tumour may undergo malignant transformation, but the cause of such change is unknown. Normal body cells, if subjected to the appropriate (and little understood) stimulus, may form tumours and these tumours may be either benign or malignant from the start. Both types of tumour rarely are found in the same individual at the same time. It is possible, however, for a malignant tumour to remain quiescent, mimicking a benign one clinically, for a long time. Of the group of tumours in which malignancy is variable, some are benign from the start and remain so; others are apparently malignant from their moment of origin; and finally, a few appear to change from benign to malignant. In the latter case the histologic picture of the tumour before and after malignant transformation may show no differences. Thus, acquired malignancy is not necessarily dependent upon discernible changes in the appearance of the tumour cells. The regression of a malignant tumour to benign is unknown. For plant tumours, see gall.

Tumuc-Humac Mountains, Portuguese SERRA DE TUMUCUMAQUE, French MASSIF DES TUMUC-HUMAC, Dutch TOEMOEK-HOEMAK GEBERGTE, mountain range that forms the Brazilian border with French Guiana and Suriname. An eastern extension of the Acaraí Mountains, the range extends for about 180 mi (290 km) in an east-west direction. Attaining elevations of 2,800 ft (850 m) above sea level, it constitutes part of the northern watershed of the Amazon Basin. During the Spanish colonial era it was thought to hide El Dorado, the fabulous country of gold. The area, however, was little explored until the 20th century, and it was only in 1952 that the Francis Mazière expedition made the first recorded crossing of the range from French Guiana into Brazil.

tumulus, prehistoric grave form in continental Europe. *See* burial mound.

Tumulus period, Japanese KOFUN, also called GREAT BURIAL PERIOD, early period (c. AD 250-c. 500) of tomb culture in Japan, characterized by large earthen keyhole-shaped burial mounds surrounded by moats. The largest of the 71 known tumuli, 1,500 feet (457 metres) long and 120 feet high, lie in the Yamato plain of Nara Prefecture. Their impressive size indicates a highly organized aristocratic society with rulers powerful enough to command huge numbers of workers. Improved armour and iron weapons in the tombs suggest a society of conquest dominated by horse-riding

The most noteworthy objects found in and around the tombs are the hollow clay haniwa sculptures. Mounted on clay cylinders embedded in the dirt, they stand in erect position along the approach to the burial place. Also found among the funerary gifts is the magatama, a comma-shaped green jade ornamental jewel which, with the sword and mirror, forms part of the Imperial regalia. It is believed that the present Imperial line dates back to the tomb-culture rulers. See also haniwa; magatama.

Tumut, town, southeastern New South Wales, Australia, situated on the Tumut River, at the northern approach to the Australian Alps. The river valley, explored in 1824 by Hamilton Hume and William Hovell, was settled in the 1830s. The town was surveyed in 1848 and its name is derived from the Aboriginal word doomut, or "river campsite." Tumut was proclaimed a municipality in 1887 and a shire in 1928. It serves an agricultural (stock, tobacco, fodder, fruit, vegetables) and mining (granite, chromite) district and has a butter factory, a eucalyptus oil distillery, and sawmilling, pineboard, and millet-broom industries. Tumut lies on the Snowy Mountains Highway and is connected by rail to Sydney (196 mi [315 km] northeast). Pop. (1981) 5,816.

Tumut River, river, south New South Wales, Australia, rising on the northwest slopes of the Snowy Mountains. It flows 90 mi (145 km) to join the Murrumbidgee River, east of the town of Gundagai.

The Tumut River is a major part of the Snowy Mountains Hydroelectric Project. Its upper regions are impounded to create Tumut Pond Reservoir, which also receives water from the Tooma Reservoir on the Tooma River. Water can also be diverted back and forth between Tumut Pond and Lake Eucumbene through a 14-mi- (23-km-) long tunnel, thereby adding to the Tumut River water from the Snowy and Murrumbidgee rivers. At Tumut Pond is the first of four hydroelectric power stations.

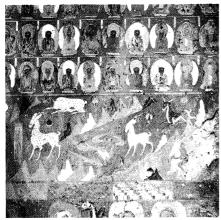

Below Tumut Pond is the second power station. Below that, the river widens into Talbingo Reservoir, which is impounded by Talbingo Dam. This dam, when built in 1971, was the highest dam in Australia (532 ft [162 m]), and its power station is the largest in the Snowy Mountains project.

Below Talbingo Reservoir, the river is again impounded by the Jounama Dam; there, water can be returned to Talbingo Reservoir or can be passed downstream to Blowering Reservoir, impounded by Blowering Dam. This reservoir serves mainly as storage for the irrigation of the Murrumbidgee Valley, but some of its waters pass through the river's fourth power station and on to the confluence with the Murrumbidgee River.

T'un-hsi, Pinyin TUNXI, city located in southern Anhwei Province (sheng), China. It is a county (hsien) seat and the administrative centre of Hui-chou Prefecture (ti-ch'ü). T'un-hsi is situated on the navigable Hsin-an Chiang (river), in the centre of the river basins occupying the southern section of Anhwei. It is also the centre of the local highway network. T'un-hsi is in the centre of a mountainous area with comparatively little cultivated land. In recent centuries it has been essentially an area of tea and timber production. The name T'un-hsi is practically synonymous with tea, for there the leaves are processed from such well-known nearby producing areas as Ch'imen, Hsiu-ning, and She-hsien in Anhwei, and Ching-te-chen and Wu-yüan in neighbouring Kiangsi Province. In this area some 60 percent (in some sections as much as 80 percent) of the rural population is engaged in tea production. Tea from T'un-hsi is exported all over China, as well as abroad. Since 1949

an extensive tea-processing plant has been established there, as well as small-scale industries such as dyeing. Pop. (1988 est.) 63,700.

Tun-huang, Pinyin DUNHUANG, town located in western Kansu sheng (province), China. Situated in an oasis in the Kansu-Sinkiang desert, Tun-huang is at the far-western limit of traditional Chinese settlement along the Silk

Deer jātaka, fresco painting from Cave 257, Tun-huang, Kansu province, China, 8th century, T'ang dynasty

Holle Bildarchiv, Baden-Baden

Road across Central Asia and was the first trading town reached by foreign merchants entering Chinese-administered territory from the west.

In ancient times it was the point at which the two branches of the Silk Road, running around the Tarim Basin on the north and on the south, converged. Tun-huang was first brought under control of the Chinese under the Han dynasty (206 BC-AD 220) during an expansionist period at the end of the 2nd century BC. A Tun-huang commandery (chun) was established either in 111 BC or, according to some accounts, in 92-93 BC. A defensive line for protection from the Mongols was built to the north, and a sizable military force, consisting partly of banished convicts, was stationed there and settled in military colonies along the line of defense. After the decay of Han central power, Tun-huang became semiindependent; later, in the 4th and 5th centuries AD, it successively formed part of the Later Liang (386-c. 403/404), Northern Liang (401-439), and Western Liang (400-421) regimes, all centred in Kansu. Throughout this period Tun-huang remained an important caravan town and commercial centre for trade with Central Asia. It had a merchant community of Sogdian and Central Asian merchants who carried on most of the caravan trade.

In the late 5th century the Northern Wei dynasty (386-534/535) brought Tun-huang back under Chinese domination, under the name Kua-chou; their rule was followed by the rule of the Western Wei (535-556/557), Northern Chou (557-581), and Sui (581-618) dynasties. In 618 the area passed to the T'ang dynasty (618-907), who renamed it Sha-chou in 633. It remained under T'ang administration until 781, when, after being cut off from China by the Tibetan occupation of Kansu for some 18 years, it also fell into the hands of the Tibetans. On the breakup of the Tibetan state in the 840s, Tun-huang nominally reverted to T'ang rule but in fact remained in the hands of a family of local governors, who set up an independent state named Hsi-han Chin-kuo in 905. Later it became a part of a small kingdom under the Ts'ao clan and in the mid-11th century was taken by the Western Hsia (Tangut) dynasty. The Mongols (who ruled China from 1206 to 1368) took it when they crushed the Western Hsia dynasty in 1227, and, after the fall of Mongol rule, the Ming dynasty (13681644) established a garrison there. In the 15th century, however, Tun-huang was overrun by the Turfan kingdom and remained a part of Uighuristan until 1723, when the Ch'ing dynasty (1644–1911/12) occupied the area. A civil government was restored in 1760.

During the period from 366 to the fall of the Western Hsia dynasty, Tun-huang was a great centre of Buddhism. It was one of the chief places of entry for Buddhist monks and missionaries from the kingdoms of Central Asia, and these Buddhists founded the first of Tun-huang's caves-known as the Cave of the Thousand Buddhas (Ch'ien-fo Tung)-in 366; from this period onward the town became a major Buddhist centre and place of pilgrimage. Even the Tibetan occupying forces established temples. There were numbers of monastic communities (many non-Chinese) that played a predominant role in local society and to which successive governors were generous patrons. In one of the cave temples a rich collection of more than 30,000 drawings and manuscripts dating from the 5th to the 11th century was walled up in about 1015, to be discovered early in the 20th century. These manuscripts include not only Buddhist but also Taoist, Zoroastrian, and Nestorian scriptures, as well as vast numbers of lay documents. Many of the nearly 500 caves were opened to the public after 1949, but in the 1980s an influx of thousands of Chinese and foreign tourists put the caves at risk. In 1989 officials announced plans to close most of the caves by 1993 and to build a visitor's centre that would contain several cave replicas.

By the early 1970s Tun-huang's importance as a trading centre had been largely lost, since the new highway and railway across the Sinkiang Uighur autonomous region pass to the north through An-hsi. Pop. (1988 est.) 20.200.

Tun Ismail bin Dato' Abdul Rahman: see Ismail bin Dato' Abdul Rahman, Tun.

tuna, also called TUNNY, any of a number of oceanic fishes, some very large, that are of great commercial value as food. Tunas are found throughout the warmer waters of the world. They are related to mackerels and commonly placed with them in the family Scombridae (order Perciformes). Tunas vary considerably, both within and among species. Their classification is also variable and may differ from one authority to another.

Tunas are elongated, rather robust fishes, streamlined and with a rounded body tapering to a slender tail base and a forked or crescentshaped tail. They have a conspicuous keel on

Yellowfin tuna (Thunnus albacares)

Painted especially for Encyclopaedia Britannica by Tom Dolan, under the supervision of Loren P. Woods, Chicago Natural History Museum

either side of the tail base, a row of small finlets behind dorsal and anal fins, and a corselet of enlarged scales in the shoulder region. Another notable feature is a well-developed network of blood vessels below the skin that acts as a temperature-regulating device associated with long-term, slow swimming. Tunas range from moderate to very large in size. The giant of the group is the bluefin tuna (*Thunnus thynnus*), which grows to a maximum length and weight of about 4.3 m (14 feet) and 800 kg (1,800 pounds). In colour, tunas are generally dark above and silvery below, often with an iridescent shine.

The most important species of tuna from a commercial standpoint are: the skipjack (*Katsuwonus*, or *Euthynnus*, pelamis), a fish found worldwide, having a longitudinally striped belly and growing to about 90 cm (3 feet)

and 23 kg; the bluefin tuna, a prized game fish usually having yellow finlets and often marked with silvery spots or bars; the albacore (*Thunnus alalunga*), a fish found worldwide, growing to about 36 kg and marked with a shining blue stripe on each side; the yellowfin tuna (*T. albacares*), a valued food and sport fish, found worldwide, growing to about 182 kg and distinguished by yellow fins and a golden stripe on each side; and the bigeye tuna (*T. obesus*), a robust fish with relatively large eyes, found worldwide and growing to 'about 2 m and 136 kg.

Tunbridge Wells, borough, county of Kent, England, southeast of London. Its area is 128 square miles (331 square km). The town of Royal Tunbridge Wells, now included in the borough of Tunbridge Wells, grew up as a spa under royal patronage at the beginning of the 17th century and was at its zenith as a resort of fashionable society under the dandy Richard "Beau" Nash before the rise of the seaside resort of Brighton. The Pantiles Parade, with the original chalybeate spring and other 17th-century features, is preserved beside the Church of St. Charles the Martyr (1684). The 19th-century town grew beside the railway station. It was designated a royal borough in 1889. During and after World War II it grew in importance as a shopping and administrative centre; it also has some light industry. Royal Tunbridge Wells is set on the sandy heights of The Weald, within commuting range of London (37 miles [60 km] northwest). Pop. (1981) town, 58,141; (1986 est.) district, 98,400.

tundra, treeless, level or rolling ground in polar regions (arctic tundra) or on high mountains (alpine tundra), characterized by bare ground and rock or by such vegetation as mosses, lichens, small herbs, and low shrubs. A brief treatment of tundras follows. For full treatment, see MACROPAEDIA: Biosphere.

The plant life of tundras is greenish brown, and species succession takes place slowly. The cool and foggy tundras found along coastal areas produce matted and grassy swards, algae and fungi are found along rocky cliffs, and rosette plants grow in rock cornices and shallow gravel beds. In the drier inland tundras, spongy turf and lichen heaths develop.

Tundra climates vary, the most severe being the Arctic regions where polar deserts fluctuate in temperature extremes from 40° F (4° C) at midsummer to -25° F (-32° C) during the winter months. Alpine tundra has a more moderate climate, with cool summers and moderate winters (rarely falling below 0° F $[-18^{\circ} C]$ in winter). The freezing climate of the Arctic produces a layer of permanently frozen soil, called the permafrost, which can reach soil depths of between 300 and 1,500 feet (90 and 456 m). Another layer of soil alternates between freezing and thawing, with seasonal variations in temperature. The permafrost layer exists only in Arctic tundra, but both Arctic and Alpine tundras have a freezethaw layer.

Because Arctic tundras receive extremely long periods of daylight and darkness (lasting between one and four months), biological rhythms tend to be adjusted more to variations in temperature than to the amount of sunlight available for photosynthesis. The levels of carbon dioxide in Alpine tundra are lower than in Arctic tundra because the air is thinner at high altitudes.

Arctic tundra. Arctic tundra covers about one-tenth of the total surface of the Earth. Its southern boundary meets the northernmost timberline, where boggy soils are threaded with numerous streams and lakes. Precipitation is less than 15 inches (38 cm) annually, and the sparse vegetation has a growing season

between two and four months long. Most of the biological activity is confined to the freezethaw layer, because the softer soils of spring through autumn (thaw periods) allow animals to burrow, plant roots to extend down, and organic matter to decompose into food for microorganisms. Coastal tundras are dominated by mosses, sedges, and cotton grass, and ma-

Late summer Arctic tundra in the Brooks Range, Gates of the Arctic National Park and Preserve, Alaska

rine waters support a variety of life cycles. On more elevated sites, like hummocks, the soil is wetter and peatier and is planted with low willows, grasses, and rushes. Sunflower plants and legumes of various kinds thrive along the sandy banks of streams and lakes. Many of the plant species are perennials that flower within a few days of maturity, after the snows have begun to melt. They may germinate as soon as four to six weeks after maturing.

Animals common in Arctic tundras are the polar bear, Arctic fox, Arctic wolf, Arctic hare, and Arctic weasel. Many of these develop a white coat during the winter months as camouflage against the snow and ice. Large herbivores, such as caribou, musk-oxen, and reindeer, are adapted for the cold by virtue of their large body-surface areas, which prevent heat from dispersing to the outside. Lemmings are an important species in the Arctic tundra. They remain active throughout the long winters, burrowing under the snow to feed on the roots of grasses and sedges. When their populations increase sufficiently, the accumulation of manure around their burrows adds nitrogen and other nutrients to the soil, stimulating plant growth. Microflora dwelling in the soil contribute to the decomposition of organic materials.

Insects like mosquitoes and black flies, common to Arctic tundras, have adapted darkly coloured bodies to absorb as much heat from sunlight as possible. Many tundra birds are migratory, remaining in the tundra only long enough to nest and molt. Geese often consume cotton grasses so completely during their stay that the mosses left behind on the soil layer indirectly promote deep thaws, increasing the amount of soil creep. Birds of prey (e.g., jaegars and snowy owls) and predatory animals (e.g., wolves and foxes) fluctuate in population levels according to the availability of their prey, particularly lemmings. In general, the food web in the tundra is simple, easily subject to imbalance if a critical species fluctuates rapidly in population.

Alpine tundra. Alpine tundras begin above the timberline of spruce and firs, either on gentle slopes where the soil has developed large meadow areas or on windswept slopes where cushion plants dominate. Plant communities

are influenced by soil drainage, snow cover, and the times of thawing. Annual precipitation is higher than in Arctic tundra. Blinding snowstorms, or whiteouts, obscure the landscape during the winter months, and summer rains can be heavy. The stratification of the soil and the inclination of the Alpine slopes allow for good drainage, however. Alpine tundra is dominated by shrubs and herbs; willows are common along streams or where snowdrifts are deep, as in basins or on the lee side of rock ridges. In the higher mountains, where the climate is more severe than along lower slopes, only lichens and mosses can survive.

Animal species are limited and only partially adapted to their wintry environment. Many enter into vertical migration patterns according to seasonal changes. Mountain sheep, ibex, chamois, wildcats, and many birds descend to warmer slopes to seek food in the winter. Some animals, like marmots and ground squirrels, consume large amounts of vegetation in the summer and early autumn and hibernate during the winter. Others, like rabbits, forage for what they can find in the snow; pikas and voles store large amounts of hay for winter feeding.

tune family, in music, group of melodies interrelated by melodic correspondence, particularly in general melodic contour, important intervals, and prominent accented tones. There may be differences of rhythmic pat-tern, mode, and text among melodies within a group. Such groups of related melodies may have evolved from a single melody that was changed by variation and imitation as it was diffused by oral tradition.

A closely related concept, particularly applied to European folk music, is that of "wandering melodies"—that is, similar tunes found in geographically distant areas. In general, it is difficult to trace members of tune families to their source, and in some cases it is likely that similar melodies developed independently within cultures having similar musical systems. Musical examples of tune families may be found in Bertrand Bronson, The Ballad As Song (1969).

Tune Stone, 5th-century monument bearing the most important Norwegian runic inscription, written vertically on two sides of the stone. Discovered in 1627 in southeastern Norway, it is now in Oslo. Authorities do not agree on the translation, but it is clear that WiwaR carved the runes in memory of

Tune Stone By courtesy of the Universitetets Oldsaksamling, Oslo

WoduridaR. The latter part of the inscription tells how WoduridaR was honoured after his death, though he left no sons or male relatives. but only three daughters.

tuned circuit, any electrically conducting pathway containing both inductive and capacitive elements. If these elements are connected in series, the circuit presents low impedance to alternating current of the resonant frequency, which is determined by the values of the inductance and capacitance, and high impedance to current of other frequencies.

In a parallel-connected tuned circuit, the impedance is high at the resonant frequency, low at others. See also resonance.

Tung, Pinyin DONG, also called (Wade-Giles) TUNG-CHIA, TUNG-JEN, OF KAM, non-Chinese people found in southeastern Kweichow province, China, and in neighbouring Kwangsi Chuang autonomous region and Hunan province. One of the Thai-related Chuang tribes, the Tung first appeared in China during the Sung dynasty (AD 960-1279), moving southwest in a series of migrations, possibly forced by the advancing Mongols. Concentrated today in sparsely populated Kweichow, they share the area with the Puvi (Chungchia). Their language belongs to the Chuang Tung language group, the written form of which is called Kam-Sui-Mak, related to the Thai language.

Influenced by the Yao, Miao, and other Austro-Asiatic peoples, the Tung live at intermediate elevations in large houses built on piling. Pagoda-like wooden drum towers up to 100 feet (30 m) high are characteristic of their architecture. They grow rice in flooded fields, using bamboo pipes for irrigation, and raise water buffalo. The buffalo are chiefly a sign of wealth and are also used for sacrifices. The Tung raise fish in some of the flooded fields and hunt with falcons. In the late 20th century they numbered 1,570,000, about onethird of whom were located in Kweichow. The Tung of Kweichow grow cotton and indigo and weave fine cotton cloth marketed in Yunnan and Kweichow. Weekly markets, often coinciding with festival days, are the centre of Tung social life and trade. Little is known of the Tung religion; it has been described as pantheistic, and a form of black magic called Tu is practiced.

In 1957 the Tung were incorporated into the province of Kweichow and allocated four minority deputies to be sent to the National People's Congress.

T'ung-ch'eng, Pinyin TONGCHENG, town in Anhwei sheng (province), China. It stands on the edge of the Yangtze River floodplain, the area to the south being a maze of lakes, the largest of which is Ts'ai-tzu Lake.

It was founded as a county under the Sui dynasty (AD 581-618) and received the name T'ung-ch'eng during the T'ang dynasty (618-907). From the beginning of the Ming period (1368–1644), it was administratively and commercially dependent upon An-ch'ing. Many immigrants came there from southern Anhwei and Chekiang provinces in the 14th and 15th centuries, when large-scale drainage and reclamation of the marshy southern part of the county were undertaken both by the local authorities and by individual families.

The area became noteworthy from the 15th century onward, when a group of wealthy local clans became not only both rich and prosperous but also remarkable for their scholarship. By the mid-16th century the area was already famed as the most important centre of scholarship north of the Yangtze. It was seriously devastated by a series of local risings in the period from 1634 to 1644 at the end of the Ming period, which continued for a few years thereafter. The preeminence of the local scholars was again reestablished, however, with the local Yao and Chang clans producing a great

number of high-ranking officials throughout the 18th century. Not only was T'ung-ch'eng thus a centre of a strong political faction but it also became the focus of the T'ung-ch'eng school, one of the chief literary schools that flourished during the Ch'ing period (1644-1911). The school advocated the philosophy of the Neo-Confucians, who had flourished in Sung times (960–1279), combining this with emphasis upon rigorous textual scholarship and the use of simple and unadorned prose. The T'ung-ch'eng school was of national importance in the late 19th century, one of its advocates being the great general and modernizer Tseng Kuo-fan. Several of the earliest translators and experts in Western affairs belonged to the school. Pop. (mid-1970s est.)

Tung Ch'i-ch'ang, Pinyin DONG QICHANG (b. 1555, Hua-t'ing, Kiangsu Province, China—d. 1636), Chinese painter, calligrapher, and theoretician who was one of the finest artists of the late Ming period. The most distinguished connoisseur of his day, Tung Ch'i-ch'ang set forward ideas that have continued to be influential on Chinese aesthetic theory.

Tung Ch'i-ch'ang was born to a poor but scholarly family and, though he at first failed the government examinations, passed the *chin-shih* ("advanced scholar") examination at the age of 34 in 1589 and was appointed to the first of a series of official positions within

the Ming government.

10,000-50,000.

He is perhaps best known for his writings on Chinese painting. Dividing it into "Northern" and "Southern" schools as first suggested by his older contemporary and friend, Mo Shih-lung (died 1587), he traced the lineage and analyzed the traditions of both branches. He maintained that the Southern school stressed sudden, intuitive realization of truth, whereas the Northern taught the more gradual acquisition of such insight. Painters associated with the Southern school were then those "literati" (wen-jen), sensitive poets and scholars who were also gentlemen painters, who painted intuitively (like an "amateur") without conscious thought of function or beauty-appealing to a similarly sensitive élite rather than popular taste. In contrast, the "professional" painter of the Northern school worked to create a handsome surface of immediate visual appeal with little suggestion of his own inner nature. At the very centre of the scholarly ideal of the Southern school was the art of calligraphy. It expressed abstractly the real nature of the individual who wielded the brush without interposing any pictorial description.

Tung Ch'i-ch'ang's calligraphy followed the eminent calligraphers Chao Meng-fu and Wen Cheng-ming and ultimately masters of the Chin and T'ang dynasties. Like those two artists, his creative approach was conscientious, disciplined, scholarly, and systematic, seeking out the spirit rather than slavishly reproducing the outward appearance of his models in trying to recapture antiquity.

Tung Ch'i-ch'ang especially favoured the Four Masters of the Yüan dynasty (Huang Kung-wang, Wu Chen, Wang Meng, and Ni Tsan), who had both the selfless personality and personal style indicative of the artistscholar's highest ideal. His own paintings reveal his debt to them in both style and motif, yet he went considerably beyond them in banishing all immediate attraction from his art and stressing instead stark forms, seemingly anomalous spatial renderings, and clumsy handling of ink and brush. Tung Ch'i-ch'ang's writings appear on his paintings as well as in various compilations of his writings-including the anthologies Hua-yen ("The Eye of Painting"), Hua-chih ("The Meaning of Painting"), and Hua-ch'an-shih sui-pi ("Notes from the Painting-Meditation Studio [of Tung Ch'ich'ang]").

Tung-chia (people): see Tung.

T'ung-chih, Pinyin TONGZHI (reign title), personal name (Wade-Giles romanization) TSAI-CH'UN, posthumous name, or shih, I TI, temple name (CH'ING) MU TSUNG (b. April 27, 1856, Peking,—d. Jan. 12, 1875, Peking), emperor (reigned 1861–75) of the Ch'ing dynasty (1644–1911/12), during whose reign occurred a short revitalization of the beleaguered Ch'ing government, known as the T'ung-chih Restoration.

Ascending the throne at the age of six, the young ruler assumed the reign title of T'ungchih (Union for Order). He ruled under the regency of a triumvirate headed by his mother, the empress dowager Tz'u-hsi (1835–1908).

the empress dowager Tz'u-hsi (1835–1908).
The restoration under T'ung-chih followed the examples of the great restorations in the middle of the Han (206 BC-AD 220) and T'ang (AD 618-907) dynasties. In the first years of the Tung-chih reign, the Chinese government finally quelled the great Taiping Rebellion (1850–64), which had been threatening South China, and crushed the Nien Rebellion (1853-68) in North China. The finances of the Imperial treasury were restored, and an attempt was made to recruit good men into the government. The system of civil service examinations was once again held in areas that had long been under rebel control. The government also made an effort to revive agricultural production by distributing seeds and tools and helping to develop new land. A program was also undertaken to manufacture Western arms, although the effort to adopt foreign technology was only superficially successful because the study of the Confucian Classics, not Western science, remained the only sure path to official advancement.

The Tsungli Yamen (Office for General Management) was created to handle foreign affairs, and the government began attempts to understand and deal with the West. T'ung-chih assumed personal control of the government in 1873 when he was 17. One of his first acts was to grant an audience to the representatives of six foreign countries. For the first time in Chinese history, the Emperor did not demand the ceremonial kowtow—kneeling and touching the forehead to the ground as a sign of supplication. The government concluded a détente with the Western powers with the treaties of Tientsin (1858) and Peking (1860).

T'ung-chih was a weak, uninterested ruler, whose affairs were constantly scrutinized by the empress dowager Tz'u-hsi. He died a little more than two years after assuming control of the government.

Tung Cho (d. AD 192, China), general whose seizure of power and tyrannical rule ended the Han dynasty (206 BC-AD 220) and divided the Chinese Empire.

In AD 190 Tung Cho burned Lo-yang, the capital, and removed himself and the Emperor to the ancient capital of Ch'ang-an. He had the city of Mei-wu, said to have been an exact duplicate of the capital, built for his clansmen. Opposition to his rule sprang up throughout the country, and the empire gradually became divided into satrapies ruled by rival generals. Tung was assassinated by one of his own lieutenants at the bidding of a rival.

Tung Chung-shu, Pinyin DONG ZHONGSHU (b. c. 179 BC, Kuang-ch'uan, China—d. c. 104 BC, China), scholar instrumental in establishing Confucianism in 136 as the state cult of China and as the basis of official political philosophy—a position it was to hold for 2,000 years. As a philosopher, Tung merged the Confucianist and Yin-Yang schools of thought.

As a chief minister to the emperor Wu (c. 140–87) of the Han dynasty, Tung was chiefly responsible for the dismissal of all non-Confucian scholars from government. His proposal that Confucianism become the unifying

thought of the Han Empire was put into effect, as were his proposals to set up an Imperial college (t'ai-hsūeh) for training promising students and to require nobles and governors to recommend annually persons of talent and good moral character for official appointment. Out of these institutional means developed the civil service examinations that became the basis of recruitment into the bureaucracy, guaranteeing that men of humble birth and high ability might rise to positions of power and influence.

According to Tung's theory, Yang (light, positive, male) and Yin (dark, negative, female) are the two basic forces of the universe and as such should be kept in harmony. The ruler has the duty to preserve that harmony. He must prevent disturbances by caring for and educating his people. He may reform institutions when necessary but may never alter or destroy the basic moral principles of Heaven (T'ien). In Tung's system the ruler has the central position—undoubtedly one of the major reasons Confucianism was accepted by Emperor Wu. Confucian scholars, however, are given an equal if less obvious power. It is they who interpret the portents and thus exercise a check on the policies of the ruler.

Tung's Ch'un-ch'iu fan-lu ("Luxuriant Dew

Tung's Ch'un-ch'iu fan-lu ("Luxuriant Dew of the Spring and Autumn Annals") is one of the most important philosophical works of the

Han period. In it, Tung interpreted the Confucian Classic "Spring and Autumn Annals" (Ch'un-ch'iu), a chronicle of the events in Confucius' native state of Lu between 722 Bc and 481 Bc, supposedly edited by Confucius. Tung felt that Confucius not only recorded events in such a way as to exercise judgment upon them but that he also laid down the rules to be used in governing future dynasties. According to Tung, Confucius understood the relationship between man and nature and

omens.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

T'ung-hua, Pinyin TONGHUA, city, southern Kirin Province (sheng), China. It is a county-level municipality (shih) and the administrative centre of T'ung-hua Prefecture (ti-ch'u). T'ung-hua is situated in the valley of the Hun Chiang (river) in the densely forested Ch'ang-pai Shan (mountains)—an area well-known from early times for the manufacturing of various forest products and for ginseng (a medicinal preparation made from an aromatic root).

The history of Chinese colonization in the area began in the mid-19th century, when the region was officially opened for settlement in the period 1862-74. Most of the first settlers came from Shantung Province, many of them during and after the great famines of the 1870s. T'ung-hua was constituted a county seat in 1876. During the early period, most of T'unghua's trade went via the Hun and Yalu rivers: but under the Japanese occupation after 1932, a railway was constructed linking T'ung-hua with the main Manchurian rail network and with northern Korea. The area was found to be rich in coal and iron ore. The Japanese planned to establish a base of heavy industry there and constructed a power station on the Hun Chiang. Iron ore from the area was sent to the great steelworks at An-shan in Liaoning Province.

Since 1949, T'ung-hua has changed from a centre of light industry, producing vegetable oils, wines, and various handicrafts, into an

industrialized city. A large paper industry has been set up, and engineering plants making such products as electrical and power equipment and mining machinery have been established. The most important development, however, has been the construction of a large integrated iron and steel complex. Coal is mined in the area. Pop. (1985 est.) 285,100.

Tung-jen (people): see Tung.

T'ung-kan (Chinese Muslims): see Hui.

T'ung-kuan, Pinyin TONGGUAN, town in the extreme east of Shensi sheng (province), China. Situated on the south bank of the Huang Ho (Yellow River), just below its confluence with the Wei River where the Huang bends to the east, it is opposite the town of Feng-ling-tu in Shansi Province. It is located in an extremely narrow and precipitous pass. T'ungkuan ("T'ung Pass") has always stood at the eastern gateway into the Wei River Valley and Shensi Province, known to the people of the North China Plain to the east as Kuan-chung, or Kuan-nei ("Within the Pass"). T'ung-kuan town was originally some 1¹/₄ miles (2 km) southeast and was moved to its present site in 611. Under the T'ang dynasty (618-907) it was known as Lung-chin hsien (county) and was the key to the defenses of the T'ang capital, Ch'ang-an. With the transfer after 907 of the capital to the eastern plains, T'ung-kuan lost its major defensive role; it remained an important strategic place, however, and was the site of a wei (guard) under the Ming dynasty (1368-1644). It became T'ung-kuan hsien under the Ch'ing dynasty (1644-1911). After 1949, under Communist rule, it was merged with Wei-nan Prefecture to the west. T'ung-kuan is connected by a spur line to the Lunghai Railway at Hsien-yang. Pop. (mid-1970s est.) less than 10,000.

T'ung-liao, formerly PAI-YIN T'AI-LAI, Pinyin TONGLIAO, OF BAIYIN TAILAI, town located in the Inner Mongolia Autonomous ch'ü (region), China. Situated on the east bank of the Hsi-liao River, T'ung-liao was originally the centre of the Barin tala horse pastures, which were established in the 17th century under the Manchu dynasty. When the area was opened up for Chinese settlement in 1912, a colonization bureau (huang-wu-chü) was created, but it met with little success because of its corrupt officials. Many Chinese did, however, settle in the vicinity, and they founded a town called Little Pa-lin t'ai-lai, which in 1912 was officially named T'ung-liao Chen. In 1915 the nearby community of Little Pai-in t'ai-lai (almost identical in name) was destroyed by a flood; its people moved to T'ung-liao, which then grew considerably. In 1918 it was constituted a county (hsien) seat, and it subsequently developed as a regional communication and commercial centre for the surrounding plain and as a collecting point for pastoral products-cattle, sheep, horses, hides, and furs. It later became industrialized and developed as the focus of a road network with connections to the Inner Mongolian interior, to Ch'ih-feng (southwest), and to Shen-yang (Mukden) and Ch'ang-ch'un on the Manchurian (Northeast) Plain. Railway spurs also link it with the main Ha-erh-pin-Shen-yang (Harbin-Mukden) line at Ssu-p'ing, with the Shen-yang-Peking line, and with the Chinese Eastern main line northwest of An-ta, between Ha-erh-pin and Tsitsihar. Pop. (1985 est.) 184,400.

Tung-liao (city, China): see Liao-yüan.

Tung-lin, Pinyin DONGLIN, party of Chinese scholars and officials who attempted to combat the moral laxity and intellectual weakness they felt was undermining public life during the last years of the Ming dynasty (1368–1644).

The party was founded by Ku Hsien-ch'eng, a government official forced out of office because of his outspoken criticism of those in power. In 1604 he established the Tunglin ("Eastern Forest") Academy at Wu-hsi in south-central China as a centre for private learning and philosophic discussion. Many of the group that gathered around Ku were also active champions of governmental integrity; many were simply scholars; all were interested in returning to what they felt were the traditional Confucian values. Interpretations of this varied, but the Tung-lin scholars were united in their denunciation of Buddhist and Taoist influences that had crept into Confucian philosophy. Their prestige soon spread among scholar-officials, and between 1620 and 1623 they were able to dominate many government offices.

Their sense of moral outrage, however, made many enemies. When a Tung-lin leader, Yang Lien, attacked the powerful court eunuch Wei Chung-hsien in 1624, Wei mobilized the enemies of the reformers. Over the next two years hundreds of Tung-lin supporters were barred from the government, and leading figures were tortured, imprisoned, and executed. By 1627 the Tung-lin party had been practically wiped out, but their martyrdom became an example to all of China.

T'ung-ling, Pinyin TONGLING, city and industrial centre located in southern Anhwei Province (sheng), China. Located on the southeast bank of the Yangtze River between An-ch'ing and Wu-hu, T'ung-ling grew into an industrial city of consequence only in the second half of the 20th century but has been a mining centre since at least the 7th century AD. The T'ung-kuan Shan copper mines take their name from the official mint and copper-mining bureau originally established there. Under the Sung dynasty (960-1279) it was a special industrial prefecture named Likuo-chien. Under the Ming dynasty (1368-1644) iron mining and smelting also began, the operations being greatly expanded in the 18th century. In 1902 mining rights there were obtained by British interests, but no exploitation followed. Under the Japanese occupation during 1938-45, copper mining was revived on a moderate scale, the ore being sent to Manchuria for smelting. After 1949 the mines were modernized and a smelter built to produce crude copper, which was sent elsewhere for further refining. Large new copper deposits were discovered in the vicinity. In 1959-60 iron mining and smelting were again begun on a large scale, and a chemical industry was also established. T'ung-ling was dependent on the Yangtze River for transport until 1969, at which time a railroad was constructed to connect the city with Wu-hu. Pop. (1985 est.) 169,500.

tung oil, also called wood oil, or China wood oil, pale-yellow, pungent drying oil obtained from the seeds of the tung tree. On long standing or on heating, tung oil polymerizes to a hard, waterproof gel that is highly resistant to acids and alkalies. It is used in quick-drying varnishes and paints, as a waterproofing agent, and in making linoleum, oilcloth, and insulating compounds. Tung oil is produced chiefly in China from the tung tree (q.v.; Aleurites fordii).

Tung-pei (China): see Manchuria.

T'ung-shan (China): see Suchow.

Tung-t'ing Lake, Wade-Giles romanization TUNG-T'ING HU, Pinyin DONGTING HU, large lake in northern Hunan Province, China. It lies in a basin to the south of the Yangtze River. The lake is connected to the Yangtze by four channels; some 40 percent of the river's waters (more in flood periods) flow into the lake. The lake is also fed from the south by almost the entire drainage of Hunan Province,

with the Hsiang River flowing in from the south and the Tzu, Yüan, and Li rivers from the southwest and west. The waters of the entire lake system discharge into the Yangtze at Yüeh-yang.

The lake's size varies greatly from season to season. Its normal size is about 95 miles (150 km) from east to west and 60 miles (95 km) from north to south, while its area is 1,089 square miles (2,820 square km). In flood periods its water level may rise by as much as 50 feet (15 m), and the inundated area may increase up to 7,700 square miles (20,000 square km).

The lake, like P'o-yang Lake farther east, acts as a huge retention reservoir for the Yangtze. In the flood season, from June until October, the Yangtze waters flood into the lake. At this time, not only the Yüeh-yang outlet but also two of the inflow channels (the T'ai-p'ing and Ou-ch'ih streams) are navigable by large craft, which can also pass up the southern rivers. From October to April, however, more water is discharged from the lake than enters it, the water level falls, and much of the lake's area becomes dry land.

Much construction work has been done to supplement the role played by Tung-t'ing Lake in regulating flooding on the Yangtze. In the northwest angle between the lake and the Yangtze, a huge artificial retention basin was built in 1954-56, with floodgates through which the Yangtze can be diverted in time of need. The basin is kept empty, and its floor is under cultivation, except during the flood season. Called Ta-t'ung Lake, it is regulated by a great barrage (dam) across the T'ai-p'ing Stream entrance to Tung-t'ing Lake. Between the 1930s and the 1950s, much of the land along the lake banks and inside the dikes surrounding Tung-t'ing Lake was reclaimed-a fact hastened over the years by the gradual silting up of the lake from the huge amounts of sediment carried in by its inflowing rivers, especially the Yangtze. As a result, the area of the lake was said to be 400 square miles (1,000 square km) less in the 1970s than it was in 1937. At one time, as a result of such reclamation, the lake was almost divided in two and no longer fulfilled its regulatory function adequately, causing floods on the lower courses of the various rivers flowing into the lake. In the 1950s, however, such reclamation was prohibited, and works were undertaken to reconnect the different sections of the lake

Tung-t'ing Lake provides a communication link between the various rivers of Hunan and also between northern Hunan and the Yangtze, the cities around the lake's margin being the chief agricultural collection and distribution centres for a fertile plain. The lake is also a fishing ground, particularly during winter, being noted for its carp. The Changling Oil Refinery, built in 1971, is located on the edge of Tung-t'ing Lake and provides fuel oil for the province.

tung tree, also called TUNG OIL TREE (Aleurites fordii), small Asian tree of the spurge family (Euphorbiaceae), commercially valuable for tung oil (q, v), which is extracted from its nutlike seeds. In the Orient tung oil was traditionally used for lighting, but it also has important modern industrial uses.

The tung tree grows to a height of 7.5 m (25 feet). It has large leaves, lobed or unlobed, attractive white flowers with reddish centres, and apple-sized globular fruit. The tung and its relatives, the candlenut tree (Aleurites moluccana), mu tree (A. montana), Japan wood oil tree (A. cordata), and lumbang tree (A. trisperma), are decorative and are planted as shade trees or as sources of tung oil in the subtropical and tropical areas of many countries, including the American Deep South, where they grow rapidly under favourable soil conditions.

T'ung-wen kuan, Pinyin TONGWEN GUAN ("Interpreters College"), first institution in China for the study of Western thought and society.

The Tung-wen kuan was originally established in 1862 to train Chinese in Western languages and thereby free Chinese diplomats from reliance on foreign interpreters. In 1866 the study of astronomy and mathematics was added to the curriculum, and gradually the school curriculum began to resemble that of a small liberal arts college. The enrollment, initially 30, increased to 100 in 1869 and to 163 in 1879, but, with several notable exceptions, the quality of the students remained low.

The school helped disseminate Western knowledge in China. Many of the professors and students made translations of Western writings, and in 1873 a primitive sort of university press was established, which printed works in the fields of international law, political science, chemistry, physics, and natural philosophy. In 1902 the T'ung-wen kuan was absorbed by the Imperial University.

tungstate mineral: see molybdate and tungstate minerals.

tungsten (W), also called WOLFRAM, chemical element, an exceptionally strong metal of Group VIb of the periodic table, used in steels to increase hardness and strength and in lamp filaments.

Tungsten metal was first isolated (1783) by the Spanish chemists and mineralogists Juan José and Fausto Elhuyar by charcoal reduction of the oxide (WO₃) derived from the mineral wolframite. Earlier (1781) the Swedish chemist Carl Wilhelm Scheele had discovered tungstic acid in a mineral now known as scheelite. and his countryman Torbern Bergman had concluded that a new metal could be prepared from the acid. The names tungsten and wolfram have been used for the metal since its discovery, though everywhere Jön Jacob Berzelius' symbol W prevails. In British and American usage tungsten is preferred; in Germany and a number of other European countries wolfram is accepted.

Occurrence, properties, and uses. The amount of tungsten in the Earth's crust is estimated to be 1.5 parts per million, or about 1.5 grams per ton of rock. Tungsten is about as abundant as molybdenum, which it resembles, or tin and half as plentiful as uranium. The two economically important minerals are wolframite and scheelite. For information on the mining and recovery of tungsten, see MACROPAEDIA: Industries, Extraction and Processing.

Tungsten metal has a nickel-white to grayish lustre. Among metals it has the highest melting point, the highest tensile strength at temperatures of more than 1,650° C (3,002° F), and the lowest coefficient of linear thermal expansion (4.43 \times 10⁻⁶ per °C at 20° C). Tungsten is ordinarily brittle at room temperature. Pure tungsten can, however, be made ductile by mechanical working at high temperatures and can then be drawn into very fine wire. Tungsten was first commercially employed as a lamp filament material and thereafter used in many electrical and electronic applications. It is used in the form of cemented tungsten carbide for very hard and tough dies, tools, gauges, and bits. Much tungsten goes into the production of tungsten steels, and some has been used in the aerospace industry to fabricate rocket-engine nozzle throats and leadingedge reentry surfaces.

Natural tungsten is a mixture of five stable isotopes: tungsten-180 (0.14 percent), tungsten-182 (26.41 percent), tungsten-183 (14.40 percent), tungsten-184 (30.64 percent), and tungsten-186 (28.41 percent). Tungsten crystals are isometric and, by X-ray analysis, are seen to be body-centric cubic.

Compounds. Chemically, tungsten is relatively inert. Compounds have been prepared,

however, in which the element has oxidation states from 0 to +6. The states above +2, especially +6, are most common. In the +4, +5, and +6 states tungsten forms a variety of complexes.

The most important tungsten compound is tungsten carbide (WC), which is noted for its hardness (9.5 on the Mohs scale). It is used alone or in combination with carbides of other metals to impart hardness to cast iron and the cutting edges of saws and drills.

tungsten carbide, an important member of the class of inorganic compounds of carbon, used alone or in combination with carbides of other metals to impart hardness to cast iron, cutting edges of saws and drills, and penetrating cores of armour-piercing projectiles.

Tungsten carbide is a dense, metallike substance, light gray with a bluish tinge, that decomposes, rather than melts, at 2,600° C (4,700° F). It is prepared by heating powdered tungsten with carbon black in the presence of hydrogen at 1,400°-1,600° C (2,550°-2,900° F). For fabrication, a process developed in the 1920s is employed: the powdered tungsten carbide is mixed with powdered cobalt and pressed into the desired shape, then heated to temperatures of 1,400°-1,600° C; the cobalt, which melts, wets and partially dissolves the grains of tungsten carbide, thus acting as a binder or cement. The cemented composites of tungsten carbide–cobalt are known by many trade names, including Widia and Carboloy.

Tungus (people): see Evenk.

Tunguska event, enormous aerial explosion that, at about 7:40 AM on June 30, 1908, flattened approximately 2,000 square km (500,-000 acres) of pine forest near the Podkamennaya Tunguska River, central Siberia (60° 55 N, 101° 57' E), in what is now the Russian S.F.S.R. The energy of the explosion was equivalent to that of 10 to 15 megatons of TNT. Uncertain evidence of various kinds suggests that the explosion was perhaps caused by a comet fragment colliding with the Earth. Such an object, composed mainly of ice and dust, would disintegrate in the atmosphere high above the Earth's surface, creating a fireball and blast wave but no crater. It has been estimated that the object encountered the Earth at about 100,000 km per hour (62,-000 miles per hour) and weighed anywhere from 100,000 to more than 1,000,000 tons.

The remote site of the explosion was first investigated from 1927 to 1930 in expeditions led by Russian scientist Leonid Alekseyevich Kulik (1883-1942). Around the epicentre he found felled, splintered trees lying radially for some 15 to 30 km (9 to 18.6 miles); everything had been devastated and scorched, and very little was growing two decades after the event. The epicentre was easy to pinpoint because the felled trees all pointed away from it, but at the centre there was no crater, just a marshy bog. Eyewitnesses who had observed the event from a distance spoke of a fireball lighting the horizon, followed by trembling ground and hot winds strong enough to throw people down and shake buildings as in an earthquake. (At the time, seismographs in western Europe recorded seismic waves from the blast.) The blast had been initially visible from about 800 km (500 miles) away; and, because the object (whatever it was) vaporized, gases were dispersed into the atmosphere, thus causing the abnormally bright nighttime skies in Siberia and Europe for some time after the

Tunguska River, either of two roughly parallel rivers of western Siberia, Russian S.F.S.R., both tributaries of the Yenisey. Both rivers flow generally northwest, but the Podkamennaya Tunguska River (q.v.) turns west at about 62° N to join the Yenisey, whereas the Nizhnyaya Tunguska River (q.v.), or "Lower Tunguska," continues its northwestward course to about 66° N before flowing west to the Yenisey.

tunic, Latin TUNICA, basic garment worn by men and women in the ancient Mediterranean world. It was fashioned from two pieces of linen sewn up the sides and across the top, with holes left for the head and arms. It reached to the knees or lower, was with or without sleeves, belted at the waist, and held at the shoulders by clasps. Essentially an undergarment, it was usually covered by a mantle but might be worn alone by the young or by workingmen. It was made of dark or light linen or white wool. Tunics that were worn by Roman senators and other dignitaries were decorated with broad purple stripes, and children's tunics were often decorated with various colours. The garment was worn into the European Middle Ages by both laity and clergy until finally replaced by the fitted body garment in the 14th century. Even after secular fashions changed, the tunic was retained in ecclesiastical vestments such as the alb and dalmatic. In modern times the word tunic is used to refer to women's clothing that resembles the ancient style.

tunicate, also called UROCHORDATE, any member of the subphylum Tunicata (Urochordata) of the phylum Chordata. Small marine animals found in great numbers throughout the seas of the world, they are either sessile (permanently attached to the seafloor or other surfaces) or pelagic (floating).

A brief treatment of tunicates follows. For full treatment, see MACROPAEDIA: Chordates. Tunicates show their chordate relationship in the possession of a muscular tail, gill slits, a notochord, and a nerve cord in the larval stage, which are resorbed at metamorphosis. Their name derives from their characteristic tunic, a secreted protective covering containing cellulose, a glucose polysaccharide not normally found in animals. Tunicates include more than 2,000 species grouped in three classes: Ascidiacea, Thaliacea, and Appendicularia. The Ascidiacea, or sea squirts, are sessile; the Thaliacea are pelagic and often form colonies; and the Appendicularia are freeswimming. The sea squirts attach themselves to the bottoms of ships and the sides of pilings, to seaweed, coral reefs and shellfish, as well as the seafloor. They range in size from a few millimetres (a fraction of an inch) to 30 cm (1 foot). The Thaliacea usually form floating colonies that may reach 4 m (13 feet) in length. The Appendicularia are often too small for the human eye to see.

Tunicates typically have two apertures, or siphons, in the tunic. Water, carrying food and oxygen, enters the body through the branchial aperture; it is filtered and passes out through the atrial aperture. In colonial species of ascidians, the individuals, called zooids, retain individual branchial apertures, but they may share a common atrial aperture or retain individual ones, depending on the structure of the colony. Some colonies of Thaliacea assume a thimble shape; water discharged into the thimble from the atrial apertures serves to move the colony forward.

Most tunicates are hermaphroditic, but asexual reproduction also takes place in colonial forms. In cooler regions spawning takes place in spring and summer, while in the tropics it occurs year-round. An embryo may develop into a larva in just a few hours. The larvae have notochords and nerve cords, as well as

muscular tails twice as long as their bodies. The sessile forms are equipped with sticky protuberances, called papillae, by which they fasten themselves to a surface at the end of the larval stage, which may range from six hours to several days. After attachment, the body resorbs the tail, using it as a food supply during metamorphosis into its adult form. Pelagic species achieve metamorphosis, which takes only a short time, without attaching themselves. Larvae do not feed during their extremely brief life; adults feed on microorganisms.

Asexual reproduction in colonial forms is effected through budding, that is, by the formation of new individuals by the development of outgrowths on the parent, which then break off. Budding may be achieved by the growth of rootlike stolons on the posterior end of the zooid, or of buds on the pharynx or on the body wall. In some pelagic groups sexually differentiated individuals (gonozooids) produce a larva that becomes an oozoid, or asexually reproducing form, which in turn produces another gonozooid generation.

The tunic, also called the test, consists of cellulose. It is composed of living tissues sustained by blood vessels. Within the tunic is the muscular body wall, which controls the opening of the siphons and encloses the pharynx and the atrial cavity. The pharynx, a sac into which the branchial siphon opens, is separated from the body wall by the atrial cavity, which leads to the outside through the atrial siphon. The branchial sac is perforated; each of the many perforations (stigmas) has small, hairlike processes (cilia) that drive water into the body.

The branchial sac excretes mucus, to which food adheres before it enters the esophagus, where it is carried to the digestive tract. Waste is passed from the anus into the atrial cavity near the atrial aperture, from which it is discharged with the water passing out of the body. The openings of the genital ducts are situated near the anus. In the simpler forms of ascidians, the viscera are enclosed by membranes called epicardia. In more advanced species, the epicardia assume other functions such as storage. At the end of every 50 to 100 beats the tunicate heart reverses the flow of blood; it stops and then resumes functioning in the opposite direction. The blood includes several different types of cells.

Tunicates are important links in food chains. They become a nuisance when they grow on ships' hulls, but some species are useful in making pharmaceuticals. Because tunicates are soft-bodied, there is no fossil record of early tunicate forms.

tuning and temperament, in music, the adjustment of one sound source, such as a voice or string, to produce a desired pitch in relation to a given pitch, and the modification of that tuning to lessen dissonance. The determination of pitch, the quality of sound that is described as "high" or "low," is based upon the frequency of vibration of sound waves. The sounding of a sustained pitch produces other vibrations called overtones, or partials, whose frequencies are the integral multiples of the frequency of the principal note.

A brief treatment of tuning and temperament follows. For full treatment, see MACROPAEDIA: Music. The Art of.

Fundamental to the concept of tuning is the mathematical relationship between intervals (the distance between two pitches). The earliest development of the system of simple mathematical ratios of intervals was that of the school of Pythagoras, in the 6th century The starting point for all tuning systems in Western music is the interval of the octave. The diatonic scale (the basis of all Western music, as represented by the white keys on a keyboard) consists of seven intervals: five large (whole tones) and two small (semitones). Their frequency ratios are irrational numbers; these result in dissonance, subjectively described as harsh and unpleasant to the ear. The intervals whose frequency ratios are simple, i.e., the unison, octave, perfect fifth, perfect fourth, and major third, result in consonance, described as pleasing and harmonious. Dissonance results from the acoustical phenomenon of beats, the interference between sound waves of a close frequency, and consonance is the absence of beats.

Temperament, or the modification of tuning in order to lessen dissonance, was first mentioned in Franchinus Gafurius' treatise Practica Musica (Milan, 1496). He advocated diminishing the fifths by a slight amount, spreading the D to A dissonance over several octaves. In mean-tone temperament, customary in the 16th century, the interval of two octaves and one third is tuned perfectly to the overtone series, and the difference is spread through the four fifths, which flattens them and sharpens the sixths by one fourth of a comma. Equal whole tones are created, thereby giving its name, the mean, or average, whole tone being exactly one-half of the pure third. This worked well within a limited number of keys, each of these being similar enough to the others to be harmonious but different enough to maintain highly individual characteristics. However, the use of enharmonic notes, often differing by almost a quarter of a tone, created problems.

The move to equal temperament, which began in the 17th century, was brought about by the expansion of tonalities, chromaticism, and enharmonic modulation (changing key by using one note to serve as a pivot to another key). Here the octave is divided into 12 equal semitones of 100 cents each, and the only remaining pure interval is the octave. All of the others are tempered to some extent. The fifth is two cents flat, for example, and the major third is 14 cents sharp. Although equal temperament sacrifices purely tuned intervals, numerous gains result from its use. The complex harmonies and tonalities of 19thand 20th-century music would be impossible without the concept of enharmonics, which is completely dependent upon equal temperament. The "twelve tone" music of Arnold Schoenberg, Alban Berg, and Anton Webern would not have developed without the complete equality of semitones, and though new techniques are gradually being used, this system still holds fast today.

tuning fork, narrow, two-pronged steel bar that when tuned to a specific musical pitch retains its tuning almost indefinitely. It was apparently invented by George Frideric Handel's trumpeter John Shore shortly before Shore's death in 1752.

Because it produces a nearly pure tone (without overtones), it is useful in experimental

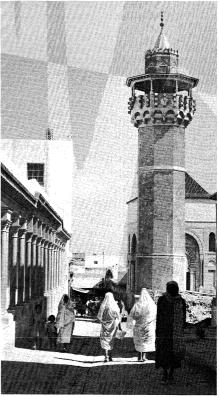

Tuning fork By courtesy of J.C. Deagan, Inc.

study of the physics of sound. It has also been used in musical instruments-e.g., the dulcitone, or typophone, a set of graduated tuning forks struck by felt hammers by means of a keyboard mechanism.

Tunis, Arabic TŪNIS, or TŪNUS, capital and largest city of Tunisia, on the northern African coast, between the western and eastern basins of the Mediterranean Sea. Tunis was built at

the end of the shallow Lake of Tunis, an inlet of the Gulf of Tunis, and is linked with its port, Ḥalq al-Wādī, 6 miles (10 km) to the northeast.

Tunis was founded by the Libyans, who in the 9th century BC surrendered the site of Carthage to the Phoenicians from Tyre. In 146 BC, during the Third Punic War between

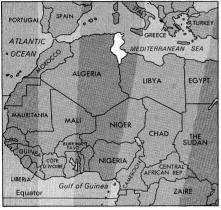

A street in al-Madinah, the old city of Tunis

Carthage and Rome, Tunis and Carthage were destroyed. The city flourished under Roman rule, but its importance dates chiefly from the Muslim conquest in the 7th century AD. It became the capital city under the Aghlabids (800-909) and reached its greatest prosperity under the Hafsid dynasty (1236-1574). The Holy Roman emperor Charles V took possession of it in 1535, and in 1539 the city passed into the hands of the Turks. It was retaken by the Spaniards, who held it from 1573 to 1574 but who were obliged to yield it to the Ottoman Empire, under which it remained until the French protectorate (1881-1956). Occupied by the Germans in 1942 and liberated by British forces and Allied troops in 1943, it became the national capital of Tunisia when independence was achieved in 1956.

Agriculture remains a major source of income. Olives and cereals are the principal crops grown, and olive oil and foodstuffs are processed. Manufactures include textiles and clothing, carpets, and cement and metal building structures. There are also chemical (superphosphate), metallurgical, machine, and electrical industries and railway workshops. There are several thermoelectric plants at Halq al-Wādī, and Maqrīn has a lead smelter. Tourism is of particular economic importance. Al-'Uwaynah International Airport and the International Airport of Tunis-Carthage are located northeast of the city.

Tunis has two cultural centres, as well as a theatre that is used by international theatre groups. The summer festival—the Festival of Carthage, held in July-has achieved a certain renown. Among the city's attractions are its thermal baths, dating from the time of Rome's Antonine emperors (who reigned in the 2nd century), the heights of Sīdī-Bū Sa'īd, the exoticism of its markets (suqs), and the mosque of az-Zaytūnah (8th century), the oldest and most venerated monument in Tunis. The University of Tunis was founded in 1960. Southeast of the city, along the valley of the Wadi Milyān, are magnificent remains of the aqueduct built by the Romans to link Mount Zaghwān to Carthage. Pop. (1984) city (commune), 596,654; (1981 est.) metropolitan area, 1,200,000.

Tunisia, officially REPUBLIC OF TUNISIA, Arabic AL-JUMHŪRĪYAH AT-TŪNISĪYAH, country of North Africa, lying along the Mediterranean coast and covering an area of 59,664 square miles (154,530 square km). The capital is Tunis. It is the smallest country of the region, with a maximum length from north to south of 470 miles (756 km) and a maximum width from east to west of 218 miles (351 km). It is bordered by Algeria to the west and southwest, Libya to the southeast, and the Mediterranean Sea to the east and north. It has a 750-mile-

Tunisia

(1,200-kilometre-) long coastline. The population in 1990 was estimated at 8,182,000.

A brief treatment of Tunisia follows. For full treatment, see MACROPAEDIA: North Africa. For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

The land. Tunisia can be divided into four physiographic regions from north to south. The mountainous northern region, occupying one-third of the total land area, is dominated by two mountain chains—the Northern Tell (north) and the High Tell (south)—that are continuations, respectively, of the Tell Atlas and the Saharan Atlas mountains of Algeria. The highest point in Tunisia, Mount ash-Sha'nabī (5,066 feet [1,544 m] above sea level), is located near the Algerian border. The central region is an extensive plateau that is about 1,600 feet (500 m) in elevation. Farther south lies a series of low-lying shatt (chotts, or shallow salt lakes), the largest of which is the Shatt al-Jarid. The southernmost portion of Tunisia is given over to the sand and rock of the Sahara (desert). Rich artesian water sources make possible well-cultivated oases here and there in the southern part of Tunisia. The Majardah (Medjerda) is the country's largest river (286 miles [460 km] long), and the only perennial one; it is much used for hydroelectric power and irrigation. The Majardah valley has the country's most fertile soil and is its prime agricultural area.

The Mediterranean climate of northern Tunisia has mild, rainy winters and hot, dry summers. Average daily high temperatures at Tunis on the Mediterranean coast range from 91° F (33° C) in August to 58° F (14° C) in January. Temperatures are affected by the sea, being less extreme on the coast than inland. The desert climate of the south, with frequent siroccos (hot southerly winds) blowing in from the Sahara, is characterized by much higher

daytime temperatures and a much broader temperature range. Precipitation ranges from 40 to 60 inches (1,000 to 1,500 mm) annually in the north to only 4 to 8 inches (100 to 200 mm) in the south, where cultivation without irrigation is impossible. Green cork and oak forests dominate the wetter mountain slopes, and the central steppes support a sparse ground cover of esparto grass; some shrubs, such as acacia and saltbush, are found in the arid south, but most of the Sahara is devoid of vegetation except at oases. Gazelles, wild boars, a breed of wild sheep, and jackals are among the country's wildlife.

Tunisia's principal mineral resource is phosphate rock, of which it has some of the largest reserves in Africa. The country also contains some of the largest oil reserves and some of the largest natural gas fields on the continent.

The people. Tunisia's population is largely a mixture of Arab and Berber elements. Arabs came to North Africa beginning in the 7th century and easily conquered the indigenous Berbers. The Arabs brought their language and religion with them and intermarried with the local people. Most Tunisians today claim Arab ancestry and culture, and only traces of Berber culture remain. The country's official language is Arabic, though French is also widely spoken. The overwhelming majority of the people are Muslim.

Nearly two-fifths of Tunisia's population is under 15 years of age. The annual rate of population growth is high by world standards but is comparatively low for the Middle East and North Africa. Governmental efforts to promote family planning and a high rate of emigration have in part suppressed the rate of population growth. The country's population density is the highest in North Africa, with most people living near the coast and more than half living in urban areas. The entire southern half of Tunisia is only lightly populated.

The economy. Tunisia has a mixed economy in which both the public and private sectors participate. Services, agriculture, light industries, and the production and export of petroleum and phosphates are the largest sectors of the economy. Unemployment and underemployment are widespread, and economic development has been heavily subsidized by Western countries and international organizations. The gross national product (GNP) is growing faster than the population; the GNP per capita is similar to those of other developing countries but is low for the Middle East and North Africa region.

Private agriculture has traditionally been the mainstay of Tunisia's economy, though the manufacturing sector has assumed a larger place in the economy in recent decades. Agriculture accounts for less than one-fifth of the GNP and employs about one-fourth of the work force. Tunisian agriculture remains plagued by the country's uncertain rainfall patterns, and the size of its harvests vary as a result. Dry farming predominates, though an ambitious water development program begun with foreign assistance in the 1980s has greatly increased the country's irrigated acreage.

Harvests of wheat and barley, which are the chief staples, frequently fall short of domestic demand. The government has introduced new strains of Mexican dwarf wheat to alleviate the shortfall, and this variety now accounts for more than one-tenth of the wheat harvest. Wheat is grown mostly in the north, and barley primarily in central Tunisia, where the rainfall is lower. Cash crops include olives, sugar beets, citrus fruits, and vegetables. Sheep are the primary livestock, and there are also goats, cattle, and poultry.

The mineral industry is dominated by the production of petroleum and phosphates. Petroleum has become a chief Tunisian export, though heavy grades of petroleum must be imported. Most phosphate is used domes-

tically to produce chemicals and fertilizers for export

Manufacturing industries account for approximately one-eighth of the GNP but employ nearly one-fifth of the work force. The nation's industries are concentrated in Tunis. Most manufacturing establishments employ no more than five workers; traditional artisanship, which is strongly promoted by the government, remains an important source of income for many Tunisians. Principal manufactures include processed foods, crude steel, chemicals, textiles, and leather goods.

Electricity is generated almost entirely by thermal plants using domestic fuels. Some hydroelectric power is also produced along the Majardah River. Tunisia's road and rail network is sufficiently dense that all its cities and major towns are linked up. The country has several ports along its lengthy coastline. Tourism, based on Tunisia's long beaches as well as its ancient Roman sites and later Islamic buildings, is an important industry.

Tourism, foreign aid, and remittances from Tunisians working abroad are important sources of foreign exchange and help to offset the country's unfavourable balance of trade. Petroleum and petroleum products, textiles, fertilizers, and agricultural commodities are chief among Tunisia's exports; food, machinery, raw materials, and chemicals and pharmaceutical products are the nation's principal imports. Its chief trading partners include France, which supplies up to one-third of Tunisia's imports, Germany, Italy, and Belgium-Luxembourg.

Government and social conditions. Tunisia is a republic. Its 1959 constitution vests legislative power in the unicameral Chamber of Deputies, consisting of 141 members directly elected to five-year terms. Executive power resides with the president, who is directly elected to a five-year term; according to the constitution, the president is eligible for an unlimited number of consecutive terms. The president governs with the assistance of an appointed cabinet headed by a prime minister. The Constitutional Democratic Rally (former Destourian Socialist Party) has been the dominant and often the only officially recognized party since independence, and opposition parties have not participated in elections frequently or with effect. An independent judiciary is headed by the Court of Cassation; its justices are appointed by the president.

Health conditions in Tunisia are improving, though far from adequate, and compare favourably to those of many developing countries. A substantial increase in the numbers of health facilities and personnel, though a shortage still prevails, has contributed to the control of major infectious diseases such as typhoid, diphtheria, and typhus. Diseases of infancy and childhood constitute the most serious health problem. The average life expectancy is about 65 years.

The government accords a high priority to education, which regularly receives nearly one-fourth of the national budget. The adult literacy rate is about 60 percent for males and almost 40 percent for females. Public education is free but not compulsory. There are six-year primary, seven-year secondary, and three-year vocational schools, and institutions of higher education. Arabic, the language of instruction in early primary grades, is gradually replaced by French in later grades.

The government controls all print and electronic news media. Self-censorship of the press is increasingly being replaced by official censorship. The broadcasting industry has been a state monopoly since independence.

Cultural life. Tunisia's history as either a centre or vassal of Phoenician, Carthaginian, Roman, Berber, and Arabic power has left a

rich heritage of architectural remains, particularly in the north. Modern Tunisians utilize both Arabic and French in literature, but generally use French in the scientific disciplines.

History. From the 12th century BC the Phoenicians had a series of trading posts and ports of call on the North African coast. Carthage was founded in the 8th century BC, and by the 6th century the Carthaginian kingdom encompassed most of present-day Tunisia. Carthage became part of Rome's African province in 146 BC after the Punic Wars. Roman rule endured until the Muslim Arab invasions in the mid-7th century AD. Since then Tunisia has been fought over, won, and lost by the 'Abbasids; their vassals the Aghlabids; the Shī'i Fāṭimids; the Almohads; the Hafsids; Spain; and finally the Ottomans, who conquered the place in 1574 and held it until their own decline in the late 19th centurv.

As Ottoman power declined, Tunisia was caught between French, British, and Italian aspirations in the region, and for some time their conflicting interests helped maintain Tunisia's autonomy. In a deal consummated in 1881, the British occupied Cyprus and the French

took Tunisia as a protectorate.

In theory the beys, rulers of Tunisia, continued to hold sway, but actual power resided in French hands. In the early 20th century Tunisians began to demand more participation in government, although they rallied behind the French in World War I. After the war, agitation resumed. In 1920 the Destour Party demanded equal Tunisian participation in the government. A Neo-Destour party arose in the 1930s, led by Habib Bourguiba and supported by the French Popular Front government. Dissolved during World War II, it returned after the war to lead the independence movement. In 1956 France granted full independence to Tunisia, and Bourguiba headed its government. The rule of the beys was abolished and a republic declared. The Neo-Destour Party took the name Destourian Socialist Party (Parti Socialiste Destourien, PSD) and became the ruling party of the state. The party (later known as the Constitutional Democratic Rally) undertook progressive social reforms, such as the enfranchisement of women, and, under Bourguiba's rule (1957-87), the country's economic development proceeded steadily, if slowly.

Tunja, city and capital of Boyacá departamento, north-central Colombia. It lies in the high valley of the Teatinos, or Boyacá, River. Founded in 1539 by Captain Gonzalo Suárez Rendón, the settlement was originally called Hunza by the local Chibcha Indians. In 1819 it served as Simón Bolívar's operating base for his victory over the Spanish at Boyacá, 5 miles (8 km) south.

The city is a communications, commercial,

Carl Frank

and agricultural centre and is a market for the llano (plain) cattle country. Gold and emerald mines are in the vicinity. Many of the city's colonial buildings survive, including the 16thcentury churches of Santo Domingo and San Laureano. The Pedagogical and Technological University of Colombia was founded in 1953. The city is situated on the Pan-American Highway linking Cúcuta and Bogotá; railway connections are with Bogotá to the southwest. Pop. (1985) 87,851.

tunnel, horizontal or nearly horizontal subsurface passageway that occurs naturally or is made by man. Man-made tunnels are used for such purposes as mining, transportation, water supply, and power installations.

A brief treatment of tunnel building follows. For full treatment, see MACROPAEDIA: Public Works.

The earliest tunnels were probably extensions of prehistoric cave dwellings. Ancient civilizations used tunnels to carry water for irrigation and for drinking, and in the early 22nd century BC a tunnel for pedestrian traffic was built in Babylonia under the Euphrates River. The Egyptians excavated temple rooms inside cliffs, while the Romans built aqueduct tunnels through mountains. By the 17th century tunnels were being constructed for canals. During the 19th and 20th centuries the development of railroad and later motor-vehicle transportation led to a tremendous expansion in the number of tunnels and in their length. (See the Table.)

Early tunnel-building techniques varied. The Egyptians used copper saws that were capable portal) or from a vertical shaft, down which equipment is lowered and out of which rubble or muck is removed. All tunnels need some form of ventilation to supply air to workers and, later, to traffic and also to draw out potentially dangerous fumes from blasting or from gas deposits.

Soft-ground tunnels are generally shallow and are often built for use as subways, watersupply systems, and sewers. Excavation is much easier than it is in solid rock, but the 'stand-up time" (the time an excavated section will safely stand up without support) is very short. In order to prevent the tunnel from collapsing, a support structure is continously built around the heading, or excavation face. A circular or arch-shaped design has been found to be the best at bearing the ground load from above. Brick and stone were used for support in early tunnels, but in modern tunneling steel is generally used to provide temporary support until a concrete lining can be installed.

Soft-soil excavation can be accomplished by a number of methods, from simple hand mining with shovel and pick-axe to full-face boring with sophisticated machinery. One such device, the tunneling mole, utilizes a rotating wheel set with teeth that continuously excavates material and loads it onto a conveyor belt. In some machines the cutter is pressed against the face, forcing earth through sievelike holes and onto the belt.

Although tunnels through solid rock can be excavated at only about half the rate of tunnels through soft earth, rock bores have the

of cutting soft rock, while the Babylonians constructed masonry tunnels. The Romans tunneled through solid rock by heating the rock face with fire and then rapidly cooling it with water, causing the rock to crack. Tunnel building has always been hazardous, and often hundreds or even thousands of workers died constructing ancient tunnels. The development of modern tunneling technology has also included vast improvements in worker

Tunnels can be divided into four general categories, depending on the material through which they pass: soft ground, solid rock, soft rock, and subaqueous. Before starting to excavate a tunnel, investigation of the geological conditions of the site is always necessary and is accomplished by conducting air surveys, analyzing surface samples, and drilling test holes. Excavation of a drift, or horizontal shaft, can begin from a hill or mountain slope (in which case the entrance is called a

advantage of much longer stand-up times. If a tunnel is pushed through unfractured blocks, it may need little or no additional support. Tunnelers often encounter areas of defective rock, however, and must be able to quickly change their method of tunneling to suit the conditions.

One of the greatest advances in solid-rock excavation was the introduction of gunpowder blasting in the 17th century. The basic method has remained the same, although different explosives are used. Conventional blasting done with dynamite is a cyclical process in which pilot holes are first drilled for the explosives, the blast is detonated, fumes are ventilated from the shaft, and rubble is removed. In order to preserve the strength of the rock, Swedish engineers have perfected a technique called sound-wall blasting, in which numerous small charges are placed according to complicated plans. Another method that cuts a smooth surface in the tunnel is the rock

mole, which dislodges rock with disk cutters or uses drill bits similar to those used in oil

The problem of water inflow, in which water from a subterranean source fills up the shaft, can occur in any type of tunnelling operation; it is a constant danger during the construction of subaqueous tunnels. An early solution involved using a pressurized excavation chamber that held back incoming water; but the danger, expense, and slow progress of this method made it prohibitive. Alternate methods include the construction of parallel drainage tunnels and the use of prefabricated sections that can be floated into position, sunk, and attached to other sections.

Tunnel building has become increasingly efficient and safe, especially with the use of innovations that stabilize the heading. In soft soils concrete-like substances called grout are often injected into the tunnel area to stabilize the soil and to check water seepage. This helps prevent soil loss (the settling of earth from above), which is a major concern when tunnels are built under city buildings. A method of tunnel support, called shotcreting, was developed in Sweden. It involves the spraying of a cement mixture (shotcrete) onto the tunnel crown with a long robot arm shortly after the excavation. Shotcreting provides immediate support and minimizes soil loss. A permanent shield can then be built by thickening the concrete lining; steel ribs can be used for additional support. This method can also be used in rock tunnels.

tunnelling, also called BARRIER PENETRA-TION, in physics, passage of minute particles through seemingly impassable force barriers. The phenomenon first drew attention in the case of alpha decay, in which alpha particles (nuclei of helium atoms) escape from certain radioactive atomic nuclei. Because nuclear constituents are held together by a force that the alpha particles have insufficient energy to overcome, their tunnelling is contrary to the conventional understanding of classical physics and requires instead explanation in terms of quantum mechanics.

On the basis of quantum mechanics, particles of subatomic size make their way across barriers even though their energies are too small to carry them over in the conventional way. Such particles follow the undulations of a quantum-mechanical (de Broglie) wave, accumulating where the wave grows and thinning out where it diminishes. Thus, the alpha particles, which seem to be tunnelling through an impenetrable barrier, really penetrate it as a natural consequence of their wave properties.

tunnelling shield, machine for driving tunnels in soft ground, especially under rivers or

Tunnelling shield for San Francisco subway By courtesy of Robert S. Mayo, C.E., Mayo Tunnel & Mine Equipment, Inc., Lancaster, Pa.

in water-bearing strata. The problem of tunnelling under a river had defied the engineering imagination for centuries because of the difficulty of preventing mud and water from seeping in and collapsing the tunnel heading. In 1818 Marc Isambard Brunel, an émigré French naval officer in England, observed the action of a tiny marine borer, the shipworm, whose shell plates permitted it to bore through timber and push the sawdust out behind it. Brunel built a giant iron casing, or shield, that could be pushed forward through soft ground by means of screw jacks, while miners dug through shutter openings in the face.

Brunel's shield, rectangular in plan, was successfully employed in driving the world's first underwater tunnel, under the Thames at London, 1825-42. In 1865 Peter Barlow of London patented a much simpler shield of circular cross section, 8 feet (2.5 metres) in diameter, with which James Henry Greathead drove a small-bore tunnel under the Thames in less than a year at modest cost. Simultaneously, Alfred Ely Beach of New York City devised a shield, also circular in cross section, which he used to drive a short experimental subway under Broadway. In the 1880s Greathead successfully used compressed air behind his shield in a London subway tunnel to prevent flooding while the lining was being installed. The combination of shield and compressed air made tunnelling possible under the largest

Modern tunnelling shields are essentially the same as the Greathead design; that is, powerful steel cylinders shoved forward by hydraulic jacks. A diaphragm, or curtain, in the front has a door that may be opened to permit men to work in front of the shield, or it may be closed when the shield is shoved through very soft ground. In front of the diaphragm the cylinder is prolonged by a circular cutting edge that projects farther at the top, forming a protective hood for men working in front of the shield. Behind the diaphragm an erector arm, an adjunct of the shield, constructs the tunnel lining by successively setting segments of steel rings in place. The steel is later covered over with masonry. Hydraulic jacks to advance the shield are braced against the end of the completed lining.

Tunney, Gene, byname of JAMES JOSEPH TUNNEY, also called THE FIGHTING MARINE (b. May 25, 1898, New York City—d. Nov. 7, 1978, Greenwich, Conn., U.S.), U.S. boxer who defeated Jack Dempsey in 1926 to become the world heavyweight boxing champion.

Tunney began boxing while working as a clerk for the Ocean Steamship Company in New York City (1915-17). He joined the U.S. Marine Corps during World War I and in 1919 won the light heavyweight championship of the American Expeditionary Force in Paris. He returned home to his boxing career and won the U.S. light heavyweight championship in 1922. That year Tunney suffered his only professional defeat, against Harry Greb, but regained the title from Greb in 1923. He knocked out Georges Carpentier in 1924 and subsequently fought as a heavyweight.

Dempsey was the favoured fighter in the world championship bout in Philadelphia on Sept. 23, 1926, but Tunney won by decision after 10 rounds. The rematch in Chicago on Sept. 22, 1927, gave rise to the lasting controversy of the "long count." In the seventh round Tunney was knocked to the canvas, Dempsey failed to retire immediately to a neutral corner, and the count did not begin until he had done so, several seconds later. Tunney then rose on the count of nine and completed the 10-round fight, again winning

by decision. Tunney defended his title against Tom Heeney in 1928 and then announced his

Tunney (right) fighting Jack Dempsey, 1927

retirement on July 28 of that year. From 1915 to 1928 Tunney had 76 bouts, winning 56.

Tunney entered the business world in the United States and Canada, becoming an executive of banks, manufacturing companies, insurance firms, and a newspaper (the *Toronto* Globe and Mail). He pursued his interest in literature and was the author of A Man Must Fight (1932) and the autobiographical Arms for Living (1941). Of his four children, John V. Tunney (1934-) was a U.S. Senator (1971-77).

tunny (fish): see tuna.

Tunstall, Cuthbert, Tunstall also spelled TONSTALL (b. 1474, Hackforth, Yorkshire, Eng.—d. Nov. 18, 1559, Lambeth, London), prelate, bishop of London (1522-30) and of Durham (1530-52 and 1553-59), who was a leading conservative in the age of the English Reformation. While not a great theologian, he was nevertheless of notable intellectual ability, writing an excellent arithmetic textbook, De arte supputandi libri quattuor (1522) and a treatise on the Eucharist in which he defended the Catholic doctrine. Learned in humanistic disciplines, he was friendly with Sir Thomas More and Erasmus. His contemporaries praised his character.

Born illegitimate, Tunstall studied law at Oxford, Cambridge, and Padua universities. In 1508-09 he became chancellor to William Warham, archbishop of Canterbury, and from 1514 he advanced rapidly in Thomas (later Cardinal) Wolsey's service, being employed particularly on diplomatic negotiations abroad. In the Reformation he reluctantly broke with Rome and firmly opposed doctrinal innovation, yet remained in Henry VIII's favour, while his European reputation made his eventual submission politically valuable. In 1537-38 he served as president of the Council

Imprisoned and deprived under Edward VI (though initially a member of the council of regency), he was reinstated by Mary but refused the oath of supremacy under Elizabeth and was again deprived (1559). Cuthbert Tunstal, by Charles Sturge, was published in 1938.

Tunxi (China): see T'un-hsi.

Tuorian Stage, lowermost stage of the Upper Cambrian Series of rocks in the Soviet Union (the Cambrian Period began about 570,000,-000 years ago and lasted about 70,000,000 years). The Tuorian Stage follows the Maya Stage of the Middle Cambrian Series and precedes the Shidertinian Stage. Calcareous facies with a brachiopod and trilobite fauna are prominent, although quartzites and metamorphic rocks also occur.

Tupã, city, western São Paulo state, Brazil. situated in the highlands at 1,676 ft (511 m) above sea level, between the Peixe and Tietê rivers. The settlement was given town status in 1936 and was made the seat of a municipality in 1938. Economic activity in Tupã centres on the processing of products from the hinterland, including cotton, coffee, rice, and timber. The city is linked by road, railway, and air to São Paulo, 260 miles (420 km) southeast. Pop. (1980 prelim.) 44,450.

Tupac Amaru II, original name José GABRIEL CONDORCANQUI (b. 1740–42?, Peru—d. May 18, 1781, Cuzco, Peru), Peruvian Indian revolutionary, a descendant of the last Inca ruler, Tupac Amaru, with whom he was identified when he led the Peruvian peasants in an unsuccessful rebellion against Spanish rule.

Tupac Amaru II was a cacique (hereditary chief) in the Tinta region of southern Peru. He received a formal Jesuit education but maintained his identification with the Indian population. In 1780 he arrested and executed the *corregidor* (provincial administrator), Antonio Arriaga, on charges of cruelty. This act led to the last general Indian rebellion against Spain, at first with the support of some Creoles (Spaniards born in America). The revolt, which spread throughout southern Peru and into Bolivia and Argentina, lost this support, however, when it became a violent battle between Indians and Europeans. Tupac Amaru II and his family were captured in March 1781 and taken to Cuzco. After being forced to witness the execution of his wife and sons, he was mutilated, drawn and quartered, and beheaded. The revolution continued until the Spanish government issued a general pardon of the insurgents.

Tupamaro, member of NATIONAL LIBERATION MOVEMENT, Spanish MOVIMIENTO DE LIBERACIÓN NACIONAL, an Uruguayan leftist urban guerrilla organization founded in about 1963. The group was named for Tupac Amaru II, the leader of an 18th-century revolt against Spanish rule in Peru.

The chief founder was Raúl Sendic, a labour organizer; and the earliest Tupamaro efforts were a mixture of idealism, public relations, and theft—robbing banks and businesses and then, in Robin Hood fashion, distributing food and goods to the poor. About 1968 the Tupamaros began more earnestly to undermine the established order, raiding arsenals, engaging in arson, and mounting a wave of violence, chiefly through political kidnappings and assassinations of police and officials. Their success was brief, however; in the early 1970s they had reached the zenith of their power. Thereafter, a military government (brought to power in a coup in 1973), using hardline tactics and a disciplined army, managed to kill some 300 Tupamaros and imprison 3,000 others. After democratic rule returned to Uruguay in 1985, most of those jailed, including Sendic, were released, and the Tupamaros were reorganized as a legal political party.

Tupelo, city, seat (1866) of Lee county, northeastern Mississippi, U.S. It is located 63 miles (101 km) north-northeast of Columbus. It is the headquarters and focal point of the Natchez Trace Parkway. In 1859 the original settlement of Harrisburg was moved 2 miles (3 km) east to the Gulf, Mobile, and Ohio Railroad line. The new community, Gum Pond, was later renamed Tupelo for the local tupelo trees that supplied construction timber. It developed as a processing and shipping centre for cotton and dairy produce and later acquired diversified manufactures including textiles, electronic equipment, and furniture.

Within the city limits is Tupelo National Battlefield, where the Confederates under Nathan

B. Forrest and Stephen D. Lee were contained by A.J. Smith's Federal troops (July 14-15, 1864) during the American Civil War. Also in the vicinity are Brices Cross Roads National Battlefield Site (June 10, 1864, where the Federals were defeated by Forrest); the Ackia Battleground National Monument (1938, marking the spot where the Chickasaw Indians and the British defeated the Choctaws and French in 1736); Tombigbee State Park; and a U.S. fish hatchery. Disaster struck the city on April 5, 1936, when a tornado killed 201 people and injured 1,000. The rock and roll star Elvis Presley (1935-77) was born in Tupelo, and his house is open to the public. Inc. 1891. Pop. (1988 est.) 26,226.

tupelo, any of about seven species of trees constituting the genus *Nyssa*, and belonging to the sour gum family (Nyssaceae). Five of

Black tupelo (Nyssa sylvatica)
Joan E. Rahn—EB Inc.

the species are found in moist or swampy areas of eastern North America, one in eastern Asia, and one in western Malaysia. They all have horizontal or hanging branches and broad alternate leaves, and they are dioecious (male and female flowers on different plants).

The most widely distributed member in North America is the black tupelo (Nyssa sylvatica), also known as black gum, sour gum, or pepperidge tree. It grows in woods and moist areas from Maine southward to the Gulf Coast and westward to Oklahoma. This tree typically grows to a height of 60 feet (18 m) and occasionally attains a height of 100 feet (30 m). It is sometimes grown as an ornamental and is prized for the brilliant scarlet autumnal foliage. A variety of the black tupelo called the swamp black tupelo (N. sylvatica, variety biflora) grows in swamps along the East coast and in the Deep South. The water tupelo (N. aquatica), also called cotton gum, or swamp gum, grows in swamps of the southeastern and Gulf coasts and in the Mississippi River valley northward to southern Illinois. It grows in pure stands or in association with bald cypress and other swamp trees. The water tupelo typically reaches heights of 80-100 feet (24-30 m), and its trunk is conspicuously enlarged at the base. The ogeechee lime (N.ogeche) is a rarer North American tupelo that produces edible fruits and a fine honey. All the North American tupelos produce small greenish white flowers and small bluish black or purple berries (fruits).

Tupelo wood, most of which comes from the water tupelo, is pale yellow to light brown, fine-textured, and strong. It is used for crates and boxes, flooring, wooden utensils, and veneers.

Tupí-Guaraní languages, one of the most widespread groups of South American Indian languages (after Arawakan). It is divided by some scholars into two major divisions: Tupí in eastern Brazil and Guaraní in Paraguay and Argentina. These languages were used by the first European traders and missionaries as contact languages in their dealings with the Indians. Guaraní became the national language of Paraguay, although not with official status; persons not speaking Guaraní are in a minority in that country. The language is also a literary language for works of a popular character, especially for songs. Some scholars classify Tupí-Guaraní with a number of other less important groups in a Tupian grouping.

Tupian, South American Indians who speak languages of the Tupian linguistic group. Tupian-speaking peoples were widespread south of the Amazon. The similarity between dialects suggests that their scattering was fairly recent. Aboriginal Tupian speakers were found from the mouth of the Amazon to the Rio de la Plata, both along the Atlantic coast and in the interior.

The Tupians were tropical rain forest farmers, rivermen, and coastal navigators. Using slash-and-burn cultivation, they grew cassava, sweet potatoes, corn (maize), beans, peanuts (groundnuts), cotton, and dyes. They collected turtles and turtle eggs and caught fish and river mammals with arrows and harpoons from large dugout canoes. They also used vegetable drugs for fishing. The hunting of wild game was secondary.

The basic unit of Tupian society was the extended family (including parents, married children, and their families), occupying a single large thatched house, but some Tupians had patrilineal clans. On the lower Amazon and the coast, palisaded multi-house villages of several thousand persons occurred. These villages warred incessantly, capturing, torturing, and eating their victims. Religion was largely shamanistic with little village ceremonialism. See also Guaraní; Sirionó; Tupinambá; Kawaíb.

Tupinambá, South American Indian peoples who spoke Tupian languages and inhabited the eastern coast of Brazil from Ceará in the north to Pôrto Alegre in the south. The various groups bore such names as Potiguara, Caeté, Tupinambá, Tupinikin, and Guaraní but are known collectively as Tupinambá.

The Tupinambá lived in unusually large patrilineal villages that numbered from 400 to 1,600 persons. They supplemented farming with ocean fishing. Cassava and corn (maize) were among their staple foods. Not much is known of their social organization.

Warfare among the Tupinambá groups was constant, and indeed their religious and social values centred upon warfare and, it was alleged, on cannibalism. Ordinary Tupinambá social relations, on the other hand, were marked by gentleness and cooperation. The Tupinambá believed in demons and also in a great many ghosts who haunted dark places and often caused harm. They had shamans who communicated with spirits and were able to cure sickness. See also Tupian.

Tupolev, Andrey Nikolayevich (b. Nov. 10 [Oct. 29, Old Style], 1888, Pustomazovo, Russia—d. Dec. 23, 1972, Moscow), one of the Soviet Union's foremost aircraft designers, who helped create the Tu-144 (North Atlantic Treaty Organization code name "Charger"), the world's first supersonic passenger plane.

Tupolev entered the Moscow Higher Technical School in 1909, where he became a student and disciple of Nikolay Y. Zhukovsky, the "Father of Russian Aviation." In 1918 they organized the Central Aerohydrodynamic Institute, of which Tupolev became assistant director in 1918. He became head of the institute's design bureau in 1922.

In 1938 Tupolev was arrested as an "enemy of the people" but was released in 1943 and restored to favour. He became a lieutenant general in the Soviet army and received several Stalin prizes. He was elected to the Academy of Sciences of the U.S.S.R. in 1953 and served as a deputy to the Supreme Soviet from 1944 to 1956.

Under his direction more than 100 types of passenger aircraft and military planes were designed and built. His early aircraft included the four-engine ANT-25, which in 1937 flew along the polar route from Moscow to San Jacinto, Calif. His twin-engine tactical support bomber, the Tu-2 Bat, was used by the Soviet air force from 1944 until 1948; it was also widely used in the 1950s by the Polish and

Tupolev, 1968

Chinese air forces. The Tu-20 Bear, a fourengine turboprop bomber that first appeared in 1955, is still standard equipment in the Soviet air force and has been widely used for reconnaissance.

His supersonic bombers included the twinengine Tu-22 Blinder and a twin-jet variable geometry (swing-wing) bomber, which first appeared in the autumn of 1969. Tupolev's design group was also responsible for the supersonic all-weather interceptor Tu-28P Fiddler.

The Tu-104, which appeared in 1955, became one of the first jet transports to provide regular civilian passenger service. Tupolev was awarded the Lenin Prize in 1957 for this plane. With his son Alexey A. Tupolev, the elder Tupolev designed the Tu-144 Charger supersonic transport, which made its first test flight at a speed greater than sound in June 1060

Tupolev Tu-144, world's first supersonic transport aircraft, designed by the veteran Soviet aircraft designer Andrey N. Tupolev and his son Alexey. It was test-flown in December 1968, exceeded the speed of sound in June 1969, and was first publicly shown in Moscow in May 1970. In its production model the Tu-144 was 65.7 m (215 feet) in length, with a wingspan of 28.8 m (94 feet). Its normal cruising speed was Mach 2.2 (2,300 kilometres per hour [1,430 miles per hour]). Among its notable features were the "double-delta' swept-back wings, the "moustache" foreplanes that pivoted out from the fuselage just aft of the flight deck to improve flight characteristics during takeoff and landing, and the nose section that could be "drooped" downward to improve the crew's line of vision during takeoff and landing. The aircraft was put into commercial service on the Moscow-Alma Ata route, but it reportedly had a troubled service record, and by the mid-1980s, it had been taken out of service.

Tupper, Sir Charles, 1st Baronet (b. July 2, 1821, Amherst, Nova Scotia [now in Canada]—d. Oct. 30, 1915, Bexleyheath, Kent, Eng.), premier of Nova Scotia from 1864 to 1867 and prime minister of Canada in 1896, who was responsible for the legislation that made Nova Scotia a province of Canada

Tupper, 1883

By courtesy of the Public Archives of Canada

in 1867. As Canada's minister of railways and canals (1879-84), Tupper introduced the bill giving the Canadian Pacific Railway its charter in 1881.

In 1855 Tupper was elected to the Nova Scotia Legislative Assembly. He became provincial secretary (1856-60) and later premier. Tupper was interested in the union of the British North American provinces, and he worked to make Nova Scotia a province of Canada, a goal that he accomplished in 1867. Local opposition to Tupper's action was violent, but attempts to defeat him failed and he was elected to the new Canadian House of Commons (1867). He served in Sir John Macdonald's Conservative Cabinet from 1870 until 1873 and served again after 1878. From 1884 until 1896 he held the post of high commissioner to London, except for an interval (1887-88) when he returned to Canada as minister of finance in Macdonald's Cabinet. He became prime minister of Canada in 1896. After his party's defeat later in that year, Tupper became leader of the opposition. Earlier he had been knighted (1879) and created a baronet (1888). Reminiscences of Tupper's career are set forth in his Recollections of Sixty Years (1914).

Ţūr, aṭ-, town, capital of Sīnā' al-Janūbīah muḥāfazah (governorate), southwestern Sinai Peninsula, Egypt. It lies on the coast of the Gulf of Suez. Aṭ-Ṭūr has been an administrative centre and seaport since the Roman and Byzantine periods. In the town the Byzantine emperor Justinian (527–565) built a monastery, its ruins still extant. From the medieval period into the early 20th century, the town served as a quarantine station for hajj pilgrims. Until the opening of the Suez Canal (1869) aṭ-Ṭūr was also a port for the Red Sea trade.

Only limited agricultural activity is carried on in the vicinity by the Twara Bedouin, for whom at-Tur is a traditional centre. Their crops include dates, vegetables, and barley. Stock raising is economically important; camels, donkeys, sheep, and goats are raised, but the Twara must migrate seasonally to find pasture for their flocks. At-Tūr has also developed a fishing industry. The main spur for the town's redevelopment has been the opening of petroleum deposits along the coast of the gulf since the 1970s. The town serves as a centre for nearby oil fields.

The town's population is partly Christian, and there is an active monastery, a large church, and a guesthouse operated by monks of the Greek Orthodox St. Catherine's monastic order. There is also a sulphur hot spring and spa in the hills northeast of the town. At-Tür is served by the coastal highway which links it to the Nile valley by way of the Ahmad Hamdi Tunnel (1980) under the Suez Čanal. Pop. (1986 prelim.) 4,499.

Tura, urban settlement and administrative centre of Evenky autonomous *okrug* (district), Krasnoyarsk *kray* (region), northeast central Russian Soviet Federated Socialist Republic. The settlement lies along the Nizhnaya

(Lower) Tunguska River at its confluence with the Kochechum. Tura is a transshipment point on the river and has an institute of agriculture of the far north and a regional museum. Pop. (1976 est.) 5,100.

Tura, Cosimo, Cosimo also spelled cosmè (b. c. 1430, Ferrara, Duchy of Ferrara [Italy]—d. 1495, Ferrara), early Italian Renaissance painter, who was the founder and the first significant figure of the 15th-century School of Ferrara.

Tura was court artist at the celebrated Renaissance court of the Este dukes at Ferrara and served successively dukes Borso and Ercole I. He was probably trained in Francesco Squarcione's workshop in Padua and was influenced by Andrea Mantegna and by Piero della Francesca, when the latter artist was working in Ferrara (c. 1449–50).

Tura was a master of allegory and a considerable decorative painter. The important part played by him in the complex and eru-

"Primavera" ("Allegorical Figure"); wood panel painting by Cosimo Tura, c. 1460; in the National Gallery, London

By courtesy of the trustees of the National Gallery, London; photograph, J.R. Freeman & Co., Ltd.

dite cycle of frescoes in the Schifanoia Palace at Ferrara (1469–71) can still be seen. Other important works include his "Primavera" (c. 1460); the organ doors showing the "Annuciation" (1469) in Ferrara cathedral; a "Pietà" (c. 1472) in Venice; and a "Lamentation" from the Roverella altarpiece (c. 1472).

Tura remained within the tradition of Squarcione throughout his life, but within that tradition he developed his own personal idiom. His work is characterized by a mannered, nervous, and wiry line and the use of carefully rendered detail and brilliant colour. His figures are usually draped in metallic, angular folds.

turaco, also spelled TOURACO, also called LOURIE, or PLANTAIN-EATER, any of about 18 species of African birds constituting the family Musophagidae, placed with the cuckoos (order Cuculiformes) or separated as a distinct order, Musophagiformes. Certain of the grayish species are called go-away birds, in imitation of their calls.

Turacos are remarkable for their coloration. Some species are predominantly gray, brown, and white, but the 10 species of the genus *Tauraco* and the 2 of *Musophaga* possess unique and beautiful red pigment, turacin, and a green pigment, turacoverdin. The for-

mer occurs in the wing feathers of all 12 species and in the crests of a few; turacoverdin is found in the body plumage of these species and some of Corythaixoides.

Turaco (Tauraco hartlaubi) Lilvan Simmons-FB Inc.

Musophagids vary in size from about 35 centimetres (14 inches) in the predominantly green and blue species of Tauraco to about 70 cm (28 in.) in the great blue turaco (Corythaeola cristata). Long-tailed and short-winged, they spend their time entirely in trees in search of fruit, taking a few invertebrates; despite the alternate name, they do not eat plantains (bananas). They are social, moving in small, noisy flocks, but nest solitarily. The nest is a flat platform of twigs. Two or three white eggs are laid, producing young with thick down. able to clamber about at an early age aided by well-developed claws on the wings.

Turan Plain, Russian Turanskaya Niz-MENNOST, extensive lowland in southwestern Kazakh and northwestern Uzbek and Turkmen Soviet Socialist republics, bounded by the Kazakh Upland in the north, the foot of the Tien Shan and Pamir-Alay mountains in the east, the Kopet-Dag Mountains in the south, and the Caspian Sea in the west. It consists mainly of sand and clay desert. There are a number of hills up to 3,300 ft (1,000 m), as well as several depressions below sea level. The lowland is traversed by the lower courses of the Sur Darya and Amu Darya.

turban, Arabic 'IMĀMAH, Persian DULBĀND, a headdress, of obscure Oriental origin, con-

"A Man in a Turban," oil painting by Jan van Eyck, c. 1433; in the National Gallery, London

sisting of a long scarf wound round the head or an inner hat.

Early Persians were a conical cap sometimes encircled by bands of cloth, which perhaps may be considered one of the origins of the turban. The turban did not become common among the Turks, however, until after the capture of Constantinople in 1453, when the sultan adopted the style of the Prophet Muhammad by surrounding his cap with a large amount of white muslin wound round and round. Since then, the turban has been worn by men of the Muslim faith and of such offshoots of Islām as Sikhism, though after the early 19th century it was no longer obligatory for Muslims.

The turban varies in shape, colour, and size, some up to 50 yards (45 metres) long, depending on one's position in society—the larger the turban the higher the status. In wearing a turban, the forehead must be left bare so that the skin may touch the ground when one prays.

The turban was adopted by Europeans in the 14th century, when men wrapped their hoods around their heads, turban fashion. At times from the late 18th century until the present, women have worn turbans fashioned of silk scarves, satin, silk moiré, gauze, or tulle over wire, crepe, and the like.

turban shell, any marine snail of the family Turbinidae (subclass Prosobranchia of the class Gastropoda) that has a wide aperture in the first whorl of the stout shell, which

Turban shell (Turbo sarmaticus) J.M. Clayton from the Natural History Photographic Agency-EB

is topped by a bulbous, turban-like coil. The shell may be beaded, knobbed, or ridged. The largest species of turban shell is the 20centimetre (8-inch) green turban (Turbo marmoratus), native to the East Indies and Australia; its broad, round "cat's-eye" operculum-(lid for closing the aperture) is used for making buttons.

Turbat, town and administrative headquarters of Turbat district, Makrān division, Baluchistan province, Pakistan. The town is located on the left bank of the Kech River, a tributary to the Dasht River. It is a market place for dates grown in the surrounding region and has a date-processing factory. Points of interest include the former palace of the nawab (a provincial governor of the Mughal Empire) of Makran, the Jama Masjid (mosque), and a rest house. Roads link Turbat town with Panjgūr and Kalāt to the northwest and with Pasni to the southeast.

Turbat district, formerly part of former Makrān district, is drained to the south by the Dasht River; the Makran Range is the north and east descends to coastal plains in the south. Jowar (sorghum), barley, wheat, and rice are grown, and livestock are raised; the district is a major centre of date production. Pop. (1981 prelim.) town, 52,000; district, 378.000.

Turbay Ayala, Julio César, byname TURCO (b. June 18, 1916, Bogotá), president of Colombia from 1978 to 1982.

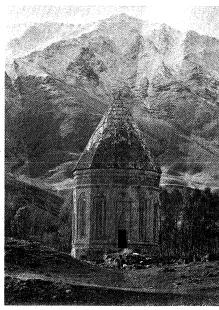

Of Lebanese descent (hence his nickname

"Turco"), Turbay Ayala was educated at the Escuela Nacional de Comercio (Bogotá) and the Colegio Universitario de Botero. He was awarded an honorary doctorate of law from the University of Cauca in 1957. Turbay served in the House of Representatives from 1943 to 1953 and held administrative positions on the Liberal Party's executive board. He was appointed minister of mines and energy in 1957 and became minister of foreign affairs in 1958 under Pres. Alberto Lleras Camargo. A centrist liberal, Turbay held that Latin American solidarity and the Alliance for Progress were essential for the economic and social development of Latin America and he opposed Cuba's ties with the Soviet Union as incompatible with Latin-American unity.

Turbay was elected to two successive terms in the Senate (1966–69), serving concurrently as UN ambassador. In the latter role he was responsible for reestablishing diplomatic relations between the U.S.S.R. and Colombia after a 20-year break. Between 1970 and 1976 he served as ambassador to Great Britain, chairman of the Liberal Party, vice president, and ambassador to the United States. After a stormy campaign, Turbay won the 1978 presidential election, narrowly defeating the Conservative candidate, Belisario Betancur Cuartas. He took office in the midst of the continuing labour and student unrest which had plagued his predecessor and found it necessary to decree a "security statute" which curtailed personal freedoms and permitted civilians accused of terrorism to be tried in military courts. In spite of a 35 percent increase in the minimum wage, industrial violence increased, leading to thousands of arrests in 1979.

Turbay Ayala was unable by law to run for reelection in 1982 and was succeeded by Belisario Betancur Cuartas.

türbe (Turkish: "tomb-tower"), Persian GONBAD, form of mausoleum architecture developed by and popular among the Seljuq Turks in Iran (mid-11th to 13th century) and

Anatolian türbe near Lake Van, Tur., 1322

later carried by them into Mesopotamia and Anatolia.

The tower form of the tomb may have been based on the cylindrical and conical forms of Seljuq tents. The earliest towers, varying in height up to 200 feet (60 metres), were traditionally built on a circular ground plan, but square and polygonal configurations had become popular by the 12th century.

The oldest surviving türbe is the Gonbad-e Qābūs, in the Gorgān region of northeastern Iran, which was built in 1006–07 for the emir Shams al-Ma'ālī Qābūs (d. 1012). The tower rises to a height of 200 feet (60 m). Its conical roof created a type, but its 10-pointed, starshaped ground plan remained unique. An example of the more common, round form is the *tūrbe* at Radkan, in Rayy, dated roughly to the 13th century. It is ornate, as Persian monuments tended to be, featuring the deeply incised, regular, concave grooves known as fluting.

In Anatolia, *türbe* architecture was simpler but no less monumental than that of Iran. A number have survived there, the earliest dated from the 12th century. Round and polygonal forms occur with equal frequency. The interior typically has a vaulted dome; the exterior, a cone. These forms were used continually from their introduction in the 12th century through the early Ottoman period (14th century). Although under the Ottomans the domed mausoleum became more popular than the funerary tower, *türbes* were still being built in the 17th century.

Turberville, George, Turberville also spelled TURBERVILE (b. 1540?, Winterbourne Whitchurch, Dorset, Eng.—d. before 1597), first English poet to publish a book of verses to his lady, a genre that became popular in the Elizabethan age.

After attending the University of Oxford, Turberville went to Russia (1568–69) as secretary to Thomas Randolph, the first English ambassador there, and later settled at Shapwick, Dorset. In Epitaphes, Epigrams, Songs and Sonets... (1567), Turberville followed models in Tottel's Miscellany and the Greek Anthology, addressing poems to his lady, the Countess of Warwick. He was also notable for his translations of Ovid and Mantuanus (1567), which included some of the first attempts at blank verse in English.

turbidimetry (chemistry): see nephelometry and turbidimetry.

turbinal, also called TURBINATE, OF TURBINATED BONE: see nasal concha.

turbine, any of various devices that convert the energy in a stream of fluid into mechanical energy by passing the stream through a system of fixed and moving fanlike blades and causing the latter to rotate.

A brief treatment of turbines follows. For full treatment, *see* MACROPAEDIA: Energy Conversion.

There are four broad classes of turbines: water (hydraulic), steam, wind, and gas. The most important application of the first three is the generation of electricity, while gas turbines are most frequently employed in aircraft to provide the motive power for jet propulsion.

The principles of turbine operation were applied in ancient times. The waterwheel, the ancestor of the water turbine, was used for grinding grain by the Romans about 70 BC. Early devices of this sort were simple paddle wheels immersed in streams where the flow of water was available to turn the wheels. A precursor of the steam-driven turbine was supposedly constructed by Hero of Alexandria about the 1st century AD. This device operated on the principle of reaction; rotation was achieved by steam issuing from curved tubes in a manner similar to that of water issuing from a rotating lawn sprinkler. The windmill, from which the modern wind turbine developed, was already in use by the mid-7th century AD in Persia. Windmills with vertical sails on horizontal shafts appear to have reached Europe through contact with the Arabs several hundred years later.

Water turbines. There are two major classes of water turbines, impulse and reaction. Hydraulic conditions at dams and waterfalls determine in large part the type of turbine that will be most effective. Impulse turbines are generally employed for high heads of water

and low flow rates, whereas reaction turbines are primarily used for heads ranging down from about 450 m (1,500 feet) and moderate or high flow rates.

Impulse turbines extract energy from water by first converting the head of water into kinetic energy. This is accomplished by passing the water through a specially shaped nozzle that discharges a jet into the air. This jet is directed onto buckets that are fixed on the rim of the runner (rotor) and formed in such a way as to remove the maximum velocity from the water. The most widely used kind of impulse turbine is the Pelton turbine, or Pelton wheel, in which each bucket is divided in the centre by a double-curved wall so that the jet of water is split upon hitting the bucket and diverted to either side, transmitting a maximum amount of energy to the turbine.

The reaction turbine achieves rotation chiefly through the reactive force produced by the acceleration of water in the runner rather than in the supply nozzles, as in the case of impulse turbines. The precise way in which this acceleration occurs differs in the three major kinds of reaction turbines—the Francis, the Kaplan, and the Deriaz. In all of them, however, a fraction of the hydraulic pressure is first converted into velocity in the passage of the water through the inlet structure, which consists of a spiral casing and a gate device that leads to the runner. The energy from the water is transformed into mechanical energy in a single-stage runner (i.e., rotor with only one wheel of buckets or blades) that absorbs the full energy of the water.

Steam turbines. This type of machine transforms thermal energy stored in steam into work. It has supplanted all other prime movers in applications involving the generation of large amounts of electric power. The steam required to drive turbines of this kind is produced chiefly by nuclear reactors and boilers that burn coal or oil.

A steam turbine typically consists of a shaft (rotor) resting in bearings and enclosed in a cylindrically shaped casing. Jets of steam issuing from nozzles located on the periphery of the turbine cylinder and impinging on the blades or buckets attached to the shaft cause the shaft to turn. In effect, a steam turbine generates motive power in a manner akin to a windmill, except that it utilizes high-pressure steam rather than a current of air as its working medium.

Steam turbines may be classified as condensing or noncondensing, depending on whether or not the steam is exhausted to a condenser. In the first type, exhaust steam is condensed by circulating large amounts of cold water through the tubes of the condenser. This water absorbs the heat given up during condensation and carries it away. The process of continuous condensation maintains a low pressure in the condenser, thus increasing the expansion ratio of the steam (i.e., the ratio of the expanded volume of steam to its original volume) and the consequent efficiency and work output of the turbine. Because of the need to maintain the highest possible efficiency, all centralstation power plants employ condensing turbines, which are connected directly to large electric generators.

In noncondensing turbines, steam, after expanding through the turbine, is exhausted to the atmosphere, a heating system, or some other kind of equipment. Machines of this type are most widely used in industrial plants where steam is needed at low or intermediate pressures and where by-product power can be generated economically by installing a noncondensing turbine between the steam generator and the equipment requiring steam.

Wind turbines. These devices convert the tremendous energy in wind to electric power. Wind turbines are generally classified into two basic types: vertical-axis machines and horizontal-axis machines.

Vertical-axis units are perhaps best exemplified by the Darrieus turbine, which features two blades consisting of twisted aluminum strips tied to the shaft at the top and bottom and bowed out in the middle, much like the blades of a food mixer. Horizontal-axis wind turbines have a rotor with metal blades that are twisted like the propeller of an airplane. The blades are rotated about their support axis by an automatic governor to maintain proper generator speed. Clusters of hundreds of wind turbines of this kind, known as wind farms, have been constructed in areas of high, nearly continuous winds, as, for example, the Tehachapi Mountains, near Barstow, Calif., and certain locations in Hawaii and New Hampshire. The millions of kilowatt-hours of electricity generated by these wind farms are fed into the electric-utilities network.

Gas turbines. The term gas turbine properly refers only to a turbine that utilizes gas as the working fluid, but it is commonly used to describe a complete internal-combustion engine consisting of a compressor, combustion chamber, and turbine. Such a heat engine can drive an electric generator, pump, or propeller; in the case of pure jet aircraft, it can develop thrust by accelerating the turbine exhaust flow through a nozzle (see also jet engine).

turbo train, high-speed passenger train powered by a gas-turbine engine similar to that used in jet aircraft. Unlike conventional trains, the turbo variety does not have a separate locomotive; its turbine power unit is small enough to be built into a passenger car. A typical turbo train consists of several passenger cars with power units located in each of the end cars. The cars are constructed of aluminum, and this, with various other design features aimed at reducing weight, minimizes the power required for high-speed locomotion. A pendulous banking suspension system enables the turbo train to travel around corners safely and smoothly at speeds 30 to 40 percent faster than other types of trains. With such a suspension system, a car is suspended above its centre of gravity so as to swing freely from a special frame, which causes the train to bank inward rather than outward around curves under centrifugal force.

The turbo train was developed during the early 1960s by engineers at the United Aircraft Corporation (now United Technologies Corporation) and was first produced by a unit of the Sikorsky Aircraft Division. These American-built turbo trains operated in the 1970s between Boston and New York City and also provided rail service between Montreal and Toronto during this period but were then abandoned. French-designed models were still operating in New York state in the mid-1980s.

The success of the Japanese Shinkansen highspeed electric trains and the sharp rise of fuel prices in the 1970s caused a serious decline in the use of turbo trains, although the suspension system developed for turbo trains continued in use.

turbojet, jet engine in which a turbine-driven compressor draws in and compresses air, forcing it into a combustion chamber into which fuel is injected. Ignition causes the gases to expand and to rush first through the turbine and then through a nozzle at the rear. Forward thrust is generated as a reaction to the rearward momentum of the exhaust gases.

The first turbojet-powered aircraft, a Heinkel He 178, was flown in Germany in 1939. A turbojet had been devised some years earlier in England by Sir Frank Whittle, but the first flight using his engine did not take place until 1941

During the 1960s the turbofan, or fanjet, a modification of the turbojet, came into common use. Some of the incoming air is bypassed around the combustion chamber and is accelerated to the rear by a turbine-operated fan. The turbofan moves a much greater mass of air than the simple turbojet, providing advantages in power and economy. *Compare* ramjet.

turboprop, also called P JET, hybrid engine that provides jet thrust and also drives a propeller. It is basically similar to a turbojet except that an added turbine, rearward of the combustion chamber, works through a shaft and speed-reducing gears to turn a propeller at the front of the engine.

The first experimental turboprop aircraft, a modified Gloster Meteor fighter equipped with two Rolls-Royce Trent units, flew in 1945 in England. The first turboprop commercial airliner to enter scheduled service was the Vickers Type 701 Viscount, April 18, 1953.

As a consequence of improvements in tur-

As a consequence of improvements in turbojet design, the turboprop—less efficient at high speeds—lost much of its importance in the 1960s, although it was retained for relatively short range aircraft.

turbot (Scophthalmus maximus), broadbodied European flatfish of the family Scophthalmidae or, in some classifications, Bothidae. A highly valued food fish, the turbot lives along sand and gravel shores. It is a left-sided flatfish, with its eyes normally on the left side of the head, and it is scaleless, though its head and body are studded with numerous bony knobs, or tubercles. It reaches a maximum length of 1 metre (40 inches) and weight of about 25 kilograms (55 pounds). Colour varies with the surroundings but is usually gray brown or light brown with darker markings.

Several other flatfish are also called turbot. Among them are the Black Sea turbot (S. maeoticus), a relative of the European species, and certain right-sided, Pacific Ocean flatfish of the genus Pleuronichthys and the family Pleuronectidae.

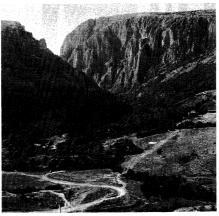

turbulence (meteorology): *see* atmospheric turbulence; clear-air turbulence.

turbulent flow, type of fluid (gas or liquid) flow in which the fluid undergoes irregular fluctuations, or mixing, in contrast to laminar flow, in which the fluid moves in smooth paths or layers. In turbulent flow the speed of the fluid at a point is continuously undergoing changes in both magnitude and direction. The flow of wind and rivers is generally turbulent in this sense, even if the currents are gentle. The air or water swirls and eddies while its overall bulk moves along a specific direction.

Most kinds of fluid flow are turbulent, except for laminar flow at the leading edge of solids moving relative to fluids or extremely close to solid surfaces, such as the inside wall of a pipe, or in cases of fluids of high viscosity (relatively great sluggishness) flowing slowly through small channels. Common examples of turbulent flow are blood flow in arteries, oil transport in pipelines, lava flow, atmosphere and ocean currents, the flow through pumps and turbines, and the flow in boat wakes and around aircraft-wing tips.

Turcoman (people): see Turkmen.

Turda, city, Cluj judeţ (district), west central Romania, on the Arieş River. Turda was first a Dacian settlement (Dierna) and later a Roman castrum (Potaissa), around which grew a municipium and later a colony. On the outskirts of the city are the salt mines worked in Roman times. In the Middle Ages, Turda was the meeting place of the Transylvanian Diet. The city is now an important industrial centre, with a cement mill, a glass and ceramics factory, a chemical works, and other plants producing silicon furnace linings and material

for insulating electrical products. It is also the centre for a tourist district, which includes the Turda Gorges (Cheile Turzii), an impressive feature of karst geology that is a national monument, and the Arieş Valley, which provides access to the Apuseni Mountains. Pop. (1982 est.) 58,744.

Turdidae, songbird family, order Passeriformes, consisting of the thrushes, bluebirds, robins, and other birds—about 305 species of the most renowned songbirds in the world, absent only from the polar regions and certain islands.

Members range in size from 11.5 to 33 centimetres (4.5 to 13 inches) long. They have slender bills and stout legs and feet, the lower leg smooth rather than scaly. Included here are such delightful songsters as the nightingale (Luscinia megarhychos), American robin (Turdus migratorius), and wood thrush (Hylocichla mustelina); as well as the bluebirds (Sialia) of poetry and the European blackbird (T. merula). Kittlitz's, or Bonin, thrush (Zoothera terrestris), last seen in 1828 on Peel Island, the Bonins (southeast of Japan) and the Raiatea thrush (T. ulietensis), not seen since 1774 on Raiatea, Society Islands (near Tahiti), are both extinct.

The Turdidae belongs to the songbird suborder (Passeres).

tureen, covered container, sometimes made to rest on a stand or dish, from which liquids, generally soup or sauce, are served at table. The earliest silver and pottery examples, dating from the early 18th century, were called terrines or terrenes (from Latin terra, "earth"), which suggests a pottery origin for the form. Most tureens are crafted in a bowl-like shape that has been influenced by the decorative conventions of their time, but novel pottery

types, in the form of realistically modelled animals and vegetables, have also been popular.

Turenne, Henri de La Tour d'Auvergne, vicomte de (viscount of) (b. Sept. 11, 1611, Sedan, Fr.—d. July 27, 1675, Sasbach, Baden-Baden), French military leader, marshal of France (from 1643), one of the greatest military commanders during the reign of Louis XIV. Beginning his military career in the Thirty Years' War (from 1625), he subsequently commanded the royal armies in the civil war of the Fronde (1648–53), in the French invasion of the Spanish Netherlands (1667), and in the third Dutch War (begun in 1672). Napoleon later deemed him history's greatest military leader.

Background and early military successes. Henri was a son of the Protestant Henri, duc de Bouillon, by his second wife, Elizabeth of Nassau, daughter of William the Silent, the stadholder of the Netherlands. When his father died in 1623, Turenne was sent to learn soldiering with his mother's brothers, Maurice and Frederick Henry, the princes of Orange who were leading the Dutch against the Spaniards in the Netherlands. Though he was given command of an infantry regiment in

the French service for the campaign of 1630, he was back with Frederick Henry in 1632.

In 1635, however, when Louis XIII's minister Cardinal de Richelieu brought France into open war against the Habsburgs (later called the Thirty Years' War), Turenne, with the rank of maréchal de camp, or brigadier, went to serve under Cardinal de La Valette (Louis de Nogaret) on the Rhine. He was a hero of a retreat from Mainz to Metz and was wounded in the assault on Saverne in July 1636. After a mission to Liège to hire troops for the French, he was sent to the Rhine again in 1638 to reinforce Bernhard of Saxe-Weimar at the siege of Breisach; he conducted the assault and won the respect of Bernhard's German troops. Two campaigns fought in Italy, culminating in the capture of Turin on Sept. 17, 1640, confirmed his reputation.

In 1642, when the French army was besieging Spanish-held Perpignan, Turenne was second in command. The conspiracy of the King's favourite, the Marquis de Cinq-Mars, against Richelieu was then brought to light, and the Duc de Bouillon was arrested. Turenne remained loyal to Louis XIII and to Richelieu; but Bouillon had to surrender Sedan in order to obtain his freedom. When Louis XIII died in 1643, the queen, Anne of Austria, became regent for her infant son Louis XIV. She gave Turenne a command in Italy in the same year, but his brother's conduct made him suspect to Richelieu's successor, Cardinal Mazarin, and no fresh troops were sent to him. Anne made Turenne a marshal of France, however, on May 16, 1643.

Command of the French forces in Germany. On Dec. 3, 1643, news reached Paris that France's Army of Germany had been scattered in the Black Forest, and its commander was dead. The command was given to Turenne, who made an effective army from this broken force-mainly Germans who had followed Bernhard of Saxe-Weimar. But he had barely 10,000 men and remained weaker than his Bavarian opponents, a fact that dictated his conduct from 1644 to 1648. The Rhineland was devastated, and Turenne could act only by marching far into Germany to seize control of new forage lands. Unless he could join forces with another army, therefore, he could do nothing.

In 1644 Turenne watched the Bavarians take Freiburg im Breisgau, appealed for help, and was joined by the small army of the Duke d'Enghien, Louis II de Bourbon, prince de Condé. The latter was younger by 10 years than Turenne but took command of both armies because a French prince was senior to a French marshal; even so, they were good colleagues. Three fierce actions near Freiburg induced the Bavarians to leave the Rhine valley; and Enghien and Turenne took Philippsburg in September and gained control of the Rhine towns as far north as Bingen.

In 1645 Turenne, intending to effect a junction with France's Swedish allies in Germany, marched through Württemberg. But in May the Bavarians made a surprise attack, and half of Turenne's army was lost in the Battle of Marienthal (Mergentheim). Turenne fell back, and Mazarin sent Enghien to rescue him. Their united forces met the Bavarians in the Battle of Nördlingen and reached the Danube but with such heavy loss in infantry that they soon had to return to the Rhine.

In 1646 Turenne achieved his plan of joining the much stronger Swedish army, though Mazarin feared the Protestant supremacy in Germany that might be the result. Turenne crossed the Rhine at Wesel and met the Swedes under Field Marshal Carl Gustav Wrangel. The two commanders evaded the Austro-Bavarians on the Main, marched straight for the Danube, and threatened Augsburg and Munich. The elector Maximilian I of Bavaria then began negotiations with the French and, by the Treaty of Ulm (March 14, 1647), abandoned his alliance with the Holy Roman emperor Ferdinand III. But Turenne was thwarted, and Ferdinand's Austrians were saved, when Mazarin ordered the Army of Germany to operate in Luxembourg. Then, when the army reached the Vosges, the German cavalry mutinied and turned back across the Rhine. For three months Turenne marched with them far into Germany. In the end his powerful personality brought most of them back to the French service.

When Bavaria returned to the emperor's side in 1648, Turenne rejoined Wrangel, and they reached the Danube, the Lech, and—after the Battle of Zusmarshausen—the Inn River, the nearest point to Austria yet attained by the French. Maximilian fled from Bavaria, and the emperor agreed to the Peace of Westphalia, ending the Thirty Years' War.

Participation in the Fronde. The same year marked the beginning of the so-called Fronde, an aristocratic rebellion against Mazarin. Turenne's family's interests and the friendship of Condé's sister, the Duchess de Longueville, led him to intervene on the side of the rebellion in the first war of the Fronde, precipitated by the unpopularity of Mazarin's fiscal measures. The cardinal at once sent a new general and arrears of pay to the Army of Germany, and Turenne fled to Holland just when the compromise peace was being negotiated at Rueil. He returned to Paris in May 1649.

When Mazarin arrested the overbearing Condé on Jan. 18, 1650, Turenne again fled, joining the Duchess de Longueville at Stenay on the eastern border of Champagne. They

tied themselves by treaty to the Spaniards, then at war with France, and waged war in Champagne until Turenne was completely defeated in the Battle of Rethel (Dec. 15, 1650) by superior forces under Marshal du Plessis-Praslin (César, later Duke de Choiseul) and narrowly escaped capture.

Mazarin's voluntary exile from Paris and Condé's release brought Turenne back to Paris in May 1651, with his credit at a low point. In August 1651 he married the firmly Protestant Charlotte de Caumont. He stood aloof from politics without committing himself to Condé's faction. It was his brother, the Duke de Bouillon, who came to terms with the queenregent in March 1652, with the result that Turenne was promptly put in command of one of the two divisions of the royal army, each 4,000 strong, which had been assembled on the Loire to oppose Condé and his allies.

A few days later his courageous and clear-sighted action in blocking the bridge at Jargeau saved the young king from capture by the rebels; and in April, at Bléneau, he checked Condé and rescued his defeated colleague, Marshal d'Hocquincourt (Charles de Monchy). His campaign of 1652–53, first on the Loire, then before Paris, and in Champagne, was Turenne's greatest service to the monarchy: his resources were small, and but for his great skill he might have been overwhelmed; yet he staunchly kept the queenregent's court from taking refuge far from Paris and thus enabled the young Louis XIV at last to reenter his capital.

The Franco-Spanish War. With the defeat of the rebellion, good troops from other parts of France could be brought to reinforce those in the northeast and to prosecute the struggle there against the Spaniards, with whom Condé was now serving. The turning point came in 1654, when Turenne and his colleagues stormed three lines of trenches and expelled the army that was besieging Arras. In 1658 Turenne surmounted the physical obstacles to investing Dunkirk and, when the Spaniards advanced, defeated them in the Battle of the Dunes (June 14), skillfully using the difficult ground into which his enemy had unwisely moved. His victory enabled him to hand Dunkirk over to France's English allies and allowed him to move freely in Flanders, taking Ypres and threatening Ghent and Brussels. The Franco-Spanish Peace of the Pyrenees followed in 1659. For the second time Turenne's operations had won an advantageous peace.

Last campaigns. On April 5, 1660, Turenne was appointed "marshal-general of the camps and armies of the King," an extraordinary honour that implied that he might have been constable of France if he abjured his Protestant faith. When he abjured in 1668, after his wife's death (1666), however, he was not made constable (ex officio commander in chief in war). The development of the Ministry of War by the Marquis de Louvois enabled Louis XIV to command in person, and in the War of Devolution (1667–68) and in the invasion of Holland (1672) Turenne marched at his side. Then, when the German allies of the Dutch menaced the lower Rhineland, Turenne was once more sent east of the Rhine, but with only 16,000 men, a secondary command.

Yet these campaigns of 1672–75 brought him enduring fame. He resented the detailed control of military affairs by the arrogant Marquis de Louvois, but the minister's supplies enabled him to maintain active operations into the winter. He had long been a master of "strategic chess moves," but he was bolder now; he offered battle more often and looked for opportunities when his more powerful adversaries were weakened by detachments. By January 1673 he had broken the German coalition for a time and by invading the County of Mark had forced the elector Frederick William of Brandenburg to negotiate; he had also prevented the enemy

from crossing the Rhine. Later in the year his wider maneuvering against the emperor Leopold I's army had such success that he could have reached Bohemia; but Louvois refused him reinforcement for a decisive operation, and when Turenne was called back to cover Alsace, the emperor's forces struck at Bonn and so broke the French control of the lower Rhine.

Greatly superior German forces moved toward the Rhine in 1674. Turenne defeated a detached corps at Sinzheim, near Heidelberg, on June 16, and ravaged the Palatinate. But by September he was again west of the Rhine, with little hope of barring the advance of the main enemy forces. At Enzheim, near Strassburg, he attacked them on October 4, but he drew back before a decisive point was reached; and as the Brandenburgers also joined the emperor's forces, their 57,000 men seemed in secure possession of Alsace. Turenne replied in December with the most famous of his marches. He turned south on the French side of the Vosges, reappeared at Belfort, and, at Turckheim on Jan. 5, 1675, delivered so heavy a blow on the flank of the main army that the Germans decided to recross the Rhine. Alsace was saved.

In June 1675 Turenne was on the right bank of the Rhine maneuvering against the Italian field marshal in imperial service, Raimondo Montecuccoli, for the control of the crossing near Strassburg. The armies were in contact at Sasbach, and Turenne was examining a position when he was killed by a cannon shot on July 27, 1675. He was buried with the kings of France at Saint-Denis. Later the emperor Napoleon had his remains transferred to the Invalides in Paris. (I.D'O.E.)

BIBLIOGRAPHY. Max Weygard, *Turenne: Marshall of France* (1930), is the only biography in English.

turf, in horticulture, the surface layer of soil with its matted, dense vegetation, usually grasses grown for ornamental or recreational use. Such turf grasses include Kentucky bluegrass, creeping bent grass, fine or red fescue, and perennial ryegrass among the popular cool-season types and Bermuda grass, zoysia grass, and St. Augustine grass among the warm-season types.

Turf grasses are often grown on turf, or sod, farms. Portions of the sod—as plugs, blocks, squares, or strips of turf grass—are cut and transplanted to areas where they quickly establish and grow. Lawns are fine-textured turfs that are mowed regularly and closely to develop into dense, uniformly green coverings that beautify open spaces and provide sports playing surfaces, as in tennis lawns, golf and bowling greens, and racing turfs. See also bent grass; Bermuda grass; bluegrass; carpet grass; fescue; ryegrass; Zoysia.

Turfan (China): see T'u-lu-p'an.

Turfan Depression, Wade-Giles romanization T'U-LU-P'AN P'EN-TI, Pinyin TURPAN PENDI, deep mountain basin in the Uighur Autonomous Region of Sinkiang, China. The Turfan Depression is a fault trough, descending at its lowest point to 505 feet (154 m) below sea level (the lowest elevation in China) at Lake Ai-ting, whereas the neighbouring Tarim River and Lop Nor (Lop Lake) areas are between 2,000 and 3,000 feet (600 and 900 m) above sea level. The basin has an area of 20,000 square miles (50,000 square km).

The basin lies between the Po-ko-ta Mountains to the north and the northern section of the K'u-lu-k'o-t'a-ko range to the south. Within this depression another major fault forms the Chüeh-lo-t'a-ko Mountains, which divide the basin into two sections. The northern section forms a zone at the foot of the Po-

ko-ta range. This area, about 500 feet (150 m) above sea level, drains into the lower southern depression through steep canyonlike gorges. The lower basin, once the site of a lake, slopes toward the south where there is a salt swamp called Ai-ting Lake.

The whole basin is irrigable, either (in the north) using surface water or (in the south) by the Persian technique of using tunnels that tap groundwater from higher areas. Since 1964 canals have been dug through which the melting snow of the T'ien Shan (mountains) to the north is brought to the oases in the basin. The area has great climatic extremes: the average monthly temperature is 14° F (-10° C) in January and 90° F (32° C) in July. Daily variations from these averages, however, can be enormous. The highest temperature recorded in China, 118° F (48° C), was at Turfan (T'u-lu-p'an) in the northern part of the basin, while the lowest recorded temperature, -62° F (-52° C), was at Fu-yun, not far from Turfan. Rainfall in the depression is scanty, with only 0.6-1.2 inches (16-30 mm) per year. The extreme temperatures and windblown sands are major problems for the basin's inhabitants.

The basin is intensively farmed and is especially well-known for its fruit, particularly Hami melons and grapes. Watermelons, apples, peaches, apricots, and nuts are also produced. The area also grows a good deal of cotton and silk in addition to grain crops, especially wheat.

The inhabitants are almost entirely Uighur Muslims, who, after the Communists came to power in 1949, were organized into communes rather later than elsewhere in China.

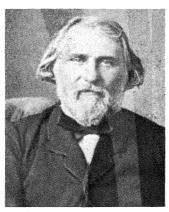

The higher northern part of the depression forms long-established natural routes leading from the trade route known as the Kansu, or Hosi, Corridor to the southeast. One route lies northwest through the gap at Wu-lu-mu-ch'i between the Op-lo-ho-lo and Po-ko-ta ranges into the Dzungaria region of Sinkiang Uighur to the north; another is formed across the western end of the depression and A-hai-ch'üan Pass to Yen-ch'i (Karashahr) and the northern edge of the Tarim Basin to the south. There are ruins of several ancient cities in the area. The modern centres of population in the depression are the cities of Turfan, on the north of the depression, and T'o-k'o-sun (Toksun), at the western end.

Turgay, also spelled TURGAI, or TURGAI, oblast (province), central Kazakh Soviet Socialist Republic, created in 1970, though a larger *oblast* of the same name existed in tsarist times. With an area of 43,200 square miles (111,900 square km), it embraces the western fringes of the Kazakh Upland and part of the Turgay Steppe. The main rivers are the Ishim, flowing north, and the Turgay, south. The climate is continental, and annual precipitation varies from 8 to 12 inches (200 to 300 mm). There are important bauxite mines at Arkalyk, and large fire-clay deposits in the same area are exploited. Crops, chiefly grain, are grown in the north, while the arid, sparsely inhabited south is given over mainly to sheep. The Tobol-Tselinograd railway traverses the oblast, with a branch line from Yesil to Arkalyk; the latter is the administrative centre. Other cities include Oktyabrsky, Zhaksy, Derzhavinsky, and Amangeldy. Pop. (1987 est.) 322,000.

Turgay Valley, also spelled TURGAI, or TURGAI, Russian TURGAYSKAYA DOLINA, also spelled TURGAISKAIA DOLINA, depression in western Kazakh Soviet Socialist Republic. Some 12–125 miles (20–200 km) wide, it runs roughly north–south for about 375 miles (600 km) through the middle of the Turgay Plateau. It was formed by a caving-in of the

ancient foundation, and in the Ice Age, water flowed along it from the West Siberian Plain to the Turan Plain. Today it contains a chain of fresh and saline lakes, with the Ubagan River flowing north and the Turgay south. The valley is a major spring and autumn migration route for birds.

Turgenev, Ivan (Sergeyevich) (b. Nov. 9 [Oct. 28, Old Style], 1818, Oryol, Russia—d. Sept. 3 [Aug. 22], 1883, Bougival, near Paris, Fr.), Russian novelist, poet, and playwright, whose major works include the short-story collection A Sportsman's Sketches (1852) and the novels Rudin (1856), Home of the Gentry (1859), On the Eve (1860), and Fathers and Sons (1862). These works offer realistic, affectionate portrayals of the Russian peasantry and penetrating studies of the Russian intelligentsia who were attempting to move the

Ivan Turgenev
From the collection of David Magarshack

country into a new age. The many years that Turgenev spent in western Europe were due in part to his personal and artistic stand as a liberal between the reactionary tsarist rule and the spirit of revolutionary radicalism that held so great a sway in the contemporary artistic and intellectual circles in Russia. Turgenev poured into his writings not only a deep concern for the future of his native land but also an integrity of craft that has ensured his place in Russian literature.

Early life and works. Turgenev was the second son of a retired cavalry officer, Sergey Turgenev, and a wealthy mother, Varvara Petrovna, née Lutovinova, who owned the extensive estate of Spasskoye-Lutovinovo. Turgenev's earliest memory was of nearly falling into the bear pit in Bern, Switz., during his family's grand tour of Europe in 1822. He was rescued by his father, but he was not saved from Europe. Turgenev was to be the only Russian writer with avowedly European outlook and sympathies. Though he was given an education of sorts at home, in Moscow schools and at the universities of both Moscow and St. Petersburg, Turgenev tended to regard his education as having taken place chiefly during his plunge "into the German sea" when he spent the years 1838 to 1841 at the University of Berlin, where he met the leading figures of his own generation, including the anti-Marxist revolutionary Mikhail Bakunin. Through them his interest was aroused in the philosophy of G.W.F. Hegel, which underlay much revolutionary thought, and he was also inspired with the ideal of dedicating his life and talent to the future of Russia. He returned home as a confirmed believer in the superiority of the West and of the need for Russia to follow a course of Westernization.

Though Turgenev had composed derivative verse and a poetic drama, *Steno* (1834), in the style of the English poet Lord Byron, the first of his works to attract attention was a long poem, *Parasha*, published in 1843. The potential of the author was quickly appre-

ciated by the critic Vissarion Belinsky, who became Turgenev's close friend and mentor. Belinsky's conviction that literature's primary aim was to reflect the truth of life and to adopt a critical attitude toward its injustices became an article of faith for Turgenev. He never believed, however, that social concerns should take precedence over art. Despite the influence of Belinsky, he remained a writer of remarkable detachment, of a cool and sometimes ironic objectivity that his enemies unfairly labeled disdain.

Turgenev was not a man of grand passions, although the love story was to provide the most common formula for his fiction, and a love for the renowned singer Pauline Viardot, whom he first met in 1843, was to dominate his entire life. His relation with Viardot, like his love for Europe, usually has been considered platonic, yet some of his letters, often as brilliant in their observation and as felicitous in their manner as anything he wrote, suggest the existence of a greater intimacy. Generally, though, they reveal him as the fond and devoted admirer, in which role he was for the most part content. He never married, though in 1842 he had had an illegitimate daughter by a peasant woman at Spasskoye; he later entrusted the upbringing of the child to Viardot.

During the 1840s, Turgenev wrote more long poems, including A Conversation, and Andrey, The Landowner, and some criticism. Having failed to obtain a professorship at St. Petersburg university and having abandoned work in the government service, he began to publish short works in prose. These were studies in the "intellectual-without-a-will" so typical of his generation. The most famous was "The Diary of a Superfluous Man" (1850), which supplied the epithet "superfluous man' for so many similar weak-willed intellectual protagonists in Turgenev's work as well as in Russian literature generally.

Simultaneously, he tried his hand at writing plays, some, like A Poor Gentleman (1848), rather obviously imitative of the Russian master Nikolay Gogol. Of these, *The Bachelor* (1849) was the only one staged at this time, the others falling afoul of the official censors. Others of a more intimately penetrating character, such as One May Spin a Thread Too Finely (1848), led to the detailed psychological studies in his dramatic masterpiece. A Month in the Country (1855). This was not staged professionally until 1872. Without precedent in the Russian theatre, it required for its appreciation by critics and audiences the prior success after 1898 of the plays of Anton Chekhov at the Moscow Art Theatre. It was there in 1909, under the great director Konstantin Stanislavsky, that it was revealed as one of the major works of the Russian

Sketches of rural life. Before going abroad in 1847, Turgenev left in the editorial offices of the literary journal Sovremennik ("The Contemporary") a short study, "Khor and Kalinych," of two peasants whom he had met on a hunting trip in the Orel region. It was published with the subtitle "From a Hunter's Sketches," and it had an instantaneous success. From it was to grow the short-story cycle ASportsman's Sketches, first published in 1852, that brought him lasting fame. Many of the sketches portrayed various types of landowners or episodes, drawn from his experience, of the life of the manorial, serf-owning Russian gentry. Of these, the most important are "Two Landowners," a study of two types of despotic serf-owners, and "Hamlet of Shchi-grovsky Province," which contains one of the most profound and poignant analyses of the problem of the "superfluous man." Far more significant are the sketches that tell of Turgenev's encounters with peasants during his hunting trips. Amid evocative descriptions of the countryside, Turgenev's portraits suggest that, though the peasants may be "children of nature" who seek the freedom offered by the beauty of their surroundings, they are always circumscribed by the fact of serfdom.

Turgenev could never pretend to be much more than an understanding stranger toward the peasants about whom he wrote, yet through his compassionate, lucid observation, he created portraits of enormous vitality and wide impact. Not only did they make the predominantly upper class reading public aware of the human qualities of the peasantry, but they also may have been influential in provoking the sentiment for reform that led eventually to the emancipation of the serfs in 1861. He added to the *Sketches* during the 1870s, including the moving study of the paralyzed Lukeriya in "A Living Relic" (1874).

When the first collected edition appeared, after appearing separately in various issues of the Sovremennik, Turgenev was arrested, detained for a month in St. Petersburg, then given 18 months of enforced residence at Spasskoye. The ostensible pretext for such official harrassment was an obituary of Gogol, which he had published against censorship regulations. But his criticism of serfdom in the Sketches, certainly muted in tone by any standards and explicit only in his references to the landowners' brutality toward their peasants, was sufficient to cause this temporary martyrdom for his art.

First novels. Although Turgenev wrote "Mumu," a remarkable exposure of the cruelties of serfdom, while detained in St. Petersburg, his work was evolving toward such extended character studies as Yakov Pasynkov (1855) and the subtle if pessimistic examinations of the contrariness of love found in "Faust" and "A Correspondence" (1856). Time and national events, moreover, were impinging upon him. With the defeat of Russia in the Crimean War (1854-56), Turgenev's own generation, "the men of the forties," began to belong to the past. The two novels that he published during the 1850s—Rudin (1856) and Home of the Gentry (1859)—are permeated by a spirit of ironic nostalgia for the weaknesses and futilities so manifest in this generation of a decade earlier.

The first of Turgenev's novels, Rudin. tells of an eloquent intellectual, Dmitry Rudin, a character modeled partly on Bakunin, whose power of oratory and passionately held belief in the need for progress so affect the younger members of a provincial salon that the heroine, Natalya, falls in love with him. But when she challenges him to live up to his words, he fails her. The evocation of the world of the Russian country house and of the summer atmosphere that form the backdrop to the tragicomedy of this relationship is evidence of Turgenev's power of perceiving and recording the constancies of the natural scene. The vaster implications about Russian society as a whole and about the role of the Russian intelligentsia are present as shading at the edges of the picture rather than as colours or details in the foreground.

Turgenev's second novel, *Home of the Gentry*, is an elegiac study of unrequited love in which the hero, Lavretsky, is not so much weak as the victim of his unbalanced upbringing. The work is notable for the delicacy of the love story, though it is a shade mawkish on occasion. More important in terms of the author's thought is the elaborate biography of the hero. In it is the suggestion that the influence of the West has inhibited Turgenev's generation from taking action, forcing them to acknowledge finally that they must leave the future of Russia to those younger and more radical than themselves.

The objectivity of Turgenev as a chronicler of the Russian intelligentsia is apparent in these early novels. Unsympathetic though he may have been to some of the trends in the thinking of the younger, radical generation that emerged after the Crimean War, he en-

deavoured to portray the positive aspirations of these young men and women with scrupulous candour. Their attitude to him, particularly that of such leading figures as the radical critics Nikolay Chernyshevsky and Nikolay Dobrolyubov, was generally cold when it was not actively hostile. His own rather self-indulgent nature was challenged by the forcefulness of these younger contemporaries. He moved away from an emphasis on the fallibility of his heroes, who had been attacked as a type by Chernyshevsky, using the short story "Asya" (1858) as his point of departure. Instead, Turgenev focused on their youthful ardour and their sense of moral purpose. These attributes had obvious revolutionary implications that were not shared by Turgenev, whose liberalism could accept gradual change but opposed anything more radical, especially the idea of an insurgent peasantry.

The novel On the Eve (1860) deals with the problem facing the younger intelligentsia on the eve of the Crimean War and refers also to the changes awaiting Russia on the eve of the emancipation of the serfs in 1861. It is an episodic work, further weakened by the shallow portrayal of its Bulgarian hero. Although it has several successful minor characters and some powerful scenes, its treatment of personal relations, particularly of love, demonstrates Turgenev's profound pessimism toward such matters. Such pessimism became increasingly marked in Turgenev's view of life. It seems that there could be no real reconciliation between the liberalism of Turgenev's generation and the revolutionary aspirations of the younger intelligentsia. Turgenev himself could hardly fail to feel a sense of personal involvement in this rupture.

Turgenev's greatest novel, Fathers and Sons (1862), grew from this sense of involvement and yet succeeded in illustrating, with remarkable balance and profundity, the issues that divided the generations. The hero, Bazarov, is the most powerful of Turgenev's creations. A nihilist, denying all laws save those of the natural sciences, uncouth and forthright in his opinions, he is nonetheless susceptible to love and by that token doomed to unhappiness. In sociopolitical terms he represents the victory of the nongentry revolutionary intelligentsia over the gentry intelligentsia to which Turgenev belonged. In artistic terms he is a triumphant example of objective portraiture, and in the poignancy of his death he approaches tragic stature. The miracle of the novel as a whole is Turgenev's superb mastery of his theme, despite his personal hostility toward Bazarov's antiaestheticism, and his success in endowing all the characters with a quality of spontaneous life. Yet at the novel's first appearance the radical younger generation attacked it bitterly as a slander, and the conservatives condemned it as too lenient in its exposure of nihilism.

Turgenev's novels are "months in the country," which contain balanced contrasts such as those between youth and age, between the tragic ephemerality of love and the comic transience of ideas, between Hamlet's concern with self and the ineptitudes of the quixotic pursuit of altruism. The last of these contrasts he amplified into a major essay, "Hamlet and Don Quixote" (1860). If he differed from his great contemporaries Fyodor Dostoyevsky and Leo Tolstoy in the scale of his work, he also differed from them in believing that literature should not provide answers to life's question marks. He constructed his novels according to a simple formula that had the sole purpose of illuminating the character and predicament of a single figure, whether hero or heroine. They are important chiefly as detailed and deft sociopsychological portraits. A major device of the novels is the examination of the effect of a newcomer's arrival upon a small social circle. The circle, in its turn, subjects the newcomer to scrutiny through the relation that develops

between the heroine, who always belongs to the "place" of the fiction, and the newcomerhero. The promise of happiness is offered, but the ending of the relation is invariably calami-

Self-exile and fame. Always touchy about his literary reputation, Turgenev reacted to the almost unanimously hostile reception given to Fathers and Sons by leaving Russia. He took up residence in Baden-Baden in southern Germany, to which resort Viardot had retired. Quarrels with Tolstoy and Dostoyevsky and his general estrangement from the Russian literary scene made him an exile in a very real sense. His only novel of this period, Smoke (1867), set in Baden-Baden, is infused with a satirically embittered tone that makes caricatures of both the left and the right wings of the intelligentsia. The love story is deeply moving, but both this emotion and the political sentiments are made to seem ultimately no more lasting and real than the smoke of the title.

The Franco-German War of 1870–71 forced the Viardots to leave Baden-Baden, and Turgenev followed them, first to London and then to Paris. He now became an honoured ambassador of Russian culture in the Paris of the 1870s. The writers George Sand, Gustave Flaubert, the Goncourt brothers, the young Émile Zola, and Henry James were only a few of the many illustrious contemporaries with whom he corresponded and who sought his company. He was elected vice president of the Paris international literary congress in 1878, and in 1879 he was awarded an honorary degree by the University of Oxford. In Russia he was feted on his annual visits.

The literary work of this final period combined nostalgia for the past-eloquently displayed in such beautiful pieces as " of the Steppes" (1870), "Torrents of Spring" (1872), and "Punin and Baburin" (1874)with stories of a quasi-fantastic character-"The Song of Triumphant Love" (1881) and "Klara Milich" (1883). Turgenev's final novel, Virgin Soil (1877), was designed to recoup his literary reputation in the eyes of the younger generation. Its aim was to portray the dedication and self-sacrifice of young populists who hoped to sow the seeds of revolution in the virgin soil of the Russian peasantry. Despite its realism and his efforts to give the war top-icality, it is the least successful of his novels. His last major work, Poems in Prose, is remarkable chiefly for its wistfulness and for its famous eulogy to the Russian language.

Evaluation. Turgenev's work is distinguished from that of his most famous contemporaries by its sophisticated lack of hyperbole, its balance, and its concern for artistic values. His greatest work was always topical, committed literature, having universal appeal in the elegance of the love story and the psychological acuity of the portraiture. He was similarly a letter writer of great charm, wit, and probity. His reputation may have become overshadowed by those of Dostoyevsky and Tolstoy, but his own qualities of lucidity and urbanity and, above all, his sense of the extreme preciousness of the beautiful in life endow his work with a magic that has lasting appeal.

Useful translations include Turgenev's Literary Reminiscences and Autobiographical Fragments, trans. by David Magarshack, with an essay by Edmund Wilson (1958); and Turgenev's Letters: A Selection, ed. and trans. by E.H. Lehrman (1961). Leonard B. Schapiro, Turgenev: His Life and Times (1978, reissued 1982) is a well-researched biography. A. Yarmolinsky, Turgenev the Man: His Art and His

Age (1926, rev. ed. 1959); David Magarshack, Turgenev: A Life (1954); and Henri Troyat, Turgenev (1988), are useful complementary biographies. See also H. Granjard, Ivan Tourguénev et les courants politiques et sociaux de son temps (1954), a valuable study of Turgenev's political evolution; R.H. Freeborn, Turgenev: The Novelist's Novelist (1960), a guide to Turgenev's novels; and Patrick Waddington, Turgenev and England (1980), a study of England's influence on the writer.

Turgenev, Nikolay Ivanovich (b. Oct. 23 [Oct. 12, Old Style], 1789, Simbirsk, Russia—d. Nov. 10 [Oct. 29], 1871, Paris), Russian government official and economist who was a cofounder of the revolutionary Northern Society, which staged the Decembrist uprising of 1825 in St. Petersburg (now Leningrad).

Born into the middle class, Turgenev was one of a number of Russian youths infected by the liberal spirit that emerged in Europe after the French Revolution. He belonged to the Union of Welfare, a reformist society, many of whose members eventually came to advocate the overthrow of the autocracy. In 1821 the group formally disbanded but covertly reorganized itself into several secret branches, including the Northern Society in St. Petersburg.

An opponent of serfdom, Turgenev wrote a number of books on taxation and serfdom that had a wide influence prior to the 1825 revolt, the most prominent of these being Experience of the Theory of Taxation (1818). Abroad at the time of the December uprising, Turgenev became an emigré (having been tried in absentia and sentenced to hard labour for life). In 1847 he published Russia and the Russians, regarded as one of the first comprehensive accounts of the development of Russian political thought.

Turgot, Anne-Robert-Jacques, BARON DE L'AULNE (b. May 10, 1727, Paris—d. March 18, 1781, Paris), French economist, who was an administrator under Louis XV and served as the comptroller general of finance (1774–

Turgot, portrait, 18th century; in the Musée de Versailles

Giraudon—Art Resource/EB Inc.

76) under Louis XVI. His efforts at instituting financial reform were blocked by the privileged classes.

Youth. Turgot was born into an old Norman family whose members had already held some important administrative posts. (His fa-

ther. Michel-Étienne [1690-1751], was to be 'provost of merchants," the head of the Paris municipality, from 1729 to 1740.) Destined for the church, he entered the Seminary of Saint-Sulpice (1743) and the Sorbonne (1749), exhibiting both as a schoolboy and as an advanced student a precocious but sound maturity of intellect. He was influenced from his adolescence by all the fashionable ideas of his day: scientific curiosity, liberalism, tolerance, and an interest in social evolution. In 1751, on the threshold of ordination, he drew back, explaining to his relatives that it would have been impossible for him always to have lived under false pretenses, being, in fact, a deist. His occasional attendance at mass was necessitated by his rank.

From that time on, Turgot's friends comprised such philosophes as the Marquis de Condorcet and Pierre-Samuel du Pont de Nemours, who were both attached to the famous physiocratic school of thought, which generally has been regarded as the first scientific school of economics. Late in 1751 he announced his intention of seeking a career in the royal administration and entered the law, becoming a deputy solicitor general in January 1752 and later a counselor magistrate to the Parlement (supreme court of law) in Paris (December 1752).

Early career. In 1753 he bought, as was the custom, the office of examiner of petitions, thus entering the branch of the magistracy that provided officials for the bureaucracy and that upheld the royal authority. With 39 other examiners he was called upon to serve in the Royal Chamber, which acted as a supreme court in 1753-54, when the Parlement was exiled for defying the crown. He combined his duties with other forms of intellectual activity. In 1753 he translated into French Josiah Tucker's Reflections on the Expediency of a Law for the Naturalization of Foreign Protestants (1752) and the following year published Lettres sur la tolérance (Letters on Tolerance). Between 1753 and 1756 Turgot accompanied J.-C.-M. Vincent de Gournay, the mentor of the physiocratic school and an intendant of commerce, on his tours of inspection to various French provinces.

By 1761 Turgot had drawn enough attention to himself for Louis XV to accept his nomination as intendant to the administrative region of Limoges. He occupied this post, then considered one of the least desirable available, for 13 years and there displayed his extraordinary capacities as an administrator, reformer, and economist. In 1766 he published his best-known work, Reflections on the Formation and Distribution of Wealth, to which he was to add-among other famous works-Lettres sur la liberté du commerce des grains (1770; "Letters on the Freedom of the Grain Trade"). He introduced new methods to the peasant region he administered, substituting a small tax in money for the corvée (unpaid work required of peasants for the upkeep of roads); compiling a land register (cadastre) for tax purposes; and combatting the famine of 1770-71, during which—despite oppositionhe maintained the free commerce in grain. He was appointed comptroller general by Louis

XVI on Aug. 24, 1774.

Ministry. Turgot was all that a successful courtier should not be. Large and fat, with regular and quite distinguished features, he was nevertheless a shy and awkward bachelor who blushed easily, spoke with hesitation, and was rarely convivially gay. Though his customary serious manner was tinged with humour, he was not persuasive and could irritate a questioner with the brusqueness of his statements, his theoretical cast of thought, and the suppressed irony of his half smile.

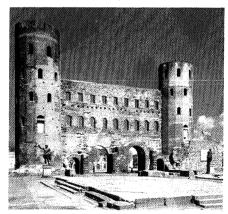

Realizing that the young king was inexperienced and wishing to avoid political storms, Turgot temporized during the first days of his ministry, but later, feeling himself threatened

by his adversaries, a frenzy for public service drove him to accumulate reforms. He introduced his Six Edicts in 1776. Four of them (suppressing certain dues and offices) were of no great importance, and the fifth (suppressing the guilds of Paris) encountered no serious opposition. It was against the sixth edict, that abolishing the corvée, that his enemies, who defended privilege, concentrated their attack. Appealing in vain to the good sense and courage of the young king from whom he had been alienated by a coalition of financiers, place-holders, privileged classes, and the religious party at court, he saw his reforms abandoned and, after his dismissal on May 1776, forgotten. Five years later, having published nothing since his public disgrace, he died in Paris attended by a few friends.

BIBLIOGRAPHY. The best modern work on Turgot is by the French politician Edgar Faure, La Disgrâce de Turgot, 2 vol. (1961). Earlier but nevertheless useful works are W. Walker Stephens (ed.), The Life and Writings of Turgot (1895); and Douglas Dakin, Turgot and the Ancien Régime in France (1939). Other significant works are the biography by Turgot's contemporary, P.S. Dupont de Memours, Mémoires sur la vie et les ourrages de M. Turgot (1782); and F. Alengry, Turgot (1727–1781) homme privé, homme d'état (1942). The complete works of Turgot have been edited by Gustave Schelle, 5 vol. (1913–33). B. Cazes has published extracts from his works under the title Turgot, écrits économiques (1970).

Türgovishte, also spelled Tărgovište, formerly (until 1934) ESKI DZHUMAYA, town, eastern Bulgaria, on the Vrana River. Known formerly for its great cattle fair, which attracted visitors from throughout the Balkans, it continues as a craft centre, producing textiles, furniture, pottery, and processed foods. It has long been a centre for the Muslim faith in Bulgaria. Its former Turkish name was Eski Cumaya (Dzhumaya), but the modern town has subdued its Oriental character. It was taken from the Turks by the Russians in 1878 and restored to Bulgaria. Five major roads radiate from the town. Pop. (1986 est.) 46,512.

Turin, Italian TORINO, Latin AUGUSTA TAU-RINORUM, city, capital of Torino provincia and of Piemonte (Piedmont) regione, northwestern Italy, on the Po River, near its junction with

Palatine Gate, Turin, Italy

the Sangone, the Dora Riparia, and the Stura di Lanzo. The original settlement of Taurisia, founded by the Taurini, was partly destroyed by the Carthaginian invader Hannibal in 218 BC. It later became a Roman military colony, known successively as Julia Taurinorum and Augusta Taurinorum, rebuilt by the emperor Augustus in the form of an enclosed rectangle divided into 72 blocks (insulae). The remains of the walls and the Palatine Gate and the Palatine Towers are still visible. Dominated by barbarians after the decline of Rome in the

4th century, the city became part of the Lombard kingdom and then of the Frankish empire. It was linked to Savoy in 1046 by the marriage of Countess Adelaide to Count Odo of Savoy, and it recognized the supremacy of Savoy in 1280 after an intervening period of semi-independence and conflict. Occupied by the French from 1536 to 1562, Turin became the capital of the duchy of Savoy in 1563. It was besieged in 1640 and 1706 (during the War of the Spanish Succession) by the French, who were defeated by Eugene of Savoy in 1706, and it was occupied again by the French during the Napoleonic Wars. The city became the capital of the Kingdom of Sardinia in 1720 and in the 19th century became the political and intellectual centre of the Risorgimento, the movement for Italian political unification. It served as the first capital of a united Italy from 1861 to 1865. Turin sustained heavy airraid damage during World War II.

Turin has been a bishopric since about 415 and an archbishopric since 1510 and is rich in ecclesiastical architecture. Noteworthy churches include the Renaissance cathedral of San Giovanni Battista (1492-98), with the brilliantly original Baroque Santa Sindone Chapel by Guarino Guarini; La Consolata (1679; completed 1714), also by Guarini; the Waldensian Church (1850-53), the first Protestant church in Turin; and the nearby Basilica of Superga (1717-31), long the royal burial church. A ducal and royal city for centuries, Turin has many fine palaces. The Madama Palace, begun in the 13th century, owes its name to the resident-widows of the 17th-century dukes of Savoy. Used by the Sardinian Senate in 1848-60 and by the Italian Senate in 1861-64, it now houses the Museum of Ancient Arts. The Carignano Palace (1680), the birthplace (1820) of King Victor Emmanuel II and once the meeting place of the Sardinian chamber of deputies and of the first Italian Parliament, now houses the National Museum of the Italian Risorgimento. The Royal Palace (1646-58) houses the Royal Armoury, with one of the finest collections of arms in Europe. The Academy of Science (1678), formerly a Jesuit college, now houses the Museum of Antiquities, the Egyptian Museum, and the Sabauda Gallery. Other secular structures include the remains of the old citadel; the Mole Antonelliana, begun in 1863 as a synagogue and later completed by the city; the modern Turin Exhibition Buildings and Gallery of Modern Art; and numerous public monuments to notable figures in Turin's past. Other museums display collections on artillery, automobiles, mountains, cinema, and natural history, zoology, paleontology, and mineralogy. There are also several fine libraries.

The University of Turin was founded in 1404. Other educational institutions include the Turin Polytechnic (1859), the Gallery of the Albertina Academy (1652), the Giuseppe Verdi State Musical Conservatory (1867), the Institute of Business and Industrial Organization Studies (1935), and the University Institute of European Studies (1952).

Situated on a broad, fertile plain east of the Alps, Turin is one of Italy's most important industrial and communications centres. Turin is a major road and rail junction and has an international airport and a heliport. The city is preeminent in Italy's automotive industry, with Fiat and Lancia plants that produce most of the national output of automobiles. Airplane, ball-bearing, rubber, and paper industries are also important, as are tanning and leatherworking and typography and lithography. There are metallurgical, chemical, plastics, and electrotechnical industries, and chocolate and wines (especially vermouth) are also notable products. Pop. (1987 est.) mun., 1,035,565.

Turin, Shroud of, also called HOLY SHROUD, Italian SANTA SINDONE, a length of linen that

for centuries was purported to be the burial garment of Jesus Christ; it has been preserved since 1578 in the royal chapel of the Cathedral of San Giovanni Battista in Turin, Italy. Measuring 14 feet 3 inches long and 3 feet 7 inches wide, it seems to portray two faint brownish images, those of the back and front of a gaunt, sunken-eyed, 5-foot 7-inch manas if a body had been laid lengthwise along one half of the shroud while the other half had been doubled over the head to cover the whole front of the body from face to feet. The images contain markings that allegedly correspond to the stigmata of Jesus, including a thorn mark on the head, lacerations (as if from flogging) on the back, bruises on the shoulders, and various stains of what is presumed to be blood.

The shroud first emerged historically in 1354, when it is recorded in the hands of a famed knight, Geoffroi de Charnay, seigneur de Lirey. In 1389, when it went on exhibition, it was denounced as false by the local bishop of Troyes, who declared it "cunningly painted, the truth being attested by the artist who painted it." The Avignon antipope Clement VII (reigned 1378–94) sanctioned its use as an object of devotion provided that it were exhibited as a "representation" of the true shroud. Subsequent popes, from Julius II on, however, took its authenticity for granted. In 1453, Geoffroi de Charnay's granddaughter Marguerite gave the shroud to the House of Savoy at Chambéry, and there it was damaged by fire and water in 1532. It was moved to the new Savoyard capital of Turin in 1578. Ever since, it has been publicly exhibited only rarely, as, in recent times, on the marriage of Prince Umberto (1931) and on the 400th anniversary of its arrival in Turin (1978).

Scholarly analyses—attempting to use scientific methods to prove or disprove its authenticity—have been applied to the shroud since the late 19th century. It was early no-

ticed (1898) that the sepia-tone images on the shroud seem to have the character of photographic negatives rather than positives. Beginning in the 1970s, tests were made to determine whether the images were the result of paints (or other pigments), scorches, or other agents; none of the tests proved conclusive. In 1988 the age of the cloth itself was finally determined. Three laboratories in different countries were provided with postage stamp-sized pieces of the shroud's linen cloth. Having subjected these samples to carbon-14 dating, all three laboratories concluded that the cloth of the shroud had been made sometime between AD 1260 and 1390. The Roman Catholic church accepted the results and announced that the Shroud of Turin was not authentic, but the church encouraged Christians to continue venerating the shroud as an inspiring pictorial image of Christ.

Turin, University of, Italian UNIVERSITÀ DEGLI STUDI DI TORINO, autonomous coeducational state institution of higher learning in Turin, Italy, that was founded in 1404. Erasmus was a graduate of the school in 1506. The university was reorganized and reestablished in 1713. An Institute of Business and Economics was added in 1906; a veterinary medicine faculty was added in 1934; and faculties of agriculture, pharmacy, and commerce were added in 1935. Among the university's faculties are law, political science, philosophy, literature, education, mathematics and natural sciences, medicine, and veterinary medicine.

Turin faience, tin-glazed earthenware made in Turin, Italy, from the 16th century through the 18th. It is known that the Genoese G.G. Bianchi opened a pottery factory in Turin in 1646. In 1725 Giorgio Rossetti expanded Turin's faience industry, in which he was followed by his descendants. Another factory was that of G.A. Ardizzone (flourished 1765). These 18th-century potters produced

such wares as faience plates with wavy edges and fanciful ornamental designs that were executed on white in muted tones of blue, yellow, and green.

Turin Papyrus, also called TURIN PA-PYRUS OF KINGS, OF TURIN CANON, hieratic manuscript of the 19th dynasty of Egypt, listing the kings of Egypt from earliest times to the reign of Ramses II (1279-13 BC), under whom it was written. Although the papyrus, now in the Egyptian Museum in Turin, Italy, is in very fragmentary condition, it is still considered the most detailed and reliable of the existing Egyptian king lists. It lists not only names, but also regnal years, months, and days, and also divides pharaonic history into dynasties and into three major periods, labeled by scholars the Old Kingdom, the Middle Kingdom, and the New Kingdom. Manetho's History (3rd century BC) was derived from a source like the Turin Papyrus but was far less reliable.

Turina, Joaquín (b. Dec. 9, 1882, Seville, Spain—d. Jan. 14, 1949, Madrid), Spanish composer who helped to promote the national character of 20th-century Spanish music.

After studying in Seville and Madrid, Turina went in 1905 to Paris, where he was a pupil of Moritz Moszkowski for piano and Vincent d'Indy for composition. Though he absorbed elements of the French style, he was inspired in Paris by Isaac Albéniz to write distinctively Spanish music. He wrote the Sonata española for violin and piano and the symphonic poem La procesión del roccio (1912) and in 1914 returned to Spain. His native city, Seville, figures largely in his predominantly picturesque works, notably in the Sinfonía sevillana (1920),

in the Canto a Sevilla (1927; "Song to Seville") for voice and orchestra, and in his albums of piano miniatures, among them Rincones sevillanos ("Sevillian Nooks") and La leyenda de

Turina
Archivo Mas, Barcelona

la Giralda ("The Legend of Giralda"). He was most successful in his numerous songs. He also wrote two operas, Margot (1914) and Jardin de oriente (1923; "Garden of the East"), incidental music, and chamber works. His Danzas fantásticas for orchestra (1920; "Fantastic Dances") and La oración del torero (1925; "The Torero's Speech") for string quartet or string orchestra were particularly popular. He was critic for the Madrid paper El Debate and wrote a short encyclopædia of music.

Turing, Alan M(athison) (b. June 23, 1912, London—d. June 7, 1954, Wilmslow, Cheshire, Eng.), English mathematician and logician who pioneered in computer theory and contributed important logical analyses of computer processes.

The son of a British member of the Indian Civil Service, Turing studied at Sherborne school and at King's College, Cambridge. In 1935, while studying under a graduate fellowship at King's College, Turing undertook work in mathematical logic; during this time he wrote the paper commonly recognized as his most brilliant contribution, "On Computable Numbers, with an Application to the Entscheidungsproblem" (1937). In this article he proved that there are some mathematical problems that cannot be solved by a fixed, definite process, which he defined as a process that can be done by an automatic machine. He further posited a theoretical computing device that was not limited in use by a fixed maximum amount of data storage or liable to malfunctioning as are actual computing machines. This Turing machine (as it was later called) is frequently used as a point of reference in basic discussions of automata theory (q.v.). It is also the theoretical basis for the digital computers that came into being in the

According to Turing's specifications, the Turing machine performs its functions in a sequence of discrete steps. At a given moment it assumes one of a finite list of internal states. In any of these states except one designated as 'passive," the machine scans an infinite tape that is divided into squares, each of which is either blank or has printed on it one of a finite number of symbols. The machine then can alter the condition of the scanned square (by erasing, printing, or both), move the tape so that the scanned square becomes the one next right or left, or change to another state between the given moment and the next. Any such act is determined by the internal state of the machine and the condition of the scanned square at the given moment. The output of the machine can be interpreted from the symbols that remain on the tape after the machine has reached the passive state and stopped.

Turing continued his mathematical studies at Princeton University, completing a Ph.D.

(1938) under the direction of the American mathematician Alonzo Church. He then returned to England and accepted a renewed fellowship at King's College. During World War II he served with the Government Code and Cypher School, at Bletchley, Buckinghamshire, where he played a significant role in breaking the German "Enigma" codes. In 1945 he joined the staff of the National Physical Laboratory in Greater London to lead the design, construction, and use of a large electronic digital computer that was named the Automatic Computing Engine (ACE). In 1948 he became deputy director of the Computing Laboratory at the University of Manchester, where the Manchester Automatic Digital Machine (MADAM; as referred to by the press), the computer with the largest memory capacity in the world at that time, was being built. His efforts in the construction of early computers and the development of early programming techniques were of prime importance. He also championed the theory that computers could be constructed that would be capable of thought and even proposed that machine thought could more closely resemble human thought if a random element, such as a roulette wheel, could be introduced. Turing's papers on this subject are widely acknowledged as the foundation of research in artificial intelligence.

In 1952 Turing published the first part of his theoretical study of morphogenesis, the development of pattern and form in living organisms. His main goal was to show how a uniform, symmetric structure could grow and develop, as a result of diffusion, into a strongly unsymmetric structure with a definite pattern. He left his work unfinished, however. He aparently committed suicide, probably because of the depressing medical treatment that he had been forced to undergo (in lieu of prison) to "cure" him of homosexuality. (He seems to have prepared a cyanide-coated apple and eaten it.)

Andrew Hodges' biography Alan Turing: The Enigma was published in 1983.

Turishcheva, Lyudmila Ivanovna (b. Oct. 7, 1952, Grozny, Russian S.F.S.R.), Soviet gymnast who was European champion (1971 and 1973), world champion (1970, 1974), and an Olympic medal winner from 1968 through 1976.

Turishcheva was graduated from the Rostov Pedagogical Institute in 1974. In the 1968 Olympic Games at Mexico City, she won a gold medal as a team member in the combined exercises, as she also did in the 1972 games at Munich and the 1976 games at Montreal. She won a gold medal for all-around individual performance in 1972 and silver medals for the floor exercises in 1972 and 1976 and for the vault in 1976. She won bronze medals in 1972 for the vault and in 1976 for individual all-around performance. She competed at first for the Dinamo Club, Grozny; from 1973 for Rostov-na-Donu; and from 1978 for Kiev. After she retired from competition she became a coach and teacher.

Turkana, a people living in the arid, sandy expanse of northwestern Kenya, from Lake Rudolf (Lake Turkana) to the Ugandan border. They speak a Teso language of the Eastern Nilotic group. They are believed to have moved to their present lands about 200 years ago from an area now in northeastern Uganda where the closely related Jie and Karamojong still live. Northwestern Kenya is a hostile wasteland of scrub and thorn trees. Sandstorms occur during the dry season and flash floods during the rainy season. Rains are very uneven in frequency and amount from year to year, and in the 1970s and early 1980s severe drought caused widespread famine. While a few have migrated in search of labour, most Turkana remain in their isolated land.

The Turkana resisted British conquest, and a

military expedition in 1918 caused considerable loss of life and cattle but did not establish effective British administration. The region was not completely occupied until 1942.

Turkana are ardent pastoralists who give names to, sing to, and diligently care for their cattle. Milk and other dairy products (butter, ghee, and yoghurt) as well as blood are important to the Turkana diet; hides, horns, and bones are likewise to their material culture. Camels provide milk and meat and are used for bridewealth payments. Goats and sheep are also kept. Livestock are slaughtered and meat shared in the community. Turkana practice transhumance, visiting the same general pastures from season to season and returning to rainy season sites for millet and vegetable farming. Wild nuts, berries, game, and fish are also important foods. Houses are temporary structures made of leafy boughs or palm fronds; a thorny, encircling fence is used for protection from predators. A father, his wives, and their sons and wives live together or in adjacent homesteads.

Turkana marry outside their clans, and upon marriage women join their husbands' clans. Cattle are given clan brands. Turkana men belong to either of two alternating age sets, called Stones and Leopards; a man is of the set opposite to that of his father. In the past, Stones and Leopards wore different ornaments, ate apart at feasts, and raided in separate columns as warriors. The oldest men in extended families provide leadership. The British chose headmen from war leaders or retired colonial policemen, and Turkana chiefs participate in contemporary Kenyan administration.

Turkana make many wooden containers and other useful objects that are prized by collectors of African art.

Turkana, Lake (East Africa): see Rudolf, Lake.

Turkestan (China): see Turkistan.

Turkestan, city, Chimkent oblast (administrative region), Kazakh Soviet Socialist Republic, in the Syrdarya plain. An ancient centre of the caravan trade, known earlier as Khazret and later as Yassy, it was also a religious centre because of the 12th-century Muslim saint Khwājah Aḥmad Yasawī, whose 14th-century mausoleum is the city's chief monument. Captured by the Russians in 1864, Turkestan now has several industries. Pop. (1986 est.) 77,000.

Turkestansky Khrebet, also spelled turkestanskij chrebet (Soviet Union): see Turkistan Range.

Turkey, officially REPUBLIC OF TURKEY, Turkish TÜRKIYE CUMHURIYETI, Middle Eastern country that lies mainly (95 percent) in Asia, with 5 percent extending into Europe, and that covers an area of 300,948 square miles (779,452 square km). The capital is Ankara. It is bordered to the east by Iran and the U.S.S.R., to the south by Iraq, Syria, and the Mediterranean, to the west by Greece and

Turkey

Bulgaria, and to the north by the Black Sea. The Asian part, Anatolia, is separated from the European part, Thrace, by the Bosporus, the Sea of Marmara, and the Dardanelles Strait. The population in 1984 was estimated at 48,319,000.

The article that follows is a summary of significant detail about Turkey. Fuller treatment is provided in the following MACROPAEDIA articles. For geography and history, see Turkey and Ancient Anatolia. For information about the country in its regional setting, see Asia; Europe. For information about regional aspects of Turkey's history, see Byzantine Empire, The History of the; Islāmic World, The. For information about Turkey's peoples and their traditional cultures, see Islāmic World, The; Middle Eastern Religions, Ancient. For information about a major city, see Istanbul.

The most recent statistics about Turkey's administration, society, and economy are provided in WORLD DATA: A STATISTICAL SUPPLEMENT; current history is summarized in the annual issues of the *Britannica Book of the Year*.

The land. Asiatic Turkey includes a belt of young mountain ranges with a mean elevation of about 3,600 ft (1,100 m), dominating the north and south and encircling the Central Anatolian Plateau. North of the plateau are the Pontic Mountains, and to its south rise the Taurus Mountains. Cilo Daği (13,504 ft [4,116 m]) in the eastern Taurus is the highest point in the region. Central Anatolia is a semi-arid plateau divided into several basins. Eastern Anatolia comprises lofty ranges and recent volcanic cones, such as Ağri Daği (Mt. Ararat), the highest peak in Turkey at 16,853 ft. Western Anatolia has elongated mountain ridges separated by depressed floors. The plateaus around Istanbul are deeply dissected by valleys, such as those occupied by the Bosporus and the Dardanelles straits.

The water divide between the drainage basins of the Atlantic and Indian oceans runs obliquely through eastern Anatolia. The country west and north of the main divide drains to the Black Sea through the Kizil Irmak and Sakarya rivers. The western regions of the country drain to the sea of Marmara. The principal rivers of the Mediterranean basin are the Göksu, Seyan, and the lower course of the Orontes. The Tigris and Euphrates rivers, rising in the eastern mountains, drain toward the Persian Gulf and the Indian Ocean. Lake Van, Turkey's largest lake, is a large salt lake, variable in size and without any outlet.

Turkey has a variety of soil types with an outer belt of red and reddish-brown podzolic soils extending over the humid northern and southern marginal regions. The drier northwestern part is covered by slightly acid brown and yellowish brown podzolic soils.

There are four climatic regions. The southern and western coasts have a Mediterranean climate and experience a highest mean temperature of 84° F (29° C) in July. The Black Sea coast enjoys warm summers, mild winters, and an average 96 in. (2,438 mm) of rainfall throughout the year. The high northeastern plateaus have warm summers but severe winters with average temperatures of 10° F (-12° C). The central plateau has hot, dry summers and cold, moist winters.

Large areas in the south, west, and northwest are covered by secondary Mediterranean vegetation of thick, scrubby underbrush. The Black Sea coast is the most densely forested region. The dry Anatolian interior is a region of steppes, with short grasses and bushes. Wild animals include the wolf, fox, boar, wildcat, marten, hyena, bear, deer, and gazelle. The water buffalo, Angora goat, and camel are domesticated.

Almost two-fifths of Turkey's land area is considered arable, with more than one-half of the cultivated land devoted to cereals. About one-seventh of the area is available as pasture-

land. In the early 1980s estimated reserves of fossil fuels included about 39,000,000 metric tons (280,000,000 bbl) of petroleum, 550,000,000,000 cu ft (15,570,000,000 cu m) of natural gas, and more than 8,800,000,000 tons (8,000,000,000 metric tons) of coal (both hard coal and lignite). In the early 1980s Turkey was the fifth largest chromite producer in the world, with a total reserve estimated at about 4,000,000 tons. It also has substantial reserves of antimony, copper, iron, sulfur, lead, and zinc.

The people. Turkey has been a melting pot of racially and culturally distinct groups since early prehistoric times. The most decisive influence was the incursion of Turks from the east who introduced a new element of mixed Mediterranean-Mongoloid origin into the country's ethnic composition from the 11th century AD onward. The dominant stock seems to be Mediterranean-Turkic, giving way to Mediterranean in western and southern coastal areas and becoming mixed with Alpine stock in the interior and the east.

Turkish is the mother tongue of more than 90 percent of the country's population. The principal linguistic minority groups are Kurds and Arabs. Kurdish, the native language of about 7 percent of the population, is widely spoken by the predominantly rural and migratory populations of the eastern and southeastern regions. Arabic is spoken by about 1 percent of the population, principally in southeastern Anatolia. Greek, Armenian, and Yiddish are spoken by very small groups in the larger cities, mainly in Istanbul.

Nearly all Turks are Muslims. Small Christian and Jewish minorities live mainly in Istanbul, Ankara and İzmir.

Turkey has one of the highest rates of population increase in the world, as the consequence of a high birth rate (about 35 per 1,000) and an average death rate of 11.5 per 1,000. Nearly 40 percent is younger than 14 years of age. The annual rate of growth is approximately 2.3 percent.

The economy. Turkey has a developing economy, part private, part publicly owned, based almost equally on agriculture and manufacturing. The gross national product (GNP) in 1981 was U.S. \$59,700,000,000 and the GNP per capita was \$1,300.

Agriculture accounts for nearly one-quarter of the GNP and employs more than 60 percent of the work force. Normally self-sufficient, Turkey had to increase imports of foodstuffs (particularly wheat and rice) in the late 1970s and early 1980s. Cash crops such as cotton and tobacco are important for export. More than one-third of the total land area is cultivated, and the narrow coastal lowlands are extensively irrigated. Irrigated cash crops include the world's largest production of hazelnuts and sultana raisins, and other nuts and fruits (including oranges, lemons, and melons); vegetables are also grown for the foreign market.

Sheep and lesser numbers of cattle and goats graze the permanent pastureland. In the late 1970s the country was self-sufficient in dairy products and meat production. Forests, mainly coniferous, occupy about one-fourth of the country, mainly around the Black Sea, but are little exploited.

Mining by mostly state-owned companies accounts for only 2 to 3 percent of the GNP. Locally mined iron ore, coal, lignite, bauxite, and copper provide raw materials for the country's key fledgling industries. Turkey is the world's second largest producer of boron and exports chromite. The country's limited supply of petroleum (meeting only 15 percent of Turkey's needs in the early 1980s) compelled it to apply most of its foreign exchange receipts to oil imports. Production of electricity amounted to 23,275,000,000 kW-hr in 1980 and was generated equally by thermal and hydroelectric sources. A series of four gi-

ant dams was planned on the upper Euphrates River in southeastern Turkey (one of which was operational and another under construction in the early 1980s), along with greatly increased mining of the country's vast lignite reserves to ameliorate Turkey's serious energy deficiency.

Manufacturing employs about one-tenth of the work force and in the early 1980s for the first time surpassed agriculture in value of exports. Locally grown cotton and low wages made textiles (including yarn, fabrics, and rugs) the chief industrial growth sector in the 1960s and 1970s despite low productivity. The petrochemical industry expanded rapidly in the early 1980s. Tourism is an important source of national income. In the early 1980s about 1,500,000 tourists arrived annually, and net receipts from tourism were about \$280,000,000.

Underemployment is widespread. Real unemployment was estimated at between 15 and 20 percent in the early 1980s and thought to be rising. Rural unemployment is more severe than urban unemployment, yet skilled labour and personnel with managerial skills are in short supply outside Istanbul. Labour unions were legalized by the Trade Union Law of 1947 and have grown significantly since; the largest federation is Türk-İş. In the 1970s many unskilled Turks travelled to western Europe (principally West Germany) to find employment, but after 1980 the foreign employment trend shifted away from Europe and toward Middle Eastern countries. Nearly 1,000,000 workers were abroad in 1981.

The mid-1960s-mid-1970s decade experienced sustained growth; but a negative balance-of-payments caused by the country's heavy expenditure for oil imports, combined with structural deficiencies in the development of industries, led to high deficits and near bankruptcy in 1977. The International Monetary Fund imposed stringent financial constraints in 1978, and an austerity program introduced by the government in 1980, together with increased remittances by workers abroad, has enabled Turkey to substantially offset its persistent trade deficit.

Expenditures by the central government slightly exceeded revenues in the early 1980s. Revenues were derived mainly from taxes on income. Public expenditures account for nearly one-fourth of the GNP; nearly one-half of the government's budget is allocated to finance, and one-fifth goes to defense.

Turkey's railway system extends over 6,630 mi (10,670 km), but truck transport over the road system, about three-fourths paved in the early 1980s, dominated transport. The ports of Istanbul, İzmir, and Mersin handle international and coastal traffic, but the principal marine terminal for petrochemicals is near Iskenderun. Shipping is divided between state and private companies. International airports are located near Istanbul, Ankara, Adana, and Dalaman, and Antalya and İzmir handle charter flights only.

Principal exports in the early 1980s were divided almost equally between agricultural and industrial products. Among Turkey's leading trading partners for export are Germany, Iraq, and Libya, followed by the United States and Switzerland. Petroleum from Iraq and Libya is the major import; Germany is Turkey's principal source for machinery and equipment.

Administrative and social conditions. The Turkish republic, founded by Mustafa Kemal Atatürk in 1923 after the fall of the Ottoman Empire, was a one-party state until 1946. Since then a number of parties have contested power, and Turkey has experienced a series of economic instabilities and political upheavals. Atatürk laid down the ideological base of modern Turkey. His reforms in soci-

ety, religion, politics, and language are a subject for debate in Turkey today. Alternating parliamentary and military governments experienced growing instability until 1980, when a National Security Council representing the armed forces assumed control of the country, administering it without political parties. The 1982 Constitution provides for a democratic parliamentary government, which has been taking shape gradually. Turkey is a member of the North Atlantic Treaty Organization (NATO) and of the Central Treaty Organization (Cento).

When the Turkish Republic was formed, the population was estimated to be only 10 percent literate. Atatürk's programs stressed national education, and by the early 1980s the rate of literacy rose to 64.9 percent. The ministry of health and social welfare carried out public health programs and operated a large number of hospitals and dispensaries. State medical services are provided free to the poor, and private medical institutions are operated by organizations and large business enterprises. Life expectancy was 62 years, and infant mortality improved in the late 1970s and early '80s to 131 per 1,000 births. The leading causes of death in the mid-1970s were measles, infectious hepatitis, leprosy, and epidemic meningitis; the incidence of these diseases has diminished since the late 1960s.

Turkey's long and varied cultural heritage is based on Persian, Arabic, Byzantine, Ottoman, and Western civilizations. Among the most important of Atatürk's reforms were the revival of the Turkish language to replace Arabic and the reduction of Islamic influence upon the nation. Modern Turkish culture has been dominated by nationalism.

The ministry of culture was established in 1971, and the government extensively supports a national network of the arts, encompassing theatre, opera, ballet, music, and fine arts, as well as popular art forms. Every province has museums. The Atatürk Cultural Centre in Ankara is under construction.

History. Originally settled by indigenous Anatolian peoples, Turkey was occupied around 1900 BC by the Indo-European Hittites, who subsequently made it an international power until their collapse around 1200 BC. Subsequently Phrygians and Lydians invaded Anatolia, but in the east the indigenous Urartu (Armenian) kingdom ruled. The Persian Empire occupied the area in the 6th century BC, and it subsequently passed under Greek-Hellenistic rule and, ultimately, Roman rule by the 1st century BC. The Armenian kingdom remained a border state between the rival Romans (later Byzantines) and the Parthians and, later, Sassanians to the east. Byzantine rule emerged when Constantine the Great made Constantinople (Istanbul) his cap-

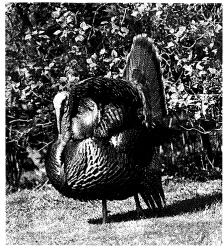

During the 11th century a group of nomadic Turkic people, the Oğuz, invaded Anatolia. An Oğuz tribe, the Kayi, entered at about the same time and came to occupy eastern and central Anatolia during the 12th century. Osman I, a Kayi, established the Ottoman dynasty. In their initial stages of expansion, the Ottomans were leaders of the Turkish gazis, or fighters for the faith of Islam against the Byzantine Empire. In the 13th–14th centuries the Ottomans took over the Byzantine territories of western Anatolia and southeastern Europe, making the Christian Balkan states their vassals, and conquered the Turkmen principalities of eastern Anatolia. In the 15th century the Ottoman sultans imposed direct rule on their Balkan vassals, conquered Constantinople (1453), and extended their rule eastward to the Euphrates River (1468) and westward into Hungary. By the end of the 16th century, at the height of its power and

wealth, the Ottoman Empire included most of the Balkans, a large portion of Hungary in central Europe, and the bulk of the Middle East and North Africa. After the reign of Süleyman I the Magnificent (1494-1566) the empire began to decline politically, administratively, and financially. By 1718 Austria had driven the Turks out of Hungary, and Russia had annexed the Crimea in 1783. In the 19th century the Ottoman Empire lost control of Egypt and most of the Balkans. During the late 19th century the millet system for the governance of minorities began to deteriorate, and systematic persecution of Armenians began, culminating in the genocidal massacre of the Armenians during World War I. The Revolution of the Young Turks in 1908 attempted to revive the empire, but it continued to suffer military and territorial losses in the Balkans. After World War I Turkey lost its Arab provinces and part of Asia Minor, but, after a fierce civil war and a war with Greece, Turkey's present boundaries were drawn in 1923 at the Conference of Lausanne, and Turkey became a republic with Kemal Atatürk as the first president. The sultanate and caliphate were abolished, and modernization began under his direction.

After World War II Turkey aligned itself with the West and received U.S. military and economic aid. Turkey joined NATO (1952); was a signatory in the Balkan Entente (1953); joined the Baghdad Pact (1955; later renamed Cento), and joined the Organization for European Economic Co-operation (OEEC) and the Council of Europe. In 1959 Turkey resolved for the time a three-year dispute with Greece over Cyprus. The Second Turkish Republic was created, and a new constitution was adopted in 1961. Turkey became an associate member of the Common Market in 1963. Disputes between Greek and Turkish Cypriots in Cyprus eventuated in a civil war there by the end of 1963. Greece and Turkey were on the brink of war, but pressure from the United Nations helped control the conflict. In 1974 a major crisis occurred on Cyprus with a coup by the Greek military government and the occupation of northern Cyprus by Turkish forces. The U.S. imposed an embargo on military aid to Turkey, which closed U.S. military bases there. New agreements were negotiated and implemented, lifting the embargo and reopening four bases by late 1978. After increasing domestic instability and political turmoil, the armed forces commanders who formed Turkey's National Security Council (NSC) took over the government in a bloodless coup in 1980. During 1982 the NSC began planning the reform of institutions with a view to reestablishing parliamentary rule. A new Constitution was drafted and approved by a majority of voters.

turkey, either of two species of birds in the family Meleagrididae (order Galliformes). The best known is the common turkey (Meleagris gallopavo), a native game bird of North America but widely domesticated for the table. The other species is Agriocharis (or Meleagris) ocellata, the ocellated turkey. For unrelated but similar birds see bustard (Australian turkey); megapode (brush turkey); and snakebird (water turkev).

Domestication of the common turkey began probably in Mexico, whence the South Mexican turkey (M. g. gallopavo) was introduced by the Spanish into Europe in the early 16th century. When the bird became popular in England, the name turkey-cock, formerly used for the guinea fowl of Islamic (or "Turkish") lands, was transferred to it. English colonists then introduced European-bred strains of the turkey to eastern North America in the 17th century. Races found today in Mexico and in the southeastern and southwestern U.S. differ slightly in feather markings and in rump colour, but all are basically dark, with irides-

Male common turkey (Meleagris gallopavo), displaying

cent bronze and green plumage; naked, warty, red head (turning blue or whitish with excitement), a long red fleshy ornament over the bill, feather tassel on the breast, and more or less prominent leg spurs. The male, called gobbler or tom, may be 130 centimetres (50 inches) long and weigh 10 kilograms (22 pounds), though average weight is less; hens generally weigh half as much as the males. Domesticated strains, developed for their fine-tasting flesh, may be considerably heavier.

The wild turkey prefers woodlands near water. It eats seeds, insects, and an occasional frog or lizard. When alarmed it may run rapidly to cover but can fly strongly for short distances (about 0.4 kilometre, or 1/4 mile). Formerly diminished under hunting pressure, M. gallopavo has come back well under various state game management programs in the United States.

In courtship display the male spreads his tail, droops his wings and shakes the quills audibly, retracts his head, struts about, and utters rapid gobbling sounds. He assembles a harem, and each hen lays 8-15 brownish spotted eggs in a hollow in the ground. The young (poults) hatch in 28 days.

The ocellated turkey, of Central America, is smaller than M. gallopavo. It has a blue head with reddish-yellow bumps, bright-tipped feathers, almost peacock-like, and, in addition to the long bill wattle, a yellow-tipped knob on the crown. It has never been domesticated.

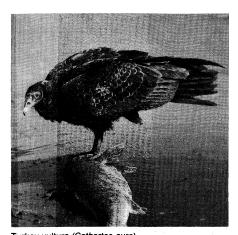

The earliest fossil turkey is M. leopoldi of the lower Pleistocene Epoch (about 2,500,000 years ago) of Texas. See also fowl, domestic.

turkey beard: see bear grass. turkey fish: see lion-fish.

turkey gnat: see black fly.

turkey trot, bouncy American ballroom dance dating from the 1910s. Imitating a turkey's walk, dancers quickly bobbed up and down to the ragtime music, rising on the ball of the foot and then dropping to the heel. Onlookers accustomed to the smooth glides of earlier dances were shocked at the jerky movements of the turkey trot and other related "rag" dances—the grizzly bear, bunny hug, chicken flip, and horse trot.

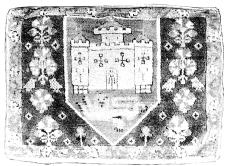

turkey vulture, also called TURKEY BUZZARD (Cathartes aura), long-winged, long-tailed vulture (family Cathartidae, the New World vultures), with dark plumage, whitish beak, white legs, and bare red head (black in immature birds) covered with whitish bumps. Wingspread is about 1.8 metres (6 feet). Length is about 75 centimetres (30 inches). The turkey vulture has an elaborate olfactory canal and uses its keen sense of smell in

Turkey vulture (Cathartes aura) Allan D. Cruickshank-The National Audubon Society Collection/Photo

finding food. It subsists mainly on carrion. The species occurs throughout the Americas except northern Canada; northerly and southernmost populations are migratory. The eggs, one to three, white with brown spots, are laid in a crude nest; the sexes share incubation. Hatching is in five or six weeks.

Turkey work, form of knotted embroidery practiced in England from the 16th century to the mid-18th century, but especially in the 17th century. Used for upholstery and table covers, it was worked in imitation of Turkish carpets, which are known from paintings to have been imported to England from the 16th century. The designs were usually of geometrically stylized flowers. A document from the

Turkey work cushion decorated with the arms of the city of Norwich; 1651; in the Norwich Castle Museum

By courtesy of Castle Museum, Norwich, Eng.

reign of William III (1689-1702) gives the number of Turkey work chairs made per annum as 60,000. Because so few examples have survived in England, while examples have been found abroad—for example, in Italy it may be deduced that Turkey work was an export item.

Turkic PEOPLES, various peoples historically and linguistically connected with the T'uchueh, the name given by the Chinese to the nomad people who in the 6th century AD founded an empire stretching from Mongolia and the northern frontier of China to the Black Sea. With some exceptions, notably in the European part of Turkey and in the Volga region, the Turkic peoples are confined to Asia. Their most important cultural link, aside from history and language, is that with Islam for, with the exception of the Yakut of eastern Siberia and the Chuvash of the Volga region of the U.S.S.R., they are all Muslim.

Turkic peoples may be divided into two

main groups, the western and the eastern. The former include the Turkic peoples of Europe and those of western Asia inhabiting the Asiatic part of Turkey and the northwest of Iran. The eastern group comprises the Turkic peoples of the Soviet Union and of the Chinese region of Sinkiang. They display a great variety of anthropological types. While most of them can be described as dark skinned, many of the Tatars and the Turks of Turkey are as fair as western Europeans.

Apart from the Turks of Turkey, none of the Turkic peoples can be said to have had any continuous national or political existence until the formation, after the Russian Revolution of 1917, of the various Soviet republics and, after 1955, of the Sinkiang Uighur Autonomous Region of China.

The most numerous of the Turkic peoples, after the Turks of Turkey, are the Uzbek (q.v.)of the U.S.S.R. and Afghanistan. Their name seems to have originated from that of one of the khans of the Golden Horde (q.v.) who embraced Islām; the name came to be applied to the Muslim section of the Golden Horde, which constituted the ruling class.

Another numerous group are the Kazakh (q.v.), who are thought to have been formed of the Kipchak tribes that comprised part of the Golden Horde. Most of them live in the U.S.S.R.; there are 800,000 in Sinking and neighbouring Kansu and Tsinghai provinces.

The Kirgiz (q.v.), whose origin is obscure, inhabit the Kirgiz Soviet Socialist Republic of the U.S.S.R. There is a small minority of

Kirgiz in western China.

The Turkmen (q.v.) were until 1924 a nomadic, tribal people with no political unity. Most of them live in the U.S.S.R.; there are large bodies in Iran and Afghanistan and oth-

ers in Iraq, Syria, and Turkey.

The Azerbaijani (q.v.), who inhabit the Azerbaijan Soviet Socialist Republic and the Iranian provinces of East and West Azerbaijan, are one people; they were divided between the Russian and Persian empires in 1828 by the Treaty of Turkmanchay.

The Kara-Kalpak (q.v.) of the Soviet Union are closely allied to the Kazakh, whose language strongly resembles their own. The Tatars (q.v.) consist of two groups, those living in the present Tatar Autonomous Soviet Socialist Republic and those formerly inhabiting the Crimean Peninsula but deported from their homes in 1944 and now living mainly in the Uzbek Soviet Socialist Republic. The first group are thought to be descended from indigenous Turkic tribes of the Kipchak group. It is probable, however, that they also contain Bulgarian elements.

The Bashkirs (q.v.) are widely dispersed in the eastern part of the European U.S.S.R., where they have an autonomous republic, and beyond the Ural Mountains. Although the Bashkir language is purely Turkic, their culture is mixed; some ethnographers believe that they were originally Hungarian.

The Karachays and Balkars of the Soviet Caucasus are of uncertain origin. In the course of many centuries, they have become mixed with the Ossetes (Ossetians), from whom they are anthropologically indistinguishable. According to the 1979 Soviet census, there were 131,000 Karachays and 66,000 Balkars. They were deported during World War II to areas in Central Asia but have since been allowed to return.

The Yakut (q.v.) of Siberia are classified as a Turkic people because of their language, but little is known of their origin. They are believed to have emigrated northward from the region of Lake Baikal; their culture is in some respects identifiable with that of adjoining Siberian peoples.

The Chuvash (q, v) are one of the largest non-Slav communities inhabiting the Volga region of the U.S.S.R. They are Orthodox Christians, and only their language suggests that they are of Turkic origin.

The Uighur (q.v.) form the predominant population of the Sinkiang region of western China; a small number occupy Central Asian parts of the Soviet Union.

Turkic languages, group of closely related languages forming a subfamily of the Altaic language family (the other subfamilies being Mongolian and Manchu-Tungus). The Turkic languages are remarkable for the uniformity and interresemblance in their structures, only Chuvash and Yakut being strongly divergent. They have changed little (in comparison with the Indo-European languages) from the earliest extant Turkish inscriptions, found near the Orkhon River, in the Mongolian People's Republic, and the Yenisey River, in the U.S.S.R., which date from the 8th century AD.

Classification. The classification of the modern Turkic languages, according to historical-geographic criteria, is as follows:

1. Southeastern (Chagatai, or Uighur) group, including Uzbek and Uighur, as well as Sarig (Yellow) Uighur and Salar.

2. Southwestern (Oğuz, or Turkmen) group, including Turkish (Ottoman Turkish); Gagauz; Azerbaijani (Azeri); other dialects spoken in Iran closely related to Azerbaijani; and Turkmen.

3. Northwestern (Kipchak) group, including Kirgiz, Kazakh, Kara-Kalpak, Nogay, Kumyk, Bashkir, Tatar, Karaim, and Karachay and

4. Northeastern (Altai) group, including Tuvinian (Tuva), Khakass, and Altai (or Oirot). 5. Khalaj, strongly divergent language of Iran.

6. Yakut, sometimes included with the northeastern group.

7. Chuvash, sometimes considered so different from the other Turkic languages (having a number of very archaic features) as to be classified as a separate subgroup of the Altaic

The development of distinct Turkic literary languages began in the 8th century in Inner Asia. The Uighur literary language flourished in the 9th-14th centuries; the Qarakhanid literary language came into existence in the 11th century. Khwārezmian (13th-14th centuries) and Chagatai (15th-16th centuries), the latter with its post-classical products of the 17th-19th centuries, were the antecedents of the modern Uzbek and Uighur (New-Uighur) literary languages. In the Oğuz area Turkish has the most significant literary tradition. Its antecedent is the Ottoman Turkish language, which developed from the Old Anatolian Turkish literary language (13th-15th centuries) of the Seljuq Turks, the first Turkish conquerors of Anatolia (11th century).

The Arabic script was generally used by all Turkic peoples writing Turkic languages until the early 1920s, when the Latin script began to be introduced to the Turkic peoples of the U.S.S.R. After 1939 the Latin script was almost completely replaced in the U.S.S.R. by modified forms of the Cyrillic alphabet. Turkey officially adopted a Latin script after 1928. Currently, the Arabic alphabet is used only by Turkic peoples living in China, Iran, and the Arab countries.

Linguistic characteristics. The outstanding characteristic of the Turkic languages is vowel harmony. The vowels are of two kinds-front vowels, produced at the front of the mouth (e,i,\ddot{o},\ddot{u}) , and back vowels, produced at the back of the mouth (a,i,o,u). Purely Turkic words can contain only all front or all back vowels, and all suffixes and affixes must conform to the vowel of the syllable preceding them in the word. Thus, Turkish ev "house," evler "houses," evlerim "my houses," evlerime "to my houses"; but at "horse," atlar "horses," atlarım "my horses," atlarıma "to my horses." Vowel harmony has to some extent broken down in a few Turkic languages, notably in certain dialects of Uzbek, and it is usually not applied to foreign words incorporated into Turkish.

The morphology of the Turkic languages is governed by agglutination—i.e., the expression of grammatical concepts by the use of suffixes rather than by independent words. For example, the word evlerimde ("in my houses") is composed of ev "house," ler = plural suffix, im = possessive suffix of the 1st person singular, and de = locative suffix "in." (Attached to a word with back vowels, these suffixes change their vowels according to the law of vowel harmony but retain their meaning.)

The Turkic languages lack relative pronouns but possess a great number of verbal nominals, participles, and gerunds. Thus the sentence "I know that the person who had come went away" is rendered in Uzbek: Kelgan kishining ketganini bilaman (literally "Having-come person's having-gone his know I").

Turkish bath, kind of bath, originated in the Middle East, that combines exposure to warm air, then steam or hot-air immersion, massage, and finally a cold-water bath or shower. The Turkish bath typically requires movement from one room or chamber to the next. Separate wash rooms and soaking pools may be included in the bath building, as are dressing and rest rooms. The Turkish bath has been used for weight reduction, cleansing, and relaxation purposes.

Authorities believe the Turkish bath originally combined some massage and cosmetic aspects of East Indian bathing with Roman plumbing techniques, but it also had distinctive features. A description written in 1699 points out an environmental difference: instead of a high-windowed, light-flooded tepidarium (warm room), the Turkish bath had "cupolas sparsely pierced by the glow of coloured bullions, or...stalactite cupolas in the smaller rooms. Half-light, quiescence, seclusion from the outside world are preferred." The Turkish baths at Constantinople contained a series of domed rooms, the domes supported on pendentives; each series of rooms had warm, hot, and steam areas.

Christian crusaders returning from wars in the Middle East brought the Turkish bath concept back to western Europe. Europeans at the time, however, could not easily supply the great quantities of hot water that were required for a Turkish bath, so the bath did not become popular in Europe until much later. It survives today in the United States, western Europe, Turkey, and many other countries and regions. Many baths, including those in Turkey, have special days for men and women. The Turkish bath may be a weekly or monthly practice, one indulged in in addition to the more frequent tub bath or shower.

Turkish checkers, board game, variety of the game checkers in which all 64 squares of the board are used. There are 16 men to a side, 8 each on the second and third rows to commence play. The men move to the sides or straight forward but not diagonally or backward. Captures are made by jumping, either to the side or forward; the maximum number of pieces possible must be captured. Pieces are removed one by one when captured. The king may move any number of squares forward, sideways, or backward. See also checkers.

Turkish crescent (musical instrument): *see* jingling Johnny.

Turkish language, Turkish TÜRKÇE, member of the Turkic language family (a subfamily of the Altaic language group) spoken in Turkey, Cyprus, the U.S.S.R., and elsewhere in southeastern Europe and the Middle East. With Azerbaijani (Azeri), Turkmen, and Gagauz, it forms the southwestern, or Oğuz, division of the Turkic languages.

Modern Turkish is the descendant of Ottoman Turkish and so-called Old Anatolian

Turkish, introduced into Anatolia by the Seljuq Turks in the late 11th century AD, where it gradually absorbed a great many Arabic and Persian words and even grammatical forms and was written in Arabic script. After the founding of the Turkish republic in 1923, the Arabic script was replaced by the Latin alphabet (1929). Language reform was initiated and long supported by the Turkish government. Although extremist efforts sometimes comprised this undertaking and led to a certain amount of distrust, the movement contributed greatly to the purifying of the vocabulary and to the birth of a new literary language.

From the point of view of grammatical structure, three periods of Turkish may be differentiated: Old (Ottoman) Turkish, 13th-15th century; Middle (Ottoman) Turkish, 16th-18th century; and New (Ottoman) Turkish, 19th-20th century.

The most distinctive feature of Turkish is vowel harmony, both palatal and labial varieties. Palatal harmony is based on a distinction between front vowels (e,i,\bar{o},\bar{u}) and back vowels (a,l,o,u). As a rule, all the vowels of a word must belong to the same class (back or front)—e.g., sargi "bandage," sergi "exhibition"—and the vowels of suffixes vary according to the class of vowels in the root—e.g., ev-de "in the house," but oda-da "in the room." In morphology Turkish is marked by its tendency to designate grammatical categories by the addition of suffixes; e.g., parasizliklarından "because of their poverty" is composed of para "money," -siz "-less," -lik "-ness," -lar "plural," i "possessive," -ndan "from, due to."

Syntactically, Turkish tends to use noun phrases for situations in which English would use dependent clauses with relative pronouns. Turkish thus produces phrases like: Ingiltere konsolosluğuna yakın otelde oturan arkadaşımız "our friend who lives in the hotel near the British Consulate," literally "England consulate-its-to near hotel-in living friend-our."

Turkish literature, writings of all the Turkish peoples, in several languages and over a period of some 12 centuries.

A brief treatment of Turkish literature follows. For full treatment, see MACROPAEDIA: Islāmic Art.

Turkish literature can be divided into three main periods: the purely Turkish period before the conversion of the Turks to Islām, covering approximately the 8th to the 11th century AD; the period of Islāmic culture, from the 11th to the mid-19th century, when Arabic and Persian influences were strong; and the modern period, from the accession of Sultan Abdülmecid I in 1839, when the influence of Western thought and literature became predominant

The Pre-Islāmic period. The oldest literary legacy is to be found in the Orhon inscriptions (q.v.), discovered in the valley of the Orhon, northern Mongolia, in 1889 and deciphered in 1893 by the Danish philologist Vilhelm Thomsen. They are carved in a script used also for inscriptions found in Mongolia, Siberia, and western Turkistan and called by Thomsen "Turkish runes." They relate in epic and forceful language the origins and ancient history of the Turks. Their polished style suggests considerable earlier development of the language.

The Islāmic period. With conversion to Islām, the Turks gradually adopted Arabo-Persian metres and literary traditions. Linguistically there arose three traditions. First, the Chagatai language of the eastern Turks was used mainly in central Asia, by the Golden Horde, in Egypt, and in the Indian courts of the Mughal period. Lacking a political and literary centre, it was influenced by local spoken dialects. 'Alī Shir Navā'ī and the Mughal emperor Babur were among the great classical

writers in this dialect. The second tradition centred on Azeri, the literary language of the eastern Oghuz in western Persia, Iraq, and eastern Anatolia before the Ottoman conquest. Seyid İmadeddin Nesimi is its first outstanding representative; his poems have rare beauty and religious feeling. Shah Ismā' īl, founder of the Şafavid dynasty of Persia, had a lasting influence on popular religious literature in Anatolia. His poems, a blend of religious emotion and political propaganda, preach the Shi'ite doctrine. Mehmed bin Süleyman Fuzuli, the greatest representative of the classical school, influenced Azeri and Ottoman poets of all succeeding generations.

The third and most prolific Turkish literature was written in Anatolian, or Ottoman, Turkish, the language of Anatolian Seljuks and of the Ottoman Empire after the 13th century. In the earliest, preclassic period, spanning the 14th and 15th centuries, the influence of the Persian classics was paramount. But by the mid-15th century, with the establishment of the Turks in Istanbul, the golden age of Turkish letters began, lasting through the 17th century. The Persian classics were no longer mechanically imitated but had been fully assimilated, and this circumstance enabled Turkish poets to evolve a genuine classical poetry that bore the imprint of their own individuality. A price had to be paid, however, for this assimilation. The Turkish language lost some of its purity by accepting a large number of Persian and Arabic words and constructions. As a result, Turkish literature was restricted to a small educated class. The two greatest poets among the many splendid poets of the era were Fuzuli and Bâkî. The prose of the classical period also showed great varietywith folktales, half-religious and half-epic narratives, belles-lettres written in a rather heavy and artificial style, and, particularly, the work of the chroniclers, who were masters of classical prose. Notable in the postclassic period, beginning in the 18th century, was Ahmed Nedim, who sang in colourful poems of the so-called Tulip Age of Istanbul under Ahmed III. In the second half of the century, Gâlib Dede, the last great classical author, wrote the original mystical romance Hüsn ü Ask ("Beauty and Love").

The modern period. In the 19th century the introduction of Western reforms had its effect on literature. Mainly under French influence, various writers adopted and adapted Western literary forms, such as the novel, the drama, and the essay, while the rigid forms and attitudes of classical poetry gradually went out of fashion in the country. In the 20th century, a Turkish nationalist literature flourished, and an especially rich and varied literature developed after Kemal Atatürk's reforms. Particularly after the 1930s, a fundamental change began to take place; for the first time, a native and original literature began to develop. Unlike the preceding literary schools, republican literature did not deal only with the life and problems of the upper and middle classes of the old capital of Istanbul but was increasingly concerned with the problems and destiny of the people in every part of Turkey.

Turkish style, also called MOORISH STYLE, a fashion of furniture and decorative design based on Middle Eastern styles that flourished from the latter half of the 19th century until the late 1920s. It was favoured especially for the men's smoking rooms once found in every gentleman's residence, then for clubs, and finally, when they proliferated at the turn of the century, for cafes and restaurants. The style may have originated in the tendency to associate tobacco with the Middle East, but, more fundamentally, it was part of a nostalgia for the exotic as expressed partly in ideas culled from the Muslim world that had first manifested themselves in poetry and painting much earlier in the century. Closely associated

with this romanticism was the notion that decor of this kind was somehow raffish and suitable for any form of male self-indulgence.

With a velvet smoking cap, based on the tarboosh worn by Muslim men, the 19thcentury man-about-town smoked his cigar in surroundings of this kind, assured that he was playing the role of a hedonistic sheikh, of the kind later to be popularized by the film actor Rudolph Valentino. Later, cafes, too, began to assume this kind of decorative flavour emphasized by the fact that they served coffee. During this period, private homes frequently had a Turkish corner, with mats, a divan, and small tables heavily inlaid with Arabic designs. Fretted Saracenic arches, bead curtains. potted palms, and heavily sprung ottomans were other characteristic features. There was a revival of this style among some groups of young people in the 1960s and early 1970s, again motivated by a nostalgia for the roman-

Turkistan, also spelled TURKESTAN, in Asian history, the regions of Central Asia lying between Siberia on the north; Tibet, India, Afghanistan, and Iran on the south; the Gobi (desert) on the east; and the Caspian Sea on the west. The term was intended to indicate the areas inhabited by Turkic peoples, but the regions also contained peoples who were not Turkic, such as the Tadzhiks, and excluded some who were, including the Turks of the former Ottoman Empire and the Turko-Tatar peoples of the Volga area. The total of more than 1,000,000 sq mi (2,600,000 sq km) was divided by the Pamirs and Tien Shan (mountains) between West Turkistan (Russian)—covering the present Turkmen, Uzbek, Tadzhik, and Kirgiz soviet socialist republics—the southern part of the Kazakh S.S.R., and East Turkistan (Chinese), formerly the province of Sinkiang and now the Sinkiang Uighur Autonomous Region. For a time after the mid-1920s, West Turkistan was known as Soviet Central Asia (administratively excluding the Kazakh S.S.R.).

Early history. Turkistan may be said to have entered history with the conquest of Kashgaria by the Huns at the beginning of the 2nd century BC. After the break-up of the Hun empire, East Turkistan was annexed by the Chinese. About AD 400 the Hephthalites created an empire in West Turkistan. During the 6th century the Turks first appeared and established themselves in Transoxiana, the lands east of the Amu Darya (Oxus) River.

Transoxiana was conquered by the Arabs in the 8th century and attained its greatest prosperity under their successors, the Persian Samanid dynasty. At about the same time the Uighurs from Mongolia occupied East Turkistan, where they have remained the majority population. The whole of Turkistan was under various Turkic rulers until the appearance of the Mongols under Genghis Khan, who occupied Kashgar in 1218 and Transoxiana in 1220. Genghis Khan assigned Turkistan to his second son Chagatai, whose descendants eventually divided into two branches, the khans of Transoxiana and those of East Turkistan. In 1369 Timur conquered Transoxiana and made Samarkand the capital of his empire. After his death there were rival claimants to his territories; and in 1500 the Uzbek chief, Shaybani Khan, supplanted the Timurid dynasty in Transoxiana. After a century of uncertain rule, the Shaybanids were displaced by the Ashtarkhanid (or Astrakhan) dynasty, which was in turn overthrown by Nadir Shah in 1740. During the next century, West Turkistan was mainly controlled by the three rival khanates of Bukhara, Khiva (Khorezm), and Kokand.

In East Turkistan the rule of the Chagatai khans gave way in the northeast to the Dzungar branch of the western Mongols, or Kalmyks, while the southwestern oases were

ruled by the religious aristocracy known as the Khojas. All of East Turkistan was annexed by the Manchu dynasty of China in 1762, and thereafter its history developed independently from that of West Turkistan.

Russian penetration. During the 18th century, Russia penetrated deeply into what is now Khazahkstan, or the Kazakh S.S.R.; and by the mid-19th century it had established itself on the northern frontiers of Turkistan and held a line of forts running roughly east and west, on both sides of the Aral Sea. Between the 1850s and the 1880s economic and strategic considerations impelled the Russian government to bring the whole of West Turkistan under its control, only the khanates of Bukhara and Khiva being left partially independent under their traditional rulers. The imposition of Russian rule brought a high degree of security to West Turkistan and also a number of improvements in the economy, communications, and irrigation. The government interfered very little in the traditional life of the people and largely ignored their education, with the result that at the outbreak of the Russian Revolution of 1917 illiteracy stood at about 97 percent. During Pyotr Stolypin's administration (1906-11), the colonization of Turkistan from European Russia was greatly developed, and a large number of Russians and Ukrainians entered the region. The preferential land and water rights given to these new settlers was a root cause of the 1916 revolt, which was precipitated by the decision to recruit military labour units from the local population, previously exempt from compulsory military service. The revolt was put down with great severity, thus to some extent predisposing the population in favour of the forthcoming Soviet regime.

Nationalist stirrings that occurred prior to the Revolution of 1917 were aimed at cultural and judicial recognition rather than at political separation from Russia. The civil war after the revolution resulted in some genuine nationalist uprisings, which eventually came under Soviet control. The policy of Lenin and Stalin toward the region involved the precise categorization of nationalities and culminated in the administrative redistribution of 1924, which led to the establishment of a union republic for each of the five main peoples (Uzbeks, Turkmens, Kirgiz, Tadzhiks, and Kazakhs).

Although East Turkistan, or Sinkiang, had been under Chinese dominion since 1762 and a province of China since 1884, Russian influence was considerable there in the second half of the 19th century. Russian forces occupied Kuldja and the Taranchi sultanate from 1871 to 1881. Russian influence increased after the collapse of the Manchu dynasty in 1912 and particularly after the consolidation of the Soviet regime in West Turkistan.

Sinkiang Uighur Autonomous Region. After 1912, Sinkiang was under the rule of warlords, but in 1942 the governor, Shen Shih-tsai, declared his allegiance to the Chinese government. After a succession of revolts against Chinese authority, mainly in the north, a measure of autonomy was granted. With the establishment of the Chinese People's Republic in 1949, Sinkiang allegedly recognized the authority of the Communist regime and in 1950 was occupied by the Chinese Army of Liberation. In 1955 the Communist government announced the creation of the Sinkiang Uighur Autonomous Region, within which certain non-Chinese national communities other than the Uighur were given a degree of regional autonomy. The U.S.S.R. relinquished its joint ownership of oil, metallurgical, and other enterprises, and Soviet influence virtually came to an end.

Turkistan Range, Russian TURKESTANSKY KHREBET, also spelled TURKESTANSKIJ CHREBET, mountain range in Kirgiz, Tadzhik, and Uzbek Soviet Socialist republics. Branching

off from the Alay Mountains, it extends for 200 mi (320 km) east-west between the Fergana and Zeravshan valleys. Its highest point is Piramidalny Peak (18,077 ft [5,510 m]). It is composed mainly of schists, sandstones, and limestones. Below the snow line, groves of trees grow on the northern slopes, while the drier, sheer southern slopes are almost devoid of vegetation. The Ura-Tyube-Dushanbe road crosses the Shakhristan Pass at 11,083 ft.

Turkmen, also spelled Turkoman, or Tur-COMAN, Russian singular TURKMEN, plural TURKMENY, people belonging to the southwestern branch of the Turkic linguistic group (see Turkmen language). The majority live in the Turkmen Soviet Socialist Republic and in neighbouring parts of Soviet Central Asia and numbered 2,028,000 in 1979. A large group lives in Iran, especially in the north, and in northeastern and northwestern Afghanistan. These groups are called the Transcaspian Turkmen. Pockets of Turkmen are found in northern Iraq and Syria. Large groups live in central Turkey, where their proportional numbers effect minority discrimination, especially after 1958. The number of Turkmen in the world may be more than 3,125,000.

The territory of the Turkmen is generally arid. They moved at about the time Islām rose from the Altai mountain area of Inner Asia. They were by tradition a nomadic pastoral people, living in tent villages and raising sheep, goats, horses, camels, asses, and cat-tle. With the help of irrigation and fertilizers, the Turkmen of the Soviet Union have taken up agriculture, and their stock breeding is no longer nomadic. Outside the Soviet Union some Turkmen continue their nomadic pastoral life. An important adjunct to the economy is rug weaving (see Ersari carpets; Salor rugs; Tekke carpets; Yomut carpets). For the Transcaspian Turkmen, government control began in Iran in 1925 at the order of Reza Shah Pahlavi. Flight into the U.S.S.R. was in vain, and they fled back. Many added cotton farming and fishing to their pastoralism. Later many of the Turkmen in the U.S.S.R. fled to Afghanistan.

Turkmen social organization is based on descent in the paternal line. Although most of the Central Asian Turks were divided into a noble and a common stratum, the Turkmen had a division according to economic function, herding carrying more prestige than farming. At the head of each division was a khān. This mode of organization no longer exists in the Soviet Union but continues elsewhere

The Turkmen are Muslims but, like most Turkic nomads, are not as deeply influenced by Islām as are the sedentary Turks.

Turkmen language, member of the Turkic language group (a subfamily of the Altaic languages), spoken in the Turkmen S.S.R. and in parts of the neighbouring Kazakh S.S.R. and Uzbek S.S.R. in the Soviet Union.

Turkmen is a member of the southwestern, or Oğuz, division of the Turkic languages. Its literary tradition dates back to the 14th century AD. Later, writers began to use the Chagatai literary language of the southeastern (Chagatai) Turkic language division. In the 18th and 19th centuries an exclusively Turkmen literary language began to emerge, but this development was ended with the introduction of a new literary language based on spoken Turkmen after the Russian Revolution of 1917. Turkmen was written with the Arabic alphabet before 1927, when the Latin alphabet as modified for Turkish was adopted. In the Soviet Union the Latin alphabet was replaced by a Cyrillic alphabet in 1940. See also Turkic languages.

Turkmenistan, officially turkmen soviet socialist republic, also called turkmeniya, Russian turkmenistan, or turkmenskaya sovetskaya sotsialisticheskaya respublika, Akademiya Nauk romanization turkmenistan, or turkmenskaja sovetskaja socialističeskaja respublika, historic region and one of the union republics of the Soviet Union.

A brief treatment of Turkmenistan follows. For full treatment, see MACROPAEDIA: Union of Soviet Socialist Republics.

Physical and human geography. men S.S.R. was established in 1925, and the capital is Ashkhabad. Its Central Asian neighbours are the Kazakh S.S.R. to the north, the Uzbek S.S.R. to the east, and Iran and Afghanistan to the south; the Caspian Sea forms its western border. Turkmenistan is principally composed of desert and is subject to earthquakes in the Kopet-Dag region. Turkmenistan's position deep inside Asia and the climatic response to its relief bring it a strongly continental climate with great fluctuations in temperature during the day and the year. The temperature is seldom lower than 95° F (35° C) during summer days, and the maximum temperature in the southeastern Kara-Kum (desert) reaches 122° F (50° C) in the shade. By contrast, in winter the temperature in Kushka drops to -27° Humidity is very low and rainfall meagre; irrigation is therefore very important. The main rivers are the Amu Darya (ancient Oxus), which flows along the northeastern border to the Aral Sea; and the Tedzhen, Murgab, and Atrek. Many canals and reservoirs have been built. The construction across the Kara-Kum of the world's largest irrigation and shipping canal, the Karakumsky Canal, began in the 1950s and continued in the 1980s. When it is completed sometime after 1990, it will be 870 miles (1,400 km) long.

Turkmenistan's soils are varied, but in most of the desert region there is no definite soil layer. In the oases, a layer suitable for irrigated cultivation has formed. Except in the oases and mountain valleys and plateaus, vegetation is of a pronounced desert character. In the mountain valleys of the Kopet-Dag, wild grape, almond, fig, and walnut are found, and along riverbanks there are forests of black poplar, willow, and reeds and canes.

The animal world is represented mainly by desert creatures such as fox, wildcat, and Kara-Kum gazelle. In the mountains are mountain sheep and goat, cheetah, lynx, snow leopard, and porcupine. Jackal, wild pig, and pink deer can be seen along the Amu Darya. The eastern coast of the Caspian Sea is the winter home of vast flocks of migratory waterfowl. The beluga sturgeon, prized for caviar, and numerous other fishes are found in the Caspian.

There are two broad regions of Turkmenistan: the oasis region and the desert. The principal oases are the Kopet-Dag, Tedzhen, Murgab, Middle Amu-Darya, and Lower Amu-Darya, and they have water supplies, cultivated lands, and developed industry. Ashkhabad, the capital, is the economic and cultural centre of the Kopet-Dag oasis, and also of all Turkmenistan.

In the desert region, western Turkmenistan is one of the most industrially developed regions of the republic, emphasizing oil extraction and refining, chemical and mining industries, and fisheries and fish processing. The Kara-Kum portion of the desert has cattle raising and resources of natural gas and petroleum.

The population of Turkmenistan has a high natural rate of increase because of a high birth rate and low mortality rate.

It is a multinational republic with Turkmens constituting two-thirds of the populace, Russians about 15 percent, and smaller numbers

of Uzbeks, Kazakhs, Tatars, Ukrainians, Armenians, Azerbaijanis, and Kara-Kalpaks.

The Turkmens, who had traditionally been divided on a clan basis up to the 19th century, were, when they were conquered by tsarist Russia, a pastoral people, nomadic in habit and frequently mercenaries. They ceased to be nomads with the imposition of Soviet government and began to develop a sense of nationhood. The economy was radically reconstructed by 1930, and the republic now specializes in cotton growing and in oil and gas extraction.

The governmental structure of the Turkmen S.S.R. is similar to that of other Soviet republics, and the ruling power de facto is the Communist Party. There has been a great improvement in health facilities during the 20th century. Education is free and compulsory between the ages of 7 and 17; there are vocational schools and institutions of higher education.

The intellectual and cultural life of Turkmenistan was brought to a high level by a revival in Islāmic education. The traditional practice of composing poetry orally yielded to the printing press. More than 500 books are published annually, half of them in the Turkmen language. All news media are rigidly controlled by the government.

History. The origins of the ethnically distinctive Turkmens are unknown, although several traditions exist. It is certain, however, that until the early 20th century they were organized solely by tribes, alternating in ascendancy and defeat. The first Russian incursion into the area, in 1717, was unsuccessful, but in 1869 a foothold was established. The Russians assumed control of the region, establishing first a military district and then the Transcaspian oblast. The Turkmens revolted in 1916, and, during the Russian Civil War, Turkmenistan was one of many battlefields. Bolshevik rule was established there in 1920.

The Transcaspian oblast became the Turkmen oblast in 1921, and in 1924 the Turkmen S.S.R. was assembled from the Turkmen oblast and the Turkmen districts of the former Khorezmian and Bukharan republics. It became part of the U.S.S.R. in 1925. Area 188,500 square miles (488,100 square km). Pop. (1989 prelim.) 3,534,000.

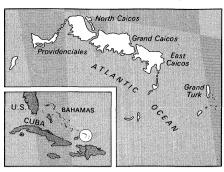

Turkoman, also called TURKMENY (people): see Turkmen.

Turks and Caicos Islands, officially COL-ONY OF THE TURKS AND CAICOS ISLANDS, British dependency in the West Indies, consisting of two small groups of islands lying at the southeastern end of The Bahamas and about 90 miles (145 km) north of the Dominican Republic. The Turks group is composed of Grand Turk, Salt Cay, and lesser cays. The Caicos group consists of six principal islands-South Caicos, East Caicos, Middle (or Grand) Caicos, North Caicos, Providenciales, and West Caicos—and several cays. Together they cover a total land area of 193 square miles (500 square km). The seat of government is at Cockburn Town on Grand Turk Island, and the population in 1990 was estimated to be 11,000.

For information about regional aspects of the Turks and Caicos Islands, *see MACROPAEDIA*: West Indies.

For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

The land. The islands are geographically an extension of the Bahamas chain and are similarly flat and composed largely of coraline limestone. Elevations do not reach more than 163 feet (50 m). The 22-mile- (35-kilometre-) wide deep-sea Turks Islands Passage separates the Turks group on the east from the Caicos group on the west. The name Turks allegedly derives from that of the Turk's head cactus, whose scarlet flowers are said to resemble a

Turks and Caicos Islands

Turkish fez; that of Caicos perhaps from cayos (Spanish: "keys"). The islands are surrounded by coral reefs, which pose a hazard to navigation. The climate is warm, pleasant, and rather dry. Temperatures range from 75° to 90° F (24° to 32° C) during the year, and rainfall averages only 21 inches (533 mm) annually. Accordingly, drinking water is scarce, and water conservation is rigidly practiced. The southeast trade winds temper the warmest days, which come between April and November. Hurricanes are fairly common. Vegetation is mainly of the xerophytic scrub variety, and there are salt marshes. The surrounding waters are rich in sea life, abounding especially with crustaceans.

The people. About one-third of the inhabitants of the Turks and Caicos Islands are blacks, the descendants of African slaves. Nearly two-thirds of the population is racially mixed, and there are also a small number of white residents. The official language is English, and the Protestant denominations have the largest church memberships, among which the Baptists, Methodists, and Anglicans are most prominent. Of the eight Turks islands, only two, Grand Turk and Salt Cay, are inhabited. The main populated islands of the Caicos are South Caicos, Middle Caicos, North Caicos, and Providenciales. The most populous island is Grand Turk, and the two main communities are Cockburn Town on that island and Cockburn Harbour on South Caicos. There are many Turks and Caicos citizens living in The Bahamas, where there is greater economic opportunity.

The economy. Because of limited natural resources, the main industries on Turks and Caicos are tourism, offshore financial services, and fishing. Salt production was the mainstay of the economy until it became unprofitable because of world market competition and ceased altogether in 1964. Tourism is growing with help from the government, which is improving the infrastructure and providing financial incentives for the expansion of resort facilities. Offshore banking is also being encouraged. The fishing industry is based for the most part on catches of lobster and conch. most of which is exported to the United States. Agriculture is extremely limited by the dry climate and the unfertile soil; corn (maize), beans, and cassava are grown, and some cattle are grazed.

The islands' road network extends for only about 75 miles (120 km), and Grand Turk and South Caicos have some surfaced roads. The chief ports are Grand Turk, Salt Cay, and Cockburn Harbour on South Caicos. International airports operate on Grand Turk, South Caicos, and Providenciales, and some of the other islands have landing strips.

Government and social conditions. The Turks and Caicos Islands are a British crown colony administered in accordance with the 1976 constitution (amended in 1988). The British monarch is the head of state and is represented in the territory by a governor, who has executive power. The governor is president of, and is advised by, the Executive Council, which includes the various ministers.

The Legislative Council is composed of 13 elected members, 6 appointed members, and a speaker who is also elected.

Living conditions on the islands are generally poor. Unemployment is often severe, and such basics as fresh water and electricity have limited availability. Nevertheless, health on the islands is good; a modern cottage hospital operates on Grand Turk, and there are outpatient and dental clinics on the other populated islands. Education is free and is compulsory at the primary level; the government also provides secondary education, and most of the people are literate. A government-owned radio station broadcasting out of Grand Turk is heard throughout the populated islands.

heard throughout the populated islands.

History. There is evidence that a primitive culture once existed on Turks and Caicos. At the time of Juan Ponce de León's arrival in 1512, the islands were inhabited by Indians. They remained unsettled by Europeans until 1678, when British settlers from Bermuda established a salt-panning industry. The islands were at first placed under the Bahamas government, but in 1874 they were annexed to the colony of Jamaica, remaining a part of that territory until 1959. In that year they received a new constitution providing for separate government, and in 1962 the islands became a crown colony. The Bahamas governor was also the governor of Turks and Caicos from 1965 until 1973, when the islands received their own governor. In 1976 a new constitution took effect, and elections were held establishing a ministerial type of government. Some efforts toward independence were made in the early 1980s, but these ceased in 1985-86 when drug and corruption scandals forced the governor to dissolve the executive council and assume administrative control. In 1988 elections were held to restore representative

Turku, Swedish ÅBO, city, capital of Turku ja Pori *lääni* (province), southwestern Finland, at the mouth of the Aura River, west-northwest of Helsinki. Finland's oldest city, it was originally a trading centre a few miles north of

The medieval castle at Turku, Fin. Art Resource—EB Inc.

its present site, to which it was transferred at the beginning of the 13th century. It received its first known charter in 1525. The Court of Appeals was set up there in 1623, as was a university in 1640 (transferred to Helsinki in 1828). Finland's capital under Swedish and then Russian rule until 1812, Turku was almost entirely destroyed by fire in 1827. The city was rebuilt according to plans by the architect Carl Ludwig Engel, but it was again damaged during World War II. Turku remains an important industrial and cultural centre. It is Finland's fourth largest city and largest winter port and contains a major tobacco factory and important naval shipyards. Industries include sugar refining and production of steel,

lumber, flour, pottery, and textiles.

A bilingual city, Turku has a Swedish-speaking (established 1918) and a Finnish-speaking (1922) university, several specialized institutes of higher education, art galleries, libraries, and museums. It is the seat of the archbishop of

the Evangelical Lutheran Church of Finland, and its many historical sites include a cathedral (consecrated 1290, enlarged in the 16th century); a medieval castle, now housing the historical museum; a Swedish Theatre (1838); and a Greek Orthodox church (1846). Pop. (1986 est.) mun., 161,398.

Turku ja Pori, in full turun ja po-RIN, Swedish åbo och björneborgs, lääni (province), southwestern Finland, northwest of Helsinki, bounded by the Gulf of Bothnia to the west and southwest. Its land area is 8,559 square miles (22,170 square km). Turku ja Pori includes numerous small lakes; the Kokemaen River is the principal waterway, with the port of Pori near its mouth. The land is generally level and fertile. Agriculture and dairying are important, as are timber processing and the manufacture of wood products. Along the coast and on the numerous offshore islands, farming dominates the local economy. Though increasingly connected by ferries and bridges, the islands have suffered steady depopulation. Turku ja Pori's administrative capital, Turku, at the mouth of the Aura River, is the province's chief seaport and industrial centre. Rauma (Raumo), Pori, Salo, and Uusikaupunki (Nystad) are other industrial towns and seaports. The main horticultural-research station in Finland is at Piikkiö (Pikis). Pop. (1988 est.) 714,340.

Turloch O'CONNOR, also spelled TURLOUGH O'CONOR, Old Irish TOIRDELBACH UA CONCHUBAIR (b. 1088, Connaught, Ire.—d. 1156), king of Connaught and from 1121 the most powerful Irish prince. In 1118 he divided Munster into two coequal kingdoms; in 1125 he deposed the king of Meath and appointed three kings in his stead; in 1126 he made his son Conchobar king of Dublin and Leinster; and in 1129 he built Ireland's first castle, commanding the passage of the Shannon at Athlone.

Turlock, city, Stanislaus county, central California, U.S., in the San Joaquin Valley, 40 miles (64 km) southeast of Stockton. It was founded (c. 1860) by John Mitchell, a grain farmer. After the Central Pacific Railroad came through the valley in the 1870s, Turlock (from the Irish turlough, "dry lake") became a shipping point for wheat. In 1901 Turlock Irrigation District transformed the dry farming of the valley into diversified farming (fruit growing, poultry raising, dairying). Food processing is supplemented by warehousing and light manufacturing. California State College, Stanislaus (1960), is in the city. Turlock Lake State Park is to the east. Inc. 1908. Pop. (1987 est.) 34,818.

turmeric (Curcuma longa), perennial herbaceous plant of the ginger family (Zingiberaceae), the tuberous rhizomes, or underground stems, of which have been used from antiquity as a condiment, a dye, and medically as an aromatic stimulant. In biblical times it was used as a perfume as well as a spice. In the Middle Ages it was called Indian saffron because of its orange-yellow colour. The rhizome has a pepperlike aroma and a somewhat bitter, warm taste. It is the ingredient that colours and flavours prepared mustard and is used in curry powder, relishes, pickles, spiced butters for vegetables, in fish and egg dishes, and with poultry, rice, and pork. In parts of Asia turmeric water is applied as a cosmetic to lend a golden glow to the complexion.

Native to southern India and Indonesia, turmeric is cultivated on the mainland and in the islands of the Indian Ocean. Production involves a boiling process, which is followed by exposure of the rhizomes to sunlight for five to seven days to dry. Then they are polished by hand rubbing or by rotation in a mounted drum. Dried rhizomes vary from approximately 2.5 to 7.5 cm (1 to 3 inches) in length. The spice is usually sold in ground form. Distillation yields 1.3 to 5.5 percent essential oil, the principal components of which are turmerone and ar-turmerone. The colouring matter is curcumin.

Turmeric (Curcuma longa)
W.H. Hodge

Paper tinged with a tincture of turmeric, on addition of alkali, turns from yellow to reddish brown, becoming violet on drying, thus providing a test for alkalinity.

Turnbull, Herbert Western (b. Aug. 31, 1885, Tettenhall, Wolverhampton, Eng.—d. May 4, 1961, Grasmere, Westmoreland), English mathematician who made extensive and notable contributions to the study of algebraic invariants and concomitants of quadratics.

After serving as lecturer at St. Catharine's College, Cambridge (1909), the University of Liverpool (1910), and the University of Hong Kong (1912), Turnbull became master at St. Stephen's College in Hong Kong (1911–15), and Warden of the University Hostel (1913–15). He was Fereday Fellow at St. John's College, Oxford (1919–26), and from 1921 held the Regius chair of mathematics at United College of St. Salvator and St. Leonard, St. Andrews.

Turnbull became an outstanding contributor to the symbolic calculus of Clebsch and Gordon. His major works include The Theory of Determinants, Matrices, and Invariants (1960), The Great Mathematicians (1961), An Introduction to the Theory of Canonical Matrices (1961), James Gregory Tercentenary Memorial Volume (1939), Theory of Equations (1957), The Mathematical Discoveries of Newton (1945), and The Correspondence of Isaac Newton, 3 vol. (1959–61).

Turner, Big Joe, byname of Joseph Vernon Turner (b. May 18, 1911, Kansas City, Mo., U.S.—d. Nov. 24, 1985, Englewood, Calif.), American blues singer, or "shouter," whose records were imitated by white musicians in the early days of rock and roll.

Singing in his youth in church choirs and informally for tips, Turner drew attention as a singing bartender, accompanied by pianist Pete Johnson, in Kansas City saloons. Discovered by jazz critic John Hammond, Turner, with his convincing baritone voice, was taken to New York City for the 1938 Carnegie Hall "Spirituals to Swing" concert and stayed on

to become a popular attraction, with boogie-woogie piano accompaniment, at New York nightclubs. He began recording with top jazz musicians and touring the United States and Canada, sometimes with blues players or Count Basie's orchestra. In 1951 he made a top-selling rhythm-and-blues record, "Chains of Love," and followed it with "Sweet 16," "Honey, Hush," "Shake, Rattle and Roll," and "Flip, Flop and Fly," which were re-recorded by young white musicians, notably Bill Haley, using censored lyrics. Turner appeared in several movies (including the documentary Last Of The Blue Devils, 1979), at major jazz and folk festivals in the United States and Europe, on television, and in jazz clubs, recording continually into the 1980s.

Turner, Ethel (Sibyl), married name MRS. HERBERT RAINE CURLEWIS (b. Jan. 24, 1872, Doncaster, Yorkshire, Eng.—d. April 8, 1958, Sydney), Australian novelist and writer for children, whose popular novel Seven Little Australians (1894) was filmed (1939), twice dramatized for television, once in Britain (1953) and once in Australia (1973), and made into a musical (1978).

Turner's parents immigrated with her to Australia in 1881, and she was educated and reared in Sydney. She and a sister published a monthly magazine, *The Parthenon*, from 1889 to 1892, and thereafter she was employed as a children's writer-editor for newspapers in Sydney. Her first book, *Seven Little Australians*, was a quick success, being translated into several languages and eventually becoming an Australian children's classic. She wrote about 30 other novels and collections of short stories and verse, mostly about girls for girls. Much of her work is characterized by the sentimentality and melodrama prized during the late 19th and early 20th centuries.

Turner, Frederick Jackson (b. Nov. 14, 1861, Portage, Wis., U.S.—d. March 14, 1932, San Marino, Calif.), noted American teacher and scholar who evolved a seminal theory of American history based on the influence of the frontier in shaping the character of people and democratic institutions over a period of almost 300 years. His overall emphasis, however, was on a multicausal interpretation of history, with such forces as politics, economics, culture, and geography all interreacting. Turner's reputation lay less in the bulk of his writings or the number of his graduate students than in his penetrating analyses, which changed the direction of much American historical writing.

Deeply influenced by his observations of Wisconsin life during boyhood days, Turner, while in graduate school at Johns Hopkins University, rejected the doctrine that American institutions could be traced mainly to European origins. As an instructor at the University of Wisconsin at Madison, from 1889, he demonstrated his own theories in a series

Frederick Jackson Turner

of original essays. In the first, "The Significance of History" (1891), Turner expounded the idea that history was rewritten by each age in terms of its own conditions and must be so understood. This article was followed the next year with "Problems in American History," in which he first pegged the country's evolution to the continuous flow of Western colonization made possible by the abundance of free land. He also urged historians to call upon the tools of other disciplines, such as geology, meteorology, and biology, to deepen their interpretations.

Turner's most significant contribution was produced as an address before an international congress of historians held simultaneously with the World's Columbian Exposition in Chicago (1893). Employing arresting literary imagery in combination with incisive reasoning, the young historian presented his new theory concerning the influence of environment on transplanted peoples, in what came to be known as the "frontier school" of historiography. He traced the social evolution of frontier life as it continually developed across the continent from the primitive conditions of explorer, trapper, and trader, through maturing agricultural stages, finally reaching the complexity of city and factory. Turner held that the American character was decisively shaped by conditions on the frontier, which evoked such qualities as "coarseness and strength . . . acuteness and inquisitiveness, that practical, inventive turn of mind . . . restless, nervous energy . . . that buoyancy and exuberance which comes with freedom....

Two more articles on the West followed (1896, 1903), but by this time Turner was focusing his main attention on the phenomenon of sectionalism as a major force in U.S. development. His Significance of Sections in American History (1932) was awarded the Pulitzer Prize posthumously in 1933, and another unfinished study was published in 1935: The United States, 1830–1850: The Nation and Its Sections.

Having been made a full professor in 1892, Turner taught at the University of Wisconsin until 1910 and at Harvard University for the next 14 years. He served as president of the American Historical Association (1909–10) and on the editorial board of the American Historical Review from 1910 to 1915. Poor health led to his move to the Henry E. Huntington Library, San Marino, Calif., where he remained as a research associate until his death

A collection of his selected essays can be found in *Frontier and Section* (1961), with an excellent biographical introduction by Ray Allen Billington.

Turner, Herbert Hall (b. Aug. 13, 1861, Leeds, Yorkshire, Eng.—d. Aug. 20, 1930, Stockholm), English astronomer who pioneered many of the procedures now universally employed in determining stellar positions from astronomical photographs.

In 1884 Turner was appointed chief assistant at the Royal Observatory, Greenwich, and in 1893 he became Savilian professor of astronomy and director of the University Observatory at Oxford. A plan for international cooperation in compiling an astrographic chart and catalog had been formulated in 1887 at Paris. Turner worked unceasingly on Oxford's share of the project and made innovations in astronomical photography that contributed to the success of the project. Through his efforts, Oxford was the second observatory to finish its share of the catalog, and he then turned to helping others finish their zones. After the formation of the International Astronomical Union in 1919, he was appointed president of the committee in charge of the project. He also contributed much to worldwide seismological studies and established Oxford as an international centre of seismological research. A prolific writer as well as an exceptional speaker, Turner produced four popular expositions of astronomy: Modern Astronomy (1901); Astronomical Discovery (1904); The Great Star Map (1912); and A Voyage in Space (1915). At his suggestion the ninth planet, discovered by the U.S. astronomer Clyde W. Tombaugh in 1930, was named Pluto.

Turner, J(oseph) M(allord) W(illiam) (b. April 23, 1775, London—d. Dec. 19, 1851, London), English Romantic painter, perhaps the greatest 19th-century landscapist, whose expressionistic studies of light, colour, and atmosphere were unmatched in their range and sublimity. His marine paintings are particularly notable.

Early life and works. Turner was the son of a barber, but nothing is known about his mother except that she died insane in

J.M.W. Turner, detail of a self-portrait in oil, 1798; in the Tate Gallery, London

By courtesy of the trustees of the Tate Gallery,

1804. At the age of 10 Turner was sent to live with an uncle at Brentford, Middlesex, where he attended school. Several drawings are dated as early as 1787. These are sufficiently professional to corroborate the tradition that his father used to sell the boy's work to his customers. After some instruction under Thomas Malton, a topographical watercolourist, Turner entered the Royal Academy schools in 1789 and exhibited a watercolour when he was only 15. He used to spend the summer holidays touring the country in search of subjects for his sketchbooks and visited Oxford in 1789, Bristol in 1791, and Wales in 1792. In 1794 he began working for engravers, supplying designs for the Copper Plate Magazine and the Pocket Magazine. Engraved views of picturesque ruins of castles and abbeys were much in demand at the time. In the winters he attended the evening sessions at the house of Thomas Monro, the doctor and connoisseur who had treated John Robert Cozens, an English landscape painter in watercolours, during his last illness and who owned a number of his drawings. Turner, Thomas Girtin, and other young artists were employed at making copies or elaborations of his unfinished drawings. The influence of Cozens and of the Welsh landscape painter Richard Wilson helped broaden Turner's outlook.

From 1796 Turner began to exhibit oil paintings as well as watercolours at the Royal Academy. The first one, "Fishermen at Sea," is a moonlight scene and was acclaimed by a contemporary critic as the work "of an original mind." In 1799, at the youngest permitted age (24), Turner was elected an associate of the Royal Academy, and in 1802 he became a full Academician, a dignity he marked by a series of large pictures in which he emulated the achievements of the old masters. He took his duties seriously, attending academic functions regularly, filling various offices, and bequeath-

ing £20,000 to the Academy. He was helpful and encouraging to other artists insofar as his shyness and brusque manner allowed. In 1807 he was appointed professor of perspective. His infrequent lectures were said to have been difficult to follow but worth it for his diagrams. In about 1800 Turner took a studio at 64 Harley Street, London, and in 1804 opened a private gallery, where he continued to show his latest work for many seasons. He was by this time overwhelmed with commissions, and the success of his career was assured.

In the midst of professional success came personal grief. In 1800 Turner's mother became hopelessly ill and was committed to a mental hospital. His father came to live with him and devoted the rest of his life to serving as a studio assistant and general agent. Turner's private life, such as it was, was secretive, unsociable, and somewhat eccentric. In 1798 he entered into an affair, which was to last about 10 years, with Sarah Danby, a widow who bore him two children. As he never married, was close with money, and devoted his time almost entirely to his art, he was able to amass a considerable fortune.

He continued to travel in search of inspiration. His travels took him in 1797 to Yorkshire and the Lake District, in 1798 to Wales again, in 1801 to Scotland, and in 1802 to the Continent for the first time. The crossing to Calais was rough, and in his picture "Calais Pier" he left a vivid record of his experience on arrival. From Paris he proceeded to Lyon, through Switzerland, and back to Paris through Strasbourg and Nancy. He made more than 400 drawings during the tour and continued for many years after to paint pictures of scenes that had impressed him on the tour. In Paris he made detailed notes in the Louvre, where all the paintings brought from Italy by Napoleon were then displayed. He filled a sketchbook with copies and criticism of the paintings, showing that his taste was for the great Venetians of the 16th century. Turner's figure compositions "Venus and Adonis" and "Holy Family" (1803; Tate Gallery, London) show that he tried his hand in the Venetian manner. These pictures and the many early seapieces reveal his methodic attempt to master every style that he admired.

In 1807 Turner began his great enterprise of publishing a series of 100 plates known as the Liber Studiorum. His aim was to perpetuate the great variety and range of his work; some of the subjects were taken from existing paintings and watercolours; others were specially designed for the *Liber*. He employed several engravers, although he supervised the work at every stage, etched some of the plates himself, and made innumerable preparatory drawings. The publication was issued in parts consisting of five plates each, covering all the styles of landscape composition, such as historical, architectural, mountainous, pastoral, and marine. The first part appeared in June 1807 and the last in 1819, when Turner evidently lost interest in the project and abandoned it after the publication of 71 plates.

Middle years. During the second decade of the 1800s, Turner's painting became increasingly luminous and atmospheric in quality. Even in paintings of actual places, as "St. Mawes at the Pilchard Season" (1812; Tate Gallery) and the two pictures of Oxford painted between 1809 and 1812 (exhibited in 1812), the hard facts of topography are diffused behind pearly films of colour; other pictures, such as "Frosty Morning," are based entirely on effects of light. Turner was much in demand as a painter of castles and countryseats for their owners. Two examples of such paintings are "Somer Hill, Tunbridge" and "Linlithgow Palace" (1810; Walker Art Gallery, Liverpool). He continued to excel in marine painting, one of the most ambitious works being "Wreck of a Transport Ship" (1810; Gulbenkian Foundation, Lisbon).

The Earl of Egremont, who had bought a seapiece in 1802, became a regular patron and close friend. Turner probably paid his first visit to his other great friend and patron, Walter Fawkes, at Farnley Hall, Yorkshire, in 1810 and subsequently spent some weeks there nearly every summer until the death of Fawkes in 1825.

Turner continued to make extensive tours, between 1811 and 1813 of Devonshire, Cornwall, and Somerset, and in 1815 and 1816 of Yorkshire for the purpose of supplying 20 watercolours to illustrate T.D. Whitaker's *History of Richmondshire*. The following year he went to the Continent, primarily to visit the battlefield of Waterloo, of which he afterward painted a dark and romantic picture, "The Field of Waterloo" (1818; Tate Gallery).

As if he felt that he had done all he could with the beauty of his native country, he set out in the summer of 1819 on his first visit to Italy. He spent three months in Romevisited Naples, Florence, and Venice-and returned home in midwinter. During his journey he made about 1,500 drawings, and in the next few years he painted a series of pictures inspired by what he had seen. They show a great advance in Turner's style, particularly in the matter of colour, which becomes purer, more prismatic, with general heightening of key. A comparison of "The Bay of Baiae, with Apollo and the Sibyl" with any of the earlier pictures reveals a far more iridescent treatment resembling the transparency of a watercolour. The shadows are as colourful as the lights, and he achieves contrasts by setting off cold and warm colours instead of dark and light tones.

During the 1820s, tours of the Continent alternated with visits to various parts of England and Scotland. In 1821 Turner painted a series of delicate watercolours of the Seine on blue paper; in 1825 he revisited The Netherlands and Belgium and the following year the Meuse, Moselle, and the Loire. Notable among the pictures of this period are such views as "The Harbor of Dieppe," "Cologne: The Arrival of a Packet Boat: Evening," and "Mortlake Terrace: Early Summer Morning" (Frick Collection, New York City). In 1827 he stayed with John Nash, the architect, at Cowes and painted the brilliant sketches of the regatta now at the Tate Gallery. In 1828 he went to Italy again and held an exhibition of some of his pictures in Rome. After his father's death in 1829, Turner often visited the Earl of Egremont at Petworth, Sussex. The splendid sketches of Petworth probably belong to the early 1830s.

Later life and works. In the last years of his life, Turner was more famous, richer, and more secretive than ever. After several years of inactivity as professor of perspective at the Royal Academy, he resigned in 1838. In 1839 he bought a cottage in Chelsea, where he lived incognito under the assumed name of Booth. He was looked after by his old housekeeper, who guarded his privacy so zealously that she made it difficult for people to gain admission to his gallery. Turner continued to travel, however. In the last 15 years of his life, he revisited Italy, Switzerland, Germany, and France. Observers have recorded the untiring energy with which he sketched while abroad. and the drawings, numbering about 19,000 in the Turner Bequest, bear witness to this

While his earlier paintings and drawings show the most accurate observation of architectural and natural detail, in his later work this is sacrificed to general effects of colour and light with the barest indication of mass. His composition tends to become more fluid, suggesting movement and space; some of his paintings are mere colour notations, barely tinted on a white ground, such as "Norham Castle, Sunrise" and "Sunrise, with a Boat Between Headlands" (1835–45; Tate Gallery).

Contemporary accounts describe how Turner used to send canvases in this state to the Academy and add the detail, and perhaps the specific subjects that Turner felt to be necessary before his art was worthy to be shown to the public, on the three or more varnishing days allowed to academicians before the exhibition was formally opened, so that they could make last-minute adjustments to allow for the particular circumstances of the placing and lighting of the work. Turner's extreme exploitation of this opportunity served as a demonstration of his extraordinary virtuosity and, on occasion, of his consideration or lack of it-for the paintings of his neighbours; Constable, for example, was the victim of an enlarged red buoy in Turner's seapiece "Helvoetsluys," which completely eclipsed the reds in his own "Opening of Waterloo Bridge" at the Royal Academy in 1832. This practice may account for the large number of slightly brushed-in canvases found in Turner's studio at the time of his death. These colourful abstractions are far more appreciated now than the romantic subjects he exhibited.

Apart from fanciful reconstructions of ancient Rome and the scintillating Venetian subjects, which found ready purchasers in his day, the outstanding examples of his late work are "The Parting of Hero and Leander" (1837; National Gallery, London), a daring composition of sunset and moonlight with visions of spirits rising from the waters; "The 'Fighting Temeraire' Tugged to Her Last Berth To Be Broken Up, 1838," a tribute to the passing age of sail; and "Rain, Steam, and Speed—the Great Western Railway." Actually, the first picture to be hung in the National Gallery was the opalescent "Venice from the Steps of the Europa" (1842), presented in 1847, while Turner was still alive. Turner's preoccupation with the elements of fire and water appears in the two pictures "Burning of the Houses of Parliament," in the large sketch "A Fire at Sea" (Tate Gallery), and in "Rockets and Blue Lights" (1840; Sterling and Francine Clark Art Institute, Willamstown, Mass.).

Turner died in 1851 and was buried in St. Paul's Cathedral. By his will he intended to leave his fortune of £140,000 to found a charity for "decayed artists" and his pictures to the country, on condition that a gallery be built to exhibit them. As a result of protracted litigation with his rather distant relatives, the money reverted to them, while the pictures and drawings of the Turner Bequest became national property. It was not until 1908 that a special gallery was built by Sir Joseph Duveen to house them at the Tate Gallery. All the drawings and watercolours were transferred to the British Museum for safety after the Thames flood of 1928, when the storerooms at the Tate Gallery were inundated.

Evaluation. Even in the early years of the 19th century, Turner was strongly criticized by the more conservative critics and connoisseurs, such as Sir George Beaumont, for his forcefulness and high-keyed colour. By the end of his life, although his Venetian subjects and more finished watercolours still appealed to some purchasers, mainly from the newly rich merchant or manufacturing classes, and imitations of his works were beginning to be made, his style was developing along lines totally different from the contemporary taste for realism and high finish typified by such artists as William Powell Frith and the Pre-Raphaelite movement, founded in 1848. Turner's immense reputation in the second half of the 19th century was due largely to the enthusiastic if sometimes misguided championship of the most influential English art critic of the time, John Ruskin, who published the first part of Modern Painters in 1843 to prove Turner's superiority to all previous landscape

painters and to extol his accurate rendering of natural appearance.

In his pursuit of light and pure colour Turner had anticipated the achievements of the French Impressionists; and when Monet and Pissarro saw his work in London in 1870, they were greatly interested, although few of his truly impressionist sketches were shown at that time. In the 1920s, when the Postimpressionist cult was at its height through the writings of the English art critic Roger Fry, Turner's reputation suffered a temporary eclipse. In 1948 a representative collection of his work was shown at the Venice Biennale and afterward in the principal capitals of Europe, and abstract painters began to find a common purpose with their own work in some of Turner's late colour compositions. Subsequent major exhibitions have further strengthened his sta-

Turner: A Critical Biography (1966), the best approach to Turner the man, though overstressing the sociological, political, and psychological aspects; L. Herrmann, Ruskin and Turner (1968), an account of Ruskin's Turner collection with a catalog of the watercolours and drawings in the Ashmolean Museum, and Turner (1975), a general survey; J. Gage, Color in Turner: Poetry and Truth (1969), an analytical treatment of Turner's colour theory; Graham Reynolds, Turner (1969), a sound introduction to Turner's work; G. Wilkinson, Turner's Early Sketchbooks (1972); E. Joll and M. Butlin, The Paintings of J.M.W. Turner, 2 vol. (1977), an annotated catalog of Turner's oil paintings.

Turner, **Joe** (American musician): *see* Turner, Big Joe.

Turner, John Napier (b. June 7, 1929, Richmond, Surrey, Eng.), Canadian lawyer and politician who in June 1984 succeeded Pierre Elliott Trudeau as head of the Liberal Party and prime minister of Canada. In general elections of September of the same year his party was routed by the Progressive-Conservatives under Brian Mulroney.

Turner's family immigrated to Canada in 1932, and Turner gained his early education in Ottawa. His widowed mother, Phyllis Gregory Turner, held several important bureaucratic posts in Canada's wartime government and infused into young Turner a sense of respect for and interest in the calling of public office. After graduating in political science from the University of British Columbia (A.B., 1949) he studied for a year in Paris and attended Oxford University as a Rhodes scholar, receiving a degree in law in 1952 and a master's degree in 1957.

Turner returned to Canada and worked for various corporations, winning his first election to the House of Commons as a Liberal Party member in June 1962. In 1965 he was appointed to his first Cabinet post but lost a bid for leadership of the Liberals in 1968 to Trudeau. Under Trudeau, Turner first served as justice minister and in 1972 was appointed minister of finance, a post he abruptly resigned in September 1975, followed by his resignation from Parliament in February 1976. He returned to corporate law and for the next eight years also served as director of several companies while retaining close connections with political associates.

When Trudeau announced in February 1984 that he would not seek reelection as head of the Liberal Party, Turner ran as candidate for the leadership and won. His premiership, however, was brief, lasting less than three months.

Turner wrote Politics of Purpose (1968).

Turner, Nat (b. Oct. 2, 1800, Southampton County, Va., U.S.—d. Nov. 11, 1831, Jerusalem, Va.), black American bondsman who led the only effective, sustained slave revolt (August 1831) in U.S. history. Spreading terror throughout the white South, his action set off a new wave of oppressive legislation prohibiting the education, movement, and assembly of slaves and stiffened proslavery, anti-Abolitionist convictions that persisted in that region until the Civil War (1861–65).

Turner was born the property of a prosperous small plantation owner in a remote area of Virginia. His mother was an African native who transmitted a passionate hatred of slavery to her son. He learned to read from one of his master's sons and he eagerly absorbed intensive religious training. In the early 1820s he was sold to a neighbouring farmer of small means. During the following decade his religious ardour tended to approach fanaticism, and he saw himself called upon by God to lead his people out of bondage. He began to exert a powerful influence on many of the nearby slaves, who called him "the Prophet."

In 1831, shortly after he had been sold again—this time to a craftsman named Joseph Travis—a sign in the form of an eclipse of the Sun caused Turner to believe that the hour to strike was near. His plan was to capture the armoury at the county seat, Jerusalem, and, having gathered many recruits, to press on to the Dismal Swamp, 30 miles to the east, where capture would be difficult. On the night of August 21, together with seven fellow slaves in whom he had put his trust, he launched a campaign of total annihilation, murdering Travis and his family in their sleep and then setting forth on a bloody march toward Jerusalem. In two days and nights 51 white people were ruthlessly slain. Doomed from the start, Turner's insurrection was handicapped by lack of discipline among his followers and by the fact that only 75 blacks rallied to his cause. Armed resistance from the whites and the arrival of the state militia—a total force of 3,000 men provided the final crushing blow. Only a few miles from the county seat the insurgents were dispersed and either killed or captured, and many innocent slaves were massacred in the hysteria that followed. Turner eluded his pursuers for six weeks but was finally captured, tried, and hanged.

Nat Turner's rebellion put an end to the white Southern myth that slaves were either contented with their lot or too servile to mount an armed revolt. In Southampton County black people came to measure time from "Nat's Fray" or "Old Nat's War." For many years in black churches throughout the country, the name Jerusalem referred not only to the Bible but also covertly to the place where the rebel slave had met his death.

F. Roy Johnson wrote *The Nat Turner Slave Insurrection* (1966), but Turner has been most

widely popularized by William Styron in his highly controversial novel *The Confessions of Nat Turner* (1967), which was followed by John H. Clarke (ed.), *William Styron's Nat Turner: Ten Black Writers Respond* (1968).

Turner, Ralph E(dmund) (b. Nov. 6, 1893, Anthon, Iowa, U.S.—d. Oct. 5, 1964, New Haven, Conn.), American cultural historian, professor at Yale from 1944 to 1961, and, as an American delegate to an educators' conference in London (1944), one of the planners of the United Nations Educational, Scientific and Cultural Organization (UNESCO). In his historical research he relied on the methods of cultural anthropology.

He was chairman of the international editorial board preparing a six-volume Cultural History of Mankind, and he lived to see the publication (1963) of the first volume. From 1936 until 1941 he was economic historian for the Bureau of Research and Statistics, Social Security Board. During World War II he served in various governmental capacities as an economic analyst and as cultural-relations officer for the Department of State. His publications include America in Civilization (1925), James Silk Buckingham: A Social Biography (1933), and The Great Cultural Traditions, 2 vol. (1941).

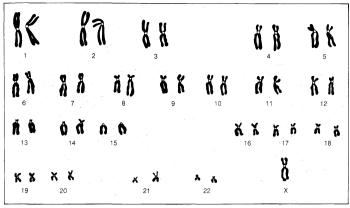

Turner, William (b. 1508?, Morpeth, Northumberland, Eng.—d. July 7, 1568, London), English naturalist, botanist, and theologian known as the "father of English botany." His *A New Herball* was the first English herbal to include original material.

Turner studied at Pembroke Hall, Cambridge. His dissatisfaction with derivative herbals led him to write Libellus de re herbaria novus (1538), the first essay on scientific botany in English. Turner's fervent religious beliefs led to several periods of exile to the Continent, during which he studied with and met numerous naturalists and learned about contemporary discoveries in botany. An extended version of the Libellus entitled The Names of Herbes (1548) was written in English, containing German and French synonyms, and included unorthodox and vivid original observations. He served as the dean of Wells Cathedral from 1550 until the accession of Queen Mary in 1553 sent him into exile. After her death he returned to Wells until suspension for nonconformity in 1564.

Turner's best known work, A New Herball (in three parts; 1551-68), demonstrated his medical bias. He chose to write in English, the vernacular, so that practical botanical and medical knowledge would be widely available to medical practitioners and apothecaries. Turner's works were used extensively by later botanists such as John Ray and Jean Bauhin.

Turner's syndrome, relatively uncommon human sex-chromosome disorder. Affected individuals show the following signs and symptoms: low hairline; webbed neck; shieldshaped chest with widely spaced nipples; usually kidney and heart malformations with coarctation (narrowing) of the aorta; a 10 percent frequency of moderate to severe mental retardation; and, most importantly, ovarian dysgenesis—i.e., the ovaries are absent or are present only as primitive streaks. The disorder sometimes goes unrecognized until the individual fails to undergo puberty, even well past the appropriate age. Treatment with female hormones enables the patient to experience puberty, look mature, and have a normal sex drive. She will remain sterile, however, and malformations (e.g., webbed neck, coarctation of the aorta) can be corrected only by surgery.

Chromosomes of body cells are normal, but sex chromosomes are abnormal in the majority of afflicted individuals with XO, XX, and X ring patterns and mosaics; so-called super-female patterns with three or more X chromosomes may be present. In the remain-

Turner's syndrome
The karyotype shows 45 chromosomes and an XO sex-chromosome constitution
From V.A. McKusick, Human Genetics

der, the chromosomal pattern is normal female, and in these the sexual and body-build aberrations are less common. Though such persons usually are infertile, pregnancy, on rare occasions, may be possible.

Pure gonadal dysgenesis refers to Turner's type of streak gonads with a minimum of body abnormalities. Thus, the patient may have immature breasts, and height may be average or above average. Mixed, or atypical, gonadal dysgenesis is characterized by an undifferentiated streak gonad on one side and an intra-abdominal testis on the other. This combination is related in part to true hermaphroditism and in part to testicular feminization. The clitoris may be enlarged. The chromosomal pattern may be XO/XY, XY, or one of a number of other combinations.

Turner's syndrome may occur with a male body type. In general, these persons are characterized by underdeveloped testes, decreased or absent sperm formation, stunted growth, webbing, skeletal abnormalities, and variably sparse body hair. Information on sex chromosomes is limited, but XO patterns have been found.

Turney, John: see Monsarrat, Nicholas.

Turnhout, municipality, Antwerp province, northern Belgium, at the junction of the Antwerp-Turnhout Canal and the d'Embranchement, near The Netherlands border, northeast of Antwerp. Believed to date back to Frankish times, it was first recorded in the 12th century as a market centre. It serves an agricultural district but is now basically industrial. Diamond cutting and the manufacture of paper, bricks, cement, leather goods, tobacco products, lace, playing cards, prayer books, and electrical equipment are the main activities. Historical structures include the 15th-century castle of the dukes of Brabant (now the Palace of Justice), the Church of St. Peter (begun 1484) with a carillon, and a béguinage (a secular retreat for nuns) dating from the 14th century. The Taxandria Museum has a collection of local antiquities. The nearby Liereman Moer (Liereman Marshes) have many aquatic birds, notably corncrakes and heron. Pop. (1983 est.) mun., 37,461.

turnip, hardy biennial plant cultivated for its fleshy roots and tender growing tops. There are two species, belonging to the family Brassicaceae: Brassica rapa, the turnip proper; and Brassica napobrassica, the Swedish turnip, or rutabaga. The true turnip probably originated in middle and eastern Asia and by cultivation has spread throughout the temperate zone.

The turnip "root" is formed by the thickening of the primary root of the seedling together with the base of the young stem immediately above it. The stem remains short during the first year; the leaves, forming a rosette-like bunch at the top of the root, are grass green and bear rough hairs. In the sec-

ond season the bud in the centre of the rosette forms a strong, erect, branched stem bearing somewhat glaucous smooth leaves. Stem and branches end in clusters of small, bright-yellow flowers, which are succeeded by smooth, elongated, short-beaked seed pods.

The rutabaga differs from the turnip in having the first foliage leaves glaucous, not grass green, in colour, and the later leaves smooth and glaucous; the root bears a distinct neck with well-marked leaf scars; the flesh is firmer and more nutritious; and the roots keep much better during winter. The white-fleshed varieties have a rough, green skin and are of irregular form; the flowers have a bright canary colour. Yellow-fleshed rutabagas have a smooth skin of a green, purple, or bronze colour; flowers are buff yellow or pale orange.

Both the turnip and rutabaga are cool-season crops. The rutabaga grows less rapidly, requiring a longer season. In the lower latitudes turnips are sown either in early spring or in late summer, developing rapidly enough

Turnip (Brassica rapa)
G.R. Roberts

to produce a crop before extremes of summer or late fall weather occur. Rutabagas, however, are sown only as a main or late crop and are more hardy to cold. Rutabagas are extensively cultivated in Canada, Great Britain, and northern Europe, and to lesser extent in the U.S.

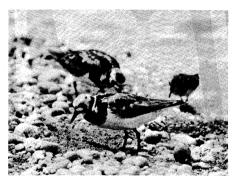

Young turnip roots are also used raw in salads and as appetizers, and the young leaves may be cooked and served. The roots are also cooked and served as whole or mashed vegetables, and are used in stews.

turnover, an individual pie (q.v.), formed by folding a round of pastry in half over a fill-

ing. The open edges are pressed or crimped together to enclose the filling during cooking and eating. Turnovers may be baked or fried. Many turnovers contain savoury fillings; the *empanada* of South and Central America frequently contains a mixture of chopped meats, hard-boiled eggs, minced vegetables, olives, and raisins, highly seasoned. Russian *pirozhki* may be filled with meat, fish, cabbage, mushrooms, or cheese. Cornish pasties are large turnovers filled with beef, onions, and turnips; they are the traditional midday meal carried into the pits by miners. Turnovers may also be filled with sweet mixtures or fruit.

Turnovo (Bulgaria): see Veliko Turnovo.

turnstone, either of two species of shorebirds (genus *Arenaria*) that constitute the subfamily Arenariinae (family Scolopacidae). The bird

Ruddy turnstone (Arenaria interpres)
E.R. Degginger—EB Inc.

uses its short, flattened bill, which is slightly recurved (upturned at the tip), to overturn pebbles and shells in search of food. Turnstones grow to a length of about 20 centimetres (8 inches).

The ruddy turnstone (A. interpres), pied black, white, and reddish, is a notable migrant: it breeds chiefly in the Arctic and migrates south to winter on seacoasts in Argentina, Chile, South Africa, Australia, and New Zealand. (A banded bird is known to have travelled 450 miles in a single day.) On the wintering grounds, ruddy turnstones feed primarily on small crustaceans and other invertebrates but have been known to eat berries and terns' eggs. On the breeding ground the male may make many false nests, while the female makes a single, true nest, in which she lays four eggs. The male incubates by day; the female, at night. As soon as the young are fledged, the female departs alone for the wintering ground; the male remains with the young nearly two weeks longer and then departs, to be followed by the young.

The black turnstone (A. melanocephala), which breeds in Arctic Alaska and winters as far south as Mexico, has a black and white wing pattern but is otherwise dark.

turntable, in sound reproduction, rotating platform that carries a phonograph record. Turntables commonly revolve at 16²/₃, 33¹/₅, 45, or 78 revolutions per minute; many record players have gearing that allows the user to choose among these speeds. For best sound reproduction, constant turning speed is crucial; transcription turntables used by radio stations are weighted to minimize speed variations and are driven by synchronous motors. Though several different types of driving mechanism were tried in early phonographs, the electric motor, cushion-mounted to minimize vibration, became the most widely employed.

Turnus, in Roman legend, king of the Rutuli (an ancient Italic tribe on the coast of Latium), and the accepted suitor of Lavinia, daughter of Latinus, king of the Latins. After

68

Latinus betrothed Lavinia instead to the hero Aeneas (q,v), Turnus, joined by the Rutuli and the Latins, made war against Aeneas and the Trojans. Though Turnus was protected by the goddess Juno, Aeneas finally succeeded in pursuing and killing him.

turnverein (from German turnen, "to practice gymnastics," and Verein, "club, union"), association of gymnasts founded by the German teacher and patriot Friedrich Ludwig Jahn in Berlin in 1811. The term now also denotes a place for physical exercise. The early turnvereins were centres for the cultivation of health and vigour through gymnastic exercise, including the use of such modern gymnastic equipment as the horizontal bar, parallel bars, side horse, and vaulting horse. The organizations were also intended to prepare German youth to defend their country against Napoleonic France, and gymnasts were encouraged to develop a spirit of patriotism and Deutschheit ("Germanness").

In the German states during the Revolution of 1848, some turnverein members sided with factions who unsuccessfully revolted against the monarchy, and they were forced to leave the country. Turnvereins were subsequently established by such émigrés in other countries, notably the United States, at Cincinnati, Ohio, in 1848, where the organization now called the American Turners was founded. Similar organizations, called Sokols (see Sokol), formed in Bohemia (modern Czechoslovakia) in the 1860s, emphasized social and communal unity rather than nationalism.

Turnvereins continue to foster citizenship and cultural programs together with health and physical-education activities, particularly gymnastics.

Turonian Stage, standard, worldwide division of Late Cretaceous rocks. It corresponds to the time interval of the Late Cretaceous that extended from 91 to 88.5 million years ago. Rocks of the Turonian Stage overlie those of the Cenomanian and underlie those of the Coniacian Stage. In Great Britain the Turonian is represented by the calcareous Middle Chalk, whereas elsewhere in Europe limestones predominate; a complete Turonian record exists in the western interior region of the United States. Numerous zones, representing smaller divisions of Turonian rocks are recognized and are characterized by distinctive fossil forms. Especially prominent are various species of ammonite cephalopods (mollusks) as well as the Cretaceous clam species Inoceramus labi-

Turoszów Coal Basin, coalfield in Jelenia Góra województwo (province), southwestern Poland, at the border of Poland with Czechoslovakia and Germany. The Turoszów Coal Basin has an area of 52 square miles (135 square km), making it the largest lignite deposit in Lower Silesia; it is twice as large as the deposit at Legnica. The Turoszów browncoal basin has been extensively mined and has produced more coal than any other coal reserve in the country. Two open-cast coal mines (Turów I and Turów II) and Poland's largest thermoelectric power plant operate in the basin near the town of Bogatynia.

Turpan (city, China): see T'u-lu-p'an.

Turpan (basin, China): see Turfan Depression

turpentine, the resinous exudate or extract obtained from coniferous trees, particularly those of the genus *Pinus*. Turpentines are semifluid substances consisting of resins dissolved in a volatile oil; this mixture is separable by various distillation techniques into a volatile portion called oil (or spirit) of turpentine and a nonvolatile portion called rosin. Although

the term turpentine originally referred to the whole oleoresinous exudate, it now commonly refers to its volatile turpentine fraction only, which has various uses in industry and the visual arts.

Oil of turpentine is a colourless, oily, odorous, flammable, water-immiscible liquid with a hot, disagreeable taste. It is a good solvent for sulphur, phosphorus, resins, waxes, oils, and natural rubber. It hardens upon exposure to air. Chemically, oil of turpentine is a mixture of cyclic monoterpene hydrocarbons, the predominant constituent being pinene.

Formerly, the largest use for turpentine oil was as a paint and varnish solvent. Oil painters generally prefer it as a paint thinner and brush cleaner to petroleum solvents (mineral spirits), even though the latter are less expensive. But the largest use of turpentine oil is now in the chemical industry, as a raw material in the synthesis of resins, insecticides, oil additives, and synthetic pine oil and camphor. Turpentine oil is also used as a rubber solvent in the manufacture of plastics.

Turpentine oil is generally produced in countries that have vast tracts of pine trees. The principal European turpentines are derived from the cluster pine (P. pinaster) and the Scotch pine (P. sylvestris), while the main sources of turpentine in the United States are the longleaf pine (P. palustris) and the slash pine (P. caribaea).

Turpentine oil is classified according to the way it is produced. Sulfate turpentine, used widely in the chemicals industry, is obtained as a by-product of the kraft, or sulfate, process of cooking wood pulp in the course of the manufacture of kraft paper. Wood turpentine is obtained by the steam distillation of dead, shredded bits of pine wood, while gum turpentine results from the distillation of the exudate of the living pine tree obtained by tapping. Crude turpentine obtained from the living pine by tapping typically contains 65 percent gum rosin and 18 percent gum turpentine.

Various other oleoresins (solutions of resins dispersed in essential oils) are known as turpentines. Venice turpentine, for example, is a pale green, viscous liquid that is collected from the larch (*Larix decidua*, or *L. europea*). It is used for lithographic work and in sealing wax and varnishes. *See also* balsam; Canada balsam.

Crude turpentine is one of a group of pinetree derivatives that are known as naval stores (q.v.).

Turpin, Dick, byname of RICHARD TURPIN (baptized Sept. 25, 1705, Hempstead, Eng.—d. April 7, 1739, Knavesmire, near York), English robber who became celebrated in legend and fiction.

Son of an alehouse keeper, he was apprenticed to a butcher, but, having been detected at cattle stealing, he joined a notorious gang of deer stealers and smugglers in Essex. When the gang was broken up, Turpin in 1735 went into partnership with Tom King, a well-known highwayman, whom he accidentally killed while firing at a constable (or, by some accounts, an innkeeper). To avoid arrest he finally left Essex for Lincolnshire and Yorkshire, where he set up under an assumed name (John Palmer) as a horse dealer. He was finally convicted at York assizes of horse stealing and hanged in 1739.

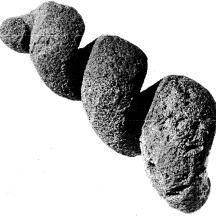

Harrison Ainsworth, in his romance *Rook-wood* (1834), gave a spirited account of a ride by Dick Turpin on his mare, Black Bess, from London to York, but the incident is pure fiction.

turquoise, hydrated copper and aluminum phosphate [CuAl₆(PO₄)₄(OH)₈ · 4H₂O] that is extensively used as a gemstone. It is a secondary mineral deposited from circulating waters, and it occurs chiefly in arid environments as blue to greenish, waxy veinlets

in alumina-rich, weathered, volcanic, or sedimentary rocks. Turquoise was obtained from the Sinai Peninsula before the 4th millennium BC in one of the world's first important hardrock mining operations. It was transported to Europe through Turkey, probably accounting for its name, which is French for "Turkish." Highly prized turquoise has come from Neyshābūr, Iran. Numerous deposits in the southwestern United States have been worked for centuries by American Indians. Turquoise also occurs in northern Africa, Australia, Siberia, and Europe. For detailed physical properties, see phosphate mineral (table).

The colour of turquoise ranges from blue through various shades of green to greenish and yellowish gray. A delicate sky blue, which provides an attractive contrast with precious metals, is most valued for gem purposes. Delicate veining, caused by impurities, is desired by some collectors as proof of a natural stone. Turquoise is opaque except in the thinnest splinters, takes a fair to good polish, and has a feeble, faintly waxy lustre. The stone's colour and lustre tend to deteriorate with exposure to sunlight, heat, or various weak acids. For most gem uses, turquoise is cut en cabochon, with a low-convex, polished upper surface. It may be carved or engraved, and irregular pieces are often set in mosaics with jasper, obsidian, and mother of pearl. Turquoise matrix, which is any natural aggregate of turquoise with limonite or other substances, is also valued.

turritellid (genus *Turritella*), any of several species of gastropods (snails) abundantly represented in fossil and living form from the

Turritellid from Highlands, N.J.

Cretaceous Period, which began about 144 million years ago, up to the present. Many forms or species of turritellids are known; all are characterized by a high, pointed shell that narrows greatly at the apex. The shell is frequently ornamented by lines, ridges, or grooves.

Tursunzade, formerly (until 1978) REGAR, city, Tadzhikistan, Soviet Union. It lies in the west-central part of the republic, near the border with Uzbekistan. The city developed as a regional centre for an agricultural district in the western part of the Gissar valley. In 1975, however, the city's economic emphasis changed when one of the largest aluminum plants in the Soviet Union began operation there. Power for the complex is supplied by the Nursk hydroelectric station on the Vakhsh River. Pop. (1980 est.) 21,000.

turtle (order Chelonia), reptile chiefly characterized by a protective shell that encloses the vital organs of the body.

A brief treatment of turtles follows. For full treatment, see MACROPAEDIA: Reptiles.

Turtles are toothless, generally slow-moving and unaggressive animals that range in length from less than 10 cm (4 inches) to more than 2 m (6.5 feet). They have sturdy, sprawling limbs with short feet or (in marine turtles) paddlelike flippers, and they have a protective bony shell overlaid with horny shields. The shell is separated into an upper section, the carapace, joined at the sides to a lower section, the plastron.

Gulf coast box turtle (Terrapene carolina major)

Turtles are found in most parts of the world and have existed in relatively the same form for the last 200 million years. Most of the 200 to 250 living species are aquatic or semi-aquatic, and the majority are found in or near the tropics, but many range into temperate regions. Some turtles are terrestrial, and a few are marine, with the rest living in freshwater. Turtles feed on soft plant material or small animals or both. They are able to fast for long periods. Breeding usually takes place once yearly; the female lays her whitish, rounded or elongated eggs on land, usually in a hole she has dug with her hind legs.

Turtles have provided humans with meat, eggs, and tortoiseshell. Some species of turtles are kept as pets. Nonmarine turtles are commonly called tortoises in Great Britain, while in the United States some edible turtles are known as terrapins.

The world's living species of turtles are placed in two suborders. In the members of one, Pleurodira, the neck is bent sideways to draw the head into the shell, and in those of the other, Cryptodira, the head and neck are withdrawn backward into the shell. The pleurodires are now restricted in range to South America, Africa, Madagascar, Australia, New Guinea, and adjacent islands. The cryptodires, by contrast, are found on all the continents except Australia and include about four-fifths of all living species of turtles.

The largest family among the cryptodires is that of the common freshwater turtles (Emydidae), which includes about one-third of all living species and has a geographic range equal to that of the suborder as a whole. These turtles, many of which occur in the eastern half of the United States, are mostly aquatic or semiaquatic in habitat. Next in number of species are the true tortoises (family Testudinidae), with about half as many species as are found in Emydidae. The slow, plodding tortoises of fable belong to this widely distributed terrestrial group, the gigantic species of which are confined to the Galápagos and other oceanic islands. (See tortoise.) The other families of cryptodires include mud and musk turtles (family Kinosternidae); sea turtles (family Cheloniidae), which are found in all the warmer oceanic waters of the world; and snapping turtles (family Chelydridae), which are fairly large and aggressive turtles common in North America.

The suborder Pleurodira, with its members now restricted in range to the continents of the Southern Hemisphere, includes about 20 percent of all living species of turtles. The two (living) families in it are the snake-necked turtles (family Chelidae), so named for their long head and neck; and the side-necked turtles (family Pelomedusidae), from which the common name of the suborder as a whole is derived.

Turtle, one-man submarine, the first to be put to military use, built and designed by the American inventor David Bushnell (q, v) in 1775 for use against British warships. The pear-shaped vessel was made of oak reinforced with iron bands, and measured about 7.5 feet (2.3 m) long by 6 feet (1.8 m) wide. It was equipped with a mine that was to be attached to the hull of an enemy ship. In 1776, in New York harbour, the *Turtle* attempted to sink the British warship HMS *Eagle* but failed; none of its succeeding missions was successful.

turtledove, also spelled TURTLE DOVE (species Streptopelia turtur), European and North African bird of the pigeon family, Columbidae (order Columbiformes) that is the type species, or namesake, of its genus. The turtledove is

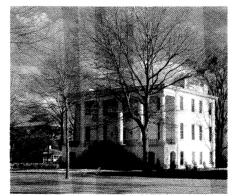

Turtledove (Streptopelia turtur)
Stephen Dalton—EB Inc.

28 cm (11 inches) long. Its body is reddish brown, the head blue-gray, and the tail is marked with a white tip. It is a ground feeder that eats prodigious amounts of small seeds. Streptopelia turtur is migratory and winters in northern Africa.

The name turtledove is commonly applied to the other *Streptopelia* species, including other turtledoves, collared doves, and ring-necked doves. These slim-bodied, fast-flying game-birds are found throughout the temperate and tropical Old World. The ringed turtledove, or ringdove (*S. risorea*), has feral New World populations in California and Florida. The laughing dove (*S. senegalensis*) and spotted dove (*S. chinensis*) have also been introduced outside their native habitats.

Turun ja Porin lääni (Finland): see Turku ja Pori.

Tuscaloosa, city, seat of Tuscaloosa county, western Alabama, U.S., on the Black Warrior River. Founded in 1816 by Thomas York on land opened to settlement after the Creek War, it was named for the Choctaw Indian chief Tuscaloosa ("Black Warrior"), who fought the

President's Mansion, an antebellum house, University of Alabama, Tuscaloosa

Spanish explorer Hernando de Soto in southern Alabama in 1540. The city served as the state capital (1826-46) and was partially burned during the American Civil War. It lies at the edge of coal and mineral deposits in a farming region. Its diversified agricultural and industrial economy is augmented by several institutions, including the University of Alabama (founded 1831) and Stillman College (1876). Antebellum houses in the city include Gorgas Home and President's Mansion. Inc. 1819. Pop. (1988 est.) 74,100.

Tuscan order, the simplest of the orders of classical architecture. *See* order.

Tuscania, formerly (until 1911) TOSCANELLA, Latin TUSCANIA, or TUSCANA, town, Viterbo provincia, Lazio (Latium) regione, central Italy, west of Viterbo. The ancient city was a prosperous Etruscan centre in the 3rd century BC, and Etruscan tombs have been found nearby. Until a disastrous earthquake in 1971, the town contained many relics and treasures of the Etruscan, Roman, and medieval periods. The quake severely damaged the town's two magnificent Romanesque-Lombard churches, San Pietro (8th and 12th centuries), the rose window and parts of the apse and adjacent towers of which collapsed, and Santa Maria Maggiore (7th and 12th centuries), which lost the top of its stone bell tower. Other churches and buildings in the town also sustained heavy damage. Pop. (1989 est.) mun., 7,641.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Tuscany, Italian Toscana, regione, west-central Italy. It lies along the Tyrrhenian and Ligurian seas and comprises the provincie of Massa-Carrara, Lucca, Pistoia, Firenze, Livorno, Pisa, Arezzo, Siena, and Grosseto, with an area of 8,877 square miles (22,992 square km).

Tuscany is a transitional region occupying much of the former grand duchy of that name between northern Italy and the peninsula. It is bordered in the north and northeast by the Tuscan-Emilian Apennines and

Grape vineyards and olive trees in the Arno valley, Tuscany, Italy

the Apuan Alps, these being separated by a series of long valleys from the sub-Apennine hills of Mount Albano, Mount Pratomagno, and others. South of Siena the surface rises to less fertile mountains and plateaus, such as the Metallifere Mountains, Mount Argentario, and Mount Amiata. The lowlands of Tuscany are either interior valleys, such as that of the Arno River, or coastal plains, such as the Maremma.

Historical Tuscany. The name Tuscany is derived from an Etruscan tribe that settled there around 1000 BC. Tuscia came into official use under the Roman Empire in the 3rd century AD. Politically united under the barbarian Lombards as a duchy with its seat at

Lucca in the 6th century, Tuscany was next set up as a county by the Franks in 774. In the 11th century the area passed to the Attoni family, who, already holding Canossa, Modena, Reggio, and Mantua, became an important power of central Italy. The most famous representative of this line, Matilda, supported Pope Gregory VII (1073–85) in the Investiture Controversy. After her death in 1115, the cities of Tuscany gradually affirmed their independence, and the area lost its traditional unity. For the next four centuries these cities fought among themselves; supremacy was won first by Pisa and then by Florence, and the area became the greatest centre of Renaissance culture. After the advent of the Medici as rulers of Florence in 1434, with the family's gradual consolidation of power over the area, Tuscany was transformed into a principality.

During the foreign invasions of Italy in the late 15th and early 16th centuries, the Medici were twice expelled (1495–1512 and 1527–30) but were restored by the Holy Roman emperor Charles V in 1530, and the Medici rulers used the title grand duke from 1569. The culture and economy of the area declined

beginning in the 16th century.

In 1737, on the death of the last Medici grand duke, Gian Gastone, Tuscany was assigned to Francis of Lorraine, future husband of the Habsburg heiress Maria Theresa, beginning the rule of the Habsburg-Lorraine family. Under Francis and his son the grand duke Leopold I (later the Holy Roman emperor Leopold II), the great period of Tuscan reform took place. Internal trade barriers were removed, ecclesiastical privileges reduced, and the death penalty abolished. With the French domination of the peninsula, during the late 1790s, Ferdinand III was forced to flee from the duchy. In 1801 Napoleon Bonaparte founded the Tuscan kingdom of Etruria for Louis of Bourbon-Parma, nephew of the Spanish queen, but in 1808 annexed it to the French Émpire and finally in 1809 gave it to his sister Élisa to rule. With the defeats of Napoleon in 1814, Ferdinand III was restored to Tuscany, but many of the reforms introduced by the French were retained.

Under Ferdinand and his son Leopold II. during the first half of the 19th century, Tuscany was noted among Italian states for its tolerance toward liberals and its progressive government. With the spread of liberal revolutions through Italy in 1848, Leopold granted a constitution, but increasing revolutionary agitation culminated in the proclamation of a republic (Feb. 8, 1849) and forced the Grand Duke to flee. Leopold's return under the protection of the Austrians cost him the support of many Tuscans. When war between Piedmont and Austria (the Second War of Italian Independence) broke out in 1859, Leopold, after refusing both to grant a constitution and to join Piedmont in the fight, was expelled by the Florentines. With a provisional government controlled by the nobleman Bettino Ricasoli working for Italian unification under Piedmont, the Tuscans, in a plebiscite of March 11-12, 1860, voted overwhelmingly for annexation. Tuscany formally became part of the new Italian state with the proclamation of the kingdom on Feb. 18, 1861.

The modern region. Tuscany is one of the most prosperous agricultural regions in Italy, specializing in cereals (especially wheat), olives and olive oil, and wines, notably those of the Chianti district near Siena. Vegetables and fruit are also grown, and cattle, horses, pigs, and poultry are extensively raised. Tuscan agriculture is characterized by the mezzadria system, with the landlord, who provides capital and current expenses, sharing the harvest with the tenant, who supplies the labour. There is, however, a growing tendency to the

organization of agricultural cooperatives. The storms and floods of 1966 dealt a severe blow to Tuscan agriculture, as well as inundating Florence and Grosseto. Watered chiefly by the Arno and Ombrone rivers, Tuscany has few rivers capable of supporting major hydroelectric projects, but borax deposits at Larderello produce enough underground steam to power a major generating station. Among the mineral resources, easily worked iron ore from the offshore island of Elba is nearing exhaustion. but lead, zinc, antimony, mercury, copper, and iron pyrites are still produced in the region. Lignite (brown coal) is mined around San Giovanni Valdarno, and the marble of Carrara is world famous. Metallurgy, chemicals, and textiles are major industries; and the region is famous for its artisan industries, especially in Florence, the capital. Tourism is important at the coastal resorts and the historical centres of the region. Livorno, the major port, has shipbuilding industries. Other important centres are Piombino, Lucca, Pistoia, Grosseto, Pisa, and Siena, Pop. (1983) est.) 3,581,742.

Tuscarawas River, river rising in Summit County, northeastern Ohio, U.S., near Akron and Barberton (there dammed to form the Portage Lakes). It flows south past Massillon, Dover, and New Philadelphia and then west to join the Walhonding, near Coshocton, after a course of 125 mi (201 km), to form the Muskingum River. Beach City Reservoir is impounded by a flood-control dam on the Tuscarawas north of Dover, and Tappan, Piedmont, Clendening, Leesville, and Atwood reservoirs are on its tributaries. The river's name is derived from the Tuscarora Indian tribe.

Tuscarora, Iroquoian-speaking Indians of North America who occupied what is now North Carolina when first encountered by Europeans in the 17th century. They were noted for their use of Indian hemp for fibre and medicine; their name derives from an Iroquoian term for "hemp gatherers." Though expert hunters, they also depended heavily on cultivating corn (maize). Later they extended their economy by trading rum to neighbouring Indian groups. The typical Tuscarora dwelling at the time of first European contact was a round lodge of poles overlaid with bark. Evidence suggests that they were organized in exogamous clans, with the clans grouped into two moieties in each of the three tribes constituting the Tuscarora nation.

Depredations of Tuscarora colonists, who also kidnapped men, women, and children to be sold into slavery and took tribal lands without payment, led to the outbreak of war in 1711, following the failure of peaceful Tuscarora attempts to obtain relief. Over the following 90 years groups of Tuscarora fled or drifted northward, having been admitted into the Iroquois League (q.v.) as the sixth nation. During the American Revolution many Tuscarora supported the colonists; those who favoured the British were granted lands on Grand River reservation, Ontario. The highest estimate of Tuscarora population in the early 18th century was about 5,600. By the second half of the 20th century their numbers had dwindled to the hundreds, living in New York state and adjacent parts of Canada.

Tusculum, ancient Italic city (now Frascati) in Latium, 15 miles (24 kilometres) southeast of Rome, a favourite resort of wealthy Romans under the late republic and the empire (1st century BC-4th century AD). Tusculum was a Latin settlement during the early Iron Age (early 1st millennium BC) and was probably under Etruscan influence. According to Roman tradition Octavius Mamilius of Tusculum, son-in-law of the last Roman king, organized a league of 30 Latin cities against Rome in the late 5th century BC, but was de-

feated and killed in a battle at Lake Regillus in 497, which established Roman supremacy over the Latins. Thereafter, the city usually remained loyal to Rome.

The Roman writer Cicero had a villa at Tusculum in the 1st century BC and composed his philosophical work *Tusculanae disputationes* there. In the early medieval period, Tusculum was an important stronghold, and its counts were influential at Rome. The Romans finally destroyed it during a war in 1191.

The remains of ancient Tusculum include a forum, an amphitheatre of the 2nd century AD, and a complex of buildings wrongly known as the villa of Cicero. The highest point of the city was its citadel, on which are the remains of a medieval castle.

Tuscumbia, city, seat (1867) of Colbert County, northwestern Alabama, U.S., in the Muscle Shoals area on the Tennessee River. It forms with Florence, Sheffield, and the city of Muscle Shoals a four-city metropolitan area. Founded in 1817 as Ococoposa (a Chickasaw-Choctaw word meaning "cold water," referring to a local creek), it was renamed Tuscumbia (1822) after Tash-Ka-Ambi. an Indian chief. It is a farming community with light manufacturing. Tuscumbia was the birthplace (Ivy Green) of Helen Keller, the internationally known blind and deaf lecturer. William Gibson's play The Miracle Worker (1959), portraying her childhood efforts under the tutelage of Anne Sullivan to overcome her handicaps, is staged there each summer. Inc. town, 1820; city, 1865. Pop. (1980) 9,137.

Tushino, Thief of: see in Dmitry, False.

Tūsī, Naṣīr ad-Dīn aṭ- (b. Feb. 18, 1201, Tūs, Khorāsān—d. June 26, 1274, Baghdad), outstanding Persian philosopher, scientist, and mathematician.

Ţūsī became astrologer to the Ismā'īlī governor Nāṣir ad-Dīn 'Abd ar-Raḥīm, and later, pretending to be an Ismā'īlī, lived and studied at the castle of Alamut, headquarters of the Ismā'īlī terrorist sect, the Assassins. In 1256 he betrayed the defenses of the fortress to the invading Mongols, whose army he joined; Hülegü Khan took him as a confidential adviser when he attacked and destroyed Baghdad in 1258. Tūsī profited by his office as head of the ministry of religious bequests to build a fine observatory at Maragheh. A man of exceptionally wide erudition, he wrote many books in Arabic and Persian. He improved upon earlier Arabic translations of Euclid, Ptolemy, Autolycus, Theodosius, Apollonius, and others, and made original contributions to mathematics and astronomy; his Zij-i Ilkhani is a splendidly accurate table of planetary movements. His Tajrīd al-'aqā'id is a highly esteemed treatise on Shī'ite dogmatics. His most famous and popular work is the Akhlāq Naṣīrī, a treatise on ethics in the Greek tradition resting upon the 11th-century Tahdhīb al-akhlāq of Ibn Miskawayh, which he drafted while a prisoner of the Assassins and later revised for his Mongol master. This work has been translated into English. Tusī was a Twelver Shī'ite but is credited with a number of distinctively Ismā'īlī dissertations, notably the Tasavvurat. He made important contributions to many branches of Islamic learning and wrote in excellent philosophical prose.

tusk shell, also called ELEPHANT'S TUSK, ELEPHANT'S TOOTH, OR TOOTH SHELL, any of several marine mollusks of the class Scaphopoda. There are four genera of tusk shells (*Dentalium* is typical and most common) and more than 350 species. Most tusk shells live in fairly deep water, sometimes to depths of about 4,000 metres (13,000 feet); many deep-sea species are cosmopolitan in distribution.

Tusk shells are elongated, bilaterally symmetrical (i.e., the external halves are mirror images of one another) animals with a tubular, tusklike shell, open at both ends. The

animals are encased in a tubular mantle and breathe through the body surface. At the anterior (front), larger end of the shell is an extensible foot adapted for digging and an imperfectly developed head with slender tentacles, the captacula, that serve as sensory and food-catching organs. The anterior end is usually buried in the sea bottom. The posterior end admits water for respiration and discharges wastes. Tusk shells feed upon such small organisms as protozoans of the order Forminifera and young bivalves. Sexes are separate, and the eggs develop into free-swimming larvae.

Tuskegee, city, seat of Macon county, east-central Alabama, U.S., adjacent to the Tuskegee National Forest. It was founded in 1833, and its name was a variation of Taskigi, a nearby Indian village. Fort Decatur (founded 1815), 8 miles (13 km) north-northwest on the Tallapoosa River, was the headquarters for John Sevier, a noted frontiersman who was appointed commissioner to determine the boundary of the Creek Indian lands. Sevier died and was buried there, but his remains were moved to Knoxville, Tenn., in 1888.

The city is best known as the seat of Tuskegee University, originally incorporated in 1881 as Tuskegee Institute, a coeducational elementary and secondary school for blacks and now a private institution of higher learning, largely but not exclusively for blacks. Booker T. Washington, the educator, was principal of the school from its founding until his death in 1915. The Booker T. Washington Monument shows the institute's founder lifting a "veil of ignorance" from the head of a freed black. On the campus is the laboratory used by George Washington Carver, the botanist, for his work on the peanut (groundnut) and sweet potato. The George Washington Carver Museum also houses other Carver exhibits and a display of African art. The university's library contains a special collection of books relating to the Southern black.

In 1957 the state legislature authorized changes in the city's boundaries to exclude almost all of its 400 black voters from the electoral roll. The U.S. Supreme Court in 1960 found that act to be unconstitutional, and in 1972 John Ford was elected as the first black mayor of the city.

Tuskegee has cottonseed oil, planing mills, gristmills, and a fertilizer factory. Inc. 1843. Pop. (1987 est.) 12,867.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Tussaud, Marie, née GROSHOLTZ (b. Dec. 1, 1761, Strasbourg, Fr.—d. April 16, 1850, London), French-born founder of Madame Tussaud's museum of wax figures, in central London

Her early life was spent first in Bern and then in Paris, where she learned the art of wax modeling from her uncle, Philippe Curtius, whose two wax museums she inherited upon his death in 1794. From 1780 until the outbreak of the French Revolution in 1789, she was art tutor at Versailles to Louis XVI's sister, Madame Élisabeth, and was later imprisoned as a royalist. During the Reign of Terror she had the gruesome duty of making death masks from heads—often those of her friends. Trashly expended by the millotine.

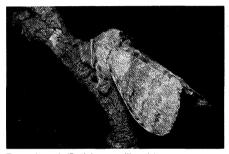

friends—freshly severed by the guillotine. Her marriage in 1795 to François Tussaud, an engineer from Mâcon, was not a success; and in 1802 she took her two sons and her collection of wax models to England. She toured the British Isles for 33 years before finally establishing a permanent home in Baker Street, London, where she worked until eight years before her death. (In 1884 Madame Tussaud's moved to the Marylebone Road, London.)

The exhibition is topical as well as historical and includes both the famous and the infamous. Notorious characters and the relics of famous crimes are segregated in the "Chamber of Horrors," a name coined jokingly by a contributor to *Punch* in 1845. Many of the original models made by Marie Tussaud of her great contemporaries, such as Voltaire, Benjamin Franklin, Horatio Nelson, and Sir Walter Scott, are still preserved.

Tussi (people): see Tutsi.

tussie-mussie (floral bouquet): see nosegav.

tussock moth, typical member of the small family Liparidae (formerly Lymantriidae) of the order Lepidoptera, named for the hair tufts, or tussocks, on most larval forms. The family, found in both Europe and the New World, includes several species destructive to shade and forest trees: the gypsy moth (q.v.; Lymantria dispar), browntail moth (Nygmia phaeorrhoea), satin moth (Stilpnotia salicis), and nun moth (Lymantria monacha).

Tussock moth (Dasichyra pudibunda)

L. Hugh Newman from the Natural History Photographic Agency-EB Inc.

The large larvae are hairy, with many species having stinging hairs. Most feed on foliage of trees and shrubs, sometimes foraging daily from a silken tent or colonial nest of webbed leaves. The larvae of certain species overwinter in these nests; others overwinter as eggs. Pupation occurs above ground in cocoons attached to tree branches or trunks.

The adult is medium-sized. Females range in colour from white to brown; some, such as the white-marked tussock moth (*Hemero-campa leucostigma*), lack wings.

Tutankhamen, original name TUTANKHATEN (fl. 14th century BC), king of Egypt (reigned 1333–23 BC), known chiefly for his intact tomb discovered in 1922. During his reign,

Tutankhamen, gold funerary mask found in the King's tomb, 14th century sc; in the Egyptian Museum, Cairo

© Lee Boltin

powerful advisers restored the traditional religion and art style after the death of Akhenaton, who had led the "Amarna revolution."

Medical analysis of his mummy shows that Tutankhaten was probably a brother of Smenkhkare, his immediate predecessor, and son-in-law of the great King Akhenaton, with whom Smenkhkare was coregent. As suggested by a docket from Tell el-Amarna (Akhenaton's capital Akhetaton) and other circumstantial evidence, young Tutankhaten probably became king after the deaths of Akhenaton and his coregent. Seals from Tell el-Amarna suggest that Tutankhaten resided there during his first year or two. He was married to Akhenaton's third daughter, probably the eldest surviving princess of the royal family, to solidify his claim to the throne. Because at his accession he was still young, his vizier and regent, Ay, who had ties with the royal family, and the general of the armies, Horemheb, became his chief advisers.

Under their tutelage, Tutankhaten moved his residence to Memphis, the administrative capital, near modern Cairo, and restored his father's Theban palace. He also changed his name, at the latest by the fourth year of his reign, to Tutankhamen and issued a decree restoring the temples, images, personnel, and privileges of the old gods and also admitting the errors of Akhenaton's course. In spite of these capitulations to the Amon priesthood, no proscription or persecution of Aten, Akhenaton's god, was undertaken. Royal vineyards (up to the king's death) and elements of the army still remained named after the Aten.

During his ninth year, perhaps under Horemheb, the Egyptians marched into Syria to assist Egypt's old ally, the Mitannian kingdom of northern Syria, which was embroiled in hostilities with vassals of the Hittites. As reinforcements sent by the Hittite king hastened to aid his vassals, Tutankhamen unexpectedly died, aged about 18 years. Because none of his children survived, Ay succeeded him, perhaps marrying his widow.

Some time after his death, Tutankhamen's tomb in western Thebes (not his original, which Ay had appropriated for himself) was entered twice by plunderers who, however, were caught after doing only minor damage. The burial chamber was not entered and remained intact until it was discovered in 1922 by Howard Carter, the English Egyptologist who excavated the tomb. When in the 19th dynasty the "Amarna kings"—Akhenaton, Smenkhkare, Tutankhamen, and Ay were stricken from the royal lists and publicly condemned, the location of Tutankhamen's tomb was forgotten, and his relatively few monuments were usurped, chiefly by his former general, Horemheb, who later became pharaoh. In the 20th dynasty, when the tomb of Ramses VI was cut immediately above that of Tutankhamen, the stone rubble dumped down the side of the valley covered the young king's tomb with a deep layer of chips. The workers of the 20th dynasty came close to Tutankhamen's tomb and clearly had no knowledge of it. The tomb escaped the great series

the Valley of the Kings revealed its location. Inside his small tomb, the king's mummy lay within a nest of three coffins, the innermost of solid gold, the two outer ones of gold hammered over wooden frames. On the king's head was a magnificent golden portrait mask, and numerous pieces of jewelry and amulets lay upon the mummy and in its wrappings. The coffins and stone sarcophagus were surrounded by four shrines of hammered gold over wood, covered with texts, which practically filled the burial chamber. The other rooms were crammed with furniture, statu-

of robberies at the end of the 20th dynasty

and was preserved until a systematic search of

ary, clothes, a chariot, weapons, staffs, and numerous other objects. But for his tomb, Tutankhamen had little claim to fame; as it is, he is perhaps better known than any of his longer lived and better documented predecessors and successors.

Books on the subject include Howard Carter's *The Tomb of Tutankhamūn* (1923–33) and Christiane Desroches-Noblecourt's *Tutankhamen* (1963). In 1977, in connection with a traveling exhibition of objects from the tomb, *Tutankhamun*: The Tomb and its *Treasures*, with text by I.E.S. Edwards and photographs by Lee Boltin and Harry Burton, was published.

Tuthmosis (Egyptian kings): see Thutmose.

Tuticorin, town, Tirunelveli district, Tamil Nādu state, southern India. The town lies on the Gulf of Mannar, east of Tirunelveli town, to which it is connected by road and rail. It developed from a small fishing village into a flourishing Portuguese colony in the 16th century and further expanded during Dutch and British occupancies; the port later declined with the growth of Madras. Since the late 1960s the harbour has been deepened, warehouse and fishing facilities have been improved, and industry has been expanded. In 1974 New Tuticorin, about 5 mi (8 km) southeast of the original port, was declared the 10th major port of India. It can receive vessels with drafts of up to 27 ft (8.25 m) at low water and 29 ft at high water. It is the leading port of Tamil Nādu. The town has seven colleges affiliated with Madurai-Kamaraj University. Pop. (1981) town, 192,949; metropolitan area,

Tutsi, also called BATUSI, TUSSI, WATUSI, or WATUTSI, ethnic group of probable Nilotic stock, whose members live within Rwanda and Burundi. The Tutsi form the traditional aristocratic minority in both countries, constituting about 9 percent and 14 percent of the population, respectively. They are tall, small boned, and relatively light-skinned.

The Tutsi first penetrated the area in the 14th or 15th century, entering from the north-

Tutsi man

east seeking new rangelands. Though skilled warriors, they obtained dominance over the resident Hutu (q.v.) through a slow and largely peaceful infiltration. The Tutsi established a feudal relationship with the Hutu based on their possession of cattle and their more advanced knowledge of warfare. At the head of a complex pyramidal political structure was the mwami ("king"), who was considered to be of divine origin.

Tutsi expansion continued until the European colonial period of the late 19th century. They retained their dominant position over the Hutu in Rwanda until 1961, when the monarchy was overthrown. In Burundi they

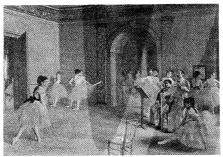

kept control in the face of periodic Hutu risings. An unsuccessful revolt in Burundi in 1972 led to the death of an estimated 100,000 people, mostly Hutu.

The Tutsi considered work with a hoe demeaning and made their living by owning and dealing in cattle. Occasionally an impoverished Tutsi would be forced back to the land, but his clan, when necessary, would generally make arrangements for him to borrow cattle, the symbol of superior status, so that he might not lose face.

Hutu and Tutsi cultures have largely inte-

Hutu and Tutsi cultures have largely integrated. The Tutsi adopted the mutually intelligible Bantu languages, Rwanda and Rundi, which were originally spoken by the Hutu. The kinship and clan system is probably derived from Tutsi culture, and the central importance of cattle certainly is. The Hutu and Tutsi adhere essentially to the same religious beliefs, which include forms of animism and Christianity.

tutu, standard skirt worn by female ballet dancers, consisting of four or five layers of silk or nylon frills; the skirt is attached to

Ballet dancers in Romantic tutus in "Le Foyer de la danse," oil on canvas by Edgar Degas, 1872; in the Louvre. Paris

Giraudon-Art Resource/EB Inc.

a sleek-fitting bodice. (Originally tutu designated a short, trouser-like petticoat worn under a dancer's costume.) The prototype of the Romantic tutu, extending to within about 12 inches (30 centimetres) of the floor, was introduced in the 1830s by Marie Taglioni. The tutu gradually was shortened until, by the 1880s, the whole leg was visible. Both the Romantic and the brief tutu are worn in contemporary ballet.

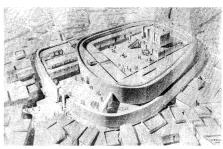

Tutu, Desmond (Mpilo) (b. Oct. 7, 1931, Klerksdorp, S.Af.), black South African Anglican cleric who in 1984 received the Nobel Prize for Peace for his role in the opposition to apartheid in South Africa.

Tutu was born of Xhosa and Tswana parents and was educated in South African mission schools at which his father taught. Though he wanted a medical career, Tutu was unable to afford training and instead became a schoolteacher in 1954. He resigned his post in 1957. Ordained an Anglican parish priest in 1961, Tutu lectured at a theological seminary in Johannesburg. In the late 1960s he moved to London, where he obtained an M.A. from Kings College, London. From 1972 to 1975 he served as an assistant director for the World Council of Churches. He was appointed dean of Johannesburg (1975–76) and was the first black to hold that position.

In 1978 he accepted an appointment as the general secretary of the South African Council of Churches and became a leading spokesman for the rights of black South Africans. He emphasized nonviolent means of protest and encouraged the application of economic pressure by countries dealing with South Africa. The Divine Intention, a collection of his lectures, was published in 1982, and Hope and Suffering, a collection of his sermons, in 1983. In 1985 he was installed as Johannesburg's first black Anglican bishop, and in 1986 he

was elected the first black archbishop of Cape Town, thus becoming the titular head of South Africa's 1,600,000-member Anglican Church.

Tutub, modern KHAFĀJĪ, ancient Sumerian city-state located in the Diyālā Valley east

Isometric drawing showing a reconstruction of the temple oval at Tutub, c. 2900 BC

By courtesy of the Oriental Institute, the University of Chicago

of Baghdad, Iraq. Tutub was most important during the Early Dynastic Period (c. 2900–2334 BC), and important remains have been found dating to that period—particularly the temple oval. Tutub was excavated between 1930 and 1938 by investigators from the Oriental Institute of the University of Chicago.

Tutuila, largest island in American Samoa, southwestern Pacific. About 18 mi (30 km) long and 6 mi across at its widest point, the island has an area of 52 sq mi (135 sq km). It has a densely wooded, broken, mountainous backbone culminating in Mt. Matafao (2,142 ft [653 m]). Numerous deep valleys descend to a fertile coastal strip. A collective family economy prevails, but the island is no longer self-sufficient in food staples. A growing export trade is based on canned tuna, copra, and local handicrafts. The harbour of the chief

Indented coastline of Tutuila, American Samoa Jacques Barrau

town, Pago Pago, is one of the best in the Pacific. Pop. (1980) 30,124.

Tutuola, Amos (b. 1920, Abeokuta, Nigeria), Nigerian author of richly inventive fantasies. He incorporates Yoruba myths and legends into loosely constructed prose epics that improvise on traditional themes found in Yoruba folktales. Perhaps his best known work is the novel *The Palm-Wine Drinkard and His Dead Palm-Wine Tapster in the Deads' Town* (1952).

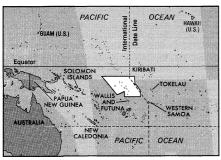

My Life in the Bush of Ghosts (1954) reiterates the quest motif, introduced in The Palm-Wine Drinkard, through the experiences of a boy who, in trying to escape from slave traders, finds himself in the Bush of Ghosts. Another quest is found in Simbi and the Satyr of the Dark Jungle (1955), a more compact tale focusing upon a beautiful and rich young girl who leaves her home and experiences poverty and starvation. In this and other tales—The Brave African Huntress (1958), The Feather Woman of the Jungle (1962), Ajaiyi and His Inherited Poverty (1967), and The Witch-Herbalist of the Remote Town (1981)—Tutuola's rich vision imposes unity upon a series of relatively random events.

Tutuola was influenced by Daniel Olorunfemi Fagunwa, a Nigerian author who wrote similar folk fantasies earlier in Yoruba, and was also familiar with *The Thousand and One Nights, Pilgrim's Progress*, and other episodic adventure stories used as textbooks at the Salvation Army primary school that he attended. Some of these influences can be seen most clearly in one of his earliest narratives, a hunter's tale recounting visits to several extraterrestrial residences of ghosts, including heaven and hell.

Tutuola had only six years of formal schooling and wrote completely outside the mainstream of Nigerian literature. His vivid presentation of the world of Yoruba mythology and religion and his grasp of literary form made him a success among a wide British, African, and American audience. Also popular are his short stories and the theatrical and operatic versions of *The Palm-Wine Drinkard* that have been made by others.

Tuva (people): see Tuvinian.

Tuvalu, formerly ELLICE ISLANDS, constitutional monarchy comprising nine islands in the west-central Pacific, 2,500 miles (4,000 km) northeast of Australia, with a total land area of about 10 square miles (26 square km) but claiming an exclusive economic zone extending 200 nautical miles (370 km) from its coasts, covering 500,000 square miles (1,300,000 square km). Fongafale on Funafuti Atoll is the capital, and the group had a population estimated in 1988 at 8,700. See also Pacific Islands.

Tuvalu

For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

The land. Tuvalu's islands, stretching some 420 miles (676 km) northwestward in a line from Niulakita to Nanumea, are anchored onto a chain of submarine seamounts. Four—Nanumanga, Niutao, Vaitupu, and Niulakita—are reef islands, while the remainder are true atolls with lagoons. Ranging in size from Vaitupu, 1.89 square miles, down to Niulakita, 0.16 square mile, all are low-lying; they have maximum elevations of less than 20 feet (6 m).

The climate is warm throughout the year with relatively high humidity; daytime temperatures range from 80° F to 85° F (27° C to 29° C), but the islands are cooled by prevalent southeast trade winds. Annual rainfall varies between an average of 100 inches (2,500 mm) in the northern islands to 125 inches (3,200 mm) in the south, mostly occurring as heavy showers. Periodically, severe droughts may affect the islands, and on rare occasions (for example, in 1894 and 1972) typhoons have

The porous, relatively poor coral-derived soil limits vegetation to about three dozen species, with coconut palms, breadfruit trees, pandanus, casuarina, and salt-tolerant herbs, ferns, and grasses predominant. Bird and wildlife variety likewise is limited, with the Polynesian rat, lizards, and turtles the principal wild fauna. By contrast, sea fauna abound, with castor-oil fish, tuna, bonito, kingfish,

and flying fish especially prevalent and octopuses, crabs, and a variety of other fish and crustaceans inhabiting the reefs and lagoons. There are no mineral deposits. Because of the extremely porous soil, the supply of fresh water is such a persistent problem that drinking water is often replaced by coconut milk. Rain catchment cisterns have partly alleviated the problem.

The people. Tuvaluans are more than 90 percent Polynesian and are closely related to Samoans and Tokelauans, except for the Nui islanders, who are overwhelmingly of Kiribati Micronesian ancestry. There are very few Europeans or other foreigners. The Tuvalu language is a Samoan-related dialect of Polynesian, except on Nui, where a Kiribati (Gilbertese) dialect is spoken; English, the official language, is widely used throughout the islands. Almost all Tuvaluans are members of the Church of Tuvalu, which evolved from Congregational missions. There are small groups of Seventh Day Adventists, Bahā'īs, and Roman Catholics. Population density is extremely high, and about one-third of the population is urban, mostly concentrated on Funafuti Atoll, the centre of government and commerce. Although the birth and death rates are relatively high, the population growth rate is uncharacteristically low because of a high rate of emigration for work abroad.

The economy. Tuvalu's developing economy is based mainly on subsistence agriculture, fishing, and limited cash-crop production. Its gross national product (GNP) per capita is relatively low in comparison with other countries of Oceania.

Because of poor soil quality in Tuvalu, the islanders pursue a tradition of planting in trenches dug to the water table, 6 to 12 feet below the surface. Taro, bananas, and sugarcane are planted in hillocks of good soil mulched with leaves within the trenches, which are 10 to 20 feet wide (larger in swampy areas). Breadfruit and pawpaw are grown on embankments between the trenches. Coconut palms and pandanus grow freely on the islands, and copra is the only cash crop, marketed by a copra cooperative. The land is overwhelmingly held in small family plots or communally. Niulakita is entirely devoted to coconut palms in a plantation worked by people from Niutao. Pigs and chickens are the only livestock, raised by families or communally and fed on coconut scraps and waste.

Fishing, chiefly for castor-oil fish, is conducted only for the local market, but several islands harvest and process bêche-de-mer for export. South Korea, the United States, and Taiwan have signed fishing agreements to operate vessels within Tuvalu's exclusive economic zone.

There is no manufacturing save for the production of traditional multicoloured mats, Panama hats, baskets, and bags woven from pandanus leaves. Commercial activity is limited to cooperative societies centred on each island and a few businesses on Funafuti Atoll. A modest foreign-exchange earner is postage-stamp production and sales abroad. Electricity, all of which is produced by thermal power plants, is distributed only to Funafuti and Vaitupu.

The government's main development projects in the 1980s were the modernization of coconut agriculture, the development of hydroponic agriculture, the introduction of salttolerant crops, and the establishment of a deep-sea fishing industry; but all development was dependent on foreign aid, mostly from the United Kingdom, Australia, and New Zealand.

About four-fifths of the islands' labour force is employed in village subsistence agriculture and small-scale fishing, the remainder in business, services, or government service. About 10 percent of Tuvalu's labour force is employed abroad (mainly in the Nauru phos-

phate industry) or on ships, and remittances from these are the principal source of foreign exchange.

Irregular interisland shipping and air service (at Funafuti) are the most important forms of transport, but only two islands have navigable passages into their lagoons. Funafuti is the main port, and deepening of wharf-side waters was finished in 1980, permitting oceangoing ships to anchor alongside. In 1979 New Zealand helped blast a passage through the reef into Nui's lagoon. Tuvalu's imports have generally ranged about tenfold higher than exports in value. Food and food productsabout one-fourth of imports, followed by manufactured goods, machinery and transport equipment, and mineral fuels-are imported mainly from Australia, New Zealand, and the United Kingdom. Copra is virtually the only export.

Government and social conditions. According to its 1978 constitution, the British monarch is the head of state in Tuvalu, represented by a Tuvaluan chosen as governorgeneral. The unicameral Parliament has 12 members elected by universal adult suffrage to a four-year term, along with one ex-officio member; the parliament in turn elects the prime minister. The Cabinet is chosen by the governor-general, upon advice of the prime minister, from members of Parliament. The judiciary consists of a High Court with civil and criminal courts on each of the inhabited islands. Appeals from the High Court are directed to the Fiji Court of Appeal or to the Judicial Committee of the Privy Council of the United Kingdom.

Funafuti has a modern hospital, and each island is served by a dispensary. Health is generally good, filarial fever having been eliminated in 1975 by a World Health Organization program; but infant mortality has remained fairly high, partly because of erratic fresh water supply. Life expectancy is 57 years for males and 60 years for females, which is somewhat low for Oceania as a whole.

There are primary schools in each of the eight inhabited islands, and primary education is available free to all children. There is a secondary school on Vaitupu, and the Maritime Training School opened on Funafuti in 1979; vocational-training students are sent to Fiji and other islands, as are all students in higher education.

Telegraph and telephone service is available on the eight populated islands. Radio Tuvalu broadcasts from a station on Funafuti in Tuvaluan and English, and there is one fortnightly government newspaper. Tuvalu has been little affected by European influences, save for Christianization, and local traditions and crafts are still strong, although some modernization has influenced Funafuti.

History. Traditions recorded by missionaries in the 19th century indicate Samoa or Tonga as the original home of Tuvalu's first Polynesian settlers. Tuvaluan language supports this, and genealogical data would date the settlement to about AD 1325, estimating one generation per 25 years. Archaeologists in the late 1970s tentatively suggested initial settlement by AD 300-500. Nui was occupied at some later point by Micronesian people from present-day Kiribati.

The Spanish explorer Alvaro de Mendaña de Neira sighted Nui in 1568 and Niulakita in 1595. The group's former name, Ellice Islands, originated from the owner of the ship Rebecca, whose captain, Arent De Peyster, visited Funafuti in 1819. A number of castaways and beachcombers settled and intermarried with Tuvaluans during the period 1820–70, when whalers frequented the surrounding seas. Some of these became agents and traders and started copra and coconut-oil exports. Pe-

ruvian "blackbirders" forcibly abducted from Funafuti and Nukulaelae much of the population, none of whom ever returned; a few years later, in 1865, London Missionary Society pastors established themselves and rapidly converted the islanders.

The United States claimed the four southern islands through the congressional Guano Act of 1856, and an American mined the guano deposits on Niulakita in the early 1890s. In 1892, when the British established the Gilbert Islands Protectorate, Captain E.H.M. Davis of HMS Royalist toured the islands of Tuvalu and convinced the islanders to join the British protectorate. They became the Gilbert and Ellice Islands Colony in 1916. Funafuti atoll was chosen as administrative centre and became the port of entry. It was also the site of scientific drilling operations in 1897–98 and 1911 to test Darwin's theory of atoll evolution.

After the Japanese occupied the Gilberts in 1942, U.S. forces occupied the Ellice Islands and built airstrips on three islands; the Gilberts were liberated in 1943. Many Tuvaluans emigrated to Tarawa in the Gilberts after World War II for employment, and rivalry between them and Kiribatians set the stage for separation of the two. Tuvaluans gained representation in the colonial government in 1967, expanded in 1970. After an inquiry, the Tuvaluans voted overwhelmingly in 1974 for separation from the Gilberts. The separation in 1975-76 was followed by a general election of a House of Assembly in 1977. After Tuvalu's independence on Oct. 1, 1978, this became the House of Parliament. Early in 1979 the United States signed a treaty of friendship with Tuvalu and relinquished its claims to the four southern islands, in return for access to the World War II U.S.-built bases and the right to veto any other nation's request to use any of Tuvalu's islands for military purposes. The first postindependence parliamentary elections were held in 1981.

Tuve, Merle Antony (b. June 27, 1901, Canton, S.D., U.S.—d. May 20, 1982, Bethesda, Md.), American research physicist and geophysicist who developed the radio-wave exploration method for the ionosphere.

In 1926 Tuve investigated long-range seismic refraction (change in the path through the Earth of a disturbance as it passes through material of varying composition). He constructed an upper-mantle-velocities map of the United States that delineated areas of varying composition directly beneath the Earth's crust. He also verified the existence of the neutron, measured the bonding forces in atomic nuclei, produced beta and gamma waves and high-velocity protons, and researched radioastronomy and artificial radioactivity.

After receiving his doctorate in physics from Johns Hopkins University (1926), he joined the Department of Terrestrial Magnetism of the Carnegie Institution of Washington, Washington, D.C., serving as director of the department from 1946 to 1966. In that same year Tuve was awarded the U.S. Presidential Medal of Merit and made a commander in the Order of the British Empire. He was knighted in 1948 and, in addition to his other honours, was named Distinguished Service Member of the Carnegie Institution in 1966.

Tuvinian, also called TUVA, SOYOT, or URYANKHAI, large ethnolinguistic group inhabiting the Tuvinian Autonomous Soviet Socialist Republic of the Soviet Union; the group also constitutes a small minority in the Mongolian People's Republic. They are a Turkic-speaking people with Mongol influences. They

live among the headwaters of the Yenisey River, in an area that has characteristics of both Siberian taiga and central Asian steppe. Pastoralism and hunting are their traditional occupations; since the early 1950s, collectivized agriculture has been prominent. The growing of millet and fishing have customarily been a subsidiary part of the economy. The Tuvinian traditional dwellings include the felt tents (called *gers*, or yurts) of the steppe peoples and the conical bark tents of Siberia.

Since the 17th century the Tuvinian have come under increasing Russian cultural influence. Their traditional social organization is based on a system of clans, and their traditional religion combines shamanism and features of Tibetan Buddhism. In the late 20th century the Tuvinian numbered about 180,000 in the Soviet Union and 24,000 in the Mongolian People's Republic.

Tuvinian Autonomous Soviet Socialist Republic, also called TUVA, or TYVA, administrative division of the Russian Soviet Federated Socialist Republic, situated in the basin of the Upper Yenisey River. Bordering Mongolia, it has an area of 65,850 square miles (170,500 square km). Its relief consists of two broad basins, the Tuva and Todzha, drained by two main tributaries of the Yenisey. High mountain ranges, including the Zapadny (Western) Sayans to the northwest and the Vostochny (Eastern) Sayans to the northeast, enclose the basins. The climate is generally of the dry, sharply continental type, with severe winters and warm summers.

There are five cities and three urban settlements, including Kyzyl (q.v.), the capital. More than one-half of the population is rural.

Tannu Tuva was part of the Chinese Empire from 1757 until 1911, when tsarist Russia fomented a separatist movement and in 1914 took the country under its protection. In 1921 independence was proclaimed for the Tannu Tuva People's Republic, but in 1944 it was annexed by the Soviet Union and made an autonomous *oblast* (province) of the Russian S.F.S.R. In 1961 its status was raised to that of an autonomous republic. Tuvinians constitute about three-fifths of the population (most of the rest being Russians).

The Tuvinian A.S.S.R. is an agricultural region, with cattle breeding the main occupation. Industries include food processing, leather making, woodworking, and the manufacture of building materials, but mining, especially of cobalt and asbestos, is the most developed. The fur trade is also economically important. Pop. (1987 est.) 289,000.

Tuwim, Julian (b. Sept. 13, 1894, Łódź, Pol.—d. Dec. 27, 1953, Zakopane), lyric poet who was leader of the 20th-century group of Polish poets called Skamander (q, v).

Tuwim spent his life in Poland, except for five years of exile in Brazil and the United States during World War II. He began his career in 1915 with the publication of a flamboyant Futurist manifesto that created a scandal and presented a position that he soon abandoned. Tuwim's poetry throughout his life was marked by explosive energy and great emotional tension. Among his works published in the years before World War II are Czychanie na Boga (1918; "Lurking God"), Tańczący Sokrates (1920; "The Dancing Socrates"), and his most important collection, Słowa we Krwi (1926; "Words Bathed in Blood"). During his exile he wrote a long, discursive autobiographical poem, Kwiaty polskie (1949; "Polish Flowers"), and also produced a volume of children's songs.

Tuxpan, in full TUXPAN DE RODRÍGUEZ, city, northern Veracruz *estado* ("state"), east-central Mexico. It lies along the Tuxpan River, $7^{1/2}$ miles (12 km) from its mouth on the Gulf of Mexico. Despite its hot, humid climate, Tuxpan is a thriving commercial, in-

dustrial, and transportation centre. The principal source of income is petroleum from the nearby oilfields, much of which is exported. Other exports include corn (maize), bananas, fish, and livestock from the hinterland that are processed in the city. Shipyards are located nearby. Highways and air service link Tuxpan with Mexico City, to the southwest, and with coastal urban centres. Ships can reach Tuxpan via the river or via an inland canal-and-lagoon route through the oil fields from Tampico to the north-northwest. Pop. (1980) 56,037.

Tuxtla, in full TUXTLA GUTIÉRREZ, city, capital of Chiapas estado ("state"), southeastern Mexico. It lies at 1,732 feet (528 m) above sea level in the Chiapas Valley, 7½ miles (12 km) west of the Grijalva River and about 240 miles (390 km) east of Oaxaca. In 1892 Tuxtla replaced San Cristóbal de las Casas as state capital. In addition to its administrative functions, Tuxtla is the major commercial and manufacturing centre in the state. Much of the corn (maize), cotton, cacao, coffee, tobacco, sugarcane, henequen, and other tropical crops cultivated in the region are processed in and distributed from the city. A state archaeological museum is located there. Tuxtla is on that portion of the Pan-American Highway linking Mexico City with Guatemala City, and it has an airfield. The Autonomous University of Chiapas was established at Tuxtla in 1975. The annual fair of Guadalupe held in December attracts a number of tourists. Pop. (1980)

Tuy Hoa, city, south-central Vietnam. An agricultural centre and fishing port on the South China Sea coast near the mouth of the Da Rang River, it is the focus of a fertile, densely populated agricultural lowland devoted to sugarcane, cotton, and rice. Many of the Vietnamese farmers of the Tuy Hoa region were recruited in the 1920s by the French to relocate on newly founded rubber and tea plantations in the central highlands. In 1936 the city was linked to Saigon (now Ho Chi Minh City) and Hanoi by the completion of the coastal railway. It is also served by the national coastal highway and has a hospital and a commercial airport. A ruined 4th-century-AD Cham (Champa) tower is located there. Pop. (1971 est.) 65,087.

Tuyra River (Panama): see Tuira River.

Tuz Gölü, English LAKE TUZ, saline lake occupying a depression in the dry central plateau of Turkey, 65 miles (105 km) northeast of Konya. It lies at an elevation of 3,035 feet (925 m). For most of the year it has a surface area of about 580 square miles (1,500 square km) and reaches a depth of some 2,950 feet (900 m). Normally about 50 miles (80 km) long and 30 miles (50 km) wide, it recedes each summer to leave a desolate expanse of encrusted salt, which is worked. The lake has no outlet, and few surface streams feed into it: rainfall in the surrounding area is as low as 10 inches (250 mm) per year.

Tuzigoot National Monument, national monument in central Arizona, U.S., located in the Verde Valley, 5 miles (8 km) northeast of Clarkdale. It was established in 1939 and occupies 43 acres (17 hectares). Its outstanding feature is the ruin, excavated in 1933–34 and partially rebuilt, of a pre-Columbian Indian pueblo (village) containing 110 rooms and occupied by three cultural groups between AD 1000 and 1400. A museum displays such artifacts as stone and horn implements, jewelry, matting, and pottery, all recovered from the floors of the pueblo and from graves.

Tuzla, town, in Bosnia and Hercegovina, Yugoslavia, situated in the Tuzla Basin. Tuzla has long been associated with local deposits of rock salt. In the 10th century it was called Soli (Salts), and its present name is from the Turkish tuz. "salt."

The first Bosnian-Hercegovinian theatre (1898) was in Tuzla. From 1510 it was a Turkish garrison town, until in the 19th century it passed under the Austro-Hungarian Empire; in 1918 it was incorporated into Yugoslavia. Large quantities of lignite are mined in the basin, and there is a mining institute in the town. Its good rail and road connections make Tuzla a collection point for agricultural produce. It is also the site of thermal power stations. Pop. (1981 prelim.) mun., 121,717.

TVA: see Tennessee Valley Authority.

Tver (Russian S.F.S.R.): see Kalinin.

Tver, Principality of, Russian TVERSKOYE KNYAZHESTVO, medieval principality located in the region northwest of Moscow and centring on the city of Tver (modern Kalinin) and including the towns of Kashin, Mikulin, Kholm, Dorogobuzh, and Staritsa. Descendants of Prince Yaroslav Yaroslavich (brother of Alexander Nevsky and son of Yaroslav Vsevolodovich) founded the principality in 1246. Under their rule Tver rivaled Moscow for supremacy in northeastern Russia during the 14th and 15th centuries. In 1305 Yaroslav's son Michael I was made grand prince of Vladimir (i.e., chief among the Russian princes). Yury of Moscow, however, gained the support of Öz Beg (Uzbek), khan (1313– 41) of the Golden Horde, and in 1317 replaced Michael as grand prince. Michael refused to accept his loss and defeated the military force sent by Öz Beg and Yury to dethrone him. He was killed by Öz Beg in 1318.

In 1322 the patent conferring the title was again bestowed on a Tver prince, Dmitry Mikhaylovich. But he was executed (1326) by Oz Beg for killing Yury of Moscow. The patent was then passed to his brother Alexander, who held it until the Tver population revolted against Mongol officials (1327). Tver was then plundered by an expedition sent by the Golden Horde; the patent for the grand prince of Vladimir was never again bestowed upon a Tver prince.

Alexander fled to Lithuania, but his brothers, Constantine and Vasily, tried to restore

civil war during Vasily's reign (1346-67), it was strong enough by 1368, under Michael II. son of Alexander, to join Lithuania and challenge Moscow's dominant position. Dmitry Donskoy decisively defeated Michael in 1375 and forced Tver to acknowledge Moscow's suzerainty. Michael and his son Ivan, however, maintained Tver's independence, and under the rule of Boris Aleksandrovich (1425-61) the principality flourished culturally and economically, while maintaining cordial relations with Moscow. Nevertheless, in 1485 Ivan III of Moscow annexed the Principality of Tver, whose last prince, Michael III Borisovich (1461-85), unsuccessfully allied himself with King Casimir IV of Poland and was forced to flee.

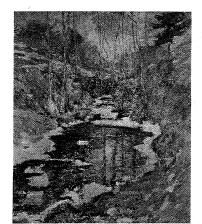

Tvrtko I, in full tvrtko kotromanić (b. c. 1338—d. 1391), probably the greatest ruler of Bosnia, ruling as Bosnian ban (provincial lord, subservient to the king of Hungary) from 1353 and king of the Serbs and Bosnia from

In 1363 Tvrtko commenced war with King Louis I of Hungary, but afterward Louis helped him regain power following a revolution in Bosnia. At Bileća in 1388 Tvrtko's forces halted an Ottoman Turkish invasion. In 1390 he extended his power into Croatia and to the Dalmatian islands in the Adriatic

Twa, also called BATWA, one of the bestknown of the many Pygmy groups scattered across equatorial Africa. Like all other African Pygmies, the Twa, averaging about 5 feet (1.5 m) in height, are a people of mixed ancestry, probably descendants of the original inhabitants of the tropical rain forest. They live in the high mountains and plains around Lake Kivu, in Zaire, Rwanda, and Burundi, and function in economic symbiosis with the pastoral Tutsi, the agricultural Hutu, and other peoples. Many specialize in pottery, which they market; others hunt.

Twachtman, John Henry (b. Aug. 4, 1853, Cincinnati, Ohio, U.S.—d. Aug. 8, 1902,

the principality. Although Tver suffered from

Gloucester, Mass.), painter and etcher, one of the first American Impressionists.

Twachtman went to Munich in 1875 to

study painting and adopted the broad brush-

work and warmly dark tonal colouring of the

"Hemlock Pool," oil painting by Twachtman, c. 1902; in the Addison Gallery of American Art, Andover, Mass. By courtesy of the Addison Gallery of American Art, Phillips

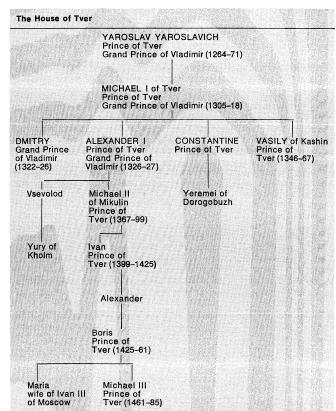

Munich school, as, for example, in "Venetian Landscape" (1878; Museum of Fine Arts, Boston). Later, he studied at the Académie Julian in Paris, where he came into contact with Impressionism and began to paint with broken dabs of colour.

Unsuccessful at first, he supported himself after 1889 by teaching at the Art Students League in New York City. From that year also, his lyrical interpretation of landscape attained its maturity. He preferred painting scenes of nature veiled in cool, shimmering light—e.g., 'The White Bridge" (Minneapolis [Minn.] Institute of Arts). Among his best-known works are winter or early spring landscapes with delicate high-keyed colour and strong underlying formal construction—e.g., "Hemlock Pool" (c. 1902; Addison Gallery of American Art, Andover, Mass.). Twachtman was also prominent among The Ten, a group of American painters exhibiting independently of the National Academy of Design from 1895 onward.

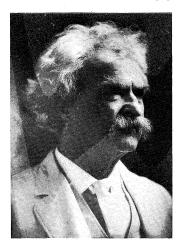

Twain, Mark, pseudonym of SAMUEL LANG-HORNE CLEMENS (b. Nov. 30, 1835, Florida, Mo., U.S.—d. April 21, 1910, Redding, Conn.), American humorist, writer, newspaperman, and lecturer who won a worldwide audience for his stories of youthful adventures, especially The Adventures of Tom Sawyer (1876), Life on the Mississippi (1883), and The Adventures of Huckleberry Finn (1884).

Youth in Hannibal and early travels. Clemens was the sixth child of John Marshall and Jane Lampton Clemens. He was four when the family moved to nearby Hannibal, on the west bank of the Mississippi, where his father kept a dry-goods and grocery store, practiced law, and entered local politics. There Samuel spent his boyhood, enchanted by the romance and awed by the violence of river life-the steamboats, keelboats, and giant lumber rafts and also the human flotsam washed up by the river: professional gamblers and confidence men, itinerant stevedores and indigent raftsmen, quick with fist, knife, or derringer. Hannibal was an ideal place for a boy to grow up, with its woods and hills, its opportunities for fishing, and a nearby island in the river.

Samuel's father died in 1847, when the boy was 11. From that time on, it became necessary for Samuel to contribute to the family's support. He became a delivery boy, grocery clerk, and blacksmith's helper during sum-

mers or after school. At the age of 13 he became a full-time apprentice to a local printer. When his brother Orion, 10 years older than he, established the *Hannibal Journal*, Samuel became a compositor for that paper.

Twain

By courtesy of the Mark Twain Home

The late 1840s and the 1850s were periods during which localized humour of a superior sort flourished in both New England and what then was the Southwest, and these humorous writings introduced Samuel to techniques that were to figure prominently in some of his later writings. He contributed some amateurish bits of humour to Orion's Journal and was the "S.L.C." of Hannibal whose sketch "The Dandy Frightening the Squatter" was printed in a Boston humorous paper, The Carpet-Bag, in May 1852. This was an anecdote similar to a number then going the rounds, contrasting the strength and forthrightness of a frontiersman with the weakness and foolishness of an Eastern dandy.

Since Orion was as poor a businessman as his father had been, the Journal did not do well, and young Clemens became restless. In 1853 he set out as an itinerant printer and worked his way eastward on newspapers in St. Louis, New York City, and Philadelphia. In the summer of 1854 he rejoined Orion, who had now moved to Iowa. Except for a brief period as a printer in St. Louis, he worked at his trade for Orion in Keokuk, Iowa, until the fall of 1856. When in 1856 he began another period of wandering, he had a commission to write some comic travel letters for the Keokuk Daily Post. These, signed with the pseudonym "Thomas Jefferson Snodgrass," were characterized by the misspelling, the atrocious grammar, and the weirdly constructed sentences then becoming fashionable among rising humorists. But only five letters appeared, for on the way down the Mississippi toward New Orleans, Clemens met a steamboat pilot named Horace Bixby who agreed to take him on as an apprentice and teach him the mysteries of navigating the tortuous channels of the great and treacherous river. For almost four years Clemens plied the Mississippi; he later remembered these years as the most carefree of his life. He never met a man later anywhere whose kind he had not known on the river. After 1859 he was a licensed pilot in his own right, but two years later the Civil War cut across the river, bringing an end to traffic from north to south.

After probably spending a few weeks during the spring of 1861 in the Confederate militia, Clemens joined his brother Orion in a trip to the Nevada Territory, where the latter had been apointed territorial secretary. In Nevada, after unsuccessful stock speculation in min-

ing and timberlands and equally unsuccessful prospecting for gold and silver, Samuel became a writer for the Virginia City Territorial Enterprise. He signed his contributions "Josh" and delighted in perpetrating such journalistic hoaxes as an account of "The Petrified Man" and "The Empire City Massacre," preposterous tall tales told so plausibly that other newspapers reprinted them as true.

It was in Virginia City on Feb. 3, 1863, that "Mark Twain" was born when Clemens, then 27. signed a humorous travel account with that pseudonym. The new name was a riverman's term for water "two fathoms deep" and thus just barely safe for navigation. In the spring of 1864, Twain left Nevada for California. In San Francisco he met and was encouraged by the author Bret Harte and spent convivial evenings with Charles Farrar Browne, who, under the pseudonym Artemus Ward, was then one of the most popular American humorists and platform lecturers and who encouraged him to contribute to a collection of Western sketches that he planned to publish. Twain, however, chose to sojourn in the Tuolumne Hills, where he did pocket mining at Angels Camp. With friends at nearby Jackass Hill, Twain heard the story that he would make famous as "The Celebrated Jumping Frog of Calaveras County." Published in a New York periodical, The Saturday Press, in November 1865, this story was an immediate hit when it was reprinted in newspapers far and wide. Written much in the manner of the Southwestern humour of the period of Clemens' youth, this fine tall tale brought not only his first national fame but also the first approval of his work by several discerning critic

Trips abroad and mature writing. When, in 1866, the Pacific Steamboat Company inaugurated passenger service between San Francisco and Honolulu, Twain took the trip as a correspondent for The Sacramento Union. His letters and the lectures that he later gave about the trip were immediately popular. Since he enjoyed going places and talking about them, he set out again as "traveling correspondent" for California's largest paper, the Alta California, it was advertised that he would "circle the globe and write letters" as he went. The first leg of the journey was to New York City by way of the Isthmus of Panama, and in June 1867 he took the excursion steamship Quaker City for a voyage to Europe and the Holy Land. The letters that he wrote during the next five months, for the Alta California and Horace Greeley's New York Tribune, caught the public fancy and, when revised for publication in 1869 as The Innocents Abroad; or, The New Pilgrim's Progress, established Twain as a popular favourite. In his book Twain sharply satirized tourists who learned what they should see and feel by carefully reading guidebooks. He assumed the role of a keen-eyed, shrewd Westerner who was refreshingly honest and vivid in describing foreign scenes and his reactions to them. It is probable that Americans liked the implication that a common man could judge the Old World as well as the next man. But the chief attraction of the book was its humour, which readers of the time found delightful. The book showed that Mark Twain had found a method of writing about travel which, though seemingly artless, deftly employed changes of pace. Serious passages—history, statistics, description, explanation, argumentation—alternated with laughable ones. The humour itself was varied, sometimes being in the vein of the Southwestern yarn spinners whom he had encountered when a printer's devil, sometimes in that of contemporaneous humorists such as Artemus Ward and Josh Billings, who chiefly used burlesque and parody, anticlimactic sentences, puns, malapropisms, and other verbal devices. Thereafter he was to use the formula successfully in a number of books combining factual materials with humour.

In 1870 Twain resumed his career as a public lecturer who charmed audiences with laconic recitations of incredible comic incidents. Meanwhile, he had met Olivia Langdon of Elmira, N.Y. On Feb. 2, 1870, they were married, and in September 1871 they moved to Hartford, Conn., where Twain built a large and elaborate house in which he and his family would live for the next 20 years—the happiest and most productive period of his life. They soon had three daughters.

In 1872 Roughing It appeared, a chronicle of an overland stagecoach journey Twain had taken more than 10 years before and of Twain's adventures among the Pacific islands. Meanwhile, he collaborated with his neighbour Charles Dudley Warner on The Gilded Age, a satire on financial and political malfeasance that, when published in 1873, gave a name to the expansive post-Civil War era.

Twain continued to lecture with great success in the United States and, in 1872 and 1873, in England, holding audiences spellbound with his comic-coated satire, drawling cadences, and outlandish exaggerations. He recorded his experiences as a pilot in "Old Times on the Mississippi" for the Atlantic Monthly (1875), expanded eight years later to Life on the Mississippi, an authentic and compelling description of a way of life that was, even then, long past. After having written boyhood friends, asking them to send their recollections of old days in Hannibal, he published The Adventures of Tom Sawyer in 1876, a narrative of youthful escapades that became an immediate and continuing favourite.

Tom Sawyer is perhaps Twain's best book for a juvenile audience. The setting was a small Mississippi River town, and the characters were the grownups and the children of the town in the 1830s. The book's nostalgic attitude and its wistful re-creation of pre-Civil War life are humorously spiced by its main character, Tom Sawyer. Rather than being the prematurely moral "model boy" of Sundayschool stories, Tom is depicted as "the normal boy," mischievous and irresponsible but goodhearted; and the book's subplots show him winning triumphs again and again. These happy endings endear the book to children, while the lifelike picture of a boy and his friends is enjoyed by both young and old.

In 1878 and 1879 Twain and his family again traveled abroad. A walking tour through the Black Forest provided much of the material for A Tramp Abroad (1880). A year later, in The Prince and the Pauper (1881), Twain again captured popular fancy as he spoke once more of boyhood adventures, this time through the device of transposed identities in old England, but with an undertone of social criticism that ridiculed the pretensions and achievements of monarchy. Twain's novel The Adventures of Huckleberry Finn appeared in 1884.

Huckleberry Finn, by general agreement, is Twain's finest book and an outstanding American novel. Its narrator is Huck, a youngster whose carelessly recorded vernacular speech is admirably adapted to detailed and poetic descriptions of scenes, vivid representations of characters, and narrative renditions that are both broadly comic and subtly ironic. Huck, son of the village drunkard, is uneducated, superstitious, and sometimes credulous; but he also has a native shrewdness, a cheerfulness that is hard to put down, compassionate tolerance, and an instinctive tendency to reach the right decisions about important matters. He runs away from his persecuting father and, with his companion, the runaway slave Jim, makes a long and frequently interrupted voyage floating down the Mississippi River on a raft.

During the journey Huck meets and comes to know members of greatly varied groups, so that the book memorably portrays almost every class living on or along the river. Huck overcomes his initial prejudices and learns to respect and love Jim. The book's pages are dotted with idyllic descriptions of the great river and the surrounding forests, and Huck's exuberance and unconscious humour permeate the whole. But a thread that runs through adventure after adventure is the theme of man's inhumanity to man—of human cruelty. Children miss this theme, but adults who read the book with care cannot fail to be impressed by an attitude that was to become a reiterated theme of the author during his later years.

Twain turned next to historical fiction. In A Connecticut Yankee in King Arthur's Court (1889) he transplants a commonsensical Yankee back in time to Britain during the Dark Ages. Through a series of wary adventures Twain celebrates American homespun ingenuity in contrast to the superstitious ineptitude of a chivalric monarchy.

The popular image of Mark Twain was by now well-established. He was a gruff but knowledgeable, unaffected man who had been places and seen things and was not fooled by pretense. He talked and wrote with contagious humanity and charm in the language of ordinary people. At the same time, he scornfully berated man; evolution failed, he said, when man appeared, for his was the only evil heart in the entire animal kingdom. Yet Mark Twain was one with those he scorned: what any man sees in the human race, he admitted, "is merely himself in the deep and private honesty of his own heart." Perceptive, comic, but also bitter, Twain seemed to be the mirror of all men.

Financial difficulties and last years. Twain began speculating unsuccessfully again in the late 1880s through his enthusiastic financial support of an inventor named James W. Paige, who was developing a typesetting machine. The device proved worthless, and, in order to economize, Twain closed the large Hartford house and moved with his family to Europe. In 1892 the publishing firm he had established in 1884 published The American Claimant and in 1894 Tom Sawyer Abroad, neither of which was very successful. The company became more embroiled in financial difficulties, and soon Twain was bankrupt.

He turned over the management of his affairs to a friend, Henry Huttleston Rogers, an executive of the Standard Oil Company, and set about earning enough money to completely pay off his debts. The returns from The Tragedy of Pudd'nhead Wilson (1894), Personal Recollections of Joan of Arc (1895), a lecture tour around the world, and Following the Equator (1897), in which he described the tour, made him solvent again. In England during the lecture tour Twain received news of the death of his eldest daughter, Susy. Though grief-stricken, he and the rest of the family remained abroad for five more years. Jean, the youngest daughter, was discovered to be incurably ill, and Twain's wife, never robust, was failing. The Man That Corrupted Hadleyburg and Other Stories and Sketches was issued in 1900.

Late in that year, Twain and his family returned to the United States, where he was widely acclaimed as a man who had refused to bow to bankruptcy but had laboured diligently to pay every creditor every dollar he was owed. The family lived then in New York City, where Twain was greatly in demand as a speaker. He was by now a public hero, lauded and applauded, the friend of great industrial magnates, and the recipient of honorary degrees, but he still spoke out frankly and bitterly on public issues, denouncing imperialism and the baseness of the white man's conduct in subduing the Congo.

In the fall of 1903 Twain and his family settled near Florence, Italy. His wife died six months later, and he expressed his grief, his loneliness, and his pessimism about the human character in several late works. In 1906 Twain began to dictate his autobiography. The

rambling, uneven account was uncompleted when he died in April 1910.

MAJOR WORKS. Novels. The Gilded Age, with Charles Dudley Warner (1873); The Adventures of Tom Sawyer (1876); The Prince and the Pauper (1881); The Adventures of Huckleberry Finn (1884); A Connecticut Yankee in King Arthur's Court (1889); The American Claimant (1892); Tom Sawyer Abroad (1894); The Tragedy of Pudánhead Wilson (1894); Personal Recollections of Joan of Arc (1895); Tom Sawyer, Detective (1896); The Mysterious Stranger (1916, posthumously published from the incomplete manuscript; redited more accurately, 1969).

edited more accurately, 1969).

Tales and sketches. The Celebrated Jumping Frog of Calaveras County, and Other Sketches (1867); Mark Twain's Sketches, New and Old (1875); The Stolen White Elephant and Other Stories (1882); The £1,000,000 Bank-Note and Other New Stories (1893); The Man That Corrupted Hadleyburg and Other Stories and Sketches (1900); A Double Barrelled Detective Story (1902); The \$30,000 Bequest, and Other Stories (1906).

Travel sketches. The Innocents Abroad; or, The New Pilgrim's Progress (1869); A Tramp Abroad (1880); Following the Equator (1897).

Reminiscences. Roughing It (872); Life on the Mississippi (1883).

Autobiography. Mark Twain's Autobiography (incomplete upon his death, published in 1924 with additional fragments appearing in later editions).

Philosophical dialogue. What Is Man? (1906). Other works. Mark Twain's (Burlesque) Autobiography (1871); How to Tell a Story and Other Essays (1897); Extracts from Adam's Diary (1904); King Leopold's Soliloquy (1905); Eve's Diary (1906); Christian Science (1907); Is Shakespeare Dead? (1909); Extract from Captain Stormfield's Visit to Heaven (1909).

BIBLIOGRAPHY. The authorized biography, Albert B. Paine, Mark Twain, a Biography: The Personal and Literary Life of Samuel Langhorne Clemens, 3 vol. (1912), though often corrected by later writers, is still important; as are such reminiscent accounts as William Dean Howells, My Mark Twain (1910, reprinted 1967); Mary Lawton, A Lifetime with Mark Twain (1925); and Clara Clemens, My Father, Mark Twain (1931). Dixon Wecter details early years in Sam Clemens of Hannibal (1952); as does M.M. Brashear in Mark Twain: Son of Missouri (1934). Ivan Benson writes of Mark Twain's Western Years (1938); Edgar M. Branch of The Literary Apprenticeship of Mark Twain (1950); Kenneth R. Andrews of Nook Farm: Mark Twain's Hartford Circle (1950); Samuel C. Webster of Mark Twain: Business Man (1946); Louis J. Budd of Mark Twain: Social Philosopher (1962); Howard G. Baetzhold of Mark Twain and John Bull (1970); and William R. Macnaughton of Mark Twain's Last Years as a Writer (1979). Edward C. Wagenknecht, Mark Twain: The Man and His Work, 3rd ed. (1967), contains valuable bibliographical material; but see also Merle Johnson, A Bibliography of the Works of Mark Twain (1935). More complete modern biographies are J. Delancey Ferguson, Mark Twain: Man and Legend (1943); and Justin Kaplan, Mister Clemens and Mark Twain (1966). Van Wyck Brooks, The Ordeal of Mark Twain, rev. ed. (1923), answered by Bernard Devoto, Mark Twain's America (1932), created a controversy about Clemens' literary integrity; for details, see Lewis Leary (ed.), A Casebook on Mark Twain's Wound (1962). Critical studies include: Walter Blair, Mark Twain and Huck Finn (1960); Henry Nash Smith, Mark Twain: The Development of a Writer (1962); James M. Cox, Mark Twain: The Fate of Humor (1966); and William M. Gibson, The Art of Mark Twain (1976).

Twardowski, Samuel (b. c. 1600, Lutynia, near Jarocin, Kingdom of Poland—d. 1661, Zalesie Wielkie, near Krotoszyn), Polish poet, diarist, and essayist.

An impoverished Polish nobleman, Twardowski was a hanger-on at various magnates' courts. While traveling as secretary with one of his patrons to Turkey on a diplomatic mission, he wrote a diary of the journey in verse: Przeważna legacja J.O. Książęcia Krzysztofa Zbaraskiego (1633; "The Important Mission

of His Grace Duke Krzysztof Zbaraski"). He also wrote about many historical events, as in Wojna domowa z Kozaki i Tatary (1681; "A Civil War with the Cossacks and Tatars"), an account of the Zaporozhian Cossacks' revolt, under the leadership of Khmelnytsky, against Polish domination in the mid-17th century. Twardowski also wrote Baroque pastoral romances such as Nadobna Pasqualina (1655; "Fair Pasqualina") and Dafnis w drzewo bobkowe przemienieła się (1638; "Daphne Transformed into a Laurel Tree").

twayblade, any member of either of two genera of orchids, family Orchidaceae: Liparis and Listera. Liparis, also known as false twayblade, with about 200 species, is distributed worldwide. Each plant has broad, paired leaves, and most have dull-coloured, purplish flowers borne in a terminal spike. The flowers of the large twayblade (Liparis lilifolia) of eastern North America have thin, slender side petals and a broad lip. The fen orchid (Liparis loeselii) is a similar species found in northern Eurasia.

Listera, with about 30 north-temperate species, also is characterized by broad, paired leaves. Each flower has a large, forked lip. The common twayblade (Listera ovata) found throughout Eurasia has small green flowers and broad, egg-shaped leaves. All species of Listera have an unusual pollination mechanism by which pollen grains are glued to a visiting insect with an explosive force. The

Large twayblade (*Liparis lilifolia*)
Hugh Spencer

frightened insect then leaves and transfers the pollen to the next flower it visits. A common twayblade usually does not flower until its 10th year but may reproduce vegetatively by means of buds along the roots. The lesser twayblade (*Listera cordata*), also widespread in Eurasia, has heart-shaped leaves.

tweed, any of several fabrics of medium-to-heavy weight, rough in surface texture, and produced in a great variety of colour and weave effects largely determined by the place of manufacture. The descriptions "Scottish," "Welsh," "Cheviot," "Saxony," "Harris," "Yorkshire," "Donegal," and "West of England," for example, cover an extremely wide range of woolen and mixture cloths. Most tweeds are made entirely of wool; but an increasing number consist of blends of wool and cotton, wool and rayon, or wool and manmade fibres, each of which imparts a special property.

The word tweed was not derived from the River Tweed, although the cloth was manufactured in the Tweed Valley. Tweed is usually made by a variation of the basic twill weave,

and the old Scottish name for twill was tweel. The name tweed is attributed to a mistake on the part of a London clerk who in 1826, when drafting an order or invoice for tweels, accidentally wrote tweeds, a name that quickly established itself.

The wide range of modified twill weaves in use includes herringbones, diamonds, chevrons, cross twills, and checks, along with an even more extensive variety of stripe, marl, fleck, and mingled heather effects in many tones and hues. The counts of the yarns and the twist and colours employed vary greatly, as do the ends and picks in warp and weft, or filling. Most tweeds are colour woven from dyed yarns, but some are piece-dyed. Technical advances in dyeing raw stock, yarns, and fabrics, together with new techniques in finishing, have resulted in a wide variety of stable and hard-wearing apparel cloths made in different weights.

Tweed, River, river in southern Scotland, flowing eastward for 97 miles (156 km) and forming for 17 miles (27 km) the border with England, in which country lie the last 2 miles (3 km) of its course. The river rises at Tweed's Wells and flows northeast in a flatfloored valley; it receives among its tributaries Talla Water, now dammed for Edinburgh's water supply, and the Lyne. Flowing eastward through the Southern Uplands in a gorgelike valley to Melrose, the Tweed receives the Leithen, Gala, and the Ettrick-Yarrow system. From Melrose the Tweed flows through the broad agricultural basin of the Merse and at Kelso is joined by the Teviot. It empties into the North Sea at Berwick-upon-Tweed in England. The towns of the Tweed valley are woolen manufacturing and market towns, with several famous abbeys.

Tweed, William Marcy, byname Boss TWEED (b. April 3, 1823, New York, N.Y., U.S.—d. April 12, 1878, New York, N.Y.), American politician who, with his "Tweed ring" cronies, systematically plundered New York City of sums estimated at between \$30,000,000 and \$200,000,000.

Boss Tweed

By courtesy of the Library of Congress, Washington, D.C.

Tweed was a bookkeeper and a volunteer fireman when elected alderman on his second try in 1851, and the following year he was also elected to a term in Congress. He grad-ually strengthened his position in Tammany Hall (the executive committee of New York City's Democratic Party organization), and in 1856 he was elected to a new, bipartisan city board of supervisors, after which he held other important positions in the city government. Meanwhile he managed to have his cronies named to other key city and county posts, thus establishing what became the Tweed ring. By 1860 he headed Tammany Hall's general committee and thus controlled the Democratic Party's nominations to all city positions. In that same year he opened a law office through which he received large fees from various corporations for his "legal services." He became a state senator in 1868 and also became grand sachem (principal leader) of Tammany Hall that same year. Tweed dominated the Democratic Party in both the city and state and had his candidates elected mayor of New York City, governor, and speaker of the state assembly. In 1870 he forced the passage of a new city charter creating a board of audit by means of which he and his associates could control the city treasury. The Tweed ring then proceeded to milk the city through such devices as faked leases, padded bills, false vouchers, unnecessary repairs, and overpriced goods and services bought from suppliers controlled by the ring. Vote fraud at elections was rampant.

Toppling Tweed became the prime goal of a growing reform movement. Exposed at last by *The New York Times*, the satiric cartoons of Thomas Nast in *Harper's Weekly*, and the efforts of a reform lawyer, Samuel J. Tilden, Tweed was tried on charges of forgery and larceny. He was convicted and sentenced to prison (1873) but was released in 1875. Rearrested on a civil charge, he was convicted and imprisoned, but he escaped to Cuba and then to Spain. Again arrested and extradited to the United States, he was confined again to jail in New York City, where he died.

Tweed River, principal river of the North Coast district, New South Wales, Australia, usually associated with the Clarence and Richmond rivers. Of its three arms, two rise in the McPherson Range and the third in the Tweed Range of the Eastern Highlands. The river flows 50 miles (80 km) east past Murwillumbah and Condong to enter the Pacific Ocean at Tweed Heads. Visited in 1823 by the explorer John Oxley, the river was named after the River Tweed of Scotland. Its valley yields sugarcane, bananas, and dairy products.

Tweeddale, district, Borders (q.v.) region, southern Scotland; created by the reorganization of 1975, it constitutes the former county of Peeblesshire (q.v.), or Peebles. The district, with an area of 347 square miles (899 square km), lies in the Southern Uplands and is drained by the River Tweed and its tributaries. Sheep are raised on the moors, and the district's limited agricultural land, along the valley floors, grows barley and fodder crops and pastures beef cattle. Peebles, the seat of the district authority, Innerleithen, and Walkerburn produce woolen goods and knitwear. Trout and salmon fishing and moorland scenery attract tourists. Pop. (1987 est.) 14,734.

Tweeddale, John Hay, 2nd Earl and 1st Marquess of, EARL OF GIFFORD, VISCOUNT OF WALDEN, LORD HAY OF YESTER (b. c. Aug. 13, 1625, Yester, East Lothian, Scot.—d. Aug. 11, 1697, Edinburgh), British statesman and lord high chancellor of Scotland from 1692 to 1696.

Scotland from 1692 to 1696.

During the English Civil Wars he initially supported Charles I but then joined the Covenanters and fought in the Scottish ranks against the king at Marston Moor (July 1644). He fought with the Royalist section of the Covenanters at Preston (August 1648) and succeeded to his father's earldom in 1653. Nevertheless, he was a member of the Commonwealth Parliaments of 1656 and 1659.

Tweeddale was appointed a member of the Privy Council for Scotland soon after the Restoration of Charles II. While a policy of leniency toward the Covenanters prevailed (1667–74), Tweeddale took a prominent role in Scottish affairs. With the hardening of the official attitude in 1674, he was dismissed. In 1680 he returned to an office in the Treasury, which he held during the reign of James VII (James II of England).

Tweeddale supported William III and became a privy councillor (1689), lord high chancellor of Scotland (1692), and Marquess of Tweeddale (1694). During William's absence abroad, Tweeddale acted as lord high commissioner for Scotland. In this position he

formally assented (1695) to the act establishing the Darién Company, which unsuccessfully attempted to establish a colony on the Isthmus of Panama. For this action he was dismissed from office when William returned to England in 1696.

Twelve, The, also called THE TWELVE PROPHETS, or THE MINOR PROPHETS, book of the Hebrew Bible that contains the books of 12 minor prophets: Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, and Malachi. In most other versions of the Old Testament, each of these 12 is treated as a separate book (e.g., the Book of Hosea), but in the Hebrew Bible they are consolidated into one book that is the last of eight books in the second division of the Hebrew Bible, known as Nevi'im (q.v.), or The Prophets. See Old Testament.

Twelve Patriarchs, Testaments of the, pseudepigraphal work (not in any biblical canon) purporting to present the last words of the 12 sons of Jacob—founders of the 12 tribes of Israel. The book is an imitation of the "blessing of Jacob" described in chapter 49 of Genesis, but, unlike its model, this work contains lengthy moral exhortations based on the supposed sin or virtue of each patriarch.

Each essay includes an autobiography of the patriarch, including many elements of folk history (Haggada); an admonitory passage warning against the specific vice of the patriarch; and a prophecy, sometimes with apocalyptic overtones, explaining the fate of the patriarch's sons in the Last Age. In general, the admonitions are based on a belief in resurrection and the Last Judgment, and the tone of the work is decidedly pietistic and ascetic.

In its extant form, the book is a Jewish work, probably of the late 2nd century AD, with Christian interpolations. It was written in Greek, and Semitic originals are known for only two of the testaments, those of Levi and Naphtali. The *Testaments* are connected historically and ideologically with the Essene sect at Qumrān and their Dead Sea Scrolls, among which the fragments of the testaments of Levi (in Aramaic) and Naphtali (in Hebrew) were found. Further, many parallels exist between the *Testaments* and the *Damascus Document* (q.v.) produced by the Essenes, though there are also important differences.

The work is extant in several Greek manuscripts and in Armenian and Slavic translations.

Twelve Tables, Law of the, Latin LEX XII TABULARUM, the earliest codification of ancient Roman law, traditionally dated 451-450 BC.

The Twelve Tables were allegedly written at the demand of the plebeians, who at law felt hampered by the fact that court judgments were rendered according to unwritten custom preserved within a narrow group of learned patricians. They managed to have a commission of 10 (decemvirs) appointed to draw up a code. The decemvirs began work in 451, and in 450 the code was posted in the Forum.

The Twelve Tables were in no sense a reform or a liberalizing of old custom. They recognized the prerogatives of the patrician class and of the patriarchal family, the validity of enslavement for unpaid debt, and the interference of religious custom in civil cases. That they reveal a remarkable liberality for their time with respect to testamentary rights and contracts is probably due not to any alteration brought in by the decemvirs but rather to the progress that had been made in commercial customs in Rome in an era of prosperity and vigorous trade.

Only random quotations from the Twelve Tables are extant, so that much knowledge of their contents derives from references in later juridical writings. Romans venerated the Twelve Tables as a prime legal source.

12-tone music, large body of music, written roughly since World War I, that uses the so-called 12-tone method or technique of composition. The Austrian-born composer Arnold Schoenberg is credited with the invention of this technique, although other composers (e.g., the American composer Charles Ives and the Austrian Josef Hauer) anticipated Schoenberg's invention by writing music that in a few respects was similar technically to his 12-tone music.

Between 1912 and 1922 Schoenberg came to realize that he was searching for a new method of composition that would provide a new basis for musical structure to replace the old basis of tonality, which he felt was being stretched and distorted too much to remain a unifying structural principle. Instead of using 1 or 2 tones as main points of focus for an entire composition (as key centres in tonal music), Schoenberg suggested using all 12 tones "related only to one another." In such a system, unlike tonality, no notes would predominate as focal points, nor would any hierarchy of importance be assigned to the individual tones.

The new unifying principle in composition would then arise from the particular order given to a collection of the 12 tones, an order that would be different for each composition. The basic order for any one composition came to be known as its basic set, its 12-tone row, or its 12-tone series, all of which terms are synonymous. The basic set for Schoenberg's Wind Quintet (1924) is Eb-G-A-B-C#-C-Bb-D-E-F#-Ab-F; for his String Quartet No. 4 (1936) it is D-C#-A-Bb-F-Eb-E-C-Ab-G-F#-B.

The basic set is not a theme, for it has no specific shape, rhythm, or loudness. It is a backbone, a musical idea that permeates the composition in which it is used. Because of the various principles of composing and manipulating the basic set recognized by Schoenberg and others, it is not often possible nor even desirable to hear the basic set when the composition is performed. This situation has led many people to attack Schoenberg's method as unmusical and as mathematical madness. Such views seem unjustifiable, because, as Schoenberg pointed out, his method specifies only a tiny fraction of the total nature of a composition-certainly no more than composing with tonality specifies.

Schoenberg's best-known pupils were the Austrian composers Anton von Webern and Alban Berg, each of whom wrote 12-tone music. Neither used the idea of the basic set in the same manner as Schoenberg did, and their music differs greatly in many respects from each other's and from Schoenberg's. Other important composers include the Russian-born Igor Stravinsky, the American Roger Sessions, the Austrian-born Ernst Krenek, the Italian Luigi Dallapiccola, and the German Hans Werner Henze. Many, such as Stravinsky (who had earlier criticized the approach severely) and Sessions, began writing 12-tone music after composing much non-12-tone music.

Some composers also have used some of the notions behind the basic set while simultaneously writing tonal music; among them are Schoenberg himself, the Austrian-born Ernst Toch, the American Walter Piston, and the Russian Dmitry Shostakovich. The American composer Benjamin Johnston combined principles of 12-tone music with microtonality (use of intervals smaller than whole tones or semitones). There are no sufficient analytical techniques used by musicians in understanding 12-tone music, which is partly why it remains not very well understood as a total musical phenomenon by composers, performers, and listeners alike. Twelve-tone music is an example of serialism (q.v.) in music.

Twelve Tribes of Israel, in the Old Testament, the Hebrew people who, after the death

of Moses, took possession of the Promised Land of Canaan under the leadership of Joshua. Because the tribes were named after sons or grandsons of Jacob (whose name was changed to Israel by God), the Hebrew people became known as Israelites.

Jacob's first wife, Leah, bore him six sons: Reuben, Simeon, Levi, Judah, Issachar, and Zebulun. With the exception of Levi, each was the father of a tribe. Two other tribes, Gad and Asher, were named after sons born to Jacob and Zilpah, Leah's maidservant. Two additional tribes, Dan and Naphtali, were named after sons of Jacob born of Bilhah, the maidservant of Rachel, Jacob's second wife. Rachel bore Jacob two sons, Joseph and Benjamin. Though a tribe was named after Benjamin, none bore the name of Joseph. Two tribes, however, were named after Joseph's sons, Manasseh and Ephraim. The 10 tribes that settled in northern Palestine became known as the Ten Lost Tribes of Israel (q.v.).

Twelvers (Islām): see Ithnā 'Asharīyah.

Twentieth Century-Fox Film Corporation, major American motion-picture studio, formed in 1935 by the merger of Joseph Schenck's Twentieth Century Pictures and William Fox's Fox Film Corporation. In 1927 Fox had secured the patents to a German sound-on-film process and later that year had introduced the first sound newsreel, Fox-Movietone News. He failed, however, in his attempt to dominate the sound-film industry.

From 1935 to 1971 (except for 1956-61), Darryl F. Zanuck was the controlling executive of the corporation, producing such great films as Lloyd's London (1936), The Grapes of Wrath (1940), and Gentlemen's Agreement (1947). In 1953, Twentieth Century-Fox introduced CinemaScope, the process by which a picture is projected on a screen two and a half times as wide as it is high; the first film was The Robe, an adaptation of Lloyd C. Douglas' best seller. It began the trend toward the use of wide screens in motion-picture theatres. Later big box-office successes included The King and I (1956), South Pacific (1958), The Sound of Music (1965), The Towering Inferno (1975), and the most profitable film in the history of the industry to that time, Star Wars (1977).

In 1981 the corporation was bought by Marvin Davis and his family, who in turn, in the course of 1985, sold it to the international publisher Rupert Murdoch. Murdoch consolidated his American film and television companies under a holding company, Fox, Inc.

Twentieth Congress of the Communist Party of the Soviet Union (Feb. 14-25, 1956), event notable as the first stage of First Secretary Nikita S. Khrushchev's program to repudiate Stalinism in the Soviet Union.

Highlighting the Twentieth Congress were two addresses given by Khrushchev: the famous secret speech (q.v.) denouncing Stalin (February 24–25), and his Report of the Central Committee to the Congress (February 14). The Report, nearly as important a document as the secret speech, announced a new line in Soviet foreign policy. Rejecting the notion that war between East and West was "fa-talistically inevitable," Khrushchev declared that "the Leninist principle of coexistence of states with different social systems" was the basis of the foreign policy of the U.S.S.R. Khrushchev also used the Twentieth Congress to consolidate his leadership by promoting persons loyal to him to high party office. The congress newly elected 40 percent of the full and candidate members of the Central Committee, and five new candidate members were added to the Presidium. Thus, by the end of the Congress, Khrushchev had successfully launched his drive to wrest control of the party from the Stalinist old guard and to discredit the excesses of Stalin's rule.

Twenty, The Society of the (art): see Vingt, Les.

Twenty-five Articles of Religion, creed prepared by John Wesley, founder of Methodism, for the Methodist church in America. The creed was accepted at the conference in Baltimore, Md., in 1784, when the Methodist Episcopal Church was formally organized.

Essentially an abridgment of the Thirty-nine Articles of the Church of England, the Twenty-five Articles excluded references to specifically English situations and went beyond the original in excluding the strict Calvinist interpretation of predestination, adopting a more general Lutheran view. In general, Wesley simplified and liberalized the Church of England creed. His own Arminian (based on the views of the 17th-century Dutch Reformed theologian Arminius) beliefs (i.e., that man can by his own will accept or reject divine grace) were not explicitly stated in this creed.

Twenty-four Parganas, district, West Bengal state, northeastern India, occupying the southwestern corner of the Ganges Delta ex-

Lift irrigation in Twenty-four Parganas district, West Bengal, India

tending along the east bank of the Hooghly River. Its area of 5,458 sq mi (14,136 sq km) consists of one vast plain sloping gently seaward. It derives its name from the number of parganas, or revenue districts, ceded to the British East India Company in 1757 by Mīr Ja'far, nawab of Bengal. The south is heavily forested near the coast and intersected by large tidal rivers, the Hooghly and Ichāmati being the most important. The north is a land of dying riverbeds, characteristic of the upper delta of central Bengal. Agriculture in the low, swampy region is regulated by the seasonal distribution of rainfall. Rice, jute, sugarcane, legumes, mustard, and potatoes are the chief crops. An industrialized area extends along the Hooghly from Budge Budge to the district's northern limits. Headquartered at Alipore, the original district was enlarged in 1947 by the incorporation of the southwestern portion of Jessore district, the main portion being transferred to East Pakistan (now Bangladesh). Pop. (1981) 10,739,439.

21-centimetre radiation, electromagnetic radiation of radio wavelength emitted by cold, neutral, interstellar hydrogen atoms. The hydrogen atom is composed of a positively charged particle, the proton, and a negatively charged particle, the electron. These particles can be considered as spinning around their own axes of rotation. When the spins of the two particles are antiparallel, then the atom is in its lowest energy state. When the spins are parallel, the atom has a tiny amount of extra energy. In the very cold space between the stars, the interstellar hydrogen atoms are at a state of lowest possible energy. Collisions between particles, however, can at times excite some atoms (which makes the spin of the particles parallel), giving them a tiny amount of energy. According to the rules of quantum mechanics, such atoms radiate their acquired energy in the form of low-energy photons that correspond to a wavelength of 21 centimetres, or a frequency of 1,420 megacycles. This radio radiation was theoretically predicted by the Dutch astronomer H.C. van de Hulst soon after the end of World War II and was experimentally detected by Harold Ewen at Harvard University in 1951. Since that time, 21-centimetre hydrogen emission has come to play a vital role in the study of the Milky Way Galaxy, because it readily penetrates the clouds of interstellar dust particles that obstruct optical observations deep into the galactic centre.

Twenty-one Demands (Jan. 18, 1915), claims made by the Japanese government to special privileges in China during World War I. The major European powers, which already enjoyed similar privileges in China, could not oppose Japan's move because of their involvement in the war. On May 7 Japan delivered an ultimatum, to which the Chinese president, Yüan Shih-k'ai, capitulated by signing a series of Sino-Japanese agreements on May 25.

The demands called for confirmation of Japan's railway and mining claims in Shantung Province; granting of special concessions in Manchuria; Sino-Japanese control of the Han-Yeh-P'ing mining base in central China; access to harbours, bays, and islands along China's coast; and Japanese control, through advisers, of Chinese financial, political, and police affairs. Yüan's forced acceptance of all but the last point greatly increased anti-Japanese feeling in China.

Twenty-six, dice game popular in the United States Midwest from the 1930s through the 1950s, in which a player selects a number from 1 to 6 and then casts 10 dice 13 times, attempting to throw the chosen number 26 times or more, exactly 13, or fewer than 10.

Twenty-six was played mostly in taverns and at store counters, with the house paying off winners in drinks or merchandise. Local and federal antigambling drives largely closed the game down.

26th of July Movement, Spanish Movimiento 26 De Julio, revolutionary movement led by Fidel Castro that overthrew the regime of Fulgencio Batista in Cuba (1959). Its name commemorated an attack on the Santiago army barracks on July 26, 1953. The movement began formally in 1955 when Castro went to Mexico to form a disciplined guerrilla force. The leaders of the movement remaining in Cuba to carry out sabotage and political activities were Frank País, Armando Hart, and Enrique Oltuski. At this time the movement espoused a reform program that included distribution of land to peasants, nationalization of public services, industrialization, and mass education.

In early 1957, with Castro back in Cuba fighting in the Sierra Maestra, "Civic Resistance" groups were organized in the cities, and numerous middle-class and professional persons gravitated toward Castro. In 1958 the movement joined in a "Junta of Unity" with most other groups opposing Batista. After Castro's victory, the 26th of July Movement was integrated into the Organizaciones Revolucionarias Integradas in 1961.

twice-born (Hinduism): see dvija.

twilight glow, weak, widespread, and relatively steady glow from the sky that is observed around twilight; it is part of the overall phenomenon called airglow (q.v.).

twill, one of the three basic textile weaves, producing a fabric with a diagonal rib, ridge, or wale. In regular twill the diagonal line is repeated regularly, usually running upward from left to right at a 45° angle.

The weave can be varied in many ways, for example, by changing the direction of the twill line (as in herringbone twill) or its angle. The smallest twill is one of the most popular weaves in men's wear.

twin, either of two young who are simultaneously born from one mother. Twinning, common in many animals, is of two biological kinds: the one-egg (monozygotic), or identical, type and the two-egg (dizygotic), or fraternal, type. The latter type is more usual and can be thought of simply as a litter of two. In humans, psychological studies of sets of identical twins, since they are genetically identical, have provided much otherwise unobtainable information on the relative effects of genetic endowment and environment. See also multiple birth.

Twin Cities (Minnesota, U.S.): see Minneapolis; Saint Paul.

Twin Falls, city, seat (1907) of Twin Falls County, south central Idaho, U.S. Located close to Twin Falls (65 ft [20 m] high), Shoshone Falls (212 ft), and Auger Falls (140 ft) of the Snake River, the city is adjacent to a spectacular canyon that bisects the broad, arid river plains. The community, established in 1904, grew up almost overnight with the coming of irrigation and a Union Pacific branch railway. It is primarily an agriculture, trading, and supply centre, but there has been some industrial development, including plastics, hosiery, and farm machinery manufacturing. The (junior) College of Southern Idaho (1964) is located there, as is the headquarters of the Minidoka Division of the Sawtooth National Forest. Inc. village, 1905; city, 1907. Pop. (1980) 26,209.

twin wire process, in papermaking, modification of the Fourdrinier process using two wire mesh belts instead of one to form the pulp into paper. See Fourdrinier machine.

twinflower (Linnaea borealis), evergreen, creeping shrub of the family Caprifoliaceae, native to moist pinelands or cold bogs in

Twinflower (Linnaea borealis)
John Kohout from Root Resources—EB Inc

northern regions of both hemispheres. It is named for the paired, nodding, bell-like white or pink flowers borne above a mat of small, roundish leaves.

The fragrant flowers have five green sepals, five petals, and four stamens in two pairs of different length. The *americana* variety has more tubular flowers, and the *longiflora* variety has larger leaves and corolla.

Twining, Nathan F(arragut) (b. Oct. 11, 1897, Monroe, Wis., U.S.—d. March 29, 1982, Lackland Air Force Base, near San Antonio, Texas), U.S. Air Force officer who played a large part in directing the air war against Japan during World War II.

A 1918 graduate of the U.S. Military

Twining
By courtesy of the U.S. Army

Academy, West Point, N.Y., Twining became a U.S. army pilot in 1924 and gained further experience thereafter as a combat unit commander and as a staff and engineering officer.

As commander of the 13th Air Force in the South Pacific (spring 1943), Twining directed strategic air assaults against stubbornly held Japanese positions in the Solomon Islands (Guadalcanal and Bougainville) and New Guinea. His pilots were so successful in downing enemy planes that they dubbed their combat missions "turkey shoots." Later (1944–45), from Italy he led the 15th Air Force in the strategic bombing campaign against Germany and the Balkans. In the closing months of the war he returned to the Pacific to command the 20th Air Force B-29s that were assaulting Japan from the Mariana Islands.

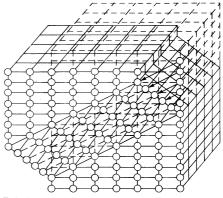

One of the most widely experienced and best qualified of U.S. air commanders, Twining became chief of staff of the U.S. Air Force in 1953, contributing much toward making it an almost all-jet combat force with a high atomic-weapons capability. He served as chairman of the Joint Chiefs of Staff from 1957 to 1960, and played a major role in developing an interventionist U.S. foreign policy.

twinning, in crystallography, regular intergrowth of two or more crystal grains so that each grain is a reflected image of and/or rotated with its neighbour. Other grains added to the twin form crystals that often appear symmetrically joined, sometimes in a starlike or crosslike shape.

Twinning often occurs from the beginning of crystal growth. The individuals that comprise a twin have atomic structures with different orientations, but they must have certain common planes or directions. They must fit simply and must be derived from each other by a simple movement.

There are several kinds of twin crystals. Penetration twins are complete crystals that pass through one another and often share the centre of their axial systems.

Some geometric relations concerning crystal twinning can be set down. Twinning results

Twinning in a crystal

From Stephen M. Edelglass, *Engineering Materials Science*, Copyright © 1966, the Ronald Press Company, New York

in reflected images along a common twinning plane, repetitions rotated about a common twinning axis, or both. Such twinning planes and axes have simple relations to the crystallographic axes of the crystal and are governed by some fundamental laws; e.g., because the resulting twin would be identical to the original crystal, no plane of symmetry in the simple crystal may become a twinning plane, and no axis of 2-, 4-, or 6-fold symmetry may become a twinning axis; also, twinned crystals in classes with a centre of symmetry will have a twinning axis perpendicular to a twinning plane, but, lacking a centre of symmetry, a twinning axis or plane may occur independently.

Twins (constellation): see Gemini.

twist, vigorous dance that developed in the early 1960s in the United States and became internationally popular after its adoption in fashionable circles. The twist's characteristic hip and leg movements have been described as "drying the buttocks with an imaginary towel while grinding out an imaginary cigarette with one foot." Partners synchronized body positions and gyrations but never touched. Dances evolved from the twist—such as the frug, the ierk, and the watusi-were invariably performed by shaking the pelvis. In these dances partners only sometimes coordinated their movements. Suggested precursors of the twist include the shimmy and the black bottom, and a song popular before 1910 included the lines "Mama, mama, where is sis? / Down on the levee doin' the double twis'."

twisted moss: see screw moss.

twisting, in yarn and rope production, process that binds fibres or yarns together in a continuous strand, accomplished in spinning or playing operations. The direction of the twist may be to the right, described as Z twist, or to the left, described as S twist.

Single yarn is formed by twisting fibres or filaments in one direction. Ply yarn is made by twisting two or more single yarns together, usually by combining singles twisted in one direction with a ply twist in the opposite direction. Twine, cord, or rope can be made with a cable twist, each twist in the opposite direction of the preceding twist (S/Z/S or Z/ S/Z), or with a hawser twist, the single yarns and the first ply twist in one direction and the second ply twist in the opposite direction (S/S/Z or Z/Z/S). The number of turns per unit of length in a yarn affects the appearance and durability of fabric made from that yarn. Yarns used for soft-surfaced fabrics have less twist than those used for smooth-surfaced fabrics. Yarns made into crepe fabrics have maximum twist.

two-clawed hunting spider: see sac spider.

two-field system, basis of agricultural organization in Europe and the Middle East in early times. Arable land was divided into two fields or groups of fields; one group was planted to wheat, barley, or rye, while the other was allowed to lie fallow until the next planting season to recover its fertility. After cropping the first group of fields was turned to fallow, with the livestock permitted to graze on the stubble and enrich the soil with their droppings. Beginning about the 8th century, between the Loire and the Rhine rivers, the two-field system gave way to the more sophisticated three-field system (q.v.).

two-horned sculpin, any fish of the family Icelidae (order Scorpaeniformes). *See* sculpin.

two natures of Christ (theological doctrine): *see* Christ, two natures of.

two-party system, political system in which the electorate gives its votes largely to only two major parties and in which one or the other party can win a majority in the legislature. The United States is the classic example of a nation with a two-party system. Contrasts between two-party and multiparty systems are often exaggerated. Within each major party in the United States, the Republicans and the Democrats, many factions are struggling for power. Presence of divergent interests under a single party canopy masks a process of struggle and compromise that under a multiparty system is out in the open.

Major influences favourable to the two-party system are the use of single-member districts for the election of representatives, the presidential system, and the absence of proportional representation. In Great Britain and the United States members of the national representative assemblies are chosen from single-member districts, and the candidate polling the largest number of votes is the winner. Such an electoral system compels a party to strive for a majority of the votes in a district or other electoral area. Usually only two fairly evenly matched parties may successfully compete for office in a single-member district, and a third party suffers recurring defeat unless it can swallow up one of the other parties. Parties do not thrive under the certainty of defeat. A third party may have a substantial popular following and yet capture few seats in the representative body. With, for instance, 20 percent of the popular vote spread evenly over an entire country, such a party would not win a single seat. (Under full proportional representation, it would be entitled to 20 percent of the seats in a legislative body.) The rise of the Labour Party in Great Britain, for example, virtually deprived the Liberal Party of parliamentary seats even when it had a substantial popular following. In 1981, on the formation of the Social Democratic Party, Britain moved toward what looked like a three-party system, especially after the SDP and Liberal Party formed an alliance.

In addition to the single-member-district system, in the United States the presidential system induces parties to seek majority support. No fractional party can elect its presidential candidate and third parties in national politics have proved to be protest movements more than serious electoral enterprises.

The two-party system is said to promote governmental stability because a single party can win a majority in the parliament and govern. In a multiparty country, on the other hand, the formation of a government depends on the maintenance of a coalition of parties with enough total strength to form a parliamentary majority. The weakness of the ties that bind the coalition may threaten the continuance of a cabinet in power. The stability shown by the government of the United States has not been entirely due to its party system, it has been argued, but has been promoted also by the fixed tenure and strong constitutional position of the president.

The two-party system moderates the animosities of political strife. To appeal for support of a majority of voters a party must present a program sympathetic to the desires of most of the politically active elements of the population. In the formulation of such a program an effort must be made to reconcile the conflicting interests of different sectors of the population. This enables the party, if expedient, to resist demands that it commit itself without reservation to the policies urged by any particular extremist element. In effect, the party is a coalition for the purpose of campaigning for office. In Great Britain and Canada differences in program and in composition between the two major parties have been perhaps greater than in the United States. Nevertheless, in all of these countries a broad area of agreement exists among the leading parties. With two major parties of similar views and of approximately equal strength competing for control of a government it is possible for governmental control to alternate

between the parties without shifts in policy so radical as to incite minorities to resistance.

Two Sicilies, Kingdom of the, name sometimes given to the state that united the southern part of the Italian peninsula with the island of Sicily between the mid-15th and the mid-19th centuries. (For a brief history of the state, see Naples, Kingdom of.) United by the Normans in the 11th century, the two areas were divided in 1282 between the Angevin (French) dynasty on the mainland and the Aragonese (Spanish) dynasty on the island, both of which claimed the title of king of Sicily. In 1443 Alfonso V of Aragon, on reuniting the two portions, took the title of rex Utriusque Siciliae (king of the Two Sicilies). This title was sometimes used during the Spanish and Bourbon rule of the two areas, from the 16th to the 19th century; it became official in 1815, when the administration of both areas was combined, and Sicily lost its autonomy.

two-step, ballroom dance appearing in about 1890 in the United States. Its origins are unclear but may include the polka, galop, or waltz. The dance consists of sliding steps to the side in $\frac{2}{4}$ time. It was one source of the fox-trot, which in about 1920 overtook it in popularity, and the term two-step often refers to the fox-trot (q.v.).

Two Thousand Guineas, one of the English Classic horse races (with the Derby, the Saint Leger, the One Thousand Guineas, and the Oaks), first run in 1809. Run at Newmarket, Suffolk, the 1-mile event is open to three-year-old colts (carrying 126 pounds) and fillies (121 pounds). For winners since 1949, see Sporting Record: Horse Racing.

two-tier gold system, arrangement set up to protect international monetary reserves from the pressure of higher gold prices; under a two-tier system, monetary gold used as reserves would sell at a fixed price, and gold used as an ordinary commodity would sell at a freely fluctuating market-determined price.

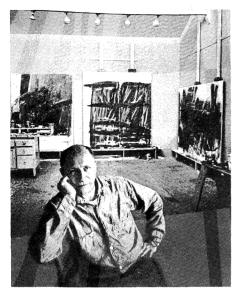

The system was formulated in an agreement reached by seven members of the London gold pool (Great Britain, West Germany, Switzerland, The Netherlands, Belgium, Italy, and the United States) on March 17, 1968. The monetary authorities agreed not to sell monetary gold on the London market or any other private gold market; the stock of officially held gold was to be maintained at the existing level and only transferred among countries in settling international debts. The governments agreed to cooperate to maintain the existing parities among their currencies and pledged not to sell gold to any country that had sold its official gold in private markets for a profit. Within weeks after the agreement had been formulated, most other countries had adhered to it.

The expectation was that the market price of gold would settle above the monetary price of \$35 an ounce, but, in fact, it fluctuated widely both above and below this price. The two-tier system lost its usefulness when the U.S. government terminated official trading in gold in August 1971; in November 1973 the system was terminated by agreement between the seven original adherents.

Tworkov, Jack (b. Aug. 15, 1900, Biała, Pol.—d. Sept. 4, 1982, Provincetown, Mass. U.S.), Polish-born U.S. painter, a leading exponent of the post-World War II Abstract Expressionist movement, whose teaching and distinctive style, characterized by gestural brushwork, greatly influenced the course of American art during the 1950s and '60s.

Tworkov immigrated to the U.S. in 1913. After getting a degree in creative writing from

Columbia University (1923), he returned to his earlier interest in painting.

Tworkov, photograph by Arnold Newman, 1960

Tworkov's early paintings reflect his deep admiration for the work of Cézanne. While working for the WPA federal arts project, however, he met the painter Willem de Kooning, who taught him to paint from his own immediate experience. After World War II he joined de Kooning and other artists, who together evolved Abstract Expressionism (q.v.).

By 1955 Tworkov revealed his mature style in works that are built up of countless diagonal strokes of paint, creating shimmering atmospheric fields of colour that completely obliterate all references to the objects or scenes that inspired them. Later he replaced the multitude of flickering lines with broad strokes; these forceful compositions, intricately balanced chromatically and architectonically, culminated in the gridlike format of "Variables" (1963; Leo Castelli Gallery, New York City). In the late 1960s the grid work became literal in the "Crossfield" series (begun 1968); in these, Tworkov superimposed a network of ruled lines onto an overall field of widely spaced strokes "drawn" in paint. The diagrammatic lines emphasized and organized the surface of the canvas while allowing him to retain his free gestural line.

From 1963 to 1969 he was chairman of the department of art at Yale University.

Twysden, Sir Roger (b. Aug. 21, 1597, East Peckham, Kent, Eng.—d. June 27, 1672, East Peckham), English political pamphleteer and constitutional historian who is noted for his work on the development of English law and constitutional government.

Twysden was educated at Emmanuel College, Cambridge; he was knighted in 1620 and served in Parliament in 1625 and 1626. He became a county justice of the peace in 1636. At the outbreak of the Civil War between Charles I and Parliament in 1642, he participated in the writing of a petition stating grievances against the King, Parliament, and the ecclesiastical authorities. He was imprisoned from July to September of that year for anti-parliamentary activities, including his defense of liberties stemming from the Magna Carta. In June 1643 he attempted to escape to France but was recognized and again imprisoned. During his detention he wrote The Laws of Henry I (1645) and began a study of parliamentary history, completed in 1655 as Certaine Considerations upon the Government of England, his major work and one of the first treatises dealing with the historical roots of English constitutional law and history. Released after 1647, he continued both his research of ancient records in London and his petitioning of Parliament on various issues throughout the 1650s. After the restoration of the monarchy in 1660, he was again made a justice of the peace and remained active in public affairs until shortly before his death.

In 1652 Twysden wrote Historiae Anglicanae Scriptores X, a compilation of 10 early English chronicles and histories that is a valuable source of medieval material. In 1657 he wrote An Historical Vindication of the Church of England, an examination of the Reformation in its historical context from early resistance to the authority of Rome until the separation of the English royal house from Roman dictates. He also composed an autobiography, An Historical Narrative of the Two Houses of Parliament..., which presents his personal experiences with Parliament (unpublished until 1858-61).

Tyagaraja (b. 1767, Tamilnad, India—d. 1847), Indian composer renowned in southern India for his Telugu kīrtanas and rāgas (devotional songs). These songs were mostly in praise of Rāma, who, like Krishna, was believed to be an incarnation of the god Vishnu. Tyagaraja became a devotee of Vaisnava at an early age and is regarded as an exponent of gāna-mārga-i.e., salvation through devotional music.

Tyard, Pontus de (b. c. 1522, Bissy-sur-Fley, Burgundy—d. Sept. 23, 1605, Bragny-sur-Saône), Burgundian poet, member of the literary circle known as La Pléiade, forthright theorist, and popularizer of Renaissance learning for the elife.

Tyard, engraving

Tyard was seigneur (lord) of Bissy-sur-Fley and an associate of the Lyonese poets, especially Maurice Scève. In 1551 he translated León Hebreo's Dialoghi di amore, the breviary of 16th-century philosophic lovers. His lyrical Erreurs amoureuses (1549), which include one of the first French sonnet sequences, also revived the sestina in France. They were augmented in successive editions, as was his important prose work, Discours philosophiques, a Neoplatonic encyclopaedia finally completed in 1587. Its first treatise, the Solitaire premier (1552), complements Joachim du Bellay's Défense et illustration de la langue française (1549), which expounded the theories on poetic diction and language reform of La Pléiade. In 1578 Tyard was given the bishopric of Chalon-sur-Saône, from which he retired in 1594.

In his enthusiasm for enriching the language and adapting classic imagery and genre, Tyard shared the contempt for the masses felt by his associates. In the Solitaire premier he praised the poets who decorated their verse so richly with the ornaments of antiquity that the ignorant could not comprehend them. He remarked that the purpose of the poet is not to be understood by nor to lower himself to

accommodate a popular audience still fond of medieval genres. It was this hauteur and this sense of mission without contact beyond the protective society of the court that caused La Pléiade to shine so briefly and to become within a generation as dead as the Greek poets from whom they took their name.

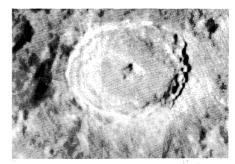

Tybald, Simon: see Simon of Sudbury.

Tyburn, small left-bank tributary of the River Thames, England, its course now wholly within London and below ground. Before it was culverted, the river traversed the West End of London from the heights of Hampstead to Westminster. After crossing Regent's Park, its former course was marked by the windings of Marylebone Lane and the dip in Piccadilly. It formerly entered the marshy floodplain of the Thames south of Green Park. One of its branches wandered toward the Thames by what became New Scotland Yard (Metropolitan Police headquarters), and another entered south of the site of the modern Houses of Parliament. Between was the small gravel island of Westminster. From the 13th century the Tyburn supplied water for London through conduits of elm trunks. Its water is now drained off by sewer. The name Tyburn became famous in connection with the Middlesex Gallows, which stood west of the stream near the modern Marble Arch at the junction of Edgware and Bayswater roads in the northeastern corner of Hyde Park. It was a place of execution from as early as 1300 until 1783. Around the gibbet were open galleries for the public.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Tyche, in Greek religion, the goddess of chance, with whom the Roman Fortuna was later identified; a capricious dispenser of good and ill fortune. The Greek poet Hesiod called her the daughter of the Titan Oceanus and his consort Tethys; other writers attributed her fatherhood to Zeus, the supreme god. She was also associated with the more beneficent Agathos Daimon, a good spirit, protective of individuals and families, and with Nemesis, who, as an abstraction, represented punishment of overprosperous man and so was believed to act as a moderating influence. She was often shown winged, wearing a crown, and bearing a sceptre and cornucopia; but she also appeared blindfolded and with various devices signifying uncertainty and risk. Among her monuments was a temple at Argos, where the legendary Palamedes is said to have dedicated to her the first set of dice, which he is supposed to have invented.

Tycho, conspicuous lunar crater constituting the centre of the most extensive system of bright rays (light-coloured surficial streaks) that dominate the southern highlands and ex-

Tycho By courtesy of Lick Observatory

tend for vast distances-more than 2,600 kilometres (1,600 miles)—across the Moon. The crater, located at 43° S and 11° W, measures 85 km (53 mi) in diameter and about 4 km (2.5 mi) deep. Because of its relatively young age, the crater is distinguished by hummocky rim deposits and seemingly fresh pools of dark flowlike materials. The U.S. lunar probe Surveyor 7, which landed on Tycho's northern flank in 1968, returned images of a very blocky rim and analyzed its aluminum-rich highland material.

Tycho Brahe (Danish astronomer): *see* Brahe, Tycho.

Tychonic system, scheme for the structure of the solar system put forward in 1583 by the Danish astronomer Tycho Brahe. He retained from the ancient Ptolemaic system the idea of Earth as a fixed centre of the universe around which the Sun and Moon revolved but held that, as in the newer system of Copernicus, all other planets revolved around the Sun. In both the Tychonic and Ptolemaic systems an outer sphere containing the fixed stars was considered to revolve every day around the Earth. The Tychonic theory explained the observed variations of phase of Venus, for which the Ptolemaic system had no explanation.

A system somewhat similar to Tycho's had been proposed in the 4th century BC by the Greek philosopher Heracleides Ponticus, who thought that at least Mercury and Venus (it is uncertain if Heracleides included other planets) went around the Sun.

Tycho's Nova, also called B CASSIOPEIAE, or NOVA CASSIOPEIAE 1572, one of the few recorded supernovae in the Milky Way Galaxy to which the solar system belongs. The Danish astronomer Tycho Brahe first observed the "new star" on Nov. 11, 1572. Other European observers claimed to have noticed it as early as the preceding August, but Tycho's precise measurements showed that it was not some relatively nearby phenomenon, such as a comet, but at the distance of the stars, and that therefore real changes could occur among them.

The supernova (violently exploding star) remained visible to the unaided eye until March 1574. It attained the apparent magnitude of Venus (about -4) and was seen by day. There is no known stellar remnant but only traces of glowing nebulosity.

Tychy, town, Katowice województwo (province), southern Poland. It lies on the Bielsko-Biała rail line on the southern edge of the Górny Śląsk (Upper Silesia) industrial district surrounded by the Pszczyna forests. The town was earliest known for its beer, having opened its first brewery in 1629, and, latterly, for the large Tychy automobile plant. In 1951 the town of Nowe (New) Tychy was begun as part of a Socialist public works project designed to accommodate 130,000 industrial workers and alleviate the crowded housing situation in the Górny Ślask industrial region. The new town was built to provide wholesome housing for the miners of Upper Silesia; it is completely residential, surrounding a cultural avenue, with Jezioro (Lake) Paprocańskie at one end and a large park at the other. The new and old towns are under one administration. Pop. (1982 est.) 171,900.

Tyddewi (Wales): see Saint David's.

Tydings-McDuffie Act (1934), also called PHILIPPINE COMMONWEALTH AND INDEPENDENCE ACT, the U.S. statute that provided for Philippine independence, to take effect on July 4, 1946, after a ten-year transitional period of Commonwealth government. The bill was signed by Pres. Franklin D. Roosevelt on March 24, 1934, and was sent to the Philippine Senate for approval. Although that body had previously rejected the similar Hare-Hawes-Cutting Act, it approved the Tydings-McDuffie Act on May 1.

Following the terms of the independence act, Filipinos elected delegates for a constitutional

convention on July 10, and Roosevelt approved the Philippine constitution on March 23, 1935. The Commonwealth government, under the presidency of Manuel Quezon, was inaugurated in November of that year. For the next ten years the Philippines remained U.S. territory. Foreign affairs, defense, and monetary matters remained under U.S. jurisdiction, but all other internal matters were in the hands of Filipinos. During the Commonwealth period, duties were to be imposed on a graduated scale, but the trade provisions were subsequently amended in 1939 in favour of the Philippines.

Tye, Christopher (b. c. 1500—d. 1573), composer and organist who was an innovator in the style of English cathedral music perfected by Thomas Tallis, William Byrd, and Orlando Gibbons.

Tye, like Tallis, bridged the mid-16th-century change of musical style and of liturgy (from Roman to Anglican) in England. Much of his Latin church music is incomplete, but two masses survive. Also surviving are 14 English anthems, psalm settings, and music for instrumental ensembles, including 19 works based on the plainsong fragment *In nomine*.

Possibly a chorister at King's College, Cambridge, in 1511, he took the bachelor of music degree there in 1536 and the doctor of music in 1545; in 1548 he was incorporated as doctor of music at Oxford. From 1541 or 1542 until 1561 he was choirmaster at Ely Cathedral. He was ordained in 1560. References to Tye in Samuel Rowley's play When You See Me, You Know Me (1605) suggest he was music tutor to Prince Edward, later Edward VI. In Tye's musical setting of his own versification of the first 14 chapters of the Acts of the Apostles, the title page refers to him as a gentleman of the Chapel Royal.

tyee: see king salmon.

Tyers, Lake, coastal lake in Gippsland, on the eastern coast of Victoria, Australia, near the northeastern end of Ninety Mile Beach. The lake consists of two main channels; the eastern half curves northeasterly into the interior for about 10 mi (16 km), and the western channel extends northwesterly about 5 mi. Lake Tyers opens into the Tasman Sea to the south. The lake was named for Charles James Tyers, a surveyor who was appointed commissioner of Crown Lands in 1842. The nearby township of Lake Tyers, together with 4,000 ac (1,600 ha), was an Aboriginal reserve until 1971, when Sir Rowan Delacombe, the governor of Victoria, assigned ownership of the property to a trust of 5,000 Aborigines. Tourists visit Lake Tyers for fishing and boat-

Tyler, city, seat (1846) of Smith County, northeastern Texas, U.S., located 99 mi (159 km) east-southeast of Dallas. Laid out in 1846 and named for Pres. John Tyler, it was a farming centre until 1930 when the East Texas oil field was discovered. A transportation focus, Tyler became the administrative headquarters for oil companies and has refineries and commercial and light industrial developments. It is also known for its flower industry, exemplified by Tyler Rose Park, its annual Texas Rose Festival (October), and Azalea and Spring Flower Trails. The city is the seat of Texas College (1894), Tyler Junior College (1926), and Texas Eastern University (1972). There are many small lakes in the vicinity, including Lake Tyler, a 2,450-ac (990-ha) reservoir impounded on Prairie and Mud creeks. Inc. city, 1907. Pop. (1980) city, 70,508; (1982 est.) metropolitan area (SMSA),

Tyler, John (b. March 29, 1790, Charles City County, Va., U.S.—d. Jan. 18, 1862, Richmond), 10th president of the United States (1841–45) who took office upon the death of

Pres. William Henry Harrison. A maverick Democrat who refused allegiance to the program of party leader Andrew Jackson, Tyler

John Tyler, portrait by George Healy, 1858; in the National Museum of American Art, Smithsonian Institution, Washington, D.C.

National Museum of American Art (formerly National Collection of Fine Arts) Smithsonian Institution, Washington, D.C.

was rejected in office by both Democrats and Whigs, and functioned as a political independent.

Born into a politically active family, young Tyler studied law and began his political career in the Virginia legislature (1811–16, 1823–25, 1839). He was elected a U.S. congressman (1817–21), state governor (1825–27), and U.S. senator (1827–36). His service in Washington was marked by consistent support of states' rights and strict construction of the Constitution. While in the Senate, Tyler—who was a slaveholder—sought to prohibit the slave trade in the District of Columbia, but opposed its abolition there without the consent of Maryland and Virginia. He voted against a protective tariff as unconstitutional, but also condemned South Carolina's attempt to nullify it.

In an unusual show of independence, Tyler resigned from the Senate in 1836 rather than yield to his state legislature's instructions to reverse his vote on Senate resolutions censuring President Jackson for removal of deposits from the Bank of the United States. This anti-Jackson stand endeared Tyler to the opposition Whig Party, which in 1840 nominated him for the vice presidency in an effort to attract Southern support. Harrison and Tyler won after a campaign that sedulously avoided the issues and stressed innocuous party insignia and the slogan "Tippecanoe and Tyler too!"

When Tyler was unexpectedly thrust into the presidency, upon President Harrison's death, his opponents proposed to recognize him as acting president only, but Tyler successfully claimed all the rights and privileges of office. When he vetoed a new national bank bill, all but one member of the Cabinet resigned; he promptly appointed new members who shared his states' rights views.

Tyler was now a president without a party; he had been repudiated by the Whigs, and the Democrats refused to recognize him. Even so, his administration accomplished a great deal. It reorganized the U.S. Navy, established the U.S. Weather Bureau, brought the Second Seminole War (1835–42) in Florida to an end, and quieted Dorr's Rebellion (1842) in Rhode Island.

In 1844 Tyler was renominated for the presidency by an irregular convention but withdrew in favour of the regular Democratic nominee, James K. Polk. He continued to take an active interest in public affairs and remained a strong champion of Southern rights and interests. On the eve of the Civil War he stood firmly against secession, however, and exerted himself to preserve the Union Early in 1861 he presided over the Washington Peace Conference—an abortive effort to compromise sectional differences. When the Senate rejected the proposed plan, he relinquished all hope of saving the Union and urged an immediate break as a delegate to the Virginia Secession Convention.

Shortly before his death Tyler was elected to the Confederate House of Representatives. A useful biography is O.P. Chitwood's *John Tyler, Champion of the Old South* (1939).

Tyler, Moses Coit (b. Aug. 2, 1835, Griswold, Conn., U.S.—d. Dec. 28, 1900, Ithaca, N.Y.), U.S. literary historian whose use of literary documents in the history of pre-Revolutionary American ideas was a major contribution to U.S. historiography.

Moses Coit Tyler, 1872

By courtesy of the Library of Congress, Washington, D.C.

The descendant of an old New England family, Tyler was taken west in 1837 by his parents, who eventually settled in Detroit in 1842. In 1852 he entered the University of Michigan, Ann Arbor, transferring a year later to Yale University. After graduating, he attended both Yale and Andover Theological seminaries. He served as a pastor in Poughkeepsie, N.Y., from 1860 to 1862, when, in disillusionment, he abandoned the ministry. The following year he travelled to England, where he lectured, wrote, and helped to found the London School of Physical Education. Returning to the United States, he became in 1867 the sole professor of English literature at the University of Michigan, working throughout the next five years to improve teaching methods and curricula for literature courses. In 1873 he left Michigan for New York to become literary editor of *The Christian Union*, a politically liberal and reformist religious weekly. The same year he wrote Manual of English Literature in England. Unhappy in the field of journalism, he returned to the University of Michigan in 1874, creating the first course on American literature and working on his projected History of American Literature, 1607-1765, 2 vol. (1878). The work was well received by scholars, particularly because of its stress on basically historical and sociopolitical

In 1881 Tyler was given the newly created chair of American history at Cornell University, Ithaca, N.Y. He was active in founding the American Historical Association in 1884 and published a biography of the U.S. partiot and orator Patrick Henry in 1886. After studying the language and university system of Germany in 1888, he began the next year the

monumental Literary History of the American Revolution, 2 vol. (1897). A trailblazing intellectual history of the period between 1763 and 1783, it concentrated on essayists, pamphleteers, and satirists, thus broadening the scope of historical research. In part influenced by the German school of cultural history, the history was the product of a full and scholarly use of the primary sources of the period. Jessica Tyler Austen's Moses Coit Tyler (1911) and Howard M. Jones's Life of Moses Coit Tyler (1933) are excellent biographies.

Tyler, Royall, original name WILLIAM CLARK TYLER (b. July 18, 1757, Boston—d. Aug. 26, 1826, Brattleboro, Vt., U.S.), U.S. lawyer, teacher, and dramatist, author of the first American comedy, *The Contrast* (1787).

After graduating from Harvard University, Tyler served in the U.S. Army and later became a lawyer. A meeting with Thomas Wignell, the star comedian of the American Company, in New York City, led him to write The Contrast, which premiered in 1787 at the John Street Theatre. A light comedy echoing the English playwrights Oliver Goldsmith and Richard Sheridan (especially The School for Scandal), The Contrast contains a Yankee character, the predecessor of many such in years to follow, that brought something native to the stage. His other plays, some no longer extant, did not equal The Contrast.

Tyler, Wat, byname of WALTER TYLER (d. June 15, 1381, London), leader of the Peasants' Revolt of 1381, the first great popular rebellion in English history; his leadership proved one of the chief factors in the success of protest against the harsh taxation of the poorer classes.

Chosen as captain by the Kentish rebels on June 7, Tyler led them in the capture of Canterbury (June 10); of the Savoy palace belonging to John of Gaunt, the King's uncle (June 13); and of London Bridge and the Tower of London (June 14). Although King Richard II promised concessions on June 14, Tyler's men refused to disarm and disband. They met with Richard on June 15 at Smithfield, where Tyler presented more radical demands, which included the confiscation of all church lands. Fighting broke out in the course of the negotiations, and Tyler was badly wounded. His followers carried him to St. Bartholomew's Hospital, from which he was later dragged away and beheaded by order of the lord mayor of London, William (later Sir William) Walworth. After Tyler's death the government quickly reasserted its authority and ended the rebellion.

tylopod, any of the pad-footed, even-toed, hoofed mammals of the suborder Tylopoda (order Artiodactyla). This group contains three extinct families and one living family, Camelidae, which contains the camels and the lamoids—the llama, alpaca, guanaco, and vicuña.

The chief distinguishing features of the tylopods are found in the structure of the feet, the bone enclosing the middle ear, the neck vertebrae, the number and form of the teeth, and the absence of horns. The living forms are cud chewers and have a rumen.

Tylor, Sir Edward Burnett (b. Oct. 2, 1832, London—d. Jan. 2, 1917, Wellington, Somerset, Eng.), English anthropologist regarded as the founder of cultural anthropology. His most important work, *Primitive Culture* (1871), influenced by Darwin's theory of biological evolution, developed the theory of an evolutionary, progressive relationship between primitive and modern cultures. Tylor was knighted in 1912.

Early life and travels. Tylor was the son of a prosperous Quaker brass founder. He attended a Quaker school until he was 16, when, barred by his faith from entering a university, he became a clerk in the family business. In 1855, at the age of 23, symptoms of tubercu-

Tylor, detail of a chalk drawing by G. Bonavia; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

losis led him to travel to America in search of health. He made his way in 1856 to Cuba, where, in Havana, he entered into conversation with a fellow Quaker who turned out to be the archaeologist and ethnologist Henry Christy. Christy was on his way to Mexico to study remnants of the ancient Toltec culture in the Valley of Mexico. The two became friends, and Christy persuaded Tylor to accompany him on his expedition.

Travelling in arduous and sometimes dangerous circumstances, they searched for the Toltec remains, Tylor under Christy's experienced direction gaining practical knowledge of archaeological and anthropological fieldwork. The expedition lasted for six months, and after its conclusion Tylor, now firmly set on the course of his life's work, returned to England. In 1858 he married and spent some time travelling in Europe before publishing the experiences of his Mexican expedition in his first book, Anahuac; or, Mexico and the Mexicans Ancient and Modern (1861). Although mainly a well-conceived travelogue, Anahuac contains elements that characterize Tylor's later work when he had become a full-fledged anthropologist: a firm grasp on factual data, a sense of cultural differences, and a curious combination of empirical methods with occasional hints of the superiority of a 19th-century Englishman in judging other cultures.

Tylor's concept of progressive development. After Anahuac, Tylor published three major works. Researches into the Early History of Mankind and the Development of Civilization (1865), which immediately established his reputation as a leading anthropologist, elaborated the thesis that cultures past and present, civilized and primitive, must be studied as parts of a single history of human thought. "The past," he wrote, "is continually needed to explain the present, and the whole to explain the part. Tylor's fame, however, is based chiefly upon the publication of *Primitive Culture*. In it he again traced a progressive development from a savage to a civilized state and pictured primitive man as an early philosopher applying his reason to explain events in the human and natural world that were beyond his control, even though his scientific ignorance produced erroneous explanations. Tylor identified, for example, the earliest form of religious belief as "animism," a belief in spiritual beings, arrived at, he assumed, by primitive attempts to explain the difference between the living body and the corpse and the separation of soul and body in dreams.

Primitive Culture also elaborated upon a theme that became a central concept in his work: the relation of the life of primitive to that of modern populations.

By long experience of the course of human society, the principle of development in culture has

become so ingrained in our philosophy that ethnologists, of whatever school, hardly doubt but that, whether by progress or degradation, savagery and civilization are connected as lower and higher stages of one formation.

Thus, "culture" should be studied not only in the artistic and spiritual achievements of civilizations but in man's technological and moral accomplishments made at all stages of his development. Tylor noted how customs and beliefs from a distant, primitive past seemed to have lived on into the modern world, and he became well-known for his examination of such "survivals," a concept that he introduced. His evolutionary view of human development was endorsed by most of his colleagues and, of course, by Charles Darwin, who had established biological evolution as the key to human development.

Assessment. In the late 19th-century political and theological controversy over the question whether all the races of mankind belonged physically and mentally to a single species, Tylor was a powerful advocate of the physical and psychological unity of all mankind. On this question, as in all anthropological disputes, he based his position on respect for empirical evidence, which he hoped would bring the standards and procedures of the natural sciences to the study of humanity.

His last book, Anthropology, an Introduction to the Study of Man and Civilization (1881), is an excellent summary of what was, late in the 19th century, known and thought in that field. Like all Tylor's work, it conveys a vast quantity of information in a lucid and energetic style.

Tylor was made a fellow of the Royal Society in 1871 and given a doctorate of civil law at the University of Oxford in 1875. Eight years later he returned to Oxford to give lectures and stayed there as keeper of the university's museum, becoming reader in anthropology in 1884 and the first professor of anthropology in 1896. He was also elected the first Gifford lecturer at Aberdeen University in 1888. He retired from active life in 1909 and died in 1917. (B.V.S.)

BIBLIOGRAPHY. R.R. Marett, Tylor (1936), a biography, also contains an account of Tylor's contribution to anthropology. G. Elliot Smith, "Edward Burnett Tylor," in H.J. and Hugh Massingham (eds.), The Great Victorians (1932), contains a biographical essay and critical assessment, particularly of Tylor's ideas on invention and the diffusion of culture. Godfrey Lienhardt, "Edward Tylor," in Timothy Raison (ed.), The Founding Fathers of Social Science (1969), is a short essay on Tylor's life and work that attempts to assess his influence in contemporary social anthropology. Anthropological Essays Presented to Edward Burnett Tylor in Honour of His 75th Birthday, Oct. 2nd 1907, with a bibliography by Barbara W. Freire Marreco (1907), is a Festschrift with essays on ethnological themes by a number of Tylor's contemporaries; the bibliography is indispensable for students of Tylor's work.

tympanic membrane, also called EARDRUM MEMBRANE, membrane in the human ear that receives sound vibrations from the outer air and transmits them to the auditory ossicles, which are tiny bones in the tympanic (middle ear) cavity. It also serves as the lateral wall of the tympanic cavity, separating it from the external auditory canal. The membrane lies across the end of the external canal and looks like a flattened cone with its tip (apex) pointed inward. The edges are attached to a ring of bone, the tympanic annulus.

Accurate diagnosis of middle-ear diseases is dependent on the appearance and mobility of the tympanic membrane, which is normally pearl gray but is sometimes tinged with pink or yellow. The drum membrane has three layers: the outer layer, continuous with the skin on the external canal; the inner layer, continuous with the mucous membrane lining the middle ear; and, between the two, a

layer of radial and circular fibres that gives the membrane its tension and stiffness. The membrane is well-supplied with blood vessels, and its sensory nerve fibres make it extremely sensitive to pain.

tympanites (animal disease): see bloat.

tympanum, plural TYMPANA, in architecture, an area, triangular or semicircular in shape, that is within an arch above a lintel. In Europe during the 11th and 12th centuries, tympana over church portals were decorated with intricate and stylized relief sculpture.

A particularly popular subject for tympanum decoration was the Last Judgment. Typically, the figure of Christ appears in the centre of the composition, dominant in size and usually enclosed in a mandorla (an oval, nimbuslike form). At his right and left are the four Evangelists, sometimes represented or accompanied by their animal symbols. To the sides, smaller figures of angels and demons weigh sins of the resurrected dead, who are ranked along the lowest and smallest section of the tympanum, directly above the lintel. Fine examples of Romanesque tympana may be seen at the abbey church of Saint-Pierre at Moissac, Fr., and at the cathedral of Saint-Lazare at Autun.

Tynan, Katherine, married name HINKSON (b. Jan. 23, 1861, Dublin—d. April 2, 1931, Wimbledon, Surrey, Eng.), Irish poet and novelist whose works are dominated by the combined influences of Catholicism and Irish patriotism.

Like the poet William Butler Yeats, she developed a deep and abiding interest in Celtic mythology. Her Collected Poems were published in 1930. A prodigious writer, she produced five autobiographical volumes: Twenty-five Years (1913), The Middle Years (1917), The Years of the Shadow (1919), The Wandering Years (1922), and Memories (1924). She also wrote more than 100 romantic novels, the best-known of which is The House in the Forest (1928).

Tyndale, James Scott, Baron: see Monmouth, James Scott, duke of.

Tyndale, William (b. c. 1490–94, Gloucestershire, Eng.—d. Oct. 6, 1536, Vilvorde, Flanders, Neth.), English biblical translator, humanist, and Protestant martyr.

Tyndale was educated at the University of Oxford and became an instructor at the University of Cambridge, where, in 1521, he fell in with a group of humanist scholars meeting at the White Horse Inn. Tyndale became convinced that the Bible alone should determine the practices and doctrines of the church and that every believer should be able to read the Bible in his own language.

After church authorities in England prevented him from translating the Bible there, he went to Germany in 1524, receiving financial support from wealthy London merchants. His New Testament translation was completed in July 1525 and printed at Cologne and, when Catholic authorities suppressed it, at Worms. The first copies reached England in 1526. Tyndale then began work on an Old Testament translation but was captured in Antwerp before it was completed; he was executed at Vilvorde in 1536.

At the time of his death, 50,000 copies of his New Testament had been printed, the first vernacular English text of any part of the Bible to be so published. Tyndale's version became the basis for most subsequent English translations, beginning with the King James Version of 1611.

Tyndall, John (b. Aug. 2, 1820, Leighlin Bridge, County Carlow, Ire.—d. Dec. 4, 1893, Hindhead, Surrey, Eng.), British physicist who demonstrated why the sky is blue.

In 1853 Tyndall was chosen professor of natural philosophy at the Royal Institution,

London, where he became a colleague and friend of Michael Faraday. His early work was concerned with the magnetic properties of crystals, but in 1859 he began investigating the ability of various gases to absorb and radiate heat. He established that humid air absorbs heat with little change in temperature, a phenomenon of meteorological importance.

Tyndall studied the diffusion of light by large molecules and dust, known as the Tyndall effect; he also performed experiments demonstrating that the sky's blue colour results from

Tyndall
BBC Hulton Picture Library

the scattering of the Sun's rays by molecules in the atmosphere, a phenomenon which was later explained theoretically by Lord Rayleigh. In 1881 he delivered the final blow to the long-held idea of spontaneous generation by proving that germ-free air does not lead to food decay. Tyndall's publications, more than 16 books and 145 papers, include Heat Considered as a Mode of Motion (1862), Six Lectures on Light (1873), and Forms of Water (1872).

Tyne River, river in northern England, flowing for 62 miles (100 km) into the North Sea below Newcastle upon Tyne. It is formed by the confluence, near Hexham, of the North Tyne, with its tributary the Rede, and the South Tyne. From Wylam the Tyne functioned as the historic county boundary be-tween Northumberland and Durham. The river crosses a coalfield and for its last 14 miles (23 km) is a tidal waterway. Since about 1850 the Tyne Improvement Commission has carried out dredging on the lower river, dock construction, and improvement of the entrance. The historic crossing is from Gateshead to Newcastle upon Tyne, 10 miles (16 km) from the mouth. The Tyne has shipped coal for at least six centuries, and its estuary is now lined with industry and large urban communities constituting the Tyne and Wear conurbation, but for most of their courses the river and its tributaries flow through unspoiled countryside. Much of the Tyne Basin, including the first section of the Roman Hadrian's Wall, lies within the Northumberland National Park.

Tyne and Wear, area in northeastern England. It covers 208 square miles (540 square km) and is bounded by Northumberland (north and west), Durham (south), and the North Sea (east). It is an urban, industrial region made up of five administrative districts: the city of Newcastle upon Tyne and the boroughs of Gateshead, North Tyneside, South Tyneside, and Sunderland. (From 1974 to 1986 Tyne and Wear had its own administrative metropolitan county council.) It is named for its two main rivers, the Tyne and the Wear.

There is some evidence of prehistoric settlement before the Roman occupation and the associated building of Hadrian's Wall (AD 122), a defensive line extending westward from what is now Wallsend on the Tyne near

Newcastle. Saxon settlement and the eventual establishment of the kingdom of Northumbria followed the Roman withdrawal. In 1080 the Normans built a fortress at Newcastle, dominating the Tyne crossing.

Exploitation of the area's greatest asset, coal, began in the 13th century but was restricted to the exposed coalfield west of Newcastle, near the river for transport. Throughout medieval times coal was exported from Newcastle to London, but it was not until the wood shortage of Elizabethan times that coal became important as domestic fuel and trade increased dramatically. During the 18th century, improvements in mining techniques and the development of the steam engine enabled the exploration of the concealed coalfield east of Newcastle. Long before the Industrial Revolution, coal-dependent industries (glass, pottery, chemicals, and iron) developed along the Tyne. For a time Tyneside was also the country's chief salt-producing area, using coal to evaporate seawater.

The 19th century brought two major advances: the development of heavy transport (railways and, later, iron ships) and the widening market for different types of coal for smelting, gas, and steam production. With the coming of the railways, the mines, no longer limited by accessibility to water transport, were able to penetrate farther east into the concealed coalfield beneath the limestone. Drab mining settlements came into being, often attached to existing agricultural villages-e.g., Easington and Easington Colliery. Later expansion continued eastward to exploit seams beneath the North Sea. Industrial development during the late 19th century concentrated in the Tyneside ports. The old industries-salt, glass, and chemicals—declined and were replaced by expanding shipyards building new iron ships.

Like most British areas greatly dependent upon heavy industry, the region suffered during the depressed years between World Wars I and II, and unemployment remains a problem despite efforts to diversify the industrial structure. The area remains very dependent on heavy industry-shipbuilding, repairing, marine and heavy electrical engineering, and soap and paint manufacturing. Pop. (1985 est.) 1,140,000.

Tynedale, district, county of Northumberland, northern England. It occupies an area of 858 square miles (2,221 square km) in the western part of the county and is bordered on the northwest by Scotland. The district is an area of hills, both rounded and craggy, and bleak moorlands separated by the narrow, fertile valleys of the North Tyne and South Tyne rivers, which merge to form the Tyne River in the southeastern part of the district. The central and northwestern limestone area commonly called the western uplands (elevation 1,000 feet [300 m]) rises on the northeast to an extension of the igneous-based and peatcovered Cheviot Hills (more than 1,500 feet [450 m] high). In the south, below the South Tyne valley, the district extends into the Pennines, which are more than 1,800 feet (550 m) high.

The valleys penetrate into the uplands from the east, and comparative isolation has given each a distinctive character. The principal market and small industrial centres of the district (Prudhoe, Corbridge, Hexham, and Haltwhistle) are located adjacent to the South Tyne and the lower Tyne, where mixed farming is commonplace. Although of low agricultural value, the district's moorlands provide enough pasturage for sheep (especially the locally popular Cheviot and Blackface).

Thick spruce forests, part of an afforestation scheme begun in the 1920s and 1930s, are found in the moorland in the northwest near

the headwaters of the North Tyne. The dam at Kielder Reservoir was built on the North Tyne to supplement water flow to industries along the River Tyne and by pipeline to the Wear and Tees rivers; the reservoir is a major recreational resource in the area.

Antiquities of the Anglo-Saxon and Roman periods are gathered at a museum in Corbridge (the site of a Roman camp); and a section of Hadrian's Wall is well-preserved directly north of the South and lower Tyne valleys and extends east-west through the district.

The valleys of the South Tyne and the Tyne River are important avenues for transportation routes between northwestern and northeastern England. Hexham is the district seat. Pop. (1985 est.) 54,900.

Tyo, Kingdom of (African history): see Anziku, Kingdom of.

type name, also called TICKET NAME, in dramatic practice, name given to a character to ensure that the personality may be instantly ascertained. In England the allegorical morality plays of the late Middle Ages presented characters personifying, for example, the seven deadly sins-being named Envy, Sloth, Lust, and so forth. Tudor and Elizabethan dramatists were much-influenced by the moralities, and Ben Jonson in particular adopted the habit of christening his characters in such a way that whatever "humour" governed them was pointed up. In his play The Alchemist appear Subtle and Face (two confidence tricksters), Sir Epicure Mammon (a voluptuary), Abel Drugger (a naive tobacconist), and Dol Common (a strumpet). Type names were later a feature of Restoration comedy. In Sir John Vanbrugh's comedy *The Relapse*, there appear, among a gallery of familiar characters with type names, Lord Foppington and his brother Young Fashion. Type names continued to be a fixture of English literature in the latter part of the 18th century, as is evident in some of the characters invented by the dramatist Richard Brinsley Sheridan: Joseph Surface and the dramatist Sir Fretful Plagiary. The most prominent and inventive user of type names in 19th-century English literature was the novelist Charles Dickens, though his type names are imaginatively suggestive creations rather than explicit labels of a character's occupation, attitudes, or flaws: Josiah Bounderby, Thomas Gradgrind, Mrs. Sparsit, Tulkinghorn, Dr. Blimber, Mrs. Jellyby, and Captain Cuttle. Anthony Trollope and other Victorian novelists also sometimes used type names, especially for comic or flawed charac-

Type names can be found in most other national literatures, and their use has persisted at a diminished level, usually in comedic works or for comic effect.

types, theory of, in logic, a theory introduced by the British philosopher Bertrand Russell in his Principia Mathematica (1910-13) to deal with logical paradoxes arising from the unrestricted use of predicate functions as variables. Arguments of three kinds can be incorporated as variables: (1) In the pure functional calculus of the first order, only individual variables exist. (2) In the secondorder calculus, propositional variables are introduced. (3) Higher orders are achieved by allowing predicate functions as variables. The type of a predicate function is determined by the number and type of its arguments. By not allowing predicate functions with arguments of equal or higher type to be used together, contradictions within the system are avoided.

typesetting, the setting of type for use in any of a variety of printing processes. See printing.

typesetting machine, basic element in modern letterpress printing. The problem of mechanizing typesetting was solved in the 19th century by devising machines that could cast type from matrices, or molds. The first to be successful was that of Ottmar Mergenthaler, German-born American inventor, which cast thin slugs of a molten, fast-cooling alloy from brass matrices of characters activated by a typewriter-like keyboard; each slug represented a column line of type. The slug could be used either directly for printing or for producing a matrix of a page to be printed; after use it could be melted for reuse. Mergenthaler's Linotype (q.v.) machine was patented in 1884; in 1885 another American inventor, Tolbert Lanston, perfected the Monotype (q.v.), a machine in which type is cast in individual letters. Both machines were made possible by the development of machine tools, specifically, the mechanical punch cutter. A third process, the Intertype (q.v.), developed later, also sets type by the line. Linotype and Intertype are economically advantageous in newspaper and in most book and magazine printing. Monotype is used if tighter or more irregular spacing is needed, as in catalogs; it is also used for some book and magazine work. All modern machines have great flexibility in respect to line widths, type fonts, and type sizes.

All three typesetting machines have been adapted for photocomposition (q.v.) and for teletypesetting, by which a perforated tape, encoded by impulses received over a telephone wire, activates the typesetting keys. A significant development of the 1960s was the use of computers to prepare tapes and to drive and control typesetting and photocomposition at very high speeds (see computerized typesetting). Another development was the introduction of a family of printing machines that represented a combination of typewriter and composing machine; these could be operated by typists without the technical training required for typesetting machines.

typewriter, any of various machines for writing characters similar to those made by printers' types, especially a machine in which the characters are produced by steel types striking the paper through an inked ribbon with the types being actuated by corresponding keys

The Sholes and Glidden typewriter of c. 1873, which. with refinements, became the Remington Model 1 By courtesy of Remington Rand Office Machines Divis

on a keyboard and the paper being held by a platen that is automatically moved along with a carriage when a key is struck.

The invention of various kinds of machines was attempted in the 19th century. Most were large and cumbersome, some resembling pianos in size and shape. All were much slower to use than handwriting. Finally, in 1867, the American inventor Christopher Latham Sholes read an article in the journal Scientific American describing a new British-invented machine and was inspired to construct what became the first practical typewriter. His second model, patented in 1868, wrote at a speed far exceeding that of a pen. It was a crude machine, but Sholes added many improvements in the next few years, and in 1873 he signed a contract with E. Remington and Sons, gunsmiths, of Ilion, N.Y., for manufacture. The first typewriters were placed on the market in 1874, and the machine was soon renamed the Remington. Among its original features that were still standard in machines built a century later were the cylinder, with its line-spacing and carriage-return mechanism; the escapement, which causes the letter spacing by carriage movement; the arrangement of the typebars so as to strike the paper at a common centre; the actuation of the typebars by means of key levers and connecting wires; printing through an inked ribbon; and the positions of the different characters on the keyboard, which conform almost exactly to the arrangement that is now universal. Mark Twain purchased a Remington and became the first author to submit a typewritten book manuscript.

The first typewriter had no shift-key mechanism—it wrote capital letters only. The problem of printing both capitals and small letters without increasing the number of keys was solved by placing two types, a capital and lowercase of the same letter, on each bar, in combination with a cylinder-shifting mechanism. The first shift-key typewriter—the Remington Model 2—appeared on the market in 1878. Soon after appeared the so-called double-keyboard machines, which contained twice the number of keys—one for every character, whether capital or small letter. For many years the double keyboard and the shift-key machines competed for popular favour, but the development of the so-called touch method of typing, for which the compact keyboard of the shift-key machines was far better suited, decided the contest.

Another early issue concerned the relative merits of the typebar and the type wheel, first applied in cylinder models brought out in the 1880s and later. In modern machines of this variety the type faces are mounted on a circle or segment, the operation of the keys brings each type to correct printing position, and the imprint of type on paper is produced by a trigger action. The type-wheel machines offer an advantage in the ease with which the type segments may be changed, thus extending the range and versatility of the machine.

On nearly all typewriters the printing is done through an inked ribbon, which is fitted on spools, travels with the operation of the machine, and reverses automatically when one spool becomes completely unwound. On other machines an inking pad is used, the type contacting the pad prior to printing.

Noiseless typewriters. The noiseless linkage is a variation of the conventional typebar linkage causing the typebar to strike the platen at a lower velocity but with the same momentum. Although it produces less noise than the conventional typewriter, the noiseless typewriter cannot produce as fine an impression or as many carbon copies.

A significant advance Electric typewriters. in the typewriter field was the development of the electric typewriter, basically a mechanical typewriter with the typing stroke powered by an electric-motor drive. The typist initiates the key stroke, the carriage motion, and other controls by touching the proper key. The actuation is performed by the proper linkage clutching to a constantly rotating drive shaft. Advantages of this system include lighter touch, faster and more uniform typing, more legible and numerous carbon copies, and less operator fatigue. Especially valuable as an office machine capable of a high volume of output, electric typewriters are produced by all major typewriter manufacturers.

The first electrically operated typewriter, consisting of a printing wheel, was invented by Thomas A. Edison in 1872 and later developed into the ticker-tape printer. The electric typewriter as an office writing machine was pioneered by James Smathers in 1920.

In 1961 the first commercially successful typewriter based on a spherical type-car-

rier design was introduced by the International Business Machines Corporation. The sphere-shaped typing element moves across the paper, tilting and rotating as the desired character or symbol is selected. The motion of the element from left to right eliminates the need for a movable paper carriage

need for a movable paper carriage. Portable typewriters. The early portables of the late 19th century were slow, awkward, type-wheel machines. In 1909 the first successful portables appeared on the market. By the 1950s practically every typewriter manufacturer produced a portable typewriter; all of them were typebar machines similar in operation to the office machines. Designed with lighter parts than those of standard models, portables are more compact but less sturdy. Electrical operation of portable typewriters was introduced in 1956.

Typewriter composing machines. Special-purpose typewriting machines have been developed for use as composing machines; that is, to prepare originals that look as if they had been set in printer's type (or at least more so than ordinary typewriting does), from which additional copies can be printed. Ordinary typewriting cannot compare in quality, style, and versatility with printing from type produced directly on metal slugs by standard composing machines, but the high cost of skilled typesetting labour prompted the development of composing typewriters that require far less operator training. Since the fundamental requirement of a composing typewriter is the ability to supply different styles and sizes of type, the type-wheel machine is far more suitable than the typebar. Other major requirements of a typing machine whose output must resemble print are the proportional spacing of characters in a word (rather than centring every character within the same width, as in ordinary typewriting) and justification, or alignment of the right-hand margin. An electric typebar machine was developed that provided proportional spacing—assigning space for each character in proportion to its width. The other requirement, margin justification, proved more difficult to attain. Most of these machines provided for preliminary typing of a line, determining the necessary compensation for the line length, and retyping to the exact length. A more complicated machine was introduced that would automatically justify a line of type with one keyboarding. This was accomplished by a system in which the operator typed manually into a storage unit, from which a computer first automatically compensated for line length and then operated a second typing mechanism. By mid-20th century the typewriter had begun to be used as a composing machine in spite of its limitations. and it became more popular as improvements were developed.

Automatically controlled machines. the most important advances in the field of typewriters and office machines was the development of automatic controls that allow typing from remote electrical signals rather than from manual control. This technique enabled office machine manufacturers to develop an integrated system of business communication utilizing remote control typewriters and computer techniques. With such a system, machines handling all the different office machine functions, such as the typewriter, calculating machine, and printing telegraph, together with mass data processing computers and electronic storage systems, are tied together by the use of a "common language" in the form of coded electrical signals. This coded information, coming into an office via appropriate communication channels, can be automatically recorded and printed. Component machines produced by any manufacturer can be connected to any other without the use of special code converters. Other automatic typewriter devices also have become available. A vacuum-operated system, for example, controls and operates any number of standard typewriters from a perforated roll of paper tape, much like the player piano, making possible rapid production of form letters and other papers.

High-speed printers. The need high-speed printing machines to convert the output of computers to readable form prompted the introduction of a specialized high-speed form of "typewriter" in 1953. In this class of machines, the paper is fed between a continuously rotating type wheel and a bank of electrically actuated printing hammers. At the instant the proper character on the face of the type wheel is opposite the proper hammer, the hammer strikes the paper and prints the character, while the type wheel continues to rotate. By this means, speeds up to 100,-000 characters per minute have been attained, as compared with about 1,000 characters per minute attainable with conventional typebar mechanisms. A number of different models operating on this principle were developed; all of them required elaborate electronic controls to solve the complex synchronization problem. Many other high-speed-output devices for computers were developed. Most of them utilize techniques that are remote from the typewriter field, in some cases using printing mediums other than paper. Speeds of up to 10,000 characters per second were attained by certain nonmechanical systems, which, although not actually typewriters, compete with typewriters as computer-output devices.

Typhales, cattail order of monocotyledonous flowering plants comprising two families (Sparganiaceae and Typhaceae) and two genera (*Sparganium* and *Typha*) of erect or floating marsh, pond, and streamside plants found

Cattail (Typha)

Robert J. Ashworth—The National Audubon Society Collection/Photo Researchers

mainly in temperate and cold regions of the Northern and Southern Hemispheres. The two families are closely related and have similar technical characters, including separate, petaless, wind-pollinated male and female flowers in dense inflorescences (clusters), but the plants differ significantly in appearance.

Members of the burreed family (Sparganiaceae) have spherical flower heads; some species have separate male and female flower heads with the male heads above the female on the same stem, or with the male flowers in the upper part of the same head with the female flowers but being more crowded than the female flowers. The plant stems arise from creeping rootstocks, usually project above the water, and bear long, linear leaves whose lower ends sheath the stem.

The cattail family (Typhaceae), also called bulrushes and reedmaces, have an elongate flowering spike that is divided into two parts: a slender yellow upper portion, bearing the male flowers, and a stout brown lower portion, bearing the female flowers. The plant stems arise from a thick rootstock under the water and rise about 2.5 m (8 feet) above the water, bearing two ranks of flat, linear leaves.

The burreeds (Sparganium species) are seldom cultivated, but they are an important source of food and cover for wildlife. The cattails (Typha species), also important to wildlife, are often cultivated ornamentally as pond plants and for dried flower arrangements, especially the common cattail (T. latifolia) and the smaller narrow-leaf cattail (T. angustifolia). Cattail leaves are sometimes used for making mats, baskets, chair seats, and other woven articles, and they are also good for caulking and stopping cracks in barrels and boats because of their ability to swell when wet. Cattails have been called the most useful of all wild plants as sources of emergency food. The rootstocks, for example, are a source of an edible starch; the young stems are edible as salad plants or vegetables; and the yellow pollen is considered a nutritious and agreeably flavoured additive to cookie doughs and pancake batters. Even the immature, still-green flowering spikes can be boiled and eaten like corn on the cob.

Typhaon, also spelled TYPHOEUS (Greek mythology): *see* Typhon.

typhoid, also called TYPHOID FEVER, acute infectious disease of humans caused by the bacterium Salmonella typhi. The bacterium usually enters the body through the mouth by the ingestion of contaminated food or water, penetrates the intestinal wall, and multiplies in lymphoid tissue there; it first enters into the bloodstream within 24 to 72 hours, causing septicemia (blood poisoning) and systemic infection

After an average 10–14 day incubation period, the early symptoms of typhoid appear: headache, lassitude, generalized aching, fever, and restlessness that may interfere with sleep. There may be loss of appetite, nosebleeds, cough, and diarrhea or constipation. Persistent fever develops and gradually rises, usually in a stepwise fashion, reaching a peak of 103° or 104° F (39.4° or 40° C) after 7–10 days and continuing with only slight morning remissions for another 10–14 days. During the first few days of the disease the patient may remain ambulatory.

During about the second week of fever, when typhoid bacilli are present in great numbers in the bloodstream, a rash of small, rose-coloured spots appears on the trunk, lasts four or five days, and then fades away. The lymph follicles (Peyer's patches) along the intestinal wall in which the typhoid bacilli have multiplied become inflamed and necrotic and may slough off, leaving ulcers in the walls of the bowel. The dead fragments of bowel tissue may erode blood vessels, causing a hemorrhage into the bowel, or they may perforate the bowel wall, allowing the bowel's contents to enter the peritoneal cavity (peritonitis). Other complications can include acute inflammation of the gall bladder, heart failure, pneumonia, osteomyelitis, encephalitis, and meningitis. With a continued high fever the symptoms usually increase in intensity, and mental confusion and delirium may appear.

By the end of the third week the patient is prostrated and emaciated, his abdominal symptoms are marked, and mental disturbance is prominent. In favourable cases, during about the beginning of the fourth week, the fever begins to decline, the symptoms begin to abate, and the temperature gradually returns to normal. If untreated, typhoid proves fatal in up to 25 percent of all cases.

Most major epidemics of typhoid have been caused by the pollution of public water supplies. Food and milk may be contaminated, however, by a carrier of the disease who is employed in handling and processing them; by flies; or by the use of polluted water for cleaning purposes. Shellfish, particularly oysters, grown in polluted water and fresh vegetables grown on soil fertilized or contaminated by untreated sewage are dangerous. The prevention of typhoid fever depends mainly on proper sewage treatment, filtration and chlorination of water, and the exclusion of carriers from employment in food industries and restaurants. In the early part of the 20th century, prophylactic vaccination using killed typhoid organisms was introduced, mainly in military forces and institutions, and contributed to a lowering of the incidence of the

The treatment of typhoid formerly was entirely symptomatic and supportive. After 1948 treatment with antibiotics, particularly with chloramphenicol, proved to be effective. Chloramphenicol begins to lower the patient's fever within three or four days after beginning therapy, and there is progressive improvement thereafter. The drug treatment is continued for several weeks in order to prevent relapses. Ampicillin, often in combination with other drugs, is an effective alternate treatment.

About 30 percent of typhoid cases become transient carriers of the disease, excreting the causative bacteria in the stool or urine for weeks or months. About 5 percent remain long-term carriers, harbouring the microorganisms and shedding them for years. In these carriers, who show no apparent ill effects, the bacilli are found mainly in the gallbladder and biliary passages. The bacteria may be excreted continuously or intermittently. One of the most famous instances of carrier-borne disease in medical history was the early 20th-century case of Typhoid Mary (q, v).

Typhoid Mary, byname of MARY MALLON (b. 1870?—d. Nov. 11, 1938, North Brother Island, New York City), famous typhoid carrier in the New York City area in the early 20th century. Fifty-one original cases of typhoid and three deaths were directly attributed to her (countless more were indirectly attributed), although she herself was immune to the typhoid bacillus (Salmonella typhi).

Mary's case first arose in 1904, when an epidemic of typhoid spread over Oyster Bay and adjacent towns on Long Island, and the sources were found to be households in which Mary had been a cook. When discovered, she disappeared—to be rediscovered in 1907 as a cook in a Park Avenue home in Manhattan. Again she fled, but authorities led by George Soper, a sanitary engineer in the New York City Department of Health, finally overtook her and had her committed to an isolation centre on North Brother Island, off the Bronx. There she stayed, despite an appeal to the U.S. Supreme Court, until 1910, when the health department released her on condition that she never accept employment that involved the handling of food.

Four years later, Soper began looking for her again when an epidemic broke out at a sanatorium in Newfoundland, N.J., and at Sloane Maternity Hospital in Manhattan; Mary had worked as a cook at both places. She was at

last found in a suburban home in Westchester county and returned to North Brother Island, where she remained the rest of her life. A paralytic stroke in 1932 led to her slow death, six years later.

Mary's claim to having been born in the United States was never confirmed, nor was her age ever verified.

Typhon, also spelled TYPHAON, or TYPHOEUS, in Greek mythology, youngest son of Gaea (Earth) and Tartarus (of the nether world). He was described as a grisly monster with a hundred dragons' heads who was conquered and cast into the underworld by Zeus. In other accounts, he was confined in the land of the Arimi in Cilicia or under Mount Etna or in other volcanic regions, where he was the cause of eruptions. Typhon was thus the personification of volcanic forces. Among his children by his wife, Echidna, were Cerberus, the three-headed hound of hell, the multiheaded Lernean Hydra, and the Chimera (q.v.). He was also the father of dangerous winds (typhoons), and by later writers he was identified with the Egyptian god Seth.

typhoon, local name in the western North Pacific area for any large, traveling tropical cyclone (q.v.).

typhus, acute, infectious series of diseases that are characterized by a sudden onset with headache, chills, fever, and general pains, a rash appearing on the third to fifth day, and toxemia (toxic substances in the blood), and terminating after about two to three weeks. Originally considered a single clinical entity, it is now regarded as a group of closely related diseases caused by different species of rickettsiae (bacteria belonging to the family Rickettsiales) and transmitted to humans by insect carriers under the following general classifications: epidemic (louse-borne) typhus; murine, or endemic (flea-borne), typhus; scrub (miteborne) typhus, or tsutsugamushi disease; and tick-borne typhus.

Epidemic typhus is caused by Rickettsia prowazekii and is conveyed from person to person by the body louse, Pediculus humanus. The louse is infected by feeding upon a human who has the disease. The rickettsial bacteria grow in the epithelial cells lining the louse's gut wall and are excreted in the insect's feces. The infection kills the louse after 12 to 18 days. Man is commonly infected by scratching a louse bite, thus rubbing the louse's infected feces into the wound by abrasion. (Rickettsiae may remain viable and retain their virulence for many days in dried louse feces.) After an incubation period of one to two weeks, an infected person experiences headache, loss of appetite, malaise, and a rapid rise in temperature with fever, chills, marked prostration, and nausea. Four to six days after onset a characteristic rash appears over most of the body. The temperature reaches a maximum range by the end of the first week and is sustained until about the 12th day, when it generally falls rather rapidly, becoming normal in an uncomplicated course about the 14th to 16th day. Depression and weakness may be protracted during the recovery, and the patient's convalescence is slow. In fatal cases of the disease, prostration is progressive, and delirium and coma follow; cardiac failure may be the immediate cause of death.

Epidemic typhus has been one of the great disease scourges in human history. It is classically associated with people crowded together in filth, cold, poverty, and hunger; with wars and famine; with refugees; prisons and jails; concentration camps; and ships. Recognizable descriptions of the disease occur in European literature from the Middle Ages on, and devastating epidemics of typhus continued to occur intermittently throughout Europe in the 17th, 18th, and 19th centuries. Prominent outbreaks occurred during the Napoleonic Wars

and during the Irish potato famine of 1846-49. Epidemic typhus was clearly differentiated as a disease entity from typhoid fever in the 19th century, and in the early 20th century typhus decreased and then practically disappeared from western Europe as improvements in living conditions and hygiene occurred. The disease remained intermittently epidemic in eastern Europe, the Middle East, and parts of Africa, however. At the close of World War I the disease caused several million deaths in Russia, Poland, and Romania, and during World War II it again caused epidemics, this time among refugees and displaced persons, particularly in the German concentration camps.

A vaccine for typhus was developed during World War II and is effective in greatly alleviating the course of the disease if contracted. The development of the pesticide DDT in the mid-20th century provided an effective means of preventing outbreaks of epidemic typhus, since this chemical is a powerful and long-lasting lousicide. It is applied directly to the clothing of persons at risk and kills the lice as they hatch on the person's body. Like other types of typhus, epidemic typhus can be quickly and effectively treated by chloramphenicol and by the tetracyclines. Despite techniques using vaccination and delousing, typhus is still an ever-present threat to impoverished and destitute peoples in many parts of the world

A condition that is closely related to epidemic typhus is Brill-Zinsser disease, or recrudescent typhus, in which mild symptoms of epidemic louse-borne typhus reappear after a latent period, sometimes of many years, in persons who at one time had contracted epidemic typhus. The disease was first noted when cases of typhus occurred in communities that were free of lice. If treated early with chloroamphenicol or a tetracycline drug, most patients with Brill-Zinsser disease recover.

Endemic, or murine, typhus, caused by Rickettsia typhi (mooseri), has as its principal reservoir of infection the Norway rat; occasionally, the common house mouse and other species of small rodents have also been found to be infected. The tropical rat flea Xenopsylla cheopis is the principal carrier of the disease, and transmission to humans occurs through the medium of infected flea feces. The frequency of occurrence of human cases is determined by the amount of contact humans have with domestic rodents. The course of the illness is essentially the same as for louseborne typhus, but it is milder, complications are less frequent, and the overall fatality rate is less than 5 percent.

Scrub typhus (*q.v.*) is usually classed as a separate disease entity. Tick-borne typhus is also classed as a separate disease called spotted fever (*see* Rocky Mountain spotted fever).

typographic printing: see letterpress printing.

typography, the design and selection of letter forms used to make a page of printed text and thus a book or other publication.

A brief treatment of typography follows. For full treatment, see MACROPAEDIA: Printing, Typography, and Photoengraving.

The typographer's primary task is to make the letter forms easy to read and secondarily to make them aesthetically pleasing. Perhaps the most basic aspect of typography is, in the Western world, the highly standardized set of characters it inherited from handwriting. Western typefaces resolve into three main kinds—roman, italic, and black letter—all derived from kinds of script. A fourth style, sans serif, which came into vogue in the first half of the 20th century, can be considered a subtype

The roman capital letters were established in form by the 1st century AD; lower-case forms developed later but still well before the standardized script known as Caroline was imposed by Charlemagne on his empire in the 8th century. A script similar to Caroline, prevalent in Spain and Italy, provided the model for roman typefaces, while a slanted, cursive version, used by chancery scribes for speed, was the source of italic type. In Germany and Britain, however, Caroline gave way to the angular, thick-stroked script known as Old English or Gothic, the model for black letter, which, since printing was invented in Germany, was the first kind of type used. Within 15 years after Johannes Gutenberg had published his Bible (1456), printing had spread through most of Europe. Between 1450 and 1500 most of the conventions of typography were established: the three major types of typefaces, page numbering, the title page, printers' marks, and the colophon (an inscription giving the place and date of publication, the printer-publisher's name, and other information).

In Renaissance Italy a typeface based on a script earlier than Gothic was preferred for classical texts, and a clearer, rounder face, called antiqua, the prototype of roman faces, quickly superseded black letter except in legal and ecclesiastical works. By the early 16th century antiqua was used everywhere in Europe except Germany, where black letter type remained standard until 1940. In the 1490s Aldus Manutius of Venice printed a series of Latin texts in a new cursive typeface, now known as italic and reserved for special functions (such as indicating foreign expressions).

The ascendancy of the roman and italic typefaces was greatly furthered by early 16th-century French typographers, in particular Claude Garamond, the first commercial type-founder, who made his well-designed versions available to all printers and, as a result, so dominated typography that subsequent 16th-and 17th-century developments may be seen as mere refinements to Garamond faces. Garamond's designs were superseded by those of Romain du Roi, which departed from previous practice by being designed not purely in imitation of script but according to mathematically determined proportions.

Among the greatest figures of 18th-century typography were William Caslon, whose type-faces are still in use, and John Baskerville and Giambattista Bodoni, both celebrated as much for their versions of italic and roman type as for their tasteful style of book design.

Printing was mechanized in the 19th century, but type was still cast and composed by hand until the invention in 1884 of punch-cutting machines made feasible the Linotype and Monotype mechanical composition systems. The range of typefaces first used in such systems was small and of poor quality until typography came under the influence of the Arts and Crafts movement and its leader, William Morris, whose private Kelmscott Press set a standard of craftsmanship and design that inspired a generation of printers and typographers.

Early in the 20th century, as more printers installed composing machines, better designed fonts (based on traditional faces like Caslon) began to appear. Perhaps the most influential figure in typography between the wars was the English typographer Stanley Morison, who organized the production of a range of fonts for the composing machine, taken from the best of traditional and contemporary typefaces (and including his own enormously successful Times New Roman). The most important typographic development of the second half of the 20th century has been that of phototypesetting, or filmsetting, in which type is composed optically on film before being transferred to either a lithographic plate or a letterpress block. Although traditional letterpress will probably be used by small businesses for some time, it has been rendered obsolete for most purposes by the combination of offset lithography, phototypesetting, and computerization.

typology, system of groupings (such as "landed gentry" or "rain forests"), usually called types, the members of which are identified by postulating specified attributes that are mutually exclusive and collectively exhaustive—groupings set up to aid demonstration or inquiry by establishing a limited relationship among phenomena. A type may represent one kind of attribute or several and need include only those features that are significant for the problem at hand.

Because a type need deal with only one kind of attribute, typologies can be used for the study of variables and of transitional situations. Classifications, on the other hand, deal with "natural classes"—*i.e.*, with groupings that differ from other groupings in as many particulars as one can discover. For this reason classifications can be only a preliminary step in the study of variables, for they cannot deal elegantly with transitional situations in which variables are to be expected. The more gradual the change, the fewer are the distinctive features upon which to define natural classes and the more difficult it becomes to draw a line between classes. In this situation typologies may be invoked.

When the problem is simply that of ordering unconditioned phenomena, it is difficult to distinguish typologies from classifications. The latter have been considered preliminary to the discovery of sequences or laws. Because typologies invariably use ordering for additional purposes, classifications can be regarded as typologies that are limited to the problem of order. Typologies, subsisting usually on the frontiers of research, are less durable than classifications in that their descriptions are accepted only to the degree that they continue to provide solutions to problems.

A typology elicits a particular order depending on the purposes of the investigator and on the phenomena so arranged, an order that limits the ways in which the data can be explained. There can be different interpretations of the relations of the phenomena. The Linnaean system for setting up divisions in biology is an ordering that was only later found to be in accord with biological evolution. In social and cultural studies, in which the significant distinctions are not of the genus and species kind, this kind of ordering has been less successful.

Typologies are characteristic of the social sciences and have had a great development in archaeology. Arne Furumark, a Swedish archaeologist, regards typologies as applicable to archaeology because of the inertia of the human mind, which usually views the undisturbed development of material culture as taking place gradually. This view has been contrasted with the "Swedish typology" of B.E. Hildebrand and Oscar Montelius, which sees cultural material as produced through a process analogous to that of organic evolution—a view that might be a step toward delineating processes of interaction and development per se, regardless of the sources of the material.

In anthropology and archaeology, typological systems may be based on variations of style or artifacts, paintings, buildings, burial customs, social systems, or ideologies. Christian Jürgensen Thomsen, a Danish antiquary, used a typology of materials to establish his celebrated Stone, Bronze, and Iron ages. Later the Stone Age was subdivided by L.L. Gabriel de Mortillet, a French anthropologist. Subsequently, typologies, combined with careful stratigraphic work, were used to conceptualize elements changing through time, to fill stratigraphic gaps, and to extrapolate strata. A seriation technique, called sequence dating,

based on shared typological features, enabled Sir Flinders Petrie to establish the temporal order of a large number of Egyptian graves.

Some typologies go beyond the problem of order and help to show the importance of particular factors. Comparisons among examples of a single type rely on the postulated constancy of the type to focus on variable factors and suggest explanations of the variations. Two sequences of identical types may show differences in proportions or in rates of change, leading to additional inferences, such as the assumption of a causal relation.

Large-scale typologies may assume that certain factors are of overriding significance. Where ordering is chronological there are the developmental stages of the social evolutionist Lewis Henry Morgan or the repetitive sequences of the philosophers of history Oswald Spengler and Arnold Toynbee. Where time is of less concern there are such constructs as the leisure class of the U.S. economist Thorstein Veblen; the inner- and other-directed personality types of David Riesman, a Harvard sociologist and publicist; and the polar cultural types of Sir Henry Maine, Ferdinand Julius Tönnies, and Robert Redfield.

Tvr. Old Norse Týr. Old English TIW. one of the oldest gods of the Germanic peoples and a somewhat enigmatic figure. He was apparently the god concerned with the formalities of war-especially treaties-and also, appropriately, of justice. It is in his character as guarantor of contracts, guardian of oaths, that the most famous myth about him may be understood: as a guarantee of good faith, he placed his hand between the jaws of the monstrous wolf Fenrir while the gods, pretending sport but intending a trap, bound the wolf; when Fenrir realized he had been tricked he bit off Tyr's hand (hence Tyr's identification as the one-handed god). He came to be identified by the Romans with their own Mars, hence dies Marti (Mars' Day) came to be rendered Týsdagr (Tuesday).

Tyrannidae (bird family): see tyrant fly-catcher.

Tyrannosaurus, genus of very large carnivorous dinosaurs found as fossils in Late Cretaceous deposits of North America and eastern Asia (the Cretaceous Period began 136,000,000 years ago and lasted 71,000,000 years). Fully grown, Tyrannosaurus, probably the largest land carnivore of all time, was more than 14 metres (47 feet) long; the skull alone was more than 4 feet long. Tyrannosaurus was a biped, walking about on its powerfully developed hind limbs. If the animal stood upright, it was more than 6.5 metres (20 feet) tall, but

the ordinary pose was stooped with the body carried forward. It has been estimated that in life *Tyrannosaurus* weighed almost eight tons. The body was massive, and the neck was short and thick. The skull was very large in relation to the body and was armed with large, pointed teeth up to 15 centimetres (6 inches) long; the teeth had serrated edges and were effective for cutting and slicing. The forelimbs were very small and useless, except perhaps for grasping at close range. The long tail served as a counterbalance to the body. The musculature was very well developed, especially those muscles used for biting and chewing and for support and mobility.

Tyrannosaurus remains are often encountered in the same deposits as the remains of the giant horned dinosaurs (ceratopsians), upon which Tyrannosaurus probably preyed. Tyrannosaurus probably was a rather rare animal, with perhaps only a single individual present for every 100 square miles. Best known is the species Tyrannosaurus rex.

tyrannulet, any of about 50 species of birds in the New World flycatcher family, Tyrannidae (order Passeriformes), of small size, with

Paltry tyrannulet (Tyranniscus vilissimus)

diminutive bill. The name tyrannulet is given to members of about 20 genera. Fairly typical of the group and among the most widely distributed are the 9-centimetre (3¹/2-inch) beardless tyrannulets of the genus *Camptostoma*. The northern form, *C. imberbe*, occurs north

Tyrannosaurus rex, skeleton

By courtesy of the American Museum of Natural History, New York

to Texas and Arizona (where it is called the beardless flycatcher), and the southern form, *C. obsoletum*, is found as far south as Argentina; their ranges meet in Costa Rica. The birds are called beardless for lack of bristles at the corners of the mouth.

Some tyrannulets, like the bent bills (*Oncostoma*), regularly build their nest near aggressive wasps, which do not harm the birds but will attack other intruders.

tyrant, Greek TYRANNOS, cruel and oppressive ruler or, in ancient Greece, either a king, or basileus (7th century BC), or a ruler who has seized power unconstitutionally or inherited such power (classical Greece). In the 10th and 9th centuries monarchy had been the usual form of government in the Greek states; the aristocratic regimes that had replaced monarchy were by the 7th century themselves unpopular. Thus the opportunity arose for ambitious men to seize power in the name of the opporessed.

The best known tyrannies were those founded by Cypselus at Corinth and Orthagoras at Sicyon, c. 650. There were tyrants also in Asiatic Greece, the most famous of whom was Thrasybulus of Miletus (c. 600). The tyrants often sprang from the fringe of the aristocracy; for example, the mother of Cypselus belonged to the ruling clan of the Bacchiads, but his father did not. The nature of the discontent that provided them with a following may have varied from place to place. At Sicyon, Cleisthenes, who ruled c. 600-c. 570 and was the most successful of the Orthagorids, expressed or exploited the resentment felt by the non-Dorian and underprivileged element in society toward those who claimed descent from the Dorian invaders. Some historians have supposed that the introduction of the hoplite phalanx early in the 7th century led to the development of a class of substantial farmers, who served in the phalanx and supported the tyrants as their champions against the aristocracies. But although the tyrants may have made use of hoplite tactics, substantial farmers were probably a conservative, not a revolutionary, force, and there is no reason to suppose that farmer-hoplites developed class consciousness.

Tyrants came to be considered oppressive, especially by their rivals for political power. Cypselus' son Periander, whose powerful reign at Corinth lasted about 40 years, came to be regarded as a typically bad tyrant. The Corinthian tyranny fell in the late 580s soon after he died.

Sparta, which had developed a constitution under which all citizens were soldiers and theoretically equal, avoided tyranny. Peisistratus established a tyranny at Athens in the middle of the 6th century; his son Hippias was expelled by King Cleomenes I of Sparta in 510. This may be taken as the end of the "age of tyrants" but not the end of tyranny. The Persians preferred to keep tyrants in charge of the Greek cities of Anatolia, which they conquered c. 540.

In the west, where military autocracy easily took root, the popularity of Gelon of Syracuse rested to a great extent on his defeat of the Carthaginians at Himera in 480; his brother and successor, Hieron, patron of Pindar and others, won a celebrated victory over the Etruscans at Cumae in 474. In 405 Dionysius I of Syracuse, the most powerful of all tyrants, first established his rule during the crisis of another Carthaginian invasion.

In the Hellenistic period some tyrants rested their power on class feeling; others were foreign nominees, like the tyrants supported by the Macedonian kings in the Peloponnese in the 3rd century. The phenomenon continued as long as Greece was free. The great tyrants were notable patrons of the arts and conspicuous builders. They often aided in the transition from narrow aristocracy to more

democratic constitutions, but the Greeks in principle chafed under their illegal autocracy; tyranny thus early acquired a bad name, and tyrannicides such as Harmodius and Aristogiton, who killed Hippias' brother Hipparchus at Athens, received the highest honours. In Plato's classification of constitutions the wise king is the best ruler, the tyrant the worst.

tyrant flycatcher, also called NEW WORLD FLYCATCHER, family name TYRANNIDAE, any of about 367 species of aggressive, insect-eating birds in the New World (order Passeriformes). About one-third of the species are not flycatcher-like in habit and bear names derived from their habitats (e.g., bush tyrant, marsh tyrant), or from their similarity to the songbird groups (tit-tyrant, shrike-tyrant). A few are named for their bill shape (spade bill, flat bill, bent bill). Many have common names not suggestive of their appearance (e.g., phoebe, pewee, kingbird).

Tyrant flycatchers range in size from 7.5 to 40.5 centimetres (3 to 16 inches) long, some species having greatly elongated tail feathers. Most tyrannids are plain coloured, in shades of gray, brown, or olive above and tan, white, or yellow below; a few are strikingly patterned in black and white. Many have a patch of red or yellow on the crown (often concealed, but erectile, nevertheless). In all but a few, the sexes are marked alike. A notable exception is *Pyrocephalus rubinus*, found from the southwestern United States to Argentina, the male of which is fiery red with dark wings and back.

The more arboreal tyrant flycatchers have weak legs and feet and hold themselves upright when perched. Like the Old World flycatchers of the family Muscicapidae (see flycatcher), the fly-catching tyrannids dart from a perch to seize insects on the wing. The bills of such forms of flycatcher are broad, flattened, and slightly hooked, with bristles at the base that appear to serve as aids in insect capture. The shrike tyrants (Agriornis) of southern South America take prey as large as mice and small frogs. A number of tyrannids, especially the elaenias, feed extensively on berries and other fruit.

Most tyrant flycatchers have rather simple songs that are often squeaking or grating sounds or monotonous whistles; a few, such as the pewees (*Contopus*), have melodious songs approaching those of the better singers among the songbirds.

Nearly all tyrannids are territorial during the breeding season. Many, especially the kingbird, attack or harass any large bird, such as a crow or hawk, that enters its territory. Exposed nests include open cups, domed structures, and hanging bags; some species nest in holes. There are no brood parasites, but at least one species habitually usurps the nests

Pearly-vented tody tyrant (Idioptilon margaritaceiventer)
Paul Schwartz—Photo Researchers

of other birds, usually those of oropendolas, which build hanging nests.

The family Tyrannidae is best represented in Central and South America, but about 30 species breed in North America. The nearest relatives are the manakins (Pipridae) and cotingas (Cotingidae); the boundaries of the three families are so poorly defined that the family allocations of a number of genera are controversial.

Other members of the tyrant flycatcher group are known by the names attila, elaenia, flatbill, kingbird, kiskadee, pewee, phoebe, spadebill, and tyrannulet (qq, v).

Tyrconnell, Richard Talbot, earl of (b. 1630—d. Aug. 14, 1691, County Limerick, Ire.), Irish Jacobite, a leader in the war (1689–91) waged by Irish Roman Catholics against the Protestant king William III of England.

Richard Talbot, earl of Tyrconnell, detail of an oil painting by an unknown French artist, 1690; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

The son of Sir William Talbot, a Roman Catholic lawyer and politician, Richard fought with the Royalist forces in Ireland during the English Civil War between the Royalists and Parliamentarians. In November 1655 he was arrested in London for plotting to overthrow Oliver Cromwell's Protectorate, but he soon escaped to Flanders. During the reign of Charles II (1660-85) he became a close associate of the King's Catholic brother James, duke of York, and, when York ascended the throne as James II in 1685, Talbot was created earl of Tyrconnell and appointed to the Privy Council in England. James made him lieutenant general of the Irish army in March 1686 and lord deputy of Ireland in February 1687, in which capacity he pursued a strongly pro-Catholic policy

Although James II was deposed by William of Orange (later King William III) in 1688, Tyrconnell continued to rule Ireland in James's name. He commanded troops against William, but the Jacobite cause in Ireland was doomed by the time Tyrconnell died. James had made him duke of Tyrconnell in March 1689, but the title was recognized only by the Jacobites.

Tyrconnell, Rory O'Donnell, 1st earl of (b. 1575—d. July 28, 1608, Rome), Irish chieftain who rebelled against the English and died in exile.

The second son of Hugh MacManus O'Donnell, he allied with his younger brother Hugh Roe, who transferred his authority as chief to Rory upon leaving for Spain. In 1602 Rory gave his allegiance to the English lord deputy and, in the following summer, went to London with Hugh O'Neill, 2nd earl of Tyrone, where he was received with favour by James I, who created him earl of Tyrconnell. In 1605 he was invested with authority as lieutenant of the king in Donegal. But the arrangement

between Rory and Niall Garve O'Donnell insisted upon by the government was displeasing to both O'Donnells, and Rory, like Hugh Roe before him, entered into negotiations with Spain. His country had been reduced to a desert by famine and war, and his own reckless extravagance had plunged him deeply in debt. These circumstances as much as the fear that his designs were known to the government may have persuaded him to leave Ireland. In September 1607 "the flight of the earls" took place, Tyrconnell and Tyrone reaching Rome in April 1608, where Tyrconnell died the following July.

Rory O'Donnell was attainted by the Irish parliament in 1614, but his son Hugh, who lived at the Spanish court, assumed the title of earl; and the last titular earl of Tyrconnell was this Hugh's son Hugh Albert, who died without heirs in 1642.

Tyrdt (Parthian rulers): see under Tiridates.

Tyre, modern sor, coastal town in al-Janub muhāfazah (governorate), southern Lebanon. It was a major Phoenician seaport from c. 2000 BC onwards through the Roman period.

Tyre, built on an island and the neighbouring mainland, was probably originally founded as a colony of Sidon (modern Sayda) to the north and was mentioned in Egyptian records of the 14th century BC as being subject to Egypt. It became independent when Egyptian influence in Phoenicia declined and soon surpassed Sidon as a trade centre, developing commercial relations with all parts of the Mediterranean world. In the 9th century BC colonists from Tyre founded the city of Carthage in North Africa, which later became Rome's principal rival in the West. The town is frequently mentioned in the Bible as having had close ties with Israel. Hiram, king of Tyre, furnished building materials for Solomon's Temple in Jerusalem (10th century), and the notorious Jezebel, wife of King Ahab, was the daughter of Ethbaal "king of Tyre and Sidon." In the 10th and 9th centuries Tyre probably enjoyed some kind of primacy over the other cities of Phoenicia and was ruled by kings whose power was limited by a merchant oligarchy.

For much of the 8th and 7th centuries the town was subject to Assyria, and in 585-573 it successfully withstood a prolonged siege by the Babylonian king Nebuchadrezzar II. Between 538 and 332 it was ruled by the Achaemenian kings of Persia. In this period it lost its hegemony in Phoenicia but continued to flourish. Probably the most famous episode in the history of Tyre was its resistance to the army of the Macedonian conqueror Alexander the Great, who took it after a seven-month siege in 332, using floating batteries and building a causeway to gain access to the island. After its capture, 10,000 of the inhabitants were put to death, and 30,000 were sold into slavery. Alexander's causeway, which was never removed, permanently converted the island into a peninsula.

Tyre was subsequently under the influence of Ptolemaic Egypt and in 200 became part of the Hellenistic Seleucid Kingdom; it finally came under Roman rule in 68 BC. It was often mentioned in the New Testament and was famous in Roman times for its silk products and for a purple dye extracted from snails of the genus Murex. By the 2nd century AD it had a sizable Christian community, and the Christian scholar Origen was buried there (c. 254). Under Muslim rule from 638 to 1124, Tyre grew prosperous as part of the Kingdom of Jerusalem, a Crusader State in the 12th and 13th centuries. The Holy Roman emperor Frederick I Barbarossa, who died on the Third Crusade, was buried in its cathedral (1190). Captured and destroyed by the Muslim Mamlūks in 1291, the town never recovered its former importance.

The silted up harbour on the south side of the peninsula has been excavated by the Institut Français d'Archéologie de Beyrouth, but most of the remains of the Phoenician period still lie beneath the present town. Pop. (1982 est.) 23,000.

tyre: see tire.

Tyrian purple, naturally occurring dye highly valued in antiquity. It is closely related to indigo (a, v).

Tyrifjorden, lake, Buskerud fylke (county), southeastern Norway, in the Ringerike (q.v.)region. Irregular in shape, it ranges up to 20 mi (32 km) in length and 10 mi in width, attains a maximum depth of 922 ft (281 m), and has an area of 52 sq mi (134 sq km). The Begna (river) flows southward into the lake, which is then drained by the Dramselva (river), which empties into Dramsfjorden, a branch of Oslofjorden. Three large bays give the lake its distinctive shape, while several islands lie in the eastern part. The main town on the lake is Vikersund, but the most important town of the region is Hønefoss, just north of the lake on the Begna. The lake is completely bordered by highways, and a rail line parallels its western shore.

Tyrnau (Czechoslovakia): see Trnava.

Tyrol (Austria): see Tirol.

Tyrone, former (until 1973) county, Northern Ireland. It was bounded by the former counties of Londonderry (north) and Fermanagh and Monaghan (south), and by former County Armagh and Lough (lake) Neagh (east). It had an area of 1,260 sq mi (3,263 sq km). In the

Celtic highcross at Arboe, Cookstown district, Northern Ireland

Tiers-Monkmeyer

north, the Sperrin Mountains rise to 2,240 ft (683 m), the highest peaks being Sawel and Mullaghcloga. To the southwest, Bessy Bell (1,387 ft) and Mary Gray (803 ft) straddle the River Mourne. Sandstones and limestones are most common in the south and west of former Tyrone County. The moorlands of the mountainous regions are unproductive, but the river valleys are extremely fertile. Lough Neagh, the largest lake in the British Isles, is on what was the eastern boundary. The climate is temperate, with an average annual rainfall of more than 55 in. (1,400 mm) in the mountainous north.

The former county derived its name from Tir Eoghain (land of Eoghan, son of Niall of the Nine Hostages). From the 5th to the 16th century AD, the O'Nialls (or O'Neills) were rulers of this territory, and successive chiefs were installed at Tullaghoge near Dungannon. After the flight (1607) of Hugh O'Neill, earl of Tyrone, from the English, ownership of his vast estates lapsed and passed to the crown; the lands were subsequently divided and granted by the King under the scheme for the Plantation of Ulster. Royalist forces under Lord Mountjoy established fortifications at strategic points; and Tyrone became colonized. In 1688–89 troops of James II occupied part of Tyrone, and Omagh was severely damaged.

In the 1973 administrative reorganization of Northern Ireland, the county was divided into the districts of Strabane, Omagh, and Dungannon, and a portion of Cookstown district.

Tyrone, Conn O'Neill, 1st earl of, byname CONN THE LAME, Irish CONN BACACH, Conn also spelled CON (b. c. 1480—d. 1559), the first of the O'Neills whom the attempts of the English in the 16th century to subjugate Ireland brought to the front as leaders of the native Irish.

Conn, who was related through his mother to the earl of Kildare (Fitzgerald), became chief of the Tyrone branch of the O'Neills (Cinel Eoghain) about 1520. When Kildare became viceroy in 1524, O'Neill consented to act as his swordbearer in ceremonies of state; but his allegiance was not to be reckoned upon. However, the territory of Tyrone having been invaded in 1541 by Sir Anthony St. Leger, the English lord deputy, Conn delivered up his son as a hostage, attended a parliament held at Trim, and, crossing to England, made his submission at Greenwich to Henry VIII, who created him earl of Tyrone for life. He was also made a privy councillor in Ireland and received a grant of lands. This event created a deep impression in Ireland, where O'Neill's submission to the English king and his acceptance of an English title were resented by his clansmen and dependents.

The resulting feud was aggravated by the nomination of Conn's illegitimate son Matthew as his heir, with the title of baron of Dungannon. Matthew's parentage was actually in doubt, and in addition this nomination by the King was contrary to the Irish law or custom of tanistry. Matthew was murdered by followers of Conn's son Shane in 1558, and Conn died the following year. Elizabeth I settled the chieftainship on Shane but gave the earldom to Matthew's son Hugh.

Tyrone, Hugh O'Neill, 2nd earl of, byname THE GREAT EARL (b. c. 1540—d. July 20, 1616, Rome), Irish rebel who, from 1595 to 1603, led an unsuccessful Roman Catholic uprising against English rule in Ireland. The defeat of O'Neill and the conquest of his province of Ulster was the final step in the subjugation of Ireland by the English.

Although born into the powerful O'Neill family of Ulster, Hugh grew up in London. In 1568 he returned to Ireland and assumed his grandfather's title of earl of Tyrone. By cooperating with the government of Queen Elizabeth I, he established his base of power, and in 1593 he replaced Turlough Luineach O'Neill as chieftain of the O'Neills. Skirmishes between Tyrone's forces and the English in 1595 were followed by three years of fruitless negotiations between the two sides.

In 1598 Tyrone reopened hostilities. His victory (August 14) over the English in the Battle of the Yellow Ford on the Blackwater River, Ulster—the most serious defeat sustained by the English in the Irish wars—sparked a general revolt throughout the country. Pope Clement VIII lent moral support to Tyrone's cause, and in September 1601, 4,000 Spanish troops arrived at Kinsale, Munster, to assist the insurrection. But these reinforcements were quickly surrounded at Kinsale, and Tyrone suffered a staggering defeat (December 1601) while attempting to break the siege. He continued to resist until forced to surrender

on March 30, 1603, six days after the death of Queen Elizabeth.

Elizabeth's successor, King James I, allowed Tyrone to keep most of his lands, but the chieftain soon found that he could not bear the loss of his former independence and prestige. In September 1607 Tyrone, with Rory O'Donnell, earl of Tyrconnell, and about 100 northern chieftains, secretly embarked on a ship bound for Spain. The vessel was blown off course and landed in the Netherlands. From there the refugees made their way to Rome, where they were acclaimed by Pope Paul V This "flight of the earls" signalled the end of Gaelic Ulster; thereafter the province was rapidly Anglicized. Outlawed by the English, O'Neill lived in Rome the rest of his life. See S. O'Faslain, The Great O'Neill (1943).

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

tyrosine, an amino acid comprising about 1 to 6 percent by weight of the mixture obtained by hydrolysis of most proteins. First isolated from casein (1849), tyrosine is particularly abundant in insulin (a hormone) and papain (an enzyme found in fruit of the papaya), which contain 13 percent by weight. Tyrosine is one of several so-called essential amino acids for certain animals; *i.e.*, they cannot synthesize it and require dietary sources. Other species can, however, convert phenylalanine, also an essential amino acid for fowl and mammals, to tyrosine whenever necessary for protein synthesis.

tyrosinemia, also called TYROSINOSIS, inherited inability of the body to metabolize normally the amino acid tyrosine. In the normal metabolic pathway of tyrosine, para-(p-)hydroxyphenylpyruvic acid is converted to homogentisic acid (in the liver) by a specific organic catalyst or enzyme, called p-hydroxyphenylpyruvic acid oxidase. This enzyme is not active in individuals with tyrosinemia. Clinical features of the disease include an increase in concentration of tyrosine in the blood and urine, defects in kidney function, and replacement of liver cells with fibrous tissue. There may also be fewer circulating platelets than normal and an increased pigmentation of the skin. Affected children may develop a form of rickets that does not improve with administration of vitamin D. A diet low in tyrosine and phenylalanine, an amino acid that the body converts to tyrosine, helps keep tyrosinemia under control. This disorder is extremely rare; it is transmitted through a recessive gene.

Tyrrell, George (b. Feb. 6, 1861, Dublin—d. July 15, 1909, Storrington, Sussex, Eng.), Irish-born British Jesuit priest and philosopher, a prominent member of the Modernist movement, which sought to reinterpret traditional Catholic teaching in the light of contemporary knowledge.

Tyrrell was raised in the Anglican Church but converted to Roman Catholicism in 1879 and joined the Society of Jesus the following year. After his ordination in 1891, he was assigned to teach philosophy in a Jesuit college, Stonyhurst College, in Lancashire.

Considering himself within the liberal Catholic tradition exemplified by John Henry Cardinal Newman, Tyrrell argued that each age had the right to adjust the expression of Christianity to current knowledge. His own early liberal views were characterized by an optimism about the ability of Catholic theology to incorporate scientific findings. His commitment to the application of historical and critical methods to theological issues brought him into conflict with popes Leo XIII and Pius X, both of whom endorsed conservative interpretations of the Bible and of church dogma. By

1901 Tyrrell was in open conflict with his Jesuit superiors. His theology grew increasingly liberal, eventually leading him to repudiate Newman and associate himself with the Baron Friedrich von Hügel, an Italian-born philosopher and theologian who introduced Tyrrell to the works of the Continental Modernists.

Books such as Religion as a Factor of Life (1902) and The Church and the Future (1903)—in which Tyrrell, under various pseudonyms, attacked religious authoritarianism—accelerated his fall from favour. In 1906 he was expelled from the Jesuit order. The following year, Pius X issued his crucial encyclical Pascendi Dominici Gregis ("Feeding the Lord's Flock"), in which he condemned Modernism and declared its teachings to be the very essence of heresy. Rather than submit to papal authority, Tyrrell published a letter denouncing the encyclical and was subsequently excommunicated. He settled at Storrington, despondent but determined to remain a Catholic; he refused, however, to retract what he had written and, indeed, continued to write and publish on theological issues. H. Egerton's Father Tyrrell's Modernism appeared in 1909. In 1912 M.D. Petre published Autobiography and Life of George Tyrrell (2 vol.) and in 1920, Letters.

Tyrrell, Sir James (d. 1502, London), English soldier and royal official alleged by the 16th-century Humanist Sir Thomas More to have murdered the 12-year-old king Edward V and his younger brother Richard in the Tower of London in August 1483. Modern research has shown that there is little evidence for More's allegation.

Tyrrell fought on the Yorkist side in their victory over the Lancastrians at Tewkesbury in 1471, and he was knighted after the battle. Sometime during the next decade he became a servant of Richard of Gloucester. In 1482 he was made a knight banneret for his service in Richard's wars in Scotland, and after Richard became King Richard III, he was master of the royal henchmen. Thus More, in his History of King Richard III, was misinformed in claiming that Richard was not well acquainted with Tyrrell before supposedly commissioning him to perform the murders; it also seems incorrect to assert, as More does, that Tyrrell was knighted as his reward for committing the crimes.

Richard III's successor, King Henry VII, made Tyrrell governor of Guisnes Castle, which guarded the English-held port of Calais, Fr., but in 1502 the King had Tyrrell executed for harbouring a traitor. More claims that, shortly before his death, Tyrrell confessed to the murder of the princes, but this confession is mentioned in no other source. It has never been proved conclusively that Richard III ordered the princes killed, and Tyrrell's involvement in the crime is even more doubtful.

Tyrrell, Lake, shallow, salt-crusted depression of 70 sq mi (180 sq km), in the Mallee district, northwestern Victoria, Australia, 195 mi (314 km) northwest of Melbourne. Usually dry, it is occasionally fed by Tyrrell Creek. An extraction plant at Sea Lake, a town on the lake's south shore, harvests the salt deposits. The lake was visited (1838) by Edward Eyre, who was seeking new grazing lands, and was named after an early settler in the Port Phillip area of South Australia.

Tyrrhenian Sea, Latin MARE TYRRHENUM, Italian MARE TIRRENO, arm of the Mediterranean Sea, between the western coast of Italy and the islands of Corsica, Sardinia, and Sicily. It is connected with the Ligurian Sea (northwest) through the Tuscan Archipelago and with the Ionian Sea (southeast) through the Strait of Messina. Chief inlets of the sea include the Bay of Naples and the gulfs of Gaeta, Salerno, Policastro, and Sant'Eufemia. Islands within the sea are located in the north

(Tuscan Archipelago, including Elba), east, and southeast (islands of Eolie). Ports include Civitavecchia, Pozzuoli, Naples, Salerno, and Palermo (in Sicily).

Tyrrhenian Stage, major division of Pleistocene deposits and time in Mediterranean Europe (the Pleistocene Epoch began about 2,500,000 years ago and ended about 10,000 years ago). The Tyrrhenian Stage precedes the Flandrian Stage, which is partly Pleistocene and partly Holocene (younger than 10,000 years old) in age. The Tyrrhenian is characterized by a faunal assemblage in which warm-water forms predominate.

Tyrtaeus (fl. c. 650 BC, Sparta), Greek elegiac poet, author of stirring poetry on military themes supposedly composed to help Sparta win the Second Messenian War.

Greek tradition after Tyrtaeus' time claimed that he was an Athenian or Milesian schoolmaster, sent to Sparta in reluctant compliance with an oracle, to strengthen Spartan morale. It is probable, however, that stories of his non-Laconian origin were invented after the 6th-century revolution at Sparta, when other Greeks could no longer imagine that Sparta had ever been able to produce its own poets.

Only fragments of Tyrtaeus' poems survive; these combine exhortations to courage and self-discipline with reminders of past victories and assurances of future successes.

Tyrwhitt, Thomas (b. March 27, 1730, London—d. Aug. 15, 1786, London), English scholar especially notable for his work on the medieval English poet Geoffrey Chaucer. In classical and English scholarship alike, Tyrwhitt showed the same qualities of balance,

Tyrwhitt, engraving BBC Hulton Picture Library

wide knowledge, and critical acumen. (He was the one man able, on linguistic grounds alone, to denounce as a forgery the poems by Thomas Chatterton purporting to be by one "Thomas Payalau")

"Thomas Rowley.")

After leaving Oxford University, he was called to the bar but never practiced. Deputy secretary of war (1756), then clerk of the House of Commons (1762), he retired in 1768. He edited Aristotle's *Poetics* (1794), but his fame rests chiefly upon an edition of Chaucer's Canterbury Tales, 5 vol. (1775–78). Chaucer's reputation had suffered because the principles on which his verse depends were no longer understood; it was Tyrwhitt who pointed out that final e's (by his time mute) ought to be pronounced as separate syllables and that the accent of a word was often placed in the French manner (e.g., virtúe, not vírtue). Tyrwhitt's scholarship is still held in great respect.

Tyson, Edward (b. 1650, Clevedon, Somerset, Eng.—d. Aug. 1, 1708), English physician and pioneer of comparative anatomy whose delineation of the similarities and differences between men and apes provided an empirical basis for the study of man and not only suggested a continuity of animality and humanity, but also indicated the existence of definite relationships between humans and other primates

Tyson's comparisons, set forth in his landmark treatise (1699) of anthropology and comparative anatomy, remarkable for its empirical approach, proved so accurate that they served as an aid to naturalists 150 years later. He thought, however, that the chimpanzees from which he made his observations were pygmies and believed them to be the "missing link."

Tytler, James (b. c. 1747, Fearn, Ross and Cromarty, Scot.—d. Jan. 11, 1804, Salem, Mass., U.S.), Scottish editor of *Encyclopædia Britannica*'s second edition, who was sometimes called "Balloon Tytler" because of his experiments in aeronautics.

Known in Edinburgh as a debt-ridden eccentric, between 1776 and 1784 Tytler almost single-handedly revised the original edition of *Encyclopadia Britannica*, enlarging it from three to ten volumes, including historical and biographical material for the first time. He was one of the first men in Britain to attempt a balloon ascension (August 1784). A political radical, he was forced to emigrate in 1792 because a handbill he had printed was deemed seditious. Tytler ended his days as a newspaper publisher in the United States.

Tyumen, also spelled TIUMEN, or T'UMEN', oblast (administrative region), northern Russian Soviet Federated Socialist Republic, occupying an area of 554,100 sq mi (1,435,200 sq km) in the Ob-Irtysh Basin. In the extreme west the Urals attain 6,214 ft (1,894 m) in Mt. Narodnaya, but the remainder of the huge area is a low, exceptionally flat plain, with innumerable lakes and very extensive swamps. The *oblast* stretches from tundra in the north, with its scanty vegetation of mosses and lichens and poor soils, through dense swamp forests, or taiga, of spruce, fir, pine, larch, and birch, to forest-steppe with birch in the south. More than 80 percent of the area is occupied by the Khanty-Mansi and Yamalo-Nenets autonomous okruga (qq.v.). Tyumen city is the administrative centre.

Until the 1960s economic activity was confined to timber working, fur trapping, and reindeer herding, and communications were extremely sparse; only in the forest-steppe south was agriculture important. Major oil deposits were opened in the 1960s along the Ob, with Surgut and Nadym as the main centres. Towns and communications have developed as a result of increasing production. Pop. (1983 est.) 2,293,000.

Tyumen, also spelled TIUMEN, or T'UMEN', city and administrative centre of Tyumen oblast (region), Russian Soviet Federated Socialist Republic, in the southwestern part of the West Siberian Plain. It is situated on both banks of the Tura River at its crossing by the Trans-Siberian Railroad. Founded in 1586, it is the oldest Russian city in Siberia, located on the site of a Tatar town, Chingi-Tura, founded in the 14th century. A river port, it functions as a transshipment point. Its main industries are metalworking, engineering, shipbuilding, timber products, and chemicals. The city grew rapidly after the discovery of oil and gas farther to the north in Western Siberia. Pop. (1983 est.) 397,000.

Tyuratam (Soviet Union): see Baykonyr.

Tyus, Wyomia (b. Aug. 29, 1945, Griffin, Ga., U.S.), U.S. sprinter who held the world record for the 100-metre race (1964–65, 1968–72) and was the first woman to win the Olympic Games gold medal in the event twice.

Tyus began running in junior high school and continued at Tennessee State University (Nashville), from which she was graduated in 1967. In the 1964 Olympic Games at Tokyo,

she won the gold medal with a time of 11.4 seconds. In the same year, she won the 100metre race in the Amateur Athletic Union (AAU) meet, and she won the 100-yard dash in the 1965 and 1966 AAU meets. In 1966 Tyus also won the 220-yard dash and was the AAU champion in the 60-yard dash (1965-67). In 1965 she tied the world record for the 100-yard dash, and then in 1968 she set a world record for the 100 metres in the Olympic Games at Mexico City with a time of 11.08 seconds. In those games she also placed sixth in the 200-metre race and was a member of the 4 × 100-metre relay team that won the gold medal. In 1973 Tyus entered professional track competitions, and later she frequently served as a television sports commentator.

Tyutchev, Fyodor Ivanovich, Tyutchev also spelled TIUTCHEV (b. Dec. 5 [Nov. 23, Old Style], 1803, Ovstug, Russia—d. July 27 [July 15], 1873, St. Petersburg [Leningrad]), Russian writer who was remarkable both as a highly original philosophic poet and as a mili-

Tyutchev Novosti Press Agency

tant Slavophile and whose whole work constitutes a struggle to fuse political passion with poetic imagination.

The son of a wealthy landowner, educated at home and at Moscow University, Tyutchev served his country as a diplomat in Munich and Turin. In Germany he developed a friendship with the poet Heinrich Heine and met frequently with the idealist philosopher Friedrich W.J. von Schelling. His protracted expatriate life, however, only made Tyutchev more Russian at heart. Though the bare and poverty-stricken Russian countryside depressed him, he voiced a proud, intimate, and tragic vision of the motherland in his poetry. He also wrote political articles and political verses, both of which reflect his reactionary nationalist and Pan-Slavist views, as well as his deep love of Russia. He once wrote, "I love poetry and my country above all else in the world.

Tyutchev's love poems, most of them inspired by his liaison with his daughter's governess, are among the most passionate and poignant in the Russian language. He is regarded as one of the three greatest Russian poets of the 19th century, making a trinity with Aleksandr Pushkin and Mikhail Lermontov.

tyuyamunite, radioactive, yellow, soft, and waxy uranium and vanadium oxide mineral, $Ca(UO_2)_2(VO_4)_2 \cdot nH_2O$. It is considered to be the calcium analogue of carnotite, from which it can be made artificially and reversibly by cation exchange (calcium exchanges places with potassium in carnotite's molecular structure). Tyuyamunite occurs widely with carnotite in the southwestern United States and Turkistan, U.S.S.R. For detailed physical properties, *see* vanadate mineral (table).

Tyva (Russian S.F.S.R.): *see* Tuvinian Autonomous Soviet Socialist Republic.

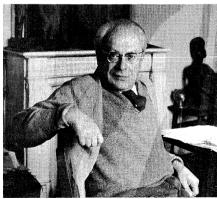

tzaddiq, also spelled TSADDIK, Or ZADDIK (Hebrew: "righteous man"), plural TZADDIQIM, TSADDIKIM, or ZADDIKIM, one who embodies the religious ideals of Judaism. In the Bible, a tzaddiq is a just or righteous man (Genesis 6:9), who, if a ruler, rules justly or righteously (II Samuel 23:3) and who takes joy in justice (Proverbs 21:15). The Talmud (compendium of Jewish law, lore, and commentary) asserts that the continued existence of the world is due to the merits of 36 individuals, each of whom is gamur tzaddiq ("completely righteous"). While recognizing that tzaddiqim have special privileges, the Talmud also notes their special obligations. They are at least partially responsible for the sins of their generation.

In the 18th-century Pietistic movement known as Hasidism, the Jewish religious leader (tzaddiq) was viewed as a mediator between man and God. Because the tzaddiq's life was expected to be a living expression of the Torah, his behaviour was even more important than his doctrine. Rabbi Leib, a disciple of Dov Baer of Mezhirich, thus was said to have visited his master not to hear explanations of the Torah but to see how Dov Baer laced and unlaced his shoes.

In early Hasidism, the tzaddiq traveled widely and often seemed to engage in such secular matters as idle talk and the consumption of wine. The Hasidic formula for such conduct was "descent on behalf of ascent" ('aliyya tzrikha yerida)—a calculated risk to strengthen the spiritual life of the Jewish community. Whereas some tzaddiqim lived simple and humble lives, others sought wealth and luxury. Toward the end of the 18th century the tzaddiqim ceased to travel. Thereafter, they were available at home for those who sought advice and instructions. This change gave rise to "practical tzaddiqism," a development that included, among other things, the writing of a quittel ("prayer note") to guarantee the success of petitions made by visitors who offered money for the service. Such developments contributed to the gradual deterioration of an institution that had earlier been a vital spiritual force within Jewish communities.

tzar, feminine TZARINA: see tsar.

Tzara, Tristan (b. 1896, Moineşti, Rom.—d. December 1963, Paris), Romanian-born French poet and essayist known mainly as the founder of Dada, a nihilistic revolutionary movement in the arts, the purpose of which

Tzara Maywald

was the demolition of all the values of modern civilization.

The Dadaist movement originated in Zürich during World War I, with the participation of the artists Jean Arp, Francis Picabia, and Marcel Duchamp. Tzara wrote the first Dada texts—La Première Aventure céleste de Monsieur Antipyrine (1916; "The First Heavenly Adventure of Mr. Antipyrine") and Vingteing poèmes (1918; "Twenty-Five Poems")—and the movement's manifestos, Sept Manifestes

Dada (1924; "Seven Dada Manifestos"). In Paris he engaged in tumultuous activities with André Breton, Philippe Soupault, and Louis Aragon to shock the public and to disintegrate the structures of language. In about 1930, weary of nihilism and destruction, he joined his friends in the more constructive activities of Surrealism. He devoted much time to the reconciliation of Surrealism and Marxism and joined the Communist Party in 1936 and the French Resistance movement during World War II. These political commitments brought him closer to his fellowmen, and he gradually matured into a lyrical poet. His poems revealed the anguish of his soul, caught between revolt and wonderment at the daily tragedy of the human condition. His mature works started with L'Homme approximatif (1931; "The Approximate Man") and continued with Parler seul (1950; "Speaking Alone") and La Face intérieure (1953; "The Inner Face"). In these, the anarchically scrambled words of Dada were replaced with a difficult but humanized language.

Tzedog (sect): see Sadducee.

Tzeltal, Mayan Indians of central Chiapas in southeastern Mexico, most closely related culturally and linguistically to their neighbours to the west, the Tzotzil (q, v). The habitat of the Tzeltal varies from plains and gentle hills to high peaks; climate and vegetation vary with

Tzeltal Indian woman Donald Cordry

altitude. The Indians are agricultural, growing corn (maize), beans of several varieties, and chilies as staples. Squash, manioc, and peanuts (groundnuts) are also planted. Cultivation is with the digging stick and the hoe. Settlement is in villages and surrounding hamlets; in many communities, however, only non-Indians live in the villages proper. Houses are of logs or wattle and daub, with thatched roofs. Ceramics, spinning, weaving, mat making, and basketmaking are the major crafts. Each community has its own clothing styles, generally traditional. Basically, men's clothing consists of short pants and a knee-length shirt, hat, sandals, and a red sash; women's clothing is a long wraparound skirt of wool, a sash, a cotton blouse or tunic, and a rebozo, or shawl. Women always go barefoot.

The ritual kinship institution (compadrazgo) occurs but is strongest in communities with influential mixed (ladino) or non-Indian populations. In more traditional locales, godparents (compadres) are chosen only at baptism, and the ties invoked are often informal. Religion is Roman Catholic, with a degree of pagan syncretism. The laymen's religious society (cofradía) elects officers in charge of organizing and financing the fiesta of the local patron saint and caring for the saint's image. A number of non-Christian rituals are also common.

Tzetzes, John (fl. 12th century AD, Constantinople), Byzantine didactic poet and scholar

who preserved much valuable information from ancient Greek literature and scholarship, in which he was widely read.

Tzetzes was for a time secretary to a provincial governor, then earned a meagre living by teaching and writing. He has been described as the perfect specimen of the Byzantine pedant. His literary and scholarly output was enormous, although it contained many inaccuracies—mostly because he was quoting from memory, lacking books, which he said his poverty forced him to do without.

Of his numerous and varied works the most important is the Chiliades ("Thousands"). Also known as the Book of Histories, the work is a long poem (more than 12,000 lines of 15 syllables) containing literary, historical, antiquarian, and mythological miscellanies, intended to serve as a commentary on Tzetzes' own letters, which are addressed to friends and famous contemporaries as well as to fictitious persons. Though the whole work suffers from an unnecessary display of learning, the total number of authors quoted being more than 400, it contains much information unavailable elsewhere. Another work is Allegoriai on the *Iliad* and the *Odyssey*, two long didactic poems containing interpretations of Homeric theology

Tzevi, Shabbetai (Jewish false messiah): *see* Shabbetai Tzevi.

Tziá (Greece): see Kéa.

Tzotzil, Mayan Indians of central Chiapas in southeastern Mexico. Linguistically and culturally the Tzotzil are most closely related to the neighbouring Tzeltal (q.v.). The habitat of the Tzotzil is highland, with mountains, volcanic outcroppings, and valley lowlands. The climate at high altitudes is cool to cold, and summers are very wet. The native Tzotzil live mainly in the higher reaches. They are agricultural, growing chiefly corn (maize), beans, and squash. Fields are burned to clear them and planted and cultivated with the hoe and digging stick. Vegetables and cash crops such as peaches are also raised. Sheep are kept, primarily for their wool, and there are occasional chickens, turkeys, and pigs. There is also some hunting and fishing. Pottery is made in some areas, and weaving is universal. Baskets, nets, hammocks, hats, and rope are made of fibre products as well. Carpentry, stonework, and leatherwork are skills of the Bohom (Chamula) region.

Houses are built of a variety of materials, including wattle and daub, poles, and lumber. Thatched roofs are usual. Households are generally congregated loosely around a central village. Clothing styles vary a good deal from community to community, but basically they consist of shirt, short pants, neckerchief,

Tzotzil Indian musicians playing in Tuxtla Gutiérrez, Mex.

Donald Cordry

hat, and, for warmth, a wool poncho for men; women wear a blouse or *huipil* (long overblouse or tunic), long skirt, sash, and shawl. Colours, styles, materials and decorative elements of clothing vary considerably.

Ritual kinship (compadrazgo) is frequent, the extent of the institution depending on the extent of observance of Roman Catholic sacraments, because such sacraments are considered the proper occasion for establishment of ritual ties. In some communities organized Catholicism is weak, but Christian mythology is intertwined with native beliefs in all areas.

tz'u, in Chinese poetry, song form characterized by lines of unequal length, with prescribed rhyme schemes and tonal patterns, each bearing the name of a musical air. The varying line lengths are comparable to the natural rhythm of speech and therefore easily understood when sung. First sung by ordinary folk, they were popularized by professional women singers and poets during the T'ang dynasty (618–907). The tz'u served as a major vehicle for Sung dynasty (960–1279) verse.

Tzu-ang (painter): see Chao Meng-fu.

Tz'u-chou ware, Pinyin CIZHOU, stoneware produced in Chihli Province, northern China, during the Sung (960–1279), Yuan (1279–1368), and Ming (1368–1644) dynasties. Vases, bottles, and other vessels are decorated with simple but marvellously assured brushwork in brown, black, or gray on a white, cream, buff, or, occasionally, turquoise

Tz'u-chou stoneware jug, Sung dynasty (AD 960-1279); in the Museum of Fine Arts, Roston

By courtesy of the Museum of Fine Arts, Boston, Hoyt Collection

background; the pale background is achieved by applying a coating of slip (semi-liquid clay) to the body of the vessel before firing. Bold strokes, curves, seemingly haphazard splotches, freehand concentric bands around the vessel, and sketchy animals and birds are typical decorative motifs. Another type of ornamentation consists of incisions in the slip coating that reveal the contrasting colour of the body beneath.

Tz'u-hsi, Pinyin CIXI, also called (Wade-Giles romanization) HSIAO-CH'IN, or HSIEN HUANG-HOU, byname EMPRESS DOWAGER (b. Nov. 29, 1835, Peking—d. Nov. 15, 1908, Peking), consort of the Hsien-feng emperor (reigned 1850-61), mother of the T'ung-chih emperor (reigned 1861-75), and adoptive mother of the Kuang-hsü emperor (reigned 1875-1908), who dominated the Chinese empire for almost half a century. Ruling through a clique of conservative, corrupt officials, she maintained an iron grip over the Manchu Imperial house (Ch'ing dynasty, 1644-1911/12), becoming one of the most powerful women in the history of China.

A low-ranking concubine to the Hsien-feng emperor, Tz'u-hsi bore his only son in 1856.

On Hsien-feng's death, the six-year-old boy became the T'ung-chih emperor; state business was put in the hands of a regency council of eight elder officials. The regency was transferred to Tz'u-hsi and Hsien-feng's former senior consort, Tz'u-an, a few months later as a result of their clever plotting. The two empress dowagers were aided in their intriguing by Prince Kung, the former emperor's brother, who then became the prince counsellor.

Under this triumviral rule, the government entered a temporary period of revitalization; the great Taiping Rebellion (1850–64), which had devastated South China, was quelled, as was the Nien Rebellion (1853–68) in the northern provinces. Schools were created for the study of foreign languages, a modern customs service was instituted, Western-style arsenals were constructed, and the first Chinese foreign service office was installed. Internally, an effort was made to end governmental corruption and to recruit men of talent.

Although the regency was terminated in 1873 after the T'ung-chih emperor attained maturity, Tz'u-hsi's control over state affairs continued. It was even rumoured that she hastened the demise of the young emperor by leading him into excesses and disrupting his personal life. Following T'ung-chih's death, Tz'u-hsi, with the support of the army, flagrantly violated the succession laws and had her three-year-old nephew, whom she adopted, named as the new heir. The two empress dowagers thus continued to act as regents, but after Tz'u-an's sudden death in 1881, Tz'uhsi became the sole holder of the office. Three years later, she displaced Prince Kung, having long since sabotaged most of his reform programs.

In 1889 Tz'u-hsi nominally relinquished control over the government to retire to the magnificent summer palace she had rebuilt northwest of Peking. But in 1898, a few years after the shocking defeat of the Chinese forces in the Sino-Japanese War (1894-95), the young Kuang-hsü emperor, under the influence of a group of reformers, put through a number of radical proposals designed to renovate and modernize the Chinese government and to eliminate corruption. But conservative officials collected around Tz'u-hsi, who again used the military to institute a coup. The new reforms were reversed, the Emperor was confined to his palace, and Tz'u-hsi resumed the regency. Most historians believe that China's last chance for peaceful change thus ended.

The following year Tz'u-hsi began to back

Tz'u-hsi, c. 1904

By courtesy of the Smithsonian Institution, Freer Gallery of Art, Washington, D.C.

those officials who were encouraging the anti-foreign Boxer rebels. In 1900 the Boxer Rebellion reached its peak; some 100 foreigners were killed, and the foreign legations in Peking were surrounded. But a coalition of foreign troops soon captured the capital, and Tz'u-hsi was forced to flee the city and accept the humiliating peace terms. Returning to Peking in 1902, she finally began to implement many of the innovations she had reversed in 1898, although the Kuanghsü emperor was not allowed to participate in the government. The day before Tz'u-hsi died, Kuang-hsü's death was announced, presumably from poison, in accordance with her deathbed command.

tzu-ian (Chinese: "naturalness"), in Chinese Taoism, an ideal state of human existence that results from living in complete harmony with the forces of nature. Taoists, observing that everything in the world has its natural state, strive to attain a state of complete spontaneity in order to become what nature intended them to be. As a consequence, life becomes exceedingly simple; and such things as life and death, good health and illness are accepted as part of the irresistible cycle of nature, which ceaselessly makes and unmakes the world. Unlike the rest of the universe, however, man must resolve to bring his existence into conformity with the forces of nature. He can do this best by first observing the ever-changing world about him and then "fatalistically" abstaining from struggle against powers beyond

Tzu-kung, Pinyin zigong, city in central Szechwan Province (sheng), China. Tzu-kung is a prefecture-level municipality (shih), which was formed in 1939 by the merger of Kung-ching—a great salt-producing district with a history dating to the 7th century AD—and the rapidly developing town of Tzu-liu-ching. The city is situated on the Ching Ho (river), a tributary of the T'o Chiang (river), and the area is connected by rail to Nei-chiang and by highway to such surrounding cities as Le-shan and Lu-chou. Tzukung's prosperity was long dependent on its salt industry; deep drilling for brine has been an established practice in the area since the 9th century. In recent times important deposits of oil and natural gas have also been discovered and exploited. Natural gas had already been in use since early times as a fuel to evaporate the brine. On the basis of its salt production, Tzu-kung has built up a large and varied chemical industry, producing potassium chloride, bromine, iodine, barium salts, and other products. Fertilizers are another important by-product, and Tzu-kung salt is used extensively by the chemical works at nearby Le-shan. Tzu-kung also has engineering works,

and there is a power generating plant using coal from Le-shan and from Huang-chin-k'ou further north. Pop. (1980 UN est.) 738,000.

Tzu-po, also called CHANG-TIEN, Pinyin ZIBO, or ZHANGDIAN, industrial city and municipality (shih), central Shantung Province (sheng), China. The core of the present 1,135-sq-mi (2,935-sq km) autonomous subprovincial-level municipality was formed under the People's Republic by amalgamating the two counties (hsien) of Tzu-ch'eng (Tzu-ch'uan) and Po-shan, which together form the richest coal field and mining area in the province. Tzuch'eng was an old-established city and administrative centre. Pan-yang County (hsien) was established there in the 2nd century BC; it subsequently fell into abeyance in the 3rd century AD but was revived in the 6th century under the name Pei-ch'iu County. In 596 it became the seat of a prefecture, Tzu-chou, and in 598 received the name Tzu-ch'uan, by which it was long known. It remained an important administrative centre and was also a focus of routes, being situated on the route skirting the northern edge of the T'ai Shan (mountains), at the mouth of the valley leading up to Po-shan and to a pass over the mountains. Po-shan itself was a later development, originally comprising two towns—Po-shan proper, which was first walled in 1558, and Yen-chen-chen. The centre of an important ceramic and glass industry, in the 16th century it was rich enough to warrant having its own tax bureau. In 1734 the city had developed enough to become an independent county.

Its 20th-century development into a major industrial complex began with the completion in 1904 of the railway linking Tsingtao to Chi-nan, passing to the north of Tzuch'eng town, through the important market towns of Chang-tien (now the seat of Tzu-po municipality) and Chou-ts'un. A branch line was built by the Germans from Chang-tien to Po-shan, however, after they acquired coal-mining rights in a zone along the railway and began mining in the area around Tzu-ch'eng. During World War I the Japanese controlled both the railway and the mines; in 1921 the mines came under the control of a Sino-Japanese company, the Lu-ta Colliery Company. The Po-shan mines, which were developed later, in 1924, also passed into the control of a Sino-Japanese firm, the Po-tung Company.

By the time of the Japanese invasion in 1937, Po-shan had outstripped Tzu-ch'eng in production, producing 1,000,000 tons annually to Tzu-ch'eng's 600,000 tons. The local iron industry was also established before World War II. In 1919 the Japanese had founded the Chin-ling-chen Ironworks on the main railway line a few miles east of Chang-tien, using supplies of local iron ore and coking coal from Tzu-ch'eng.

After 1949, when the whole area was merged

After 1949, when the whole area was merged into a single municipality, it was developed

into a major industrial base. During the 1950s and 1960s, when Po-shan was the seat of the municipality, it took the administrative name of the municipality, Tzu-po; subsequently, when the seat was removed to Chang-tien, it took the name of Tzu-po, and Po-shan resumed its former name. By 1963 the city of Tzu-po (Po-shan) had outstripped Tsingtao as Shantung's greatest industrial city. Between 1953 and 1958 the municipality's population rose from 259,000 to 875,000. Within the enlarged municipality, growth was concentrated at Po-shan and Tzu-po (the former Changtien), each of which in the early 1970s was considerably bigger than Tzu-ch'eng; the municipality then had a total population of more than 1,200,000.

Mining and heavy industry, machine building, and the manufacture of electrical equipment and batteries were all major enterprises. In addition to the traditional ceramic and glass industries, firebrick, refractory materials, and industrial ceramics are also manufactured. There is also an important chemical industry. While heavy industry is concentrated in Tzuch'eng and Po-shan, Tzu-po (Chang-tien) and Chou-t'un—in addition to their growing roles as transportation centres—have developed as centres of textile manufacturing and food processing. Pop. (1983 est.) mun. 2,234,000.

Tzu Ssu, Pinyin zi si, also called (Wade-Gile romanization) k'ung chi (b. 483—d. 402 bc), Chinese philosopher, grandson of Confucius, native of the ancient state of Lu (present Shantung province), and according to tradition, the author of the Doctrine of the Mean. This classic, now part of the Li Chi ("Record of Rites") and classified as one of the Four Books, reaffirms Confucius' interpretation of the mean as the state of equilibrium (chung yung) of the exemplary man. The work also broadens the concept of mean through its discussion of the "timely mean" (shih chung) that is relative and varies according to situation.

Tzutuiil, also spelled zutuhil, or tzutuhil, Mayan Indians of the midwestern highlands of Guatemala. The Tzutujil language is closely related to those of the neighbouring Cakchiquel and Quiché (qq.v.). The Tzutujil, like the neighbouring Mayan peoples, are agricultural, growing the Indian staple crops—corn (maize), beans, and squash. They also keep a few domestic animals such as sheep, pigs, and chickens. The people live in *municipios*, districts or communities oriented around central villages; the villages themselves are not usually permanently inhabited in this region. The Indians consider themselves members of the municipio rather than Tzutujil or Guatemalan. The basic cultural pattern is very similar to that of the Ouiché or the Cakchiquel; custom and dress vary to some extent from one municipio to the next. See also Maya.

U (Burmese title): see under proper name (e.g., Nu, U).

U-2, single-seat, U.S. high-altitude jet reconnaissance and research aircraft. A prototype flew in 1955. On May 1, 1960, a U-2 was shot down over the Soviet Union (see U-2 Affair), and in 1962 a U-2 took photographs that confirmed the presence of Soviet missiles in Cuba. The U-2 had a top speed of 494 miles (795 km) per hour and a service ceiling of approximately 70,000 feet (21,000 m).

The U-2 was replaced in U.S. service in the mid-1960s by the SR-71 Blackbird, a two-jet aircraft constructed mainly of titanium, capable of flying at even higher altitudes than the U-2 and at speeds exceeding 2,000 miles per hour (3,200 kilometres per hour). It could survey 100,000 square miles (260,000 square km) of the Earth's surface in one hour. Artificial satellites now accomplish most observations formerly undertaken by the U-2 and SR-71.

U-2 Affair (1960), confrontation between the United States and the Soviet Union that began with the shooting down of a U.S. U-2 reconnaissance plane over the Soviet Union and that caused the collapse of a summit conference in Paris between the United States, the Soviet Union, Great Britain, and France. On May 5 the Soviet premier Nikita S. Khrushchev told the Supreme Soviet of the U.S.S.R. that an American spy plane had been shot down on May 1 over Sverdlovsk, referring to the flight as an "aggressive act" by the United States.

On May 7 he revealed that the pilot of the plane, Francis Gary Powers, had parachuted to safety, was alive and well in Moscow, and had testified that he had taken off from Peshāwar, in Pakistan, with the mission of flying across the Soviet Union over the Aral Sea and via Sverdlovsk, Kirov, Arkhangelsk, and Murmansk to Bodö military airfield in Norway, collecting intelligence information en route. Powers admitted working for the U.S. Central

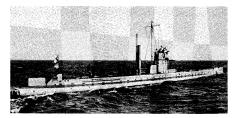

Intelligence Agency.

On May 7 the United States stated that there had been no authorization for any such flight as Khrushchev had described, although a U-2 probably had flown over Soviet territory. The Soviet Union refused to accept that the U.S. government had had no knowledge of the flights and on May 13 sent protest notes to Turkey, Pakistan, and Norway, which in turn protested to the United States, seeking assurances that no U.S. aircraft would be allowed to use their territories for unauthorized purposes. On May 16 in Paris Khrushchev declared that the Soviet Union could not take part in the summit talks unless the U.S. government immediately stopped flights over Soviet territory, apologized for those already made, and punished the persons responsible. The response of President Dwight D. Eisenhower, promising to suspend all such flights during the remainder of his presidency, did not satisfy the Soviet Union, and the conference was adjourned on May 17.

Francis Gary Powers was tried (August 17-19) and sentenced to 10 years' confinement, but he was exchanged for the Soviet spy Rudolf Abel on Feb. 10, 1962.

U-boat, German U-BOOT, abbreviation of UNTERSEEBOOT ("undersea boat"), a German submarine. The destruction of enemy shipping by German U-boats was a spectacular feature of both World Wars I and II.

World War I. Germany was the first country to employ submarines in war as substitutes for surface commerce raiders. At the outset of World War I, German U-boats, though numbering only 38, achieved notable successes against British warships; but because of the reactions of neutral powers (especially the United States) Germany hesitated before adopting unrestricted U-boat warfare against merchant ships. The decision to do so in

U-boat of World War II

By courtesy of the Bundesarchiv, Freiburg im Breisgau

February 1917 was largely responsible for the entry of the United States into the war. The U-boat campaign then became a race between German sinkings of merchant ships and the building of ships, mainly in the United States, to replace them. In April 1917, 430 Allied and neutral ships totaling 852,000 tons were sunk, and it seemed likely that the German gamble would succeed. However, the introduction of convoys, the arrival of numerous U.S. destroyers, and the vast output of American shipyards turned the tables. By the end of the war Germany had built 334 U-boats and had 226 under construction. The peak U-boat strength of 140 was reached in October 1917, but there were never more than about 60 at sea at one time. In 1914-18 the destructionmore than 10,000,000 tons—caused by the U-boats was especially remarkable in view of the small size (less than 1,000 tons), frailty, and vulnerability of the craft.

World War II. The Armistice terms of 1918 required Germany to surrender all its U-boats, and the Treaty of Versailles forbade it to possess them in the future. In 1935, however, Adolf Hitler's Germany repudiated the treaty and forcefully negotiated the right to build U-boats. Britain was ill-prepared in 1939 for a resumption of unrestricted submarine warfare, and during the early months of World War II the U-boats, which at that time numbered only 57, again achieved great successes. The first phase, during which the U-boats generally operated singly, ended in March 1941, by which time many merchant ships were sailing in convoy, trained escort groups were becoming available, and aircraft were proving their effectiveness as anti-U-boat weapons. In the next phase the Germans, having acquired air and U-boat bases in Norway and western France, were able to reach much farther out into the Atlantic, and their U-boats began to operate in groups (called wolf packs by the British). One U-boat would shadow a convoy and summon others by radio, and then the group would attack, generally on the surface at night. These tactics succeeded until radar came to the aid of the escorts and until convoys could be given continuous sea and air escort all the way across the Atlantic in both directions. In March 1943, as in April 1917, the Germans nearly succeeded in cutting Britain's Atlantic lifeline, but by May escort carriers and very-long-range reconnaissance bombers became available. After the U-boats lost 41 of their number during that month, they withdrew temporarily from the Atlantic.

In the next phase, U-boats were sent to remote waters where unescorted targets could still be found. Although at first they achieved considerable successes, especially in the Indian Ocean, the Allied strategy of striking at the U-boats' supply vessels and putting all possible shipping into convoys again proved successful. In the final phase the U-boats—then fitted with the snorkel (schnorkel) ventilating tube, which permitted extended underwater travel and greatly reduced the effectiveness of radar—returned to the coastal waters around the British Isles, but they sank few ships and themselves suffered heavy losses.

In World War II Germany built 1,162 U-boats, of which 785 were destroyed and the remainder surrendered (or were scuttled to avoid surrender) at the capitulation. Of the 632 U-boats sunk at sea, Allied surface ships and shore-based aircraft accounted for the great majority (246 and 245 respectively).

U Geminorum star, any of a class of irregular variable stars that display sudden increases in brightness so great that they are sometimes called dwarf novae. Some have been observed to brighten by as much as 5 magnitudes (100 times) in a period of hours. The prototype star, U Geminorum, brightens by as much as 4 magnitudes (about 40 times) in a few days, declining again to normal brightness in two or three weeks. U Geminorum was the first of the class to be discovered, in 1855, by the English astronomer John Russell Hind. Fewer than 200 U Geminorum stars are known; sometimes they are called SS Cygni stars, after the brightest known member of the class.

U Thong style, one of the canonical styles for Buddha icons developed in Thailand (Siam) in the southern capital of Ayutthaya, beginning in the 14th century. To retain the greatest spiritual potency, Buddha icons in Thai temples had to resemble as closely as possible an original prototype that tradition erroneously believed had been made during the lifetime

Buddha, bronze, U Thong style, 13th-14th century; in the Musée Guimet, Paris
Cliche Musees Nationaux, Paris

of the Buddha. Of the three major efforts by Thai kings to establish an "authentic" canon for the icons, the Sukhothai style (q.v.) was the first, followed by the U Thong and the lion types.

The populace of southern Thailand, which captured Sukhothai in approximately 1350, was in the 14th century still largely Mon, and the fusion of styles resulted in the more solid, corporeal, and squared-off U Thong image. Although the resulting changes may be seen most readily in the shape of the head, now more square than oval, and the broader, more sober features, there is also an increased heaviness of the body, no longer weightless but firmly seated on the ground. While the Sukhothai style is characterized by linear emphasis, the U Thong style again shows concern for solidity and modeling. At the same time, the U Thong images are rather stolid and lack the linear excitement and uniquely Thai character of Sukhothai art. U Thong style, like Sukhothai style, is still copied in Thailand.

Uaimh, An (Ireland): see Navan.

uakari (*Cacajao*), any of several diurnal monkeys, belonging to the Cebidae, the only fam-

ily of short-tailed American monkeys. Uakaris are about 35-50 cm (14-20 inches) long, excluding their 15-20-centimetre (6-8-inch) tails. They have bare faces, which become

Red uakari (Cacajao rubicundus)
Tierbilder Okapia, Frankfurt am Main

flushed in excitement, and long, shaggy fur. Colour in the three species is grayish with a pink face, reddish with a bright scarlet face, and brownish with a black face.

Uakaris are rare and are confined to certain forest ranges along the Amazon River. They are said to live in small groups and are found among the higher branches. They are quadrupedal and feed on nuts, fruit, and vegetation. Uakaris are captured by the Amazonian Indians; the young are kept as pets, the adults eaten. In general, uakaris do not do well in captivity. All species are listed as vulnerable or endangered in the *Red Data Book*.

Uaxactún, ruined ancient Mayan city of the southern lowlands, located in what is now north-central Guatemala, about 12 miles (20 km) north of the ancient Mayan city of Tikal. Uaxactún was a ceremonial centre of only modest size, compared with Tikal, but it has been important in Mayan archaeology because intensive excavations made there by archaeol-

North Court of Group E, Classic period, Uaxactún, Guatemala

James D. Nations-D. Donne Bryant Stock

ogists of the Carnegie Institution of Washington established the first long, Formative-to-Classic ceramic sequences for the Mayan area.

Occupation of the Uaxactún site began in the Middle Formative period of Mayan culture (900-300 BC), and before the close of the Late Formative period (300 BC-AD 100) a number of ceremonial buildings had been erected, including a temple with giant stucco masks reminiscent of the more ancient Olmec

civilization. As in Tikal, the major constructions date from the Classic period (AD 100–900). In the 9th century, Uaxactún shared in the general decline of other southern lowland Mayan centres and was abandoned in the 10th century.

Ubaid, Tell el-: see 'Ubayd, Tall al-.

Ubangi River, also spelled OUBANGUI, largest right-bank tributary of the Congo River, marking the border between Zaire and the People's Republic of the Congo. The Ubangi is formed by the union (near Yakoma on the border between the Central African Republic and Zaire) of the Bomu and Uele (Welle) rivers, and it then flows west for about 350 miles (560 km). It bends northeast of Bangui and flows a somewhat longer distance southwest. The total length of the Ubangi, with the Uele, is approximately 1,400 miles (2,250 km). Its mean discharge at Bangui is estimated at 151,-147 cubic feet (4,280 cubic m) per second; from May to December, when in flood, the discharge may exceed 494,000 cubic feet (14,-000 cubic m), while during low water (February-April) it drops to 35,300 cubic feet (1,000 cubic m).

In its upper reaches the Ubangi divides into arms separated by elongated islands, while elsewhere confining rocks cause rapids, such as those of Bangui. The Ubangi changes on entering the Congo Basin, its wide course being split by sandy shoals. Some of its tributaries are still impeded by rapids. The area between longitude 16° E and the Ubangi consists of flat, swampy valleys and low divides descending east and southeast from the western hills to the Congo River. Much of the region is covered with dense equatorial rain forest, and large portions of the region that lie northeast and southwest of the Sangha River are permanently inundated. The Ubangi River joins the Congo at the village of Irebu, at the mouth of the Irebu Channel. Low-lying, swampy Lake Tumba drains through this channel into the Congo River. The Congo waters during late April to late June push back those of the Ubangi. Some clearance for navigation has taken place, and barges of 600 tons can reach Bangui.

The Uele was visited from the north in 1870 by Georg Schweinfurth, and Wilhelm Junker in 1882–83 established it as part of the Congo River system.

Ubani (Nigeria): see Bonny.

Ubasti (Egyptian goddess): see Bast.

Ubayd, Tall al-, also spelled TELL EL-UBAID, ancient site that gave its name to a prehistoric cultural period, the Ubaid, in Mesopotamia; it is located near the ruins of ancient Ur in present-day southeastern Iraq. Excavations have uncovered Ubaidian remains throughout southern Mesopotamia. The hallmark of the period was a painted pottery decorated with geometric and sometimes floral and animal designs in dark paint on a buff or drab clay. Many vessels seem to have been made on a slow wheel, and they had loop handles and spouts (the first historical occurrence of these). In the south the Ubaid period is dated from about 5200 to about 3500 BC, but in the

Painted Ubaid ware from Ur, first half of the 4th millennium BC; in the British Museum

By courtesy of the trustees of the British Museum

north Ubaidian characteristics do not seem to appear until about 4300. Some scholars believe the characteristics of the northern Ubaid period may have been outgrowths of the preceding Halaf period rather than the result of cultural influences received directly from the south, but the overall picture is one of great homogeneity throughout the entire area from the Persian Gulf to the Mediterranean Sea.

Ubayyid, al-, also spelled EL-OBEID, town, central Sudan. It lies on a sandy, scrub-covered plateau at an elevation of 1,869 feet (570 m). Founded by the Egyptians in 1821, the town was captured and largely destroyed by the Mahdist forces in 1882, but it was rebuilt after Kurdufan was federated with the Anglo-Egyptian Sudan in 1899. Al-Ubayyid is encircled by a forest reserve that tends to alleviate dust storms. Located on a spur of the Khartoum-Nyala railroad, the town is a commercial and communications centre, trading in gum arabic (the area's main product), millet, oilseeds, and livestock. It also has an airport. Pop. (1983) 140,000.

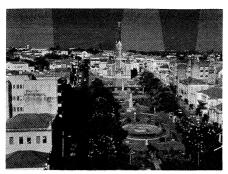

Ube, city, Yamaguchi ken (prefecture), Honshu, Japan, on the Inland Sea. Coal was mined in the area in the late 17th century, but Ube remained a small village until undersea mining operations began in the Meiji period (1868–1912). It then developed into a large mining and industrial city, manufacturing chemicals from coal. Because of the gradual decline of coal mining in Japan after World War II, many of the mines were closed. The city's products now include ammonium sulfate, cement, and soda. Ube also has a well-equipped harbour. Pop. (1987 est.) 175,404.

Úbeda, city, Jaén province, in the comunidad autónoma ("autonomous community") of Andalusia, southern Spain. Übeda lies northeast of the city of Jaén, on the Úbeda Hills in the Guadalimar Valley. Originally an Iberian settlement, the city was occupied by the Arabs in 711 and was reconquered by Ferdinand III of Castile in 1234. It is renowned for its architecture, particularly of the Renaissance period, which is reflected by the Sacra Capilla del Salvador (completed 1556 with a Classic facade), the Hospital de Santiago (begun in 1567 by Andrés de Vandelvira), and the Palacio del Condestable Dávalos (now a government hotel). Most of the city has been declared a national monument.

Situated in a well-watered olive-growing region, Übeda produces olive oil and olive-pressing equipment. Manufactures include plastics, pottery, esparto-grass mats, and forged metal products. St. John of the Cross died in the city. Pop. (1981) 28,717.

Uber Cup, trophy representing the women's world championship in the sport of badminton. The cup was contributed by Mrs. H.S. Uber, former English champion, in 1956 for a series of women's international team competitions to be held every three years. For winning teams, *see* Sporting Record: *Badminton*.

Uberaba, city, western Minas Gerais estado ("state"), Brazil, in the highlands at 2,575 feet (785 m) above sea level, on the Uberaba River. It was given city status in 1856. Uberaba is the trade centre of an important agricultural area, yielding cattle (the largest source of income), rice, oranges, corn (maize), beans, coffee, sugarcane, and bananas. A well-known cattle and agricultural exhibition is held there each May. The city's well-developed industry includes cement and lime plants, shoe factories, and sugar mills. Freight is transported by rail and road to Belo Horizonte, the state capital (262 miles [422 km] east), and to neighbouring communities in Minas Gerais and São Paulo states. Uberaba is an archdiocese, the seat of the stock-raising district, called the Triangulo Mineiro (Minas Triangle), and also the seat of the Regional Centre for Economic

Rui Barbosa Square and the cathedral at Uberaba, Braz.

Plessner International

and Social Research on Latin America. Pop. (1980) 180,228.

Uberlândia, city, western Minas Gerais state, Brazil, on the Rio Bom Jardim, a tributary of the Rio Araguari (also known as Rio das Velhas), at 2,802 ft (854 m) above sea level. It was given city status in 1892. Uberlândia is a trade centre for a primarily agricultural and pastoral hinterland. Chief crops include cotton, corn (maize), rice, and feijão (beans). The city processes cattle and hog products (including xarque [jerked beef] and dairy foods) and manufactures plastics and chemicals. The Federal University of Uberlândia (1969) is located there. Uberlândia is on the main highway and railroad between São Paulo and Brasília (220 mi [350 km] north). Pop. (1980) 230,185.

Uberti, Farinata degli (d. Nov. 11, 1264), Florentine nobleman who became the leader of the Florentine Ghibellines, the proimperial party. According to Dante (*Inferno*, canto X), Uberti alone dissuaded the members of the Ghibelline coalition from razing the city of Florence, which they had just captured.

Uberti became chief of the Ghibellines in 1239, but he was exiled from Florence along with his party after the death of the Holy Roman emperor Frederick II in 1250. He allied himself with Frederick's natural son, Manfred, the Ghibelline claimant to the throne of Sicily (1258). In September 1260, despite lack of support from his allies in Naples and Siena and thanks to his own superior tactical skill, Uberti led the Ghibelline forces to victory over the rival propapalist Guelf party at Montaperti. He followed up this victory by capturing Florence. Uberti was condemned posthumously as a heretic by the Inquisition (1283).

Ubico (Castañeda), Jorge, byname TATA (Spanish: "Daddy") (b. Nov. 10, 1878, Guatemala City—d. June 14, 1946, New Orleans), soldier and dictator who ruled Guatemala for 13 years (1931–44).

Ubico received a commission in the army in 1897, distinguished himself in several campaigns, and rose to the rank of colonel. In 1907 he was appointed governor of Alta Verapaz and in 1911 governor of Retalhuleu, where he served with efficiency and honesty. In the following years he was made a brigadier general, a member of the National Assembly, and minister of war (1922–26) under Pres. José María Orellana. In 1931, backed by the Liberals and the Progressives, he was elected president of Guatemala, an office he held until 1944.

Ubico restored Guatemala's international credit, built roads and public works, improved public health, ended the peonage of Indians, and eliminated wholesale corruption. He cultivated the friendship of the United States and was rewarded with tariff reductions and armaments. At the same time he also eliminated all political opposition and democratic activity in Guatemala. Unrest developed, and when Ubico suspended freedom of speech and

the press on June 22, 1944, the response was a general strike the next day. Forced to resign on July 1, he fled the country and made his home in New Orleans.

ubiquinone, also called COENZYME Q, any of several members of a series of organic compounds belonging to a class called quinones. Widely distributed in plants, animals, and microorganisms, ubiquinones function in conjunction with enzymes in cellular respiration (i.e., oxidation-reduction processes). The naturally occurring ubiquinones differ from each other only slightly in chemical structure, depending on the source, the structures resembling those of the fat-soluble vitamin K and certain derivatives of vitamin E.

Ubon Ratchathani, town and changwat (province) in the Northeastern region of Thailand, on the Khorat Plateau. Ubon Ratchathani town, the provincial capital, near the confluence of the Mae Nam (river) Mun and the Mae Nam Chi, is a major trading centre for rice, cattle, and tobacco. A road leads east to Pakxe (Laos) on the Mekong River.

The province borders Kampuchea (Cambodia) on the south and Laos on the east along

result of a more distinct dry season). Frontier communities and villages, including Pucallpa, are located mostly along the sandy and eroded banks of the Ucayali River. Agricultural cooperatives adjacent to these settlements are tilled by mestizo colonists who raise bananas, cassava, corn (maize), and rice, as well as pigs and cattle: rosewood felled in the rain forest is trucked to Callao (the port of Lima) for export. The often proselytized Shipibo Indians live in remote areas. Transportation in Ucayali is almost entirely riverine except for the road to Lima, the airport at Pucallpa, and occasional trails and landing strips. Minor ports along the Ucayali River are Puerto Oriente in the north and Atalava, the terminus for navigation in the uppermost section of the river. in the south. Pop. (1984 est.) 237,300.

Ucayali River, Spanish Río UCAYALI, headwater of the Amazon, formed by the junction of the Apurímac and Urubamba rivers in east central Peru. The Ucayali meanders northward from this junction for about 910 mi

Wat (temple) Supat Wanaram, Ubon Ratchathani, Thailand Jules Bucher—Photo Researchers

the Mekong River. With an area of 7,300 sq mi (18,906 sq km), it is one of Thailand's largest and most populous provinces. Drained by the Mae Nam Mun, Mae Nam Chi, and the Lam (river) Dom Yai, it produces rice, freshwater fish, cattle, pigs, sugarcane, timber, and cotton. There are large numbers of Lao (Laotian) and Khmer (Kampuchean) peoples in the province. Apart from Ubon Ratchathani, the main towns include Warin Chamrap (the eastern terminus of the railway from Bangkok) and Phibun Mangsahan. Pop. (1980) town, 50,788; (1983 est.) province, 1,648,187.

UBS: see United Bible Societies.

UBV system, system of classifying stars by spectral type, based on photometric measurements of the ultraviolet (U), blue (B), and visual (V [yellow]) magnitudes. It was introduced in the early 1950s by Harold Lester Johnson and William Wilson Morgan, American astronomers, and has largely superseded the less accurate system using the north polar sequence.

Ucayali, department of eastern Peru (until 1980 part of Loreto department) spanning the upper and middle sections of the meandering Ucayali River, a principal tributary of the Amazon. Formerly a very isolated area of Peru, Ucayali department experienced rapid population growth (particularly at Pucallpa [q.v.], the departmental capital) after 1945 with the completion of a road system from Lima. With an area of 38,931 sq mi (100,831 sq km), most of Ucayali is a humid, lowlying region with tropical rain forest (although in the far south it is more savanna-like as a

(1,465 km) through a densely forested floodplain east of the Andes to its junction with the Marañón, 55 mi south-southwest of Iquitos. This confluence is considered to mark the head of the Amazon. The total length of the Ucayali and its longest tributary, the Apurímac, is 1,701 mi.

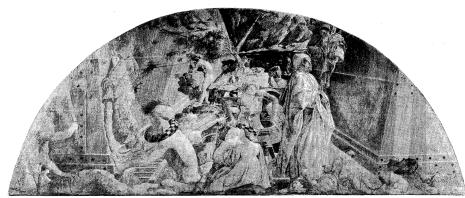

Pucalipa, on the Ucayali River in Peru

Shallow-draft vessels ply the river as far south as its junction with the Pachitea, 675 mi upstream from Iquitos. Along the Ucayali are small river ports, notably Pucallpa, Contamana, and Requena.

Uccello, Paolo, original name PAOLO DI DONO (b. 1397, Pratovecchio, near Florence—d. Dec. 10, 1475, Florence), Florentine painter whose work attempted uniquely to reconcile two distinct artistic styles—the essentially decorative late Gothic and the new heroic style of the early Renaissance. Probably his most

famous paintings are three panels representing 'The Rout of San Romano" (mid-1450s). His careful and sophisticated perspective studies are clearly evident in "The Flood" (1447-48). Apprenticeship and early work. By the time Paolo was 10 years old he was already an apprentice in the workshop of the sculptor Lorenzo Ghiberti, who was then at work on what became one of the supreme masterpieces of the history of art—the bronze doors for the Baptistery of the Florence cathedral, which consisted of 28 panels illustrating New Testament scenes of the life of Christ. In 1414 Uccello joined the confraternity of painters (Compagnia di S. Luca), and in the following year he became a member of the Arte dei Medici e degli Speziali, the official guild tural treatment of the horse and rider, and a sense of controlled potential energy within the figure all indicate Uccello's desire to assimilate the new style of the Renaissance that had blossomed in Florence since his birth. Following the Hawkwood monument, in 1443 Uccello completed four heads of prophets around a colossal clock on the interior of the west facade of the cathedral; between 1443 and 1445 he contributed the designs for two stained-glass windows in the cupola.

After a brief trip to Padua in 1447, Uccello returned to the Chiostro Verde of Sta. Maria Novella. In a fresco illustrating the Flood and the recession, Uccello presented two separate scenes united by a rapidly receding perspective scheme that reflected the influence of Donatello's contemporary reliefs in Padua. Human forms in "The Flood," especially the nudes, were reminiscent of figures in Masaccio's fres-

"The Flood," fresco by Paolo Uccello, c. 1447–48; in the Chiostro Verde, Sta. Maria Novella, Florence By courtesy of the Soprintendenza alle Gallerie, Florence

to which painters belonged. Though Uccello must by then have been established as an independent painter, nothing of his work from this time remains, and there is no definite indication of his early training as a painter, except that he was a member of the workshop of Ghiberti, where many of the outstanding artists of the time were trained.

Uccello's earliest, and now badly damaged, frescoes are in the Chiostro Verde (the Green Cloister, so called because of the green cast of the frescoes that covered its walls) of Sta. Maria Novella; they represent episodes from the creation. These frescoes, marked with a pervasive concern for elegant linear forms and insistent, stylized patterning of landscape features, are consistent with the late Gothic tradition that was still predominant at the beginning of the 15th century in Florentine studios and have given rise to the hope that Uccello's artistic origins may yet be found in some of these studios.

From 1425 to 1431, Uccello worked in Venice as a master mosaicist. All his work in Venice has been lost, and plans to reconstruct it have been unsuccessful. Uccello may have been induced to return to Florence by the commission for a series of frescoes in the cloister of S. Miniato al Monte depicting scenes from monastic legends. While the figural formulations of these ruinous frescoes still closely approximate the Sta. Maria Novella cycle, there is also a fascination with the novel perspective schemes that had appeared in Florence during Uccello's Venetian sojourn and with a simplified and more monumental treatment of forms deriving from the recent sculpture of Donatello and Nanni di Banco. Later years. In 1436 in the Florence cathe-

dral, Uccello completed a monochrome fresco of an equestrian monument to Sir John Hawkwood, an English mercenary who had commanded Florentine troops at the end of the 14th century. In the Hawkwood fresco, a single-point perspective scheme, a fully sculp-

coes in the Brancacci Chapel (c. 1425), perhaps the most influential of all paintings of the early Renaissance, but the explosion of details throughout the narrative again suggests Uccello's Gothic training. More than any other painting by Uccello, "The Flood" indicates the difficulties that he and his contemporaries faced in attempting to graft the rapidly developing heroic style of the Renaissance onto an older, more decorative mode of painting.

Perhaps Uccello's most famous paintings are three panels representing the rout of San Romano, now in the Louvre, Paris; the National Gallery, London; and the Uffizi, Florence. These panels represent the victory in 1432 of Florentine forces under Niccolò da Tolentino over the troops of their arch rival, Siena. There are Renaissance elements, such as a sculpturesque treatment of forms and fragments of a broken perspective scheme in this work, but the bright handling of colour and the elaborate decorative patterns of the figures and landscape are indebted to the Gothic style, which continued to be used through the 15th century in Florence to enrich the environments of the new princes of the day, such as the Medici, who acquired all three of the panels representing the rout of San Romano.

Uccello is justly famous for his careful and sophisticated perspective studies, most clearly visible in "The Flood," in the underdrawing (sinopia) for his last fresco, "The Nativity," formerly in S. Martino della Scala in Florence, and in three drawings universally attributed to him that are now in the Uffizi. These drawings indicate a meticulous, analytic mind, keenly interested in the application of scientific laws to the reconstruction of objects in a three-dimensional space. In these studies he was probably assisted by a noted mathematician, Paolo Toscanelli. Uccello's perspective studies were to influence the Renaissance art treatises of artists such as Piero della Francesca, Leonardo da Vinci, and Albrecht Dürer. Uccello apparently led an increasingly reclusive existence during his last years.

Assessment. Uccello was long thought to be significant primarily for his role in establishing new means of rendering perspective that became a major component of the Renaissance style. The 16th-century biographer Giorgio Vasari said that Uccello was "intoxicated" by perspective. Later historians found the unique charm and decorative genius evinced by his compositions to be an even more important contribution. Though in ruinous condition, they indicate the immense difficulties faced by artists of his time in taking advantage of new developments without giving up the best in traditional art. (J.T.Pa.)

MAJOR WORKS. "The Creation of the Animals"; "The Creation of Adam"; "The Creation of Eve"; "The Fall" (frescoes, early 1430s; Sta. Maria Novella, Florence); "Sir John Hawkwood" (fresco, 1436; cathedral, Florence); "Scenes from Monastic Legends" (frescoes, c. 1440; S. Miniato al Monte, Florence); "The Flood," "The Recession of the Flood," "The Sacrifice of Noah," and "The Drunkenness of Noah" (1447–48; Sta. Maria Novella); "The Rout of San Romano" (mid-1450s; panels in the National Gallery, London; Uffizi, Florence; and the Louvre, Paris); "St. George and the Dragon" (1455–760; Musée Jacquemart-André, Paris); "St. George and the Dragon" (c. 1460; National Gallery); "The Profanation of the Host" (c. 1466–69; Galleria Nazionale delle Marche, Urbino, Italy); "A Hunt in a Forest" (after 1460; Ashmolean Museum, Oxford); "The Founders of Florentine Art" (after 1460?; Louvre).

BIBLIOGRAPHY. The standard and most readable and complete work on Uccello (and his followers) in English is John Pope-Hennessy, Paolo Uccello, 2nd ed. (1969). Eve Borsook discusses Uccello's Florentine frescoes in The Mural Painters of Tuscany, from Cimabue to Andrea del Sarto (1960). Uccello's role in the investigation of perspective is mentioned by John White in The Birth and Rebirth of Pictorial Space, 2nd ed. (1967); and this subject is treated more fully by Alessandro Parronchi in Studi su la dolce prospettiva (1964).

Ucciali, Treaty of (May 2, 1889), pact signed at Wachile (Ucciali), Welo province, Eth., by the Italians and Menelik II of Ethiopian, whereby Italy was granted the northern Ethiopian territories of Bogos, Hamasen (Asmera), and Akale-Guzai, in exchange for money and the provision of 30,000 muskets and 28 cannons.

Article XVII of the treaty stated that the emperor of Ethiopia "could" have recourse to the good offices of the Italian government in his dealings with other foreign powers; but the Italian text of the treaty had the word "must." Based on their own text, the Italians proclaimed a protectorate over Ethiopia. In September 1890, Menelik II repudiated their claim, and in 1893 he officially denounced the entire treaty. An attempt by the Italians to impose a protectorate over Ethiopia by force was finally confounded by their defeat at the Battle of Adowa (March 1, 1896). By the Treaty of Addis Ababa (Oct. 26, 1896), the country south of the Mareb and Muna rivers was restored to Ethiopia, and Italy acknowledged the absolute independence of Ethiopia.

Uccle, Flemish UKKEL, municipality, Brabant province, central Belgium, just south of Brussels; it is one of the 19 communes that make up Greater Brussels. Formerly a separate town dating back to the 12th century, it is now a primarily residential suburb with some light manufacturing. It is the site of the Royal Observatory and has several châteaus (Errera, Uccle, and Ithier). The Russian Orthodox Cathedral, surrounded by birch trees, is modelled on a church in Novgorod. The Auberge du Cornet, an inn dating from 1570, lies near the wooded Wolvendael Park, a remnant of the Forêt (forest) de Soigne. The main body of the forest extends into eastern Uccle. Pop. (1982) mun., 75,552.

Uchimura Kanzō (b. April 2, 1861, Edo, Japan—d. March 28, 1930, Tokyo), Japanese

religious thinker and critic, an important formative influence on many writers and intellectual leaders of modern Japan.

Uchimura came from a samurai (warrior) family and studied at the Sapporo Agricul-

Uchimura Kanzō

tural School, where he was baptized in 1871. Refusing foreign missionary help, in 1882 he founded his own independent Japanese Christian Church. He continued his studies in the United States (1884-88) and returned to Japan to teach in Tokyo. There he became the centre of controversy in 1891 when he questioned the divinity of the emperor by refusing to bow when presented with the Imperial Rescript on Education. Among his writings are Kirisutoshintō no nagusame (1893; "Consolations of a Christian"), Kyūanroku (1893; "Seeking Peace of Mind"), and Yo wa ikanishite Kirisuto-shintō to narishi ya (1895; "How I Became a Christian"). His religious freethinking drew around him groups of young men, among them the writers Masamune Hakuchō, Mushanokōji Saneatsu, and Arishima Takeo, who in 1910 founded the influential Shirakaha "White Birch") journal as a vehicle for their humanitarian ideals.

Uchta (Russian S.F.S.R.): see Ukhta.

Ucicky, Gustav, original name GUSTAV KLIMT (b. July 6, 1899, Vienna—d. April 26, 1961, Hamburg), Austrian film director known for historical and nationalistic German films done during Adolf Hitler's rise to power. Ucicky began his career as a cameraman with Michael Curtiz in Vilma but moved to Germany in 1928, becoming involved in the newly formed, state-subsidized studio Universum Film. His early movies, such as Hocuspocus (1929) and Der unsterbliche Lump (1930; Immortal Vagabond), were light and well directed. They were not only entertaining but praised for artistic photography.

Ucicky's first nationalistic film, Yorck (1931), was panned in the United States as being no more than an over-glorified episode of German history. Similarly criticized in Austria, the movie launched a string of films that were approved for the German people by Joseph Goebbels, Nazi minister of public enlightenment. Morgenrot (1932; Dawn), which gained some recognition both in Europe and the United States, was a realistic story of U-boat warfare and depicts the dangerous and tenuous life in a submarine. Flüchtlinge (1933; "Refugees") was crudely anti-Soviet, however, and was followed by several other propaganda films. After the war, Ucicky resumed directing, producing several largely entertaining films between 1949 and 1960.

'ūd, also spelled OUD, stringed musical instrument prominent in medieval and modern Islāmic music, the parent of the European lute. The 'ūd has a deep, pear-shaped body; a fretless fingerboard; and a relatively shorter neck

and somewhat less acutely bent-back pegbox than the European lute. The tuning pegs are set in the sides of the pegbox. The gut strings, plucked with a plectrum, are fastened to a tension (guitar-type) bridge on the instrument's belly.

The 'ud is not completely standardized in size or number of strings. Four pairs of strings (the classical number) are common, although five and six pairs are also found. Tunings vary; the pitch range is similar to that of a lute or guitar. The 'ud is known in Turkey as the lauta and in the Balkans as the oud or uti. The kuwitra, a longer necked, narrower variety, is common in North Africa.

The 'ud appeared in medieval Persia as the barbat in the 7th century AD. Its name, 'ud (Arabic: "wood"), refers to its aloe wood belly, in contrast to the skin bellies of earlier lutes. Originally, it had a tapered body of one piece with a neck and two crescent-shaped sound holes, much like some East Asian lutes, suggesting a common West Asian origin. In Andalusia during the Muslim occupation of Spain (711–1492) the present form probably emerged, with a separate neck and round sound hole with a wooden rose (three sound holes are now common).

Some medieval theorists mention the frets of the ' $\bar{u}d$ when discussing the proper note intervals of the $maq\bar{u}m\bar{u}t$, or melodic modes. Surviving pictures of the ' $\bar{u}d$ show no frets, but it is possible that both fretted and unfretted types were used.

Uda, in full UDA TENNŌ, personal name sadami (b. June 10, 867, Kyōto—d. Sept. 3, 931, Kyōto), 59th emperor of Japan, from 887 to 897.

The son of the emperor Kōkō, Uda was one of the few rulers during this period whose mother was not a member of the Fujiwara family, which, partly through intermarriage with the Imperial line, dominated Japan from 859 to 1160. During the first part of Uda's reign, Mototsune, the head of the Fujiwara house, occupied the post of kampaku, or chancellor, through which he could issue commands on behalf of the Emperor. After Mototsune's death in 891, Uda kept the post vacant, selecting his advisers from members of minor Japanese noble families.

In 897 Uda abdicated in favour of his eldest son, who became the emperor Daigo, although Uda continued to exercise power as the retired emperor. In 899 Uda succeeded in getting his favourite, the renowned scholar Sugawara Michizane, appointed to the important post of minister of the right. But he was forced to concede the more important post of minister of the left to Fujiwara Tokihira, the head of the Fujiwara house. In 901 Tokihira forced his rival into exile, where Sugawara is said to have died of a broken heart. Fujiwara clansmen then surged back into powerful positions, from which they were able to dominate the government for three centuries.

Together, Uda and Fujiwara Tokihira introduced a series of measures designed to prevent the further avoidance of taxes by large rural landholders. Although their effort was largely unsuccessful, in 927 it did result in the *Engi shiki* ("Institutes of the Engi, or Yengi, Period"), a compilation of the existing administrative regulations of the period, which is today looked upon with great historical interest

Udaipur, also spelled UDAYPUR, town, administrative headquarters of Udaipur district, Rājasthān state, northwestern India. Udaipur (City of Sunrise) was made the capital of the princely state of Udaipur in 1568 by Mahārāṇā Udai Singh after the sack of Chittaurgarh. A walled town, it stands on a ridge crowned by the Mahārāṇā's palace, begun in 1570. To the west lies Lake Pichola with its two small islands and marble palaces, one of which served as a refuge for the Mughal emperor Shāh Ja-

hān (reigned 1628-58) when, before his accession, he revolted against his father, Jahāngīr. A major road and rail junction, the town is an agricultural distributing centre. Factories pro-

Island palaces in Lake Pichola, Udaipur, Rājasthān, India

duce chemicals, asbestos, and clay; and cloth, embroidery, ivory, and lacquer ware handicrafts also are manufactured there. Udaipur has several hospitals, a museum, and the University of Udaipur (established in 1962).

Udaipur district (6,667 sq mi [17,267 sq km]) consists of a hilly, forested sector forming part of the Arāvalli Range. The Banās is the principal river. Agriculture is the most important occupation; jowar (sorghum), gram, corn (maize), sugarcane, and oilseeds are the chief crops. The district is rich in mineral deposits, which include beryllium, lead, zinc, silver, asbestos, iron ore, mica, emerald, garnet, and glass sand.

Udaipur (Mewār) princely state was established in the 8th century by Sīsōdia Rājputs (warrior rulers of the historic region of Rājputāna), generally recognized as the highest in rank of the Rājput princes. The dynasty later made a long resistance to the Muslim invasions. In the 18th century the state suffered from internal dissension and incursions by the Marāthās and came under British paramountcy in 1818. In 1948 it merged with the union of Rājasthān. Pop. (1981) town, 232,588; district, 2,356,959.

Udall, Nicholas (b. December 1505?, Southampton, Hampshire, Eng.—d. December 1556, Westminster, Eng.), English playwright, translator, and schoolmaster, author of the first known English comedy, *Ralph Roister Doister*.

Udall was educated at the University of Oxford, where he became lecturer and fellow. He became a schoolmaster in 1529 and was teaching in London in 1533 when he wrote "ditties and interludes" for Anne Boleyn's coronation. In 1534 he published Floures for Latine Spekynge Selected and Gathered out of Terence... translated into Englysshe (dated 1533). The same year he became headmaster of Eton College.

From 1542 to 1545 Udall seems to have been in London, engaged in work as a translator. In 1542 he published a version of Erasmus' *Apopthegmes*; and he was employed by Catherine Parr, who shared his enthusiasm for the Reformation, to take charge of a translation of Erasmus' paraphrase of the New Testament. The first volume, containing the Gospels and Acts, was published in 1548; the Gospel According to Luke was translated by Udall, and the Gospel According to John was translated by Princess Mary (later Queen Mary I).

In 1549 Udall became tutor to the young Edward Courtenay; in 1551 he obtained a prebend at Windsor, and in 1553 he was given a living in the Isle of Wight. Meanwhile he

had become famous as a playwright and translator. Even under Queen Mary, his Protestant sympathies did not cause him to fall into disfavour at court; various documents refer to his connection with plays presented before the Queen. He became a tutor in the household of Stephen Gardiner, bishop of Winchester, and in December 1555 was appointed headmaster of Westminster.

Although Udall is credited in John Bale's catalog of English writers with "many comedies," the only play extant that can certainly be assigned to him is Ralph Roister Doister. This must have been written, and probably was performed, about 1553. The play marks the emergence of English comedy from the medieval morality plays, interludes, and farces. It is modelled on Terence and Plautus: its central idea-of a braggart soldier-hero, with an impecunious parasite to flatter him, who thinks every woman he sees falls in love with him, and is finally shown to be an arrant cowis derived from Plautus' Miles Gloriosus. The incidents, characters, and colloquial idiom, however, are English. It was probably written as a Christmas entertainment to be performed by Udall's pupils in London.

Udāsī, sect within Sikhism, a religion of India. The Udāsī (from the Sanskrit udās, to renounce) sect, which requires celibacy and asceticism of its members, originated with the followers of Sirī Chānd, the son of the first Sikh Gurū (religious teacher and leader of the Sikh community), Nānak. Under the leader-ship of Bābā Gurdittā, the eldest son of the sixth Guru, Hargobind, they served as missionaries, particularly north and east of the Punjab, the Sikh homeland. They did not adopt the five K's (unshorn hair, comb, sword, military shorts, and steel bracelet), emblems of the Khālsā order. Udāsīs may cut their hair and shave; they wear reddish garments, and use caste marks, sacred threads, and prayer books more generally associated with Hindu ascetics. The Udāsīs maintain a temple adjacent to the Harimandir, the main Sikh temple in Amritsar, Puniab.

Udayagiri, village and archaeological site, Ganjām district, Orissa state, eastern India. In the village are located several Jaina and Buddhist rock-cut caves. One of these is a doublestoried cave with ranges of cells cut into three sides of an open courtyard. Inscriptions in the caves date from the 2nd century BC to the 10th century AD.

Udayanācārya (fl. 10th century, near Darbhanga, Bihār state, India), Hindu logician who attempted to reconcile the views held by the two major schools of logic out of which developed the Navya Nyāya (New Nyāya) school of "right" reasoning, which is still recognized and followed in some regions of India. Of the two schools, the old Nyāya system was concerned with the critical examination of the objects of knowledge by means of logical proof, while the earlier Vaiśesika system dealt with particulars—objects that can be thought of and named.

Udayanācārya assumed, with the Vaišeṣika, that the world was formed by atoms, from which physical bodies also derived. But he was equally concerned with the mind and its right apprehension of objects in nature. His vigorous thinking was set forth in the Kusumāñjali and the Bauddhadhikkāra, the latter an attack on the atheistic thesis of Buddhism. Living in a period of lively controversy with

the Buddhists, Udayanācārya defended his belief in a personal God by resorting to the two natures of the world: cause and effect. The presence of the world is an effect that cannot be explained by the activity of atoms alone. A supreme being had to cause the effect and regulate the activity of the atoms; hence, according to Udayanācārya, God exists.

Uddandapura (India): see Odantapurī.

Uddevalla, town, in the län (county) of Göteborg och Bohus, southwestern Sweden, on the river called Bäveån, at the head of Byfjorden, an inlet of the Skagerrak, north of Göteborg. To the east, huge gravel banks bear traces of crustacea from 10,000 years ago. The site has been identified with Odensvold, a pagan place of sacrifice. The town was incorporated in 1498. On several occasions during the Danish-Swedish wars large parts of it were destroyed and ravaged by fire. Uddevalla was once dependent on the grain trade, fishing, and stone quarrying, but it has developed into an important industrial town in which shipbuilding predominates. Its coastal position also makes it a popular summer resort. Pop. (1984 est.) mun., 45,827.

Udhampur, town, administrative headquarters of Udhampur district, in Indian-administered Jammu and Kashmir state, in the northern part of the Indian subcontinent, situated at an altitude of 2,500 ft (760 m). It is named after Udham Singh, eldest son of Gulab Singh, the founder and ruler of the Jammu and Kashmir state. Situated on the Pathān-kot-Uri national highway connecting Srīnagar via Udhampur to the rest of India, Udhampur town is an important military cantonment in northern India. Krimchi, a group of four Šiva temples (11th century AD), are situated 6 mi (10 km) north of the town. The Chenāni hydroelectric project and an old fort are other places of interest.

Udhampur district, with an area of 1,756 sq mi (4,546 sq km), is bounded by Doda district on the east, Kathua district on the south, Jammu and Punch districts on the west, and Ananatnāg district on the north. Sloping from the Pīr Panjāl Ranges of the Middle Himalayas in the north to the Jammu Siwālik Hills on the south, the district is drained by the Chenāb and Tāwi rivers. The Chenāb River, flowing through a deep gorge, separates Udhampur from Doda district in the east. Forests of pine, fir, and spruce cover the hills. Agriculture is carried out on the terraced hill slopes and small alluvial tracts of river valleys. Rice, corn (maize), jowar (sorghum), and barley are grown. The grassy slopes of the higher elevations are grazing grounds for the sheep and goats of the Gujjar and Bakarwal nomads who move up from the lower altitudes in the summer. Livestock, dried milk, raw wool, and hides are local trade items. Industries include sawmilling, rice milling, metalworking, and ore smelting. The shrine of Vaisno Devi is a major Hindu place of pilgrimage. Pop. (1981) town, 22,509; district, 453,636.

Udi-Nsukka Plateau, pair of plateaus in south central Nigeria that form a nearly continuous elevated area. The Nsukka Plateau, which forms the main eastward-facing escarpment, extends about 80 mi (130 km) from Nsukka in the north to Enugu in the south. The Udi Plateau continues southward for about 100 mi to a point near Okigwi. The average elevation is slightly more than 1,000 ft (300 m), and the highest point (1,897 ft) is found 15 mi north-northwest of Enugu.

The steep escarpments of the east and north (the latter trending east-west and sometimes called the Igala Plateau) form spectacular landscapes. Numerous tributaries of the Cross

River cascade over the eastern escarpment onto the Cross River Plains; the headwaters of the Anambra, the Adada, and the Mamu rise in the western part of the plateau and flow through the Anambra Lowlands before emptying into the Niger; and a number of small streams flow north to feed the Benue. The scarp at the southern end, called the Awgu-Okigwi Cuesta, is the source of the Imo River.

Coal deposits were discovered in the southern part of the plateau in 1909, and mining began near Enugu in 1915; the railway from Port Harcourt (151 mi south-southwest of Enugu) was originally built to handle the export of coal from the Enugu fields. Although coal was also known to exist in the north, it was not until 1968 that exploitation began in the Okaba field near Ankpa. These deposits made Nigeria the first coal-producing nation in West Africa.

The plateau is marked by small, round-topped hills. Most of it is covered by open grassland with occasional clusters of woodlands and oil palm trees. Its poor, sandy, and acidic soils (with many regions of severe erosion) have been overworked in the densely populated areas in the south, and there is considerable population pressure to move out of farming and off the plateau. Yams and palm produce are the most important crops; but corn (maize), cassava, taro, pumpkins, avocados, and fruit are also cultivated. Cashew trees were introduced in the 1950s.

Ibo people are the principal inhabitants in the south, and Igala predominate in the north. Enugu is at the foot of an eastern escarpment, and Nsukka, Enugu Ezike, and Ankpa are major towns on the plateau.

Udine, city, capital of Udine province, Friuli-Venezia Giulia region, northeastern Italy, northwest of Trieste, near the Yugoslav border. Possibly the site of a Roman frontier station called Utina, the city was the seat of

Ossuary for the war dead, Udine, Italy G. Barone—SCALA from Art Resource/EB Inc.

the Roman Catholic patriarchate of Aquileia from 1238 until 1751, when the patriarchate was dissolved and replaced by the archbishoprics of Udine and Gorizia. Conquered by the Venetians in 1420 and ceded to Austria by the Treaty of Campo Formio in 1797, Udine was united with Italy in 1866. It was the headquarters of the Italian army in 1915-17 during World War I and suffered heavy bomb damage in World War II. The city is dominated by the castle (rebuilt 1517), originally the seat of the patriarchs and of the Venetian governors, now housing a museum and art gallery with works by Giovanni Tiepolo. Other notable buildings are the Palazzo del Comune (1448-56); the elegant Loggia del San Giovanni (1533-39), by Bernardino da Morcote, with a notable clock tower by Giovanni da Udine, a native of the city; and the 16th-century archiepiscopal palace. Udine was relatively undamaged in the severe earthquake that shook Friuli-Venezia Giulia in May 1976. It is a thriving trade and industrial centre with ironworks, cotton mills, tanneries, and machine and food industries. Pop. (1986 est.) mun., 100,372.

Udjo (Egyptian goddess): see Buto.

Udmurt Autonomous Soviet Socialist Republic, also called UDMURTIYA, administrative division of the Russian Soviet Federated Socialist Republic. It lies partly in the basin of the middle Kama River, which flows along part of its southeastern boundary, and partly in the drainage area of the Cheptsa and Kilmez rivers; it covers an area of 16,250 square miles (42,100 square km). Its capital is Izhevsk.

From the republic's highest point, a low (1,080 feet [330 m]) outlier of the Ural Mountains on the northeastern edge, the land slopes gently to the west and south. Udmurtiya's markedly continental climate, with long winters, has an average January temperature of 5° F (-15° C) and an average July temperature of 64° F (18° C). Rainfall, with a summer maximum, is about 16-20 inches (400-500 mm) annually. A large zone of boreal forest, or taiga, is dominated by spruce, pine, and birch and covers about two-fifths of the republic's surface; some deciduous trees, mainly oak and linden, appear in the extreme south. The soil in the west and north is alluvial and often marshy, while in the east it is of a humus-carbonate type. Along the rivers are broad floodplain meadows, which make good pastures. Natural resources include peat, limestone, manganese, quartz sand, petroleum, and oil shales.

Settled by the Finno-Ugric Udmurt people, the area came under the control of the Khanate of Kazan in the 14th and 15th centuries and passed into Russian control in 1552 during the reign of Ivan IV the Terrible. Established as the Votskaya autonomous *oblast* (province) in 1920, it was renamed the Udmurt autonomous *oblast* in 1932 and raised to its present status in 1934. Of the population—Russians, Udmurts, Tatars, Mari, and Ukrainians—about seven-tenths was urban in the late 20th century. Major cities include Sarapul, Votkinsk, Glazov, and Izhevsk (q.v.; formerly Ustinov).

Udmurtiya is a part of the Urals economic region and is heavily industrialized. Major industries include metallurgy, machine and tool manufacturing, lumbering, leatherworking, flax processing, brick and cement making, and food processing. High-grade steel, rifles, furniture, motorcycles, electric motors, and handling, transport, and construction equipment are manufactured at Izhevsk; locomotives and conveyor belts at Votkinsk; oil-drilling machinery and radios at Sarapul; rolling stock and timber-working equipment at Kambarka; and glass at Mozhga. Elsewhere timber cutting and sawmilling are the chief occupations. Electric power is generated at thermoelectric plants at Izhevsk, Votkinsk, and Sarapul.

Arable land occupies about half of the republic, the greater part in the southern section. Rye and oats are the chief crops, and wheat, corn (maize), flax, and hemp are also grown. Market (or truck) gardening, dairying, beekeeping, and stock raising (cattle, sheep, goats, and pigs) are also practiced.

Railways, motor roads, and airlines intersect at Izhevsk. A north-south railroad passes through Izhevsk to connect two east-west lines that cut through the northern and southern parts of the republic. The Perm-Kazan highway crosses the republic. Air connections to Moscow and other regional centres are available at Izhevsk. Pop. (1987 est.) 1,587,000.

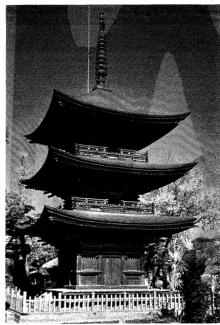

Udon Thani, town, northeastern Thailand, near the northern (Laotian) border. Udon Thani is the major town of the northern Khorat Plateau and is served by road, rail, and air.

The surrounding area produces rice, livestock, timber, and freshwater fish. Pop. (1985 est.) 83,029.

Uea, Île (New Caledonia): see Ouvéa, Île.

Uebi Scebeli (eastern Africa): *see* Shebeli River.

Ueda, city, Nagano ken (prefecture), Honshu, Japan. It lies along the Chikuma River. Ueda was a castle town during the Tokugawa period (1603–1867) and later became a centre of silk manufacturing and the site of the Sericultural Professional School. The silk industry declined during the mid-20th century, and

Buddhist pagoda at Ueda, Japan Photos Pack—EB Inc.

synthetic textiles, processed foods, and electrical appliances are now produced. Served by a railway and highway, Ueda is a gateway to such tourist areas as the hot springs of Bessho and the skiing resort of Sugadaira. The castle remains contain a museum, and Ueda houses the Buddhist Shinano-Kokubun Shrine. Pop. (1986 est.) 116,795.

Ueda Akinari, pseudonym of UEDA SENJIRO (b. July 25, 1734, Ōsaka—d. Aug. 8, 1809, Kyōto), preeminent writer and poet of late 18th-century Japan, best-known for his tales of the supernatural.

Ueda was adopted into the family of an oil and paper merchant and brought up with great kindness. A childhood attack of smallpox left him with some paralysis in his hands, and it may have caused his blindness late in life. Ueda became interested in classical Japanese and Chinese literature around the age of 25. He had started to write *ukiyo-zōshi*, "tales of the floating world," the popular fiction of the day, when in 1771 the business he had managed since his stepfather's death (1761) burned down. He took that as his opportunity to devote his full time to writing. In 1776, after eight years of work, he produced Ugetsu monogatari (Tales of Moonlight and Rain). These ghost tales showed a concern for literary style not present in most popular fiction of the time, in which the text was usually simply an accompaniment for the illustrations that formed the main part of the books. A student of history and philology, Ueda called for a revival of classical literature and language reform. His late years were spent in poverty-stricken wandering. Harusame monogatari (1808; Tales of the Spring Rain) is another fine collection of stories. Ugetsu monogatari was the basis for

the successful film *Ugetsu* (1953) by the eminent director Mizoguchi Kenji.

Ueno, city, Mie ken (prefecture), Honshu, Japan. It lies in an intermontane basin at the head of the Kii Peninsula. The city developed around a castle built in 1611 and still retains some of its early character. Hakuho Park is on the site of the old castle, which was rebuilt in 1953. The Aizen Temple in Ueno is dedicated to the god of love. The industry of the city includes the traditional manufacture of sake (rice wine), textiles, stoneware, and umbrellas. Ueno is connected by railway to Nara (west) and Nagoya (east). Pop. (1985) 60,811.

Ueno Zoological Garden, Japanese UENO DŌBUTSUEN, oldest and most famous zoological garden in Japan. It was founded in 1882 by the Tokyo Museum, but its administration was transferred to the city government in 1924. The zoo occupies a 32-acre (13-hectare) site in the Ueno district of Tokyo and is landscaped in traditional Japanese style. The zoo suffered much damage during World War II but was rebuilt within 10 years, primarily along prewar lines. A modernization program was pursued in the late 20th century. Among the renovated buildings are an elephant house (1968), a big-cat house (1974), and an aquarium (1962), which has special exhibits of goldfish and jellyfish and also houses reptiles. The Ueno Zoological Garden has about 8,860 specimens representing approximately 960 species, including the rare giant salamander and breeding groups of several rare pheasants and wallabies. The zoo emphasizes public education and also sponsors active research on zoo animal husbandry and reproduction.

In 1958 the Ueno Zoological Garden opened a sister facility, the 125-acre (50-hectare) Tama Zoological Park, in the outlying county of Hodokubo, enabling it to expand its collection. A unique exhibit at Tama Park is a 4-acre (1.6-hectare) insectarium, where 15,000 native insects are bred and displayed. The park's collection is organized by zoogeographical area (i.e., all animals native to a particular region are grouped together), with emphasis on Asian and African faunas. Tama Park has a good breeding herd of scimitar-horned oryx and also keeps Indian rhinoceroses. In addition, it serves as the repository of the international studbooks for the Japanese serow and the Manchurian crane.

Uesugi FAMILY, one of the most important warrior clans in Japan from early in the 15th century until the last half of the 19th.

The Uesugi were already dominant in the Kantō region of Honshu when the appointment of the head of the family to the hereditary post of governor-general of Kantō in 1439 made them the second most powerful clan in Japan and the dominant power in the western part of the country.

By the middle of the 16th century, however, the family had been replaced in the Kantō region by the newly ascendant feudal power of the Hōjō family. With the aid of Uesugi Kenshin (1530–78), a warrior who had been adopted into the family, the clan was able to recoup some of its losses, and by the late 16th century it was relocated in the northern tip of the north Honshu plain in central Japan.

Uesugi Kagekatsu (1555–1623), who succeeded Kenshin as head of the clan, became one of the early allies in the campaign of Toyotomi Hideyoshi to reunify Japan. Before Hideyoshi died, he appointed Kagekatsu to serve as one of the five regents for his infant son Hideyori.

In 1600 Kagekatsu attempted to challenge the power of Tokugawa Ieyasu, the head of the regency council. Kagekatsu's defeat marked the ascendancy of the Tokugawa family as the preeminent power in Japan. But Ieyasu, who in 1603 had himself appointed shogun, or hereditary military dictator of Japan, permitted the Uesugi family to retain part of its former domain. Under the Tokugawa system, the Uesugi became the daimyos, or lords, of Yonezawa in northern Honshu. The Uesugi continued to rule that territory until the Meiji Restoration (1868), when the Tokugawa house was overthrown and the feudal structure of Japan abolished. Under the new government Yonezawa was incorporated into the newly created Yamagata prefecture.

Uesugi Kenshin, also called UESUGI TERUTORA, original name NAGAO TORACHIYO (b. Feb. 18, 1530, Takada, Echigo province, Japan—d. April 19, 1578, Takada), one of the most powerful military figures in 16th-century Japan.

Nagao Torachiyo was the third son of the head of Echigo Province in northeastern Japan. With the death of his father in 1543, the family's control of the area began to disintegrate. Torachiyo not only restored order to the area but also gained control of neighbouring provinces, becoming one of the most powerful warriors on the Kantō Plain in central Honshu.

In 1552 Uesugi Norimasa, who had inherited the position of kanrei, or governor-general, of Kantō and whose family had long been the most powerful in the area, was defeated by the Hōjō clan and took shelter with Torachiyo, whom he adopted as his son. Torachiyo then changed his surname to Uesugi. He received many of the hereditary vassals of the Uesugi family, and he also became involved in a series of battles with the eastern warlords of the Hojo and Takeda families for control of the Kantō region. Though his battles with the noted general Takeda Shingen resulted in no permanent gain for either side, they brought Uesugi an honour in the form of a new personal name. The shogun Ashikaga Yoshiteru granted him, as official head of the Uesugi family, the special name Terutora, which contained a written character from the shogun's own name.

Meanwhile, Oda Nobunaga had become the strongest military leader in Japan, and in 1573 he overthrew the shogunate and began to consolidate his control over the capital. The only warrior strong enough to challenge Oda was Uesugi (Takeda having died), and in 1577 he agreed to undertake an expedition to restore the shogunate. He died, however, before the expedition could get under way.

Ufa, city and capital, Bashkir Autonomous Soviet Socialist Republic, western Russian S.F.S.R., on the Belaya (White) River just below its confluence with the Ufa. A defensive site in a loop formed by the two rivers led to the foundation there of a fortress in 1574 to protect the trade route across the Ural Mountains from Kazan to Tyumen. It became a town in 1586 and derived importance from this trade route. Ufa grew rapidly in the 20th century as a major manufacturing centre, stimulated by the development of the Volga-Urals oil field. In 1956 its satellite town of Chernikovsk, a few miles to the northeast, with three large oil refineries and important petrochemical industries, was united administratively with Ufa. Synthetic rubber, polyethylene, herbicides, and other products are made.

Ufa itself has large engineering industries making power and mining machinery, electrical apparatus, telephones, and typewriters. There is also a range of timber-processing industries—making furniture, veneer, prefabricated houses, and matches—and various food and other light industries. Ufa is a major focus of rail, road, and oil and gas pipelines at the

head of navigation on the Belaya. The city is strung out for almost 25 miles (40 km) along the river on the high right bank, but it has extended onto the lower river terrace and across to the low left bank. It is an important cultural centre, with a university; petroleum, aviation, teacher-training, medical, agricultural, and arts institutes; and numerous scientificresearch establishments. Pop. (1989 prelim.) 1,083,000.

Ufa, in full UNIVERSUM FILM-AKTIENGESELL-SCHAFT, German motion-picture production company, the pictures of which were the most artistically outstanding and technically competent films of the silent era. Located in Berlin, its studios were the best equipped and most modern studios in the world. It encouraged experimentation and imaginative camera work and employed such internationally prominent directors as Ernst Lubitsch, famous for directing sophisticated comedies, and G.W. Pabst, a pioneer in the expressive use of camera position and editing techniques.

Ufa was established in 1917 when the German government consolidated most of the leading studios. In the post-World War I era, Ufa's films of the macabre—e.g., The Cabinet of Dr. Caligari (1919), directed by the experimental and imaginative Robert Wiene; its realistic films based on the life of the common man—e.g., The Last Laugh (1924), directed by F.W. Murnau, who experimented with the subjective use of the camera; and its dramas based on traditional German legends were especially popular.

From 1925 to 1930 many directors and actors emigrated to the United States and, despite loans and cooperation from U.S. companies, the studio's financial stability weakened. In 1927 controlling stock was purchased by Alfred Hugenberg, a conservative newspaper owner and future supporter of the dictator Adolf Hitler. By 1938 the Nazi government had complete control of the film industry, using Ufa as a propaganda tool until the end of World War II, when the government fell and the company ceased to exist. The studio itself, however, located in Berlin, remains a production centre to this day.

Ufa Plateau, Russian UFIMSKOYE PLATO, plateau lying immediately to the west of the Central Ural Mountains in the Bashkir Autonomous Soviet Socialist Republic and Sverdlovsk oblast (province), Russian S.F.S.R., embracing parts of the basins of the Ufa, Yuryuzan, and Ay rivers. It has a total north-south length of 95 miles (150 km). The plateau varies in elevation from 1,300 to 1,650 feet (400 to 500 m), reaching its highest point at 2,270 feet. It is a gentle anticline of limestones, and its surface is characterized by extensive eroded limestones, or karst, phenomena. It is also underlain by extensive oil deposits.

Ufer, Walter (b. July 22, 1876, Louisville, Ky., U.S.—d. Aug. 2, 1936, Santa Fe, N.M.), American painter who was a member of the Taos Society of Artists and who specialized in portraits of Indians and landscapes of the southwestern United States.

Ufer studied at the Royal Academy in Dresden, Ger., and at the Art Institute of Chicago. In 1911 he abandoned a career in advertising to study painting in Munich and to travel across Europe and North Africa. Soon after his return to the United States, he moved to Taos, N.M., where a small art colony had been established in 1898. This was the first such colony devoted to the art of the American West, and in 1914 they formed the Taos Society of Artists, which exhibited throughout the United States and Europe. Ufer became a member of Britain's Royal Society of Artists in 1922 and the National Academy in 1926.

Uffizi Gallery, Italian GALLERIA DEGLI UF-FIZI, art museum in Florence that has the world's finest collection of Italian Renaissance painting, as well as notable masterpieces of Flemish, Dutch, German, and French painting. It also has antiques, sculpture, and more than 100,000 drawings and prints. In 1559 Cosimo I de' Medici engaged Giorgio Vasari to plan a building for the offices (uffizi) of the government judiciary. The Uffizi Palace, one of the most important examples of Italian Mannerist architecture, has been subsequently enlarged and remodeled, but always in keeping with Vasari's original design. After Cosimo I died in 1574, the new grand duke of Tuscany, Francis I, commissioned Bernardo

The Uffizi on the Arno River, Florence

Buontalenti to add and decorate new rooms to house the art treasures of the Medici collection. The galleries were expanded in the 17th century by the grand duke Ferdinand II and his brother, Cardinal Leopoldo, who collected the self-portraits later exhibited in the Vasari corridor connecting the Uffizi and the Pitti Palace. In the 18th century the Medici's personal property was bequeathed to the Lorraine family with a pact providing that the works of art should always remain in Florence.

It was the grand duke Leopold I who gave the Uffizi its status as a museum. He engaged Luigi Lanzi to reorganize it, appointed its first director, and opened it to the public.

Ufford, Robert de: see Suffolk, Robert de Ufford, 1st Earl of.

Ugaki Kazushige (b. June 1868, Okayama prefecture, Japan—d. April 30, 1956, Tokyo), Japanese soldier-statesman, who in the years before World War II headed the so-called Control Faction of the Japanese army, a group that stressed the development of new weapons and opposed the rightist "Imperial Way" faction, which emphasized increased indoctrination of troops with ultranationalist ideology. Ugaki's faction was in control of the military most of the time between 1920 and 1945.

A graduate of the Imperial Military Academy and the War College (1900), Ugaki became a staff officer at army headquarters and, in 1919, president of the War College. In 1924 he became a full general and took the post of minister of the army, in which, despite strong opposition from the armed forces, he began to implement the arms-reduction program that Japan had agreed upon at the 1922 Washington Conference. He resigned from the Cabinet in 1927 but resumed his post two years later and again met strong opposition to his acceptance of the warships' limitations imposed by the 1930 London Naval Conference; the opposition increased when he formed a committee to reorganize the army as part of a general retrenchment brought on by the Great Depression.

In March 1931 a group of young officers, under the illusion that Ugaki's policies were dictated by civilians, attempted a coup to install Ugaki as premier. Although Ugaki did not cooperate with the plotters, he nevertheless resigned his post, assuming responsibility for

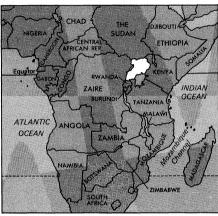

the attempt. Ugaki was then appointed governor-general of Korea, where he attempted to develop war-related industries. Later he was proposed as prime minister, but army objections blocked his forming of a cabinet. In 1938, however, he became minister of foreign affairs and minister of overseas affairs in the new government of Konoe Fumimaro.

Late in World War II, Ugaki entered into negotiations with the Republic of China in an attempt to end the conflict with that country, but again army opposition forced him to resign from the government. After the war Ugaki reentered politics and in 1953 won election to the upper house of the Japanese Diet (parliament).

Uganda, officially REPUBLIC OF UGANDA, Swahili JAMHURI YA UGANDA, landlocked eastern African country lying on the equator, covering an area of 93,070 square miles (241,040 square km). The capital is Kampala. Facing Lake Victoria to the southeast, Uganda is bordered by Tanzania and Rwanda to the southwest, Zaire to the west, The Sudan to the north, and Kenya to the east. The population in 1990 was estimated at 16,928,000.

A brief treatment of Uganda follows. For full treatment, see MACROPAEDIA: Eastern Africa. For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL

The land. Most of the country is situated on part of the Central African plateau, marked by mountains and valleys. The western boundary

Uganda

is composed of the volcanic Virunga Mountains, the Ruwenzori Range, and the western branch of the East African Rift Valley System. The Virungas rise to 13,540 feet (4,127 m) at Mount Muhavura, and the Ruwenzoris rise to 16,763 feet at Margherita Peak; their peaks are capped by snow and glaciers. The rest of the boundary is composed of the western Rift Valley, which contains Lake Albert and the valley of the Albert Nile. The northeastern border of the plateau is defined by a string of volcanic mountains, Mount Elgon being the highest of the chain, reaching 14,178 feet. The country's drainage system is dominated by major lakes, including Lake Victoria (26,828 square miles [69,485 square km]), the world's second largest freshwater body following Lake Superior, and Lakes Albert and Kyoga. The major rivers, the Victoria Nile and the Albert Nile, draining northward from Lake Albert, are the major tributaries of the Nile basin. Rivers that rise to the north of Lake Victoria flow into Lake Kyoga. The soils of Uganda are predominantly ferralites (containing iron and aluminum) and waterlogged clays.

Although Uganda is on the equator, its climate is warm, rather than hot. Temperatures are ameliorated by the region's high elevation and-locally-by the presence of large lakes. Average daily maxima at Kampala are 83° F (28° C) in January and 77° F (25° C) in July. Temperatures are somewhat higher in the north and somewhat cooler in the mountains. In the Lake Victoria region, the annual rainfall of 60 inches (1,500 mm) is distributed throughout the year fairly evenly, while along some sections of the northeast border, rainfall averages less than 20 inches (500 mm) and is distributed much more seasonally. Wooded savanna is typical of central and northern Uganda. In the south, natural vegetation has been largely replaced by cultivated plots, with scattered patches of forest or of elephant grass. Of the 2,800 square miles (7,200 square km) devoted to national parks and game reserves, about 1,500 square miles (3,900 square km) are located in Kabalega National Park. The fauna includes lion, rhinoceros, leopard, elephant, hippopotamus, buffalo, cob and topi (antelope), and a number of species of monkeys. About one-third of Uganda's area is considered arable, with major areas devoted to cereals, and somewhat less is available as pasture.

The people. For more than 1,000 years Uganda has been a meeting place of different peoples. There are about 40 ethnic groups in the country belonging to the three main linguistic groups: the Bantu, the Nilotic, and the Nilo-Hamitic. The Bantu-speaking Ganda constitute about one-fifth of the total population. Other Bantu-speaking peoples are Soga, Nyoro, and Nkole. Acholi, Lango, and Karamojong are the larger Nilotic groups. Although there has been much admixture of these groups over the centuries, the linguistic, cultural, and traditional differences are still clear. English and Swahili serve as common and official languages. Luganda is the most widely spoken language. Islām and Christianity were introduced during the 19th century.

About four-fifths of the population are Chris-

tians, almost a third of whom also profess traditional beliefs, and a minority are Muslims.

Uganda's annual rate of population growth is above average for Sub-Saharan Africa, primarily because of the country's high rate of natural increase. Net migration is negligible. Almost half the population is under 15 years of age. Areas of heavy population concentration are in the east and southwest and along Lake Victoria, where the principal urban areas are located. Kampala, the national commercial and administrative capital, is the largest city. Other major cities are Jinja, Masaka, and Mbale. Though the urban population constitutes only about 10 percent of the total, it is growing steadily and has led to the depopulation of the villages.

Uganda has a developing, The economy. market economy based largely on agriculture. Economic deterioration due to corruption, expulsion of foreign firms, and civil war was slowed considerably after the early 1980s, but violence and civil disorder remain serious obstacles to economic recovery. The gross national product (GNP) per capita is among the lowest in the world.

Agriculture accounts for more than half of the GNP and employs more than four-fifths of the work force. More than one-half of agricultural production is accounted for by subsistence farmers. Main food crops are cassava, sweet potatoes, millet, plantains, and corn (maize). Export crops include coffee, tea, cotton, and sugar.

Output of blister copper fell sharply during the 1970s, and both the copper mine at Kilembe and the Jinja smelter ceased production. Uganda exploits substantial deposits of apatite at Tororo and mines tungsten, beryl, and tin on a small scale. There are also unexploited deposits of high-grade iron ore at Kigezi.

Industry accounts for less than 10 percent of the GNP and employs a comparable percentage of the work force. Output has fallen drastically since the early 1970s; there are severe shortages of fuel, machinery and parts, and

technical and managerial skills. The main industries include food processing, textiles, steel, and metal products. Some revitalization of industry is taking place with the aid of foreign investors and international aid.

Nearly all of Uganda's electricity is produced hydroelectrically, with the Owen Falls dam on the Nile River providing the bulk of the generating power.

The government's economic-recovery plan aims at providing greater encouragement and protection for foreign investors, strengthening the main export industries, and rehabilitating essential human services. By the 1980s Uganda succeeded in attracting some foreign aid from a variety of multilateral and bilateral organizations, and development expenditures increased in some measure, despite civil war. Exports, largely composed of coffee, tea,

cotton, copper, sugar, and hides, generally outweigh imports of machinery, metals, and paper. Principal trading partners include the United Kingdom, the United States, Kenya,

Tanzania, and France.

Government and social conditions. Uganda is a sovereign republic, and the constitution that was adopted in 1967 vested executive power in an elected president. The president was assisted by a cabinet of ministers, appointed from among the members of the unicameral National Assembly, who were elected every five years. The Ugandan judiciary was intended to operate as an independent branch of government, and it comprised magistrate's courts, the High Court, and the High Court of Appeals. Despite this constitutional framework, the actual powers and status of the various branches of government varied with each president. Under Idi Amin (1971–79), all representative government was abolished, and in 1985 the constitution was suspended. Pending the drafting of a new document, Uganda is governed by a nonelected president and by an indirectly elected body called the National Resistance Council.

Health and welfare services are provided through doctors, nurses, midwives, and health inspectors, and medical facilities include a school of hygiene, a department of preventive medicine, a disease-vector control unit, and a number of rural health centres. Diseases such as malaria, hookworm, venereal diseases, and intestinal disorders are, however, common. There is a tremendous housing shortage owing to rapid urbanization, but the National Housing Corporation builds homes for different income groups.

The government has overall responsibility for educational services at all levels. Postprimary school enrollment is, however, closely linked to manpower needs. The Makerere University in Kampala has faculties of arts, social services, science, law, engineering, veterinary science, agriculture, and education. Radio Uganda and Uganda Television are state-owned, and broadcasting stations are maintained in all major towns; plays and traditional music are broadcast. Several daily newspapers are published in Uganda, all of them in Kampala. The press has little freedom, and there are many government restrictions on foreign and national press.

Traditional cultures have gen-Cultural life. erally survived the colonial impact, but not without modifications. The practice and appreciation of fine arts are limited to a small but expanding section of the population. A dance group representing major ethnic groups has been established to strengthen the performing arts. In addition, historians, musicologists, anthropologists, and theologians delve into oral traditions in order to reconstruct aspects of Ugandan culture. Cultural institutions include the National Theatre and the Uganda Museum in Kampala, the Entebbe Botanical

Gardens, and museums at the Ruwenzori and Kabarega national parks.

History. Bantu-speaking peoples were probably among the earliest inhabitants of the area. Toward the end of the 17th century, Nilo-Hamitic groups began to move into northern Uganda and a century later into the south. Arabs reached the country in the 1840s trading in ivory and slaves. In 1862 the Buganda kingdom was crossed by Captain John Hanning Speke and James Augustus Grant, the first European explorers to reach the area. Kabaka (ruler) Mutesa I allowed the first missionaries of the British Church Missionary Society to enter his kingdom in 1877. When Mutesa died in 1884, he was succeeded by his son Mwanga, who began persecuting the Christians and tried to expel them as well as the Arabs from his kingdom. The Arabs, however, expelled both the Christian missionaries and Kabaka Mwanga from Buganda and seized control of the kingdoms; but, with the assistance of the Christians, Mwanga's kingdom was restored.

The German Carl Peters made a treaty of protection with Mwanga in 1889, but this was revoked when the Anglo-German agreement of 1890 declared all of the country north of latitude 1° S to be a British sphere of influence. The Imperial British East Africa Company agreed to administer the region on behalf of the British government, and in 1890 the company's agent, F.D. Lugard, made a treaty with Mwanga, placing Buganda under the company's protection. Lugard also made treaties of protection with the rulers of the western states of Ankole and Toro. In 1894 the territory was formally proclaimed a British protectorate. Although there were a few skirmishes on the southwestern frontier in 1914, Uganda was never in danger of invasion during World War I. The conditions of World War II required Uganda to become as economically self-sufficient as possible. After the war, riots in 1945 marked the beginning of a new political era.

Uganda gained its independence in 1962, with Milton Obote as prime minister. A year later Mutesa II, the kabaka of Buganda, was elected the first president of the state, and Uganda became a member of the United Nations and of the Commonwealth of Nations. Obote ousted Mutesa in 1966, took over as president, and proclaimed a new constitution a year later. In 1971 a military coup replaced Obote with Major General Idi Amin Dada, whose reign was notorious for its brutality. Late in 1978 Amin invaded Tanzania. In retaliation, Tanzanian forces invaded Uganda a year later and deposed Amin. There were two provisional presidents from 1979 to 1980. Milton Obote was elected to the office of president in 1980, but he was once again deposed by a military coup in 1985, and the new military rulers themselves were soon pushed out by the armed National Resistance Movement, led by Yoweri Museveni.

Uganda, Martyrs of, a group of 22 African Roman Catholics who were executed during the persecution of Christians under Mwanga, kabaka (ruler) of Buganda (now Uganda) from 1885 to 1887.

The first Roman Catholic missions to Bantuspeaking Africa were established by the White Fathers in 1879. Christians were tolerated by the kabaka Mutesa I, but his successor, Mwanga, launched a campaign against them. Mwanga massacred the Anglican missionary Bishop James Hannington and his colleagues in October 1885. St. Joseph Mukasa, an important member of the royal household, reproached the kabaka for the massacre and for his homosexual debauchery. On November 15 of that year, Mwanga had Joseph beheaded.

The Christian pages under Joseph's guidance became the next victims. For their refusal to satisfy his sexual demands, Mwanga, having learned that they had received religious instruction from the page St. Denis Ssebuggwawo, ordered that all the youths be arrested. St. Charles Lwanga, Mukasa's successor, then secretly baptized those boys who had only been catechumens. The following day they were herded away to the village of Namugongo. Three of them were murdered en route (St. Pontian Ngondwe, a soldier, and the royal servants Athanasius Bazzekuketta and Gonzaga Gonza). All the survivors, as recorded by Father Lourdel, superior of the Roman Catholic mission to Uganda, were imprisoned for a week. With the exception of St. Mbaga-Tuzinde, who was bludgeoned by his own father, the following pages were burned alive on June 3, 1886: SS. Ambrose Kibuka, Anatole Kiriggwajjo, Achilles Kiwanuka, Mugagga, Mukasa Kiriwawanvu, Adolphus Mukasa Ludigo, Gyavira, and Kizito. The soldiers and officials SS. Bruno Serunkuma, James Buzabaliawo, and Luke Banabakintu were martyred with them

Mwanga continued his persecution, destroying Protestant and Roman Catholic missionaries alike. Subsequent victims included SS. Matthias Mulumba, assistant judge to a provincial chief; Andrew Kaggwa, chief of Kigowa; and Noe Mawaggali, a Roman Catholic leader. The page St. Jean Marie Muzeyi was beheaded on Jan. 27, 1887. Collectively, the martyrs were solemnly beatified by Pope Benedict XV in 1920 and canonized by Pope Paul VI on Oct. 18, 1964. Their feast day is June 3.

BIBLIOGRAPHY. Accounts of the martyrs are found in J.P. Thoonen, *Black Martyrs* (1941); and J.F. Faupel, *African Holocaust*, 2nd rev. ed. (1965).

Ugarit, ancient city lying in a large artificial mound called Ras Shamra (Ra's Shamrah), 6 miles (10 km) north of Al-Lādhiqīyah (Latakia) on the Mediterranean coast of northern Syria. Its ruins, about half a mile from the shore, were first uncovered by the plow of a peasant at Al-Baydā Bay. Excavations were begun in 1929 by a French archaeological mission under the direction of Claude F.A. Schaeffer.

Golden bowl from Ugarit, 14th century BC; in the Musée National, Aleppo, Syria

The golden age of Ugarit. The most prosperous and the best-documented age in Ugarit's history, dated from about 1450 to about 1200 BC, produced great royal palaces and temples and shrines, with a high priests' library and other libraries on the acropolis. Some of the family vaults built under the stone houses show strong Mycenaean influence. Mycenaean and Cypriot pottery in great amounts has also been found.

After the discovery of the temple library, which revealed a hitherto unknown cuneiform alphabetic script as well as an entirely new mythological and religious literature, several other palatial as well as private libraries were found, along with archives dealing with all aspects of the city's political, social, economic, and cultural life.

The art of Ugarit in its golden age is best illustrated by a golden cup and patera (bowl) ornamented with incised Ugaritic scenes; by carved stone stelae and bronze statuettes and ceremonial axes; by carved ivory panels depicting royal activities; and by other fine-carved ivories. Despite Egyptian influence, Ugaritic art exhibits a Syrian style of its own.

Soon after 1200 BC Ugarit came to an end. Its fall coincided with the invasion of the Northern and Sea Peoples and certainly with earthquakes and famines. In the Iron Age and during the 6th-4th century BC, there were small settlements on the site (Leňkos Limen).

The excavators of the site were fortunate in the number and variety of finds of ancient records in cuneiform script. The excavations continue, and each season throws some new and often unexpected light on the ancient north Canaanite civilization. The texts are written on clay tablets either in the Babylonian cuneiform script or in the special alphabetic cuneiform script invented in Ugarit. Several copies of this alphabet, with its 30 signs, were found in 1949 and later. A shorter alphabet, with 25, or even 22, signs, seems to have been used by 13th-century traders.

Scribes used four languages: Ugaritic, Akkadian, Sumerian, and Hurrian, and seven different scripts were used in Ugarit in this period: Egyptian and Hittite hieroglyphic and Cypro-Minoan, Sumerian, Akkadian, Hurrian, and Ugaritic cuneiform. These show clearly the cosmopolitan character of the city.

The Middle Bronze Age period. A carnelian bead identified with the pharaoh Sesostris I (reigned 1971–28 BC) and a stela and statuettes, gifts to the kings of Ugarit from other Middle Kingdom pharaohs (e.g., Sesostris II, 1897–78, and Amenemhet III, 1842–1797), provided the first exact dating in the history of Ugarit. Eggshell ware from Crete (Middle Minoan period) and Babylonian cylinder seals found in the tombs of level II also provided cross datings. During the 18th and 17th centuries BC, Ugarit was apparently under the control of new tribes related to the Hyksos, probably mainly Hurrians or Mitannians, who mutilated the Egyptian monuments.

Ras Shamra texts and the Bible. texts discovered at Ugarit, including the "Legend of Keret," the "Aghat Epic" (or "Legend of Danel"), the "Myth of Baal-Aliyan," and the "Death of Baal," reveal an Old Canaanite mythology. A tablet names the Ugaritic pantheon with Babylonian equivalents; El, Asherah of the Sea, and Baal were the main deities. These texts not only constitute a literature of high standing and great originality but also have an important bearing on Old Testament studies. It is now evident that the patriarchal stories in the Old Testament were not merely transmitted orally but were based on written documents of Canaanite origin, the discovery of which at Ugarit has led to a new appraisal of the Old Testament.

The Ras Shamra mound. Soundings made through the Ras Shamra mound revealed a reliable stratigraphic sequence of settlements from the beginning of the Neolithic period. Above the ground level, five main upper levels (levels V to I) were identified. The three lowest levels have been subdivided into smaller layers. The earliest settlement on level V—already a small fortified town in the 7th millennium BC—shows a prepottery stage with flint industries. Also on level V, but in a later layer, light, sun-dried pottery appears. Level IV and part of level III date back to the Chalcolithic, or Copper-Stone, Age, when

new ethnic groups arrived from the northeast and the east. This stage shows Mediterranean as well as strong Mesopotamian influence. During the Early Chalcolithic Age, painted pottery of the Hassunan and Halafian cultures of northern Iraq is very common. The Late Chalcolithic shows fresh Mesopotamian influence with its monochromatic. Ubaidian, geometrical painted pottery. The flint industry was then in competition with the first metal tools, made of copper. The Early Bronze Age (3rd millennium) layers, immediately above, in level III, vielded no more painted ware but various monochromatic burnished wares and some red polished ware of Anatolian origin. With Early Bronze Age III, metallurgy quickly developed. In the Middle Bronze Age newcomers, so-called Torque-Bearers, expert in bronze metallurgy, arrived (c. 2000–1900 BC). Levels II and I correspond to historical periods within the 2nd millennium BC.

BIBLIOGRAPHY. Claude F.A. Schaeffer, Cuneiform Texts of Ras Shamra-Ugarit (1939, reprinted 1980), discusses the inscriptions that gave a start to the study of the ancient city. Adrian Curtis, Ugarit (Ras Shamra) (1985), is a history of politics, culture, and everyday life. Michael Heltzer, The Internal Organization of the Kingdom of Ugarit (1982), and The Rural Community in Ancient Ugarit (1976), are detailed surveys. A glimpse of social life and customs is found in A. van Selms, Marriage & Family Life in Ugaritic Literature (1954). The place of the Ugarit culture in Biblical studies is explored in Peter C. Craigie, Ugarit and the Old Testament (1983). Translations of Ugarit legends are given in Godfrey R. Driver, Canaanite Myths and Legends, 2nd ed., edited by J.C.L. Gibson (1978).

Ugaritic alphabet, cuneiform writing system used on the Syrian coast from the 15th to 13th century BC. It is believed that it was invented independent of other cuneiform writing systems and of the linear North Semitic

Ugaritic alphabet tablet From D. Diringer, Writing

alphabet, though similarities in certain letters suggest that it may have been patterned after the North Semitic alphabet. Unlike the North Semitic alphabet, however, Ugaritic was written from left to right; its 30 symbols included 3 syllabic signs for vowels, as opposed to the 22 consonantal letters in the North Semitic alphabet. Extant documents in Ugaritic are written on clay tablets with a wedge-shaped stylus and date from the 15th-14th century BC. They were found primarily at Ugarit (Ras Shamra) on the Syrian coast in 1929. Two other inscriptions in Ugaritic, found at Beth-Shemesh in Palestine (modern Tel Bet Shemesh, Israel) and in Lower Galilee (modern northern Israel), suggest that the script may have been known throughout a fairly

Ugedei (Mongol ruler): see Ögödei.

Ughelli, town, Bendel state, southern Nigeria, in the western Niger delta east of Warri. Originally an agricultural-trade centre (cassava, plantains, sugarcane, palm oil and kernels) for the Urhobo (Isoko) people, it has also developed industries producing sheet glass, glass bottles, and natural gas. Petroleum deposits were discovered in the vicinity, and since 1965 crude oil from the Ughelli fields has

been shipped via the 140-mile (225-kilometre) Trans-Niger Pipeline southeastward to the port of Bonny for export. The town has a technical college. Pop. (1971 est.) 10,761.

Ugolnye Kopi (Russian S.F.S.R.): see Kopeysk.

Ugra, Battle of the (1480), bloodless confrontation between the armies of Muscovy and the Golden Horde, traditionally marking the end of the "Tatar yoke" in Russia. By 1480 the Golden Horde had lost control of large portions of its empire; Ivan III of Moscow had stopped paying tribute to the Horde and no longer recognized it as an authority over Muscovy. In 1480 Akhmet, khan of the Golden Horde, led an army to the Ugra River, about 150 miles (240 km) southwest of Moscow, and waited there for his Lithuanian allies. The Muscovite army was drawn up on the opposite bank of the river. The two armies faced each other but did not fight. When the Lithuanians did not appear and Akhmet received word that his base camp near Sarai had been raided by allies of Ivan, he withdrew his army. The Muscovite army returned home. Although the event itself had little significance, Muscovite chroniclers later composed grandiose tales about it, giving rise to the notion that the Muscovites had won a great victory on the Ugra and liberated themselves from Tatar rule.

Uguccione DELLA FAGGIUOLA (b. c. 1250, Massa Trabaria, Tuscany [Italy]—d. Nov. 1, 1319, Vicenza), Tuscan noble who, as tyrant of Pisa and Lucca, played a role in the 14th-century Italian struggle between papal and imperial factions.

A member of an old Ghibelline (pro-imperial) family, Uguccione had served as podestà (chief magistrate) and captain general in several Italian cities when the sudden death of Holy Roman Emperor Henry VII left Ghibelline Pisa without effective leadership. Offered the position of podestà, the 60-year-old Uguccione soon became captain of war and virtual dictator. A Ghibelline rising in Lucca, led by the mercenary captain Castruccio Castracani, enabled Uguccione to make an easy conquest of the neighbouring city. Invading Florentine territory in 1315, he won a resounding victory over Guelf (papal) forces at Montecatini, northwest of Florence; in 1316, however, he was overthrown in Pisa and Lucca by Castracani.

After an unsuccessful attempt to retake the two cities, aided by Cangrande I della Scala, lord of Verona, Uguccione returned to Verona and became *podestà* of Vicenza. He died the following year.

Uhaimer, Tall al- (Iraq): see Kish.

UHF, abbreviation of ULTRAHIGH FRE-QUENCY, conventionally defined portion of the electromagnetic spectrum, encompassing radiations having a wavelength between 0.1 and 1 m and a frequency between 3,000 and 300 megahertz. UHF signals are used extensively in televison broadcasting. UHF waves typically carry televison signals on channels 14 through 83.

UHF waves are very weakly reflected by the ionized layers of the upper atmosphere. Therefore, unlike longer waves, they bend very little around the curvature of the Earth and are easily obstructed by tall buildings and mountains. They can, however, be concentrated into narrow, highly directional signal beams. The characteristics make UHF suitable for line-of-sight applications that require high accuracy. Besides their use in television broadcasting, UHF waves are utilized in ship and aircraft navigation systems and for certain types of

police communications. In some instances, radio communications between spacecraft and Earth-based tracking stations are carried via UHF signals. See also VHF.

Uhland, (Johann) Ludwig (b. April 26, 1787, Tübingen, Württemberg [Germany]—d. Nov. 13, 1862, Tübingen), German Romantic poet and political figure who was an important figure in the development of German medieval studies.

Uhland, oil painting by Gottlob Wilhelm Morff, 1818; in the Schiller-Nationalmuseum, Marbach, Ger

By courtesy of the Schiller-Nationalmuseum, Marbach,

Uhland studied law and classical and medieval literature at the University of Tübingen. He wrote his first poems while in Tübingen, publishing *Vaterländische Gedichte* ("Fatherland Poems") in 1815. It was the first of some 50 editions of the work issued during his lifetime. The collection, which was inspired by the contemporary political situation in Germany, reflected both his serious study of folklore and his ability to create ballads in the folk style.

From 1812 to 1814 Uhland was secretary in the Ministry of Justice at Stuttgart. He then practiced law and began to support the struggle for parliamentary democracy in Württemberg. From 1819 to 1827 he represented Tübingen in the Ständeversammlung (parliament), and from 1826 to 1829, Stuttgart. In 1829 he was appointed professor at Tübingen, but, when he was refused leave of absence by the university to sit as a liberal in the Landtag (provincial diet), he resigned the professorship (1833). In 1848 he was a member of the German National Assembly in Frankfurt.

The spirit of German Romanticism and nationalism inspired much of Uhland's poetry, as did his political career and his researches into the literary heritage of Germany. His poetry utilizes the classical form developed by Johann Wolfgang von Goethe and Friedrich von Schiller, but his naive, precise, and graceful style is uniquely his own.

Uhlenbeck, George Eugene (b. Dec. 6, 1900, Batavia, Java [now Jakarta, Indon.]—d. Oct. 31, 1988, Boulder, Colo., U.S.), Dutch-American physicist who, with Samuel A. Goudsmit, proposed the concept of electron spin.

In 1925, while working on his Ph.D. at the University of Leiden, Neth. (1927), he and Goudsmit put forth their idea of electron spin after ascertaining that electrons rotate about an axis. Uhlenbeck joined the physics department at the University of Michigan, U.S., in 1927, returned to The Netherlands, as professor at the State University at Utrecht, and then became full professor at the University of Michigan in 1939. From 1943 to 1945 he worked at the Radiation Laboratory of the Massachusetts Institute of Technology, and in the postwar period he worked in The Netherlands. In 1960 he was appointed professor and

physicist at the Rockefeller Medical Research Center at the State University of New York, New York City, becoming professor emeritus in 1974. He wrote many papers on atomic structure, quantum mechanics, kinetic theory of matter, and nuclear physics.

Ŭich'ŏn (Buddhist priest): see Daigak Guksa.

Uige, formerly CARMONA, town, northern Angola. Uíge grew from a small, economically undeveloped market centre in 1945 to become Angola's major centre for coffee production in the 1950s. The Portuguese designated Uíge a city in 1956. Its prosperity was short lived, however, as recurrent fighting between the National Front for the Liberation of Angola (FNLA), one of three preindependence guerrilla movements, and Portuguese forces from 1961 to 1974 resulted in heightened instability in the city and its environs. Portuguese settlers abandoned the town in 1974-75 prior to Angolan independence. In 1976 the city, which had become the headquarters of the FNLA, was captured by forces of the Popular Movement for the Liberation of Angola (MPLA), the preindependence guerrilla movement that later became the national government. Attempts at reviving coffee production in the locality had only limited success in the 1980s. Pop. (1985 est.) 69,484.

Uighur, Chinese (Pinyin) UYGUR, Turkic-speaking people of interior Asia who live for the most part in northwestern China, in the Uygur Autonomous Region of Sinkiang; a small number occupy central Asian parts of the Soviet Union. There were more than 6,400,000 Uighurs in China in the late 20th century, most of them in Sinkiang; there were also some 200,000 in the Soviet Union, most of whom lived in the Uzbek, Kazakh, and Kirgiz Soviet Socialist republics.

The Uighur are among the oldest Turkic-speaking peoples of Central Asia and are mentioned in Chinese records from the 3rd century AD. They first rose to prominence in the 8th century, when they established a kingdom along the Orhon River in what is now north-central Mongolia. In 840 this state was overrun by the Kirgiz, however, and the Uighur migrated southwestward to the area around the Tien Shan (mountains). There the Uighur formed another independent kingdom in the Turfan region, but this was overthrown by the expanding Mongols in the 13th century. The Uighurs' subsequent history was uneventful.

The Uighur are, in the main, a sedentary, village-dwelling people, their habitat being the network of oases formed in the valleys and lower slopes of the Tien Shan, Pamir, and related mountain systems. The region is one of the most arid in the world; hence, they must practice irrigation to conserve their water supply for agriculture. Their principal food crops are wheat, corn (maize), kaoliang (a form of sorghum), and melons. The chief industrial crop is cotton, which has long been grown in the area. Petroleum has been discovered in Sinkiang, and an industrial economy is being established in the region.

The chief Uighur cities are Urumchi, the capital of Sinkiang, and Kashgar, an ancient centre of trade near the Russo-Chinese border. The Uighur have lacked political unity in recent centuries, except for a brief period during the 19th century when they were in revolt against Peking. Their indigenous social organization is centred on the village: they marry within the village, and the village is organized to run its own affairs. They are Sunnite Muslims, as are the great majority of Turkic peoples of interior Asia.

Uighur Autonomous Region of Sinkiang (China): *see* Sinkiang, Uygur Autonomous Region of.

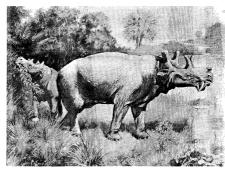

Uighur language, also called NEW-UIGHUR, member of the Turkic language group (a subfamily of the Altaic languages), spoken in the Uygur Autonomous Region of Sinkiang of northwestern China and in the Uzbek S.S.R. and neighbouring areas of the Soviet Union. The modern Uighur language, which was known as Taranchi in Russia prior to the Russian Revolution of 1917, is classified with Uzbek in the southeastern (Uighur, or Chagatai) division of the Turkic languages. Speakers of two Turkic dialects, Salar and Sarig (Yellow) Uighur, which are closely related to the southeastern division, also employ Uighur as their literary language.

The Uighur literary language was originally written in Arabic script; but it officially adopted the Latin alphabet in 1930, and in the U.S.S.R. it adopted the Cyrillic alphabet in 1947. In China the Arabic script continues to be widely used for writing Uighur. See also Turkic languages.

Ŭijŏngbu, city, Kyŏnggi do (province), northwestern South Korea, 5 miles (8 km) northeast of Seoul. Its name, meaning "the Cabinet" in old Korean, derives from its being the temporary site of the Cabinet office during the Yi dynasty (1392–1910). The city was formerly the market centre for agricultural products grown in the surrounding area. Üijŏngbu developed rapidly after the Korean War (1950–53) as a service centre for nearby military installations, and it became a municipality in 1963. It has now become an industrial satellite of Seoul. Most of the city's industries, including cotton textiles and paper, were established after 1960. Pop. (1985) 162,700.

Uinta Mountains, segment of the south-central Rocky Mountains, extending eastward for more than 100 miles (160 km) from the Wasatch Range across northeastern Utah and slightly into southeastern Wyoming, U.S.

or protuberances, were present on the skull of the uintatherium. The anteriormost pair may have supported prominent horns. Uintatherium's teeth were distinctive: males of

the genus possessed large, powerful canines; incisors were absent in the upper jaw but present in a reduced state in the lower; and the upper molars were characterized by the presence of V-shaped crests. By the end of the Eocene epoch, uintatherium and closely related forms became extinct; they were unable to adapt to the changing environmental conditions of that time.

Uisang Daisa (b. 625, Korea—d. 702, Korea), Buddhist who devoted himself to the propagation of the teaching of the *Avatamsaka-sūtra* (*Garland Sutra*), which provided ideological support for the political system of the state of Silla (661–935), one of the three kingdoms into which ancient Korea was divided.

Uisang Daisa became a monk at 20, and at 37 he went to China, where he studied the

Bear River valley and the Uinta Mountains, northern Utah David Muench—EB Inc.

Many summits exceed 13,000 feet (4,000 m), including Kings Peak (13,528 feet [4,123 m]), the highest point in Utah.

The mountains are a headstream region for the Provo, Weber, and Bear rivers and include the High Uintas Primitive Area and parts of the Ashley, Wasatch, and Uinta national forests. The Uintah and Ouray Indian Reservation lies to the south.

uintaite (bitumen): see Gilsonite.

Uintatherium, extinct genus of large, primitive hoofed mammals found as fossils in North America in terrestrial deposits of the Middle and Late Eocene epoch (52 million of 36.6 million years ago). The uintatherium, which was as large as the modern rhinoceros, was among the largest animals of its time. The limbs were strongly constructed in order to support the massive body. The skull was mostly occupied by bone rather than brain, and uintatherium must have had a very limited intelligence. Three pairs of bony growths,

Garland Sutra under the direction of Chihyen, the 2nd patriarch of the Chinese Garland School. While in China he wrote his major work, An Explanatory Diagram on the Garland World System, which elicited high acclaim from his master and is still read widely in the Buddhist circles of East Asia. On returning home in 671, he built, on the order of King Munmu, the Pusök sa (temple) as the centre of the Garland sect.

Uitenhage, town, southeastern Cape Province, South Africa, near the Indian Ocean, northwest of Port Elizabeth. It was founded in 1804 by J.A. Uitenhage de Mist, a Dutch governmental official sent to the Cape Colony by the government of the Batavian Republic, and it contains a number of 19th-century buildings, including the Drostdy (1815), Town Hall (1882, extended in 1952), and Court House (1898). Uitenhage is an industrial town, with automobile-assembly plants, railway workshops, and textile and tire factories. It is also the centre of a substantial sheep- and

goat-farming district. Pop. (1978 est.) mun., 87,760.

uitlander (Afrikaans: "outlander"), any British or other non-Afrikaner immigrant in the Transvaal in the 1880s and '90s. The prospect of gold lured large numbers of new-comers to Johannesburg, where they became a majority of the citizenry, led by an aristocracy of wealthy mine owners. The Transvaal's long-established rural population of Boers ("farmers," or Afrikaners), afraid of being overwhelmed, passed laws to restrict the uitlanders' influence. A law of 1888 declared that only the Dutch language could be used in legal proceedings and official documents.

Naturalization and the right to vote, under a law passed in 1890, involved not only a naturalization fee but also a minimum of 14 years' residence. The franchise became a focus of uitlander protest. In 1892 the lawyer Charles Leonard organized the National Union, which held meetings and circulated petitions demanding that uitlanders be given the right to vote. From that time on, tensions mounted steadily, aggravated by the Jameson Raid of 1895 and by open British support for the uitlanders. War finally erupted in 1899 (see South African War).

Uitzilopochtli (Aztec god): see Huitzilopochtli.

uji, any of the hereditary lineage groups that, until their official abolition in AD 604, formed the basic, decentralized ruling structure of early Japan. They are often referred to as the great clans because of their traditions of common descent, and they were ruled by an uji chief who was considered a direct descendant of the deity (uji-gami) worshipped by the group's members. The uji members, who had the privilege of having personal surnames and being called by titles of respect, were supported by the labour of common workers, who were organized into subunits of the uji known as be (q.v.).

When the Yamato *uji* began to establish itself as the leading power in the 3rd century, its chief created the Japanese Imperial line, which is said to be descended from Amaterasu, the sun goddess and deity of the Yamato. Imperial rule over the autonomous *uji* remained weak until the adoption of centralized government in the mid-7th century.

Uji, city, Kyōto Urban Prefecture (fiu), Honshu, Japan, on the Uji-gawa (Uji River), in the southeastern corner of the Kyōto Basin. It developed in about the 7th century as a river crossing. During the Tokugawa era (1603–1868) it was the main post town on the road between Nara and Ōtsu.

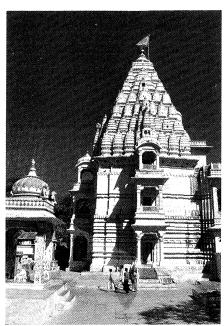

Uji is best known as the place where tea was first cultivated in Japan in the Muromachi era (1338-1573). High-quality green tea is still grown on the fertile alluvial fan of the Uji-gawa, and there is cormorant fishing in the river. With improved road and rail connections to Kyōto, the city became a residential suburb and resort, serving the greater urban centre. Among its many historic temples and shrines is the Byodo-in. It was built as a residence in the mid-11th century for a minister who later converted the building into a Buddhist temple when he became a Buddhist monk. Minamoto Yorimasa, a warrior and poet who supposedly killed the nue (a monster having the head of a monkey, the body of a tiger, and the tail of a serpent) in 1153, fought against the Taira clan at Uji-bashi (Uji Bridge) in 1180. After his defeat he took refuge in the Byōdō-in, where he committed seppuku. Pop. (1983 est.) 160,018.

uji-gami, in the Shintō religion of Japan, the tutelary deity of a village or geographical area. The meaning of *uji-gami* has undergone considerable evolution over the centuries, mainly because of the historical migrations of clan

communities in Japan. Originally the term referred to the ancestral deity of a family or clan, blood kinship forming the basis of the spiritual relationship. The extent of the *ujigami*'s protection was later enlarged to cover those who lived with the clan or near it and since has extended over the parish into which one is born. *Uji-ko* are those who live within or were born within the geographic boundaries of the tutelary deity and who help manage the shrine affairs.

Uji-Yamada (Japan): see Ise.

Ujjain, city, administrative headquarters of Ujjain district, Madhya Pradesh state, central India, just east of the Siprā River. Ujjain, one of seven sacred Hindu cities, is the site of the Kumbha Melā festival every 12 years. Lying

Remains of the Mahākāl temple in Ujjain, Madhya Pradesh. India

Baldev—Shostal Assoc./EB Inc.

on the first meridian of the ancient Hindu geographers, it was the capital (as Ujjayinī) of the Aryan Avanti kingdom (6th-4th century BC). In the 2nd century BC, Ujjain was the seat of the emperor Aśoka, the last of the Mauryan rulers and one of the most influential early Buddhists. The city was known to the Greek geographer Ptolemy in the 2nd century AD as Ozene, the capital of the Western Satraps, the Greek, Scythian, and Parthian rulers of western India. An important trade centre in ancient times, it passed in 400 to Candra Gupta II of Magadha, the legendary Vikramāditya. In 1235 Iltutmish of Delhi sacked Ujjain, and it remained in Muslim hands until its capture in 1750 by the Sindhias, who made it their capital. With the transfer of the capital to Lashkar in Gwalior (1810) and the rise of Indore, Ujjain declined in importance. It was constituted a municipality in 1887. Near the Sindhia palace are the gateway remains of the Mahākāl (Siva) temple, one of the most sacred in India, destroyed in 1235. Just southeast are the ruins of the observatory built by Maharaja Jai Singh of Jaipur, governor of Mālwa (1728-34) under the Mughals. Just north lies Bharathari Cave, an 11th-century temple.

A rail junction, the city is a major agricultural and textile-trade centre. Cotton ginning and milling, oilseed milling, handweaving, and the manufacture of metalware, tiles, hosiery, confectionery, strawboard, and batteries are important industries. Ujiain is the seat of Vikram University (founded 1957).

Ujjain district, with an area of 2,348 sq mi (6,081 sq km), was constituted in 1948

from portions of Gwalior and Indore princely states. It comprises a fertile plain of the Mālwa Plateau and receives electric power from the Gāndhī Sāgar Dam on the Chambal River. Jowar (sorghum), wheat, cotton, pulses, legumes, and poppy are the chief crops. Pop. (1981) city, 278,454; metropolitan area, 282, 203; district, 1,117,002.

'Ujmān (United Arab Emirates): see Ajman.

Ujung-Kulon National Park, national park on the island of Java, in Jawa Barat propinsi (West Java province), Indonesia. A remote area of low hills and plateaus, with small lagoons and coastal dunes, it occupies 528 sq mi (1,367 sq km), chiefly on the peninsula known as Menanjung Ujung Kulon, at the extreme western tip of Java. The park faces the Sunda Strait, separating Java from Sumatra, and includes Pulau Panaitan, a hilly island about 6 mi (10 km) north of the peninsula.

Kepulauan Krakatau, a small group of islands, remnants of the famous volcanic eruption of Krakatoa in 1883, are located about 40 mi north of the peninsula. Following Krakatoa's explosions and tidal waves, the peninsula was a blanketed by a layer of volcanic ash and dust. After the jungle grew back and the area was reinhabited by wildlife, it was set aside as a nature reserve in 1921 and declared a national park in 1980. The park today contains the last remaining low-relief forest on Java; typical trees are of the genera Ficus and Barringtonia. Animal species found there include the Javan tiger; the rare, one-horned Javan rhinoceros; banteng (a species of wild cattle); Javan gibbon; Javan leaf-monkey; crocodile; green sea turtle; green peafowl; jungle fowl; the muntjac, or barking deer; and the chevrotain, or mouse deer.

Ujung Pandang, formerly MACASSAR, or MAKASAR, kotamadya (city) and capital, Sulawesi Selatan propinsi (South Celebes province), Celebes, Indon., on the western side of the most southerly peninsula of Celebes, on a low site surrounded by swampy country. The forest-clad hills of Maros and the Bantimurung waterfall are nearby attractions. Also near the city, the largest on the island, is the grave of Dipo Negoro, the Javanese prince who died there in exile in 1855 after leading the Java War (1825–30) against the Dutch. Already a flourishing port when the Portuguese arrived in the 16th century, Makasar subsequently came under control of the Dutch, who built a trading station in 1607 and finally deposed the Sultan in 1667. It was briefly (1946-49) the capital of the Dutch-sponsored state of Indonesia Timur (East Indonesia). The people, the Makasarese, are a branch of the Malay people and are closely related to the Buginese.

The main exports from Ujung Pandang are copra, gums and resins, rubber, coffee, and rattan. The port is also a distribution centre for other parts of Celebes, the Moluccas, and the Lesser Sunda Islands. There is an airport, good roads link the city to the hinterland, and a long-disused steam tramway connects with Takalar. Cultural amenities include Hasanuddin State University, the major university of eastern Indonesia. Pop. (1980) 709,038.

Újvidék (Yugoslavia): see Novi Sad.

U.K.: see United Kingdom.

ukelele: see ukulele.

Ukemochi no Kami (Japanese: Goddess Who Possesses Food), in Shintō mythology, the goddess of food. She is also sometimes identified as Wakaukanome (Young Woman with Food) and is associated with Toyuke (Toyouke) Ōkami, the god of food, clothing, and housing, who is enshrined in the Outer Shrine of Ise.

According to the legend recounted in the Nihon shoki ("Chronicles of Japan"), the moon god, Tsukiyomi, was dispatched to earth by his sister, the sun goddess Amaterasu, to visit Ukemochi no Kami. (According to the Kojiki, "Records of Ancient Matters," it was another brother, the storm god Susanoo, who was sent on the mission.) The food goddess welcomed him by facing the land and disgorging from her mouth boiled rice, turning toward the sea and spewing out all kinds of fishes, and turning toward the land and disgorging game. She presented these foods to him at a banquet, but he was displeased at being offered the goddess's vomit and drew his sword and killed her. When he returned to heaven and informed his sister of what he had done, she became angry and said, "Henceforth I shall not meet you face to face," which is said to explain why the Sun and the Moon are never seen together.

Another messenger sent to the food goddess by Amaterasu found various stuffs produced from her dead body. From her head came the ox and the horse; from her forehead, millet; from her eyebrows, silkworms; from her eyes, panic grass (a cereal); from her belly, rice; and from her genitals, wheat and beans. Amaterasu had the food grains sown for mankind's future use and, placing the silkworms in her mouth, reeled thread from them, thereby beginning the art of sericulture—the production

of raw silk.

Ukhta, also spelled UCHTA, industrial city, Komi Autonomous Soviet Socialist Republic, northwestern Russian S.F.S.R., on the Ukhta River. It was founded as the village of Chibyu in 1931 and became a city in 1943, when it was linked to the Pechora railway. Ukhta lies in the centre of a small oil and gas area; some oil is refined locally. The city has institutes for the oil, forestry, and railway industries. Pop. (1987 est.) 105,000.

Ukiah, city, seat (1859) of Mendocino county, northwestern California, U.S., on the Russian River, 60 miles (97 km) north-northwest of Santa Rosa. Settled in 1856, it derived its name from Pomo Indian yokaya (probably "deep valley," or "south valley"). Its main economic activities are fruit packing, wine making, stock raising, and lumbering (based on the Mendocino National Forest and including the manufacture of plywood and Masonite). Ukiah is the site of one of the world's five International Latitude Observatories, established 1899 by the International Geodetic Association on the 39°08' parallel, and of Mendocino College (1972). Înc. 1876. Pop. (1987 est.) 13,513.

ukiyo-e (Japanese: "pictures of the floating world"), one of the most important genres of art of the Tokugawa period in Japan. The style is a mixture of the realistic narrative of the emaki ("picture scrolls") produced in the Kamakura period and the mature decorative style of the Momoyama and Tokugawa periods. The ukiyo-e style also has about it something of both native and foreign realism.

Screen paintings (generally unsigned) were the first works to be done in the style. These depicted aspects of the entertainment quarters (euphemistically called the "floating world") of Edo (modern Tokyo) and other urban centres. Common subjects included famous courtesans and prostitutes, Kabuki actors and wellknown scenes from Kabuki plays, and erotica. More important than screen painting, however, were wood-block prints, ukiyo-e artists being the first to exploit that medium. A new interest in the urban everyday world and its market motivated the swift development of ukiyo-e prints designed for mass consumption.

Hishikawa Moronobu is generally accredited

"Hanshozuku Bijin Soroi," ukiyo-e colour woodcut by Okumura Masanobu (1686-1764), Edo period; in the Philadelphia Museum of Art By courtesy of the Philadelphia Museum of Art, given by Mrs. Anne Archbold

as the first master of ukiyo-e. The transition from single- to two-colour prints was made by Okumura Masanobu. In 1765 polychrome prints using numerous blocks were introduced by Suzuki Harunobu. The essence of the ukiyo-e style was embodied in the works of Utamaro, Hokusai, and Hiroshige.

Ukkel (Belgium): see Uccle.

Ukko, in Finnish folk religion, the god of thunder, one of the most important deities. The name Ukko is derived from ukkonen, "thunder," but it also means "old man" and is used as a term of respect. Ukko had his abode at the centre of the heavenly vault, the navel of the sky; hence he was often called Jumala, "Heaven God." Ukko was believed to control rainfall and thus the fertility of the land, and sacrifices were directed toward him at the beginning of the planting season and in times of drought. As a god of thunder, Ukko has conceptual cognates among most Finno-Ugric peoples, such as the Erzo-Mordvin god Purgine (or Pirgine), whose name is borrowed from the Baltic Perkunas.

Ukmergė, city, centre of a rayon (sector), Lithuanian Soviet Socialist Republic, on the Sventoji River. It was founded in the 13th century, when it was known as Vilkomir. Ukmerge lies about 45 miles (72 km) north and slightly west of Vilnius. It has a variety of industries, including the manufacture of agricultural machinery, furniture, and foodstuffs. Pop. (1970) 21,663.

Ukraine, officially ukrainian soviet so-CIALIST REPUBLIC, Russian UKRAINA, or UKRAINSKAYA SOVETSKAYA SOTSIALISTICH-ESKAYA RESPUBLIKA, Academiya Nauk romanization UKRAINA, or UKRAINSKAJA SO-VETSKAJA SOCIALISTIČESKAJA RESPUBLIKA, Ukrainian ukraina, or ukrainska radyan-SKA SOTSIALISTYCHNA RESPUBLIKA, one of the union republics of the Soviet Union.

A brief treatment of the Ukraine follows. For full treatment, see MACROPAEDIA: Union of

Soviet Socialist Republics.

geography. The Physical and human Ukrainian S.S.R. lies in the southwest of the European Soviet Union, bordered by the Belorussian S.S.R. on the north; the Russian S.F.S.R. on the east; the Sea of Azov, the Black Sea, the Moldavian S.S.R., and Romania on

the south; and Hungary, Czechoslovakia, and Poland on the west. The capital is Kiev.

The Ukraine consists almost entirely of level plains averaging 574 feet (175 m) in elevation and occupying a large portion of the East European Plain. The northeastern portion of the Ukraine is a spur of the Central Russian Upland. In the southern Ukraine the Black Sea Lowland extends along the shores of the Black and Azov seas, and in the Crimean Peninsula it becomes the North Crimean Lowland. The Crimean Mountains form the southern coast of the Crimean Peninsula between the Black Sea and the Sea of Azov and consist of three low, parallel ranges with fertile valleys between them. In the west the Carpathian Mountains extend for more than 150 miles (240 km).

The Ukraine lies in a temperate climatic zone, and almost all the major rivers drain southward through the plains toward the

Azov-Black Sea Basin.

The conservation of natural resources is given high priority, and the Ukraine established its first nature reserve, Askaniya-Nova, in 1921, three years before becoming part of the Soviet Union. This reserve preserves a portion of virgin steppe with characteristic fescue and feather grasses. Some 40 mammals, including the onager and Przewalski's horse, have been introduced in a program of breeding endangered species. There are other important nature reserves including one on the Black Sea.

The Ukraine is one of the richest areas of the world in manganese-bearing ores, and iron-ore reserves are widely found. Other minerals include anthracite, bituminous coal, petroleum, titanium ores, bauxite deposits, nephelites, alunites, mercuric sulfide, ozokerite, potash, rock salt, phosphorites, and natural sulfur. Numerous mineral springs are the centres of

Ukrainian health spas.

The Ukraine has a major ferrous-metal industry, producing much of the Soviet Union's cast iron, steel and rolled steel, and steel pipe. Mining is also a very high proportion of the Soviet total. Manufactured goods include metallurgical equipment, diesel locomotives, tractors, and television sets. The Ukrainian chemical industry accounts for much of the coke produced in the Soviet Union and also produces mineral fertilizers and sulfuric acid. The food industry accounts for much of the national output of granulated sugar. Virtually all of the energy for industrial processes in the Ukraine is provided by fossil fuels.

Thousands of collective farms (kolkhozy) and state farms (sovkhozy) employing mechanized farming methods raise cattle for meat and

milk, cereals, and sugar beets.

The Ukraine is, together with Belorussia, one of the founding members of the United Nations; the two are the only UN members that are not at least nominally fully sovereign nations. In other respects the government of the Ukraine is similar to that of the other Soviet republics; the Communist Party of the Ukraine chooses members of a Supreme Soviet, who are then ratified by the voters every four years. The Supreme Soviet appoints a Presidium and a Council of Ministers (cabinet).

Education is required in the Ukraine between the ages of 7 and 17. Ukrainian is the main language of instruction, although there are schools in which Russian, Moldavian, Polish, Bulgarian, Hungarian, French, German, Spanish, or English is dominant. There are correspondence schools and numerous institutions of higher education. The Academy of Sciences of the Ukrainian S.S.R. coordinates the work of numerous scientific institutions. Illiteracy was virtually eliminated by the 1920s. All news media, including scores of broadcast stations and newspapers, are strictly controlled by the republic.

The Ukrainian literary tradition goes back to pre-Christian times, and oral literature earlier still. In the Soviet period the journal Literaturna Ukraina published work by members of the Ukrainian Writers Union such as V.S. Zemlyak, N. Ia. Zarudny, Gonchar, and Lesya Ukrainka. Music, particularly folk music, has great vitality. Contemporary composers include Konstantin Yankevych, Yuli Meytus, and the Mayboroda brothers, Yury and Platon. Theatre is also a venerable Ukrainian tradition, going back to the early 18th century and perpetuated in modern times not only on the stage but also in cinema.

History. The Ukraine was not widely called the Ukraine until the 19th century. Various states existed in this territory—Kievan Rus (9th–13th century), the Galician-Volhynian principality (11th–14th), the Cossack Hetmanate (17th–18th), and the Crimean Khanate (15th–18th).

In the 9th century the Dnepr River became an important trade route between the Baltic and Black seas, and Kiev became eastern Europe's major political and cultural centre. The name Rus, which first designated the lands around Kiev, later came to include the entire Kievan domain. Under the rulers Vladimir I (St. Vladimir) and Yaroslav I (Yaroslav the Wise), Kievan Rus in the 11th century reached the height of its power (see also Rurik dynasty). The 12th and 13th centuries saw the decentralization of power and a shift in trade routes. The Mongol conquest in the mid-13th century marked the end of Kievan power, but the Galician-Volhynian principality in the western Ukraine continued into the 14th century.

In the 14th century Lithuania annexed most of the Ukrainian lands except for the Galician principality, which passed to the kingdom of Poland; the southern Ukraine remained under Mongol control. The division of the Kievan metropolitanate into two separate jurisdictions for Muscovy and Lithuania in 1458 marked the increasing differentiation among the former lands of Kievan Rus. After the Union of Lublin in 1569, the Ukraine was transferred from Lithuania to Poland. The negotiation of the Union of Brest-Litovsk in 1596 divided the Ukrainians into Orthodox and Ukrainian Catholic faithful.

Religious dissent and social strife were augmented by the Zaporozhian Cossacks, nominally subjects of the Polish king but in fact a class of free warriors. From their stronghold on the lower Dnepr, called the Zaporozhian Sich, the Cossacks in 1648, led by their hetman (military leader) Bohdan Khmelnitsky, rose against the Poles and formed a quasiindependent, if short-lived, state. Khmelnitsky's need for help against the Poles led to an agreement with the Muscovite tsar in 1654, which was considered an act of submission by the Muscovites. Poland-Lithuania was forced to recognize Muscovite suzerainty over Kiev and the lands east of the Dnepr, and the Cossack Hetmanate was gradually absorbed into the Russian Empire; in the late 18th century the remnants of Ukrainian autonomy were abolished. The Russian annexation of the Crimea (1783) opened the Black Sea coast to colonization, and the area was rapidly settled and became a major grain-exporting region in the first half of the 19th century.

In the 18th-century partitions of Poland, the Russian Empire obtained the Ukrainian lands west of the Dnepr, except for Galicia, which went to Austria. A Ukrainian national movement developed in the 19th century. In the Russian Empire the movement faced political repression and restrictions against the Ukrainian language (1863, 1876). In Austria-Hungary conditions were more favourable. By World War I, Ukrainians of Galicia had set up a network of cultural, political, and religious institutions.

After the Russian Revolution of February 1917, a Ukrainian Central Rada (*rada* meaning "council"), led by Myhaylo Hrushevsky, was formed in Kiev, and after the Bolshevik

Revolution in October the Russian communist government set up a Ukrainian Soviet Socialist Republic in Kharkov. Several governments struggled for control of the Ukraine during 1917–21, when the Soviet government emerged victorious. In 1924 the Ukrainian Soviet Socialist Republic became one of the constituent republics of the Soviet Union.

Following the collapse of the Austro-Hungarian Empire, Ukrainians seized the Galician capital of Lemberg (Lvov, Lviv) on Nov. 1, 1918, and proclaimed a Western Ukrainian National Republic (ZUNR), which united in January 1919 with the Ukrainian National Republic (UNR) of Symon Petlyura. Soon, however, Ukrainian troops were driven from Galician territory (June 1919), Bukovina was annexed by Romania, and the former Ukrainian provinces of Hungary were included in the new Czechoslovak state.

In the interwar period, the Soviet government carried out a policy of rapid industrialization and collectivization of agriculture. Collectivization met with peasant resistance, and a famine in the early 1930s took an estimated five million lives. In that same decade, under Joseph Stalin, political repression increased; the policy of introducing the Ukrainian language into all aspects of the republic's life ended, and non-Marxist cultural and scholarly activities were curtailed. In eastern Galicia, Ukrainian resistance to Polish rule led to a cycle of repression and terrorism. In Bukovina and Bessarabia, the Romanians looked with disfavour on Ukrainian institutions. Only in Czechoslovak Transcarpathia did Ukrainians enjoy broad political and cultural rights.

The German-Soviet Treaty of Nonaggression (1939) brought the Polish territories of east-ern Galicia and western Volhynia into the Ukrainian S.S.R. The German attack on the Soviet Union in June 1941 and rapid conquest of the Ukraine initially found some local support but soon provoked guerrilla resistance. After the defeat of the Germans, all the ethnically Ukrainian lands became part of the Soviet Union. In the western Ukraine, collectivization in the late 1940s and the outlawing of the Ukrainian Catholic Church (1946-89) caused dissatisfaction and prolonged the wartime guerrilla resistance. Controls were relaxed after Stalin's death in 1953, but government policy continued to emphasize the Ukraine's ties to Russia. After Mikhail Gorbachev introduced the freedoms of glasnost and perestroika into Soviet policy in the late 1980s, many Ukrainians, especially the intellectuals, awakened to new feelings of outspoken nationalism. Area 233,100 square miles (603,700 square km). Pop. (1988 est.) 51,377,-

Ukrainian Catholic Church, largest of the Eastern Catholic churches, in communion with Rome since the Union of Brest-Litovsk (1596). Byzantine Christianity was established among the Ukrainians in 988 by St. Vladimir (Volodimir) and followed Constantinople in the Great Schism of 1054. Temporary reunion with Rome was effected in the mid-15th century, and a definitive union was achieved at Brest-Litovsk in 1596, when Metropolitan Michael Ragoza of Kiev and the bishops of Vladimir, Lutsk, Polotsk, Pinsk, and Kholm agreed to join the Roman communion, on condition that their traditional rites be preserved intact. The Orthodox did not accept the union peaceably; and the bishops of Lvov and Przemyśl, as well as the Orthodox Zaporozhian Cossacks, opposed the Catholics. In 1633 the metropolitanate of Kiev returned to Orthodoxy, while Lvov joined the union in 1677, followed by Przemyśl in 1692

The partition of Poland at the end of the 18th century brought all Ukrainians, except those in the province of Galicia, under Russian control; and by 1839 the tsarist government forcibly returned the Ukrainian Catholics to

Orthodoxy. Galicia meanwhile came under the domination of the Austro-Hungarian Empire, and in 1807 it was organized into the metropolitanate of Lvov. With the occupation of Galicia by Soviet armies in 1939, all church activity was suppressed, and the hierarchy was interned. In 1944 the Soviet authorities began to put pressure on the Ukrainian bishops to dissolve the Union of Brest-Litovsk. On their refusal, they were arrested and imprisoned or deported. A spurious synod in 1946 broke the union with Rome and "united" the Ukrainian Catholics with the Russian Orthodox. Not until December 1989, during the general liberalization of Soviet life, was the Ukrainian Catholic Church again made legal.

A great number of Ukrainians emigrated to the Americas and western Europe between 1880 and 1914 and again after World War II. They are organized into the metropolitanate of Canada, with the sees of Winnipeg (metropolitan see), Edmonton, Saskatoon, and Toronto; the metropolitanate of the United States, with the metropolitan see of Philadelphia and the eparchies of Stamford, Conn., and St. Nicholas of Chicago. Apostolic exarchies exist in Australia (Melbourne), Brazil (Curitiba), France (Paris), England (London), and Germany (Munich).

Ukrainian language, also called RUTHENIAN, Ukrainian UKRAINSKA MOVA, East Slavic language spoken in the Ukraine, U.S.S.R., and in Ukrainian communities in other parts of the Soviet Union, Poland, and Czechoslovakia. Written in a form of the Cyrillic alphabet, Ukrainian is closely related to Russian and Belorussian, from which it was indistinguishable until the 12th or 13th century.

After the fall of Kievan Rus in the 13th century, the Ukrainian dialectal characteristics became very marked, but it was not until the end of the 18th century that modern literary Ukrainian emerged. The language contains a large number of words borrowed from Polish but has fewer borrowings from Church Slavonic than does Russian.

Ukrainian literature, writings in the Ukrainian language. The earliest literary heritage of the Ukrainians, works of Kievan Rus from the 11th to the 13th century, is shared with the Russians and the Belorussians. After the Mongol invasion (13th century), Ukrainian literature was in decline until its revival in the 16th century. By the early 19th century the vernacular had become a vehicle of literature, and an era of prolific writing began.

Nineteenth-century Ukrainian literature reflects the rapid development of Ukrainian national consciousness. Ukrainian writers at first were mainly concerned with reawakening that consciousness and a sense of historical continuity. Virtually the entire Ukrainian literary process in the 19th century occurred under official and unofficial Russian disfavour, and in 1863 and 1871 all Ukrainian publications were prohibited. Not until 1905 did the Russian Academy of Sciences concede that Ukrainian was indeed a separate language.

Ivan Kotlyarevsky, classicist poet and playwright, inaugurated modern Ukrainian literature with his Eneida (1798), a travesty of Virgil's Aeneid. Kotlyarevsky's work had enormous (at times undue) influence on later Ukrainian writers. Classicist prose appeared only with Hryhoriy Kvitka Osnovyanenko's novel Marusya (1834). His Konotopska vidma (1837; "The Witch of Konotop") is a first-rate novella that is reminiscent of Nikolay Gogol. About 1830 Kharkov became the centre of Ukrainian Romanticism (Izmaïl Sreznevsky, Levko Borovykovsky, A. Metlynsky, and Mykola Kostomarov). In the western Ukraine, Romanticism was represented by the "Ruthenian Triad": Markiian Shashkevych, Yakov

Holovatsky, and Ivan Vahylevych. The Romantic movement reached its peak in the work of the Kiev Romantics and found its highest expression in the Brotherhood of Saints Cyril and Methodius (1846). Its ideology was reflected in Kostomarov's biblical *Knyhy bytiia ukrainskoho narodu* ("Books of Genesis of the Ukrainian People").

The early poetry of Taras Shevchenko, the outstanding Ukrainian poet of the 19th century, expressed the interests of the Romantics, but it soon moved to a more sombre portrayal of Ukrainian history, especially in the long poem *Haidamaky* (1841; "The Haidamaks"), and to works satirizing Russia's oppression of the Ukraine—*e.g.*, Son ("The Dream"), *Kavkaz* ("The Caucasus"), and *Poslaniie* ("The Epistle"). His later poetry, written after his release (1857) from exile, treats broader themes.

After Shevchenko, the most important Romantic was Panteleymon Kulish, poet, prose writer (*Chorna rada*; "The Black Council"),

translator, and historian.

Ukrainian Realism, which begins with Marko Vovchok (Narodni opovidannia, 1857; "Tales of the People"), was long confined to populist themes and the portrayal of village life. Anatoli Svydnytsky's novel Lyuboratski was exceptional for its artistry but had little influence on the development of Ukrainian Realism since, though written in 1862, it was not published until 1898. Ivan Nechuy-Levytsky's literary body of work was larger and thematically broader, ranging from the portrayal of village life in Kaydasheva simya (1879; "The Kaydash Family") to that of the Ukrainian intelligentsia in Khmary (1908; "The Clouds"). Panas Myrny (pseudonym of Panas Rudchenko) was the major representative of Ukrainian Realism. His depiction of social injustice and the birth of social protest—in Khiba revut voly, yak yasla povni? (1880; "Do the Oxen Low When the Manger Is Full?"), written with his brother Ivan Rudchenko (pseudonym Ivan Bilyk), and in Poviya ("The Whore")—has a new psychological dimension. The novels of the influential Ivan Franko describing the Boryslav oil industries of Galicia were written in the naturalistic manner of Zola. The long narrative poems Moysey ("Moses"), Panski zharty ("Nobleman's Jests"), and Ivan Vyshensky are the heights of Franko's poetic achievement.

Writing at the turn of the century were such outstanding figures as the Neoromantic poet Lesya Ukrainka, Mikhaylo Kotsiubynsky, and

Vasyl Stefanyk.

In the first three decades of the 20th century, Ukrainian literature experienced a renaissance, characterized by a variety of quickly succeeding and often strongly competing literary movements. Realism, with a distinctly decadent strain, was the most notable characteristic of Volodymyr Vynnychenko's prose. Pavlo Tychyna was the leading Symbolist poet; others included D. Zahul, P. Tereshchenko, and O. Slisarenko. Neoclassicism produced outstanding poets in Mykola Zerov, Maksym Rylsky, and Mikhaylo Dray-Khmara. Futurism was initiated by M. Semenko and produced one of the Ukraine's greatest 20th-century poets, Mykola Bazhan.

After the Russian Revolution, during a period of relative freedom between 1917 and 1932, a host of talented writers emerged: Mykola Khvylovy's prose was imbued with revolutionary and national Romanticism, Hryhoriy Kosynka's prose was Impressionistic, while Y. Yanovsky's stories and novels were unabashedly romantic, and V. Pidmohylny adhered to the principles of realism. Other writers of note include the novelist and filmmaker Aleksandr Dovzhenko, as well as the novelists Borys Antonenko-Davydovych, Volodymyr Gzhytsky, Mikhaylo Ivchenko,

and Oles Dosvitny, the poet Mike Yohansen, and the humorist Ostap Vyshnia. The outstanding dramatist was Mykola Kulish.

In 1932 the Communist Party enforced Socialist Realism as the required literary style. Typical representatives of this official literature were the dramatist Oleksandr Korniychuk (Korniichuk) and the novelist Mikhaylo Stelmakh.

The post-Stalinist period saw the emergence of a new generation that rejected drab Socialist Realism. Known as the "Writers of the Sixties," they included Lina Kostenko, Vasyl Symonenko, V. Korotych, Ivan Drach, M. Vinhranovsky, V. Holoborodko, and I. Kalynets. Repressive measures taken in the 1970s silenced many of them or else turned them back to Socialist Realism.

Mihailovich et al., Modern Slavic Literatures, vol. 2, Bulgarian, Czechoslovak, Polish, Ukrainian, and Yugoslav Literatures (1976); and Dmytro Čyževs'kyj, A History of Ukrainian Literature, from the 11th to the End of the 19th Century (1975; originally published in Ukrainian, 1956).

Articles are alphabetized word by word, not letter by letter

Ukrainka, Lesya, pseudonym of LARISA PETROVNA KOSACH-KVITKA (b. Feb. 25 [Feb. 13, Old Style], 1871, Novograd-Volynsky, Ukraine, Russian Empire—d. Aug. 1 [July 19], 1913, Surami, Georgia, Russian Empire), poet of the Ukrainian modernist movement. Her early lyrical work, influenced by Taras Shevchenko and Ivan Franko, dealt with the poet's loneliness and social alienation and was informed by a love of freedom (especially national freedom). Ukrainka was active in the Ukrainian struggle against tsarism and joined Ukrainian Marxist organizations, translating the Communist Manifesto into Ukrainian in 1902. In 1907 she was arrested and, following her release, was kept under observation by the tsarist police. Her later dramatic poems were inspired by various historical milieuse.g., the classical world, the early Christian era, and the medieval period. This series was crowned by Lisova pisnya (1912; "The Forest Song"), in which the poet reflects on the timeless tension between ideals and reality.

ukulele, also spelled UKELELE (Hawaiian: "flea"), small guitar derived from the *machada*, or *machete*, a four-stringed guitar introduced into Hawaii by the Portuguese in the 1870s. It is seldom more than 24 inches (60 cm) long.

The ukulele has been played in Europe and the United States as a jazz and solo instrument in the 20th century. It is tuned (in the middle-C octave) g'-c'-e'-a' or d'-f\psi'-a'-b'.

Ulaanbaatar, also spelled ULAN BATOR, formerly urga, or niislel khureheh, capital city of the Mongolian People's Republic, situated on the Tuul River on a windswept plateau at an elevation of 4,430 feet (1,350 m). It originated as a seasonal migratory abode of the Mongolian princes and in 1639 finally attained permanence on the present site with the construction of Da Khure Monastery. This building became the residence of the bodgogegen, high priest of the Tibetan Buddhist religion (to which the Mongols adhere), sometimes called "living Buddha," and remained as such for about 200 years. Da Khure became known to the Russians as Urga and developed as a trade centre between China and Russia. In 1911, when Outer Mongolia declared itself independent, the city was renamed Niislel Khureheh ("Capital of Mongolia"). In 1921 it was occupied by troops of Mongolia's revolutionary leader, Damdiny Sühbaatar, and the Soviet Red Army. When Mongolia was declared a people's republic in 1924, the city

Monument to Damdiny Sühbaatar, Mongolian hero, in Sühbaatar Square, Ulaanbaatar, Mongolia

was renamed Ulaanbaatar, which means "Red Hero."

With Soviet help a new city was planned, and its central feature was Sühbaatar Square, site of a Neoclassic Palladian government building, a mausoleum (containing the remains of the Mongolian heroes Sühbaatar and Khorloghiyin Choybalsan), the National Theatre (1932), and the Hotel Altai. The city is also the site of the Mongolian State University (founded 1942), several professional and technical schools, and the Academy of Sciences of the Mongolian People's Republic.

Ulaanbaatar is the main industrial centre of Mongolia. An industrial combine produces leather, carpets, felt, soap, textiles, and garments. There are also cement, iron, and brick works; vehicle-repair yards; a distillery; food-processing plants; and other factories. A railroad connects the city with China and the Soviet Union. An international airport has direct flights to Irkutsk and Omsk in the Soviet Union. Pop. (1986 est.) 500,200.

Ulaangom, also spelled ULAAN GOOM, town, northwestern Mongolian People's Republic. Located southwest of Uvs Lake, the town is a regional road and commercial centre. It has a brickyard. The surrounding semidesert terrain is suitable for year-round grazing of sheep, cattle, and goats. Pop. (1979) 24,800.

'ulamā', also spelled ULEMA, the learned of Islām, those who possess the quality of 'ilm, "learning" in its widest sense. From the 'ulamā', versed theoretically and practically in the Muslim sciences, come the religious teachers of the Islāmic community—theologians (mutakallimūn), canon lawyers (mufīs), judges (qādīs), professors—and high state religious officials like the shaykh al-Islām. In a narrower sense, 'ulamā' may refer to a council of learned men holding government appointments in a Muslim state.

Historically, the 'ulamā' have been a powerful class, and in early Islām it was their consensus (ijmā') on theological and juridical problems that determined the communal practices of future generations. Their authority over the community was so pervasive that Muslim

governments always attempted to secure their support; in the Ottoman and Mughal empires they sometimes decisively influenced important policies. Although there is no priesthood in Islām, and every believer may perform priestly functions such as leading the liturgical prayer, the 'ulamā' have played a clerical role in Islāmic society. Hence they are sometimes referred to as the "Muslim priests."

In modern times the 'ulamā' have gradually lost ground to the new Western-educated classes; although they have been abolished in Turkey, their hold on the conservative masses in the rest of the Muslim world remains firm. One of the most crucial problems facing 20th-century Islām has been the integration of the 'ulamā' and the modern laity.

Ulan Bator (Mongolia): see Ulaanbaatar.

Ulan-Ude, city and capital, Buryat Autonomous Soviet Socialist Republic, east-central Russian S.F.S.R. It lies at the confluence of the Selenga and Uda rivers and in a deep valley between the Khamar-Daban and Tsagan-Daban mountain ranges. The wintering camp of Udinskoye, established there in 1666, became the town of Verkhne-Udinsk in 1783; it was renamed Ulan-Ude in 1934.

The city's development was greatly stimulated when the Trans-Siberian Railroad reached it in 1900 and later by the construction of a branch line to Ulaanbaatar in Mongolia in 1949—a branch extended to Peking in 1956. Ulan-Ude's role as a major rail junction led to the establishment of large locomotive and carriage repair works. Other industries include glassmaking, food processing, and other light industries. Ulan-Ude has agricultural, teachertraining, technological, and cultural institutes, several theatres, and a philharmonic hall. Pop. (1989 prelim.) 353,000.

Ulanova, Galina (Sergeyevna) (b. Jan. 10, 1910, St. Petersburg, Russia), first *prima ballerina assoluta* of the Soviet Union and a People's Artist of the Republic.

The daughter of dancers Sergey Ulanov and Marie Romanova of the Mariinsky The-

Galina Ulanova as Giselle

By courtesy of the Dance Collection, the New York Public Library at Lincoln Center

atre (now the Kirov State Academic Theatre of Opera and Ballet), she was trained in the Leningrad State School of Choreography, where she studied under Agrippina Vaganova. After graduation she joined the Kirov Theatre, where her first major creation was the role of Maria in R.V. Zakharov's Fountain of

Bakhchisaray (1934). Another important creation in L.M. Lavrovsky's Romeo and Juliet (1940) displayed her skill as a dramatic dancer. She also excelled in such classical ballets as Giselle and Swan Lake.

In 1944 Ulanova was transferred to the Bolshoi Ballet in Moscow. Her first appearance outside the Soviet Union was in Florence in 1951. She danced with the Bolshoi company at the Royal Opera House, London, in 1956, gaining immediate popularity, and also performed with the Bolshoi in several other countries. She made her American debut with the Bolshoi Ballet in 1959, winning accolades for *Giselle* and *Romeo and Juliet*. Her performances in films of the Bolshoi Ballet did much to increase world interest in ballet.

A lyrical dancer in the tradition of Anna Pavlova, Ulanova was considered the embodiment of the Soviet school of ballet. Appearing only occasionally after 1959 and retiring about 1963, she coached young dancers (notably the ballerina Yekaterina Maksimova in *Giselle*), served as ballet mistress of the Bolshoi Theatre, and occasionally wrote dance articles for Soviet journals.

Ulászló (Hungarian personal name): *see under* Vladislas, except as below.

Ulászló I (king of Hungary and Poland): see Władysław III Warneńczyk.

Ulbricht, Walter (b. June 30, 1893, Leipzig, Ger.—d. Aug. 1, 1973, East Berlin), German Communist leader and head of the post-World War II German Democratic Republic, or East Germany.

Ulbricht, 1966

By courtesy of the Portratsammlung Deutsche Staatsbibliothek, Berlin

Ulbricht, a cabinetmaker by trade, joined the Social Democratic Party (SPD) in 1912 and during World War I served on the Eastern Front, deserting twice. After the war he entered the new German Communist Party (KPD). A bureaucrat and organizer, he was elected to the party's central committee in 1923. With the rise of Joseph Stalin, Ulbricht became instrumental in Bolshevizing the German party and organizing it on a cell basis. He became a member of the Reichstag (federal lower house) in 1928 and led the Berlin party organization from 1929.

After Adolf Hitler's accession to power in Germany (January 1933), Ulbricht fled abroad, serving for the next five years as an agent of both the KPD and the Comintern in Paris and Moscow and in Spain during the Spanish Civil War (1936–39), all the time relentlessly persecuting Trotskyites and other deviationists. Back in Moscow at the start of Germany's invasion of the Soviet Union (1941), Ulbricht was assigned to propagandize German prisoners of war and process information from the German army.

Returning to Germany on April 30, 1945, Ulbricht helped reestablish the KPD and was charged with organizing an administration in the Soviet-occupied zone of Germany. He played a leading role in the merger of the KPD and the SPD into the Socialist Unity Party (SED; April 1946), which controlled East Germany until 1989.

On the formation of the German Democratic Republic (Oct. 11, 1949), Ulbricht became deputy prime minister, adding the post of general secretary of the SED in 1950. When, on the death of President Wilhelm Pieck (1960), the presidency was abolished and a council of state instituted in its stead. Ulbricht became its chairman, thus formally taking supreme power. He crushed all opposition and became so powerful that he was able to block the de-Stalinization movement that swept eastern Europe after the death of the Soviet dictator. Only after the erection of the Berlin Wall (1961) did the government finally begin to ease its strict control and permit a certain amount of economic liberalization and decentralization. East Germany became one of the most industrialized nations in eastern Europe. vet Ulbricht remained implacably opposed to the Federal Republic of Germany. Forced to retire as first secretary of the SED in May 1971, he retained his position as head of state until his death.

BIBLIOGRAPHY. Carola Stern, Ulbricht: A Political Biography (1965); and Gregory W. Sandford, From Hitler to Ulbricht (1983), examine Ulbricht's role in the Communist reconstruction of East Germany.

ulcer, a lesion or sore on the skin or mucous membrane resulting from the gradual disintegration of the surface epithelium. An ulcer may be superficial or it may extend into the deeper layer of the skin or other underlying tissue. An ulcer has a depressed floor or crater surrounded by sharply defined edges that are sometimes elevated above the level of the adjoining surface. The main symptom of ulcers is pain. Any ulcer that is hard to the touch may well be a cancer.

The main causes of ulcers are infection, faulty blood circulation, nerve damage, trauma, nutritional disturbances, or cancer. Such bacterial infections as tuberculosis or syphilis can cause ulcers on any surface of the body. Any infection under the skin, such as a boil or carbuncle, may break through the surface and form an inflammatory ulcer. The ulcers on the legs of persons with varicose veins are caused by the slow circulation of the blood in the skin. Diabetics may sustain ulcers on their feet or toes after losing sensation in those areas due to nervous-system damage. A bedsore (q.v.), or decubitus ulcer, typically occurs on the skin of the back in immobilized or bedridden persons. Ulcers can also result from burns, electric burns, frostbite, or other external traumas, as well as from an inadequate intake of thiamine or other vitamins. A peptic ulcer (q.v.) is an ulcer in that part of the intestinal tract bathed by gastric juice, i.e., the stomach and the first segment of the duodenum.

When an ulcer of the skin has been present for at least one month, the possibility of cancer must be considered. If the patient is past middle age, the probability of cancer is increased. Ulcers on the vermilion border of the lower lip in elderly men are frequently cancers. Such cancers must be recognized and treated early before they spread and become inoperable. By contrast, superficial ulcers on the lips, known as cold sores, are caused by a virus and are not serious. Ulcers in the mouth and throat are frequently caused by infection but are sometimes cancerous, especially in older persons. Cancerous ulcers may also occur in the small or large intestine and the rectum.

Uleaborg (Finland): see Oulu.
Ulenspegel, Dyl: see Eulenspiegel, Till.

ulexite, borate mineral that consists of hydrated sodium and calcium borate (NaCa- $B_5O_9 \cdot 8H_2O$). Individual crystals are colourless and have a vitreous lustre, whereas the more common nodular, rounded, or lenslike crystal aggregates (often resembling cotton balls) are white and have a silky or satiny lustre.

Ulexite is found in arid regions, where it may be derived from boron leached from sediments and pyroclastic rocks by circulating waters. Typical occurrences are in saline playas (dry lakes) and marshes, as in Esmeralda county, Nevada; in Death Valley and the Kramer district, California; in the nitrate region of Chile, where it is widespread; and in Canada's Maritime provinces. For detailed physical properties, see borate mineral (table).

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Ulfilas, Gothic WULFILA (b. c. 311—d. c. 382, Constantinople [now Istanbul, Tur.]), Christian bishop and missionary who evangelized the Goths, reputedly created the Gothic alphabet, and wrote the earliest translation of the Bible into a Germanic language. Although his life cannot be reconstructed with certainty, fragments have come from 4th- and 5th-century ecclesiastical historians.

Ulfilas is believed to have descended from 3rd-century Cappadocians, who, captured by the Goths, were displaced and settled north of the Danube River. At the age of 30 he was supposedly sent on an embassy to the Roman emperor and was consecrated (341) bishop of the Gothic Christians by Eusebius of Nicomedia, bishop of Constantinople, an Arian (i.e., a follower of the heretical doctrine that the Son was neither equal with God the Father nor eternal). Because of persecution by the Gothic ruler, Ulfilas, after working for seven years among the Goths north of the Danube, led his congregation to Moesia (now part of Bulgaria) with the consent of the Arian Roman emperor Constantius II. Some historians report that Ulfilas in about 375 helped the persecuted Christian Goths to cross the Danube into Roman territory.

By the time of his consecration, Ulfilas had accepted the homoean formula (i.e., the Trinitarian doctrine affirming that the Son was "like" the Father) promulgated by the Council of Constantinople (360), which he attended. He subsequently taught the similarity of the Son to the Father and the complete subordination of the Holy Spirit, an Arian form of Christianity that he carried to the Visigoths. He was certainly the principal agent in their conversion, a fact of great significance for the history of the Christian church and of Europe. When in 379 a champion of Nicene orthodoxy, Theodosius I the Great, became Roman emperor, Ulfilas apparently led a party of compromise and conciliation with the homoean position. After the Council of Aquileia (381), Theodosius summoned Ulfilas to Constantinople for discussions, during which he died.

Ulfilas' outstanding contribution to writing is his invention of the Gothic alphabet, which he devised from Greek (primarily) and Latin. For the first time in the Germanic world, writing could be used for the propagation of ideas. He coined a Germanic Christian terminology, some of which is still in use. Before 381 he translated parts of the Bible from Greek to Gothic. Much of his Gothic translations of the Gospels and Pauline Letters survive, together with fragments of his Book of Nehemiah. Although he reputedly translated the whole bible except the Books of Kings, the extent of his work cannot be ascertained. Surviving

passages from his Bible translation are in W. Streitberg's *Gotische Bibel* (3rd ed., 1950). He reportedly wrote many sermons and interpretations in Gothic, Greek, and Latin, and some extant Arian writings have been ascribed to

The national Gothic church that Ulfilas helped to create, endowing it with a vernacular Bible and probably liturgy, was Arian from the start. The Goths' adherence to Arianism caused a breach between them and the Roman Empire that made Arianism part of the national self-consciousness of the Visigoths and of other Germanic peoples, including Ostrogoths, Vandals, and Burgundians.

Ulfsdotter, Katarina: see Catherine of Sweden. Saint.

Ulhāsnagar, town, northwestern Mahārāshtra state, western India. It lies northeast of Bombay. Part of the Thāna industrial area, it specializes in the manufacture of chemicals and silk and nylon textiles. The town became important in 1947 as a refugee camp for displaced persons from Sindh, Pakistan. It has an industrial-training institute. Pop. (1981) town, 273,668; metropolitan area, 648,671.

Ulianovsk, also spelled ULJANOVSK (Russian S.F.S.R.): *see* Ulyanovsk.

Ulithi, also called URUSHI, or MACKENZIE IS-LAND, coral atoll in the Federated States of Micronesia, in the western Pacific Ocean. Its islets have a total land area of 1.75 square miles (4.5 square km).

Ulithi was probably sighted by the Portuguese in 1526, but it remained undisturbed until 1791, when it was visited by a British naval vessel. The site of a Japanese seaplane base during World War II, Ulithi was captured in 1944 by U.S. forces and served as a large American naval base for the duration of the war. The atoll's inhabitants, who are generally lighter skinned than the Micronesians, are probably partly Polynesian and speak a distinctive dialect. Pop. (1980) 710.

Ulixes (Greek mythology): see Odysseus.

Ull, Old Norse ULLR, in Norse mythology, the god of snowshoes, hunting, the bow, and the shield; he was a handsome stepson of the thunder god Thor. Ull possessed warrior-like attributes and was called upon for aid in individual combat. He resided at Ydalir (Yew Dales).

Although not much has been recorded about UII, he must have been a very prominent deity in the Norse pantheon at one time because, according to one tradition, the god Odin offered UII's favours as a reward to the one who would aid him. In addition, UII's name appears as part of many Swedish and Norwegian place-names. In the chronicles of the Danish historian Saxo Grammaticus, Ollerus is the equivalent of UII.

Ulladulla, town, southeastern New South Wales, Australia. It lies 40 miles (65 km) south of Jervis Bay. The town was established in the 1820s as an anchorage for ships importing cedarwood to Sydney (108 miles [174 km] northeast), and its name was derived from an Aboriginal word meaning "safe harbour." Serving a hinterland of dairying, intensive

Serving a hinterland of dairying, intensive agriculture, and lumbering, the town has an artificial harbour from which large sport- and commercial-fishing fleets sail, the latter supplying much of Sydney's fish. Situated along the Prince's Highway, Ulladulla is a growing resort, with fine ocean beaches extending between Conjola and Burril lakes (lagoons). Pop. (1986) 7,408.

Ullathorne, William Bernard (b. May 7, 1806, Pocklington, Yorkshire, Eng.—d. March 21, 1889, Oscott, Warwickshire), Roman Catholic missionary to Australia and first bishop of Birmingham, Eng. He was influential in securing the final abolition (1857) of

the British system of transporting convicts to Australia.

Ullathorne was a descendant of Sir Thomas More. He served as a cabin boy before joining the Benedictines at Downside Abbey, near Bath, in 1823 and was ordained in 1831. He volunteered to serve the convicts in Australia, where he was sent the following year as vicar general. He was the first chaplain to visit the penal colony on Norfolk Island in the southern Pacific Ocean, between New Caledonia and northern New Zealand. While working with the convicts (1832-42), he made visits to Rome and England. In 1836 his Horrors of Transportation Briefly Unfolded was published, and in 1838 he gave evidence before the Parliamentary Commission on Transportation, which influenced the abolition of the transportation system.

Ullathorne left Australia to work in Coventry, Eng., where he remained until his appointments as vicar apostolic of England's western district (1846) and of the central district (1848) and subsequently as first bishop of Birmingham (1850). Ullathorne cofounded the Dominican convent at Stone, Staffordshire, in 1853. When he resigned from his diocese in 1888, he was made titular archbishop of Cabasa, Egypt. Ullathorne's autobiography, From Cabin-Boy to Archbishop, was edited in 1941 by S. Leslie.

Ullswater, lake, in the county of Cumbria in the Lake District of England. It is the district's second largest lake, with an area of about 3 square miles (0.8 square km), and is about 7.5 miles (12 km) long and 0.5 mile (0.8 km) wide, with a maximum depth of 205 feet (62 m). It is drained by the River Eden

Ullswater from Glencoyne Park, Cumbria J. Allan Cash—EB Inc.

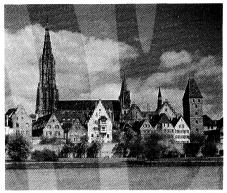

to Solway Firth. Pooley Bridge is a locality situated at the outlet. The lake has four small islands in the north, and nearby is the Aira Force waterfall. Adjacent Gowbarrow was established as a national park in 1910.

Ullung Island, volcanic island, Kyŏngsangpuk do (province), South Korea. It lies in the Sea of Japan (East Sea), 75 miles (120 km) off the northeastern coast of South Korea. With the associated islands of Kkakse, Chuk, and Tok, Ullung Island constitutes Ullung county of the province. Before its domination by the Silla kingdom (57 BC-AD 935) in 512, it was an independent kingdom named Usan-guk. The island has an area of 28 square miles (73 square km), and its summit, Sŏngin Peak (3,228 feet [984 m]), has a caldera crater.

The entire coastline has rocky bluffs 100–300 feet high, which preclude port development. Neighbouring waters with the interchange of warm and cold currents offer good fishing ground for cuttlefish, which is exported, and various other marine products. Agricultural products, however, must be imported. The mountain area produces Chinese juniper, birch, and princess trees, all used to make

quality furniture. Ullung-do is connected with Pusan and Jukbyon by regular sea routes. Pop. (1980) Ullung-gun, 18,960.

Ulm, city, Baden-Württemberg Land (state), southwestern Germany, on the left bank of the Danube River at its junction with the Iller and the Blau, opposite the Bavarian town of Neu Ulm. It was first mentioned as a royal domain in 854 and was chartered in the 12th century by the Hohenstaufen emperors. It played a leading part in the town leagues and wars of the 14th and 15th centuries, becoming

Ulm cathedral, facing the Danube River, Germany
Toni Schneiders—Bruce Coleman

a free imperial city with extensive territorial authority. Ulm's location at the hub of important trade routes and its prominence in the manufacture of linen and fustian brought it great prosperity in the Middle Ages. It became Protestant in 1530 and declined after the religious French wars of the 16th and 17th centuries. It passed to Bavaria in 1802, losing its territories and immunities, and in 1810 it was ceded to Württemberg. In 1869 the former suburb of Neu Ulm on the Danube's right bank was chartered as a Bavarian town. By the mid-20th century Ulm had expanded industrially and commercially to become the economic hub of the area.

Although it was severely damaged in World War II, most of the important buildings have been repaired and many medieval walls, gates, and fountains survive. The Gothic Münster (cathedral), founded in 1377 and restored and completed in 1890, escaped damage; its tower, one of the highest in the world (528 ft [161 m]), dominates the city. Other notable landmarks include the town hall, built as a warehouse for weavers, textile merchants, and saddlers (1370, extended in the 20th century), the Neuer Bau (1585-93), and the Schwörhaus (1613), where the freemen and the town council annually swore to maintain the city's constitution. A major road, rail, and communications centre, Ulm's industries include the manufacture of motor vehicles and machinery, electrical equipment, and diversified light manufacturing. Ulm University was founded in 1967. The city has an unusual Bread Museum displaying breads typical of ancient Egypt and of medieval times. Pop. (1989 est.) 106,508.

Ulm, Battle of (Sept. 25–Oct. 20, 1805), major strategic triumph of Napoleon, conducted by his Grand Army of about 210,000 men against an Austrian Army of about 72,000 under the command of Baron Karl Mack von Leiberich.

Austria had joined the Anglo-Russian alliance (Third Coalition) against Napoleon in August 1805. The Austrians planned to make Italy the main battleground and concentrated the bulk of their forces there.

On September 11 Baron Mack led a smaller Austrian force into Bavaria, which was allied to France. He concentrated between Ulm and Günzburg, on the upper Danube, about 80 miles (130 kilometres) from the eastern edge

of the Black Forest, through which he expected Napoleon to march; he then waited for the slow-moving Russians under M.I. Kutuzov to join him. Mack expected Napoleon to have no more than 70,000 troops to meet him. Napoleon, however, chose to make Germany the main battleground and massed the Grand Army to annihilate Mack before the Russians arrived. On September 25 the first French troops crossed the Rhine River north of the Black Forest, wheeled south, and, moving about 18 miles a day, crossed the Danube two weeks later, before Mack was aware of it.

The Grand Army, its movements effectively screened by its cavalry, moved on Mack's rear along the Danube, between Ingolstadt and Donauworth, and cut his lines of retreat eastward. During the second week of October several battles took place in which large numbers of Austrian troops were dispersed or captured as the net around Ulm drew tighter. Napoleon forced the main Austrian body to retire into the city of Ulm on the 15th. On the 16th, French artillery fired on the town, and Mack saw that his troops were in no condition to withstand a siege until the Russian reinforcements arrived. After negotiations Mack surrendered on the 20th, with the Russians still about 100 miles away. Austrian prisoners captured by the manoeuvre around Ulm numbered between 50,000 and 60,000. French losses were insignificant.

Ulmaceae, the elm family of the nettle order (Urticales), with 15 genera of trees and shrubs, distributed primarily throughout temperate regions. Members of the family have watery sap, and its leaves alternate along the stem. The leaves usually have toothed edges and often are lopsided at the base. The flowers lack petals. Male and female flowers are borne together or apart on the same plant. The fruit, a samara, may be winged, fleshy, or nutlike.

Elms (*Ulmus*) and hackberries (*Celtis*) are important shade and ornamental trees. The planer tree, or water elm (*Planera aquatica*), of southeastern North America produces useful timber known as false sandalwood. Trees and shrubs in the Eurasian genus *Zelkova* sometimes are planted as ornamentals. *See also* elm; hackberry; Zelkova.

Ulman, Douglas Elton (actor): see Fairbanks, Douglas.

Ulmanis, Kārlis (b. Sept. 4, 1877, Berze, Latvia, Russian Empire—d. 1942), a leader in the fight for Latvian independence in the early decades of the 20th century. He was the first head of the Latvian Republic in 1918 and again in 1936–40 and was premier in 1918, 1919–21, 1925–26, 1931–32, and 1934–40.

Ulmanis studied agronomy in Germany as a young man and afterward worked to improve dairy farming and cattle breeding in Latvia. During the period of upheaval at the time of the Russian Revolution of 1905, he worked to promote freedom from Russia, which had controlled the country for more than a century. The defeat of the revolution forced Ulmanis to seek exile in the United States, where he taught in the agriculture department of the University of Nebraska.

In 1913 he was granted amnesty by the Russian government and returned to Latvia. At the time of the Russian Revolution of 1917, he founded the Latvian Farmers' Union to press for independence. Then with other nationalists he formed a Latvian national council that proclaimed independence on Nov. 18, 1918, and appointed Ulmanis head of the provisional government.

He remained in power until June 1921, during the confused period immediately following the end of World War I, when the new nation was forced to fight to maintain itself in the face of threats, pressure, and military action from Russia, native Latvian Communists, and German forces. With a Latvian army formed by

Gen. Jānis Balodis and supported on occasion by French and British naval forces and Polish troops, the new government was able to clear the country of opposition. Ulmanis organized the election of a constituent assembly, and the first Saeima (parliament) convened on Aug. 11, 1920. That same month peace was concluded with the Soviet Union.

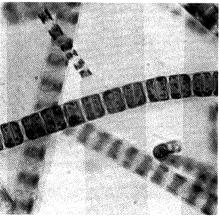

Ulmanis again served as premier from December 1925 to May 1926 and from March 1931 to December 1932. He came to power for the last time on March 17, 1934, during a period of great tension created by the demands of right-wing nationalists and the Nazified German minority. On May 15, 1934, Ulmanis and General Balodis declared a state of siege, dissolving the Saeima and all political parties, and instituting authoritarian rule. In June 1940, under an ultimatum backed by Soviet military forces, Ulmanis resigned, and Russian forces occupied the country. Ulmanis was arrested on July 21, 1940, by Soviet authorities and deported to Russia.

ulna, inner of two bones of the forearm (when viewed with the palm facing forward), present in all land vertebrates.

In humans the upper end of the bone presents a large C-shaped notch, the semilunar, or trochlear, notch, which articulates with the trochlea of the humerus (upper arm bone) to form the elbow joint. The projection that forms the upper border of this notch is called the olecranon process-it articulates behind the humerus in the olecranon fossa and may be felt as the point of the elbow. The projection that forms the lower border of the trochlear notch, the coronoid process, enters the coronoid fossa of the humerus when the elbow is flexed. On the outer side is the radial notch, which articulates with the head of the radius. The head of the bone is elsewhere roughened for muscle attachment. The shaft is triangular in cross section; an interosseous ridge extends its length and provides attachment for the interosseous membrane connecting the ulna and radius. The lower end of the bone presents a small cylindrical head that articulates with the radius at the side and the wrist bones below. Also at the lower end is a styloid process, medially, that articulates with a disk between it and the cuneiform (os triquetrum) wrist bone.

In amphibians and some reptiles, the radius and ulna do not articulate. The elbow joint evolved first among birds and mammals. The radius tends to be slender in birds; but the ulna is more often reduced in mammals, especially in those adapted for running and, in the case of bats, flying.

Ulothrix, genus of filamentous green algae found in marine and fresh waters; it survives

Ulothrix (highly magnified)
Grant Heilman

best at low temperatures and thrives during winter and spring months. Each cell contains a distinct nucleus, a central vacuole, and a large, thin chloroplast with at least one pyrenoid.

Ulothrix shows little cellular differentiation other than the specialized cell for attachment, called the holdfast. In most species, all the cells can form reproductive bodies. Ulothrix reproduces vegetatively by fragmentation, asexually by nonmotile resting spores (aplanospores) and motile quadriflagellate spores (zoospores), and sexually by biflagellate gametes.

Ulpian, Latin in full DOMITIUS ULPIANUS (b. Tyre, Phoenicia—d. AD 228), Roman jurist and imperial official whose writings supplied one-third of the total content of the Byzantine emperor Justinian I's monumental Digest, or Pandects (completed 533). He was a subordinate to Papinian when that older jurist was praetorian prefect (chief adviser to the emperor and commander of his bodyguard) under Lucius Septimius Severus (reigned 193–211), and he annotated Papinian's works. Afterward Ulpian was master of petitions to the emperor Caracalla, and under Severus Alexander he served as praetorian prefect from 222 until 228, when he was murdered by officers in his command.

Ulpian wrote prolifically on law in a clear, elegant style. Like Papinian, he was an intelligent editor and interpreter of existing ideas rather than an original legal thinker, such as Marcus Antistius Labeo. His major works are the commentaries Libri ad Sabinum (51 books interpreting the civil law; incomplete) and Libri ad edictum (81 books concerning praetorian edicts). Justinian's compilers, headed by Tribonian, drew heavily on these and other treatises and monographs by Ulpian. A work variously called Tituli ex corpore Ulpiani, Epitome Ulpiani, or Regulae Ulpiani is no longer believed to be his.

Ulrich (b. Feb. 8, 1487, Reichenweier, Alsace—d. Nov. 6, 1550, Tübingen, Württemberg), duke of Württemberg (1498–1519, 1534–50), a prominent figure in the German religious Reformation.

A grandson of Ulrich V, count of Württemberg, he succeeded his kinsman Eberhard II as duke of Württemberg in 1498, being declared of age in 1503. He obtained territories from the Palatinate through alliance with the Holy Roman emperor Maximilian I and with the Wittelsbachs of Bavaria but fell deeply into debt through keeping too splendid a court. A new tax (1514) provoked the peasant insur-rection known as the "Poor Conrad" rising. The States General then forced him to conclude the Treaty of Tübingen, whereby, in return for their assuming liability for his debts, he granted them important rights. Subsequent breaches of the general peace by Ulrich led to his being expelled by the Swabian League in 1519; and in 1520 the Swabian League sold Württemberg to the emperor Charles V, who in turn granted the territory to his brother Ferdinand.

Ulrich passed some time in Switzerland, France, and Germany, occupied with brigand exploits and in service under Francis I of France; but he never lost sight of the possibility of recovering Württemberg, and in about 1523 he announced his conversion to the Protestant faith. On the disintegration of the Swabian League and with the aid of Francis I, Ulrich returned to Württemberg in 1534; and Ferdinand, who was preoccupied with war against the Turks, agreed to his restoration in

the Treaty of Kaaden, on condition that he should hold Württemberg as an Austrian fief. Ulrich then invited Lutheran theologians to reform the church, dissolved the monasteries, confiscated ecclesiastical lands, and gave the universities and schools over to the new doctrine. Though the emperor Charles V occupied Württemberg again during his war against the League of Schmalkalden, he restored it to Ulrich on payment of a heavy war indemnity (1547).

Ulrich, SAINT, Ulrich also spelled ULRIC (b. c. 890, Augsburg, Alemannia—d. July 4, 973, Augsburg; canonized 993; feast day July 4), bishop and patron saint of Augsburg, the first person known to have been canonized by a none.

Of noble birth, he studied at the monastic school of Sankt Gallen (St. Gall), Switz., and was then trained by his uncle Bishop Adalbero of Augsburg. He returned to Zürich in 910, remaining there until 924, when he was appointed bishop of Augsburg by the German king Henry I the Fowler.

A supporter of the Holy Roman emperor Otto I the Great, he acted as mediator in the imperial struggle with Otto's son Liudolf of Swabia, who had rebelled against his father but submitted in 955. By fortifying Augsburg, Ulrich also enabled that city to withstand a siege by the Magyars (Hungarians) until Otto arrived to defeat them at the Battle of Lechfeld (Aug. 10, 955), near Augsburg. Otto then granted Ulrich the unprecedented right to coin money. He was canonized by Pope John XV in 993.

Ulrich von HUTTEN (b. April 21, 1488, near Fulda, Abbacy of Fulda—d. Aug. 29?, 1523, near Zürich), Franconian knight and Humanist, famed as a German patriot, satirist, and supporter of Luther's cause. His restless, ad-

Ulrich von Hutten, woodcut portrait from the German edition of his dialogues, 1520

By courtesy of the Library of Congress, Washington, D.C.

venturous life, reflecting the turbulent Reformation period, was occupied with public and private quarrels, pursued with both pen and sword.

As a supporter of the ancient status of the knightly order (Ritterstand), Ulrich looked back to the Middle Ages; but as a writer he looked forward, employing the new literary forms of the Humanists in biting Latin dialogues, satirizing the pretensions of princes, the papacy, Scholasticism, and obscurantism. He was the main contributor to the second volume of the Epistolae obscurorum virorum (1515-17; "Letters of Obscure Men"), a famous attack on monkish life and letters. As a patriot, he envisioned a united Germany and after 1520 wrote satires in German. His vigorous series of satiric pamphlets on Luther's behalf, which first were published in Latin, were subsequently translated into German in his Gesprächbüchlein (1522; "Little Conversation Book").

Ulrich joined the forces of Franz von Sickingen (q.v.) in the knights' war (1522) against the German princes. On the defeat of their cause he fled to Switzerland, where he was refused help by his former friend Erasmus. Penniless and dying of syphilis, he was given refuge by Huldrych Zwingli.

The legend of Ulrich as a warrior for freedom has been much romanticized in German literature, notably by C.F. Meyer in *Huttens letzte Tage* (1871; "Hutten's Last Days").

Ulrika Eleonora (b. Jan. 23, 1688, Stockholm—d. Nov. 24, 1741, Stockholm), Swedish queen whose short reign (1718–20) led to Sweden's Age of Freedom—a 52-year decline of absolutism in favour of parliamentary government.

Ulrika Eleonora was a sister of the unmarried king Charles XII; after the death of her

Ulrika Eleonora, detail from a portrait by Martin van Mytens, c. 1730; in Gripsholm Castle, Sweden By courtesy of the Svenska Portrattarkivet, Stockholm

elder sister Hedvig Sofia in 1708, she became heir to the Swedish throne. Ulrika Eleonora was married to Frederick of Hesse-Kassel in 1715, after Charles XII assured her that marriage to a Calvinist would not jeopardize her succession. Ulrika's devotion to her husband led her to subordinate her own ambitions to those of Frederick. Thus, although Ulrika became queen in 1718 after Charles's death, she abdicated in 1720 in favour of her husband, who came to the Swedish throne as Frederick I (ruled 1720–51).

Èven in 1718, however, when Ulrika was vying for the throne against her nephew, Charles Frederick of Holstein-Gottorp, both she and Frederick came under the influence of the anti-absolutist parliamentary forces led by Count Arvid Bernhard Horn. Therefore, when Frederick became king, he gave up significant powers to Parliament, thus inaugurating the Swedish Age of Freedom.

Ulsan, city, Kyöngsang-namdo (South Kyöngsang Province), southeastern South Korea. At the eastern end of T'aebaek-sanmaek (mountains), facing the Sea of Japan (East Sea), on Ulsan-man (bay), it is 45 mi (72 km) north-northeast of Pusan. It is the heart of the

Oil refinery in Ulsan, South Korea Shostal—EB Inc.

country's special industrial area known as the Ulsan Industrial District.

Until 1962, when the city was connected by rail and highway with Seoul, Pusan, Taegu, and Taejŏn, it was primarily a fishing port and a market centre for agricultural products (especially pears) from the Ulsan plain

and the delta of the T'aehwa River. By the end of the first five-year economic plan (1966), the city had become an open port, and major industrial plants had been built. Installations include a thermoelectric power plant, an oil refinery, and fertilizer, automobile, aluminum, nylon, synthetic textile, and thermoplastic resin factories, within an area of about 10 square miles (26 square km). The port of Pangŏjin, on Ulsan Bay, became part of Ulsan in 1962. Shipbuilding is carried on there. Pop. (1985) 551,014.

Ulster, ancient ULAID, one of the ancient provinces of Ireland, and subsequently the northernmost of Ireland's four traditional provinces (the others being Leinster, Munster, and Connaught). Owing to the Ulster cycle of Irish Gaelic literature, which recounts the exploits of Cú Chulainn and many other Ulster heroes, Ulster has a place of great prominence in Irish literature.

Ancient Ulster extended from the northern and northeastern coasts of Ireland south to what is now County Louth and west to what is now County Donegal. About the beginning of the Christian era, when the ancient provinces of Ireland were first taking permanent shape, Ulster had its capital at Emain Macha, near Armagh. Attacks from the midland kingdom of Meath (Midhe, or Mide) led to Ulster's disintegration in the 4th and 5th centuries. The province subsequently split into the three kingdoms of Oriel, or Airgialla (in central Ulster), Aileach (in western Ulster), and the smaller kingdom of Ulaid (in eastern Ulster).

During the Anglo-Norman invasion of Ireland in the late 12th century, one of the baronial adventurers, John de Courci, captured eastern Ulster and ruled that small kingdom until dispossessed in 1205 by King John, who created Hugh de Lacy (d. 1242) earl of Ulster. From 1263 to 1333 the earldom was held by the Anglo-Norman family of de Burgh, passing then to an heiress who married Lionel, duke of Clarence, a son of King Edward III, and ultimately to the crown.

In the 16th century Ulster was administratively divided into nine shires (counties), of which those in the Republic of Ireland still exist. Meanwhile, the O'Neills (of County Tyrone) and the O'Donnells (of County Tyrconnell) had become virtually supreme in much of Ulster. These two Roman Catholic clans were involved in a serious rebellion against Queen Elizabeth I from 1594 to 1601, caused in part by attempts to impose the English Reformation on the Irish. The failure of negotiations with James I led to the flight of the northern earls of Tyrone, Tyrconnell, and many others in 1607. Soon afterward thousands of settlers, mainly Lowland Scots Presbyterians, were introduced into Ulster, and particularly into its eastern portions, which became predominantly Protestant as a result. Their descendants prospered, and their refusal to join the rest of Ireland in accepting Home Rule led to the establishment of the state of Northern Ireland in 1920, consisting of the six Ulster counties of Antrim, Down, Armagh, Londonderry, Tyrone, and Fermanagh (replaced in the early 1970s by 26 local districts). The three Ulster counties of Monaghan, Cavan, and Donegal were included in the Republic of Ireland. The name Ulster is now commonly applied to Northern Ireland.

Ulster, EARLS OF, titled Anglo-Irish nobility of several creations, grouped below chronologically and indicated by the symbol ●.

• Ulster, Hugh de Lacy, earl of (b. c. 1176—d. before Dec. 26, 1242, Ulster, Ire.), one of the most powerful Anglo-Norman lords in Ulster (in Ireland) in the first half of the 13th century.

He was the younger son of Hugh de Lacy, 1st lord of Meath. For a time he was coadjutor of John de Courci in Leinster and Munster, but

after 1200 the rivalry between the two developed into war, and in 1203 de Lacy drove de Courci out of Down and in the following year took him prisoner. He was rewarded by King John with grants of land in Ulster and Connaught, which were confirmed by a charter on May 29, 1205, on which date (or earlier) Hugh was created earl. He returned to Ireland with quasi-viceregal authority. In 1207 war broke out between the Earl of Ulster and the justiciar. This brought King John in person to Ireland, where he expelled the earl's brother, Walter de Lacy, from Meath, and compelled the earl himself to flee to Scotland.

For several years Ulster took part in the wars in France, and he did not return to Ireland until 1221, when he allied himself with the O'Neills against the English. In 1226 his lands in Ulster were handed over to his brother Walter, but they were restored to him in the following year, after which date he appears to have loyally served the king, being more than once summoned to England to give advice about Irish affairs. On his death he left no surviving legitimate children, and the earldom of Ulster reverted to the crown.

• Ulster, Richard de Burgh, 2nd earl of (b. 1259?—d. July 29, 1326, Athassel Monastery, near Cashel, County Tipperary, Ire.), one of the most powerful Irish nobles of the late 13th and early 14th centuries, a member of a historic Anglo-Irish family, the Burghs, and son of Walter de Burgh (c. 1230–71), the 1st earl of Ulster (of the second creation).

In 1286 he ravaged Connaught and reestablished his family's power there, deposing Brian O'Neill as chief native king and substituting a nominee of his own. He also attacked the native king of Connaught in favour of that branch of the O'Connors whom his own family supported. He led his forces from Ireland to support England's King Edward I in his Scottish campaigns; and, on Edward de Bruce's invasion of Ulster in 1315, the Earl of Ulster marched against him, although he had given his daughter Elizabeth in marriage to Robert de Bruce, afterward king of Scotland, about 1304. Occasionally summoned to English Parliaments, he spent most of his 40 years of activity in Ireland, where he was the greatest noble of his day, usually fighting the natives or his Anglo-Norman rivals, the Geraldines.

- Ulster, Lionel of Antwerp, earl of: see Clarence, Lionel of Antwerp, duke of.
- Ulster, Edmund Mortimer, 3rd earl of: see March, Edmund Mortimer, 5th earl of.

Ulster cycle, Irish Gaelic ULAID CYCLE, in ancient Irish Gaelic literature, a group of legends and tales dealing with the heroic age of the Ulaids, a people of northeast Ireland from whom the modern name Ulster derives. The stories, set in the 1st century BC, were recorded from oral tradition between the 8th and 11th century and are preserved in the 12th-century manuscripts The Book of the Dun Cow (q.v.; c. 1100) and The Book of Leinster (q.v., c. 1160) and also in later compilations, such as The Yellow Book of Lecan (14th century). They reflect the customs of a free pre-Christian aristocracy who fought from chariots, took heads as trophies, were subject to taboo (geis), and were influenced by druids. Mythological elements are freely intermingled with legendary elements that have an air of authenticity. Events centre on the reign of the semi-historical King Conor (Conchobar mac Nessa) at Emain Macha (near modern Armagh) and his Knights of the Red Branch (i.e., the palace building in which the heads and arms of vanquished enemies were stored). A rival court at Connaught is ruled by King Ailill and Queen Medb (q, v). The chief hero of the Red Branch is the Achilles-like Cú Chulainn (q.v.), born of a mortal mother, Dechtire, the sister of King Conor, and a divine father, the god Lug of the Long Arm.

Most of the stories are short prose narratives, using verse for description and for scenes of heightened emotion. They fall into types such as destructions, cattle raids, or elopements. The longest tale and the closest approach to an epic is The Cattle Raid of Cooley (q.v.), dealing with a conflict between the men of Ulster and of Connaught. One tale portrays the familiar father-son duel, in which Cú Chulainn unknowingly kills his own son, who has come to seek him. Another tale, Bricriu's Feast, contains a beheading game that is the source for Sir Gawayne and the Grene Knight. The tale having the most profound influence on later Irish literature is The Fate of the Sons of Usnech, the tragic love story of Deirdre (q.v.) and Noisi, which was retold in dramatic form in the 20th century by John Millington Synge and William Butler Yeats.

Ulster Defence Association (UDA), loyalist paramilitary organization, largest of the Protestant militant groups in Northern Ireland. The UDA was founded in September 1971 by Andy Tyrie.

Ostensibly not an armed force but a defense force, the UDA is not banned by the Northern Ireland government. Members began their activities in the early 1970s seeking to "defend the streets" during the mass bombings and heaviest attacks of the Irish Republican Army (IRA). The group sees itself and is viewed by the Protestant community as defensive. Yet its members claimed responsibility for such acts as the murders on Oct. 29, 1980, of four Irish nationalists who had been trying to win political privileges for IRA terrorists in Northern Ireland prisons. The UDA's political program is one of opposition to Home Rule, which would remove Northern Ireland from the government of the United Kingdom and unite it with the (Catholic) Republic of Ireland.

Ulster Volunteer Force (UVF), a paramilitary group formed in Northern Ireland in 1966 by Protestant militants opposed to the militant Irish Republican Army (IRA), which was fighting to force Northern Ireland out of the United Kingdom and into unification with the Republic of Ireland. The UVF's name was a revival of that of a Protestant loyalist organization of 1913–20, which then had successfully resisted Home Rule for Northern Ireland.

From its founding the UVF openly declared its violent opposition to the IRA. On June 28, 1966, the government of Northern Ireland proscribed the UVF and charged three of its members with conspiring to incite disorder and murder; the three were found guilty and sentenced to life imprisonment. During succeeding years a series of bombings, assassinations, murders, and reprisals were carried out in the name of the UVF. Notably, 11 extremists, most of them UVF members, were sentenced on Feb. 20, 1979, to long terms of imprisonment for the murder of 19 Roman Catholics (most of whom were victims chosen at random) in revenge for IRA and Provisional IRA terrorist attacks.

ultimogeniture (inheritance): *see* primogeniture and ultimogeniture.

ultisol, weathered, frequently reddish, acidic soil type of humid areas in the middle to low latitudes. The characteristic profile consists of a moderately to strongly acidic clay horizon, a dark surface horizon rich in humus, and a leached horizon. Not as intensely weathered as the oxisols, with which they are geographically associated, ultisols still contain appreciable amounts of such primary minerals as feldspars and micas, as well as a mixture of clay types.

The addition of lime raises the pH of these soils, thereby reducing aluminum toxicity and

increasing the availability of nutrients provided by application of organic fertilizers. Where this treatment has been used, in areas such as the southeastern United States and Southeast Asia, which have a long year-round growing season and ample rainfall, the ultisols rank among the world's most productive soils.

Ultra, Allied intelligence system that, in tapping the very highest level communications among the German armed forces, as well as (after 1941) the Japanese armed forces, contributed to the Allied victory in World War II

In 1938 a Polish mechanic employed in a German factory producing secret signaling machines named Enigma (which worked on the basis of a set of preset revolving drums) took notes of the components before being repatriated and, with the help of the British and French secret services, constructed a wooden mockup of the machine. A British cryptographer later smuggled a complete new Enigma machine to England. There, British mathematicians and cryptographers conquered the problems of Enigma variations and found means of cracking the ciphers. Early in 1939 the intelligence chief of Britain's secret service MI-6, Frederick William Winterbotham, set up the Ultra project at Bletchley Park, 50 miles (80 km) north of London, for the purpose of intercepting the Germans' Enigma signals and controlling the distribution of the resultant secret information. Strict rules were established to restrict the number of people who knew about the existence of the Ultra information and to ensure that no actions would alert the Axis powers that the Allies had knowledge of their plans.

The incoming signals from the German war machine (more than 2.000 daily at the war's height) were of the highest level, even from Adolf Hitler himself. Such information enabled the Allies to build up an accurate picture of enemy plans and orders of battle, forming the basis of war plans both strategic and tactical. Ultra intercepts of signals helped the Royal Air Force to win the Battle of Britain. Signals between Adolf Hitler and General Günther von Kluge led to the destruction of a large part of the German forces in Normandy in 1944 after the Allied landing. In the Pacific the Germans had supplied their Japanese ally with an Enigma machine as early as 1937; the modified Japanese version, called "Purple" by the Americans, was duplicated by the U.S. Signal Intelligence Service well before Pearl Harbor. Resultant revelations of Japanese plans led to U.S. naval victories in the battles of the Coral Sea and Midway, crushing the offensive power of the Japanese fleet, and enabled American flyers to find and shoot down the plane carrying Admiral Yamamoto Isoroku, the Japanese commander in the Pacific.

For 29 years after the war the existence of Ultra remained an official British secret. The ban was not lifted until 1974, the year that Winterbotham published *The Ultra Secret*. A more accurate and complete account is given in Ronald Lewin's *Ultra Goes to War: The First Account of World War II's Greatest Secret Based on Official Documents* (1978).

ultrahigh frequency: see UHF.

Ultraism, Spanish ULTRAÍSMO, movement in Spanish and Spanish-American poetry after World War I, characterized by a tendency to use free verse, complicated metrical innovations, and daring imagery and symbolism instead of traditional form and content. Influenced by the emphasis on form of the French Symbolists and Parnassians, a distinguished coterie of avant-garde poets (ultraístas) produced verse that often defied objective analysis and gave the impression of a coldly intellec-

tual experimentation. Launched in Madrid in 1919 by the poet Guillermo de Torre, Ultraism attracted most of the important contemporary poets. Their works were published chiefly in the two major avant-garde periodicals, *Grecia* (1919–20) and *Ultra* (1921–22).

Jorge Luis Borges introduced Ultraism to South America in 1921. There the movement attracted poets such as the Chileans Pablo Neruda and Vicente Huidobro and the Mexican poets Jaime Torres Bodet and Carlos Pellicer. Although the movement had subsided by 1923, the sociopolitical overtones of much of the writing of the South American *ultraistas*, as seen in the verse of César Vallejo of Peru, flowered into the Marxist poetry of the following decade. Later the verbal techniques of the *ultraistas* were revived by post-World War II avant-garde writers.

ultramarine, pigment in the gem lapis lazuli, used by painters as early as the European Middle Ages. Ore containing the colour was ground, and the powdered lapis lazuli was separated from the other mineral matter. The pigment was first produced artificially in the late 1820s in France and Germany, being made from about equal amounts of china clay, sulfur, and sodium carbonate, with lesser amounts of silica and rosin or pitch. The mixture is fired slowly to 750° C (1,380° F) and cooled in a sealed furnace. Depending on the proportion of the ingredients, the shade varies from greenish to reddish blue.

Ultramarine is used in paints, lacquers, and decorating materials. It has a particularly brilliant blue colour and is very lightfast, but it is not suitable for use outdoors because it weathers to a dull-blue powder.

ultramicroscope, microscope arrangement used to study colloidal-size particles that are too small to be visible in an ordinary light microscope. The particles, usually suspended in a liquid, are illuminated with a strong light beam perpendicular to the optical axis of the microscope. These particles scatter light, and their movements are seen only as flashes against a dark background; their structure is not resolved.

Ultramontanism (from Medieval Latin ultramontanus, "beyond the mountains"), in Roman Catholicism, a strong emphasis on papal authority and on centralization of the church. The word identified those northern European members of the church who regularly looked southward beyond the Alps (that is, to the popes of Rome) for guidance.

During the period of struggle within the church over the extent of papal prerogatives—beginning especially in the 15th century with the conciliar movement and continuing in the following centuries with the growth of strong nationalism and theological liberalism—the Ultramontanists were opposed by those, such as the Gallicans, who wished to restrict papal power. The Ultramontane Party triumphed in 1870 at the first Vatican Council when the dogma of papal infallibility was defined as a matter of Catholic belief.

ultrasonics, vibrational or stress waves in elastic media that have a frequency above those of sound waves that can be detected by the human ear—i.e., above 20 kilohertz. Such waves may be longitudinal waves of the same type as the sound waves that travel in air, or, in solids, they may be transverse or shear waves. In addition, some ultrasonic waves propagate along the surface of a solid (Rayleigh waves) or in thin rods and sections of material (Lamb waves).

A brief treatment of ultrasonics follows. For full treatment, see MACROPAEDIA: Sound.

There are numerous means of generating and detecting ultrasonic vibration. The most common are magnetostrictive or piezoelectric transducers, which convert high-frequency alternating magnetic fields or electric currents into mechanical vibrations. A distinction is made between high-power and low-power ultrasonics on the basis of whether the waves produce a distortion in the medium.

High-power applications include ultrasonic welding; ultrasonic drilling, in which the direction of vibration and thus of cutting is perpendicular to the surface of the material to be cut, so that holes may be drilled in any shape; and ultrasonic irradiation of fluid suspensions, which may be used for the clarification of wine by precipitation or the coagulation of particles suspended in factory exhaust fumes. High-amplitude ultrasonic waves applied to a liquid may cause the liquid to cavitate and generate shock waves that produce vigorous streaming and shear stresses. These effects can be exploited in the production of emulsions, the cleaning of surfaces, and the disruption of biological structures.

Low-power ultrasonic waves are used in sonar devices for underwater detection and navigation and for mapping the seabed profile and composition. Similar pulse-echo techniques are used in the nondestructive testing of industrial materials and structures (e.g., reinforced plastics, railway lines, aircraft, and reactor vessels); ultrasonic waves are scattered by discontinuities in a test object and can thus be used to detect cavities or cracks or to measure thickness.

In medicine, low-power ultrasonics can be used in place of X rays to produce an image of internal bodily structures. (See ultrasound.)

Ultrasonic waves are used in the laboratory to study certain properties of materials, including the compressibility of molecules in solution, the elastic moduli of solids, and the molecular structure of gases and liquids. At very high frequencies (100 megahertz and upward) ultrasonic microscopy gives visualization of small structures with resolution comparable to that of optical microscopy. Ultrasonics at these frequencies are also used in solid-state physics.

ultrasound, also called ULTRASONOGRAPHY, in medicine, the use of high-frequency sound (ultrasonic) waves to produce images of structures within the human body. Ultrasonic waves are sound waves that are above the range of sound audible to humans. The ultrasonic waves are produced by the electrical stimulation of a piezoelectric crystal and can be aimed at a specific area of the body. As the waves travel through bodily tissues, they are reflected back at any point where there is a change in tissue density, as for instance in the border between two different organs of the body. The reflected echoes are received by an electronic apparatus that determines the intensity level of the echoes and the position of the tissue giving rise to the echoes. The images thus formed can be displayed in static form, or, through the use of rapid multiple sound scans, they can in effect provide a moving picture of the inside of the body.

Part of ultrasound's usefulness is due to the fact that the sound waves cause no damage to human tissues, unlike X rays or other ionizing radiations used in diagnostic radiology. Because of its safety, ultrasound is most commonly used to examine fetuses in utero in order to ascertain birth defects or other abnormalities. Ultrasound is also used to provide images of the heart, liver, kidneys, gallbladder, breast, eye, and major blood vessels.

ultraviolet astronomy, study of the ultraviolet spectra of astronomical objects. It has yielded much important information about chemical abundances and processes in interstellar matter, the Sun, and certain other stellar objects, such as white dwarfs.

Ultraviolet astronomy became feasible with the advent of rockets capable of carrying instruments above the Earth's atmosphere, which absorbs most electromagnetic radiation of ultraviolet wavelengths (i.e., roughly 100 to 4,000 angstroms) from celestial sources. Much of it is lost even at the highest altitudes that balloons can reach. During the 1920s unsuccessful attempts were made to photograph the Sun's ultraviolet spectrum from balloons; not until 1946 did a rocket-born camera succeed in doing so. Since the early 1960s the United States and several other countries have placed in Earth orbit unmanned satellite observatories carrying telescopes with optical surfaces specially coated for high ultraviolet reflectivity. These include eight Orbiting Solar Observatories, launched from 1962 to 1975 by the U.S. National Aeronautics and Space Administration (NASA), which enabled astronomers to obtain thousands of ultraviolet spectra of the Sun's corona. Another series of U.S. satellites, known as Orbiting Astronomical Observatories, have permitted the study of the interstellar medium and remote stars in the spectral range of 1,200 to 4,000 angstroms. Other significant ultraviolet observations of stellar bodies and interstellar gas clouds have been made with a telescope carried aboard the International Ultraviolet Explorer spacecraft, launched in 1978 by British and European space agencies in collaboration with NASA.

ultraviolet radiation, that portion of the electromagnetic spectrum adjacent to the short wavelength, or violet end of the visible light range. Often called black light, ultraviolet radiation is invisible to the human eye, but when it falls on certain surfaces, it causes them to fluoresce, or emit visible light.

Ultraviolet radiation is produced by high-temperature surfaces, such as the Sun, in a continuous spectrum and by atomic excitation in a gaseous discharge tube as a discrete spectrum of wavelengths. The ultraviolet spectrum is usually divided into two regions: near ultraviolet (nearer the visible spectrum), with wavelengths 2,000 to 3,800 angstrom units (one angstrom is 10^{-10} metre, or 0.1 nanometre); and far ultraviolet, with wavelengths 100 to 2,000 angstrom units.

Ultraviolet radiation can produce direct and indirect effects upon the human body. The direct effects are limited to the surface skin because the rays have low penetrating power. The direct effects include reddening of the skin (sunburn), pigmentation development (suntan), and progressive adaptation to heavier radiation doses. Ultraviolet burns can be mild, causing only redness and tenderness, or they can be so severe as to produce blisters, swelling, seepage of fluid, and sloughing of the outer skin. The blood capillaries (minute vessels) in the skin dilate with aggregations of red and white blood cells to produce the red coloration. A suntan occurs when the pigments

in cells in the deeper tissue portion of the skin are activated by ultraviolet radiation, and the cells migrate to the surface of the skin. When these cells die, the pigmentation disappears. The degree of pigmentation is directly related to the length of ultraviolet exposure and the body's inherent ability to produce pigments. Tanning is a natural body defense to help protect the skin from further injury.

Constant exposure to sunlight, as among

Constant exposure to sunlight, as among farmers and sailors, induces thickening of the skin, more rapid skin aging, and a much higher frequency of skin disorders, including cancer, particularly in persons with fair skin. There is an increase in skin temperature, skin respiration, and skin cholesterol (fat) after ultraviolet radiation. Similarly, there is a decrease in pain sensitivity, perspiration, and mineral levels.

The indirect effects of ultraviolet radiation are for the most part caused when the damaged skin cells release histamine, causing inflammation. The respiratory tract becomes more susceptible to bronchits and pneumonia, and calcified scar tissue may form in the lungs after overexposure to ultraviolet rays. Histamine stimulates the stomach to produce more secre-

tions and a stronger acid concentration than normal; this, in turn, leads to inflammation of the stomach lining, or ulcers. The circulatory system shows a fall in blood pressure but an increase in red blood cells, white blood cells, and clotting proteins. In general, the body's metabolism may change because of stimulation of endocrine glands; there may be loss of weight, increase in appetite, reduction in respiration rate, and less fatigability. Ultraviolet radiation is generally not lethal to the human body, but it can kill individual tissue cells and such organisms as bacteria.

Ulúa River, Spanish Río ULÚA, river in northwestern Honduras. Its headstreams rise deep in the central highlands, draining much of northwestern Honduras. The Ulúa proper, about 150 mi (240 km) long, is formed by the union of the Jicatuyo and Mejocote rivers, northwest of Santa Bárbara. It flows northeastward through Santa Bárbara, Cortés, and Yoro departments, forming the border between the last two. Emerging from the highlands, it enters the Sula Valley, famous for its banana plantations, and becomes navigable. The Ulúa enters the Gulf of Honduras eastnortheast of Puerto Cortés.

Ulūgh Beg (b. 1394, Soltānīyeh, Timurid Iran—d. Oct. 27, 1449, Samarkand, Timurid Empire), grandson of the Asian conqueror Timur (Tamerlane) and one whose primary interest was in the arts and intellectual matters. Under his brief rule the Timurid dynasty of Iran reached its cultural peak.

His father, Shāh Rokh, captured the city of Samarkand and gave it to Ulūgh Beg, who made the city a centre of Muslim culture. There he wrote poetry and history and studied the Qur'ān. His greatest interest, however, was astronomy, and he constructed an observatory (begun in 1428) at Samarkand. In his observations he discovered a number of errors in the computations of the 2nd-century Alexandrian astronomer Ptolemy, whose figures were still being used.

Ulugh Beg was a failure in more mundane affairs. On his father's death in 1447 he was unable to consolidate his power, though he was Shāh Rokh's sole surviving son. Other Timurid princes profited from his lack of action, and he was put to death at the instigation of his son, 'Abd al-Laṭīf.

Ulundi, town, capital of the nonindependent black state of KwaZulu, north central Natal, South Africa, located on the north bank of the White Mfolozi River. The site was chosen by Cetshwayo as the location of his new capital when he became king of the Zulu in 1873. He called it UluNdi ("the High Place"). The village was captured and burned by the British in 1879 in the last battle of the Anglo-Zulu War, in which Cetshwayo was defeated. A memorial has been erected on the site.

In the 1970s it was decided to build the new capital of KwaZulu at Ulundi. It is one of the several areas that were being developed by the South African Bantu Trust in South Africa in the early 1980s. Light industries in the area process foodstuffs, tobacco, and timber. Roads and a railway link the town with Vryheid and Richards Bay. The population is mostly Zulu, and Christianity is the dominant religion.

Ulva (algae): see sea lettuce.

Ulverstone, town, northern Tasmania, Australia, near the mouth of the River Leven on Bass Strait. Surveyed by 1855 and named after Ulverston, Eng., in the English Lake District, it was proclaimed a town in 1888 and was made a municipality in 1908. The centre of an agricultural, pastoral, and lumbering region, it also serves as a resort and retirement town and as a residential area for Burnie (west) and Devonport (east). Located on a rail line and the Bass Highway to Launceston, 55 mi (90 km) southeast, Ulverstone has vegetable-

canning and furniture-making plants. Pop. (1981) 9,413.

Ulyanov, Vladimir Ilich: see Lenin, Vladimir Ilich.

Ulyanovsk, also spelled ulianovsk, or ul-JANOVSK, oblast (administrative region), western Russian Soviet Federated Socialist Republic, with an area of 14,550 sq mi (37,300 sq km) athwart the Middle Volga River, which is there transformed into a broad lake by the downstream Kuybyshev barrage. The larger western part lies on the Volga Upland, which is dissected by river valleys and erosion gullies; the smaller Trans-Volga is a low plain. In the west are extensive oak woods, but elsewhere the forest-steppe vegetation on fertile soils has been largely cleared for intensive agriculture. Grains, especially wheat, together with sunflowers and sugar beets, are the main crops. The communities, apart from Ulyanovsk, the oblast headquarters, are small and engaged chiefly in processing farm produce. Pop. (1984 est.) 1,299,000.

Ulyanovsk, also spelled ULIANOVSK, or ULJANOVSK, formerly (until 1780) SINBIRSK, or (1780–1924) SIMBIRSK, city and administrative centre of Ulyanovsk *oblast*, western Russian Soviet Federated Socialist Republic, on the Volga River at its confluence with the Sviyaga. Founded in 1648, it was a key fortress on the Sinbirsk defensive line; in 1924 it was renamed after V.I. Ulyanov (Lenin), who was born there and whose home is preserved as a museum.

Ulyanovsk has engineering industries making buses and light trucks, machine tools, and motors; there are also food-processing and consumer-goods industries. The city has polytechnic, agricultural, and teacher-training institutes. Pop. (1984 est.) 524,000.

Ulysses (Greek mythology): see Odysseus.

Uman, also spelled UMAN', city, centre of a rayon (district), Cherkassy oblast (administrative region), Ukrainian Soviet Socialist Republic, at the confluence of the Uman and Kamenka rivers. It dates from the Middle Ages and was incorporated in 1795. Uman is an industrial centre specializing in the manufacture of scientific instruments, with some engineering, food, and building-materials industries. It has teacher-training and agricultural institutes. Pop. (1984 est.) 85,000.

Umanak, also spelled ũmánaq (Greenland): see Uummannaq Fjord.

umangite, a copper selenide (Cu₃Se₂) that occurs only in small grains or fine granular aggregates with other copper minerals of the sulfide group, as in the Sierra de Umango (for which it is named), Argentina. It also occurs in the Harz Mountains of Germany and at Skrickerum, Swed. Umangite alters to malachite. For detailed physical properties, *see* sulfide mineral (table).

'Umar, also spelled omar, Turkish Ömer, name of Muslim caliphs, grouped below chronologically and indicated by the symbol •.

• 'Umar I, in full 'UMAR IBN AL-KHAŢTĀB (b. c. AD 586, Mecca—d. Nov. 3, 644, Medina, Arabia), the second Muslim caliph (from 634), under whom Arab armies conquered Mesopotamia and Syria and began the conquest of Iran and Egypt.

A member of the clan of 'Adi of the Meccan tribe of Quraysh (Koreish), 'Umar at first opposed Muḥammad but, about 615, became a Muslim. By 622, when he went to Medina with Muḥammad and the other Meccan Muslims, he had become one of Muḥammad's chief advisers, closely associated with Abū

Bakr. His position in the state was marked by Muhammad's marriage to his daughter Hafsa in 625. On Muhammad's death in 632 Umar was largely responsible for reconciling the Medinan Muslims to the acceptance of a Meccan, Abū Bakr, as head of state (caliph). Abū Bakr (reigned 632-634) relied greatly on Umar and nominated him to succeed him. As caliph, 'Umar was the first to call himself "commander of the faithful" (amīr al-mu'minīn). His reign saw the transformation of the Islamic state from an Arabian principality to a world power. Throughout this remarkable expansion Umar closely controlled general policy and laid down the principles for administering the conquered lands. The structure of the later Islāmic empire, including legal practice, is largely due to him. Assassinated by a Persian slave for personal reasons, he died at Medina 10 years after coming to the throne. A strong ruler, stern toward offenders, and himself ascetic to the point of harshness, he was universally respected for his justice and authority.

• 'Umar II, in full 'UMAR IBN 'ABD AL-'AZĪZ (b. 682/683, Medina, Arabia—d. February 720, near Aleppo, Syria), pious and respected caliph who attempted to preserve the integrity of the Muslim Umayyad caliphate (661–750) by emphasizing religion and a return to the original principles of the Islāmic faith. His father, 'Abd al-'Azīz, was a governor of Egypt, and through his mother he was a descendant of 'Umar I (second caliph, 634–644). He received a traditional education in Medina and won fame for his piety and learning.

In February or March 706, 'Umar was appointed governor of the Hejaz. During his tenure of office, he initiated policies that later characterized his reign, particularly his creation of a consultative body of pious men to aid him in his rule.

Umar was elevated to the caliphate by the will of his predecessor, the caliph Sulayman, in September or October 717. At the time of his accession the stability of the Umayyad caliphate was threatened by the discontent of both the Mawālī (non-Arab Muslims) and the "pious opposition," who resented the Umayyads allegedly for putting political interests ahead of established religious principles. Umar, mainly interested in home affairs, attempted no major military conquests; soon after his accession he lifted his predecessor's disastrous siege of Constantinople. Initiating a policy of internal consolidation, he dismissed unpopular governors, reformed the taxation system, and granted the Mawālī the same fiscal rights as Arab Muslims.

Although many of his policies seemed untenable, 'Umar attempted to arrest the disintegration of the Umayyad caliphate by appealing to a broad segment of the Muslim population. He, alone of the Umayyads, was respected by the later 'Abbāsid dynasty and was highly regarded even among the Shī'ah, schismatic followers of Muhammad's son-in-law 'Alī.

'Umar ibn Abī Rabī'ah, full name 'UMAR IBN 'ABD ALLĀH IBN ABĪ RABĪ'AH AL-MAKH-ZŪMĪ (b. November 644, Mecca—d. 712/719, Mecca), one of the greatest poets in early Arabic literature.

Umar belonged to the wealthy merchant family of Makhzūm, a member of the Meccan tribe of Quraysh (of which the Prophet Muḥammad was also a member). He spent most of his life in Mecca, also travelling to southern Arabia, Syria, and Mesopotamia. Little is known about his life, for the numerous anecdotes related about him are manifestly literary fabrications. The internal evidence of his poetry, however, gives a valuable picture of the social life of the Meccan and Medinan aristocracy of his time.

His poetry centres on his own life and emotions, eschewing the traditional themes of journeys, battles, and tribal lore, and celebrates his love affairs with the noble Arab ladies who came to Mecca on pilgrimage. Although this genre of Arabic poetry had been sporadically practiced before his time, 'Umar ibn Abī Rabī'ah was the first to perfect it with a light metre and an accurate perception of human feeling.

'Umar Tal, in full AL-HĀJJ (the Pilgrim) 'UMAR IBN SA'ID TAL, also spelled EL-HADJ OMAR IBN SA'ID TAL (b. c. 1797, Halvar, Futa Toro [Fouta-Toro]—d. Feb. 12, 1864, near Hamdalahi, Tukulor Empire), West African Tukulor leader who, after launching a jihād (holy war) in 1854, established a Muslim realm, the Tukulor Empire, between the upper Senegal and Niger rivers (in what is now upper Guinea, eastern Senegal, and western and central Mali). The empire survived until the 1890s under his son, Ahmadu Seku.

Early life and pilgrimage to Mecca. 'Umar Tal was born in the upper valley of the Sénégal River, in the land of the Tukulor people. His father was an educated Muslim who instructed students in the Qur'ān, and 'Umar, a mystic, perfected his studies in Arabic and the Qur'ān with Moorish scholars who initiated him into the Tijānī brotherhood.

At the age of 23, 'Umar set out on the pilgrimage to Mecca. He was already well known for his piety and erudition and was received with honour in the countries through which he travelled. Muhammad Bello, amīr of Sokoto in Nigeria, offered him his daughter Maryam in marriage. Enriched by this princely alliance, 'Umar had become an important personage when he reached Mecca about 1827. He visited the tomb of the Prophet in Medina, returned to Mecca, and then settled for a while in Cairo. On a visit to Jerusalem he succeeded in curing a son of Ibrahim Pasha, the viceroy of Egypt. In Mecca, finally, he was designated caliph for black Africa by the head of the Tijānī brotherhood.

Armed with his prestige as a scholar, mystic, and miracle worker, 'Umar returned to the interior of Africa in 1833. Trained for political leadership by his father-in-law, Muhammad Bello, the amīr of Sokoto, with whom he again spent several years, and his position strengthened by the title of caliph, 'Umar now decided to obey the voice of God and to convert the pagan Africans to Islām.

By now he not only was looked upon as a miracle worker but also had acquired a bodyguard of followers and of devoted Hausa

Upon the death of Bello, he left for his native country, hoping to conquer the Fouta with the help of the French, in exchange for a trade treaty, an agreement the French declined because of 'Umar's growing strength. Umar realized that faith without force would be ineffective and made careful preparations for his task. In northeastern Guinea, where he first established himself, he wrote down his teachings in a book called Kitāb rimāḥ hizb ar-raḥīm ("Book of the Spears of the Party of God"). Deriving his inspiration from Suf--a mystic Islāmic doctrine-he defined the Tijānī "way" as the best one for saving one's soul and for approaching God. He recommended meditation, self-denial, and blind obedience to the sheikh. He gained many followers in Guinea, but, when in 1845 he went to preach in his own country, he met with little success.

Military achievements. Having built up an army 'Umar decided to use force. In March 1854 he issued an order for a jihād to sweep away the pagans and bring back the Muslims who had strayed from the fold. Starting out with about 10,000 men who lived off the land, he spread terror in order to force the pagan chieftains to submit. In 1855 he de-

feated the Bambara pagans of Mali, adding to his empire. He forcibly converted them, yet these conversions proved to be ineffectual. To defend his authority 'Umar had 300 hostages executed, but revolt broke out again as soon as his armies were removed.

After an unsuccessful attack on a French fort that had refused to supply him weapons, 'Umar again set off toward the east, but he had great difficulty subsisting in a land already ravaged. His men deserted, and his companions began to doubt his mission.

Having been unable to decisively conquer his adversaries, 'Umar was to spend the next 10 years trying to contain his empire. Repressing new revolts, he was led eastward by the resistance he stirred up. In 1860 he signed a treaty with the French general Louis Faidherbe, governor of Senegal, accepting the Sénégal River as a common boundary.

Umar perennially had to defend his conquests and foil hostile coalitions without giving up the principle of the *jihād*. This proved difficult, however, when he was confronted by the Fulani people of the Masina, who were Muslims, followers of the Qādirī brotherhood. When 'Umar attacked the Fulani, he no longer represented the "wrath of God"—he was a conqueror; his mission turned into a fratricidal war.

Both armies prayed to the same God before the battle. Umar, recognizing the danger to his divine mission, proposed a duel with Aḥmadu III, the leader of the Fulani army. But the latter refused the judgment of God. Umar won the battle, and Aḥmadu was captured and beheaded.

In 1863 'Umar took possession of the city of Timbuktu, but, defeated by the nomadic Tuaregs, he had to beat a retreat. In a subsequent battle, attacked by the Tuaregs, the Moors, and the Fulani, his army was destroyed. He withdrew to the city of Hamdalahi, where he was besieged. He escaped and took refuge in a cave but was killed when the cave was blown up with gunpowder.

Al-Ḥājj 'Umar Tal's empire lasted for 50 years, from 1848 to 1897, when it was annexed by the French. Few of the Mali people still remember it, except the descendants of the Tijani initiates or the Fulani and Bambaras, who suffered the conqueror's cruelties. In order to enhance his own position, General Faidherbe described 'Umar in his reports as the symbol of resistance to French penetration, at the same time recognizing his virtues and his courage. In fact, 'Umar was not anxious to oppose the French. He had sought their neutrality and had hoped to buy arms from them, but they had other sources and feared his power. The mosque of Dinguiraye in Guinea is all that remains of 'Umar's empire.

Assessment. 'Umar Tal lived, fought, and died more like a 7th-century warrior than a 19th-century political leader. He was a mystic, and his life resembled those of the early followers of the Prophet Muhammad, who fought in the name of God and converted by fire and the sword. Senegalese poets, singing of 'Umar's life, have compared it with the Prophet's. Some have glorified him and lauded his victories, citing the thousands he killed and the thousands he sold into slavery as proof of the divine character of his mission; others to this day hate him for having shed Muslim blood. (J.C.F.)

BIBLIOGRAPHY. A complete bibliography on Senegal, Masina, and the life of 'Umar Tal is included in Yves-J. Saint-Martin, L'Empire Toucouleur 1848–1897 (1970), an indispensable work. Additional information may be found in J. Spencer Trimingham, A History of Islam in West Africa (1962); and J.D. Hargreaves, Prelude to the Partition of West Africa (1963). The Kitāb rimāh hizb ar-raḥīm (written 1845, published in Arabic 1927), is 'Umar's most famous work, in which he explains his doctrine.

'Umarī, al-, in full shihāb ad-dīn aḥmad IBN FAOL ALLAH AL-'UMARI (b. June 12, 1301, Damascus-d. March 1, 1349, Damascus), scholar and writer whose works on the administration of the Mamlūk dominions of Egypt and Syria became standard sources for

Mamlūk history.

A scion of a family of bureaucrats, al-'Umarī, as his name implies, traced his origin to Umar, the second Islamic caliph. His father held the important post of kātib as-sirr (head of the chancery) of the Mamluk Empire. Al-Umarī began his career as an assistant to his father. By temperament he was unsuited to the civil service; he was much too independent of mind and action to have survived in any bureaucracy. In c. 1337 he was dismissed from office and imprisoned. On the death of his father in 1337, his brother was appointed as head of the chancery. In 1339 al-Umari was released from prison and appointed to his father's old post, but in 1342 he was again banished from office and replaced by another brother.

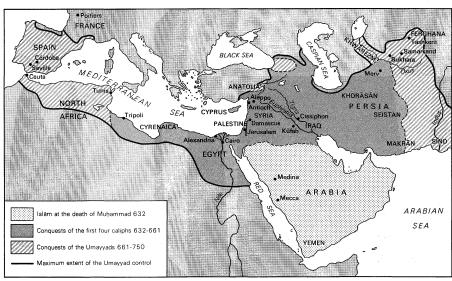

Al-Umari spent his remaining years in the pursuit of scholarship. He wrote at-Ta'rīf bial-muştalah ash-sharīf, a comprehensive study of the principles of Mamluk administration, and Masālik al-abṣār fī mamālik al-amṣār, an encyclopaedic compendium also relating to administrative practices.

Umayyad DYNASTY, also spelled OMAYYAD, first great Muslim dynasty to rule the Empire of the Caliphate (AD 661-750), sometimes referred to as the Arab kingdom (reflecting traditional Muslim disapproval of the secular

came the basis of Umayyad strength, enabling the creation of a united empire through greater control of the conquered provinces and of Arab tribal rivalries. Muslim rule expanded to Khorāsān, garrison cities were founded at Mery and Seistan as bases for expeditions into Central Asia and northwestern India, and the invasion of northwestern Africa was begun. A new fleet conducted a series of campaigns against Constantinople (669-678), which, while ultimately unsuccessful, offset the secular image of the state, because they were directed against the Christians. Though the Sufyanids generally retained the Byzantine and Persian administrative bureaucracies they inherited in the provinces, politically they were organized along Arab tribal lines, in which the caliph was chosen by his peers to become, theoretically, "first among equals" and act on the advice of a shūrā (tribal council). Mu'āwiyah, however, in securing during his lifetime an oath of allegiance to his son Yazīd I, disregarded the traditional election (bay'ah) and introduced the alien concept of hereditary succession.

Civil war and the deaths of Yazīd I in 683 and of Mu'āwiyah II in 684 brought Sufyānid rule to an end. Marwan I was proclaimed caliph in Syria in 684 amid tribal wars.

Under 'Abd al-Malik (reigned 685-705), the Umayyad caliphate reached its peak. Muslim armies overran most of Spain in the west and invaded Mukrān and Sind in India, while in Central Asia, the Khorāsānian garrisons conquered Bukhara, Samarkand, Khwarezm, Fergana, and Tashkent. In an extensive program

The expansion of the caliphal empire through the conquests of the Umayyads Adapted from R. Trehame and H. Fullard (eds.), Muir's Historical Atlas: Ancient, Medieval and Modern, 9th ed. (1965); George Philip & Son Ltd., London

nature of the Umayyad state). The Umayyads, headed by Abū Sufyān, were a largely merchant family of the Quraysh tribe centred at Mecca. They had initially resisted Islām, not converting until 627, but subsequently became prominent administrators under Muhammad and his immediate successors. In the first Muslim civil war (fitnah; 656-661)—the struggle for the caliphate following the murder of 'Uthman, the third caliph (reigned 644-656)—Abū Sufyān's son Mu'āwiyah, then governor of Syria, emerged victorious over 'Alī, Muhammad's son-in-law and fourth caliph; Mu'āwiyah then established himself as the first Umayyad caliph.

Umayyad rule was divided between two branches of the family: the Sufyanid (reigned 661-684), descendants of Abū Sufyān, and the Marwanid (reigned 684-750), Marwan I and his successors. The Sufyanids, notably Mu'awiyah I (reigned 661-680), centralized caliphal authority in Damascus. The Syrian army beof Arabization, Arabic became the official state language; the financial administration of the empire was reorganized, with Arabs replacing Persian and Greek officials; and a new Arabic coinage replaced the former imitations of Byzantine and Sāsānian coins. Communications also improved with the introduction of a regular post service from Damascus to the provincial capitals, and architecture flourished.

Decline began with the disastrous defeat of the Syrian army by the Byzantine Leo III, the Isaurian (717). Then the fiscal reforms of the pious 'Umar II (reigned 717-720), intended to mollify the increasingly discontented mawālī (non-Arab Muslims) by placing all Muslims on the same footing, without respect of nationality, led to financial crisis, while the recrudescence of feuds between southern (Kalb) and northern (Qays) Arab tribes seriously reduced military power.

Hishām (reigned 724-743) was able to stem the tide temporarily. As the empire was reaching the limits of expansion—the Muslim advance into France was decisively halted at Poitiers (732), and Arab forces in Anatolia were destroyed (740)—frontier defenses, manned by Syrian troops, were organized to meet the challenge of Turks in Central Asia and Berbers in North Africa.

But in the years following Hishām's death, feuds between the Oavs and the Kalb erupted into major revolts in Syria, Iraq, and Khorāsān (745-746), while the mawālī became involved with the Hāshimīyah (q.v.), a religio-political sect that denied the legitimacy of Umayyad rule. In 749 the Hāshimīyah, aided by the western provinces, proclaimed as caliph Abū al-'Abbās as-Saffāḥ, who thereby became first of the 'Abbasid dynasty.

The last Umayyad, Marwan II (reigned 744-750), was defeated at the Battle of the Great Zāb River (750). Members of the Umayyad house were hunted down and killed, but one of the survivors, 'Abd ar-Raḥmān, escaped and established himself as a Muslim ruler in Spain (756), founding the dynasty of the Umayyads of Córdoba.

Umbala (India): see Ambāla.

Umbelliferae (plant family): see Apiaceae.

Umberto (Italian personal name): see under Humbert, except as below.

Umberto, English HUMBERT, name of kings of Italy, grouped below chronologically and indicated by the symbol .

• Umberto I (b. March 14, 1844, Turin, Piedmont, Kingdom of Sardinia—d. July 29, 1900, Monza, Italy), duke of Savoy and king of Italy who led his country out of its isolation and into the Triple Alliance with Austria and Germany. He supported nationalistic and imperialistic policies that led to disaster for Italy and helped create the atmosphere in which he was assassinated.

Having received a totally military education, Umberto first fought in the war against Austria (1866). The calm and decisive leadership he showed in saving his troops at the Italian debacle at Custoza (June 1866) won him great popularity. His marriage to his cousin Margherita Teresa Giovanna, princess of Savoy (April 22, 1868), and the birth of their son, the future Victor Emmanuel III (Nov. 11, 1869), also gained him public sympathy in spite of prevailing anti-monarchist sentiment.

Umberto ascended the throne on Jan. 9. 1878, but his respect for the constitutional regime, as well as his attempt to reconcile various political and regional elements in Italy, allayed the suspicions of the leftists. Neverthe-

Antonio Piccinni By courtesy of the Museo Centrale del Risorgimento,

less, he maintained an authoritarian view of the king's prerogative, which he used, probably under the influence of the ambitious and energetic queen, to bring Italy into the Triple Alliance (May 20, 1882) with Germany and Austria-Hungary. He also urged Italy's entry into the armaments race despite the country's limited resources, and he encouraged colonial adventures in Africa.

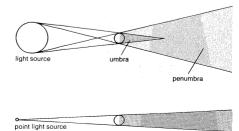

A tariff war with France led to grave economic difficulties (1888), and the defeat of the Italians by Ethiopians in the Battle of Adowa (1896) meant the failure of Italian colonialism. In the face of increasing social unrest, Umberto condoned the imposition of martial law (1898) and the harsh repression that followed, especially at Milan. This period of turmoil culminated in Umberto's assassination by an anarchist, G. Bresci.

• Umberto II (b. Sept. 15, 1904, Racconigi, Italy—d. March 18, 1983, Geneva, Switz.), prince of Savoy and briefly king of Italy in 1946 until he was forced to abdicate after a republican form of government was approved in a general referendum.

The son of King Victor Emmanuel III, Umberto graduated from the Royal Military Academy in Turin. He became a general in 1931 and commanded an armoured division in World War II. On Mussolini's recommendation he was made marshal in October 1942. After the Allies took Rome, his father appointed him lieutenant general of the realm (June 2, 1944) and abdicated in his favour on May 9, 1946. Although Umberto campaigned to rally the monarchist forces, the Italian people voted for a republic. On June 14 Umberto and his male heirs were permanently banished from Italy. He took residence at Cascais, Port., under the title Count of Sarre.

umbilical cord, Latin FUNICULUS UMBILI-CALIS, narrow cord of tissue that connects a developing embryo, or fetus, with the placenta (the extra-embryonic tissues responsible for providing nourishment and other lifesustaining functions). In the human fetus, the umbilical cord arises at the belly and by the time of birth is about 2 feet (60 cm) long and 0.5 inch (1.3 cm) in diameter. It contains two umbilical arteries and one umbilical vein, through which the fetal heart pumps blood to and from the placenta, in which exchange of nutrient and waste materials with the circulatory system of the mother takes place. The umbilical vein carries blood oxygenated in the maternal body from the placenta to the fetus, while the umbilical arteries carry deoxygenated blood and fetal wastes from the fetus to the placenta, where they are treated in the maternal body. After birth, the umbilical cord is clamped or tied and is then cut. The stump of the cord that remains attached to the baby withers and falls off after a few days, leaving the circular depression in the abdomen known as the navel.

umbra, that part of a shadow area over which all light from a given source is excluded. The shadow from a point source of illumination is essentially all umbra, but that from a source

Umbra

of some size (as from the Sun) consists of a small umbra and a much larger partial shadow called the penumbra (q.v.). Thus, in an eclipse of the Sun, the regions of umbra are those experiencing total eclipse and those of penumbra, partial eclipse. The term is also used for the darkest inner portion of a sunspot.

umbrella, a portable, hand-held device that is used for protection against rain and sunlight. The modern umbrella consists of a circular fabric or plastic screen stretched over hinged ribs that radiate from a central pole. The hinged ribs permit the screen to be opened and closed so that the umbrella can be carried with ease when not in use.

Umbrellas in ancient Egypt, Mesopotamia, China, and India were used to protect important persons from the sun. They were often large and held by bearers, and they served as marks of honour and authority for the wearer. The ancient Greeks helped introduce umbrellas into Europe as sunshades, and the Romans used them to protect against rain. The use of umbrellas disappeared in Europe during the Middle Ages but had reappeared in Italy by the late 16th century, where they were regarded as marks of distinction for the pope and clergy. By the 17th century the use of the umbrella had spread to France, and by the 18th century umbrellas were common throughout Europe. A small, dainty umbrella used for shading women's faces from the sun became known as a parasol and was a standard element of fashionable women's outdoor attire in the 18th and 19th centuries. The traditional construction of umbrellas using cane ribs was replaced in the 1850s by modern umbrellas using a very light but strong steel frame. Men in the West began carrying umbrellas for personal use in the mid-19th century. Men's umbrellas were generally black, but in the 20th century men's as well as women's umbrellas were made in a variety of bright and colourful designs.

umbrella pine, also called JAPANESE UM-BRELLA PINE (Sciadopitys verticillata), coniferous evergreen tree native to Japan, the only member of the genus Sciadopitys of the deciduous cypress family (Taxodiaceae). Although slow growing, it may reach a height of 36 m (116 feet), with a trunk diameter of 1.2 m (4 feet). The short branches are arranged in circles about the trunk. The small, scalelike leaves are less than 6 mm (0.2 inch) long and adhere closely to the bark. Modified shoots assuming the form and function of leaves occur in umbrella-like whorls of 15 to 35 at the tips of the twigs. Several varieties of the umbrella pine are cultivated as ornamentals. Its wood is used in making boats; its bark, in the form of oakum, is used for caulking.

umbrella plant, any of several unrelated but similarly leaved plants. Cyperus alternifolius (family Cyperaceae), also called umbrella palm and umbrella sedge, is widely cultivated in water gardens and as a potted plant. It grows up to 1 m (3 feet) high. Native to Madagascar, Réunion, and Mauritius, it is widely naturalized in the tropics and subtropics.

Eriogonum alenii, native to the western United States, is a white woolly member of the buckwheat family (Polygonaceae). It grows to 50 cm (20 inches). Another umbrella plant, in the family Saxifragaceae, is Peltiphyllum peltatum; its leaves are about 25 cm (10 inches) across, with 10–15 lobes. It grows well in wet places, reaching about 2 m (6 feet) in height.

umbrellabird, any of three species of cotingas (family Cotingidae, order Passeriformes) of tropical American forests. They are notable for their unique, umbrella-like crest and for the pendant suspended from the throat, which is an inflatable wattle. When displaying, the male spreads the crest to cover his head and, at the same time, makes rumbling noises.

Long-wattled umbrellabird (Cephalopterus penduliger)
Painting by Murrell Butler

The three species are black and 38–50 cm (15–20 inches) long. All spend most of their lives in the canopies of tall trees. In the ornate umbrellabird (*C. ornatus*) of the Amazon basin, the wattle is short, triangular, and devoid of feathers on the hindside. In the long-wattled umbrellabird (*Cephalopterus penduliger*), found west of the Andes in Ecuador and Colombia, the wattle may be 28 cm (11 inches) long and is entirely shingled with short, black feathers. The bare-necked umbrellabird (*C. glabricollis*) of Panama and Costa Rica has a short, round wattle, which is bright red and unfeathered. The latter two species are con-

sidered by some authorities to be subspecies

of C. ornatus.

Umbri, English UMBRIANS, ancient pre-Etruscan people who gradually concentrated in Umbria (in central Italy) in response to Etruscan and Gallic pressure. By about 400 BC the inhabitants of this area spoke an Indo-European dialect (Umbrian). The Umbri never fought any important wars against the Romans; in the Social War (90–89 BC), for instance, they joined the rebel allies tardily and were among the first to make peace with Rome. Ancient authors described the Umbri as closely resembling their Etruscan enemies in their habits, and the Umbrian alphabet was undoubtedly of Etruscan origin.

Umbria, region, central Italy, including the provinces of Perugia and Terni, with an area of 3,265 square miles (8,456 square km). It lies roughly equidistant between Rome (south) and Florence (north). The modern region takes its name from the Umbria of Roman times.

The Roman emperor Augustus made Umbria (together with the district of Ager Gallicus) one of the 11 regions into which he administratively divided Italy in the 1st century BC. After the Lombard invasion in the 6th century AD, most of the region was incorporated in the Duchy of Spoleto, but part remained in Byzantine hands until the establishment of the temporal power of the Holy See. Later rivalry between the popes and the Holy Roman emperors gave rise to conditions that favoured the emergence of communes, and Perugia (q.v.) became the dominant city-state of Umbria. The campaigns of Cesare Borgia and Pope Julius II in the 15th and early 16th centuries won back most of the towns for the Papal States, and in 1540 Pope Paul III finally subdued Perugia. The expression "Province of Umbria" embraced the modern region (minus Orvieto) and Rieti in the late 17th century and was extended to include Camerino in the 18th. Umbria was attached to the Roman Republic in 1798, restored to papal rule in 1800, and incorporated in the French empire in 1808. Under papal rule again from 1814, the "Legation of Umbria" comprised the "delegations" of Spoleto, Perugia, and Rieti until its occupation by the forces of Sardinia-Piedmont in 1860. Under the kingdom of Italy (from 1861) the region had only one province, that of Perugia, until that of Terni was created in 1927

While Umbria has some interesting monuments of the Roman and early medieval periods, such architectural glories as the cathedrals of Assisi and Orvieto and palaces such as those of Todi, Perugia, and Gubbio were built during the medieval Gothic period, some embellished by the greatest artists of the 13th and 14th centuries. During the Renaissance, Umbria once more occupied a place of honour in the creative arts as the home of the Umbrian school of painting, with such masters as Perugino and Pinturicchio.

Umbria's core is the upper and middle valley of the Tiber River, flanked on the west and east by low hills that gradually rise in the east to the Umbrian-Marchigian Apennines. The characteristic feature of the region's physiography is the prevalence of wide basins, some of lacustrine origin (Lake Trasimeno), some being sections of river valleys, and others small, isolated depressions such as the plains of Gubbia and Torri

of Gubbio and Terni.

Farming in the hills and valleys is prosperous and is characterized by intensive land use, especially intercropping. Wheat, corn (maize), potatoes, sugar beets, grapes, and olives are grown, and the wine of Orvieto is known throughout Italy. Livestock raising is extensive. The major power centre of Umbria is the hydroelectric complex of Terni, which supports steel, chemical, and electrochemical industries at Terni, Narni, and Foligno. Textile and food industries at Perugia, the regional capital, are important. The region is served by two major rail lines from Rome and has an excellent system of highways and bus communications. Pop. (1988 est.) 818,226.

Umbrian language, one of the ancient Italic languages closely related to Oscan and Volscian and more distantly related to Latin and Faliscan. Umbrian was spoken in central Italy, probably only in the area of the Tiber River valley in the last few centuries BC; it was displaced by Latin at an unknown date. Modern knowledge of the language is derived almost entirely from the Iguvine Tables (q.v.), a set of bronze tablets discovered near Gubbio (ancient Iguvium), Italy, in 1444. Dating from between about 300 BC and about 90 BC, the tables are written in an Umbrian alphabet derived from Etruscan and in the Latin script. As it appears in these tablets, Umbrian is quite similar to the Oscan language and Latin language in structure but shows a series of sound shifts and some differences in vocabulary.

Umbriel, one of the major satellites of the planet Uranus. It orbits the planet at a distance of 266,300 km (165,110 miles). Umbriel has an orbital period of 4.144 days. Its discovery is usually attributed to William Lassell in 1851, but William Herschel, who discovered Uranus and two other satellites, probably detected it more than 60 years earlier, in 1787,

or possibly in 1798.

Umbriel's diameter is estimated as 1,110 km (690 miles), and its mass is about 1.2×10^{-5} that of Uranus. Astronomers believe that the satellite is composed largely of water ice intermixed with small amounts of frozen methane and rocky material. Umbriel is distinct from the other major satellites of Uranus in that it shows no evidence of tectonic activity. However, like the Moon's, its surface is covered with impact craters, most measuring from about 100 to 200 km (62 to 124 miles) across.

Umbundu (people): see Ovimbundu.

Umeå, town and capital of Västerbotten *län* (county), northeastern Sweden. It lies on the left bank of the Umeå River near the Gulf of Bothnia. It has long been an educational and

cultural centre for northern Sweden. In 1622 it was incorporated by Gustavus II Adolphus. After suffering several destructive fires, especially in 1888, it was largely rebuilt. It is a commercial centre and port and manufactures furniture and machinery; it also has sawmills, the products of which are exported from its foreport, Holmsund. Umeå University (1963) has a sizable school of medicine. An open-air museum in the town has exhibits and collections illustrating the area's past. Pop. (1989 est.) 88,726.

Umehara Ryūzaburō (b. March 9, 1888, Kyōto, Japan—d. Jan. 16, 1986), Westernstyle Japanese painter whose vibrant colours, dynamic brushstrokes, and liberated spirit had a strong impact on young Japanese painters. Umehara first studied painting under Asai Chū at the Kansai Art School. From 1908 to 1913 he toured Europe. In 1909 he was in France, where he studied in Paris at the Académie Julian and met Pierre-Auguste Renoir and became his devoted pupil. He founded several artist groups in Tokyo, including the Nikakai in 1914 and the Shuń yōkai in 1922. From 1944 to 1952 he was a professor at Tokyo University.

professor at Tokyo University. Among his famous works are "Woman Wearing a Bonnet" (1908), "Necklace" (1913), "Landscape of Naples" (1912), "Seated Nude" (1921), and the landscapes "Kirishima" (1937), "Sakura-jima" (1937), and "Asama-yama" (1950). He was given the Order of Cultural Merit in 1952 and the Asahi Culture Prize in 1956

Umfolozi Game Reserve, wild animal sanctuary in northern Natal, South Africa, southwest of the Hluhluwe Game Reserve. Lying about 35 miles (56 km) inland from the Indian Ocean, Umfolozi is now mostly surrounded by the nonindependent black state of KwaZulu. It was established in 1897 and has an area of 185 square miles (480 square km). A wooded savanna area with thorn trees, it is the habitat of rare white rhinoceroses, as well as black rhinoceroses, assorted species of antelope, wildebeests, zebras, giraffes, and numerous birds.

umiak, boat used by the Greenland and later by the Alaskan Eskimos for transport. It was called the woman's boat, as opposed to the kayak, the men's hunting and fishing boat.

Like the kayak, the umiak was made of seal or other animal skins stretched over a driftwood or whalebone frame and was paddled. Unlike the kayak, it was an open boat, either round in shape or elongated much like the birchbark canoe. The umiak was used by women for transporting themselves, children, the elderly, and possessions; the umiak was also used by the men for whaling. In the 20th century the umiak was first furnished with an outboard motor and finally displaced by conventional motorboats, as was the kayak, except for recreation or sporting.

umland: see hinterland.

Umlazi, new town in the nonindependent black state of KwaZulu, southeastern Natal, South Africa. It lies along the south bank of the Umlazi (Umlass) River and adjoins the city of Durban on the west. The present site of Umlazi was occupied by American missionaries in 1836, but it became an Anglican mission reserve in 1856. Umlazi was officially opened to black residents in 1965 (most of whom formerly resided in Durban) and acquired town status in 1973. It is the largest town in KwaZulu. Local industries in Umlazi produce beverages, wearing apparel, leather goods, sawn wood and wood products, paper, rubber goods, and plastic products. Many of the inhabitants commute to Durban, Hammarsdale, and Pietermaritzburg for employment. A branch campus of the University of Zululand is located at Umlazi, and the town lies near the Pietermaritzburg-Durban railway. Pop. (1979 est.) 172,550.

Umm al-Qaywayn, also spelled UMM AL-QAIWAIN, constituent emirate of the United Arab Emirates, on the Arabian Peninsula facing the Persian Gulf. The second smallest in area (290 square miles [750 square km]) and the least populous of the federation's seven emirates, Umm al-Qaywayn is roughly triangular in shape and is bounded by the emirates of Ra's al-Khaymah (northeast) and Ash-Shariqah (south and west). On the northwest, it fronts the Persian Gulf for 17 miles (27 km) in a straight-line distance; actually, Umm al-Qaywayn's coastline is much longer and is extremely irregular, with numerous small inlets, spits, and offshore islets. On one of these spits is the town of Umm al-Qaywayn, which is the capital and only settlement of consequence.

In the early 19th century the sheikhs of Umm al-Qaywayn acknowledged the more powerful state of Ash-Shāriqah as their liege; Ash-Shāriqah rulers, of the Qawāsim people, were leaders of the Persian Gulf's coastal pirates, and Umm al-Qaywayn town was a pirate harbour. Because of the piracy in the Gulf, Britain intervened forcibly and compelled the Gulf states, including Umm al-Qaywayn, to sign the General Treaty of Peace of 1820; this was Umm al-Qaywayn's first recognition as an independent power. The sheikhdom subsequently came under British control, and when the British finally withdrew from the Persian Gulf area (1971), Umm al-Qaywayn became a founding member of the United Arab Emirates.

The local economy was traditionally dependent upon pearl diving and fishing, based at Umm al-Qaywayn town. Between World Wars I and II, the harbour, now silted up, was one of the chief trade emporiums of the Trucial Coast. Native boatbuilding, long a specialty, is still practiced.

Umm al-Qaywayn town is connected by paved road with Ra's al-Khaymah town and Abu Dhabi town. About 20 miles (32 km) inland from the capital is the oasis of Falaj al-Mu'allá, with extensive plantations of date palms. Otherwise, the emirate is almost entirely uninhabited desert. In 1964–72 a large portion of its revenues came from the sale of postage stamps, printed abroad not for any legitimate postal purpose but entirely for sale to collectors.

No oil has been found in Umm al-Qaywayn. Although electricity and a few modern improvements have been introduced, it has remained the most undeveloped of any of the seven emirates. Pop. (1985 prelim.) 29,229.

Umm Qays (Jordan): see Gadara.

Umm Sa'id (Qatar): see Musay'id.

Umniati River, river, tributary of the Zambezi River in north-central Zimbabwe. It has its source in the Daramumbe Range on the main watershed north of Chivhu. Flowing northwest for 325 miles (520 km), the Umniati joins the Zambezi River near the Kariba Dam. Its tributaries include the Sebakwe, Umsweswe, and Umfuli rivers. Its lower course, formed by the confluence with the Umfuli River, is also known as the Sanyati. The river valley has been interesting to mineral prospectors for years, and copper has been mined near the confluence with the Umfuli.

'umrah, the "minor pilgrimage" undertaken by Muslims whenever they enter Mecca (a territory forbidden to non-Muslims). It is also meritorious, though optional, for Muslims residing in Mecca. Its similarity to the major and obligatory Islāmic pilgrimage (hajj) made some fusion of the two natural, though pilgrims have the choice of performing the

'umrah separately or in combination with the hajj. As in the hajj, the pilgrim begins the 'umrah by assuming the state of ihram (ritual purity). Following a formal declaration of intent (nīyah) to perform the 'umrah, he enters Mecca and circles the sacred shrine of the Ka'bah seven times. He may then touch the Black Stone, pray at the sacred stone Maqām Ibrāhīm, drink the holy water of the Zamzam spring, and touch the Black Stone again, though these ceremonies are supererogatory. The sa'y, running seven times between the hills of as-Ṣafā and al-Marwah, and the ritual shaving of the head complete the 'umrah.

In its present form, the 'umrah dates from Muhammad's lifetime and is a composite of several pre-Islāmic ceremonies that were reinterpreted in monotheistic terms and supplemented by Muslim prayers. See also hajj.

Umsiligasi (South African king): see Mzilikazi

Umtali (town, Zimbabwe): see Mutare.

Umtata, town and capital of Transkei, a southern African republic not internationally recognized. Located on the Umtata ("The Taker") River (so named because of its destructive flooding), the town lies at an elevation of 2,290 feet (698 m) in the Kaffraria region near the southeast coast of South Africa. The town began as a European settlement in 1869 and functioned as a buffer zone between the warring Pondo and Tembu peoples. A military post was later established at Umtata, and it was officially proclaimed a town in 1882. It became the headquarters of the Transkeian Territories General Council (known as the Bunga) in 1903.

A summit meeting of the homeland leaders was held at Umtata in 1973, when they decided to federate their own states after independence. When Transkei was declared independent in 1976, Umtata became its capital. Subsistence agriculture and livestock raising are the primary economic activities in the area; Umtata has some secondary industries that produce textiles, wood products, foodstuffs, and processed tobacco. The town is dominated by the parliament buildings and has other buildings dating back to colonial times, including the Town Hall and a hospital erected in memory of Major Sir Henry George Elliot (1877-1902) of the Cape Colonial Service. Umtata has a technical college, the University of Transkei (1977), and road and rail connections with East London, South Africa. There is an airfield, and the Umtata Falls are 2 miles (3 km) southeast of the town.

> A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Pop. (1984 est.) mun., 80,000.

Umuahia, town, Imo State, southern Nigeria. It lies along the railroad from Port Harcourt to Enugu. It is an agricultural market centre and (since 1916) collecting point on the railway for the crops of the surrounding region: yams, cassava, corn (maize), taro, citrus fruits, and palm oil and kernels. The town has a palmoil-processing plant and several breweries, and the National Root Crop Research Institute at Umudike, is adjacent to the town. Umuahia is the headquarters of the Umuahia/Ikwuano Local Government Council and has teacherraining colleges, Trinity College (theological), and several hospitals. Pop. (1983 est.) 47,550.

Umvukwe Range, mountain range in northern Zimbabwe, extending about 100 miles (160 km) north from the Hunyani River and rising to a high point of 5,748 feet (1,752 m). The range forms the northern section of

an enormous tabular block of igneous rock (norite) and is a major chrome-mining area. Major towns in the area are Darwendale, Maryland Junction, and Kildonan.

UMWA: see United Mine Workers of America.

UN: see United Nations.

Una, town, south-central Himāchal Pradesh state, northern India. It lies along the Soān River at an elevation of 1,815 feet (550 m), about 110 miles (175 km) northwest of Simla, the state capital. Formerly an important commercial centre, it declined after the construction of all-weather roads that bypass the town. Agriculture and horticulture, mainly orchards, are the basis of the economy. The town's manufactures include paints and varnishes, plastic bags, resin, and turpentine. Una has a government college affiliated with Himāchal Pradesh University at Simla.

The region in which Una is situated was successively ruled by the Mughals and Rājputs until it was annexed by the British after the Gurkha war of 1815-16. Most of the population of the region is economically dependent on agriculture; crops grown include wheat, corn (maize), barley, and tea. Orchards of apricots, mangoes, apples, and pears, together with grapes, are raised on the hill slopes; animal husbandry is also important. Cottage industries include wool carding and spinning; the making of shawls, scarves, blankets, and tweeds; fruit packing; rice milling; oilseed crushing; flour milling; and beekeeping. In recent years, roads have been constructed in this remote area to make it accessible to increasing numbers of tourists. Pop. (1981) 9,157.

Unaka Mountains, segments of the Blue Ridge and Appalachian mountain systems in the southeastern United States. They extend from southwestern Virginia along the Tennessee-North Carolina border into northern Georgia. The main ridges average 5,000 feet (1,500 m), rising in the Great Smoky Mountains to Clingmans Dome (6,643 feet [2,025 m]), Tennessee's highest point. Other features in the Unakas are the Iron Mountains, the Chilhowee, Unicoi, Stone, Bald, and Holston ranges, and Brasstown Bald (4,784 feet [1,458 m]; the highest point in Georgia). The Unakas have been severely dissected by stream erosion and in general are characterized by steep slopes and deep, narrow valleys that are clothed with hardwood forest. The Unaka region abounds with wildlife and is included in the Pisgah, Nantahala, Jefferson, and Cherokee national forests. Tourism is popular, especially in the Great Smoky Mountains National Park. The Cherokee Indians named the mountains Unaka ("White"), probably in reference to a persistent white haze or to some white rock formations. Frequently, the name Unaka is applied specifically to those peaks in Avery and Mitchell counties of North Carolina and in Unicoi and Carter counties of Tennessee.

Unamuno (y Jugo), Miguel de (b. Sept. 29, 1864, Bilbao, Spain—d. Dec. 31, 1936, Salamanca), educator, philosopher, and author whose essays had great influence in early 20th-century Spain.

Unamuno was the son of Basque parents. After attending the Instituto Vizcaino of Bilbao, he entered the University of Madrid in 1880 and in four years received a doctorate in philosophy and letters. Six years later he became professor of Greek language and literature at the University of Salamanca.

In 1901 Unamuno became rector of the university, but he was relieved of his duties in 1914 after publicly espousing the Allied cause in World War I. His opposition in 1924 to the military government ruling Spain resulted in his forced exile, from which he escaped to France. When General Miguel Primo de Rivera's dictatorship fell, Unamuno

returned to the University of Salamanca and was reelected rector of the university in 1931, but in October 1936 he denounced Franco's Falangists, was removed once again as rector, and was placed under house arrest. He died of a heart attack two months later.

Unamuno was an early Existentialist who concerned himself largely with the tension between intellect and emotion, faith and reason. Man's "hunger for immortality" is, he held, constantly denied by reason and can only be satisfied by faith, and the resulting tension results in unceasing agony.

Although an accomplished poet and playwright, Unamuno was most influential as an essayist and novelist. His mature philosophy found the fullest expression in Del sentimiento trágico de la vida en los hombres y en los pueblos (1913; The Tragic Sense of Life in Men and Peoples), in which he stressed the vital role spiritual anxiety can have in driving man to live the fullest possible life. This and other themes were explored in La agonía del cristianismo (1925; The Agony of Christianity). His most famous novel is Abel Sánchez: una historia de pasión (1917; Abel Sanchez), a modern re-creation of the biblical story of Cain and Abel, which centres on the painfully conflicting impulses of the character representing Cain. Unamuno's El Cristo de Velázquez (1920; The Christ of Velázquez), a study of the painter in poetry, is regarded as a superb example of modern Spanish verse.

Unanimism, French UNANIMISME, French literary movement based on the psychological concept of group consciousness and collective emotion and the need for the poet to merge with this transcendent consciousness. Founded by Jules Romains in about 1908, Unanimism particularly influenced some members of the Abbaye group, a loose organization of young artists and writers who were interested in printing and publicizing new works. Petit Traité de versification (1923; "Small Treatise on Versification"), by Romains and Georges Chennevière, and Notes sur la technique po-étique (1910; "Notes on Poetic Technique"), by Georges Duhamel and Charles Vildrac, outlined the Unanimist theories of prosody, which resembled those of the American poet Walt Whitman in encouraging the use of strongly accented rhythms and the replacement of symbols and allegory by simple and unadorned diction.

Unas (fl. 24th century BC), last king of the 5th dynasty (c. 2465-c. 2325 BC) in Egypt, the first pharaoh to inscribe the interior of his pyramid with religious and magical texts known as Pyramid Texts. According to later king lists, Unas was the last ruler of the 5th dynasty, but the innovations in his pyramid complex and the use of blocks from his predecessor's monuments in his own pyramid have led some to consider him the founder of the 6th dynasty, or at least a transitional ruler.

The reliefs and texts in Unas' burial chamber and other rooms were meant to assist the deceased pharaoh in the afterlife. The texts preserve many archaic practices and compose a valuable compendium of early Egyptian beliefs. Unas' causeway, connecting his pyramid complex on the high desert with the valley temple near the edge of cultivation, contained interesting reliefs that probably recount events of his reign. His texts depict the transport of granite blocks from Aswan for the king's temple. The first known battle scene in Egyptian relief, probably recording a raid against the Bedouins of the northeast frontier, also appears. Trade with Syria and Palestine is attested by scenes of ships carrying Asiatics. Finally, a fragmentary but vivid scene of starving people depicts a famine; some scholars suggest that it describes Unas' aid to famished desert tribesmen. The work of the complex represents a high point of subject variety in Old Kingdom scenes.

Unas' daughter married his successor Teti. whom the ancient sources considered the founder of the 6th dynasty.

unau. either of two species of tree-dwelling mammals also known as two-toed sloths. See sloth.

uncertainty principle, also called HEISEN-BERG UNCERTAINTY PRINCIPLE, OF INDE-TERMINACY PRINCIPLE, statement, articulated (1927) by the German physicist Werner Heisenberg, that the position and the velocity of an object cannot both be measured exactly. at the same time, even in theory. The very concepts of exact position and exact velocity together, in fact, have no meaning in nature.

Ordinary experience provides no clue of this principle. It is easy to measure both the position and the velocity of, say, an automobile, because the uncertainties implied by this principle for ordinary objects are too small to be observed. The complete rule stipulates that the product of the uncertainties in position and velocity is equal to or greater than a tiny physical quantity, or constant (about 10^{-34} joule-second, the value of the quantity $h/(2\pi)$, where h is Planck's constant). Only for the exceedingly small masses of atoms and subatomic particles does the product of the uncertainties become significant.

Any attempt to measure precisely the velocity of a subatomic particle, such as an electron, will knock it about in an unpredictable way, so that a simultaneous measurement of its position has no validity. This result has nothing to do with inadequacies in the measuring instruments, the technique, or the observer; it arises out of the intimate connection in nature between particles and waves in the realm of subatomic dimensions.

Every particle has a wave associated with it; each particle actually exhibits wavelike behaviour. The particle is most likely to be found in those places where the undulations of the wave are greatest, or most intense. The more intense the undulations of the associated wave become, however, the more ill defined becomes the wavelength, which in turn determines the momentum of the particle. So a strictly localized wave has an indeterminate wavelength; its associated particle, while having a definite position, has no certain velocity. A particle wave having a well-defined wavelength, on the other hand, is spread out; the associated particle, while having a rather precise velocity, may be almost anywhere. A quite accurate measurement of one observable involves a relatively large uncertainty in the measurement of the other.

The uncertainty principle is alternatively expressed in terms of a particle's momentum and position. The momentum of a particle is equal to the product of its mass times its velocity. Thus, the product of the uncertainties in the momentum and the position of a particle equals $h/(2\pi)$ or more. The principle applies to other related (conjugate) pairs of observables, such as energy and time: the product of the uncertainty in an energy measurement and the uncertainty in the time interval during which the measurement is made also equals $h/(2\pi)$ or more. The same relation holds, for an unstable atom or nucleus, between the uncertainty in the quantity of energy radiated and the uncertainty in the lifetime of the unstable system as it makes a transition to a more stable state.

uncial, in calligraphy, ancient majuscular book hand characterized by simple, rounded strokes. It apparently originated in the 2nd century AD when the codex form of book developed along with the growing use of parchment and vellum as writing surfaces. Unlike its prototype square roman, uncial is adapted to direct strokes of the pen held in one position and was thus the natural favourite of scribes; most of the works of Latin literature + CENOBROADEXIOII ODERITO GENERABILES AL GATORIS quem capar ecclesiae OCCICAL ALTA EIOCS PETRUS LANCOBAROORUCO CXTREODIS DECINIB. for more than 500 years were copied in this hand.

Half-uncial, or semi-uncial, script developed through the scribes' tendency in certain schools, such as the Insular script of the British Isles, to adopt more cursive forms, admitting ascenders and descenders.

uncinariasis: see hookworm disease.

Uncle Sam, popular U.S. symbol usually associated with a cartoon figure having long white hair and chin whiskers and dressed in a swallow-tailed coat, vest, tall hat, and striped trousers. His appearance is derived from two

James Montgomery Flagg's representation of Uncle Sam, which was first used on World War I recruiting

By courtesy of the Library of Congress, Washington, D.C

earlier symbolic figures in American folk-lore—Brother Jonathan and Yankee Doodle. The origin of the term Uncle Sam, though disputed, is usually associated with a business-man from Troy, N.Y., Samuel Wilson, known affectionately as "Uncle Sam" Wilson. The barrels of beef that he supplied the army during the War of 1812 were stamped "U.S." to indicate government property. This identification is said to have led to the widespread use

of the nickname Uncle Sam for the United States; and a resolution passed by Congress in 1961 recognized Wilson as the namesake of

the national symbol.

Uncle Sam and his predecessor Brother Jonathan were used interchangeably to represent the United States by U.S. cartoonists from the early 1830s to 1861. Cartoonists of the British humour magazine *Punch* helped evolve the modern figure by their drawings of both Brother Jonathan and Uncle Sam as lean, whiskered gentlemen wearing top hats and striped pants. Probably the first U.S. po-

litical cartoonist to crystallize the figure of Uncle Sam was Thomas Nast, beginning in the early 1870s. One of the most familiar treatments in the 20th century was shown in James Montgomery Flagg's World War I re-cruiting poster, also used in World War II, for which the caption read, "I Want You."

unconscious, also called subconscious, the complex of mental activities within an individual that proceed without his awareness. Sigmund Freud, the founder of psychoanalvsis, stated that such unconscious processes may affect a person's behaviour even though he cannot report on them. Freud and his followers felt that dreams and slips of the tongue were really concealed examples of unconscious content too threatening to be confronted di-

Some theorists (e.g., the early experimental psychologist Wilhelm Wundt) denied the role of unconscious processes, defining psychology as the study of conscious states. Yet, the existence of unconscious mental activities seems well established and continues to be an important concept in modern psychiatry.

Freud distinguished among different levels of consciousness. Activities within the immediate field of awareness he termed conscious; e.g., reading this article is a conscious activity. The retention of data easily brought to awareness is a preconscious activity; for example, one may not be thinking (conscious) of his address but readily recalls it when asked. Data that cannot be recalled with effort at a specific time but that later may be remembered are retained on an unconscious level. For example, under ordinary conditions a person may be unconscious of ever having been locked in a closet as a child; yet under hypnosis he may recall the experience vividly.

Because one's experiences cannot be observed directly by another (as one cannot feel another's headache), efforts to study these levels of awareness objectively are based on inference; i.e., at most, the investigator can say only that another individual behaves as if he were unconscious or as if he were conscious.

Efforts to interpret the origin and significance of unconscious activities lean heavily on psychoanalytic theory, developed by Freud and his followers. For example, the origin of many neurotic symptoms is held to depend on conflicts that have been removed from consciousness through a process called repression. As knowledge of psychophysiological function grows, many psychoanalytic ideas are seen to be related to activities of the central nervous system. That the physiological foundation of memory may rest in chemical changes occurring within brain cells has been inferred from clinical observations that: (1) direct stimulation of the surface of the brain (the cortex) while the patient is conscious on the operating table during surgery has the effect of bringing long-forgotten (unconscious) experiences back to awareness; (2) removal of specific parts of the brain seems to abolish the retention of specific experiences in memory; (3) the general probability of bringing unconscious or preconscious data to awareness is enhanced by direct electrical stimulation of a portion of the brain structure called the reticular formation, or the reticular activating system. Also, according to what is called brain blood-shift theory, the transition from unconscious to conscious activities is mediated by localized changes in the blood supply to different parts of the brain. These biopsychological explorations have shed new light on the validity of psychoanalytic ideas about the unconscious. See also psychoanalysis.

UNCTAD: see United Nations Conference on Trade and Development.

Undenominational Fellowship of Christian Churches and Churches of Christ. also called INDEPENDENT CHRISTIAN CHURCHES, autonomous Protestant churches in the United States that were formerly associated primarily with the Disciples of Christ. These churches refused to become part of the restructured Christian Church (Disciples of Christ) in 1968 because they feared that the development of denominational institutions in the reorganized church would infringe on the freedom of the local congregation. From 1967 to 1969 the number of congregations listed in the Yearbook of Christian Churches (Disciples of Christ) dropped from 8,046 to

The Independent Christian Churches do not identify with the Churches of Christ, however, because the independents accept the use of musical instruments in church services, which the Churches of Christ reject. In general, the independents are more conservative theologically than the members of the Christian Church (Disciples of Christ). They have no denominational structure or national organization.

underground film, motion picture made and distributed outside the commercial film industry, usually as an artistic expression of its maker, who often acts as its producer, director, writer, photographer, and editor. Underground films usually display greater freedom in form, technique, and content than films directed toward a mass audience and distributed through regular commercial outlets. The term underground film came into common use in the 1950s, when the greater availability of good-quality 16-millimetre film stock and equipment permitted an increasing number of nonprofessionals to engage in cinema art. The term was also applied to earlier films that were considered too experimental, too frank, or too esoteric for the general public, made both by professionals and by amateurs.

In the underground film the interplay of light and shadow basic to cinema art often takes precedence over narrative structure. The filmmaker ordinarily uses inexpensive production methods and a 16-millimetre or 8-millimetre camera. He may incorporate overexposures, underexposures, or triple exposures. Some underground films are purely abstract patterns of light and colour. Such films vary considerably in length. Robert Breer's A Miracle (1954) is 14 seconds long, while Andy Warhol, the most highly publicized of the underground filmmakers, did a study of the Empire State Building, Empire (1964), that lasts eight hours. During the 1920s filmmaking was stimulated by nonobjective art, represented by the Dadaist, Cubist, and Surrealist movements. Leading filmmakers such as Jean Renoir, René Clair, and Sergey Eisenstein made private experiments in addition to their publicly shown films. The classic Un Chien andalou (1928; "An Andalusian Dog") by the director Luis Buñuel and the Surrealist artist Salvador Dalí, financed by Buñuel's mother, was a product of this period.

Little of comparable interest was produced until the late 1950s, when a host of new cinema artists arose in the United States. Unlike their predecessors, they were strongly influenced by the techniques and personal expression of commercial films by directors such as Jean-Luc Godard, Ingmar Bergman, and Federico Fellini. Jonas Mekas, Stan Brakhage, and Stan Vanderbeek were among the creative leaders of the movement, which grew rapidly. Students from newly established film departments in universities across the country released thousands of independently produced film experiments. Outstanding examples, such

as Stan Vanderbeek's *Breathdeath* (1963–64) and Kenneth Anger's *Scorpio Rising* (1962–64), were seen over the years by a vast audience. In the 1970s underground filmmakers, many of whom had a background in painting or sculpture, continued to emphasize composition and form and an intensity of feeling rather than dramatic structure. Magic and the supernatural and political protest, traditionally popular topics in the underground, remained prominent among the great variety of subjects considered.

Underground Railroad, in the United States, a system existing in the Northern states before the Civil War by which escaped slaves from the South were secretly helped by sympathetic Northerners, in defiance of the Fugitive Slave Acts (q.v.), to reach places of safety in the North or in Canada. Though neither underground nor a railroad, it was thus named because its activities had to be carried out in secret, using darkness or disguise, and because railway terms were used in reference to the conduct of the system. Various routes were lines, stopping places were called stations, those who aided along the way were conductors, and their charges were known as packages or freight. The network of routes extended in all directions throughout 14 Northern states and "the promised land" of Canada, which was beyond the reach of fugitive-slave hunters. Those who most actively assisted slaves to escape by way of the "railroad" were members of the free black community (including such former slaves as Harriet Tubman), Northern abolitionists, philanthropists, and such church leaders as Quaker Thomas Garrett. Harriet Beecher Stowe, famous for her novel Uncle Tom's Cabin, gained firsthand knowledge of fugitive slaves through her contact with the Underground Railroad in Cincinnati, Ohio.

Estimates of the number of black people who reached freedom vary greatly, from 40,000 to 100,000. Although only a small minority of Northerners participated in the Underground Railroad, its existence did much to arouse Northern sympathy for the lot of the slave in the antebellum period, at the same time convincing many Southerners that the North as a whole would never peaceably allow the institution of slavery to remain unchallenged.

underground railway: see subway.

Underhill, Evelyn (b. Dec. 6, 1875, Wolverhampton, Staffordshire, Eng.—d. June 15, 1941, London), English mystical poet and author of such works as *Mysticism* (1911), *The Mystic Way* (1913), and *Worship* (1936), which helped establish mystical theology as a respectable discipline among contemporary intellectuals.

Underhill was a lifelong Anglican, but she was also attracted by Roman Catholic piety and religious experience. By 1940 she had supplemented her earlier and more diffuse mystical attitudes with a greater understanding and acceptance of institutional and sacramental elements in traditional Christianity, and she had come to centre her theology on an experience of Christ.

A frequent lecturer at conferences and seminaries, she also conducted retreats from 1924 and gained a reputation as a leading religious counselor. She was a contributor to numerous journals and was the theological editor of *The Spectator* from 1929 to 1932. Among her other works are *Man and the Supernatural* (1927), *The Mystery of Sacrifice* (1938), and two books of poetry, *The Bar-lamb's Ballad Book* (1902) and *Immanence* (1913).

Underhill, John (b. c. 1597, Kenilworth, Warwickshire, Eng.—d. Sept. 21, 1672, Killingworth, Oyster Bay, N.Y.), British-American colonial military officer, privateer, and magistrate.

John Underhill received his initial military training in Holland. He immigrated to Boston

in 1630 and organized the militia of Massachusetts Bay Colony. He became a town selectman in 1634; later that year he traveled to England seeking to increase the colony's military supplies.

During the Pequot War in 1637, Underhill's troops joined with Captain John Mason's Connecticut forces in destroying the Indian fort at Mystic. Underhill subsequently wrote an excellent descriptive account of the war, News from America. After the conflict. Underhill's support of the antinomian religious dissidents resulted in his banishment by the Massachusetts General Court. He fled Massachusetts Bay for Dover, N.H., where he organized a church and declared himself governor of the settlement. His actions and conduct were challenged by Massachusetts authorities, however, and in 1640 he was temporarily excluded from the church after he openly confessed to adultery before Boston's First Church.

Although he was reinstated in the Congregational order and his sentence of banishment was repealed in 1641, Underhill left Massachusetts for New Haven. He became a member of that colony's legislature. From New Haven he went to New Netherlands, where he served that government as a military officer and, later, as a member of the Council for New Amsterdam. The outbreak of the Anglo-Dutch wars in 1652 obliged him to leave the colony for Providence, R.I. There he obtained a privateer's commission and campaigned against his former Dutch employers.

When the English seized New Netherlands (1664), Underhill retired to his estate on Long Island and served as surveyor of customs for Long Island and as high constable and sheriff of Yorkshire. He was also a member of the Hempstead Convention that in 1665 drafted the so-called Duke of York's laws, a law code first applied to Yorkshire and eventually extended to the whole of New York province.

undersea cable, also called MARINE CABLE. assembly of conductors enclosed by an insulating sheath and laid on the ocean floor for the transmission of messages. Undersea cables for transmitting telegraph signals antedated the invention of the telephone; the first undersea telegraph cable was laid in 1850 between England and France. The Atlantic was spanned in 1858 between Ireland and Newfoundland, but the cable's insulation failed and it had to be abandoned. The first permanently successful transatlantic cable was laid in 1866, and in the same year another cable, partially laid in 1865, was also completed. The American financier Cyrus W. Field and the British scientist Lord Kelvin were closely associated with the two enterprises. Use of long undersea cables suitable for telephony followed the development in the 1950s of telephone repeaters with sufficiently long life to make the operation economically practical. The development of vacuum-tube repeaters that could operate continuously and flawlessly with no attention for at least 20 years, at depths up to 2,000 fathoms (12,000 feet [3,660 m]), made possible the first transatlantic telephone cable, from Scotland to Newfoundland (1956). The system provided 36 telephone circuits. Similar undersea systems between Port Angeles, Wash., and Ketchikan, Alaska, and between California and Hawaii were later put into service. A 5,300-nautical-mile (9,816-kilometre) cable between Hawaii and Japan (1964) provided 128 voice circuits; the same number of circuits were provided in 1965 by a cable linking the United States and France. Newer cables use transistorized repeaters and provide even more voice circuits; some are capable of transmitting television programs.

undertow, a strong seaward bottom current returning the water of broken waves back out to sea. There is in fact no such current in a gross sense, for the overall flow of surface water toward the shore in a surf zone is very small. The water actually thrown up on the shore by breaking waves does flow back, however, and under certain circumstances this return flow may be experienced by swimmers as a strong current. Returning water may, for example, be channelized by the presence or form of obstacles on the bottom into rip currents of significant velocity but quite narrow lateral dimension. Also, since the volume of returning water varies with the size of the waves, the swimmer who waits for a low-water trough or a cycle of low waves before standing up to walk to shore may encounter the return flow from large waves just gone by and again experience a seemingly strong current.

underwater diving, also called UNDERWATER SWIMMING, swimming done underwater either with a minimum of equipment, as in skin diving (free diving) or with a scuba (abbreviation of self-contained underwater-breathing apparatus) or an Aqualung. The only aspect of underwater diving that is competitive is spearfishing.

Underwater swimming and diving is as old as swimming and has been perpetuated into the present by pearl divers and sponge divers. Skin diving requires only a face mask, goggles, a short breathing tube (protruding from the mouth and kept above water), and flippers, or foot fins. A wet suit, a dry suit, or the latter over the former may be used in cold water. Skin diving was first popularized in the 1920s and 1930s in the Mediterranean and off the California coast, notably by the American diver Guy Gilpatric, whose The Compleat Goggler (1938) gave great impetus to the sport and aroused the interest of the French naval engineer and diver Jacques Cousteau. The goggles, flippers, snorkel (the name given the air tube from the German submarine air exhaust and intake device that allowed submerged operation), and face mask were all developed into their basic forms in the 1930s.

Attempts to construct diving apparatus go back to the 19th century, but the sport of scuba, or Aqualung, diving dates from 1943, when Cousteau and the French engineer Émile Gagnan developed the first fully automatic compressed-air Aqualung. Cousteau also did important work on the development of underwater cameras and photography and popularized the sport in *Le Monde du silence* (1952; *The Silent World*), written with Frédéric Dumas, and in other writings and television and film productions. Clubs formed after 1943 as fast as equipment became available;

Scuba diver wearing open-circuit equipment

national associations were formed in France, Italy, Great Britain, Canada, and the United States; and in 1959 Cousteau formed, with 15 national organizations (later more than 50), the Confédération Mondiale des Activités Subaquatique (CMAS; World Underwater Federation).

The fish hunted for food and the coral hunted for ornament by primitive divers are still objects of search for modern skin divers and scuba divers. An improved spear gun devised in the 1930s is used for food hunting, and special underwater cameras are widely used for recreational and scientific purposes. In addition, scuba diving has been useful scientifically in oceanography, in the study of fish and other marine organisms, and in the study of water pollution, as well as in the exploration of ships on the ocean floor and for salvage work, in which the earlier diving helmet with air line from on shipboard has been largely replaced.

Underwood, Francis Henry (b. Jan. 12, 1825, Enfield, Mass., U.S.—d. Aug. 7, 1894, Edinburgh), American author and lawyer who became a founder of *The Atlantic Monthly* in order to further the antislavery cause.

Following a year at Amherst (Mass.) College, Underwood went to Kentucky where he studied law. There his strong aversion to slavery was heightened by close observation. In 1850 he returned to Massachusetts and, after three years of political work, joined the publishing house of Phillips, Sampson and Company as assistant editor. The antislavery atmosphere of the northeast led him to the idea of publishing a literary magazine to oppose slavery. By 1857, after several years of editorial experience, he had gained the support of such liberal writers as Harriet Beecher Stowe, Oliver Wendell Holmes, Ralph Waldo Emerson, Henry David Thoreau, Henry Wadsworth Longfellow, and James Russell Lowell and persuaded his firm to publish a magazine. Edited by Lowell, with Underwood as assistant editor, The Atlantic Monthly began publication in November 1857. Underwood left the magazine in 1859 after it was purchased by another firm, resuming his political activity and writing the biographies of Lowell, Longfellow, and the poet and reformer John Greenleaf Whittier, as well as several short stories and novels. His best known book is Quabbin: The Story of a Small Town (1893), an account of his boyhood in Enfield. At his death he was U.S. consul in Scotland.

Underwood, Oscar W(ilder) (b. May 6, 1862, Louisville, Ky., U.S.—d. Jan. 25, 1929, Fairfax County, Va.), U.S. congressman from Alabama (1895–1927) who drafted the Underwood Tariff Act of 1913.

After studying law at the University of Virginia he was admitted to the bar in 1884. Underwood settled in Birmingham, Ala., and was elected to the U.S. House of Representatives (1895–96; 1897–1915), rising to chairman of the Ways and Means Committee and becoming an expert on trade and tariffs. He ran for the Senate in 1914 and served for two terms (1915–27).

Underwood decided to seek the Democratic presidential nomination in 1912. He lost the nomination to Woodrow Wilson, but the winning candidate was for the most part receptive to his views on the subject of protective tariffs, and it was under the Wilson administration that Underwood was able to enact the tariff legislation that bears his name. The bill, passed in 1913, sought to promote international trade by lowering import duties (and, to make up for the expected loss of revenue, levied the first federal income tax). Underwood generally supported Wilson's programs, promoting passage of the Federal Reserve Act (1913) and advocating U.S. participation in the League of Nations.

He was a member of the U.S. delegation

to the Washington conference on arms limitations (1921–22) under the administration of Warren G. Harding and reportedly refused Harding's offer of an appointment to the Supreme Court. He sought the Democratic presidential nomination once again in 1924, but his denunciation of the Ku Klux Klan—which alienated his Southern colleagues—and his opposition to Prohibition were largely responsible for his failure to win the party's support.

Undset, Sigrid (b. May 20, 1882, Kalundborg, Den.—d. June 10, 1949, Lillehammer, Nor.), Norwegian novelist whose readership is international and who received the Nobel Prize for Literature in 1928.

Her father was an archaeologist, and her home life was steeped in legend, folklore, and the history of Norway. Both this influence and her own life story are constantly present

Sigrid Undset

By courtesy of the Royal Norwegian Embassy, London

in her works—from Elleve aar (1934; Eleven Years), in which she tells of her childhood, to the story of her flight from Nazi-occupied Norway, published originally in English as Return to the Future (1942; Norwegian Tillbake til fremtiden).

She worked in the office of an electrical engineering firm for 10 years before she married, bore children, and began to write. Her early novels deal with the woman's position in the contemporary unromantic world of the lower middle class. These include Splinten av troldspeilet (1917; Images in a Mirror) and Jenny (1911). She then turned to the distant past and created what is considered her masterpiece, the trilogy Kristin Lavransdatter (1920-22). Though the medieval climate of the novel is strikingly evoked, it is still a story of a woman's fate, portraying the proud, independent Kristin's growth, through her marriage to a charming but irresponsible man, into a strong but humble and self-sacrificing woman. Both in this and in the four-volume historical novel Olav Audunssøn (1925-27; The Master of Hestviken), religious problems are prominent and reflect the author's preoccupation with such matters. She was converted to the Roman Catholic faith in 1924, and in her later novels, in which she returned to contemporary themes, her new religion continues to play an important role. During the Nazi occupation of Norway, she fled the country and spent the remainder of the war years in the United States, lecturing and writing on behalf of her war-torn country and its government-in-exile.

unemployment, the condition of one who is capable of working, actively seeking work, but unable to find any work. It is important to note that to be considered unemployed a per-

son must be an active member of the labour force and in search of remunerative work.

Underemployment is the term used to designate the situation of those who are able to find employment only for shorter than normal periods—part-time workers, seasonal workers, day or casual workers. The term may also describe the condition of workers whose education or training make them overqualified for their jobs.

Statistics on unemployment are collected and analyzed by government labour offices in most countries and have come to be considered a chief indicator of economic health. Trends in unemployment and statistical differences among groups in the population are studied for what they may reveal of general economic trends and as bases for possible governmental action. Full employment has been a stated goal of many governments since World War II, and a variety of programs have been devised to attain it. It should be pointed out that full employment is not necessarily synonymous with a zero unemployment rate, for at any given time the unemployment rate will include some number of persons who are between jobs and not unemployed in any long-term sense. In the United States an unemployment rate of 2 percent is often cited as

For international statistical data on unemployment, see BRITANNICA WORLD DATA ANNUAL

unemployment insurance, a form of social insurance (q, v) designed to compensate certain categories of workers for unemployment that is involuntary and short-term. Unemployment insurance programs were created primarily to provide financial assistance to laid-off workers during a period deemed long enough to enable them to find another job or be rehired at their original job. In most countries, workers who have been permanently disabled or who have been unemployed for a long period of time are not covered by unemployment insurance but are usually covered by other plans. In such countries as Canada, Germany, Israel, Norway, and the United Kingdom, all occupations are covered; the United States denies coverage to farm workers, domestic servants, workers who have been employed only briefly, government workers, and most self-employed workers; such countries as Austria, Ireland, and Japan exclude public employees

Benefits vary from one legal jurisdiction to another. In most countries the benefits are related to earnings; a few countries pay a flat rate to all beneficiaries. In addition, benefits are usually paid only for a limited period of time.

Funding for unemployment insurance varies from country to country. Employers or employees may be taxed specifically for unemployment insurance, or funding may come out of general government revenues.

Unequal Treaty, in Chinese history, any of a series of treaties in which China was forced to concede many of its territorial and sovereignty rights. They were negotiated during the 19th and early 20th centuries between China and foreign imperialist powers, especially Great Britain, France, Germany, the United States, Russia, and Japan.

Patterned largely on the terms of an accord in 1835 between China and the khanate of Kokand, the Unequal Treaties were initiated by the trading conflict between Britain and China known as the first Opium War (1839–42), which was terminated by the Treaty of Nanking (Aug. 29, 1842). Under the terms of this agreement, China paid the British an indemnity, ceded the territory of Hong Kong, and agreed to establish a "fair and reasonable" tariff. Moreover, British merchants, who were

previously allowed to trade only at the South China port of Canton, were now to be allowed to trade at five ports (called treaty ports), including Canton and Shanghai.

The agreement was supplemented the following year by the British Supplementary Treaty of the Bogue (Oct. 8, 1843), which granted British citizens in China extraterritorial rights, by which they were to be under the control of their own consuls and were not subject to Chinese law. It also included a most-favoured-nation clause, guaranteeing to Britain all privileges that China might grant to any other power.

Over the next few years China concluded a series of similar treaties with other powers; the most important treaties were the Treaty of Wanghia with the United States and the Treaty of Whampoa with France (both 1844). Each additional treaty expanded upon the rights of extraterritoriality, and as a result the foreigners obtained an independent legal, judicial, police, and taxation system within the treaty ports.

Following the defeat of China by Britain and France in the second Opium War (1856-60), a new series of agreements was negotiated. The resulting treaties of Tientsin (1858) supplemented the old treaties by providing for the residence of foreign diplomats in Peking, the right of foreigners to travel in the interior of China, the opening of the country's major waterway, the Yangtze River, to foreign navigation, permission for Christian missionaries to propagate their faith, legalization of opium importation and the coolie trade, and the opening of 10 new ports to foreign trade and residence. Russia, meanwhile, signed a separate agreement, the Treaty of Aigun (May 16, 1858), by which Russia would have jurisdiction over the lands north of the Amur River from its junction with the Argun River to the Tatar Strait, China would control the lands south of the Amur from the Argun to the Ussuri River, and the territory east of the Ussuri to the Sea of Japan would be held in common. According to the treaty, only Russian and Chinese vessels would have been permitted to navigate the Amur, Ussuri, and Songhuajiang rivers.

In 1860, after the Chinese had failed to ratify these treaties, the British and French resumed the war, captured Peking, and forced the Chinese to sign the Peking Convention, in which they agreed to carry out the initial settlements. Other Western nations again exacted similar agreements. The Chefoo Convention, negotiated with Britain in 1876 (although not ratified by Britain until 1885) following the murder of a British explorer by Chinese nationals, resulted in more Chinese concessions and the opening of several new ports. (See also Opium Wars.) By the Treaty of Peking (Nov. 14, 1860), Russia attained what it had sought in the unratified Treaty of Aigun; Russia was also given jurisdiction over the lands east of the Ussuri and south of Lake Khanka, which included the settlement of Vladivostok.

In 1885 another Treaty of Tientsin concluded the Sino-French War and ceded Annam (now in Vietnam) to France, while the Treaty of Shimonoseki, signed in 1895 following the Sino-Japanese War, ceded Taiwan and the Pescadores to Japan, recognized the independence of Korea, and provided for the opening of still more ports as well as the right of Japanese nationals to operate factories inside China. The Boxer Protocol, signed in 1901 following China's unsuccessful attempt to expel all foreigners from the country during the Boxer Rebellion, provided for the stationing of foreign troops at key points between Peking and the sea.

After the Russian Revolution, the Soviet government terminated most of the privileges gained by tsarist Russia under the Unequal Treaties. Between 1928 and 1931 the Chinese Nationalists succeeded in persuading the

Western powers to return tariff autonomy to China, but extraterritorial privileges were not relinquished by Britain, France, and the United States until 1946. British rights in Hong Kong, Portuguese rights in Macau, and Russian possessions in Turkistan are still contested by the Chinese.

UNESCO: see United Nations Educational, Scientific and Cultural Organization.

uneven parallel bars, also called ASYMMET-RICAL PARALLEL BARS, gymnastic apparatus developed in the 1930s and used in women's competition. The dimensions and construction are the same as for the parallel bars (q, v) used in men's gymnastics, except that the top bar is 2.3 m (90.6 in.) above the floor, while the lower bar is 1.5 m high. The apparatus was first used in international competition at the 1936 Olympic Games. It allows a great variety of movements, although hanging and swinging exercises predominate. In her routine the performer strives for smoothness and equal use of both bars. See Sporting Record: Gymnastics. See also Olympic Games.

Ung Lich (Vietnamese emperor): see Ham Nghi.

Ungaretti, Giuseppe (b. Feb. 10, 1888, Alexandria—d. June 1, 1970, Milan), Italian poet, founder of the Hermetic movement (see Hermeticism) that brought about a reorientation in modern Italian poetry.

Born in Egypt of parents who were Italian settlers, Ungaretti lived in Alexandria until he was 24; the desert regions of Egypt were to provide recurring images in his later work. He went to Paris in 1912 to study at the Sorbonne and became close friends with the poets Guillaume Apollinaire, Charles Péguy, and Paul Valéry and the then avant-garde artists Pablo Picasso, Georges Braque, and Fernand Léger. Contact with French Symbolist poetry, particularly that of Stéphane Mallarmé, was one of the most important influences of his life.

At the outbreak of World War I, Ungaretti enlisted in the Italian Army, and while on the battlefield he wrote his first volume of poetry, each poem dated individually as if it were to be his last. These poems, published in *Il porto sepolto* (1916; "The Buried Port"), used neither rhyme, punctuation, nor traditional form; this was Ungaretti's first attempt to strip ornament from words and to present them in their purest, most evocative form. Though reflecting the experimental attitude of the Futurists, Ungaretti's poetry developed in a coherent and original direction, as is apparent in *Allegria di naufragi* (1919; "Gay Shipwrecks"), which shows the influence of Giacomo Leopardi and includes revised poems from Ungaretti's first volume.

Further change is evident in *Sentimento del tempo* (1933; "The Feeling of Time"), which, containing poems written between 1919 and 1932, used more obscure language and difficult symbolism.

Ungaretti went to South America for a cultural conference and from 1936 to 1942 taught Italian literature at the University of São Paulo, Brazil. His nine-year-old son died in Brazil, and Ungaretti's anguish over his loss as well as his sorrow over the atrocities of Nazism and World War II are expressed in the poems Il dolore (1947; "Grief"). In 1942 Ungaretti returned to Italy and taught contemporary Italian literature at the University of Rome until his retirement in 1957. Important volumes published during this time are La terra promessa (1950; "The Promised Land") and Un grido e paesaggi (1952). Among his later volumes were Il taccuino del vecchio (1960; "An Old Man's Notebook") and Morte delle stagioni (1967; "Death of the Seasons").

Ungaretti also translated into Italian Racine's *Phèdre*, a collection of Shakespeare's sonnets, and works of Luis de Góngora y Argote, Stéphane Mallarmé, and William Blake;

all were later incorporated in *Traduzioni*, 2 vol. (1946–50). An English translation of Ungaretti's poetry is A. Mandelbaum's *Selected Poems* (1975).

Ungava, peninsular section of northern Quebec province, Canada, bounded by the Hudson Strait (north), Ungava Bay and Labrador (east), the Eastmain River (south), and the Hudson Bay (west). Physically, it is a part of the Canadian Shield, a rocky, glacial-scoured plateau characterized by innumerable lakes and thin, poorly drained soils. After the Ouebec-Newfoundland border was established in 1927, the term Ungava was generally applied to the repetitive northern Quebec part of the peninsula (Ungava Peninsula) occupying about 240,000 square miles (622,000 square km), whereas the term Labrador (q.v.) referred to the Newfoundland portion; the geographic usage of both terms, however, is employed irrespective of political divisions. Ungava is also coterminous with the administrative region of Quebec province known as Nouveau-Québec (q.v.; New Quebec). Economic activity is centred along the Quebec-Newfoundland border, an area with immense iron-ore deposits, where the region's largest towns of Schefferville in Quebec and Labrador City and Wabush in Newfoundland have sprung up since exploitation of the deposits began in the 1950s.

Ungava Bay, French BAIE D'UNGAVA, inlet off the Hudson Strait, on the northeast coast of Nouveau-Québec (New Quebec) region, northern Quebec province, Canada. The bay is about 200 miles (320 km) long, 160 miles (260 km) wide at the mouth, and has a maximum depth of 978 feet (298 m). It is fed by several large rivers, notably the Feuilles, Arnaud, Baleine, and George. Akpatok Island (area 551 square miles [1,427 square km]) at its mouth rises to 930 feet (283 m). Its coastal region is rich in minerals, including iron-ore deposits to the west. Because the bay is icefree only four months a year, much of the ore is stockpiled in Greenland and Newfoundland for shipment.

Ungava-Quebec Crater, formerly CHUBB CRATER, the largest crater on the Earth's surface that is definitely known to be of meteoritic origin. It is located in the northwestern part of the Ungava Peninsula, northern Quebec province, Canada. First studied in 1950, the crater is 2.1 miles (3.3 km) in diameter and 1,203 feet (367 m) deep, with a rim standing 333 feet (101 m) above ground level. Filled by a lake, it is surrounded by many smaller circular lakes. The surrounding strata are tilted upward toward the centre of the crater and are broken here and there by radial fissures.

Unggi, city, extreme northeastern North Korea. It lies 16 miles (26 km) southwest of the estuary of the Tumen River, which forms North Korea's boundary with the U.S.S.R. Until Unggi's port was opened in 1921, it was a poor village, but it developed rapidly during the Japanese occupation (1910–45) as a transportation junction, connecting with China by rail and with Japan by a sea route. After independence, however, Unggi declined in importance as Ch'ôngjin, to the south, was developed instead. The neighbouring waters are fishing grounds for codfish, pollack, and herring. The city's industries include chemicals and ceramics. It is connected with Najin by the Ungna Tunnel. Pop. (latest est.) 20,-882

ungulate, generally, any hoofed mammal. Although the term is no longer used in formal classification, it is still widely applied to a diverse group of placental mammals that are characterized as hoofed, herbivorous quadrupeds. The feature that unites them, the hoof, consists of hornlike dermal (skin) tissue, comparable to the human fingernail, which

extends over the end of a broadened terminal digit.

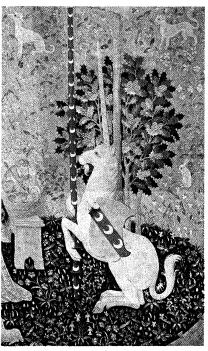

Modern hoofed mammals are composed of four orders: Artiodactyla (swine, camels, deer, and bovines); Perissodactyla (horses, tapirs, and rhinoceroses); Proboscidea (elephants); and Hyracoidea (hyraxes). Ten orders of fossil ungulates are also recognized: Condylarthra (condylarths); Pyrotheria (pyrotheres); Xenungulata (xenungulates); Pantodonta (pantodonts); Dinocerata (uintatheres); Desmostylia (desmostylians); Embrithopoda (embrithopods); Notoungulata (notoungulates, including the toxodonts); Astrapotheria (astrapotheres); and Litopterna (litopterns).

unicorn, mythological animal resembling a horse or a kid with a single horn on its

Unicorn, detail from "The Lady and the Unicorn" tapestry, late 15th century; in the Musée de Cluny, Paris

Giraudon-Art Resource/EB Inc.

forehead. The unicorn appeared in early Mesopotamian artworks, and it also was referred to in the ancient myths of India and China. The earliest description in Greek literature of a single-horned (Greek monokerōs, Latin unicornis) animal was by the historian Ctesias (c. 400 BC), who related that the Indian wild ass was the size of a horse, with a white body, purple head, and blue eyes; on its forehead was a cubit-long horn coloured red at the pointed tip, black in the middle, and white at the base. Those who drank from its horn were thought to be protected from stomach trouble, epilepsy, and poison. It was very fleet of foot and difficult to capture. The actual animal behind Ctesias' description was probably the Indian rhinoceros.

Certain poetical passages of the biblical Old Testament refer to a strong and splendid horned animal called *re'em*. This word was translated "unicorn" or "rhinoceros" in many versions of the Bible, but many modern translations prefer "wild ox" (aurochs), which is the correct meaning of the Hebrew *re'em*. As a biblical animal the unicorn was interpreted

allegorically in the early Christian church. One of the earliest such interpretations appears in the ancient Greek bestiary known as the Physiologus, which states that the unicorn is a strong, fierce animal that can be caught only if a virgin maiden is thrown before it. The unicorn leaps into the virgin's lap, and she suckles it and leads it to the king's palace. Medieval writers thus likened the unicorn to Christ, who raised up a horn of salvation for mankind and dwelt in the womb of the Virgin Mary. Other legends tell of the unicorn's combat with the elephant, whom it finally spears to death with its horn, and of the unicorn's purifying of poisoned waters with its horn so that other animals may drink.

Cups reputedly made of unicorn horn but actually made of rhinoceros horn or narwhal tusk were highly valued by important persons in the Middle Ages as a protection against poisoned drinks. Many fine representations of the hunt of the unicorn survive in medieval art, not only in Europe but also in the Islāmic world and in China.

unicorn beetle (Dynastes tityus), a large, easily recognized insect of the Dynastinae subfamily of the beetle family Scarabaeidae (order Coleoptera). It is closely related to the rhinoceros and elephant beetles. Hornlike structures on the thorax (region behind the head) and on the head of the male (usually lacking in the females) make it conspicuous.

The unicorn beetle is about 62 mm (2.4 inches) in length and is found in northern temperate regions. The function or evolutionary value of the horns is not yet known; they can give a strong pinch, however. The larvae can damage plant roots; adults usually live under rotting bark.

unicorn fish, any of certain exclusively marine fishes belonging to the genus Naso, in the family Acanthuridae (order Perciformes), occurring in the tropical Indo-Pacific region. The 16 species are herbivorous algae eaters. Unicorn fishes have a pair of sharp forward-pointing spines that protrude from the side of the tail shaft, and the fishes also have a long spike, a frontal horn, protruding from the forehead.

The eellike *Eumecichthys fiski*, in the crestfish family Lophotidae (order Lampridiformes), is also called unicorn fish.

unicorn plant, any North American herb of the family Martyniaceae of the flowering plant order Scrophulariales, and particularly *Probo*seidea louisianica. There are nine species of unicorn plants, most having large purple or creamy white flowers.

The unicorn plant is often grown for its novel fruits, which are hanging, hornlike, woody pods with a thick body, 3 or 4 inches (76 or 101 mm) long, ending in a curved beak of equal or even greater length. When dry, the beak splits into two clawlike appendages.

unidentified flying object (UFO), also called FLYING SAUCER, any aerial object or optical phenomenon not readily explainable to the observer. UFO's became a major subject of interest with the developments in aeronautics and astronautics following World War II.

In 1948 the U.S. Air Force began maintaining a file of UFO reports called Project Blue Book. A series of radar detections coincident with visual sightings near the National Airport in Washington, D.C., in July 1952, led the U.S. government to establish a panel of scientists headed by H.P. Robertson, a physicist of the California Institute of Technology (Pasadena), and including engineers, meteorologists, physicists, and an astronomer. The thrust of public and governmental concern was indicated by the fact that the panel was organized by the Central Intelligence Agency

(CIA) and was briefed on U.S. military activities and intelligence and that its report was originally classified Secret. Later declassified, the report revealed that 90 percent of UFO sightings could be readily identified with astronomical and meteorological phenomena (e.g., bright planets, meteors, auroras, ion clouds) or with aircraft, birds, balloons, searchlights, hot gases, and other phenomena, sometimes complicated by unusual meteorological conditions.

Lenticular clouds over São Paulo, Braz., natural phenomena that can be easily mistaken for "flying saucers"

By courtesy of the Aerial Phenomena Research Organization, Inc., Tucson, Ariz.

The publicity given to early sightings in the press undoubtedly helped stimulate further sightings not only in the U.S. but also in western Europe, the Soviet Union, Australia, and elsewhere. A second panel organized in February 1966 reached conclusions similar to those of its predecessor. This left a number of sightings admittedly unexplained, and in the mid-1960s a few scientists and engineers, notably James E. McDonald, a University of Arizona (Tucson) meteorologist, and J. Allen Hynek, a Northwestern University (Evanston, Ill.) astronomer, concluded that a small percentage of the most reliable UFO reports gave definite indications of the presence of extraterrestrial visitors.

This sensational hypothesis, promoted in newspaper and magazine articles, met with prompt resistance from other scientists. The continuing controversy led in 1968 to the sponsorship by the U.S. Air Force of a study at the University of Colorado under the direction of E.U. Condon, a noted physicist. The Condon Report, "A Scientific Study of UFO's," was reviewed by a special committee of the National Academy of Sciences and released in early 1969. A total of 37 scientists wrote chapters or parts of chapters for the report, which covered investigations of 59 UFO sightings in detail, analyzed public-opinion polls, and reviewed the capabilities of radar and photography. Condon's own "Conclusions and Recommendations" firmly rejected ETH—the extraterrestrial hypothesis-and declared that no further investigation was needed.

This left a wide variety of opinions on UFO's. A large fraction of the U.S. public, and a few scientists and engineers, continued to support ETH. A middle group of scientists felt that the possibility of extraterrestrial visitation, however slight, justified continued investigation, and still another group favoured continuing investigation on the grounds that UFO reports are useful in sociopsychological studies. These varying views and attitudes were expressed at a symposium held by the American Association for the Advancement of Science, in December 1969. Several years later, in 1973, a group of U.S. scientists organized the Center for UFO Studies in Northfield, Ill., to conduct further work.

Official records of UFO sightings and events. By 1969 Project Blue Book had recorded reports of 12,618 sightings or events, each of which was ultimately classified as "identified" with a known astronomical, atmospheric, or artificial phenomenon, or as "unidentified," including cases in which information was insufficient. The project, however, was terminated in December 1969 on the basis of the conclusions of the Condon Report. The only other official and fairly complete records of UFO sightings were maintained in Canada, where they were transferred in 1968 from the Canadian Department of National Defense to the Canadian National Research Council. The Canadian records totalled about 750 in the late 1960s. Less complete records have been maintained in Great Britain, Sweden, Denmark, Australia, and Greece.

Types of UFO reports. UFO reports have varied widely in reliability, as judged by the number of witnesses, whether the witnesses were independent of each other, by the observing conditions (fog, haze, illumination, etc.), and by the direction of sighting. Typically, the witness who reports a sighting considers the object to be of extraterrestrial origin, or possibly a military vehicle, but certainly under intelligent control; this inference is usually based on what is perceived as formation-flying by sets of objects, unnatural motions seemingly centred on a target, or sudden, apparently purposive alterations in direction, brightness, and motion.

That the unaided human eye plays tricks bordering on hallucinations is well known. A bright light, such as the planet Venus, often appears to move, although a clamped telescope or a sighting bar shows it to be fixed. Visual impressions of distance are also highly unreliable, being based on assumed size. Reflections from windows and eyeglasses can provide superimposed views. Optical defects can turn point sources of light into apparently saucer-shaped objects. Such optical illusions, and the psychological desire to interpret visual images, are known to account for many visual UFO reports. Radar sightings, while more reliable in certain respects, fail to discriminate between physical objects and meteor trails, tracks of ionized gas, rain, or thermal discontinuities. Furthermore, several effects can give false radar echoes: electronic interference, reflections from ionized layers or clouds, and reflections from regions of humidity, as in a cumulus cloud. Even "contact events" in which activities besides sighting were reported-have been found most frequently to involve dreams or hallucinations; the reliability of such reports depended heavily on whether there were two or more independent

Unification Church, byname of HOLY SPIRIT ASSOCIATION FOR THE UNIFICATION OF WORLD CHRISTIANITY, religious movement that was founded in South Korea in 1954 by Sun Myung Moon (q.v.). The movement shifted its base to New York City in 1971. Its network of missionary, cultural, and economic enterprises extends to more than 100 countries and is said to involve more than 3,000,000 believers. Only about 10,000, with considerable turnover, are members of the highly visible U.S. branch.

The basic teachings of the movement are posited in *Divine Principle*, written by Moon in the early 1950s with the aid of biblical study and revelation. The movement, influenced by *yin-yang* motifs and Korean shamanism, seeks to establish divine rule of Earth through the restoration of the family based on the union of the Lord and Lady of the Second Advent (believed to be Moon and his wife, Hak Ja Han). According to Unification doctrine, God's efforts to reestablish rightful order reached a provisional climax in Jesus, who, by exemplifying individual oneness with God.

inaugurated the kingdom spiritually but was prevented by his crucifixion from restoring divine rule through procreative marriage. The completion of Christ's thwarted work is believed to be approaching its final stages in the mission conferred by the ascended Jesus on Moon.

Unification stresses communal and devotional discipline as well as unreserved commitment to practical service such as fund-raising, business operations, and educational, missionary, and humanitarian activity. Controversy about the "Moonies"—a derisive name the members of the Unification Church now espouse—has mounted with regard to recruitment practices (said to include protein starvation and brainwashing), appeals for money, business policies, and conformity to immigration and tax laws.

unified field theory, also called GRAND UNI-FIED THEORY, in particle physics, an attempt to describe all known forces and the patterns and relationships between elementary particles in terms of a single unifying concept. Fundamental forces in physics are described as fields that mediate the interaction between separate objects. The electric field, for example, specifies at each point in space and time the force exerted upon a tiny electrically charged "test" particle. In the 19th century the discovery of the fundamental field equations of electromagnetism by the British physicist J.C. Maxwell unified the forces of electrostatics and magnetism into one fundamental object, now called the electromagnetic field tensor. General relativity, Albert Einstein's brilliant theory of gravitation, associates the phenomenon of gravity with a field that describes the geometrical properties of space and time at any given point. Later, Einstein and others attempted to construct a unified field theory of gravity and electromagnetism in which these apparently disparate forces would emerge as aspects of a single fundamental field.

The developments in atomic, nuclear, and particle physics, however, led to the discovery of the weak interaction and the strong interaction as new force laws, which any complete unified field theory must describe. The weak interaction is responsible for beta-decay radioactivity and is quite feeble in comparison with electromagnetism, whereas the strong force binds together the atomic nucleus and is a short-range force that overwhelms electromagnetism at nuclear distances. During the early 1960s, physicists realized that all matter was composed of two fundamental kinds of objects, quarks and leptons. Quarks participate in all interactions; leptons participate in all except the strong interactions. As these objects are also described by fields in modern quantum theory, their properties must be explained by a complete unified field theory.

Major advances toward such a description occurred during the late 1960s and early 1970s. For the first time, a particular new physical concept was successfully exploited to construct realistic unified field theories. This concept, known as local gauge invariance, postulates symmetries of the basic field equations that are independently realized at each distinct point in space and time (see gauge theory). Both electromagnetism and general relativity involve such symmetries, but the important step taken here was to employ a generalized form of local gauge symmetries that could describe a richer set of interactions. Steven Weinberg and Abdus Salam first proposed unified descriptions of both the electromagnetic and weak interactions, while a similar theory of strong interactions called quantum chromodynamics, was developed by others. As of the mid-1980s, both theories were still being subjected to critical experimental tests, but results all seemed to corroborate their basic principles. The formal mathematical structure of these theories is so alike that it has become possible to propose precise mathematical "grand unified theories" of the strong, weak, and electromagnetic interactions.

Such grand unified theories make predictions that can be experimentally tested. Many of them predict that the proton, previously thought to be stable, can decay into lighter particles at a very slow rate. An assemblage of 1031 protons may produce one such decay per year. Nonetheless, experimentalists are trying to detect events of this sort with apparatus in deep underground mines shielded from the bombardment of cosmic rays. These theories will otherwise be difficult to test, since the energy scale required to directly observe the unification is 1012 times greater than current particle-accelerator energy capacities. Furthermore, these theories are incomplete, because they do not yet successfully incorporate gravity. The problem of incorporating all known natural forces into a single unified physical theory is being pursued by theoretical physicists throughout the world. Although progress has been made through the invention of "supersymmetries," the ultimate success may require a fundamental revision of the prevailing view of space and time itself.

unified model (physics): see collective model.

unified science, in the philosophy of logical positivism, a doctrine holding that all sciences share the same language, laws, and method or at least one or two of these features. A unityof-science movement arose in the Vienna Circle, a group of scientists and philosophers that met regularly in Vienna in the 1920s and '30s and was associated in particular with Rudolf Carnap and Otto Neurath, leading members of the Circle. The Circle produced a series of monographs under the title Einheitswissenschaft—"Unified Science"—and later the Journal of Unified Science and the International Encyclopedia of Unified Science. Versions of the unity of science thesis are still supported by many contemporary philosophers of science.

The claim that all sciences share a common language may mean one of two things: (1) For the logical positivist, the claim often meant that all scientific terms could be restated as, or reduced to, a set of basic statements or "protocol" sentences describing immediate experience or perception. (2) More recently, unity of language has meant the reduction of all scientific terms to terms of physics.

The unity of law means that the laws of the various sciences are to be deduced from some set of fundamental laws, often thought to be those of physics.

Finally, the unity of method means that the procedures for testing and supporting statements in the various sciences are basically the same—the procedures of the populations biologist, for example, are fundamentally no different than those of the theoretical physicist.

Unified Silla DYNASTY (668–935), dynasty that unified the three kingdoms of the Korean peninsula—Silla, Paekche, and Koguryŏ. The old Silla kingdom had forged an alliance with T'ang China (618–907) and had conquered the kingdom of Paekche to the southeast in 660 and the northern Korean kingdom of Koguryŏ—largest of the three—in 668.

This was the first occasion within historical times that the Korean peninsula had been unified under indigenous leadership. For nearly a decade after 668 fighting ensued in which Silla finally expelled T'ang forces. Thereafter the Korean nation was divided for only brief transitional periods. Under the Silla dynasty, Korea, which was one of the earliest of the nation-states to emerge, assumed many of the cultural, linguistic, and geographic features it maintains today.

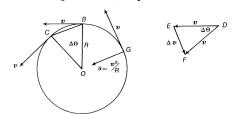

After the unification, the country was reorganized in accord with the Chinese bureau-

cratic model. A complex system of ministries and bureaus was created; the peninsula was divided into nine provinces, which were in turn divided into prefectures and subprefectures; and military garrisons were established throughout the country. But a bureaucratic class based on merit, as in China, was never firmly established, and the old aristocracy remained firmly in control.

The visual arts of the Unified Silla period reflected the international style of T'ang realism, but without its eroticism. Silla art's idealized naturalism emphasized flowing lines and soft contours. Rich ornamental tiles featured lotus blossoms and complex floral patterns.

After more than 100 years of peace, the kingdom was torn in the 9th century by conflicts among the aristocracy and by peasant uprisings. In 935 Silla was overthrown, and the new Koryö dynasty was established.

uniform circular motion, motion of a particle moving at a constant speed on a circle. In

Uniform circular motion

the Figure the velocity vector \mathbf{v} of the particle is constant in magnitude, but it changes in direction by an amount Δv while the particle moves from position B to position C, and the radius R of the circle sweeps out the angle $\Delta\Theta$. Because OB and OC are perpendicular to the velocity vectors, the isosceles triangles OBC and DEF are similar, so that the ratio of the chord BC to the radius R is equal to the ratio of the magnitudes of Δv to v. As $\Delta \Theta$ approaches zero, the chord BC and the arc BC approach one another, and the chord can be replaced by the arc in the ratio. Because the speed of the particle is constant, if Δt is the time corresponding to $\Delta\Theta$, the length of the arc BC is equal to $v\Delta t$; and, using the ratio relationship, $v\Delta t/R = \Delta v/v$, from which, approximately, $\Delta v/\Delta t = v^2/R$. In the limit, as Δt approaches zero, v^2/R is the magnitude of the instantaneous acceleration a of the particle and is directed inward toward the centre of the circle, as shown at G in the Figure; this acceleration is known as the centripetal acceleration or the normal (at a right angle to the path) component of the acceleration, the other component, which appears when the speed of the particle is changing, being tangent to the path.

Consult the INDEX first

uniformitarianism, in geology, the doctrine that physical, chemical, gravitational, and geologic processes are independent of time. When William Whewell, a Cambridge scholar, introduced the term in 1832, the prevailing view (called catastrophism) was that the Earth had originated through supernatural means and had been affected by a series of catastrophic events such as the biblical Flood. In contrast to the catastrophic view of geology the principle of uniformity postulates that phenomena displayed in the rocks may be entirely accounted for by geologic processes which continue to operate at the present day-in other words, the present is the key to the past. This principle is fundamental to geologic thinking and underlies the whole development of the science of geology. The expression uniformitarianism, however, has passed into history, for the controversy between catastrophists and uniformitarians has largely died. Geology as an applied science draws on the other sciences, but in the early 19th century geologic discovery had outrun the physics and chemistry of the day. As geologic phenomena became explicable in terms of advancing physics, chemistry, and biology, the reality of the principle of uniformity as a major philosophical tenet of geology became established and the controversy ended.

The idea that the laws that govern geologic processes have not changed during the history of the Earth were articulated by the Scottish geologist James Hutton (1726-97), who in 1785 presented his ideas—later published in two volumes as Theory of the Earth (1795)at meetings of the Royal Society of Edinburgh. In this work Hutton showed that the Earth had a long history and that this history could be interpreted in terms of processes observed at the present, of which he gave examples. He showed, for instance, how soils were formed by the weathering of rocks and how layers of sediment accumulated. He stated that there was no need of any preternatural cause to explain the geologic record. Hutton's proposal challenged the concept of a biblical Earth (with a history of some 6,000 years) that was created especially to be a home for man; the effect of his ideas on the learned world can be compared only with the earlier revolution in thought brought about by Nicolaus Copernicus, Johannes Kepler, and Galileo when they displaced the concept of a universe centred on the Earth with the concept of a solar system centred on the Sun. Both advances challenged existing thought and were fiercely resisted for many years. In the publication Principles of Geology, 3 vol. (1830-33), the Scottish geologist Sir Charles Lyell (1797-1875) deciphered the history of the Earth employing Huttonian principles and made available a host of new geologic evidence in support of the view that physical laws were permanent and that any form of supernaturalism can be rejected. Lyell's work in turn profoundly influenced Charles Darwin (1809-82), who recognized Lyell as having produced a revolution in sci-

The publication in 1859 of the conclusions of Darwin and Alfred Wallace on the origin of species extended the principle of uniformity to the plant and animal kingdoms. Although the catastrophists continued to fight a rearguard action against the Huttonian-Lyellian-Darwinian view until the end of the century, a new criticism was raised by William Thomson (later Lord Kelvin), one of the leading researchers on thermodynamics. Thomson pointed out that the Earth is losing heat by conduction and that the nature of geologic processes may have changed as a consequence; he also concluded that this cooling placed an upper limit on the age of the Earth. With the discovery of radioactivity and the realization that radioactive isotopes within the Earth provide a continuing internal source of heat, it became clear that Thomson's conclusion that the Earth was less than 100 million years old was incorrect, but his argument that the Earth suffers an irreversible loss of energy remains

This heat loss, due in part to the decay of the heat-producing radio nucleides, has an important consequence. Although the principle of uniformity is correct in that physical laws have not changed over geologic time, the behaviour of the Earth has altered as temperatures have fallen. One important consequence is that the extent of igneous activity and movement of the crust has changed during geologic time. It is possible that the plate tectonism that operates today and that has operated in past geologic intervals of time was preceded by somewhat different processes of deformation during Precambrian times.

Unigenitus, in full UNIGENITUS DEI FILIUS, bull issued by Pope Clement XI on Sept. 8, 1713, condemning the doctrines of Jansenism, a dissident religious movement within France. The publication of the bull began a doctrinal controversy in France that lasted throughout much of the 18th century and that merged with the fight for liberty of the church in France, called Gallicanism, and with the opposition of the Parlements (supreme courts) to the crown.

Unigenitus, which condemned 101 theological propositions of the Jansenist writer Pasquier Quesnel contained in the book Réflexions morales, was issued at the request of the French king, Louis XIV, who wished to suppress the Jansenist faction. Louis was able to secure initial acceptance of the bull, but some French bishops (led by Louis-Antoine de Noailles, cardinal-archbishop of Paris) rejected it, and the Parlement of Paris accepted it only with reservations. The Jansenists were supported by the magistrates of the Parlements, who regarded the bull as an unwarranted papal interference with the French Church. The crown, in supporting the pope and those French bishops who accepted the bull, found itself increasingly at odds with the parlementaires.

The controversy over *Unigenitus* broke out in earnest after the death of Louis XIV in 1715. In 1717 four bishops appealed against the bull to a future ecumenical council (which they held to have authority over the pope). But the bishops' effective opposition ended with the death of the cardinal de Noailles in 1729.

As a further blow to the Jansenist cause, a royal declaration of 1730 made the bull a law of the state and threatened ecclesiastics who rejected it with loss of lands.

The final episode in the controversy occurred from 1749 to 1754 over the issue of billets de confession. The billets were papers affirming submission to the bull that suspected Jansenists were ordered to sign by the archbishop of Paris, Christophe de Beaumont. If they refused, the last sacraments and burial in consecrated ground would be denied them. The Parlement of Paris, claiming jurisdiction over matters of ecclesiastical discipline and supported by public opinion, opposed the billets. It ordered priests to administer the sacraments to everyone of the faithful under pain of banishment and confiscation of goods. In 1754 King Louis XV forbade continuation of the dispute.

Unilever, either of twin companies, Unilever PLC (based in London) and Unilever NV (based in Rotterdam), which are the holding companies for more than 500 companies worldwide engaged in the manufacture and sale of soaps, foods, and other products mainly for household consumption. The boards of directors of the two companies are identical in membership, and mutual agreements equalize dividends on ordinary capital, so that the companies, though dual in appearance, are unitary in fact.

The modern Unilever is descended chiefly from three companies founded in the 19th century. In The Netherlands the Jurgens family had been in the dairy business for some 50 years when in 1854 two brothers, Anton and Johannes, formed a partnership, Gebroeders Jurgens, at Oss and began concentrating on butter export, chiefly to Britain. The heavy demand for increasingly expensive butter, however, led the company in 1871 to start producing the newly invented margarine. Meanwhile, another family in Oss, the Van den Berghs, had established themselves in the butter trade at mid-century and, in the 1870s, also began making margarine.

In the following decade, in 1885, in Britain, William Hesketh Lever (later Viscount Leverhulme), together with his brother, James Darcy Lever, founded Lever Brothers for the making and selling of soap. He was first to market the wrapped bar of soap made from tallow and vegetable and cottonseed oils and, even more important, introduced energetic advertising, with slogans and giveaway prize campaiens.

The three businesses grew at a great rate—Lever Brothers expanding operations into continental Europe and overseas, and the Jurgens and Van den Berghs extending more into Britain and other parts of the world. By the First World War the British were also making margarine, and the Dutch were also producing soap, for both products were made from similar oils and fats.

In 1927 the two Dutch firms merged to form Margarine Unie NV in The Netherlands and Margarine Union Limited in Britain, bonded together with common directors and equalized dividends and capital values. In 1928 other major European producers of oils, soaps, and margarines were brought in. Finally, in 1929, Lever Brothers and its associated firms joined the group, and the twin companies were renamed Unilever.

By the late 20th century the majority of Unilever sales were in home products—soaps and detergents, margarines, cooking fats, salad dressings, dairy products, toiletries (tooth-

pastes, hairsprays, etc.), packaged and processed foods, and packaging materials. The group also produces other paper and plastic products, industrial chemicals, and animal feeds

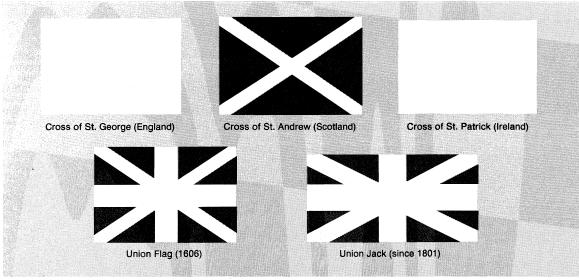

Union, industrial township, Union County, northeastern New Jersey, U.S., on the Elizabeth River, immediately northwest of the town of Elizabeth. Settled in the 1740s as Connecticut Farms, Union was incorporated in 1808. It once included what is now Roselle Park (separated in 1901), Kenilworth (1907), part of the Elmora section of Elizabeth (1908), and Hillside (Lyons Farms, 1913). Liberty Hall, or Ursino (1762), was once the home of William Livingston, first governor of New Jersey. Kean College of New Jersey (formerly Newark State College, founded 1855) moved to Union in 1958. Pop. (1985 est.) 50,848.

union: see trade union.

Union, Act of (May 1, 1707), treaty that effected the union of England and Scotland under the name of Great Britain.

Since 1603 England and Scotland had been under the same monarchs. After the Revolution of 1688 and again in 1702-03, projects for a closer union miscarried, and in 1703-04 international tension provoked a dangerous legislative warfare between the separate parliaments of England and Scotland. On both sides of the border, however, statesmen were beginning to realize that an incorporating union offered the only mutually acceptable solution to a problem that had suddenly become urgent: Scotland's need for economic security and material assistance and England's need for political safeguards against French attacks and a possible Jacobite restoration, for which Scotland might serve as a conveniently open backdoor. England's bargaining card was freedom of trade; Scotland's, acquiescence in the Hanoverian succession. Both points were quickly accepted by the commissioners appointed by Queen Anne to discuss union, and within three months they had agreed on a detailed treaty (April-July 1706).

The two kingdoms were to be united, the Protestant succession was adopted, and trade was to be free and equal throughout Great Britain and its dominions. Subject to certain temporary concessions, taxation, direct and indirect, would also be uniform; and England compensated Scotland for undertaking to share responsibility for England's national debt by payment of an equivalent of £398,085 10 shillings. Scots law and the law courts were to be preserved. In the united Parliament Scotland, because of its relative poverty,

was given the inadequate representation of 45 commoners and 16 lords. By separate statutes annexed to the treaty, the Presbyterian Church of Scotland and the Episcopal Church of England were secured against change.

With only minor amendments the Scottish Parliament passed the treaty in January 1707, and the English passed it soon after. The royal assent was given on March 6, and the union went into effect on May 1, 1707.

Union, Act of (Jan. 1, 1801), legislative agreement uniting Great Britain (England and Scotland) and Ireland under the name of the United Kingdom of Great Britain and Ireland.

The Irish Rebellion of 1798 brought the Irish question forcibly to the attention of the British Cabinet; and William Pitt the Younger, the British prime minister, decided that the best solution was a union. By legislative enactments in both the Irish and the British parliaments, the Irish Parliament was to be abolished, and Ireland thenceforth was to be represented at the Parliament in Westminster, London, by 4 spiritual peers, 28 temporal peers, and 100 members of Parliament. A union, Pitt argued, would both strengthen the connection between the two countries and provide Ireland with opportunities for economic development. It would also, he thought (mistakenly), make it easier to grant concessions to the Roman Catholics, since they would be a minority in a United Kingdom. Naturally the union met with strong resistance in the İrish Parliament. but the British government, by the undisguised purchase of votes, either by cash or by bestowal of honours, secured a majority in both the British and Irish Houses that carried the union on March 28, 1800. The Act of Union received the royal assent on Aug. 1, 1800, and it came into effect on Jan. 1, 1801. Henceforth, the monarch was called the king (or queen) of the United Kingdom of Great Britain and Ireland.

The union remained until the recognition of the Irish Free State (excluding six of the counties of the northern province of Ulster) by the Anglo-Irish treaty of December 1921. The union officially ended in January 1922 when the Provisional Government led by Michael Collins was established in Ireland. (On May 29, 1953, by proclamation, Elizabeth II became known as queen of the United Kingdom of Great Britain and Northern Ireland.)

Union Carbide Corporation, major American manufacturer of chemicals, petrochemicals, and related products. Headquarters are in Danbury, Conn., U.S.

The company was formed in 1917 as Union Carbide and Carbon Corporation, acquiring four earlier companies: Linde Air Products Company (established 1907), National Carbon Company (1899), Prest-O-Lite Company, Inc. (1913), and Union Carbide Company (1898). It assumed its present name in 1957.

Formed during wartime, the company immediately took on the manufacture of new diversified products, providing helium, ferrozirconium, and activated carbon for the U.S. military, thus setting the pattern for the company's future development. After World War I, it retained its chemicals business and moved into the consumer field, becoming one of the first companies to use market research to discover potential consumer needs and creating products to fill them. Early products of this type were the first antifreeze, Prestone, and the first batteries for portable radios, under the Eveready brand.

World War II further expanded the company's research and development activities. Union Carbide was a major contributor to the development of the first atomic bomb. Union Carbide had already become a pioneer in the manufacture of petrochemicals. It also produced plastics, industrial gases, metals and carbon products, and electronics and medical products. In 1986–87, however, it sold many

of its home and automobile products businesses (such as those for batteries, waxes, and antifreeze).

On Dec. 3, 1984, Union Carbide's pesticide plant in Bhopal, India, was the scene of one of the worst industrial accidents in history when poisonous gas leaked and spread over a populated area, killing about 2,500 people and injuring many more. Suits for damages were brought against the company, and in 1989 India's Supreme Court ordered Union Carbide to pay \$470,000,000 in compensation to the victims of the accident.

Union Française: see French Union.

Union Group (southwestern Pacific Ocean): see Tokelau.

Union Jack, national flag of the United Kingdom, in which are combined the crosses of St. George (England), St. Andrew (Scotland), and St. Patrick (Ireland).

The earliest form of the flag of Great Britain, developed in 1606 and used during the reigns of James I (1603–25) and Charles I (1625–49), displayed the red cross of England superimposed on the white cross of Scotland, with the blue field of the latter. Because in heraldry a red on blue is not considered permissible, the red cross had to be bordered with white, its own correct field. During the Commonwealth period (1649-60) Oliver Cromwell added an Irish harp at the centre, but the flag resumed its original form on the restoration of Charles II in 1660. Thus did the old flag—the "Union Flag," or "Great Union"—continue in use until Jan. 1, 1801, the effective date of the legislative union of Great Britain and Ireland. The need then was to incorporate the cross of St. Patrick (diagonal, red on white) with the existing flag. To combine the three crosses without losing their individual identities, the designers made the background white broader on one side of the Irish red than on the other. In fact, the continuity of direction of the arms of the red St. Patrick's cross was broken by portions of it being removed from the centre. Thus the Irish and the Scottish crosses can be distinguished easily from each other, while the Irish (red) cross has its proper white background.

The Union Jack is the most important of all British ensigns and is flown by representatives of the United Kingdom all the world over. In certain authorized military, naval, royal, and other uses, the Union Jack may be incorporated into another flag. It is part of the flags of such Commonwealth nations as Australia, Fiji, New Zealand, and Tuvalu, as well as of the state of Hawaii, the Australian states, and three Canadian states. For illustrations of the Union Jack and its constituent flags, see page 132 opposite. For illustrations of other Commonwealth flags, see flag.

Union League, also called LOYAL LEAGUE, in the history of the United States, any of the associations originally organized in the North to inspire loyalty to the Union cause during the American Civil War. During Reconstruction, they spread to the South to ensure Republicans of support among newly enfranchised blacks.

Ohio Republicans established the first Union League of America in 1862 to counteract such antiwar groups as the Copperheads and to stem the tide of Democratic political victories resulting from too many Northern defeats on the battleground. Attempting to rouse enthusiasm for the war effort and to infuse new vitality into the Republican Party, the leagues quickly spread throughout the North, serving as a social as well as a political force.

As the Federal armies swept southward toward the end of the war, the leagues followed. Under Radical Reconstruction (1865–77), the societies became the main vehicle for propagandizing the Republican cause among the emancipated blacks.

Unwilling to share political power, Southern whites countered by organizing their own secret societies, such as the Ku Klux Klan, to keep blacks from the polls through intimidation and violence. Eventually, the Republican effort to claim some of the fruits of victory was lost by the Union leagues, and the machinery of government in the Southern states gradually reverted to traditional white Democratic control by the end of Reconstruction.

Union of : see under substantive word (e.g., Lublin, Union of), except as below.

Union of Soviet Socialist Republics (U.S.S.R.), also called SOVIET UNION, Russian soyuz sovetskikh sotsialisticheskikh RESPUBLIK, or SOVETSKY SOYUZ, Akademiya Nauk romanization sojuz sovetskich so-CIALISTIČESKICH RESPUBLIK, OF SOVETSKIJ SO-JUZ, world's largest country (8,649,800 square miles [22,403,000 square km]), covering about one-sixth of the total land surface of the Earth. The Soviet Union occupies the entire northern part of Asia as well as the easternmost portion of Europe. The national capital is Moscow. The Soviet Union is bordered on the west by Norway, Finland, the Baltic Sea, Poland, Czechoslovakia, Hungary, and Romania and on the south by Turkey, Iran, Afghanistan, China, Mongolia, and North Korea; the northern and eastern borders are defined by the Arctic and the Pacific oceans, respectively. The third most populous country in the world (after China and India), its population in 1990 was estimated at 290,417,000.

A brief treatment of the Soviet Union and Russia follows. For full treatment, *see* MACROPAEDIA: Union of Soviet Socialist Republics.

For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

Union of Soviet Socialist Republics

The land. The natural landscape of the Soviet Union is extremely diverse. The country can be divided into two broad physiographic zones: a relatively low-lying area of plains and plateaus covering about two-thirds of the total area in the north and west, and a discontinuous belt of complexly folded mountains in the south and east. The plains are divided by the north-south-trending Ural Mountains into the Russian portion of the East European Plain in the west and the West Siberian Lowlands in the east. The Turgay Plateau and the Kazakh Uplands terminate the West Siberian Lowlands to the south and are themselves terminated farther south by the Turan Plain. To the east of the West Siberian Lowlands, the Central Siberian Plateau rises between the Yenisey (west) and Lena (east) rivers.

The high mountain belt of the southern part of the Soviet Union includes (from west to east) the Carpathians, the Crimean hills, the Caucasus Mountains (up to 18,000 feet), and, farther east across the Caspian Sea and Kara-Kum Desert, the Kopet-Dag Mountains, the

Pamir Mountains (often reaching 23,000 feet), the Tien Shan (up to 16,000 feet), and the Altai and the Sayan mountains in Soviet Asia, and the Pacific maritime mountain ranges in the Soviet Far East.

Soviet hydroelectric resources are the world's greatest; the country has more than 150,000 rivers, four of them (the Ob, Yenisey, Lena, and Amur) more than 1,700 miles (2,700 km) long. The Ob (together with its tributary, the Irtysh) is the longest and has the largest drainage basin; the Yenisey, however, has the greatest average annual discharge. The nation's total internal navigable waterways amount to more than 85,600 miles (138,000 km), but most of the Soviet rivers are covered with ice in the winter. The Volga (largest river in Soviet Europe), Dnepr, Angara, and a number of other rivers have been converted into a series of reservoirs used for power, flood control, irrigation, and navigation purposes. There are some 270,000 natural lakes, including five of the world's largest: the Caspian Sea, the Aral Sea, Lake Baikal (also the world's deepest), Lake Balkhash, and Lake Ladoga.

The Soviet Union's widely variable climate is greatly influenced by its complex topography. The characteristic feature of the Soviet Union's temperate continental climate is the sharp contrast between summer and winter and the varying length of these seasons in the different regions. Average January temperatures range from a mild 43° F (6° C) in the southwest (on the Black Sea coast) to a remarkably cold -58° F (-50° C) near Verkhoyansk, in northeastern Siberia. Average July temperatures range from 32° F (0° C) on the Arctic Coast to 86° F (30° C) in Soviet Asia. Annual average precipitation varies from as much as 100 inches (2,500 mm) in the southwest (on the Black Sea coast) to less than 2 inches (50 mm) in eastern Siberia.

The Soviet Union can be divided into seven latitudinal climatic and vegetational zones from north to south. The tundra zone along the Arctic coast has long, bitter winters and short summers (one to two months); it is barely covered by mosses, lichens, and various grasses, and the subsoil is permanently frozen. The taiga zone (which is predominantly coniferous) in the broad north-central part of the country, covering about one-third of the Soviet Union's total land area, has long, severe winters and a short spring and summer; this zone in the Soviet Union contains about onefifth of all the forest land in the world and is the largest timber-producing area in the country. The steppe zone (parts of the Ukraine, northern Kazakhstan, and Soviet Europe) has cold winters and hot dry summers; the forest steppe in the north is covered by oak, birch, and aspen trees interspersed with open grassland; and the southern part is open, treeless grassland. Fertile black soils, mechanization, and irrigation facilities have made this region the most important Soviet agricultural area; it produces wheat, corn (maize), cotton, sugar beets, sunflowers, and potatoes. Cattle raising is also important. The Mediterranean zone (the Crimean coast and the lowlands facing the northern part of the Baltic Sea), with hot, dry summers and cool, rainy winters, has forests of oak and juniper, and pine at higher elevations. Vineyards, tobacco, and flowers for perfume are important. The subtropical zone is the southeastern Black Sea coast; with its heavy annual rainfall (100 inches), it is the only tea- and citrus-fruit-producing area in the Soviet Union. The semidesert zone lies north of the Caspian Sea; with its high evaporation rate and low annual rainfall (less than 10 inches), it supports a scanty cover of grass and scrub and is primarily a region of nomadic herding and irrigated farming. The desert zone is in central Asia and has cold winters and

very hot summers. Annual average rainfall is less than 6 inches in the plains. Its sparse natural vegetation is limited to a few sand acacia, saltwood, and wormwood trees; dry grass; and shrubs. In southern Turkmenistan where there are deposits of loess and river alluvium, various crops can be grown with irrigation, including cotton, alfalfa, and a wide variety of fruits and vegetables.

The Soviet Union's wealth of natural mineral resources has sustained its industrial growth. In the late 20th century, its coal and petroleum reserves were among the largest in the world, and it had the largest natural-gas reserves in the world. Three-fourths of the natural-gas reserves are in Siberia and the Soviet Far East. The country also has large reserves of iron ore, manganese, asbestos, copper, potash, lead, zinc, chromite, titanium, gold, silver, nickel, and cobalt.

The people. The Soviet Union has more than 100 ethnolinguistic groups; some of these nationalities predominate within a union or autonomous republic, in which the preservation of the national language and culture can have high priority. Russian is the official language, although each of the union republics also uses its own language as coofficial. Seven major European and Asian language families are represented, with the Slavic languages (Russian, Ukrainian, Belorussian, and Polish) dominating. The Turkic languages have the second largest number of speakers. According to ethnic results of the 1989 census, Russians constituted 50.8 percent of the population and Ukrainians 15.4 percent, with other groups accounting for less than 6 and more than 1 percent including Uzbeks, Belorussians, Kazakhs, Tatars, Azerbaijanis, Armenians, Tadzhiks, Georgians, Moldavians, Lithuanians, and Turkmens.

The place occupied by organized religion in Soviet society was changing in the early 1990s. From 1918 on, the official Soviet policy was to eradicate religion. Accordingly, church and state were separated by government decree, and all church property was confiscated and became the property of the state. Churches were denied legal status, and private instruction in religion was severely restricted. This situation persisted into the 1980s, at which time the government's attitude toward religion began to soften. Owing to broader changes in the Soviet political and cultural outlook, the churches by the early 1990s were allowed to function with relative freedom_compared to the preceding seven decades. Thousands of church buildings and mosques were being restored and reopened, and the government began allowing and even encouraging religious bodies to engage in charitable and educational work and other noncultic activities that had previously been banned.

It is estimated that more than one-half of the population are religionists. The largest group is the Russian Orthodox church, which is the church of most religiously observant ethnic Russians and is strongest in the Russian S.F.S.R. The next largest religious community is that of Islam, estimated at more than one-tenth of the total population. Most of the country's Muslims speak Turkic languages and live in Kazakhstan, Uzbekistan, and the other Soviet central Asian republics. Easternrite Catholics predominate in the Ukraine and Belorussia, while many Latvians and Estonians are Lutherans. There are smaller numbers of Armenian Catholics, Baptists, Jews, Buddhists, and other denominations,

The European portion of the Soviet Union is the most densely populated part of the country and includes the Moscow and Leningrad regions, the Ukraine, Belorussia, Transcaucasia, North Caucasus, Moldavia, and the Black Sea region. The least populated regions are Kazakhstan, the European and Asian North. the Far East, and South Siberia.

A characteristic trend between 1960 and the

late 1980s was the large increase in the total urban population of the Soviet Union (by almost three-fourths) and an accompanying decline in the rural population, especially in the Ukraine and Belorussia. At the same time, rural areas in central Asia and Kazakhstan recorded substantial growths. The general population continues to be concentrated in cities with more than 100,000 people.

The Soviet Union's rate of natural increase declined steadily from 1960 on, partly as a result of a drop in the birth rate. The birth rate varies widely by union republics, major economic regions, and oblasts; the European portions of the country had the lowest birth rates, while the Soviet central Asian republics had the highest ones, along with the fastest population growth.

The economy. The Soviet Union's economy was undergoing a slow and difficult transition in the early 1990s. Despite some changes, it remained a centrally planned economy based largely on heavy industries, government services, and agriculture, and the government continued to manage the economy through annual and five-year plans. In the late 1980s, though, the government began trying to decentralize its economic management by allowing factory and plant managers greater autonomy in their operations. A program was under way to make many Soviet industrial enterprises rely on their own profitability and competitiveness rather than on subsidies from the central government. Small-scale private businesses were legalized and even encouraged in some localities, as were joint ventures between Soviet and foreign firms. More radical measures, such as the privatization of the nation's farms, the closing of unprofitable statesupported industries, and the creation of a commercial banking system were under consideration but had not yet been adopted.

The Soviet Union's gross national product (GNP), which is growing more rapidly than the population, increased by about one-sixth between 1980 and 1988. The GNP per capita is relatively low for a leading industrialized country.

Agriculture accounts for nearly one-fourth of the net material product and employs about one-fifth of the work force. It is highly mechanized, operating on a large scale in two modes: the collective farm, in which part of the profit is distributed among members; and the state farm, which is run by the state and pays wages to its workers. Agricultural and certain clerical workers are allotted small private plots, which produce a disproportionately large fraction of the country's potatoes, vegetables, milk, and

Potatoes, sugar beets, wheat, barley, rye, corn (maize), and oats are the leading crops. Soviet agriculture has long been plagued by intermittent poor harvests and occasional crop failures owing to inefficient use of land, the inadequate level of mechanization, and poor storage facilities. Because of these problems, the Soviet Union is still dependent on Western imports for its food requirements. Pastureswhich support sheep, cattle, pigs, and other livestock—cover more than one-sixth of the land. Soviet production of roundwood is the world's second largest. Soviet landings of marine fish are second only to Japan's and come primarily from the Pacific and Arctic oceans.

Natural gas, a rapidly growing Soviet energy source in the 1970s, assumed even greater significance in the 1980s because oil production leveled off and a stagnating coal industry was unable to substitute coal for oil. Natural gas accounts for about two-fifths of total fuel production. Pipelines were installed during the early 1980s to move large amounts of gas from the producing region in West Siberia, which produces more than two-thirds of the country's total output, to markets in the European part of the U.S.S.R. and to eastern and western Europe for export.

The Soviet Union is the world's largest producer of petroleum, the exports of which go mostly to the countries of eastern Europe. Exports of natural gas are also a major source of foreign exchange. The Soviet Union is the world's leading producer of iron ore, manganese ore, platinum, potash, and mercury and is a major producer of aluminum, coal, arsenic, chromium ore, nickel, lead, copper, tin, tungsten, and phosphate rock.

Manufacturing industries (together with mining and public utilities) account for more than two-fifths of the net material product and employ about one-third of the work force. Soviet industrial output is one of the largest in the world and is dominated by heavy industry. The Soviet Union is the world's largest producer of steel, diesel locomotives and railway cars, and tractors and is a leading producer of textiles, chemicals, generators, and motor vehicles. Most types of consumer goods are in chronic short supply, however.

The country generates the second greatest amount of electricity (after the United States) in the world. About three-fourths is thermal, one-eighth is generated from hydroelectric power, and more than one-tenth is from nuclear power. The basic trend in electric-power generation is the expansion of hydroelectric and especially nuclear generating capacity while keeping growth of thermal plants to a minimum. The Soviet Union's nuclear-power program experienced a setback in 1986, however, when its plant at Chernobyl (80 miles [130 km] north of Kiev) suffered an explosion and meltdown.

Nearly all workers belong to labour unions, which participate in the management of industries, administer state social-insurance funds, and sponsor vocational training and other educational services. Unlike Western unions, they do not bargain with management to reach wage agreements or to improve working conditions. Women constitute about 50 percent of the labour force.

External trade is still controlled by the government, though the latter began taking steps in the early 1990s to encourage foreign investment in Soviet enterprises. The Soviet Union's chief imports are industrial machinery and technology, including complete industrial plants, as well as food and live animals, while its principal exports are fuels, chemicals and related products, machinery and transport equipment, and mineral raw materials. The nation's chief trading partners include Germany, Czechoslovakia, Bulgaria, Poland, Hungary, Japan, Yugoslavia, and Italy.

While the Soviet Union's transportation systems—rail, air, waterways, and motor vehicles—rank among the most heavily used in the world, and the public transportation network is generally excellent, the Soviet highway system is underdeveloped. On the whole, the European part of the country is better provided with roads than the east.

Government and social conditions. The Soviet Union consists of 15 union republics, 20 autonomous republics, 8 autonomous oblasts (provinces), 10 autonomous okrugs (districts), and 129 krays (regions) and oblasts (provinces).

From the 1920s, the Soviet Union was a highly centralized state governed by the only legal political party, the Communist Party of the Soviet Union (CPSU; Kommunisticheskaya Partiya Sovetskogo Soyuza). The Communist Party exercised an undisputed monopoly of power in policy-making concerning economic planning, education, culture, arts, science, and the military. It supervised the implementation of policy by the government. The party's top leadership was in fact responsible for the central government, and intermediate party bodies guided and directed local governments. The Politburo (Political Bureau) of the party's Central Committee was the nation's highest policy-making body, and the Secretariat of the Central Committee handled the day-today administration of the party; together the Politburo and the Secretariat formed the real seat of power in the Soviet Union.

But under the leadership of Mikhail S. Gorbachev, the general secretary of the CPSU from 1985 and the national president from 1990, the Soviet Union's political system underwent fundamental changes that were designed to release the government from the Communist Party's dominance and make the former more accountable to the public through free elections and other democratic processes. These objectives were realized chiefly through changes to the constitution that altered the structure of the formal government. Under the reorganization plan, which was approved in 1988, a new 2,250-member Congress of People's Deputies was established, with a significant portion of its members being chosen in multicandidate regional and national elections using secret ballots. The Congress sets overall social and economic policies and is the highest state body, meeting annually. The Congress in turn elects the 542 members of the Supreme Soviet, which meets for four to six months each year. The Supreme Soviet is a true national parliament with substantial legislative powers. The Congress of Deputies also elects (by secret ballot) a president of the Supreme Soviet who has broad executive powers over domestic affairs, foreign policy, defense, and other areas. The Supreme Soviet elects the membership of a steering committee, or presidium, which makes decisions between sessions of the Supreme Soviet.

Each of the constituent republics of the Soviet Union also has its own Supreme Soviet, whose members are now elected directly by the public in contested races using the secret ballot. The selection process for regional and local governing bodies was similarly democratized through the use of multicandidate elections. These changes concentrated more power and authority in the legislative and administrative branches of the government at the expense of the Communist Party. In 1990 the Congress of People's Deputies abolished the Communist Party's constitutionally guaranteed monopoly of power, thus setting the stage for the legalization of other political parties.

The Soviet judicial system is highly centralized and hierarchical; it is headed by the Supreme Court of the U.S.S.R. The Soviet Union has large armed forces, comprising an army, air force, navy, and air defense. The Soviets possess the world's largest arsenal of strategic nuclear-armed ballistic missiles.

The Soviet Union's comprehensive social-welfare system provides a complete range of social-security benefits as well as free health services for the entire population. The extensive network of health facilities and personnel contributes to health conditions roughly comparable to those of other industrialized countries, with an average life expectancy of 65 years for men and 74 years for women and a relatively low infant mortality rate. Although it was improving until the mid-1970s, the standard of living is lower than that of many developed Western countries. Comparatively lower wages and shortages of consumer goods, housing, and various foods still prevail.

The Soviet Union's population is almost entirely literate. Education is free at all levels and compulsory between the ages of 7 and 17. The educational system includes three-year primary schools and general, technical, or vocational secondary schools attended variously for 8, 10, or 11 years. University enrollment is specified by the annual economic plan, and admittance is determined by competitive examination.

Throughout the history of the Soviet state, the communications media were controlled by the government and the Communist Party. Extensive censorship was practiced to assure that the mass media supported the state ideology and otherwise conformed to Communist Party guidelines. Under the leadership of Gorbachev, however, the government began allowing markedly greater freedom of expression, investigation, and debate in the mass media. In 1990 the Supreme Soviet took steps to abolish most government censorship and to legalize the private ownership of newspapers. It was by such means that the country's reformist leaders sought to loosen the Communist Party's tight hold on the nation's mass media.

Cultural life. Literature occupies a prominent place in Soviet cultural life. The country's best-known writers are those of the 19th and early 20th centuries—Aleksandr Pushkin, Nikolay Gogol, Ivan Turgenev, Leo Tolstoy, Fyodor Dostoyevsky, Anton Chekhov, and Maksim Gorky—their influence being felt throughout the world. In the 20th century, such prominent writers as Boris Pasternak and Aleksandr Solzhenitsyn did not receive official favour and found greater success abroad. Yevgeny Yevtushenko, Andrey Voznesensky, and many other Soviet poets have also achieved popularity.

Among the greatest Russian composers were Aleksandr Borodin, Modest Mussorgsky, Nikolay Rimsky-Korsakov, and Peter Ilich Tchaikovsky. Their legacy is evident in more contemporary music, notably that of Sergey Rachmaninoff, Igor Stravinsky, Sergey Prokofiev, and Dmitry Shostakovich.

Soviet theatre inherited the tradition of Russian realist theatre and was exemplified in the work of Konstantin Stanislavsky of the Moscow Art Theatre. The leading theatre company for ballet and opera in the Soviet Union is the Bolshoi Theatre, which was organized in the mid-1770s. Russian ballet had a formative role in Western dance through a number of figures such as Sergey Diaghilev and Vaslav Nijinsky. Soviet ballet has produced such great stars as Yekaterina Geltser and Galina Ulanova. Ballet in the West was also enriched by the emigration of several Soviet-trained dancers.

History. The European region of the Soviet Union was inhabited by Indo-European and Ural-Altaic peoples during the 2nd millennium BC. During the 8th and 9th centuries AD the Rus civilization emerged along the northern Volga River and expanded southward to the limits of the Byzantine Empire. During the middle and late 10th century, Svyatoslav, grand prince of Kiev, began to unite the land of Rus; his son Vladimir continued the unification, and, after he was baptized in the Byzantine church in 982, Vladimir established Russian Christianity for centuries to come.

After the Mongol conquest of most of Russia in about 1240, such principalities as Novgorod continued to prosper; others, e.g., Muscovy (Moscow) and Tver, became important centres; and others declined.

Moscow began its rise to primacy in the 14th century, and, by the mid-15th century, Vasily II the Blind secured the throne of Great Russia for his son Ivan III the Great (reigned 1462-1505). Ivan IV the Terrible (reigned 1533-84) was the first tsar of Russia (1547), and his military campaigns against the Tatars added several non-Slavic states to the empire. Ivan was succeeded by his idiot son, Fyodor I (1584-98), whose brother-in-law Boris Godunov actually ruled as regent and, after Fyodor's death, as tsar (1598-1605). But 15 years of dynastic chaos, known as the Time of Troubles, intruded and ended at last with the election of Michael Romanov as tsar, establishing a line of rulers that endured until the 1917 revolution.

The outstanding early Romanov tsar was Peter I the Great (1689-1725), who initiated a

number of Western reforms, added the Baltic provinces and areas along the Caspian Sea to the empire, and established Russia as a legitimate European power. Many of the reforms were consolidated by the empresses Elizabeth (1741-62) and Catherine II the Great (1762-96). Catherine added the Crimea and the Ukraine, as well as additional Polish territory, to the empire.

The Napoleonic Wars diverted Alexander I (reigned 1801-25) from reforms to defense and warfare. Opposition to serfdom had been growing since the time of Catherine the Great. who had hoped to end it but was forced to extend it. The institution was finally abolished by Alexander II (reigned 1855-81), but this "Tsar Liberator" was assassinated by revolutionaries in 1881.

Russia's defeat in the Russo-Japanese War was followed by a wave of strikes and riots including Bloody Sunday (Jan. 22, 1905), and Tsar Nicholas II agreed to form a national Duma (parliament). Between 1906 and 1917 several Dumas, often with left-wing majorities, were elected and dissolved, and some progress at reform was made.

Russia's entry into World War I was a disaster for the nation. By the autumn of 1915 Russia had lost more than 1 million men. In February-March 1917 the Romanov dynasty was overthrown, and a democratic Provisional Government was established. But in October (November, New Style), a minority revolutionary group that was led by Vladimir Ilich Lenin and claimed the name Bolsheviks seized the government and put to death the tsar and his family. Russia withdrew from World War I, and the Bolsheviks defeated their opponents in a civil war (1918-20), forming the Union of Soviet Socialist Republics.

After Lenin's death (1924) Joseph Stalin defeated his rivals for political leadership. During Stalin's regime the Soviet Union underwent rapid industrialization; agriculture was forcibly collectivized, and Stalin carried out numerous political purges in order to consolidate his power and eliminate real or fancied enemies. The Soviet Union developed into a world power and played a major role in the de-

Leaders of Bussia and the Union of Coviet Confellat Benubling

feat of Germany in World War II, after which it exerted its dominance over eastern Europe and influenced the Chinese Communists. After Stalin died (1953), Nikita Khrushchev soon came to power and attempted to relax some of the strict controls governing Soviet society while opposing the influence of the United States in world affairs. Soviet installation of missiles in Cuba led to a crisis with the United States in 1962. Soviet influence over China decreased, and relations between the two countries deteriorated.

In 1964 a collective leadership under Leonid Brezhnev and Aleksey Kosygin ousted Khrushchev and took control of the government, and within a few years Brezhnev assumed undivided control of the Communist Party and the government. During the 1960s and '70s the Soviet Union sought to spread its influence worldwide, either directly or through surrogates like Cuba. After the death of Brezhnev in 1982 a series of leaders sought to end bureaucratic inefficiency and corruption and to reform the economy, but with indifferent success.

The accession to power of Mikhail Gorbachev in 1985, however, signaled the start of new changes in Soviet society-chiefly a restructuring (perestroika) of the nation's political and economic systems which eventually constituted a rejection of socialism itself. Gorbachev encouraged a new openness (glasnost) in public discussion, debate, and cultural expression; sought to gradually decentralize Soviet economic decision making; and sought to make the government directly responsible to the electorate rather than to the Communist Party. By the early 1990s, Gorbachev's reforms had eroded the Communist Party's monolithic grip on power and had set the stage for political pluralism and the functioning of authentic democratic institutions in the Soviet Union.

Union Oil Company of California: see Unocal Corporation.

Union Pacific Railroad Company, company that extended the American railway system to the Pacific Coast; it was incorporated by an act of Congress on July 1, 1862. The original road was built westward 1,006 miles (1,620 km) from Omaha, Neb., to meet the

Central Pacific, which was being built eastward from Sacramento, Calif. The two railroads were joined at Promontory, Utah, on May 10, 1869.

The Union Pacific was largely financed by federal loans and land grants, but it overextended itself through its involvement in the Crédit Mobilier scandal, in which a few manipulators reaped enormous profits. After exposure of the scheme, which left the railroad badly in debt, the company went into receivership in 1893. It was reorganized in 1897 under the leadership of Edward H. Harriman, who was responsible for major improvements and standardization and who led the railroad to participate in the economic development of the West. Harriman used the railroad as a holding company for the securities of other transportation companies in his empire.

The Union Pacific grew to operate in 13 western states, extending from Council Bluffs, Iowa, and Kansas City, Mo., to Portland, Ore., and Los Angeles. Since 1969 it has been owned by the Union Pacific Corporation, a

holding company.

In 1982 the Union Pacific merged with two other railroads, the Missouri Pacific Railroad Company (q.v.) and the Western Pacific Railroad Company (headquartered in San Francisco), to form what came to be called the "Union Pacific System." Union Pacific and Missouri Pacific retained their separate corporate identities to some degree (under the holding company Union Pacific Corporation), but Western Pacific became a subsidiary of Union Pacific. Trafficking and marketing of all three railroads were fully unified. The Union Pacific Corporation is headquartered in Bethlehem,

union shop, arrangement under which workers are required to join a particular union within a specified period of time after beginning employment. Such an arrangement differs from the closed shop in that the employer's choice of new employees is not restricted to union members. The justification given for the union shop is that it prevents workers from enjoying the benefits of unionism without bearing their share of the costs of such representation.

Union shop agreements are uncommon in most countries, where one union seldom gains exclusive bargaining rights for all the workers of a plant. In the United States, however, where a single union may be chosen by majority vote to represent all the workers, and in Japan, where a single union customarily represents all the employees of an enterprise, union shop agreements are both legal and common. In some states of the United States, however, so-called right-to-work laws prohibit requiring union membership as a condition of employment, and thus both the union shop and the closed shop are forbidden in states with such laws.

unionism, enterprise (Japanese labour): see enterprise unionism.

Uniontown, city, seat (1784) of Fayette county, southwestern Pennsylvania, U.S. It lies along Redstone Creek, among the rugged foothills of the Alleghenies, 45 miles (72 km) southeast of Pittsburgh. Settled in 1767 and laid out (1776) by Henry Beeson, a Quaker, it was first known as Beeson's Town. Its location on the old National Road was an important factor in its early development. It is now a trade and marketing centre with coal, steel, and textile industries. Fort Necessity National Battlefield, 11 miles (18 km) southeast, is the site of the opening battle of the French and Indian Wars. George C. Marshall, World War II general and secretary of state and of defense, was born in Uniontown. The Fayette campus of Pennsylvania State University was opened in 1934. Inc. borough, 1796; city, 1916. Pop. (1988 est.) 12,570.

*The Danilovich dynasty is a late branch of the Rurik dynasty, named after its progenitor, Daniel. †In 1721, Peter I the Great took the title of "emperor" (Russian *imperator*), considering it a larger, more European title than the Russian "tsar." However, despite the official titling, conventional usage took an odd turn. Every male sovereign continued usually to be called tsar (and his consort tsarina, or *tsariusa*), but every female sovereign was conventionally called empress (*imperatritsa*). ‡The direct line of the Romanov dynasty came to an end in 1761 with the death of Elizabeth, daughter of Peter I. However, subsequent rulers of the "Holstein-Gottorp dynasty" (the first, Peter III, was son of Charles Frederick, duke of Holstein-Gottorp, and Anna, daughter of Peter I) took the family name of Romanov.

unique-headed bug, also called GNAT BUG, any of the approximately 130 insect species of the family Enicocephalidae (order Heteroptera). The unique-headed bug, found

Unique-headed bug feeding on a millipede

throughout the world, is about 4 mm (0.2 inch) long and, as indicated by its common name, has an unusual elongated head that is constricted behind the eyes and also at the base. Its forewings are entirely membranous. Both the beak and the antennae have four joints, and the front pair of legs is adapted for grasping prey. Though it is found in all zoogeographic regions, little is known of its habits. Two North American species are Enicocephalus formicina and Systelloderus biceps (Henicocephalus culicis).

unisexuality, in biology, the condition of an organism or species capable of producing only male or female gametes (sex cells) but never both. A unisexual organism of a bisexual species is one in which the male and female gonads are found in separate individuals. In plants this condition is often called dioecism. A unisexual species is one in which all individuals are of the same sex. Some species of whiptail lizards, for example, are only female. New individuals grow from eggs that develop without fertilization (parthenogenesis).

Unisys Corporation, American manufacturer of computer systems. The company was formed in 1986 from the merger of Sperry Corporation and Burroughs Corporation.

The Sperry Corporation arose out of the merger of North American Aviation Company, Curtiss-Wright Corporation, and Sperry Gyroscope in 1933. The corporation specialized in the manufacture of gyroscopes and other aeronautical machinery, machine tools, and heavy and precision machinery. In 1955 Sperry merged with Remington Rand, Inc., becoming Sperry Rand Corporation. Remington Rand had been formed in 1927, combining several manufacturers of office machines and business equipment, including the Remington Typewriter Company (established in 1873) and the Rand Kardex Bureau (formed in 1886). Remington Rand's main business had developed around typewriters, business machines, and electric shavers. Sperry Rand Corporation was renamed Sperry Corporation in 1979.

The Burroughs Corporation began as the Burroughs Adding Machine Company in 1905, producing the world's first practical adding machines, which had been perfected by the inventor William Seward Burroughs a decade or so before. The company succeeded Burroughs' own American Arithmometer Company. The Burroughs Adding Machine Company became the world's largest manufacturer of such devices, and in the 1950s and '60s it branched out into the manufacture of computer systems for business and office uses. It was renamed the Burroughs Corporation in 1953.

At the time of the 1986 merger, Sperry mainly produced military electronics systems and computer systems for use in the transportation and utilities industries. Burroughs had concentrated on computer systems for banking and other financial uses.

unit train, freight train composed of cars carrying a single type of commodity that are all bound for the same destination. By hauling only one kind of freight for one destination, a unit train does not need to switch cars at various intermediate junctions and so can make nonstop runs between two terminals. This reduces not only the shipping time but also the cost. The unit train was introduced by American railroad companies in the 1950s so that they could offer lower shipping rates and thereby make their freight service more marketable. Initially, unit trains were used primarily to haul coal from mines to power plants. By the late 20th century about 50 percent of the coal shipped in the United States was carried by these trains. Other forms of bulk cargo, such as grain and cement, were also transported in this fashion.

To fully exploit the advantages of the unit train and to extend this service to shippers of manufactured goods, American railroads in the second half of the 20th century redesigned their equipment. They developed larger freight cars, many of which are specially constructed to carry particular commodities. The 10.000cubic-foot (280-cubic-metre) boxcar, for example, is three times larger than the standard car and can economically transport such items as automobile parts and television sets. Another key innovation is the tri-level rack car capable of carrying 12 to 15 finished automobiles from assembly points to distribution points. Though most widely employed in the United States, unit trains equipped with these and other types of high-volume freight cars are also used in Canada and various European countries on a limited scale.

unit trust: see mutual fund.

Unitarian Universalist Association, religious organization in the United States formed in May 1961 by merger of the Universalist Church of America and the American Unitarian Association. The American Unitarian Association was founded in 1825 as the result of a gradual development of Unitarianism (the denial of the Trinity) within New England Congregationalism in the late 18th and early 19th centuries. The Universalist Church of America developed from an 18th-century movement in the eastern United States among those who believed in universal salvation. The first Universalist Church was formed in 1779, and in 1790 the Universalists adopted a doctrinal statement and plan for church government at a convention in Philadelphia.

The Unitarian Universalist Association has no creed, and individual congregations vary widely in their worship service, religious beliefs, and religious practices. National headquarters, in Boston, Mass., consist of departments dealing with the ministry, extension, religious education, adult education, world service, world churches, and publications. District organizations cover the continental area, with boards and executives responsible to district churches and fellowships. The General Assembly of delegates from churches and fellowships meets annually.

Unitarianism, religious movement that stresses the free use of reason in religion, holds generally that God exists only in one person, and denies the divinity of Christ and the doctrine of the Trinity.

A brief treatment of Unitarianism follows. For full treatment, see MACROPAEDIA: Protestantism: Unitarians and Universalists.

Theological foundations for the view of God as a unity and for the humanity of Jesus are found in 2nd- and 3rd-century monarchianism and in the teachings of Arius (c. 250-c. 336) and his followers (Arians)—both early groups of Christians whose doctrines were later declared heretical by the church. The modern roots of Unitarianism are traced to the 16th-century Protestant Reformation, when certain

liberal, radical, and rationalist reformers revived the Platonic emphasis on reason and the unity of God. Many such thinkers fled Italy during the Inquisition. Michael Servetus, a leading Neoplatonic Unitarian, fled eventually to Geneva, where he was burned at the stake by Calvinists. Some Italians found refuge in Poland. Chief among these was Faustus Socinus, who arrived at Kraków in 1579. Socinus' theology stressed the complete humanity of Jesus, a view still held by most Unitarians and Universalists. In Transylvania, an important early figure was Ferenc Dávid, who was convicted as a heretic for teaching that prayers could not be addressed to Jesus (since Jesus was merely human). He died in prison in 1579. The church that Dávid founded in Transylvania is the world's oldest extant Unitarian body.

Although some unorthodox thinkers in England drew upon Socinus and others, the mainstream of British Unitarianism, like that of American Unitarianism, grew out of Calvinist Puritanism. Calvin's doctrine of providence, coupled with an increasingly scientific view of the universe, led to a decline in religious orthodoxy and an increased emphasis on reason and morals among the more liberal Calvinist clergy. Joseph Priestley, an English scientist and dissenting minister, was among those who began preaching "Unitarian Christianity," emphasizing Jesus' humanity, God's omnipotence, and the rational faculty of man. The English Unitarians became strong in Parliament, the professions, and social reform. The name "Free Christian" was adopted by some groups who opposed the name "Unitarian" as sectarian and divisive. The movement fared somewhat less well in Scotland and Ireland.

American Unitarianism developed more slowly out of New England Congregationalist churches that rejected the 18th-century revival movement. Congregational autonomy protected from controversy those ministers who stressed moderation, reason, and morals over spiritual revivalism. The Transcendentalist movement of the 19th century injected Unitarianism with a new interest in the intuitive and emotional aspects of religion. When Unitarianism spread into the frontier of the Middle West, its religious fundamentals changed to human aspiration and scientific truth, rather than Christianity and the Bible. Both British and American Unitarian groups formed national associations in 1825. In 1961 American Unitarians merged with the national organization of Universalist churches, with whom they shared a history of liberal idealism. In polity, most Unitarians and Universalists are congregational. Forms of worship, based on Protestant tradition, vary widely from group to group. See also Universalism.

Unitas, Johnny, byname of John Constantine Unitas (b. May 7, 1933, Pittsburgh, Pa., U.S.), American professional football quarterback who was named greatest all-time National Football League (NFL) quarterback in 1969.

Unitas played football at St. Justin's High School (Pittsburgh), but his weight (145 pounds) caused him to be rejected for an athletic scholarship at Notre Dame University. He played for the University of Louisville (Kentucky), where he grew to 6 feet 1 inch and a weight of 190 pounds. He was drafted by the NFL Pittsburgh Steelers in 1955 but was released before the regular season began. He worked at construction jobs and played for the semiprofessional Bloomfield Rams for \$6 a game until he joined the NFL Baltimore Colts as a backup quarterback in 1957.

Unitas led the Colts to five league championship games (1958-59, 1964, 1968, and

1970) and to two Super Bowl games (1969, 1971). He played with them until he was traded to the NFL San Diego Chargers in 1972, and he retired in 1974. After he retired from football, he was a television football commentator and ran an airfreight company and two restaurants. He was elected to the Football Hall of Fame in 1979.

Unitas Fratrum (Latin), English UNITY OF BRETHREN, Protestant religious group inspired by Hussite spiritual ideals in Bohemia in the mid-15th century. They followed a simple, humble life of nonviolence, using the Bible as their sole rule of faith. Though they denied transubstantiation, they received the Eucharist and deemed religious hymns of great importance. In 1501 they printed the first Protestant hymnbook and in 1579-93 published the Kralice (or Kralitz) Bible, a landmark in Czech literature. Their Confessio Bohemica. reflecting Lutheran and Calvinist influences, effected a union with Lutheran Hussites in 1575 that received Holy Roman imperial sanction in 1609. By that time the Unitas Fratrum comprised half of the Protestants in Bohemia and more than that in Moravia. About the mid-16th century, Unitas emigrants moved into Poland and survived there for some two centuries. Having joined the Czech estates in their fight with Ferdinand I (Thirty Years' War), the Unitas Fratrum forces' defeat in 1620 at the Battle of the White Mountain was a prelude to their suppression. In 1627 an imperial edict outlawed all Protestants; the Unitas was destroyed, with all its churches, its Bible, and its hymnbooks. Members were forcibly "catholicized" or exiled. Remnants of the group, however, eventually found refuge in Saxony and under the name of Herrnhuters had great religious influence through their missionary activities. Both the Moravian Church and the Evangelical Czech Brethren Church in Czechoslovakia trace their origin to the Unitas Fratrum.

United Aircraft Corporation: see United Technologies Corporation.

United Airlines, Inc., American international airline serving North America and the Far East. Headquarters are at Elk Grove Vil-

lage, a suburb of Chicago, Ill. United Airlines dates to 1929, when William E. Boeing (1881-1956), Frederick B. Rentschler (1887-1956), and their associates founded United Aircraft Transport Corporation, a conglomerate of both aircraft manufacturing and air transport. By 1930 it had acquired four mail carriers-Boeing Air Transport (formed in 1927), Pacific Air Transport (1926), Varney Air Lines (1926), and National Air Transport (1925)—and in 1931 established United Airlines, Inc., in Chicago as a holding company providing an umbrella management for the four operating divisions. In 1934, under U.S. congressional pressure, aircraft conglomerates were forced to dissolve, separating the manufacture of aircraft from air transport. United Airlines, Inc., became an independent operating company, fully unifying all the transport divisions. (The Boeing and United Aircraft manufacturing companies also emerged from the dissolution.) William A. "Pat" Patterson (1899-1980), the new president, was the major influence on the compa-

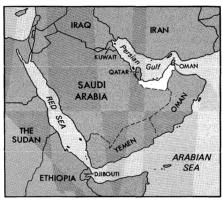

From 1930 the company had a network of routes from New York to San Francisco and Seattle, Wash., along with a number of north-south routes in the West; and in that year the company's (and the world's) first stewardesses were trained and put into service on the Chicago-San Francisco flights. Transcontinental flights from New York followed. After World War II, the expansion of United's

ny's progress until his retirement in 1966.

routes and services was phenomenal. In 1961, upon its merger with Capital Airlines, United became the largest air carrier (in terms of number of passengers) in the Western world, exceeded globally only by the Soviet Union's Aeroflot (United retained that first rank for a couple of decades). In 1968–69 United Airlines reorganized itself, and in 1986 it acquired Pan American World Airways' trans-Pacific routes (connecting the United States with East Asia and the South Pacific).

In the two decades following its reorganization in 1968–69, United embarked on a number of corporate mergers. Its new parent and holding company, UAL, Inc., acquired the Western International (later Westin) Hotels (a large American hotel chain) in 1970, the Hertz Corporation (the largest car-rental business in the United States) in 1985, and Hilton International Co. (another large hotel chain) in early 1987. These businesses were sold off in late 1987, however, and henceforth the parent company concentrated on its major subsidiary, United Airlines, which remained one of the largest air carriers in the United States.

United Arab Emirates (U.A.E.), Arabic AL-IMĀRĀT AL-ʿARABĪYAH AL-MUTTAḤIDAH, union of seven emirates lying along the oilrich eastern coast of the Arabian Peninsula, and covering 30,000 square miles (77,700 square km). The union consists of Abu Dhabi (accounting for most of the union's

United Arab Emirates

area), Dubayy (Dubai), 'Ajmān, ash-Shāriqah, Umm al-Qaywayn, Ra's al-Khaymah, and al-Fujayrah. The capital is Abu Dhabi town. Extending about 70 miles (110 km) from north to south and about 375 miles (600 km) from east to west, the union is bordered by Qatar on the northwest, Saudi Arabia on the west and south, and Oman on the southeast and northeast. It is separated from Iran by the Persian Gulf on the north and by the Gulf of Oman on the east. The population in 1990 was estimated to be 1,881,000.

A brief treatment of the United Arab Emirates follows. For full treatment, *see* MACROPAEDIA: Arabian Peninsula.

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. The only landscape feature breaking the monotony of the United Arab Emirates' low-lying desert plain is the intrusion of Oman's Hajar Mountains along the Musandam Peninsula in the east. The desert plains, generally lying at less than 500 feet (150 m) above sea level, rise dramatically at the Hajar Mountains to elevations of nearly 10,000 feet (3,050 m). Although the union's longest coastline borders the Persian Gulf to the north, its three natural deepwater harbours are located along the much shorter eastern coast on the Gulf of Oman.

The climate is hot and humid along the coast and hot and dry in the interior. Rainfall averages only 3 to 4 inches (75 to 100 mm)

annually, and the summer heat may reach 115° F (46° C) along the coast and 120° F (49° C) or more in the desert interior. The average January temperature is 65° F (18° C).

Vegetation is scanty and largely limited to the low shrubs that offer forage to herds tended by nomads. The gulf waters are home to schools of mackerel, grouper, and tuna, as well as sharks and occasional whales.

The United Arab Emirates' estimated proved reserves of petroleum and natural gas are among the world's largest. Its reserves of petroleum represented about 11 percent of world totals in the late 20th century. Natural-gas reserves represented about 5 percent of world reserves but still ranked among the world's 10 largest.

The people. The U.A.E.'s indigenous inhabitants are Arabs who adhere to the Sunnite and Shī'ite sects of Islām. A large part of the population also consists of South Asian immigrants (Indian, Pakistani, Bangladeshi, and Iranian). The government has encouraged fertility among nationals to offset the growing proportion of these immigrants. The official language is Arabic. English, Persian, Urdu, and Hindi are also spoken. About two-thirds of the population is male, owing to the huge influx of petroleum and construction workers. The U.A.E.'s annual rate of population growth in the 1980s was one of the highest in the Middle East, owing largely to immigration. The birth rate is about average for a developing country, but the death rate is extremely low. Population estimates show Abu Dhabi emirate to have the largest population of the emirates, followed by Dubayy and ash-Shāriqah. Most of the population is concentrated in Abu Dhabi town and the towns of the peninsula, including Dubayy town (the largest) and ash-Shāriqah town.

The economy. The U.A.E. has a developing mixed state and private-enterprise economy. The gross national product (GNP) per capita is the highest in the Middle East and one of the highest in the world. The GNP is not growing as fast as the population, however. Petroleum and natural-gas extracting and refining account for about one-third of the gross domestic product (GDP).

Only about 50 square miles (130 square km), or less than 0.2 percent, of the total land in the U.A.E. is arable or permanently cropped, and of this two-fifths requires irrigation. Most agriculture is centred in the northern emirates of ash-Shāriqah, Ra's al-Khaymah, 'Ajmān, and al-Fujayrah. In the oases, date palms are the emirates' major crop, together with alfalfa. Other foods grown include wheat, barley, millet, and fruits such as mangoes. Improved agricultural methods have led to a dramatic increase in vegetable production. Animal life is mostly restricted to domesticated goats, sheep, and camels. Fishing from the Persian Gulf supplies domestic needs.

Petroleum and natural-gas extraction are the principal industries in the U.A.E., with production concentrated in Abu Dhabi (about two-thirds of the petroleum and the entire output of natural gas), Dubayy, and ash-Shāriqah emirates. Marble is quarried in 'Ajmān, and sand-, gravel-, and limestone-quarrying support the local cement industry.

Manufacturing and utilities account for about one-tenth of the GDP. Refined petroleum, liquefied natural gas, cement and building materials, and aluminum are the principal products. Electric-energy production is from thermal power plants. Large oil revenues have made possible the extensive construction of new buildings, roads and other transportation facilities, and industrial plants. More than four-fifths of the U.A.E.'s labour force are foreign nationals, most concentrated in unskilled construction work.

Each emirate in the union sets its own domestic economic policy, although a significant portion of the federal budget is earmarked for national development, providing the federal government with a measure of control. Abu Dhabi contributed the major part of the federal budget in the early 1980s, although Dubayy agreed henceforth to transfer half of its petroleum revenues to the federal budget. National and foreign banks have flourished in the U.A.E.

Roads link major towns throughout the seven emirates. Each emirate administers its own shipping; Dubayy, on the Persian Gulf, is the emirates' main port. International airports are located at Dubayy, Abu Dhabi, Ra's al-Khaymah, and ash-Shāriqah.

Exports in the mid-1980s greatly exceeded imports and consisted mainly of petroleum and natural gas, followed by dates, aluminum, dried fish, and pearls. Imports consist principally of machinery and transport equipment, consumer durable goods, and food and live animals.

Government and social conditions. Each of the seven emirates in the U.A.E. is governed by its own hereditary ruler, and each retains primary control over mineral rights, taxation, and police powers.

The union's provisional constitution, adopted in 1971 and renewed in 1976 and 1981, vests highest federal authority in the Supreme Council of Rulers, which consists of the rulers of the seven emirates. All decisions must gain the approval of no fewer than five rulers, including those from Abu Dhabi and Dubayy, the largest emirates. The council elects the president and vice president from its members. The president appoints the prime minister and the Federal Council of Ministers to assume the country's executive authority. Proposed laws are reviewed by the Federal National Council, a 40-member consultative body appointed to two-year terms by the seven rulers. Highest judicial power in the country rests with the Union Supreme Court, which has jurisdiction over all federal matters.

The federal government provides free hospital treatment and medical care throughout the U.A.E. and has devoted large amounts of oil revenue to the building of hospitals and rural and mobile health clinics. The U.A.E. has many physicians, but, because of a shortage of native doctors, most medical personnel have been recruited from foreign countries.

Education in the U.A.E. is compulsory between the ages of 6 and 12. A dearth of native teachers has forced the government to staff schools with teachers from other Arab countries. The country's only institution of higher learning is the United Arab Emirates University, which opened in 1977. All education is provided free. Although it is free from overt censorship, the nation's press never criticizes the government.

The U.A.E.'s culture is that of Islām. The people are divided into tribal groups united under the patriarchal emirates of each of the rulers. Although the U.A.E. has undergone extensive modernization, many of its people continue to practice traditional ways of life.

History. Excavations at Bahrain and Kuwait attest to those areas' importance as trading and commercial centres of the Persian Gulf communities as early as Sumerian times (c. 3000 BC). Their conversion to Islām occurred within Muḥammad's lifetime, but his death brought apostasy, and the Caliphate had to restore orthodoxy by force. Influences from Iran, across the gulf, brought many conversions to Shī'ism.

The Portuguese entered the Persian Gulf in the early 16th century. The British East India Company arrived about 100 years later. In 1819–20 the British launched an attack upon the coastal ports and exacted the General Treaty of 1820, by which the local inhabitants renounced piracy. By 1853 the Treaty of Maritime Peace in Perpetuity had been signed, and the area became known as the Trucial Coast. In 1892 Britain gained control over the

foreign policy of the area by securing the pact known as the Exclusive Agreements with the Rulers of the Trucial States. From 1873 to 1947 the Trucial Coast was

From 1873 to 1947 the Trucial Coast was administered by British India and after 1947 by the London Foreign Office, but the British never assumed sovereignty. Each state maintained full internal control. In 1960 the Trucial States Council was formed, with representation from the rulers of the various states. When the British vacated the Persian Gulf in 1971, the Trucial States federated and became known as the United Arab Emirates. Ra's alkhaymah joined the federation in 1972, while Bahrain and Qatar opted for separate independence.

United Arab Republic (U.A.R.), Arabic AL-JUMHŪRĪYAH AL-ʿARABĪYAH AL-MUTTAḤIDAH, political union of Egypt and Syria proclaimed on Feb. 1, 1958, and ratified in nationwide plebiscites. It ended on Sept. 28, 1961, when Syria, following a military coup, declared itself independent of Egypt. Despite the dissolution of the union, Egypt retained the name United Arab Republic until Sept. 2, 1971, when it took the name Arab Republic of Egypt.

United Artists Corporation, major investor in and distributor of independently produced motion pictures in the United States. The corporation was formed in 1919 by Charlie Chaplin, the comedy star; Mary Pickford and her husband, Douglas Fairbanks, the popular film stars; and D.W. Griffith, the director who was a pioneer in the development of camera techniques. They were the leading filmmakers of their day and wanted complete freedom in producing and distributing their films. The company also handled the distribution of highquality films made by independent producers. United Artists was the first major production company to be controlled by its artists rather than by businessmen. It also started the trend among studios to act as distributing agencies for films other than those it produced.

Besides the films of its founders (including Chaplin's The Gold Rush, 1925), United Artists prospered in the 1920s with films starring Gloria Swanson, Norma Talmadge, Buster Keaton, and Rudolph Valentino. The company met the new challenge of sound films in the 1930s with the talents of such producers as Samuel Goldwyn, Howard Hughes, and Alexander Korda. The corporation eventually encountered financial difficulties, though, and was reorganized in 1951: the production studio was sold, and United Artists became solely a financing and distributing facility. Although the new administration established itself with modestly budgeted films, the company was fully competitive by the mid-1950s with all the major studios because of such films as The African Queen (1951), High Noon (1952), Marty (1955), Witness for the Prosecution (1957), Some Like It Hot (1959), The Apartment and The Magnificent Seven (both 1960), and West Side Story (1961). The company's subsequent successes included the James Bond and Pink Panther series and such films as One Flew over the Cuckoo's Nest (1975) and Rocky (1975). In its later years, United Artists underwent various ownerships and corporate organizations.

United Australia Party (UAP; 1931-44), political party formed by a fusion of Nationalist Party and conservative Australian Labor Party members, which alone or in coalition with the Country Party controlled the Australian commonwealth government for 10 years. Brought to power in the general election of 1931, the UAP sought to meet the Great Depression with deflationary policies. The UAP's conservative economic program gave Australians a sense of security and, along with factional strife within the opposition Australian Labor Party, allowed the UAP to stay in power de-

spite the fact that no dramatic economic upsurge resulted from the UAP's governmental measures. With the death in 1939 of the UAP prime minister Joseph A. Lyons, a power struggle within the UAP-Country coalition prepared the way for the Labor Party to take the reins of government in 1941. The UAP was dissolved in 1944 and was succeeded by the Liberal Party.

United Automobile, Aerospace and Agricultural Implement Workers of America: International Union, also called (1941–62) UNITED AUTOMOBILE, AIRCRAFT AND AGRICULTURAL IMPLEMENT WORKERS OF AMERICA, Or (1935–41) UNITED AUTOMOBILE WORKERS OF AMERICA (UAW), American industrial union of automotive and other vehicular workers, headquartered in Detroit, Mich.

The United Automobile Workers was a product of the founding of the Committee for Industrial Organization (CIO) in 1935. The latter's drive to organize the workers in the automotive industries began in earnest with the passage of the National Labor Relations Act (Wagner Act) in 1935 and was marked by bitter conflict between union organizers and the automobile manufacturers. While the constitutionality of the act remained in doubt, the industry refused to yield; the union retaliated by importing from France the technique of the "sit-down" strike. However, President Franklin D. Roosevelt's overwhelming success in the election of 1936 and the sustaining of the Wagner Act by the Supreme Court in the following year prompted General Motors to change its policy. It agreed to accept the UAW as the bargaining agent for its employees, whereupon most of the rest of the industry followed suit. Henry Ford, as usual, went his own way, and some years of violent conflict ensued before the Ford Motor Company and the UAW finally came to terms in 1941.

Walter Reuther, an early and vigorous organizer, became president of the union in 1946 (and held this position until his death in 1970) and also president of the CIO in 1952. When the American Federation of Labor (AFL) and the CIO merged in 1955, Reuther held positions making him second only to George Meany, president of the combined AFL-CIO. The relationship was uneasy, and in 1968 the friction between Meany and Reuther broke into the open. As a result, the UAW withdrew from the AFL-CIO that year and joined the International Brotherhood of Teamsters in a new alliance. Dissatisfaction with the corruption in the Teamsters, however, soon led to dissolution of the alliance in 1972. In 1981 the UAW reaffiliated with the AFL-CIO.

United Brands Company, American corporation formed in 1970 in the merger of United Fruit Company and AMK Corporation (the holding company for John Morrell and Co., meat-packers). It engages in the production and distribution of bananas and other fruits and produce, the processing and distribution of meats, the manufacture and distribution of other foods, fats, oils, and beverages, and the administration of diversified activities in plastics, animal feeds, telecommunications, and other areas. Headquarters for United Brands are in New York City.

United Fruit Company, the main company, was founded in 1899 in the merger of the Boston Fruit Company and other companies producing and marketing bananas grown in the Caribbean islands, Central America, and Colombia. The principal founder was Minor C. Keith, who had begun to acquire banana plantations and to build a railroad in Costa Rica as early as 1872. In 1884 he contracted with the Costa Rican government to fund the national debt and to lay about 50 more miles of track. In return he received, for 99 years,

full rights to these rail lines and 800,000 acres (325,000 hectares) of virgin land, tax exempt for 20 years.

United Fruit Company was capitalized at \$11,230,000 at its founding. The company then expanded its capitalization to \$215,000,-000 by 1930 by absorbing more than 20 rival firms, and it became the largest employer in Central America. From the time the company began, Caribbean and Latin-American governments made available vast undeveloped tracts of jungle lands, which United Fruit cleared, planted, and supplied with extensive railroad and port facilities. Marketing operations included a shipping arm, the Great White Fleet, one of the largest of private merchant navies. All these efforts were matched by an advertising campaign that was extremely successful in marketing bananas in North America and Europe.

As a foreign corporation of conspicuous size, United Fruit sometimes became the target of popular attacks. The Latin-American press often referred to it as el pulpo ("the octopus"), accusing it of exploiting labourers, bribing officials, and influencing governments during the period of Yankee "dollar diplomacy" in the first decades of the 20th century. The company's defenders, however, have pointed out that United Fruit's early excesses were somewhat mitigated later. Through the Associated Producers Program, the company gradually transferred title of portions of its landholdings to individual growers, provided them with reasonable credit terms and technological assistance, and acted as marketing agent for their produce; its workers were comparatively well paid and were provided with medical care.

United Brands still owns or leases extensive banana plantations in Honduras, Costa Rica, Guatemala, Panama, and Colombia. It also has continued to produce, for the U.S. government, Jamaican sugar; Costa Rican, Panamanian, and Ecuadorian cocoa; and abaca in Guatemala. Throughout Central America and northern South America it has maintained holdings that produced tropical woods, quinine, essential oils, and rubber.

United Church of Canada, church established June 10, 1925, in Toronto by the union of the Congregational, Methodist, and Presbyterian churches of Canada. The three churches were each the result of mergers that had taken place within each denomination in Canada in the 19th and early 20th century. In 1968 the Canada Conference of the Evangelical United Brethren Church merged with the United Church.

Before the end of the 19th century, the three denominational groups began cooperating in order to avoid duplication of ministries and interconfessional competition and to serve an expanding and developing country more effectively. In 1904 the three churches began official negotiations for organic unity, and by 1908 the Basis of Union was prepared. It stated the principles of doctrine, church government, the ministry, administration, and law that would apply to the new church. The Methodists and Congregationalists soon approved the basis and declared their readiness to unite. A strong minority among the Presbyterians, however, were not in favour of the basis or of the union itself on any terms. Although the Presbyterian General Assembly voted several times by a large majority to enter the union, unwillingness to split the denomination prevented its doing so for several

In many western settlements, however, many local Presbyterian and Methodist congregations united, using the principles of the Basis of Union. By 1923 there were more than 3,000 union congregations, and these congregations

put pressure on the three denominations to merge officially. The Presbyterian General Assembly finally decided to proceed with the union, even if a minority of its churches stayed out. The final result was that 784 Presbyterian congregations out of a total of 4,512 voted to remain out of the union and continued as the Presbyterian Church in Canada. Only eight Congregational churches refused to join, but all of the 4,797 Methodist congregations entered the union. The new United Church had about 600,000 members, and in the period after the union it grew faster than the general Canadian population.

The system of church government accepted by the United Church is presbyterian. Its doctrine, as stated in the Basis of Union, is conservative in nature and attempts to do justice to the basic beliefs of the three denominations. While this remains the official statement of the church's doctrine, with which ministers must be "in essential agreement," the Statement of Faith (1940) and the Catechism (1944), approved by the General Council, are contemporary in style and liberal in content. The United Church endeavours to be tolerant of all shades of doctrinal opinion consistent with the acceptance of Jesus Christ as Lord. In attempting to be not only a united but also a uniting church, the United Church of Canada is ecumenical in spirit, open in discussion, and cooperative in action. It is a member of the World Methodist Council, the World Alliance of Reformed Churches (Presbyterian and Congregational), the Canadian Council of Churches, and the World Council of Churches.

Where the same name may denote a person, place, or thing, the articles will be found in that order

United Church of Christ, Protestant denomination in the United States, formed by union of the Evangelical and Reformed Church (q.v.) and the General Council of Congregational Christian Churches (see Congregational Christian Churches, General Council of). Each was the result of former unions. Negotiations toward union of the two bodies were begun in 1942, and during the next 15 years there were seven revisions of the Basis of Union. The United Church of Christ was formed in a uniting General Synod on June 25, 1957, and its constitution was declared in force on July 4, 1961.

A Statement of Faith for the new church was adopted by the two uniting groups in 1959 in Oberlin, Ohio. This statement is, however, considered a testimony to the faith of the uniting churches rather than a final rule of faith. The local churches are neither bound by it nor required to accept it.

Church government is a combination of congregationalism and presbyterianism. The autonomy of each local church in the management of its own affairs is guaranteed by the constitution of the United Church of Christ. Local churches in an area are combined into an association, and several associations make up a conference (usually comprised of a state). Associations and conferences hold annual meetings. The highest representative body of the United Church of Christ is the General Synod, which is composed of about 700 delegates chosen by the conferences. It meets biennially. Headquarters of the church are in New York City.

United Daughters of the Confederacy (UDC), U.S. women's patriotic society, founded in Nashville, Tenn., Sept. 10, 1894, that draws its members from descendants of those who served in the Confederacy's armed forces or government or who gave to either their loyal and substantial private support. Its chief purpose is broadly commemorative and historical:

to preserve and mark sites; to gather historical records and other material; to celebrate historic occasions; and, by offering prizes, to encourage student essays on the historic South. In addition, it aids needy descendants of loyal Confederates, especially in securing education.

United East India Company: see Vereenigde Oost-Indische Compagnie.

United Evangelical Lutheran Church, church organized in 1896 in Minneapolis, Minn., as the United Danish Evangelical Lutheran Church in America by merger of the Danish Evangelical Lutheran Church in North America (the North Church) and the Danish Evangelical Lutheran Church Association in America (the Blair Church). "Danish" was dropped from the church's name in 1946. Both of the merging groups had earlier separated from other Lutheran groups.

The group that formed the North Church had the same early history in the United States as members of the American Evangelical Lutheran Church (formed as the Danish Evangelical Lutheran Church in America in 1874), but the North Church group formed its own church in 1894 because they were Pietists who wished to emphasize personal religious experience. The Blair Church was formed in 1884 by Danish pastors who separated from the Norwegian–Danish Conference to better serve the Danish immigrants.

The United Evangelical Lutheran Church was strongly Pictistic. It stressed the need for repentance, congregations often held prayer meetings, and laymen had a strong role in church government. Niels C. Carlsen, president of the church (1925–50), proposed union negotiations in 1948 that resulted in the merger of the United Evangelical Lutheran Church into the American Lutheran Church

(q.v.) in 1960.

United Evangelical Lutheran Church of Germany, German VEREINIGTE EVANGE-LISCH-LUTHERISCHE KIRCHE DEUTSCHLANDS (VELKD), union of 10 Lutheran territorial churches in Germany, organized in 1948 at Eisenach, E. Ger. The territorial churches were those of Bavaria, Brunswick, Hamburg, Hanover, Mecklenburg, Saxony, Schaumburg-Lippe, Schleswig-Holstein, and Thüring-en. The territorial churches of Württemberg and Oldenburg did not join. The Lutheran territorial church of Lübeck joined the united church in 1949, and then in 1967 Eutin joined. Also in 1967 Mecklenburg, Saxony, and Thüringen withdrew from the union and formed the United Evangelical Lutheran Church in the German Democratic Republic.

The Lutheran, Reformed, and United, or Union (a combination of Lutheran and Reformed), territorial churches in Germany had developed out of the changes in church life and organization and the various religious and political settlements brought about by the 16th-century Protestant Reformation. Until 1918 the prince of each German territory was the head of the church in his territory, which was either Lutheran, Reformed, or United. After the defeat of Germany in World War I, the German Empire was replaced by the German Republic, and the churches were no longer state churches headed by princes. They reorganized themselves into self-governing churches, but they remained independent territorial churches. Attempts to attain closer union were made, and during the Nazi era (1933-45), the churches cooperated in various ways to resist the German government's efforts to gain control over them. After World War II ended, the Lutheran churches were able to complete their long-sought union by forming the VELKD.

Although the member territorial churches retained considerable autonomy, the VELKD considers itself a united church rather than a federation of churches. Each of the member

churches is headed by a bishop, and all the bishops are members of the bishops' council of the VELKD. A presiding bishop is elected to head the united church. In addition, a general synod, which meets annually, an executive committee, and an administrative office make up the church government.

The VELKD cooperates with the Evangelical Church in Germany (Evangelische Kirche in Deutschland; EKD), which is a federation of Lutheran, Reformed, and United territorial churches organized in 1948. It is also a member of the Lutheran World Federation and of the World Council of Churches.

United Free Church of Scotland, Presbyterian church formed in 1900 as the result of the union between the Free Church of Scotland and the United Presbyterian Church (qq.v.). A series of unanimous decisions brought the United Presbyterian Church into the union. In the Free Church, however, a small minority strongly opposed union. They claimed to be the authentic Free Church and engaged in legal action to have their position and their sole right to the property of the Free Church recognized and declared. In the Scottish courts in 1901 and 1902, the verdict was unanimously against the claim and for the United Free Church, but in 1904 the House of Lords reversed this decision. The situation thus created was so difficult that government action followed. After an investigation a commission was set up that assigned to the United Free Church all the properties that the Free Church was not able to use.

Meanwhile, the turmoil had helped to weld the United Free Church into a closer unity as a vital, active church. From 1900 to 1929 it supported three colleges, in Aberdeen, Edinburgh, and Glasgow, and many of these schools' professors were among the notable scholars of the period. What has come to be regarded as the first milestone in the Protestant Ecumenical Movement, the World Missionary Conference of 1910, was housed in the General Assembly Hall of the United Free Church in Edinburgh.

When the United Free Church united with the Church of Scotland in 1929, a small minority of its members chose to remain outside. See also Scotland, Church of.

United Front, in Chinese history, either of two coalitions between the Chinese Communist Party (CCP) and the Nationalist Party (Kuomintang [KMT]). The first United Front was begun in 1924. In return for Soviet military and organizational aid, Sun Yat-sen, the founder of the KMT, agreed to a "bloc within" alliance in which CCP members joined the KMT as individuals while retaining their separate CCP memberships. The alliance was held together by the personal prestige of Sun Yat-sen. After Sun's death, in 1925, tension began to develop between the right wing of the KMT and the Communists. Finally, in March 1926, Chiang Kai-shek, who had been made commander in chief of the KMT army, expelled the Communists from positions of high leadership. A short time later, Chiang began his Northern Expedition to eliminate the powerful provincial warlords among whom the country was divided. The Northern Expedition met with success, and, as a result, Chiang gained the support of financial circles in Shanghai and of a number of warlords, whose armies were incorporated into his. In April 1927 Chiang began a bloody purge of all Communists in areas under his control. The Communist labour movement, which had been instrumental in aiding Chiang in the capture of the large South China cities, was almost entirely destroyed. The left wing of the KMT, which had already established an independent regime in Wu-han, in central China, continued to support the Communists, but the Wu-han regime's military situation became untenable, and friction developed between the

Communists and the KMT left wing. In July 1927 they dissolved their alliance, officially ending the first United Front.

Communist remnants fled to the countryside, where they began to organize the peasantry and established several independent "soin rural areas. In 1936 the Communists moved to North China, near the Manchurian area (Northeast Provinces) then occupied by Japanese troops. Led by Mao Zedong, the Communists responded to the growing anti-Japanese sentiment of their countrymen by calling on the KMT to join with them in expelling the Japanese. Chiang at first ignored these pleas; he was forced to change his attitude after the Sian Incident (q.v.) in December 1936, when he was kidnapped and held captive by troops of the Manchurian warlord Chang Hsüeh-liang, who wanted the KMT to fight the Japanese, not the Communists. Chiang was compelled, not only by his personal situation but by the pressure of events in general, to agree to Chang Hsüeh-liang's demands.

Thus in 1937 the second United Front between the KMT and the Communists was formally established, this time on the basis of a "bloc without" alliance between two separate groups; the Communists reorganized their army as the New 4th Army and put it nominally under KMT direction. In the fighting against the Japanese, however, the regular KMT armies either were crushed or were ordered to retreat. Afraid of high casualty rates, Chiang pulled his best troops off the front lines as early as 1939. Communist guerrillas, who mobilized the population behind the Japanese lines, soon became the only forces still fighting the Japanese. Worried about the resulting growth in Communist strength, the KMT began to use their troops to blockade Communist positions, several times even fighting against them. The United Front, however, continued officially until 1945, when, at the end of World War II, talks on unification between the two sides broke down, and a fullscale civil war ensued between the Communists and the KMT.

United Fruit Company, major division of United Brands Company (q, v).

United House of Prayer for All People, Pentecostal Holiness church founded by Bishop Charles Emmanuel ("Sweet Daddy") Grace (1881/84?–1960). After leaving a job as a cook on a Southern railway, he began to preach, assuming the name "Grace" and proclaiming himself "Bishop." He established a house of worship in 1926 in Charlotte, N.C., and later moved to Newark, N.J. He claimed to be an emissary of God with authority to grant or withhold salvation. The death of Grace led to temporary difficulties for the group over tax litigation and the succession to Grace's leadership.

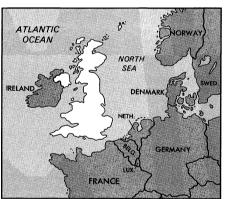

The key to the success of this cult was that the many offerings went directly to Daddy Grace to advance the sale of his healing-power products: soap, stationery, tea, coffee, cookies, toothpaste, facial creams, talcum powder, hair dressing, and the *Grace Magazine*. The church is headquartered in Washington, D.C., and has a reported membership of 50,000.

United Ireland Party, Irish political party officially called by its Irish name, Fine Gael (a,v.).

United Irishmen, Society of, Irish political organization formed in October 1791 by Theobald Wolfe Tone, James Napper Tandy, and Thomas Russell to achieve Roman Catholic emancipation and (with Protestant cooperation) parliamentary reform. British attempts to suppress the society caused its reorganization as an underground movement dedicated to securing complete Irish independence. In April 1794 the society opened negotiations with Revolutionary France for

military aid, but the British government soon learned of the activity. Twice in 1796–97 French expeditionary forces failed to reach Ireland. Still anticipating help from France, the United Irishmen made plans for a rebellion in 1798. The principal conspirators were arrested in advance of the uprising, and the meagre aid provided by France came too late to be effective. Only in County Wexford did the rebels make any gains, but they were unable to hold the area, and the rebellion collapsed.

United Kingdom, officially UNITED KING-DOM OF GREAT BRITAIN AND NORTHERN IRE-LAND, byname GREAT BRITAIN, OF BRITAIN, island nation, situated off the northwestern coast of Europe in the Atlantic Ocean, covering an area of 94,251 square miles (244,-110 square km). The capital is London. The United Kingdom comprises the island of Great Britain—consisting of England (50,363 square miles [130,440 square km]), occupying most of the southern two-thirds of the island; Scotland (30,418 square miles [78,782 square kml), occupying the northern one-third of the island; and Wales (8,019 square miles [20,769 square km]), lying to the west of Englandand Northern Ireland, also known as Ulster, lying in the northeastern part of the island of Ireland (5,452 square miles). The country extends between latitudes 49° and 61° N (about 600 miles [970 km] from south to north) and longitudes 1° E to 9° W (about 300 miles [510 km] at its widest extent east-to-west). The population in 1990 was estimated at 57,-

United Kingdom

A brief treatment of the United Kingdom follows. For full treatment, see MACROPAEDIA: United Kingdom.

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. The land area of the United Kingdom is about evenly divided between lowlands (elevation less than 330 feet [100 m] above sea level) and uplands (between 330 and 2,000 feet [100 and 610 m]), with some 5 percent consisting of highlands (above 2,000 feet). England has three hill regions of up to 3,000 feet (900 m) in the north, west, and southwest and two lowland regions (below 1,000 feet [300 m]) in the southeast and east. The northern hill region includes the northsouth Pennine Range, which peaks at Cross Fell (2,930 feet [893 m]), and England's highest point, Scafell Pike (3,210 feet [978 m]), in the Cumbrian Mountains of the Lake District. The countryside connecting these five regions is composed mainly of rich agricultural plains. The Thames and Severn are the principal rivers in England; the Mersey and Humber estuaries are significant for developing port

*Knowledge about the early Scottish kings, until Malcolm II, is slim and is partly based on traditional lists of kings. The dating of reigns is thus inexact.

†Eochaid may have been a minor and Giric his guardian; or Giric may have been a usurper. Both appear in the lists of kings for the period.

of kings for the period.

Athelstan was king of Wessex and the
first king of all England.

§"Stewart" was the original spelling for
the Scottish family; but, during the
16th century, French influence led to
the adoption of the spelling Stuart (or
Steuart), owing to the absence of the
letter "w" in the French alphabet.

Lames VI of Scottand became also

letter "w" in the French alphabet.

| James VI of Scotland became also James I of England in 1603. Upon accession to the English throne he styled himself "King of Great Britain" and was so proclaimed. Legally, however, he and his successors held separate English and Scotlish kingships until the Act of Union of 1707, when the two kingdoms were united as the Kingdom of Great Britain.

¶The United Kingdom was formed on Jan. 1, 1801, with the union of Great Britain and Ireland. After 1801 George III was styled "King of the United Kingdom of Great Britain and Ireland."

William and Mary, as husband and wife, reigned jointly until Mary's death in 1694. William then reigned alone until his own death in 1702.

bGeorge IV was regent from Feb. 5,

n 1917, during World War I, George V changed the name of his house from Saxe-Coburg-Gotha to Windsor.

♦ Edward VIII succeeded upon the death of his father, George V, on Jan. 20, 1936, but abdicated on Dec. 11, 1936, before coronation.

Nevis (4,406 feet [1,343 m]) is the highest point in the United Kingdom; the Central Lowlands (more than 500 feet [150 m] elevation); and the Southern Uplands (up to 2,800 feet [850 m]). The Clyde, Spey, and Tweed are the main rivers in Scotland.

Most of Wales is occupied by the Cambrian Mountains, and much of the land is suitable only for pasture. Wales's highest point is found in Snowdonia (3,560 feet [1,085 m]); the Dee, Tywi, and Teifi are the main rivers

Northern Ireland consists mainly of low plateaus and hills (average elevation 500 to 600 feet [150 to 180 m]); Lough Neagh, the largest freshwater lake (150 square miles [390 square km]) of the United Kingdom, is in the centre of Northern Ireland; the Bann, Erne, and Foyle are the major rivers.

The climate of the United Kingdom is temperate, being warmed by the North Atlantic Current and by southwest winds. Average temperatures range from 39° to 43° F (4° to 6° C) in winter in the north and from 53° F (12° to 17° C) in summer in the south. The mean annual temperature is 43° F (6° C) in the extreme north of Scotland (the Hebrides) and 52° F (11° C) in southwestern England. The average annual rainfall is more than 40 inches (1,000 mm), ranging from 20 inches (500 mm) on the southeastern coasts to as much as 200 inches (5,100 mm) in the western and northern highlands.

Forests cover less than one-tenth of the total area of the United Kingdom and are concentrated chiefly in northeastern Scotland and southeastern England; oak, elm, ash, beech, pine, and birch are the most common trees. Fauna includes red deer, fox, otter, squirrel, and rabbit.

The United Kingdom has very few mineral resources. The ancient tin mines of Cornwall and the iron-ore deposits of north-central England, which helped to build the Industrial Revolution, were exhausted or uneconomical to work by the late 20th century. Moreover, coal, once the primary energy source of the British economy, has also declined steadily in output and significance since the early 1950s. At the same time, however, a valuable, relatively new energy source is the nation's proved petroleum and natural-gas reserves, principally in the British sector of the North Sea.

The people. The English are the predominant ethnic group, constituting the majority of the population. Scots, Irish, and Welsh also make up significant proportions. Since the early 1950s a rapidly growing percentage of the country's population has been formed of Commonwealth immigrants, particularly from India, the West Indies, Pakistan, and Bangladesh. The United Kingdom has a very small estimated annual rate of population growth. Birth and death rates have continued to decline since 1871. Infant mortality, however, is relatively high for a developed country. Because the birth rates are low, the population as a whole is aging, and children 15 years and younger constitute less than one-fifth of the population, whereas persons 60 years and older account for more than one-fifth. Life expectancy is 72 years for males and 78 years for females.

English is the major language throughout the United Kingdom, although a substantial number in Wales speak Welsh as their sole language. Almost three-fifths of the population belong to the Church of England (Anglican); Roman Catholics constitute one-eighth of the population; there are some Presbyterians, Methodists, and Baptists; and the remainder are mostly other Protestants, Muslims, Jews, Hindus, and Sikhs.

About 92 percent of the population in the United Kingdom live in urban areas. England and Wales are the most heavily urbanized, followed by Scotland and then Northern Ireland. Between 1971 and 1981, however, many urban inhabitants migrated to nonmetropolitan

areas. The population of the Shetland Islands increased by more than 50 percent because of the development of the North Sea oil industries in the late 1970s. Since 1871, emigration has usually surpassed immigration, except during the 1930s, when there was an influx of European refugees, and between 1957 and 1962, when there was an inflow from The Commonwealth countries.

The economy. The United Kingdom has a developed mixed private- and public-enterprise economy largely based on services, especially international trade, and heavy industries. The government controls the production of coal, steel, and ships; it also runs certain utilities, the railways, and most civil aviation. The gross national product (GNP) is growing faster than the population, but only slowly. The GNP per capita lags behind those of most other western European countries.

Agriculture accounts for less than 2 percent of the GNP and employs some 2 percent of the work force. Farming is highly mechanized, though farms are not extremely large, and is dominated by the raising of sheep and cattle. Pastures cover about one-half of the land. Arable land is limited to less than one-third of the nation's land area, and the United Kingdom is not agriculturally self-sufficient. Chief crops include barley, wheat, sugar beets, and potatoes.

The Forestry Commission manages one-half of the country's productive woodland. Fishing is highly mechanized, and British trawlers land huge quantities of fish annually. Catches consist largely of cod, haddock, plaice, herring, and mackerel, and nearly one-tenth of the total catch is shellfish.

The mineral industry accounts for approximately 6 percent of the GNP and employs less than 1 percent of the work force. Production from oil fields in the North Sea has allowed the United Kingdom to become virtually self-sufficient in petroleum. The British National Oil corporation, established by the government in 1975, is active in the production and marketing of petroleum; the government moved to divest the corporation of its control over offshore oil fields in 1981 and offered private firms a controlling interest over production. The United Kingdom's coal industry, despite its steady decline since the early 1950s, remains one of the largest and most technologically advanced in Europe. The government controls the production of coal through the National Coal Board; private operators are allowed to operate certain small mines. A public corporation also controls the production of iron and steel, which has been heavily subsidized by the government and the European Coal and Steel Community.

Manufacturing industries account for onefifth of the GNP and employ a similar proportion of the work force. Small companies predominate, though companies with 500 or more employees employ a larger percentage of the work force. Major manufactures include motor vehicles, aerospace equipment, electronic data-processing and telecommunication equipment, metal goods, precision instruments, petrochemicals, and other chemicals

Electricity is largely generated from domestic fuels, although about one-fifth comes from nuclear power.

The Trades Union Congress, which was founded in 1868, encompasses all but a small number of unions in England and Northern Ireland; there are similar central bodies in Scotland and Wales. The Confederation of British Industry represents employers.

Public revenues ordinarily fall short of expenditures and are chiefly derived from income taxes, which are highly progressive, and excises. A single graduated income tax was introduced in 1973. Deficits are offset by public borrowing

Exports of goods and services account for

Prime ministers of Great Britain and the United Kingdom*

The origin of the term prime minister and the question to whom it should originally be applied have long been issues of scholarly and political debate. Although the term was used as Early as the reign of Queen Anne (1702–14), it acquired wider currency during the reign of George II (1727–60), when it began to be used as a term of reproach toward Sir Robert Walpole. The title prime minister did not become official until 1905, to refer to the leader of a government. †Before the development of the Conservative and Liberal parties in the mid-19th century, parties in Britain were largely simply alliances of prominent groups or aristocratic families. The designations Whig and Tory tend often to be approximate. In all cases, the party designation is that of the prime minister; he might lead a coalition government, as did David Lloyd George and Winston Churchill (in his first term).

as much as one-third of the GNP, and the British merchant marine—merchant navv. in British usage-remains one of the largest in the world. The European Community, which the United Kingdom joined in 1973, accounts for nearly one-half of the country's trade. Exports to the countries of The Commonwealth represent a significant share of the United Kingdom's total exports and ordinarily exceed imports.

Government and social conditions. The United Kingdom is a constitutional monarchy and a parliamentary democracy. Its constitution is partly unwritten and is flexible. The constitution's basic sources are legislative enactments of Parliament and decisions made by courts of law. The reigning monarch is permanent head of state. Royal powers are largely honorific; for instance, the right to veto legislative acts has not been exercised since the early 18th century. Executive power is wielded by the prime minister, who is the leader of the majority party in Parliament, and the Cabinet, which is appointed by the prime minister from among his or her party. The prime minister also appoints about 25 ministers outside the Cabinet, as well as 50 junior ministers. Legislative power is vested in the Parliament, consisting of the monarch, the hereditary and appointive House of Lords, and the elected House of Commons. The 650 members of the House of Commons are elected to five-year terms, although the prime minister may call general elections at any time. The House of Lords was stripped of most of its power in 1911, and now its main function is to revise legislation. The Cabinet, as the representative of the majority party in the House of Commons, can effectively control legislation. A two-party system has existed in the United Kingdom since the late 17th century, though it is occasionally threatened by a third party. The Conservative Party and the Labour Party are the dominant parties of the modern era. (In the early 20th century, Labour displaced the Liberals as one of the two dominant parties.) The independent judiciary is headed by the Supreme Court of Judicature, which is composed of the Appeal Court, the High Court of Justice, and the Crown Court. Scotland has a distinct legal system based on Roman law. There is no right of judicial review of legislation. The United Kingdom is a member of the North Atlantic Treaty Organization.

The United Kingdom's comprehensive social-security system provides cash benefits for sickness, maternity, temporary disability, and unemployment; family allowances; and oldage, invalidity, permanent-disability, and survivor pensions. The National Health Service, in operation since 1948, offers free medical treatment to all citizens through a network of about 2,500 hospitals. An environmental provision of the government in 1956 to ensure the well-being of the population, now imitated elsewhere, is the regulation of air quality through the establishment of smokeless zones, where emission from chimneys is prohibited. The overall supply of housing meets the overall demand; however, regional or local shortages exist. More than three-fifths of the total housing is owner-occupied, one-fourth is publicly owned and rented, and the remainder is privately owned and rented. In an attempt to ensure adequate housing, the local authorities construct new housing and allocate existing housing on the basis of need.

The educational system is primarily administered by elected local education officials. Education is compulsory and free, in statesupported schools, between the ages of 5 and 16. General education may lead to technical or commercial study or to higher education. Internationally prominent universities include

those of Oxford (12th century) and Cambridge (13th century).

The communications media of the United Kingdom are among the most influential in the world. A high circulation rate of readers per inhabitants supports a diversified newspaper industry. High editorial standards mark some of the most prestigious papers, such as The Times of London, The Guardian, and The Observer. The state-owned British Broadcasting Corporation (BBC) has an international reputation for impartiality and objectivity. Its radio and television broadcasts include news, educational, cultural, and entertainment programs. The Independent Television Authority (ITA) was established in 1954 to provide facilities for commercial-television companies. In 1972 the ITA became the Independent Broadcasting Authority, with responsibility also for commercial radio.

Widespread changes in the United Kingdom's cultural life have occurred since 1945, with new forms of popular culture having emerged. The Arts Council, formed in 1946, provides widespread support for many kinds of contemporary creative and performing arts. The formation of the Arts Council coincided with a great expansion of the cultural market, mainly commercial, and of audiences and viewers for the arts generally.

History. The early pre-Roman inhabitants of Britain were Celtic-speaking peoples, including the Brythonic people of Wales, the Picts of Scotland, and the Britons of Britain. Celts also settled in Ireland in about 500 BC. Julius Caesar invaded Britain in 55 and 54 BC. but the island was not subdued by Rome until the 1st century AD. The Roman province of Britannia endured until the 5th century and included present-day England and Wales. In the 5th century Nordic tribes of Angles, Saxons, and Jutes invaded Britain, driving many Celtic inhabitants into Cornwall and Wales. The invasions had little effect on the Celtic peoples of Wales and Scotland. Christianity was introduced throughout the United Kingdom in the 6th century and during the 7th century began to flourish as many kingdoms converted to Christianity. During the 8th and 9th centuries Vikings, particularly Danes, raided the coasts of Britain and often sent conquering armies.

In the late 9th century Alfred the Great (849-899), ruler of Wessex, united England to repel a Danish invasion. About the same time, the Scots attained dominance in Scotland, and Malcolm II (1005-34) united the Scottish kingdom. William of Normandy conquered England in 1066 and became William I (1066-87). Norman kings established a strong central government and feudal state. From the 11th century on, Scotland came under the influence of the English throne.

Henry II (1154-89) conquered Ireland in the late 12th century. Henry's sons Richard I (1189-99) and John (1199-1216) had conflicts with the clergy and nobles, and eventually John was forced to grant the nobles certain concessions in the Magna Carta (1215)

The concept of community of the realm developed during the 13th century, providing the foundation for parliamentary government. During the reign of Edward I (1272-1307), statute law developed to supplement English common law, and the first Parliament was convened. Edward conquered Wales and made it a principality of England (1284), passed exclusively to the heir to the English throne (Prince of Wales; 1301). Edward also attempted to dominate the affairs of Scotland. In 1314 Robert Bruce won independence for Scotland by defeating English forces at Bannockburn, and in 1328 English monarchs recognized the independence of Scotland. The house of Stewart (Stuart after 1603) ascended to the Scottish throne in 1371 with the coronation of Robert II.

The Tudors became the ruling family of En-

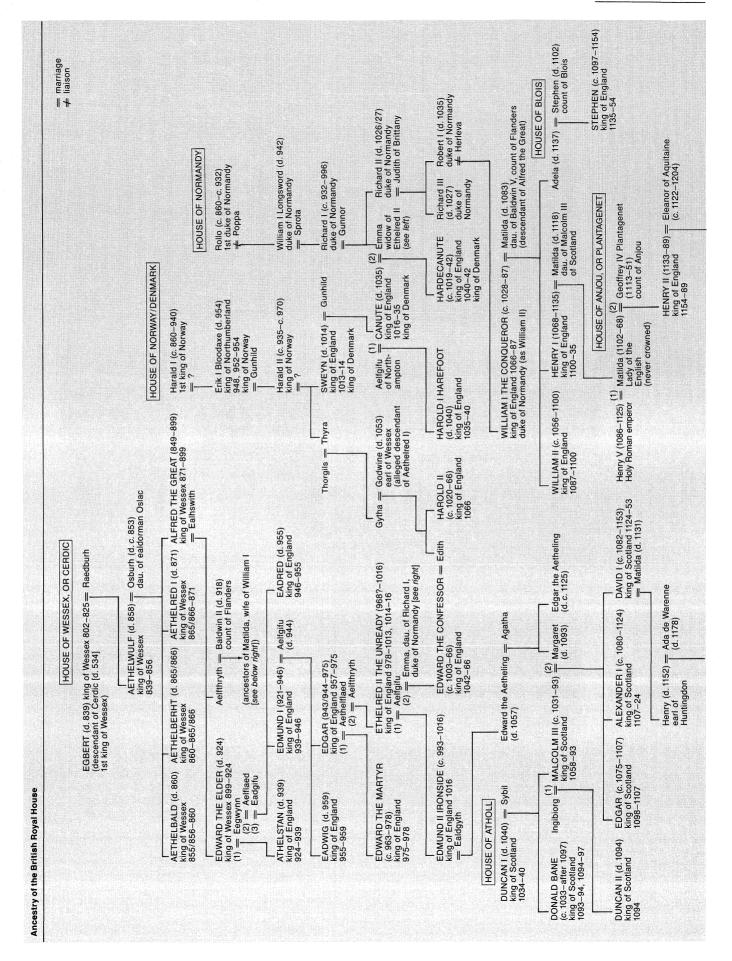

gland following the War of the Roses (1455-85). Henry VIII (1509-47) established the Church of England and incorporated Wales as part of England. The reign of Elizabeth I (1558-1603) began a period of colonial expansion, as English sailors and explorers challenged Spanish supremacy of the high seas and in the New World. In 1588 the defeat of the Spanish Armada prevented an invasion of England by Spain. In 1603 James VI of Scotland ascended to the English throne, becoming James I and establishing a personal union of the two kingdoms. Civil war erupted in 1642 between royalists and parliamentarians, ending in the execution of Charles I (1649). After eleven years of Puritan rule under Oliver Cromwell and his son (1649-60), the monarchy was restored with Charles II. In 1707 England and Scotland assented to the Act of Union, forming the kingdom of Great Britain. The Hanoverians ascended to the English throne in 1714, when George Louis, elector of Hanover, became George I of Great Britain. During the reign of George III, Great Britain's American colonies won independence in 1783. This was followed by a period of war with revolutionary France and later the empire of Napoleon Bonaparte (1789-1815). In 1801 legislation united Great Britain with Ireland to create the United Kingdom of Great Britain and Ireland.

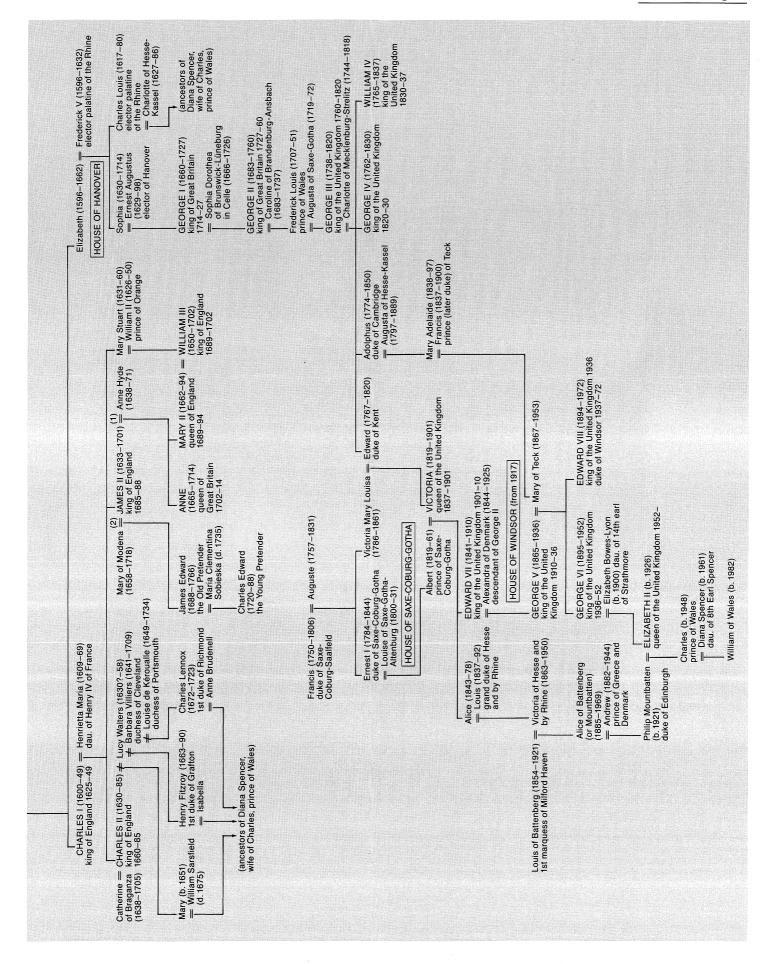

During the reign of Queen Victoria (1837-1901) Britain's colonial expansion reached its zenith, though the older dominions, such as Canada and Australia, were gradually granted independence (1867 and 1901, respectively). The growth of parliamentary government during the 19th century was enhanced by the leadership of prime ministers such as Sir Robert Peel, Benjamin Disraeli, and William Gladstone. The United Kingdom entered World War I allied with France and Russia in 1914. Following the war, revolutionary disorder erupted in Ireland, and in 1921 the Irish Free State was granted dominion status. The six counties of Ulster, however, remained in the United Kingdom as Northern Ireland.

The United Kingdom entered World War II in 1939 and battled German and Japanese forces in Europe, Africa, and Asia. Following the war the Irish Free State became the Irish Republic and left the Commonwealth. India also gained independence from the United Kingdom after the war. Throughout the postwar period and into the 1970s, the United Kingdom continued to lose its overseas colonies and dependencies. The status of Northern Ireland became controversial as British troops were brought in to maintain order from the 1970s on. Violence and terrorist acts increased between Roman Catholics seeking union with the Republic of Ireland and Protestants wishing to remain part of the United Kingdom.

Domestically, during the 20th century, the United Kingdom underwent a quiet revolution with the advent of the Labour Party and the creation of a welfare state. The first Labour ministry was established in 1924 under Ramsay MacDonald, and in the 1945 elections the party, espousing a socialist platform, won an overwhelming majority in Parliament and at once embarked on a nationalization program. The state bought out shareholders in the Bank of England, the coal mines, all inland transport, aviation, gas, and electricity. It subsidized housing and food. It put through a "cradle-to-grave" social-insurance plan and also set up a National Health Service to provide free medical care. Subsequent Conservative governments denationalized such sectors as iron and steel and trucking, but the basic welfare state remained. In 1973, under a Conservative government, Britain joined the European Economic Community.

United Methodist Church, in the United States, a major Protestant church formed

in 1968 in Dallas, Texas, by the union of The Methodist Church and the Evangelical United Brethren Church. It developed from the British Methodist revival movement led by John Wesley that was taken to the American colonies in the 1760s. The autonomous Methodist Episcopal Church was organized in 1784 in Baltimore, Md., with Thomas Coke and Francis Asbury as superintendents (later called bishops).

The church grew rapidly, aided by the circuitriding system, in which Methodist preachers regularly rode to frontier communities to preach the gospel. Various schisms devel-oped, however. In 1830 a dissenting group organized the Methodist Protestant Church, a nonepiscopal church. The slavery question caused a larger disruption, and in 1845 in Louisville, Ky., southern Methodists organized the Methodist Episcopal Church, South.

Movements toward reunion of the Methodists began in the 1870s but advanced slowly. Finally, in 1939, The Methodist Church was organized by union of the Methodist Episcopal Church; the Methodist Episcopal Church, South; and the Methodist Protestant Church. The merger in 1968 that formed the United Methodist Church brought together The Methodist Church, primarily of British background, and the Evangelical United Brethren Church, primarily of German background but

very similar to the Methodists.

The church is episcopally governed. It is divided into geographic areas, each of which has an annual conference. These areas are combined into five jurisdictions, which hold a jurisdictional conference every four years. Bishops, who are appointed by the jurisdictional conferences, serve one or more annual conference areas. These areas are subdivided into districts, which are presided over by district superintendents. The supreme ruling body of the church is the general conference, which meets every four years and is composed of an equal number of ministers and laymen elected by the annual conferences. United Methodists constitute the second largest American Protestant denomination, outnumbered only by Southern Baptists.

United Mine Workers of America (UMWA), American labour union, founded in 1890, that engaged in bitter, and often successful, disputes with coal-mine operators for fair pay, safe working conditions, and other worker benefits. An industrial union, the UMWA includes miners in the bituminous and anthracite coal mines, as well as workers outside the mines.

Under the leadership of John Mitchell, who served as its president from 1898 to 1908, the union grew rapidly in spite of the determined opposition of the mine operators. The UMWA held successful strikes in the coalfields in 1897 and 1902, and by 1920 it had approximately 500,000 members. But the union lost members, strength, and influence during the 1920s because of the antiunion climate of that era and because of the presence of the newer and unorganized coalfields of West Virginia and Kentucky (the union itself had its basis in the fields of western Pennsylvania and the lower

From 1920 to 1960 the UMWA was led by John L. Lewis, a militant and usually effective chief. In 1933 Lewis capitalized on the prolabour mentality of the New Deal and set about organizing the Appalachian coalfields. He succeeded, and as a consequence the UMWA formed the backbone of Franklin D. Roosevelt's labour support in the presidential election of 1936. Lewis and the union were also a mainstay of the Committee for Industrial Organization (founded in 1935 and renamed the Congress of Industrial Organizations in 1938). In 1942 he withdrew the miners from the CIO, and, with the exception of the years 1946-47, the union has since remained unaffiliated. Among its many strikes was that of 1943, during World War II, which provoked much public indignation and led to the government's seizure of the mines.

The UMWA's efforts to secure improvements in pay, safety conditions, health care, insurance, and pensions made American miners among the best-paid and best-insured miners in the world. Automation, the development of other sources of fuel, and the general decline of unionism in later years lessened the importance of the union. There had been about a half million UMWA members in 1946, but by the 1990s there were fewer than 65,000 members, who mined only a third of the nation's

United Nations (UN), international organization established by charter on Oct. 24, 1945, with the purposes of maintaining international peace and security, developing friendly relations among nations on the principle of equal rights and self-determination, and encouraging international cooperation in solving international economic, social, cultural, and humanitarian problems.

A brief treatment of the United Nations follows. For full treatment, see MACROPAEDIA:

United Nations.

The term United Nations was originally used during World War II to denote those countries that were allied against the Axis Powers (Germany, Japan, and Italy). Dumbarton Oaks, an estate in Washington, D.C., set the scene for the earliest attempts to permanently organize this United Nations. Representatives of the "Big Four" (United Kingdom, United States, U.S.S.R., and China) met there from August 21 to October 7, 1944, to draft some preliminary proposals, which were later discussed and more clearly outlined at the Yalta Conference in February 1945, bringing together Winston Churchill, Joseph Stalin, and Franklin D. Roosevelt. The proposals, as supplemented by their decisions, formed the basis of negotiations at the United Nations Conference on International Organization, held in San Francisco two months later; the resultant Charter of the United Nations was signed in June and came into force on Oct. 24, 1945. The headquarters is now located at the UN Building in New York City.

Six principal organs of the United Nations were established.

The General Assembly includes representatives of all members of the UN. A nation may send up to five representatives but still has

only one vote. Decisions are reached either by majority or by two-thirds vote, depending upon the subject matter. The General Assembly works through the committee system and receives reports from the various councils: it is also responsible for choosing the members of these councils. It performs such functions as supervising trust agreements, budgetary matters, and financial assessments. The assembly is responsible for the election of judges to the World Court and plays an important role in amending the charter and proposing conferences. It is convened yearly or by special session when necessary.

The Security Council consists of five permanent members (United Kingdom, U.S.S.R. United States, France, and China) and 10 nonpermanent ones. It is continuously subject to convening and is mainly concerned with the maintenance of international security. The presidency is rotated among members each month. Nonpermanent members are chosen from groups and regions in the most equitable fashion possible. Nine votes are sufficient to carry a Security Council decision, but any permanent member may exercise a veto over

any substantive proposal.

The Economic and Social Council has 54 members elected for three years by the General Assembly. It is mainly concerned with the management of the UN's social, economic, cultural, and humanitarian activities. Convening at least twice yearly, this council makes studies and proposes suggestions for economic and social improvements. A series of commissions operates under this council, including four major ones located in Europe, Asia, Latin America, and Africa.

The Trusteeship Council has handled the affairs of trust territories, i.e., those colonies that have been placed under the care of a country by the UN. Members are elected by the General Assembly for a three-year term on the basis of need, depending upon the number of

trusteeships.

The International Court of Justice, also known as the World Court, is located in The Hague. It is the main judicial branch of the UN and consists of 15 judges elected for nineyear terms by both the General Assembly and the Security Council. Each judge must come from a different country, with the principal legal systems of the world represented at all times. The court settles disputes and hands down decisions and opinions to the General Assembly and the Security Council.

The Secretariat is the administrative department of the UN, headed by the secretarygeneral, who functions in a position of polit-

ical importance and is appointed by both the General Assembly and the Security Council. Trygve Lie of Norway served as the first secretary general from 1946, followed by Dag Hammarskjöld of Sweden from 1953, U Thant of Burma from 1962, Kurt Waldheim of Austria from 1972, and Javier Pérez de Cuellar of Peru from 1982.

The United Nations attempts to promote harmonious interaction among the countries of the world. Other programs and agencies under its supervision include the International Bank for Reconstruction and Development (World Bank); International Monetary Fund (IMF); International Labour Organization (ILO); Food and Agriculture Organization (FAO); World Health Organization (WHO); United Nations Educational, Scientific and Cultural Organization (UNESCO); and United Nations Children's Fund (UNICEF).

United Nations Capital Development Fund (UNCDF), UN organization established by the General Assembly in 1966 and fully operational in 1974. It aids developing countries by means of grants and loans.

Available to any member state of the UN system, UNCDF provides rapid assistance. However, its resources are primarily used to assist the 30 least developed countries that belong to the UN. Assistance applies to agriculture, agro-industry, drinking water supply, health and nutrition, low-income housing, and roads and rural schools. The fund is governed by an Executive Board composed of 24 members elected by the General Assembly.

Nations Children's (UNICEF), special program of the United Nations devoted to aiding national efforts to improve the health, nutrition, education, and general welfare of children. UNICEF was created in December 1946 as the United Nations International Children's Emergency Fund (hence UNICEF) to provide relief to children in countries devastated by war. After 1950 the fund's efforts were directed toward general programs for the improvement of children's welfare, particularly in less developed countries as well as those in various emergency situations. The change in name to the United Nations Children's Fund reflected this shift in function.

Much of UNICEF's effort has been in fields in which relatively small expenditures could have a significant impact on the lives of children, such as the prevention and treatment of certain diseases and surplus food shipments. Other activities to which UNICEF contributes include the development of health services and the training of health personnel, construction of educational facilities and teacher training, and the extension of other welfare services. The activities are financed by both government and private voluntary contributions. Headquarters are in New York City.

United Nations Conference on Trade and Development (UNCTAD), permanent organ of the UN General Assembly, instituted to promote international trade, especially with a view to accelerating economic development. It was established by an act of a United Nations Conference on Trade and Development, which met in Geneva in March-June 1964 chiefly to consider the trade needs of the developing countries. The Conference meets every four years. UNCTAD's main functions include the promotion of trade between countries in different stages of development and with different economic systems, initiation of action for the negotiation of trade agreements, and the formulation of international trade policies.

A Trade and Development Board, consisting (since 1976) of representatives of all countries belonging to UNCTAD, is responsible for UNCTAD's functions when the conference is not in session. In addition, a permanent and full-time secretariat is also maintained.

United Nations Development Programme (UNDP), UN organization formed in November 1965 through the merger of the Expanded Programme of Technical Assistance and the UN Special Fund. Its Governing Council consists of representatives from 48 nations-27 developing nations and 21 developed nations. Headquarters are in New York City.

UNDP aims to build more productive societies and economies in low-income nations by helping them develop their natural resources and human capabilities. Aid is administered through five-year Country Programmes, which fund projects conceived to attract developmental capital, train skilled manpower, and institute modern technologies responsible for expanding commerce and industry. UNDP acts to make experts available to study growth potentials as well as to help provide facilities for scientific research.

United Nations Disaster Relief Co-ordinator, Office of the (UNDRO), UN office established in March 1972 to coordinate international relief activities to countries struck by natural or other disasters. It is headed by a disaster relief coordinator who reports directly

to the UN secretary general.

UNDRO attempts to consolidate the resources of the international community in response to disasters. Responding to requests from stricken states for disaster assistance, UNDRO is authorized not only to direct UN assistance but also to mobilize aid from nongovernmental organs such as the International Red Cross. By matching donor responses to reported needs, UNDRO functions as an information coordination centre. By aiding the establishment of stock-piles in areas susceptible to natural disasters and by implementing effective use of natural resources, UNDRO promotes the effectiveness of the international community in combatting disasters.

United Nations Educational, Scientific and Cultural Organization (UNESCO), specialized agency of the United Nations created in 1946 to contribute to world peace by promoting international collaboration in education, science, and culture. The activities of UNESCO are mainly facilitative; the organization attempts to assist, support, and complement national efforts of member states in the elimination of illiteracy and the extension of free education and seeks to encourage the free exchange of ideas and knowledge among peoples and nations of the world by providing clearinghouse and exchange services. With the increasing attention devoted to the needs and problems of less developed countries in the 1960s and '70s, a greater portion of UNESCO's regular program funds were being used for educational and scientific development projects. During the 1980s UNESCO experienced mounting criticism for its overly politicized approach to cultural and other issues and for the sustained expansion of its budget—prompting the United States to withdraw from the organization on Dec. 31, 1984, and the United Kingdom to withdraw exactly one year later.

UNESCO's organization includes a General Conference that meets every two years, a 45-member Executive Board, and a Secretariat. The constitution, which was adopted in November 1945, also provides for national advisory commissions in member states to further the integration of UNESCO's work with the work of member states

In December 1962 a resolution of the UNES-CO General Conference established the International Institute for Educational Planning (IIEP) to serve as a world centre for advanced training and research in educational planning. Although it is administratively a part of UNESCO, its own Executive Board controls its policies and programs. In January 1969 the International Bureau of Education was incorporated into UNESCO.

The permanent headquarters of UNESCO is in Paris.

United Nations Environment Programme (UNEP), UN organization established in 1972 to guide and coordinate environmental activities within the United Nations system. UNEP recommends to its parent body policies that will promote environmental cooperation on an international level. Earthwatch, an international monitoring system devised to facilitate information exchanges among governments, is UNEP's most widely recognized activity. Participation in this enterprise enables members to assess significant environmental risks and to act accordingly.

The Governing Council is composed of 58 members who are elected by the UN General

United Nations Fund for Population Activities (UNFPA), trust fund under the jurisdiction of the United Nations Development Programme (UNDP). Originally created as the Trust Fund for Population Activities in 1967, it became a fund of the General Assembly in 1972 and a subsidiary organ of the General Assembly in 1979, with the UNDP's Governing Council as its governing body. UNFPA funds family planning and population control projects in more than 120 countries. Projects supported by the fund fall into eight categories: (1) collecting and analyzing basic population data, (2) studying population dynamics, (3) formulating and evaluating population policies, (4) implementing policies, (5) family planning, (6) communication and education, (7) devising special programs, and (8) conducting multisector activities.

United Nations High Commissioner for Refugees, Office of the (UNHCR), organization established as the successor to the International Refugee Organization (q.v.) by the UN General Assembly on Jan. 1, 1951, to provide legal and political protection for refugees until they could acquire nationality in new countries of residence. With the main office in Geneva and branch offices in important countries of asylum, the UNHCR intervenes with the various governments to ensure such minimal rights as freedom from arbitrary expulsion, access to the courts, the right to work and to educational opportunities, and possession of identity and travel documents. Financed primarily by voluntary governmental contributions, the UNHCR also provides social and economic aid. Programs have included housing projects and efforts to resettle African refugees south of the Sahara.

United Nations Industrial Development Organization (UNIDO), international UN organization established by the General Assembly on Jan. 1, 1967. Meeting annually, the UNIDO board is composed of representatives of 45 member states, elected by the General Assembly.

UNIDO aims to assist in the industrialization of the developing countries by coordinating other UN organizations devoted to this end. Its activities help to formulate industrial development policies and programs by providing advisers and other assistance, mostly in terms of information, education, and research. Its Investment Promotion Offices in Brussels, Cologne, New York City, Paris, Tokyo, Vienna, and Zürich publicize investment opportunities and provide information to potential

United Nations Institute for Training and Research (UNITAR), United Nations organization established in 1965 to provide highpriority training and research projects to help facilitate the UN objectives of world peace and security and of economic and social progress.

A Board of Trustees of up to 30 members is appointed by the UN secretary-general; the secretary-general himself and the presidents of the General Assembly and the Economic and Social Council (ECOSOC) are ex-officio members. Meetings usually occur once annually. UNITAR's fundamental activities are interorganizational, with primary attention paid to analyzing UN procedures, functions, and structures. Its training program includes a variety of courses designed to benefit both new and long-standing UN delegates, as well as nondiplomatic officials.

United Nations Korean Reconstruction Agency (UNKRA), economic-rehabilitation program established in 1950 to aid South Korea in recovering from the disruption caused by the 1945 partition creating the two Korean republics. In addition to problems of economic reconstruction, much attention was concentrated on the problem of refugees who were displaced by World War II and those who were made homeless by the ensuing Korean War. Thirty-four UN member states and five nonmember states contributed \$148,500,000 to the UNKRA program, which was terminated July 1, 1958.

United Nations Monetary and Financial Conference: see Bretton Woods Conference.

United Nations Relief and Rehabilitation Administration (UNRRA), administrative body for an extensive social-welfare program that assisted nations ravaged by World War II. Created on Nov. 9, 1943, by a 44-nation agreement, its operations concentrated on distributing relief supplies, such as food, clothing, fuel, shelter, and medicines; providing relief services, with trained personnel; and aiding agricultural and economic rehabilitation. In addition, it also provided camps, personnel, and food for the care and repatriation of millions of displaced persons and refugees after the war. UNRRA discontinued its activities in 1947; unfinished projects were turned over to the International Refugee Organization, the World Health Organization, and the United Nations International Children's Emergency Fund (now the United Nations Children's Fund).

United Nations Relief and Works Agency for Palestine Refugees in the Near East (UNRWA), agency created by the General Assembly on Dec. 9, 1949, to provide relief, health, and education services for those Palestinians (the great majority of whom are Arabs) who lost both their homes and means of livelihood during the Arab-Israeli wars following the creation of the state of Israel in 1948. Approximately 500,000 Palestinians originally qualified for relief; by the mid-1980s more than 2,100,000 were on the relief rolls, including children of the original refugees, destitute nonrefugees, and deceased refugees whose ration cards were used by others. Although some have been able to find part-time work or to move out of the camps, UNRWA continues to provide camps, food, clothing, schools, vocational training, and health clinics, often working in cooperation with the United Nations Educational, Scientific and Cultural Organization (UNESCO). UNRWA is financed by voluntary contributions of member governments, and, like its predecessor organization, the United Nations Relief for Palestine Refugees in the Near East, it was originally designated a temporary agency. Its mandate has been renewed several times, however, because of the complexity of the problem.

United Nations Research Institute for Social Development (UNRISD), autonomous United Nations body established in 1964 to conduct research into the problems and poli-

cies of social and economic development. UNRISD is dependent on voluntary contributions from governments, from other UN organizations, and from various national and international agencies because it does not receive monies from the regular UN budget; it has been supported by 15, primarily European, governments.

As a research organ, UNRISD investigates the relations between social and economic change during varying phases of economic growth. UNRISD's autonomous position frees it to conduct research using and interpreting its own data, to question internationally fashionable assumptions, and to propose alternatives. Focusing on the practical issues of developing countries, UNRISD conducts systematic field studies and comparative analyses of social and economic development.

United Party (UP), Afrikaans VERENIGDE PARTY, in full UNITED SOUTH AFRICAN NATIONALIST PARTY, one of the two leading political parties of the Republic of South Africa from 1934, when it was founded, to 1977. It was the official opposition party from 1948 to 1977 and drew its main support from the English-speaking white population. It differed from the Afrikaner-supported National Party (NP) in its emphasis on the need for social and economic development for the country's black population within the framework of apartheid.

The UP was formed in 1934 by a merger of the National Party and the South African Party, led by J.B.M. Hertzog and Jan Smuts, respectively. Hertzog's hope was for a new sense of national unity, in which the Afrikaners (who had dominated the National Party) and the English-speaking South Africans (of the South African Party) would live side by side in equality and mutual respect as the two dominant white ethnic groups. Although the UP remained in power from 1934 to 1948, its success as an English-Afrikaner coalition ended in 1939, when Hertzog and other Afrikaner nationalists left the party because of the UP's decision to support Great Britain against Germany in World War II. The UP then formed a new government under Smuts with the cooperation of the Labour Party and the Dominionites, giving it a more clearly Englishspeaking, pro-British cast.

After the war, the "liberalism" of Smuts and the United Party came under fierce attack from the Nationalists, who sought to reduce South Africa's links with Great Britain, the Commonwealth, and the United Nations; to advance the power of the Afrikaner people; and, above all, to preserve white supremacy, especially through the policy of apartheid. In the general election of 1948 the National Party was victorious. Smuts resigned, and, when he died two years later, his party went further into decline. Over the years the party continued to lose strength through defections of members who formed the Progressive Party in 1959 and the Reform Party in 1975 or who joined the ruling National Party. On June 28, 1977, the United Party was formally disbanded, and its majority faction formed the "centrist" New Republic Party. The United Party had by this time ceased to be the chief party of opposition. That place had been yielded to the Progressive Party (or Progressive Federal Party)

United Pentecostal Church, Inc., Protestant denomination organized in St. Louis, Mo., in 1945 by merger of the Pentecostal Assemblies of Jesus Christ and the Pentecostal Church, Inc. It is the largest of the Jesus Only groups (a movement for which the sacrament of baptism is given in the name of Jesus only, rather than in the name of the Trinity), and it emphasizes justification and baptism of the Holy Spirit (demonstrated by speaking in tongues) and practices foot washing, healing, and conscientious objection. It has a rigid holiness code of behaviour and dress. The church

government is congregational with a General Conference, made up of all ministers and one layman from each congregation, which meets annually. Headquarters are located in St. Louis, Mo. See Pentecostalism.

United Presbyterian Church, denomination that flourished in Scotland from 1847 to 1900. It was formed through the union of the United Secession Church and the Relief Church, which had developed from groups that left the Church of Scotland in the 18th century. The United Presbyterian Church, the Church of Scotland, and the Free Church of Scotland each claimed to represent the soundest traditions of Scottish Presbyterianism. While the three were barely distinguishable in doctrine, polity, and worship, the United Presbyterian Church was marked by a special zeal for foreign missions and by its constant opposition to all state aid to the church, holding that this led inevitably to state control. Intermittent negotiations, renewed in 1897. resulted in the formation of the United Free Church of Scotland in 1900, which reunited with the Church of Scotland in 1929.

United Press International (UPI), American-based news agency, one of the largest proprietary news wire services in the world. With the Associated Press, Reuters, Agence France-Presse, and Tass, it transmits more than 80 percent of the world flow of international news. It was created in 1958 upon the merger of the United Press (UP; 1907) with the International News Service (INS). UPI and its precursor agencies pioneered in some key areas of news coverage, including the wired transmission of news photographs in 1925. By the late 20th century UPI's clients in about 100 countries included print and broadcast media.

Roy W. Howard (1883-1964) has been credited with building United Press into a major news-gathering organization. It was created when E.W. Scripps combined three regional news services under his control to sell news to all newspapers, not only those with a franchise, as with the Associated Press. Scripps made Howard the UP's general manager in 1912. Soon the agency established bureaus in major European capitals. It began to supply news to Latin-American papers during World War I. Throughout its history United Press stressed human-interest and feature news, and it developed the subsidiary United Features syndicate to sell special features. It also established UP Movietone News to supply news film to television stations.

William Randolph Hearst had set up INS to provide news to morning newspapers. In 1928 other Hearst news services were merged into INS to enable it to provide around-the-clock service. It had about 2,000 domestic and foreign clients in 1958, when it was merged with UP, then much larger. The merged organization was, by the late 20th century, serving some 7,500 newspaper and radio clients in the United States and other countries, transmitting in many languages over radio and leased wire facilities. As befell many of its clients, UPI found costs rising faster than revenues in the 1970s, and the number of subscribers dropped sharply. In 1982 Scripps–Howard sold the service.

United Provinces of Central America, Spanish Provincias Unidas de Centro-América (1823–40), union of what are now the states of Guatemala, Honduras, El Salvador, Costa Rica, and Nicaragua.

Since the 1520s these regions, along with the Mexican state of Chiapas, had composed the captaincy general of Guatemala, part of the viceroyalty of New Spain (Mexico). In 1821 they became independent from Spain, and in 1822 they were joined to the ephemeral empire of Mexico, ruled by Agustín de Iturbide. Following Iturbide's abdication in March

1823, delegates from the Central American provinces, representing mostly upper-class creoles, assembled at Guatemala City in July to declare themselves completely independent and to form a federal republic—the United Provinces of Central America. They drew up a constitution that provided for a federal capital in Guatemala City and a president for each of the five constituent states, which were to enjoy complete local autonomy; suffrage was restricted to the upper classes, slavery was abolished, and the privileges of the Roman Catholic church were maintained. Manuel José Arce was elected first president in 1825.

Liberal-Conservative dissensions developed and soon erupted into civil war; the Liberals gained control in 1830, when their leader, Francisco Morazán, was elected president. His administration quickly disestablished the church and passed a series of anticlerical laws; other measures were enacted to promote trade and industry. In 1834 Morazán moved the capital of the foundering federation from Guatemala City, a Conservative stronghold, to San Salvador.

After an outbreak of cholera in 1837, which the clergy blamed on the "godless" Liberals, the Conservatives incited an Indian revolt. A mestizo rebel leader, Rafael Carreta, seized Guatemala City in 1838, whereupon most of the member states went their own ways. By April 1839, only El Salvador remained loyal. Morazán, after a disastrous defeat at the hands of Carrera in March 1840, resigned his office.

About 25 abortive attempts were made to restore the union. In the 19th century the Guatemalan government tried many times to gain hegemony over the other Central American states by force. Carrera, who controlled the Guatemalan government until his death in 1865, interfered frequently in El Salvador, Honduras, and Nicaragua by installing conservative regimes. Justo Rufino Barrios, Guatemalan president from 1873 to 1885, urged in 1882 that the old federation be revived; in 1885 he declared himself its ruler and marched his army into El Salvador, where he was defeated and killed at the Battle of Chalchuapa (April 2).

United Provinces of the Netherlands: see Dutch Republic.

United Service Organizations, Inc. (USO), formerly (1941–51) UNITED SERVICE ORGANIZATIONS FOR NATIONAL DEFENSE, INC., private, nonprofit social-service agency first chartered on Feb. 4, 1941, to provide social, welfare, and recreational services for members of the U.S. armed forces and their families.

First proposed by General George C. Marshall in 1940 to enhance the quality of life and morale of servicemen, the USO was established, at his urging, by representatives of the Salvation Army, the YMCA, the National Board of the YWCA, the National Jewish Welfare Board, the National Catholic Community Service, and (from March 1941) the Travelers Aid Association of America. USO service clubs and recreational centres began appearing in the summer of 1941, and USO Camp Shows, Inc., was incorporated in November 1941 to provide celebrity entertainment for military commands overseas and at home (especially, later, at veterans' hospitals). In June 1943 the USO had its peak number of volunteers (739,000) and in March 1944 its peak number of recreational clubs (3,035); in July 1944 it handled 661,000 cases of travelers' aid.

After the war, early in 1948, the old USO dissolved, but it was revived the following year and largely reorganized on March 27, 1951, after the outbreak of the Korean War. It expanded significantly in the 1950s and again in the 1960s, during the Vietnam War. In later years, it greatly enlarged its counseling services, offering housing information, drug-abuse programs, training services for war

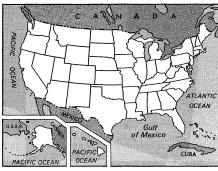

brides, and other human services. Among the USO's entertainment services, Bob Hope's Christmas Shows were especially popular.

United Society of Believers in Christ's Second Appearing: see Shaker.

United South African Nationalist Party: see United Party.

United States, officially UNITED STATES OF AMERICA, abbreviation U.S., or U.S.A., byname AMERICA, country of North America with 48 contiguous states occupying the mid-latitudes of the continent, together with the state of Alaska (the largest) at the northwest extreme of North America and the island state of Hawaii lying in the mid-Pacific Ocean. Its total area, including the U.S. share of the Great Lakes, is 3,679,192 square miles (9,529,063 square km); its capital is Washington, D.C. The coterminous United States is bounded to the north by Canada; to the west by the Pacific Ocean; to the south by Mexico, the Gulf of Mexico, and the Straits of Florida; and to the east by the Atlantic Ocean. The population in 1990 was estimated to be 250,410,000.

A brief treatment of the United States follows. For full treatment, *see* MACROPAEDIA: United States of America.

United States

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. The continental United States may be divided into five major physiographic regions. They include the Atlantic Coastal Plain and the Appalachian Mountains in the east and the southeast; the Interior Lowlands, covering the nation's vast midsection; and the Western Cordillera and, contained within its branches, the Western Intermontane Plateaus.

The Atlantic Coastal Plain is part of North America's larger eastern-coastal plains, which extend from New England in the United States to Mexico's Yucatán Peninsula. Narrow in the northeastern United States, the plain widens southward, as flooded river valleys such as Chesapeake Bay form major estuaries. Offshore sandbars and barrier beaches stretch intermittently along the length of the eastern seaboard. Turning westward, the plain includes the Florida Peninsula, which never exceeds 350 feet (107 m) above sea level, and the entire Gulf Coast; it extends as much as 500 miles (800 km) inland along the Mississippi River before turning southward into Mexico.

The Appalachian Mountains, trending from south-southwest to north-northeast for about 1,500 miles (2,400 km), rise abruptly to the west of the coastal plain along the Blue Ridge escarpment from the Piedmont. The latter is a well-drained, rolling landscape, contrasting markedly with the low and often swampy Atlantic Plain. The Appalachians are very old, consisting of the eroded stumps of much greater ranges but today rising to only 6,684 feet (2,037 m), at Mount Mitchell. They generally do not exceed 3,500 feet (1,100 m) in elevation and are almost entirely forested.

The Interior Lowlands and their upland

fringes, widest in the north, stretch along the Canadian border from Lake Ontario (the easternmost of the Great Lakes) westward to the Rocky Mountains (roughly 400 miles [650 km] from the Pacific Coast). The region narrows to the south, eventually reaching the Atlantic Plain near the Rio Grande. The Interior Lowlands may be further divided into two major subregions: the eastern and more humid Central Lowland corresponds roughly with the country's "Corn Belt"; the western and drier Great Plains continue northward far into Canada and comprise the continent's major wheat-growing region. The Central Lowland is bounded by the Great Lakes and the Canadian Shield to the north and by the Ohio River and the Ozark Plateau (the westernmost extension of the Appalachian system) to the east and south. The Central Lowland merges into the Great Plains roughly 300 miles (500 km) west of the Mississippi River. The Great Plains, though seemingly flat, actually rise continuously from about 2,000 feet elevation in the east to more than 6,000 feet as they approach the Rocky Mountain front, the easternmost limit of the Western Cordillera.

The western United States is dominated by the two branches of the Western Cordillera: the eastern ranges form the Pacific-Gulf of Mexico drainage divide along the Rocky Mountains; the western ranges consist of two smaller systems, the Sierra Nevada and the Cascades forming an interior chain of mountains and the Coastal Ranges the other. The country's highest peaks lie within the western branches of the Cordillera. Mount McKinley, the continent's highest peak, at 20,320 feet (6,194 m), lies within the Alaska Range (an extension of the Western Cordillera), and Mount Whitney, the highest peak within the coterminous United States, at 14,494 feet (4,418 m), is in the Sierra Nevada.

The western Intermontane Plateau's region is dominated by the Great Basin (a vast interior drainage system), which contains the Great Salt Lake. The west coast of the country is among the most geologically active regions in the world; the explosive eruption of Mount St. Helens during the spring of 1980 was a dramatic reminder of this fact. The Hawaii and Islands, of which the islands of Hawaii and Maui are the largest, were formed almost entirely by volcanic action. Alaska, another geologically active region, consists of an insular and cordilleran area in the south; interior basins, plains, and tablelands; the Brooks Range in the north; and the tundra-covered Arctic Plains in the far north.

The hydrology of the coterminous United States is dominated by the Mississippi River basin (including its two major tributaries, the Missouri and the Ohio rivers), which is roughly coincident with the Interior Lowlands region, covering about two-fifths of the coterminous states. The Mississippi and several of its tributaries make up one of the world's great navigable inland-waterway systems. The country's other major network of inland waterways consists of the Great Lakes (constituting by far the largest freshwater-lake group in the world) and the St. Lawrence River. West of the Rockies, nearly all of the rivers are strongly affected by aridity. In the deserts and steppes of the intermontane basins, most of the scanty runoff disappears into interior basins, only one of which, the Great Salt Lake, holds any substantial volume of surface water. Aside from lesser coastal streams, only three large river systems reach the Pacific Ocean-the Columbia, the Colorado, and the San Joaquin-Sacramento system of California's Central Valley. All three of these river systems flow for considerable distances across dry lands from which they receive little or no

Although the United States experiences wide climatic variation, the precipitation pattern may be depicted as two comparatively humid coasts separated by a progressively more humid (west to east) interior. Rainfall generally declines westward from the humid eastern zone (lying roughly along and southeastward of the Appalachians), where precipitation is usually greater than 40 inches (1,000 mm). It ranges between 30 and 40 inches (760 to 1,000 mm) throughout much of the Central Lowland and between 10 and 30 inches (250 and 760 mm) westward in the Great Plains. The Great Plains are separated from the Pacific coast by the extremely arid landscape of the intermontane basins, much of which receives less than 4 inches (100 mm) of precipitation annually. The far northwest coast (or Pacific Northwest) is the wettest part of the country, often receiving 70 inches (1,780 mm) or more of rainfall annually. Both Alaska and Hawaii are very humid, precipitation ranging from 60 to 200 inches (1,500 to 5,100 mm) in Alaska and from as little as 10 to more than 480 inches (12,200 mm; at Mount Waialeale) in Hawaii.

Temperatures throughout the coterminous United States vary seasonally. The greatest extremes occur in the vast north-central plains; Chicago's average temperature ranges from 27° F (-3° C) in January to 75° F (24° C) in July, while Mobile's (lying along the Gulf of Mexico and directly south of Chicago) January and July temperatures are 52° F (11° C) and 82° F (28° C), respectively. The frost-free period decreases northward, from more than 240 days along the Gulf of Mexico to less than 120 days along most of the country's border with Canada. The climate is generally milder along both oceanic coasts than it is in the interior.

About one-fifth of the territory of the United States is arable; the area sown to cereal grains by itself is approximately equivalent to the combined areas of France and the United Kingdom. The Central Lowland and the Great Plains, now largely devoted to agriculture, originally supported tall grasslands (prairie) and short grasslands (steppe), respectively. The country also possesses vast rangelands and pasturelands, and forests (covering roughly one-fourth and one-third of total land area, respectively). Prior to modern settlement, forests of such hardwoods as oak, hickory, and walnut, interspersed with softwood species, stretched unbroken through much of the east and north-central United States. The western-coastal forests are known for their enormous redwoods and Douglas firs. The western mountains support typically alpine vegetation, while the intermontane region, for the most part, contains desert shrub and a variety of cactus species. Alaskan vegetation ranges from coastal rain forests to the tundra and permafrost of its northern-coastal plain. Hawaii's plant life is lush and tropical.

Animal life in the United States is composed of both a continental-scale range of indigenous wildlife (many, such as the wolf, bighorn sheep, and the cougar, were, in the late 20th century, considered endangered) and an extensive list of introduced species, such as the English sparrow and many varieties of domestic livestock. The ebb and flow of human development has not allowed a clear-cut equilibrium among domestic and wild animal populations to emerge.

The United States is rich in both metallic and energy minerals and is among the leading producers of many: two-fifths of the world's molybdenum; about one-sixth of its copper; one-tenth of its lead, gold, and silver; and somewhat smaller amounts of its iron ore and zinc, to mention a few of the more important. The country's extensive energy resources

include more than one-fourth of the world's recoverable reserves of high-quality coal (anthracite and bituminous), more than one-eighth of the world's recoverable reserves of lignite, and substantial reserves of petroleum and natural gas. Such critical metals as cobalt, chromium, manganese, and platinum, however, supply only a fraction of domestic needs.

The people. The United States is not a homogeneous but rather a pluralistic society, a nation of groups. The notion that it has been a great "melting pot" in which people from all nations and cultures have blended into what are called "Americans" is in many respects a myth. During the 1960s and early 1970s a strong trend developed among minorities, initiated by blacks and taken up later by Hispanics and various non-Anglo-Saxon white ethnic groups, to organize pressure for social change. These campaigns for equal rights and equal opportunities made increasingly apparent the variety of ethnic and racial groups that make up the nation.

Before the arrival of European colonists, the American Indian population of what is today the United States comprised only a few ethnic, though many linguistic, stocks. But, although the arrival of the first blacks, both freemen and slaves, followed the colonists by only a few years, until about 1860 the population of the United States was relatively homogeneous. Of 5,000,000 European immigrants between 1820 and 1860, 9 of 10 were from England, Ireland, or Germany. After the American Civil War, however, larger numbers of immigrants began to arrive from Italy, the Balkans, Poland, Russia, and other countries of eastern and southern Europe. Most were markedly different in culture and language from the earlier Americans. The new immigrants established their own neighbourhoods, usually urban, and rapidly developed ethnic societies, clubs, newspapers, and theatres; and the areas in which they lived became distinctive cultural and social enclaves within the larger society. During the same period, the native peoples of Alaska and Hawaii began to see their cultures submerged, sometimes violently, in the flood of immigrants. In the 20th century the rest of the Americas and Asia added their millions to

The people of the United States in the late 20th century comprised a large white majority (about 85 percent of the total), who usually still thought of themselves first as "Americans" but who nevertheless still identified strongly with many of their original national heritages; a black minority of 12 percent, representing a growing, but disproportionately disadvantaged and sometimes alienated, fraction of the nation; and smaller numbers of Asians, Pacific islanders, American Indians, Eskimo (Inuit), and Aleut (together about 3 percent).

Linguistically, both the white and black groups tended to speak English. Spanish was spoken by the Hispanic minority of about 7 percent, whose ethnic heritage was largely Mexican and included a variety of racial groups. Except for a few other large urban enclaves of immigrant populations, only the Spanish, Asian, and native American groups maintained a sufficient sense of community to permit keeping their languages alive. Indeed, locally, members of these communities were numerous enough to make a problem of the sociologically thorny issues of bilingual education and government services.

Protestants make up about 55 percent of the American population, with the largest denominations and groups of denominations being the Baptists, Methodists, Lutherans, Pentecostals, Presbyterians, Disciples of Christ, and Congregationalists. About 30 percent of the total were Roman Catholics, 3 percent were Jews, and 2 percent were Eastern Orthodox. An additional 7 percent considered themselves to be nonreligious or atheist.

The United States has a gross birth rate that

is somewhat higher than Europe's but much lower than those of most other regions of the world. In general, as family income and educational levels rise, the number of children declines. Roman Catholics and fundamentalist Protestants tend to have the highest birth rates. About one-fifth of the total population of the United States is less than 15 years of age.

The gross death rate is somewhat lower than Europe's. The average life expectancy for blacks in the United States was nearly five years short of that for whites, and comparative mortality rates at various ages for nonwhite males were generally much higher than those for whites. Major causes of death are chronic diseases associated with old age—i.e., heart disease, cerebrovascular disorders, and cancer.

Few populations in the world are as mobile as that of the United States, where every year 10 percent of the people move. In the late 20th century the United States was a suburban nation, with about 45 percent of the people living in the suburbs, about 30 percent in the central cities, and 25 percent in rural areas. The declining farm population, representing 3 percent of the total, was the smallest proportionately in the history of the nation.

The economy. The United States has a developed, largely free-enterprise economy, with manufacturing and services being the primary components of the gross national product (GNP). The overall GNP is the highest in the world, and it is growing much more rapidly than the population. The GNP per capita is among the highest in the world.

Agriculture generates about 2 percent of the GNP and employs about 3 percent of the labour force. Farming is largely mechanized and scientifically controlled, and the production of most cash crops substantially exceeds domestic needs, making the United States a leading exporter of food. About one-tenth of the arable land is irrigated, mostly in the southwest and west. The principal crops grown include corn (maize), wheat, soybeans, sugarcane and sugar beets, sorghum, hay, barley, potatoes, cotton, oats, tomatoes, sunflower seeds, and peanuts (groundnuts). Fruits include oranges, grapes, apples, grapefruits, and lemons and limes. The country also ranks high worldwide in the production of tobacco, avocados, pineapples, strawberries, almonds, walnuts, and hops. Raw and refined sugar, wine, beer, and honey are produced in large quantities.

The principal livestock of the United States include cattle, pigs, horses, and sheep. Dairying is well-developed; milk, cheese, and butter production exceed domestic needs—some is exported and some stored under government subsidy. Cattle hide and wool production supports leather and textile industries. Poultry is important.

Commercial forestry is well-developed, with substantial areas harvested periodically and reforested. The United States is the world's leading producer of wood.

The United States ranks among the world's leading fishing nations, and almost all of the commercial catch is marine. Fishing fleets operate in the Atlantic and Pacific oceans, the Arctic and Caribbean seas, and the Gulf of Mexico.

Mining is well-developed and highly mechanized. Coal leads in energy-mineral production, and, of metals, iron ore, copper, bauxite, lead, zinc, molybdenum, mercury, tungsten, titanium ore, and silver are the most important. Phosphate rock and potash, salt, limestone, gypsum, lime, marl, pumice, boron, and talc are also extracted, and the country is among the world leaders in mica, barite, sulfur, and feldspar production.

Manufacturing, which accounts for about 20 percent of the GNP and employs about 16 percent of the work force, is well-diversified. Aluminum, steel and iron metals and manu-

factured wares, cement and building materials, machinery, motor vehicles and other transport equipment and parts, electrical and electronics wares, processed food and tobacco, chemicals, textiles and clothing, and rubber and plastics are the leading products. Nearly three-fourths of the country's electrical energy is produced by thermal power plants and the remainder by nuclear and hydroelectric plants. Manufacturing began to shift from heavy durable goods to electronics, computers, and software in the 1970s and '80s as the older industries became less competitive with foreign products because of outdated plants and equipment, lowered growth in productivity, and relatively high labour costs.

Construction generates approximately 4 percent of the GNP and employs an equal percentage of the labour force. Major construction activities include maintenance of the interstate highway system as well as natural-gas and crude-petroleum pipelines and riverchannel improvements on the Mississippi and other rivers.

Tourism centres on such semitropical areas as Florida, southern California, Hawaii, Puerto Rico, and the U.S. Virgin Islands, with fine beaches and fishing, and upon winter sports resorts in the Rocky Mountains and in New England; the winter resorts also offer Alpine scenery and climate in summer. The large metropolitan areas are also attractions with their museums and cultural events; the historic sites of the eastern seaboard states,

the natural wonders and national parks of the western states, and the Canadian-American Niagara Falls also figure importantly among the attractions that appeal to U.S. and foreign tourists

The labour force is about two-thirds of the population aged 16 years and over. Unemployment became a serious problem during the recession of the early 1980s and was aggravated by the shift from traditional heavy industries toward electronics industries and by automation. Trade unionism is well-developed and exercises substantial political influence. The American Federation of Labour-Congress of Industrial Organizations (AFL-CIO) is the principal federation, with which most unions are affiliated. The federation's member unions and the other independent unions negotiate contracts governing wages and working conditions for their members and also negotiate grievances with employers; they also help members find jobs, with interim financial aid and support from the AFL-CIO. In certain industries, jobs are assigned through union hiring halls. Federal legislation provides for regulation of labour-management relations through the Department of Labor and various agencies that adjudicate labour disputes, establish a federal minimum wage, administer occupational safety and health policies, and aid stateadministered unemployment programs.

The government regulates the economy through taxation, exemptions, allowances, subsidies, and deductions; interest rates are controlled by the politically independent Federal Reserve Bank. The Department of Commerce and various regulatory agencies guarantee open competition, and the Department of Justice enforces legislation against restraint of trade. Industries considered to be in the national interest receive research and development aid channeled primarily through the departments of Energy and Defense, the National Aeronautics and Space Administration, and the National Science Foundation.

Federal revenue is generated mainly through individual income taxes, social security taxes, corporate income taxes, and excise taxes. Expenditures are mainly for defense, social security, social welfare, interest on the national debt, health, and education. The Department of the Treasury and the Federal Reserve System regulate monetary policy. Escalating military expenditures for technologically advanced systems and the rapid expansion of social and welfare services in the 1960s and '70s produced serious budgetary deficits that were aggravated by periodic economic recession. The national debt thus continued to rise.

The national transportation network includes the largest railroad system (in terms of total length of track) and the largest road network (in terms of mileage) in the world. Railroads increasingly are used for long-distance largevolume freight hauling and truck-flatcar "pig-

gyback" hauling. More than four-fifths of the nation's roads are paved, and about one-tenth of the total consists of limited-access interstate highways. The country's extensive inland waterways are served by more than 50 ports, of which New York and New Orleans handle the most traffic; the Mississippi River is the country's busiest inland waterway. Air service is well-developed; the interregional connecting airports of Atlanta and Chicago have the highest volume of commercial air transport traffic in the world.

The merchandise trade balance was consistently in deficit between the mid-1970s and the late 1980s. The exports of services kept the goods and services balance positive from the late 1970s into the early 1980s, when it too became negative. Leading exports include chemicals and related products, motor vehicles and parts, office machinery and computers, aircraft and parts, cereal grains, and general industrial and electrical machinery. Leading export markets include Canada, Japan, Mexico, the United Kingdom, and Germany. Major imports include motor vehicles and parts, crude petroleum and refined products, basic iron and steel manufactures, and raw materials (excluding fuels and food). Principal import sources include Japan, Canada, Germany, and Mexico.

Government and social conditions. United States is a federal republic composed of a national government and 50 state governments. The country's Constitution, adopted in 1789, delegates certain powers to the national government and reserves all other powers to the states. Defense, foreign policy, foreign trade, the higher levels of justice, internal security, and regulation of interstate commerce are among the national government's most important areas of responsibility. The states' major functions encompass agriculture and conservation, highway and motor vehicle supervision, public safety and correction. regulation of intrastate commerce, and the administration of education and health and welfare programs.

The Constitution divides the national government's power among three coequal branches: the executive, the legislative, and the judicial; the states have governmental structures closely paralleling this arrangement. Highest executive authority rests with the president, who is elected to four-year terms by democratically chosen electors from each of the 50 states and the District of Columbia. The president serves as head of state, commander in chief of the armed forces, and treaty maker. He is also head of government, initiating legislation and formulating foreign policy. Legislative power is vested in the 435-member House of Representatives and the 100-member Senate. Each state elects two senators to six-year terms. House members are elected to two-vear terms by popular vote; the number of representatives granted to each state is based on population as adjusted by a decennial census. The judicial branch is headed by the Supreme Court, a nine-member body appointed by the president with the consent of the Senate. Using its powers of judicial review, the court can invalidate legislative, executive, and administrative acts that do not conform to the Constitution and is the court of last resort in appeals from lower court decisions.

Two political parties dominate electoral politics in the United States: the (largely centreleft) Democratic Party and the (largely centreright) Republican Party. Each organization seeks the support of a broad base of voters and a wide spectrum of interests; both parties, therefore, generally espouse politically moderate programs. Their constituencies overlap in a large body of relatively independent voters. The United States is a global military power

with forces stationed by various treaties in western Europe, Japan, and South Korea. The country has a large and sophisticated nuclear weapons force consisting of tactical missiles, strategic bombers, submarine-launched ballistic missiles, and intercontinental ballistic missiles.

Social welfare in the United States is financed and administered by both the public and private sectors; benefits cover unemployment, work injury, sickness, maternity, old age, disability, and widowhood. The national and state governments, moreover, work together to provide cash payments and social services to indigent families with dependent children.

Health and sanitary conditions are excellent, except in areas with concentrations of rural or urban poor. The death rate for heart disease, the nation's leading health problem, declined steadily between the late 1960s and the early 1980s. The country, furthermore, has a high proportion of doctors for the size of its population. Health indicators for the black population, however, are generally less favourable; the mortality rate for black infants, for example, is almost twice as high as for white infants.

Education in most states is free and compulsory between the ages of 6 and 16 years. The great majority of U.S. students remain in school until they complete secondary school at 17 or 18 years of age. While education is largely the province of the state and local governments, the national government plays a major role by supporting school lunch programs, administering Indian education, making research grants to universities, underwriting loans to college students, financing education for veterans, and subsidizing the purchase of teaching materials. The United States has a number of the world's most outstanding institutions of higher learning, including Harvard University (Massachusetts), Yale University (Connecticut), Princeton University (New Jersey), Massachusetts Institute of Technology, the University of Chicago (Illinois), Stanford University (California), and the University of California.

Constitutional guarantees of press freedom (on both federal and state levels) give the nation's news media unparalleled freedom to act as a check on government action. Not even an official-secrets act restrains the press from adopting a virtual adversary role to government. Media coverage of the Vietnam War countered and helped reverse government policy; it has stimulated the rise and fall of various demagogues and other political figures, and its coverage of the Watergate scandal forced President Richard Nixon to resign (1974) in the face of imminent impeachment. The power of the media in America is enormous and ubiquitous.

Cultural life. American culture has produced many outstanding writers and artists. The country's 19th-century literature was dominated by such names as Mark Twain, Edgar Allan Poe, Herman Melville, Walt Whitman, and Henry James. Among the great American writers of the 20th century have been Ernest Hemingway, William Faulkner, John Steinbeck, H.L. Mencken, F. Scott Fitzgerald, Norman Mailer, and Saul Bellow; the dramatists Eugene O'Neill and Tennessee Williams; and the poets Ezra Pound, T.S. Eliot, and Robert Frost.

One of the country's most popular and internationally influential art forms has been the motion picture. American filmmakers such as Howard Hawks, George Cukor, Orson Welles, Frank Capra, John Ford, and John Huston gained world renown for cinematic artistry.

The country has developed several distinctive types of popular music: jazz, the blues, country and western, and rock and roll. The most popular performers have included Duke Ellington in jazz, Albert King in the blues,

Hank Williams in country and western, and Elvis Presley in rock and roll.

History The territory now part of the United States has been inhabited for from 15,000 to 40,000 years, as attested by local evidence. The aboriginal peoples, ancestral to today's American Indians, left no firm monuments on the scale of contemporaneous cultures elsewhere, but both the pueblos of the Southwest and the great mounds of the Mississippi Valley antedate the arrival of the European colonial powers. The original 13 British colonies that became the United States of America in 1776 were just one of many attempts by European powers to build empires in North America. All seized land from the native Indians, and most learned survival skills from the Indians, who then were usually either assimilated or driven off by superior European weapons. The Spaniards reached Florida as early as 1513 and New Mexico in 1540. The French began their exploration of the vast Mississippi Valley in 1673. The Russians reached Alaska in 1741

Of all the colonizers, the British were the most successful. In 1607 Jamestown became the first permanent British settlement in North America and the foundation of the Virginia colony. It was followed 13 years later by the Pilgrim settlement at Plymouth, which was soon dwarfed by the mighty Puritan colony of Massachusetts Bay. Most of New England was settled by Puritans fleeing either the harassment of Charles I or the orthodoxy of Massachusetts Bay. Pennsylvania was given to the Quaker William Penn as payment for a debt, and Maryland, a grant to the Roman Catholic George Calvert, was the first colony to establish religious freedom. New York, New Jersey, and Delaware were taken from the Dutch by the British in 1664, a year after the Carolinas had been granted to eight British noblemen. The 13th colony was Georgia, founded by James Oglethorpe in 1732 as a refuge for debtors and convicts.

When the British successfully evicted the French from North America in 1763, they embarked on a number of policies that the colonials found particularly odious. Settlement was prohibited west of the Appalachians and measures were passed to raise revenue in the colonies. These revenue-raising measures and Britain's generally exploitive mercantilist economic policy irked the colonials, who began to band together to oppose and subvert the measures. Britain increased its military presence to enforce compliance (a presence part of whose cost was exacted from the colonials), and fighting broke out in 1775. The Second Continental Congress, acting for the 13 colonies, declared independence on July 4, 1776, and created Articles of Confederation to govern the new nation. Victory over the British came in 1783, and the resulting Treaty of Paris established U.S. boundaries, except for Spanish Florida, west to the Mississippi River.

The Articles of Confederation provided a weak central government and proved inadequate to govern the growing nation. A new constitution was created in 1787, ratified in 1788, and took effect in 1789. George Washington was the first president, and his sober and reasoned judgments were instrumental in establishing both the tenor of the country and the precedents of the executive office. Under the new Constitution, the country began to grow almost immediately. Before the Louisiana Purchase of 1803 nearly doubled the size of the United States, four more states had been admitted to the Union. The movement west, later called Manifest Destiny, had begun.

As the United States moved west, the issue of slavery was intensifying strains between the rapidly industrializing North against the plantation South. The South had been devoted to strong states' rights vis-à-vis the federal gov-

ernment. Kentucky and Virginia had claimed the right to nullify federal laws as early as 1798, and South Carolina provoked the Nullification crisis of 1832 that elicited President Andrew Jackson's threat of force against the state. Many compromises over the slavery issue had held the Union together for more than a half-century, but the election as president in 1860 of Abraham Lincoln, whose Republican Party clearly advocated the prohibition of slavery in federal territories, led South Carolina to secede, joined by 10 other Southern states by the next year.

Lincoln denied the Southern states' right to secede. The resulting Civil War traumatized the nation, but it resulted in the preserva-tion of the Union, the abolition of slavery, the establishment of citizenship for former slaves, and the institution of universal adult male suffrage. Lincoln's plans for magnanimity to the defeated South were cut short by his assassination, and Congress, completely dominated by northern Radical Republicans, embarked on its own, more punitive scheme of reconstruction. The excesses and abuses of this system, and its protection of black civil rights in the South, came to an end with the withdrawal of federal (Northern) troops by 1877. Thereafter, Southern segregationism became universal and would not ease for almost another hundred years.

The post-Civil War United States was characterized by increasing industrialization, the continuing westward movement, a massive influx of foreign immigrants, and the slow emergence of the United States into a position of world power. The westward movement, fueled by the desire for land, led to war with Mexico and to a long series of evictions of Indians from lands granted them by treaty, pushing them constantly into less desirable reservations. Immigrants fleeing pogroms, massacres, and starvation in Europe and Asia exceeded 13,000,000 between 1900 and 1914 alone; they laboured in building the nation's roads, railways, and industrial plants, but their assimilation was slow; the large city ghettos that housed many of them became notorious for their slums and squalor. As they gradually became assimilated, they moved out of the ghettos, which were occupied by new waves of immigrants.

Business interests were encouraging U.S. involvement abroad, particularly in Latin America. When Cuba revolted against Spain in 1895, U.S. sympathies and interests, and massive pro-intervention propaganda by the Hearst and Pulitzer newspapers, ultimately led to war with Spain (1898). The U.S. victory brought with it widespread territories (the Philippines. Guam, Puerto Rico) and world prominence. Prominence had its price. Though President Woodrow Wilson pledged neutrality in World War I, the United States was unable to remain outside the struggle. Its entry into the war in 1917 was decisive in bringing about an Allied victory. Wilson's visionary peace without victory was never realized, but his League of Nations and many of his Fourteen Points (for postwar peace) were incorporated in the Treaty of Versailles (1919). The U.S. Senate, however, refused to ratify the treaty or join the League, and a period of isolationism set

The decade that followed World War I was a remarkable one for the United States. It was a time of Protestant morality (Prohibition, the Scopes evolution trial) and reaction against it (bootleggers and speakeasies and flappers). Government protected business (and in the Teapot Dome scandal was corrupted by it). Most of all, it was a time of prosperitywhich came to a sudden end in 1929 when the stock market crashed and the Great Depression began. It ushered in the Franklin Roosevelt era of heavy federal involvement in economic and social policy. His New Deal legislation revolutionized the country, but full recovery was never achieved until war production became massive on the eve of World War II. The Japanese attack on Pearl Harbor catapulted the United States into World War II. which, owing to U.S. production capacity secure from enemy attack, it was able to win. The Allied victory in 1945 left the United States the leader of the Western world, deeply involved in the reconstruction of Europe and Japan, but embroiled in a cold war with the Soviet Union. A Soviet-inspired attack on South Korea involved the United States in the Korean War (1950-53), and a Communistsupported revolution led the United States into the Vietnam War (1961-73). The war in Vietnam precipitated a moral and spiritual crisis in the United States in which popular support for South Vietnam waned and sentiments for American withdrawal from the conflict increased. The war's end was followed by the Watergate scandal, which for the first time forced the resignation of a U.S. president (Richard Nixon). While the Vietnam War was going on, joint black and white civil rights marches and demonstrations, to a large degree under the leadership of Martin Luther King, Jr., forced attention on basic civil rights, and state and local segregationist policies directed against blacks began to be struck down by the courts. American space technology landed a man on the moon in 1969. The United States' relations with the People's Republic of China—broken since 1949—took a positive turn in 1972. Economic problems, notably inflation and unemployment, that commanded attention in the 1970s gave way to a period of reassessment in the late 1980s. Changing relationships to such economic powers as Japan and such geopolitical powers as the Soviet Union were significant concerns of the country into the last decade of the 20th century.

Consult the INDEX first

United States, Bank of the, central bank chartered in 1791 by the U.S. Congress at the urging of Alexander Hamilton and over the objections of Thomas Jefferson. Extended debate over its constitutionality contributed significantly to the evolution of pro- and anti-bank factions into the first American political parties—respectively, the Federalists and the Democratic-Republicans. Antagonism over the bank issue grew so heated that its charter could not be renewed in 1811. Reconstituted in 1816, the Bank of the United States continued to stir controversy and partisanship, with Henry Clay and the Whigs ardently supporting it and Andrew Jackson and the Democrats ardently opposing it.

The first Bank was a cornerstone of Hamilton's fiscal policy; it was a means to fund the public debt left from the Revolution, to facilitate the issuance of a stable national currency, and to provide a convenient means of exchange for all the people of the United States. It was capitalized at \$10,000,000 and fully subscribed almost instantly, with the federal government holding the largest block of ownership, 20 percent. A substantial interest in the Bank was also purchased by Europeans.

The Bank accomplished all Hamilton had hoped for and also succeeded in an unforeseen role: the regulation of private banks chartered by the several states. At this time the issuance of notes was a more conspicuous feature of banking than were deposits. Bank notes entered circulation as the money banks lent to their borrowers, and these notes comprised most of the total currency in circulation.

The rapid growth of the young country generated powerful demand for loans and tended to stimulate the overextension of credit. It was in the general interest to restrain such overexpansion, and the Bank imposed that restraint automatically. As the depository of the government, with offices in the chief seaports and commercial centres, it constantly received from collectors of revenue the notes of private banks by which monies due the government were paid. As fast as it received such notes it called for their redemption in gold and silver by the banks of issue, thus automatically restricting the overextension of credit and protecting the economy from inflation. Conversely, in periods of panic and deflation, the Bank could ease the pressure. It was engaged precisely in what came later to be called central banking.

Despite its successes, the Bank met political opposition that gathered force with partisan changes taking place in the country. In good part, this opposition was based on the very restraints the Bank imposed on private, statechartered banks; this was also seen as an affront to states' rights, and the Bank's federal charter was called unconstitutional. In 1811, when the 20-year charter expired, renewal was politically impossible. Its officers acknowledged reality and successfully sought a state charter in New York.

Within a few years, however, economic developments, chaotic conditions among the state banks, and changes in the composition of Congress combined to enable the chartering of a new Bank of the United States with wider powers than before and with closer links to the government. There was some early mismanagement, but in 1823 Nicholas Biddle of Philadelphia became its president and the Bank began to flourish.

Under Biddle, the central banking responsibilities were recognized and developed as consciously as those of the Bank of England at the same time—perhaps more so. But since these responsibilities usually had to be exercised as restraints, private banks resented them and

complained of oppression.

The rapid development of American industry and transportation were enhancing the richness of the country's resources; at the same time, the idea of democracy was beginning to connote to entrepreneurs the idea of free enterprise and laissez-faire. Hence, the very conditions that made credit restraint advisable made it objectionable. Meanwhile, a developing agrarian populism, especially in the South and West, and among the poor everywhere, was seeing in democracy opposition to privilege and aristocracy and wealth. The Bank became known as "the monster," and the enemy of the common people. These incongruous strains united against the Bank under Andrew Jackson, who became president in 1829. His attacks on the Bank were sustained and colourful and rallied wide support. Attacks on its constitutionality continued, although a decade earlier the Supreme Court, in Mc-Culloch v. Maryland, had found the charter constitutional under the doctrine of implied

Henry Clay, leader of the Whigs in the Senate from 1831, championed the Bank against the Jacksonian Democrats and in 1832 deliberately injected the bank question into the presidential campaign by bringing about the renewal, four years early, of the Bank's charter, adopted by Congress on July 3. Jackson promptly vetoed the bank renewal act as unconstitutional, disdaining the Supreme Court decision and asserting that officeholders were bound by their oaths to uphold the constitution as they, not others, understood it. In a demagogic veto message he depicted the Bank as the "prostration of our Government to the advancement of the few at the expense of the many.

The Bank issue dominated the campaign of 1832, in which Jackson decisively defeated Clay. The veto stood, but the Bank's charter still had four years to run, so Jackson determined to scuttle it ahead of time by withdrawing government funds from it. He shuffled his cabinet twice before finding in Roger B. Taney—who as attorney general had declared the move legal—a treasury secretary willing to withdraw U.S. deposits from the Bank of the United States and place them in various state-chartered private institutions, which quickly became known as "pet banks."

The Bank carried on as best it could until the expiry of its charter in 1836, when it sought and won a state charter as the Bank of the United States of Pennsylvania. The long and rancorous affair became known as the Bank War, and Jackson's victory in it precluded for almost 80 years—until the creation in 1913 of the Federal Reserve System—any effective regulation of private banks in the United States.

United States, Supreme Court of the: see Supreme Court of the United States.

United States Air Force, The (USAF), one of the major components of the U.S. military organization, with primary responsibility for air warfare, air defense, and the development of military space research. It must also provide air services in coordination with the other military branches.

U.S. military activities in the air began with the use of balloons by the army for reconnaissance during the American Civil War and the Spanish-American War. The Aeronautical Division of the Signal Corps of the U.S. Army was created on Aug. 1, 1907. Congress passed the first appropriations for aeronautics in 1911 and on July 18, 1914, created the Aviation Section of the Signal Corps. (For the development of naval aviation, see United States Navy, The.)

The first use of military aircraft, in an action against Pancho Villa in Mexico in 1916, was a failure. The next year the United States entered World War I with one ill-equipped air unit, the 1st Aero Squadron. The Aviation Act of July 24, 1917, provided increased funds, and the Overman Act of May 20, 1918, removed aviation from the Signal Corps by establishing the Army Bureau of Aircraft Production and the Air Service, U.S. Army.

Much of the success of U.S. military air activity during World War I was attributable to William ("Billy") Mitchell, combat air commander (1917–18), who coordinated air attacks with a combined U.S.-French-British force and developed a strong conviction that the United States should establish a separate air force. Despite his efforts, however, the Army Reorganization Act of 1920 created the Air Service (after 1926, Air Corps) as a combatant unit within the Army.

The Air Corps was supplanted on June 20, 1941, by the Army Air Forces as an autonomous command within the Army. On July 26, 1947, the National Security Act created the independent U.S. Air Force, and Executive Order No. 9877 defined the roles and responsibilities of the new military branch. The National Security Act Amendments of 1949 reorganized the military services, with the Department of the Air Force included within the Department of Defense.

Headquarters of the Department of the Air Force are at the Pentagon, outside Washington, D.C. The department consists of the Office of the Secretary of the Air Force; the Air Staff, which provides assistance to the secretary and the chief of staff; and the field organization, which consists of 13 commands and 13 separate operating agencies.

Of the major commands, 10 are domestic and are organized according to function. They are the Aerospace Defense (former Air Defense) Command; Air Force Logistics Command; Air Force Systems (former Air Research and Development) Command, charged with the development of aerospace technology; Air Training Command; Air University, offering higher education for officers; Military

Airlift Command, providing air transport to all U.S. military services worldwide; Strategic Air Command (SAC); Tactical Air Command (TAC); U.S. Air Force Security Service, monitoring all Air Force communications; and the Air Force Communications Service, providing communications, flight facilities, and air traffic control services to the Air Force and other U.S. and foreign government and civil organizations.

The three overseas commands are organized regionally. They are the U.S. Air Forces in Europe (USAFE), Pacific Air Forces (PACAF), and Alaskan Air Command (AAC).

The separate operating agencies of the Air Force include the Air Force Reserve, the Air Force Intelligence Service, and the United States Air Force Academy.

United States Air Force Academy, institution of higher education for the training of commissioned officers for the U.S. Air Force. It was created by act of Congress on April 1, 1954, formally opened on July 11, 1955, at temporary quarters at Lowry Air Force Base, Denver, Colo., and transferred to a permanent site 7 miles (11 km) north of Colorado Springs, Colo., in the latter part of 1958. This academy occupies an 18,000-acre (7,300-hectare) reservation in an area surrounded by mountains.

The four-year curriculum, leading to a bachelor's degree and a second lieutenant's commission in the Air Force, covers traditional higher education as well as airmanship. Studies include subjects such as government, geography, history, and philosophy, and the science courses range from the fundamentals of mathematics, physics, and chemistry through the technical areas related to aeronautical engineering.

The airmanship program includes military training, intramural athletics, leadership, and flight training. The flight training qualifies graduates in aerial navigation, entitling them to the position of an aircraft observer. During the sophomore year, the cadets receive pilot training; and, if physically qualified, most graduates go to Air Force pilot training schools.

Any U.S. citizen of good moral character who will be 17 years old but less than 22 on July 1 of the year that he plans to enter the academy, who has never been married, and who can meet the prescribed physical standards may compete for appointment to the Air Force Academy. Roughly 85 percent of the vacancies, allocated to the states on the basis of congressional representation, are filled by competitive examinations among candidates nominated by United States senators and representatives. The remainder are filled by competitive examinations among candidates nominated by the president and vice president, among members of the regular and reserve components of the Air Force and Army, and children of deceased veterans of the armed forces.

United States Amateur Championship, golf tournament conducted annually in the United States from 1895 for male amateur golfers with handicaps of three or less. The field of 150 golfers is determined by 36-hole sectional qualifying rounds. The championship is conducted by the United States Golf Association.

The championship, originally at match play (most winning holes), was changed to medal play (fewest strokes) in 1965 but returned to match play in 1973. From the 1960s on, the tournament had increasing difficulty in attracting top-flight contestants year after year because most promising young amateurs became professionals. Among amateur champions who later became outstanding professionals are Arnold Palmer (1954) and Jack Nicklaus (1959, 1961). Bobby Jones, one of the greatest American golfers, who first played

in the 1916 tournament and won in 1924-25, 1927-28, and 1930, never turned professional. See Sporting Record: Golf.

United States Army, The, major branch of the U.S. military organization, charged with the preservation of peace and security and the defense of the nation. It also administers federal programs of environmental protection and development; provides military assistance to federal, state, and local governmental agencies; assists in times of natural disaster; and provides emergency medical air transportation.

The first regular U.S. fighting force, the Continental Army, was organized by the Second Continental Congress on June 14, 1775, to supplement local militia forces in the imminent War of Independence. It was placed under the control of a five-member civilian board, and U.S. military forces have remained in civilian control ever since. The Constitution (1787) placed the military forces under the control of the president as commander in chief, and in 1789 the civilian Department of War was established to administer the military forces.

The Continental Army was officially disbanded on Nov. 2, 1783. Thereafter, the size of the Army increased during times of crisis and decreased during times of peace. The conscription established during World War II was reinstituted in 1948 and was periodically renewed until 1973, when the Army was returned to volunteer status.

The current administrative structure of the U.S. Army was established by the National Security Act of 1947 and amendments to it in 1949. The Department of the Army is organized as a military section of the Department of Defense. It is headed by the Office of the Secretary of the Army. The Army Staff gives advice and assistance to the secretary and administers civil functions, including the civil works program of the Corps of Engineers.

There are 12 major Army commands. They are Forces Command, which is responsible for all Army forces in the continental United States, the Army Reserve, and the Army National Guard; Training and Doctrine Command; Materiel Development and Readiness Command, which is responsible for supply logistics and research, development, and evaluation of new materiel; Communications Command; Intelligence and Security Command; Health Services Command, which serves the Army and other governmental agencies; Criminal Investigation Command; Military Traffic Management Command; Military District of Washington, which is charged with defense of the national capital; U.S. Army, Europe; U.S. Army, Japan; and Eighth U.S. Army. The Army also administers the U.S. Military Academy at West Point, N.Y.

United States Claims Court, court established by act of Congress of Oct. 1, 1982, to handle cases in which the United States or any of its branches, departments, or agencies is a defendant, such as in legal disputes over contracts with the government. The court assumed the original jurisdiction formerly exercised by the United States Court of Claims, concurrently abolished in 1982.

Among the cases handled by this trial court are those arising from supply and construction contracts, those involving compensation for property taken, those arising from claims to back pay or to tax refunds, and those involving alleged government infringement or misinterpretation of private patents, trademarks, copyrights, or licenses. Judgments of the Claims Court are final on both the claimant and the United States, subject to right of appeal to the United States Court of Appeals for the Federal Circuit (see United States Court of Appeals).

United States Coast Guard, The (USCG), military service within the U.S. armed forces that is charged with the enforcement of maritime laws. It consists of approximately 30,000 officers and enlisted personnel, in addition to civilians. During peacetime it is under the jurisdiction of the Department of Transportation; in time of war it is within the Department of the Navy and under the direction of the president. The USCG was established in 1790 by Secretary of the Treasury Alexander Hamilton as the Revenue Marine Service. It later became the Revenue Cutter Service and, in 1915, was combined with the U.S. Lifesaving Service (formed 1878) to become the Coast Guard. It was under the (peacetime) jurisdiction of the Treasury Department until 1967.

The Coast Guard enforces all applicable federal laws on the high seas and waters within the territorial jurisdiction of the United States. It administers laws and promulgates and enforces regulations for the promotion of safety of life and property along the entire U.S. coast (including Alaska and Hawaii). It develops and operates aids to navigation in order to maintain the safety of ports and vessels in U.S. territorial waters.

The peacetime duties of the Coast Guard involve the inspection of vessels and their equipment, and the direction and operation of lighthouses, lightships, buoys, and such electronic navigational aids as loran (long-range navigation) stations and radio beacons. The Coast Guard maintains an extensive network of lifeboat and search-and-rescue stations using surface vessels and aircraft. It also operates the International Ice Patrol, which maintains surveillance of icebergs in the North Atlantic shipping lanes. The USCG also gathers data for the Weather Bureau and assists distressed ships and planes. Wartime duties include ship escort, port security, and manning transports. The Coast Guard also assists in the interdiction of illegal narcotics that enter the United States on or over coastal waters.

The Coast Guard's organization parallels that of the U.S. Navy, and Coast Guard ranks, ratings, and uniforms are identical to those of the Navy except for the shield insignia of the Coast Guard. The USCG is headed by a Coast Guard admiral who is appointed by the president. Branches of the USCG include the Coast Guard Reserve and the Women's Reserve, although since 1973 women have also been permitted to serve in the regular Coast Guard. The U.S. Coast Guard Academy is located in New London, Conn.

United States Coast Guard Academy, institution of higher learning for the training of commissioned officers for the U.S. Coast Guard, founded by act of Congress in 1876. The academy since 1932 has occupied a 90-acre (36-hectare) site 1.5 miles (2.4 km) north of New London, Conn., overlooking the Thames River.

Entrance to the Coast Guard Academy is restricted to unmarried persons between the ages of 17 and 22 at the time of their appointment. Unlike the naval and military academies, appointment to the Coast Guard Academy is obtained exclusively through nationwide competitive examinations. There are no political nominations. Women were admitted to the academy beginning in 1975. The Coast Guard Academy confers on its graduates the bachelor of science degree and a commission as ensign in the U.S. Coast Guard.

United States Court of Appeals, any of 12 intermediate appellate courts included in the U.S. federal judicial system and created by act of Congress of March 3, 1891. Each Court of Appeals is empowered to review all final decisions and certain interlocutory decisions of district courts (see United States District Court) within its jurisdiction, except those few appealable directly to the United States Supreme Court. A Court of Appeals may also review and enforce orders of various federal regulatory agencies, such as the Federal Trade Commission, the Securities and Exchange Commission, and the National Labor Relations Board. All decisions of a Court of Appeals are subject to discretionary review or appeal in the Supreme Court.

Each Court of Appeals has jurisdiction over one of 12 judicial circuits: District of Columbia Circuit, for Washington, D.C.; 1st Circuit, for Maine, New Hampshire, Massachusetts, Rhode Island, and Puerto Rico; 2nd Circuit, for Vermont, Connecticut, and New York; 3rd Circuit, for New Jersey, Pennsylvania, Delaware, and the Virgin Islands; 4th Circuit, for Maryland, West Virginia, Virginia, North Carolina, and South Carolina; 5th Circuit, for Mississippi, Louisiana, and Texas; 6th Circuit, for Ohio, Michigan, Kentucky, and Tennessee; 7th Circuit, for Indiana, Illinois, and Wisconsin; 8th Circuit, for Minnesota, Iowa, Missouri, Arkansas, Nebraska, North Dakota, and South Dakota; 9th Circuit, for California, Oregon, Washington, Arizona, Nevada, Idaho, Montana, Alaska, Hawaii, and certain Pacific islands; 10th Circuit, for Colorado, Wyoming, Utah, New Mexico, Oklahoma, and Kansas; and 11th Circuit, for Georgia, Florida, and Alabama.

In addition to these geographically apportioned courts, there is a United States Court of Appeals for the Federal Circuit (created by act of Congress of April 2, 1982), whose jurisdiction is subject-oriented. Its jurisdiction is nationwide, and it hears appeals from U.S. district and territorial courts primarily in patent, trademark, and copyright cases but also in other cases in which the United States or its agencies is a defendant, as in alleged breaches of contract or in disputes over internal revenue. The court sits primarily in Washington, D.C.

United States Court of Military Appeals, court created by the U.S. Congress in 1950 as the supreme court for military personnel. It hears appeals brought to it from cases originally adjudicated in military tribunals, in which the presiding members are all serviceconnected.

The Court of Military Appeals consists of three civilian judges appointed by the president and confirmed by the Senate for a term of 15 years. In the late 20th century the Supreme Court ruled that many of the constitutional procedural safeguards that have not historically been considered applicable to military cases may, indeed, apply. Congress has also enacted legislation imposing these safeguards on military trials.

United States District Court, any of the 90 trial courts of general jurisdiction in the U.S. federal judicial system. Each state and the District of Columbia has at least one federal District Court, and a populous state may have more than one (at most, four). The Commonwealth of Puerto Rico also has a district court comparable to those in the states.

Each District Court has at least one district judge and can have more than a score of district judges, as well as a clerk, a United States attorney, a United States marshal, one or more United States magistrates, bankruptcy judges, probation officers, court reporters, and their staffs.

Decisions of a District Court are subject to appeal to a United States Court of Appeals (q.v.), except that certain injunction orders and certain decisions holding acts of Congress unconstitutional may be appealed directly to the United States Supreme Court. Certain appeals—notably those inolving contracts, patents, and other relations to which the United States government is party—are taken to the United States Court of Appeals for the Federal Circuit.

United States Marine Corps, The (USMC), separate military service within the U.S. Department of the Navy, charged with the provision of marine troops for seizure and defense of advanced bases and with conducting operations on land and in the air incident to naval campaigns. It is also responsible for providing detachments for service aboard certain types of naval vessels, as well as security forces for naval shore installations and U.S. diplomatic missions in foreign countries. Finally, the corps is required to be ready to perform such other duties as the president of the United States may direct.

The Marine Corps was founded in 1775, when the Continental Congress ordered that two battalions of Marines be raised for service as landing forces with the fleet. Marines have participated in all wars of the United States, being in most instances first, or among the first, to fight. In addition, Marines have executed more than 300 landings on foreign shores and served in every major U.S. naval action since 1775.

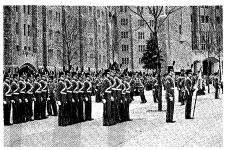

The U.S. Marine Corps is structured according to the National Security Act of 1947 and its amendments of 1952. The commandant of the corps has coequal status with members of the Joint Chiefs of Staff in all matters pertaining to the corps. The corps is composed of two operating forces, the Fleet Marine Force, Pacific (FMFPAC) and the Fleet Marine Force, Atlantic (FMFLANT); a supporting establishment for recruitment, training, supply logistics, and maintenance of bases, installations, and schools; and the Marine Corps Reserve.

The Marine Corps emblem is the Western Hemisphere superimposed on a foul anchor and surmounted by a spread eagle. The Corps motto is Semper Fidelis (Latin: "Always Faithful"), which is also the title of the Corps march, composed by John Philip Sousa. Perhaps even more familiar is "The Marines' Hymn." The Marine Band, the oldest musical organization in the U.S. armed forces, is known as "The President's Own" because of its privilege of performing at all state functions at the White House. The official colours of the Corps are scarlet and gold, but forest green enjoys semiofficial recognition. The distinctive dress-blue uniform of Marines, with its standing collar, is well known, whereas the forest-green service uniform bespeaks the original status of the Corps as light infantry. From the standing collar—descended from the tall leather neckpiece of the 18th- and 19th-century uniform—comes the traditional nickname for Marines of "leathernecks." In naval formations, Marines have the privilege of forming on the right of line or at the head of column, the traditional places of honour and seniority.

United States Merchant Marine Academy, institution of higher education that prepares cadets to serve as officers in the United States merchant marine. The U.S. Merchant Marine Corps was established in 1938; the academy, occupying 68 acres (27.5 hectares) at Kings Point on the north shore of Long Island, N.Y., was dedicated on Sept. 30, 1943.

Graduates are licensed as either deck or engineer officers and receive the degree of bachelor of science. They are also eligible to apply for commissions as ensign in the U.S. Naval Reserve. Candidates for admission to the academy must be unmarried U.S. citizens, have reached their 17th but not 22nd birthday by July 1 of the year in which they plan to enter the academy, be nominated by a congressman, take a competitive examination held annually, and meet rigid physical

Milton and Joan Mann-CAMERAMANN INTERNATIONAL

education for the training of commissioned officers for the U.S. Army. It was originally founded as a school for the U.S. Corps of Engineers on March 16, 1802, and is one of the oldest service academies in the world. Framed by the Hudson Highlands and poised above the Hudson River, the academy currently occupies about 16,000 acres (6,000 hectares) of Orange county, N.Y., 50 miles (80 km) north of New York City.

Although the site of West Point had been occupied continuously by troops since 1778, it did not become U.S. government property until 1790, when at the request of its owner, Stephen Moore, Congress appropriated the money for its purchase. Subsequent acquisitions were made from time to time.

At the outbreak of the Revolutionary War, both the colonists and the British had recognized the importance of gaining possession of the Hudson River valley, and West Point became the strategic key to its defense. General George Washington established his headquarters there in 1779. In 1780 Major General Benedict Arnold, who was then in command at West Point, attempted to betray it to the British; but his treason was discovered and he fled to the enemy.

The founding of an American military school had been proposed by General Henry Knox in 1776, and Washington and Alexander Hamilton had repeatedly urged adoption of the plan, but it was not until March 16, 1802, that Congress passed the act establishing the United States Military Academy at West Point. The academy opened on July 4, 1802. Before 1812 it was conducted as an apprentice school for military engineers and, in effect, as the first U.S. school of engineering. During its early years, however, the institution suffered from lack of proper organization and discipline.

An act of Congress of April 29, 1812, reorganized the academy and increased the authorized strength of the corps of cadets to 250, expanded the staff of the academy, and established a four-year curriculum. This legislative goal was not effective until the superintendency of Colonel Sylvanus Thayer (1817-33), who became known as the "father of the military academy" because of his lasting influence upon the West Point physical plant, the library, the curriculum, and the pedagogical method. Under Thayer's leadership the academy produced military technicians whose skills were adaptable to meet the civil-engineering needs for the program of internal improvement that accompanied America's westward expansion. An act of Congress of July 13, 1866, allowed the selection of a military academy superintendent from branches of the Army other than the Corps of Engineers.

The academy is under the immediate supervision and control of the Department of the Army, exercised through the superintendent, in whom is vested the immediate military command of the academy and the military post. The goal of the educational program is to instruct and train the corps of cadets so that each graduate will have the qualities and attributes essential to continued development through a lifetime career as an officer in the

Army. The four-year course of college-level education and training leads to a bachelor of science degree and a commission as second lieutenant in the Army. The curriculum is balanced between mathematics and basic and engineering sciences, the humanities and social sciences, military science, and physical education.

Cadets must be at least 17 years of age but not yet 22, as well as unmarried, at the time of their appointment. They must have a high-school education or its equivalent and must take scholastic-aptitude tests and a medical examination before admission. Enrollment is 4,417. The great majority of appointments to the academy are made by U.S. senators and representatives. Citizens of the Philippines, the various Latin-American republics, Canada, and certain other countries, if fully qualified, may also be admitted to the academy. Women were first admitted to the academy in 1976.

The academic year lasts from August to May, inclusive. The third class (sophomores) receives extensive field training at the training areas on the academy reservation. The second and first classes (juniors and seniors) obtain supplementary instruction at other Army training centres. The second class also takes part in joint amphibious maneuvers with the midshipmen from the United States Naval Academy, Annapolis, Md. First classmen serve as instructors for the new fourth class (freshmen), which enters the academy in July; they also assist in training the third class.

West Point has trained most of the great American military commanders since the first half of the 19th century. Among its graduates have been Ulysses S. Grant, William T. Sherman, Robert E. Lee, Thomas ("Stonewall") Jackson, Jefferson Davis, John J. Pershing, Dwight D. Eisenhower, Douglas MacArthur, Omar Bradley, and George Patton.

United States National Arboretum, arboretum in Washington, D.C., operated by the U.S. Department of Agriculture, occupying 415 acres (168 hectares) on the west bank of the Anacostia River. Among the more than 7,000 kinds of plants are special collections of camellias, hollies, apple trees, and slow-growing conifers. The arboretum was established in 1937.

United States Naval Academy, byname ANNAPOLIS ACADEMY, institution of higher education conducted by the U.S. Department of the Navy and located at Annapolis, Md., for the purpose of preparing young men and women to enter the lowest commissioned ranks of the U.S. Navy and Marine Corps.

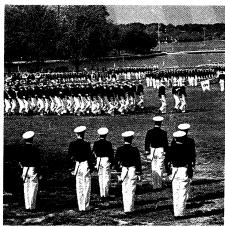

The academy was founded as a Naval School on Oct. 10, 1845, by George Bancroft, historian, educator, and secretary of the Navy, to improve the then-unsatisfactory methods of instructing midshipmen. At first the course was five years, of which only the first and last were spent at the school, the intervening three years being spent on board ships on active service. The school was reorganized in 1850–51 as the U.S. Naval Academy, with a course of study of four consecutive years. A summer practice cruise replaced the omitted sea service and permitted intensive training.

During the American Civil War the academy was moved to Newport, R.I., but was brought back to Annapolis in 1865. In the following years great improvements were effected in the organization and curriculum. During the American Civil War, Spanish-American War, and World Wars I and II, the course was shortened to provide more officers for the fleets.

Under the superintendent, the academy is organized into an executive department, headed by the commandant of midshipmen, who is charged with interior discipline, drills, and all military and professional training; and an academic department, headed by the dean in charge of the faculty and academic programs.

Candidates must be U.S. citizens who are between the ages of 17 and 22 and are unmarried. Candidates are appointed upon nomination by the president, the vice president, and the senators, representatives, and territorial delegates in Congress. Also, 170 enlisted personnel each year may be appointed from the Navy and Marine Corps and 170 more from the Naval and Marine Corps Reserve by the president, as well as 65 candidates from among the children of military personnel who died in wartime. Women were admitted to the academy beginning in 1976.

Entrance examinations are designed to admit competent graduates of first-class secondary

Dress parade at the United States Naval Academy, Annapolis, Md.

Eric Carle-Shostal Assoc./EB Inc.

schools. The physical requirements are rigid. The core academic curriculum consists of courses in engineering, the physical sciences, social sciences, and humanities. Professional raining is given in such subjects as small arms, drill, seamanship and navigation, tactics, naval engineering, naval weapons, military law, naval electricity and electronics, and leadership. Graduates are awarded the degree of bachelor of science and a commission as ensign in the Navy or as second lieutenant in the Marine Corps. The U.S. Naval postgraduate school was moved from Annapolis to Monterey, Calif., in 1951.

United States Naval Observatory (USNO), in Washington, D.C., an official source, with the U.S. National Institute of Standards and Technology (NIST; formerly the National Bureau of Standards), for standard time in the United States. The positional measurement of celestial objects for purposes of timekeeping and navigation has been the main work of the observatory since its beginning. In 1833 the first small observatory building was constructed near the Capitol. Time signals for the public were first given (1844) by the dropping of a ball from a staff on an observatory building. In 1904 the observatory broadcast the world's first radio time signals.

The observatory has been enlarged and moved several times. A 40-inch (102-centimetre) reflecting telescope acquired in 1934 was moved in 1955 to Flagstaff, Ariz., to obtain better atmospheric conditions, and a 61-inch (155-centimetre) reflector has been in use at Flagstaff since 1964. Other stations are maintained in Florida and in Argentina.

maintained in Florida and in Argentina. Statutory responsibility for "standard time" (i.e., establishment of time zones in the United States) is currently lodged with the Department of Transportation. The Naval Observatory is specifically responsible for standard time, time interval, and radio-frequency standards for use by the U.S. Department of

Defense and its contractors. Both the USNO and the NIST maintain independent time standards, but since October 1968 they have been coordinated to maintain synchronization to approximately one microsecond. USNO broadcasts time and frequency information at intervals (as the NIST does on a 24-hour basis). Both agencies cooperate with the Bureau International de l'Heure in Paris.

United States Navy, The (USN), major branch of the U.S. military organization, charged with the defense of the nation at sea, the support of all other U.S. military services, and the maintenance of freedom of the seas and of peace and security on the seas wherever the interests of the United States extend.

The Continental Navy was established by the Second Continental Congress on Oct. 13, 1775, to supply and support the Continental Army during the War of Independence. The Navy was disbanded in 1784, and until 1798 U.S. merchant ships sailed unprotected. To counter the harassment of French and Barbary pirates, the U.S. Congress established the Department of the Navy on April 30, 1798. The U.S. Navy gained valuable experience against the Royal Navy of Great Britain in the War of 1812 and was important in the Union victory in the American Civil War (1861–65).

Sea victories during the Spanish-American War (1898) led to a period of steady growth. Naval aviation was inaugurated in 1910 when a civilian pilot, Eugene Ely, flew an airplane off a cruiser at Hampton Roads, Va.; the next year he landed on and took off from a cruiser in San Francisco Bay. The Office of the Chief of Naval Operations was set up in 1915, and a shipbuilding program was begun in 1916.

a shipbuilding program was begun in 1916. Although the U.S. Navy did not engage in sea battles during World War I, it nevertheless grew eightfold in size. Its chief activities were the transport of about 2,000,000 U.S. troops to France, the patrolling of the North Atlantic sea lanes to protect Allied commerce shipping from German U-boats, and the laying of a large antisubmarine mine field in the North Sea. During the interwar years, the first U.S. aircraft carrier, the USS Langley, was alunched (1922), a naval patrol was placed in the Atlantic (1939), and the escort of Allied

convoys was begun (1941). The United States entered World War II after the Japanese attack on the U.S. naval base at Pearl Harbor, Hawaii, on Dec. 7, 1941. During the war the U.S. Navy undertook a huge building program that made it larger than all the other combatant nations' navies combined. It expanded from a force of about 300,000 officers and men in mid-1941 to more than 3,000,000 by war's end. The Navy played a more important role in American military operations during World War II than in any previous war in the nation's history. In addition to antisubmarine operations and troop transport duties, it conducted several major series of amphibious assaults in the Pacific theatre and along the European coast for which it developed new landing craft and tactics. U.S. naval forces fought many major battles with Japanese forces in the Pacific in which aircraft carriers proved decisive. Aircraft carriers have since formed the backbone of the U.S. Navy's fleets.

Since the 1950s, the U.S. Navy has become one of the most mobile sea forces in the world. It has developed nuclear-powered ships such as the *Triton* (launched 1960), the first submarine to circumnavigate the globe while submerged, and the aircraft carrier USS *Enterprise* (1960) and has adapted cruisers and submarines for the firing of guided missiles with nuclear warheads.

The Department of the Navy was placed within the Department of Defense by the 1949

amendments to the National Security Act of 1947. The Navy includes the U.S. Marine Corps (see United States Marine Corps, The) and the U.S. Coast Guard when it is operating as a service of the Navy. The department is headed by a civilian secretary of the Navy, who is appointed by the president acting as commander in chief. The chief of naval operations, the senior military officer, advises the president and the secretary, is a member of the Joint Chiefs of Staff, is commander of the Navy's operating forces (except the Marine Corps), and directs the Naval Reserve.

The four operating forces are the Pacific Fleet, which operates in the Pacific and Indian oceans; the Atlantic Fleet, which operates in the Atlantic Ocean and the Mediterranean Sea; the Naval Forces, Europe; and the Military Sealift Command, which provides ocean transport on government or commercial vessels for the Department of Defense and other federal agencies, provides at-sea logistic support to the armed forces, and conducts scientific and other projects for federal agencies.

The U.S. Naval Academy, established in 1845, is located at Annapolis, Md.

United States Open Championship, one of the world's major golf tournaments, open to both amateur and professional golfers (hence the name). It has been held annually since 1895 under supervision of the United States Golf Association. Since 1898 the competition has been 72 holes of stroke play (the player with the lowest total number of strokes is the winner). Regional qualifying tournaments have been held since 1924 to keep the number of players manageable, although golfers become eligible to compete in the Open by winning specified tournaments. For winners, see Sporting Record: Golf.

United States Open Tennis Championships, byname U.S. OPEN, international tennis tournament, one of four major annual events in tennis.

The championships, established in 1881 as a national men's singles and doubles contest, were organized by the U.S. National Lawn Tennis Association (USLTA; now the U.S. Tennis Association) and held in Newport, R.I. Women's singles competition was first played in 1887 (officially added in 1889), women's doubles in 1890, and mixed doubles in 1892. Venues for the men's and women's championships were different until 1942; from 1978 all of the U.S. Open championships were played on the rubberized surface of the USTA's National Tennis Center in Flushing Meadows, N.Y. The U.S. tournament—like the other "Big Four," or "Grand Slam," tennis championships—was opened to professional players as well as amateurs in 1968. For winners of the U.S. Open, see Sporting Record: Tennis.

United States Rubber Company: see Uniroyal Holdings Inc.

United States Steel Corporation, subsidiary of USX Corporation (q,v,).

United States v. E.C. Knight Company, byname SUGAR TRUST CASE (1895), legal case in which the U.S. Supreme Court first interpreted the Sherman Antitrust Act of 1890. The case began when the E.C. Knight Company gained control of the American Sugar Refining Company. By 1892 American Sugar enjoyed a virtual monopoly of sugar refining in the United States, controlling 98 percent of the industry.

President Grover Cleveland ordered the government to sue the Knight Company under the provisions of the Sherman Act, and the case reached the Supreme Court in 1895. The court ruled 8 to 1 against the government, declaring that manufacturing (i.e., refining) was a local activity not subject to congressional regulation of interstate commerce.

The decision, permitting combinations of manufacturers, put most monopolies beyond the reach of the Sherman Antitrust Act. Not until serious trust-busting began under presidents Theodore Roosevelt and William Howard Taft were teeth put into the antitrust laws and the power of monopolies somewhat curtailed.

United States War of Independence, also called AMERICAN REVOLUTION, or AMERICAN REVOLUTIONARY WAR (1775-83), insurrection by which 13 of Great Britain's North American colonies won political independence and went on to form the United States of America.

A brief treatment of the United States War of Independence follows. For full treatment, see MACROPAEDIA: United States of America.

After the successful conclusion of the French and Indian War in 1763, the British government decided to make its North American colonies pay more of the costs of governing them. Over the next 12 years Britain imposed a series of new taxes and other revenue-raising measures on the colonies that aroused heated opposition. The American colonists resented the trade regulations by which Britain utilized American economic resources to its own advantage, and they likewise resented their lack of representation in the British Parliament. British intransigence to these grievances spurred a growing desire for independence on the Americans' part. Open fighting broke out between the British and Americans in 1775. and the next year the American colonies declared their independence from Britain.

The conflict thus began as a civil war within the British Empire over colonial affairs, but, with America being joined by France in 1778, Spain in 1779, and the Netherlands in 1780, it became an international war. On land the Americans assembled both state militias and the Continental (national) Army, with approximately 20,000 men, mostly farmers, fighting at any given time. By contrast, the British army was composed of reliable and well-rained professionals, numbering about 42,000 regulars, supplemented by about 30,000 German mercenaries.

The war began when the British general Thomas Gage sent a force from Boston to destroy American rebel military stores at Concord, Mass. After fighting broke out at Lexington and Concord on April 19, 1775, rebel forces began a siege of Boston that ended when the American general Henry Knox arrived with artillery captured from Fort Ticonderoga, forcing General William Howe, Gage's replacement, to evacuate Boston on March 17, 1776. An American force under General Richard Montgomery invaded Canada in the fall of 1775, captured Montreal, and launched an unsuccessful attack on Quebec, in which Montgomery was killed. The Americans maintained a siege on the city until the arrival of British reinforcements in the spring and then retreated to Fort Ticonderoga.

The British government sent General Howe's brother, Richard, Admiral Lord Howe, with a large fleet to join his brother in New York, authorizing them to treat with the Americans and assure them pardon should they submit. When the Americans, who declared themselves independent on July 4, 1776, refused this offer of peace, General Howe landed on Long Island and on August 27 defeated the army of General George Washington, the commander in chief of the American forces. When Washington retreated into Manhattan, Howe drew him north, defeated his army at Chatterton Hill near White Plains on October 28, and then stormed the garrison Washington had left behind on Manhattan, seizing prisoners and supplies. Lord Cornwallis, having taken Washington's other garrison at Fort Lee, drove the American army across New Jersey to the western bank of the Delaware and then quartered his troops for the winter at outposts in New Jersey. On Christmas night, Washington crossed the Delaware and attacked Cornwallis' garrison at Trenton, taking nearly 1,000 prisoners. Though Cornwallis soon recaptured Trenton, Washington escaped and went on to defeat British reinforcements at Princeton. Washington's Trenton-Princeton campaign roused the country and kept the struggle for independence alive.

In 1777 a British army under General John Burgoyne moved south from Canada; a smaller force under Lieutenant Colonel Barry St. Leger was to join Burgoyne in Albany after having come down the St. Lawrence River and through the Mohawk Valley. After he captured Fort Ticonderoga on July 5, Burgoyne sent a force of German mercenaries to Bennington, Vt., to collect much-needed horses, but the Germans were nearly wiped out by a force of New Englanders. St. Leger, meanwhile, was checked at Oriskany on August 6 by General Benedict Arnold's army. As Burgoyne approached Albany he was twice defeated by another American force, led by General Horatio Gates, and on Oct. 17, 1777, at Saratoga, he was forced to surrender his army. Earlier that fall, Howe had sailed from New York to Chesapeake Bay, and once ashore he had defeated Washington's forces at Brandywine Creek on September 11 and occupied the American capital of Philadelphia on September 25.

After a mildly successful attack at Germantown on October 4, Washington quartered his 11,000 troops for the winter at Valley Forge. Though the conditions at Valley Forge were bleak and food was scarce, a Prussian offi-cer, Baron Friedrich Wilhelm von Steuben, was able to give the American troops valuable training in maneuvers and in the more efficient use of their weapons. Von Steuben's aid contributed greatly to Washington's success at Monmouth, N.J., on June 28, 1778. After that battle British forces in the north remained chiefly in and around the city of New York.

While the French had been secretly furnishing financial and material aid to the Americans since 1776, in 1778 they began to prepare fleets and armies and in June finally declared war on Britain. With action in the north largely a stalemate, their primary contribution was in the south, where they participated in such undertakings as the siege of British-held Savannah and the decisive siege of Yorktown. Cornwallis destroyed an army under Gates at Camden, S.C., on Aug. 16, 1780, but suffered heavy setbacks at Kings Mountain on October 7 and at Cowpens on Jan. 17, 1781. After Cornwallis won a costly victory at Guilford Court House, N.C., on March 15, 1781, he entered Virginia to join other British forces there, setting up a base at Yorktown. Washington's army and a force under the French Count de Rochambeau placed Yorktown under siege, and Cornwallis surrendered his army of more than 7,000 men on Oct. 19, 1781.

Thereafter, land action in America died out, though war continued on the high seas. Although a Continental Navy was created in 1775, as the war progressed the American sea effort lapsed largely into privateering, and after 1780 the war at sea was fought chiefly among Britain and America's European allies. American privateers, and the conspicuously successful naval commander John Paul Jones, swarmed around the British Isles, and by the end of the war they had captured 1,500 British merchant ships and 12,000 sailors. After 1780 Spain and the Netherlands were able to control much of the water around the British Isles, thus keeping the bulk of British naval forces tied down in Europe.

The Treaty of Paris (Sept. 3, 1783) ended the U.S. War of Independence. Great Britain recognized the independence of the United States (with western boundaries to the Mississippi River) and ceded Florida to Spain. Other provisions called for payment of U.S. private debts to British citizens, U.S. use of the Newfoundland fisheries, and fair treatment for American colonials loval to Britain.

In explaining the outcome of the war, scholars point out that Britain seemed never to have an overall strategy for winning and often displayed a lack of understanding and cooperation among their armies. The Americans, on the other hand, were by no means inept even before von Steuben's training at Valley Forge, and the state militias performed admirably alongside the Continental Army in crises. French supplies and funds from 1776 to 1778, and direct military and naval support after 1778, enabled the American forces to take advantage of British disorganization, to defeat entire British armies at Saratoga and Yorktown and to secure the independence of the 13 American states

United States Women's Amateur Championship, golf tournament conducted annually in the United States for female golfers with handicaps of five or less. A field of 150 players, chosen by sectional qualifying tournaments, plays 36 holes of medal play (fewest strokes), and the 32 lowest scores compete in four rounds of match play (most holes won).

The first championship in 1895 was at medal play but after that at match play in the final rounds. The tournament was conducted until 1926 by the United States Golf Association and thereafter by its Women's Committee. See Sporting Record: Golf.

United Steelworkers of America (uswa), one of the largest U.S. labour unions, with a membership of about 500,000 in the late 20th century. An industrial union, it represents workers in steel and some other related industries (e.g., aluminum). The union was a product of the organizing campaign conducted in the late 1930s by the Committee for Industrial Organization (later the Congress of Industrial Organizations). The Steel Workers Organizing Committee, as it was initially called, developed quickly under the leadership of Philip Murray into a strong organization. In 1937 the giant United States Steel Corporation recognized it as a bargaining agent. A group of other steel firms, known as "little steel," held out against the union until 1941. when, under pressure from the federal government, they too recognized it.

A battle with the steel companies to retain jobs endangered by technological progress led to a major strike that began in July 1959. An injunction brought by the federal government returned the strikers to work. The strike was settled in January 1960, with the union winning most of its demands.

United Synagogue of America (USA), central federation of some 835 Conservative Jewish congregations located in the United States and Canada. It was organized in 1913 by Solomon Schechter, a Talmudic scholar and spokesman for the Conservative movement.

To assist and increase individual participation in a fuller Jewish life, the United Synagogue has administrative divisions for youth activities, Jewish education, adult studies, music, social action, dietary laws, and congregational standards. The USA is affiliated with the National Federation of Jewish Men's Clubs, the Rabbinical Assembly, and the Women's League for Conservative Judaism.

United Technologies Corporation, formerly (1934-75) UNITED AIRCRAFT CORPO-RATION, major U.S. manufacturer of aviation and aerospace equipment and industrial equipment. Headquarters are in Hartford, Conn.

The company was formed as United Aircraft and Transport Company in 1928 by the merger of a number of aviation companies, including Pratt & Whitney, manufacturer of airplane engines; Boeing, airplanes; Chance Vought, airplane design; and several small air-

lines that were combined into United Airlines. In 1934, however, the merger was broken up by an act of Congress. The three resulting companies were Boeing, United Airlines, and United Aircraft Corporation, which became United Technologies Corporation in 1975. In addition to Pratt & Whitney and Chance Vought, the new company retained Hamilton Standard, the propeller-manufacturing division, and Sikorsky Aircraft, the company created by Igor Sikorsky, who built the world's first helicopter.

United Aircraft began large-scale research and development in the 1930s. The Sikorsky division specialized in helicopter manufacturing by 1943. Following World War II, the company began making jet engines and then spacecraft and missiles. Hamilton Standard diversified, developing and building environmental and fuel controls. In 1958 the company acquired Norden, a manufacturer of radar and advanced electronics, and that same year formed a chemical-systems division to

develop solid-propellant rockets.

The company has played a major role in U.S. spaceflight; it developed the first successful liquid-hydrogen rocket engine and the lifesupport systems for the Apollo spacecraft and lunar modules, designed much of the Space Shuttle, and has conducted research into ramjet propulsion. Through 1972, more than half its sales were to the U.S. government. In the mid-1970s the company began to acquire nonaerospace companies.

United Workers' Party (Israel): see Ma-

Uniti, Compagnia degli (Italian: "Company of the United"), company of actors performing commedia dell'arte (improvised popular comedy) in Italy in the late 16th and early 17th centuries. This period is acknowledged as the golden age of the genre. The performers were noted for their skills, culture, wit, and sophistication. Leadership was provided by Drusiano Martinelli and his wife, Angelica.

Documents of the company's activities exist from 1578 to 1640, including performances in Genoa, Padua, and the court at Mantua. One of the most noted actors to perform with the Uniti was Silvio Fiorelli, known for the innovations he made in the characters of the cowardly braggart Capitano Mattamoros and the eccentric curmudgeon Pulcinella.

unities, in drama, the three principles governing time, place, and action. Rigid observation of the unities implies that a play should be confined to a single action occurring in a single place and occupying no more than a single day's time.

The three unities evolved and were redefined in 1570 by the Italian humanist Lodovico Castelvetro in his interpretation of Aristotle's Poetics and are usually referred to as "Aristotelian rules" for dramatic structure. Actually, Aristotle's observations on tragedy are descriptive rather than prescriptive, and he emphasizes only one unity, that of plot, or action.

In the French Classical tragedy, the unities were adhered to literally and became the source of endless critical polemics. Disputes arose over such problems as whether a single day meant 12 or 24 hours and whether a single place meant one room or one city. Some believed that the action represented in the play should occupy no more time than that required for the play's performance—about two hours. In spite of such severe restrictions, the great 17th-century French dramatists Pierre Corneille and Jean Racine, confining the crises of their characters' lives to a single setting and a brief span of hours, produced a unique form of tragedy that derives its austere power from its singleness of concentration. The prestige of the unities continued to dominate French drama until the Romantic era, when it was destroyed, in an evening of catcalls and violence, with the opening of Victor Hugo's Romantic tragedy *Hernani* (1830).

In England, where playwrights often had two or more plots in a play, they mixed comedy and tragedy and switched to "another part of the forest" freely; the unities were esteemed in theory but ignored in practice.

Unity of Brethren: see Unitas Fratrum.

Unity of Science movement, movement within Logical Positivism that held that propositions in science should describe objectively existing, directly observable states of affairs or events and that there should be a unitary set of physical premises from which the regularities of all of reality could be derived. Thus, it is reductionist in its physicalist observationism and in its proposal for the unity of explanatory principles of science. See also unified science.

Unity School of Christianity, also called UNITY, religious movement founded in Kansas City, Mo., in 1889 by Charles Fillmore (1854-1948), a real-estate agent, and his wife, Myrtle (1845-1931). Mrs. Fillmore believed that spiritual healing had cured her of tuberculosis. As a result, the Fillmores began studying spiritual healing. They were deeply influenced by Emma Curtis Hopkins, a former follower of Mary Baker Eddy, who founded Christian Science. Unity, however, is closer to New Thought, which in general emphasizes the primacy of mind and spiritual healing, than it is to Christian Science. Until 1922 it was a member of the International New Thought Alliance

Unity developed gradually as the Fillmores attempted to share their insights concerning religion and spiritual healing. They began publishing magazines, books, and pamphlets and started the service known as Silent Unity, which, through prayer and counselling, helps people by telephone and by mail. As the work and the number of employees increased, Unity moved several times within Kansas City. After World War I, the Fillmores began developing Unity Village, 15 miles from Kansas City and eventually covering 1,400 acres, and by 1949 all departments of Unity were located there. After Charles Fillmore's death, Unity was led by the Fillmores' sons and grandchildren.

From Unity Village a variety of activities are carried on. The publishing operation produces books, pamphlets, and periodicals, including Unity, Daily Word, and Wee Wisdom. The staff of Silent Unity is available day and night to aid people through counselling and prayer. It has been reported that as many as 2,500,-000 requests for aid are received by Silent Unity each year. All are answered by mail or by telephone free of charge, but many persons who make requests give a contribution. Unity also conducts classes for interested individuals and a course of study for those who wish to become Unity ministers and teachers in the approximately 300 Unity centres, which are located in many states in the U.S. and in other countries.

Although Unity prefers to consider itself a nonsectarian educational institution that attempts to teach religious truth, it has essentially become a denomination. Unity ministers must complete a prescribed course of study and be approved by the Unity School of Christianity. Ministers are organized into the Unity Ministers Association; they hold an annual conference.

Unity emphasizes spiritual healing, prosperity, and practical Christianity. Unlike some New Thought groups, it stresses its agreements with traditional Christianity. Sin, illness, the

world, and matter are considered real and material, in contrast to the doctrines of Christian Science, but illnesses are considered unnatural and curable by spiritual means. The practice of medicine, however, is not rejected. There is no definite creed, although a statement written by Charles Fillmore, the *Unity Statement of Faith*, is available in a pamphlet. Unity is tolerant of the beliefs and practices of others.

Official statistics are difficult to interpret, since the movement is interdenominational, but the Unity movement is thought to reach some 6,000,000 persons, most of whom, however, are not members. Its influence extends far beyond the membership.

universal, in epistemology and logic, a general term or common noun representing a recurrence or a principle of grouping or classifying, which is considered as an entity and thus as posing the problem of what sort of being should be ascribed to the referents of general terms. It raises the question, for instance, of whether there is any redness apart from particular red things.

The debate over the status of universals stems from the ancient Greek theory of Forms or Ideas, which Plato held to have a real existence distinct from their manifestations in individual objects; ideal beauty must exist, he thought, as a precondition of its manifesting itself, albeit imperfectly, in certain things recognized as beautiful. Aristotle was rather less positive, arguing that Forms or universals exist but only "in" the particulars in which they are discerned. Although both Plato and Aristotle were Realists in holding that universals are real, there was a difference between them, later summed up in the phrases universalia ante rem (Plato's belief in "universals before the thing") and universalia in re (Aristotle's belief in "universals in the thing").

Christian Scholastic philosophers of the Middle Ages were influenced on the one hand by Augustine's identification of the Platonic Forms with archetypes in the mind of God and on the other by a passing reference by Boethius, a late Roman scholar, in his commentary on Porphyry's Isagoge, to the questions "whether genera and species are substances or are set in the mind alone; whether they are corporeal or incorporeal substances; and whether they are separate from the things perceived by the senses or set in them." The Platonic-Augustinian position, extreme Realism, is reflected in the works of the Pseudo-Dionysius the Areopagite, of John Scotus Erigena, of Anselm, of Guillaume de Champeaux, and of Gilbert de La Porrée; the Aristotelian position, moderate Realism, in those of Albertus Magnus and of Thomas Aquinas.

The medieval minority's opposition to Realism granted existence to universals only as mental concepts. Conceptualist arguments were put forward by Roscelin, by Abelard, and by William of Ockham; but Roscelin and Ockham were so uncompromising that their antagonists equated their conceptualism with Nominalism (i.e., with the contention that universals are merely words or names arbitrarily applied to similar things for convenience). Modern scholars, however, doubt that there were any medieval Nominalists, for extreme Nominalism cannot explain man's perception of similarities.

In the 17th century, however, the Materialist philosopher Thomas Hobbes defended a moderate Nominalism based on the close connection between thought and speech. Later philosophers, divided between those who upheld the validity of ontology (the theory of Being) and those concerned only with logic and with linguistic analysis, shifted the perennial debate about universals into fields of epistemology barely explored by the Scholastics. Thus, modified forms of all four views—Platonic, Aristotelian, Conceptualist, and Nominalist—are still defended.

Universal Copyright Convention (1952), convention adopted at Geneva by an international conference convened under the auspices of UNESCO, which for several years had been consulting with copyright experts from various countries. The convention came into force in 1955.

Its main features are the following: (1) no signatory nation should accord its domestic authors more favourable copyright treatment than the authors of other signatory nations, though no minimum protection for either domestic or foreign authors is stipulated; (2) a formal copyright notice must appear in all copies of a work and consist of the symbol ©, the name of the copyright owner, and the year of first publication; a signatory nation, however, might require further formalities, provided such formalities do not favour domestic over foreign works; (3) the minimum term of copyright in member nations must be the life of the author plus 25 years (except for photographic works and works of applied art, which have a 10-year term); (4) all adhering nations are required to grant an exclusive right of translation for a seven-year period, subject to a compulsory license under certain circumstances for the balance of the term of copyright.

The convention did not abrogate any other multilateral or bilateral conventions or arrangements between two or more member states. Where there are any differences, the provisions of the Universal Copyright Convention are to prevail except as regards the Berne Convention (q.v.), which takes priority over the UCC, and conventions or arrangements between two or more American republics.

Both the Universal Copyright Convention and the Berne Convention were revised at a Paris conference in 1971 to take into consideration the special needs of developing countries, especially with regard to translations, reproductions, public performances, and broadcasting. The liberalized regulations were to apply only to teaching, scholarship, and research.

Universal Decimal Classification, also called BRUSSELS CLASSIFICATION, system of library organization. It is distinguished from the Dewey Decimal Classification (q.v.) by expansions using various symbols in addition to Arabic numerals, resulting in exceedingly long notations. This system grew out of the international subject index of the Institut Internationale du Bibliographie at Brussels, which in 1895 adopted the Dewey Decimal Classification as the basis for its index. First published in 1905, it was later translated into several languages.

Despite differences, the Dewey and Universal Decimal Classifications are fundamentally the same. In its ability to create a hybrid notation (i.e., Arabic number plus symbol), Universal Decimal parallels the Colon Classification (q.v.). Its decimal basis and attempts at hierarchical range underscore its theoretical origin in Dewey. Revision has been continuous.

In particular, it is intended mainly for use with classified cards rather than books. It is, however, used in libraries, notably in Europe and in the United Nations library. Its application has been heavily weighted in the areas of science and technology. The Universal Decimal's Relative Index, for consultation by the public, is arranged alphabetically for access to the number under which a subject or book is classed.

Universal Declaration of Human Rights, declaration completed by the United Nations Commission on Human Rights in June 1948 and adopted, after a few changes, by the General Assembly at its Paris session on Dec. 10, 1948, by unanimous vote (with the six members of the Soviet bloc, Saudi Arabia, and the Union of South Africa abstaining). The declaration contained general definitions

Universal Declaration of Human Rights [1948]

Preamble

Whereas recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice and peace in the world,

Whereas disregard and contempt for human rights have resulted in barbarous acts which have outraged the conscience of mankind, and the advent of a world in which human beings shall enjoy freedom of speech and belief and freedom from fear and want has been proclaimed as the highest aspiration of the common people,

Whereas it is essential, if man is not to be compelled to have recourse, as a last resort, to rebellion against tyranny and oppression, that human rights should be protected by the rule of law,

Whereas it is essential to promote the development of friendly relations between nations,

Whereas the peoples of the United Nations have in the Charter reaffirmed their faith in fundamental human rights, in the dignity and worth of the human person and in the equal rights of men and women and have determined to promote social progress and better standards of life in larger freedom,

Whereas Member States have pledged themselves to achieve, in co-operation with the United Nations, the promotion of universal respect for and observance of human rights and fundamental freedoms.

Whereas a common understanding of these rights and freedoms is of the greatest importance for the full realization of this pledge, Now, therefore,

The General Assembly

Proclaims this Universal Declaration of Human Rights as a common standard of achievement for all peoples and all nations, to the end that every individual and every organ of society, keeping this Declaration constantly in mind, shall strive by teaching and education to promote respect for these rights and freedoms and by progressive measures, national and international, to secure their universal and effective recognition and observance, both among the peoples of Member States themselves and among the peoples of territories under their jurisdiction.

Article 1

All human beings are born free and equal in dignity and rights. They are endowed with reason and conscience and should act towards one another in a spirit of brotherhood.

Article 2

Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status.

Furthermore, no distinction shall be made on the basis of the political, jurisdictional or international status of the country or territory to which a person belongs, whether it be independent, trust, non-self-governing or under any other limitation of sovereignty.

Article 3

Everyone has the right to life, liberty and the security of person.

No one shall be held in slavery or servitude; slavery and the slave trade shall be prohibited in all their forms.

Article 5

No one shall be subjected to torture or to cruel, inhuman or degrading treatment or punishment.

Article 6

Everyone has the right to recognition everywhere as a person before the law.

Article 7

All are equal before the law and are entitled without any discrimination to equal protection of the law. All are entitled to equal protection against any discrimination in violation of this Declaration and against any incitement to such discrimination.

Article 8

Everyone has the right to an effective remedy by the competent national tribunals for acts violating the fundamental rights granted him by the constitution or by law.

Article 9

No one shall be subjected to arbitrary arrest, detention or exile. Article 10

Everyone is entitled in full equality to a fair, and public hearing by an independent and impartial tribunal, in the determination of his rights and obligations and of any criminal charge against him. Article 11

- 1. Everyone charged with a penal offence has the right to be presumed innocent until proved guilty according to law in a public trial at which he has had all the guarantees necessary for his defence
- 2. No one shall be held guilty of any penal offence on account of any act or omission which did not constitute a penal offence, under national or international law, at the time when it was committed. Nor shall a heavier penalty be imposed than the one that was applicable at the time the penal offence was committed.

Article 12

No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honour and reputation. Everyone has the right to the protection of the law against such interference or attacks.

Article 13

- 1. Everyone has the right to freedom of movement and residence within the borders of each State.
- 2. Everyone has the right to leave any country, including his own, and to return to his country.

Article 14

- 1. Everyone has the right to seek and to enjoy in other countries asylum from persecution.
- 2. This right may not be invoked in the case of prosecutions genuinely arising from non-political crimes or from acts contrary to the purposes and principles of the United Nations.

Article 15

- 1. Everyone has the right to a nationality.
- 2. No one shall be arbitrarily deprived of his nationality nor denied the right to change his nationality.

Article 16

- 1. Men and women of full age, without any limitation due to race, nationality or religion, have the right to marry and to found a family. They are entitled to equal rights as to marriage, during marriage and at its dissolution.
- 2. Marriage shall be entered into only with the free and full consent of the intending spouses.
- 3. The family is the natural and fundamental group unit of society and is entitled to protection by society and the State.

Article 17

- 1. Everyone has the right to own property alone as well as in association with others.
- 2. No one shall be arbitrarily deprived of his property.

Article 18

Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship and observance.

Article 19

Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers.

Article 20

- 1. Everyone has the right to freedom of peaceful assembly and association
- 2. No one may be compelled to belong to an association.

Article 2

- 1. Everyone has the right to take part in the government of his country, directly or through freely chosen representatives.
- 2. Everyone has the right of equal access to public service in his country.
- 3. The will of the people shall be the basis of the authority of government; this will shall be expressed in periodic and genuine elections which shall be by universal and equal suffrage and shall be held by secret vote or by equivalent free voting procedures.

Article 22

Everyone, as a member of society, has the right to social security and is entitled to realization, through national effort and international co-operation and in accordance with the organization and resources of each State, of the economic, social and cultural rights indispensable for his dignity and the free development of his personality.

Article 23

- 1. Everyone has the right to work, to free choice of employment, to just and favourable conditions of work and to protection against unemployment.
- 2. Everyone, without any discrimination, has the right to equal pay for equal work.
- 3. Everyone who works has the right to just and favourable remuneration ensuring for himself and his family an existence worthy of human dignity, and supplemented, if necessary, by other means of social protection.
- 4. Everyone has the right to form and to join trade unions for the protection of his interests.

Article 24

Everyone has the right to rest and leisure, including reasonable limitation of working hours and periodic holidays with pay,

Article 25

- 1. Everyone has the right to a standard of living adequate for the health and well-being of himself and of his family, including food, clothing, housing and medical care and necessary social services, and the right to security in the event of unemployment, sickness, disability, widowhood, old age or other lack of livelihood in circumstances beyond his control.
- 2. Motherhood and childhood are entitled to special care and

assistance. All children, whether born in or out of wedlock, shall enjoy the same social protection.

Article 26

- 1. Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education shall be made generally available and higher education shall be equally accessible to all on the basis of merit.
- 2. Education shall be directed to the full development of the human personality and to the strengthening of respect for human rights and fundamental freedoms. It shall promote understanding, tolerance and friendship among all nations, racial or religious groups, and shall further the activities of the United Nations for the maintenance of peace.
- 3. Parents have a prior right to choose the kind of education that shall be given to their children.

Article 27

- 1. Everyone has the right freely to participate in the cultural life of the community, to enjoy the arts and to share in scientific advancement and its benefits.
- 2. Everyone has the right to the protection of the moral and material interests resulting from any scientific, literary or artistic production of which he is the author.

Article 28

Everyone is entitled to a social and international order in which the rights and freedoms set forth in this Declaration can be fully realized.

Article 29

- 1. Everyone has duties to the community in which alone the free and full development of his personality is possible.
- 2. In the exercise of his rights and freedoms, everyone shall be subject only to such limitations as are determined by law solely for the purpose of securing due recognition and respect for the rights and freedoms of others and of meeting the just requirements of morality, public order and the general welfare in a democratic society.
- 3. These rights and freedoms may in no case be exercised contrary to the purposes and principles of the United Nations.

Article 30

Nothing in this Declaration may be interpreted as implying for any State, group or person any right to engage in any activity or to perform any act aimed at the destruction of any of the rights and freedoms set forth herein.

not only of those principal civil and political rights recognized in democratic constitutions but also of several so-called economic, social, and cultural rights. To the first group belong such rights as life, liberty, and security of person; freedom from arbitrary arrest, detention, or exile; right to a fair and public hearing by an independent and impartial tribunal; freedom of thought, conscience, and religion; and freedom of peaceful assembly and association. Among the new items in the declaration were the right to social security; right to work; right to education; right to participate in the cultural life of the community; and right to enjoy the arts and to share in scientific advancement and its benefits.

universal man (Humanist ideal): see Renaissance man.

Universal Negro Improvement Association (UNIA), primarily in the United States, organization founded by the Marcus Garvey (q, v), dedicated to racial pride, economic self-sufficiency, and the formation of an independent black nation in Africa. Though Garvey had founded the UNIA in Jamaica in 1914, its main influence was felt in the principal urban black neighbourhoods of the U.S. North after

his arrival in Harlem, in New York City, in 1916.

Garvey had a strong appeal to poor blacks in urban ghettos, but most black leaders in the U.S. criticized him as an imposter, particularly after he announced, in New York, the founding of the Empire of Africa, with himself as provisional president. In turn, Garvey denounced the NAACP and many black leaders, asserting that they sought only assimilation into white society. Garvey's leadership was cut short in 1923 when he was indicted and convicted of fraud in his handling of funds raised to establish a black steamship line. In 1927, Pres. Calvin Coolidge pardoned Garvey but ordered him deported as an undesirable alien.

The UNIA never revived. Although the organization did not transport a single person to Africa, its influence reached multitudes on both sides of the Atlantic, and it proved to be a forerunner of black nationalism, which emerged in the U.S. after World War II.

Universal Pictures Company, U.S. motion-picture studio that was one of the leading producers of film serials in the 1920s and of popular horror films in the '30s. Carl

Laemmle, a film exhibitor turned producer, formed the company in 1912. In its early days it was a top producer of popular, low-budget serials and also presented many of the films of Erich von Stroheim (1885–1957), who was a pioneer in realistic film direction.

For many years after the award-winning film All Quiet on the Western Front (1930), the studio presented its characteristic low-budget films, which included the well-known horror films Frankenstein (1931) and Dracula (1931). In the 1960s it regained much box-office success through the comedies of Doris Day and Rock Hudson. It was known as Universal-International for a time and since the early 1970s has been owned by the Music Corporation of America, which turned it into the largest and most profitable packager of films for television in the world.

Universal Postal Union (UPU), specialized agency of the United Nations that aims to organize and improve postal service throughout the world and to ensure international collaboration in this area. Among the principles governing its operation as set forth in the Universal Postal Convention and the General Regulations, two of the most important

were the formation of a single territory by all signatory nations for the purposes of postal communication and uniformity of postal rates and units of weight. The original agreement adopted in 1875 applied only to letter mail; other postal services, such as parcel post and international money orders, have been regulated by supplementary agreements that are binding only on signing members.

A first attempt to establish some general principles governing international postal service was made at an international conference in Paris in 1863; previously, international postal exchange had been regulated by a plethora of bilateral agreements. At the first International Postal Congress 11 years later, representatives of 22 countries adopted the Bern Treaty, creating the General Postal Union. The union actually came into effect on July 1, 1875; the name was changed to Universal Postal Union at the second congress in 1878. In 1948 the UPU became a specialized agency of the United Nations.

The Universal Postal Congress is the legislative body and meets every five years. The Executive Council, which consists of 40 representative countries elected by the congress, ensures the continuity of the work of UPU and meets annually. The International Bureau is maintained at Bern and acts as a secretariat in carrying out the daily operations. In 1957 a Consultative Committee (later Council) for Postal Studies was created to study and prode information on the economic, technical, and operational problems of postal service.

Universal Time (UT), the mean solar time of the Greenwich meridian (0° longitude). Universal Time replaced the designation Greenwich Mean Time in 1928; it is now used to denote the solar time (q, v) when an accuracy of about one second suffices. In 1955 the International Astronomical Union defined several categories of Universal Time of successively increasing accuracy. UT0 represents the initial values of Universal Time obtained by optical observations of star transits at various astronomical observatories. These values differ slightly from each other because of the effects of polar motion (q.v.). UT1, which gives the precise angular coordinate of the Earth about its spin axis, is obtained by correcting UT0 for the effects of polar motion. Finally, an empirical correction to take account of annual changes in the Earth's speed of rotation is added to UT1 to convert it into UT2. Coordinated Universal Time (q.v.), the international basis of civil and scientific time, is obtained from an atomic clock that is adjusted in epoch so as to remain close to UT1; in this way, the solar time that is indicated by Universal Time is kept in close coordination with atomic time.

Universalism, belief in the salvation of all souls. Although Universalism has appeared at various times in Christian history, most notably in the works of Origen of Alexandria in the 3rd century, as an organized movement it had its beginnings in the United States in the middle of the 18th century. The Enlightenment was responsible for mitigating the sterner aspects of Calvinistic theology and preparing the way for the reemergence of the doctrine of universal salvation. The Universalists believed it impossible that a loving God would elect only a portion of mankind to salvation and doom the rest to eternal punishment. They insisted that punishment in the afterlife was for a limited period during which the soul was purified and prepared for eternity in the presence of God.

The forerunner of Universalism in the United States was George De Benneville (1703–93), who in 1741 migrated from Europe to Pennsylvania, where he preached and practiced medicine among the Europeans and the Indians. The early Universalist movement was given its greatest impetus by the preaching of

John Murray (1741–1815), who moved from England to colonial America in 1770. He propagated the doctrine throughout most of the colonies, often against much opposition from orthodox Christians who believed that Universalism would lead to immorality.

The Universalism of John Murray was a modified Calvinism. Near the close of the 18th century Universalists were to follow Hosea Ballou in rejecting Calvinistic tenets. Ballou introduced a Unitarian conception of God and reinterpreted the atonement: the death of Jesus was not a vicarious atonement for the sins of mankind but rather a demonstration of God's infinite and unchangeable love for his children. Ballou also put great stress on the use of reason in religion.

From the beginning of the 19th century, Universalists felt a close kinship with Unitarians, since the two groups shared many views and practices. Various attempts to unite the national bodies of the two denominations, the Universalist Church of America and the American Unitarian Association, culminated in the formation of the Unitarian Universalist Association in 1960 and formal merger in 1961.

Universalist churches are congregational in polity. Each church manages its own affairs but joins with other churches in district or regional groupings. The Unitarian Universalist Association consists of representatives of the local churches and the districts and seeks to give a continental voice to the movement. In accord with congregational polity, each Universalist church is free to choose its own form of worship. Simple, nonliturgical services are commonest, with great emphasis put on the sermon.

From the beginning, Universalists have differed widely in matters of belief. Various attempts to write statements of faith, one as late as 1935, met with only partial success. Liberalism, freedom of individual interpretation, tolerance of diversity, agreement on methods of approaching theological and church issues, and belief in the inherent dignity of man have been the strongest elements keeping the movement together. Universalists generally stress the use of reason in religion and modification of belief in the light of the discoveries of science. Thus, the miraculous elements of traditional Christianity are rejected as incompatible with modern knowledge. Jesus is considered a great teacher and an example worthy of imitation, but he is not held to be divine. A broader conception of Universalism began to emerge in the 20th century. Although stressing their ties to the Christian tradition, Universalists were exploring the universal elements of religion and seeking closer relationships with the non-Christian religions of the world. See also Unitarianism.

universe, the whole cosmic system of matter and energy of which the Earth is a part. See Cosmos.

university, institution of higher education, usually comprising a liberal arts and sciences college and graduate and professional schools and having the authority to confer degrees in various fields of study.

The modern university evolved from the medieval schools known as *studia generalia* (singular, *studium generale*); they were generally recognized places of study open to students from all parts of Europe. The earliest *studia* arose out of efforts to educate clerks and monks beyond the level of the cathedral and monastic schools. Inclusion of scholars from foreign countries constituted the primary difference between the *studia* and the schools from which they grew.

The earliest universities were institutions in which the essences or "universals" were studied. They were corporations of students and masters, and they received their charters from popes and emperors. The first of them, at

Bologna, was founded late in the 11th century. At Bologna toward the end of the 12th century there were four "universities" of scholars corresponding to the four "nations" of Lombards, Tuscans, Romans, and Ultramontanes (a fusion of French, German, English, and other nations). Those "universities" were at first merely private societies formed for the personal interest of their members.

Even at that early stage, before there was any definite university organization, individual scholars of Paris or Bologna enjoyed a favoured position. In Paris, for example, where they were classed as members of the clergy, they had the right of trial by an ecclesiastical court. In 1158 Frederick I Barbarossa granted scholars of Bologna such privileges as protection against unjust arrest and the right to trial before their peers. Privileges applied only to individual masters and students; there was no recognition of the *studia* as such.

The early corporations were free to govern themselves, provided they taught neither atheism nor heresy. Students and masters together elected their own rectors (presidents). As the price of independence, however, universities had to finance themselves. So teachers charged fees, and, to assure themselves of a livelihood, they had to please their students.

By the 13th century, several "universities" of scholars developed into corporate bodies with well-defined administrative functions, becoming known as *universitas studii*. In the course of time, probably toward the latter part of the 14th century, the term university began to designate a community of teachers and scholars whose joint existence was recognized by civil or ecclesiastical authority. These early universities had no permanent buildings and little corporate property, and they were subject to the loss of dissatisfied students, who could migrate to another city and establish a place of study there. The history of Cambridge began in 1209, when a number of disaffected students moved from Oxford.

Until the end of the 18th century universities concentrated on preparing young men for careers in church and state. Courses of study were fixed. Normally the student began by studying grammar, logic, and rhetoric. Grammar was mainly Latin; logic was the syllogism; and rhetoric consisted of traditional themes. The student then chose his major subject, usually law, medicine, or theology. Final examinations were grueling, and most students failed.

Exempt from taxation, military service, and civil justice, early university students often turned their freedom to license. They earned a reputation for hard drinking, mayhem, and brawling with townspeople. To tame the rowdies, residence halls were built, and students had to live in university confines under strict discipline.

The first modern universities—institutions for both graduates and undergraduates-were founded in Germany late in the 17th century (Halle, 1694) when Harvard (1636) and Yale (1701) still were colleges. (At early Harvard the average student was 16 years old, and the level of study resembled that of a modern secondary school.) Throughout the 18th century, higher education in the United States was limited to colleges sponsored almost entirely by religious denominations: William and Mary (1693), by the Church of England; Princeton (1746), by Presbyterians; King's College (1754), now Columbia, by the Anglicans of New York. Considerable autonomy remained within the colleges but legal authority was assumed by nonresident boards. In states where no religious colleges were established, new institutions were created that became state universities from the beginning. Thus the universities of Georgia, North Carolina, Vermont,

and Tennessee date their origins to a period before 1800

The American universities of the early 19th century tended to imitate German models, seeking to combine the Prussian ideal of academic freedom with the native tradition of educational opportunity for the many. In 1859, for instance, the University of Michigan catalog stated that "all the colleges of the University shall . . . correspond in general to the course in the Gymnasia (classical secondary schools) of Germany." The catalog also declared that an institution "cannot deserve the name of a University which does not aim . . . to make it possible for every student to study what he pleases and to the extent that

Gradually, fixed curriculums gave way to free elective systems at most universities, and courses of study multiplied and changed with the growth of knowledge and the needs of increasingly complex societies. During the 1960s universities everywhere were plunged into turmoil as students demanded to be treated as adults with political as well as educational rights, and to take part in university governance. On campuses and off, students demonstrated against racism, imperialism, colonialism, and sexual inequality. The university, they said, must contribute to social justice. Universities responded by liberalizing their curriculums, placing more students on faculty and administrative committees, and permitting some students to pursue experimental studies they had designed themselves. Social and professional studies now included service courses and field work to meet some of the needs of local communities and test the student's commitment to his chosen profession. Ethnic and women's studies were created in many universities.

Universities face a range of problems. Even private universities with endowments must seek government funds in order to preserve quality and, in some cases, keep their doors open. Governments in turn tend to make funding conditional on curriculum changes they specify, such as, in the United States, affirmative action programs. State support everywhere is linked to social, political, and economic needs and on a public's willingness to tax itself in return for the benefits universities are thought to bestow. The challenge before the university, then, is to accept public support and broaden its social contribution without compromising its traditional independence.

Internally, universities have yet to strike a satisfactory balance between teaching and research. Although students continually demand better instruction, faculty members still are promoted largely on the strength of their scholarly work. Nor have the universities found the ideal blend of required and elective courses, each school enacting programs that seem to respond best to its own needs. Finally, universities increasingly had to take into account tight job markets for their graduates. In nearly all professions there is a surplus of qualified applicants, especially those coming from the humanities. Universities and students looked toward ways of creating opportunities for a satisfying career outside traditional roles for graduates in scholarship, teaching, and the professions. The university's basic traditional functions remain unchanged—enabling students to learn from their cultural heritage, helping them to realize their intellectual and creative abilities, and encouraging them to become humane and responsible people. The university expands knowledge across the entire spectrum of disciplines, and it can add to the understanding and enjoyment of life. It continues to be needed for imaginative solutions to the problems of society.

university college, in British and formerly British educational systems, an institution of higher learning that does not have the authority to award its own degrees. Students enrolled at a university college ordinarily receive their degrees from a recognized universityin England, usually the University of London. In due course, a university college may be granted university status. The University College of Bristol, for example, was founded in 1876 and became the University of Bristol in 1909; the University College of Ghana, founded in 1948, became the University of Ghana in 1961.

university extension, division of an institution of higher learning that conducts educational activities for persons (usually adults) who are generally not full-time students. These activities are sometimes called extramural studies, continuing education, higher adult education, or university adult education. Since its inception, group instruction in the form of formal lectures, discussion groups, seminars, and workshops has remained the core of extension courses. One important consequence of the university extension movement was that it helped to establish higher education for

In 1867 an extension course was being offered by a Cambridge University professor. and by the 1880s such courses were flourishing in centres throughout England.

About 1885 in the United States university leaders became aware of the programs at British universities. The most significant development came at the University of Chicago when extension was included as an integral part of the design for the new university, incorporating provisions for off-campus centres, correspondence instruction, and various other programs.

At many U.S. universities the number of adults engaged in extension programs has become greater than the number of full-time students enrolled on campus, and specialized units offering such programs have proliferated rapidly. Some universities reorganized themselves to give extension an important place as an all-institutional function paralleling that of resident teaching and research.

Elsewhere in the world, university extension has developed most fully in English-speaking countries. In some instances, following British practice, the term extramural studies is used. In every case, significant variations on the British or U.S. pattern have occurred as a result of adjustment to local conditions.

University of --: see under substantive word or words (e.g., London, University of), except as below.

University of Chicago Laboratory School, byname DEWEY SCHOOL, or UNIVERSITY ELE-MENTARY SCHOOL, a pioneer in the progressive education movement founded in Chicago in 1894 by American educator John Dewey as a research and demonstration centre for the Graduate School of Education of the University of Chicago. Commencing operation in 1896, the Laboratory School was designed to exhibit, test, and conduct research in educational methods centring on the child, adapting to individual psychological needs and pace of growth, providing learning experiences, and developing individual personalities. Subjects were correlated, connecting reading, writing, history, spelling, arithmetic, and science to life; emphasis was placed on physical training, music, art, and on such practical skills as domestic science and manual training. In 1902 the University of Chicago took over the Chicago Institute, a private, progressive normal school, and combined it with the Laboratory School, with Dewey's wife, Alice Chipman Dewey, as first principal (1902-04) of the new institution.

University wit, any of a notable group of pioneer English dramatists writing during the last 15 years of the 16th century, who, taking hold of the native dramatic inheritance of interlude and chronicle play, transformed it into a potentially ebullient drama by writing plays of quality and great diversity. They thus prepared the ground for the genius of William Shakespeare. Their forerunner was John Lyly, an Oxford man, and they included Christopher Marlowe, Robert Greene, Thomas Nashe (all graduates of Cambridge), and Thomas Lodge and George Peele (both of Oxford). Another of the wits, though not university trained, was Thomas Kvd. The greatest poetic dramatist was Marlowe, whose handling of blank verse gave the theatre its characteristic voice for the next 50 years and who established it as the true home of the poet.

Universum Film-Aktiengesellschaft (motion-picture company): see Ufa.

Unkei (b. 1148?—d. 1223), Japanese sculptor of the Late Heian (897–1185) and early Kamakura (1192-1333) periods, who established a style of Buddhist sculpture that had an immense impact on Japanese art for centuries. His father, Kökei, was a famous sculptor,

Kongō-rikishi, colossal wood sculpture by Unkei at the south gate of the Todai-ii, Nara, Japan, 1203

probably a descendant of Jocho (?-1057), the most famous sculptor of the Late Heian period who had executed the Amida at the Hoodo or "Phoenix Hall," of the Byodo-in temple at Uji near Kyōto. Unkei became a sculptor of merit before the age of 20 and was commissioned by the Kamakura shogunate (the military government with its headquarters in Kamakura) to make statues for the Köfukuji (Kōfuku Temple) and Tōdai-ji in Nara. He undertook the task with the help of Kaikei, his father's best pupil, and more than 20 assistants. Of their joint products, the nearly 26foot-tall statues of the Nio (two giant protector gods of temples) at the Nandai-mon (Great South Gate) of Todai-ji (completed in 1203) are best known. The realistic and dynamic style of these statues is typical of Unkei's art. In his later years he chiefly worked for the Kamakura shogunate, producing many portrait sculptures.

Unkiar Skelessi, Treaty of (1833): see Hünkâr İskelesi, Treaty of.

Unkoku Tōgan (b. 1547—d. 1618, Japan), Japanese painter best remembered as a suiboku-ga ("water-ink painting") artist. He worked in the manner of the 15th-century artist Sesshū at a time when the orthodox style of the Kanō school dominated painting.

Initially a student under a Kanō artist (probably Shōei), he became familiar with the style of Sesshū while serving as a painter to the Mori family in Suo province (now Yamaguchi prefecture). The Moris owned the most famous of Sesshū's works: a 55-foot- (17-metre-) long landscape painting from 1486. He copied this scroll painting, modeled his own style after it, and used it to back his claim in the famous legal contest with Hasegawa Tōhaku over succession to the line of Sesshū. The case was decided in favour of Togan, who thus received the right to call himself the "fifth generation of Sesshū." One of his Sesshū-style paintings, "Chinese Landscapes," is an ink landscape closely resembling the original Sesshū scroll, although it lacks the bold lines of the Sesshū landscape and has, instead, more variations in tones, creating a greater sense of atmospheric depth. A screen painting of Mount Yoshino, famous for its cherry blossoms, and "The Deer" are among Togan's well-known works. The bulk of his work is in the Daitoku Temple in Kyöto.

UNKRA: see United Nations Korean Reconstruction Agency.

unlawful assembly, gathering of persons for the purpose of committing either a crime involving force or a noncriminal act in a manner likely to terrify the public. The extent to which a government penalizes disorderly assemblies often reflects the political value that it places on the right of assembly.

In Anglo-American law an assembly of persons is unlawful if the participants share a common illegal purpose, regardless of whether steps are taken to effect that purpose. Thus, it is distinguishable from rout and riot, which require more than mere intent (see riot). In Canada an assembly is unlawful not if it has an unlawful purpose but, rather, if it causes persons in the vicinity to fear that the assembly will disturb the peace tumultuously or cause others to do so. In some U.S. jurisdictions two persons are enough to constitute an assembly. In India five persons are required.

The continental European codes usually subsume the offense of unlawful assembly under the heading of resistance to public authority. Some constitutions in code-law countries follow the U.S. Constitution in guaranteeing freedom of assembly. But the administrative authority vested in local police forces to control the use of public parks and roads and, if there is a danger of violence, to disperse crowds can be misused to justify interference in many public gatherings that are innocent in their purpose. See also disturbing the peace.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Uno Sōsuke (b. Aug. 27, 1922, Shiga *ken* [prefecture], Japan), prime minister of Japan for 68 days (June 2–Aug. 9, 1989).

The son of a wealthy brewer, Uno attended the Kobe University of Commerce, served in the army in World War II, and was first elected to the House of Representatives in 1960. He served in various ministerial posts before the Liberal-Democratic Party chose him to be prime minister; he was chosen largely by default, he being one of the few politicians without links to the influence-peddling and bribery scandals that brought down the ministry of his predecessor, Takeshita Noboru. Ironically, Uno soon was compelled to resign as a result of a sex scandal (media reports that he had had extramarital affairs with several geishas, including an outspoken "Ms. A") and by the Liberal-Democrats' severe losses in the parliamentary elections of July 1989.

Unocal Corporation, formerly (1890–1983) UNION OIL COMPANY OF CALIFORNIA, American petrochemical corporation founded in 1890 with the union of three "wildcatter" companies—the Hardison & Stewart Oil Company, the Sespe Oil Company, and the Torrey Canyon Oil Company. Originally centred in Santa Paula, Calif., it became headquartered in Los Angeles in 1900. Its present name was adopted in 1983, when the company was reorganized. Its founders were Wallace L. Hardison (1850–1909), Lyman Stewart (1840–1923), and Thomas R. Bard (1841–1915), the company's first president and, later, a U.S. senator (1900–05).

Initially an oil producer and refiner, Union began, after the turn of the century, to construct pipelines and tankers and to market products not only in the United States but also in Europe, South America, and the Orient. In 1917 it bought Pinal-Dome Oil Company and its 20 filling stations in southern California, thus beginning retail operations. In 1965 it acquired, through merger, the Pure Oil Company (operating mainly in Texas and the Gulf of Mexico), thereby doubling Union's size.

Unocal engages in the worldwide exploration, production, transportation, and marketing of crude oil and natural gas; the manufacture and sale of petroleum products, chemicals, and fertilizers; the mining, processing, and sale of such elements as molybdenum, columbium, rare earths, and uranium; and the development of geothermal power. It owns a major interest in Union Oil Company of Canada Ltd. The company's trademark is Union 76.

UNRRA: see United Nations Relief and Rehabilitation Administration.

Unruh, Fritz von (b. May 10, 1885, Koblenz, Ger.—d. Nov. 28, 1970, Diez, W.Ger.), dramatist, poet, and novelist, one of the most poetically gifted of the younger German Expressionist writers.

Unruh Bayaria-Verlag

The son of a general, Unruh was an army officer in active service until 1912, when he resigned his commission to devote his time to writing. His critical reflections on the military establishment in his play Offiziere ("Officers"), staged by Max Reinhardt in 1911, and his antiwar sentiments expressed in the dramatic poem Vor der Entscheidung (1914; "Before the Decision") are early variations on the two themes basic to his entire work: the nature of the social order into which the individual has to be integrated, and the necessity to ground this order not in authority but in the integrity and responsibility of the individual toward humanity. Explorations of these themes with and through his war experiences, on a metaphysical plane, in his narrative Der Opfergang written in 1916 at Verdun, published 1919; Way of Sacrifice) and, on a mythical level, in the tragedy Ein Geschlecht (1916; "A Family"), strengthened his antimilitaristic attitude and led to such later works as Heinrich von Andernach (1925), a festival play and a great plea for love among men.

He foresaw the coming Nazi dictatorship in

his drama *Bonaparte* (1927) and continued to press his warnings in *Berlin in Monte Carlo* (1931) and *Zero* (1932).

Unruh left Germany in 1932, living in France and the United States, until he returned to Germany in 1962.

UNRWA: see United Nations Relief and Works Agency for Palestine Refugees in the Near East.

Unser, Bobby and Al, Bobby Unser's original name ROBERT WILLIAM UNSER (respectively b. Feb. 20, 1934, Albuquerque, N.M., U.S.; b. May 29, 1939, Albuquerque), brothers, U.S. automobile-racing drivers from a family of drivers, who each won the Indianapolis 500 race (Bobby: 1968, 1975, and 1981; Al: 1970, 1971, 1978, and 1987).

Both brothers drove early in their careers in the Pike's Peak hill climb and won; winning this event had been almost a family monopoly Bobby first raced in 1949 and first competed in the Indianapolis 500 race in 1963. He won two United States Automobile Club (USAC) races in 1967 before winning his first Indianapolis 500 in 1968. His 1981 Indianapolis 500 victory was controversial: he crossed the finish line first, but he was placed second for advancing in position while the race was under the yellow (caution) flag. Mario Andretti was declared the winner. He appealed the decision to USAC as well as a \$40,000 fine. Further appeal, however, restored him as winner but let the fine stand. Bobby retired as a driver in 1982. In 1968 Al won five USAC races, placed third in the season's rankings and second in 1969. In 1970 he won both the Indianapolis 500 and the USAC championship. He also raced in stock-car races from 1967.

Unter den Linden, avenue in Berlin, Germany, running eastward from the Brandenburg Gate for nearly a mile. The street is named for the linden trees that formerly grew along the central promenade.

The focus of Berlin's social and cultural life before World War II, Unter den Linden was lined with palaces and museums; many of the buildings were destroyed during the war. The remains of the former Imperial Palace (1538) were razed in 1951 to create a plaza. Present landmarks along the avenue include the State Library, the State Opera House, several new ministries, the Soviet Embassy (1951), and Humboldt University (formerly Berlin University). During the East German period, the area was often used for mass rallies.

Unterfranken, English LOWER FRANCO-NIA, Regierungsbezirk (administrative district), northwestern corner of Bavaria Land (state), central Germany. Unterfranken is bordered by Thuringia Land to the northeast, the Regierungsbezirke of Oberfranken (Upper Franconia) and Mittelfranken (Middle Franconia) to the east, Baden-Württemberg Land to the south, and Hessen (Hesse) Land to the west. The district occupies an area of 3,294 square miles (8,531 square km), within what was once the historic region of Franconia. Its name is derived from that of the Franks, a Germanic people who forcibly settled territory extending from the Rhineland eastward along the Main River as far as the Fichtel Hills (Fichtelgebirge) from the early 6th century AD. These lands were split into East Franconia and West, or Rhenish, Franconia. By the 12th century, following further territorial changes, the name Franconia had come to refer only to the eastern division. In Napoleon's 1806 reorganization of Germany, East Franconia was divided between the kingdoms of Bavaria and Württemberg and the Grand Duchy of Baden. The current Bavarian Regierungsbezirke of Unterfranken, Mittelfranken, and Oberfranken were first created

as provinces of the Kingdom of Bavaria in 1837 by King Louis I.

The Spessart and Rhön plateaus form a natural frontier with the Land of Hessen in western Unterfranken. The Spessart, composed of horizontal red sandstones, is bounded by the rectangular course of the Main River to the west, south, and east. The undulating plateau has no dominating peaks but is broken into a series of ridges by deep winding valleys. The steep scarp of the western Spessart overlooks the city of Aschaffenburg, situated on the hilly bank of the Main. To the east more gentle slopes merge with the Franconian Plateaus. The Spessart upland, being almost completely covered with beech and oak forests, is sparsely populated but attracts many recreationalists from nearby urban centres. Much of the forested land lies within the 505-sq-mi (1,307sq-km) area of the Bayerischer Spessart Nature Park. The Sinn River separates the northern Spessart from the volcanic basalt highlands of the Rhön plateau. In the Rhön region, mixed forest interspersed with grassland dominates. Bad Kissingen, located in the Saale river valley, enjoys an international reputation as one of Bayern's leading health spas.

Central Unterfranken lies on the Franconian Plateaus, an undulating region of horizontal limestones covered by fertile loess and clay soils. Large farms and open cultivated fields dominate the landscape from the Grabfeld in the north across the Main Triangle as far south as the Ochsenfurt Gau, forming one of Bayern's leading agricultural regions. The chief crops produced include sugar beets. wheat, barley, rye, and potatoes. Livestock are fattened on locally grown fodder crops. The plateau is dissected by steep-sided valleys whose slopes are covered with vineyards, orchards, and forests. The largest among these is the Main valley, an important road, rail, and water route linking Nürnberg with Frankfurt and the Rhine River. In its course across the Franconian Plateaus, the Main passes through Würzburg, the largest city and administrative seat of Unterfranken, and Schweinfurt. The most pleasant climate of Bayern can be found in the central Main valley.

The Franconian Terrace, composed of the Hassberge (Hass Mountains) and the Steigerwald (Steiger Forest), is a north-south scarp rising some 230 to 330 ft (70 to 100 m) above the Franconian Plateaus to the east. Vineyards located on the edge of the Steigerwald scarp supply the district's wine industry. The terrace top, covered by coniferous forest, is sparsely populated.

Industry in Unterfranken is concentrated in the cities of Schweinfurt, Würzburg, and Aschaffenburg. Schweinfurt, the chief industrial centre of the district, manufactures steel, ball bearings, small motors, and specialized machinery. Würzburg is famous for its beer. It also has an important cattle-and-sheep market. Würzburg is the principal centre of wine production and marketing in Unterfranken and produces steel, machinery, electrical equipment, clothing, and foodstuffs. Aschaffenburg, together with surrounding towns, forms an important centre of the German clothing industry. Electrical engineering is concentrated in the town of Bad Neustadt.

The people of Unterfranken speak Franconian, one of three main German dialects in Bayern. The rural settlement pattern of the Franconian Plateaus is one of large irregular villages. Farmsteads consist of two or more buildings set around a rectangular courtyard entered through a gateway. The houses face the street and are generally a two-story, half-timbered design with steep roofs. Würzburg is noted for its splendid architecture and sculpture. Among its most famous sites is the *Residenz* of the Prince-Bishops, built in

1719–44, a masterpiece of southern German Baroque architecture. Higher education in the *Regierungsbezirk* is centred in Würzburg and includes the Bayerische-Julius-Maximilians-Universität Würzburg (founded in 1582), the Hochschule für Musik, and a state technical college. The population of Unterfranken is predominantly Roman Catholic. Pop. (1989 est.) 1,216,630.

Unterharz (mountains): see Harz.

Unterseeboot (German submarine): see U-boat.

Unterwalden, former canton, central Switzerland; it occupied the basins of the Sarner Aa (river) and the Engelberger Aa. The former canton is divided (east and west) into two sovereign half cantons, or demicantons-Nidwalden and Obwalden—based on the medieval distinction between the upper and lower river valleys. Unterwalden was included in the Zürichgau (district) and was ruled after 1173 by the Habsburg counts, acting as the representatives of the German king. In 1291, with Uri and Schwyz, it formed the Everlasting League that became the nucleus of the Swiss Confederation. In 1340 Unterwalden divided itself into Nidwalden and Obwalden. Although continuing to maintain their distinct identities, Nidwalden and Obwalden usually acted in concert as Unterwalden canton. In 1803 they became half cantons having equal

untouchable, also called HARIJAN, in traditional Indian society, any member of a wide range of low-caste Hindu groups and any person outside the caste system. The use of the term and the social disabilities associated with it were declared illegal in the constitutions adopted by the Constituent Assembly of India in 1949 and of Pakistan in 1953. Mahatma Gandhi, the great modern social leader, called untouchables Harijans (children of the god Hari Viṣṇu, or simply, children of God) and worked for many years to promote their emancipation.

Traditionally, the groups characterized as untouchable were those whose occupations and habits of life involved polluting activities, of which the most important were (1) taking life for a living, a category that included, for example, fishermen; (2) killing or disposing of dead cattle or working with their hides for a living; (3) pursuing activities that brought the participant into contact with emissions of the human body, such as feces, urine, sweat, and spittle, a category that included such occupational groups as sweepers and washermen; and (4) eating the flesh of cattle or of domestic pigs and chickens, a category into which most of the primitive tribes of India fell.

Orthodox Hindus regarded the hill tribes of India as untouchables, not because they were primitive or pagan but because they were eaters of beef and of the scavenging village pigs and chickens. Much confusion had arisen on this issue because the unassimilated hill tribes never accepted their relegation to the ranks of the untouchables nor did they seem to realize that their status was decided on a purely behavioral basis.

Until the adoption of the new constitutions in independent India and Pakistan, the untouchables were subjected to many social restrictions, which increased in severity from north to south in India. In many cases, they were segregated in hamlets outside the town or village boundary. They were forbidden entry to many temples, to most schools, and to wells from which higher castes drew water. Their touch was seen as seriously polluting to people of higher caste, involving much remedial ritual. In southern India, even the sight of some untouchable groups was once held to be polluting, and they were forced to live a nocturnal existence. These restrictions led many untouchables to seek some degree of emancipation through conversion to Christianity, Islām, or Buddhism.

The modern constitution of India formally recognized the plight of the untouchables by legally establishing their ethnic subgroups as scheduled castes (population about 80,000,-000 in the 1970s) and scheduled tribes (about 38,000,000). Besides banning untouchability, the constitution provides these groups with specific educational and vocational privileges and grants them special representation in the Indian parliament. In support of these efforts, the Untouchability (Offenses) Act (1955) provides penalties for preventing anyone from enjoying a wide variety of religious, occupational, and social rights on the grounds that he is a Harijan, the name now popularly used in place of the term untouchable. Despite such measures, the traditional divisions between pure and polluted caste groups persist in some levels of Indian society, making full emancipation of these groups slow to come about.

Unzen-dake, also called Fugen-dake, volcano on central Shimabara-hantō (Shimabara Peninsula), Japan. The 4,462-ft (1,360-m) volcano last erupted in 1792. Unzen hot-spring resort is a tourist base for Unzen-Amakusa National Park. The view from the mountain includes Shimabara-kaiwan (Shimabara Gulf), Misumi-hantō (Misumi Peninsula), and the Amakusa-rettō (Amakusa Archipelago). The mountain's slopes are covered with pine, fir, and camphor trees, fruit orchards, and cultivated corn (maize). A seismological observatory is located there to observe earthquakes.

uomo universale (Humanist ideal): *see* Renaissance man.

upādāna (Sanskrit and Pāli), in the Buddhist chain of dependent origination, the grasping that leads to becoming. *See* pratītya-samutpāda.

upādhi (Sanskrit: "imposition"), in Indian philosophy, particularly in the philosophical schools of Nyāya and Bhedābheda (Difference—Nondifference), the concept of adventitious limiting conditions. In logic, *upādhi* operates as follows: a syllogism requires a ground (*hetu*) to prove the proposition; *e.g.*, that there is fire on the mountain is proved by the presence there of smoke. But this ground needs a qualification: there is fire without smoke. An *upādhi* is recognized for the *hetu*. Smoke being produced by fire in living wood, the *hetu* must be refined to: the presence of smoke wherever there is fire in living wood.

In Bhedābheda philosophy, the concept of *upādhi* is applied to the relationship between Brahman, the supreme being, and its product, the evolved world. The doctrine of difference-nondifference is held to account for this relation: Brahman and world are nondifferent in their essence but are different inasmuch as limiting conditions such as time and space, adventitious to this essence, are imposed on it

upamāna (Sanskrit: "comparison"), the fourth of the five means of knowledge (pramāṇa) in Hindu philosophy by which man can have valid cognitions of the world. Upamāna describes knowledge imparted by means of analogy. Thus, when the meaning of a word is unknown, for example, gavaya (Sanskrit: "wild ox"), the similarity of the name to the word gaus ("cow") will provide knowledge that gavaya is in the bovine family. See also pramāna.

upanayana, Hindu ritual of initiation, restricted to the three upper varṇas, or social classes; it marks the male child's entrance upon the life of a student (brahmacārin) and his acceptance as a full member of his religious community. The ceremony is performed between the ages of 5 and 24, the wide variance reflecting the different educational requirements of the three upper classes—

Brahmans (priests and teachers), Kshattriyas (warriors and rulers), and Vaiśyas (merchants and tradesmen).

After a ritual bath the boy is dressed as an ascetic and brought before his guru (personal spiritual guide), who invests him with a deerskin to use as an upper garment, a staff, and the sacred thread (upavīta, or yajñopavīta). The thread, consisting of a loop made of three symbolically knotted and twisted strands of cotton cord, is replaced regularly so that it is worn throughout the lifetime of the owner. normally over the left shoulder and diagonally across the chest to the right hip. It identifies the wearer as dvija, or "twice-born," the second birth understood as having taken place with the imparting by the guru to the student of the "Gayatrī" mantra, a sacred verse of the Rigveda. The initiation ceremony concludes with the student's kindling of the sacrificial fire and his begging of alms, symbolic of his dependence on others during his brahmacārin period.

The actual observance of *upanayana* is increasingly confined to more orthodox Hindus, particularly those of the Brahman caste. As a prerequisite to marriage it is sometimes replaced by a simpler and less meaningful ceremony called in North India *janeu*, which takes place on the day of marriage; often both initiation ceremonies are omitted altogether.

A corresponding rite among Parsis (whose ancient homeland was Iran) is called *nowzād* (Persian: "new birth"); it invests both six-year-old boys and girls with a thread worn around the waist. Some scholars suggest that this indicates a common and ancient Indo-Iranian origin of the two ceremonies.

Upanishad, also spelled Upanishad (Sanskrit: "session"), any of the speculative texts that contain elaborations in prose and verse of the Vedas, the most ancient Hindu sacred literature.

The name Upanishad implies sitting at the feet of the teacher, and the Upanishads, of which approximately 108 are known, record the views of a succession of Hindu teachers and sages who were active as early as c. 1000 BC and who flourished c. 600 BC. The texts form the basis of much of later Indian philosophy. They represent the final stage in the tradition of the Vedas, so the teaching based on them is known as the Vedanta (Sanskrit: 'conclusion of the Veda"). The older Upanishads may be part of the Brahmanas (commentaries) of their respective Vedas but are distinguished from them both by increased philosophical and mystical questioning and by their diminished concern with Vedic deities and sacrificial rites. Though the earliest Upanishads are believed to have been formulated prior to the rise of Buddhism, the name, if not the genre, continued to be used as late as the spread of Islām in India.

The special concern of the Upanishads is with the nature of reality. There is a development toward the concept of a single supreme being, and knowledge is directed toward reunion with it. Of fundamental importance to all Hindu thought is the equation in some of the Upanishads of atman (the self) with Brahman (ultimate reality). The nature of morality and of eternal life is discussed in the Katha Upanishad in the tale of Naciketas, who visits Yama, the god of the dead. Other themes are transmigration and causality in creation.

The appearance in Europe in the early 19th century of second- and third-hand translations of the Upanishads had a profound effect on certain thinkers, notably in Germany; the philosopher Arthur Schopenhauer fully acknowledged their influence on his thought.

upāsaka, feminine Upāsikā (Sanskrit: "servant"), lay devotee of the Gautama Buddha. Although the term correctly refers to any Buddhist who is not a member of a monastic order, its modern usage in Southeast Asia

more frequently connotes the particularly pious person who visits the local monastery on the weekly holy days and who undertakes special vows.

Since its beginnings in India, Buddhism has accepted both men and women of any race, social class, or caste. All that is required of believers is the simple affirmation of the Triratna (Threefold Refuge), composed of the Buddha, the dharma (teachings), and the sangha (community of believers). The Buddhist layman is expected to observe the five precepts (not to kill, steal, commit sexual misconduct, lie, or take intoxicants) and to support the monastic community by giving alms.

The Theravada (Way of the Elders) Buddhist tradition of Southeast Asia distinguishes between the religious paths of the layman and the monk; achievement of Nirvāṇa (spiritual emancipation) is normally considered possible only if a devotee renounces worldly life and joins a monastic order. This has not been the case with the Mahāyāna (Greater Vehicle) tradition of Tibet and the Far East, which recognizes several celebrated spiritual masters who at the same time have been married householders.

upasampadā, Buddhist rite of higher ordination, by which a novice becomes a monk, or bhikku (Pālī bhikkhu; Sanskrit bhikşu). The ceremony as observed in the Theravāda (Way of the Elders) tradition is basically the same as in ancient Buddhism. Ordination is not necessarily permanent and, in some countries, may be repeated in a monk's lifetime.

A candidate for ordination must be at least 20 years old, have the permission of his parents, be exempt from military service, be free from debt and from contagious disease, and have received at least some elementary instruction in Buddhism.

The ceremony may be performed on any day determined to be auspicious, except during vassa (varşa), the rainy season retreat. It takes place within the sanctuary in the presence of monks already ordained. The pabbajjā (q,v), or ceremony of lower ordination to the rank of novice, is repeated even if the candidate has undergone it previously. He dons the garments of a monk and repeats the Triratna (Threefold Refuge) of the Buddha, the dharma (teaching), the sangha (community of believers), and the 10 precepts (basic rules of ethical conduct for a monk; see sīla); the candidate then stands before the assembly in the company of his sponsoring tutors and is questioned on his fitness to be received into the order. The assembly is questioned three times, and, if there is no objection to his ordination, the candidate is accepted into the priesthood. Female novices are ordained nuns (Pālī bhikkunīs) in a similar rite.

Updike, Daniel Berkeley (b. Feb. 24, 1860, Providence, R.I., U.S.—d. Dec. 28, 1941, Boston), American printer and scholar, founder in 1893 of the distinguished Merrymount Press in Boston.

Between 1880 and 1893 he worked for the publisher Houghton Mifflin and from 1892 was at that company's Riverside Press. He then started his own commercial venture and published the Humanist Library, a series produced in a Renaissance style, in the early part of the 20th century. Selling books did not please Updike, however, and he dropped that portion of his business and concentrated on manufacturing books for others. Merrymount Press soon acquired a reputation for its superior designs and excellent printing, and trade publishers and book clubs became customers. Updike particularly liked to work with religious and educational groups because he found their problems interesting.

His book designs combine the functional and the beautiful. They are noteworthy for their clarity of organization, easy readability, and excellent workmanship, based upon the use of a few carefully selected typefaces and immaculate presswork. His masterpieces are a complex folio edition of *The Book of Common Prayer* (1930) and an edition of Izaak Walton's *The Compleat Angler* (1928). He taught printing history at the Harvard Business School, and his *Printing Types: Their History, Forms, and Use* (1922) became an authoritative text.

Updike, John (Hoyer) (b. March 18, 1932, Shillington, Pa., U.S.), American writer of novels, short stories, and poetry, known for his careful craftsmaship and realistic but subtle depiction of "American, Protestant, smalltown, middle-class" life.

Updike grew up in Shillington, Pa., and many of his early stories draw on his youthful experiences. He was graduated from Harvard University in 1954. In 1955 he began an association with The New Yorker magazine, to which he contributed editorials, poetry, stories, and criticism throughout his prolific career. His poetry—intellectual, witty pieces on the absurdities of modern life-was gathered in his first book, The Carpentered Hen and Other Tame Creatures (1958). About this time, Updike devoted himself to writing fiction full-time, and several works followed. Rabbit, Run (1960), which is considered to be one of his best novels, concerns a former star athlete who is unable to recapture success when bound by marriage and small-town life and flees responsibility. Later works, Rabbit Redux (1971) and Rabbit is Rich (1981)—the latter earning him a Pulitzer Prize in 1982follow the same character during later periods of his life. The Centaur (1963) and Of the Farm (1965) are notable among his novels set in Pennsylvania. Most of his later fiction is set in New England, where (in Ipswich, Mass.) he lived from the 1960s.

In his determination to write "fiction that is not fraudulent," Updike continued to explore the issues that confront middle-class America—issues such as fidelity, religion, and responsibility. His later novels include Couples (1968), Bech: A Book (1970), Marry Me (1976), The Coup (1976), and The Witches of Eastwick (1984). His several collections of short stories include *The Same Door* (1959), Pigeon Feathers (1962), Museums and Women (1972), and Problems (1979). Updike also wrote nonfiction and criticism, much of it appearing in The New Yorker magazine. It has been collected in Assorted Prose (1965), Picked-Up Pieces (1975), and Hugging the Shore (1983). He also continued to write poetry, usually light verse.

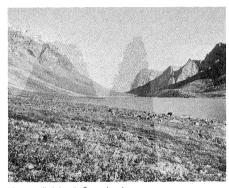

updraft and downdraft, in meteorology, upward-moving and downward-moving air currents, respectively, that result from a number of causes. Local daytime heating of the ground sometimes causes the surface air to become much warmer than the air above, and, because the warmer air is lighter, it rises; this vertical current, called a thermal, may reach an altitude of 3 kilometres (2 miles). Updrafts and downdrafts also occur as part of the turbulence produced when air currents or air masses collide with one another or with topographic obstacles.

Strong updrafts and downdrafts occur in a thunderstorm. Updrafts characterize a storm's early development, during which warm air rises to the level where condensation and precipitation can begin. When a storm is fully developed, updrafts exist alongside downdrafts caused by the downward dragging of air by falling precipitation. These downdrafts, originating at high levels, contain cold, dense air that spreads out at the ground as a cold air wedge. Downdrafts encountered by aircraft are sometimes called air pockets because it was formerly thought that they were pockets of low pressure or vacuum.

upekṣa (Sanskrit), Pāli UPEKKHĀ, in Buddhism, the perfect virtue of equanimity. It is one of the four practices known as brahmavihāra (a, y, b).

Upemba National Park, park in southeastern Zaire, central Africa. It was created in 1939 and has an area of 4,530 square miles (11,730 square km). Its northern and western borders touch the Lualaba River and the surrounding lakes and marshlands of the Kamolondo plains. Lake Upemba, an expansion of the Lualaba River, lies largely within the park; it covers approximately 200 square miles (500 square km) and is swampy and overgrown with papyrus. The Lufira River flows from the southeast to join the Lualaba River north of the lake. The forested Kibara Mountains rise to 6,070 feet (1,850 m) in the northeast. The park's wildlife includes zebras, antelopes, elephants, buffalo, lions, and aquatic birds.

Upernavik, town, western Greenland. It is situated on a small island in Baffin Bay, about 100 miles (160 km) north of Nordost Bay. A whaling and sealing base (founded 1771), it

Upernavik island, Greenland Art Resource—EB Inc.

has a weather and radio station and a hospital. Graphite deposits are located nearby. On Kingittoq (Kingigtoq) Island to the northwest was found an early 14th-century runic stone, which tells of three men wintering there. Qaarsorsuaq Island to the south is known for its huge, vertical bird cliffs. Upernavik Fjord, a 30-mile- (48-kilometre-) long inlet of Baffin Bay, extends southeast to the inland ice cap, where it receives Upernavik Glacier. Pop. (1987) 2.229.

Upfield, Arthur William (b. Sept. 1, 1888, Gosport, Hampshire, Eng.—d. Feb. 13, 1964, Bowral, N.S.W., Australia), English-born Australian popular novelist who wrote more than 30 novels featuring Detective Inspector Napoleon (Boney) Bonaparte, a half-Aboriginal Australian detective.

Upfield emigrated to Australia in 1911 and was a sheepherder, gold miner, cowhand, soldier, and fur trapper before turning to writing. While working in the Australian wilderness Upfield met a half-Aboriginal who became the prototype of his detective hero. His novels, all interspersed with lengthy descriptions of the colourful Australian landscape, include The Barrakee Mystery (1929), in which Bonaparte first appeared; Murder Down Under (1943); and The Body at Madman's Bend (1963). Upfield also wrote serious newspaper and magazine articles on Australian topography and history, as well as short stories.

upholstery, materials used in the craft of covering, padding, and stuffing seating and bedding. The earliest upholsterers, from early Egyptian times to the beginning of the Renaissance, nailed animal skins or dressed leather across a rigid framework. They slowly developed the craft to include cushions, padding,

and pillows—stuffed with such materials as goose down and horsehair.

The medieval upholsterer, who was primarily concerned with fabrics, made mattresses and hangings. In the 17th century beds were draped with sumptuous fabrics and ornate trimmings; as these beddings became less fashionable, chairs and sofas were in turn elaborately upholstered with velvet, silks, and needlework.

Springs, which permitted soft, bulky shapes, were first used by upholsterers in the 18th century; helical by the mid-19th century, they were later flattened for maximum resiliency. Upholstery techniques were revolutionized in the 20th century with the introduction of molded sponge rubber, dirt and liquid retardants, plywood, naugahyde, and synthetic fibres, which created new springing, cushioning, and covering materials.

Upjohn, Richard (b. Jan. 22, 1802, Shaftesbury, Dorset, Eng.—d. Aug. 17, 1878, Garrison, N.Y., U.S.), British-American architect who was the most active exponent in his time of the Gothic Revival style in ecclesiastical architecture.

Although his parents wished him to enter one of the "learned professions," Upjohn became apprenticed to a British cabinetmaker. In 1829, having amassed debts in England, he went to the United States and settled in New Bedford, Mass. Soon afterward he became an architect, working from 1834 to 1839 in Boston, where he employed a variety of styles. His first Gothic church, St. John's, was built in Bangor, Maine (1837). In 1839 he moved to New York City, where he began to design in his mature style. His first example is Trinity Church, New York City (1839–46), a building that became renowned for the beauty and purity of its Perpendicular Gothic lines.

Upjohn's success with Trinity Church led to many other church commissions, as well as houses (Edward King residence, Newport, R.I., 1845) and offices (Trinity Building, New York City, 1852), both in Italian Renaissance style. The Gothic style soon became inseparable from his religious and moral convictions. Although most of his churches were Episcopalian, he accepted commissions for other denominations (Madison Square Presbyterian Church). But so strong was his belief that Gothic was the expression of Christian architecture that he refused to design a church for Unitarians, a sect he considered anti-Christian. He usually contributed designs for at least one mission church a year. For poor parishes he published in Upjohn's Rural Architecture (1852; reprinted 1975) an unpretentious design in wood, remarkable for its structural honesty and its liturgical character.

In 1853 Upjohn took his son Richard Mitchell into full partnership. The latter became more and more influential in the firm as public tastes changed from pure Gothic to picturesque eclecticism. In 1857 Upjohn helped found the American Institute of Architects and served as its president until he resigned in 1876.

BIBLIOGRAPHY. Everard M. Upjohn, Richard Upjohn, Architect and Churchman (1939, reprinted 1968), contains illustrations and plans.

uplift, in geology, vertical elevation of the Earth's surface in response to natural causes. Broad, relatively slow and gentle uplift is termed warping, or epeirogeny, in contrast to the more concentrated and severe orogeny, the uplift associated with earthquakes and mountain building. Uplift of the Earth's surface also has occurred in response to the removal of Pleistocene ice sheets through melting and wastage. Such elastic rebound is both measurable and ongoing in southern Canada and in the general Scandinavian area today.

Upolu, most populous island of Western Samoa, South Pacific Ocean. It lies across the

Apolima Strait from the island of Savai'i. Of volcanic origin, Upolu is about 46 miles (74 km) long and 16 miles (26 km) across at its widest point, with an area of 432 square miles (1,119 square km). It has a mountain range

Sunset on Upolu, Western Samoa

culminating in Mount Vaaifetu (3,600 feet [1,097 m]), a forested interior, fertile coastal soils, and a wet tropical climate. The port of Apia (q,v), the commercial and political centre and focal point of Upolu's history, is on the northern shore. A large coconut plantation is near Mulifanua in the northwestern section. The island's products include copra, cocoa, coffee, bananas, taro, and rubber. Cattle are raised and pigs are plentiful. Faleolo Airport is 23 miles (37 km) west of Apia by coastal road. Pop. (1981 prelim.), including adjacent islands, 113,199.

uposatha, fortnightly meetings of the Buddhist monastic assembly, at the times of the full moon and the new moon, to reaffirm the rules of discipline. The uposatha observance, now confined almost entirely to the Theravāda (Way of the Elders) tradition of Southeast Asia, can be traced back to pre-Buddhist ceremonies of ancient India. Later Buddhists added the quarter days in the lunar cycle, establishing four holy days each month (known as poya days in Sri Lanka [formerly Ceylon] and as wan phra in Thailand).

On the fortnightly uposatha days, all the monks of a monastery gather in the sanctuary (novices and laymen are excluded) for mutual confession of offenses and recitation of the 227-rule monastic code, the pātimokkha. The four monthly holy days are also occasions for the more devout laymen to visit a local monastery, take part in devotional services, and perhaps hear a sermon by a monk. A layman may vow to observe, for the duration of uposatha, the 10 precepts (dasa-sīla) ordinarily observed in their entirety only by monks.

Uppdal, Kristofer Oliver (b. Feb. 19, 1878, Beitstad, Nor.—d. Dec. 26, 1961, Olbu), proletarian Norwegian novelist whose major work is the 10-volume *Dansen gjenom skuggeheimen* (1911–24; "The Dance Through the World of Shadows"), which deals with the development of the Norwegian industrial working class from its peasant origin.

Uppdal's own life recapitulates the history of Norway's labour movement in his rise from farm boy to skilled worker and eventually labour leader. He published his first poems in 1905, then devoted his most productive years to his powerful and monumental study of the subtle class distinctions within the working class. His later years were unproductive as a result of mental illness.

Upper Austria: see Oberösterreich.

Upper Avon (river, England): *see* Avon, Upper.

Upper Burma, geographic and historic division of Burma (Myanmar), referring to the central and northern portion of the country. The division between Upper and Lower Burma was accentuated during 1852–85, when

Lower Burma (comprising the extreme southern fringes of the country) became British Burma. In 1885 Upper Burma also fell under British domination. Unlike coastal Lower Burma, Upper Burma is considered the heartland of the country and corresponds roughly to Burma's dry zone, lying as it does in the rain shadow of the Arakan Mountain Range. It was the area of the earliest Burman settlement in the country and was the domain of the Burman kings. Upper Burma is bisected by the main course of the Irrawaddy River.

Upper Canada, from 1791 to 1841, the region in Canada now known as Ontario. With the Act of Union of 1841, it became known as Canada West (q.v.). See also Ontario.

Upper Egypt, Arabic QIBLI MIŞR, also called Aş-ŞA'ID ("The Upland"), geographic and cultural division of Egypt, generally consisting of the Nile River valley south of the delta and the 30th parallel N. It thus consists of the entire Nile River valley from Cairo south to Lake Nasser (formed by the Aswān High Dam). This division also includes what some scholars term Middle Egypt (from Lisht to Panopolis).

In late predynastic times, Upper Egypt constituted a political entity separate from Lower Egypt (the delta region). But Menes (fl. 2900 BC) joined Upper and Lower Egypt, and each Egyptian king thenceforth had as one of his royal titles "King of Upper and Lower Egypt" (or "He of the Sut-Plant and the Bee"), thus signifying that he was the deified representation of those divisions' unification.

Upper Hutt, city of southern North Island, New Zealand. It lies in the Hutt River valley near Wellington. Founded in 1848, it is part of the larger Hutt area named for Sir William Hutt, an original shareholder in the New Zealand Company, which pioneered the region in 1840. Upper Hutt is for the most part residential, although it does have engineering works, tire- and vaccine-manufacturing plants, and some farming and poultry keeping. It is known as a centre of veterinary practice. Pop. (1988 est.) city, 31,000; Upper Hutt Valley urban area, 36,000.

Upper Volta (western Africa): see Burkina Faso.

Upper Yosemite Fall, cataract on the west slope of the Sierra Nevada in Yosemite National Park, east-central California, U.S. It lies 150 miles (240 km) east of San Francisco. With a drop of 1,430 feet (436 m), it is one of the highest waterfalls in the world and is one of the park's most scenic attractions. Reaching a peak volume during May and June, it is fed mainly by melting snow; hence it may be dry for part of the year.

Uppingham, parish in Rutland district, county of Leicestershire, England, noted for its 16th-century houses and its public (independent secondary) school. It came into being as a market town in what is still a predominantly agricultural area. Uppingham School (1584) still has its original building. Under Edward Thring (q.v.) as headmaster, it became a school of great educational influence. Pop. (1981) 2,839.

Uppland, landskap (province), east-central Sweden. It is bounded by the Gulf of Bothnia and the Baltic Sea on the east and by the traditional landskaper (provinces) of Södermanland, Västmanland, and Gästrikland on the south, west, and north, respectively. Its land area of 4,893 square miles (12,674 square km) is composed of the administrative län (county) of Uppsala, the northern part of Stockholm län, and the eastern part of Västmanland län. The province's surface is generally flat, especially in the area around Uppsala, averaging less than 200 feet (60 m) in elevation; but, in some areas, notably in the northwest and west,

it reaches elevations of more than 300 feet (90 m). Bordering on Mälaren (lake), southern Uppland (and also the coastal region, known as Roslagen) has a more varied landscape, with deep bays, wooded heights, and numerous islands. Forests and bogs predominate in the north.

Uppland was the principal settlement in central Sweden during the Bronze Age, and as early as 2000 BC it engaged in active trading with points to the south. During the Iron Age it extended its hegemony over neighbouring kingdoms, becoming the heart of the Swedish empire. With the advent of Christianity it became the seat of an archbishopric as well.

Grain and potatoes are grown on the landskap's fertile plains, and there is some livestock raising and dairying. Industry is diversified, ranging from ironworking and sawmilling in the north, with its forests and iron-ore deposits, to the manufacture of chocolate, machinery, and electrical equipment in the industrial towns of the south, such as Enköping, Sundbyberg, and Solna. Chiefly residential towns include Djursholm and Lidingö; Norrtälje, Östhammar, Öregrund, and Vaxholm are popular resorts. As the home of Uppsala University (1477) and the seat of a Lutheran archbishopric, Uppland's principal city, Uppsala, is also the historic cultural and religious centre of Sweden. Pop. (1988 est.) 1,152,482.

Uppsala, län (county) in east-central Sweden. It lies between Mälaren (lake) on the south and the Gulf of Bothnia on the north. Its land area of 2,698 square miles (6,989 square km) constitutes most of the western part of the landskap (province) of Uppland. The län's low, level surface is drained by the Fyris River. Grain and potatoes are grown, and there is some stock raising and dairying. Major ironore deposits are found in the region around Dannemora, and there are several ironworks and steelworks. Sawmilling is predominant in the area near the mouth of the Dal River in the north, and there is a major hydroelectric plant located at Älvkarleby. The capital and largest city is Uppsala. Pop. (1988 est.) 257,739

Uppsala, city and capital of the *län* (county) of Uppsala, east-central Sweden. It lies 40 miles (64 km) north of Stockholm. Originally known as Östra Aros, it was founded as a trading post at the head of navigation on the Fyris River at a point a few miles from Gamla (Old) Uppsala, which was the political and religious centre of the ancient kingdom of Svea. By the 13th century the new Uppsala had become a royal residence and an important commercial centre.

Although it later relinquished its political

primacy to Stockholm, Uppsala has remained a religious centre as the seat of the archbishop of Sweden. The Gothic cathedral, the largest such structure in Sweden, dominates the city. Work began on this edifice in the late 13th century but progressed slowly, and it was not until 1435 that the church was consecrated. The cathedral was subsequently ravaged by fire several times but was finally restored in the late 19th century. Opposite the cathedral is the Gustavianum, a medieval bishop's palace that is now a museum of archaeology and cultural history.

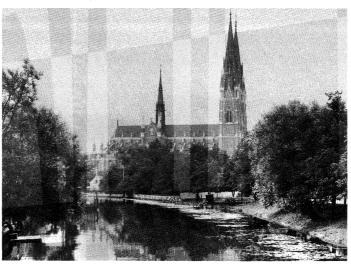

With its many schools, Uppsala is also a seat of Swedish learning and culture. Prestigious Uppsala University (1477) is the country's oldest, and the university's library, the Carolina Rediviva (1841), is one of the largest in Sweden. Other notable places in the city include a large castle that was begun by Gustav I Vasa in the mid-16th century and was partly rebuilt in the 18th century. In 1654 it was the scene of Queen Christina's abdication; it is now the governor's residence. Other points of interest in the city include the botanic garden and house of the botanist and explorer Carolus Linnaeus, who enunciated the principles of taxonomic classification of plants and animals, and the Victoria Museum, containing Egyptian antiquities.

With the coming of the railway in the 1860s, Uppsala developed rapidly from a university town and agrarian-trade centre to an industrial city. Its industries include printing and publishing, food processing, and the manufacture of pharmaceuticals and machinery. The city is an important rail hub and is also a military centre. Pop. (1988 est.) mun., 159,962.

Uppsala University, Swedish UPPSALA UNIVERSITET, state-sponsored coeducational university at Uppsala, the oldest institution of higher learning in Sweden. It was founded in 1477 but closed in 1510 owing to the religious disputes of the time. It was reopened in 1595 with faculties of theology and philosophy, and in 1624 King Gustav II Adolf granted it large landed estates, thus providing the school's future financial basis. The most famous figure associated with the university was the 18th-century Swedish botanist Carolus Linnaeus.

The university currently has faculties of theology, law, medicine, arts (containing historical-philosophical and linguistic divisions), pharmacy, social science, and science (which

The Gothic cathedral at Uppsala in Sweden Ewing Galloway, N.Y.

contains mathematical-physical, biology and earth science, and chemistry divisions). The university's library, the Carolina Rediviva, is one of Sweden's largest and contains the illu-

Dean's house at Uppsala University in Sweden J. Allan Cash-EB Inc

minated manuscript Codex Argenteus, which is the only extant manuscript of Bishop Ulfilas' 4th-century translation of the Gospels into the Gothic language. The main university building (1887) has a large art collection. In the late 20th century Uppsala University had an enrollment of about 15,000 students.

upright piano, musical instrument in which the soundboard and plane of the strings run vertically, perpendicular to the keyboard, thus taking up less floor space than the normal grand piano. Upright pianos are made in various heights; the shortest are called spinets or consoles, and these are generally considered to have an inferior tone resulting from the shortness of their strings and their relatively small

Giraffeklavier ("giraffe-style" upright piano) in Biedermeier style, by Gebroeders Muller, about 1820; in the Centraal Museum der Gemeente, Utrecht, The Netherlands

soundboards. The larger upright pianos were quite popular in the later 19th and early 20th centuries. The action (hammer and damper mechanism) of the upright differs from the grand-piano action mainly in that upright action is returned to a resting position by means of springs rather than by gravity alone, as in a grand. This, in part, accounts for the characteristic "touch" of uprights, which is distinct from that of grands. The chief advantages of upright pianos lie in their modest price and compactness; they are instruments for the home and school, not for the concert stage.

The majority of upright pianos have strings running upward from the bottom of the case. near the floor; this design is owed to John Isaac Hawkins, an Englishman who lived in the United States in about 1800 and became an important piano maker in Philadelphia. Earlier, the strings started upward from near the level of the keys; these instruments were necessarily much taller and lent themselves to various decorative designs, among them lyreshaped; round; the "pyramid" model of the Saxon organ-builder Ernst Christian Friderici (1745), with both sides sloping upward to the top; and the "giraffe-style" design of Martin Seuffert (1804) of Vienna, with one side straight and one bent, as on a grand piano.

upslope wind: see anabatic wind.

Upton, Francis Robbins (b. 1852, Peabody, Mass., U.S.—d. March 10, 1921, Orange, N.J.), American mathematician and physicist who, as assistant to Thomas Edison, contributed to the development of the American electric industry

Upton studied at Bowdoin College, Brunswick, Maine; Princeton University; and-with Hermann von Helmholtz—Berlin University. In 1878 he joined Edison at his laboratory in Menlo Park, N.J. There he worked out mathematical problems arising during the development of such devices as the incandescent lamp, the watt-hour meter, and large dynamos. He was a partner and general manager of the Edison Lamp Works, established in 1880.

Upton also helped Edison publicize his new inventions by writing descriptive articles for such popular magazines as Scribner's Monthly and Scientific American.

'Uqaylid DYNASTY, Muslim Arab dynasty whose various branches ruled Mosul (c. 992-1096) and Takrīt (1036-c. 1057), in what is now Iraq.

The 'Uqaylids, descendants of the famous Bedouin tribe of 'Amir ibn Şa'şa'ah, established themselves in Jazīrat ibn 'Umar, Niṣībīn (modern Nusaybin, Tur.), and Balad (northern Iraq) at the end of the 10th century. Abū adh-Dhawwūd Muḥammad (reigned c. 990–996), the first 'Uqaylid, was drawn into the struggle between the Hamdanids and Marwanids for possession of Mosul and eventually succeeded the Hamdanids as emir of Mosul, though remaining nominally subject to the Buyids of Baghdad.

The reign of Qirwash ibn al-Muqallad (1001-50), who assumed the emirate after many years of bitter family feuding, was troubled by the threat of Oğuz tribesmen invading his dominions from western Iran and southern Iraq, forcing him into defensive alliances with the Mazyadids, another Muslim Arab dynasty in al-Hillah, central Iraq.

Muslim ibn Quraysh (reigned 1061-85), however, was able to bring the Uqaylid dynasty to the height of its power. By allying himself with the Seljuq sultans Alp-Arslan and Malik-Shāh, Muslim annexed part of northern Syria and thus established 'Uqaylid rule over an area reaching from Aleppo to Baghdad. Ugaylid fortunes declined, however, when Muslim switched allegiance to his coreligionists, the Shī'ite Fāṭimids of Egypt. Seljuq armies invaded Mosul and routed Muslim, who was subsequently killed in battle with Seljuq forces. The 'Uqaylids were allowed to remain in Mosul as Seljug governors but were finally subjugated by the Seljuq sultan Tutush in 1096.

Another 'Ugaylid line had been installed in Takrīt, on the Tigris River, sometime before 1036. The governorship remained in their hands until they submitted to the Seljuq sultan Toghril Beg, who in 1055 took Baghdad and displaced the Buyids as overlord of Iraq.

'uqqāl (Arabic: "the wise"), singular 'ĀQIL, in the Druze religion, an elite of initiates who alone know Druze doctrine (hikmah, literally "wisdom"), participate fully in the Druze religious services, and have access to Druze scripture. The religious system of the Druzes is kept secret from the rest of their own numbers, who are known as *juhhāl* ("the ignorant"), as well as from the outside world. Any Druze man or woman deemed worthy after serious scrutiny is eligible for admission into the 'uqqāl.

Once initiated, the 'uqqāl adopt distinctive dress and white turbans and must pursue lives of religious piety, sobriety, and virtue. They abstain from alcohol and tobacco and attend secret Thursday-evening services at the khilwah, an austere, unadorned house of worship usually located outside the village. The 'uqqāl are further bound by the seven Druze principles of conduct: utter honesty under all circumstances but specifically avoidance of theft, murder, and adultery; Druze solidarity; renunciation of other religions; avoidance of unbelievers; belief in the oneness of God; acceptance of God's acts; and submission to God's will.

The 'uqqāl may deepen their knowledge of Druze doctrine in progressive stages until some finally become "the generous," ajāwīd. Any rise in the hierarchy brings with it greater obligations to live a blameless life. Any taint of evil, however remote, must be scrupulously avoided. The more learned or devout among the 'uqqāl are distinguished as sheikhs and after special schooling devote themselves to the study and copying of the religious texts; they often retire completely to the khilwahs.

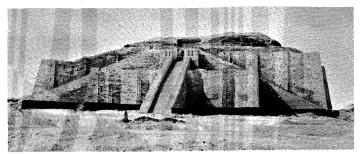

The 'uggāl bear responsibility for the juhhāl. who in their ignorance are denied the possibility of spiritual growth. The juhhāl, whose lives are not so restricted morally and sensually as those of the 'uqqāl, are aware of the doctrine of the unity of God and possess detailed mythologies of creation and tanāsukh, transmigration of souls, in which Druze souls are always reborn as Druze souls.

The juhhāl generally live by the principle of taqīyah, or dissimulation of faith, and when living among Muslims or Christians they may superficially adopt their practices.

Uqșur, al- (Egypt): see Luxor.

Ur, modern tall al-muqayyar, or tell EL-MUQAYYAR, important city of ancient southern Mesopotamia (Sumer), situated about 140 miles (225 km) southeast of the site of Babylon and about 10 miles (16 km) west of the present bed of the Euphrates River. In antiquity the river ran much closer to the city; the change in its course has left the ruins in a desert that once was irrigated and fertile land. The first serious excavations at Ur were made after World War I by H.R. Hall of the British Museum, and as a result a joint expedition was formed by the British Museum and the University of Pennsylvania that carried on the excavations under Leonard Woolley's directorship from 1922 until 1934. Almost every period of the city's lifetime has been illustrated by the discoveries, and knowledge of Mesopotamian history has been greatly enlarged.

Foundation of the city. At some time in the 4th millennium BC, the city was founded by

Northeastern facade (the ascents partly restored) of the ziggurat at Ur

settlers thought to have been from northern Mesopotamia, farmers still in the Chalcolithic phase of culture. There is evidence that their occupation was ended by a flood, formerly thought to be the one described in Genesis. From the succeeding "Jamdat Nasr" (Late Protoliterate) phase a large cemetery produced valuable remains allied to more sensational discoveries made at Erech.

Ur in the early dynastic period, 29th-24th century BC. In the next (Early Dynastic) period Ur became the capital of the whole of southern Mesopotamia under the Sumerian kings of the 1st dynasty of Ur (25th century BC). Excavation of a vast cemetery from the period preceding that dynasty (26th century) produced royal tombs containing almost incredible treasures in gold, silver, bronze, and semiprecious stones, showing not only the wealth of the people of Ur but also their highly developed civilization and art. Not the least remarkable discovery was that of the custom whereby kings were buried along with a whole retinue of their court officials, servants, and women, privileged to continue their service in the next world. Musical instruments from the royal tombs, golden weapons, engraved shell plaques and mosaic pictures, statuary and carved cylinder seals, all are a collection of unique importance, illustrating a civilization previously unknown to the historian. A further development of it, or perhaps a different aspect, was shown by the excavation at al-'Ubayd, a suburb of Ur, of a small temple also of a type previously unsuspected, richly decorated with statuary, mosaics, and metal reliefs and having columns sheathed with coloured mosaic or polished copper. The inscribed foundation tablet of the temple, stating that it was the work of a king of the 1st dynasty of Ur, dated the building and proved the historical character of a dynasty that had been mentioned by ancient Sumerian historians but that modern scholars had previously dismissed as fictitious.

A few personal inscriptions confirmed the real existence of the almost legendary ruler Sargon I, king of Akkad, who reigned in the 24th century BC, and a cemetery illustrated the material culture of his time.

Third dynasty of Ur, 22nd-21st century BC. To the next period, that of the 3rd dynasty of Ur, when Ur was again the capital of an empire, belong some of the most important architectural monuments preserved on the site. Foremost among these is the ziggurat, a three-storied solid mass of mud brick faced with burnt bricks set in bitumen, rather like a stepped pyramid; on its summit was a small shrine, the bedchamber of the moon god Nanna (Sin), the patron deity and divine king of Ur. The lowest stage measures at its foot some 210 by 150 feet (64 by 46 metres), and its height was about 40 feet. On three sides the walls, relieved by shallow buttresses, rose sheer. On the northeast face were three great staircases, each of 100 steps, one projecting at right angles from the centre of the building, two leaning against its wall, and all three converging in a gateway between the first and the second terrace. From this a single flight

of steps led upward to the top terrace and to the door of the god's little shrine. The lower part of the ziggurat, built by Ur-Nammu, the founder of the dynasty, was astonishingly well preserved; enough of the upper part survived to make the restoration certain.

The excavations showed that by the 3rd millennium BC Sumerian architects were acquainted with the column, the arch, the vault, and the dome-i.e., with all the basic forms of architecture. The ziggurat exhibited its refinements. The walls all sloped inward, and their angle, together with the carefully calculated heights of the successive stages, leads the eye inward and upward; the sharper slope of the stairways accentuates that effect and fixes attention on the shrine, the religious focus of the whole huge structure. Surprisingly, there is not a single straight line in the structure. Each wall, from base to top and horizontally from corner to corner, is a convex curve, a curve so slight as not to be apparent but giving to the eye of the observer an illusion of strength where a straight line might have seemed to sag under the weight of the superstructure. The architect thus employed the principle of entasis, which was to be rediscovered by the builders of the Parthenon at Athens.

Succeeding dynasties, 21st-6th century BC. The great brick mausoleums of the 3rddynasty kings and the temples they built were sacked and destroyed by the Elamites, but the temples at least were restored by the kings of the succeeding dynasties of Isin and Larsa; and Ur, though it ceased to be the capital, retained its religious and its commercial importance. Having access by river and canal to the Persian Gulf, it was the natural headquarters of foreign trade. As early as the reign of Sargon of Akkad it had been in touch with India, at least indirectly. Personal seals of the Indus Valley type from the 3rd dynasty and the Larsa period have been found at Ur, while many hundreds of clay tablets show how the foreign trade was organized. The "sea kings' of Ur carried goods for export to the entrepôt at Dilmun (Bahrain) and there picked up the copper and ivory that came from the east.

The clay tablets were found in the residential quarter of the city, of which a considerable area was excavated. The houses of private citizens in the Larsa period and under Hammurabi of Babylon (c. 18th century BC, in which period Abraham is supposed to have lived at Ur) were comfortable and well built two-story houses with ample accommodation for the family, for servants, and for guests, of a type that ensured privacy and was suited to the climate. In some houses was a kind of chapel in which the family god was worshipped and under the pavement of which the members of the family were buried. Many large state temples were excavated as were also some small wayside shrines dedicated by private persons to minor deities, the latter throwing a new light upon Babylonian religious practices; but the domestic chapels with their provision for the worship of the nameless family gods are yet more interesting and have a possible relation to the religion of the Hebrew patriarchs.

After a long period of relative neglect, Ur

experienced a revival in the Neo-Babylonian period, under Nebuchadrezzar II (605-562 BC), who practically rebuilt the city. Scarcely less active was Nabonidus, the last king of Babylon (556-539 BC), whose great work was the remodelling of the ziggurat, increasing its height to seven stages.

The last phase, 6th-4th century BC. last king to build at Ur was the Achaemenian Cyrus the Great, whose inscription on bricks is similar to the "edict" quoted by the scribe Ezra regarding the restoration of the Temple at Jerusalem. The conqueror was clearly anxious to placate his new subjects by honouring their gods, whatever those gods might be. But Ur was now thoroughly decadent; it survived into the reign of Artaxerxes II, but only a single tablet (of Philip Arrhidaeus, 317 BC) carries on the story. It was perhaps at this time that the Euphrates changed its course; and with the breakdown of the whole irrigation system, Ur, its fields reduced to desert, was finally abandoned.

Discoveries made on other sites have supplemented the unusually full record obtained from the Ur excavations. Knowledge of the city's history and of the manner of life of its inhabitants, of their business, and of their art is now fairly complete and remarkably detailed.

BIBLIOGRAPHY. J.E. Taylor, "Notes on the Ruins of Muqeyer," Jl. R. Asiat. Soc., 15:260-276 (1855)—the ruins of Mugeyer (Tall al-Mugayyar) were later identified as the site of Ur of the Chaldees. H.R. Hall, A Season's Work at Ur (1930); C.J. Gadd, History and Monuments of Ur (1929); C. Leonard Wooley, Excavations at Ur (1954 and 1964) and Ur of the Chaldees (1938); C. The Ur excavation volumes include reports on the excavations at al-'Ubayd (near Ur), the Royal Cemetery (the predynastic and Sargonid graves excavated between 1926 and 1931), archaic seal impressions, the sites and objects prior in date to the 3rd dynasty of Ur, the ziggurat and its surroundings, the Kassite period and the period of the Assyrian kings, the Neo-Babylonian and Persian periods, and seal cylinders.

Ura-Tyube, also spelled URA-TIUBE, or URA-T'UBE, city, Leninabad oblast (administrative region), Tadzhik Soviet Socialist Republic, in the northern foothills of the Turkistan Range. One of the most ancient cities of the republic, it may date from the 6th century AD, but it has borne its present name only since the 17th century. Famous in the past for its handicrafts. particularly carving, glazed pottery, embroidery, and gold and silver ornaments, it now has an economy based on fruit processing and wine making, though some crafts survive. In the centre of the city is the 16th-century tiled Kok-Gumbez Mosque. Pop. (1974 est.) 36,-

'Urābī Pasha, 'Urābī also spelled ARABI, in full ahmad 'urābī pasha al-mişrī (b. 1839, near az-Zaqāziq, Egypt-d. Sept. 21, 1911, Cairo), Egyptian nationalist who led a socialpolitical movement that expressed the discontent of the Egyptian educated classes, army officials, and peasantry with foreign control. Born of peasant stock, 'Urābī studied in Cairo

at al-Azhar, the leading institution of Islāmic learning in the Middle East. Conscripted into the army, he rose to the rank of colonel after serving as a commissariat officer during the Egyptian-Ethiopian war of 1875-76. In 1879 he participated in the officers' revolt against the khedive Ismā'īl Pasha.

Early in his career 'Urābī joined a secret society within the army with the object of eliminating the Turkish and Circassian officers who monopolized the highest ranks. In

1881 he led a revolt against this dominance. The following year, intervention by the European powers and the dispute about the rights of the Egyptian Assembly concerning budget controls led to the formation of the nationalist ministry of Mahmūd Sāmī al-Bārūdī, with 'Urābī as minister of war. 'Urābī emerged as the national hero under the slogan Misr li'l Mişriyin ("Egypt for Egyptians"). Khedive Tawfiq, threatened by 'Urābi's increasing popularity, requested the assistance of the French and British, who promptly staged a naval demonstration in the bay of Alexandria. Riots then broke out in Alexandria; when the British fleet bombarded the city (July 1882), Urābī, who was commander in chief of the Egyptian army, organized the resistance and proclaimed the khedive a traitor. 'Urābī's army was defeated at at-Tall al-Kabīr (Sept. 13, 1882) by British troops that had landed at Ismailia under the command of Sir Garnet Wolseley. 'Urābī Pasha was captured, courtmartialed, and sentenced to death, but, with British intervention, the sentence was changed to exile in Ceylon. He was permitted to return to Egypt in 1901.

Urabon (Japanese festival): see Bon.

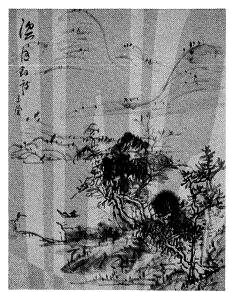

uracil, a colourless, crystalline organic compound of the pyrimidine family that occurs as a component of ribonucleic acids (RNA's), substances involved in the transmission of hereditary characteristics.

Chemical decomposition of RNA's under appropriate conditions yields, first, uridylic acid (called a nucleotide), a molecule composed of uracil, the sugar ribose, and phosphoric acid, followed by cleavage of the phosphoric acid, which leaves uridine (called a nucleoside), a molecule composed of uracil and the sugar. The final product is uracil itself.

Uracil is a component of several coenzymes that act in conjunction with enzymes in several processes of carbohydrate metabolism.

Uragami Gyokudō, also called HYŌUEMON GYOKUDŌ (b. 1745, Bizen, Japan—d. Oct. 10, 1820, Kyōto), Japanese painter-musician who excelled in depicting scenes of nature realistically and in the art of playing the seven-stringed zither.

The son of a retainer of Lord Ikeda of Okayama, Uragami took zither lessons early

"An Idyll of an Old Angler," painting by Uragami Gyokudō, c. 1811, leaf from an album called "Enkacho" ("Haze and Mist"); in the collection of Hikotaro Umezawa, Tokyo

By courtesy of Hikotaro Umezawa, Tokyo; photograph, Kadokawa-Shoten, Tokyo

in life and continued his musical training after he himself became a retainer. He also studied Confucianism and a southern school of Chinese art with emphasis on scholarly and literary themes. After abruptly resigning his retainership in 1795, he wandered through various parts of Japan and finally settled down in Edo (now Tokyo) to help revive gagaku, or Imperial court music. Although self-taught, he became a first-rate painter, gifted enough to carry on the tradition of the school of painting called Nan-ga. He had a keen appreciation of nature, reproducing scenes with an amazing degree of realism. His "Toun shisetsu" ("Snow Sifted Through Frozen Clouds") is considered a masterpiece.

Urakawan series, major division of rocks and time of the Cretaceous period (144 to 66.4 million years ago) in Japan. Rocks of the Urakawan series overlie those of the Gyliakian series and underlie those of the Hetonaian. The series is divided into two shorter spans of time, the Lower and Upper Urakawan stages. Several zones, representing still smaller spans of time, are recognized in the Urakawan and are characterized by fossils of distinctive ammonite cephalopods (mollusks).

To make the best use of the Britannica, consult the INDEX first

Ural-Altaic languages, hypothetical language grouping that includes all the languages of the Uralic and Altaic language families. Most of the evidence for including the Uralic and Altaic languages in one language family is based on similarities of language structure rather than on a common core of inherited vocabulary. Common Ural-Altaic linguistic features present in most of the languages include vowel harmony (i.e., vowels in the same word must harmonize in method of articulation); alternation of the final consonant of a stem according to the nature (open or closed) of a following syllable (this phenomenon is more common in certain Uralic languages than in the Altaic languages); complete lack of prefixes; the use of suffixes to express the grammatical modifications that are expressed in English by prepositions; lack of adjectival declension and of grammatical gender; and similarity in form of nouns and verbs.

Ural Mountains, also called the URALS, Russian URALSKY KHREBET, or URAL, mountain range in the Soviet Union, extending for about 1,300 miles (2,100 km) from the Kara Sea in the north to the Ural River in the south; its eastern slopes form part of the traditional physiographic boundary between Europe and Asia

A brief treatment of the Ural Mountains follows. For full treatment, see MACROPAEDIA: Furone.

The vast Russian S.F.S.R. stretches eastward and westward from the Urals. The mountains may be divided into five major sections from north to south. The northernmost Polar Urals, extending in a 240-mile (390-kilometre) arc from northeast toward the southeast, are typically Alpine. The next section southward is the highest segment of the range, the Nether-Polar Urals, rising to 6,217 feet (1,895 m) at Mount Narodnaya. Both of these sections are strewn with glaciers. The Northern Urals have peaks rising to between 3,000 and 5,000 feet (900 and 1,500 m). The summits, often flattened, are the remnants of ancient peneplains uplifted by recent tectonic movements. The lower Central Urals rarely exceed 1,600 feet (490 m), although the highest peak, Mount Sredny Baseg, rises above 3,000 feet. The Southern Urals continue southwestward, forming several parallel ridges and lying generally below 4,000 feet (1,220 m). This southernmost section of the Ural Mountains reaches 5,380 feet (1,640 m) above sea level at Mount Yamantau. The Urals are extremely rich in mineral resources, including major deposits of copper, nickel, chromite, gold, and platinum. Nonmetallic mineral resources include asbestos, talc, and fireclay. Amethyst, topaz, and emerald are among its gems and precious stones. Much of the Soviet Union's rich supplies of bituminous coal and lignite are found in the Urals.

Ural River, river in the Russian S.F.S.R. and Kazakh S.S.R., 1,509 miles (2,428 km) in length and draining 91,500 square miles (237,000 square km). It rises in the Ural Mountains near Mount Kruglaya and flows south along their eastern flank past Magnitogorsk. At Orsk it cuts westward across the southern end of the Urals, past Orenburg, and turns south again across a lowland of semidesert to enter the Caspian Sea at Guryev. Its flow has a great spring maximum, and freeze-up lasts from late November to April. Navigation is possible to Uralsk. A canal was started in the late 1970s to divert water from the Volga River to the Ural, just south of Uralsk. A barrage and hydroelectric station have been built at Iriklinsky, south of Magnitogorsk.

Uralian emerald, yellowish green or emeraldgreen andradite, a variety of garnet, not emerald. *See* andradite.

Uralian Geosyncline, a linear trough in the Earth's crust in the Soviet Union, in which there were deposited rocks of the Paleozoic era (570 to 245 million years ago). The geosyncline was active during the Ordovician period (505 to 438 million years ago), as indicated by sediments known to be of this age that occur in the Uralian belt. As in other parts of the world, several thousand metres of sediments of uncertain—but probably Cambrian—age underlie the Uralian Geosyncline, which very likely existed in some form about 570 to 500 million years ago. Two rock facies are present: a eugeosynclinal assemblage including abundant volcanic rocks occurs in the eastern part of the Uralian Geosyncline, whereas shales, relatively well-sorted quartzose sandstones, and limestones to the west attest to shallowwater, miogeosynclinal conditions. The latter deposits lie up on the Russian Platform and correlate with other sediments deposited on the Baltic Shield.

The Uralian Geosyncline and its deposits were affected only slightly by the Caledonian orogeny at the end of Silurian time (about 408 million years ago). The dual sedimentation pattern in the eastern and western segments continued through Carboniferous time (360 to 286 million years ago); carbonate rocks predominate in the Carboniferous sequence, but a few thin coal beds are known. Carbonate deposition continued into Permian time (286 to 245 million years ago), but a great increase in sands and clastic deposits generally attest to the effects of orogenic (mountain-building) activity in Late Permian time. The geosynclinal sediments were folded, crumpled, and faulted, and the history of the geosyncline came to an end with the birth of the present Ural Mountains.

Some evaporite deposits of great significance formed in the Uralian Geosyncline during Permian time. The Kungurian Series, near Solikamsk, includes 1,400 m (4,500 feet) of salt, gypsum, and anhydrite and is one of the world's greatest potash deposits.

Uralic languages, family of more than 20 related languages, all descended from a Proto-Uralic language that existed 7,000 to 10,000 years ago. These languages are spread over a large area, from western Siberia in the east to Hungary and Finland in the west. They range from such well-established national languages as Hungarian and Finnish to tiny minority languages of the Soviet Union, representing only a few native speakers with little ethnic or political unity. Some of the smaller groups

A brief treatment of the Uralic languages follows. For full treatment, see MACROPAEDIA:

Languages of the World.

The original homeland of the Uralic peoples is thought to have been in the vicinity of the central Ural Mountains; this assumption is based on extensive analysis of cognate words in Uralic languages for the names of flora and fauna, and of the geographical distribution of the present-day Uralic peoples. Because of their great geographic diversity, and consequently their lack of recent contact with each other, and because of the ancient breakup of Proto-Uralic, many of these languages are quite dissimilar.

The Uralic languages can be divided into two primary groups, Finno-Ugric and Samoyedic. This division reflects the earliest dialectal split from Proto-Uralic, and accordingly the languages in these two groups share the fewest similar features. Finno-Ugric is further divided into Finnic and Ugric. The Ugric group consists of Hungarian and two Ob-Ugric languages of western Siberia, Mansi (Vogul) and Khanty (Ostyak). The Hungarian tribes arrived at their present location in the Carpathian Basin more than a thousand years ago. Hungarian has the most speakers of any Uralic language and has had a rich literary tradition for several hundred years. The approximately 20,000 Khanty and Mansi speakers are dispersed around the Ob River and its tributaries. Both groups have little ethnic identity and a weak literary tradition, with great dialectal divergence.

Within the Finnic group there are several subgroups. Of the Baltic-Finnic languages the most important is Finnish, spoken mostly in Finland. The Finnish tribes probably occupied their present location about 2,000 years ago. Estonian is very similar to Finnish. Most of its speakers live in the Estonian S.S.R. of the Soviet Union. Both Finnish and Estonian have written texts from the early 16th century and have had a canonized literary form since

the middle of the 19th century.

There are five minor Baltic-Finnic languages: Karelian, Veps, Ingrian, Votic, and Livonian. All are spoken in the Soviet Union, mainly near the Gulf of Finland, and none has a literary form. Karelian and Veps have many speakers, but the other three are rapidly dying out.

The Lapp languages have about 30,000 speakers scattered from Sweden to the Soviet Union. They consist of several mutually unintelligible languages and dialects, less similar than Estonian and Finnish. Only the largest language group, North Lapp, has any literary tradition.

Another branch of Finnic consists of two closely related Permic languages, Udmurt (Votyak) and Komi (Zyrian). The Udmurt live mostly in the Udmurtskaya A.S.S.R., but Komi speakers spread beyond the Komi A.S.S.R. Both languages serve as the local administrative language and have relatively slight dialectal diversity.

Two more separate Finnic languages are Mordvin and Mari (Cheremis). Fewer than half the Mordvin speakers are in the Mordovskaya A.S.S.R. There are two main dialects, sometimes even considered separate languages, each of which has literary status. Mari speakers live mostly in the Mariyskaya A.S.S.R. There are two separate literary languages, based on two similar dialects.

Of the three North Samoyedic languages of northern Siberia, only Nenets (Yurak Samoyed) has a literary tradition. Enets (Yenisey Samoyed) has only a few hundred speakers, and Nganasan (Tavgy Samoyed) has fewer than a thousand. Only one South Samoyed language, Selkup (Ostyak Samoyed), still exists, with speakers in western Siberia; six other languages are now extinct.

The Proto-Uralic language has been partially reconstructed by painstaking comparison of the modern Uralic languages. According to this analysis, it had a limited inventory of consonant sounds, and in particular there was no contrast between voiced and voiceless consonants (i.e., the contrast that differentiates the English "bit" and "pit"). The vocalic system has not been reliably reconstructed, though it probably did contrast long and short vowels. Words were probably stressed on their first syllable, as in most modern Uralic languages. Both modern Uralic and Proto-Uralic languages were characterized by vowel harmony.

The Uralic languages are basically agglutinative; i.e., stems and affixes (prefixes, suffixes, and endings) are combined unchanged, and each element expresses only one bit of meaning. Relations within a sentence are carried by suffixes and postpositions (equivalent to prepositions, but following a noun instead of preceding it). Proto-Uralic probably had no marker to denote the plural of nouns, since today the forms for expressing the plural vary greatly from language to language. Possession is expressed by a suffix either on the possessor or on the item possessed.

A widespread characteristic of the modern Uralic verb is the distinction between subjective and objective conjugations. The purpose of this system is to single out the subject or the object for emphasis (focus).

Uralsk, also spelled URAL'SK, oblast (administrative region), western Kazakh Soviet Socialist Republic, with an area of 58,375 sq mi (151,200 sq km). Known in 1932-62 as Zapadno-Kazakhstan oblast, it lies mainly in the Caspian Depression in dry steppe and semidesert zones. The only substantial river is the Ural, which crosses the *oblast* northsouth. The climate is continental and dry, with precipitation varying from just over 12 in. (300 mm) in the north to 8 in. in the south. The economy is almost entirely agricultural, with stock breeding (sheep, goats, cattle, horses, and camels) predominating. Wheat, barley, and other grains are grown, mainly in the north and in river valleys. There are also extensive haylands, and there is fishing in the Ural. A major new canal to regulate the flow of water in the Ural and to provide water for irrigation in the northern Caspian Depression was under construction in the late 1970s, connecting the Volgograd reservoir and a point on the Ural River just south of the city of Uralsk. Industry is concentrated in Uralsk, the capital; other cities include Aksay, Peremyotnoye, Daryinskoye, Kaztalovka, and Saykhin. Half the population are Kazakhs, the remainder being mostly Russians and Ukrainians; about 61 percent is rural. Pop. (1983 est.) 603,000.

Uralsk, also spelled URAL'SK, city and administrative centre of Uralsk oblast (administrative region), Kazakh Soviet Socialist Republic, on the right bank of the Ural River. Founded in 1613 or 1622 by Cossacks fleeing a tsarist punitive campaign, it was known as Yaitsky Gorodok until 1775, when its name was changed following the Pugachov Rebellion. The town was a centre of both the Stenka Razin (1667) and Yemelyan Pugachov (1773) uprisings and was the headquarters of the Ural Cossacks. It had a lively trade with European Russia in fish from the Ural and livestock products from the Kazakh steppes. Its commercial importance began to decline in the early 20th century when the new railway to Turkistan bypassed it. Industry today includes leather and footwear, meat-packing, flour milling, some engineering, and a licorice works. Uralsk has teacher-training and agricultural institutes, the oldest theatre in Kazakhstan, and a museum with historic Cossack mementos. Pop. (1983 est.) 183,000.

Urania, in Greek religion, one of the nine Muses, patron of astronomy. In some accounts

she was the mother of Linus the musician (in other versions, his mother is the Muse Calliope); the father was either Hermes or Amphimarus, son of Poseidon. Urania was also occasionally used as a byname for Aphrodite. Her attributes were the globe and compass.

Uraniborg, observatory established in 1576 by the Danish astronomer Tycho Brahe. It was the last of the primitive observatories in that it antedated the invention (c. 1608) of the telescope; and it was the first of the modern observatories in that it was completely supported by the state and produced the first organized, extensive array of dependable data in astronomical history, including a catalog of more than 1,000 stars.

In 1576 Frederick II of Denmark granted the island of Ven (off the coast of southern Sweden, then under Danish hegemony) in fief to Tycho. A palatial three-story building was constructed in which student astronomers and staff were quartered and royalty was sometimes entertained. Instruments included quadrants, parallactic rulers, and armillary spheres, built to Tycho's demanding standards of accuracy. Kepler based his laws of planetary motion on computations with the precise data accumulated at Uraniborg. The observatory was abandoned when Tycho's fief was withdrawn in 1597.

uraninite, a major ore mineral of uranium, uranium dioxide (UO₂). Uraninite usually forms black, moderately hard, very dense crystals and less dense masses; the massive variety is called pitchblende.

The element uranium was discovered by M.H. Klaproth in 1789 in uraninite from

Uraninite in pitchblende from Great Bear Lake, Northwest Territories, embedded (for display) in a larger mass of feldspar from Grafton Center, N.H. By courtesy of the Field Museum of Natural History, Chicago; photograph, John H. Gerard—EB Inc.

Joachimsthal. Radium was first extracted from uraninite ore from the same locality by Pierre and Marie Curie and G. Bémont in 1898.

Uraninite has been obtained largely from hydrothermal vein deposits, as in the Katanga district of Zaire; at Joachimsthal and adjacent places in the Erzgebirge, Ger.; at Great Bear Lake in the Northwest Territories; and the Lake Athabasca district in Alberta and Saskatchewan. The uraninite of veins usually is pitchblende. Uraninite is recovered as a by-product from the conglomeratic gold ores of the Witwatersrand, S.Af., and in the Blind River area, Ont. Important deposits of fine-grained uraninite occur in sedimentary rocks, chiefly sandstones and conglomerates, in the Colorado Plateau area of the western United States. Deposits in sandstones often are extensively oxidized to carnotite and other secondary uranyl minerals, which may themselves constitute important uranium ores. Uraninite is widespread as a well-crystallized accessory mineral in pegmatites, but

such occurrences are of little or no economic importance. Fine specimens have been found in pegmatites at Wilberforce, Ont.; the Spruce Pine district, N.C.; and Grafton, N.H.

Through oxidation the composition of uraninite varies between UO_2 and $UO_{2\cdot 6}$. Thorium atoms can substitute for uranium atoms in the crystal structure, so that a complete solidsolution series extends to thorianite. Some varieties in this series contain appreciable amounts of rare earths, particularly cerium. Types rich in thorium and rare earths occur principally in pegmatites; some have been designated by varietal names. Lead accumulates in uraninite as a product of the radioactive decay of uranium and thorium; the amount present can be used to calculate the geologic age of the mineral. Uraninite often alters to yellow or orange-red hydrated oxides (e.g., gummite) and to greenish-yellow silicates. It is not resistant to weathering, and the uranium may be leached and redeposited locally as autunite, torbernite, or other secondary minerals. For detailed physical properties, see oxide mineral (table).

uranium (U), radioactive chemical element of the actinide series in Group IIIb of the periodic table, atomic number 92, an important

Uranium comprises about two parts per million of the Earth's crust. Some important uranium minerals are pitchblende, uraninite, carnotite, autunite, and torbernite. These and other recoverable uranium ores, as sources of nuclear fuels, contain many times more energy than all the known recoverable deposits of fossil fuels. One pound of uranium yields as much energy as 3,000,000 pounds of coal. For additional information about uranium ore deposits as well as coverage of mining, refining, and recovery techniques, see MACROPAEDIA: Industries, Extraction and Processing.

Uranium is silvery-white in colour and is dense and not hard enough to scratch glass. It is ductile, malleable, and capable of taking a high polish. In air the metal tarnishes and when finely divided breaks into flames. It is a poor conductor of electricity. Though discovered (1789) by Martin Heinrich Klaproth, who named it after the then recently discovered planet Uranus, the metal itself was first isolated (1841) by Eugène-Melchior Péligot by the reduction of uranium tetrachloride (UCl₄) with potassium.

Henri Becquerel first discovered (1896) the phenomenon of radioactivity in uranium. It is now known that uranium, radioactive in all its isotopes, consists naturally of a mixture of uranium-238 (99.27 percent, 4,510,000,-000-year half-life), uranium-235 (0.72 percent, 713,000,000-year half-life), and uranium-234 (0.006 percent, 247,000-year half-life). These long half-lives make possible determinations of the age of the Earth by measuring the amounts of lead, uranium's ultimate decay product, in certain uranium-containing rocks. Uranium-238 is the parent and uranium-234 one of the daughters in the radioactive uranium decay series; uranium-235 is the parent of the actinium decay series.

The element uranium became the subject of intense study and broad interest after Otto Hahn and Fritz Strassmann discovered (late 1938) nuclear fission in uranium bombarded by slow neutrons. Enrico Fermi suggested (early 1939) that neutrons might be among the fission products and could thus continue the fission as a chain reaction. Leo Szilard, Herbert L. Anderson, Jean-Frédéric Joliot-Curie, and their coworkers confirmed (1939) this prediction; later investigation showed that an average of 21/2 neutrons per atom are released during fission. Those discoveries led to the first self-sustaining nuclear chain reaction (Dec. 2,

1942), the first atomic bomb test (July 16, 1945), the first atomic bomb dropped in warfare (Aug. 6, 1945), the first atomic-powered submarine (1955), and the first full-scale nuclear-powered electrical generator (1957).

Fission occurs with slow neutrons in the relatively rare isotope uranium-235 (the only naturally occurring fissile material), which must be separated from the plentiful isotope uranium-238 for its various uses. Uranium-238, however, after absorbing neutrons and undergoing negative beta decay, becomes the synthetic element plutonium, fissile with slow neutrons. Natural uranium, therefore, can be used in converter and breeder reactors, in which fission is sustained by the rare uranium-235 and plutonium is manufactured at the same time by the transmutation of uranium-238. Fissile uranium-233 can be synthesized for use as a nuclear fuel from the nonfissile thorium isotope thorium-232, which is abundant in nature. Uranium is also important as the primary material from which the synthetic transuranium elements have been prepared by transmutation reactions.

Uranium, which is strongly electropositive, reacts with water; it dissolves in acids but not in alkalies. The important oxidation states are +4 (as in the oxide UO_2 and the green ion U^{4+}) and +6 (as in the oxide UO₃ and the yellow uranyl ion UO_{5}^{2+}). It also exhibits a +3 and a +5 state, but the respective ions are unstable (the red U3+ and the UO2 ion, which undergoes disproportionation to U4+ and UO2+).

Uranium compounds are used as colouring agents for ceramics. Uranium hexafluoride (UF₆) in the vapour state is used in the gas diffusion method of separating uranium-235 from uranium-238.

atomic number atomic weight 238.03 1,132.3° C (2,070.1° F) melting point boiling point 3,818° C (6,904° F) specific gravity 19.05 valence 3,4,5,6 2-8-18-32-21-9-2 or electronic config. $(Rn)5f^36d^17s^2$

uranium-234-uranium-238 dating, method of age determination that makes use of the radioactive decay of uranium-238 to uranium-234; the method can be used for dating of sediments from either a marine or a playa lake environment. Because this method is useful for the period of time from about 100,000 years to 1,200,000 years before present, it helps in bridging the gap between the carbon-14 dating method and the potassium-argon dating method.

Uranium City, municipal corporation, centre of the Beaverlodge Lake mining region in extreme northwestern Saskatchewan, Canada, near the north shore of Lake Athabasca. The discovery in the early 1950s and the subsequent production of uranium ore there by the Eldorado Mining and Refining Company (a Crown corporation, renamed Eldorado Nuclear Limited in 1968) were responsible for the relocation of nearby Goldfields, a former gold-mining town. Uranium City and District is reached from Alberta by air service from Edmonton and, in summer months, by barge traffic on the Athabasca waterway to the McMurray-Waterways railhead. Pop. (1981)

uranium series, set of unstable heavy nuclei comprising one of the four radioactive series (q.v.).

uranium-thorium-lead dating: see common-lead dating.

Uranus, in Greek mythology, the personification of heaven. According to Hesiod's *Theogony*, Gaea (Earth), emerging from primeval Chaos, produced Uranus, the Mountains, and the Sea. From Gaea's subsequent union with Uranus were born the Titans, the Cyclopes, and the Hecatoncheires.

Uranus hated his offspring and hid them in Gaea's body. She appealed to them for vengeance, but Cronus (a Titan) alone responded. With the harpe (a scimitar) he removed the testicles of Uranus as he approached Gaea. From the drops of Uranus' blood that fell upon her were born the Erinyes, the Giants, and the Meliai (the ash-tree nymphs). The severed genitals floated on the sea, producing a white foam, from which sprang the goddess of love, Aphrodite. Cronus by his action had separated Heaven and Earth. Uranus also had other consorts: Hestia, Nyx, Hemera, and Clymene.

There was no cult of Uranus in classical Greece. This circumstance, together with other elements in the story, suggests pre-Greek origins. The use of the harpe points to an Oriental source, and the story bears a close resemblance to the Hittite myth of Kumarbi.

Uranus, in astronomy, seventh major planet from the Sun. It was discovered in 1781 by the English astronomer William Herschel during

a telescopic survey of the sky.

A brief treatment of Uranus follows. For full treatment, see MACROPAEDIA: Solar System. Uranus is almost 15 times as massive as the Earth, and its volume exceeds that of the latter by more than 50 times. Stellar occultation measurements conducted by James Elliot and other U.S. investigators in 1977 revealed the existence of nine sharply defined, narrow, dark rings lying from 1.6 to 1.95 R_{II} (where R_{II} is Uranus' equatorial radius of 26,-000 kilometres [16,120 miles]). A tenth ring was discovered in 1986 by the U.S. Voyager 2 space probe during its flyby of the planet. Three of the rings are circular, while the others have a large range in eccentricity and are variable (by up to a factor of five) in width. All of the rings consist primarily of bouldersized chunks of dark matter about one metre (three feet) in diameter. The composition of the ring particles has not yet been determined, but investigators speculate that they are made up of rock fragments and water ice intermixed with a black, amorphous polymer, which might account for the coal-black colour of the particles. The gaps between the rings are filled with numerous bright dust particles.

In addition to its system of rings, Uranus has at least 15 satellites. The five major moons—Miranda, Umbriel, Ariel, Oberon, and Titania—have diameters ranging from 310 to 1,600 km (193 to 990 mi). The other moons are substantially smaller and lie inside the orbit of Miranda, the innermost of the major Uranian satellites. Two of the moonlets seem to act as "shepherds" of the ring dubbed epsilon, gravitationally confining its constituent

particles.

Data transmitted by Voyager 2 revealed that Uranus is surrounded by a magnetic field comparable in strength to those around the Earth and Saturn. Trapped within this field is a radiation belt more intense than the Earth's. The axis of the Uranian field is tilted some 55° from the planet's axis of rotation. This is an exceedingly large inclination when compared to that of the magnetic fields of other planets (e.g., the Earth's field is tilted a mere 11°). The magnetic field of Uranus is swept back into a long "tail" by the solar wind (outflow of charged particles from the Sun's corona). Because the field is inclined so sharply, the tail is twisted much like a corkscrew.

An analysis of radio emissions from Uranus' magnetic field has enabled investigators to estimate the rotation period of the planet to be about 17.3 hours. Uranus' axis of rotation is unusual in that it lies in the plane of its orbit. The axes of all other planets in the solar system are roughly perpendicular to the plane of their orbits.

Uranus is thought to have a core of heavy, rocky material possibly in a molten state. The core is surrounded by a mantle thousands of kilometres deep that is composed of water, along with substantial amounts of methane and ammonia. This Uranian "ocean" is heated to several thousand degrees Celsius, but it does not boil away because of the tremendous pressure from the weight of the overlying atmosphere. It has been hypothesized that this enormous superheated ocean is electrically conducting and generates Uranus' magnetic field.

Uranus' atmosphere appears to extend thousands of kilometres above the ocean in successive layers. The layer closest to the ocean surface most likely consists of methane clouds, while the upper reaches seem to be composed principally of hydrogen and some helium. The temperature at the very top of the atmosphere is about -212° C (-350° F). Available data suggest that the temperature increases with depth. Like Jupiter and Saturn, Uranus has bands of clouds. Such atmospheric banding is probably caused by temperature differentials: regions of upwelling generate high, lightcoloured clouds, whereas those of downdraft produce low, comparatively dark zones. A few individual cloud formations somewhat resembling terrestrial thunderheads have been detected in the planet's atmosphere between 25° and 50° latitude. Measurements indicate that these clouds are borne by winds traveling at roughly 355 kph (220 mph) in the same direction as the planet's rotation. What generates such high-speed winds remains a mystery.

Urartian language, also called CHALDEAN, or VANNIC, ancient language spoken in northeastern Anatolia and used as the official language of Urartu from the 9th to the 6th century BC. Non-Indo-European in origin, it is thought to be descended from the same parent language as the older Hurrian language (q.v.). The surviving texts of the language are written in a variant of the cuneiform script known as Neo-Assyrian. Two bilingual inscriptions in Assyrian and Urartian led to the deciphering of Urartian. In 1933 the German Orientalist Johannes Friedrich published the first reliable description of the language in his Urartian grammar.

Urartu, ancient country of southwest Asia centred in the mountainous region southeast of the Black Sea and southwest of the Caspian. Mentioned in Assyrian sources from the early 13th century BC, Urartu enjoyed considerable political power in the Near East in the 9th and 8th centuries BC. The Urartians were succeeded in the area in the 6th century BC by the Armenians.

"Urartu" is an Assyrian name. The Urartians themselves called their country Biainili and their capital, located at modern Van, Tushpa (Turushpa). Most Urartian settlements are

found between the four lakes Çildir and Van in Turkey, Urmia in Iran, and Sevan in Soviet Armenia, with a sparser extension toward the Euphrates.

The Urartians had a number of traits in common with the Hurrians, an earlier Near Eastern people. Both nations spoke closely related languages and must have sprung from a common ancestor nation (perhaps 3000 BC or earlier). Although the Urartians owed much of their cultural heritage to the Hurrians, they were to a much greater degree indebted to the Assyrians, from whom they borrowed script and literary forms, military and diplomatic practices, and artistic motifs and styles.

The Assyrian influence was manifested in two phases: first, from c. 1275 BC to 840, when the Assyrians campaigned in Urartian territory and met only scattered resistance; second, from 840 to 612, during the heyday of the Urartian kingdom. In the first phase Assyrian influence was felt directly, and the local inhabitants were helplessly exposed to ruthless depredation at the hands of the Assyrians. During this time, the Urartians seem to have eagerly absorbed or imitated the amenities of Assyria's higher civilization. In the second phase, Urartu produced its own distinctive counterparts to all Assyrian achievements.

The first century of the new kingdom seems to have emphasized military operations in imitation of Assyria, and Urartu waged relentless warfare on its neighbours to the east, west, and north.

For the reign of Sarduri I (c. 840-830 BC) there remain only the inscriptions at Van. But for the reigns of his son Ishpuini (c. 830-810) and especially of Ishpuini's son Meinua (c. 810-781) Urartian conquests can be measured indirectly from widespread inscriptions ranging from the lower Murat basin (around Elâziğ) in the west, to the Aras (Araks, Araxes River; from Erzurum to Mount Ararat) in the north, and to the south shore of Lake Urmia in the southeast. Ardini, or Musasir, once conquered by Tiglath-pileser I of Assyria c. 1100, now became part of the Urartian sphere of influence, although technically neutral under its own dynasty of priest-rulers. The temple of Haldi at Ardini was richly endowed by the Urartian kings but was open to Assyrian worshippers.

A number of Urartian inscriptions dealing with religious subjects date to the end of Ishpuini's reign, when Meinua acted as co-regent. It seems that the state religion received its established form under these kings, and the hierarchy of the many gods in the Urartian pantheon is expressed by a list of sacrifices due them.

The first evidence of engineering projects, designed to increase the productivity of the

home country by irrigation, dates to the reign of Meinua. This is the "Canal of Meinua," which led and still leads fresh water over a distance of about 46 miles (28 kilometres) from an abundant spring to the southern edge of Van.

From the reigns of Meinua's son Argishti I (c. 780-756) and grandson Sarduri II (\bar{c} . 755-735) there is, in addition to inscriptions, a direct historical source in the form of annals carved into the rock of Van and into stelae that were displaced in later times to other locations in the vicinity. Under these kings Urartu thrust out westward to the great bend of the Euphrates and intermittently beyond, toward Melitene (modern Malatya) and the ancient Syrian district of Commagene, thus cutting off one of the main supply roads by which Assyria obtained essential iron from the western Taurus Mountains. Argishti I subdued the Melitene Hilaruada (c. 777), as did Sarduri II in the 750s. King Kushtashpi of Commagene was subjugated by Sarduri II around 745. Part of the domain of King Tuate of Tabal in the Taurus had also fallen to Argishti I about 777. For a short time Urartu thus had a bridgehead west of the Euphrates from Malatya to Halfeti (ancient Halpa) in Commagene, and its empire reached to within 20 mi of Aleppo in northern Syria.

Argishti and Sarduri also embarked on what was in the end to prove the most fruitful of all Urartian ventures: the conquest and subsequent agricultural exploitation of the regions across the Aras: under Argishti I, Diauehi ("the Land of the Sons of Diau"; Assyrian: Daiaeni) was finally defeated, and the upper and middle Aras Valley became a major centre of building, irrigation, and agricultural activity. Sarduri added lakes Cildir and Sevan. Further advance to the northwest was checked by a new adversary, the kingdom of Qulha (Greek Colchis). The tens of thousands of prisoners taken on the yearly military campaigns (in one year as many as 39,000) provided the manpower for intensive cultivation of the royal estates and processing of their crops

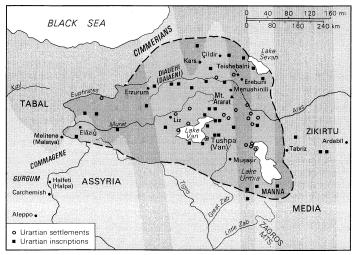

Armenian legend attributed much of the surviving Urartian construction to Queen Semiramis. The historical queen Sammu-ramat, however, Babylonia-born regent of Assyria from 810 to 806, did not intervene at all in the affairs of Urartu. On the contrary, the reigns of her husband, son, and elder grandsons (823–745) marked a period of Assyrian military decline, during which the Urartians extended their frontiers.

Several times the Urartian kings of this period claimed, probably with justification, to have defeated Assyrian armies: Argishti reported victories over the Assyrians in his sixth and seventh regnal years, when he operated in the Zab and Lake Urmia areas; and Sarduri II defeated the Assyrian king Ashur-nirari V in the upper basin of the Tigris c. 753.

The period c. 744–715 saw the renewal of

The period c. 744–715 saw the renewal of Assyrian expansion. In spite of the support of a number of south Anatolian and north Syrian vassals, Sarduri II lost ground steadily, and in 743 Tiglath-pileser III of Assyria (744–727) defeated him and his allies in Commagene near Halfeti. When Tiglath-pileser in 735 advanced all the way to the gates of Tushpa, a palace revolt may have placed Sarduri's son Rusas I (c. 735–713) at the head of the state.

Tiglath-pileser's son, king Sargon II of Assyria (721-705) completed the elimination of Urartu as a rival for hegemony in the Near East. Urartu's hopes of help from the north Syrian principalities were dashed by their swift subjection, ending with the incorporation of Carchemish into the Assyrian Empire in 717. In the metal-rich Taurus Mountains, the kingdom of Tabal remained a potential ally of Rusas I, as well as of the Phrygian king Mi-

Ancient Urartu

das of the legendary golden touch. After the latter's defeat, Tabal was annihilated and annexed to Assyria.

In the same year Sargon began to close in on Urartu from the east. For two years operations were mostly limited to western Iran. There Assyria championed the interests of the kingdom of Manna, while Urartu aided and abetted Iranian tribes encroaching upon Manna from the east and north. But behind the Urartian lines Assyrian intelligence officers were collecting information with a view to a much more ambitious military undertak-

ing against Urartu. What finally tipped the scales in favour of Assyria was the opening up of a second front: the Cimmerians, a nomadic people from the Caucasus, invaded Urartu shortly before 714. Perhaps Rusas I (c. 735–713) himself provoked the onslaught by unwisely destroying several buffer states to the north. In any case, Rusas soon found the Cimmerians at his borders. Undaunted, he proceeded to the attack but suffered a major disaster: the Assyrian crown prince Sennacherib, sent north by King Sar-

soon found the Cimmerians at his borders. Undaunted, he proceeded to the attack but suffered a major disaster: the Assyrian crown prince Sennacherib, sent north by King Sargon II (721-705) to gather intelligence about Urartian affairs, reported to his father that Rusas' whole army had been defeated in Cimmerian territory and that Rusas himself had fled back to Urartu, having lost contact with his commanders. This encouraged Sargon to undertake the ambitious campaign of 714 that put an end to the aspirations of the Urartian kings outside of their mountain homeland. After unsuccessfully heading a coalition of his allies against Assyria, Rusas hastened back to Tuspha, which Sargon wisely did not try to besiege. Sargon avoided a clash with the Cimmerians and instead plundered the main sanctuary of the Urartians at Ardini and car-

The military setbacks of Rusas I ended Urartu's political power. Nevertheless, his son Argishti II (c. 712–685) and successors continued the royal tradition of developing the country's natural resources, and Urartian culture not only survived but continued to flourish for a while, despite its political impotence. The Urartians were finally overcome by invading Armenians toward the end of the 7th century RC.

ried off the statue of Haldi. Hearing of this

third calamity, Rusas committed suicide.

Urawa, capital, Saitama ken (prefecture), Honshu, Japan, on the Tohoku railway line north of Tokyo. During the Tokugawa era (1603–1867) Urawa was a post town on the Nakasendo Road. It was designated the prefectural capital in 1876. Urawa is a commercial and residential suburb of the Tokyo-Yokohama Metropolitan Area, with a growing industrial sector. In the city's environs are Tajimagahara, Japan's largest primrose garden, and Sagiyama, a sanctuary for migratory herons. Pop. (1983 est.) 370,242.

Urban, Latin URBANUS, name of Roman Catholic popes, grouped below chronologically and indicated by the symbol ●.

• Urban I, SAINT (b. Rome?—d. 230, Rome; feast day May 25), pope from 222 to 230. Succeeding that of St. Calixtus I, his pontificate occurred within the reign of the Roman emperor Severus Alexander, a time of peace for the church. His Baptism of St. Cecilia's

husband, St. Valerian, is fictitious. He was buried in the cemetery of St. Calixtus, Rome.

• Urban II, original name odo of châtil-LON-SUR-MARNE, or odo of LAGERY, or of LAGNY, French odon, or EUDES, de châtil-LON-SUR-MARNE, or de LAGERY, or de LAGNY (b. c. 1035, Châtillon-sur-Marne, or Lagery, or Lagny, Champagne, Fr.—d. July 29, 1099, Rome), head of the Roman Catholic Church (1088–99) who developed ecclesiastical reforms begun by Pope Gregory VII, launched the Crusade movement, and strengthened the papacy as a political entity.

papacy as a political entity. Early life and career. Odo was born of noble parents about 1035 in the Champagne region of France. After studies in Soissons and Reims, he took the position of archdeacon in the diocese of Reims, at that time the most important metropolis in France. An archdeacon was an ordained cleric appointed by the

Urban II (left), attended by Abbot Hugh of Cluny (right) and cardinals and monks, consecrating the third abbey church at Cluny, detail of a miniature from "Chronicon Cluniacense," late 12th century; in the Bibliothèque Nationale, Paris (lat. 17,716, fol. 91)

bishop to assist him in administration; in the Middle Ages it was an office of considerable power. Odo held the position probably from 1055 to 1067. Subsequently he became a monk and then (c. 1070-74) prior superior at Cluny, the most important centre of reform monasticism in Europe in the 11th century. At Reims and Cluny, Odo gained experience in ecclesiastical policy and administration and made contacts with two important reform groups of his time: the canons regular—clergymen dedicated to the active service of the church, who live a strict life in communityand the monks of Cluny. In 1079 he went to Rome on a mission for his abbot, Hugh of Cluny.

While in Rome he was created cardinal and bishop of Ostia (the seaport for Rome) by Gregory VII. In 1084 Gregory VII sent him as papal legate to Germany. During the crisis of Gregory VII's struggle with Henry IV, the Holy Roman emperor, Odo remained loyal to the legitimate papacy. After Gregory VII's death in 1085, he also served his successor, Victor III, who died in September 1087. After a long delay, during which the reform cardinals tried unsuccessfully to regain control of Rome from Guibert of Ravenna, who had been named Pope Clement III by Henry IV in 1080, Odo was elected pope in Terracina, south of Rome, on March 12, 1088.

Pontificate. As pope, Urban II found active support for his policies and reforms among

several groups: the nobility, whose mentality and interests he knew; the monks; the canons regular, for whom he became patron and legislator; and also, increasingly, the bishops.

Urban felt that his most urgent task was to secure his position against the antipope Clement III and to establish his authority as legitimate pope throughout Christendom. He attempted, with moderation and tolerance, to reconcile the church-state traditions of his age with ecclesiastical notions of reform. In practice he pushed the controversial question of lay investiture—the act whereby a temporal ruler granted title and possession to a church office-more into the background while at the same time retaining reform legislation. He thus softened the conflict and permitted a more peaceful discussion of the problems at issue. At the Council of Clermont (France), in 1095, during which he eloquently called the First Crusade, Urban attempted, however, to prevent a further and complete feudalization of church-state relationships by prohibiting the clergy from taking oaths of fealty to lay-

Despite Urban's attempts at reconciliation, it did not prove possible to come to terms with Henry IV or with a large part of the church within the empire. England also remained closed to papal policies of reform and centralization, although Urban had been recognized there since 1095; a conflict between Anselm, the theologian who was named archbishop of Canterbury, and King William II particularly strained the relations between Urban and the King. On the other hand, despite a long-standing conflict between Philip I of France and Urban (brought about by the King's scandalous marriage), France began under this French pope to become the most important support of the medieval papacy. Urban obtained special support in southern Europe: his particularly faithful allies were the Normans of southern Italy and Sicily. In Spain, Urban supported the Christian reconquest of the country from the Moors and carried out the ecclesiastical reorganization of the country. In southern Italy, southern France, and Spain, kings and princes became vassals of the Roman See and concluded treaties and concordats in feudal form with the Pope: by this the temporal rulers sought to secure their independence from more powerful lords, and the Pope for his part was able to carry out his reform aims in these territories.

From 1095 Urban was at the height of his success. From this time several important church councils took place: in 1095 at Piacenza, Italy, at which reform legislation was enacted; also in 1095 at Clermont, where Urban preached the First Crusade; in 1098 at Bari, Italy, where he worked for a reunion between Greek Christians and Rome; and in 1099 at Rome, where again reform legislation was passed. Urban's idea for a crusade and his attempt to reconcile the Latin and Greek churches sprang from his idea of the unity of all Christendom and from his experiences with the struggles against the Muslims in Spain and Sicily. He was, for a while, able to attract the Byzantine emperor Alexius I to his plans but never the Greek Church. Whereas the First Crusade led to military success with the conquest of Jerusalem in 1099, the project for union failed. Urban's pontificate not only led to a further centralization of the Roman Church but also to the expansion of papal administration; it contributed to the development of the Roman Curia, the administrative body of the papacy, and to the gradual formation of the College of Cardinals. The term Curia Romana first appeared in a bull written by Urban in 1089.

Urban died in Rome in 1099. Despite many problems that were still unsolved, the victory of medieval reform papacy was secured. Urban was beatified in 1881 by Pope Leo XIII.

(Al.Be.

BIBLIOGRAPHY. A full account of Urban II's life and pontificate is given by A. Becker, Papst Urban II, vol. 1 (1964; vol. 2 in prep.). The chapters by F. Kempf in H. Jedin and J. Dolan (eds.), Handbuch der Kirchengeschichte, vol. 3 (1966; Handbook of Church History, vol. 3, 1969), present a good survey of Urban's history and offer a rich bibliography. The First Crusade and its connection with the history of Byzantium is related by S. Runciman in A History of the Crusades, vol. 1 (1951). Among the earlier biographies, the work of H.K. Mann, The Lives of the Popes in the Early Middle Ages, 2nd ed., vol. 7 (1925), still has value. Among the more important later works are A. Fliche in Histoire de l'Église, vol. 8 (1944); and J. Haller, Das Papstum, vol. 2 (1951).

• Urban III, original name UBERTO CRIVEL-LI (b. Milan—d. Oct. 19/20, 1187, Ferrara, Romagna), pope from 1185 to 1187. Of noble birth, he was made cardinal and

Of noble birth, he was made cardinal and archbishop of Milan in 1182 by Pope Lucius III, whom he succeeded on Nov. 25, 1185, and from whom he inherited an imperial diplomatic crisis that harassed his entire pontificate.

On Jan. 27, 1186, Henry VI, son of the Holy Roman emperor Frederick I Barbarossa (of the Hohenstaufen dynasty), married Constance, the daughter and heiress of the late king Roger II of Sicily. Urban resented the marriage as an attempt to encircle the papacy, for it confronted him with the ominous prospect of Hohenstaufen domination of southern and northern Italy. The marriage was conducted at Milan by the Patriarch of Aquileia, who soon after crowned Henry as king of Italy, which Urban considered a deliberate offense to his authority. He excommunicated the Patriarch.

The Emperor and the Pope later clashed on ecclesiastical matters. Against the imperial candidate, Rudolph, Urban consecrated (June 1, 1186) Folman as archbishop of Trier, whereupon the Emperor dispatched Henry to invade the Papal States. In April/May 1187 Frederick convoked the Diet of Gelnhausen, which barred the papal legate Philip of Heinsberg, archbishop of Cologne, and whose bishops supported the Emperor. On hearing the results, Urban summoned the Emperor to Verona, whose citizens refused to allow the Pope to use their city as the place of Frederick's excommunication. Thus, Urban started for Venice to complete his plans, but he died en route. An open rupture resulted, and a long, disastrous struggle for southern Italy developed between the two factions. M.C. de Fischer-Reichenbach's Urbain III et Barberousse was published in 1940.

• Urban IV, original name JACQUES PANTALÉON (b. c. 1200, Troyes, Champagne—d. Oct. 2, 1264, Perugia, Papal States), pope from 1261 to 1264.

Of humble origin, he was first a priest at Lyon and then professor of canon law at Paris before being elevated to the bishopric of Verdun in 1253. Two years later he was made patriarch of Jerusalem by Pope Alexander IV, whom he succeeded on Aug. 29, 1261. Urban was faced with two tasks: freeing the Kingdom of Sicily, a papal fief, from Hohenstaufen domination and restoring papal influence in Italy, where it had diminished because of Alexander's vacillation in the Sicilian problem.

In 1263 Urban fatefully decided to offer the crown of Sicily to Charles of Anjou, the able and ambitious brother of King St. Louis IX of France, despite the claims of Manfred, illegitimate son of the late Hohenstaufen emperor Frederick II. By this time Urban had considered Manfred's power and the rise of the Ghibellines (anti-papal and pro-imperialistic political party) in Tuscany and Lombardy a critical threat to the church. Later negotiations between the Pope and Louis were tedious, menaced by both Manfred and the Ghibellines. Concurrent intrigue, including the suspicion of a plot to assassinate Urban, caused the Pope to leave for Perugia. He died,

Alinari—Art Resource/EB Inc.

however, before Charles arrived, leaving the Sicilian problem to torment his successors.

Urban's bull of 1264 had ordered the whole church to observe the Feast of Corpus Christi, a festival in honour of the Real Presence of Christ in the Eucharist (observed on the Thursday after Trinity Sunday). Because of Urban's early death, the order was ignored in most countries until after its confirmation by Pope Clement V at the Council of Vienne in 1311–12. J. Guiraud's edition of Les Registres d'Urbain IV, 1261–64 (2 vol.) was published in 1901–30.

• Urban V, Blessed, original name GUIL-LAUME DE GRIMOARD (b. c. 1310, Languedoc, Fr.—d. Dec. 19, 1370, Avignon, Provence; beatified March 10, 1870; feast day December 19), pope from 1362 to 1370.

Of noble birth, he joined the Benedictines, later teaching law at Avignon. He became abbot of Saint-Germain, Auxerre, in 1352 and of Saint-Victor, Marseille, in 1361. On Sept. 28, 1362, he was elected successor to Innocent VI and was crowned at Avignon, seat of the papacy from 1309 to 1377.

As pope he helped to restore peace in Italy and began to reform the Avignonese Curia, which in 1365 he planned to reestablish at Rome, despite French opposition. In the same year, the Holy Roman emperor Charles IV visited Urban at Avignon and undertook to escort him to Rome; on June 4 the Pope crowned him king of Burgundy. Urban also felt the reunion of the Eastern and Western churches was urgently important and that negotiations with the patriarch of Constantinople would be facilitated if the papacy were back in Rome. Thus, on April 30, 1367, he left Avignon, arriving at Rome on the following October 15. He installed himself at the Vatican but was destined not to remain there long. Finding most of the churches in ruin, he initiated a program of restoration.

In October 1369 the Byzantine emperor John V Palaeologus met Urban at Rome, where he confessed the Roman faith and offered to submit the Byzantine Church to Roman supremacy. John's clergy and people, however, refused to support him, and so the Greek and Latin churches remained separated. Urban failed to achieve a compromise and refused to convoke an Eastern-Western council.

Meanwhile, the Anglo-French war resumed in 1369, and renewed strife in Rome and the Papal States led Urban to decide to return in September 1370 to Avignon.

Urban V was a man of austere life and great piety. As a patron of learning, he founded new universities at Orange, Kraków, and Vienna.

• Urban VI, original name BARTOLOMEO PRIGNANO (b. c. 1318, Naples—d. Oct. 15,

1389, Rome), pope from 1378 to 1389 whose election sparked the Western Schism (1378–1417).

Archbishop first of Acerenza (1363) and then of Bari (1377), he became papal chancellor for Pope Gregory XI, whom he was elected to succeed on April 8, 1378. This election of an Italian appeased the Romans, who were determined to end the French-dominated papacy at Avignon (1309–77).

Once made pope, however, Urban, a devout and competent official, became a harsh and ill-tempered reformer. He soon enraged the cardinals with his bitterness and hostility, and 13 French cardinals—fearing that the majority in the Sacred College would be turned against them by a new promotion of Italians—left Rome. At Anagni, four months later, they declared Urban's election as "null because it was not made freely but under fear." At Fondi, on Sept. 20, 1378, they elected the French cardinal Robert of Geneva, who became antipope Clement VII. Thus began the Western Schism that wracked the Roman Church for 40 years. By the end of 1378 France favoured Clement, followed later by Scotland, Savoy, Portugal.

Alinari—Art Resource/EB Inc.

Castile, Aragon, and Navarre. England backed Urban, as did Bohemia, the Holy Roman Empire, Poland, Hungary, Flanders, and northern and central Italy. In 1381 Portugal switched to Urban's side. After failing to dislodge Urban from the Vatican, Clement returned to Naples, but the populace, recognizing Urban, effected his expulsion. Clement entered Avignon on June 20, 1379, and the divided papacy split the church.

For housing Clement, Queen Joan I of Naples was excommunicated by Urban, who placed her kingdom under interdict in 1385. The Neapolitan and papal armies clashed at the Battle of Nocera. The Bishop of Aquila and those cardinals implicated in plots against Urban were subsequently captured and brutally killed. The Papal States fell into anarchy. Urban may have died by poisoning. An account of Urban's fall and the turmoil of his time is in *The Origins of the Great Schism* (1948), by Walter Ullmann.

• Urban VII, original name GIAMBATTISTA CASTAGNA (b. Aug. 4, 1521, Rome—d. Sept.

Urban VII, detail from a monument by Ambrogio Buonvicino; in the church of Sta. Maria sopra Minerva, Rome
Alinari—Art Resource/FR Inc.

27, 1590, Rome), pope from Sept. 15 to Sept. 27, 1590.

Of noble birth, he held several key church offices, including papal ambassador to Spain (until 1572), cardinal priest (1583), and inquisitor general (1586). Known for his charity and piety, he was elected pope on Sept. 15, 1590, but died of malaria 12 days later, before his consecration.

• Urban VIII, original name MAFFEO BARBERINI (baptized April 5, 1568, Florence—d. July 29, 1644, Rome), pope from 1623 to 1644.

The son of an aristocratic Florentine family, Barberini filled many distinguished church appointments. He served as papal legate in France (1601) and was simultaneously appointed (1604) archbishop of Nazareth and nuncio to Paris. Pope Paul V made him cardinal in 1606 and bishop of Spoleto in 1608. He became an astute politician during these years, acquiring many friends and making few enemies. He was elected Pope Gregory XV's successor on Aug. 6, 1623.

Urban's pontificate coincided with the ministry of Cardinal de Richelieu of France and

Urban VIII, detail from a monument by Gian Lorenzo Bernini; in the Basilica of St. Peter's. Rome

Alinari—Art Resource/EB Inc.

with the decisive period of the Thirty Years' War. His policy, when contrasted with that of his successor, Innocent X, appears to have been decidedly pro-French and hostile to the Roman Catholic cause in Germany. In fact, he desired the extinction of Protestantism everywhere, but, because he ultimately feared Habsburg domination in Italy, he withheld his support from them and allied with their enemy Richelieu. This alliance destroyed the Habsburgs' claim to be considered the exclusive champions of Roman Catholicism and so turned the Thirty Years' War into a conflict of dynastic interests that resulted not so much in the triumph of Protestantism as in the ruin of Germany

Determined to strengthen the papacy's material resources and defense, Urban greatly fortified the Castel Sant'Angelo in Rome (1624-41). He also erected Fort Urbano at Castelfranco, transformed Civitavecchia into a flourishing port with a military harbour, and enlarged the arsenal at Tivoli. The Duchy of Urbino was acquired by the pope in 1626, and the Papal States became a compact, welldefended bloc dominating central Italy. Unfortunately, concurrent with his expensive fortifications and defense plan, Urban was guilty of large-scale nepotism. His building programwhich included the grandiose papal villa at Castel Gandolfo and extravagant piazzas and fountains-combined with the enrichment of his family, tended to squander the financial resources of the papacy.

In an endeavour to establish supremacy over northern Italy, Urban began the War of Castro (1642-44) against Duke Odoardo I Farnese of Parma, whom he excommunicated in 1642, but the campaign ended in the pope's defeat and humiliation in March 1644. Venice, Tuscany, and Modena then formed an antipapal league to protect Parma, and France also intervened in Odoardo's favour. Peace was concluded at Venice on March 31, 1644, and Urban died soon afterward.

Urban's involvements in church affairs were multifarious. For the training of missionaries, he founded (1627) the Collegium Urbanum, and in 1633 he declared China and Japan (which had been closed to proselytization in 1585 by Pope Gregory XIII) open again for missionaries. Urban's bull In eminenti (published in June 1643) condemned the doctrines of Jansenism, a French movement that emphasized God's sovereignty and deemphasized man's free will. Conversely, he approved new orders, among them the Visitandines and the Lazarists, and promulgated several canonizations, including those of Saints Elizabeth of Portugal, Francis Borgia, and John of God. He also issued revisions of the breviary, missal, and pontifical.

A promoter of the arts, Urban VIII was the foremost patron of the important Baroque sculptor and architect Gian Lorenzo Bernini, some of whose finest works he commissioned, including the loggias of St. Peter's, Rome, and Urban's tomb in the basilica.

BIBLIOGRAPHY. W.N. Weech, Urban VIII (1905); A. Kraus, Das päpstliche Staatssekretariat unter Urban VIII, 1623-1644 (1964; "The Papal Secretary of State Under Urban VIII...").

urban climate, any set of climatic conditions that prevails in a large metropolitan area and that differs from the climate of its rural surroundings.

Urban climates are distinguished from those of less built-up areas by differences of air temperature, humidity, wind speed and direction, and amount of precipitation. These differences are attributable in large part to the altering of the natural terrain through the construction of artificial structures and surfaces. For example, tall buildings, paved streets, and parking lots affect wind flow, precipitation runoff, and the energy balance of a locale.

Also characteristic of the atmosphere over urban centres are substantially higher concentrations of pollutants such as carbon monoxide, the oxides of sulfur and nitrogen, hydrocarbons, oxidants, and particulate matter. Foreign matter of this kind is introduced into the air by industrial processes (e.g., chemical discharges by oil refineries), fuel combustion (for the operation of motor vehicles and for the heating of offices and factories), and the burning of solid wastes. Urban pollution concentrations depend on the magnitude of local emissions sources and the prevailing meteorological ventilation of the area—i.e., the height of the atmospheric layer through which the pollutants are being mixed and the average wind speed through that layer. Heavy concentrations of air pollutants have considerable impact on temperature, visibility, and precipitation in and around cities. Moreover, there occasionally arise weather conditions that allow the accumulation of pollutants over an urban area for several days. Such conditions, termed temperature inversions (increasing air temperature with increasing altitude), strongly inhibit atmospheric mixing and can cause acute distress in the population and even, under extremely severe conditions, loss of life. Atmospheric inversion caused an air-pollution disaster in London in December 1952 in which about 3,500 persons died from respiratory diseases.

The centre of a city is warmer than are outlying areas. Daily minimum temperature readings at related urban and rural sites frequently show that the urban site is 6° to 11° C (10° to 20° F) warmer than the rural site. Two primary processes influence the forma-

tion of this "heat island." During summer, urban masonry and asphalt absorb, store, and reradiate more solar energy per unit area than do the vegetation and soil typical of rural areas. Furthermore, less of this energy can be used for evaporation in urban areas, which characteristically exhibit greater precipitation runoff from streets and buildings. At night, radiative losses from urban building and street materials keep the city's air warmer than that of rural areas.

During winter the urban atmosphere is warmed slightly, but significantly, by energy from fuel combustion for home heating, power generation, industry, and transportation. Also contributing to the warmer urban atmosphere is the blanket of pollutants and water vapour that absorbs a portion of the thermal radiation emitted by the Earth's surface. Part of the absorbed radiation warms the surrounding air, a process that tends to stabilize the air over a city, which in turn increases the probability of higher pollutant concentrations.

The average relative humidity in cities is usually several percent lower than that of adjacent rural areas, primarily because of increased runoff of precipitation and the lack of evapotranspiration from vegetation in urban areas. Some moisture, however, is added to urban atmospheres by the many combustion sources.

The flow of wind through a city is characterized by mean speeds that are 20 to 30 percent lower than those of winds blowing across the adjacent countryside. This difference occurs as a result of the increased frictional drag on air flowing over built-up urban terrain, which is rougher than rural areas. Another difference between urban and rural wind flow is the convergence of low-level wind over a city (i.e., air tends to flow into a city from all directions). This is caused primarily by the horizontal thermal gradients of the urban heat island.

The amount of solar radiation received by cities is reduced by the blanket of particulates in the overlying atmosphere. The higher particulate concentrations in urban atmospheres reduce visibility by both scattering and absorbing light. In addition, some particles provide opportunities for the condensation of water vapour to form water droplets, the ingredients of fog.

A city also influences precipitation patterns in its vicinity. Such city-generated or city-modified weather factors as wind turbulence, thermal convection, and high concentrations of condensation nuclei might be expected to increase precipitation. Although appropriate continuous, quantitative measurements have not been made for a sufficient length of time, there is some data to suggest that the amount of precipitation over many large cities is about 5 to 10 percent greater than that over nearby rural areas, with the greatest increases occurring downwind of the city centre.

urban planning, the programs pursued in most industrialized countries in an attempt to achieve certain social and economic objectives, in particular to shape and improve the urban environment in which increasing proportions of the world's population spend their lives

A brief treatment of urban planning follows. For full treatment, see MACROPAEDIA: Cities. Evidence of urban planning—such as orderly street systems; division of a city into specialized, functional districts, or quarters; fortifications; and conduits for the water supply and sewage disposal—can be found in the ancient ruins of cities in China, India, Egypt, Asia Minor, the Mediterranean region, and South and Central America. During the Renaissance, European city areas were consciously planned to achieve practical circulation and also to provide fortification against invasion. The radial boulevards of Paris were designed with military as well as aesthetic objectives.

The planning concepts of the European Renaissance were exported to the New World. William Penn developed the gridiron plan—the laying out of streets and plots of land adaptable to rapid change in land use—that dominated American urban planning as the society expanded westward. By dividing land into lots, the gridiron plan accommodates itself to urban expansion, but it uses land inefficiently and creates traffic-flow problems.

The modern urban planning and redevelopment movement arose in response to the disorder and squalor of the slum areas created by the Industrial Revolution in the 19th century. Reformation of these areas was the objective of the early city planners, who imposed regulatory laws establishing standards for housing, sanitation, water supply, sewage, and public health conditions. Urban planners also introduced parks and playgrounds into congested city neighbourhoods, providing places for recreation, as well as visual relief.

The chief new urban-planning concept of the early 20th century was zoning—the regulation of building activity to set limits of height and density and to protect established neighbourhoods. This arose in response to the sprawling, haphazard growth of industrial cities, where factories invaded residential areas, and where skyscrapers blocked out the sunlight of smaller buildings.

Urban territory expanded further as a result of improved public transportation. Workers could live far from their jobs, traveling back and forth by bus, subway, or car. The sprawling and crowded metropolis, especially its downtown and commercial areas, required well-planned circulation systems.

By the middle of the 20th century, urban planning changed its focus. Planners realized that factors of city living must be considered as a whole, so they aimed less at attacking specific problems than at the improvement of the entire urban milieu. This movement aimed at an ideal urban environment, which would give the city dweller maximum amenity.

Another aspect of urban planning has been the building of experimental new towns and cities. In Great Britain, India, Israel, and South America a few new cities were built entirely from plans. Urban planning was an important factor in Europe after World War II, when urban planners directed the reconstruction of war-shattered areas.

urban renewal, comprehensive scheme to redress a complex of urban problems, including unsanitary, deficient, or obsolete housing; inadequate transportation, sanitation, and other services and facilities; haphazard land use; and traffic congestion. Early efforts usually focused on housing reform and sanitary and publichealth measures, followed by growing emphasis on slum clearance and the relocation of population and industry from congested areas to less-crowded sites, as in the garden-city and new-towns movements in Great Britain. Each country approaches urban renewal according to its means and its political and administrative systems.

The chief activities of urban renewal are redevelopment, the clearance and rebuilding of structures that are deteriorated or obsolete in themselves or are laid out in an unsatisfactory way or the reuse of the land for other purposes; rehabilitation, the improvement of structurally sound buildings that have deteriorated or lost their original functions; and conservation, a protective process designed to maintain the function and quality of an area, for instance, by requiring or assisting adequate maintenance and preventing inappropriate developments or changes in the use of land and buildings.

urban revolution, in anthropology and archaeology, the process by which small, kin-based, nonliterate agricultural villages are transformed into large, socially complex, civ-

ilized urban centres. The term urban revolution was introduced by V. Gordon Childe, an Australian archaeologist.

Although Childe equated civilization with urbanism, other social scientists, while admitting a considerable overlap, distinguished between the cultural phenomena characteristic of urban areas and those of "civilized" societies. Childe identified 10 formal criteria that, according to his system, indicate the arrival of urban civilization: increased settlement size, concentration of wealth, large-scale public works, writing, representational art, knowledge of exact sciences, foreign trade, full-time specialists in nonsubsistence activities, classstratified society, and political organization based on residence rather than kinship. He saw the underlying causes of the urban revolution as the cumulative growth of technology and the increasing availability of food surpluses as capital.

Further archaeological evidence demonstrated that the formal criteria Childe proposed were, in reality, not universal. A core of basic structural trends, however, appeared to be essential as cities appeared in different areas at different times. The American anthropologist Robert McCormick Adams suggested that the essential transformation in the urban revolution was in the realm of social organization—an increase in the scale and complexity of society and the emergence of new political and religious institutions, which precipitated cultural and technological changes.

There is general agreement among scholars that one of the necessary—but not sufficient—preconditions for the urban revolution is the potential for production of storable food surpluses. Whether the actual production of surplus preceded the development of social institutions or whether these institutions induced or compelled farmers to produce a surplus is a matter for debate. Other features that may have been important include agencies for exchange and redistribution of goods between specialized and interdependent zones and differential control over productive resources. These conditions, in turn, would lead to concentration of wealth and class stratification. Population increases usually followed. rather than preceded, the core of the urban revolution.

The urban revolution seems to have occurred first in Mesopotamia about 3000 BC. Cities appeared somewhat later in Egypt, in the Indus Valley, and in northern China. In the New World the earliest-known urban centres are in Meso-America and Peru and date from about the 1st millennium AD.

Urbana, city, seat (1833) of Champaign county, east-central Illinois, U.S., contiguous on the west with Champaign. The cities are often called Champaign-Urbana. Settled in 1822 and named for Urbana, Ohio, it shares with Champaign the main campus of the University of Illinois (established in 1867 as the Illinois Industrial University). The economy is also dependent on agricultural activities, light manufacturing, and the Chanute Air Force Base at nearby Rantoul. A tablet in the Champaign County Court House commemorates the occasion when Abraham Lincoln spoke there against the Kansas-Nebraska Bill (1854). Lorado Taft's statue depicting Lincoln as a young lawyer is in Carle Park. Inc. 1855. Pop. (1987 est.) city, 35,875; Champaign-Urbana-Rantoul metropolitan area (MSA), 172,700.

Urbana, city, Champaign county, west-central Ohio, U.S., in a stock-raising and farming area, 40 miles (64 km) northeast of Dayton. Laid out in 1805 by Colonel William Ward of Virginia, it became the county seat in the same year and grew after a training camp was established there by General William Hull during the War of 1812. It was called Urbana, meaning "refinement," or "politeness." The coming after 1848 of the Pennsylvania, New York

Central, and Erie railroads fostered industrial development. Manufactures now include plastic products, polishes, transportation lighting equipment, and farm machinery. Urbana Colege, based on the theology of Emanuel Swedenborg, was founded in 1850. Simon Kenton (1755–1836), the Indian fighter, is buried in Oakdale Cemetery, and Richard Stanhope, George Washington's valet (who is believed to have been 114 years old when he died), is buried in a cemetery at nearby Heathtown. The "Soldier's Monument" of sculptor John Quincy Adams Ward (1830–1910), born in Urbana, is in Monument Square. The home of the writer and politician Brand Whitlock (1869–1934) stands on Main Street. Inc. village, 1816; city, 1868. Pop. (1987 est.) 10,979.

urbanization, the process by which large numbers of people become permanently concentrated in relatively small areas, forming cities.

The definition of what constitutes a city changes from time to time and place to place, but it is most usual to explain the term as a matter of demographics. The United Nations has recommended that countries regard all places with more than 20,000 inhabitants living close together as urban; but, in fact, nations compile their statistics on the basis of many different standards. The United States, for instance, uses "urban place" to mean any locality where more than 2,500 people live.

Whatever the numerical definition, it is clear that the course of human history has been marked by a process of accelerated urbanization. It was not until the Neolithic period, roughly 10,000 years ago, that humans were able to form permanent settlements. Even 5,000 years ago the only such settlements on the globe were small, semipermanent villages of peasant farmers, towns whose size was limited by the fact that they had to move whenever the soil nearby was exhausted. It was not until the time of classical antiquity that cities of more than 100,000 existed, and even these did not become common until the sustained population explosion of the last three centuries. In 1800 less than 3 percent of the world's population was living in cities of 20,000 or more; this had increased to about 25 percent by the mid-1960s and to about 40 percent by 1980. It is estimated that, by this measure, about half the world's population will be urban in the year 2000.

The little towns of ancient civilizations, both in the Old World and the New, were only possible because of improvements in agriculture and transportation. As farming became more productive, it produced a surplus of food. The development of means of transportation, dating from the invention of the wheel in about 3500 BC, made it possible for the surplus from the countryside to feed urban populations, a system that continues to the present day.

Despite the small size of these villages, the people in early towns lived quite close together. Distances could be no greater than an easy walk, and nobody could live out of the range of the water supply. In addition, because cities were constantly subject to attack, they were quite often walled, and it was difficult to extend barricades over a large area. Archaeological excavations have suggested that the population density in the cities of 2000 BC may have been as much as 128,000 per square mile (49,400 per square km); today Calcutta and Shanghai, with densities of more than 70,000 per square mile, are regarded as extremes of overcrowding.

With few exceptions, the elite—the aristocrats, government officials, clergy, and the wealthy—lived in the centre of ancient cities, which was usually located near the most important temple. Farther out were the poor,

who sometimes huddled outside the city walls altogether.

The greatest city of antiquity was Rome, which at its height in the 3rd century AD covered almost 4 square miles (10 square km) and had at least 800,000 inhabitants. To provide for this enormous population, the empire constructed a system of aqueducts that channeled drinking water from hills as far away as 44 miles (70 km). Inside the city itself, the water was pumped to individual homes through a remarkable network of conduits and lead pipes, the equal of which was not seen until the 20th century. As in most early cities, Roman housing was initially built from dried clay molded about wooden frameworks. As the city grew, it began to include structures made from mud, brick, concrete, and, eventually, finely carved marble.

This general model of city structure continued until the advent of the Industrial Revolution, although medieval towns were rarely as large as Rome. In the course of time, commerce became an increasingly important part of city life and one of the magnets that drew people from the countryside. With the invention of the mechanical clock, the windmill and water mill, and the printing press, the interconnection of city inhabitants continued apace. Cities became places where all classes and types of humanity mingled, creating a heterogeneity that became one of the most celebrated features of urban life. In 1777 Samuel Johnson cheered this aspect of cities in his famous apothegm, "When a man is tired of London, he is tired of life; for there is in London all that life can afford." At the time, it should be recalled, London had fewer than 100,000 citizens, and most of its streets were narrow, muddy paths.

The technological explosion that was the Industrial Revolution led to a momentous increase in the process of urbanization. Larger populations in small areas meant that the new factories could draw on a big pool of workers and that the larger labour force could be ever more specialized. By the 19th century there were thousands of industrial workers in Europe, many of them living in the most miserable conditions. Attracted by the promise of paid work, immigrants from rural areas flooded into the city, only to find that they were forced to live in crowded, polluted slums awash with refuse, disease, and rodents. Designed for commerce, the streets of the newer cities were often arranged in grid patterns that took little account of human needs, such as privacy and recreation, but did allow these cities to expand indefinitely.

This they did in the 20th century, when most cities became surrounded by rings of suburbs. As in the past, these outer homes usually contained the poorest citizens, with the rich living in the vibrant city centre. An exception is the United States, where suburbs populated by the affluent and the middle class grew up around cities in the 1950s and '60s.

It is speculated that one result of the continuing population explosion will be the creation, in the next 100 years, of megalopolises, concentrations of urban centres that may extend for scores of miles. It is thought that the first such growth could occur in the east coast of the United States, where there may eventually be a single urban agglomeration stretching from Boston to Washington, D.C. Other emerging megalopolises include the Tokyo-Ōsaka-Kyōto complex in Japan, the region between London and the Midland cities in Great Britain, and the Netherlands-central Belgium area.

Urbino, Latin URBINUM HORTENSE, town, Pesaro e Urbino provincia, Marche (The Marches) regione, central Italy. Founded by

the Umbrians, an ancient people of Italy, it was subsequently occupied by the Etruscans, Celts, and Gauls, and, in the 3rd century BC, by the Romans. It eventually fell under church rule in the 9th century but was ceded in the 12th century to the Montefeltro family. It became the seat of a duchy and reached its zenith as a centre of artistic and literary activity under the rule of Federico da Montefeltro (1444–82) and that of his son Guidobaldo 1482-1508). The artist Raphael was born in Ùrbino (1483). The dukedom extended its domain under the rule of the Della Rovere, who succeeded the Montefeltro, but the removal of the court to Pesaro marked the beginning of the town's decline. The dukedom and its subject towns were incorporated in the Papal States in 1626 and in the Kingdom of Italy in

The modern residential section, which developed outside the walls, is distinct from the ancient town, the street pattern and character of which are medieval, although most of its buildings were erected in the 17th and 18th centuries. The most notable landmarks,

National Gallery of The Marches (formerly the Ducal Palace), Urbino, Italy

the Ducal Palace, now the National Gallery of The Marches, with an important collection of paintings, and the mausoleum of San Bernardino outside the town, date from the late 15th century. The seat of an archbishop, Urbino's 15th-century cathedral was rebuilt in the Neoclassical style after an earthquake in 1789. Its university was founded in 1506.

Cut off from the main roads, Urbino has remained excluded from sources of development. With a decline in agriculture, its principal resources are tourists and the university. It was noted until the 17th century for the manufacture of maiolica (tin-glazed pottery). Pop. (1988 est.) mun., 15,582.

Urbino, Lorenzo di Piero de' Medici, duca (duke of): see Medici, Lorenzo di Piero de'.

Urbino maiolica, maiolica also spelled MA-JOLICA, Italian tin-glazed earthenware made in the city of Urbino, which from around 1520 dominated the market. Early wares, mostly dishes, are decorated with narrative scenes that typically cover the entire surface. The narrative scenes are taken from the Bible, from classical mythology, from classical and contemporary history, and from poetry and are painted in a range of colours, in which brilliant yellow, orange, and brown predominate. This pictorial, or istoriato, style owed much to contemporary painting and to woodcuts and engravings published in the late 15th and early 16th centuries. Later wares were decorated in a style called grotesque, which consisted of motifs copied from the painter Raphael, who in turn adopted them from motifs found during excavations of Nero's Golden House in Rome in 1509. This purely decorative style was more suited to the intrinsic nature of pottery forms than the istoriato style, which was based on the conception of a dish or plate as the mere vehicle or support of a painting.

Urbino maiolica istoriato dish, c. 1533; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

Several distinguished painters of pottery are known; of these Nicola Pellipario, who worked at Castel Durante originally and at Urbino from 1528, and Francesco Xanto Avelli di Rovigo (fl. 1529-42) are the most notable. Nicola Pellipario, who introduced and developed the istoriato style at Urbino, painted in the workshop of his son Guido (who took the name Fontana), drawing from engravings after the painter Raphael. Finely modeled figures, sometimes singly, sometimes in complex groups in architectural settings, were painted over the entire surface of the dish in an illusionist manner, with much of the drama and restless movement of Raphael's later work. Guido continued in this tradition, and in his workshop dishes, plates, roundels, and plaques were produced in large quantities between 1530 and 1580. Francesco Xanto Avelli di Rovigo favoured subjects from Ovid's Metamorphoses, an influential edition of which, illustrated with woodcuts, had appeared in 1497. He also took his themes from the Bible, from the poet Ludovico Ariosto (1474–1533), and from contemporary events.

The later style, grotesques, derived also from Raphael's paintings, was introduced by Guido Fontana's son Orazio around 1560–70. At first it consisted of little grotesques and arabesques painted in a continuous band in yellow, brown, blue, and green on a ground of white around the rim of the plate, with the narrative, or *istoriato*, portion shrunk to a roundel in the centre. Later, the *istoriato* style was totally supplanted by the grotesques. Maiolica production in Urbino declined in the late 17th century

Urchard, Sir Thomas: see Urquhart, Sir Thomas.

urchin, any of several marine invertebrates of the class Echinoidea (phylum Echinodermata), including the cake urchin, heart urchin, and sea urchin (qq,v).

Consult the INDEX first

Urdaneta, Andrés de (b. 1498, Villafranca de Oria, Spain—d. June 3, 1568, Mexico City), navigator and monk whose discovery of a favourable west-to-east route across the Pacific made possible colonization of the Philippines.

As a young man he spent eight adventurous years in the Spice Islands (Moluccas) and then, in 1553, entered the Augustinian order in Mexico City. Philip II of Spain asked him to guide an expedition from Mexico to the Philippines and to find a return route. Five earlier attempts had ended in disaster. In April 1565 Urdaneta reached the Philippine island of Cebu, where he established a mission, and on June 1 he embarked on the return voyage. By sailing at high latitudes, around 42° N, he took advantage of favourable winds, avoided typhoons, and reached the Isthmus of

Panama in 123 days. His "route of the Manila Galleon" helped the Spaniards to colonize the Philippines and to gain Eastern markets for the products of Peru and Mexico.

Urdu language, Indo-Aryan language originating in the region between the Ganges and Jamuna rivers near Delhi, now the official language of Pakistan. Numbering some 48,980,000 speakers in the late 20th century, Urdu is the primary language of the Muslims of both Pakistan and northern India.

As a spoken language, Urdu originally derived from Hindustani, the lingua franca of northern India before the partition of 1947. Although Urdu and Hindi arose from the same or very similar colloquial bases, their literary forms are almost mutually unintelligible because of the strong influences of Sanskrit on Hindi and of Persian and Arabic on Urdu. Grammar in the two languages is still nearly the same, however, except in instances in which literary Urdu adopts Persian or Arabic constructions. Nouns and pronouns show only two cases, nominative and oblique; the place of inflectional endings is taken by postpositions (similar to English prepositions, but following the object) attached to the oblique case. Urdu is written in a modified form of the Persian Arabic alphabet.

Urdu literature, writings in the Urdu language of the Muslims of Pakistan and northern India. It is written in the Perso-Arabic script, and, with a few major exceptions, the literature is the work of Muslim writers who take their themes from the life of the Indian subcontinent. Poetry written in Urdu flourished from the 16th century, but no real prose literature developed until the 19th century, despite the fact that histories and religious prose treatises are known from the 14th century. More colloquial forms of writing gradually displaced the classically ornate literary Urdu in the 19th century; in the 20th century, Urdu literature was stimulated by nationalist, pan-Islāmic, and socialist feeling, and writers from the Punjab began to contribute more than those from the traditional Urdu areas of Delhi and Lucknow.

Urdun, al-: see Jordan.

Urdunn, Nahr al-: see Jordan River.

urea, also called CARBAMIDE, the diamide of carbonic acid. Its formula is H₂NCONH₂. Urea has important uses as a fertilizer and feed supplement, as well as a starting material for the manufacture of plastics and drugs. It is a colourless, crystalline substance that melts at 132.7° C (271° F) and decomposes before boiling.

Urea is the chief nitrogenous end product of the metabolic breakdown of proteins in all mammals and some fishes. The material occurs not only in the urine of all mammals but also in their blood, bile, milk, and perspiration. In the course of the breakdown of proteins, amino groups (NH₂) are removed from the amino acids that partly comprise proteins. These amino groups are converted to ammonia (NH₃), which is toxic to the body and thus must be converted to urea by the liver. The urea then passes to the kidneys and is eventually excreted in the urine.

Urea was first isolated from urine in 1773 by the French chemist Hilaire-Marin Rouelle. Its preparation by the German chemist Friedrich Wöhler from ammonium cyanate in 1828 was the first generally accepted laboratory synthesis of a naturally occurring organic compound from inorganic materials. Urea is now prepared commercially in vast amounts from liquid ammonia and liquid carbon dioxide. These two materials are combined under high pressures and elevated temperatures to form ammonium carbamate, which then decomposes at much lower pressures to yield urea and water.

Because its nitrogen content is high and is readily converted to ammonia in the soil, urea is one of the most concentrated nitrogenous fertilizers. An inexpensive compound, it is incorporated in mixed fertilizers as well as being applied alone to the soil or sprayed on foliage. With formaldehyde it gives methyleneurea fertilizers, which release nitrogen slowly, continuously, and uniformly, a full year's supply being applied at one time. Although urea nitrogen is in nonprotein form, it can be utilized by ruminant animals (cattle, sheep), and a significant part of these animals' protein requirements can be met in this way. The use of urea to make urea-formaldehyde resin (q.v.) is second in importance only to its use as a fertilizer. Large amounts of urea are also used for the synthesis of barbiturates.

Urea reacts with alcohols to form urethanes and with malonic esters to give barbituric acids. With certain straight-chain aliphatic hydrocarbons and their derivatives, urea forms crystalline inclusion compounds, which are useful for purifying the included substances.

urea-formaldehyde resin, any of a class of substances belonging to the family of organic polymers, prepared by heating urea and formaldehyde in the presence of mild alkalies, such as pyridine or ammonia. The urea and formaldehyde undergo a condensation reaction in which they combine to form a watersoluble polymer. This polymer is used to formulate adhesives and coating agents or is mixed with wood fibre, pigments, and other substances to produce powders that can be molded into solid objects. Under the influence of heat and pressure, further reactions occur that can convert the polymer into a moisture- and heat-resistant resin. The molecular structure of the final product is that of a three-dimensional network resembling those of resins made by the reaction of formaldehyde with phenol or with melamine.

Different types of urea-formaldehyde resins are used in making molded articles, such as buttons, tableware, and housings for apparatus, and in adhesives, lacquers, and agents that render textiles resistant to creasing or crushing.

urease, an enzyme that catalyzes the hydrolysis of urea, forming ammonia and carbon dioxide. Found in large quantities in jack beans, soybeans, and other plant seeds, it also occurs in some animal tissues and intestinal microorganisms. Urease is significant in the history of enzymology as the first enzyme to be purified and crystallized (by James B. Sumner in 1926). This achievement laid the groundwork for the subsequent demonstration that urease and other enzymes are proteins.

uremia, toxic effects of abnormally high concentrations of nitrogenous substances in the blood as a result of the kidney's failure to expel these waste products by way of the urine. The end products of protein metabolism accumulate in the blood but are normally filtered out when the blood passes through the kidneys. Uremia can result from any disorder that impairs the functioning of the kidneys or that hinders the excretion of urine from the body.

The symptoms of uremia are diverse. Fatigue, lassitude, and a loss of mental concentration are among the first signs. The patient may experience persistent itching sensations, along with muscle twitching or other involuntary movements. The skin becomes dry, flaky, and turns yellowish to tan. The mouth has a dry metallic taste, and the breath has a distinct ammonialike odour. Loss of appetite progresses to nausea and vomiting, and episodes of diarrhea and constipation are common. In the more serious stages of uremia, the buildup of waste products in the bloodstream and tissues causes a wide-ranging derangement of the nervous, cardiovascular, and respiratory

systems and can lead to hypertension, convulsions, heart failure, and death.

The chief cause of uremia is damage to the kidneys, whether because of Bright's disease (glomerulonephritis), hypertension (high blood pressure), diabetes mellitus, or some other disorder that impairs kidney function. Blockages of the flow of urine due to urinary stones or, in males, enlarged prostate glands can also cause uremia. The treatment of uremia rests on the identification and treatment of the disorder that is the underlying cause. Patients whose kidneys are diseased and who are waiting for kidney transplants often suffer varying degrees of uremia. In these cases uremia, along with other syndromes due to renal insufficiency, is best treated by dialysis—i.e., the artificial filtering of the blood by a machine outside the body.

urena (*Urena lobata*), also called ARAMINA, BUN OCHRA, CAESAR WEED, or CONGO JUTE, plant of the family Malvaceae and its fibre, one of the bast fibre (q.v.) group. The plant, probably of Old World origin, grows wild in tropical and subtropical areas throughout the world. The name urena apparently derives from the name given to the plant on India's Malabar Coast.

Urena was used for its fibre in Brazil from ancient times, but it has been slow in achieving importance as a cultivated fibre crop and is still considered a troublesome weed in some countries. Commercial cultivation of the plant began in the Belgian Congo (now Zaire) in the 1920s and in Central Africa in the 1930s.

The plant, an herbaceous perennial, is usually many-branched in the wild state and grows about 1 to 2 m (3 to 7 feet) high. Cultivated plants, densely sown, reach 3 to 4.5 m (10 to 15 feet) in height, with branches and leaves mainly concentrated near the top. The leaves vary in size and shape but are usually somewhat round, with 3 to 7 lobes and serrated edges. The flowers, growing singly from the angle between the leafstalk and plant stem (leaf axil), have five petals that are usually pink. The small seeds have hooklike appendages and are produced in the greatest quantities by uncultivated plants.

Urena grows best in hot, humid climates, with direct sunlight, and in rich, well-drained soil. It is found growing wild in the tropical and temperate zones of North and South America and in Asia, Indonesia, the Philippines, and Africa. Cultivated crops, usually grown as annuals, are found mainly in the Congo Basin and Central Africa, with smaller plantings in Brazil, India, and Madagascar. Harvesting when the plants are in full flower yields a fibre of high quality. The plants' stalks are cut by hand, above the woody plant base. After the stalks are subjected to a retting operation, the fibres are removed by hand.

Urena fibre is lustrous and creamy white or pale yellow in colour. The fibre strands are about 1 m (3.3 feet) long. Urena fibre is fine, soft, and flexible and is readily dyed. Used much like jute, which it resembles in appearance and strength, urena is made into cordage, burlap (hessian), sacking fabrics, and carpeting materials and is often blended with jute or other fibres.

ureter, one of two ducts that transmit urine from each kidney to the bladder. Each ureter is a narrow tube that is about 12 inches (30 cm) long. A ureter has thick, contractile walls, and its diameter varies considerably at different points along its length. The tube emerges from each kidney, descends behind the abdominal cavity, and opens into the bladder. At its termination the ureter passes through the bladder wall in such a way that, as the bladder fills with urine, this terminal part of the ureter tends to close.

urethane, also called ETHYL CARBAMATE, chemical compound used in medicine to treat certain forms of leukemia and multiple myeloma (tumours of bone marrow). Urethane originally was introduced into medicine as a sedative and hypnotic drug, but, because of its feeble and unpredictable action, it is no longer used for those purposes. Its use in the treatment of certain malignancies is based upon its ability to interfere with cell division by acting on the chromosomes of rapidly dividing cells, i.e., cancerous cells. Paradoxically, urethane also is known to produce cancer in certain laboratory animals and, for this reason, is considered to be a potential human carcinogen (cancer-causing agent). Polymerized urethane forms polyurethane, which has various industrial uses.

urethra, duct that transmits urine from the bladder to the exterior of the body during urination. The urethra is held closed by the urethral sphincter, a muscular structure that helps keep urine in the bladder until voiding can occur.

Because the urethra is anatomically linked with the reproductive structures in the male, the characteristics of the male's and female's urethra are quite different. The male's urethra is about 8 inches (20 cm) long and passes along the length of the penis before emptying. At its emergence from the bladder, the urethra passes through the prostate gland, and seminal ducts from the testes enter the urethra at each side, making it the pathway for the transmission of semen as well as for the discharge of urine. The male urethra can be divided into three sections: the uppermost within the prostate, the next section within the urethral sphincter, and the lowermost (and longest) section within the penis.

The female urethra is embedded within the vaginal wall, and its opening is situated between the labia. The female urethra is much shorter than that of the male, being only 1½ inches (4 cm) long. It opens to the outside just after passing through the urethral sphincter. Both the male and female urethra are subject to bacterial infections (see urethritis).

urethritis, bacterial or viral infection and inflammation of the urethra, the channel for passage of urine from the urinary bladder to the outside. Urethritis is more frequent in males than in females.

The most frequent urethral infection is the venereal disease gonorrhea. The mucous glands in the lining of the urethra serve as important harbouring places for the gonococci, which invade the glands while the infection is just beginning and remain in them even after the mucous membrane has healed. Another common urethral infection is caused by the *Trichomonas vaginalis* organism frequently resident in the vagina. Chemical irritants or the spread of infection from other parts of the urinary tract may also cause urethritis.

The inflammation in the urethra can narrow its channel, and swelling and the buildup of fibrous tissue can make urination difficult and painful. Obstruction or constriction of the urethra usually produce the same results: urination becomes difficult or impossible, causing an accumulation of stagnant urine in the bladder, and this usually leads to severe infection. Eventually back pressure prevents urine from leaving the kidneys, causing renal failure. The treatment of urethritis in most cases includes the administration of antibiotics to kill the infecting organisms.

Urewera National Park, park in northeastern North Island, New Zealand. Established in 1954, it has an area of 801 square miles (2,075 square km) and has the largest expanse of indigenous forest in the North Island. The park

is located in a region between Wairoa and Rotorua, remote from European development, and contains mountain ranges, picturesque waterfalls, and several lakes. There is a wide range of forest types, and typical vegetation includes kohekohe, beech, rata, tawa, rimu, and pukatea. On Mount Manuoha (4,603 feet [1,403 m]) there is alpine grassland and subalpine scrub. Animal life includes feral cat, pig, goat, sheep, red deer, and opossum. Birds found there include the kiwi, ruru, pigeon, bush canary, gray warbler, and others. Recreational activities include hunting, fishing, canoeing, and walking. Aniwaniwa is the park's headquarters.

Urey, Harold C(layton) (b. April 29, 1893, Walkerton, Ind., U.S.—d. Jan. 5, 1981, La Jolla, Calif.), American scientist awarded the Nobel Prize for Chemistry in 1934 for his discovery of the heavy form of hydrogen known as deuterium. He was a key figure in the development of the atomic bomb and made fundamental contributions to a widely accepted theory of the origin of the Earth and other planets.

Urey received a B.S. degree from Montana State University, Missoula, in 1917. After teaching there for two years he earned a Ph.D. in chemistry (1923) from the University of California at Berkeley. While he was doing research in Copenhagen (1923-24), Urey took part in Niels Bohr's basic research on the theory of atomic structure. He taught at Johns Hopkins University, Baltimore (1924-29), and at Columbia University (1929-45); was professor of chemistry at the Institute for Nuclear Studies (1945-52) and Ryerson professor of chemistry (1952-58) at the University of Chicago; and served as professorat-large (1958-70) and as professor emeritus of chemistry (1970-81) at the University of California at San Diego.

Urey's deuterium research began in the 1920s. By distilling a sample of liquid hydrogen, he concentrated its deuterium form, demonstrating its presence by light-emission studies. In 1931 he and his associates announced their discovery of heavy water, composed of an atom of oxygen and two atoms of deuterium. He also examined the chemical properties and separation of radioactive isotopes of carbon, oxygen, nitrogen, and sulfur.

During World War II he directed a Columbia research program that became an important part of the Manhattan Project, which developed the atomic bomb. Urey's group provided the fundamental information for the separation of the fissionable isotope uranium-235 from the more abundant isotope uranium-238 through the use of gaseous diffusion, and they also investigated methods for concentrating heavy hydrogen and separating boron isotopes.

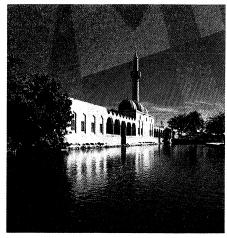

After the war his work with the heavy isotope oxygen-18 led him to devise methods for estimating the temperature of the ocean during times as far back as 180,000,000 years ago. This led him into the study of the relative abundances of the elements on Earth and the development of a theory of the origin of the elements and of their abundances in the Sun and other stars.

Urey theorized that the early atmosphere of the Earth was probably like the atmosphere now present on Jupiter—rich in ammonia, methane, and hydrogen. One of his students, Stanley Miller, working in his laboratory at the University of Chicago, demonstrated that when exposed to an energy source, such as ultraviolet radiation, these compounds and water might react to produce compounds essential for the formation of living matter.

Urey suggested that the planets of the solar system may have derived from a gaseous disk rotating about the Sun and that the disk, in combination with gases from the Sun, may have broken into fragments and begun to con-

dense. He published his theory in *The Planets:* Their Origin and Development (1952).

Urfa, formerly EDESSA, Arabic AR-RUHĀ, city, southeastern Turkey. It lies in a fertile plain and is ringed by limestone hills on three sides. The city is very old and controls a strategic pass to the south through which runs a road used since antiquity to travel between Anatolia and northern Mesopotamia. The modern name derives from the early Aramaic name,

The vivarium, a pool of sacred fish, flanked by the 17th-century *medrese* (theological school) of 'Abd ar-Raḥmān, Urfa, Tur.

Fred J. Maroon-Photo Researchers/EB Inc

Urhai, which was changed to Edessa when the town was refounded as a military settlement in the 3rd century BC. Freeing itself from imposed Hellenism, Edessa, as capital of the principality of Osroëne, was a major centre of Syrian culture; it figured prominently in the conflicts between Parthia and Rome.

Christianity reached Edessa in about AD 150, and the city became the seat of what was soon the most important bishopric in Syria. A sizable body of early Christian literature in the Syriac language was produced at Edessa.

After having been captured by the Sāsānid Persians on more than one occasion, Edessa was taken by the Arabs in about 638. Thereafter it experienced many changes of rule, including occupation by the crusaders in 1098, until it was annexed to the Ottoman Empire at some point between 1516 and 1637. It then remained Turkish, except for a short period of occupation by forces of the Ottoman governor of Egypt, Muḥammad 'Alī Pasha, in the late 1830s.

The city's monuments include the ruins of an ancient citadel situated on one of the hills overlooking the town, part of the old city walls, flood-prevention works built in the 6th century by the Roman emperor Justinian, and the 17th-century madrasah (religious school) and mosque of 'Abd ar-Raḥmān. Modern Urfa is a local market for the agricultural and livestock products of the surrounding region. The main exports are butter and wool. The city is linked by main roads with Gaziantep to the west, Mardin to the northeast, Adiyaman to the northwest, and northern Syria to the south. Pop. (1985) 194,969.

Urfé, Honoré d' (b. Feb. 10/11, 1568, Marseille—d. June 1, 1625, Villefranche-sur-Mer, Fr.), French author whose pastoral romance L'Astrée (1607-27; Astrea) was extremely popular in the 17th century and inspired many later writers. With its scene set on the banks of the Lignon in 5th-century Gaul and its atmosphere one of paradisiacal innocence, L'Astrée describes the life and adventures of shepherds and shepherdesses whose main preoccupation is love. D'Urfé's chief model for this work was Diana (1559) by the Italianate Spaniard Jorge de Montemayor.

D'Urfé was a remarkable observer of human nature, and his characters are far from being mere conventions. Céladon, Sylvandre, and Hylas were for many generations of French readers what the characters of Sir Walter Scott and Charles Dickens were for the Victorian age.

Urga (Mongolia): see Ulaanbaatar.

Urgeiriça, uranium mine and village, Viseu distrito ("district"), north-central Portugal. It lies south of Viseu town near the Mondego River. Although the deposits are small, the uranium extracted there in the late 1970s and early 1980s was nevertheless significant enough to make Portugal a net exporter of uranium. A health spa frequented for the treatment of skin and respiratory diseases is at nearby Caldas de Felgueira. Pop. (1981 prelim.) 567.

Urgench, also spelled URGENČ, city and administrative centre of Khorezm oblast (province), Uzbek Soviet Socialist Republic. It lies along the Shavat Canal and the Amu Darya (river). It was founded when the inhabitants of the ancient city of Urgench, near present-day Kunya-Urgench, 80 miles (130 km) to the northwest, moved there in the mid-17th century because of their lack of water supply. Formerly a centre of trade in the khanate of Khiva, Urgench now has several light industries and a music and drama theatre. Pop. (1989 prelim.) 128,000.

Consult the INDEX first

Urhobo, a people of the northwestern part of the Niger River delta in extreme southern Nigeria who speak a language of the Kwabranch of the Niger-Congo language family. The term Sobo is used by ethnographers as a cover term for both the Urhobo and their neighbours, the Isoko, but the two groups remain distinct from each other. Their local communities are different in economy, social organization, dialect, and origins.

Under the influence first of European traders and then of the British colonial administration, the Urhobo and other peoples began to grow oil palms, and later rubber, as cash crops. Yams and cassava, as well as corn (maize), beans, peppers, and peanuts (groundnuts), are the Urhobo's major staple crops. The Urhobo also fish and are known for their canoes, sacred mud sculptures, masks, figures, bronze jewelry, and stilt and masquerade dances.

Property duties and rights descend patrilineally. The extended family, living in a compound of dwelling structures, is the basis of town or village wards. The Urhobo traditionally worship Oghene, the Supreme Creator, who is connected with the sky. Individuals may also worship personal or ancestral spirits and supernatural powers. Christianity and its clash with existing institutions has resulted in some social problems among the Urhobo. The Urhobo's homeland has become one of Nigeria's main petroleum-producing regions since the 1960s.

Uri, canton, central Switzerland, traversed by the steep-sided valleys of the Reuss River and its tributaries. The canton has an area of 416 square miles (1,076 square km), of which about half is reckoned as productive. Forests occupy part of the canton, and more than 20 percent of the unproductive area in Uri is covered with glaciers. The highest summit in Uri is the Dammastock (11,909 feet [3,630 m]), north of the Furka Pass.

First mentioned in AD 732 as the place of banishment of the Abbot of Reichenau by the Duke of Alemannia, the area was given in 853 by Louis the German to the nunnery at Zürich

that he had just founded. The name Uri is probably derived from aurochs (German auerochs, "wild ox"), a bull's head having been borne traditionally as the arms of the region. As early as 1243 Uri had a common seal, and its privileges were recognized by Rudolf of Habsburg in 1274. With Schwyz and Unterwalden it founded the Everlasting League in 1291. It participated in the victory over the Austrians at Sempach in 1386 and annexed Urseren in 1410. At the Reformation, Uri clung to Roman Catholicism. Having formed part of the huge canton of Waldstätten in the Helvetic Republic after 1798, it became an independent canton again in 1803. It resisted all attempts at religious and constitutional reform, joined the League of Sarnen in 1832 to maintain the Swiss Confederation pact of 1815 without revision, and became one of the members of the Sonderbund (separatist Catholic league) in 1845. Its present constitution dates from 1888 (revised 1929), and its Landsgemeinde (open-air assembly) held annual meetings until 1928 near Altdorf (q.v.), the capital and largest town.

There are some cultivated fields in the Reuss River valley and pastures on the lower mountain slopes, but little of the land is capable of further cultivation because of the extremely uneven terrain. The chief railway is the main St. Gotthard line, and much of the hydroelectric power produced by plants on the Reuss is used for railway traction. Forestry is important, and there are cable and rubber factories at Altdorf. Tourism is aided by excellent roads leading to mountain passes giving access to adjacent cantons. The population is German speaking and Roman Catholic. Pop. (1987 est.) 33,849.

Uriburu, José Félix (b. July 20, 1868, Salta, Arg.—d. April 29, 1932, Paris, Fr.), Argentine soldier and statesman who led the military coup that in September 1930 overthrew the liberal regime of President Hipólito Irigoyen and restored the old landed oligarchy to the political power it had lost after the revolution of 1916. German militarist ideas and Benito Mussolini's corporate state idea were said to be his models for a new Argentina.

Uriburu was a member of the Argentine landed aristocracy and a nephew of President José Evaristo Uriburu. Educated at the military college of Argentina, he was an en-thusiastic soldier and a firm believer in the rights and privileges of his class. In 1890, as a junior officer, he was the cofounder of a military secret society dedicated to preserving the political ascendency of his class in Argentina. In 1893 he became military aide-decamp to his uncle, then vice-president, and in 1896 he served on the joint Argentine-Chilean commission established to settle long-standing boundary disputes existing between the two countries. In 1902 he went to Germany, where he served as a member of the kaiser's imperial guard, becoming an ardent admirer of Prussian militarism.

In 1907 he became director of the Superior School for War, returning the following year to Germany. He was made a member of the Supreme Council of War and the Navy in 1919 and, in 1923, inspector general of the Argentine army. He retired from the army in 1929

In 1930, during the Great Depression, Uriburu led an army revolt against President Irigoyen, becoming provisional president of Argentina in September of that year. In December he denounced the liberal-radical Irigoyen's prolabour legislation and demanded that a selected elite replace the liberal-radical democratic order that had governed since 1916. Shortly after this speech, he removed all radical-democratic leaders from their national and provincial administrative posts, dissolved the Argentine national legislature (a measure without precedent), reformed the constitution

and election law, and refused to allow the liberal-radicals to participate in politics. In 1931 he arranged for a fraudulent presidential election that was designed to ensure the oligarchy's continued control of Argentine politics and then stepped down in favour of a fellow officer, Agustín P. Justo, who had greater support among army officers.

uric acid, a compound belonging to the purine group, and the chief form in which nitrogen, resulting from the breakdown of protein during digestion, is excreted by reptiles and birds. Small quantities of uric acid (about 0.7 gram per day) are excreted by humans as a product of the breakdown of purines that are constituents of nucleoproteins. In persons suffering from gout (q.v.), however, the level of uric acid in the blood may be high. Minute quantities of a sodium salt of uric acid, precipitated in cartilage and bone, are the cause of gout.

uricosuric, any agent that reduces the concentration of uric acid in the blood by increasing the rate of its excretion in the urine. Such drugs are used in the treatment of gout, a disease caused by abnormally high concentrations of uric acid in the bloodstream. Uricosurics act by inhibiting the reabsorption of uric acid by the tubules in the kidneys. Probenecid and sulfinpyrazone are the principal uricosurics. The effects of uricosuric drugs depend on the dose: many uricosurics when given in large doses increase uric acid excretion but in low doses actually decrease the excretion of it. Compare allopurinol.

Uriel, in the Apocrypha, a leading angel, sometimes ranked as an archangel with Michael, Gabriel, and Raphael. Because his name in Hebrew means "fire of God," or "light of God," he has been variously identified in Jewish traditions as an angel of thunder and earthquake, as the wielder of the fiery sword in driving Adam and Eve from Eden, as the destroyer of the hosts of Sennacherib, as the figure who enlightens Ezra with visions, and, generally, as an angel of terror, prophecy, or mystery. John Milton in *Paradise Lost* described Uriel as "Regent of the Sun" and the "sharpest sighted spirit of all in Heaven"; but Christian tradition has generally paid little attention to Uriel.

urinalysis, laboratory examination of a sample of urine to obtain clinical information. Most of the substances normally excreted in the urine are metabolic products dissolved or suspended in water. A deviation from normal in the concentration of urinary constituents or the abnormal presence of specific substances may thus be indicative of bodily disorders. Changes in urine colour, specific gravity, and volume may also provide evidence of a specific disease or body injury.

Of the large number of organic and inorganic substances present in the urine, some tend to be more significant clinically than others and include sugars, such as glucose, fructose, and pentose; acetone bodies, which, together with glucose, may be excessively high in the urine of individuals with diabetes mellitus; creatine and creatinine, nitrogenous compounds; hemoglobin and myoglobin, the pigments involved in oxygen transport and storage; amino acids and metabolites, such as homogentisic acid, cystine, cysteine, and phenylpyruvic acid, any one of which may be excreted in large amounts by individuals in whom the organic catalyst or enzyme metabolizing it is defective; uric acid, a purine derivative, in cases of gout; urea, the principal end product of protein metabolism in humans; urobilinogen and coproporphyrins, bile pigments; minerals, such as calcium, phosphorus, magnesium, copper, and lead; fats, which may be detected in the

urine in cases of severe diabetes mellitus and kidney disease.

Among the hormones that find their way into urine, the most important clinically include the catecholamines, chorionic gonadotrophin, pituitary gonadotrophins, and 17 ketosteroids and 17 hydroxysteroids. Among the urinary proteins, which are normally barely detectable, those most frequently found in high concentrations are the serum albumins and globulins, the presence of which in the urine is usually associated with some disturbance in kidney function (see kidney function test). A great variety of drugs can also be measured in the urine, an important factor in assessing overdosage and toxic states.

urinary bladder, in most vertebrates, except birds, organ for the temporary storage of urine from the kidneys, connected to the kidneys by means of tubular structures called ureters. A urinary bladder is present in fish as an expansible part of the urinary duct, in amphibians and bladder-possessing reptiles (Sphenodon, turtles, most lizards) as a pocket in the cloaca. In mammals it is a greatly expandible muscular sac. The bladder of an average adult human is uncomfortably distended at a volume of around 350 millilitres (½ quart) of urine.

In placental mammals a special duct, the urethra, leads from the urinary bladder to the exterior; it fulfills the excretory function of the more primitive cloaca. In females the urethra is separate from the genital tract. In males the vas deferens (sperm-carrying tubes) empty into the urethra, and both urine and semen pass through the urethra to reach the exterior.

For a depiction of the urinary bladder in human anatomy, shown in relation to other parts of the body, *see* the colour Trans-Vision in the PROPAEDIA: Part Four, Section 421.

urinary tract obstruction, blockage or constriction of the excretory ducts, causing urine to be dammed up in the kidneys (hydrone-phrosis). Obstructions in the urinary tract cause distension of the walls of the bladder, ureter, or renal pelvis, depending on the location of the obstruction, which can occur in the urethra, bladder, or ureters.

Obstructions are classified as congenital or acquired. Congenital blockage usually takes the form of valvelike folds or partitions in the mucous membrane lining the excretory ducts. The most frequent site is the junction of the ureter and the renal pelvis. An obstruction of this nature is symptomless and difficult to diagnose; consequently, a great deal of damage can be done to the kidneys before it is discovered.

Acquired obstructions are usually caused by malfunction or abnormal changes in the excretory passages. Obstructions can occur in the urethra from stricture of the wall, usually as a result of infections, or, in males, from enlargement of the prostate gland, which surrounds the urethra. When the urethra is blocked, urine backs up in the bladder. The bladder walls become stretched, and the walls of the ureters and the renal pelvis thicken. Infections set in, which cause further thickening and inflammation in the ureter, bladder, and pelvic walls. Obstruction of the bladder is caused by tumours, by mineral deposits that form stones, by an enlarged prostate, or by neuromuscular disorders. Some degree of dilatation and obstruction of the ureters occurs during a normal pregnancy, caused by the pressure of a growing fetus and by hormones that cause relaxation of muscle tone.

The major concern in a blockage or obstruction is the backup of fluids into the kidney, which causes the renal pelvis and calyces to become grossly distended. The functioning tisue of the kidneys can be totally destroyed: thickening of the walls of the pelvis and ca-

lyces causes pressure on the renal arteries that interferes with blood flow to the kidneys. This speeds up kidney tissue degeneration. Infections commonly complicate the already deteriorating condition. Kidney tubules and structures that produce urine are replaced by fibrous scar tissue. Urine constituents are reabsorbed by the renal veins, tubes, and lymphatic channels, leading to uremia. Standard treatment of urinary tract obstruction is prompt surgical correction of the condition.

urination, also called MICTURITION, the process of excreting urine from the urinary bladder. Nerve centres for the control of urination are located in the spinal cord, the brainstem, and the cerebral cortex (the outer substance of the large upper portion of the brain). Both involuntary and voluntary muscles are involved.

The urinary bladder is a storage reservoir for urine—a liquid containing waste products given off by the body and extracted from the bloodstream by the kidneys. The major contractile muscle of the bladder is the detrusor. Urination involves either sustained contractions or short intermittent contractions of the detrusor along with contraction of the muscles in the urethra, the duct from the urinary bladder that conducts urine from the body.

In man and most other animals, voiding of the bladder is influenced by the volume of urine it contains. When 100–150 millilitres (3.5–5 ounces) of urine accumulate, the first sensations of a need to void are felt. The feeling increases in intensity as more urine accumulates, and it becomes uncomfortable at a bladder volume of 350–400 millilitres. Impulses from the pelvic nerves mediate the sensations of bladder filling, painful distension, and the conscious need to urinate.

A slowly filling bladder adapts progressively to the pressure from increased volume. Hence, a bladder that is rapidly filled stimulates uriation faster than one that fills slowly. When enough pressure is sensed by the walls of the bladder, the detrusor muscle contracts, the bladder neck and opening to the urethra relax, and the contents of the bladder are emptied. Normally the bladder empties completely.

Voluntary restraint of urination involves inhibition of bladder contraction, closure of the opening to the urethra, and contraction of the abdominal muscles. The ability to start and stop the flow of urine depends largely on the normal functioning of the muscles of the pelvic floor, the abdominal wall, and the diaphragm (the muscular partition between the abdomen and the chest). Infants' lack of inhibitory control over urination is related to the immaturity of the nervous system. Likewise, degeneration or destruction of certain areas of the central nervous system leads to incontinence due to the so-called neurogenic bladder. Such incontinence may be a dribbling overflow from a permanently distended bladder, or an efflux from a contracted bladder whose outlet is always open.

If the full bladder is not emptied, it becomes overdistended. In time, bladder distension can cause bleeding, ulcerations, and rupture of the bladder wall. Obstruction to the outflow of urine can follow enlargement of the prostate (the gland in males that encircles the urethra close to the bladder), swelling of the urethral tissue around its channel, fibrous stricture of the urethra, or contraction of the muscles at the openings of the bladder and the urethra. Usually urine is retained until the pressure in the bladder overcomes the obstruction. With moderately chronic retention and stress, the detrusor muscle increases in tone and the contractile force of the bladder is increased. When overdistension occurs over long periods, the detrusor muscle produces small rhythmic contractions that cause dribbling of urine. With continued distension, the muscle can become paralyzed, and urine voiding takes place only by overflow; this condition is usually termed

passive incontinence. There may also be flow of urine back to the kidneys under these conditions, causing failure of kidney function.

urine, liquid or semisolid solution of metabolic wastes and certain other, often toxic, substances that the excretory organs withdraw from the circulatory fluids and expel from the body. The composition of urine tends to mirror the water needs of the organism. Freshwater animals usually excrete very dilute urine. Marine animals tend to combat water loss to their salty environment by excreting concentrated urine; some develop methods actively to expel salts. Terrestrial animals, depending on their habitat, usually retain water and secrete a highly concentrated urine.

In most mammals, including man, urine is formed in the nephrons of the kidneys by filtration of blood plasma into the nephron; the fluid found within the nephron is known as cansular urine and is essentially the same as blood plasma without the macromolecules (e.g., proteins). As the capsular urine passes along the nephron tube, water and useful plasma components such as amino acids, glucose, and other nutrients are reabsorbed into the bloodstream, leaving a concentrated solution of waste material called final, or bladder, urine. It consists of water, urea (from amino acid metabolism), inorganic salts, creatinine, ammonia, and pigmented products of blood breakdown, one of which (urochrome) gives urine its typically yellowish colour. In addition, any unusual substances for which there is no mechanism of reabsorption into the blood remain in the urine. The products of nucleic acid breakdown are present as allantoin in most mammals and as uric acid in man and, through a quirk of breeding, in the Dalmatian dog.

In most birds, reptiles, and terrestrial insects, the end product of amino acid metabolism is not water-soluble urea but insoluble uric acid. The urine of birds and reptiles is a whitish, aqueous suspension of uric acid crystals that is passed into the cloaca and mixed with fecal material before being expelled. The urine of terrestrial insects is solid and in some cases is stored as pigment in the body rather than being expelled.

Amphibians and fishes excrete aqueous solutions of urea; unlike those of mammals, however, their excretory organs do not reabsorb large quantities of water, so their urine remains dilute. Some marine animals retain much of the urea in the blood, thus retarding osmotic water loss.

In small, primitive animals (teleost fishes, echinoderms, coelenterates, and single-celled animals), particularly those that live in aqueous environments, the end product of amino acid metabolism is the highly toxic gas ammonia, which is collected and expelled in a dilute aqueous solution. Many of the smaller animals develop no excretory system; each individual cell disposes of its waste products to the circulatory fluids, and the wastes then diffuse to the surrounding medium.

Uris, Leon (Marcus) (b. Aug. 3, 1924, Baltimore), U.S. novelist known for such panoramic, action-filled works as *Battle Cry* (1953) and *Exodus* (1958), which deals with the struggle to establish and defend the state of Israel.

Uris served as a Marine in World War II and was a newspaper driver before he turned to writing. Other books include *The Angry Hills* (1955), an account of the Jewish brigade from Palestine that fought with the British army in Greece; *Mila 18* (1961), a novel about the Jewish uprising against the Nazis in the Warsaw ghetto in 1943; *QB VII* (1970), dealing with Nazi war crimes; *Trinity* (1976), a chronicle of a Northern Irish farm family from the 1840s to 1916; and *The Haj* (1984), depicting the lives of Palestinian Arabs from World War I to the Suez war of 1956.

Urliones, Gil de, Urliones also spelled URLIENES: see Siloé. Gil de.

Urmia (Iran): see Orūmīyeh.

Urmia, Lake, Persian DARYĀCHEH-YE ORŪ-MYEH, lake in northwestern Iran that is the largest lake in the Middle East. It covers an area that varies from 2,000 to 2,300 square miles (5,200 to 6,000 square km). Like the Dead Sea, it is remarkable for the extreme salinity of its waters. Since 1967 it has enjoyed the status of a wetland protected region, and efforts have been made by the Iranian government to increase its wildlife.

The lake lies in the bottom of the large central depression of the Azerbaijan region in northwestern Iran, at an elevation of 4,183 feet (1,275 m) above sea level. The basin is surrounded by mountains in the west and north, by plateaus in the south, and by plateaus and volcanic cones in the east. The lake is about 87 miles (140 km) long and 25 to 35 miles (40 to 55 km) wide, with a maximum depth of 53 feet (16 m). In its southern portion there is a cluster of about 50 tiny islands. The shoreline varies with the lake level; when the water is high, it extends into large salt marshes to the east and south. The lake's shores are largely uninhabited.

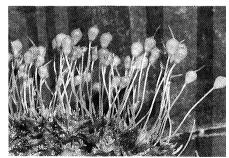

The governing factor of Lake Urmia's hydrography is its lack of an outlet. It forms the dead end of a large drainage system that covers an area of about 20,000 square miles (52,000 square km) and is subject to great seasonal variation. The main affluents are the Talkheh (Ājī) River in the northeast, which gathers the melted snows from the Sabalān and Sahand massifs, and the twin rivers Zarīneh (Jagātu) and Sīmīneh (Tatavi) in the south.

The volume of water discharged into the lake by these rivers varies considerably during the year: during the spring the Talkheh River and Sīmīneh River may each discharge about 2,000 cubic feet (57 cubic m) per second, while the rate drops to only 130 or 60 cubic feet (3.7 or 1.7 cubic m) per second in the dry summer. This variation causes the lake itself to rise and fall, fluctuating by 2 to 3 feet (0.6 to 0.9 m). In addition to seasonal variations, here are also longer periods of fluctuations, lasting from 12 to 20 years, with water-level fluctuations of 6 to 9 feet (1.8 to 2.7 m).

Because Lake Urmia's waters have no outlet, they are highly saline. The lake is one-fourth as salty as the Dead Sea, with a salt content ranging from 8 to 11 percent in the spring to 26 or 28 percent in the late autumn. The main salts are chlorine, sodium, and sulfates.

Organic life in the lake's waters is limited to a few salt-tolerant species. Copious algae provide food for brine shrimp and cause a bad smell along the lake's shores. There are breeding populations of sheldrake, flamingo, and pelican, as well as migratory birds.

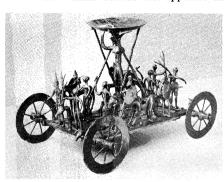

urn moss, any plant of the genus *Physcomitrium* (order Bryales), characterized by urnshaped or top-shaped capsules (spore cases) with lobed, hoodlike coverings. Fewer than 10 species are native to North America. The most common is *P. turbinatum*, sometimes called

Urn moss (*Physcomitrium turbinatum*)
Stephen Collins

top moss, about 2.5 cm (1 inch) high and having a five- to eight-lobed capsule covering. The dark brown capsules have lids with short beaks and are borne on setae (stalks) less than 1 cm (0.4 inch) long. The phyllids (leaves) of both male and female plants form bright green rosettes.

Urnfield culture, a Late Bronze Age culture of Europe, so called because of the custom of placing the cremated bones of the dead in urns. The Urnfield culture first appeared in

Bronze cult car found in a crematory grave, Strettweg, Austria, Urnfield culture, 8th-7th century BC; in the Landesmuseum Joanneum, Graz, Austria By courtesy of the Steiermarkisches Landesmuseum Joanneum, Graz, Austria

east-central Europe and northern Italy; from the 12th century BC onward, however, the use of urn cemeteries, or urnfields, gradually spread to the Ukraine, Sicily, Scandinavia, and across France to the Iberian peninsula—a movement perhaps associated with folk migrations. In most areas the genuine Urnfield tradition of flat graves was continued; occasionally, however, the urns were covered by round barrows.

Warlike behaviour among the culture's members appears to have been intense; settlements were normally fortified, and large supplies of beaten-bronze armaments have been found. The slashing sword, with flanged grips to protect the handle, was apparently adopted at this time. The uniformity of the Urnfield culture and the persistence of certain pottery and metal forms seemingly had great influence on the later culture of the Early Iron Age.

urochordate: see tunicate.

Urodela (amphibian order): see salamander.

urogenital malformation, any defect in the organs and tissues responsible for the formation and excretion of urine or in the sex organs or in both. Some of the more important conditions include:

1. Multicystic dysplastic kidney, a common type of kidney malformation in newborns in which cysts of varying size enlarge one or both kidneys. Though not necessarily fatal, the condition causes a decrease in the amount of functional kidney tissue, which creates a tendency toward infection.

2. Abnormal shapes of the kidney, of moderate frequency and including fused kidneys and horseshoe kidney. These organs usually function normally but show an increased tendency toward infection and stone formations.

3. Megalo-ureter, a disorder in which the passage carrying urine from kidney to bladder is enlarged, sometimes to the size of the small intestine. The cause is usually obstruction of the ureter, bladder, or urethra, which must be treated to avoid kidney damage.

treated to avoid kidney damage.

4. Agenesis of the abdominal muscles, occurring mostly in males, involving the failure of either one set of muscles or all to form, in which case the abdomen consists of a loose sack of skin. Because there is no support for the viscera, various malfunctions, especially of the urogenital system, occur. Treatment consists of supporting the abdominal wall by the

use of a corset and by symptomatic care of malfunctions already present.

5. Epispadias, an uncommon malformation of the male genital system in which the urethra opens on the upper surface of the penis. In hypospadias, often familial, the urethra opens on the underside of the penis. Plastic surgery can repair both anomalies.

6. Cryptorchidism (q.v.), or undescended testicles, a common disorder in males in which one or both of the testes, which usually descend from the abdomen into the scrotum during the ninth month of fetal life, fail to descend because of mechanical difficulty or hormonal defect. Spontaneous descent usually occurs within a few years; if not, hormone treatment or surgery is employed.

7. Female genital system malformations, mostly either agenesis of the ovaries, vagina, or uterus or abnormally shaped uterus. The former results in sterility or infertility, and the latter may interfere with the ability to carry an infant to term.

urogenital system, also called GENITOURINARY SYSTEM, in vertebrates, the organs concerned with reproduction and urinary excretion. Although their functions are unrelated, the structures involved in excretion and reproduction are morphologically associated and often use common ducts. The major structures of the urinary system in mammals are the kidneys, ureters, bladder, and urethra. The major structures of the reproductive system in males are the testes, sperm ducts, urethra, and penis; in females, they are the ovaries, fallopian tubes, uterus, and vagina. See excretion; reproduction.

urography, X-ray examination of any part of the urinary tract after introduction of a radiopaque substance (often an organic iodine derivative) that casts an X-ray shadow. This contrast fluid, which passes quickly into the urine, may be taken orally or injected intravenously. It may also be injected directly into the area being examined. Tumours, tuberculous abscesses, kidney stones, and obstruction by prostatic enlargement may be detected by this method. Specific types of urography include pyelography (examination of the kidney and ureter) and cystography (examination of the bladder). Motion-picture "voiding cystograms" provide evidence of gross reflux of urine into the ureters and pelvis of the kidney during voiding.

urology, medical specialty involving the diagnosis and treatment of diseases and disorders of the urinary tract and of the male reproductive organs. (The urinary tract consists of the kidneys, the bladder, the ureters, and the urethra.)

The modern specialty derives directly from the medieval lithologists, who were itinerant healers specializing in the surgical removal of bladder stones. In 1588 the Spanish surgeon Francisco Diaz wrote the first treatises on diseases of the bladder, kidneys, and urethra; he is generally regarded as the founder of modern urology. Most modern urologic procedures developed during the 19th century. At that time flexible catheters were developed for examining and draining the bladder, and in 1877 the German urologist Max Nitze developed the cystoscope. The cystoscope is a tubelike viewing instrument equipped with an electric light on its end. By introducing the instrument through the urethra, the urologist is able to view the interior of the bladder. The first decades of the early 20th century witnessed the introduction of various X-ray techniques that have proved extremely useful in diagnosing disorders of the urinary tract. Urologic surgery was largely confined to the removal of bladder stones until the German

surgeon Gustav Simon in 1869 demonstrated that human patients could survive the removal of one kidney, provided the remaining kidney was healthy.

Most of the modern urologist's patients are male, for two reasons: (1) the urinary tract in females may be treated by gynecologists, and (2) much of the urologist's work has to do with the prostate gland, which encircles the male urethra close to the juncture between the urethra and the bladder. The prostate gland is often the site of cancer; even more frequently, it enlarges in middle or old age and encroaches on the urethra, causing partial or complete obstruction of the flow of urine. The urologist treats prostate enlargement either by totally excising the prostate or by reaming a wider passageway through it. Urologists may also operate to remove stones that have formed in the urinary tract, and they may perform operations to remove cancers of the kidneys, bladder, and testicles.

uropygial gland (zoology): *see* preen gland. **urostomy**, the surgical formation of a new channel for urine and liquid wastes following the removal of the bladder or ureters. *See* ostomy.

Urquhart, Sir Thomas, Urquhart also spelled URCHARD (b. 1611, Cromarty, Scot.—d. 1660), author of one of the most original and vivid translations from any foreign language into English. His works are marked by eccentricity of both language and method.

Urquhart studied at King's College, Aberdeen, and fought against the Covenanters at Turriff (1639). He was knighted by Charles I in 1641. His strong Royalist convictions led him to join the army of Charles II in 1651. Taken prisoner at the Battle of Worcester, he was incarcerated in the Tower of London and at Windsor. Cromwell allowed his release on parole, and after 1653 he appears to have been at liberty, probably taking refuge on the Continent with other Cavaliers. He died abroad, allegedly "in a fit of excessive laughter, on being informed by his servant that the King was restored," in 1660.

In the 1640s and early '50s Urquhart published several fantastical works that combined an obscure and unintelligible symbolism with sharply drawn autobiographical reminiscences. Urquhart eventually found the perfect medium for his rich, inventive, idiosyncratic style in translating the *Works of Mr. Francis Rabelais* (books i–ii, 1653; part of book iii, 1693). His linguistic exuberance and his sympathy with the free spirit of Rabelais combined to make this translation the long-established English-language version. Peter Anthony Motteux completed book iii (1693–94), as well as books iv and v (1708).

Urquiza, Justo José de (b. Oct. 18, 1801, Arroyo Urquiza, Río de la Plata—d. April 11, 1870, Entre Ríos province, Arg.), soldier and statesman who overthrew the powerful Argentine dictator Juan Manuel de Rosas and laid the constitutional foundations of modern Argentina.

A member of the Argentine oligarchy, Urquiza was educated at the Colegio de San Carlos in Buenos Aires, from which he was graduated in 1816. He early acquired both business and political experience. In 1818 he was employed in the port of Buenos Aires; after returning to Entre Ríos in June 1819 he served as a business agent. His family's relations with the dictator Francisco Ramírez enabled Urquiza to enter politics. Active in the political life of his native province for many years, he went to Buenos Aires as the agent of Pascual Eschagüe, the governor of Entre Ríos. In the capital Urquiza became a confidant of the dictator Rosas. Made a colonel in 1837,

he replaced his patron Eschagüe as governor of Entre Ríos in 1841.

As governor Urquiza made himself supreme in Entre Ríos by suppressing all other military forces within the province. He then proceeded to break the military power of the governor of Corrientes. Besides bringing order to his province, he encouraged fiscal and administrative reform in the province's government and educational reform in the schools.

Using Entre Ríos as a powerful base and forming an alliance with lesser provincial chieftains, Urquiza revolted against Rosas, defeating him in February 1852 at the Battle of Monte Caseros. In April 1852 he issued the Protocol of Palermo, which authorized him to regulate relations between the provinces. As provisional dictator of Argentina, in August 1852 he summoned to Santa Fe a constitutional congress that in 1853 sanctioned a new constitution modeled on that of the United States. All provinces accepted the constitution, but the province of Buenos Aires refused to join the new union and did not become a member until 1859. Besides creating the Argentine Confederation, Urquiza while president negotiated a navigation treaty with Great Britain, France, and the United States that opened Argentine ports to world trade.

After leaving the presidency in 1860 he was made general of the army and continued as governor of Entre Ríos. In 1861 war again broke out between the provinces and Buenos Aires, which was determined to lead the nation. The victory by Buenos Aires at the Battle of Pavón was a severe setback to Urquiza's political plans. From 1865 to 1868 Urquiza served as the commander of the Argentine armies during the war against Paraguay. He was assassinated with his sons in his villa by followers of one of his political rivals in Entre Ríos.

Urraca (b. 1077-81—d. March 8, 1126, Saldana, Castile), queen of Leon and Castile from 1109 to 1126, daughter of Alfonso VI.

Urraca became her father's heiress when her brother, Sancho, was killed at Uclés (1108). She was the widow of Count Raymond of Burgundy, by whom she had had one son, Alfonso Ramírez (born 1104), the future Alfonso VII. To counterbalance—it was hoped—the dangers of a female succession during the Almoravid crisis, Urraca's marriage to her second cousin, Alfonso I of Aragon, was arranged (1109). This marriage, instead of producing political stability in Urraca's kingdom, led to years of anarchy. Urraca and her husband, according to the marriage settlement, became co-rulers in each other's lands, and Alfonso thereupon put Aragonese garrisons into many Leonese and Castilian cities. The notion of an Aragonese-Castilian political union was, however, premature, and although Urraca's municipalities tended to accept the Aragonese king, the magnates were hostile. Civil war broke out and continued for years, many supporting the claims of the child Alfonso Ramírez to the throne. Matters were further complicated by the temperamental incompatibility of Urraca and her husband, who soon quarreled. Pope Paschal II, moreover, declared their marriage canonically invalid. They finally separated in 1114, though the Aragonese king continued for some years thereafter to keep his garrisons in Castile and to use the royal title.

Struggles also continued between nobles and municipalities, between rival bands of magnates, between the archbishops of Santiago and Toledo, and between the former, Diego Gelmírez (q.v.), and Urraca herself. Alfonso Ramírez was crowned by Gelmírez in 1111, and his reign in Galicia began effectively—despite Urraca's intermittent but active opposition—in 1116. Urraca's death in 1126 ended a disastrous episode in the medieval political history of Christian Spain.

Urre, Philipp von: see Hutten, Philipp von.

Ursa Major (Latin: "Greater Bear"), also called the great bear, the big dipper, or CHARLES'S WAIN, in astronomy, a constellation of the Northern Hemisphere, at about 10 hours 40 minutes right ascension (the coordinate on the celestial sphere analogous to longitude on the Earth) and 56° north declination (angular distance north of the celestial equator). It was referred to in the Old Testament (Job 9:9; 38:32) and mentioned by Homer in the Iliad (xviii, 487). The Greeks identified this constellation with the nymph Callisto, who was placed in the heavens by Zeus in the form of a bear together with her son Arcas as "bear keeper," or Arcturus; the Greeks named the constellation Arctos, the she-bear, or Helice, from its turning around Polaris, the Pole Star. The Romans knew the constellation as Arctos or Ursa. Ptolemy cataloged eight of the constellation's stars. Of these, the seven brightest constitute one of the most characteristic figures in the northern sky; the group has received various names-Septentriones, the Wagon, Plow, and Big Dipper. For the Hindus these seven stars represented the seven Rishis (or Sages). Alpha and Beta are called the pointers because the line Beta-Alpha points to the Pole Star.

Five stars of the constellation form an associated group with common proper motion, but Alpha (the upper pointer) and Eta (the last star of the tail) have no connection with the others. Stars in other parts of the sky have been found to belong to the same cluster; Sirius, for example, is a stray member of it.

Ursa Minor (Latin: "Lesser Bear"), also called THE LITTLE BEAR, or THE LITTLE DIPPER, in astronomy, a constellation of the northern sky, seven of whose stars outline the Little Dipper. Polaris (Alpha Ursae Minoris), at the end of the Little Dipper's handle, marks (roughly) the position of the north celestial pole. The constellation lies at about 15 hours right ascension and 80° north declination.

Ursins, Marie-Anne de la Trémoille, princesse des (princess of) (b. 1642, Paris—d. Dec. 5, 1722, Rome), French noblewoman who exercised great influence in the government of Spain between 1701 and 1714, during the period of the War of the Spanish Succession.

Ursins moved to Italy with her first husband; after his death she married an Italian duke, who died in 1698. She remained in Rome until 1701, where her salon became a centre of French influence in Italy.

After Ursins helped arrange the marriage of Philip V of Spain, grandson of Louis XIV of France, to María Luisa of Savoy, Louis sent her to Spain to be the Queen's camarera mayor (principal lady of the bedchamber). She soon established a complete ascendancy over María Luisa, who, in turn, ruled Philip. Until 1714 it was, in effect, the Princess who decided Spanish policy. Her influence was greatest in 1713 and 1714, when, with French economist Jean Orry as de facto first minister, a complete reform of the Spanish administration was begun. Attempts by the Princess to secure for herself an independent principality in Luxembourg almost caused the breakdown in 1713 of the peace negotiations at Utrecht which ended the War of the Spanish Succession.

After the death of María Luisa in February 1714, Ursins arranged for Philip to marry Isabella Farnese. The new queen, however, warned of the authority exercised by the Princess, picked a quarrel with her at their first meeting (Dec. 23, 1714), and immediately exiled her from Spain. Ursins retired to Rome.

Ursinus (d. after 385?), antipope from 366 to 367.

After Pope Liberius' death on Sept. 24, 366, two Roman deacons, Ursinus and St.

Damasus I, were simultaneously elected as successors. The small, powerful faction supporting Ursinus gathered in the Basilica Julia, Rome, where he was apparently consecrated on September 24.

Before Damasus' consecration on the following October 1, the Pope's partisans engaged in a bloody confrontation with the Ursinians, whom they drove from the Basilica Julia. A similar battle occurred on October 26 at the Basilica Liberia, before which Ursinus had been exiled to Gaul. His adherents induced the Roman emperor Valentinian I to consider convoking a synod that would settle the papal dispute. The Emperor allowed Ursinus to return to Rome in September 367.

Again violence erupted, and Ursinus was expelled on Jan. 12, 368, being allowed to live only outside Rome. Within a few months the Ursinians were driven even farther from the city because of their agitation. Ursinus returned to Gaul, and his followers continued in schism. Allowed to return to Italy (370–372), the Ursinians became established in Milan and rekindled their opposition to Damasus.

Finally, a Roman synod in 378 exonerated Damasus and condemned Ursinus, who was exiled to Cologne. Probably ambition rather than orthodoxy was the issue of the schism, and Ursinus is known to have been still involved in intrigues against Damasus as late as 381

Ursula, SAINT (fl. probably 4th century, Rome; feast day October 21), legendary leader of 11 or 11,000 virgins reputedly martyred at Cologne, now in Germany, by the Huns, 4th-century nomadic invaders of southeastern Europe. The story is based on a 4th- or 5thcentury inscription from St. Ursula's Church, Cologne, stating that an ancient basilica had been restored on the site where some holy virgins were killed. Mentioned again in an 8th- or 9th-century sermon, the number of maidens increased to several thousand, reportedly martyred under the Roman emperor Maximian. In Jacobus de Voragine's Legenda Aurea (1265-66; Golden Legend, 1483) Ursula is a British princess who went to Rome accompanied by 11,000 virgins and was killed with them by the Huns on the return from the pilgrimage. The discovery at Cologne in 1155 of an ancient Roman burial ground believed to contain these martyrs' relics inspired additional legends. Ursula is the patron of the Order of St. Ursula (Ursulines), a congregation of nuns dedicated to educating girls. In the 1969 reform of the Roman Church calendar her feast day was reduced to observances in certain localities.

Ursuline, member of order of saint ur-SULA (O.S.U.), a Roman Catholic religious order of women founded at Brescia, Italy, in 1535, by St. Angela Merici, as the first institute for women dedicated exclusively to the education of girls. Angela and her 28 companions placed themselves under the protection of St. Ursula, a legendary 4th-century martyr whose cult was popular in medieval Europe. The original Ursulines remained in their families and carried out all kinds of charitable work, but their main endeavour was instruction in Christian doctrine. As the Ursulines spread throughout Italy and France, certain modifications of form took place, although the aim and the spirit of the founder were preserved. In 1572 the Ursulines of Milan, at the request of St. Charles Borromeo, began to live in community as a congregation. The congregation of Paris in 1612 was raised to the status of a monastic order, living a strictly cloistered, or enclosed, life. In most modern Ursuline convents the enclosure has been modified to meet the needs of the apostolate. Through the efforts of Pope Leo XIII, in 1900 'Roman union" of Ursuline convents was created. Many communities, however, retain their independent organization or are united

in smaller groups. In 1639 Marie Guyard (Marie of the Incarnation) founded the Ursuline house at Quebec, the first congregation of women to be established in North America.

Urticaceae, the nettle family comprising more than 40 genera of herbs, shrubs, small trees, and a few vines, distributed primarily in tropical regions. The family is typical of the nettle order (Urticales). Many species, especially the nettles (*Urtical*) and Australian

Nettle (Urtica gracilis)
Franklin K. Anderson—EB Inc.

nettle trees (Laportea), have stinging hairs on the stems and leaves. The leaves are varied and the sap is usually watery. The small, greenish flowers often form clusters in the leaf axils. Both male and female flowers may be borne on the same plant. The curled stamens of the male flowers straighten quickly as the flowers open, releasing the pollen. The dry, one-seeded fruit often is enclosed by the outer whorl of the flower cluster. The long fibres in the stems of some species, such as ramie (q.v.; Boehmeria nivea), are used in the textile industry.

One species of Australian nettle tree, Laportea moroides, is cultivated for its raspberry-like flower clusters. Pilea, a genus of creeping plants that includes the artillery plant (P. microphylla), and pellitory (Parietaria), a genus of wall plants, are grown as ornamentals. Baby tears (Helxine soleiroli), a mosslike creeping plant with round leaves, often is grown as a ground cover. The trumpet tree (Cecropia peltata), a tropical American species, has hollow stems that are inhabited by biting ants.

Urticales, the nettle order of flowering plants, containing about 125 genera and approximately 3,100 species in four families and belonging to the class called dicotyledon (q.v.; characterized by two seed leaves). The order includes a diversity of plant types ranging from small herbaceous (nonwoody) species to large trees. Among the group are stinging nettles; mulberry, fig, and elm trees; hop vines; and the hemp, or marijuana, plant.

A brief treatment of Urticales follows. For full treatment, see MACROPAEDIA: Angiosperms. Members of the order grow abundantly throughout the world. The large mulberry family (Moraceae) contains mostly trees and shrubs of the tropics and subtropics, with a few temperate species. The nettle family (Urticaceae) is another large group, consisting predominantly of herbs, some of them with stinging hairs. They occur mainly in the tropics, where they are shrubby and treelike, but many herbaceous nettles are native to temperate areas of the Northern Hemisphere. Ulmaceae, the elm family, includes trees and shrubs distributed over the north temperate,

tropical, and subtropical regions. Some species grow to impressive heights. The hemp family (Cannabaceae) is the smallest of the order, containing aromatic herbs of the hemp and hop genera, which are widespread in northern temperate areas.

Many species in the elm and mulberry families, including red mulberry (Morus rubra), letterwood (Brosimum guianense), and many members of Ficus, are used as timber trees and ornamentals. The rock elm (Ulmus thomassi), the hackberry (Celtis occidentalis), and other members of the Ulmaceae yield a variety of useful woods.

The mulberry family is the source of the chief edible fruits in the order. The breadfruit tree (Artocarpus altilis) is one of the highest yielding of food plants, and the carbohydrate-rich breadfruits constitute a staple food in many tropical lands. The edible fig (F. carica) has been cultivated since antiquity. Silkworms feed almost exclusively on mulberry leaves, particularly those of Morus alba. The Moraceae have a milky juice, latex, which furnished the earliest source of rubber. Members of the genera Ficus and Castilla are grown commercially to make some types of rubber and other products. Paper and bark cloth (tapa cloth) are products of the paper mulberry (Broussonetia papyrifera).

The two genera of the hemp family, *Humulus* and *Cannabis*, have been economically important for many centuries. The flowers of *H. lupulus* are the hops used in brewing to flavour and clarify beer. Various parts of the hemp plant (*C. sativa*) are dried to make the drug hashish, or marijuana. Hemp is also the source of coarse fibres used for rope and sacks. A member of the nettle family, the Chinese grass plant (*Boehmeria nivea*), yields a fine fibre called ramie that is manufactured into

silklike cloth.

Urticales is distinguished from other plant orders chiefly by floral characteristics. In most members of the order, flowers are unisexual; that is, male and female structures occur in separate flowers. The ovary (female) has two carpels (ovule-bearing structures), but contains just one ovule (potential seed), which produces a single seed. Male flowers have only a few pollen-bearing stamens. Flowers are inconspicuous, lack petals, and are composed of four or five small greenish sepals. Leaves are simple, grow alternately on the stems, and have appendages called stipules.

Some species of nettles have stinging hairs tipped by a sharp terminal cell that penetrates skin, breaks off, and releases an irritating fluid. In the wood nettle of eastern North America (Laportea canadensis), the stinging fluid is formic acid; in other species, its composition has not been ascertained. The more common species of Urtica (U. dioica and U. gracilis) produce an irritation that may last cri hours, and other species sometimes cause extremely severe reactions. Nettles are not poisonous when ingested, and their leaves are often boiled and eaten like spinach.

The nettle family typifies Urticales in being wind-pollinated. Some species are specially adapted for this process by having explosive stamens. In the artillery plant (*Pilea micro-phylla*) and many other genera of Urticaceae, the stamens spring out suddenly when the male flower bud opens, releasing puffs of pollen that the wind carries to female flowers of other plants.

Among the Moraceae, some species are insect-pollinated, notably the common fig. Small gall wasps use the clustered flower structures for laying their eggs, and they pollinate the fig trees in the process. Some of the flowers form an abnormal tissue, the gall, on which the wasp larvae feed. This close relationship between figs and gall wasps is a type of sym-

biosis, or mutual interdependence, that is also exemplified in the Urticaceae family. There the tropical American trumpet tree (Cecropia peltata) provides living space and special food bodies for ants of the Azteca genus, which in turn attack leaf-cutter ants that attempt to chew up the foliage.

Many fruits of the Moraceae are multiple fruits, formed by the fusion of several flowers. Each "seed" in a fig is actually an individual fruit. The jackfruit (Artocarpus heterophyllus) produces immense fruits that grow along the main tree trunk. Two kinds of fruits appear in the Ulmaceae family. Elms (Ulmus) have a seed enclosed in a dry, winged structure adapted for wind dispersal. In other family members, such as the hackberries (Celtis), the fruit is fleshy, with a stony pit, and the seed is dispersed by birds and animals that eat the fruit

In some species of *Ficus*, including the "strangler figs," birds and bats drop fig seeds onto the branches of other trees. There the seeds develop aerial roots that grow down along the trunk of the supporting tree, enlarge, and gradually crush the host to death. Banyans (*F. benghalensis*), which grow thick prop roots from their wide-spreading branches, may reach an immense size and resemble a dense grove of trees.

urticaria (medicine): see hives.

Uruapan, in full uruapan del progreso, city, west-central Michoacán estado ("state"), west-central Mexico. Founded in 1533, Uruapan (from a Tarascan Indian term meaning "where the flowers abound") is famous for its Spanish-colonial atmosphere and colourful lacquerware and Indian handicrafts. It is a rail terminus and agricultural marketing and processing centre in an area producing coffee, grains, sugarcane, and tropical fruit. Uruapan is a base for tourists visiting the nearby volcano Paricutín, which appeared suddenly in 1943. The city is accessible by highway, railroad, and air from Mexico City to the east. Pop. (1980) 122,828.

Urubamba River, Spanish Río URUBAMBA, river in the Amazon drainage system, rising in the Andes of southern Peru, near the border between Cuzco and Puno departamentos. It flows for about 450 miles (725 km) to its junction with the Apurímac, where it forms the Ucayali. The upper part of the Urubamba, there called the Vilcanota, flows past the

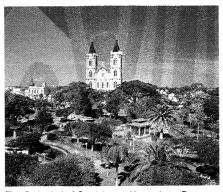

Urubamba River Valley in the Andes of Peru

towns of Sicuani, Urcos, and Urubamba and is densely settled by Indian farmers. Below Urubamba, in the Gorge of Torontoy, the river plunges from 11,000 to 8,000 feet (3,400 to 2,400 m) in 20 miles (32 km). The lower course, downstream from Quillabamba, is sparsely populated.

Uruguaiana, also spelled URUGUAYANA, city, western Rio Grande do Sul estado ("state"), southern Brazil. It lies along the Uruguay River, across the bridge from the town of

Paso de los Libres, Arg. Founded in 1839 as Sant' Ana do Uruguai, Uruguaiana was made a town and renamed in 1846; city status was

The Cathedral of Sant' Ana at Uruguaiana, Braz. Plessner International

accorded in 1874. Uruguaiana is a livestock (sheep and cattle) centre and processes meat and animal by-products. It is also a river port and is linked by rail, road, and air to other cities in the state. Pop. (1980) 79,059.

Uruguay, officially oriental republic of URUGUAY, Spanish REPÚBLICA ORIENTAL DEL URUGUAY, South America's second smallest country after Suriname, situated in the southeastern part of the continent, covering an area of 68,037 square miles (176,215 square km). The capital is Montevideo. Uruguay extends about 310 miles (500 km) from north to south and about 290 miles (470 km) from east to west. It is bordered on the north and northeast by Brazil, on the south by the estuary of the Río de la Plata, and on the southeast by the Atlantic Ocean; the entire western border is defined by the Uruguay River, which separates the country from Argentina. The population in 1990 was estimated at 3,011,000

A brief treatment of Uruguay follows. For full treatment, see MACROPAEDIA: Uruguay. For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

The land. Uruguay lies in a transitional zone between the humid pampas of Argentina and the warm, hilly uplands of Brazil. Its topography consists mainly of low plateaus and low hilly regions. Mount Mirador (1,644 feet [501 m]) in the hills of the Cuchilla Grande in the southeast is the country's highest point. The Negro River is Uruguay's principal river. Uruguay's climate is mild and temperate. Average temperatures in summer (December-February) are about 71° F (22° C) and in winter (July-August) about 50° F (10° C); mean annual precipitation is about 35 inches (890 mm). Flat or gently rolling grasslands, a part of the Pampa, dominate the Uruguayan landscape. Forests cover less than 5 percent of the total land area. Scarlet and white verbenas and other wildflowers abound in the prairies. The larger indigenous fauna includes the rhea, puma, jaguar, fox, deer, and wildcat; armadillo, as well as quail and partridge, are also found. The mineral and energy resources of Uruguay are limited. Small iron-ore, lead, copper, and gold deposits exist in the northern part of the country.

The people. Caucasians, mostly of Spanish and Italian origin, are the predominant ethnic group, mestizos account for a small percentage, and the remainder are mulattoes and blacks; few Indians remain. Spanish is the official language. Roman Catholics constitute three-fifths of the population, followed by the nonreligious (one-third), Protestants, and Jews. Uruguay has one of the lowest birth rates among South American countries, as well as one of the continent's lowest rates of natural increase. The age group encompassing persons 15 years and younger is more than one-

fourth of the population. Life expectancy is relatively high at about 69 years for men and 74 years for women. The death rate, however, is also relatively high, in part because of high infant mortality. More than four-fifths of the population lives in urban areas, almost half in Montevideo.

The economy. Uruguay has a mixed economy in which both the public and private sectors participate. The economy is largely based on services, light industries, and agriculture. The gross national product (GNP) is staying about even with the rate of growth of the population, and the GNP per capita is somewhat higher than average for South American countries. Agriculture accounts for approximately one-tenth of the GNP and employs about one-seventh of the work force. One-half of Uruguay's farmland is worked by tenant farmers, who are protected by legislation enacted in 1954. The government sets support prices for certain staples.

Pastures cover almost four-fifths of Uruguay's land area and support large herds of sheep and beef cattle and other livestock. The European Economic Community countries remain the main market for Uruguay's large meat exports; Brazil is another important destination for its beef. The country's annual production of greasy wool continues to increase. Arable land is limited to somewhat less than one-tenth of the total land area and produces wheat, rice, corn (maize), potatoes, sugar beets, and sugarcane. The government has promoted the development of fishing. Mineral industries are of negligible importance, and Uruguay must import fuels and metals. Manufacturing industries account for about one-fourth of the GNP

Uruguay

and employ almost one-fifth of the work force. Light industries predominate and are concentrated around Montevideo, where much of the country's agricultural output is processed. Leading manufactures include processed food, refined petroleum, beverages, shoes, textiles, chemicals, and transport equipment. Electricity is almost totally generated from hydroelectric power. Production of hydroelectric power principally from the Uruguay River has reduced the country's consumption of imported petroleum. Tourism, an important industry, centres on seaside resorts; most of the tourists come from Argentina. Raw materials, fuels, and capital goods dominate imports; meat, wool, and hides lead exports. Leading trading partners include Brazil, the United States, Argentina, Germany, and Nigeria.

Government and social conditions. Uruguay was ruled by a military regime after 1973 but returned to civilian government in 1985 following national elections held in 1984. The president, the highest executive authority, governs with the assistance of the Council of Ministers, who are appointed by the president. The elected General Assembly consists of a

99-member Chamber of Deputies and a 31-member Senate. Political activity was banned in 1973 but was fully restored by 1985. The judiciary is headed by the Supreme Court, and there are tribunal and local courts.

With the establishment of social-security measures in the early 20th century, Uruguay became the first welfare state in Latin America. The comprehensive program includes extensive provisions for unemployment insurance, compensation for work injury, family allowances, and aid to the aged and indigent. Additionally, the quality of health care, sanitation, and diet promote health conditions superior to those in most other Latin-American countries. Uruguay has a high literacy rate. Education is free at all levels and compulsory at the primary level and the first stage of the secondary level. The University of the Republic (founded 1849) is the country's only major university. The extensive government restrictions on the communications media were lifted in 1985. Radio and television broadcasting are widely received.

History. Prior to European settlement, Uruguay was inhabited mainly by a group of Indian tribes known collectively as the Charrúas. The Spanish navigator Juan Díaz de Solís sailed into the Río de la Plata in 1516. Portuguese from Brazil established Colonia del Sacramento on the Río de la Plata in 1680. Subsequently, the Spanish established Montevideo in 1726, driving the Portuguese from their settlement, and 50 years later Uruguay became part of the Viceroyalty of Río de la Plata. Almost all of the area's indigenous Indians were exterminated in the course of the Spanish colonization.

Uruguay became involved in the wars of independence in the Spanish American colonies in 1811. After five years of growing revolutionary activity, the Spaniards defeated José Gervasio Artigas, leader of the revolt. During the subsequent Portuguese-Brazilian occupation, Juan Antonio Lavalleja successfully resumed Uruguay's fight in 1825, and independence was granted in 1828. Uruguay's major political parties, the Colorado (Red) Party and the Blanco (White) Party, emerged during the 1830s and '40s.

After an inconclusive civil war (1839–51), Argentine and Brazilian involvement in Uruguayan affairs led to war with Paraguay (1865–70) and subsequent military rule. José Batlle y Ordóñez, a Colorado and a reformer, was elected president in 1903 and dominated Uruguayan politics until his death in 1929. His programs made Uruguayan noteworthy for advanced social legislation and political stability in the early 20th century.

Following a period of dictatorship during the Great Depression and of neutrality in World War II, Uruguay adopted a new constitution in 1951 (which was replaced again in 1966). The Nationalists (Blancos) won the 1958 elections after 93 years out of power. Subsequent inflation and economic crises stimulated extensive left-wing terrorist activity, which in turn led to a right-wing military coup in 1973. Human-rights abuses became common under the military government. The installation of civilian government in 1985 saw the freeing of many political prisoners and the restoration of full political and civil rights.

Uruguay River, Portuguese RIO URUGUAI, Spanish Río URUGUAY, river in southern South America that rises in the coastal range of southern Brazil. Its chief headstream, the Pelotas River, rises just 40 miles (64 km) from the Atlantic coast at Alto do Bispo in Santa Catarina state, Brazil, and takes the name Uruguay after it is joined by the Canoas River near Piratuba. Flowing west through the coastal range of Brazil (separating Santa Catarina and Rio Grande do Sul states), it then turns southwestward, forming the Argentina-Brazil border. Below Monte Caseros, Arg., it

turns southward, forming the border between Argentina and Uruguay until, above Buenos Aires, it combines with the Paraná River to form the great estuary of the Río de la Plata. Its 990-mile (1,593-kilometre) course is interrupted by rapids between Salto (Uruguay) and the influx of the Quaraí River (Spanish: Río Guareim) near Monte Caseros; hence its importance as a waterway is less than that of the Paraguay-Paraná river system. Ocean vessels can reach Paysandú, Uruguay, about 130 miles (210 km) from the mouth; smaller ships can proceed to Salto, 60 miles (100 km) farther upstream.

Uruk (ancient Mesopotamian city): see Erech.

Urumchi, Wade-Giles romanization wu-Lu-Mu-Ch'I, Pinyin ürümqı, city in the Sinkiang Uighur autonomous *ch'ü* (region), northwestern China. Urumchi (Mongolian: "Fine Pasture") is the capital of the autonomous region. Situated in a fertile belt of oases along the northern face of the T'ien Shan (mountains), the city commands the northern end of a gap leading from the Tarim Basin into the Dzungarian Basin.

It first came under Chinese control in the 7th and 8th centuries, when the Chinese established the protectorate general of Pei-t'ing some 80 miles (130 km) to the east. A hsien (county) named Lun-t'ai was then founded at Urumchi, which became an important centre for caravans traveling into the I-li River valley from the main route across Turkistan. After the withdrawal of the T'ang dynasty (618-907) from the area in the 750s, Urumchi came under the control of the Uighurs. It again came under Chinese rule during the campaigns of the Ch'ing dynasty against the Dzungars in the 18th century. In 1760 military colonies were established in the surrounding oases, and in 1763 a Chinese city called Ti-hua was founded there.

The city became an important Manchu garrison for northwestern China. When the Muslim Rebellion broke out in Sinkiang in the 1860s, Urumchi was taken by the rebels in 1864 but was eventually recaptured in 1876 by Ch'ing forces under Tso Tsung-t'ang. When the province of Sinkiang was set up in 1884, Urumchi became its capital. It grew rapidly into the greatest city and centre of trade in Central Asia. Its commercial importance was matched, in the last days of the empire, by its growing strategic and international significance, as the British and Russians each attempted to establish influence in Sinkiang.

Since 1949 Urumchi has been developed not only as the regional capital and cultural centre of Sinkiang but also as a major industrial base. A railway, originally planned to be extended west to join the Soviet system, links Urumchi to the Chinese rail network and was completed in the early 1960s. A highway was built following the same route, and other highways have been built across the Dzungarian and Tarim basins, greatly improving Urumchi's communications. Efforts have been made to extend the irrigated farmlands in the vicinity, along the foot of the Tien Shan, and to improve the region's agricultural productivity by mechanization.

Urumchi's new prosperity, however, comes from its mineral resources. In 1955 a large petroleum field was discovered at K'o-la-ma-i (Karamai) to the north in the Dzungarian Basin; it was brought into production in 1958–59 and has since become one of China's major sources of oil. Extensive coal deposits were found along the foot of the T'ien Shan, and there are major mining centres near Urumchi and at Liu-tao-wan. A large thermal-power station, ironworks and steelworks, an engineering industry (producing agricultural machinery), a cement works, chemical and fertilizer plants, an oil refinery, and cotton-textile mills have been built.

Urumchi remains a Uighur city, with Uighur

as its chief language; most Uighurs are Muslim. There are Kazakh, Dungan, and Manchu minorities. Much effort has been devoted to building a Uighur cultural base. There are many schools and institutes of higher education, including a university, colleges for minorities, and institutions for studying the Russian language, medicine, and agricultural science. Pop. (1987 est.) 958,196.

Urushi (Caroline Islands): see Ulithi.

Uryankhai (people): see Tuvinian.

U.S.: see under United States, except as below.

U.S. News & World Report, weekly news magazine published in Washington, D.C., one of the most influential of its kind and the first to successfully imitate the general format pioneered by Time. It was established in 1933 by David Lawrence as U.S. News and won general note for its thorough coverage of major news events in Washington, D.C., and the United States, often carrying the complete text of major speeches and documents emanating from the capital. In 1945 Lawrence founded World Report to treat world news as U.S. News treated domestic news. The two magazines merged in 1948. From its start, U.S. News & World Report had an editorial viewpoint somewhat more conservative than its larger rivals, Time and Newsweek, and unlike them it paid scant attention to sports and the arts, except as they might pertain to developing major political and economic stories.

U.S.A.: see United States.

Usa, city, Ōita ken (prefecture), northern Kyushu, Japan; it lies 24 miles (39 km) northwest of the prefectural capital Ōita. The city developed around the site of the first and most famous of shrines dedicated to the Shintō god Hachiman, Usa Hachiman Shrine, which dates to about 717-724. An annual festival is held on March 18, and the Shinkosai festival, with a procession of portable shrines (mikoshi), is held from July 31 to August 2. Before World War II, Usa was known in the United States for its manufacture or distribution of products labeled "MADE IN USA," in an apparent attempt to deceive those Americans avoiding Japanese goods. Today the city's industries turn out machinery, textiles, and rice products (such as ame, or rice jelly), and the region grows rice, vegetables, and mandarin oranges. Pop. (1985) 52,217.

USAir Group, Inc., holding company for the American airline incorporated on March 5, 1937, as All American Aviation, Inc.; the airline was renamed All American Airways, Inc., in 1948, Allegheny Airlines, Inc., in 1953, and USAir, Inc., in 1979. The holding company was established in 1983. Current headquarters are at Arlington, Va., and USAir, Inc., is based at Washington, D.C.

Beginning service in 1939 as a mail carrier over the mountainous regions of Pennsylvania and West Virginia, the company began passenger service in 1949 and expanded in subsequent decades to include a network of routes primarily serving cities and towns located in the northeastern quadrant of the United States, from the Middle West to the Atlantic Coast.

In 1968 Allegheny merged with Lake Central Airlines, Inc. (founded 1947 as Turner Airlines and adopting the Lake Central name

in 1950), which flew routes radiating from Indianapolis, Ind. In 1972 Allegheny merged with Mohawk Airlines, Inc. (founded 1945 as Robinson Airlines and adopting the Mohawk name in 1952), which flew commuter routes within New York state.

In 1987 USAir Group, Inc., bought Pacific Southwest Airlines, which had routes along the southern half of the West Coast. A more important acquisition in the same year was that of Piedmont Aviation, Inc. (founded 1940), a large airline serving the east-central United States and based in Winston-Salem, N.C.

Uşak, also spelled USHAK, city in the interior of western Turkey, at an elevation of 2,976 feet (907 m) above sea level. Situated in a region that was once part of the Hittite empire, Uşak lies near the ruins of ancient Flaviopolis. In more recent times it was the scene of some of the fiercest fighting of the Turkish War of Independence (1919–23).

Usak is noted for its carpet industry, with specialization in heavy-pile carpets. Other industries include sugar refineries, cotton and woolen textiles, and leather products. Sugar beets and cereals are the main crops in the primarily agricultural area in which the city is situated. The city lies on the main road and railway line between Izmir, 125 miles (200 km) west, and Ankara (via Afyon Karahisar). Pop. (1985) 88,267.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Uşaklıgil, Halid Ziya (b. 1866, Constantinople—d. 1945, Istanbul), writer who is considered the first true exponent in Turkey of the novel in its contemporary European form.

He was educated at a French school in Izmir, where he became devoted to the works of the 19th-century French novelists. A journey to France also contributed to his knowledge of European culture, which deeply affected him and his writing. Such early novels as *Bir Ölünün Defteri* (1889; "Journal of a Dead Man") and *Ferdi ve Şürekâsı* (1894; "Ferdi and Company") reveal this French influence.

In 1896 Halid Ziya became involved with Servet-i Fünun ("The Wealth of Knowledge"), an avant-garde journal that he and the other writers of the "new literature" published to inform their readers about European, particularly French, cultural and intellectual movements. The hero of one of his greatest novels, Mai ve Siyah (1897; "The Blue and the Black"), is a spokesman for the "new literature" movement. The novel Aşk-ı Memnu (1900; "The Forbidden Love"), often considered his masterpiece, was followed by many more novels and short stories. His characters and plots, though mainly limited to westernized upper-class circles, were drawn from personal experience. After the Young Turk revolution in 1908, Halid Ziya taught courses in European literature at Istanbul University. After World War I he continued to write, his works including dramas, articles, and his memoirs.

use, in medieval English property law, the right of one person to take the profits of land belonging to another. It involved at least two and usually three persons. One man (A) would convey or enfeoff land to another (B) on the condition that the latter would use it not for his own benefit but for the benefit of a third man (C)—who could be A himself. C (or A), thus, had the profits—that is, the use—of the land and could treat the land as he pleased. This legal institution, which arose as early as the 11th century, came to be employed not only as a legitimate method of providing for
