Yegorov, Boris Borisovich (b. Nov. 26, 1937, Moscow), Soviet physician who, with cosmonauts Vladimir M. Komarov and Konstantin P. Feoktistov, took part in the first multimanned space flight, that of Voskhod ("Sunrise") 1, on Oct. 12-13, 1964, and thus became the first practicing physician in space. Upon graduating in 1961 from the First Medical Institute, Moscow, Yegorov joined the team of physicians who studied medical telemetry data from Soviet spaceflights. An expert on the sense-of-balance mechanism in the inner ear, he began training for the Voskhod 1 flight during the summer of 1964. During the flight (which, with an apogee of 254 miles, was then the highest attained by a manned capsule), Yegorov tested the effects of radiation, confinement, weightlessness, and various other conditions of spaceflight on himself and the other cosmonauts. The flight was the first undertaken in woollen clothes rather than the usual space suits. It was suggested at the time that a longer flight had been planned, which was why a doctor was included. Yegorov was not a trained long-term professional cosmonaut and returned to medical practice. The medical information gained from the Voskhod 1 flight and subsequent research enabled Soviet scientists to make advances in adapting man to long spaceflights.

Yegoryevsk, also spelled JEGORJEVSK, or EGOREVSK, city, Moscow oblast (administrative region), western Russian Soviet Federated Socialist Republic, on the Glushitsy River southeast of the capital. In 1778 the city was formed from the village of Vysokoye and became an important trading centre, especially for grain and cattle from Ryazan province. In the 19th century it became a textile centre and now also manufactures textile machinery, clothing, and footwear. It also produces phosphates from local phosphorite deposits. There are medical and teacher-training schools and a museum of local history and culture. Pop. (1983 est.) 73,000.

Yeh-lü A-pao-chi (Khitan ruler): see A-pao-chi.

Yeh-lü Ta-shih, Pinyin YELÜ DASHI, temple name (Wade-Giles romanization) (HSI LIAO) TE TSUNG (b. 1087, China—d. 1143, Central Asia), founder of the Western Liao dynasty of Central Asia.

Yeh-lü was a member of the Imperial family of the Liao dynasty (907–1125), which had been established by the Khitan tribes and ruled much of Mongolia, Manchuria, and Northeast China. When the Liao dynasty was overthrown by the Juchen, who established the Chin dynasty, Yeh-lü fled west to Turkestan, where he imposed his suzerainty over the Central Asian oases east and west of the Pamir mountains. His empire survived until 1211, when it was finally conquered by the Mongols, who called it the Karakitai, or "Black Khitan," empire.

Yeh T'ing, Pinyin YE TING, also called YEH HSI-P'ING (b. 1897, near Hong Kong—d. 1946), outstanding military leader in modern Chinese history.

Yeh is thought to have been of peasant origin, but he received an education at the Pao-ting Military Academy, from which he graduated in 1919. He joined the Chinese Communist Party (CCP) in 1925 and within a year was commander of a vanguard unit on the Northern Expedition. He was a key figure in the Nan-ch'ang Uprising of Aug. 1, 1927, and commanded Communist units during the Canton Commune, after the coup of Dec. 11, 1927, in that city. Both of these attempts by the CCP were quickly nullified by the Nationalists of the Kuomintang (KMT). In 1928 Yeh went to the Soviet Union and in 1929 to western Europe, where he remained for five years. In October 1937, after the outbreak of the Sino-Japanese War, Yeh was appointed commander of the New 4th Army. The cooperation that had been initiated between the Communists and the KMT soon deteriorated, however, and in January 1941 Yeh (while at кмт headquarters) was arrested and his troops were ambushed. At the time of what became known as the New 4th Army Incident, the army had about 100,000 men, 9,000 of whom were killed, wounded, or captured. Yeh himself was held prisoner for five years by the кмт and soon after his release was killed in an airplane accident.

Yehezgel (Jewish prophet): see Ezekiel.

Yehoram (Old Testament king): see Jehoram.

Yehoshaphat (king of Judah): see Jehoshaphat.

Yehoshua^c (biblical Jewish leader): see Joshua.

Yehu (king of Israel): see Jehu.

Yehuda THE ḤASID: see Judah ben Samuel. Yehuda ben Shemuel ha-Levi (Hebrew poet): see Judah ha-Levi.

Yehudi, ha-, also called HA-YEHUDI HA-KADOSH (Hasidic leader): see Przysucha, Jacob Isaac ben Asher.

Yekaterina (Russian personal name): see under Catherine.

Yekaterinburg (Russian S.F.S.R.): see Sverdlovsk.

Yekaterinodar (city, Russian S.F.S.R.): see Krasnodar.

Yekaterinoslav (city, Ukrainian S.S.R.): see Dnepropetrovsk.

Yelets, also spelled YELEC, or ELETS, city, Lipetsk oblast (administrative region), western Russian Soviet Federated Socialist Republic, on the Sosna River. First mentioned in 1146 and the seat of a minor princedom in the 13th century, Yelets long served as a southern frontier fortress. It was captured by Timur in 1395 and by the Mongols in 1414; in 1483 it passed to Moscow. Although long noted for its handmade lace, Yelets today is a medium-sized industrial city, with flour milling and engineering, and is also a railway junction. Pop. (1983 est.) 114,000.

Yelizaveta (Russian personal name): see under Elizabeth, or Elisabeth.

Yelizavetgrad (Ukrainian S.S.R.): see Kirovograd.

Yelizavetpol (Azerbaijan S.S.R.): see Kirovabad.

yellow birch, also called SILVER BIRCH, or SWAMP BIRCH (Betula alleghaniensis, or B. lutea), ornamental and timber tree of the family Betulaceae, native to the northeastern part of North America.

Among the largest of birches, yellow birch grows to 30 metres (100 feet) on cool, moist bottomlands and on drier soils to elevations of 1,950 metres. On limbs and young trunks the silvery yellow bark peels in paper-thin curls; on old trunks it is red brown, deeply grooved, and broken into irregular plates. The pale green twigs are slightly aromatic.

The hard, pale red-brown wood usually is not separated from that of sweet birch commercially, both woods being sold for furniture, woodenware, veneer, vehicle parts, and flooring

yellow bunting (bird): see yellowhammer.

yellow cress: see marsh cress.

yellow-dog contract, agreement between an employer and an employee in which the employee agrees, as a condition of employment, not to join a union during the course of his employment. Such contracts, used most widely in the United States in the 1920s, enabled employers to take legal action against union organizers for encouraging workers to break these contracts.

A federal law prohibiting the use of yellow-dog contracts on the railroads (Erdman Act of 1898) was struck down by the Supreme Court as an unconstitutional infringement upon the freedom of contract (*Adair* v. *The United States*, 1908). In 1932, in accordance with the new philosophy that the government should not interfere with the workers' right to organize, the Norris-LaGuardia Act made yellow-dog contracts unenforceable in the federal courts.

yellow fever, acute infectious tropical and subtropical disease, sometimes occurring in the temperate zones. The disease, caused by a virus, infects humans, all species of monkeys, and certain other small mammals. The virus is transmitted among susceptible hosts by several species of mosquitoes.

There is considerable uncertainty over the origin of yellow fever. Western Africa has long been regarded as the home of the virus, but the first recorded outbreaks of the disease were in central and coastal South America after the Spanish conquest in the 16th century. For the next 300 years, yellow fever was one of the great plagues of the world. The tropical and subtropical regions of the Americas were subjected to devastating epidemics, and serious outbreaks occurred as far north as Boston and as far away from the endemic centres as Spain, France, England, and Italy.

By the late 19th century there were several theories about the cause and transmission of vellow fever, and in 1881 Carlos Juan Finlay of Havana, Cuba, suggested that the infectious agent was transmitted by the mosquito now known as Aedes aegypti. In his investigation of Finlay's theory, Major Walter Reed of the U.S. Army demonstrated in 1900 the transmission of vellow fever from one human to another through the bite of A. aegypti. Reed was further able to show that mosquitoes (rather than bodily contagion, as had previously been thought) were the only vector of the disease. Reed's discoveries were quickly taken up by the American surgeon William Crawford Gorgas, who was able to practically eliminate yellow fever from Havana through the control of the Aedes mosquito. Gorgas' success was repeated in Rio de Janeiro and then in Panama during the building of the Panama Canal. The last outbreak of yellow fever in the United States occurred in 1905, when New Orleans and other ports of the South were invaded.

There are two substantially different patterns of transmission of the virus: (1) urban, or classical, yellow fever, in which the transmission is from person to person by the Aedes aegypti mosquito, and (2) jungle yellow fever, in which the transmission is from a mammalian host (usually a monkey) to any one of a number of forest-living species of mosquito to humans. In South America, jungle yellow fever is transmitted by mosquitoes belonging to the genus Haemagogus, while in Africa it is transmitted by the mosquito A. africanus. The distinct transmission cycle involved in jungle yellow fever was first recognized in 1933, after which it became clear that the virus was endemic in huge areas of the Amazon and Orinoco river basins in South America and in the forests of tropical central and western Africa.

The course of yellow fever is rapid. After the bite of the infecting mosquito, there is an incubation period of several days while the virus multiplies within the body. The onset of symptoms is then abrupt, with headache, backache, rapidly rising fever, nausea, and vomiting. This stage lasts two or three days, after which the patient either begins to recover or proceeds to a deeper febrile state marked by high fever, slow pulse rate, and the vomiting of dark, altered blood. Death may occur six or seven days after the onset of symptoms. Because the virus destroys liver cells, jaundice (yellowing of the skin and eyes by deposition of bile pigment) is a common symptom in persons with yellow fever and is in fact responsible for the name of the disease.

The yellow-fever patient's convalescence is prolonged, but, when recovery does occur, it is complete and is accompanied by a lifelong immunity. The mortality rate of yellow fever varies greatly, depending upon the strain of virus and, to a certain extent, upon the race of the patient. Many persons may experience only a mild infection that lasts a few days.

There is no specific treatment for those with yellow fever. Good nursing and supportive care, particularly reduction of fever, are important both in maintaining comfort and in reducing mortality.

Yellow fever is an outstanding example of a completely preventable disease. Originally, the control of *Aedes aegypti* mosquitoes was the only preventive procedure available, as, for example, the campaign against them that made the construction of the Panama Canal possible. Live-virus vaccines, which produce active immunity without clinical illness, are the second great preventive measure.

Eradication of the Aedes aegypti mosquito gives effective protection to the populace of cities. Where people must travel or live in regions where the forest cycle of the virus is maintained through host animals, individual immunization is necessary. In these jungle-yellow-fever regions, human cases will continue as long as there remain unimmunized persons, for there is no known practical way of eliminating the virus of yellow fever from the animal and mosquito populations of the vast tropical forests in South America and Africa.

yellow-green algae, members of the division Xanthophyta (about 6,000 species), once classified with the green algae on the basis of similarity of body organization. The Xanthophyta are distinguished by their food reserve (oil), the quantity of B-carotene in their plastids, and motile bodies with unequal flagella. Frequently cell walls are two overlapping halves. The usual method of asexual reproduction is by motile zoospores and nonmotile resting aplanospores. Sexual reproduction is rare; the genus Vaucheria (q.v.) is an important exception.

Yellow Hat sect (Tibetan Buddhism): see Dge-lugs-pa.

yellow journalism, the use of lurid features and sensationalized news in newspaper publishing to attract readers and increase circulation. The phrase was coined in the 1890s to describe the tactics employed in furious competition between two New York City newspapers, the World and the Journal.

Joseph Pulitzer had purchased the New York World in 1883 and, using colourful, sensational reporting and crusades against political corruption and social injustice, had won the largest newspaper circulation in the country. His supremacy was challenged in 1895, when William Randolph Hearst, the son of a California mining tycoon, moved into New York City and bought the rival Journal. Hearst, who had already built the San Francisco Examiner into a hugely successful, mass-circulation paper, soon made it plain that he intended to do the same in New York City by outdoing his competitors in sensationalism, crusades, and Sunday features. He brought some of his staff from San Francisco and hired some away from Pulitzer's paper, including Richard F. Outcault, a cartoonist who had drawn an immensely popular comic picture series, "The Yellow Kid," for the Sunday World. After Outcault's defection, the comic was drawn for the World by George B. Luks, and the two rival picture series excited so much attention that the competition between the two newspapers came to be described as "yellow journalism." This all-out rivalry and its accompanying promotion developed large circulations for both papers and affected American journalism in many cities.

The era of yellow journalism may be said to have ended shortly after the turn of the century, with the *World*'s gradual retirement from the competition in sensationalism. Some techniques of the yellow-journalism period, however, became more or less permanent and widespread, such as banner headlines, coloured comics, and copious illustration.

yellow mombin (tree): see hog plum.

Yellow Plain (China): see North China Plain.

yellow poplar: see tulip tree.

Yellow River (China): see Huang Ho.

yellow scales, also called SHORE LICHEN (Xanthoria parietina), lichen species characterized by lobed margins and a wrinkled centre. It is usually found where the air is filled with mineral salts, especially near the sea and on rocks and walls. It was once considered a valuable medication for jaundice because of its yellow or orange colour.

Consult the INDEX first

Yellow Sea, Wade-Giles romanization and Pinyin HUANG HAI, marginal sea of the western Pacific Ocean lying between mainland China to the north and west and the Korean peninsula to the east.

A brief treatment of the Yellow Sea follows. For full treatment, *see* MACROPAEDIA: Pacific Ocean.

On the south the Yellow Sea is separated from the East China Sea by an east-west line connecting Cheju Island, off South Korea, with the mainland of China. Its major inlets are Korea Bay in the north and the Po Hai (Gulf of Chihli) in the northwest. The Strait of Chihli, between the Liaotung Peninsula to the north and the Shantung Peninsula to the south, links the Yellow Sea proper with the Po Hai.

The area of the Yellow Sea (excluding the Po Hai) is 156,000 square miles (404,000 square km), its mean depth is 144 feet (44 m), and its maximum depth is 338 feet (103 m). It derives its name from the colour of the silt-laden water discharged by the Huang Ho (Yellow River) and other major Chinese rivers including the Yangtze, Huai, Liao, and Yalu. Generally, the climatic conditions of the region are characterized by very cold, dry winters and warm, wet summers.

The Yellow Sea is famous for its fishing grounds. Chinese, North and South Korean, and Japanese trawlers exploit rich demersal (bottom-dwelling) fish resources. The leading port cities are Tsingtao, Shanghai, Tientsin, Lü-ta, and Ch'in-huang-tao in China, Inch'ŏn in South Korea, and Namp'o in North Korea.

Yellow Springs, village, Greene county, southwestern Ohio, U.S. It lies 23 miles (37 km) east-northeast of Dayton. Founded in 1804, it was named after a local mineral spring, which later (1820-80) was the site of a health resort. The village's manufactures include aluminum castings, bronze art castings, rubber and plastic components, scientific instruments, stained glass, and most of the nation's bookplates. Yellow Springs is the seat of Antioch College, founded in 1852 with Horace Mann as its first president, now with campuses throughout the United States. A branch of Fels Research Institute (for the study of human development) is also located there. John Bryan State Park is a few miles southeast. Inc. 1856. Pop. (1988 est.) 3,760.

Yellow Tiger (Chinese rebel leader): *see* Chang Hsien-chung.

Yellow Turbans, Chinese secret society whose members' uprising, the Yellow Turban Rebellion (AD 184–c. 204), contributed to the fall of the Han dynasty (AD 220). Led by Chang Chüeh, a Taoist faith healer who gained numerous adherents during a widespread pestilence, the rebellion was directed against the tyrannical eunuchs who dominated the emperor. The rebels wore yellow headdresses to signify their association with the "earth" element, which they believed would succeed the

red "fire" element that represented Han rule. To suppress the uprising, which erupted in east China, the Han conscripted huge armies at great cost, but their efforts were hampered by inefficiency and corruption in the imperial government. Chang Chüeh was killed in AD 184, but the rebellion was a continuing menace to the government for the subsequent two decades.

yellowberry: see cloudberry.

yellowhammer, also called YELLOW BUNTING (species *Emberiza citrinella*), Eurasian bird belonging to the family Emberizidae (order Passeriformes). The name is derived from the German *Ammer*, "bunting." It is a 16-centimetre (6-inch) streaked brown bird with

Yellowhammer (Emberiza citrinella)

S. Dalton from the Natural History Photographic Agency-EB Inc.

yellow-tinged head and breast. Its rapid song is heard in fields from Britain to central Asia. In the southern United States a woodpecker, the yellow-shafted flicker (see flicker), is often called yellowhammer, from its drumming.

Yellowhead Pass, route through the Rocky Mountains, at the Alberta-British Columbia border, Canada, just west of Jasper and leading from Jasper National Park into Mount Robson Provincial Park. At 3,711 feet (1,131 m) above sea level, it was noted by Sandford Fleming in his railroad survey of 1870 and was later used by the main line of the Canadian National Railway. It is now also traversed by the Yellowhead Route of the Trans Canada Highway running from Prince Rupert, B.C. (west), to Edmonton, Alta., and Portage la Prairie, Man. (east). The pass and nearby Yellowhead Lake were named for François Decoigne, a local Métis fur trader who was nicknamed Tête-Jaune (Yellowhead).

Yellowknife, also called TATSANOTTINE, a small Athabascan-speaking Indian tribe of Canada who lived northeast of the Great Bear and Great Slave lakes in what is now the Northwest Territories. The name Yellowknife derives from their use of yellow copper in making knives and other tools. In language and culture patterns the Yellowknife Indians were almost identical to the Chipewyan (q.v.), who were given to robbing and oppressing them. The Yellowknife Indians' virtual destruction came at the hands of the Dogrib (q, v), however, who in the late 18th and early 19th centuries massacred them in retaliation for earlier raids and harassments. In the late 20th century they numbered only about 500, usually counting themselves as Ojibwa.

Yellowknife, city, Fort Smith region, and capital (since 1967) of Northwest Territories, Canada. It lies on the north shore of Great Slave Lake, 5 miles (8 km) south of the mouth of the Yellowknife River on Yellowknife Bay. It was founded in 1935, one year after gold was discovered in the area, and derived its name from the Yellowknife band of Athabascan Indians. During the early years of World War II, the demand for gold declined and the city's economy suffered. Since a second major gold discovery in 1945, two large mines have been in operation—the Giant Yellowknife and the Cominco. Power is provided by a hydro-

electric station at Greyling Falls on the Yellowknife River. The city progressed to become the largest community and the most important administrative, commercial, and educational centre in the territories. Yellowknife is linked by highway around the lake southward to Hay River and Alberta. Inc. city, 1970. Pop. (1986) 11,753.

yellowlegs, either of two species of American shorebirds with trim, gray-brown and white streaked bodies, longish bills, and long, bright yellow legs. They belong to the genus Tringa of the family Scolopacidae; this family also includes the curlews, turnstones, sandpipers, and snipes. The lesser yellowlegs (T. flavipes), about 25 cm (10 inches) long, appears in sizable flocks on mud flats during migration between its breeding grounds across Canada and Alaska and its wintering ground from the Gulf of Mexico to southern Chile and Argentina. The greater yellowlegs (*T. melanoleuca*), about 35 cm (14 inches) long, with a proportionately longer and stouter (and slightly upturned) bill, has similar breeding and wintering ranges but is everywhere less common and more wary than the lesser. Individuals of the two species may be nearly the same size but are easily distinguished by voice: usually the greater yellowlegs gives a clear three-note whistle; the lesser, a flat, light call of one or two notes. Both species feed on small fish and other aquatic creatures (e.g., insects, crabs, snails, and tadpoles).

During the autumn migration, the lesser yellowlegs, and sometimes the greater, occasion-

ally stray to western Europe, where they might be confused with other *Tringa* species, such as the greenshank, the redshank, and the wood sandpiper.

yellows (plant disease): see Fusarium wilt.

Yellowstone Lake, lake in Yellowstone National Park, northwest Wyoming, U.S., lying at 7,731 feet (2,356 m) above sea level. It is the largest body of water in North America at so high an altitude. It is fed and drained by

the Yellowstone River, which flows through the lake from south to north. About 20 miles (32 km) long and 14 miles (23 km) wide, it has a shoreline of 110 miles (175 km), a maximum depth of 300 feet (90 m), and a surface area of 137 square miles (355 square km). The lake is a haven for rare species of water birds, including trumpeter swans and Canadian geese, and is prized for trout fishing.

Yellowstone National Park, the oldest, largest and probably best-known national park in the United States, situated in northwestern Wyoming and partly in southern Montana and eastern Idaho. It was established by the U.S. Congress on March 1, 1872, as the nation's first national park. The park covers 2,219,791 acres (898,349 hectares) and consists mostly of broad volcanic plateaus with an average elevation of 8,000 feet (2,440 m). Among the mountain ranges that protrude into the park are the Gallatin Range on the northwest, the Absaroka Range on the east, the Snow Mountains along the north, and the Tetons along the park's southern boundary. The park is also surrounded by the Custer, Shoshone, Teton, Targhee, Beaverhead, and Gallatin national forests.

Aside from its rugged mountains and spectacular deep valleys, Yellowstone has unusual geologic features, including fossil forests, eroded basaltic lava flows, a black obsidian (volcanic-glass) mountain, and odd erosional forms. Its biggest attractions, however, are its 10,000 hot springs, which find surface expression as steam vents, fumaroles, colourful hot pools, mud caldrons, paint pots, hot springs and terraces, hot rivers, and geysers. Of the park's 200 geysers, many erupt to heights of 100 feet (30 m) or more. Old Faithful, the most famous geyser, erupts fairly regularly every 33 to 93 minutes.

Yellowstone is also known for its lakes and rivers; among these are Yellowstone Lake, Shoshone Lake, the Snake River, and the Yellowstone River. The Grand Canyon of the Yellowstone River is a colourful gorge 19 miles (31 km) long that runs through the park. The canyon has brilliantly coloured rock walls, with two majestic waterfalls along its course.

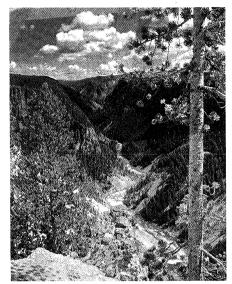

Most of Yellowstone park is forested, and the vast majority of the tree growth consists of lodgepole pine, though there are other conifer species, as well as cottonwoods and aspens. Many types of wildflowers blossom in the warm months. In 1988 a disastrous series of forest fires temporarily laid waste large areas of the park.

Animal life in Yellowstone is typical of the Rocky Mountains and includes buffalo, elk, bighorn sheep, deer, moose, black bear, grizzly bear, and coyotes. Many types of smaller mammals are also common. Hundreds of different species of birds live in the park, among them many waterfowl. The lakes and streams are stocked with fish; trout is the most popular with anglers.

The park has more than 500 miles (800 km) of roads and more than 1,000 miles (1,600 km) of trails. The John D. Rockefeller, Jr., Memorial Parkway, an 80-mile (130-kilometre) scenic roadway that was established in 1972, connects Yellowstone with Grand Teton National Park.

Yellowstone River, river noted for its scenic beauty, rising on the slopes of Yount Peak in Wyoming, U.S., and entering Yellowstone National Park. It feeds into Yellowstone Lake, below which it plunges 422 feet (129 m) in two spectacular waterfalls, and enters the magnificent Grand Canyon of the Yellowstone. Leaving the park at Gardiner, Mont., the river turns north to Livingston, thence northeast past Billings, Miles City, and Glendive.

It crosses the Montana border and enters the Missouri River after a course of 692 miles (1,114 km), near Buford, N.D. All its principal tributaries—the Bighorn, Tongue, and Powder rivers (qq.v.)—originate in the Absaroka and Wind River ranges and the Bighorn Mountains. The river system drains 70,000 square miles (181,300 square km) in southeastern Montana, north-central Wyoming, and a small northwestern area of North Dakota. It has been developed extensively for irrigation.

Yellowstone River in Yellowstone National Park, Wyoming

Grant Heilman-EB Inc

The Yellowstone was first explored in 1806, when Lieutenant William Clark sailed down the river on his return from the Pacific Ocean. Manuel Lisa (1772–1820), an Indian trader, accompanied by John Colter, a trapper (said to be the first white man to see the geysers of Yellowstone Park), established the first trading post on the Yellowstone, at the mouth of the Bighorn River, in 1807.

yellowwood, any of about 100 species of coniferous evergreen timber trees and shrubs, constituting the genus *Podocarpus* (family Podocarpaceae), widely distributed in mountain forests of the Southern Hemisphere. Most have yellowish wood, occasionally brownish or reddish; they are often known locally as brown or black pines.

Economically important members of the genus include the brown pine, plum pine, or yellow pine (Podocarpus elatus) of southeastern Australia; the black pine, or matai (P. spicatus), the kahikatea, or white pine (P. dacrydioides), the miro (P. ferrugineus), and the totara (P. totara), all native to New Zealand; kusamaki, or broad-leaved podocarpus (P. macrophyllus), of China and Japan; real yellowwood (P. latifolius), South African yellowwood (P. elongatus), and common, or bastard, yellowwood (P. falcatus) of southern Africa; plum-fir, or plum-fruited, yew (P. andinus) and willowleaf podocarpus, or mañío (P. salignus), of the Chilean Andes; and the yacca (P. coriaceus) of the West Indies.

Yeltsin, Boris Nikolayevich (b. Feb. 1, 1931, Sverdlovsk, Russian S.F.S.R.), Soviet politican who was mayor of Moscow (i.e., first secretary of Moscow's Communist Party committee) from 1985 to 1987 and president of the Russian S.F.S.R. from 1990.

Yeltsin attended the Urals Polytechnic Institute and worked at various construction projects in the Sverdlovsk district from 1955 to 1968, joining the Communist Party in

1961. In 1968 he began full-time work in the party, and in 1976 he became first secretary of the Sverdlovsk District Central Committee. Thereafter he came to know Mikhail Gorbachev, then his counterpart in the city of Stavropol; and, after coming to power, Gorbachev chose him in 1985 to clean out the corruption in the Moscow party organization and elevated him (as a nonvoting member) to the Politburo in 1986. As the mayor of Moscow, Yeltsin proved an able and determined reformer, but an estrangement between himself and Gorbachev set in when Yeltsin began strongly speaking his mind at party meetings, challenging party conservatives and even criticizing Gorbachev's own plans and policies. Yeltsin was forced to resign from the Moscow party leadership in 1987 and from the Politburo in 1988.

A maverick, a populist, and an outspoken champion of faster, more widespread reforms, Yeltsin was elected to the new Soviet parliament in March 1989, winning 89 percent of the vote of his constituency. A year later, on May 29, 1990, the parliament of the Russian S.F.S.R. elected him president of the Russian republic. In his new role, he publicly supported the right of Soviet republics to greater autonomy within the Soviet Union, took steps to give the Russian republic more autonomy and control over its own resources and finance, attacked government bureaucracy, moved toward a more market-oriented economy, and declared himself in favour of a multiparty political system. In July 1990 Yeltsin quit the Communist Party.

Yeltsin wrote Against the Grain: An Autobiography (1990).

Yelü Dashi (Chinese emperor): see Yeh-lü Ta-shih.

Yelwa, town, seat of the traditional Yauri emirate and headquarters of the Yauri Local Government Council, Sokoto state, northwestern Nigeria, between Kontagora and Birnin Kebbi. An early Niger River settlement of the Reshe (Gungawa) people, it was ruled by the kings of Yauri from their capital at Bin Yauri, 8.5 miles (14 km) south-southeast. Yelwa may have been the site of a station used by the Yauri kingdom to collect duties from boats on the Niger. In 1888, after a period of civil war in which Bin Yauri had been abandoned, Emir Abdullahi Abarshi selected Yelwa as the new Yauri capital. The Royal Niger Company established a trading post there in 1896. The British occupied the town in 1901.

Although part of Yelwa was permanently flooded by Kainji Lake (impounded on the Niger River) in 1968, the town remains the traditional seat of the emirate and its chief market centre. Onions, rice, and cotton, cultivated in the nearby extensive floodplains of the Niger, are the chief crops grown for export; but Yelwa also has considerable trade in sorghum, millet, cowpeas, peanuts (groundnuts), sugarcane, shea nuts, tobacco, kola nuts, peppers, beans, fish, cattle, and guinea fowl. Herding, fishing, cotton weaving and dyeing, blacksmithing, and leather tanning are also important local activities. Most of the town's inhabitants are Muslims belonging to the Reshe, Nupe, Yauri, and Hausa peoples. A hospital and other health facilities serve the town. Pop. (latest census) 4,781.

> A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Yemen, officially REPUBLIC OF YEMEN, Arabic AL-YAMAN, or JUMHŪRĪYAT AL-YAMAN, country occupying the southwestern corner of the Arabian Peninsula and covering 205,356 square miles (531,869 square km). The capital is San'ā'. Yemen is about 350 miles (565 km)

across (north to south) at its widest extent and about 700 miles (1,100 km) long. It is bordered by Saudi Arabia on the north and by Oman on the east. It is separated from Djibouti and Somalia by the Gulf of Aden on the southwest and from Ethiopia by the Red Sea on the west, and its southeastern coastline is formed by the Arabian Sea. Yemen also includes the island of Socotra, which lies about 600 miles (965 km) due east of Aden in the Indian Ocean; The Brothers, small islets near Socotra; the island of Perim (Barīm), in the Bab el-Mandeb, which separates the Arabian Peninsula from Africa; and Kamaran Island, located in the Red Sea. The population of Yemen in 1990 was estimated to be 11,546,-

A brief treatment of Yemen follows. For full treatment, see MACROPAEDIA: Arabia.

For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

The land. The three major regions of Yemen run generally parallel to the Red Sea and the Gulf of Aden, and consist of a narrow coastal plain, the Yemen Highlands farther inland, and a broad desert plateau in the country's northern portion. Extending southward from Saudi Arabia along the Red Sea is the Tihāmah, a narrow coastal plain that is 15 to 25 miles (25 to 40 km) wide. Along the Gulf of Aden the coastal plain is 5 to 10 miles (8 to 16 km) wide and is discontinuous. The Tihāmah of western Yemen merges eastward into highlands that reach elevations between 1,500 and 5,000 feet (450 and 1,500 m). As these highlands run farther east, they are divided by several wadi

Yemen

basins, including the perennial Wadi Ḥaḍramawt and its intermittent continuation, the Wadi Masīlah, which dissect the highlands in the east near the border with Oman. North of the Yemen Highlands is a sandy desert region that is a southern extension of Saudi Arabia's Rub' al-Khali, or Empty Quarter, and which covers as much as half of the country. In December 1982 a major earthquake centred in the highlands south of Ṣan'ā' (historically an area of severe seismic activity) destroyed several villages, leaving some 500,000 homeless and about 3,000 dead.

Precipitation in Yemen is influenced greatly by elevation. The eastern lowland coastal regions and the northern desert areas average less than 4 inches (100 mm) of rainfall a year and the southwestern highlands more than 16 inches (400 mm). Sometimes nearly 30 inches (750 mm) of rain falls in the highlands of western Yemen. At Aden, on the southern coast, January and July temperatures average 77° F (25° C) and 90° F (32° C), respectively. Daytime summer temperatures often exceed 100° F (38° C) and are commonly accompanied by 80 percent relative humidity. The highlands are appreciably cooler in the summer and can be cold in winter, with snow and frost not uncommon.

In contrast to the generally barren character of most of the Arabian Peninsula, the highlands in the western portion of Yemen are surprisingly fertile. Rainfall there is generally adequate and is distributed between two rainy seasons, and most of the agricultural land is cropped without irrigation. These highlands and intermediate elevations have good soils (in terraces and along the wadi valley floors), and the moderate climate (subtropical to temperate) permits the growing of large quantities of cereals (mainly sorghum) and potatoes. However, most of southern and eastern Yemen are generally devoid of vegetation. Among the exceptions are some cultivated patches along the riverbeds, principally on the floor and terraces of the Wadi Hadramawt. Natural vegetation is scattered along the southern coast and in the adjacent highlands, mainly thorn scrub and dwarf trees (including those from which frankincense and myrrh are obtained).

Yemen is relatively rich in mineral resources. Iron ore is mined and smelted at Mount Nuqum north of Ṣan'ā', and additional commercially exploitable iron-ore deposits are found in the north. Salt is mined at Salif, and deposits of coal, copper, sulfur, lead, zinc, nickel, silver, gold, and uranium also exist. Promising quantities of oil were discovered as well in the mid-1980s in the northeast in the Ma'rib-al-Jawf basin.

The people. Yemen has a generally homogeneous, ethnically Arab population that can be classified into three main groups: sedentary agriculturists, urban dwellers (only one-fourth of the total), and pastoral nomads. The principal religion is Islām, and its adherents are divided between the two main Muslim sects, Sunnism and Shī'ism. There are small numbers of Christians, Hindus, and Jews.

The country's birth and death rates are both very high by world standards and are the highest found in the Middle East. The estimated annual rate of population growth, however, is comparatively moderate for the region, in part because of substantial employmentrelated emigration, a characteristic feature of the Yemeni population since ancient times. A considerable proportion of the total male labour force was estimated to be working outside of the country in the late 1980s. Half of the population is under 15 years of age.

The economy. Yemen has a developing, partly state, partly private-enterprise economy. The gross national product (GNP) is growing faster than the population; the GNP per capita, however, is one of the lowest in the Middle East.

The economy of Yemen is primarily agricultural. As much as one-fourth of the GNP is derived from agriculture, which employs more than half of the labour force. The country is not self-sufficient in foodstuffs, however. In addition to sorghum and potatoes, the principal crops include dates, wheat, grapes, barley, corn (maize), cotton, millet, and garden vegetables. Mocha coffee and khat (a narcotic stimulant), grown on irrigated land, are export

Pastures support sheep, goats, and cattle. Goat-milk production averages about double cow-milk production annually. Asses and camels are used widely for rural transport.

Fishing is conducted mainly on a small scale, but the catch (oil sardine, mackerel, and cuttlefish) supplies both domestic needs and an export-processing plant at Al-Hudaydah.

Industry accounts for about one-tenth of the GNP and employs only 5 percent of the work force. The Little Aden petroleum refinery (previously owned by the British) accounts for a major share of total industrial output. With foreign aid, Yemen launched a program for diversification of its industry, which has produced considerable growth in overall output. Existing industries include the processing of foodstuffs and the manufacture of cement blocks, tiles, and bricks; textile manufacturing;

rubber and plastic products; salt production: soft-drink bottling; and dairy plants. Electricity is generated entirely from thermal-power plants. Construction, trade, and services account for almost half of the GNP and employ about one-third of the work force.

The highway network is under development. Most of the country's roads are unpaved, and maintenance of existing roads is poor. It was hoped that the reopening of the Suez Canal in 1975 would translate into increased commercial activity at the port of Aden, but in the 1980s the port was still handling only a small share of its capacity, although this activity did include support of Soviet fishing and naval vessels. Yemen's other principal port is Al-Hudaydah, with smaller ports at Al-Mukhā and Ṣalīf. Aden, Ṣan'ā', Al-Ḥudaydah, and Ta'izz have international airports, and there are several domestic airports.

The budgetary expenditures of Yemen usually exceed revenues, and the government has had to rely on loans from the Soviet Union, China, and some of the richer Arab states in order to pursue economic development. Exports amount to only a fraction of imports in value annually, creating a huge trade deficit. Expatriate workers and Saudi Arabian and private monetary transfers help offset the deficit. Yemen's principal exports include live animals and food (such as coffee, biscuits, grapes, sesame seeds, sugar, and honey), cigarettes, leather, and petroleum products, imported mainly by Saudi Arabia, Japan, Italy, and France. Imports include food and live animals, manufactured goods, machinery and transport equipment, and chemical products imported mainly from Japan, the Soviet Union, The Netherlands, the United States, and Germany.

Government and social conditions. is a republic, formed on May 22, 1990, when the People's Democratic Republic of Yemen (also called Yemen [Aden], or South Yemen) officially merged with the Yemen Arab Republic (also called Yemen [Ṣan'ā'], or North Yemen). Yemen's political system and government were in a state of transition in the early 1990s as a result of this unification. The highest government official is the president, who rules in consultation with a 5-member Presidential Council composed of leading political figures from both of the former Yemeni states. This council was empowered to rule the country until elections could be held to select members for the newly unified country's new parliament, the House of Representatives, at the end of a two-and-a-half-year transition period. The new state was planned to be a multiparty parliamentary democracy. The legal system is based on both tribal and Islāmic (Sharī'ah) law. Yemen is the recipient of military and economic aid from Saudi Arabia. the Soviet Union, and the United States, each of which seeks to influence this strategically located country.

The country's social-welfare system is extremely underdeveloped. As a result, many Yemenis still suffer from poor health and malnutrition. Diseases such as amoebic and bacillary dysentery, malaria, whooping cough, measles, hepatitis, gonorrhea, cholera, pulmonary tuberculosis, and typhoid fever infect significant portions of the population. The country has a shortage of medical personnel and hospital beds. The infant mortality rate is one of the highest in the Middle East, and life expectancy is only 48 years for males and 51

years for females.

Yemenis receive free education from the state's primary and secondary schools. Yemen nonetheless has a high adult illiteracy rate. It is estimated that only between one-third and two-thirds of the primary-school-age children attend school. Ṣan'ā' University (founded 1970) and the University of Aden (founded 1975) are the only institutions of higher learn-

Yemen was long a meeting place for ancient cultures and civilizations. The local oral literature is rich in proverbs, popular stories, superstitions, mysticism, and poetry. Written literature, though not as rich, deals mainly with the history of Yemen, Islāmic theology, biography, and poetry.

History. The Yemen Arab Republic, which was also known as North Yemen, or Yemen (Şan'ā'), occupied the western portion of Yemen, with its coastline along the Red Sea and its capital at Ṣan'ā'. The People's Democratic Republic of Yemen, which was also known as South Yemen, or Yemen (Aden), stretched along the Gulf of Aden (part of the Arabian Sea) and thus lay east of Yemen (San'ā'). Its chief city was Aden. The political division of these two portions of Yemen throughout most of the 20th century mirrored their previous history, when they were often under different rulers, whether indigenous or foreign.

The Minaean (Ma'in) kingdom of Yemen (Şan'a') traded with the Egyptians as early as the 4th century BC and probably with the Babylonians even earlier. The kingdom's prosperity was based almost entirely on the cultivation and export of frankincense, spices, and other items that were in demand in the eastern Mediterranean area.

A little to the southeast of the Minaean kingdom was the prosperous Sabaean (Saba') kingdom, which was known for its efficient and widespread irrigation system based on a dam at Ma'rib. The Sabaean kingdom expanded over most of South Arabia but declined after the 1st century BC, when the overland incense traffic gave way to competing water routes and the Ma'rib dam fell into disrepair.

Ancient Yemen (Aden), in the meantime, was divided between the Qataban and Hadramawt kingdoms (1st millennium BC). These kingdoms participated in the lucrative frankincense and myrrh trade, and they utilized an extensive irrigation system to support their populations. Qataban fell to the Sabaeans in the late 5th century BC, however.

The whole of South Arabia eventually became a part of the Himyarite kingdom (c. 100 BC-AD 525), which for a time had its capital at San'a'. Jewish settlers arrived in the region after the fall of Jerusalem in AD 70, and Christian missionaries began coming following the conversion of the Roman emperor Constantine (mid-4th century). Because of their persecution of the Christians, the Himyarites were destroyed by the Christian Abyssinian kingdom (in Ethiopia) in 525. The Persian Sasanians then took control of the region in 575, and all the area's inhabitants. at least nominally, accepted Islām in the mid-7th century. Yemeni obedience to the caliph (the leader of the Muslim world) was only rarely achieved, however, and Yemen (Aden) was frequently in the hands of local chiefs and warlords thereafter.

Almost from the beginning of the Islāmic era, conflict was present in the Yemen (Ṣan'ā') region as well. A rebellion occurred there as early as 632. By the close of the 9th century, the Shī'ite imam al-Hādī had founded the 'Alīd Zaydī dynasty, whose members figured in the government of Yemen (San'ā') until 1962.

The Egyptian Ayyūbid dynasty ruled all of Yemen from 1173 to 1229, after which the region passed to the Rasulids, who had served the Ayyūbids as local governors and who subsequently ruled Yemen from 1229 to 1451. The period of Rasulid rule was a golden age for Yemen, with achievements in science, agriculture, literature, and architecture. The Rasūlids were followed by the Tahirids, Ṣan'ā' Yemeni tribesmen, who extended their control throughout most of Aden.

The Egyptian Mamlūks tried to take over Yemen in the early 16th century; they succeeded in Yemen (Ṣanʿāʾ) but not in Aden, and by 1517 the entire region had fallen to the Ottoman Turks. In 1635 the Ottomans were expelled by the Zaydīs (of Ṣanʿāʾ), who took Aden but failed to hold it past 1735. Aden consequently was divided between rival tribal chieftains.

The Ottomans returned in the mid-19th century, seeking to secure Arabia from the crusading Wahhābīyah and the imperialist designs of Muḥammad 'Alī of Egypt, but they were not able to occupy Ṣanʿa' until 1872. Meanwhile, Muḥammad 'Alī's advances led to the British occupation of Aden in 1839. Aden was administered by Britain's Bombay 'presidency" until 1937, when it became a British crown colony and a protectorate. An Anglo-Turkish agreement in 1914 attempted to settle the boundary between Yemen (Ṣanʿaʾ) and the British-held Aden protectorate, but it was not resolved until 1934.

After Turkey's defeat in World War I, Yemen (San'ā') gained independence under the Zaydī family, which claimed the right to all of historic Yemen, including Aden and the protectorate. A revolution ended Zaydī rule in Yemen (San'ā') in 1962, and the Yemen Arab Republic was proclaimed. The Yemen (San'ā') republic was basically pro-Western and was tribal and religious in character, though it also accepted aid from the Soviet Union.

Though the city of Aden was opposed, it was included in the (British-sponsored) Federation of South Arabia, created in 1963. The British promised independence to the federation by 1968, but when they finally vacated the region in 1967, the Marxist-oriented National Liberation Front gained control of the weakening federation. Yemen (Aden) consequently became the People's Republic of South Yemen in 1967 and was renamed the People's Democratic Republic of Yemen in 1970. The Yemen (Aden) republic was Marxist and secular in character. Relations between the two Yemens remained tense and were marked by occasional conflict throughout the 1970s and '80s. Yemen (Aden) in particular suffered from chronic instability, with several coups and a brief but bloody civil war in 1986 that took thousands of lives. Yemen (Aden) maintained close relations with the Soviet Union, while Yemen (Ṣan'ā') remained pro-Western.

In 1989, however, the two Yemens agreed on a constitutional arrangement under which they would become one country, and, after their respective parliaments had approved the merger, Yemen (Ṣanʿā') and Yemen (Aden) merged into one state on May 22, 1990. The new nation was simply known as Yemen, or the Republic of Yemen.

Yemmiganūr, formerly EMMIGANŪR, or EMMIGANŪRU, town, western Andhra Pradesh state, southern India. It lies west of the city of Kurnool. Yemmiganur was included in the Hindu kingdom of Vijayanagar, which flourished during medieval times (14th–16th century). Later the town came under Muslim rule. Yemmiganūr's chief industries are cotton ginning, peanut milling, and weaving. Pop. (1981) 50,701.

yen, also called HSIEN, Pinyin YAN, type of Chinese bronze vessel produced during the Shang, or Yin (18th–12th century BC), and Chou (1111–255 BC) dynasties. A steamer, or cooking vessel, used particularly for grain, the yen consists of a deep upper bowl with a pierced bottom placed upon or attached to a lower, legged vessel similar in shape to the *li*.

The yen is not usually elaborately decorated. The form is derived from a Neolithic (c. 3000–1500 BC) pottery predecessor and is found in the bronze art of the Shang dynasty and in

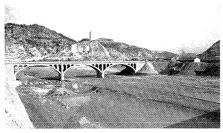

Bronze yen, Chou dynasty (c. 1111–255 Bc); in the Field Museum of Natural History, Chicago

that of the Chou, especially the early Chou $(1111-c.\ 900\ Bc)$.

yen, the monetary unit of Japan. It was divided into 100 sen and into 1,000 rin until 1954, when these tiny denominations were removed from circulation. The yen's symbol is ¥, or Y. First minted in 1869, after the Meiji Restoration, the yen was officially adopted as the basic unit in the monetary reform of 1871. In that year, the government suspended the exchange of clan notes, paper money that feudal lords had issued and circulated since the late 16th century. (According to a Ministry of Finance survey of 1868, a total of 1,694 denominations of clan money had been issued by 244 clans, 14 magistrates' offices, and 9 shogunate retainers during the Tokugawa regime.) By 1879 the replacement of clan notes by the yen-based government notes had been completed.

The term yen derives from an ancient term for Chinese round money (yüan).

Yen-an, Pinyin YAN'AN, town in northeastern Shensi sheng (province), China. It became famous as the wartime stronghold of the

Bridge over the Yen River at Yen-an, Shensi province, China

A. Topping from Rapho/Photo Researchers—EB Inc.

Chinese Communists from the mid-1930s to 1949. The area around the town is a heavily dissected plateau of loess (windblown soil) that is deeply etched by gullies. Yen-an stands on the south bank of the Yen River in a basin surrounded by hills, and is a road junction in northeast Shensi. It was a strategic town in historical times, being located near the border—between the part of Shensi where agriculture is practicable and the arid Northwest, which merges into the Ordos Desert.

The name Yen-an was first given to the commandery set up there by the Sui dynasty (581-618). A vital frontier post under the T'ang dynasty (618-907), and a part of the defenses of the Sung dynasties (960-1279) against the northwestern Hsia dynasty (1038-1227), it was the scene of a crucial victory by Mongol armies over the forces of the Juchen dynasty in 1221. Since the 15th century, the importance of the area has steadily declined. It was badly affected by Muslim uprisings of 1864-75; by droughts and famines of the

1870s, which decimated the population; and by the almost equally disastrous droughts of the 1920s and '30s, which depopulated whole counties in the area.

The Communist armies, driven from their bases in the Kiangsi Soviet areas by the Kuomintang (Chinese Nationalist Party) in 1934, eventually reached Yen-an after their epic 6,000-mile (9,600-kilometre) Long March (1934-35). They made the town their headquarters during the war of resistance against the Japanese (1937-45) and during the civil war that brought Communist victory in 1949. Yen-an has thus come to represent a symbol of the heroic phase of the Chinese Communist Revolution, when the leadership of Mao Zedong was firmly established and the Communists mastered both guerrilla warfare and the peasant-based reform policies that were to bring them to power in 1949. Remote Yen-an stands as a national shrine for the Communist government, which recalls the spirit and example of its pioneer period.

The town itself is a minor place. The original walled settlement was ruined by Japanese bombing in 1938–39. Modern Yen-an is the centre of a district that has suffered seriously from soil erosion, but it has begun to be reclaimed as part of the vast scheme for the development of the Huang Ho (Yellow River) drainage region. The surrounding area has been increasingly devoted to livestock, and the town has a long-established woolen-textile industry. Yen-an's population swelled during its days as the Communist headquarters; since 1949, however, the population has declined to almost its former level.

The whole area lies in a rich coal- and oil-bearing plain. Oil was discovered at Yench'ang about 22 miles (35 km) to the east early in the 20th century, and a small amount was produced in the 1930s. The oil field has been further developed since 1949 but still remains small. Pop. (1989 est.) 101,000.

Articles are alphabetized word by word, not letter by letter

Yen-ch'eng, Pinyin YANCHENG, city in the eastern coastal district of northern Kiangsu sheng (province), China. Yen-ch'eng is now some 25 miles (40 km) from the coast; but in ancient times it was close to the sea and, from the 8th century onward, had to be constantly protected by dikes. The most famous of these was the Dike of Lord Fan, constructed early in the 11th century by a famous statesman, Fan Chung-yen. The inhabitants of the surrounding area did not cultivate the land but lived from the profits of salt production, salt dealing, and fisheries. From the 8th century onward, Yen-ch'eng was the centre of a network of canals connecting the salt pans of the coastal region with the canal between Huaian and Yang-chou. In the vicinity were innumerable saltworks, as well as the government depots that administered the salt monopoly. Even today, after the construction of extensive irrigation works in northern Kiangsu province, the coastal zone remains largely uncultivated. West of the Eastern Trunk Canal, which passes north and south through Yench'eng, however, irrigation has made cultivation possible, so that Yen-ch'eng has become the market for agricultural produce. To the seaward side of the old dikes, much land has been reclaimed; this area is largely devoted to cotton growing, since cotton can be grown in soils with relatively high saline content. Pop. (1989 est.) 241,300.

Yen-chi, Pinyin Yanji, city, eastern Kirin sheng (province), China. It is a county-level shih (municipality) and the administrative seat of Yen-pien-ch'ao-hsien-tsu (Yen-pien Korean) autonomous chou (prefecture), which covers a mountainous area on the North

Korean-Chinese border, more than half of whose inhabitants are Korean.

Until the late 19th century the area was almost completely undeveloped. Basically it comprises the fertile Tumen River Valley and the wild ranges of the Ch'ang-pai Shan (mountains). Chinese settlers began to move into the area illegally in 1820-50, and in 1860 the Chinese government lifted the ban on settlement to preempt possible Russian encroachment. The area, however, was so remote that few Chinese settlers went there, whereas Koreans moved into the area in great numbers. In 1885 special bureaus were set up to control and tax the Korean immigrants. In 1895 Yen-chi County (hsien) was established. The area was the source of constant border disputes, first with Korea, and then-after the establishment of the Japanese protectorate in Korea in 1905—with Japan. Under Japanese occupation in the 1930s, railways were built through the area, linking T'u-men to Chi-lin (Kirin) to the west and to Chia-mu-ssu to the north. The railroads did much to open up the area, and further lines were then constructed to exploit the forests of the Ch'ang-pai Shan.

Yen-chi is the principal commercial centre of the Yen-pien Korean Autonomous Prefecture and is a collecting centre for local agriculture. There are food-processing plants, ricepolishing, oil-pressing, and flax-processing factories, and a variety of consumer industries making such products as earthenware, furniture, and knitted textiles. Agricultural implements are also manufactured. A secondary industrial centre is some 9 mi (15 km) to the south at Lung-ching, where there are machinery works, a power station, and a paper mill. Yen-chi is also an important cultural centre for the Korean minority, providing radio and newspaper services in Korean. Medical and normal colleges form Yen-pien University. Pop. (mid-1970s est.) 50,000-100,000.

Yen Fu, Pinyin YAN FU (b. Jan. 8, 1854, Foochow, Fukien Province, China—d. Oct. 27, 1921, China), Chinese scholar who translated T.H. Huxley, J.S. Mill, Herbert Spencer, Adam Smith, and others into Chinese in an attempt to show that the secret to Western wealth and power did not lie in Western technological advances, such as gunmaking, but in the ideas and institutions that lay behind these techniques.

Yen Fu was sent to England to study naval techniques, but he soon became interested in British government, jurisprudence, economics, and sociology. He returned to China in 1879. China's humiliating defeat by Japan in 1895 prompted him to advocate liberal social and political reform. He did so because he detected in liberal institutions a way of strengthening the state. His understanding of Darwinism convinced him that change must come through a gradual shift in the thought of the elite, not from revolution. In the chaotic and iconoclastic years after the Revolution of 1911, he gradually rejected his earlier position regarding Western thought and turned increasingly to ancient Chinese culture. He came to disdain the views he had once supported.

Yen Fu wrote poetry in addition to his translations; two collections of his poetry were published posthumously. In Search of Wealth and Power: Yen Fu and the West, by Benjamin Isadore Schwartz, was published in 1964.

Yen Hsi-chai (Chinese philosopher): see Yen Yüan.

Yen Jo-chü, Pinyin YAN RUOJU (b. Nov. 11, 1636, Huai-an, Kiangsu, China—d. July 9, 1704, Peking), great Chinese scholar from the early period of the Ch'ing dynasty (1644–1911/12) who proved that 25 chapters of the Shu Ching (q.v.), or Shang shu, one of the Five Classics of Confucianism, upon which the government modelled itself for more than a thousand years, were forged.

Yen early became interested in determining the authenticity of the *Shu Ching*. The work dated from the early Chou period (1122–771 BC), but after the years of turmoil following the end of the Han dynasty (206 BC-AD 220), only 29 chapters of it remained extant. Then, in the 4th century AD, an alleged copy of the 16 chapters of the "ancient script" text appeared, with 9 additional chapters. These were accepted as authentic. The 54 chapters (later some chapters were divided to make a total of 58) were made one of the bases of the civil service examination.

Yen spent 30 years making an intensive textual analysis of the work and then published his Shang shu ku-wen shu-cheng ("Inquiry into the Authenticity of the Ancient Text of the Shang shu"), which utilized historical and philological reasoning to prove that the so-called "ancient script" chapters of the Shu Ching had been forged. Yen's book helped bring about a new critical reexamination of the Classics.

Yen La Wang (Chinese general): see An Lu-shan.

Yen Li-pen, Pinyin YAN LIBEN (b. c. 600—d. 673), one of the most famous of Chinese figure painters in the early years of the Tang dynasty.

Yen Li-pen was a high officer within the Imperial court, but his fame derives from his skill as a painter. He is recorded as having painted Buddhist and Taoist subjects and as having received various Imperial commissions; but among works attributed to him the most important is a hand scroll of "Portraits of the Emperors" in the Museum of Fine Arts, Boston (only the last seven of the portraits are original; the first six were copies of earlier works), depicting a series of emperors selected from about the preceding 800 years of history. Yen Li-pen has imbued them with subtly defined characters through a tightly controlled line and limited use of colour. His brother, Yen Li-teh (died 656), was also a famous officer and painter.

Yen-t'ai, Pinyin Yantai, conventional CHEFOO, port city on the northern coast of Shantung Province (sheng), China. It is a county-level municipality (shih) and the administrative centre of Yen-t'ai Prefecture (ti-ch'ii).

It was traditionally known as Chih-fu, which was, at least as early as the 3rd century BC, the name of the island that protects the fine natural deepwater harbour, where a port has been located from early times. The name Yen-t'ai (Beacon Tower) derives from a lookout beacon built as part of the 15th-century coastal defense system erected against Japanese pirates. The port was occupied by an Anglo-French force in 1860, and in 1863 was opened to international commerce as a treaty port. It achieved some fame as the site of negotiations between the British and Chinese that resulted in the Chefoo Convention (1876), opening new treaty ports to trade, and leading to China's sending its first minister to the Court of St. James's in London.

Although Yen-t'ai was a treaty port, it had no foreign concession or settlement. Considerable numbers of foreign traders lived there, however, and although communications with the interior were maintained over poor roads, a flourishing trade grew up in the late 19th century, consisting partly of exports of silk, beans, and local produce from Shantung and partly of imports from the West. Goods were also transshipped from steamships to the junks serving the small coastal ports of northern Shantung and Hopeh. In the decade 1891-1901 the population almost doubled. Yent'ai's commerce was, however, almost ruined by the development of Tsingtao by the Germans after 1898. By 1904 a rail link connected Tsingtao with Chi-nan, after which the export

trade of Shantung became concentrated at the better port of Tsingtao. As a result, Yent'ai and the other ports of northern Shantung stagnated. Its revival began in 1956 when it was linked by rail with Lan-ts'un, just north of Tsingtao.

By the early 1970s Yen-t'ai had developed into a local market and collecting centre for the agriculture of the peninsula. It is also a major fishing port. It has a variety of industries, including flour milling, tobacco processing, and the canning of fish, meat, vegetables, and fruit, as well as wine making and brandy distilling. Ships are repaired at the port, and there are various manufactures connected with the shipping and fishing industries. A small-scale iron and steel complex was founded in 1967, manufacturing such machinery as diesel engines, mostly for local agricultural use. Pop. (1980 UN est.) 347,000.

Yen Ti (Chinese mythology): see Shen Nung.

Yen Yüan, Pinyin YAN YUAN, literary name (Wade-Giles romanization) YEN HSI-CHAI (b. April 27, 1635, Chihli Province, China—d. Sept. 30, 1704, Chihli), Chinese founder of a pragmatic empirical school of Confucianism opposed to the speculative Neo-Confucian philosophy that had dominated China since the 11th century.

Yen's father was abducted into the Manchu army when Yen was three. He never returned, and the family lived in poverty. As a young man, Yen became interested in Confucianism and studied to pass his civil service examinations, which would have given him entrance into the bureaucracy. But after failing the examination several times he decided to devote himself to teaching.

His revolt against Neo-Confucian metaphysics stemmed initially from aversion to the newly established Manchu rule of the Ch'ing dynasty (1644–1911). He believed that the Manchu conquest was made possible by faulty government and education, which had rendered China easy prey to alien conquerors. He urged that people return to the study of ancient Confucian Classics instead of the Neo-Confucian interpretations of them. He advocated implementation of the ancient "well-field" plan of the Confucian sage Mencius, in which eight families lived on a patch of land that was equally divided into nine squares. Each family would cultivate its own piece of land, and all eight families would iointly cultivate the remaining central square for the government. Yen felt that this system, by providing for an equal distribution of the land, would ensure a livelihood for all. Similarly he urged a revival of compulsory military service to make each citizen a competent defender of his country. He believed that useful knowledge and education come only from practical experience: as long as scholars buried themselves in books and in abstruse discourse, shunning physical activity and despising soldiery, China would continue to be weak. Yen put his education theory into practice when he became director of Chang-nan Academy in 1696. His curriculum included mathematics, geography, military tactics and strategy, archery, and wrestling, in addition to history and the Confucian Classics. Yen's writings, together with those of his most eminent student, Li Kung (1659-1733), became the major works of a new philosophical movement known as the Yen-Li school. A short-lived society to study and disseminate its doctrines was formed in 1920 in Peking. Yen's major works were reprinted in the late 19th century as the Yen-Li i-shu ("Works of Yen and Li").

Yenagoa, town, Rivers State, southern Nigeria, in the Niger Delta. Situated in an area of swamps and mangrove and tropical rain

forests, it is a traditional home of the Ijaw people, a fishing group who, following contact with European traders, became middlemen in the export of slaves through the ports of Brass and Nembe. When the slave trade was abolished, the Ijaw economy turned to the export of palm oil and kernels.

Yenagoa is the headquarters of the Yelga Local Government Council. The town has a general hospital. It still serves as a market and administrative centre for a predominantly agricultural region, but the exploitation of petroleum and natural-gas deposits nearby has brought some diversification. Pop. (1972 est.) 1,994.

Yenakiyevo, also spelled ENAKIEVO, or JENAKIJEVO, city, Donetsk *oblast* (province), Ukrainian S.S.R. It lies along the Bulavina River. A pig-iron concern began there in 1858 but lasted only eight years; not until the first coal mines opened in the locality in 1883 did industrialization begin. A metallurgical factory established in 1895–97 has since been reconstructed. The city was incorporated in 1925 and now has a wide industrial base, with numerous metallurgical (notably iron and steel) concerns and coke-based chemical, cement, and construction industries. It has colleges of mining and metallurgical technology. Pop. (1989) 121,000.

Yenangyaung, town, west-central Myanmar (Burma). It lies along the Irrawaddy River, 135 miles (217 km) southwest of Mandalay. It is the centre of oil fields, which were long the most productive in Myanmar. An oil pipeline links the area to a refinery at Syriam, opposite Yangôn (Rangoon). Pop. (1983) 149,962.

Yenbo (Saudi Arabia): see Yanbu'.

Yendys, Sydney: *see* Dobell, Sydney Thompson.

Yengema, town, east-central Sierra Leone. The headquarters of a diamond-mining area (leased by the Sierra Leone Selection Trust) inhabited mainly by Kono and Mandingo peoples, the town has diamond-washing plants, a hospital, and several schools. Pop. (1985 prelim.) 12,938.

Yeni Osmanlilar (Turkish secret organization): see Young Ottomans.

Yeniçeri (Turkish soldier): see Janissary.

Yeniseian languages, also spelled YENISEY-AN, also called YENISEY-OSTYAK LANGUAGES, small group of languages associated with Yukaghir, Gilyak, and the Luorawetlan languages as the Paleosiberian language group. Of the four Yeniseian languages, Kott, Arin, and Assan are extinct. The remaining language, Ket (or Yenisey-Ostyak), is spoken in northeastern Siberia around the town of Turukhansk on the Yenisey River.

Yenisey River, also spelled YENISEI, river of Asia, one of the longest rivers on the continent, flowing from south to north across the heart of the Asiatic Soviet Union.

The following is a brief treatment of the Yenisey River. For full treatment, see MACROPAEDIA: Asia.

The headwaters of the Yenisey rise in the mountainous borderland of the Soviet Union and Mongolia. Its main course flows northward along the eastern margin of the West Siberian Lowland at the foot of the Central Siberian Plateau and empties into the icy waters of the Kara Sea, a section of the Arctic Ocean, through the Yenisey Gulf. The length of the river is calculated at more than 2,500

miles (4,100 km) if the Great Yenisey is reckoned as its source, but if the headwaters of the Selenga River are considered as its source, the length is nearly 3,500 miles (5,600 km).

Most of the 996,000 square miles (2,580,-000 square km) of the Yenisey drainage basin stretches over the western sector of the Central Siberian Plateau, averaging between 1,640 and 2,300 feet (500 and 700 m) in elevation. The major tributaries to the Yenisey River system are the Abakan, Eloguy, and Turukhan rivers from the west, and the Tuba, Kan, Angara, Podkamennaya (Stony) Tunguska, Nizhnaya (Lower) Tunguska, and Kureyka rivers from the east. About half of the Yenisey's water comes from melting snow, more than a third from rainwater, and the remainder from groundwater. In terms of runoff, the Yenisey is the greatest river of the Soviet Union, with an average annual discharge of 699,200 cubic feet per second (19,800 cubic metres per second); violent floods occur in the spring.

The climate of the river basin is distinctly continental and is influenced by cold Arctic Ocean air masses. Ice begins to form on the lower Yenisey early in October, and the entire river is frozen by early December. Thawing is not complete until late May or early June. Most of the river's basin is covered with taiga (dense, marshy forest), with pine predominating in the south and larch farther north.

Hunting, fishing, the breeding of reindeer, and fur farming are the chief occupations of the basin's more northerly peoples, and mining, especially of graphite and coal, is also important. Processing and manufacturing industries are pursued in the south. The hydroelectric potential of the Yenisey is estimated at 18,000,000 kilowatts. Approximately 1,900 miles (3,000 km) of the river, between Sayanogorsk (formerly Oznachennoye) and the Kara Sea, are navigable. Lumber is the main cargo transported through the chief ports of Krasnoyarsk, Strelka, Yeniseysk, Igarka, Dudinka, and Ust-Port; seagoing vessels can sail inland up the river to Igarka.

yeoman, in English history, a class intermediate between the gentry and the labourers; a yeoman was usually a landholder but could also be a retainer, guard, attendant, or subordinate official. The word appears in Middle English as yemen, or yoman, and is perhaps a contraction of yeng man or yong man, meaning young man, or attendant. Geoffrey Chaucer's Canterbury Tales (late 14th century) depict a yeoman who is a forester and a retainer. Most yeomen of the later Middle Ages were probably occupied in cultivating the land; Raphael Holinshed, in his Chronicles (1577), described them as having free land worth £6 (originally 40 shillings) annually and as not being entitled to bear arms.

Yeomen of the Guard, the personal bodyguard of the sovereign of England, in continuous existence since they were established by King Henry VII in 1485. They should not be confused with the yeomen warders of the Tower of London, often called "Beefeaters," who, like the Yeomen of the Guard, wear Tudor costume. Originally, the Yeomen of the Guard were responsible for the king's safety on journeys at home or abroad and on the battlefield; within the precincts of his palaces, they guarded the entrances and tasted the king's food. In the 20th century the yeomen are called to their guardroom at St. James's Palace, London, only when required, a circumstance occurring normally only when the sovereign is performing certain ceremonial functions or receiving foreign heads of state. At the royal opening of Parliament, a party of yeomen, by custom since the Gunpowder Plot of 1605, search the vaults of the Palace of Westminster. Originally the guard numbered 50, but there are now 79 yeomen, chosen from the army, the marines, and the Royal Air Force, together with a captain (appointed

A member of the Yeomen of the Guard

by the government) and various other officers and members, chosen for distinguished service from the army.

Yeotmāl, town, northeastern Mahārāshtra state, western India, on major roads to Nāgpur, Bombay, and Hyderābād. It is the regional centre of an agricultural district (cotton and wheat) and has several colleges affiliated with the University of Nāgpur. Pop. (1981) 89 071

Yeovil (England): see South Somerset.

Yepes y Alvarez, Juan de: see John of the Cross, Saint.

Yeppoon, coastal town, east-central Queensland, Australia. It lies 26 miles (42 km) northeast of Rockhampton and 435 miles (700 km) north of the state capital, Brisbane. Reserved from the Cawarral pastoral run and surveyed in 1872, the town was at first known as Bald Hill. European settlement of the area began in 1865, and the town's present name is presumably of Aboriginal origin. The Yeppoon district is given to agriculture, lumbering, and fruit growing. It is of interest to naturalists because it is the merging place for tropical and temperate species of plants and birds. Yeppoon is the centre for a major fishery (including prawning) and has seafood-processing factories, timber mills, and brickworks. Yeppoon is an important tourist centre with beaches, lakes, sandcliffs, and the Great Barrier Reef in close proximity. Pop. (1986) 6,452.

yerba maté (beverage): see maté.

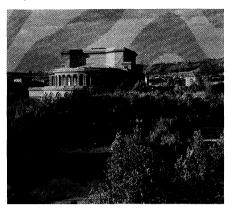

Yerby, Frank (Garvin) (b. Sept. 5, 1916, Augusta, Ga., U.S.), American author of popular historical fiction.

Yerby's story "Health Card" won the O. Henry Memorial Award for best first published short story in 1944. In 1946 his first novel, *The Foxes of Harrow*, was an immediate success. Yerby's novels are action-packed, usually revolving around a strong hero in an earlier period. The stories unfold in colourful language and include characters of all ethnic backgrounds, enmeshed in complex story lines laced with romantic intrigue and violence. His best work may be his novel *The Dahomean* (1971).

As a black author, Yerby was widely criticized for not giving more attention to racial problems in his fiction. But though Yerby himself said that writers should amuse and not preach to their readers, some critics see in his writings a savage critique of historical myths, especially of the United States and the American South.

Discrimination in the United States caused Yerby to leave and live in self-imposed exile in Madrid from 1955.

Yerevan, also spelled EREVAN, or JEREVAN, capital of the Armenian Soviet Socialist Republic, on the Razdan River, 14 miles (23 km) from the Turkish frontier. First historically recorded in AD 607, Yerevan dates by

State Opera, Yerevan, Armenian S.S.R. A. Borodulin—De Wys Inc.

archaeological evidence to a settlement on the site in the 6th-3rd millennium BC and subsequently to the fortress of Yerbuni in 783 BC. From the 6th century BC it formed part of the Armenian kingdom.

Developing as an important focus of trade, the city has had a long history of siege and storm. At different times it came under the Romans (a ruined fortress remains), Parthians, Arabs, Mongols, Turks, Persians, Georgians, and Russians. In 1582 it fell to the Turks, in 1604 to the Persians, and finally in 1827 to the Russians. In 1920 Yerevan became capital

of the Armenian republic. Modern Yerevan, climbing the hillsides from the deep trench of the Razdan, is an attractive city in a fine natural setting, framed by the extinct volcanic peaks of Mount Aragats and Mount Azhdaak to the north and Mount Ararat across the Turkish frontier to the south. Many modern buildings along its treelined streets have been constructed in traditional Armenian architectural styles and are built in variously coloured local stone. Yerevan is a major cultural centre, with a university founded in 1920 and numerous other institutions of higher education. The Academy of Sciences of the Armenian S.S.R., established in 1943, is the most prominent of the many research institutions in the city. The Matenadaran archives hold a rich collection of ancient Armenian manuscripts, such as the Lazarus Gospel of 887. Yerevan also has a number of theatres and museums.

The rapid growth of the city, from a population of about 30,000 in 1914, is due to industrial development and to the hydroelectric plants on the Razdan, one of which is at Yerevan itself. The city's chemical industries produce acetylene, plastics, synthetic rubber, and tires. Aluminum is smelted, and other industries make cars, turbines, electrical machinery, compressors, cables, and machine tools. Pop. (1986 est.) 1,148,000.

Yerkes, Charles Tyson (b. June 25, 1837, Philadelphia—d. Dec. 29, 1905, New York City), American financier who put together the syndicate of companies that built Chicago's transit system.

Yerkes started as a clerk at a Philadelphia commission broker, and by 1862 he was able to purchase his own banking house. In 1871 a stock exchange panic brought on by the Chicago fire found him unable to deliver money that he had received as an agent in a municipal bond sale. For misappropriation of funds he was imprisoned for seven months.

Pardoned and released, Yerkes managed to recoup much of his fortune by buying stock cheaply during the Panic of 1873. In 1882 he moved to Chicago and bought the option on a street-railway line. Over the next 15 years, Yerkes used stock in one line as collateral to acquire the next, creating a tangle of companies to own, build, or operate various parts of his transit system. He made notable physical improvements in his lines: replacing horsecars with cable traction; connecting city and suburbs with 500 additional miles of lines; installing electricity for 240 miles of his system; and constructing the north-side elevated and the Union Loop, circling downtown Chicago.

Extending his lines required franchises for the use of public land, and Yerkes relied on bribery to control both municipal and state politicians. When the legislature renewed his land franchises for a century without exacting any payment, the public was outraged. In the 1899 elections, the "boodle" legislators who had voted for Yerkes were defeated, and the law was repealed.

By 1901 Yerkes had sold his interests in the financially overburdened streetcar and elevated systems to Philadelphia transit kings Peter Widener and William Elkins. He went to London with \$15,000,000 to convert its subways from steam to electricity. In 1892 Yerkes gave the University of Chicago the funding for an observatory, the Yerkes Observatory in Williams Bay, Wis. The observatory's 40-inch (102-centimetre) refracting telescope is still the largest refractor in the world.

The American Realist novelist Theodore Dreiser wrote a trilogy of important novels based on Yerkes' life: *The Financier* (1912), *The Titan* (1914), and *The Stoic* (1947).

Yerkes, Robert M(earns) (b. May 26, 1876, Breadysville, Pa., U.S.—d. Feb. 3, 1956, New Haven, Conn.), American psychologist and a principal developer of comparative (animal) psychology in the United States.

After graduating from Ursinus College he took his Ph.D. degree at Harvard in 1902, and then served first as instructor and then as professor of psychology at Harvard until 1917. Yerkes' early studies of the behaviour of invertebrates soon gave way to work with the lower mammals, and his first book, *The Dancing Mouse* (1907), helped establish the use of mice and rats as standard laboratory subjects

Robert M. Yerkes, 1952
Photograph by Dellenback—Institute for Sex Research

in psychological testing. He became interested in the psychological testing of humans, and he contributed significantly to the development of multiple-choice testing and a widely used point scale (1915) for the measurement of human mental ability. During World War I he spearheaded the first mass-scale testing program, which administered psychological tests to 1,726,000 men.

When Yerkes became professor of psychology at Yale University in 1924, he renewed his studies of chimpanzees and other higher primates and was soon the world's foremost authority on the great apes. His major work, *The Great Apes* (1929; cowritten with his wife, Ada Watterson Yerkes), remained for several decades the standard work on the psychology and physiology of these animals. In 1929 he realized a longtime ambition by establishing the Yale Laboratories of Primate Biology, Or-

ange Park, Fla. A unique centre for the study of the neural and physiological bases of behaviour, it was renamed Yerkes Laboratories of Primate Biology after his resignation as director in 1941. *Chimpanzees* (1943), his other major work, was also his last. He retired from his teaching post at Yale in 1944.

Yermak TIMOFEYEVICH, Yermak also spelled ERMAK (d. Aug. 6, 1584/5, Siberia), Cossack leader of an expeditionary force during the initial Russian attempts to annex western Siberia, who became a hero of Russian folklore.

In 1579 the merchant and factory-owning Stroganov family enlisted the assistance of Yermak and a band of Cossacks to defend its possessions against attacks by Siberian tribesmen. Yermak set out with an expeditionary force of 840 men on Sept. 1, 1581, and in the spring of 1582 reached the central regions of the Tatar khanate of Sibir, whose head, Kuchum, ruled over the local tribes. Because his men had firearms Yermak was able to defeat the numerically superior forces of Khan Kuchum and occupy the capital, Kashlyk (or Sibir), on the Irtysh River.

Although the tsar sent Yermak another 500 men, revolts flared on all sides. In August 1584 Kuchum attacked and destroyed a small party of Cossacks led by Yermak, who, fighting his way to the boats, was drowned in the Irtysh, apparently by the weight of the coat of chain mail sent to him by the tsar.

Yermolova, Maria Nikolayevna (b. July 3, 1853, Moscow—d. March 12, 1928, Moscow), Russian dramatic actress whose 50-year career was devoted to imbuing her portrayals of stage heroines with a liberal spirit of active independence.

She was trained at the Moscow Theatre School and made her debut at age 17 in the title role of Gotthold Lessing's *Emilia Galotti* at the Maly Theatre (1870). Her interpretation of Emilia as an active protagonist of self-willed romanticism and turbulent emotions, in comparison with the passive characterizations of the past, established the direction of Yermolova's career. She excelled in the depiction of principals in heroic tragedy, and her lifelong membership in the Maly company was spent in this endeavour.

Yermolova's many outstanding roles included Katerina in Aleksandr N. Ostrovsky's The Storm, Laurencia in Lope de Vega's Fuente Ovejuna, Lady Anne in Shakespeare's Richard III, Lady Macbeth, and the title roles in Jean Racine's Phèdre and Friedrich Schiller's Mary Stuart and Maid of Orleans. Each of these characters was depicted in such a manner as to emphasize her independence of spirit and her popular heroism in defiance of corrupt authority. Konstantin Stanislavsky was of the opinion that Yermolova was the greatest actress he had ever observed. In 1920 Yermolova became the first person in the Soviet Union accorded the honour of being proclaimed People's Artist of the Republic. She retired from the stage in 1921.

Yersin, Alexandre (-Émile-John) (b. Sept. 23, 1863, Aubonne, near Lausanne, Switz.—d. March 1, 1943, Nha Trang, Annam, Indochina [now in Vietnam]), Swiss-born French bacteriologist and one of the discoverers of the plague bacillus, Pasteurella pestis (also called Yersinia pestis and Bacillus pestis).

Yersin studied medicine at the universities of Lausanne, Marburg, and Paris and bacteriology with Émile Roux in Paris and Robert Koch in Berlin. In 1889 he was engaged by Roux to prepare and teach a course in microbiology at the Pasteur Institute in Paris.

Yersin left Europe in 1890 to serve as a physician aboard steamships operating off

the coast of Indochina and soon began his four-year exploration of the central region. He discovered the sources of the Dong Nai River and explored the Lang Bian Plateau, where he recommended that a town, the future Da Lat, be built. In 1894 he joined the colonial health

Yersin
Harlingue—H. Roger-Viollet

service and was sent to Hong Kong, where he and Kitasato Shibasaburo independently discovered the plague bacillus while studying an outbreak of plague in China.

The next year Yersin established a laboratory at Nha Trang. There he prepared serums against plague in human beings and cattle and studied cattle diseases, tetanus, cholera, and smallpox. To finance the laboratory, designated the Pasteur Institute of Nha Trang in 1903, he undertook the cultivation of corn (maize), rice, and coffee and introduced the rubber tree (Hevea brasiliensis) to Indochina. In 1903–04 he founded a medical school in Hanoi but returned to Nha Trang, where he introduced (1920–23) a source of quinine (Cinchona ledgeriana). He was named honorary director of the Pasteur Institute in Paris in 1933.

Yerushalayim (Israel): see Jerusalem.

Yerwa, also called YERWA-MAIDUGURI (Nigeria): see Maiduguri.

Yesenin, Sergey Aleksandrovich, Yesenin also spelled ESENIN (b. Oct. 3 [Sept. 21, old style], 1895, Konstantinovo, Ryazan province, Russia—d. Dec. 27, 1925, Leningrad), the self-styled "last poet of wooden Russia," whose dual image—that of a devout and simple peasant singer and that of a rowdy and blasphemous exhibitionist—reflects his tragic maladjustment to the changing world of the revolutionary era.

The son of a peasant family of Old Believers, he left his village at 17 for Moscow and later Petrograd (now Leningrad). In the cities he became acquainted with Aleksandr Blok, the peasant poet Nikolay Klyuyev, and revolutionary politics. In 1916 he published his first book, characteristically titled for a religious feast day, *Radunitsa* ("Ritual for the Dead"). It celebrates in church book imagery the "wooden Russia" of his childhood, a world blessed by saints in painted icons, where storks nest in chimneys and the sky above the birch trees is a bright blue scarf.

Yesenin welcomed the Revolution as the social and spiritual transformation that would lead to the peasant millennium he envisioned in his next book, *Inoniya* (1918; "Otherland"). His roseate utopian view of Otherland was still informed by a simple ethos—the defense of "wooden things" against the vile world of iron, stone, and steel (urban industrialization). In 1920–21 he composed his long poetic drama *Pugachyov*, glorifying the 18th-century rebel who led a mass peasant revolt during the reign of Catherine II. In 1919 he signed the literary manifesto of the Imagists (a group of Rus-

sian poets, unrelated to the Anglo-American movement of this name). He was soon the leading exponent of the school. He became a habitué of the literary cafés of Moscow, where he gave poetry recitals and drank excessively. A marriage to Zinaida Reich (later the wife of the actor-director Vsevolod Meyerhold) ended in divorce. In 1922 he married the American dancer Isadora Duncan and accompanied her on tour, during which he smashed suites in the best hotels in Europe in drunken rampages. They visited the United States, their quarrels and public scenes duly observed in the world press. On their separation Yesenin returned to Russia. For some time he had been writing the consciously cynical, swaggering tavern poetry that appeared in Ispoved khuligana (1921; "Confessions of a Hooligan") and Moskva kabatskaya (1924; "Moscow of the Taverns"). His verse barely concealed the sense of self-depreciation that was overwhelming him. He married again, a granddaughter of Tolstoy, but continued to drink heavily and to take cocaine. In 1924 he tried to go home again but found the village peasants quoting Soviet slogans, when he himself had not been able to read five pages of Marx. Tormented by guilt that he had been unable to fulfill the messianic role of poet of the people, he tried to get in step with the national trend. In the poem "Neuyutnaya zhidkaya lunnost" (1925; 'Desolate and Pale Moonlight"), he went so far as to praise stone and steel as the secret of Russia's coming strength. But another poem, "The Stern October Has Deceived Me," bluntly voiced his alienation from Bolshevik Russia. His last major work, the confessional poem "Cherny chelovek" ("The Black Man"), is a ruthless self-castigation for his failures. In 1925 he was briefly hospitalized for a nervous breakdown. Soon after, he hanged himself in a Leningrad hotel, having written his last lines in his own blood.

A prolific and somewhat uneven writer, Yesenin had a true gift of song. His poignant short lyrics are full of striking imagery. He was very popular both during his lifetime and after his death. Frowned on by Communist critics and party leaders, who feared the debilitating effect of "Yeseninism" on the civic dedication of the young, he was long more or less out of official favour. Editions of his work that became available (1956-60) attested to his continued popularity. His complete works were published in 1966-68.

Yesha'yahu (Jewish prophet): see Isaiah.

yeshiva, also spelled YESHIVAH, or YESHIBAH (Hebrew "sitting"), plural YESHIVAS, YESHIVOT, YESHIVOTH, OF YESHIBOT, any of numerous Jewish academies of Talmudic learning, whose biblical and legal exegesis and application of Scripture have defined and regulated Jewish religious life for centuries. The early history of the yeshiva as an institution is known only through indirect evidence, and the word itself did not come into current use until the 1st century AD. Rabbinic literature refers to religious study during the periods of the biblical patriarchs, the bondage in Egypt, and the wandering in the wilderness; Ecclesiasticus, written c. 190 BC, mentions the school of its author, Ben Sira. Influential religious academies were led by the sages Hillel and Shammai in the 1st century AD.

During the period of the Second Temple of Jerusalem (6th century BC-AD 70), however, the Great Sanhedrin, the supreme judicial body, was regarded as the major source of religious learning. Intimately connected with its function as a bet din "house of judgment") was that of a bet midrash ("house of study"); the sages of the Sanhedrin were anxious to gather and train students well versed in Jewish law so that they could participate in deliberations conducted by the Sanhedrin or by local courts under its jurisdiction. Thus, before making a judicial decision, its 71 members

would "sit" before students (hence the Hebrew yeshiva and Aramaic metivia) and study the written and oral (Halakha) law.

Following the destruction of the Second Temple in AD 70, religious life centred upon the great rabbis, then located outside Jerusalem. The yeshiva of major importance in this period was that of Johanan ben Zakkai, who established an academy at Jabneh (or Jamnia, now Yibna) near the Judaean coast. Succeeding tanaim ("teachers") and sages who dominated religious scholarship were Simeon ben Gamaliel (died 175) and his son, Judah ha-Nasi (c. 135-c. 220), under whose tutelage the compilation of the Mishna was completed.

From the mid-3rd century, Jewish scholarship concentrated on the legal exegesis of the Mishna by the *amoraim* ("lecturers," or interpreters"). In Palestine yeshivas were established in Lydda, Caesarea, Sepphoris, and Tiberias. These academies produced the Palestinian Talmud and undertook the collection of Midrashim (homiletic commentaries on the Bible).

Other yeshivas simultaneously flourished in Babylonia, two of which gained extraordinary renown. The first was established by Abba Arika after his arrival at Sura in 218. The other was set up at Pumbedita by Judah bar Ezekiel. From c. 200 to 1040 these two yeshivas had immense authority as centres of learning and issued "official" interpretations of the law.

As the Babylonian yeshivas declined, others arose in Spain, France, Italy, Germany, and central Europe. Then, as Jews moved eastward, outstanding yeshivas were established in Poland. Important new centres of Jewish learning appeared in Turkey and Palestine following the expulsion of the Jews from Spain in 1492.

The Polish yeshivas suffered a debilitating blow in the violent persecutions of 1648-49, but by the latter part of the 18th century a mystical and pietistic movement called Hasidism won over large masses of Polish and Ukrainian Jews and in due course gave rise to new yeshivas.

When the Enlightenment movement (Haskala) of eastern Europe (latter half of the 18th century) challenged the traditions of the yeshivas by adapting Judaism to modern culture, Hayyim ben Isaac attempted to counter its influence by establishing a yeshiva (1803) at Volozhin, Russia. It profoundly influenced Russian Jewry until its final closing in 1892. By including secular subjects in its training of future rabbis, Volozhin departed from the traditional curriculum of European (Lithuanian, Polish, Hungarian) yeshivas.

The first yeshiva in the United States was Etz Hayyim of New York (1886), modelled after that in Volozhin. It developed into the Rabbi Isaac Elchanan Yeshiva (1896), which in turn became Yeshiva College in 1928 and Yeshiva University in 1945.

In the Nazi persecution of European Jews prior to and during World War II (1939–45) numerous yeshivas were destroyed and many scholars and rabbinic students were forced to seek other lands, notably England, Canada, the United States, and Palestine. Today the most outstanding yeshivas are located in the United States and Israel.

Rabbinic seminaries of Reform and Conservative Judaism are not usually called yeshivas. In the United States, a day school under Orthodox Jewish auspices is generally known as a "small yeshiva" (yeshiva qeţana).

Yessentuki, also spelled JESSENTUKI, or ESSENTUKI, city, Stavropol kray (territory), southwestern Russian Soviet Federated Socialist Republic, in the valley of the Podkumok River. It was founded in 1798, developed as a fortress in the 1830s, and became a city in 1917. It is located at mineral springs at the base of the Caucasus Mountains. The

city is composed of an old Cossack village in the southern sector and a newer city in the north. It is a major health resort, with sanatoriums and medicinal mud baths. It also has food-processing and garment industries. Pop. (1983 est.) 82,000.

Yesuj, also spelled YāsūJ, town and capital, Boyer Aḥmadī-ye Kohkīlūyeh ostān (province), southwestern Iran. The town has a sugar mill and other local industry producing bricks and mosaic tiles, livestock feed, mats and baskets, and carpets and rugs. Roads link it with Dogonbaden, Dehdasht, Shiraj, Nūrābād, and Bushire. There is a thermoelectric power station located at Yesuj. Pop. (1966) 931.

Yeti: see Abominable Snowman.

Yevpatoriya, also spelled EVPATORIIA, or JEVPATORIJA, city, Crimea oblast (administrative region), Ukrainian Soviet Socialist Republic, on the Kalamit Bay on the west coast of the Crimean Peninsula. Founded in the 6th century BC as a Greek colony and later renamed for Mithradates VI Eupator, sixth king of Pontus, the city has known many masters, passing to Russia with the annexation of the Crimea in 1783. Nearby the Allied armies landed (1854) during the Crimean War. With magnificent beaches, modern Yevpatoriya is a popular resort and minor coastal and fishing port. Pop. (1983 est.) 100,000.

Yevreyskaya autonomous oblast, also spelled EVREISKAIA, English JEWISH AU-TONOMOUS OBLAST, also called BIROBIDZHAN. administrative region in Khabarovsk krav (territory), far eastern Russian Soviet Federated Socialist Republic, occupying an area of 13,-900 sq mi (36,000 sq km) in the basin of the middle Amur River. Most of the oblast consists of level plain, with extensive swamps, patches of swampy forest, and grassland on fertile soils, now largely plowed up. In the north and northwest are the hills of the Bureya Range and the Lesser Khingan, clothed in dense forest of spruce, pine, fir, and larch. Winters are dry and severely cold, summers hot and moist. Although established in 1934 theoretically as a home for Jews in the Soviet Union, no mass Jewish migration developed, and Russian and Ukrainian settlers heavily outnumber the Jews. Most of the population live along the two main lines of communication, the Trans-Siberian Railroad and the navigable Amur. Timber working is well developed at centres on the railway, and tin is mined at Khingansk. Iron ore has not been exploited. Agriculture—chiefly the cultivation of wheat, rye, oats, soybeans, sunflowers, and vegetables—is concentrated in the Amur plain; fishing, especially for salmon, is important on the rivers. Birobidzhan (q.v.) is the administrative centre. Pop. (1983 est.) 200,000

Yevtushenko, Yevgeny (Aleksandrovich), Yevtushenko also spelled EVGENII EVTUSHENKO (b. July 18, 1933, Zima, Irkutskoblast, Russian S.F.S.R.), poet and spokesman for the younger post-Stalin generation of Russian poets, whose internationally publicized demands for greater artistic freedom and for a literature based on aesthetic rather than political standards signalled an easing of Soviet control over artists in the late 1950s and '60s.

Yevtushenko, a fourth-generation descendant of Ukrainians exiled to Siberia, grew up in Moscow and the small town on the Trans-Siberian Railway line that is the setting of his first important narrative poem, Stantsiya Zima (1956; Zima Junction, 1962). He was invited to study at the Gorky Institute of World Literature in Moscow, and he gained popularity and official recognition after Premier Joseph Stalin's death. Yevtushenko's gifts as an orator and publicist, his magnetic personality, and his fearless fight for a return to artistic honesty soon made him a leader of Soviet youth. He revived the brash, slangy,

Yevtushenko

unpoetic language of the early Revolutionary poets Vladimir Mayakovsky and Sergey Yesenin and reintroduced such traditions as love lyrics and personal lyrics, frowned upon under Stalinism. His poem Baby Yar (1961), mourning the Nazi massacre of an estimated 34,000 Ukrainian Jews, was an attack on lingering Soviet anti-Semitism. His travels and poetry readings in the United States and Europe established cultural links with the West, but he fell into disfavour at home when he published his Precocious Autobiography in Paris in 1963. He was recalled and his privileges were withdrawn, but he was restored to favour when he published his most ambitious cycle of poems, Bratsk Station (1966; originally published in Russian), in which he contrasts the symbol of a Siberian power plant bringing light to Russia with the symbol of Siberia as a prison throughout Russian history

Yevtushenko's play *Under the Skin of the Statue of Liberty*, which was composed of selections from his earlier poems about the United States, was produced in Moscow in 1972. His first novel, published in Russian in 1982, was translated and published in English as *Wild Berries* in 1984; that same year, a novella, *Ardabiola*, appeared in English translation. In 1978 he embarked on an acting career, and in 1981 a book of his photographs, *Invisible Threads*, was published.

yew, any tree or shrub of the genus Taxus (family Taxaceae), approximately eight species of ornamental evergreens, distributed throughout the Northern Hemisphere. Other trees called yew but not in this genus are the plum-yew (q.v.), Prince Albert yew (see Podocarpaceae), and stinking yew (q.v.). Two species are always shrubby, but the others may become trees up to 25 metres (about 80 feet) tall. Yews have rich, dark-green foliage. The branches are erect or spreading and are closely covered with flattened, linear leaves about 1/2 to 3 centimetres (about 1/5 to 11/5 inches) long. The leaves have two yellowish- or grayish-green bands along the underside. They are attached in spirals around the branch but, because of a twist at their bases, appear to grow in two rows along the sides of the branch. The reproductive structures, small, rounded, scaly, and conelike on male plants and minute, green, and solitary on female plants, are located between the leafstalk and the stem. The seeds are usually solitary, borne at the ends of short branches. As a seed matures, it is enveloped by a fleshy, red, cup-shaped aril. The foliage and seeds, but not the arils, contain a poisonous alkaloid, sometimes fatal to livestock.

The many horticultural varieties of yews differ primarily in growth habit. Yew trees grow slowly but are long-lived and only moderately susceptible to attack by pests.

Yew wood is hard, finegrained, and heavy, with white or creamy sapwood and amber to brown heartwood. The lumber was once popular for cabinetwork, implements, and archery bows; it is used more today for carved articles and turnery.

Yeysk, also spelled JEJSK, or EISK, city, Krasnodar kray (territory), southwestern Russian Soviet Federated Socialist Republic. It was founded as a port in 1848 on the southern side of Taganrog Gulf of the Sea of Azov. Fishing and associated industries (fish canning) are important; other industries include agricultural processing. The city is a noted health resort, famed for its medicinal sulfur and mud baths. A college of agricultural technology is located in the city. Pop. (1983 est.) 75,000.

Yezd (Iran): see Yazd.

Yezdegerd, also spelled YEZDEGIRD (name of Sāsānian rulers): *see under* Yazdegerd.

Yezhov, Nikolay Ivanovich, Yezhov also spelled ezhov, byname the dwarf, Russian Karlik (b. 1895, St. Petersburg, Russia—d. after January 1939), Russian Communist Party official who, while chief of the Soviet security police (NKVD) from 1936 to 1938, administered the most severe stage of the great purges, known as Yezhovshchina (or Ezhovshchina).

Nothing is known of his early life (he was nicknamed the "Dwarf" because he was but five feet tall and lame). Joining the Communist Party in March 1917, he was a political commissar in the Red Army during the Civil War and thereafter rose through several political posts, becoming a functionary for the Party Central Committee in Moscow by 1927 and one of Stalin's favourites. On April 29, 1933, he was named a member of a newly established central Purge Commission, which conducted a bloodless purge that ejected more than a million members from the Party. In January 1934, at the 17th Party Congress, he became a full member of the Central Committee and then, in February, succeeded L.M. Kaganovich in the key post of chairman of the Party Control Commission. In October 1937 he became a candidate member of the Politburo.

Meanwhile, on Sept. 26, 1936, he had succeeded G.G. Yagoda as chief of the NKVD and, in January 1937, acquired the newly created title of General Commissar of State Security. In these roles he perpetrated the grand excesses known as the Yezhovshchina, the cruel, ruthless elimination or repression of Stalin's enemies or alleged enemies in the Great Purge (see purge trials). The liquidations gradually extended from the Party leaders to the Party and state apparatchiki and finally to the general population.

By the summer of 1938, however, Yezhov himself had become the object of Stalin's suspicions, for reasons unknown. In December, L.P. Beria replaced him as head of the NKVD; and Yezhov, last heard of in January 1939, disappeared, probably executed.

Yezīdī (religious sect): see Yazīdī.

Yggdrasill, Old Norse mimameidr, in Norse mythology, the world tree, a giant ash supporting the universe. One of its roots extended into Niflheim, the underworld; another into Jötunheim, land of the giants; and the third into Asgard, home of the gods. At its base were three wells: Urdarbrunnr (Well of Fate), from which the tree was watered by the Norns (the Fates); Hvergelmir (Roaring Kettle), in which dwelt Nidhogg, the monster that gnawed at the tree's roots; and Mimisbrunnr (Mimir's Well), source of wisdom, for the waters of which Odin sacrificed an eye. After Ragnarök (q.v.; Doomsday), the world tree, though badly shaken, was to be the source of new life.

YHWH, in Hebrew, the name of God as revealed to Moses. Because of its four letters, it is also known as the Tetragrammaton. See Yahweh.

Yi, also called LOLO, or WU-MAN, ethnic group of Austro-Asiatic origin living largely in the mountains of southwest China and speaking a Tibeto-Burman language; the term is used by the Chinese to designate what they formerly called the Lolo or Wu-man. The Yi people numbered about 5.9 million in the late 20th century. Their principal concentrations were in Yunnan and Szechwan provinces, with smaller numbers in northwestern Kweichow province and in the northern part of Kwangsi Chuang autonomous region. Almost two-thirds of the Yi live in Yunnan province alone. The Yi language is spoken in six relatively distinct dialects. Among lesser minorities within the Yi language group are the Lisu, Nakhi (former Moso), Hani, Lahu, and Pai.

The traditional Yi culture includes a primitive hoe-using agriculture, livestock herding, and hunting. A caste system formerly divided the Yi into two groups. The Black Bone Yi, the ruling group, were apparently descended from a people that originated in northwest China. The far more numerous White Bone Yi were formerly subjugated or enslaved by the Black Bones. The subjugation of the White Bones was ended by the Chinese government in the 1950s. The White Bones have spread over the highlands of Yunnan and Kweichow, while the heartland of the Black Bones lies in the great and lesser Liang Mountains southwest of the Szechwan Basin.

The Lisu group, numbering about 520,000 in China, have spread southward from Yunnan as far as Myanmar (Burma) and northern Thailand. The Chinese distinguish between Black Lisu, White Lisu, and Flowery Lisu, terms that seem to relate to their degree of assimilation to Chinese culture. In the 1960s the Black Lisu, living highest up in the Salween River valley, were least civilized; they wore coarse clothes of homespun hemp, while the others dressed in colourful and elaborate garments. In their migrations the Lisu have kept to the highest parts of hill ranges, where they cultivate hill rice, corn (maize), and buckwheat on frequently shifted fields worked mainly with hoes. Their houses are of wood and bamboo. Crossbows, poisoned arrows, and dogs are used for hunting. They have a clan organization, men of one clan taking wives from others. They worship their ancestors and gods of earth and sky, wind, lightning, and forest.

The Nakhi, also known as Nasi, Mosu, or Moso, are estimated to number about 270,-000. In common with the Tibetans, many of them embrace Tibetan Buddhism; they also believe in various spirits and demons and, along with their shamans, have priest-exorcists of the Bon cult of Tibet.

Yi DYNASTY, also called CHOSŎN DYNASTY, the last and longest-lived imperial dynasty

(1392–1910) of Korea. Founded by General Yi Sŏng-gye, who established the capital at Hanyang (present-day Seoul), the kingdom was named Chosŏn after the state of the same name that had dominated the Korean peninsula in ancient times. But the regime is also frequently referred to as the Yi dynasty, after its ruling family.

General Yi established close relationships with the neighbouring Ming dynasty (1368–1644) of China, which considered Korea a client state, and Chinese cultural influences were very strong during this period. Chosòn's administration was modeled after the Chinese bureaucracy, and Neo-Confucianism was adopted as the ideology of the state and society.

Under the previous dynasties, ownership of land was concentrated in the hands of a few high-ranking bureaucrats, but Yi Sŏng-gye and his successors redistributed the land throughout the various levels of officialdom, creating a new aristocracy called the *yangban* (q.v.). Scholarship flourished under the Yi dynasty, and in 1443 the Korean phonetic alphabet, Han'gŭl, was invented. By the time of the Yi ruler King Sŏngjong (1470–94), a bureaucratic system for government administration was established.

In 1592 Korea suffered an invasion from Japan. Although Chinese troops helped repel the invaders, the country was devastated. This was followed by the invasion of northwestern Korea, in 1627, by the Manchu tribes of Manchuria, who were attempting to protect their rear in preparation for their invasion of China. Many cultural assets were lost, and the power of the central government was severely weakened. By the reigns of King Yongjo (1724-76) and King Chongjo (1776-1800), the country had largely recovered from the destruction of the wars. With an increased use of irrigation, agriculture was in a prosperous condition, and a monetary economy was burgeoning. In an effort to solve administrative problems, a school of learning called Silhak, or "Practical Learning," arose.

Korea maintained an isolationist policy until the 1880s. Starting with the conclusion of a treaty with Japan in 1876, doors to the West were opened for the first time in Korea's long history, and the country soon became an arena for competition among the powers. Japanese influence in the area became predominant, especially after the Japanese victory in wars with China (1894–95) and Russia (1904–05). In 1910 Japan formally annexed Korea, bringing the Yi dynasty to an end.

Yi Ching (Confucian text): see I Ching.

Yi Chŏng, also called T'ANŬM (Korean: "Ocean Hermit") (b. 1541, Korea), painter who was one of the most popular 16th-century Korean artists.

The great-great-grandson of King Sejong (1397-1450), Yi is said to have personified

the ideal Korean aristocrat. He is as famous for his regal and generous disposition and his scholarly tastes as he is for his painting, and he is also well known as a poet and calligrapher. A master of the traditional styles, he especially excelled in monochrome painting of bamboo; he liked the bamboo, he said, because he felt it to be unyielding and yet graceful.

yi-dam, in Tibetan Buddhism, a tutelary, or guardian, deity with whom a lama (monk) has a special, secret relationship. The lama first prepares himself by meditation, then selects from among the guardian deities the one that reveals itself as offering the right guidance for a specific or lifelong goal. The lama will thereafter begin each day by worshiping his yi-dam. Any of the principal deities in the Tibetan Buddhist pantheon can be selected as a yi-dam, who is generally worshiped in union with his female consort (vab-vum). Their appearance can be either mild, in which case they are represented as "crowned" Buddhas, wearing the ornaments of a bodhisattva "Buddha-to-be"), or wrathful, in which case they wear crowns of skulls and garlands of severed heads and carry such implements as the chopper and the skull cup.

Yi In-mun, also called YU-CH'UN (Korean: "Exist Spring") (b. 1745, Haejo, Korea—d. 1821, Seoul), famous Korean landscape painter.

A follower of the traditional Northern school of Chinese painting, Yi was known for the subtlety of his designs and the confidence of his brushstrokes. His most famous work, "River in Spring," is a long horizontal scroll depicting an endless landscape along a river. His use of watercolour, unusual in landscape painting before that time, started a new trend in Korean art.

Yi Li (Confucian classic): see I li.

Yi Sang-cha, also called HAKP'O (Korean: Study Garden) (fl. 16th century, Korea), noted

"Moon Viewing," scroll in ink and colour on silk by Yi Sang-cha; in the National Museum, Seoul

Korean painter famous for the freshness and originality of his style.

Yi was originally a slave in a scholar's household, but his great artistic talents soon came to the attention of the king, and he was admitted to the Korean Royal Academy and made a member of the middle class. He is known for his landscapes as well as for his portraits of the royal family. His talents were so great that in 1546 he was made an official court painter and a member of the court officialdom, an extremely unusual honour for a man of his background.

Yi style, Korean visual arts style characteristic of the Yi dynasty (1392–1910). Yi craftsmen and artisans, unable except occasionally to draw inspiration from imported Chinese art, relied on their own sense of beauty and perfection. Particularly in the decorative arts, the Yi style showed a more spontaneous, indigenous aesthetic sense than the sophisticated aristocratic elegance of Koryŏ style of the preceding centuries.

After 1592 many palaces and temples were built, most in the *tap'o* style (*q.v.*). Buddhist images were usually made of wood instead of bronze, iron, or granite and were usu-

Vase painted in underglaze copper red, Yi dynasty (1392–1910), probably 15th century; in the Victoria and Albert Museum, London

ally undistinguished. Among the secular arts, painting and pottery were the most important. While most pottery of this period is distinctly rougher than that of China in the Ming and Ch'ing periods, the decoration is magnificent in quality. Among the wares produced were a celadon (q.v.) called punch'öng and a porcelain ware with excellent designs painted in an underglaze blue (see punch'ong pottery).

Yiddish drama, the literature, productions, and acting style of the professional Yiddish theatre, which developed in Europe from crude beginnings in the mid-19th century and rose during its short history to peaks of brilliant artistic expression.

European Jewish drama had its origin in the Middle Ages, when dancers, mimics, and professional jesters entertained at weddings and Purim celebrations with songs and monologues. Purim, the holiday celebrating the downfall of Haman, a persecutor of the Jews in the Bible, became the occasion for increasingly elaborate plays, some of which continue to the present day. By the 16th century these plays, with their interpolated songs and free use of improvisation, were being performed in Yiddish, the language of the majority of central and eastern European Jews.

The beginning of professional Yiddish theatre is usually dated in 1876, when Abraham Goldfaden, a former schoolteacher and journalist, joined forces with two traveling musicians to present his own two-act musical

Scene from the 1945 production of H. Leivick's Miracle of the Warsaw Ghetto

From the Collection of the YIVO Institute

sketch in a tavern in Romania. The little play was well received, and Goldfaden went on to organize a full-time professional troupe, for which he wrote songs, dialogues, and, finally, full-length plays. Groups of imitators sprang up, some of them formed by Goldfaden's actors or associates.

Goldfaden and newer Yiddish dramatists, such as Joseph Judah Lerner, became well established in Russia, but the anti-Semitic laws promulgated in 1883 expressly forbade Yiddish plays, and the playwrights and many of their actors immigrated to England and the United States. New York became the centre of Yiddish drama at the turn of the century, with a vast immigrant population that supported both the commercial theatre of musical farce and sentimental melodrama and the serious art theatre. The early acting style was noted for its lack of restraint.

In the early 1880s Boris Tomashevsky came to New York from London with some other Jewish actors and presented the first Yiddish play in the United States. Jacob Gordin is credited with bringing new material and new life into the American Yiddish theatre with free adaptations of the works of major European dramatists, such as his The Jewish King Lear (1892). The role of Lear was interpreted by Jacob P. Adler, founder of a family of Yiddish- and English-speaking actors that included Sarah (his wife), Celia, Julia, Stella, and Luther Adler. Sholem Asch and Sholem Aleichem explored Jewish folk themes and characters with rich humour and sensitivity. H. Leivick (pseudonym of Leivick Halpern) produced social dramas of Jewish workers as well as powerful works such as *The Golem* (published 1921) and *Miracle of the Warsaw* Ghetto (performed 1945).

In 1918 Maurice Schwartz founded the Yiddish Art Theatre, in which he acted as director and leading actor. Schwartz became the most highly esteemed actor of the Yiddish stage in its heyday, and the theatre became the training ground for a generation of actors. Among the notable names associated with it are Rudolph Schildkraut, Jacob Ben-Ami, and Muni Weisenfreund (later known in motion pictures as Paul Muni).

World War II and the Nazi concentration camps destroyed most of the Yiddish culture of Germany and eastern Europe, and the language is rapidly dying out elsewhere, as the children of immigrants are assimilated into new cultures. All of these factors combined have had a devastating impact on the Yiddish theatre. In the second half of the 20th century, only a few Yiddish theatres of uncertain future survived in New York City, London, Bucharest, Buenos Aires, and Warsaw.

Yiddish language, the language of Ashkenazic Jewry (central and eastern European Jews and their descendants). Written in the

Hebrew alphabet, Yiddish became one of the world's most widespread languages, appearing in most countries with a Jewish population by the 19th century. Along with Hebrew and Aramaic, it is one of the three major literary languages in Jewish history.

The earliest dated Yiddish documents are from the 12th century, but scholars reconstruct an origin in the 9th century when the Ashkenazim emerged as a unique cultural entity in central Europe. Yiddish first arose through an intricate fusion of two linguistic stocks: a Semitic component (containing postclassical Hebrew and Aramaic that the first settlers brought with them to Europe from the Middle East) and a grammatically and lexically more potent Germanic component (gleaned from a number of Upper and Central German dialects). In addition, a sprinkling of Romance words also seems to have appeared in Yiddish from early on. From its birthplace on German-speaking soil, Yiddish spread to nearly all of eastern Europe, where the language acquired a Slavic component.

Western Yiddish, the only form of Yiddish that was used during the earliest history of the language, remained the dominant branch during the Old Yiddish period (ending about 1500). It comprises Southwestern (Swiss-Alsatian-Southern German), Midwestern (Central German), and Northwestern (Netherlandic-Northern German) Yiddish. Eastern Yiddish, roughly equal in importance to its western counterpart during the Middle Yiddish period (c. 1500-1700), vastly overtook it in the Modern Yiddish period (from about 1700) and includes all present-day spoken Yiddish. The major Eastern Yiddish dialects are Southeastern (Ukrainian-Romanian), Mideastern (Polish-Galician-Eastern Hungarian), and Northeastern (Lithuanian-White Russian) Yiddish, upon which modern standard pronunciation of the language is based, although the grammar of the literary language draws from all three.

From its inception, Yiddish was the language of both the marketplace and the sophisticated logical argumentation in the Talmudic academies. Its literary functions continued to grow over the centuries, especially in genres not covered by traditional Hebrew and Aramaic. The rise of Yiddish printing in the 16th century stimulated the development of a standardized literary language on a Western Yiddish model. Owing to its gradual assimilation to German, as well as to a political campaign to stamp out the language waged by adherents of the late 18th century Germanizing movement, Western Yiddish faded into eventual extinction.

By the early 19th century, Eastern Yiddish, by contrast, blossomed and became the basis for the new literary language. Prompted at first by the mystical Hasidic movement in the 18th and 19th centuries and spurred later by other social, educational, and political movements, Yiddish was carried to all the world's continents by massive migrations from eastern Europe, extending its traditional role as the Jewish lingua franca. The Yiddishist movement, dedicated to the growth and enhancement of the language, was strengthened by the proliferation of Yiddish belles lettres. Its achievements include the Czernowitz Language Conference of 1908 (which proclaimed Yiddish a national Jewish language), the orthographic and linguistic reforms introduced by Ber Borokhov in 1913, and the founding of the Yivo (Yiddish Scientific Institute) in Vilna (Vilnius), Lithuania, in 1925 (housed in New York City since 1940).

Millions of Yiddish speakers were victims of the Nazi Holocaust. The number of speakers has been further reduced by official suppression in the Soviet Union, semiofficial antagonism (until recently) of Israeli authorities zealously guarding modern Hebrew, and massive voluntary shifts to other primary languages in Western countries. The language nevertheless continues to flourish among the ultra-Orthodox Hasidim in numerous countries and among secular students of Yiddish at leading universities, including Columbia University (New York), Hebrew University (Jerusalem), McGill University (Montreal), the University of Oxford, and the University of Paris.

Consult the INDEX first

Yiddish literature, the body of written works produced in the Yiddish language of Ashkenazic Jewry (central and eastern European Jews and their descendants worldwide).

A brief treatment of Yiddish literature follows. For full treatment, see MACROPAEDIA: Yiddish Literature.

The beginnings of Yiddish literature are cloaked in mystery because of the huge number of documents that were lost or destroyed. The earliest-known explicitly dated items are proper names (1096); a rhymed blessing written into a prayer book (1272); and the extensive Cambridge Yiddish Codex (1382), discovered in Egypt and comprising the Jewish tales of Abraham, Joseph, and Moses as well as an early version of the German Ducus Horant. Other adaptations from the secular environment include the Yiddish King Arthur and the greatest work of old Yiddish literature, Bove-Buch, written in Italy in 1507 by Elijah Levita and published in 1541. It is a brilliant reworking of an Italian parallel to the Anglo-Norman Buève de Hantone (Sir Bevis of Hampton) and represents the first use of ottava rima (an eight-line stanza with a rhyme scheme of abababcc) in any Germanic language. A fusion of traditional themes with European forms is evident in the Yiddish epic versions of the biblical books of Samuel and Kings that circulated extensively in manuscript before being published in the 1540s. This same decade witnessed the publication of Yiddish translations of the Pentateuch (first five books of the Old Testament), dictionaries, historical works, and treatises on Jewish ethics, all of which were widely disseminated throughout Ashkenazic Europe. The oldest-known printed book in Yiddish is a Bible concordance (1534), preceded by the inclusion of a single Yiddish Passover poem in a 1526 volume published in Prague.

From the late 16th to the end of the 18th century the chief Yiddish literary works drew on Jewish legend and folklore, ethics, and morality. Some, such as the Ma'aseh Buch (first printed Basel 1602), took the shape of collections of short tales that had evolved over many centuries. The best-loved and most reprinted work was the Tsenerene by Jacob ben Isaac Ashkenazi of Janów Lubelski, the lost first edition of which was published in Prague in 1608. This book, which influenced Yiddish stylistics for generations, weaves legend, ethical guidelines, and rabbinic commentary around the nucleus of a Yiddish paraphrase of the Pentateuch. The first complete Yiddish renditions of the Old Testament were commissioned almost simultaneously by two competing publishers in Amsterdam in the late 1670s. Other prominent genres of older Yiddish literature include historical songs and drama.

Virtually all written Yiddish until the end of the 18th century was based on a quasi-standardized form of varieties of Western Yiddish, spoken in Central Europe. During the 18th century, western Ashkenazic civilization began to crumble. This was partly because of the influence of the Haskalah, the Berlin enlightenment movement of Moses Mendelssohn and his circle, which advocated the Germanization of the Jewish population in the Germanspeaking lands. It signaled the death of Yiddish literary creativity in the West, except for a few satiric enlightenment dramas. In eastern Europe, by contrast, the solid Yiddish-speaking population now numbered in the millions. and the rise of Hasidism, a religious movement stressing mysticism and the spiritual exaltation of each human being, gave rise to renewed creativity on an indigenous eastern European linguistic base. The wonder stories of Rabbi Nahman of Bratslav (then Russian), posthumously published in 1815, are the first major literary work created in a form of Eastern Yiddish (the dialects of Poland, the Ukraine, Lithuania, and the surrounding areas, which constitute spoken Yiddish to this day). The eastern European maskilim (adherents of the Europeanizing enlightenment movement) soon began using Yiddish as a vehicle for attacking and satirizing Hasidism. Both camps served consciously or unconsciously to develop a proto-eastern European Yiddish literature.

The grandfather of modern Yiddish literature is Sholem Yankev Abramovitsh, who came to be known by the name of his narrator, Mendele Moykher Sforim. Mendele abandoned his original goals of modernization and enlightenment to paint realistic portraits of eastern European Jewry, excelling in satire and allegory. Fusing elements from several Eastern Yiddish dialects into his literary language, Mendele in effect forged presentday literary Yiddish. The other two classicists, forming with Mendele the triumvirate of classical modern Yiddish literature, are Sholem Aleichem, the eminent humourist upon whose works the later popular musical Fiddler on the Roof (1964) was based, and Isaac Leib Peretz, a symbolist who romanticized traditional Hasidic mysticism while drawing Yiddish closer to the norms and trends of mainstream European literature.

Shortly after World War I, Yiddish literature, both in its native eastern European heartland (split into Soviet and non-Soviet groupings) and in the United States, consciously broke away from the political and social tendentiousness that had characterized much of late 19th- and early 20th-century Yiddish writing on both sides of the Atlantic. The new organizations of young Yiddish writers in Poland, the Soviet Union, and the United States set out to explore the vast potential of Yiddish for the sake of art alone and in the interwar years brought Yiddish literature to the level of a great world literature. Among the American Yiddish poets, the mystical and dramatic works of H. Leivick and the poetic experimentation of I.J. Schwartz, Zisha Landau, and Menke Katz complemented the expressionism and symbolism emanating from eastern Europe. In the arena of prose, Lamed Shapiro's impressionistic fiction established him as the undisputed master craftsman of the short story, and such novelists as Israel Joshua Singer, author of The Brothers Ashkenazi (1936), and his younger brother, Isaac Bashevis Singer, winner of the 1978 Nobel Prize for Literature and the most widely read of all Yiddish writers, strengthened the claim that New York City had become a major centre of Yiddish literature.

A number of leading Yiddish writers flourished in the Soviet Union in the 1920s, including the poet and modernistic prose master Moyshe Kulbak, the novelist David Bergelson, and the symbolist Der Nister (Pinkhes Kahanovich). The phenomenal growth of Soviet Yiddish belles lettres was curtailed by the stifling of literary freedom on the part

of the authorities and the murder of all the great Soviet Yiddish writers, particularly the shooting of the 24 leading literary figures on Aug. 12, 1952, in Moscow's Lubianka Prison. The great centres of Poland, Lithuania, Hungary, Romania, and adjacent areas, where a vibrant press and all forms of Yiddish literature had developed at a breathtaking pace, fell victim to the Nazis, who slaughtered an estimated 6,000,000 Jewish victims, the majority of whom were Yiddish speakers

of whom were Yiddish speakers.
Since the Holocaust, Yiddish literature has continued to explore modernistic literary trends and thereby secure its links with mainstream European literature. It has also returned to its Jewish roots, synthesizing the romance of the destroyed shtetl (eastern European Jewish village) with the great city life of its present centres in North America and Israel and, to a lesser degree, in western Europe, South America, South Africa, and Australia. While the aging generation of eastern European-born Yiddish writers has failed to cultivate a younger generation of authors, the burgeoning youth-for-Yiddish movements in North America and western Europe may yet write a new chapter in the history of Yiddish literature.

yield point, in mechanical engineering, load at which a solid material that is being stretched begins to flow, or change shape permanently, divided by its original cross-sectional area; or the amount of stress in a solid at the onset of permanent deformation. The yield point, alternatively called the elastic limit, marks the end of elastic behaviour and the beginning of plastic behaviour. When stresses less than the vield point are removed, the material returns to its original shape. For many materials that do not have a well-defined yield point, a quantity called yield strength is substituted. Yield strength is the stress at which a material has undergone some arbitrarily chosen amount of permanent deformation, often 0.2 percent. A few materials start to yield, or flow plastically, at a fairly well-defined stress (upper yield point) that falls rapidly to a lower steady value (lower yield point) as deformation continues. Any increase in the stress beyond the yield point causes greater permanent deformation and eventually fracture.

Yildirim: see Bayezid I.

Yima, in ancient Iranian religion, the first man, the progenitor of the human race, and son of the sun. Yima is the subject of conflicting legends obscurely reflecting different religious currents.

According to one legend, Yima declined God's (Ahura Mazdā's) offer to make him the vehicle of the religion and was instead given the task of establishing man's life on earth. He became king in a golden age in which need, death, disease, aging, and extremes of temperature were banished from the earth because of his virtue. The golden age ended, says one tale, when Ahura Mazda told Yima of a terrible winter to come. He was instructed to build an excellent domain under the earth, lit by its own light, and take in it the best individuals from each species to preserve their seed. There they should dwell through the winter's destruction, then emerge and repopulate the earth.

Zoroastrian tradition dislodged Yima as the first man, replacing him with the figure of Gayōmart. In later Persian literature Yima is the subject of many tales under the name Jamshīd.

Yin DYNASTY: see Shang dynasty.

Yin-chen (Chinese emperor): see Yung-cheng.

Yin-ch'uan, Pinyin YINCHUAN, conventional YINCHWAN, capital of Hui Autonomous Region of Ningsia, north-central China. The city is located near the western bank of the upper course of the Huang Ho, near the western

end of the Great Wall of China in the south central section of the Ho-lan Shan (mountains) and Ordos Desert. It is served by a river port at Heng-ch'eng, about 9½ mi (15 km) to the east. Until the 1950s the river, which is navigable downstream as far as Pao-t'ou in the Inner Mongolian Autonomous Region and upstream to Chung-wei and Chung-ning, was the chief communication link. Highways also link the city to Pao-t'ou along the river, to Lan-chou in Kansu Province to the southwest, to Wu-wei in Kansu to the west, and to Hsi-an (Sian [Ch'ang-an]) in Shensi Province to the southeast. Since 1958 the city has been on the railway from Lan-chou to Pao-t'ou and is thus linked to other parts of China by rail.

Yin-ch'uan originally was a county (hsien) under the name of Fu-p'ing in the 1st century BC; its name was changed to Huai-yuan in the 6th century AD. After the fall of the T'ang in 907, it was occupied by the Tangut Peoples' Hsi-Hsia dynasty, of which it was the capital. After the destruction of the Hsi-Hsia dynasty by the Mongols in 1227, it became part of the Mongol dynasty. Under the Ming (1368-1644) and Ch'ing (1644-1911) dynasties it became the prefecture (fu) of Ning-hsia. In 1928, when the province of Ning-hsia was formed from parts of Kansu and Inner Mongolia, it became the capital city. In 1954, when Ning-hsia Province was abolished, it was put in Kansu Province, but with the establishment of the Ningsia Hui Autonomous Region in 1958, it once again became the capital.

Traditionally, Yin-ch'uan was an administrative and commercial centre. In the 1950s it had many commercial firms, and there were some handicrafts but no modern industry. The city has since grown considerably. Extensive coal deposits discovered on the eastern bank of the Huang Ho, near Shih-tsui-shan, 60 mi to the north, have made Shih-tsui-shan a coal-mining centre.

Yin-ch'uan, however, remains largely nonindustrial. The immediate plains area, intensively irrigated by a system developed as long ago as the Han (206 BC-AD 220) and T'ang (618-907) dynasties, is extremely productive. Yin-ch'uan is the chief agricultural market and distribution centre for the area, also dealing in animal products from the herds tended by nomads in the surrounding grasslands. It is a market for grain and has flour mills, as well as rice-hulling and oil-extraction plants. The wool produced in the surrounding plains supplies a woollen textile mill. Yin-ch'uan is a centre for the Muslim (Hui) minority peoples, who constitute a third of the population. Pop. (mid-1970s est.) 100,000-300,000.

Yin-hsien (China): see Ning-po.

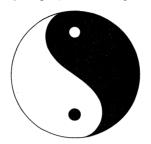

Yin Mountains, Pinyin and conventional YIN SHAN, range in the Inner Mongolian Autonomous Region, China, comprising the Tach'ing Shan, the Wu-la Shan, the Hara-narin and Sheyten Ula (mountains), and the Lang Shan. The Yin Shan mostly rise to heights of about 6,500 ft (2,000 m). The highest peaks in the southwestern Ta-ch'ing Shan reach 7,175 ft. The sub-ranges run roughly east to west along the northern bend of the Huang Ho (river) to the north of the Ordos Desert. They are sharply tilted, presenting a sharp and abrupt southern slope, and a gentle northern slope that merges into the high plateau of the Gobi (desert) to the north. The southern slope drains into the Huang Ho proper or into its tributaries, the Ta-hei Ho to the east and the Wu-chia Ho in the west. The northern slopes drain northwards into the desert; two of the longest of the northward-flowing streams are the Hsi-la-mu-lun Ho (Mongolian Shira Muren) and Ai-pu-kai Ho.

The Yin Shan ranges as a whole are mostly composed of ancient metamorphic rocks, but particularly in the southern ranges of the Wu-la Shan and the Ta-ch'ing Shan there are thick sedimentary rocks. These include rich

coal beds, and large coal mines are in operation at Shih-kuai-kou to supply power stations as well as the giant iron and steel complex at nearby Pao-t'ou, which also draws its supplies of iron ore from the northern part of the Yin Shan at Pai-yün-o-po. Most of the Yin Shan is arid, particularly in the western ranges such as the Lang Shan. In the central and eastern districts the climate is more moist; the vegetation is mostly grassland, with some trees such as birch and elm.

Yin Shan (China): see Yin Mountains.

yin-yang, Pinyin YINYANG, Japanese IN-Yō, in Eastern thought, the two complementary forces, or principles, that make up all aspects

Yin-yang symbol

and phenomena of life. Yin is conceived of as earth, female, dark, passive, and absorbing; it is present in even numbers, in valleys and streams, and is represented by the tiger, the colour orange, and a broken line. Yang is conceived of as heaven, male, light, active, and penetrating; it is present in odd numbers, in mountains, and is represented by the dragon, the colour azure, and an unbroken line. The two are both said to proceed from the Supreme Ultimate (T'ai Chi), their interplay on one another (as one increases the other decreases) being a description of the actual process of the universe and all that is in it. In harmony, the two are depicted as the light and dark halves of a circle.

The concept of yin-yang is associated in Chinese thought with the idea of the five agents, or elements (Wu hsing)—metal, wood, water, fire, and earth—both of these ideas lending substance to the characteristically Chinese belief in a cyclical theory of becoming and dissolution and an interdependence between the world of nature and human events.

The origins of the yin-yang idea are obscure but ancient. In the 3rd century BC in China, it formed the basis of an entire school of cosmology (the Yin-Yang school), whose main representative was Tsou Yen. The significance of yin-yang through the centuries has permeated every aspect of Chinese thought influencing astrology, divination, medicine, art, and government. The concept entered Japan in early times as $in-y\bar{o}$. A government bureau existed as early as AD 675 to advise the government on divination and on control of the calendar according to in-yo principles but later fell into disuse. $In-y\bar{o}$ notions permeated every level of Japanese society and persist even into modern times, as evident in the widespread belief in lucky and unlucky days and directions and in consideration of the zodiac signs when arranging marriages.

ying-ch'ing ware, Pinyin YINGQING, type of refined, thinly potted Chinese porcelain produced at Ching-te-chen, Kiangsi Province, and in Hopeh Province primarily during the Sung dynasty (960–1279), although it is likely that production began in the T'ang dynasty (618–907) and continued into the Ming dynasty (1368–1644). Authentic examples appear to be Sung and Yüan (1279–1368). Ying-ch'ing ("shadowy blue") ware is distinctive for its light buff-to-white, usually translucent, body covered with a white glaze tinged with a pale blue (ch'ing pai) ranging in tone from bluish

gray to bluish green. Sung wares are often decorated with finely carved or incised floral and animal motifs. Lightly molded relief is also found; however, it is more usual on Yüan wares. Typical are vase forms, including the mei p'ing style; ewers, often multi-lobed; conical bowls, some of which have copperbound rims; and stem cups. A certain amount of ying-ch'ing ware was exported. Forgeries are common.

Ying-k'ou, Pinyin YINGKOU, conventional NEWCHWANG, city and port in Liaoning Province (sheng), China. A prefecture-level municipality (shih), Ying-k'ou is situated near the mouth of the Hun Ho (river), some 11 mi (18 km) from the mouth of the Liao Ho, both of which are within the boundaries of the municipality. Ying-k'ou began to develop as a river port in the second quarter of the 19th century, replacing Niu-chuang and T'ien-chuang-t'ai farther upstream. At first the new port was called Mo-kou-ying (Mo-kou Encampment) after the garrison of coastal defense troops that was quartered there, and the name was later shortened to Ying-tzu-k'ou or Ying-k'ou. Under the Treaty of Tientsin (1858), Niu-chuang was opened to foreign trade, but silt in the Liao Ho (connected upstream with the Hun Ho) made it unusable, and instead Ying-k'ou was used as the port from 1864 onward. Somewhat confusingly, Europeans referred to the port as Newchwang (Niu-chuang), the name of the original treaty port.

In the late 19th century Ying-k'ou grew into a major port and was the principal outlet for goods from Manchuria. It was essentially a cargo transshipment point between the small junks that used the Liao Ho and seagoing ships. It was not, however, a very satisfactory port, since it was constantly silting up and was also ice-bound for three months of the year. Its importance largely vanished in the first decade of the 20th century because of the construction of railways in Manchuria, which diverted most of Ying-k'ou's former trade to Lü-ta (Dairen). With the construction of its own rail link with the Lü-ta to Shen-yang (Mukden) line, Ying-k'ou later regained something of its old importance, exporting great quantities of soybeans and manufacturing bean cake and vegetable oil. The city had a large foreign,

mainly Japanese, community.

Modern Ying-k'ou has developed into an important secondary industrial city, being mostly engaged in light industry. There were cotton mills, knitting factories, oil extraction plants, canneries, food-processing plants, and paper mills. The area also had a fishing industry and some large salt pans. An engineering industry, specializing in machine-tool manufacture, had also grown up, and a large-scale oil refinery had been established. Pop. (1980 UN est.)

Yirmeyahu (Hebrew prophet): see Jeremiah. Yisra'-el: see Israel.

Yisra'el, Muse'on: see Israel Museum.

Yíthion, also spelled GITHION, historically GYTHIUM, small port of Laconia, southern Peloponnese, Greece, at the northwestern extremity of the Lakonikós Kólpos (gulf) at the mouth of the Gythius River. The town is connected by a causeway to Marathonísi island, on which, according to the 2nd-century-AD Greek geographer Pausanias, the legendary Paris celebrated his nuptials with Helen. Yíthion is built on the site of Migonium, founded by the Phoenicians close to the site of an earlier

town founded by the Minoans; according to ancient legend the town was founded by Heracles and Apollo. In antiquity it served as the harbour and arsenal of Sparta, about 23 miles (37 km) to the northwest. The modern town exports olives and olive oil. Extant ruins are all of Roman date, though on a hill behind the town a sanctuary to Dionysus stood in antiquity. Pop. (1981) 4,054.

Yiyang (China): see I-yang.

yizkor (Hebrew: "may he [i.e., God] remember"), the opening word of memorial prayers recited for the dead by Ashkenazi (Germanrite) Jews during synagogue services on Yom Kippur (Day of Atonement), on the eighth day of Passover (Pesah), on Shemini Atzeret (the eighth day of Sukkot, the Feast of Tabernacles), and on the second day of Shavuot (Feast of Weeks). The prayers, recited after the reading of the Law and before the Torah scrolls are returned to their place in the holy ark, permit the worshipers to insert the names of departed relatives, who, it is believed, are also in need of atonement. This now-popular custom of praying for the dead arose during the European Middle Ages, when the names of Jewish martyrs were regularly read aloud during the services.

Sephardic (Spanish-rite) Jews have a somewhat similar custom: a person called up for the reading of the Torah may offer a short prayer (hashkava) for his departed relatives.

Yizre'el, 'Emeq (Israel): see Esdraelon, Plain of

ylang-ylang, also spelled ILANG-ILANG, also called PERFUME TREE (Cananga odorata), south Asian tree of the custard apple family (Annonaceae), in the order Magnoliales. A penetrating but evanescent perfume is distilled from its flowers.

Ylang-ylang in Tagalog (a Philippine language) means "flower of flowers." The slim, smooth-barked evergreen reaches about 25 m (80 feet) and is covered year-round with drooping, long-stalked, rich-scented flowers that have six narrow, greenish-yellow petals five centimetres (two inches) long. The alternate, pointed oval leaves have wavy margins and are 13 to 20 cm (5 to 8 inches) long. The clustered, oval black fruits hang from long stalks. Leis are made from the blooms, and the perfume is steam-distilled from the flowers

Ylang-ylang vine (Artabotrys odoratissimus), also in the family Annonaceae, produces masses of small, greenish-white flowers in spring and clustered, long-stalked, yellow, plumlike, two-seeded fruits in fall. It is not a source of commercial perfume. A 2- to 3.5-metre (6.5- to 11.5-foot) woody climber, it supports itself by hooks formed at the middle of the flower (and later fruit) stalks. Evergreen glossy leaves and fragrant flowers and fruits make it a valuable trellis or patio vine in areas of warm, moist climate.

Yngvi (Norse mythology): see Freyr.

Yo Fei (Chinese general): see Yüeh Fei.

yodel, type of singing in which high falsetto and low chest notes are rapidly alternated; its production is helped by the enunciation of open and closed vowels on the low and high notes of wide intervals. Yodeling is also used as a means of communicating over moderate distances by the inhabitants of mountainous regions. It is associated with the Alpine peoples of Switzerland and the Austrian Tirol. But it is found also in other mountain regions

(e.g., in China and the Americas) and among the Pygmies of Africa and the Aboriginal peoples of Australia.

In Alpine folk singing, yodeling—frequently mixed with nonsense syllables—occurs in passages called *Jodlers*, which occur at the beginning, middle, or end of a song. The origin of yodeling is buried in antiquity. It has been suggested that it originated as an imitation of the music of the alpenhorn (alphorn), but this point is uncertain.

Yodo River, Japanese YODO-GAWA, river, central western Honshu, Japan. The Yodo is the sole outlet of Lake Biwa, the country's largest freshwater lake, from which it issues in a southwesterly direction to Osaka Bay, connecting Kyōto Basin with Ōsaka Plain. It was a major means of transportation and communication during the Tokugawa period (1603–1867). The river is dammed for hydroelectricity and irrigation.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Yoga (Sanskrit: "Yoking," or "Union"), one of the six orthodox systems (darshans) of Indian philosophy. Its influence has been widespread among many other schools of Indian thought. Its basic text is the Yoga-sūtra by Patañjali (c. 2nd century BC?).

The practical aspects of Yoga play a more important part than does its intellectual content, which is largely based on the philosophy of Sāmkhya (q.v.), with the exception that Yoga assumes the existence of God, who is the model for the aspirant to spiritual release. Yoga holds with Samkhya that the achievement of spiritual liberation occurs when the self (purusha) is freed from the bondages of matter (prakriti) that have resulted because of ignorance and illusion. The Samkhya view of the evolution of the world through identifiable stages leads Yoga to an attempt to reverse this order, as it were, so that a person can increasingly dephenomenalize himself until the self reenters its original state of purity and consciousness. Once the aspirant has learned to control and suppress the obscuring mental activities of his mind and has succeeded in ending his attachment to material objects, he will be able to enter samadhi, i.e., a state of deep concentration that results in a blissful, ecstatic union with the ultimate reality.

Generally the Yoga process is described in eight stages (aṣṭāṅga-yoga, "eight-membered Yoga"). The first two stages are ethical preparations. They are yama ("restraint"), which denotes abstinence from injury (ahimsa), falsehood, stealing, lust, and avarice; and niyama ("observance"), which denotes cleanliness of body, contentment, austerity, study, and devotion to God.

The next two stages are physical preparations. Asana ("seat"), a series of exercises in physical posture, is intended to condition the aspirant's body and make it supple, flexible, and healthy. Mastery of the asanas is reckoned by one's ability to hold one of the prescribed postures for an extended period of time without involuntary movement or physical distractions. *Prāṇāyāma* ("breath control") is a series of exercises intended to stabilize the rhythm of breathing in order to encourage complete respiratory relaxation.

The fifth stage, pratyāhāra ("withdrawal"), involves control of the senses, or the ability to withdraw the attention of the senses from outward objects to the mind.

The first five stages are called external aids to Yoga; the remaining three are purely mental or internal aids. Dharana ("holding on") is the ability to hold and confine awareness of externals to one object for a long period of time (a common exercise is fixing the mind

on an object of meditation, such as the tip of the nose or an image of the deity). Dhyana ("concentrated meditation") is the uninterrupted contemplation of the object of meditation, beyond any memory of ego. Samadhi ("self-collectedness") is the final stage and is a precondition of attaining release from the cycle of rebirth. In this stage the meditator perceives or experiences the object of his meditation and himself as one.

The prehistory of Yoga is not clear. The early Vedic texts speak of ecstatics, who may well have been predecessors of the later yogins (followers of Yoga). Although Yoga has been made into a separate school (darsana), its influence and many of its practices have been felt in other schools.

In the course of time, certain stages of Yoga became ends in themselves, notably, the breathing exercises and sitting postures, as in the Yoga school of Hatha Yoga (q.v.). Patañjali's Yoga is sometimes known as Rāja (Royal) Yoga, to distinguish it from the other schools.

Yoga, in a less technical sense of achieving union with God, is also used, as in the epic poem the *Bhagavadgītā*, to distinguish the alternate paths (*mārgas*) to such a union.

In the 20th century, the philosophy and practice of Yoga became increasingly popular in the West. The first important organization for practitioners in the United States was the Self-Realization Fellowship, founded by Paramahansa Yogananda in 1920. Some 50 years later, instruction emphasizing both the physical and spiritual benefits of Yogic techniques was available through a wide variety of sectarian Yoga organizations, nonsectarian classes, and television programs in the United States and Europe.

Yogācāra (Sanskrit: "Practice of Yoga [Union]"), also called VIJÑĀNAVĀDA ("Doctrine of Consciousness"), an important idealistic school of Mahāyāna Buddhism. It attacked both the complete realism of Theravāda Buddhism and the provisional practical realism of the Mādhyamika school of Mahāyāna Buddhism. The name of the school comes from the title of an important 4th- or 5th-century text of the school, the Yogācāraherāsāstra ("The Science of the Street of Yoga Practice")

("The Science of the Stages of Yoga Practice"). The other name of the school, Vijñānavāda, is more descriptive of its philosophical position, which is that the reality a human being perceives does not exist, any more than do the images called up by a monk in meditation. Only the consciousness that one has of the momentary interconnected events (dharmas) that make up the cosmic flux can be said to exist. Consciousness, however, also clearly discerns in these so-called unreal events consistent patterns of continuity and regularity; in order to explain this order in which only chaos really could prevail, the school developed the tenet of the alaya-vijñana, or "storage consciousness." Sense perceptions are ordered as coherent and regular by a store of consciousness, of which one is consciously unaware. Sense impressions produce certain configurations (saṃskāras) in this unconscious that 'perfume" later impressions so that they appear consistent and regular. Each being possesses this storage consciousness, which thus becomes a kind of collective consciousness that orders human perceptions of the world, though this world does not exist. This doctrine was cheerfully attacked by the adherents of the Mādhyamika school of Mahāyāna Buddhism, who pointed out the obvious logical difficulties of such a tenet.

Apart from human consciousness, another principle was accepted as real, the so-called suchness (tathatā), which was the equivalent of the void (śūnya) of the Mādhyamika school.

The school emerged in India in about the 2nd century AD but had its period of greatest productivity in the 4th century, during

the time of Asanga and Vasubandha. Following them, the school divided into two branches, the Āgamānusariņo Vijñānavādinaḥ (Vijñānavāda School of the Scriptural Tradition) and the Nyāyānusariņo Vijñānavādinaḥ (Vijñānavāda School of the Logical Tradition), the latter subschool postulating the views of the logician Dignāga (c. AD 480–540) and his successor, Dharmakīrti (c. AD 600–660). The teachings of the Yogācāra school were

The teachings of the Yogācāra school were introduced into China by the 7th-century monk-traveller Hsüan-tsang and formed the basis of the Fa-hsiang school founded by Hsüan-tsang's pupil K'uei-chi. Because of its idealistic content it is also called Wei-shih (Ideation Only).

Transmitted to Japan, as Hossō, some time after 654, the school split into two branches, the Northern and the Southern. During the 8th century it enjoyed a period of political influence and produced such celebrated priests as Gembō and Dōkyō. In modern times the school retained the important temples of Horyū-ji, Yakushi-ji, and Kōfuku-ji, all located in or near Nara and all treasure-houses of Japanese religious art.

yogurt, also spelled YOGHURT, YOURT, or YOGHOURT, semifluid fermented milk food having a smooth texture and mildly sour flavour because of its lactic acid content. Yogurt may be made from the milk of cows, sheep, goats, or water buffalo. Cow's milk is used in the United States and north central Europe; sheep's and goat's milk are preferred in Turkey and southeastern Europe; milk from the water buffalo is most commonly used in Egypt and India.

Yogurt may have originated in Turkey, although there are many stories about its discovery. It is made in Turkish homes by boiling milk in an uncovered pan to sterilize it and to evaporate water; after cooling, the milk is inoculated with yogurt from a previous batch, incubated a few hours, then slowly cooled to room temperature before use.

Commercial dairies usually add milk solids to cow's milk to make yogurt with a custard-like consistency. Concentrated sterilized milk is inoculated with *Streptococcus thermophilus*, *Lactobacillus bulgaricus*, or *L. acidophilus*; sometimes a lactose-fermenting yeast is also added. This inoculated milk is then incubated four or five hours at about 43° to 44° C (110° to 112° F) until curd forms.

Yogurt is known and consumed in almost all parts of the world. Various flavours and sweetening may be added, or natural yogurt may be mixed with fresh fruits or vegetables. A salad of yogurt, sliced cucumbers, and spices is served in India (raita) and several Middle Eastern countries (jajik). Yogurt is also used in soups and sauces.

Yogyakarta, daerah istimewa (special district), south central Java, Indonesia, bounded on the west, north, and east by Jawa Tengah propinsi (Central Java province) and fronting the Indian Ocean on the south. It has an area of 1,224 sq mi (3,169 sq km).

In the 7th century, Yogyakarta formed part of the Buddhist kingdom of Sailendras, which was contemporaneous with the Śrivijaya Empire of Palembang (Sumatra). It was probably included in the later Kediri and Singhasari kingdoms that ruled the region successively. The end of the 13th century saw the rise of the Hindu Majapahit Empire in eastern Java, and what is now Yogyakarta passed under its rule. In the early 16th century, central Java had two Muslim kingdoms, Demak and Pajang, which were incorporated into the powerful Muslim kingdom of Mataram by Senapati Ingalaga (ruled 1584-1601). The Dutch entered the region in 1602. After numerous conflicts, Mataram subdued the state of Surabaya in eastern Java in 1625 and gained general supremacy in the territory. In rebellion against Dutch intervention in Javanese politics, Sultan Hamengkubuwana I moved his court from Kuta Gede to Yogya in Mataram in 1755 and renamed the town Yogyakarta. In 1756 another rebel, Mas Said, attacked the town. During the Napoleonic Wars early in the 19th century, the French occupied The Netherlands, and in 1808 Louis Bonaparte, then king of Holland, sent marshal Herman W. Daendels to Batavia (now Jakarta) as governor general, with the object of extending control over the rest of the Javanese states. Yogyakarta was compelled to accept French suzerainty, until the British managed to win Java by defeating the combined forces of Yogyakarta, Surakarta, and the French. The British captured Yogyakarta in 1812, and Sultan Hamengkubuwana II was deposed and exiled. In 1816, the Dutch repossessed the island of Java and by 1830 Dutch colonial rule was firmly established. The library of the sultanate at Yogyakarta, burned by the British in 1812, was rebuilt, and the court patronized Raden Saleh, a well-known painter. A new bureaucracy, the priyari, came into existence, and, together with the royal elite, was firmly tied to the Dutch colonial administration. A new kind of leadership, initially inspired by Wahidin Sudirohusodo and Kyai Haji Ahmad Dahlan from Yogyakarta, began to emerge. Islāmic reform was sponsored by Suwardi Surjaningrat from the Yogyakarta royal house of Pakualam. After the period of Japanese oc-cupation during World War II, the Republic of Indonesia was formed. The national capital was removed to Yogyakarta when the Dutch occupied Jakarta in 1946; it was moved back to Jakarta in 1950 upon independence, and Yogyakarta was given the status of a special district in the Republic of Indonesia.

Most of the western half of the special district comprises coastal plains, as much as 15 mi (24 km) wide, consisting of lava and ash soils that are often replenished by the volcanic discharges of the Pegunungan (mountains) Merapi to the north. The eastern part of Yogyakarta is an extension of the Kendang Plateau that extends east-west near the coast. The major rivers are the Ojo (together with its tributary, the Opak) and the Progo; they flow southward into the Indian Ocean. Agriculture and fishing are the principal means of livelihood of the people of the coastal lowlands. Products include rice, rubber, copra, and sugar. Yogyakarta is one of the more industrially developed areas in Indonesia; industries include railroad workshops, printing, textile making, tanning, food processing and production of transport equipment, paper, chemicals, and electrical machinery. A network of roads and railways links Yogyakarta city, the capital of the special district, with nearby Bantul, Magelang, and Surakarta. The population consists mainly of Javanese, Sundanese, and Balinese Muslims. There are also numerous Chinese, Indians, and Europeans. Pop. (1980) 2,750,813.

Yogyakarta, also spelled DJOKJAKARTA, JOGJAKARTA, JOKJAKARTA, JOKJAKARTA, OT JOKJAKARTA, kotamadya (city) and capital, Yogyakarta daerah istimewa (special district), Java, Indonesia, 18 mi (29 km) inland from the southern Java coast and near Gunung (mount) Merapi (9,485 ft [2,891 m]). It was founded by sultan Hamengkubuwana I of the Mataram kingdom in 1755. Captured by the British in 1812, the district reverted to the Dutch in 1816. From 1946 to 1949 the city was the governmental seat of the Republic of Indonesia, though from December 1948 to July 1949 it was occupied by Dutch forces.

The city is famous as a cultural centre and for its handtooled silver products, batik, and leather goods. It also has railway workshops, textile mills, tanneries, and pharmaceutical factories. In Yogyakarta are the 18th-century palace (kraton) of the sultan (the only traditional ruler in Indonesia retaining any tempo-

ral power), a state university (Universitas Gajah Mada), the Perpustakaan Yayasan Hatta (Hatta Foundation library), the Sono Budoyo museum, an art academy, and a private university. Other tourist attractions are the nearby ancient temples of Borobudur and of Prambanan, the country around Kaliurang, a hill resort high on Mt. Merapi, and the village of Kotagede, centre of the silver industry. The city has an airport and extensive rail and road connections. The city also houses the *kraton* of the Paku Alam, another traditional ruler. Pop. (1980) 398,727.

Yohannes IV, English JOHN IV, original name KASSA (b. 1831—d. March 10, 1889), emperor of Ethiopia (1872–89). Like his predecessor, Tewodros II (reigned 1855–68), he was a strong, progressive ruler, but he had to spend most of his time repelling military threats from Egypt, Italy, and the Mahdists of the Sudan.

Superior weaponry allowed Yohannes, a ras (prince) of Tigre (in northern Ethiopia), to fight his way to the Ethiopian throne four years after Tewodros' death. His main rival was Menelik II, king of Shewa, who did not recognize Yohannes as emperor until 1878/ 79, after a military defeat. Menelik's eclipse, however, was only temporary. In 1882 a dynastic marriage was arranged between Menelik's daughter and Yohannes' son, and it was agreed that Menelik would be Yohannes' successor as emperor. Yohannes also recognized Menelik's control of the south, and their separate spheres of influence were carefully defined. Tensions between the two rose again by 1888, however, when Menelik, fearing that Yohannes' son might try to follow his father to the throne, made an agreement with the Italians in exchange for arms.

Aside from the recurrent problem of the powerful king of Shewa, Yohannes' domestic concerns were mainly to reduce the power of the other regional nobles (and thus create a unitary government) and to increase his hold on his subjects through enforced conversion to the Ethiopian Church. His attempt to use religion as a basis for unity aroused resistance, however, particularly from Muslims who were ordered to build churches, pay tithes, and eventually be baptized.

The expansionist khedive (Ottoman viceroy) Ismā'il Pasha of Egypt posed the first external threat to Yohannes' empire. By the mid-1870s Egypt had encroached on Ethiopia to the east and south, but Ethiopian forces, in what verged on an anti-Muslim crusade, won decisive victories in the mountainous country of the north in 1875 and 1876. Italy, the next aggressor, in 1885 occupied the former Turkish and Egyptian Red Sea port of Mitsiwa (Massawa) and then began to expand inland toward the province of Tigre, only to be soundly defeated by Yohannes in 1887. In the same year, the Islāmic revivalist Mahdist forces, gaining ground in the Sudan, invaded Ethiopia and devastated the old capital, Gonder. In retaliation (and possibly in the hope of getting Sudanese gold and slaves and even of gaining access to the Nile) Yohannes invaded the Sudan and was killed in the Battle of Metemma (March 1889).

Yoho National Park, park in British Columbia, Canada, occupying 507 sq mi (1,313 sq km) of the western slopes of the Rocky Mountains and adjacent to two other national parks—Banff on the east and Kootenay on the south. Features include Takakkaw Falls, Natural Bridge, and Emerald Lake. A mountaineering centre, the park has several peaks of more than 10,000 ft (3,050 m), including Mts. Goodsir and Gordon. On the west side of Mt. Stephen are fossil beds thought to be 500,000,000 years old. Fauna includes a wide

Yoi (people): see Puvi.

Yojoa, Lake, Spanish LAGO DE YOJOA, southwestern Cortés, northwestern Comayagua, and southeastern Santa Bárbara departments, northwestern Honduras. The nation's largest inland lake, Yojoa has an area of 110 sq mi (285 sq km). Volcanic in origin, it nestles at an elevation of 2,133 ft (650 m) above sea level amid forested mountains. The region is a popular tourist resort, with fishing and duck shooting on the lake and hunting in the surrounding hills. Yojoa is easily accessible, lying on the main highway linking Tegucigalpa, the national capital, with San Pedro Sula and urban centres on the Caribbean.

yoke, wooden bar or frame used to join draft animals at the heads or necks so that they pull together. In the early Near East and in Greece and Rome, oxen and onagers were yoked across the horns or necks. Control of a team of yoked beasts was difficult. Furthermore, ancient yokes pressed against a hard-pulling animal's windpipe, choking it. The invention of the horse collar solved this problem and led to replacement of oxen by horses. In some areas of the world, however, oxen still are yoked together much as they were in medieval Europe.

Yokkaichi, city, Mie Prefecture (ken), Honshu, Japan, facing Ise-wan (Ise Bay), west of Nagoya. The city developed around a castle built in 1470. By the Tokugawa era (1603–1867) it had become an important trade centre, with markets open on the fourth day of each month (yokka means "fourth day in the month," and ichi means "market"). The city suffered heavy damage during World War II, but later became the site of a large petrochemical complex. Automobiles, textiles, and chemicals are produced in factories built on reclaimed land. Its growing port imports raw materials and exports its industrial products. The city is considered the nucleus of the Northern Ise Industrial Zone. Pop. (1983 est.) 259,938.

Yokohama, city and port, capital of Kanagawa Prefecture (Kanagawa-ken), Japan, and part of the Keihin Industrial Zone (q.v.; Keihin Kōgyō Chitai), the largest urban agglomeration in Japan.

The following article treats briefly the modern city of Yokohama. Fuller treatment is provided in the following MACROPAEDIA articles. For history and contemporary life, see Tokyo-Yokohama Metropolitan Area; for additional perspective on the city in its national context, see Japan.

Situated on the western coast of Tōkyō-wan (Tokyo Bay) on the Pacific coast of the island of Honshu, Yokohama was only a small fishing village when in 1859 neighbouring Kanagawa was designated Japan's major port where foreigners could reside and trade. The area flourished with the growth of Japan's foreign trade and shipping, opened wide with the Meiji Restoration beginning in 1868, and in 1889 the city of Yokohama was established through the amalgamation of Kanagawa and Yokohama. The city has become the second largest city in Japan and a major port and industrial centre. It was destroyed by earthquake and fire in 1923 and severely damaged by U.S. air raids during World War II in 1945, but was rebuilt both times.

Yokohama stands on a plain shut in by hills, one of which terminates toward the southeast in a promontory called Hommoku-misaki.

The climate is mild in winter and hot and humid in summer. Early summer and mid-autumn are the rainy seasons; typhoons usually occur in the autumn.

Yokohama and neighbouring Kawasaki form the centre of the Keihin Industrial Zone. Much of the heavy manufacturing is concentrated there, including the production of chemicals, machinery, primary metals, petroleum products, automobiles, fabricated metal goods, and shipbuilding. The port of Yokohama, one of the largest in Japan, handles imports of raw materials for the surrounding industrial zone and a wide range of exports.

Yokohama's business district, containing many important banks and other businesses, is concentrated around the port. At the northern extremity of the business district, near Sakuragi Street Station, is the central shopping street of Isezaki; the industrial area is farther north along the coast. To the south of the business district is Yamate, a hilly residential area. Yamashita Park, which was laid out in 1925 along the base of one of the piers, offers a splendid view of the harbour. Farther south near the shore, Sankei-en (Sankei Garden) contains a collection of historic buildings (notably an ancient pagoda) that were brought from other parts of the country. Positioned on a hill above Yamashita Park is Nogeyama Park, which, with its beautiful gardens, open-air theatre, concert hall, and zoo, is one of the largest parks in the city.

Yokohama's active cultural life is enhanced by its four universities, two privately owned and two public. The Kanazawa Bunko (Kanazawa Library), founded in 1275, is famous for its collection of historical books and documents. Yokohama has a commercial and industrial museum, and its numerous theatres present everything from traditional Kabuki plays to modern drama.

Local transportation is provided by buses and subway lines. Yokohama is connected by highways and railways with Tokyo, the national transportation centre, and with other major cities of Japan. Atsugi Airport, west of Yokohama, is used by some domestic airlines. The city is also served by Tokyo's Haneda and Narita international airports. Area 165 sq mi (427 sq km); Pop. (1983 est.) 2,893,421.

Yokomitsu Riichi, also called YOKOMITSU TOSHIKAZU (b. March 17, 1898, Higashiyama, Fukushima Prefecture, Japan—d. Dec. 30, 1947, Tokyo), Japanese writer who, with Kawabata Yasunari, was one of the mainstays of the Neo-sensualist school of Japanese writers, influenced by the avant-garde trends in European literature of the 1920s.

Yokomitsu began writing while still at Waseda University, which he left without graduating; and he later joined the playwright Kikuchi Kan's journal Bungei shunjū. In 1923 he joined Kawabata in publishing the journal Bungei jidai ("The Artistic Age"). It was Yokomitsu's story Atama narabi ni hara (1924; "Head and Stomach") that critics hailed as a new kind of writing. In opposition to the autobiographical legacy of naturalism and the social pleading of proletarian literature, Yokomitsu developed an aesthetic of sensual

Yokomitsu Riichi
By courtesy of the International Society for Educational Information, Tokyo

impressions presented in fresh, startling ways. Concerned always with the theory of writing, he put forth his ideas in Junsui shōsetsu ron (1935; "On the Pure Novel"). Haru wa basha ni notte (1926; Spring Came on a Horse-Drawn Cart, 1957), dealing with his wife's fatal illness, is a lyrical, sensitive story; Kikai (1930; Machine, 1962) shows his growing obsession with the idea of a mechanistic principle governing human behaviour.

Yokosuka, seaport, Kanagawa Prefecture (ken), Honshu, Japan, on the western shore of Tōkyō-wan (Tokyo Bay). Its site on the Miura-hantō (Miura Peninsula) was occupied by a small fishing village until a shipyard was established there in 1865. By 1884 it had become a major naval station and, after World War II, served as a base for the U.S. Navy and a station for the Japanese National Safety Agency.

Yokosuka has become one of Japan's important trade and fishing ports. In the east are two fine harbours of Yokosuka and Nagaura. Shipbuilding is the major industry. Yokosuka also serves as a residential district for the Tokyo-Yokohama Metropolitan Area. Pop. (1983 est.) 427,179.

Yokoyama Taikan, original name SAKAI HIDEMARO (b. Nov. 4, 1868, Mito, Japan—d. Feb 26, 1958, Tokyo), Japanese painter who, with his friend Hishida Shunsō, contributed to the revitalization of traditional Japanese painting in the modern era.

Yokoyama studied Japanese painting with Hashimoto Gahō at the Tokyo Art School and became a favourite of its principal, Okakura Kakuzo (Tenshin). Yokoyama started teaching design at the school in 1896 but left it when the principal was ousted. When the latter started the Japan Fine Arts Academy with Hishida, Shimomura Kanzan, and others, Yokoyama also joined him, in 1898. He tried to reconsider the whole technique of traditional Japanese painting, which relied heavily on line drawing, and with Hishida developed a new style, eliminating lines and concentrating on colour combinations. This style was pejoratively nicknamed mōrōtai (mōrō means vague or indistinct, but at that time had a

"Transformations," detail of a painting by Yokoyama Taikan, 1923; in the Tokyo National Museum

By courtesy of the Tokyo National Museum

stronger negative sense; mōrō shafu meant a hooligan rickshaw man).

Yokoyama became one of the examiners for the Fine Arts Exhibition sponsored by the Ministry of Education (founded in 1907; the exhibition was abbreviated as Bunten). Internal squabbling subsequently resulted in his being ousted from this post, and he concentrated on reviving the Japan Fine Arts Academy, which had closed down upon Okakura Kakuzo's death. The Academy was revived in 1914, and its annual exhibitions, which have the abbreviated name Inten, became an important, nongovernmental outlet for young talents. Among Yokoyama's works are "Yamaji" ("Mountain Path"), "Seisei ruten" ("Vicissitudes"), and "Yozakura" ("Cherry Blossoms at Night").

Yokuts, also called MARIPOSAN, California Indians speaking a language of Penutian stock who historically inhabited the San Joaquin Valley and the western footbills of the Sierra Nevada south of the Fresno River. The Yokuts were divided into tribes, perhaps as many as 50, each having a dialect, territory, and name of its own

The Yokuts gathered such plant foods as seeds and roots but were also hunters, with elaborate systems for snaring deer and running down antelope and elk to shoot them with bow and arrow. The most characteristic Yokuts dwelling was the mat-covered communal house inhabited by 10 families or more. In addition, flat roofs were erected on poles for shade. Clothing was simple: men wore loincloths or went naked; women wore fringed aprons front and back.

Chiefs headed tribes and villages. In addition to wealth, they were expected to have more than the usual knowledge, especially in religious matters. The office was hereditary and could be held by women. Two other important offices were those of jester, or clown, and of undertaker, usually a male transvestite whose exclusive function was to prepare bodies for burial or cremation. Polygamy was socially acceptable among the Yokuts, but it was rarely practiced.

Yokuts ceremonies included puberty rite for boys, involving use of the hallucinogen toloache, made from the jimsonweed. Other ceremonies, including one to prevent rattlesnake bites, were performed by the shamans—medicine men who also participated in intertribal contests of shamanistic power.

Yola, town and capital of Gongola State and seat of the traditional Adamawa emirate, eastern Nigeria. The town is served by the port of Jimeta (5½ mi [9 km] north-northwest) on the Benue River, about 500 mi above its confluence with the Niger, and by an airfield. Yola also has road connections with Numan, Jalingo, Ganye, Fufore, and Jimeta.

The name of the town is derived from yolde, a Fulfulde (Fulani language) word signifying a settlement on rising ground. Yola was founded and made the political centre of Adamawa emirate in 1841, when Modibbo ("Learned One") Adama, the Fulani founder of the emirate, established Yola as a base in his holy war against the indigenous Bata (Batta) and Vere (Verre) peoples.

Several European explorers visited the town, and in 1891 a Frenchman, Lieut. Louis Mizon, convinced the Amir to recognize French territorial claims. By 1893 the British had extended their control over this part of the emirate, and shortly afterward the Royal Niger Company established a trading post in the town. After Amir Lauwal Zubeiru forced the company to evacuate the town in 1901, a British expedition was sent there from Lokoja and defeated the Fulani forces. Although German forces raided Yola from Kamerun (Cameroon) in 1914, the town was successfully defended by the British. It was merged by the Fulani administration

with neighbouring Jimeta in 1935, but in the 1963 census they were again recognized as separate municipalities.

Much of Yola's trade has now shifted to Jimeta, but both towns are sizable market centres. Especially during the latter part of the rainy season—from July to October, when the Benue River is navigable by vessels of 4-ft (1.2-m) draft—merchants from Yola and Jimeta collect peanuts (groundnuts), cotton, hides, and skins for shipment to the Niger Delta ports of Burutu and Warri. Local trade is primarily in sorghum, millet, shea nuts, yams, rice, cowpeas, sugarcane, peanuts, fish, onions, peppers, indigo, cattle, goats, poultry, sheep, and cotton. Yola also has a substantial bakery.

The town has taken on growing functions in both administration and education. It has colleges of law, arts and sciences, and advanced teacher-training and a pre-university preparatory school. Yola is served by a hospital with a school of nursing and midwifery, a central mosque, and a Roman Catholic church. Pop. town (latest census), 8,573.

Yolande DE BRIENNE: *see* Isabella II *under* Isabella (Jerusalem).

yolk, also called DEUTOPLASM, the nutritive material of an egg, used as food by a developing, embryonic animal. Eggs with relatively little, uniformly distributed yolk are termed isolecithal. This condition occurs in invertebrates and in all but the lowest mammals. Eggs with abundant yolk concentrated in one hemisphere of the egg are termed telolecithal. This occurs in many invertebrates and in all vertebrates lower than marsupial mammals. In arthropods, the yolk is massed near the centre of the egg; such eggs are termed centrolecithal.

Yom Kippur. Hebrew Yom HA-KIPPURIM. English DAY OF ATONEMENT, the most solemn of Jewish religious holidays, observed on the 10th day of the lunar month of Tishri (in the course of September and October), when Jews seek to expiate their sins and achieve a reconciliation with God. Yom Kippur concludes the "10 days of repentance" that begin with Rosh Hoshanah (New Year's Day) on the first day of Tishri. The Bible refers to Yom Kippur as Shabbat Shabbaton ("Sabbath of Solemn Rest," or "Sabbath of Sabbaths") because, even though the holy day may fall on a weekday, it is on Yom Kippur that solemnity and cessation of work are most complete. The purpose of Yom Kippur is to effect individual and collective purification by the practice of forgiveness of the sins of others and by sincere repentance for one's own sins against God.

Yom Kippur is marked by abstention from food, drink, and sex. Among extremely Orthodox Jews the wearing of leather shoes and anointing oneself with oil are forbidden. Orthodox Jews may wear long white robes called kippelot.

Jewish congregations spend the eve of Yom Kippur and the entire day in prayer and meditation. On the eve of Yom Kippur the Kol Nidre is recited. Famous for its beautiful melody, the Kol Nidre is a declaration annulling all vows made during the course of the year insofar as they concern oneself (obligations toward others are excluded). Friends also ask and accept forgiveness from one another for past offenses on the evening before Yom Kippur, since obtaining forgiveness from one's fellows signifies God's forgiveness. God is believed to forgive the sins of those who sincerely repent and show their repentance by improved behaviour and performance of good deeds.

The services on Yom Kippur itself last continuously from morning to evening and include readings from the Torah and the reciting of penitential prayers. Yiskur, which are memorial prayers for the recently deceased,

may also be recited by members of the congregation. The services end with closing prayers and the blowing of the ritual horn known as the shofar.

Before the destruction of the Temple in Jerusalem, the high priest performed an elaborate sacrificial ceremony in the Temple, successively confessing his own sins, the sins of priests, and the sins of all Israel. Clothed in white linen, he then entered the Holy of Holies—allowed only at Yom Kippur—to sprinkle the blood of the sacrifice and to offer incense. The ceremony concluded when a goat (the scapegoat), symbolically carrying the sins of Israel, was driven to its death in the wilderness.

Yomiuri shimbun, Japanese national daily newspaper, second in circulation only to *Asahi shimbun* and the most sensational in editorial style of Japan's "big three" dailies.

Yomiuri was founded in 1874, one of five new dailies created early in the Meiji period (1868–1912) to meet the need for a vernacular newspaper in the rapidly modernizing society of Japan. Yomiuri ("selling by reading") was the practice of news vendors of the Tokugawa period (1603–1867), who hawked newssheets, printed from hand-graven blocks before the advent of movable type, by reading them aloud.

Like its more sedate rivals Asahi and Mainichi, Yomiuri has five regional morning and evening editions plus an English-language edition in Tokyo. Yomiuri was consciously influenced by the journalistic style of the American papers of William Randolph Hearst, Sr., in the early decades of the 20th century. The paper's main appeal is to working-class readers. The paper also established the first professional baseball team in Japan (now called the Yomiuri Giants), which helped to increase its circulation.

Yomou, town, capital of Yomou Region, southeastern Guinea, West Africa. It is the chief trading centre (rice, cassava, coffee, and palm oil and kernels) for a densely forested region of the Guinea Highlands mainly inhabited by the Guerze (Kpelle) and Mano (Manon) peoples. Yomou region borders Liberia on the east, west, and south and the Guinean regions of Macenta on the northwest and Nzérékoré on the northeast. Pop. (1977 prelim.) region, 72,000.

Yomut carpet, Yomut also spelled YOMUD, floor covering that is handwoven by the Yomut Turkmens of the Turkmen S.S.R., and is usually of good to excellent quality. In contrast to Tekke carpets, there is considerable variety of design among the larger Yomut carpets. Many have diagonal rows in which a single diamond- or lozenge-shaped motif is repeated with diverse colourings. This motif may be edged with latch hooks; but the most characteristic edging is composed of a graduated group of vertical bands, each of which is graced with tiny florets. A second series of carpets has vertical rows of particoloured octagons on which appear tiny, stylized twoheaded dogs. The border is usually a highly geometric vine design on white; and end aprons are covered with stylized designs of leaves and stems or, in some cases, elaborate flowering plants. Colouring ranges from bright red to plum shades, with white being used for the field in some of the small bag faces (the fronts of saddlebags or storage bags).

A weaving apparently peculiar to the Yomuts is a five-sided decorative panel resembling a storage-bag face, usually ornamented with a diamond lattice or a row of conventionalized fir trees. Yomut tent bands (used to decorate tents) and brocaded flat-surfaced rugs are also noteworthy. The larger Yomut carpets

are entirely of wool or goat hair, usually in Ghiordes knotting; in small pieces, for which Sehna knotting is used more frequently, white cotton has been combined occasionally with

Yomut carpet from Russian Turkistan, 19th century; in the Metropolitan Museum of Art, New York City

wool in the weft. Like Tekke carpets, Yomut carpets were often sold as Bokharas. *See* also Bokhara rug.

Yonago, city, Tottori Prefecture (ken), Honshu, Japan, on the delta of the Hino-kawa (Hino River), which forms the Yonago Plain. The city occupies the base of a sandspit called the Yumiga-hama, which extends from the mouth of the river northwest into the Sea of Japan. Yonago was originally a fishing village called Kano. With the construction of Yonago castle (1601), it grew into a regional centre of transport and commerce. The city is now a major industrial site, producing pulp, processed foods, iron and steel, and textiles. Yonago is also a gateway to the Daisen-Oki National Park. Pop. (1983 est.) 130,337.

Yonezawa, city, Yamagata Prefecture (ken), Honshu, Japan, on the Ou Line (railway). From the Muromachi period (1338–1573) to the Meiji Restoration (1868) it was a castle town of the Uesugi daimyo family (see Uesugi family). The ruling family initiated agrarian reforms by constructing irrigation systems and allowing samurai (warriors) to cultivate the fields and manufacture silk. Industrialization was slow until the early 1960s, when traditional small-scale textile manufacture was supplemented with the production of electrical appliances and lumber.

Matsugasaki Park, located on the old castle site, contains the shrines of two well-known members of the Uesugi family—Uesugi Kenshin (1530–78), who won a battle in defense of his fief against the Hōjō clan, and Uesugi Harunori (1756–1822), who introduced silk weaving into the city. Pop. (1980) 92,823.

Yong'an (China): see Yung-an.

Yonge, Charlotte M(ary) (b. Aug. 11, 1823, Otterbourne, Hampshire, Eng.—d. March 24,

1901, Otterbourne), English novelist who dedicated her talents as a writer to the service of the church. Her books helped to spread the influence of the Oxford Movement, which

Charlotte Yonge, detail of a watercolour by George Richmond, 1844; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

sought to bring about a return of the Church of England to the High Church ideals of the late 17th century.

Her first success came with *The Heir of Redclyffe* (1853), whose hero made goodness attractive and romantic. Her other novels include *Heartsease* (1854); *The Daisy Chain* (1856), which depicts the moral conflict of sheltered lives; and *The Young Stepmother* (1861). She also edited a magazine for girls, *The Monthly Packet*, for which she wrote historical cameos, and composed religious tracts. Her best work has a vitality that saves it from being propagandist.

Yonglo (Chinese emperor): see Yung-lo.

Yŏngsan River, Korean YŏNGSAN-GANG, river, southwestern South Korea. Rising in extreme northern Chölla-namdo (North Chölla Province), the Yŏngsan River flows southwest into the Yellow Sea near Mokp'o. The drainage basin is South Korea's most important rice growing area and was the scene in the mid-1970s of the construction of four multipurpose dams for both flood control and water storage.

Yongzheng (Chinese emperor): *see* Yungcheng.

yoni (Sanskrit: "holder"), in Hinduism, representation of the female sexual organ and thereby the symbol of the goddess Sakti, consort of Siva. The *yoni* is often associated with the *linga* (q.v.), the representation of the phallus and symbol of the god Siva, in the iconography of Saivism.

Yonkers, city, Westchester County, southeastern New York, U.S., on the east shore of the Hudson River, in a hilly region north of the Bronx, New York City. The site, once the capital village, Nappeckamack, of the Manhattan Indians, was acquired by the Dutch West India Company in 1639. Adriaen van der Donck—known as De Jonkheer, a courtesy title roughly equivalent to "squire" (whence, phonetically, Yonkers)—was given a land grant in 1646 and established the patroonship of Colendonck in 1652. The lands were then bought by Frederick Philipse who built a manor house there in 1682 (later used as the Yonkers city hall). The manor was confiscated (1779) because the founder's great grandson espoused the Tory cause during the Revolution; it is a state historic site.

A thriving farm village within the Town (township) of Yonkers (established in 1778), Yonkers was connected to New York City by railroad in 1849. The Otis Elevator Works was established there in 1854. The southern portion of old Yonkers was annexed to what later became the Bronx in 1874. Industry is now well diversified and includes printing and

publishing and the manufacture of elevators, hoisting machinery, chemicals, cables, electronic components, and clothing. St. Joseph's Seminary and College was established there in 1886 and Elizabeth Seton (junior) College in 1961. St. Andrews Golf Club, one of the oldest in the United States, was organized in Yonkers in 1888. The local Hudson River Museum has regional art and science exhibits. Inc. village, 1855; city, 1872. Pop. (1982) 192.342.

Yonne, département, Bourgogne region, central France, created from portions of the historic provinces of Champagne and Burgundy (Bourgogne) with additional small sections of the old provinces of Orléanais and Nivernais. Covering an area of 2,867 sq mi (7,425 sq km), it is named after the Yonne River, which bisects it, flowing south-north through Auxerre, the capital, and Sens. The eastern section is watered by the Armaçon River, accompanied by the Canal de Bourgogne (Burgundy Canal). The Loing River, which rises in the département within the southern border, crosses its southeast corner

Woodland and heath occupy much of the département, which comprises plains and plateaus extending southeast from the Seine Valley to the forested Morvan heights. The west of the département includes part of the Gâtinais woodland and heath district; the east includes the hilly Forêt (forest) d'Othe area. The climate is temperate with warm summers.

Cereals and fodder are the main crops, and cattle are reared. The valley slopes produce famous wines, especially those of Chablis, east of Auxerre. The towns are no more than small market centres for agricultural produce, and there is little industry (wood processing, electrical equipment, food processing). Consequently there has been a steady rural exodus to the Paris region.

The Autoroute du Sud from Paris to the Mediterranean coast crosses the *département*, which is a centre for tourism, having numerous ancient villages, historic churches, and châteaus. Beside the cathedrals of Auxerre and Sens, the Romanesque basilica of Vézelay is of particular interest, as are the châteaus of Ancy-le-Franc, Tanlay, Fleurigny, and Saint-Fargeau.

The *département* has three *arrondissements*, Auxerre, Avallon, and Sens. It is in the educational division of Dijon. Pop. (1982) 311,019.

Yonne River, Latin ICAUNA, river, north central France, a left-bank tributary of the Seine River. From its source in the Nièvre département at the foot of Mont Preneley, located in the Morvan heights west of Autun, to its confluence with the Seine at Montereau, the Yonne is 182 mi (293 km) long. It speeds north-northwest through deep, wooded gorges to Pannessières-Chaumard, where its turbulent waters are dammed to regulate its flow as well as that of the Seine. Passing through Clamecy, accompanied by the Canal du Nivernais, it enters the Yonne département and receives the Cure above Auxerre. The canalized Armançon joins it above Joigny, through which it flows before passing Sens and veering northwest to Montereau. It is navigable for 70 mi downstream from Auxerre.

Yono, city, Saitama Prefecture (ken), Honshu, Japan, in the alluvial plain of the Ara-kawa (Ara River). The city centre lies in the midst of low rice paddies, while the eastern and western sections occupy uplands. The small city area is restricted by the neighbouring cities of Ōmiya (north) and Urawa (south).

Yono was an early marketplace, linked to a major railway in 1912. Urbanization began after World War II, and the city has continued to grow rapidly as an industrial suburb of the Tokyo-Yokohama Metropolitan Area. Major products are machinery, metals, and processed foods. Pop. (1980) 72,326.

Yoram (Old Testament king): see Jehoram.

Yorck von Wartenburg, Johann (David Ludwig), Graf (count), Yorck also spelled YORK, Johann also rendered HANS (b. Sept. 26, 1759, Potsdam, Prussia [now in Germany]—d. Oct. 4, 1830, Klein-Öls, Silesia [now Oleśnica, Pol.]), Prussian field marshal, reformer, and successful commander during the Wars of Liberation (1813–15) against France. His initiative in signing a separate neutrality agreement with Russia during the Napoleonic invasion of that country (Convention of Tauroggen, 1812) opened the way for Prussia to join the Allied powers against Napoleon.

Yorck entered the Prussian army in 1772 but was cashiered for disobedience in 1779. Joining the Dutch army, he served mainly in the Dutch East Indies, where he became familiar with skirmish warfare and open battle formations. After reinstatement in the Prussian army (1787), he fought in Poland (1794) and successfully commanded the rear guard after Napoleon's rout of the Prussian army at Jena (October 1806). Promoted to major general in 1807, Yorck, as inspector of light infantry, played a leading role in the reorganization of the Prussian army. An excellent tactician, he became the tactical teacher of the

Yorck von Wartenburg, detail from a portrait by Karl Hermann

By courtesy of Bildarchiv Preussischer Kulturbesitz BPK, Rertin

army, developing the infantry scout and the line of skirmishes. His conservatism, however, led him to oppose the liberal army reforms proposed by General August Neidhardt von Gneisenau.

In 1812 Yorck led the Prussian contingent of Napoleon's invading army in Russia. During Napoleon's disastrous retreat, he concluded the Tauroggen Convention with the Russians, neutralizing his force. The Prussian king Frederick William III signed the Treaty of Kalisch (Feb. 28, 1813), which justified Yorck's action and brought Prussia into the Allied camp. In the subsequent campaigns, Yorck distinguished himself again and was created Graf von Wartenburg in 1814. He remained in the army after the conclusion of peace.

Yorghan Tepe (ancient Mesopotamian city): see Nuzu.

Yorimitsu, also called RAIKŌ, one of the most popular of the legendary Japanese warrior heroes and a member of the martial Minamoto clan. In his exploits he is always accompanied by four trusty lieutenants. One adventure concerns his vanquishing the boyfaced giant Shuten-doji ("Drunkard Boy" who lived on human blood and who together with his repulsive retainers terrorized the countryside around his stronghold on Oye-yama. To gain admittance to the stronghold, Yorimitsu and his companions disguised themselves as mountain priests. They first befuddled the creatures with a magic drink, then threw off their priestly robes to reveal themselves as warriors. Shuten-doji's severed head contin-

Yorimitsu being harried by the earth spider, woodblock print by Utagawa Kuniyoshi (1797–1861)
By courtesy of the Victoria and Albert Museum, London

ued to attack Yorimitsu even after the giant's death, but the Minamoto warriors eventually triumphed.

York, city that, together with the cities of Toronto, Etobicoke, Scarborough, and North York, and the borough of East York, constitutes the municipality of Metropolitan Toronto, Ontario, Canada. It has an area of 9 square miles (23 square km) and is encircled by the city of North York (north), the city of Toronto (south and east), and the city of Etobicoke (west). It was established as a borough in 1967, through the amalgamation of the former township of York and the town of Weston (incorporated 1881). The original York Township was formed in 1793, and it was once called Dublin.

York, city ("district"), county of North Yorkshire, England. It lies at the confluence of the Rivers Ouse and Foss, about midway between London and Edinburgh. It is the cathedral city of the archbishop of York and was historically the ecclesiastical capital of northern England. York was also the county town of the former

A street in York, North Yorkshire, with the towers of York Minster in the background

Noel Habgood-Bruce Coleman Inc

county of Yorkshire, being situated where the three ridings ("thirds"; the administrative jurisdictions into which Yorkshire was formerly divided) converged.

The Romans occupied the site in AD 71 and built a fortress and wall, traces of which remain. Under the name Eboracum, the settlement served as the Romans' northern military headquarters until they withdrew in about 400. Anglo-Saxon rule followed. In the 7th century Paulinus became the first archbishop of York, and Edwin, king of Northumbria, built a church where the present Minster stands. The Danes conquered York in 867 and retained it as their Northumbrian capital. The city's present name was derived from the Danish Yorvick.

York suffered severely in William I's conquest of northern England. Part of the city was demolished, land was flooded, and two defensive castles (now sites of Clifford's Tower and the Castle Museum complex) were built to subdue the rebellious north. In time the city revived and prospered as a staple (wholesale commerce) town, dealing especially in wool. A cycle of 48 mystery plays, performed by York's many medieval craft guilds, survives (see York plays). The city was incorporated in the 12th century and for a time was second only to London in size and importance. York's Cathedral (Minster) of St. Peter, the largest Gothic church in England, was built between the 13th and the 15th century. Other medieval buildings include the Guildhall (1446-48; restored after bombing in World War II), the Merchant Adventurers' Hall (1357), St. William's College (1453; founded for chantry priests), and many more. The medieval walls that surround the city are 2.5 miles (4 km) in circumference and date from the 14th cen-

Modern York is a major rail junction and is the site of the National Railway Museum (1975), the only national museum outside London. The city's industrial products include railway cars as well as shock absorbers, optical instruments, glass containers, and sugar and chocolate candies. York's many medieval churches and other historic buildings make tourism a significant industry. The University of York (1963) and the archbishop's residence at Bishopthorpe lie in Selby district outside the York city limits. The area of York is 11 square miles (29 square km). Pop. (1986 est.) 101,600.

York, town, York county, southwestern Maine, U.S., composed of York Village, York Beach, York Harbor, and Cape Neddick. It is situated at the mouth of the York River on the Atlantic Ocean, 43 miles (69 km) southwest of Portland. Settled in 1624 on a site called Agamenticus by Captain John Smith, who had explored the area in 1614, it became the first English city on the American continent when Sir Ferdinando Gorges endowed it with a city charter under the name of Gorgeana in 1641. The Massachusetts Bay Company took over the Gorges property in 1652, revoked the charter, reduced Gorgeana to the status of a town, and changed its name to York (after the town in Yorkshire). It was almost destroyed on Feb. 2, 1692, in a raid conducted by Abnaki Indians.

With its snug harbours, sandy beaches, and restored colonial buildings, including Old Gaol Museum (1653, one of the oldest English public buildings in the United States), the modern town of York is an attraction for photographers, artists, and vacationers. Pop. (1988 est.) 12,324.

York, city, seat (1749) of York county, southeastern Pennsylvania, U.S., on Codorus Creek, 28 mi (45 km) southeast of Harrisburg. It is the focus of a metropolitan district

that includes the boroughs of North York and West York and a number of townships. It was laid out (1741) in Springettsbury Manor, a tract owned by Springett Penn, William Penn's grandson, and was named for the English city. In 1777 the Continental Congress left Philadelphia at the British approach and, after holding a one-day session in Lancaster, moved to York and made it the national capital (Sept. 30, 1777–June 27, 1778). In the old county courthouse (built 1754–56, demolished 1849), Congress passed the Articles of Confederation, received the news of Gen. John Burgoyne's surrender at Saratoga, issued the first national thanksgiving proclamation, and received word from Benjamin Franklin in Paris that France would aid the nascent United States. It was in York that the Conway Cabal, led by Thomas Conway to deprive George Washington of command of the army, was frustrated by the Marquis de Lafayette's toast to Washington in General Gates' House (c. 1751; restored). York was also the site where \$1,500,000 in silver, lent by France, was brought in September 1778, and where \$10,000,000 in Continental money was issued from Benjamin Franklin's printing press. During the Civil War, Confederate troops entered the town (June 28, 1863), forcing the retreat of a small Federal force.

The economy is well diversified, based on agriculture, manufacturing, and distribution. Manufactures include refrigerating and ordnance equipment, paper, furniture, and textiles. York College of Pennsylvania was opened in 1941, and the York campus of Pennsylvania State University in 1949. York is noted for its markets tended mostly by Mennonite and Dunkard farm families. Inc. borough, 1787; city, 1887. Pop. (1980) 44,619.

York, DUKES OF, titled English nobility of several creations, grouped below chronologically and indicated by the symbol •.

• York, Edmund of Langley, 1st duke of, also called (1362-85) EARL OF CAMBRIDGE (b. June 5, 1341, King's Langley, Hertfordshire, Eng.—d. Aug. 1, 1402, King's Langley), fourth surviving legitimate son of King Edward III of England and founder of the House of York as a branch of the Plantagenet dynasty.

Created earl of Cambridge in 1362 and duke of York in 1385, Edmund was the least able of Edward III's sons, and in the political strife of Richard II's reign he played an ineffective part. Between 1359 and 1378 he served without distinction in several campaigns in France, Spain, and Brittany, and his one independent command, the Lisbon expedition of 1381-82 to aid King Ferdinand of Portugal against Castile, was a failure. York was appointed keeper of the realm during Richard II's absence in Ireland in 1394–95, and again on the King's departure for his second Irish expedition in May 1399. When Henry of Lancaster (afterward King Henry IV) invaded England (July), York tried to organize resistance, but he soon submitted (July 27), recognizing that Richard's cause was lost.

• York, Edward of Norwich, 2nd duke of (b. c. 1373, Norwich?, Norfolk, Eng.—d. Oct. 25, 1415, Agincourt, Fr.), Yorkist who led a checkered career in the reigns of Richard II of England and the usurper Henry IV.

Son of the 1st Duke of York, he was prominent among Richard II's favourites and was made earl of Rutland in 1390 and earl of Cork in 1394 and given many important offices. After Richard II's coup d'etat of 1397, he succeeded his uncle, Thomas, duke of Gloucester, as constable of England, obtaining also Gloucester's lordship of Holderness in Yorkshire, and was created duke of Aumarle (Albemarle) in September 1397. He deserted

Richard II in August 1399 but was denounced as Gloucester's murderer in Henry IV's first Parliament and was lucky to lose only his recent gains, including his ducal title.

He was royal lieutenant in Aquitaine in 1402 when his father's death made him duke of York, and later he served against the rebels in South Wales. Accused by his sister, Constance, Lady Despenser, of being involved in her conspiracy against King Henry IV in 1405, York was imprisoned in the Tower of London and later in Pevensey Castle, but was soon pardoned. After joining the French expedition of Thomas, duke of Clarence, in 1412, he remained in Aquitaine until August 1413. Edward was killed at the Battle of Agincourt. He died childless, and his heir was his nephew, Richard, 3rd duke of York.

Edward was the author of *The Master of Game*, the oldest English book on hunting; this work was based on a translation of the *Livre de la Chasse* of Gaston III Phoebus, comte de Foix, with an added five chapters on the conditions and practice of hunting and of game management in England. Long copied and circulated, the work was not printed until 1904

• York, Richard, 3rd duke of (b. Sept. 21, 1411—d. Dec. 30, 1460, near Wakefield, Yorkshire, Eng.), claimant to the English throne whose attempts to gain power helped precipitate the Wars of the Roses (1455–85) between the houses of Lancaster and York;

Richard, 3rd duke of York, detail of stained glass in the Hall of Trinity College, Cambridge c. 1425

he controlled the government for brief periods during the first five years of this struggle. He was the father of two English kings, Edward IV and Richard III.

In 1415 Richard succeeded his uncle Edward as duke of York. As a descendant of Lionel, duke of Clarence, third son of King Edward III (ruled 1327-77), York had a hereditary claim to the throne that was stronger, by primogeniture, than that of Henry VI (who became king in 1422), who was descended from Edward's fourth son. Nevertheless, York served Henry faithfully as governor of France and Normandy from 1436 to 1437 and 1440 to 1445. At the same time, he became an opponent of the powerful Beaufort family, which was gaining control of Henry's government. The death of Humphrey, duke of Gloucester, in 1447 left York next in line for succession to the throne, and the Beauforts had him sentvirtually banished-to Ireland as lord lieutenant. He returned to England in 1450 and led the opposition to Henry's new chief minister, Edmund Beaufort, duke of Somerset.

When the King suffered a nervous breakdown in July 1453, the ambitious queen, Margaret of Anjou, backed by Somerset, claimed the regency, but her rule was so unpopular that Parliament appointed York protector of the realm in March 1454. York was hated and feared by Margaret because he was a potential rival to the throne she hoped to obtain for her son, then an infant. Consequently, upon Henry's recovery, in December 1454. Margaret persuaded him to dismiss York and restore Somerset to power. York immediately took up arms. At St. Albans, Hertfordshire, on May 22, 1455, his forces killed Somerset in battle, and he had control of the government until Margaret again gained the upper hand in October 1456. Hostilities between the two sides reopened late in 1459; in July 1460 York's able lieutenant Richard Neville, earl of Warwick, defeated the Lancastrians at Northampton and captured the King. A compromise was then worked out whereby Henry was to remain king for life and York was to succeed him. But Margaret, who would never agree to the disinheritance of her son, raised a rebellion in northern England. York's attempt to deal with her resulted in his death when he was attacked by the Lancastrians outside his castle near Wakefield. His son Edward seized power the following year as Edward IV.

• York, James, duke of: see James II under James (Great Britain).

• York, Henry Stuart, cardinal duke of (b. March 6, 1725, Rome—d. July 13, 1807, Frascati, Italy), last legitimate descendant of the deposed (1688) Stuart monarch James II of Great Britain. To the Jacobites—supporters of Stuart claims to the British throne—he was known as King Henry IX of Great Britain for the last 19 years of his life.

Shortly after his birth, Stuart was named duke of York by his father, the exiled Stuart claimant James Edward, the Old Pretender, son of James II. Stuart raised forces in France to help his elder brother, Charles Edward, the Young Pretender, during the unsuccessful Forty-five Rebellion (Jacobite rebellion of 1745–46), but the uprising was crushed before Stuart's troops could be deployed. In 1747 the pious, mild-mannered duke was created cardinal of York by Pope Benedict XIV. He was consecrated archbishop of Corinth in 1758 and was later (1761–1803) bishop of Frascati,

Upon the death of the Young Pretender in 1788, Stuart proclaimed himself king as Henry IX. He lost his property during the Napoleonic invasion of Italy, and after 1800 he survived on a yearly pension granted him

Henry Stuart, the cardinal Duke of York, detail of a painting by an unknown artist; in the Scottish National Portrait Gallery, Edinburgh By courtesy of the Scottish National Portrait Gallery, Edinburgh

by King George III of England. Brian Fothergill's biography *The Cardinal King* was published in 1958.

• York, Prince Albert, duke of: see George VI under George (Great Britain).

York, HOUSE OF, younger branch of the house of Plantagenet (q.v.) of England. In the 15th century, having usurped the throne from the house of Lancaster (q.v.), it provided three kings of England—Edward IV, Edward V, and Richard III—and, in turn defeated, passed on its claims to the Tudor dynasty.

The house was founded by King Edward III's fifth son, Edmund of Langley (1341-1402), 1st Duke of York, but Edmund and his own son, Edward, 2nd Duke of York, had for the most part undistinguished careers. Edward, dying childless, passed on the dukedom to his nephew Richard (whose mother was a descendant of Edward III's second surviving son, Lionel, Duke of Clarence). Richard, 3rd Duke of York (1411-60), was the initial Yorkist claimant to the crown, in opposition to the Lancastrian Henry VI. It may be said that his claim, when it was advanced, was rightly barred by prescription, the house of Lancaster having then occupied the throne for three generations, and that it was really owing to the misgovernment of Queen Margaret of Anjou and her favourites that it was advanced at all. Yet it was founded upon strict principles of lineal descent, for the 3rd Duke of York was descended from Lionel, Duke of Clarence, the second surviving son of Edward III, whereas the house of Lancaster came of John of Gaunt, a younger brother of Lionel. One thing that might possibly have been considered an element of weakness in Richard's claim was that it was derived through females-an objection actually brought against it by Chief Justice John Fortescue. But apart from strict legality, Richard's claim was probably supported in the popular view by the fact that he was descended from Edward III through his father no less than through his mother.

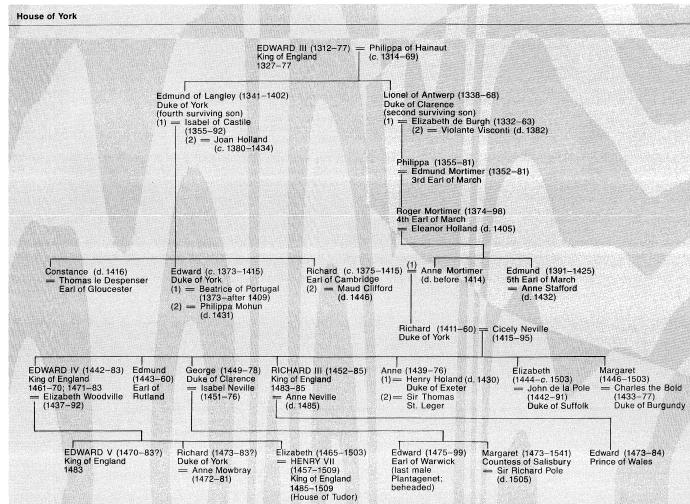

After seeking for many years to correct the weakness of Henry VI's government, Richard first took up arms and at length claimed the crown in Parliament as his right. The Lords, or those who did not purposely stay away from the House, admitted that his claim was unimpeachable but suggested as a compromise that Henry should retain the crown for life and that Richard and his heirs succeed after his death. This was accepted by Richard, and an act to that effect received Henry's own assent. But the act was repudiated by Margaret of Anjou and her followers, and Richard was slain at Wakefield fighting against them. In little more than two months, however, his son was proclaimed king at London by the title of Edward IV, and the bloody victory of Towton immediately after drove his enemies into exile and paved the way for his coronation.

After his recovery of the throne in 1471, Edward IV had little more to fear from the rivalry of the house of Lancaster. But the seeds of distrust had already been sown among the members of his own family, and in 1478 his brother Clarence was put to death—secretly, indeed, within the Tower of London, but still by his authority and that of Parliament—as a traitor. In 1483 Edward himself died; and his eldest son, Edward V, after a nominal reign of two months and a half, was put aside by his uncle, the Duke of Gloucester, who became Richard III, and then, it is said, caused him and his brother Richard, Duke of York, to be murdered. But in little more than two years Richard was slain at Bosworth Field by the Tudor Earl of Richmond, who, being proclaimed king as Henry VII, shortly afterwards fulfilled his pledge to marry the eldest daughter of Edward IV and so unite the houses of York and Lancaster.

Here the dynastic history of the house of York ends, for its claims were henceforth merged in those of the house of Tudor.

York, Alvin Cullum (b. Dec. 13, 1887, Pall Mall, Tenn., U.S.—d. Sept. 2, 1964, Nashville, Tenn.), celebrated American hero of World War I, immortalized by the film version of his life story, Sergeant York (1941).

A blacksmith from Cumberland Hill, Tenn., York was denied status as a conscientious objector and was drafted into the army during World War I. While serving in the 82nd Infantry Division at the Meuse-Argonne Offensive (October 1918), he was among a patrol of 17 men ordered to take out a German machine-gun emplacement that was checking his regiment's advance. Behind enemy lines the patrol lost half its men but managed to take a handful of prisoners before it was pinned down by extremely heavy rifle and machinegun fire. Corporal York assumed command and, while the rest of the survivors took up defensive positions and stood guard over the prisoners, York attacked alone and, firing rapidly and with deadly accuracy at the enemy gunners, killed 25 of them, which prompted the others to surrender. En route back to the American lines, he captured still more Germans, to a total of 132. York was promoted to the rank of sergeant and later received the Congressional Medal of Honor and similar honors from France and other countries. After the war he returned to Tennessee, where he lived on a farm given him by that state and helped establish an industrial institute and a Bible school for the education of rural youth.

His autobiography, Sergeant York, His Own Life Story and War Diary (ed. by T. Skeyhill), appeared in 1928.

York, Cape, northernmost point of the Australian continent, comprising the northern tip of Cape York Peninsula, in the state of Queensland. The cape juts north-northeast from the peninsula into Torres Strait, which separates it from the island of New Guinea. It is about 15 miles (25 km) long and 12 miles (19 km) wide. The cape was named in 1770 by the British navigator Captain James Cook for the Duke of York, brother of King George III.

York, Elizabeth Angela Marguerite, Duchess of (queen consort of George VI of Great Britain): see Elizabeth.

York Factory, historic settlement, northeastern Manitoba, Canada. It lies at the mouth of the Haves River, on Hudson Bay. It was the site of a Hudson's Bay Company post (Fort Nelson) built in 1682 and destroyed in 1684 by the French; a new fort, named for the Duke of York (later King James II), was quickly erected. The fort changed hands several times until by the Treaty of Utrecht (1713) it became British. As York Factory it was the chief port, supply depot, and headquarters for the fur-trading centres of northern Canada, but its importance declined with the completion in 1885 and 1915 of the transcontinental railroads and in 1931 of the branch line to Churchill on Hudson Bay, 140 miles (225 km) northwest. The trading post closed in 1957, ending 275 years of nearly continuous operation; it has been designated a national historic site and is accessible only by air or canoe.

York plays, a cycle of 48 plays, dating from the 14th century, of unknown authorship, which were performed during the European Middle Ages by craft guilds in the city of York, in the north of England, on the summer feast day of Corpus Christi. Some of the York plays are almost identical with corresponding plays in the Wakefield cycle, and it has been suggested that there was an original (now lost) from which both cycles descended. It is more likely, however, that the York cycle was transferred bodily to Wakefield some time during the later 14th century and there established as a Corpus Christi cycle.

The plays were given in York on one day, in chronological order, on pageant wagons proceeding from one selected place to another. The cycle covers the story of man's fall and redemption, from the creation of the angels to the Last Judgment; six plays are peculiar to York (the play of Herod's son, of the Transfiguration, of Pilate's wife, of Pilate's majordomo, of the high priests' purchase of the field of blood, and of the appearance of the Virgin to the Apostle Thomas).

In the last revision of the York plays, about 14 plays (mainly those concerning Christ's Passion) were redacted into alliterative verse. These are powerful and the work of a dramatic genius, often referred to as the York Realist.

The York plays have been preserved in the Ashburnham Manuscript, in the British Library.

Yorke, Philip: see Hardwicke, Philip Yorke, 1st Earl of.

Yorke Peninsula, promontory of the south coast of South Australia, between Spencer Gulf to the west and Gulf St. Vincent and Investigator Strait to the east and south. Extending southward for 160 miles (260 km) from Port Pirie to Cape Spencer, it is 20–35 miles (32–56 km) wide, with a gently rolling surface rising to 400 feet (120 m). Sighted in 1802 by Matthew Flinders, it was named after Charles Philip Yorke (later Lord Hardwicke),

then first lord of the Admiralty. The peninsula's soils yield grain crops, chiefly barley and wheat. Other resources are salt (by evaporation), limestone, and gypsum. Wallaroo is a major grain-shipping port for the peninsula. A dry, sunny climate has encouraged the growth of coastal resorts.

Yorkshire, former county of England, until 1974 the country's largest county. Historically, Yorkshire was divided into three ridings ("thirds"), each of which had the full administrative status of a county: the North Riding (now in North Yorkshire, Cleveland, and Durham); the East Riding (now in Humberside and North Yorkshire); the West Riding (now distributed among parts of the areas of Greater Manchester, South Yorkshire, and West Yorkshire and ports of four counties: North Yorkshire, Cumbria, Lancashire, and Humberside); and the City (and County) of York, where the three ridings converged. Although there was one high sheriff for the county, for most purposes the ridings were separate administrative units for a thousand years. Each riding had its own court of quarter sessions and its own county council. Yorkshire and the ridings passed out of existence with the administrative reorganization of 1974.

Many prehistoric remains have been discovered in Yorkshire, the most prominent being the hill forts found throughout the county. The Romans found the region inhabited by the Brigantes and, in the eastern portion, the Parisi. The Romans established control over the region in the 1st century AD and garrisoned the town of Eboracum (now York). Yorkshire served the Romans as a frontier base from which to repel invasions from the north. After Roman rule there ended in the early 5th century, the Angles and then the Northumbrians established themselves in Yorkshire until they were conquered by the Danes in the 9th century. Yorkshire remained strongly Anglo-Scandinavian in culture until the Normans crushed all resistance to their rule in 1069.

In the ensuing two centuries the Benedictines, Augustinians, and Cistercians established important monastic foundations in the county, while the Percys, Mowbrays, Nevilles, Warennes, and other great families established large landed estates. Yorkshire continued to serve as a defensive frontier against Scottish raids from the north. Two of the best-known battles of the Wars of the Roses were fought Yorkshire: Wakefield (1460), in which Richard, 3rd Duke of York, was slain, and Towton (1461), which saw the decisive defeat of the Lancastrians by the Yorkists. One of the most important battles of the English Civil Wars was fought in Yorkshire, at Marston Moor in 1644. The county was the principal site of the Pilgrimage of Grace, an unsuccessful uprising in 1536 against Henry VIII's Reformation legislation.

Local sheepherding enabled the woolentextile industry to become established in Yorkshire in the 14th and 15th centuries, though agriculture remained the dominant economic activity. Yorkshire entered the Industrial Revolution as a centre of woolen-textile manufacturing in the cities and towns of Leeds, Sheffield, Bradford, Halifax, Wakefield, and Huddersfield.

Owing to its long history, present-day Yorkshire has a wealth of old castles, cathedrals and churches, monasteries, abbeys, and country mansions. *See also* North Yorkshire; South Yorkshire; West Yorkshire.

Yorkshire, also called LARGE WHITE, breed of swine produced in the 18th century by crossing the large indigenous white pig of North England with the smaller, fatter, white Chinese pig. The well-fleshed Yorkshire is solid white with erect ears. Although originally a bacon breed, the Yorkshire rose to prominence in the lean-meat category during the 20th century in the United States. The boar is used

considerably as a sire of crossbred litters out of coloured dams. The Yorkshire is probably the most widely distributed breed of pig in the world

Yorkshire fog: see velvet grass.

Yorkshire Post, daily newspaper, one of the most prestigious provincial papers published in the British Isles.

The Post is descended from The Leeds Intelligencer, a four-page weekly founded in Leeds, Yorkshire, Eng., by Griffith Knight in 1754. The Intelligencer changed its name to the Yorkshire Post in 1866 and went to daily publication. It soon won a reputation as a serious newspaper interested in developments beyond the borders of Yorkshire.

Starting in 1882, when Charles Pebody assumed the duties of editor, the Yorkshire Post began to attract a continually broadening readership by stressing important local, national, and international news and by thoughtful, perceptive editorials reflecting an independent policy. In the 1930s the Post opposed any appeasement of Nazi Germany. By the 1960s it was generally ranked among Britain's most influential dailies and was considered in the same class with such papers as The Guardian of Manchester and The Scotsman of Edinburgh.

Yorkshire terrier, also called YORKIE, breed of toy dog developed about the mid-1800s in the English counties of Yorkshire and Lancashire. The lineage of the breed is unknown but appears to include several terriers, such as the Skye and Dandie Dinmont; it may also include the Maltese. The most outstanding feature of the Yorkie is its straight, silky coat, parted on the back from nose to tail and long enough to sweep the ground. Colour is dark blue-gray, with tan on the head and chest. A small, compact dog, the Yorkshire terrier stands about 8 to 9 inches (20 to 23 cm) and weighs about 4 to 8 pounds (2 to 3.5 kg). Generally healthy and spirited, it is valued as a pet and companion.

Yorkton, city, southeastern Saskatchewan, Canada, 117 miles (189 km) northeast of Regina. The original townsite, on nearby Yorkton Creek, was settled in 1882 by the York (Ontario) Farmers' Colonization Company. With the arrival of the Canadian Pacific Railway in 1890, the community moved to its present site. A wholesale and marketing centre for an extensive farming and turkey-breeding area, Yorkton has stockyards, tanneries, poultry markets, brickyards, and farmmachinery and concrete-making plants. The biennial Yorkton International Film Festival (open to amateur films) has been held regularly since 1950. A Royal Canadian Air Force radar station is 12 miles (19 km) northwest. Inc. village, 1894; town, 1900; city, 1928. Pop. (1985) 15,574.

Yorktown, historic town, seat of York county, southeastern Virginia, U.S. It is situated on the south bank of the York River across from Gloucester Point, just east-southeast of Williamsburg. Settled in 1631, it developed after 1680 when a port was authorized by Virginia's General Assembly. Yorktown became a busy shipping centre, and its Colonial Custom House (1706; restored) is regarded as the cradle of the American tariff system. By 1750, however, its commercial role had declined together with the Tidewater Virginia tobacco trade. Yorktown's place in history was assured by the siege and surrender there of British forces under General Lord Cornwallis in 1781, an event that virtually assured an American victory in the Revolutionary War.

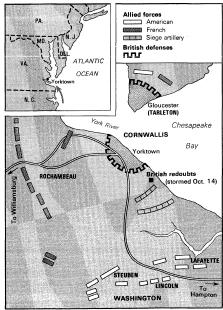

Yorktown is now included in the Colonial National Historical Park (q,v). Moore House (c. 1725), at the edge of the Revolutionary War battlefield (which surrounds the town), was where the "Articles of Capitulation" were

drafted (Oct. 18, 1781) prior to their signing the next day in a British redoubt. The reconstructed York County Courthouse (1633), Grace Episcopal Church (1697; used by the British as a powder magazine), the Monument to Alliance and Victory (1881; commemorating the American-French alliance), and the Yorktown National Civil War Cemetery are other points of interest.

Yorktown, Siege of (Sept. 28-Oct. 19, 1781), joint Franco-American land and sea campaign that entrapped a major British army on a peninsula at Yorktown, Va., and forced its surrender. The siege virtually ended military operations in the U.S. War of Independence.

After a series of reverses and the depletion of his forces' strength, the British commander in the southern colonies, General Lord Cornwallis, moved his army from Wilmington, N.C., eastward to Petersburg, Va., on the Atlantic coast, in May 1781. Cornwallis had about 7,500 men and was confronted in the region by only about 4,500 American troops under the Marquis de Lafayette, General Anthony Wayne, and Baron von Steuben. In order to maintain his seaborne lines of communication with the main British army of General Henry Clinton in New York City, Cornwallis then retreated through Virginia, first to Richmond, next to Williamsburg, and finally, near the end of July, to Yorktown and the adjacent promontory of Gloucester, both of which he proceeded to fortify.

The American commander in chief, General George Washington, ordered Lafayette to block Cornwallis' possible escape from Yorktown by land. In the meantime Washington's 2,500 Continental troops in New York were joined by 4,000 French troops under the Count de Rochambeau. This combined allied force left a screen of troops facing Clinton's forces in New York while the main Franco-American force, beginning on August 21, undertook a rapid march southward to the head of Chesapeake Bay, where it linked up with a French fleet of 24 ships under the Count de Grasse. This fleet had arrived from the West Indies and was maintaining a sea blockade of Cornwallis' army. Cornwallis' army waited in vain for rescue or reinforcements from the British navy while de Grasse's fleet transported Washington's troops southward to Williams-Va., whence they joined Lafayette's forces in the siege of Yorktown. Washington

Yorktown, siege and (inset) Washington's march, August-October 1781

From David Eggenberger, A Dictionary of Battles, copyright © 1967 by David Eggenberger; reprinted with permission of the publisher, Thomas Y. Crowell Company, Inc.

was thus vindicated in his hopes of entrapping Cornwallis on the Yorktown Peninsula.

Meanwhile, a smaller British fleet under Admiral Thomas Graves was unable to counter French naval superiority at the Battle of Virginia Capes (see Virginia Capes, Battle of) and felt forced to return to New York. A British rescue fleet, two-thirds the size of the French, set out for Virginia on October 17 with some 7,000 British troops, but it was too late. Throughout early October Washington's 14.000 Franco-American troops steadily overcame the British army's fortified positions at Yorktown. Surrounded, outgunned, and running low on food, Cornwallis surrendered his entire army on October 19. The total number of British prisoners taken was about 8,000, along with about 240 guns. Casualties on both sides were relatively light. The victory at Yorktown ended fighting in the War of Independence and virtually assured success to the American cause.

Yoro, city, northwestern Honduras. Situated in the highlands at an elevation of 1,837 feet (559 m), it is located near the headwaters of the Aguán River. Although its founding date is uncertain, it was first mentioned in 1684. It is now a commercial and manufacturing centre in a fertile agricultural area. Coffee, tobacco, livestock, and timber are the principal products of the region. In the city are sugar refineries, a tannery, and sawmills; shoes, clothing, and metalware are also manufactured. Pop. (1983 est.) mun., 32,752.

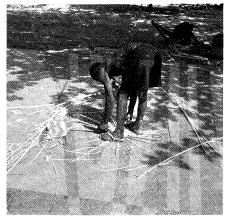

yortzeit (Judaism): see yahrzeit.

Yoruba, one of the two largest ethnic groups of Nigeria, being concentrated in the southwestern part of that country. Much smaller, scattered groups live in Benin and northern Togo. The Yoruba numbered more than 24 million in the late 20th century. They speak a language of the Kwa branch of the Niger-Congo family.

Most Yoruba men are farmers, growing yams, corn (maize), and millet as staples, and plantains, peanuts (groundnuts), beans, and peas as subsidiary crops; cocoa is a major cash crop. Other Yoruba men are traders or craftsmen. Women do no farm work but control much of the complex market system—their status depends more on their own position in the marketplace than on their husbands' status. The Yoruba have traditionally been among the most skilled and productive craftsmen of Africa. They worked at such trades as blacksmithing, weaving, leatherworking, glassmaking, and ivory- and woodcarving. In the 13th and 14th centuries Yoruba bronze casting using the lost-wax (cire perdue) method reached a peak of technical excellence never subsequently equaled in west Africa. Yoruba women engage in cotton-spinning, work, and dyeing.

Historically, the Yoruba have shared a common language and culture but were probably never a single political unit. They seem to have migrated from the east to their present lands west of the lower Niger River more than a millennium ago. They eventually became the most urbanized Africans of precolonial times. They formed numerous kingdoms of various sizes, each of which was centred on a capital city, or town, and ruled by a hereditary king, or oba. Their towns became densely populated and eventually grew into the present-day cities of Oyo, Ife-Iodun, Ilesha, Ilorin, Ijebu, Ikere-Ekiti, and others. Oyo developed in the 17th century into the largest of the Yoruba kingdoms (see Oyo empire), while Ife-Iodun (q.v.) remained a town of potent religious significance as the site of the earth's creation according to Yoruban mythology. Oyo and the other kingdoms declined in the late 18th and 19th centuries owing to disputes between minor Yoruba rulers and invasions by the Fon of Dahomey (now Benin) and by the Muslim

Fulani. The traditional Yoruba kingships still survive, though with only a shadow of their former political power.

Yoruba boy weaving a basket, Benin

In traditional Yoruba towns, the large and elaborate palace of the king (oba) lies at the centre, while grouped around it are the compounds of the patrilineages of the town. The palace and the compounds are now often modern structures.

There is much diversity in social and political organization among the Yoruba, but they share many basic features. Inheritance and succession are based on patrilineal descent; members of the patrilineage live together under the authority of a headman, share certain names and taboos, worship their own deity, and have rights in lineage lands. The Yoruba also have several kinds of voluntary associations, including the egbe, a male recreational association; the aro, a mutual-aid association of farmers; and the esusu, whose members contribute a fixed amount of money and from which they can receive loans. Political authority is vested in the oba and a council of chiefs; constituent towns each have their own ruler. who is subordinate to the oba. The king is also a ritual leader and is considered sacred.

Although some Yoruba are now Christians or Muslims, belief in their traditional religion continues. The traditional religion has an elaborate hierarchy of deities, which includes a supreme creator and some 400 lesser gods and spirits, most of whom are associated with their own cults and priests. The Yoruba language has an extensive literature of poetry, short stories, myths, and proverbs.

Yosa Buson: see Buson.

Yosano Akiko, also called но sно (b. Dec. 7, 1878, near Ōsaka, Japan—d. May 29, 1942, Tokyo), Japanese poet whose new style caused a sensation in Japanese literary circles.

Yosano was interested in poetry from her school days, and with a group of friends she published a private poetry magazine. In 1900 she joined the Shinshisha (New Poetry Association) of Yosano Tekkan and began to contribute to his magazine $My\bar{o}j\bar{o}$. She met Tekkan that year and the next year left her family and went to Tokyo, where she married him. The freshness and unconventionality of her poetry had already attracted attention, Midaregami (1901; Tangled Hair, 1935) brought her fame. Yume no hana (1906; "Dream Flowers") revealed her developing art.

In 1912 she followed her husband to France and spent a year there; *Natsu yori aki e* (1914; "From Summer to Autumn") is a collection of poetry resulting from that period. Upon her return from France she embarked on a project of translating into modern Japanese

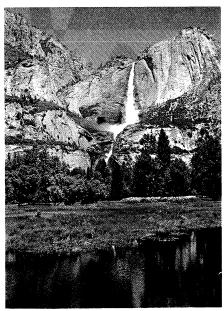

the 11th-century classic *Genji monogatari* of Murasaki Shikibu. In 1921 she established the Bunka Gakuin School for Girls, where she also taught; and in later years she was a literary critic. A posthumous collection of poetry, *Hakuōshū* (1942; "White Cherry"), expressed

drops 1,430 ft (436 m), the Lower 320 ft. With the cascades between, the total drop from the crest of the Upper to the base of the Lower is 2,425 ft, creating one of the world's highest cataracts. Maximum flow is reached in May and June; it diminishes greatly in years of little rainfall.

Yosemite National Park, scenic mountain region in central California, U.S. It was first set aside as a state park in 1864 and, together with additional surrounding territory, made a national park in 1890. It encompasses 761,320 ac (308,106 ha) in the Sierra Nevada Range,

Half Dome, Yosemite National Park, California

including the Yosemite Valley of the Merced River, and features giant sequoia groves with trees thousands of years old and points of geological interest. Yosemite Valley alone has a number of attractions, such as sheer rock walls, Yosemite Falls, and huge domes and peaks. The greatest of these is El Capitan, a granite buttress that rises 3,604 ft (1,098 m) from the valley floor. Winter sports centre on the Badger Pass Ski Area.

The plant life of the park changes markedly with altitude. Lower elevations are characterized by scattered trees, both deciduous and coniferous. At the level of Yosemite Valley grow larger stands of conifers; higher up, closer to the tree line, are mountain hemlock and lodgepole pine. The park's animal life includes mule deer, various squirrels, chipmunks, and black bears.

Yoshida Isoya (b. Dec. 19, 1894, Tokyo—d. March 24, 1974, Tokyo), Japanese architect who was a pioneer in the modern *sukiya* style of building, in which an affinity for natural materials and traditional construction techniques finds expression in contemporary structures.

Yoshida attended Tokyo Art School (now Tokyo University of Fine Arts), receiving a diploma in architecture in 1923. He concentrated on private homes and exclusive restaurants prior to World War II but afterward turned to public and, finally, to religious architecture, seeking new applications for his innovative traditionalism. Though the *sukiya* style—which has been used for tea-houses, private residences, and restaurants—is ordinarily based on handcrafting in wood, Yoshida claimed that one could use modern materials as long as they were used in the "spirit of the style." He also designed museums and other public structures, that gained him note for his grandeur of design.

Yoshida received the Japan Arts Academy Award (1952) and the Japan Cultural Medal (1964). Among his many works are the Inomata and Gokiya residences (Tokyo, 1967 and 1971), the Tsuriya restaurant (Kyōto, 1964), the Gotō Art Museum in Tokyo (1960), and the Yamato Cultural Museum at Nara (1960). He taught at his old art school from 1941 to 1961, and in 1964 he became only the second architect in Japanese history to receive the Order of Cultural Merit.

Yoshida Kenkō, original name URABE KANEYOSHI (b. c. 1283, Kyōto?—d. c. 1350/52, near Kyōto?), Japanese poet and essayist, the outstanding literary figure of his time. His collection of essays, *Tsurezure-gusa* (c. 1330; *Essays in Idleness*, 1967), became, especially after the 17th century, a basic part of Japanese education, and his views have had a prominent place in subsequent Japanese life.

He early served at court and took Buddhist

orders after the death of the emperor Go-Uda in 1324; but becoming a priest did not cause him to withdraw from society. On the contrary, he continued to take active interest in all forms of worldly activities, as his essays indicate. His poetry is conventional, but the essays of *Tsurezure-gusa* display a perceptiveness and wit that have delighted readers since the 14th century. Lamentations over the passing of old customs express his conviction that life had sadly deteriorated from its former glory.

Tsurezure-gusa has also been acclaimed for its sections treating aesthetic matters. Beauty for Yoshida implied impermanence; the shorter-lived a moment or object of beauty, the more precious he considered it.

Yoshida Shigeru (b. Sept. 22, 1878, Tokyod. Oct. 20, 1967, Ōiso, Japan), Japanese political leader who served several terms as prime minister of Japan during most of the critical transition period after World War II, when Allied troops occupied the country and Japan was attempting to build new democratic institutions.

After graduating in law from Tokyo Imperial University in 1906, Yoshida entered the Foreign Ministry. In 1928 he was appointed minister to Sweden, Norway, and Denmark and then vice foreign minister (1928-30). In 1936 the army vetoed his appointment as foreign minister, and he was instead made ambassador to Great Britain, serving until 1939. During World War II his attempts to force an early Japanese surrender led to his arrest in June 1945. He was not freed until the Allied occupation in September of that year, and he then served as foreign minister in the Cabinet of Shidehara Kijūrō, which was formed following the surrender. After the head of the Liberal Party, Hatoyama Ichirō, was prohibited by the Allies from participation in politics. Yoshida assumed the party reins and succeeded to the prime ministership on May 22 1946

Although the Socialist leader Katayama Tetsu was able to form a Cabinet in 1947 and 1948, and the leftist Ashida Hitoshi held office for a while in 1948, Yoshida served as prime minister for most of the period between 1946 and 1954, forming five separate cabinets. Having built a large personal following, he was able to rule almost autocratically, giving Japan stability in this critical recovery period. He guided his country back to economic prosperity, setting the course for postwar cooperation with the United States and western Europe. In 1951 he negotiated the peace treaty that ended World War II, as well as a security pact between Japan and the United States.

In 1954 Hatoyama Ichirō, who had been taken off the Allied political purge list in 1951, challenged Yoshida for leadership of the Liberal Party, forcing him out of office. When the two conservative parties merged into the Liberal-Democratic Party under Hatoyama's leadership in 1955, Yoshida retired from politics.

Yoshida Shigeru AP/Wide World Photos

Yoshida Tetsurō (b. May 18, 1894—d. Sept. 8, 1956), Japanese architect who spread knowledge of Japan's architecture to the West and at the same time introduced Western motifs in his own works.

Private house in Tokyo designed by Yoshida Tetsurō 1937

By courtesy of the International Society for Educational Information, Tokyo

While on a visit to Europe during 1931-32, Yoshida met the German architects Hugo Häring and Ludwig Hilberseimer. At their urging, he wrote a book, *The Japanese House* (1935), explaining Japanese architecture to the West. Two other books, one on Japanese architecture and the other on the Japanese garden, were published in 1952 and 1957, respectively. Yoshida's interest in Western architecture is reflected in his own works, such as the post office at Kyōto, the town hall at Beppu, the general post offices at Tokyo and Osaka, and a bank at Niigata—built in 1922, '28, '31, '39, and '51, respectively.

Yoshikawa Eiji, pseudonym of Yoshikawa Hidetsugu (b. Aug. 11, 1892, Kanagawa Prefecture, Japan—d. Sept. 7, 1962, Tokyo), Japanese novelist who achieved the first rank among 20th-century writers both for his popularized versions of classical Japanese literature and for his own original novels.

Because of his father's failure in business, Eiji received only a primary school education, and his early years were difficult. In 1925 he published Kennan jonan ("Troubles with Swords and Women"), and his position as a writer was established with Naruto hicho (1926-"A Secret Record of Naruto"). Later, in the romantic tradition, he wrote some light novels, but gradually he turned to a more serious exploration of the human character; he achieved a kind of perfection with the historical novel Miyamoto Musashi (1935-39; Musashi, 1981), dealing with the life of a famous samurai. Later he tried to penetrate more deeply into the lives of Japanese historical figures in Shin Heike monogatari (1950-57; The Heike Story, 1956) and Shihon taihei-ki (1958-61; "A Private Book of War History"). Eiji's exquisite style, his psychological insight, and his knowledge of history brought him a broad range of readers. In 1960 he became the first popular author to receive the Order of Cultural Merit.

Yoshino Sakuzō (b. Jan. 29, 1878, Furukawa, Miyagi Prefecture, Japan—d. March 18, 1933, Zushi, Kanagawa Prefecture), Japanese Christian politician and educator who was a leader in the movement to further democracy in Japan in the early part of the 20th century.

Yoshino converted to Christianity while still in secondary school, and he soon became prominent in the Christian Socialist movement in his country. After studying abroad from 1910 to 1913, he returned home to become a professor at Tokyo Imperial University and one of the most forceful advocates of parliamentary government in the country.

Without questioning the sovereignty of the emperor, an unheard-of act at this time, Yoshino nevertheless called for a "government for the people" (minponshugi), insisting that the people's demands be the basic goal

of government. To this end he advocated universal suffrage, civilian control over the army, the transformation of the House of Peers to a popularly elected body, and the gradual establishment of a Socialist state.

In hopes of furthering these goals, Yoshino briefly entered politics, forming his own party, the Reimeikai, in 1918. In 1924 he resigned his university post to write for the daily *Asahi shimbun*, and even after he severed that connection he continued to write for the wider public about current affairs and problems. Yoshino also played an important part in the preservation and publication of historical sources for the Meiji period.

Although for a time he captured public attention, his combination of Christian Socialism, trade unionism, and Confucian morality had only limited intellectual basis in Japanese tradition. Most intellectuals deserted his cause for Marxism, and the popular movement died with the economic and political difficulties of the post-World War I period.

Yoshkar-Ola, also spelled IOSHKAR-OLA, or JOŽKAR-OLA, city and capital, Mari Autonomous Soviet Socialist Republic, western Russian S.F.S.R., on the Malaya (little) Kokshaga River. It was founded in 1578, and in 1584 the fortress of Tsaryovokokshaysk was built there by Tsar Boris Godunov. Its remoteness from lines of communication prevented any development. In 1919 the renamed Krasnokokshaysk became capital of the then Mari autonomous oblast, to be renamed again Yoshkar-Ola in 1927. The building of a railway to Zelenodolsk on the Volga in 1927 fostered industries, especially light engineering. The city has teacher-training and forestry institutes. Pop. (1983 est.) 223,000.

Yost, Fielding (Harris), byname HURRY UP (b. April 30, 1871, Fairview, W.Va., U.S.—d. Aug. 20, 1946, Ann Arbor, Mich.), U.S. collegiate football coach at the University of Michigan (1901–23, 1925–27) and athletic director (1921–41), who became famous for his "point-a-minute" teams (average 49.8 points per game to opponents .07) that had a 55-game winning streak (1901–05) during which they were tied only once by the University of Minnesota before the University of Chicago finally beat them.

After attending the Fairmont (W.Va.) Normal School, Yost taught school for a year in Ohio, where he learned to play football. He attended Ohio Normal University (Ada, later Ohio Northern University; 1891–94) but left without taking a degree. After working in the West Virginia oil fields, he played tackle for the University of West Virginia (Morgantown; 1895–97; LL.B., 1897). Before he became coach at Michigan, Yost coached at Ohio Wesleyan University (1897, Delaware), the University of Nebraska (1898, Lincoln), the University of Kansas (1899, Lawrence), and Stanford University (1900, California), at each of which schools he won a conference championship.

Teams he coached at Michigan won 164 games, lost 29, and tied 10. They had eight undefeated seasons and won or tied for eight Big Ten (Western Conference) championships. He won his nickname from his constantly repeated admonition to his players, both in practice and in games, to "hurry up." Swift execution of plays was the key to his coaching success.

Yost was also a practicing lawyer, public speaker, and successful businessman.

Yŏsu, city, Chŏlla-namdo (South Chŏlla Province), on Yŏsu-pando (peninsula), extreme southern South Korea. Such large islands as Namhae-do, Dolsan-do, and Kŭmŏ-do protect its natural port. The Korean navy headquarters was located there during the Yi dynasty (1392–1910) before being moved to T'ongjeyŏng (present Ch'ungmu). In 1949 it became

Yŏsu and its harbour, South Korea Shostal—EB Inc.

an open port with the status of a municipality. It is connected with Seoul by rail through Kwangju and Taejon, and it has regular sea lines to Pusan, Mokp'o, and Cheju. The harbour is divided into two parts; the old western port is used mainly for fishing, and the new eastern port for trade. The city exports fresh fish. Petrochemical and other industries have been developed in the Yochon Industrial District. Pop. (1982 est.) 172,681.

Youbou River (western Africa): see Cavalla River.

Youghal (Irish: Yew Wood), urban district, market town, and fishing port on the west side of the Blackwater Estuary in County Cork, Ireland. It is possible that Danes originally occupied Youghal, but the first known history is that of the establishment of a baronial town by the Anglo-Normans in the 13th century and the granting of a charter by John of England (1199-1216). The town was fortified with walls and towers, parts of which remain. St. Mary's Church was erected about 1250 and contains the elaborate tomb of Richard Boyle, 1st earl of Cork, who died in the mid-17th century. Sir Walter Raleigh, the Elizabethan adventurer, was once mayor of the town, and his house, Myrtle Grove, survives. A convent school in Youghal was a centre of Irish needlepoint (q.v.) lace making from the mid-19th century to the 20th. The town is now an important resort, with small textile industries. Pop. (1981) 5,870.

Youghiogheny River, river rising in Preston County, W.Va., U.S., at Backbone Mountain, near the western edge of Maryland. It flows past Connellsville, Pa., to enter the Monongahela River at McKeesport, Pa., after a course of 135 mi (217 km). The Youghiogheny is the only river in western Maryland that does not flow south into the Potomac. Its name is derived from the Algonkian word meaning "contrary stream." The former borough of Somerfield, Pa., the site of a pioneer ford, was inundated according to plan by the reservoir formed by a dam (completed 1948) on the Youghiogheny (there joined by the Casselman River) at Confluence. Pa.

Young, town, south central New South Wales, Australia, on Burrangong Creek and the Western Slopes of the Great Dividing Range. The first settlement in 1830 was a sheep station. Known as Lambing Flat, the locality was the scene in 1860 of anti-Chinese rioting over local gold diggings. Proclaimed a town in 1861 and a municipality in 1882, the community was named after Sir John Young, state governor (1861-67), and now serves a district of cherry, prune, apple, and pear orchards and cereal, cattle, poultry, and pig farming. Industries include fruit processing, magnesium oxide treatment, knitwear production, brandy distilling, steel fabrication, and flour milling. The town has rail and road links to Sydney (168 miles [270 km] northeast). Pop. (1986) 6,797.

Young, Andrew, in full ANDREW JACKSON YOUNG, JR. (b. March 12, 1932, New Orleans, La., U.S.), American politician, civil-

rights leader, and clergyman.

Young was reared in a middle-class black family, attended segregated Southern schools, and later entered Howard University (Washington, D.C.) as a premed student. But he turned to the ministry and graduated in 1955 from the Hartford Theological Seminary (Hartford, Conn.) with a divinity degree.

A pastor at several black churches in the South, Young became active in the civilrights movement-especially in voter registration drives. His work brought him in contact with Dr. Martin Luther King, Jr., and Young joined with King in leading the Southern Christian Leadership Conference (SCLC). Following King's assassination in 1968, Young worked with Ralph Abernathy until he resigned from the SCLC in 1970.

Defeated that year in his first bid for a seat in Congress, Young ran again in 1972 and won. He was reelected in 1974 and 1976. In the House he opposed cuts in funds for social programs while trying to block additional funding for the war in Vietnam. He was an early supporter of Jimmy Carter, and, after Carter's victory in the 1976 presidential elections, Andrew Young was made the United States' ambassador to the United Nations. His apparent sympathy with the Third World made him very controversial, and he was fi-nally forced to resign in 1979 after it became known that he had met with a representative of the Palestine Liberation Organization. In 1981 Young was elected mayor of Atlanta, and he was reelected to that post in 1985.

Young, Art, byname of ARTHUR HENRY YOUNG (b. Jan. 14, 1866, near Orangeville, Ill., U.S.—d. Dec. 29, 1943, New York, N.Y.), satiric American cartoonist and crusader whose cartoons expressed his human warmth as well as his indignation at injustice.

In 1884 Young moved to Chicago, where he studied art and supported himself by drawing newspaper cartoons. Later he also studied art in New York City and Paris. After settling in New York City permanently around 1903, he became a socialist and was active in campaigns for woman suffrage, labour organization, the abolition of child labour, and racial equality.

His concerns were reflected in his cartoons, especially those for *The Masses* (1911–17), one of the best known of which depicted a ragged little boy looking at the sky and saying to his young companion, "Chee, Annie, look at the stars, thick as bedbugs!" That kind of compassionate satire, rather than bitter attack, characterized his simple, economical drawings. His autobiography, Art Young: His Life and Times, appeared in 1939.

Young, Arthur (b. Sept. 11, 1741, London, Eng.—d. April 20, 1820, London), prolific English writer on agriculture, politics, and economics. Besides his books on agricultural subjects, he was the author of the famous Travels in France (or Travels During the Years

1787, 1788 and 1789, Undertaken More Particularly with a View of Ascertaining the Cultivation, Resources, and National Prosperity, of the Kingdom of France; 1792). The book is especially valued for its vivid descriptions of the French Revolution.

The son of a rector, Young was initially employed in a mercantile house at King's Lynn, Norfolk, but showed no taste for commerce. When he was only 17 years old he published the pamphlet On the War in North America, and in 1761 he went to London to start a periodical, The Universal Museum. He also wrote four novels during this period.

After his father's death in 1759, his mother gave him the direction of the family estate, but the property was small and encumbered with debt. In 1767 he undertook on his own account the management of a farm in Essex. He engaged in various experiments and embodied the results in A Course of Experimental Agriculture (1770). Though Young's early farming experiments were, in general, unsuccessful, he thus acquired a solid knowledge of agriculture. He had already begun a series of journeys through England and Wales and gave an account of his observations in several books that appeared from 1768 to 1770, including A Six Weeks Tour Through the Southern Counties of England and Wales. He said that these books contained the only extant information relative to the agricultural rentals, produce, and livestock of England that was founded on actual examination. The books were favourably received, being translated into most European languages by 1792.

He published in 1768 The Farmer's Letters to the People of England, in 1771 The Farmer's Calendar, which went through a great number of editions, and in 1774 his Political Arithmetic, which was widely translated. He made tours of Ireland from 1776 to 1778, publishing his A Tour in Ireland in 1780. In 1784 he began the publication of the Annals of Agriculture, which was continued for 45 volumes; this periodical had many contributors, among whom was George III, writing under the nom de plume of "Ralph Robinson."

Young's first visit to France was made in 1787. Traversing that country in every direction just before and during the first movements of the Revolution, he gave valuable accounts of the condition of the people and the conduct of public affairs at that critical juncture. The *Travels in France* appeared in two volumes in 1792. On his return home he was appointed secretary of the British government's newly created Board of Agriculture, where he gave valuable assistance in the collection and preparation of agricultural surveys of the English counties. His last years were spent in reclusion.

Though not a particularly successful farmer himself, Young was an important propagandist for the progressive agricultural practices of his time. He advocated such innovations as the seed drill, improved crop rotations, and the use of marl as fertilizer. He advocated the enclosure of open fields and the settlement of the indigent on newly enclosed waste agricultural lands. His many books on agriculture were highly influential in their day.

Young, Brigham (b. June 1, 1801, Whitingham, Vt., U.S.-d. Aug. 29, 1877, Salt Lake City, Utah), American religious leader, second president of the Mormon church, and colonizer who significantly influenced the development of the American West.

A carpenter, joiner, painter, and glazier, Young settled in 1829 at Mendon, N.Y., near where the Book of Mormon was published in 1830. The book soon attracted Young's interest, and he was baptized into Joseph Smith's new church (the Church of Jesus Christ of Latter-day Saints) on April 14, 1832. In the spring of 1834 he joined in the march to Missouri to help dispossessed Mormons re-

Brigham Young By courtesy of Utah State Historical Society

gain their lands. He was named third of the Quorum of the Twelve Apostles in 1835. In 1838, when the Mormons were driven out of Missouri, Young, who had become senior member of the Quorum, directed the move to Nauvoo, Ill. In 1839 he went to England, where he established a mission that contributed many British converts to the Mormon church in America and that opened the way to winning converts on the European continent, especially in Scandinavia.

When Joseph Smith was murdered (June 1844), Young was in Boston, pressing his leader's presidential campaign. He returned to Nauvoo and took command of the church. In the face of mob pressure, he led the Mormons westward out of Illinois in 1846. He got no farther than the Missouri River that summer, but in 1847 he conducted a pioneer company to the Rocky Mountains. After selecting the site of Salt Lake City as a gathering place for the Mormons, Young returned to Winter Quarters (Florence, Neb., now a part of Omaha) and in December 1847 became president of the church. He returned to Utah with the Mormon emigration of 1848 and remained there for the rest of his life.

With Salt Lake City as the base for Mormon colonizing, Young dispatched missions not only in Utah but to areas now in California, Arizona, Nevada, Idaho, and Wyoming.

In 1849 the Mormons established the provisional state of Deseret, with Young as governor. The next year this area became the territory of Utah, again with Young as governor. He was appointed to a second term in 1854, but friction between the Mormons and the federal judiciary led President James Buchanan to replace him in 1857, at which time an army was sent to establish the primacy of federal rule in Utah. He never again held political office, but as president of the Mormon church he effectively ruled the people of Utah until his death.

An eminently practical man, Young made few doctrinal contributions. He was an ironfisted administrator who stabilized Mormon society and gave it a cohesion made possible, in part, by its comparative isolation. Young encouraged education and the theatre, always stressed self-sufficiency, and became a notably wealthy man. Having accepted the doctrine of plural marriage, he took more than 20 wives and fathered 47 children.

BIBLIOGRAPHY. Leonard J. Arrington, Brigham Young: American Moses (1985), is an extensive work, based on previously unavailable Mormon archival material. Newell G. Bringhurst, Brigham Young and the Expanding American Frontier (1986), examines Young's important place in frontier history.

Young, Charles Augustus (b. Dec. 15, 1834, Hanover, N.H., U.S.-d. Jan. 3, 1908, Hanover), American astronomer who made the first observations of the flash spectrum of the Sun, during the solar eclipses of 1869 and

He studied the Sun extensively, particularly with the spectroscope, and wrote several important books on astronomy, of which the best known was General Astronomy (1888). In 1879 he made accurate measurements of the diameter of Mars. He was professor of astronomy at Princeton University from 1877 to 1905

Young, Chic, pseudonym of MURAT BERNARD YOUNG (b. Jan. 9, 1901, Chicago—d. March 14, 1973, St. Petersburg, Fla., U.S.), U.S. cartoonist who created the comic strip "Blondie," which, by the 1960s, was syndicated in more than 1,500 newspapers throughout the world.

Young was born into an artistic family and worked at several jobs, including one as a stenographer in a railroad office, for a number of years. He secured his first cartooning job through his friend Edgar Martin, the creator of "Boots and Her Buddies." Moving to New York City in the mid-1920s, he briefly drew the "Beautiful Babs" series and then for six years drew the "Dumb Dora" comic strip. In 1930 "Blondie" appeared, introducing the pretty, curlyheaded Blondie and her adoring suitor (later husband), the bumbling Dagwood Bumstead. Later were added Mr. Dithers (the tyrannical boss), Baby Dumpling ("born" 1934), Cookie ("born" 1941), and Daisy and her pups. A comedy of situations that only slightly exaggerates life, Blondie was adapted to motion pictures and to a television series and a radio series. The term Dagwood sandwich came into popular usage to describe a towering, multilayered sandwich like the ones that Dagwood made to allay nocturnal hunger

Young, Cy, byname of DENTON TRUE YOUNG (b. March 29, 1867, Gilmore, Ohio, U.S.—d. Nov. 4, 1955, Newcomerstown, Ohio), professional U.S. baseball player, winner of more major league games than any other pitcher. His victory total is variously given as 509 or 511, the sum of his defeats 313, 315, or 316. In each of 16 seasons (14 consecutive, 1891–1904) he won more than 20 games; in five of those years he won more than 30. Among his other records are games started, 816 or 818; completed starts, 750 or 751; and innings pitched, 7,356 or 7,377. (Many important early records of baseball are in dispute.)

Young, a big (6 feet 2 inches, 210 pounds) right-hander, pitched for five teams during his 22 years (1890–1911) in the major leagues, spending the first nine seasons with the Cleveland team in the National League, and the period 1901–08 with the Boston Red Sox in the American League. In 1897 and 1908 he pitched no-hit games, and on May 5, 1904, he registered a perfect game (no player reaching first base) for the Red Sox against the Philadelphia Athletics. He also played for the St. Louis Cardinals (1899–1901) and the Boston Braves (1911) in the National League and the Cleveland Indians (1909–11) in the American League.

Elected to the Baseball Hall of Fame in 1937, Young is commemorated in the Cy Young Award, instituted in 1956 to honour the best major league pitcher each year (separate awards for each league from 1967).

Young, Edward (baptized July 3, 1683, Upham, Hampshire, Eng.—d. April 5, 1765, Welwyn, Hertfordshire), English poet, dramatist, and literary critic, author of *The Complaint: or, Night Thoughts* (1742–45), a long, didactic poem on death. The poem was inspired by the successive deaths of his stepdaughter, in 1736; her husband, in 1740; and Young's wife, in 1741. The poem is a blank-verse dramatic monologue of nearly 10,000 lines, divided into nine parts, or "Nights." It was enormously popular.

As a dramatist, Young lacked a theatrical sense, and his plays are rarely performed. Of them, *The Revenge* (Drury Lane, April 1721) is generally thought to be the best.

Young's fame in Europe, particularly in Ger-

Edward Young, detail of an oil painting by Joseph Highmore; in All Souls College, Oxford

many, was augmented by a prose work, the Conjectures on Original Composition (1759), addressed to his friend Samuel Richardson. It sums up succinctly and forcefully many strains of thought later regarded as Romantic.

Young, Francis Brett (b. June 29, 1884, Halesowen, Worcestershire, Eng.—d: March 28, 1954, Cape Town, S.Af.), English novelist and poet who, although at times sentimental and long-winded, achieved wide popularity for his considerable skill as a storyteller. Among his best known novels, many of which are set in his native Worcestershire, are The Dark Tower (1914), Portrait of Claire (1927), My Brother Jonathan (1928), They Seek a Country (1937), and A Man About the House (1942).

Young, John W(atts) (b. Sept. 24, 1930, San Francisco), U.S. astronaut who participated in the Gemini, Apollo, and space shuttle projects. He served as Virgil Grissom's co-pilot on Gemini 3 (1965), the first U.S. two-man space flight.

John W. Young, 1964

After graduating from Georgia Institute of Technology (1952) with a degree in aeronautical engineering, Young joined the U.S. Navy. He served in Korea before participating in a test project, during which, in 1962, he set two altitude records in an F4B Navy jet. During 1962–64 Young trained for his part in the National Aeronautics and Space Administration (NASA) project.

Gemini 3, launched on March 23, 1965, reached a maximum altitude of 139 miles (224 kilometres) on the initial orbit. The orbit was changed three times, and after 4 hours 53 minutes flight time, the spacecraft landed in the South Atlantic Ocean. After this flight U.S. Pres. Lyndon B. Johnson conferred the NASA Exceptional Service medal on Young. On July 18, 1966, Young joined Michael Collins on the Gemini 10 flight. The two docked with an Agena target vehicle and, using the Agena's engine, attained an altitude of 475 miles (764 kilometres). On May 18, 1969, Apollo 10 was launched, with Thomas P. Stafford, Eugene A. Cernan, and Young on board. The flight, which orbited the Moon, was the last

checkout of Apollo systems before the Moon landing of Apollo 11.

Young was commander of the Apollo 16 mission (April 16–27, 1972; with Charles M. Duke, Jr., and Thomas K. Mattingly), the fifth manned landing on the Moon. He retired from the Navy in 1976 but remained with the space program, becoming chief of the astronaut office. He was commander of the first space shuttle mission (April 12–14, 1981; with Robert L. Crippen), guiding the orbiter "Columbia" to a landing at Edwards Air Force Base in California after it had circled the Earth 36 times. In 1983 Young commanded the joint NASA and European Space Agency (ESA) mission, which from November 28 to December 8 placed the Spacelab (a permanently orbiting workshop) above the Earth.

Young, Lester (Willis), byname PRES, or PREZ (b. Aug. 27, 1909, Woodville, Miss., U.S.—d. March 15, 1959, New York City), U.S. tenor saxophonist who emerged in the mid-1930s Kansas City, Mo., jazz world with the Count Basie band and introduced an ap-

Lester Young, c. 1955

proach to improvisation that provided much of the basis for modern jazz solo conception. Young's tone was a striking departure from the accepted full-bodied, dark, heavy variety, with its quick vibrato, because his was light in weight, colour, and texture, with a slow vibrato. The swinging, rhythmic feeling in his improvisations was far more relaxed and graceful than that usually heard in the work of others during the 1930s. His lines were streamlined, logical, and refreshingly melodic. The impact of his style was so broad that he has been cited as a favourite by such diverse modern jazz figures as Charlie Parker, Stan Getz, and John Coltrane. Much of the West Coast "cool" style was a direct product of Lester Young's approach, many saxophonists playing his lines note for note in their own performances. He was so important that singer Billie Holiday called him president of tenor saxophonists, and he was known thereafter as Pres (or Prez). Lester Young, a biography by Lewis R. Porter, was published in 1981.

Young, Murat Bernard: see Young, Chic. Young, Owen D. (b. Oct. 27, 1874, Van Hornesville, N.Y., U.S.—d. July 11, 1962, St. Augustine, Fla.), U.S. lawyer and businessman best known for his efforts to solve reparations issues after World War I.

Educated at St. Lawrence University and Boston University Law School, Young practiced law in Boston until 1912 and then became general counsel for the General Electric Company, serving also as chairman of the board of directors (1922–39). He organized the Radio Corporation of America (RCA) in

Owen D. Young, 1956

1919, was honorary chairman of its board of directors (1919–29), and was chairman of the executive committee (1929–33). He also served in a number of public capacities, notably as a member of the first committee of experts appointed to advise the Reparations Commission concerning the stabilization of German currency after World War I. In 1929 he was chairman of the second committee of experts, which drafted a permanent plan—generally known as the Young Plan—for the settlement of reparations and also established the Bank for International Settlements.

Young, Thomas (b. June 13, 1773, Milverton, Somerset, Eng.—d. May 10, 1829, London), English physician and physicist who established the principle of interference of light and thus resurrected the century-old wave theory of light. He was also an Egyptologist who helped decipher the Rosetta Stone.

In 1799 Young set up a medical practice in London. His primary interest was in sense perception, and, while still a medical student, he had discovered the way in which the lens of the eye changes shape to focus on objects at differing distances. He discovered the cause of astigmatism in 1801, the same year he turned to the study of light.

By allowing light to pass through two closely set pinholes onto a screen, Young found that the light beams spread apart and overlapped, and, in the area of overlap, bands of bright light alternated with bands of darkness. With this demonstration of the interference of light, Young definitely established the wave nature of light. He used his new wave theory of light to explain the colours of thin films (such as soap bubbles), and, relating colour to wavelength, he calculated the approximate wavelengths of the seven colours recognized by Newton. In 1817 he proposed that light waves were transverse (vibrating at right angles to the direction of travel), rather than longitudinal (vibrating in the direction of travel) as had long been assumed, and thus explained polarization, the alignment of light waves to vibrate in the same plane.

Young's work was disparaged by most English scientists: any opposition to a theory of Newton's was unthinkable. It was only with the work of the French physicists Augustin J. Fresnel and François Arago that Young's wave theory finally achieved acceptance in Europe.

Young also studied the problem of colour perception and proposed that there is no need for a separate mechanism in the eye for every colour, it being sufficient to have three—one each for blue, green, and red. Developed later by the German physicist Hermann L.F. von Helmholtz, this theory is known as the Young-Helmholtz three-colour theory.

Having become interested in Egyptology, Young began studying the texts of the Rosetta Stone in 1814. After obtaining additional hieroglyphic writings from other sources, he succeeded in providing a nearly accurate translation within a few years and thus contributed heavily to deciphering the ancient Egyptian language.

Young also did work on measuring the size of molecules, surface tension in liquids, and on elasticity. He was the first to give the word energy its scientific significance, and Young's modulus, a constant in the mathematical equation describing elasticity, was named in his honour.

Young, Whitney M(oore), Jr. (b. July 31, 1921, Lincoln Ridge, Ky., U.S.—d. March 11, 1971, Lagos, Nigeria), articulate U.S. civil rights leader who spearheaded the drive for equal opportunity for blacks in U.S. industry and government service during his 10 years as head of the National Urban League (1961–71), the world's largest social-civil rights organization. His advocacy of a "Domestic Marshall Plan"—massive funds to help solve America's

Whitney M. Young
AP/Wide World Photos

racial problems—was felt to have strongly influenced federal poverty programs sponsored by Democratic Party administrations in Washington (1963–69).

After army service in World War II, Young switched his career interest from medicine to social work, in which he took his M.A. from the University of Minnesota (1947). Starting as director of industrial relations for the Urban League at St. Paul, Minn. (1947–50), he moved to Omaha, Neb., where he served as executive secretary (1950–54). Becoming dean of the School of Social Work of Atlanta (Georgia) University in 1954, he was instrumental in improving relations between city and university.

Appointed executive director of the National Urban League in 1961, Young won an impressive reputation as a national black activist who helped bridge the gap between white political and business leaders and poor blacks and militants. Under his direction the organization grew from 60 to 98 chapters and shifted its focus from middle-class concerns to the needs of the urban poor. He was particularly credited with almost singlehandedly persuading corporate America and major foundations to aid the civil rights movement through financial contributions in support of self-help programs for jobs, housing, education, and family rehabilitation.

Young, who had been a consultant on racial matters to both Pres. John F. Kennedy and Pres. Lyndon B. Johnson, was in Nigeria at a conference sponsored by the Ford Foundation to enhance Afro-American understanding when he died.

Young America Movement, philosophical, economic, spiritual, and political concept in vogue in the United States during the mid-1840s and early 1850s. Taking as its inspiration the European youth movements of the 1830s, Young America flowered a decade later

in the United States. Characterized by energy and enthusiasm for free-market capitalism and expanded territorial boundaries, it first took concrete form in 1845 as a political organization under the leadership of Edwin de Leon and George Henry Evans.

Espousing a credo of free trade, expansion of foreign markets, annexation of lands southward, and encouragement of republican movements abroad, Young America became a faction within the Democratic Party early in the 1850s. George Nicholas Sanders became its chief spokesman, and the *Democratic Review* was its organ.

At a time when the nation was torn by sectional controversy, Young America tried to unite disparate segments within the Democratic Party on the basis of its nationalistic program. Stephen A. Douglas was one of the group's champions in this regard, but Young America accomplished little and faded quickly as the sectional strife became ever more divisive.

Young Christian Workers, Roman Catholic movement begun in Belgium in 1912 by Father (later Cardinal) Joseph Cardijn; it attempts to train workers to evangelize and to help them adjust to the work atmosphere in offices and factories. Organized on a national basis in 1925, Cardijn's groups were approved by the Belgian bishops and had the support of Pope Pius XI. The organization was innovative, however, in that the apostolic activity was the effort of workers rather than of the clergy. In their attempt to bring Christian principles to their work situations, the workers made use of the formula "See-judge-act." Members in French-speaking areas have traditionally been called Jocists, from Jeunesse Ouvrière Chrétienne. Using the same organizational and methodological principles, Cardijn organized similar groups of young farmers, students, and married couples. In the late 20th century the organization was known in some areas as the Young Christian Movement.

Articles are alphabetized word by word, not letter by letter

Young Germany, German JUNGES DEUTSCH-LAND, a social reform and literary movement in 19th-century Germany (about 1830-50), influenced by French revolutionary ideas, which was opposed to the extreme forms of Romanticism and nationalism then current. The name was first used in Ludolf Wienbarg's Asthetische Feldzüge ("Aesthetic Campaigns," 1834). Members of Young Germany, in spite of their intellectual and literary gifts and penetrating political awareness, failed to command the enthusiasm of their countrymen but, rather, excited widespread animosity. This was partly due to their lack of social standing and higher education. The Jewish origins of some of the members was also a hindrance. The movement leaders were Ludolf Wienbarg, Karl Gutzkow, and Theodor Mundt. Heinrich Laube, Georg Herwegh, Ludwig Börne, and Heinrich Heine were also associated with the movement. They were identified collectively as Young Germany in a resolution of the Diet of the German Confederation passed on Dec. 10, 1835, which demanded the suppression of their writings by strict censorship in all the German states. Although several members of the group were gifted poets, they tended in general towards sober prose discourses, in which they tried to scour the dreamier aspects of Romanticism from the public consciousness and to arouse a drive for social and political justice. Young Germany also aimed for a vital democratic and national theatre and, in what was their most direct influence on literature, prepared the way for dramatic realism in Germany. The revolutionary movements of 1848-49 led to its decline.

Young Ireland, Irish nationalist movement of the 1840s. Begun by a group of Irish intellectuals who founded and wrote for the Nation, the movement advocated the study of Irish history and the revival of the Irish (Gaelic) language as a means of developing Irish nationalism and achieving independence. The influence of the group waned after a break with the National Repeal Association in 1846. In 1848 the movement came to an end when a revolt led by the radical wing of the Young Irelanders was suppressed.

Young Italy, Italian GIOVINE ITALIA, movement founded by Giuseppe Mazzini in 1831 to work for a united, republican Italian nation. Attracting many Italians to the cause of independence, it played an important role in the Risorgimento (struggle for Italian unifica-

Mazzini, in exile at Marseille for his revolutionary activities, was prompted to found a new society because of the repeated failures of revolts led by the Carbonari (liberal secret societies). In contrast to the clandestine methods of the Carbonari and their dependence on foreign support, Young Italy was to be based on the moral and spiritual revival of the Italian people; it was to have a popular character and educate the people in their political role. The new movement was declared to stand for a republican government because, as its official program stated, "all the men of the nation are called by the law of God and Humanity to be free and equal brothers, and only a republic could assure this." It also favoured a unitary state because "without unity there is not truly a nation, since without unity there is no strength." To propagate these ideas, Mazzini published the journal Giovine Italia from 1832 to 1834.

According to Mazzini, the movement grew from 40 members at its 1831 beginnings to more than 50,000 by 1833. Young Italy spread rapidly in northern Italy (in Liguria and in Piedmont), where a high literacy rate made possible wide distribution of the society's publication, but it always remained a middle-class movement.

Mazzini's vision was not limited to Italy. In 1834 he started Young Europe to encourage the rise of national organizations throughout Europe as well.

Young Italy plotted conspiracies against the existing governments in Italy during the 1830s and the 1840s, but its revolts met with failure. The lack of popular support for insurrection as the road to independence discredited the society. In 1848 Mazzini himself replaced Young Italy with the Italian National Committee (Associazione Nazionale Italiana). After 1850, with Piedmont leading the struggle for unification, Mazzini's influence declined.

Young Maori Party, association of educated, westernized Maori of the late 19th and early 20th centuries, dedicated to bringing about a degree of cultural assimilation of the Maori nation to the dominant pakeha (white) culture of New Zealand. The party was organized in the 1890s by a number of graduates of Te Aute College, a Maori college; its most notable leaders were Apirana Ngata, Te Rangi Hiroa (Peter Buck), and Maui Pomare. All three were eventually knighted.

The Maori population had declined as a result of their wars with white settlers in the 1860s, and although a dramatic upsurge in the rate of population growth began in the late 1890s, assuring the survival of the Maori, they continued to have an aversion to the cultural and material aspects of pakeha society. The Young Maori sought to break through this barrier, especially in the fields of public health and education. Working through the government administration (especially 1909-12) and as a parliamentary bloc, the Young Maori made gains in these and other areas.

Young Men's and Young Women's Hebrew Association (YM-YWHA), also called JEWISH COMMUNITY CENTRE, Jewish community organization in various countries that provides a wide range of cultural, educational, recreational, and social activities for all age groups in Jewish communities. The goals of the YM-YWHA are to prepare the young for participation in a democratic society, to ensure Judaism's role as a positive element in community life, and to further the cultural unity of the Jewish community.

Jewish community centres originated in the Jewish young men's literary societies that were formed in U.S. cities in the 1840s. The first organization to be called the Young Men's Hebrew Association was established in Baltimore, Md., in 1854. The first women's organization (YWHA) began as an auxiliary of the New York YMHA in the 1880s, with the first independent YWHA being established in 1902. These men's and women's organizations even-

tually merged into single entities.

There were more than 750,000 members in more than 400 Jewish Community Centres or YM-YWHA's in 240 U.S. and Canadian cities by the late 20th century. Many of these centres sponsored day camps, summer camps, and nursery schools, as well as concerts, arts-and-crafts programs, lectures, and physical- and health-education programs. The centre movement has spread to some 20 other countries around the world and is linked through the World Federation of YMHA's and Jewish Community Centres.

Young Men's Christian Association (YMCA), nonsectarian, nonpolitical Christian lay movement that aims to develop high standards of Christian character through group activities and citizenship training. It originated in London in 1844, when 12 young men, led by George Williams, an employee in, and subsequently the head of, a drapery house, formed a club for the "improvement of the spiritual condition of young men in the drap-ery and other trades." Similar clubs spread rapidly in the United Kingdom and reached Australia in 1850 and North America in 1851. where the organization eventually reached its greatest development. The first club in North America was founded in Montreal, the second in Boston.

The YMCA programs include sports and physical education, camping, counselling, formal and informal education, public affairs, and citizenship activities. Among other activities, the YMCA sponsors hotels, residence halls, and cafeterias. In the United States it operates several degree-granting institutions as well as many other schools at all levels, including night classes for adults.

YMCA services to the armed forces began, in the United States, with the Civil War, and it continued giving service through all wars thereafter. By the Geneva Convention of 1929, it was charged with promoting educational and recreational facilities in many prisoner of war camps.

Local YMCA organizations are affiliated with national councils, which in turn are members of the World Alliance of YMCA's, established in 1855 with headquarters in Geneva. At the centennial of the World Alliance in 1955, a series of conferences held in Paris was attended by 8,000 delegates representing more than 4,000,000 members in 76 countries and territories.

Young New Zealand Party, parliamentary group that became most palpable as a vigorous faction within the parliamentary opposition to the Conservative government of Harry Albert Atkinson (1887–90) and that provided the Liberal Party with many of its future major figures. Prominent in the party were William Pember Reeves, Joseph Ward, and John McKenzie, all advocates of modern social and economic ideas that were required

to raise the standards of New Zealand society. The party was bound together not only by its program but also by a national self-consciousness that moved its members to think of themselves as New Zealanders rather than as transplanted Britons.

Young Ottomans, Turkish YENI OSMANLI-LAR, secret Turkish nationalist organization formed in Istanbul in June 1865. A forerunner of other Turkish nationalist groups (see Young Turks), the Young Ottomans favoured converting the Turkish-dominated multinational Ottoman Empire into a more purely Turkish state and called for the creation of a constitutional government. By 1867 the Young Ottomans had expanded from the original 6 members to 245, including the noted poets Namık Kemal and Ziya Paşa; they were further supported financially and materially by the Egyptian prince Mustafa Fazil and had attracted the attention of the Ottoman princes Murad and Abdülhamid.

Exiled for revolutionary activities by the grand vizier Âli Paşa in 1867, the society established itself in Paris; there it made European contacts and began publishing Hürrivet ("Freedom"), an inflammatory newspaper, subsequently smuggled into Turkey, calling on the Turkish people to demand a constitution. The return to Istanbul of Mustafa Fazil and Namık Kemal weakened the Young Ottomans, and in 1871-72, during the amnesty declared after the death of Ali Paşa, most of them returned to Turkey. The movement, however, had lost its impetus and, except for the isolated activity of such individuals as Namık Kemal, ceased to be a factor in na-

Young Plan (1929), second renegotiation of Germany's World War I reparation payments. A new committee, chaired by the American Owen D. Young, met in Paris on Feb. 11, 1929, to revise the Dawes Plan of 1924. Its report (June 7, 1929), accepted with minor changes, went into effect on Sept. 1, 1930. It reduced the amount due from Germany to 121,000,000,000 Reichsmarks in 59 annuities, set up the Bank for International Settlements to handle the transfer of funds, and ended foreign controls on German economic life. However, hardly had the Young Plan started operation than the world depression of the 1930s began, and Germany's ability to pay dwindled to the vanishing point. In 1932 the Lausanne Conference proposed to reduce reparations to the token sum of 3,000,000,000 marks, but the proposal was never ratified. Adolf Hitler came to power in 1933, and within a few years all important obligations under the Treaty of Versailles-political as well as economic-were repudiated.

Young Poland movement, diverse group of early 20th-century neo-Romantic writers brought together in reaction against Naturalism and Positivism to revive the unfettered expression of feeling and imagination in Polish literature and to extend this reawakening to all the Polish arts. They looked back to the Polish Romantic writers and also to contemporary western European trends, such as Symbolism, for inspiration. Centred in Kraków, the movement was pioneered by the poet Antoni Lange and the editor and critic Zenon Przesmycki ("Miriam").

The most prominent figure of the Young Poland movement was the painter and dramatist Stanisław Wyspiański, whose play Wesele (1901; "The Wedding"), a masterpiece of evocative allusion, is written in the stylized verse of the traditional puppet-theatre. Other writers included the peasant poet Jan Kasprowicz, who established a tonic poetic metre that became the characteristic rhythm of modern Polish poetry, and the novelists Stefan Żeromski, Władysław Stanisław Reymont, and Karol Irzykowski.

Young Pretender, the: see Charles Edward, the Young Pretender.

Young Tunisians, French JEUNES TUNISIENS, political party formed in 1907 by young French-educated Tunisian intellectuals in opposition to the French protectorate established in 1883.

The party, headed by Ali Bash Hamba and Bashir Sfar, demanded complete Tunisian control of the government and administration of the country and full citizenship rights for both Tunisians and Frenchmen. The party attracted a following among the young, educated, professional Muslims, but the liberal attitudes and European ways of its members alienated the common people.

In 1911 the Young Tunisians protested against Italy's invasion of neighbouring Muslim Tripolitania. In Tunisia itself, massive protests against French registration of a Muslim cemetery as public property ended in violent riots and killings; boycotts and labour strikes were called against Italian-owned companies in Tunis. The French responded by exiling the leaders of the party, including Ali Bash Hamba and Abd al-Aziz ath-Thaalibi (1912), and driving the Young Tunisians underground. At the end of World War I they emerged again as activists in the Tunisian nationalist movement and, led by ath-Thaalibi, reorganized themselves (1920) into the Des tour (q.v.) Party, which remained active until 1957

Young Turks, Turkish JÖNTÜRKLER, coalition of various reform groups that led a revolutionary movement against the authoritarian regime of Ottoman sultan Abdülhamid II, which culminated in the establishment of a constitutional government. After their rise to power, the Young Turks introduced programs that promoted the modernization of the Ottoman Empire and a new spirit of Turkish nationalism. Their handling of foreign affairs, however, resulted in the dissolution of the Ottoman state.

In 1889 a group of students in the Imperial Medical Academy in Istanbul initiated a conspiracy against Abdülhamid that spread rapidly to other colleges in the city. When the plot was uncovered, many of its leaders fled abroad, mainly to Paris, where they prepared the groundwork for a future revolution against Abdülhamid. Among the most notable of the liberal émigrés was Ahmed Rıza, who became a key spokesman for the influential Young Turk organization known as the Committee of Union and Progress (CUP), which advocated a program of orderly reform under a strong central government and the exclusion of all foreign influence. A major rival faction was formed by Prince Sabaheddin. His group, called the League of Private Initiative and Decentralization, espoused many of the same liberal principles as those propounded by the CUP, but, unlike the latter, it favoured administrative decentralization and European assistance to implement reforms.

Although the CUP and the League played a significant role in disseminating and stimulating liberal thought, the actual impetus for the Young Turk Revolution of 1908 came from groups within the empire, particularly from discontented members of the 3rd Army Corps in Macedonia. Many young officers of the corps garrisoned at Salonika (now Thessalonika, Greece) organized to form the Ottoman Liberty Society in 1906. This secret revolutionary group merged with the CUP in Paris the following year, bringing to the Young Turk ideologists the command of the

3rd Army Corps. Later in 1907 the CUP and the League of Private Initiative and Decentralization agreed, though reluctantly, to work together to achieve their common goal.

On July 3, 1908, Maj. Ahmed Niyazi of the 3rd Corps led a revolt against the provincial authorities in Resna. Other conspirators soon followed his example, and the rebellion rapidly spread throughout the empire. Unable to rely on government troops, Abdülhamid announced on July 23 the restoration of the 1876 constitution and recalled parliament. The Young Turks had succeeded in establishing a constitutional government, but their deep-seated ideological differences resurfaced and prevented them from taking effective control of that government until 1913, when the CUP under new leaders—the triumvirate of Talât Paşa, Ahmed Cemal Paşa, and Enver Paşa-set itself up as the real arbiter of Ottoman politics.

While in power, the Young Turks carried out administrative reforms, especially of provincial administration, that led to more centralization. They were also the first Ottoman reformers to promote industrialization. In addition, the programs of the Young Turk regime effectuated greater secularization of the legal system and provided for the education of women and better state-operated primary schools. Such positive developments in domestic affairs, however, were largely overshadowed by the disastrous consequences of the regime's foreign policy decisions. An overly hasty appraisal of Germany's military capability by the Young Turk leaders led them to break neutrality and enter World War I (1914-18) on the side of the Central Powers. Upon the end of the war, with defeat imminent, the CUP Cabinet resigned on Oct. 9, 1918, less than a month before the Ottomans signed the Armistice of Mudros.

Young Women's Christian Association (YWCA), nonsectarian Christian organization that aims "to advance the physical, social, intellectual, moral, and spiritual interests of young women." The recreational, educational, and spiritual aspects of its program are symbolized in its insignia, a blue triangle the three sides of which stand for body, mind, and spirit. The YWCA and the Young Men's Christian Association (YMCA) are completely independent organizations.

The first YWCA was established in England in 1855, when two groups met to aid women: one group formed a Prayer Union to pray for women, and the other founded Christian homes for young women. The two groups merged in 1877 and took the name Young Women's Christian Association. In 1884 the organization adopted a constitution.

In the United States 35 women met in New York City and formed the first Ladies' Christian Association to provide for the "temporal, moral, and religious welfare of young women who are dependent on their own exertions for support." In 1866, in Boston, another group of women met with similar aims, formed an organization, and wrote the constitution for the Young Women's Christian Association. By 1900 hundreds of YWCAs were in existence in the United States; the national organization was formed in 1906.

The early YWCA groups were influenced by the profound social effects of the Industrial Revolution on the lives of young women, especially in the cities. The organization has continued its efforts to alleviate poverty and to help girls and women move into the mainstream of society. It provides housing for girls seeking inexpensive, safe, and comfortable quarters as they start their lives away from home. Summer camps and programs of education and recreation are offered, all without regard to the economic, racial, or religious background of participants.

Local YWCA organizations are affiliated

with their national associations, which in turn are members of the World YWCA, organized in London in 1894, with headquarters in Geneva. By the 1980s the YWCA organization in the United States offered numerous service and development programs to all females 12 years of age and older; men and boys also participated as associates or registrants. YWCA programs were concerned with racial equality and harmony, public policy, health, physical education, and recreation. In the United States in 1980 there were almost 1,278,000 members, and YWCA programs served almost 2,412,500 persons.

Younger BROTHERS, four Midwestern American outlaws of the post-Civil War era—Thomas Coleman ("Cole"; 1844–1916), John (1846–74); James ("Jim"; 1850–1902), and Robert ("Bob"; 1853–89)—who were often allied with Jesse James.

As youngsters in Lee's Summit, Mo., the Youngers were witness to the bloody Kansas-Missouri border skirmishes and then the strife of the Civil War. Cole Younger joined William C. Quantrill's raiders, Confederate guerrillas and near-outlaws, and met Frank James, another member. After the war, in 1866, Cole joined Jesse and Frank James and other outlaws in a gang robbing banks in Missouri and in surrounding states. Jim Younger joined them in 1868, John Younger about a year later, and Bob Younger about 1872. The next summer the gang added train robberies to their derring-do.

By this time, Pinkerton agents and Missouri sheriffs had been long in pursuit. In March 1874 three of them found John and Jim Younger and killed John in a shootout.

The three remaining Youngers reached the end of their career on Sept. 7, 1876, when, with Frank and Jesse James and three others, they attempted to rob the First National Bank of Northfield, Minn. Leaving the bank, they were met by the gunfire of a mob of citizens, who pursued them as they fled into nearby swamps. Three of the gang (Clell Miller, Bill Chadwell, and Charlie Pitts) were killed. Frank and Jesse James escaped; and the Youngers, with Jim badly wounded, were captured. The three Youngers pleaded guilty to robbery and murder and were sentenced to life imprisonment. Bob died in prison of tuberculosis. Cole and Jim were granted pardons in 1901. Jim, in ill health, put a bullet through his head the following year. Cole wrote The Story of Cole Younger, by Himself (1903), played in Wild West shows and carnivals for a few years, and then retired to his hometown of Lee's Summitt, Mo., where he died of a heart attack.

Younghusband, Sir Francis Edward (b. May 31, 1863, Murree, India—d. July 31, 1942, Lytchett Minster, Dorset, Eng.), British army officer and explorer whose travels, mainly in northern India and Tibet, yielded

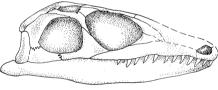

Younghusband, detail from an oil painting by W.Q. Orchardson, 1906; in the National Portrait Gallery, London By courtesy of the National Portrait Gallery, London

major contributions to geographical research; he also forced the conclusion of the AngloTibetan Treaty (Sept. 6, 1904) that gained Britain long-sought trade concessions.

Younghusband entered the army in 1882 and in 1886-87 crossed Central Asia from Peking to Yarkand, now in Sinkiang Uighur Autonomous Region, China. Continuing on to India by way of the long-unused Mustagh Pass of the Karakoram Range, he proved the range to be the water divide between India and Turkestan. On two later expeditions to Central Asia he explored the Pamir Mountains.

After repeated British attempts to gain trading rights with Tibet, Lord Curzon, viceroy of India, authorized Younghusband, accompanied by a military escort, to cross the Tibetan border to negotiate trade and frontier issues (July 1903). When efforts to begin negotiations failed, the British, under the command of Major General James Macdonald, invaded the country and slaughtered some 600 Tibetans at Guru. Younghusband moved on to Chiang-tzu (Gyantze), where his second attempt to begin trade negotiations also failed. He then marched into Lhasa, the capital, with British troops and forced the conclusion of a trade treaty with the Dalai Lama, Tibet's ruler. This action brought him a knighthood in 1904. G. Seaver published a biography, Francis Younghusband, in 1952

Youngina, extinct genus of primitive reptiles found as fossils in Late Permian deposits of South Africa (the Permian Period began 280,000,000 years ago and lasted 55,000,000 years). Youngina is representative of the eosuchians, a basic reptilian stock that gave rise to the later lizards and snakes and may have been ancestral to the reptiles that dominated the Mesozoic Era (between 65,000,000 and 225,000,000 years ago). Youngina had a slender body and limbs and a primitive and gen-

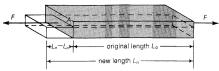

Youngina skull

eralized skull. Youngina retained the pineal eye, a light-receptive organ that in effect was a third eve.

Young's experiment, classical investigation into the nature of light, an investigation that provided the basic element in the development of the wave theory and was first performed by the English physicist and physician Thomas Young in 1801. In this experiment, Young identified the phenomenon called interference. Observing that when light from a single source is split into two beams, and the two beams are then recombined, the combined beam shows a pattern of light and dark fringes, Young concluded that the fringes result from the fact that when the beams recombine their peaks and troughs may not be in phase (in step). When two peaks coincide they reinforce each other, and a line of light results; when a peak and a trough coincide they cancel each other, and a dark line results. English scientists did not accept Young's wave theory until the work of the French physicists François Arago and Augustin-Jean Frésnel had confirmed it many vears later.

Young's modulus, numerical constant, named for the 18th-century English physician and physicist Thomas Young, that describes the elastic properties of a solid undergoing tension or compression in only one direction. as in the case of a metal rod that after being stretched or compressed lengthwise returns to its original length. Young's modulus is a mea-

Metal bar under tension increases in length and decreases in cross section

sure of the ability of a material to withstand changes in length when under lengthwise tension or compression. Sometimes referred to as the modulus of elasticity, Young's modulus is equal to the longitudinal stress divided by the strain. Stress and strain may be described as follows in the case of a metal bar under tension.

If a metal bar of cross-sectional area A is pulled by a force F at each end, the bar stretches from its original length L_a to a new length L_n . (Simultaneously the cross section decreases.) The stress is the quotient of the tensile force divided by the cross-sectional area, or F/A. (Its units in the English system are pounds per square inch, usually abbreviated psi.) The strain or relative deformation is the change in length, $L_n - L_o$, divided by the original length, or $(L_n - L_o)/L_o$. (Strain is dimensionless.) Thus Young's modulus may be expressed mathematically as

Young's modulus =
$$\frac{\text{stress}}{\text{strain}} = \frac{F/A}{(L_n - L_o)/L_o}$$

This is a specific form of Hooke's law of elasticity. The units of Young's modulus in the English system are pounds per square inch, and in the metric system newtons per square metre (N/m2). The value of Young's modulus for aluminum is about 1.0×10^7 psi, or 7.0×10^{10} N/m². The value for steel is about three times greater, which means that it takes three times as much force to stretch a steel bar the same amount as a similarly shaped aluminum bar.

Young's modulus is meaningful only in the range in which the stress is proportional to the strain, and the material returns to its original dimensions when the external force is removed. As stresses increase, Young's modulus may no longer remain constant but decrease, or the material may either flow, undergoing permanent deformation, or finally break.

When a metal bar under tension is elongated, its width is slightly diminished. This lateral shrinkage constitutes a transverse strain that is equal to the change in the width divided by the original width. The ratio of the transverse strain to the longitudinal strain is called Poisson's ratio. The average value of Poisson's ratio for steels is 0.28, and for aluminum alloys, 0.33. The volume of materials that have Poisson's ratios less than 0.50 increase under longitudinal tension and decrease under longitudinal compression.

Youngstown, city, Mahoning and Trumbull counties, seat (1876) of Mahoning County, northeastern Ohio, U.S. It lies along the Mahoning River, near the Pennsylvania border, and is equidistant (65 miles [105 km]) from Cleveland (northwest) and Pittsburgh (southeast). Youngstown is the heart of a steelindustrial complex that includes the cities of Warren, Niles, Campbell, Struthers, and Girard. The region was part of the Western Reserve until John Young, a surveyor from New York, purchased a tract of land there from the Connecticut Land Company (1797) and laid out a town (Young's town). Colonel James Hillman, a local trader, was responsible for the early development of the community, which was organized as a town in 1802. In 1805 James and Daniel Heaton built Ohio's first furnace at nearby Yellow Creek to produce iron by reducing ore with charcoal and limestone. Later, it was discovered that locally mined block coal could be used directly for iron smelting. In 1855 the first Sault Ste. Marie locks were opened, making available to Youngstown and its neighbouring steel centres the rich iron ores from the upper Great Lakes region; subsequently, four main railroad lines and four branch lines were built to transport ores and coal to Youngstown. By 1920 the city had become one of the largest steel-producing centres in the United States. Youngstown still produces steel, but in much smaller quantities after some major mill closings in the 1970s; other manufactures include aluminum, rubber, and paper products, office furniture, aircraft and automotive parts, storm windows and doors, and awnings.

Youngstown State University was first established as a night school (1908). In the city are the Butler Institute of American Art, the Youngstown Playhouse, and the Youngstown Symphony Center. The city's scenic Mill Creek Park is bisected by a 6-mile- (10-kilometre-) long gorge with three lakes and a waterfall; it is the site of the Ford Nature Education Center and several historic landmarks. Inc. village, 1848; city, 1867. Pop. (1986 est.) city, 104,-690; Youngstown-Warren metropolitan area

(MSA), 510,000.

Yourcenar, Marguerite, original name MAR-GUERITE DE CRAYENCOUR (b. June 8, 1903, Brussels—d. Dec. 17, 1987, Northeast Harbor, Maine, U.S.), French-born novelist, essayist, and short-story writer who became the first woman to be elected to the Académie Française (French Academy), an exclusive literary institution with a membership limited to 40.

Cravencour was educated at home and spent much of her early life traveling with her father. She began writing as a teenager and

Marguerite Yourcenar, 1971

continued to do so after her father's death left her independently wealthy. She led a nomadic life until the outbreak of World War II, at which time she settled permanently in the United States. She became a naturalized U.S. citizen in 1947. The name "Yourcenar' is an imperfect anagram of her original name, "Crayencour.

Yourcenar's literary works are notable for their rigorously classical style, their erudition, and their psychological subtlety. In her most important books she re-creates past eras and personages, meditating thereby on human destiny, morality, and power. Her master-piece is Mémoires d'Hadrien (1951; Memoirs of Hadrian), a historical novel constituting the fictionalized memoirs of that 2nd-century Roman emperor. Another historical novel is L'Oeuvre au noir (1968; The Abyss), an imaginary biography of a 16th-century alchemist and scholar. Among Yourcenar's other works are the short stories collected in *Nouvelles Orientales* (1938; "Oriental Tales"), the prose poem *Feux* (1936; *Fires*), and the short novel *Le Coup de Grace* (1939). She wrote numerous essays and also translated Negro spirituals and various English and American novels into French.

Membership in the Académie Française requires French citizenship. Yourcenar had become a U.S. citizen, however, so the president of France granted her a special dual U.S.-French citizenship in 1979, and she was subsequently elected to the Académie on March 6, 1980.

youth hostel, supervised shelter providing inexpensive overnight lodging, particularly for young people. Hostels range from simple accommodations in a farm house to hotels able to house several hundred guests for days at a time. They are located in many parts of the world, usually in scenic areas, and are spaced at intervals so that hostelers can hike, bicycle, or canoe from one to the next in a day. Hostelers often cook their own meals, make their own beds, and do other light work to help maintain the hostel. In return they receive lodging at much less than the usual commercial rate. In some countries hostels impose a maximum age limit on guests. Limits on the length of stay are also common.

Youth hostels were common in Germany in the early 1900s. After World War I they spread rapidly through Europe and other areas of the world. The International Youth Hostel Federation was formed in 1932 to coordinate activities of the various national youth hostel associations and to facilitate international travel by members; by 1980 its membership included national federations in 50 countries. National organizations regularly publish handbooks describing hostel locations and facilities.

Yovkov, Yordan Stefanovich (b. Nov. 9, 1880, Zheravna, Bulg.—d. Oct. 15, 1937, Sofia), Bulgarian short-story writer, novelist, and dramatist whose stories of Balkan peasant life and military experiences show a fine mastery of prose.

Yovkov grew up in the Dobruja region and, after studying in Sofia, returned there to teach. He later worked in the Bulgarian legation in Bucharest. He drew upon Balkan folktales for Staroplaninski Legendi (1927; "Balkan Legends"). His novel Chiflikut krai granitsata (1933; "The Farm by the Frontier") deals with village life in the Dobruja region. Yovkov's experiences as a military officer inspired some of his best stories. His plays include Albena (1930), Boryana (1932), and a comedy, Milionerut (1930; "The Millionaire").

Yozgat, city, central Turkey. The city lies on the site of a Bronze Age settlement 100 miles (160 km) east of Ankara in a valley of the Ak Mountains, at an elevation of 4,360 feet (1,329 m). The main road between Sivas and Ankara passes through it, but the rail line bypasses it to the southwest, and the city functions primarily as a local market and administrative centre. Mohair, wool, grain, gum, and lead are the chief products of the surrounding area, which is well-forested. There are also many ancient Hittite archaeological sites within the region. Pop. (1980) 36,349.

Ypacaraí, city, southern Paraguay. It is situated in the westward extension of the Brazilian Highlands. Its name means "water of God" in the ancient Guaraní language. Founded in 1887, it serves as a commercial and manufacturing centre for the agricultural and pastoral hinterland, the major yields of which include tobacco, cotton, fruit, and livestock. Among the industrial activities in Ypacaraí are cotton ginning, tobacco and petroleum process-

ing, tanning, and the production of ceramics, glass, soap, and stringed musical instruments. The Maria Asunta agricultural school and a business school are located in Ypacaraí. It is accessible by railroad and highway from Asunción. Pop. (1982 prelim.) 5,709.

Ypres (French), Flemish IEPER, municipality, West Flanders province, western Belgium. It lies along the Yperlee (Ieperlee) River, south of Ostend. Ypres became a major cloth-weaving city in the Middle Ages, and together with Brugge and Ghent it virtually controlled Flanders in the 13th century. At that time it was reputed to have a population of 80,000. An unsuccessful but devastating siege of the city by the English in 1383 during the Hundred Years' War helped cause Ypres' decline, however, and by the late 16th century its population had dwindled to 5,000. The town was frequently besieged by the French in the 17th century.

Ypres was the principal town within an important salient, or bulge, in the British lines on the Western Front during World War I. The Ypres salient was the site of three major battles, the second (1915) of which marked the Germans' first use of poison gas as a weapon. More than 250,000 British and other Allied soldiers lost their lives at the successive battles of Ypres, 55,000 of them having no known graves.

Ypres itself was completely destroyed during the fighting and was subsequently rebuilt in its original style. Its notable structures include the magnificent Cloth Hall (originally from 1214); the Cathedral of St. Martin (13th century), which contains the tomb of Cornelius Jansen, bishop of Ypres and founder of Jansenism; the medieval ramparts, which were rebuilt by Sébastien de Vauban in the 17th century; the Lille Gate; and the Menin Gate, a memorial to the British soldiers who died in World War I. There are 140 cemeteries, mostly containing war graves, in the environs. Ypres is now an agricultural market centre and manufactures textiles and building materials. Pop. (1983 est.) mun., 34,758.

Ypres, John (Denton Pinkstone) French, 1st earl of: see French, John (Denton Pinkstone).

Ypsilanti, city, Washtenaw County, southeastern Michigan, U.S. It lies along the Huron River just east of Ann Arbor. Originally called Woodruff's Grove, it grew up around a French trading post (1809-19) and was renamed in 1833 for Demetrios Ypsilanti, a Greek patriot whose monument stands in the city. While retaining its role as a farm-trading centre. Ypsilanti has become industrially important with a wide range of manufactures. Immediately east are the Willow Run Airport (serving the Detroit metropolitan area) and the huge Willow Run auto plants. Ypsilanti is the site of Eastern Michigan University (1849) and Cleary College (1883). Inc. village, 1832; city, 1858. Pop. (1986 est.) 23,476.

Yr Wyddgrug (Wales): see Mold.

Yrigoyen, Hipólito: see Irigoyen, Hipólito.

Yrjö-Koskinen, Sakari, original name GEORG ZACHARIAS FORSMAN (b. 1830, Vaasa, Fin.—d. Nov. 13, 1903, Helsingfors), historian and politician, author of the first history of Finland in Finnish. Later he guided the Old Finn Party in its policy of compliance with Russia's unconstitutional Russification program in Finland.

Forsman—later, when he was made a baron, named Yrjö-Koskinen—was a nationalist scholar and a member of the mid-19th-century Fennoman Party, which advocated the development of the Finnish language and its ascendancy over the Swedish of Finland's dominant minority. In his Suomen kansan historia (1869-72; "Finnish National History") he demonstrated that Finnish was a

suitable language for higher cultural development. Becoming leader of the Fennoman Party in the 1870s, Yrjö-Koskinen entered the Finnish Diet (estates assembly) in 1872 and was appointed to the Senate (the Finnish government) in 1882. Both in the legislative and in the executive bodies he consistently championed the extension of Finnish in all sectors of the grand duchy's society. With the start of intensive Russification in 1898, the Fennoman Party split into a constitutionalist Young Finn group, which opposed by passive resistance the Russian abrogation of the Finnish constitution, and Yrjö-Koskinen's Old Finn majority, which chose to comply with the reactionary measures of the imperial government. The Old Finns were rewarded with control of the Senate, of which Yrjö-Koskinen became head, as well as with a declaration of Finnish equality with Swedish in all public business. In the end, however, the policy of the "compliers" proved bankrupt, and Yrjö-Koskinen was subjected to hostile demonstrations in his last days.

Ysabel (Solomon Islands): see Santa Isabel.

Ysaÿe, Eugène (b. July 16, 1858, Liège, Belg.—d. May 12, 1931, Brussels), Belgian violinist, conductor, and composer, the foremost interpreter of the string works of French and Belgian composers of his time.

After a year as conductor of an orchestra in Berlin, Ysaÿe toured Norway, Russia, and France. From 1886 to 1897 he was professor

Ysaÿe

of violin at the Brussels Conservatory. In 1894 he began in Brussels a series of orchestral concerts that introduced much new music. In the same year he founded the Ysaÿe Quartet, to which Claude Debussy dedicated the string quartet he wrote. From 1918 to 1922 Ysaÿe was conductor of the Cincinnati (Ohio) Symphony Orchestra.

Ysaÿe's playing was known for its virtuosity, expressiveness, and intensive use of vibrato. He inspired works by César Franck (who influenced his early style), Camille Saint-Saëns, Vincent d'Indy, and Gabriel Fauré. Among his own best compositions are six sonatas for unaccompanied violin, containing novel chordal and pizzicato effects. He also wrote eight violin concerti, chamber works, and an opera in Walloon dialect, *Piér li Houien* (1931; "Peter the Miner").

Yser River, Flemish IJZER, a small stream (48 mi [77 km] long), rising on the north flanks of the sandstone hills of Monts Cassell and de Récollets in northern France and flowing in an arc through West Flanders province, western Belgium, into the North Sea below Nieuwpoort. Its estuary seems to have extended as far inland as Loo (Lo) until the 10th century, but gradual land reclamation has since reduced it to a narrow tidal creek. Numerous channels from the surrounding polders drain into the river, and sluices at Nieuwpoort regulate its depth, both for an adequate outfall and for navigation. It has been canalized just east of the French frontier, but for long summer periods it is not navigable. It is linked to Veurne by the Loo Canal and to Ypres by the Yser (IJzer) Canal.

The German advance toward Calais and the English Channel coast was stopped (October 1914) along the river during World War I. After the evacuation of Antwerp and Ghent, the Belgian army retreated to the Yser. After 15 days of desperate fighting (the Battle of the Yser), the Nieuwpoort sluices were flooded and checked the Germans; the Allies then succeeded in establishing themselves in an impregnable position on the river's left bank.

Ysleta, town, El Paso county, extreme western Texas, U.S., near the Rio Grande. Incorporated in 1955, it was later annexed by El Paso, of which it is now a southeastern section.

Regarded as the oldest settlement within the present boundaries of Texas, Ysleta was founded in 1681–82 by Spanish padres and Christian Indians who, because of a Pueblo Indian uprising, had fled from their settlements along the upper Rio Grande in the region of La Ysleta (an alternate spelling for the Spanish *isleta* ["island"]) in what is now New Mexico. The refugees first sought protection of the Spanish fort El Paso del Norte (now Juarez, Mex., across the river) and then moved to the present site to found Ysleta del Sur and build the Mission Nuestro Señora del Carmen (1682), the oldest mission in Texas, now largely reconstructed.

The Ysleta section of El Paso today is characterized by whitewashed old adobe buildings standing between modern structures. The Tigua (Tiwa) Indians maintain a museum and an arts and crafts centre in Ysleta; many of them are direct descendants of the Indians who fled the Pueblo revolt. A small stretch of irrigated land just east of the mission is claimed to be the oldest continuously cultivated plot in the United States; originally plowed in 1681, it first yielded corn (maize) and later grapes and a high grade of Egyptian long-staple cotton.

Ysopet, also spelled ISOPET, in French literature, a medieval collection of fables, often versions of Aesop's Fables. The word was first applied to a collection of tales written by Marie de France in the late 12th century; they were said to be based directly on an English version of Aesop's Fables (Esope) attributed to King Alfred the Great, of Wessex, and no longer extant. Another source, better-documented, is the medieval Romuli (falsely credited to Romulus, son of Tiberius), which includes works of the Latin writers Phaedrus and Avienus.

Consult the INDEX first

ytterbium (Yb), chemical element, rare-earth metal of transition Group IIIb of the periodic table, a low-melting-point, divalent rare earth with little commercial use.

The first concentrate of ytterbium was obtained (1878) by Jean-Charles-Galinard de Marignac and named by him for the town of Ytterby, Sweden, where the first rare-earth mineral was found. Georges Urbain and Carl Auer von Welsbach independently demonstrated (1907-08) that Marignac's earth was composed of two oxides, which Urbain called neoytterbia and lutetia. The metals are now known as ytterbium and lutetium. Ytterbium is among the less-abundant rare earths. It occurs in minute amounts in many rareearth minerals such as xenotime and euxenite and is found in the products of nuclear fission as well. Natural ytterbium consists of seven stable isotopes: ytterbium-168 (0.135 percent), ytterbium-170 (3.03 percent), ytterbium-171 (14.31 percent), ytterbium-172

(21.82 percent), ytterbium-173 (16.13 percent), ytterbium-174 (31.84 percent), and ytterbium-176 (12.73 percent).

Ytterbium may be separated from the other rare-earth elements by ion-exchange techniques. The elemental metal is prepared by the thermoreduction of its oxide, Yb₂O₃, with lanthanum metal. A divalent compound was first prepared (1929) by W.K. Klemm and W. Schuth, who reduced ytterbium(III) chloride, YbCl₃, to ytterbium(II) chloride, YbCl₂, with hydrogen. The divalent ion, Yb2+, has also been produced by electrolytic reduction or treatment of a trivalent salt with sodium amalgam. The element forms a series of palegreen divalent salts such as ytterbium(II) sulfate, bromide, hydroxide, and carbonate. The pale-green ytterbium ion Yb2+ is unstable in aqueous solution and reduces water readily, liberating hydrogen; it is less stable than the divalent europium ion Eu2+ and more stable than the divalent samarium ion Sm²⁺. In its predominant trivalent state, ytterbium forms a series of white salts such as ytterbium(III) oxide, sulfate, and nitrate.

The relatively soft, silvery-white metal is most conveniently prepared by thermoreduction of the oxide with lanthanum metal followed by distillation of the comparatively volatile ytterbium metal. Elemental ytterbium is oxidized slowly by air at room temperature; and it reacts with water, liberating hydrogen.

atomic number atomic weight 70 173.04 melting point 824° C boiling point $1,193^{\circ}$ C specific gravity valence 2,3 electronic config. 2.8-18-32-8-2 or $(Xe)4f^{14}5d^{0}6s^{2}$

yttrium (Y), chemical element, rare-earth metal of transition Group IIIb of the periodic table, used for red phosphors in colour television. Yttrium metal is silvery in colour, ductile, and relatively reactive; turnings of the metal ignite readily in air.

Johan Gadolin in 1794 isolated yttria, a new earth or metallic oxide, from a mineral found at Ytterby, Sweden. Yttria, the first rare earth to be discovered, turned out to be a mixture of oxides from which, over a span of more than a century, nine elements, yttrium, scandium (atomic number 21), and the heavy rare-earth metals from terbium (atomic number 65) to lutetium (atomic number 71), were separated. Yttrium occurs especially in the heavy rareearth ores, of which gadolinite, euxenite, and xenotime are the most important. In the igneous rocks of the Earth's crust, this element is more plentiful than any of the other rareearth elements except cerium and is twice as abundant as lead. Yttrium also occurs in the products of nuclear fission. Commercially yttrium is separated from the other rare earths by ion exchange, and the metal is produced by reduction of the fluoride with calcium. Yttrium is used in alloys and in metal-

lurgical operations. Yttrium compounds are used in optical glasses and in special ceramics, as catalysts, and in electronic and optical devices including phosphors and lasers. Red phosphors containing yttrium and europium have greatly improved colour television. One phosphor is a europium-activated yttrium orthoyanadate: another is a europium-activated yttrium oxide. Garnets utilizing yttrium oxide for solid-state microwave devices are used in radar and communication systems; yttriumiron garnets, for example, transmit shortwave energy with very little loss, Neodymium-doped yttrium-aluminum garnet lasers provide efficient tools for cutting and welding metals. Radioactive yttrium is employed in cancer therapy.

Yttrium behaves chemically as a typical trivalent rare-earth element. Its ionic radius is 0.90 angstrom (Å), near the radii of dysprosium and holmium (0.908 Å and 0.894 Å,

respectively); separation from these elements is difficult. It forms a series of nearly white salts such as yttrium oxide, sulfate, chloride, and carbonate. The Y³+ ion is diamagnetic. Stable yttrium-89 is the only naturally occurring isotope.

yu, Pinyin You, type of Chinese bronze vessel produced during the Shang (18th-12th century Bc) and early Chou (1111-c. 900 Bc) periods. It is a container, probably meant to transport wine, resembling a bucket with a swing handle and a nobbed lid.

Yü Ch'ien, Pinyin YU QIAN (b. 1398, Ch'ient'ang, Chekiang province, China—d. 1457, Peking), defense minister who saved China when the Cheng-t'ung emperor (1427-64) of the Ming dynasty was captured in 1449 while leading Chinese troops against the Mongol leader Esen.

With the emperor held hostage and the Mongol armies only 50 miles (80 km) northwest of the capital of Peking, the government was in a state of panic. Yü Ch'ien acted by placing the Cheng-t'ung emperor's brother, the Ching-t'ai emperor (1428-57), on the throne and preparing a cannon defense of the city. Soon after Esen attacked, he found his hostage valueless because a new emperor was on the throne, and he saw that the city was well-fortified. Hence, he abandoned the siege within days and retreated into Mongolia. Yü Ch'ien made no efforts to ransom the abducted emperor, but Esen returned the captive in 1450. The Chingt'ai emperor, however, continued to rule until he fell ill in 1457. The former captive took advantage of his brother's failing health and returned to the throne with the aid of a group of palace eunuchs. He later had Yü Ch'ien executed as a traitor.

Yü-lin, Pinyin YULIN, city in the southeast of the Kwangsi Chuang autonomous $ch'\ddot{u}$ (district), China. Situated on the upper waters of the Nan-liu River, which drains southwestward into the Gulf of Tonkin to the west of Pei-hai, it is also a natural route centre from which highways extend in all directions, and since 1957 it has had a rail connection to Liuchou and Nan-ning in the interior of Kwangsi and to the port of Chan-chiang in Kwangtung sheng (province). It is also a commercial and collecting centre for a somewhat unproductive agricultural area that suffers seriously from drought. Pop. (mid-1970s est.) 10,000–50,000.

Yü-men, Pinyin YUMEN, city in western Kansu *sheng* (province), China. It is situated on the ancient Silk Road from China into Central Asia.

It was first brought under Chinese control in the last years of the 2nd century BC when it was given the name Yü-men (Jade Gate). Known as Hui-chi County in the 5th century AD, when the area was recovered by the Northern Wei dynasty, it was renamed Yümen in 581. Under the T'ang dynasty (618-907), Yü-men County's seat was at Ch'ihchin-shan, east of the modern city. After about 770 the area fell to the Tibetans, who retained control for some 70 years; and after the end of the T'ang dynasty in 907, Yü-men became a part of the Hsi-Hsia (Tangut) state. During the Ming period (1368–1644) it again became a Tibetan territory, and the county was only reestablished in the early Ch'ing (1644-1911) period. Until the end of the T'ang dynasty the overland route to Western Asia flourished, and Yü-men consequently also prospered. When sea transport subsequently replaced the old route, however, Yü-men became a backwater, although the establishment of Ch'ing hegemony in Central Asia to some extent revived the overland route.

Two important developments in the late 1930s and 1940s led to the city's spectacular revival. The first was the construction of a modern highway, paved as far west as Yümen, along the old caravan route to Wu-lumu-ch'i (Urumchi), and continuing westward to the Soviet Union. This became a vital supply line during World War II, and since 1949 the highway has been improved, and its line has been followed by a railway joining Lan-chou in Kansu to Wu-lu-mu-ch'i, now in Sinkiang Uighur Autonomous Region.

The second was the discovery of oil in the Chiu-ch'uan basin, to the north of the Nan Shan (mountains). The first oil was drilled at Lao-chun-miao near Yu-men in 1939. Appreciable production was achieved by 1941, but it was only after 1949 that large-scale development began. Prospecting after 1950 revealed vastly larger reserves than had been suspected. Yü-men has its own refinery, but the fields are also linked to the major refinery at Lan-chou by a pipeline, and some of the crude oil is shipped by rail for refining. The Yü-men Oil Administration also has general control over the K'o-la-ma-i (Karamai) field in western Sinkiang Uighur. To staff new oil fields, a university established in 1970 gives courses in mechanics and undergound operations. Pop. (mid-1970s est.) 50,000-100,000.

Yu Qian (Chinese minister): see Yü Ch'ien.

Yü River, Wade-Giles romanization YÜ CHIANG, Pinyin YU JIANG, also called SIANG, river in South China. A southern tributary of the Hsi Chiang, it rises in two branches in southeastern Yunnan Province and flows about 400 mi (750 km) generally east in Kwangsi Province to unite at Kuei-p'ing with the Hung-shui Ho to form the Hsi. It receives the Tso Chiang near Nan-ning. The river is important in China's transportation system.

Yü Ta-fu, Pinyin YU DAFU (b. 1896, Fu-yang, Chekiang Province, China—d. September 1945, Sumatra, Dutch East Indies), popular short-story writer of the 1920s in China, one of the founding members of the Creation Society, which was devoted to the promotion of modern literature.

Yü Ta-fu received his higher education in Japan, where he met other young Chinese writers, with whom he founded the Creation Society (Ch'ang-tsao she) in 1921. His first collection of short stories, *Ch'en-lun* (1921; "Sinking"), was written in vernacular Chinese, as advocated by the new writers. *Ch'en-lun* became a popular success in China because of its frank treatment of sex; when Yü returned to his country in 1922, he found himself a literary celebrity.

Yü continued his work with the Creation Society and edited or contributed to literary journals. He also continued to write the same kinds of short stories. But in 1923, after suffering tuberculosis, he abruptly changed his major theme from one of self-preoccupation to one of concern with the state of the masses. In 1926, after disagreeing with the Communist members of the Creation Society, Yü attempted to reorganize the group but was forced to resign.

Yü's first novel appeared in 1928 and was only moderately successful; his second followed four years later. In 1935 his last and major work of fiction, Ch'u-pen ("Flight"), was published. During the Sino-Japanese War, Yü wrote anti-Japanese propaganda from Hangchow and Singapore. When that Malay city fell to the Japanese in 1942, he fled to Sumatra, only to be executed by Japanese military police there shortly before the end of the war. Of Yü's many works, the most popular was Jih-chi chiu-chung (1927; "Nine Diaries"), an account of his affair with the young left-wing writer Wang Ying-hsia; the book broke all previous sales records in China. The critics' favourite is probably Kuo-ch'ü (1927; "The Past"), praised for its psychological depth.

Yü Ti, Pinyin YOU DI (Chinese: Jade Emperor), also called YÜ HUANG (Jade August One), the most revered and popular of Chinese Taoist deities. In the official Taoist pantheon, he is an impassive sage-deity, but he is popularly viewed as a celestial sovereign who guides human affairs and rules an enormous heavenly bureaucracy analogous to the Chinese Empire.

The worship of Yü Ti was officially sanctioned by the Taoist emperors of the Sung dynasty (AD 960–1279), who renamed him Yü Huang Shang Ti (Jade August Supreme Lord) and accorded him a status equivalent to that of the Confucian supreme power. Yü Ti is usually depicted on a throne wearing the Imperial dragon-embroidered robes and beaded bonnet, holding a jade ceremonial tablet.

Yu Ti Shun (Chinese mythology): see Shun.

Yü-tz'u, Pinyin YUCI, city, central Shansi Province (sheng), China. It is a county-level municipality (shih) and the administrative centre of Chin-chung Prefecture (ti-ch'ü). Yütz'u has from early times been overshadowed by T'ai-yüan, nearby to the north, of which it often has been a subordinate county since Han times (206 BC-AD 220). Originally located some distance west, it was moved to its present site in AD 448. Yü-tz'u has always been an important road centre, situated where the route from Hopeh Province, after traversing the T'ai-hang Shan (mountains), enters the T'ai-yuan Basin. It was traditionally a major agricultural collecting centre for the north of the T'ai-yüan Basin, engaging in a trade in grain, fruits, cotton, and textiles. Before World War II, however, it was a small market town, with walls some 2 mi (3 km) in circumference. It had, however, already begun to grow in importance as a rail junction, for it was there that the Shih-t'ai railway, running from Shih-chia-chuang in Hopeh to T'aiyüan, joined the T'ung-pu railway, which traversed Shansi from Ta-t'ung in the north to Feng-ling-tu in the extreme southwest. Both of these double-tracked railways are of crucial importance. During the 1950s, the population grew rapidly, partly because the city had become a communication centre and also because of the expansion of its industry. Yü-tz'u has a large-scale cotton manufacturing industry, partly built with Soviet aid. Pop. (mid-1970s est.) 50,000-100,000.

Yüan DYNASTY, Pinyin YUAN, also called MONGOL DYNASTY (1206–1368), dynasty established in China by Mongol nomads. Yüan rule stretched throughout most of Asia and

eastern Europe, though the Yüan emperors were rarely able to exercise much control over their more distant possessions.

The dynasty was established by Genghis Khan (c. 1162–1227) and gained control of China under his grandson Kublai Khan (1215–94). Genghis had occupied North China in 1215, but it was not until 1279 that Kublai was able to effect the capture of South China. Proclaiming the Yüan dynasty, he established a Chinese-style administration.

The Yüan was the first dynasty to make Peking (then called Ta-tu) its capital, although 15 centuries earlier the Ch'in capital, Yen-ching, was situated close by. The Yüan rebuilt the Grand Canal and put the roads and postal stations in good order; and their rule coincided with new cultural achievements, including the development of the novel as a literary form. The vast size of the empire resulted in more extensive foreign trade and foreign intercourse than at any other time before the modern period.

Unlike other rulers of China, the Mongols were never totally Sinicized. They continued to maintain their separateness from the native poulation and utilized foreigners, such as the European traveller Marco Polo, to staff the government bureaucracy. Revolts in the mid-14th century overthrew the Yüan, making it the shortest lived major dynasty of China. The administrative centrality of the Yüan was continued by the succeeding Ming (1368–1644) and Ch'ing (1644–1911/12), giving these later Chinese governments a more authoritarian structure than that of previous Chinese dynasties

Unlike the previous ages of the T'ang (618-907) and the Sung (960-1279), when art was encouraged by the state, artists—especially those native Chinese who steadfastly refused to serve their conquerors—had to seek inspiration within themselves and their traditions. These painters sought a return in their art to what they viewed as more ideal times, especially the T'ang and Northern Sung. Artists such as Chao Meng-fu and the Four Masters of the Yüan dynasty thus firmly fixed the ideal of "literati painting" (wen-jen-hua), which valued erudition and personal expression above elegant surface or mere representation. There was also an emphasis upon stark and simple forms (bamboo, rocks, etc.) and upon calligraphy, often with long, complementary inscriptions upon the paintings themselves. Against this radical new direction of the native Chinese in pictorial art, there was a conservative revival of Buddhist art (painting and sculpture), sponsored by the Mongols in an effort to establish their authority over the Chinese.

In addition to a renewed emphasis upon traditional craft arts (silver, lacquer, and other materials), there were important developments in ceramics, which, while continuing various earlier traditions, included new shapes, decoration, and glazes. Of special merit was the first appearance of the underglaze blue-and-white ware that was to become so popular in later periods and among Western collectors.

Under Yüan rule the regional music drama that had gone two separate ways during the Sung dynasty was intermixed as Yüan-ch'u, Yüan drama. Popular song styles became freer than before, and several forms of dancing and acrobatics were added to popular entertainment. Poetry emphasized san-ch'ü ("nondramatic songs"), and vernacular fiction grew in popularity. Dramatists—including at least a dozen prominent Sinicized Mongols—wrote romantic plays of four or five acts in vernacular, with several songs in each act. This new literary genre attracted many men of letters, as well as large audiences.

Yüan Chen, Pinyin Yuan zhen, courtesy name Wei-chih (b. 779, Lo-yang, China—d. 831, Wu-ch'ang, China), a key literary figure of the middle T'ang dynasty of China, influ-

ential in the ku-wen, or "ancient literature," revival.

Yüan entered state service through the examination system and briefly held ministerial rank. While in office he joined a famous literary circle under the poet-official Po Chü-i, which espoused Confucian ideals. Deeming literature an instrument of ethical and social improvement, the group rejected the courtly trends of the time and called for a revival of the moral themes and the straightforward style of ancient literature. Yüan thus joined Po Chü-i in reviving an old ballad tradition associated with social protest. Though famed for these hsin yüeh-fu, or "new music bureau, ballads, as well as for his more conventional poetry, Yüan was best known for his short fiction. Using contemporary settings, figures, and themes, he adapted the traditional *ch'uan ch'i*, or "marvel tale," to serious moral and social purposes. Works such as his semiautobiographical Ying-ying chuan ("Story of Ying-ying") thus set a new standard for the genre of the tale in Chinese literature.

Yüan Chi, Pinyin YUAN JI (b. 210, K'aifeng, Honan province, China—d. 263, China), eccentric Chinese poet and most prominent member of the Seven Sages of the Bamboo Grove (q, v), a group of 3rd-century poets and philosophers who sought refuge from worldly pressures in a life of drinking and verse mak-

Born into a prominent family, Yüan Chi was faced with the choice of silent acceptance of the corrupt political maneuverings of the Wei dynasty court (220–265/266) or severe punishment. He found a solution that enabled him to escape both hypocrisy and harm. In a successful effort to avoid commitment to a marriage alliance that he considered dangerous and distasteful, the poet purposely remained drunk for 60 days. When he felt the need to speak out against the ruling class, he did so through poems and essays heavily veiled in allegory. Finally he retired to a life of pleasure and poetry in the countryside, far from the pressures of the palace.

Despite Yüan Chi's clever tricks at court and his hedonistic outlook on life, his poetry is melancholy and pessimistic and has been praised for its profound view of a troubled time. His best-known collection is Yung huai shih ("Singing of Thoughts").

Yüan Chiang: see Red River; Yüan River.

Yuan Di (Chinese emperor): see Yüan-ti.

Yüan Hung (Chinese emperor): see Hsiaowen Ti.

Yuan Ji (Chinese poet): see Yüan Chi.

Yüan River, Wade-Giles romanization YÜAN CHIANG, Pinyin YUAN JIANG, conventional YÜAN KIANG, river of eastern Kweichow and western Hunan provinces, southeast China.

The Yüan River is about 500 miles (800 km) long and rises in the Miao Mountains near Tu-yün in Kweichow. Its upper stream is called the Lung-t'ou River, and downstream it is called the Ch'ing-shui River. It becomes the Yuan River after its confluence with its northern tributary, the Wu River, which flows through Chih-chiang. It then flows northeast along the western flank of the Hsüeh-feng Mountains in Hunan to discharge into the Tung-t'ing Lake at Ch'ang-te and thence into the Yangtze River.

The Yuan River is a major waterway for western Hunan and eastern Kweichow. Large vessels on it can reach Ch'ang-te, and small steamboats can travel as far as T'ao-yüan. Above this there are rapids, but shallow-draft junks can reach Hung-chiang near the Kweichow border and can travel up the Wu River as far as Chih-chiang. Although there are highways using the Yuan River valley, the river is still the chief means of transport for the mountainous areas of western Hunan.

Yüan Shih-k'ai, Pinyin YUAN SHIKAI, literary name JUNG-AN (b. 1859, Honan province, China—d. June 6, 1916), Chinese army leader and reformist minister in the twilight of the Manchu (Ch'ing) dynasty (until 1911) and then first president of the Republic of China (1912-16).

Yüan was from a landed military family of Hsiang-ch'eng in Honan province. In his youth he showed a propensity for pleasureseeking and excelled in physical activity rather than scholarship, although he was obviously a man of remarkable astuteness. He failed to win even the lowest of the classical degrees but was to have the distinction of being the first Han Chinese to hold a viceroyalty and to become a grand councillor without any academic qualification. In the last days of the

empire, he was made a marquess.

Yuan began his career in the Ch'ing brigade of the Anhwei army, commanded by Li Hungchang, which was dispatched to Korea in 1882 to try to prevent Japanese encroachment in the area. The political crises of that remote kingdom repeatedly offered him opportunities to prove the correctness of his judgment and the promptness of his action, especially in military and economic affairs. In 1885 he was made Chinese commissioner at Seoul, and his energetic and loval service to the throne contributed to the outbreak of the Sino-Japanese War of 1894-95.

With the destruction of China's navy and army by Japan in the war, Peking was exposed to external and internal attack: in consequence, the training of a new army became an urgent task that fell on Yuan. As the division under his command was the only remnant of China's army that survived the Boxer Rebellion of 1900, Yüan's political stature became greater than that of all others, and in 1901 he was given the viceroyalty of the metropolitan province. In that office, and later as a grand councillor, he was to play a decisive part in China's modernization and defense programs: throughout, he enjoyed the trust and unflinching support of the dowager empress, Tz'uhsi. On the death of the empress (1908), his opponents, notably the regent for the infant emperor, stripped him of all his offices and sent him home. Nevertheless, when the tide of revolution threatened to engulf the Manchu dynasty, the throne was to need his service once more.

At this critical juncture, Yüan appeared to conservatives and revolutionaries alike as the only man who could lead the country to peace and unity; and so both the emperor in Peking and the provisional president in Nanking recommended Yuan to be the first president of China. The treasury then was empty; the provinces were in the hands of local war lords; a permanent constitution was still in the making; and the newly elected National Assembly was, to Yüan, too quarrelsome and too cumbersome for the good of the country. When his plan for a gigantic foreign loan was obstructed by the Nationalist Party (Kuomintang) in the National Assembly, he ruthlessly murdered the chairman of the party and undermined the assembly, thus bringing about the revolt against him in 1913. His victory in that struggle marked the end of all hopes for parliamentary democracy in China. Thereafter, he contrived to make him-self president for life and then boldly tried to create a new imperial dynasty in 1915–16. Though his aim was to unite the country and to strengthen its central leadership, Yüan's last attempt, ironically, sowed dissension even among the conservative civilian and military forces that had supported him. Widespread opposition, backed by Japan, rose to challenge his authority. Yuan found his European friends preoccupied by World War I and his old lieutenants unwilling to fight. (Je.Ch.) BIBLIOGRAPHY. For a comprehensive study of the life and times of Yuan Shih-k'ai, see Jerome

Ch'en, Yüan Shih-k'ai: Brutus Assumes the Purple, 2nd ed. (1972), which includes an extensive bibliography. Other accounts that provide information on the role of Yuan Shih-k'ai in revolutionary events are Harold Schiffrin, Sun Yat-sen and the Origins of the Chinese Revolution (1968); and E.P. Young, Presidency of Yüan Shih-k'ai (1977).

Yüan-ti, Pinyin YUAN DI (posthumous name, or shih), personal name (Wade-Giles romanization) LIU SHIH (b. 75 BC, China-d. 33 or 32 BC, China), emperor (reigned 48-33/32) of the Han dynasty, who ardently promoted and helped firmly establish Confucianism as the official creed of China.

Although Confucianism had been made the state cult of China in 136 BC, previous emperors had often disregarded its teachings. Yüanti, however, not only wholeheartedly supported Confucianism, but he also appointed its adherents to important government posts, where they did much to lessen government expenses and to improve the welfare of the people.

Yuan-ti's failure to check the power of his eunuch secretaries, however, contributed to the interruption and eventual ruin of the Han dynasty. Moreover, believing himself exercising Confucian filial piety, he gave great power to the family of his empress dowager, a member of the Wang clan. Wang family members were appointed to high government posts and allowed to dominate the government. Yüanti's son and successor, Ch'eng-ti (reigned 33/ 32-7/6 BC), continued to promote members of his mother's family, and it was her nephew Wang Mang who interrupted the Han succession by seizing power and declaring himself

emperor in AD 9.

Yuba City, city, seat (1856) of Sutter county, north-central California, U.S. It lies in the Sacramento Valley, at the junction of the Feather and Yuba rivers. It was laid out during the California Gold Rush of 1849 on the site of an Indian village. The head of river navigation (until the channel filled with mining debris), it developed as an agricultural centre. The city's basic food-processing economy has been supplemented by steel fabrication, light manufacturing, and Beale Air Force Base (15 miles [24 km] east). Natural gas is tapped from Sutter Buttes (12 miles west). Yuba College (1927) is across the Feather River in neighbouring Marysville. Inc. 1908. Pop. (1988 est.) city, 22,287; metropolitan statistical area (MSA), 115,800.

Yūbari, city, central Hokkaido, northern Japan. It lies along the upper Yūbari River, in the Yūbari Range. It developed as a mining town when coal was discovered in the area in the 1880s, and by the mid-20th century it was the largest mining city in Hokkaido. Most of the coal was sent to Iwate prefecture to be used in the production of iron. The declining yield and closure of the mines after 1960, however, caused the city's population to decline. Pop. (1985) 31,665.

yuca (plant): see cassava.

Yucatán, estada ("state"), northern Yucatán Peninsula, southeastern Mexico. It is bounded on the north by the Gulf of Mexico, on the east and southeast by Quintana Roo, and on the southwest and west by Campeche. Yucatán occupied the entire peninsula when it became a state in 1824, but the secession of Campeche was ratified in 1858 and Quintana Roo was lost in 1902; later boundary changes reduced the state to its present 14,827 square miles (38,402 square km).

An attempt by the governor of the state in the early 1920s to break up the large henequen plantations failed, but they were eventually expropriated in the 1930s, and many were subdivided into cooperative *ejidos* (common lands). Production of henequen fibre, which had reached a low level, was increased after the mid-1950s, but a program to diversify crops also was undertaken. With improved connections with mainland Mexico by railroad and highway, and especially by air, many old Mayan centres, such as Chichén Itzá, Dzibilchaltún, and Uxmal, became easily accessible and tourism became important. Aside from the clusters at Mérida, the state capital, and at Progreso, the chief port, much of the population consists of rural Mayan Indians who speak little Spanish. Pop. (1980) 1,063,733.

Yucatán Channel, strait connecting the Gulf of Mexico and the Caribbean Sea, extending for 135 mi (217 km) between Cape Catoche, Mexico, and Cape San Antonio, Cuba. The north and south equatorial currents enter the channel from the southeast and form the beginnings of the Gulf Stream in the Gulf of Mexico.

Yucatán Current, oceanic surface current, the western limb of a clockwise gyre in the eastern Gulf of Mexico flowing from northern Honduras, through the Yucatán Channel, to the central eastern portion of the Gulf. The Yucatán Current is strongest in the summer, attaining velocities in excess of 6.5 ft per second (4 knots, or 2 m, per second).

Yucatán Peninsula, Spanish Península DE YUCATÁN, a projection of southeastern Mexico, lying between the Gulf of Mexico on the west and north and the Caribbean Sea on the east. Its 76,300-sq-mi (197,600-sq-km) territory includes the Mexican states of Campeche, Quintana Roo, and Yucatán and, in the south, large parts of Belize and Guatemala. The peninsula has a mean breadth of about 200 mi (320 km) and a coastline of about 700 mi (1,100 km).

On the north and west the coast is low, sandy, and semi-barren, with a number of openings through the outer bank upon which several small towns or ports have been built. The eastern coast consists of bluffs, indented with bays and bordered by several islands, the largest of which is Cozumel. There is good fishing all along the coasts, and there are many excellent beaches.

The peninsula is almost wholly composed of beds of coralline and porous limestone, covered with a layer of thin, dry soil, forming a low tableland rising gradually to the south. Where solution of the limestone by rainwater formed natural wells and caverns, the ancient Mayas and Toltecs built their cities and ceremonial centres. The climate in the northwest is hot and dry, but, toward the east and south, moisture increases, and the scrub forest gives way to tall trees, including mahogany, several valuable cabinet woods, and dyewoods. Most of the peninsula receives adequate rainfall throughout the year.

The peninsula, long called Mayapán by Mexicans, was first visited by the Spaniards in 1517. Hernán Cortés clashed with the natives of Cozumel in 1519 and traversed the inland part of the peninsula six years later. Mérida was founded in 1542, but Spanish rule was not consolidated until 1549, and even then control was limited to only about half of the peninsula. The Spaniards discovered the remains of a high aboriginal civilization that had already entered into decline. Some deserted cities were falling into ruins, but others, such as Chichén Itzá, Uxmal, and Tulum, were still inhabited by remnants of their former Maya populations. During the colonial period. Yucatán remained a remote and unimportant part of the viceroyalty. The Mayas clung to the inland rural areas of the peninsula, particularly in Quintana Roo, and offered continual

resistance to Spanish rule, especially during the Caste War of 1847.

Economic activities are varied. The chief cultivated plants are corn (maize), sugarcane, tobacco, cotton, coffee, and especially henequen. In 1502 Columbus wrote of meeting canoes manned by Indians whose gear was tied with henequen ropes, but it was not until 1811 that the fibre was first produced commercially for export; after about 1880, with the invention of cordage machines, the trade, including the making of hammocks, grew rapidly. Oil has been discovered in several parts of Yucatán, but exploitation in the 1970s was limited to the natural-gas field at Xicalango and the offshore oil fields of the Bay of Campeche: logging and chicle industries are important in the south. The restoration of ancient archaeological sites and development of transportation facilities to bring visitors to the natural wonders of the peninsula have made tourism one of the major economic activities.

Until the 20th century, Yucatán was more closely connected with Europe than with the rest of Mexico. Not until 1957 was the narrow-gauge railway line to mainland Mexico (completed only in 1949) widened to standard gauge, thus facilitating the movement of heavy freight. The highway network is still limited, but all the important centres are connected with Mexico City by air. Pop. (1980) Mexican portion, 1,711,000.

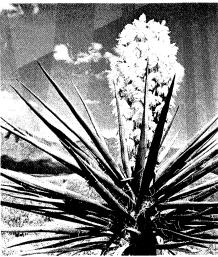

Yucatec language, also called MAYA, American Indian language of the Mayan family, spoken in the Yucatán Peninsula, including not only part of Mexico but also Belize and northern Guatemala. In its classical (i.e., 16th-century) form Yucatec was the language of Yucatán, and it survives in its modern form with little dialectal variation and only minor changes from the classical form. Written materials that may be in Yucatec (but are probably in a Cholan language) include three hieroglyphic codices surviving from the period before the Spanish conquest (see Mayan hieroglyphic writing), as well as numerous stone monument inscriptions. These, however, have yet to be deciphered.

The literature that constitutes the body of readable written material in Yucatec was written down in the late 16th and early 17th centuries in an orthography adapted from that of Spanish. Major works are the Book of Chilam Balam and the Book of the Songs of Dzitbalché.

The phonology of Yucatec is characterized by a series of glottalized consonants as well as voiceless consonants such as p, t, k. Voiced stops such as b, d, g are rare, occurring only in words borrowed from Spanish. Another characteristic of Yucatec is the use of tones to distinguish between otherwise identical words. In grammar and syntax, Yucatec uses prefixes, suffixes, and infixes to mark grammatical categories such as plural number, possession, and verb tense. Small words called particles function like English prepositions, conjunctions, adverbs, and interjections.

Yucatec Maya, Middle American Indians of the Yucatán Peninsula in eastern Mexico. The Yucatec were participants in the Maya civilization, whose calendar, architecture, and hieroglyphic writing marked them as a highly civilized people. Modern Yucatec range from highly conservative of their culture to almost completely acculturated to modern life. About 50 percent speak Mayan, and about 10 percent speak only Mayan. Many acculturated Yucatec live in Spanish-style towns and participate in the henequen-fibre industry. More traditional people live in hamlets or villages and raise corn (maize), beans, squash, chilies, yams, and other vegetables. They live in thatched houses and keep pigs and chickens. Farming techniques consist of slash-and-burn clearing and cultivation with digging sticks, hoes, and machetes. See also Maya.

Yucca, genus of about 40 species of succulent plants of the family Agavaceae, native to southern North America. Most species of Yucca are stemless, with a rosette of stiff, sword-shaped leaves at the base and clusters of waxy white flowers.

Yucca

By courtesy of the New Mexico Department of Development

The Joshua tree (Y. brevifolia) has a stem more than 10 metres (33 feet) high. Spanish bayonet (Y. aloifolia), Spanish dagger (Y. gloriosa), and Adam's needle, or bear grass (Y. filamentosa), are commonly cultivated as ornamentals for their unusual appearance and attractive flower clusters.

yucca moth, any member of the insect genus *Tegeticula* of the Prodoxidae family of moths (order Lepidoptera). The adults are small, diurnal, and have tiny spines covering their wings.

Each of the four yucca moth species is adapted to a particular species of yucca. The

Female yucca moth depositing eggs

moths emerge when the yucca flowers open. The female gathers pollen from one flower, rolls it into a ball, flies to another flower, lays four or five eggs, and inserts the pollen mass in the opening thus formed. The larvae eat about half the approximately 200 seeds produced by the plant. The yucca can be fertilized by no other insect, and the moth can utilize no other plant. Larvae of the related bogus yucca moth (*Prodoxus*) feed in the stems and seed capsules of the yucca plant and also attack the century plant.

Yuci (China): see Yü-tz'u.

Yudenich, Nikolay Nikolayevich (b. July 30 [July 18, old style], 1862, Moscow—d. Oct. 5, 1933, Saint-Laurent-du-Var, Fr.), commander of the White forces in the northwest during the Russian Civil War (1918–20). Having entered the Imperial Army in 1879,

Yudenich graduated from the General Staff Academy in 1887, served on the General Staff from 1887 until 1902, and then became a regimental commander. After participating in the Russo-Japanese War (1904–05), he was promoted to general (1905) and in 1913 was appointed chief of staff of the Caucasian military district; during World War I he commanded all Russian troops in the Caucasus (1914–15 and February–October [O.S.], 1917).

After the Bolsheviks seized power in October (O.S.) 1917, Yudenich retired to Finland but later went to Tallinn, in Estonia. In May 1919 he launched an offensive toward Petrograd (modern Leningrad), but his volunteer army was driven back to Estonia. In July, Adm. Aleksandr Kolchak (head of the White, or anti-Bolshevik, government in Siberia) recognized him as commander in chief of the northwestern White armies. Yudenich organized the scattered White forces in the Baltic region into an army of 12,000 men. His lack of sympathy for the nationalism of the local Estonian government and his quarrels with his British advisers, however, brought about a decline in his political effectiveness. When he renewed his offensive in October 1919, in coordination with a White attack on Moscow from the south, the Red Army stopped him at Pulkovo, on the outskirts of Petrograd, and forced his army to retreat to Estonia and to disband (January 1920). Yudenich fled to France and died in exile.

Yue Fei (Chinese general): see Yüeh Fei.

Yüeh, Pinyin YUE, aboriginal people of South China who in the 5th-4th century BC formed a powerful kingdom in present-day Chekiang and Fukien provinces. The name Vietnam means "south of the Yüeh," and some Chinese scholars consider the Vietnamese to be descendants of the Yüeh.

Yüeh: see Cantonese language.

Yüeh-chih, also called INDO-SCYTH, ancient people who ruled in Bactria and India from c. 128 BC to c. AD 450. The Yüeh-chih are first mentioned in Chinese sources at the beginning of the 2nd century BC as nomads living in the western part of Kansu Province, northwest China. When Lao Shang (reigned c. 174-161 BC), ruler of the Hsiung-nu (a powerful people of North China), defeated them and killed their king, the main body of Yüeh-chih moved westward into Sogdiana and Bactria, putting an end to Greek rule there. They and related tribes are the Asi (or Asiani) and Tocharians (Tochari) of Western sources. About 128 BC the Yüeh-chih were recorded living north of the Oxus River (Amu Darya), ruling Bactria as a dependency, but a little later the Great Yüeh-chih kingdom was in Bactria, and Sogdiana was occupied by the Ta-yuan (Tocharians). The remnant in Kansu were called Little Yüeh-chih.

A new dynasty, that of the Kushans (see Kushan dynasty), was subsequently founded by one of the five chieftains among whom Bactria was divided. The Kushan kingdom extended its power southward and eastward into India and northward into Central Asia. From the 3rd century onward, however, Kushan power declined, and around AD 400 the Kidara dynasty arose in Gandhāra; it survived only to about AD 450, when it was overwhelmed by the Hephtalites (originally a Yüeh-chih tribe).

Missionaries from the Great Yüeh-chih played an important part in the propagation of Buddhism in China. The spread of Indian culture into Central Asia as far as the borders of China probably also resulted from Kushan influence.

yüeh-ch'in, also called LA CH'IN, or MOON GUITAR, Chinese lute, one of a family of flat, round-bodied lutes found in Central and East Asia. It was invented, according to tradition, during the Chin dynasty (AD 265–419). It has

Yüeh-ch'in; in the Pitt-Rivers Museum, Oxford

By courtesy of the Pitt-Rivers Museum, Oxford

two pairs of silk strings, tuned (relative pitch) c-g, which run from a fastener on the wooden belly to tuning pegs set in the sides of the pegbox. A metal plate is hung inside the body, vibrating against it when the instrument is played.

The yüeh-ch'in is frequently found in Chinese opera orchestras. Its precursor, the ya cheng, was bowed with a friction stick—a sorghum stem dusted with resin.

Yüeh-chou (China): see Yüeh-yang.

Yüch Fei, Pinyin YUE FEI, also spelled YO FEI (b. 1103, T'ang-yin, Honan Province, China—d. 1141, China), one of China's greatest generals and national heroes.

In 1126 North China was overrun by the nomadic Juchen and the Sung capital at K'aifeng taken. The former emperor Hui Tsung, who had abdicated in 1125/26, together with his son, the emperor Ch'in Tsung (reigned 1125/26–27), was carried into captivity. Another son of Hui Tsung, later known as Kao Tsung (reigned 1127–62/63), reestablished the dynasty in the south, hence its designation as the Southern Sung (1127–1279).

Retreating southward with Kao Tsung, Yüeh Fei assumed command of the Sung forces. He prevented the advance of the Juchen by taking advantage of their difficulty in using their cavalry in hilly South China. Assuming the offensive, he was able to recover and secure some of the occupied territory in central China south of the Yangtze and Huai rivers.

His attempt to push north and recover all the lost Chinese territory was opposed, however, by a peace party within the capital headed by the minister Ch'in Kuei, who believed that further prosecution of the war would be too costly. Ch'in Kuei's faction proved more influential, and in 1141 Yüeh Fei was imprisoned and executed and a peace treaty was signed that relinquished the northern territory. Yüeh Fei became revered as a great national hero, and Ch'in Kuei came to be viewed as a traitor. In the 20th century, Yüeh has been extolled as a champion of national resistance in the face of foreign domination.

yüeh-fu, form of Chinese poetry derived from the folk-ballad tradition. The yüeh-fu takes its name from the Yüeh Fu (Music Bureau), created in 120 BC by Emperor Wu for the purpose of collecting songs and their musical scores for ceremonial occasions at court. The music for these songs was later lost, but the words remained, forming a collection of Han dynasty (206 BC-AD 220) folk poetry that

served as the basis of the yüeh-fu form. These poems were significant because they consisted of lines of varying lengths, with some having a regular form of five words per line rather than the then-standard four-word line. The yüeh-fu thus broke ground for the later classic five-word-line poem. Many later writers, including the great Li Po (701–762) and Po Chü-i (772–846), continued to create poems derived from the yüeh-fu tradition.

Yüeh-yang, formerly (until 1911) YÜEH-CHOU, Pinyin YUEYANG OR YUEZHOU, town in northern Hunan Province (sheng), China. It is a county (hsien) seat and the administrative centre of Yüeh-yang Prefecture (ti-ch'i). The town is situated on the east bank of the outlet from the Tung-t'ing Hu (lake) into the Yangtze River, some 5 mi (8 km) from the confluence with the Yangtze. Its port on the Yangtze is known as Ch'eng-ling-chi. The city is built on a high bluff well above high-water

level, in a good defensive position.

It was a fortified place called Pa-ch'iu in Han times (206 BC-AD 220), and on the partition of China in AD 221 a major military stronghold was built there and named Pa-ling; it was converted into a civil county before 260. In 439 it was made a commandery (chun), and in 589, after the reunification of China by the Sui dynasty (581-618), it became the prefecture of Yüeh-chou, which name it retained until 1911. Under the Sung dynasty (960-1279) it was heavily fortified, with walls some 4 mi in circumference, and became the seat of the military prefecture of Yüeh-yang, whence its present name. In 1368 the Ming dynasty promoted it to the Yüeh-yang Superior Prefecture (fu). During the Taiping Rebellion, its capture by the rebels in 1852 was an important stage in their advance up the Yangtze Valley to Nan-ching (Nanking), while its recapture in 1854 secured the control of the central government over the Middle Yangtze Basin. At the time of the foundation of the Chinese republic in 1911, it became a county, taking the name Yüeh-yang in place of its former county name, Pa-ling, even though it continued to be referred to as Yüeh-chou. Yüeh-yang briefly held municipal status in 1961-62

It was opened to foreign trade in 1898 (as compensation by the Ch'ing dynasty for the rejection of a British loan), and a foreign setlement and commercial establishments were set up at the river port of Ch'eng-ling-chi. The railway from Han-k'ou to Canton passes through Yüeh-yang, connecting it to Han-k'ou and Ch'ang-sha. Although planned as early as 1898, the section from Han-k'ou to Ch'ang-sha was completed only in 1917, and the final connection to Canton only in 1936.

Yüeh-yang has a large domestic trade and is a transshipment point for water traffic using the Tung-t'ing Hu, the Hsiang Chiang (river) and its tributaries, and other waterways and lakes in northern Hunan. It exports cotton, grain, beans, and ramie fibre, but its most important trade is in timber. Vast rafts of timber are floated down the waterways to Yüeh-yang, whence it is either shipped on down the Yangtze or else shipped elsewhere by rail. The town has little industry but has a medium-sized thermal generating station. Pop. (mid-1970s est.) 50,000–100,000.

Where the same name may denote a person, place, or thing, the articles will be found in that order

yuga, in Hindu cosmology, an age of mankind. Each yuga is progressively shorter than the preceding one, corresponding to a decline in the moral and physical state of man. Four such yugas (called Kṛta, Tretā,

Dvāpara, and Kali after throws of an Indian game of dice) make up the *mahāyuga*, and 2,000 *mahāyuga*s make up the basic cosmic cyle, the *kalpa*. The first *yuga* (Kṛta) was an age of perfection, lasting 1,728,000 years. The fourth and most degenerate *yuga* (Kali) began in 3102 BC and will last 432,000 years. At the close of the Kali *yuga*, the world will be destroyed, to be recreated after a period of quiescence as the cycle resumes again.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Yugo-Osetinskaya, English south osse-TIAN AUTONOMOUS OBLAST, Russian YUGO-OSETINSKAYA AVTONOMNAYA OBLAST, dependency of the Georgian Soviet Socialist Republic, with an area of 1,500 square miles (3,900 square km) on the southern slopes of the Great Caucasus mountains. The oblast is populated largely (about two-thirds) by the Ossetians, a Caucasian people many of whom live in the neighbouring Severo-Osetinskaya Autonomous Soviet Socialist Republic, of the Russian Soviet Federated Socialist Republic; most of the remainder are Georgians. The area is deeply intersected by rivers, which are harnessed for hydroelectric power. About 90 percent of the oblast lies more than 3,300 feet (1,000 m) above sea level, and only 9 percent of its area is cultivated. Grain, fruit, and vines are grown, partly under irrigation. Sheep are raised on the higher slopes, and the considerable forest wealth is exploited. The capital and only city is Tskhinvali.

The *oblast* has a teachers' college, several specialized secondary schools, and a research institute affiliated with the Academy of Sciences of the Georgian S.S.R. There are also a theatre, many public libraries, and a museum of regional studies that publishes magazines and newspapers in the Ossetic language. Pop. (1983 est.) 98,000.

Yugoslav literature, the body of written works produced in the group of languages spoken by the Serbs, Croats, Slovenes, Macedonians, and other diverse peoples who belong to modern Yugoslavia.

A brief account of Yugoslav literature follows. For full treatment, see MACROPAEDIA: Yugoslav Literature.

More than anything else, Yugoslavia's history is characterized by its peoples' resistance against domination by other powers. At one time or another, each of the five nations that today form a united Yugoslavia had to fight overwhelming enemies; from the 12th to the 20th century the western section of the country was dominated by Austrian, Hungarian, and Italian powers, and from the 14th to the 20th century the eastern section was ruled by the Ottoman Empire. The cultural heritage and literary traditions of the various parts of the country reflect these disparate experiences. Yet, the common experience of resistance inspired writers from all areas to tell of their struggle in works of poetry, drama, and prose. In the 20th century the horrors of two world wars only added to an already established, tragic pattern. Although a common theme united them, the various literary traditions differ on other points so much so that it is not clear whether it is more accurate to speak of Yugoslav literature or literatures.

The most important difference between these traditions is language. The history of Yugoslav literature is intimately linked with the development of its various languages and dialects, and this, in turn, is closely tied to political developments. It was not until 1850 that a group of intellectuals met in Vienna and agreed to

work toward a common literary language for Serbs and Croats. Their congress was headed by Vuk Stefanović Karadžić, a Serb who 30 years earlier had published the first grammar and dictionary of the Serbian spoken language; and Ljudevit Gaj, who headed a movement toward language and orthographic reform in Croatia. They, together with a small group of Slovenes, standardized a literary language that has since evolved to become modern Serbo-Croatian. Although the Serbs and Croats speak the same language, the Serbs use the Cyrillic alphabet and the Croats use the Latin. The participation of the Slovenes in this group effort was short-lived. Because of the immense popularity of their national poet, France Prešeren, Slovene survived to become an accepted literary language also. After World War II the Macedonian literary language was created so that now some literary histories divide the general heading of Yugoslav literature into subheadings of Serbian, Croatian, Slovene, and Macedonian.

The 19th century marked a turning point in the national literatures not only because of language reforms but also because of a renewed literary activity that continues today. Poetry was the dominant genre of the time. as it had been during the Renaissance (1500-1650), and its most outstanding representatives were, in Montenegro, Bishop Petar II Petrović Njegoš; in Serbia, Branko Radičević; in Slovenia, Prešeren; and in Croatia, Ivan Mažuranić, Petar Preradović, and Stanko Vraz. Also at this time, interest in the collecting of folk poetry that had begun in the mid-18th century—a time of awakening for the Slovene, Croatian, and Serbian literary languages—culminated in the publication of volumes of national folk songs, ballads, and epics. These had a great impact on Croatian and Serbian literatures and shaped the themes and style adopted by 19th-century poets.

Throughout their development, Yugoslav literatures have been influenced by western European literary, aesthetic, and intellectual trends. During the 16th century, for example, inspired by the Protestant Reformation in Austria, the Slovene Primož Trubar translated important Protestant texts into Slovene. Also at this time, Italian Petrarchists had a major influence on the poets of Dalmatia. The works of Yugoslav authors were touched by the social satire of the Enlightenment, the introspection of the Romantics, the coded references of the Symbolists, the realism of the Naturalists, and the psychoanalytical exploration of the Expressionists. There were, however, several important phases in their development that were the result of Yugoslavia's unique political history.

The writers of the immediate post-World War II, post-revolution period were preoccupied with themes that dealt with the war and the plight of modern man living in a decadent society. This Socialist Realism, which was the preferred mode of those who favoured strict control of literary output, was then challenged by the Modernists, who strove to protect artistic freedom, and in the early 1950s, literature was successfully separated from the political arena. Of all the eastern European governments, that of Yugoslavia grants its authors the most freedom of expression. As a result, the literary merits of their writings are emphasized rather than their political involvement or noninvolvement; but, the debate between the Modernists and Socialist Realists is far from resolved. There are those critics and writers in Yugoslavia today who maintain that until writers begin to deal explicitly with contemporary problems their works will appear pale and sterile.

Another issue that remains unresolved is the question of whether Yugoslavia has one literature or many literatures. This question becomes particularly difficult to answer at those times when groups attempt to assert their na-

tional autonomy. In addition to its five major ethnic groups and their various languages and dialects, Yugoslavia is also the home of Hungarian, Romanian, and Albanian minorities who strive to maintain their cultural heritages, their national languages, and their own literatures. Despite the united front that Yugoslavia presents to the rest of the world, its peoples are sensitive to both the similarities and differences between the country's various ethnic populations.

At the same time, regionalism, a feature of earlier periods, has been replaced by more universal themes. To western European and American readers, the best-known author of the era is Ivo Andrić, who won the Nobel Prize for Literature in 1961. Other well-known modern writers include Miroslav Krleža, Blaže Koneski, Miloš Crnjanski, Oskar Davičo, Dušan Matić, Vesna Parun, Desanka Maksimovič, and Mihailo Lalić. Some works by the more recent generation of writers have also been translated into English and have been included in anthologies of new Yugoslav writing. Some representatives of this group are the poets Vasko Popa and Ivan V. Lalić and the prose writers Meša Selimović, Danilo Kiš, and Živojin Pavlović.

Yugoslavia, officially socialist federal republic of Yugoslavia, Macedonian and Serbo-Croatian socijalistička federativna republika jugoslavija, Slovene socijalistična federativna republika jugoslavija, the largest country on the Balkan Peninsula, located in south-central Europe, covering an area of 98,766 square miles (255,804 square km). The capital is Belgrade. Extending about 590 miles (945 km) from southeast to north-

Yugoslavia

west and about 450 miles (720 km) at its widest extent from east to west, Yugoslavia is bordered on the south by Albania and Greece, on the east by Bulgaria and Romania, on the north by Hungary and Austria, and on the northwest by Italy, from which it is separated on the southwest by the Adriatic Sea. The population in 1990 was estimated at 23,915,000.

A brief treatment of Yugoslavia follows. For full treatment, see MACROPAEDIA: Yugoslavia. For current history and for statistics on society and economy, see BRITANNICA WORLD DATA ANNUAL.

The land. Yugoslavia can be divided into two major physiographic zones: the mountains and the interior plains. A rugged series of transverse mountain ridges covers almost three-quarters of the total area of the country in the centre, northwest, east, and southeast. The Julian Alps in the northwest include Yugoslavia's highest peak, Triglav (9,396 feet [2,864 m] above sea level); a belt of limestone mountains and plateaus, stretching for about 400 miles (645 km) along the Adriatic coast in the west, is a region of classic karst topography having a remarkable series of potholes, caverns, and extensive cave systems. Plains occupy about a quarter of Yugoslavia, chiefly in the north and northeast; the Pannonian Basin, consisting of the lowland floodplains

of the Drava, Sava, and Danube rivers in the north, is the most prosperous agricultural area in the country. Most of the rivers flow to the Black Sea; others enter the Adriatic and the Aegean. The Danube, the principal river, and its tributaries are navigable and are rich in hydroelectric resources.

Yugoslavia has a moderate continental climate. The mean January temperature ranges from 32° F (0° C) on the Danube Plain to 27° F (-3° C) in the mountains and to 45° F (7° C) on the narrow Adriatic coastal strip; corresponding July temperatures are 70° F (21° C), 63° F (17° C), and 75° F (24° C). Average annual rainfall ranges from 30 inches (760 mm) in the coastal region to 33 inches (838 mm) in the northeastern plains, and more than 100 inches (2,540 mm) in the mountains of Montenegro.

Forests cover about a third of the country and are evergreen along the coast, subtropical in the southeast, and deciduous in the rest of the country. Coniferous forests of firs, juniper, and pine, alternating with pasturelands, flourish at elevations as high as 6,600 feet (2,000 m). Deer, wild pig, wolf, fox, and lynx dwell in the mountains. The karst region, in which forests alternate with barren areas, supports such rare fauna as the blind salamander.

Yugoslavia has considerable mineral resources, including coal, lead, zinc, copper, and molybdenum; there are also deposits of petroleum, natural gas, antimony, bauxite,

and manganese.

The people. Yugoslavia's ethnic, religious, and linguistic variety influences its social and political composition. The Serbs constitute 36 percent of the population and Croats 20 percent; other minorities are Bosnian Muslims, Slovenes, Albanians, Macedonians, and Montenegrins. The Serbo-Croatian, Macedonian, and Slovene languages are all official; Albanian and Hungarian are also spoken. More than one-third of the population adheres to Eastern Orthodoxy; Roman Catholics constitute one-fourth; Muslims make up one-tenth; and there are a few Protestants.

The annual rate of growth of Yugoslavia's population, once one of the highest in Europe, has decreased steadily in recent decades. Birth and death rates have also decreased, partly because of improved family planning and health services. Birth rates remain higher in rural areas such as the Kosovo region. Somewhat more than half of the population lives in rural areas; the trend of migration is toward the cities.

The economy. Yugoslavia has a centrally planned economy that is largely based on services, light and heavy industries, and agriculture. The gross national product (GNP) has grown slowly and at about the same rate as

the population.

Agriculture accounts for approximately onetenth of the GNP and employs more than one-fourth of the work force. The agricultural work force has been depleted by emigration from the countryside. Small private farms predominate; socially owned farms, which receive greater financial and technical assistance from the government, employ only a small percentage of the agricultural work force. They are considerably more productive than private farms. Much of Yugoslavia's agricultural output is sold at official markets that maintain support prices for certain staples. Prices at informal peasant markets are largely uncontrolled.

Private farms are usually dry-farmed, and irrigation, which is concentrated in the Macedonia and Kosovo regions, is underdeveloped. Chief crops include corn (maize), sugar beets, wheat, and potatoes. Grapes, olives, and citrus fruits are grown along the Adriatic. Pastures cover one-fourth of the land and support pigs, sheep, cattle, and other livestock.

The state controls mineral industries; however, limited investment by foreign firms is allowed. Production of petroleum does not meet domestic demand, and large quantities of petroleum are imported from the Soviet Union, the Middle East, and Libya. Production of natural gas has been kept relatively low by a lack of distribution facilities. Coal accounts for much of Yugoslavia's domestic supply of energy. There are significant deposits of uranium, which were formerly mined by political prisoners. Iron ore, copper, gold, lead, chromium, and antimony are also mined.

Manufacturing industries account for approximately one-third of the GNP and employ about one-fourth of the work force. Industries are concentrated in the northwestern part of the country and have been hampered by inefficient allocation of raw materials and machinery. Leading manufactures include crude steel, rolled steel, pulp and paper, pig iron, plastics and resins, automobile tires, radio and television receivers, textiles, refined sugar, fertilizers, cement, sulfuric acid, ships, and motor vehicles. Tourism is of growing importance to the Yugoslav economy.

Slightly more than one-half of the electricity produced is generated from domestic fuels, and most of the remainder is generated from hydroelectric power. Nuclear power is under development and furnishes a small percentage of the country's electric power. Per capita consumption of electricity lags behind that of western Europe.

Approximately 60,000 local labour unions are associated with the central Confederation of Trade Unions of Yugoslavia, which was organized in 1945. Local unions are active in the self-management of industries. The smallest unit of self-management in the workplace is the "basic organization"; these are grouped together into a "basic organization of associated labour," each of which elects a council and keeps records and accounts. Workers have participated in the management of industries since 1950, and citizens are allowed to own houses and up to 75 acres (30 hectares) of arable land.

The balance of trade has been chronically unfavourable and has been only partially offset by remittances from numerous Yugoslavs working abroad. The government has formed Communities of Interest for Foreign Economic Relations to address the shortage of foreign exchange. Leading trading partners include the Soviet Union, which receives about one-fifth of Yugoslavia's exports annually, Italy, and Germany. Approximately two-fifths of Yugoslavia's imports are from the European Economic Community.

Government and social conditions. Yugoslavia is a federal socialist republic comprising the republics of Serbia, Croatia, Bosnia and Hercegovina, Slovenia, Macedonia, and Montenegro and the autonomous provinces of Kosovo and Vojvodina. The constitution of 1974 vests legislative power in the Federal Assembly, consisting of the Chamber of Republics and Provinces, whose 88 members are chosen by the legislatures of the constituent republics and provinces, and the Federal Chamber, whose 220 members are elected by the assemblies of individual communes. All members serve a four-year term. A collective presidency, which functions as the head of state, is composed of representatives elected by each of the republic and provincial assemblies to a five-year term and, ex officio, the president of the League of Communists of Yugoslavia, the only political party permitted. Executive power is exercised by a Federal Executive Council, which is elected by the Federal Assembly to a four-year term. The League of Communists of Yugoslavia is headed by the Presidium, which is the highest policy-making body. The judicial system includes the Federal Court of Yugoslavia and a separate court elected by the Federal Assembly for constitutional questions. The army is the largest component of the armed forces.

Virtually the entire population is covered by social-insurance programs. The major types of assistance are health protection, pensions, disability payments, family insurance, and unemployment relief. Improving health services, sanitation, and diet have dramatically improved the general health of the population; still, infant mortality is relatively high. Onefourth of the population is younger than 15 years of age, and life expectancy at birth is 66 years for males and 74 for females. The relative disparity between rural and urban health care, however, has persisted.

The literacy rate for men is about 95 percent, while for women it is only about 85 percent. Elementary education is compulsory and free between the ages of 7 and 15. Secondary schools offer vocational and general academic education. The largest university is the University of Belgrade, founded in 1863.

The Yugoslav press has a reputation for relative independence. Each region of the country has its own radio and television service.

Cultural life. Contemporary literature has flourished since 1950, when rigid aesthetic dogmas were rejected and experimentation was permitted. The two major contemporary writers are Ivo Andrić, best-known for his Na Drini ćuprija (1945; The Bridge on the Drina), and the satirist Miroslav Krleža. Yugoslavia has a deep-rooted theatrical tradition, dating to the Middle Ages. The majority of the professional performances are works of foreign authors, although there has been an upsurge in Yugoslav works. Painting has been influenced by folk themes. Contemporary artists of significance include Petar Lubarda and Pedja (Predrag Milosavljević).

Folk arts continue to exert a powerful influence. Primitive and naïve paintings, originally associated with the Hlebine School, are marked by intimate rural concepts of nature. Folk dances vary from round dances to the lively dances and music of Macedonia and the fierce bunjevac round.

History. Archaeological evidence has revealed that Yugoslavia has been inhabited since Paleolithic times. When Greeks were colonizing the Adriatic coast of Dalmatia (6th century BC), the major peoples inhabiting the region were the Illyrians and Thracians. Roman penetration began during the 3rd century BC, but the Illyrians were not subdued until AD 9. These peoples endured about five centuries of Romanization. Beginning in the 3rd century. Roman rule was weakened by invasions of Goths, Huns, and Avars. In the late 5th and early 6th centuries, Slavs settled in the region. They were followed by Serbs and Croatians in the 7th century, who settled in Dalmatia and established the regions of Serbia and Croatia.

The Frankish empire of Charlemagne began to assert its domination over Croatia in the late 8th and early 9th centuries. The kingdoms of Hungary and Croatia were united in 1102, and in the 16th century the Hungarian-Croatian kingdom passed to the Austrian Habsburgs. Serbia established its independence from the Byzantine Empire during the 12th century. Stefan Dušan, the greatest medieval Serbian ruler, enhanced this autonomy during his rule (1331–55). By 1463 all of Serbia had fallen to the Ottomans except for the mountainous enclave of Montenegro. In 1830 Serbia established its autonomy within the Ottoman Empire.

Croatian nationalism emerged in the revolutionary years of the 1840s. War between Serbia and the Ottoman Empire was avoided through European mediation in the 1860s. In 1867 Yugoslav lands were divided between Austria and Hungary with the establishment of the Austro-Hungarian Dual Monarchy. Serbia was proclaimed independent of Ottoman

rule in 1882. The Balkan Wars of 1912-13 resulted in territorial gains for many of the Balkan states and marked the end of Ottoman rule on the peninsula; it also further deteriorated the bad relations between Serbia and Austria-Hungary.

On June 28, 1914, Archduke Francis Ferdinand, heir to the Habsburg throne, was assassinated in Sarajevo, Bosnia. Austria, convinced of Serbian complicity, declared war on Serbia a month later. The Triple Entente (Russia, France, and Great Britain) entered the war on the side of Serbia against Austria-Hungary, Germany, and the Ottoman Empire. Following the war the new Kingdom of Serbs, Croats, and Slovenes was established from the lands of Serbia, Dalmatia, and Slovenia. Serbians were the largest ethnic group in the kingdom; they constituted a plurality but not a majority of the population. Croatian nationalism remained an important issue in the new kingdom, as it had been under Habsburg rule. King Alexander attempted to replace Serbian and Croatian nationalism with Yugoslav patriotism by changing the name of the kingdom to Yugoslavia in 1929.

During World War II Yugoslavia was overrun by German forces (1941) and occupied until 1944-45. Many Serbians were massacred during the German occupation, and resistance movements arose. Chetniks (former Yugoslavian soldiers) and communist-led Partisans fought separate guerrilla wars against the occupying Germans. By the end of the war it was Marshal (Josip Broz) Tito and his communist-led Partisans, and not the generally anticommunist Chetniks, who had reclaimed the country from the Germans. At first Tito and the Yugoslav communists were more ardent than the Soviet Union to complete the communist domination of southern Europe. But in the late 1940s Tito and Stalin split over Yugoslavia's attempts to create a Balkan federation, which threatened to undermine Soviet dominance. Stalin withdrew all support to Yugoslavia, but the loyalty of Yugoslav communists to Tito and the country's anti-Soviet feelings kept Tito in power until his death in 1980. During this period Yugoslavia pursued policies independent of both the Soviet Union and the West. Tito was the first leader of a Soviet-bloc country to declare independence of Soviet domination. He was succeeded by a collective presidency representing the republics and autonomous provinces

Yui Shōsetsu (d. Sept. 10, 1651, Sumpu, Suruga province, Japan), Japanese rebel whose attempted coup d'état against the Tokugawa shogunate led to increased efforts by the government to redirect the military ethos of the samurai (warrior) class toward administrative matters.

A famous military teacher in the Japanese capital of Edo (now Tokyo), Yui gained a large following among the local *rōnin* (masterless warriors). Trained only to fight, these *rōnin* were without an occupation or means of support. They were thus happy to follow Yui's plan for the overthrow of the new government. The carefully laid plot, originally scheduled for June 1651, was delayed, however, when one of Yui's coconspirators became ill. In the interim, the details of the plot became known to the government; many of Yui's followers and family were captured and executed, and he committed suicide.

The revolt greatly shocked the Tokugawa shogunate, which took action to mollify the thousands of *rōnin* still in existence throughout Japan, providing jobs for them and retraining them in clerical rather than military skills.

Yuit, also spelled YUITS, or YUITY, Eskimo group of Siberia and of Saint Lawrence Is-

land and the Diomede Islands in the Bering Sea and Strait. They are culturally related to the Chukchi. The traditional economic activity of these Asian Eskimos was the hunting of sea mammals, especially seals, walrus, and, until the latter half of the 19th century, whales. Trade with the Russians developed at the end of the 19th century. The Yuit also traded with neighbouring reindeer breeders and with American Eskimos. (Some Yuit specialized in trade and used their economic advantage to become village chiefs, with such functions as opening and closing the hunting season, helping to mediate quarrels, and deciding the times for trade journeys.) Hunting methods included harpooning from shore or boats, spearing animals in land drives, and, later, the use of guns. Hunting fur animals, fishing, and collecting plant food were auxiliary activities. Kayaks (one-man, closed skin boats), bidarkas (open, flat-bottomed boats), and (later) whaleboats provided coastal transportation; dog teams and sleds were used on land.

The Yuit believed in friendly and harmful spirits; the latter caused various misfortunes, especially illness. They honoured certain animals and birds and forbade their killing. Rituals, mainly connected with ensuring future success in hunting and with thanksgiving for past hunts, often included dramatic performances and dances. Women generally played an important part in religious rituals.

Under Soviet administration, Yuit households have been collectivized, new equipment was made available for sea hunting, and new occupations (e.g., processing products from skins and cooperating with Chukchi in reindeer breeding) were introduced. Compare Chukchi.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Yukaghir, also spelled Yukagir, or Yukha-GIR, remnant of an ancient human population (numbering about 800 in the late 20th century) of the tundra and scrub zones of Arctic Siberia east of the Lena River in the Soviet Union, site of one of the most severe climates in the inhabited world. Brought close to extinction by privation, encroachment, and diseases introduced by other groups, they are generally confined to the upper valley of the Kolyma River and have been largely assimilated by Evenk, Yakut, and Russian neighbours. They are now settled fishermen or reindeer herders (domestication of these animals probably started in the mid-17th century, just before Russian conquest).

Yukaghir economy once depended heavily on seasonal migrations of wild reindeer; these were killed in large numbers from canoes at water crossings or driven into corrals of netting. Fishing, next in importance, was based on biannual runs in major rivers; molting waterfowl also were taken in quantity. These activities involved cooperative methods and seasonal movements of the group. Permanent homes were occupied only in winter; skin or bark tents were used in warmer weather. Metal was rare, and most equipment was of bone or antler. A form of picture writing on bark was used for letters and a kind of map.

The Yukaghir formerly comprised many tribes divided into clans. Each clan was guided by an elder and had its own shaman for religious matters; the clan champion (strong man) defended the group, and the clan hunter was responsible for ensuring food supply. Married men lived with their wives' families and worked for them. Their custom of sibling avoidance is virtually unknown elsewhere. Their animistic religion stressed propitiation of supernatural guardians of game animals to ensure successful hunting.

Yukaghir language, regional name odul, isolated language spoken by a few hundred persons in the Yakut A.S.S.R. of the Soviet Union, sometimes grouped with the Paleosiberian languages although not genetically related or structurally similar to the other languages in the group. Yukaghir and two extinct languages or dialects, Omok and Chuvan (or Chuvantsy), constitute the Yukaghir language group or family.

yukata, comfortable cotton kimono decorated with stencil-dyed patterns usually in shades of indigo, worn by Japanese men and women. The yukata was originally designed as a nightgown and for wear in the home after a bath

It has become accepted practice to wear it on the street on warm summer evenings. Japanese inns and many hotels supply their guests with yukatas for lounging.

Yukawa Hideki (b. Jan. 23, 1907, Tokyo—d. Sept. 8, 1981, Kyōto), Japanese physicist who was awarded the Nobel Prize in Physics in 1949 for research in the theory of elementary particles. In 1935 he posited a theory of nuclear forces that correctly predicted the existence of mesons, transient particles with masses between those of electrons and protons.

Graduating from Kyōto Imperial University in 1929, Yukawa became a lecturer there, moving in 1933 to Ōsaka Imperial University, where in 1938 he was awarded the doctorate. He rejoined Kyōto University as professor of theoretical physics (1939–50), held faculty appointments at the Institute for Advanced Study in Princeton, N.J., and at Columbia University in New York City, and became director of the Research Institute for Fundamental Physics in Kyōto (1953–70).

Yukhagir (people): see Yukaghir.

Yuki, four groups of North American Indians who lived in the Coast Ranges and along the coast of northwestern California. They spoke distinctive languages unaffiliated with any other known language. The four Yuki groups were the Yuki proper, who lived along the upper reaches of the Eel River and its tributaries; the Huchnom, who dwelt in the Redwood Valley to the west; the Coast Yuki, who were distributed farther westward along the redwood coast; and the Wappo, who occupied an enclave among the Pomo, some 40 miles (65 km) southward in the Russian River Valley.

Only the linguistic identification links the Wappo with other Yuki; culturally they were like the Pomo. The other Yuki groups were organized into communities composed of several scattered settlements or villages occupying a natural area. Each settlement had its own chief, but there was also a head chief for the community as a whole. There were also a war leader, a "dance director," and a shaman, or medicine man. Warfare was apparently frequent between certain communities, between the different Yuki groups, and with other Californian Indians. (The Coast Yuki were generally an exception, usually maintaining friendly relations with their neighbours.) Trade was prevalent among all groups, inland people trading such items as furs with coastal groups who returned a variety of seafood and shells. Clamshell beads were used as currency.

For food the Yuki fished, mostly for salmon, gathered acorns, and hunted such animals as bear and deer, though the Coast Yuki relied more on seafood. Interior groups dwelt in domed, earth-covered houses; Coast Yuki had conical houses of bark. All groups had large dance houses and sweat houses.

Religious belief centred generally on two contrasting deities, a creator, whose actions were essentially well-intended, and another deity, sometimes associated with thunder, who might help but might also blunder or do evil. Usually the creator was the supreme god of the two, but among the Coast Yuki he had disappeared, and only Thunder remained. All Yuki had a great array of ceremonies, rituals, and initiations. *Compare* Pomo.

Yukon-Charley Rivers National Preserve. national preserve in east-central Alaska, U.S., on the Canadian border. Proclaimed a national monument in 1978, the area underwent boundary and name changes in 1980, becoming a national preserve in the latter year. Preserving the entire 88-mile (142-kilometre) Charley River basin and 140 miles (225 km) of the 1,875-mile (3,017-kilometre) Yukon River, the area contains numerous cabins and other relics of the 1898 gold rush as well as paleontological and archaeological sites. Wildlife includes peregrine falcons and other raptorial birds, caribou, moose, Dall sheep, grizzly bears, and wolves. The total area is 2,523,509 acres (1,021,226 hectares).

Yukon River, one of the major rivers of North America, whose headwaters originate in Tagish Lake on the border of the Yukon Territory and British Columbia, Can. It flows northward through the Yukon Territory and then southwestward across the U.S. state of Alaska to enter the Bering Sea at Norton Sound. The river proper, from Tagish Lake downstream, is 1,875 miles (3,017 km) long; it drains an area of about 320,000 square miles (830,000 square km), largely undeveloped despite the famous gold rush of the 1890s. The main east- and north-bank tributaries are the Teslin, Big Salmon, Pelly, Stewart, Klondike, Porcupine, and Koyukuk; the west- and southbank tributaries are the Takhini, White, and Tanana.

Prior to 1945 the main channel of the Yukon River in the central Yukon Territory of Canada was called Lewes River on most maps; this name was never used locally, however, and in 1952 the Canadian government confirmed the name Yukon River for as far as the outlet of Tagish Lake.

The delta mouth of the Yukon River was known to the Russians when they occupied nearby St. Michael Island in 1831, and by 1838 Russian fur traders had explored the river as far inland as Nulato, where they established a post near the junction of Koyukuk River. By 1846 the Russians had mapped almost 600 miles (965 km) of the lower river. Robert Campbell, one of the early members of the Hudson's Bay Company, established a trading post at Fort Selkirk, at the junction of the Pelly and Yukon rivers, in 1848. When the post was burned by hostile Indians in 1852, however, Europeans withdrew from the upper Yukon basin for two decades.

Shallow-draft steamers had been operating on the river in Alaska after 1866, and the first riverboat reached Yukon Territory a few years after that. The Yukon River became known to the world following the rich gold strikes in 1896 on one of its Canadian tributaries, the Klondike. In the summer of 1898 at least 20 vessels rounded the extremity of southwestern Alaska and navigated the lower Yukon River to reach the booming, if somewhat lawless, community of Dawson City. When the spasm of gold-mining activity subsided during the years following World War I, the use of the Yukon River for the purpose of water transport also declined.

One of the headwaters of the Yukon River springs from the 130-square-mile (335-square-kilometre) Tagish Lake, one of a group of lakes with an elevation of 2,152 feet (656 m) above sea level, on the British Columbia-Yukon Territory border at latitude 60° N. About 50 miles (80 km) downstream, the Yukon River formerly rushed through the rocky walls of narrow Miles Canyon and tumbled over rock ledges at Whitehorse Rapids. These obstacles to river travel during the gold rush era necessitated the construction of the short railroad

from Skagway, Alaska, to Whitehorse in the Yukon Territory; the latter then became the southern terminal of water transport northward. The river has since been dammed south of Whitehorse for hydroelectric power; a reservoir lake now covers the area of the rapids and fills the former Miles Canyon.

North of the 87-square-mile (225-square-kilometre) Lake Laberge, the Yukon River flows through a broad, generally flat-bottomed valley; riverbanks are not high, and the river meanders across the valley floor, with numerous sandbars and small islands dotting the channel. About 25 miles (40 km) north of the village of Carmacks, four small, rocky islands split the river into the Five Finger Rapid area, and the current flows rapidly past these islands. At the village of Selkirk, the junction of the 330-mile (530-kilometre) Pellv River swells the Yukon's volume considerably. North of Selkirk the Yukon is a clear and gentle river, with numerous low islands breaking the channel. White River, with a drainage area of 15,700 square miles (40,663 square km), adds silt from the glaciers and mountains to the southwest; Stewart River, draining 20,000 square miles (51,800 square km) in its 331-mile (533-kilometre) course, flows out of the mining area of Mayo-Keno Hill to the east. At Dawson the Yukon has an average flow of 74,000 cubic feet (2,100 cubic m) per second, but there is a wide difference between the high-water flows of June and the low water beneath the ice in March. There are no hydroelectric-power developments on the Yukon River, except for the small plant at Whitehorse.

The Klondike is a small, east-bank tributary that joins the Yukon at the historic town of Dawson. The valley floor here is covered with sinuous, wormlike ridges of gravel deposited behind the gold dredges that worked their way several times through the valley gravels over a period of 60 years.

Downstream from Dawson the river valley narrows, and the plateau is broken by mountains that rise above 4,000 feet (1,200 m), about 15 miles (24 km) north of the Yukon River. The river itself is about 1,000 feet (305 m) above sea level before it crosses the Alaska boundary. The next large tributary, the Porcupine River (448 miles [721 km] long), joins the Yukon at Fort Yukon, Alaska; the Porcupine drains northern Yukon Territory, a land occupied by only a few hundred Indians. The Yukon then flows westward for about 150 miles (240 km) across a broad, flat valley: the many channels of the braided river thread their way through islands and sandbars. At the western end of the "flats" is a long, narrow gorge, where the river rushes through a low mountain barrier known as the ramparts.

At the junction of the Tanana River, the main southern tributary in Alaska, the Yukon is less than 300 feet (90 m) above sea level. Upstream on the Tanana lies Fairbanks, the largest city in the Yukon River basin. The snow- and glacier-fed waters of the Tanana drain the northern slopes of the highest mountains in Alaska, but, after the peak runoff in July, the Tanana becomes a shallow stream by late summer. West of the Yukon's confluence with the Tanana, the Yukon valley broadens south of the river; and, within 5 miles (8 km) of its northern banks, rise the low Kokrines Hills. About 175 miles (280 km) downstream from the Tanana confluence, the last major tributary, the Koyukuk (500 miles [800 km] long), drains southward from the high and rugged Brooks Range.

As the Yukon nears the Bering Sea it bends sharply northward to empty into Norton Sound. The river delta is about 40 miles (64 km) across, swampy and lake-covered; many of the distributary channels are shallow, but the northeastern one, Apoon Pass, was the one formerly used by riverboats.

The Yukon River basin has remained sparsely

populated since its first exploration by Europeans. Although the lure of mineral wealth has been the principal factor in the region's settlement, perhaps the main resources of the Yukon basin will prove to be its scenery, its isolation, and its sparse population—all matters of attraction to tourists seeking to escape the more crowded and less scenically endowed areas of the continent.

Yukon Territory, territory of northwestern Canada. It is bounded by the U.S. state of Alaska to the west, the Northwest Territories to the east, and British Columbia to the south and extends northward above the Arctic Circle to the Beaufort Sea. Its capital, Whitehorse, is the largest settlement.

A brief treatment of the Yukon Territory follows. For full treatment, see MACROPAEDIA: Canada.

The territory was originally settled by American Indians and Inuit (Eskimos), who today constitute about one-seventh of the population. The Indians are mainly Kutchin and Nahanni, both speaking Athabascan dialects, and the Tagish, who live south of Whitehorse and speak a Tlingit dialect. To the east live small numbers of Inuit. Most of the Indians still live by hunting, trapping, and fishing and move seasonally to fishing or hunting camps; moose is the favourite game. The introduction of rifles and especially snowmobiles, however, has begun to alter traditional life-styles and has permitted overhunting of game.

The first European visitor to the region was the British explorer Sir John Franklin, who arrived in 1825 from the east seeking the Northwest Passage to the Pacific. He found the Inuit of Herschel Island using metaltipped arrows obtained in trade from Russians settled in Alaska. Based on his reports, the Hudson's Bay Company sent John Bell to explore further. Bell founded Fort McPherson on the Mackenzie River delta in 1840, followed by Fort Yukon in 1847 at the junction of the Yukon and Porcupine rivers in what was then Russian territory. Trade with the Indians flourished, and numerous trading posts were established. Fort Yukon was twice relocated, first in 1867, when the United States purchased Alaska, and again in 1890.

Gold was discovered on tributaries of the Yukon River in the 1870s, resulting in an influx of miners, American traders, and finally in the mid-1890s a small detachment of North West Mounted Police. The great gold rush of 1898 followed the discovery of rich deposits in Bonanza Creek. The Klondike boom sparked the formation of Dawson City (inhabited by 30,000 during the peak) and the construction of the White Pass and Yukon narrow-gauge railway, linking Whitehorse and Skagway (Alaska). In 1898 the Canadian Parliament separated the rapidly growing area from the Northwest Territories and gave it separate territorial status. The Klondike boom was short-lived. By 1900 most of the individual miners had given up and were replaced by companies that brought large-scale mechanical mining techniques. By 1921 the population of Dawson had fallen to 4,157.

Gold, silver, lead, zinc, copper, asbestos, and coal have been extracted in the Yukon Territory, and there are vast reserves of unmined minerals. Federal assistance stimulated the mining industry in the 1950s, but the industry began to decline in the late 20th century. Government and tourism have become the territory's economic mainstays.

World War II brought improvements in transportation, including construction of the Alaska Highway. The Klondike Highway linking Mayo, Whitehorse, Dawson, and Skagway was built in the 1950s-70s, and the Dempster Highway linking Dawson, Fort McPherson,

and Inuvik opened in 1979. The White Pass and Yukon Railway, however, discontinued service in 1982. Communications also have improved and by the early 1980s included telephone, teletype, telex, and telegram service. These improvements encouraged the development of a tourist industry. Scheduled jet air services operate between Whitehorse and Edmonton, Alta., and Vancouver, B.C. Light aircraft link all settlements in the Yukon.

Much of the territory has remained an unspoiled wilderness with an abundance of animal life, for the northern stretches of poorly drained tundra are covered by permafrost and are not hospitable to exploitation. In some areas farming is possible, but poor climate and soil make it unprofitable. Virtually no settlement has been undertaken for agricultural purposes.

Although there are few occupied Indian reserves, registered Indians are the responsibility of the federal government. The rest of the population is of European or Métis (mostly mixed European and Indian) descent.

Yukon's territorial government is based on the Yukon Act of 1898 and the Government Organization Act of 1966. It consists of the Legislative Assembly, elected by universal adult suffrage. A resident commissioner, appointed by the federal government and under the direction of the federal minister of Indian Affairs and Northern Development, although not required to be involved in dayto-day affairs, is the chief executive officer. All territorial legislation still requires the commissioner's signature. The Executive Council, headed by the government leader and composed of members of the Legislative Assembly, is responsible for daily governmental affairs. The territorial government has the same local powers as a provincial government, with the exception that federal officials administer all of the Yukon's natural resources but game. The Yukon has one federal senator, appointed by the governor-general of Canada, and one member, popularly elected, of the federal House of Commons.

Education from kindergarten through grade 12 is free and compulsory in public and government-aided Roman Catholic and private Indian schools. The government started a program in Indian communities to promote teaching in indigenous dialects with texts about land and living skills. Yukon College at Whitehorse and a network of community branches provides two years of university-level courses and a number of vocational and adult-

education programs.

Among Canadian literature about the Yukon, the verse and fiction of Robert Service and Klondike (1958) by Yukon-born Pierre Berton are the most famous. Californian Jack London first achieved literary renown with short stories and novels reflecting his experience in the Klondike gold rush. There are museums and displays in Whitehorse and Dawson commemorating the gold-rush days. Several radio and television stations, newspapers, and a library system operating out of Whitehorse provide news and entertainment.

Discovery Day in Dawson, honouring the discovery of gold in the Klondike on Aug. 17, 1896, and the Sourdough Rendezvous (February) in Whitehorse are festivals that feature competitions, music, dancing, and local folklore; Dawson's Gaslight Follies and Whitehorse's Frantic Follies re-create the atmosphere of those towns in the gold-rush days. Area 186,661 square miles (483,450 square km). Pop. (1989 est.) 25,700.

Yuma, city, seat (1870) of Yuma county, southwestern Arizona, U.S., on the Colorado River at the mouth of the Gila. Founded in 1854 as Colorado City, it was renamed Arizona City (1862) and Yuma (1873), probably from the Spanish word humo, meaning "smoke," because of the Indian practice of creating smoke clouds to induce rain. A strategic river crossing, the site was probably visited by Hernando de Alarcón (working with the Coronado expedition) in 1540.

Yuma Territorial Prison and Museum, Yuma, Ariz.

Yuma is the centre of large irrigation districts that have transformed parts of the desert into rich farming land. Thus agriculture, tourism, and some light manufacturing form the basis of the economy, which is augmented by Arizona Western College (1962), a University Extension Center, the nearby Marine Corps Air Station (1928), and the Yuma Proving Ground (1942). Yuma Territorial Prison and Museum (1875) contains mementos of frontier days. Inc. town, 1871; city, 1914. Pop. (1988 est.) 51,000.

> Consult the INDEX first

Yuma Desert, arid part of the Sonoran Desert lying east and south of the Colorado River in west-central and southwestern Arizona, U.S., and in Sonora, northwestern Mexico.

The Yuma Desert is a region of low sandy plains and dunes, some eroded volcanic hills, and low mountain ranges. Despite the hot, dry desert conditions permitting only a few permanent streams, vegetation is surprisingly varied. Scattered low shrubs (creosote bush) and giant cacti (saguaro) are common in the north, while thick growths of tall brush and cacti cover the entire landscape in Sonora.

Algodones Dunes (background) with prickly poppies and verbena, Yuma Desert, Arizona David Muench-EB Inc

Modern irrigation permits commercial agriculture in the Colorado, Gila, and Salt river valleys (winter vegetables, cotton, flax, citrus fruits, dates, and alfalfa) and in the Sonora, Yaqui, and Fuerte river valleys (wheat and cotton).

Many reservations (particularly of the Papa-

go and Pima Indians) are located in the desert. Tourist attractions include resort cities (notably Tucson and Phoenix), dude ranches, and reservoirs along the Colorado River.

Yuman, any of various Indian groups who traditionally lived in the lower Colorado River valley and adjacent areas in western Arizona, southern California, northern Baja California, and northwestern Sonora and who spoke related languages (Yuman) of Hokan stock.

Two major divisions of Yuman people are recognized: the river Yumans, who lived along the lower Colorado and middle Gila rivers and whose major groups included, from north to south, the Mojave, Halchidhoma, Yuma, and Cocopa, together with the Maricopa in the middle Gila; and the upland Yumans, who inhabited western Arizona south of the Grand Canyon and whose major groups included the Hualapai (Walapai), Havasupai, and Yavapai.

Two other groups of Yuman-speaking people, the Diegueño and the Kamia (now known as the Tipai and Ipai) lived in southern California and northern Baja California. The Kiliwa and Paipai still live in northern Baja California.

The river Yumans were primarily farmers who benefited from the annual floods of the Colorado and Gila rivers. These floods provided regular enrichment of farmland through the rich burdens of silt that they deposited, and they also made irrigation unnecessary. The Maricopa were somewhat influenced by their neighbours, the Pima, and frequently allied with the Pima against other river Yumans such as the Mojave and Yuma.

The upland Yumans in many ways resembled the ancient Desert culture (see Cochise culture), which is ancestral to many of the southwestern cultural traditions. Some farming was done, but a major part of subsistence was based on hunting and on gathering wild plant foods. The Havasupai were exceptions, partly because of contacts with the Hopi and partly because of their location in Cataract Canyon, a side canyon of the Grand Canyon. The creek flowing through this canyon made extensive farming possible through irrigation. Unlike other Yumans, the Havasupai were very peaceful. The Yavapai, on the other hand, frequently allied themselves with bands of western Apache for raiding and were sometimes called Yavapai-Apache.

All Yuman peoples resembled one another in their lack of settled villages and their loose political organization. They had a tribal sense, but not the effective organization. Most had a somewhat warlike spirit and an individual desire for renown in battle. They demonstrated craftsmanship in pottery. Artifacts were made to be functional and were rarely repaired. When something broke or wore out, it was replaced. Yuman religion is characterized by belief in a supreme creator, faith in dreams, and use of song narratives in ritual and ceremony.

The total number of Yuman peoples remaining in the late 20th century in the United States and Mexico was uncertain. There were a number of large and small reservations in California and Arizona containing such groups as the Yuma, Mojave, Havasupai, Hualapai, Yavapai, Yavapai-Apache, Cocopa, and Maricopa; these reservation Yumans probably numbered well over 4,000. See also Diegueño;

Yun, Isang (b. Sept. 17, 1917, Tongyŏng, Korea), Korean-born German composer who sought to express a distinctly Asian sensibility by means of contemporary Western techniques.

Yun was already composing at the age of 14 and studying music in Osaka and Tokyo. During World War II he was active in the resistance movement against the Japanese. From 1946 he taught in Korea. He later went to Europe for further study, first in Paris (195657) and then as a pupil of Boris Blacher in Berlin (1958–59). After settling permanently in Germany following imprisonment (1967–69) in South Korea as an alleged Communist, he began teaching in Berlin, becoming a German citizen in 1971.

Yun's main purpose in his compositions was to develop Korean music using Far Eastern performance practices but with European instruments and other techniques. His operas derive inspiration from Taoist and yin-yang philosophy.

Yün-ching-hung (China): see Ching-hung.

Yün-kang caves, Pinyin YUNGANG, magnificent Chinese Buddhist cave temples, created in the 5th century (Six Dynasties period) near the northern border (and the Great Wall) of Shansi Province.

The caves are among the earliest remaining examples of the first major flowering of Buddhist art in China. A low ridge of soft sandstone was excavated to form about 20 major cave temples and many smaller niches

Interior of Cave VI, Yün-kang, Shansi Province, second half of the 5th century AD, Six Dynasties period

Seiichi Mizuno

and caves; some served merely as cell-like enclosures for colossal figures of the Buddha (up to about 45 feet [14 metres] in height), while others contained chapels.

The first five temples were instituted by the head of the Buddhist church, a monk named T'an-yao, in about 460; their construction was among the first acts of propitiation sponsored by the foreign T'o-pa, or Northern Wei, rulers (386-535) for their earlier persecution of Buddhism in the period 446-452. The colossal Buddha images in each cave were equated with the first five emperors of the Northern Wei, thus emphasizing the political and economic role that the court imposed upon Buddhism. The remaining temples were largely constructed in the succeeding decades until 494, when the Northern Wei court was moved to the city of Lo-yang (Honan Province) and a new series of cave temples was instituted at the site of Lung-men (see Lung-men caves).

The predominant sculptural style of the innumerable images (primarily of the Buddha, with a relatively few ancillary figures that serve as either major or minor images within the caves) is a synthesis of various foreign influences ultimately derived from the Buddhist art of India. Late in the period of major work at the site, a new "Chinese style" appeared, based on indigenous styles and forms; Yün-kang, however, is considered as the type site for the first style, and the later caves at Lung-men, the type site for the second style. See also Northern Wei sculpture.

Yün-lin, hsien (county), west central Taiwan, occupying an area of 498 sq mi (1,291 sq km). It is bordered by the hsiens of Chang-hua (north), Nan-t'ou (east), and Chia-i (south) and by the Formosa Strait (west).

Yün-lin slopes from the foothills of the A-li Shan (mountains) in the east to the fertile alluvial plains in the west. The Hsi-lo Ch'i and the Pei-kang Hsi (rivers) run parallel to the northern and southern boundaries, respectively, and are sources of hydroelectricity. Sugarcane, paddy rice, peanuts (groundnuts), jute, and sweet potatoes are grown. Industries based in Yün-lin produce textiles and sugar. Coal is mined in the eastern part of the hsien; in the early 1980s unexploited reserves of offshore crude oil and natural gas were known to exist near T'ai-hsi.

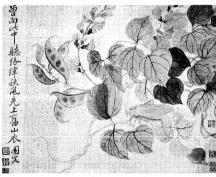

The temple of Matsu, Goddess of the Sea, at Pei-kang, attracts a number of pilgrims from all over Taiwan for annual celebrations. Tou-liu is the administrative seat of the hsien and is linked by railway with Nan-t'ou to the north and with Chia-i to the south. Pop. (1983 est.) 797,849.

Yün-lin-hsien (Taiwan): see Tou-liu.

Yün-nan-Kuei-chou Kao-yüan (China): see Yunnan-Kweichow Plateau.

Yün Nan-t'ien (Chinese painter): see Yün Shou-p'ing.

Yün Shou-p'ing, Pinyin Yun Shouping, also called Yün Nan-t'ien (b. 1633, Yang-hu, Kiangsu Province, China—d. 1690), artist who, together with the Four Wangs (see Wang Hui) and Wu Li (q.v.), is grouped among the major artists of the early Ch'ing (1644–1911/12) period who continued the orthodox tradition of painting, following the great codifications of the painter and art theoretician Tung Ch'i-ch'ang.

"Flowers," album leaf, ink and slight color on paper by Yün Shou-p'ing, 17th century; in the Honolulu Academy of Arts

By courtesy of the Honolulu Academy of Arts

Yün Shou-p'ing had an adventure-filled early life following the collapse of the Ming dynasty-being taken along in flight by his father, a Ming loyalist; then separated from his father and adopted by a high-placed family among the ruling Manchus; and, finally, restored by stealth to his father in a Buddhist monastery. Yün refused to serve the foreign Manchus but instead cultivated the learned arts of poetry, calligraphy, and painting. He was a close friend and contemporary of the rich and famous Wang Hui; and Yün much admired him-even to the extent, it is said, of admitting the other's greater mastery in the art of landscape. Yün is generally associated with the painting of flowers, usually in a "bone-(mo-ku) manner that emphasizes washes instead of lines. Yun Shou-p'ing earned the respect of both his contemporaries and later generations as an appropriate representative of the school of "literati painting" (wen-jen-hug)

Yuna River, Spanish Río Yuna, river in central and northeastern Dominican Republic, one of the nation's three most important river systems.

The Yuna is formed by the union of many headstreams arising near Bonao in the tangled mountains of Cordillera Central. The river descends northeastward into the fertile region known as the Valle del Cibao; turns and receives its major tributary, the Camú; and then flows eastward through La Vega Real region. It crosses a marshy lowland and empties into Samaná Bay, just southwest of the port of Sánchez.

Although the river is 100 mi (160 km) long, only the lower course is navigable. Its waters are used principally for irrigating rice.

Yundum, town, Western division, western Gambia. Located 14 mi (23 km) southwest of Banjul among the Dyola and Malinke (Mandingo) peoples, it is the site of a teacher training college and the government's main agricultural experimental station. Gambia's international airport, originally a World War II Allied air field, is 2 mi east-southeast. Pop. (latest census) less than 700.

Yung-an, Pinyin Yong'an, town in central Fukien Province (sheng), China. It is a county (hsien) seat in San-ming Prefecture (ti-ch'ü). Situated on the Sha Hsi (river), a southern tributary of the Min Chiang (river), which provides the main southwest to northeast route through central Fukien, Yung-an is a natural route centre on the railway line from Kiangsi Province via Nan-p'ing to Amoy. From Yung-an a network of highways radiates to Ch'üan-chou on the coast north of Amoy, to Lung-yen in southern Fukien, and southwestward through the mountains to eastern Kwangtung Province. Yung-an is the chief collection and distribution centre for a wide area, shipping large quantities of foodstuffs, timber, and forest products to Amoy and to the north.

Its prosperity has grown since the railway was opened in 1956; but it has been overshadowed by the emergence of San-ming, 25 mi (40 km) to the northeast, as an industrial city and as an administrative centre for what was formerly Yung-an's sphere of influence. Yung-an itself has only developed minor engineering and timber-working industries. Pop. (latest est.) 10,000–50,000.

Yung-cheng, Pinyin Yongzheng (reign name), personal name (Wade-Giles romanization) YIN-CHEN, temple name (CH'ING) SHIH TSUNG, posthumous name, or shih, HSIEN TI (b. Dec. 13, 1678, Peking—d. Oct. 8, 1735, Peking), the third emperor (reigned 1722–35) of the Ch'ing dynasty, during whose rule the administration was consolidated and power became concentrated in the emperor's hands.

As the fourth son of the previous emperor, Yung-cheng was not immediately in line for the throne; but when the designated heir apparent became mentally deranged, the future emperor saw an opportunity to seize the throne and began to intrigue against his brothers. Several of the chronicles of the period allege that the Yung-cheng emperor murdered his father. In any case, he succeeded to the throne by having military support in Peking when his father, who was known by his reign title as the K'ang-hsi emperor, died. The first years of Yung-cheng's reign were spent consolidating his power. He imprisoned or executed some of his brothers and their supporters and undermined the power of the others. His spy system was so efficient that every action of his ministers was said to have been reported to him. He even tampered with the Imperial

records from the last years of his father's reign and the first years of his own, ordering the suppression of any accounts unfavourable to himself or favourable to his opponents.

More significant was his removal of the Imperial princes from control of the Eight Banners, the major Ch'ing military units. When the Yung-cheng emperor ascended the throne, three of the Eight Banners were controlled directly by the throne, but the rest were under the rule of Ch'ing princes. Fearing that they could use this control for personal advantage—as the Yung-cheng emperor had done in his own ascension to the throne-he compelled all the princes to attend a special palace school, where they were indoctrinated with the idea of subservience to the throne. As a result the Eight Banners remained loyal throughout the existence of the dynasty.

In 1729 the Yung-cheng emperor increased the administrative centralization of the government. The Grand Secretariat was replaced as the top ministerial body by the previously informal Grand Council. The five or six members of the Grand Council worked directly with the Emperor, who conferred with them every day. Their business was handled quickly and secretly. The Emperor thus personally scrutinized and directed all important matters

of government.

Although the official records claim he died peacefully, he had made many enemies during his life, and according to legend he was murdered by the daughter of a man he had had executed. An able ruler, he left office having checked corruption among his officials, enforced the laws of the empire, and reorganized finances so that the state revenue was increased. In addition to temporal matters, he pursued also the study of religion, writing extensively on the subject of Ch'an (Zen) Buddhism.

Yung-chia (China): see Wen-chou.

Yung-ho, shih (municipality), T'ai-pei hsien (county), northern Taiwan, 1 mi (1.6 km) south of Taipei city, in the northern part of the island's western coastal plain. Situated on the east bank of Shuang Hsi (river), the city flourished in the early 18th century. It is a market centre for the tea and rice produced in the surrounding region. Glass and glass products, and small machinery manufacturing are the main industries; coal is mined nearby. Yung-ho is a southern suburb and serves as a residential area for Taipei city; it is linked by railway with Taipei and Hsin-tien. Several colleges of teacher training and technology are in the city. Pop. (1982 est.) 213,787.

Yung-li (Chinese emperor): see Chu Yu-lang.

Yung-lo, Pinyin YONGLO (reign name), temple name (MING) CH'ENG TSU, or (MING) T'AI TSUNG, posthumous name, or shih, wen TI, personal name CHU TI (b. May 2, 1360, Nanking—d. Aug. 5, 1424, en route to Peking), third emperor (1402–24) of China's Ming dynasty, which he raised to its greatest power. He moved the capital from Nanking to Peking, which was rebuilt with the Forbidden

City.

Youth and early career. Chu Ti's father, the Hung-wu emperor, had rapidly risen from a poor orphan of peasant origin through stages as a mendicant Buddhist monk and then a subaltern in a popular rebellion against the Mongol rulers of the Yüan dynasty to become a virtually independent satrap in part of the rich eastern Yangtze River Valley, with his headquarters at Nanking. There Chu Ti was born fourth in a brood that ultimately numbered 26 princes. Modern scholarship has suggested that Chu Ti was probably borne by a secondary consort of Korean origin, although in traditional Chinese fashion he al-

The Yung-lo emperor, detail of a portrait; in the National Palace Museum, Taipei

ways treated his father's principal consort, the revered and influential empress Ma, as his 'legal" mother.

In 1360 Hung-wu was struggling with other contenders for supremacy in the Yangtze Valley, while the Yuan government at modern Peking was all but immobilized by court factionalism. In the next seven years the Hung-wu emperor's armies swept central and eastern China clear of opposition, and in 1368 he inaugurated the new Ming dynasty, with its capital at Nanking. He drove the last Mongol emperor out of Peking and then beyond the Great Wall and the Gobi.

At the age of 10, in 1370, Chu Ti was designated prince of Yen (an ancient name for the Peking region). As he grew to manhood during the next decade, the new Ming empire was stabilized, an elaborate governmental apparatus was erected, and a new socioeconomic order characterized by authoritarian reconstruction in many fields was instituted. The boy grew up in the mold of his remarkable fatherrobust, vigorous, and temperamental—and he became his father's favourite. His natural leadership qualities clearly outshone those of his

many brothers.

In 1380, at the age of 20, the Prince of Yen took up residence at Peking. The early Ming governmental system provided that the Imperial princes other than the eldest son, who remained at Nanking as heir apparent, be enfeoffed in strategic areas as regional viceroys. Through the 1380s the Prince of Yen gained experience in patrolling and skirmishing along the northern frontier under the tutelage of the greatest generals of the age. In 1390 he and his older half brother the Prince of Chin (enfeoffed in adjacent Shansi Province to the west) were given joint command of a patrolling expedition beyond the Great Wall, and in 1393 they assumed full supervisory control over defense forces of the whole central sector of the northern frontier. Thereafter, the Prince of Yen campaigned almost annually to keep the fragmented and disorganized Mongols off balance and on the defensive.

Meanwhile, in 1392, the heir apparent died. Some historians believe that the aging Hung-wu emperor seriously considered naming the Prince of Yen his new heir, in violation of tradition and the household rules he had himself promulgated. The Emperor did hesitate for almost half a year before designating his successor, but then he complied with tradition by investing the dead crown prince's son Chu Yün-wen, then only 15 years old. From this time forward, and especially after the deaths of his two remaining seniors in 1395 and in 1398, respectively, the Prince of Yen became increasingly arrogant and imperious; when the old emperor died in the summer of 1398 the Prince of Yen, in full vigour at the age of 38, considered himself the de facto head of the Imperial clan and expected to be treated deferentially by his nephew.

The young new emperor Chu Yün-wen had other intentions. Influenced by Confucian scholar-officials, he instituted a series of reforms unsettling to the newly stabilized government. One of his major goals was to take regional power away from the princes, and in 1398-99 one prince after another was imprisoned, exiled, or driven to suicide. Thus the Prince of Yen found himself steadily more isolated and endangered, and in August 1399 he rose in rebellion, declaring it his avuncular duty to rescue the inexperienced emperor from his malicious advisers.

The rebellion lasted from 1399 into 1402 and devastated much of western Shantung Province and the northern part of the Huai River Basin. The central government at Nanking seems to have underestimated the Prince of Yen's strength and failed to muster its manpower and matériel effectively; the war was a long stalemate. In early 1402 the Prince of Yen's forces broke through the Imperial armies in the north, sped almost unopposed southward along the Grand Canal, accepted surrender of the Imperial fleet on the Yangtze River, and were admitted into the walled capital by court defectors in July 1402. Four days after the fall of Nanking, Chu Ti took the throne himself, although his reign period did not begin until 1403. The emperor Chu Yünwen had disappeared. Whether he died in a palace fire (as was officially announced) or escaped in disguise to live many more years as a recluse is a puzzle that troubled Chu Ti until his own death and has been a subject of conjecture by Chinese historians ever since.

Accession to the throne. The accession brought terrible retribution to those who had most closely advised Chu Yün-wen. They and all their relatives were put to death. Before the purge ended, thousands had perished. The new emperor also revoked the institutional and policy changes of his nephew-predecessor and even ordered history rewritten so that the founding emperor's era name was extended through 1402, as if Chu Yün-wen had never reigned at all. The one reform policy that remained in effect was that princely powers must be curtailed. Hence, the surviving frontier princes were successively transferred from their strategically located fiefs into central and south China and were deprived of all governmental authority. From the Yung-lo period on, Imperial princes were no more than salaried idlers who socially and ceremonially adorned the cities to which they were assigned and in which they were effectively confined. No subsequent Ming emperor was seriously threatened by a princely uprising.
As the Yung-lo emperor, Chu Ti was domi-

neering, jealous of his authority, and inclined toward self-aggrandizement. He staffed the central government with young men dependent on himself and relied to an unprecedented extent on eunuchs for service outside their traditionally prescribed palace spheresas foreign envoys, as supervisors of special projects such as the requisitioning of construction supplies, and as regional overseers of military garrisons. In 1420 he established a special eunuch agency called the Eastern Depot (Tung-ch'ang) charged with ferreting out treasonable activities. Although it did not become notorious in his own reign, it came to be a hated and feared secret police in collaboration with the Imperial bodyguard in later

decades and centuries.

The Yung-lo emperor also relied heavily on a secretarial group of young scholar-officials assigned to palace duty from the traditional compiling and editing agency, the Hanlin Academy, and by the end of his reign they became a Grand Secretariat, a powerful buffer between the Emperor and the administrative agencies of government. Although the Emperor, like his father, was quick to anger and sometimes abused officials cruelly, he built a strong and effective administration, and during his reign China settled into the generally stable political and socioeconomic patterns that were to characterize the remainder of the dynasty.

Like his father, Yung-lo had little personal respect for the higher forms of Chinese culture. In the fashion of the Mongol khans, he summoned to China and highly honoured a Tibetan lama, and the strongest intellectual influence on him may have been that of a Taoist priest named Tao-yen, a long-favoured personal adviser. Along more orthodox lines, his government sponsored the compilation and publication of Confucian and Neo-Confucian Classics, and it most notably sponsored the preparation in manuscript form of a monumental compendium of literature called Yung-lo ta-tien ("The Great Canon of the Yung-lo Era") in more than 11,000 volumes, which preserved many works that would otherwise have been lost. But the Emperor himself must have considered such activities a kind of busywork for litterateurs who enjoyed public esteem but not his personal trust. A military man of action, the Yung-lo emperor had little enough patience with unavoidable administrative business, much less with intellectual exercises.

Foreign policy. In the early years of his reign, he seems to have been fascinated by the regions beyond China's southern borders, perhaps in part because of rumours that the emperor Chu Yün-wen had escaped overseas. In 1403 the Yung-lo emperor sent out three fleets under eunuch commanders to proclaim his accession throughout Southeast Asia as far as Java and southern India. More vigorously than any other ruler in Chinese history, he sought recognition from faraway potentates in these regions. Throughout his reign "tributary" missions regularly travelled to China from overseas, including local kings of Malacca and Brunei. Most renowned of the Yung-lo emperor's many ocean admirals was the Muslim eunuch Cheng Ho, who led grand armadas on seven great voyages between 1405 and 1433. Cheng Ho visited no fewer than 37 countries, some as far away as the Persian Gulf, the Red Sea, and the east coast of Africa almost as far south as Zanzibar, and from all the states that he visited Cheng Ho brought home envoys bearing tribute to acknowledge the Yung-lo emperor's overlordship.

The Emperor similarly sent a eunuch emissary on repeated tribute-seeking missions to Tibet and Nepal and a civil servant across Central Asia to Afghanistan and Russian Turkistan. The Yung-lo emperor became the only ruler in Chinese history to be acknowledged suzerain by the Japanese, under the Ashikaga shogun Yoshimitsu. For a short time the Japanese were so docile as to send their own subjects to the Chinese court for punishment as piratical plunderers of the Korean and Chinese coasts. But the succession of a new shogun brought about a less submissive attitude in Japan; from 1411 on, no tribute missions arrived from Japan despite the Yung-lo emperor's inquiries, and Japanese raiders became active again on China's coast. The Emperor then threatened to send a punitive expedition against Japan if it would not reform. But in 1419, when the shogunate brusquely denied responsibility for any piratical activities and refused to resume the former tributary relationship, the Yung-lo emperor was too preoccupied with other matters to do more than grumble.

The Yung-lo emperor's expansionist inclinations led China into an ultimately disastrous military adventure against China's southern neighbour, Annam. In 1400 the young Tran dynasty, heir to the Annamite throne, had been deposed and a new dynasty proclaimed. From the beginning of Yung-lo's reign Tran

loyalist refugees urged him to intervene and restore legitimate rule, and, when his own envoys to Annam were murdered, in 1406, the Emperor authorized a punitive campaign. Chinese forces rapidly occupied and pacified Annam. Because no Tran heir seemed available, the Yung-lo emperor in 1407 transformed Annam from a tributary state into a new Chinese province. Local resistance broke out almost immediately and continued irrepressibly. Especially after 1418, guerrilla warfare against the Ming authorities made the Chinese position in Annam increasingly precarious. By that time the Emperor had lost most of his early interest in the southern regions, and the situation was allowed to deteriorate until his grandson Hsuan-te realistically, albeit with some humiliation, abandoned direct Ming rule of Annam in 1428.

During the early years of the Yung-lo emperor's reign, the northern frontier, traditionally the zone of greatest danger to any Chinese regime, was relatively quiescent. At the outset of his Peking-based insurrection in 1402, the Yung-lo emperor had sought and won the support of the Mongol tribes directly to his rear, in northeastern China. In later payment for this support, he in effect gave these Urianghad Mongols virtual autonomy by withdrawing China's command posts south of the Great Wall, and he regularly sent the Urianghad chiefs substantial gifts. Other tribes beyond the northern frontier-the Eastern Mongols, or Tatars, and the Western Mongols, or Oyrats-were too disorganized to do more than struggle among themselves. In the far west, the Turko-Mongol empire builder Timur (Tamerlane) had already invaded and pillaged both India and Syria when the Yung-lo emperor came to the Chinese throne, and in 1404 Timur prepared to launch an expedition against China. Vaguely aware of this, the Yung-lo emperor alerted his commanders in the west to prepare for trouble; but Timur died in 1405, and the expedition was cancelled. Thereafter, the Emperor maintained amicable relations with Timur's heirs at Samarkand and Herat, keeping the Central Asian trade routes

After his early years on the throne, the Yung-lo emperor's attention was diverted from the south back to the northern frontier by the emergence of an effective new Tatar leader named Aruqtai. In 1410 the Yung-lo emperor resumed the aggressive extramural patrolling in the north that had preoccupied him as a prince in the 1380s and 1390s. Between 1410 and 1424 the Emperor five times personally led grand armies northward into the Gobi, primarily against Aruqtai but occasionally against Oyrats or restless Urianghad groups. The campaigns culminated in only a few battles, in which the Chinese forces won indecisive victories, but they had the effect of forestalling the development of a new large-scale Mongol confederation that might have seriously threatened China. Astute diplomacy was also relied on during these years to keep the Mongols fragmented and to establish at least nominal Chinese authority over the Juchen peoples in the far northeast, as distant as the Amur River.

as the Alitu River.

Transfer of capital to Peking. The most notable domestic event of the Yung-lo emperor's reign was the transfer of the national capital and the central government from Nanking to Peking. This reflected and symbolized the Emperor's and the nation's shift of attention from the southern oceans to the northern land frontiers. Peking was perhaps not the ideal site for the national capital: it historically had been associated primarily with "barbarian" dynasties such as the Yüan, it was far emoved from China's economic and cultural heartland, and it was dangerously close and exposed to the northern frontier. But it was

the Yung-lo emperor's personal power base,

and it was a site from which the northern defenses could be kept under effective surveillance. In 1407 the Emperor authorized transfer of the capital there, and from 1409 on he spent most of his time in the north. In 1417 large-scale work began on the reconstruction of Peking, and thereafter the Yung-lo emperor never returned to Nanking. The new Peking palace was completed in 1420, and on New Year's Day of 1421 Peking formally became the national capital.

Before this transfer of the capital could be accomplished and before the northern defenses could be made satisfactorily secure, the Yung-lo emperor had to provide for the reliable transport of grain supplies from the affluent Yangtze Valley to the north. Since the old Grand Canal linking the Yangtze and Yellow River valleys had been neglected for centuries and was largely unusable, coastal transport service around the Shantung peninsula was reorganized, and it proved spectacularly successful in the early years of the Yung-lo emperor's reign under the naval commander Ch'en Hsüan. Rehabilitation and extension of old waterways in the north proceeded simultaneously, so that in 1411 sea transport vessels could enter the Yellow River mouth south of Shantung and thus avoid the most perilous part of the coastal route; then Ch'en Hsüan by 1415 successfully rehabilitated the southern segments of the Grand Canal, and sea transport was abandoned. With Ch'en Hsüan serving as supreme commander of the Grand Canal system until his death in 1433, the new army-operated waterways complex, extending from Hangchow in the south to outside Peking, was able to deliver grain supplies in quantities adequate for the northern needs. In 1421, when Peking became the national capital, deliveries began to exceed 3,000,000 piculs (400,000,000 pounds) annually.

The Yung-lo emperor's overseas expeditions, the ill-fated occupation of Annam, the northern campaigns, the rebuilding of Peking, and the rehabilitation of the Grand Canal all required enormous expenditures of supplies and human effort. That China was able to undertake such projects during his reign gives evidence of the Yung-lo emperor's strong leadership, but they seem to have left the country exhausted and ready for an era of recovery under his successors.

The Emperor fell ill while returning from his campaign of 1424 into Mongolia and died at the age of 64 in August, when the army was still en route to Peking. He was succeeded by his eldest son, Chu Kao-chih, who had served ably as regent during his father's frequent long absences from the capital; he is known to history by the posthumous temple designation Jen Tsung (Benevolent Forebear). The Yung-lo emperor fathered three other sons and five daughters. His principal consort was Empress Hsü, daughter of the great early Ming marshal Hsü Ta; she died early in his regin in 1407

reign, in 1407.

The Yung-lo emperor was originally given the posthumous temple designation T'ai Tsung (Grand Forebear), a designation traditionally given to the second emperor of a dynasty. In 1538, long after that designation had come to be considered an unjustifiable insult to the memory of the emperor Chu Yün-wen, it was changed to the equally flattering Ch'eng Tsu (Completing Ancestor), in acknowledgement that it was indeed Chu Ti who consolidated the new dynasty.

(C.O.Hu.)

BIBLIOGRAPHY. The major source on the Yung-lo emperor and his reign is the official reign chronicle known as *T'ai-tsung shih-lu* ("Veritable Records of T'ai-tsung"). Relevant modern scholarship, especially by Westerners, is not abundant. One of the more useful references is Gungwu Wang, "China

and South-east Asia, 1402–1424," in Jerome Ch'en and Nicholas Tarling (eds.), Studies in the Social History of China and South-East Asia, pp. 375–401 (1970).

Yung-lo ta-tien, Pinyin Yongluo dadien (Chinese: "Great Canon of the Yung-lo Era"), Chinese compilation that was the world's largest known encyclopaedia. Compiled under the direction of the Yung-lo emperor (Ch'engtsu), it was completed in 1407. The work contained 22,937 manuscript rolls, or chapters, in 11,095 volumes and was designed to include all that had ever been written on the Confucian canon, history, philosophy, and the arts and sciences. It was, in effect, a vast collection of excerpts and entire works from the mass of Chinese literature. Fewer than 400 volumes of the three manuscript copies of the set survived into modern times. A remnant was published in 1963.

Yung-ning (China): see Nan-ning.

Yung-yen (Chinese emperor): see Chiach'ing.

Yungang caves (cave temples): see Yün-kang caves.

Yungas, humid, subtropical region in western Bolivia. It occupies the eastern slopes of the Andean Cordillera Real and extends northeast and north of the cities of La Paz and Cochabamba. This rainy forested belt of rugged terrain (sharp ridges and deep gorges, eroded by numerous streams) has its counterparts in Colombia, Ecuador, and Peru. Its middle level of elevation allows a diversity of crops to be grown. Settlers have been attracted to the area by gold, coca, coffee, cacao, and sugarcane, and government efforts to improve transportation and colonize the region continue. Chulamani, the largest town, is a popular health resort; Coroico is another important centre.

Yunnan, Wade-Giles romanization YÜN-NAN, Pinyin YUNNAN, sheng (province) of the People's Republic of China, bounded by the Tibetan autonomous region on the northwest, Szechwan province on the north, and the Kwangsi Chuang autonomous region and Kweichow province on the east. To the west Yunnan borders Myanmar (Burma), and to the south and southeast it adjoins Laos and Vietnam. Yunnan is the fourth largest province in China. The capital is K'un-ming. A brief treatment of Yunnan follows. For full treatment, see MACROPAEDIA: China.

The Yüan, or Mongol, dynasty (1206-1368) marked an end to various power struggles in the region. In 1253 the Mongols destroyed the kingdom called Nanchao and, naming the area Yunnan, made it a province of the Chinese empire. Han (Chinese) migration into Yunnan was encouraged during the Ming dynasty (1368-1644), and the province was governed by local leaders representing Chinese magistrates. This policy continued through the Ch'ing dynasty (1644-1911) and under the Chinese republic in its various guises (1911-1949), when efforts were undertaken to bring the province under central government control. Since 1949 the People's Republic has made Yunnan one of China's high-priority industrial belts. A Sino-Burmese treaty in 1960 put an end to border disputes between the two countries.

Yunnan's terrain consists of a series of high mountain chains that spread out across the province. These include the Kao-li-kung, Nu, and Yun-ling Mountains. Yunnan contains two distinct regions separated by the Ai-lao Mountains—a canyon region to the west of it and a plateau region to the east. Flowing through the deep valleys between these mountains are Yunnan's major rivers: the Nmai

Hka (headstream of the Irrawaddy), the Salween, the Mekong, and the Black River. The towering height of the mountains in the north is such that the valley floors lie at heights averaging 4,000 to 5,000 feet (1,200 to 1,500 m) below the mountaintops. In the southern part of the canyon region the mountains are much lower and the valleys more open. The eastern plateau region stretches from the Ailao Mountains to the Kweichow-Kwangsi border. Its dominant land use is for rice paddies, but fruit orchards are located in the terraced rims of the basin. This region is noted for its moderate climate. Despite its proximity to the equator and because of high elevation, summers are cool; winters are mild because of shelter from the mountains. The western canvon region experiences sultry heat with high humidity at the valley bottoms, temperate climates at 6,000 to 11,000 feet (1,800 to 3,400 m), and freezing winds at the moun-

Yunnan's population is known for its great ethnolinguistic complexity. The bulk of both the city population and the agricultural population consists of Han, who live on the plains and in the valleys devoted to rice cultivation. There has been much intermarriage between the Han and non-Han immigrants and between the Han and Hui (Muslims). There is a substantial unassimilated non-Han population, which comprises 21 major and 60 minor nationalities. These groups are highly intermixed in distribution: not one county is inhabited by only a single nationality. Approximately one-tenth of Yunnan's population is urban.

In addition to the enormous rice crop, corn (maize), wheat, barley, sweet potatoes, soybeans, and oilseeds are grown. Sugarcane is grown in the southeastern part of Yunnan and bananas, coconuts, and coffee in the deep south. Walnuts, chestnuts, mulberry trees, peaches, and persimmons are grown in many parts of the province. The western canyon region holds enormous timber reserves and produces some tung oil. Industrial crops include cotton, hemp, and tobacco.

Mining is far more important than agriculture. Yunnan has one of the world's largest tin deposits. The province is also a large producer of copper and has moderate deposits of coal and iron. Other mineral products include antimony, tungsten, mercury, phosphorus, and silver. Gypsum, sulfur, fluorite, arsenic, alum, and asbestos exist in large quantities. Deposits of bauxite provide the basis for an aluminum industry. Marble is quarried at Ta-li. Salt is also produced.

Yunnan's manufacturing industries produce paper, sugar, leather, hemp, woolen yarn, and rugs. The K'un-ming area is a giant industrial complex, consisting of steelworks, iron- and copper-smelting facilities, a truck-manufacturing plant, plants for manufacturing fertilizers and industrial chemicals, an optical-instrument works, and textile and food-processing industries.

Since the government has emphasized Yunnan's economic development, the railroad network has been expanded. Highways are well developed, radiating in every direction. Trucks can reach almost every remote village, which creates a momentum for development among the rural settlers. Most of the rivers in Yunnan are unnavigable, except for short distances. K'un-ming serves as the hub for domestic and international air service. Area 168,400 square miles (436,200 square km). Pop. (1988 est.) 35,340,000.

Yunnan-Kweichow Plateau, Wade-Giles romanization YÜN-NAN-KUEI-CHOU KAO-YÜAN, Pinyin YUNNAN-GUIZHOU GAOYUAN, highland region comprising the northern part of Yunnan province and the western part of Kweichow province, China. Yunnan is more distinctly a plateau with areas of rolling

uplands, precipitous folded and fault-block mountain ranges, and deep, river-cut gorges. About 6,000 feet (2,000 m) in elevation, the Yunnan part has mountain peaks of more than 12,000 feet (3,700 m) in the west. In the Kweichow part, with an average elevation of about 4,000 feet (1,200 m), karst processes have created sinks, ravines, natural bridges, and underground streams in the limestone landscape. Much bare rock is exposed in steep slopes, and there are few large areas of level land. Within the plateau there are many small lake basins separated by mountains, and the edge of the plateau is highly dissected. Basins in the K'un-ming area (Yunnan) are the most developed farming regions on the plateau. The Stone Pinnacles of Lu-nan in Yunnan is a tourist attraction.

Yunus Emre (b. mid-13th century, Turkey—d. c. 1321, Turkey), poet and mystic who exercised a powerful influence on Turkish literature.

Though legend obscures the facts of his life, he is known to have been a Sūfī (Islāmic mystic) and sat for 40 years at the feet of his master, Tapduk Emre. Yunus Emre was well versed in mystical philosophy, especially that of the 13th-century poet and mystic Jalāl ad-Dīn ar-Rūmī. Like Rūmī, Yunus Emre became a leading representative of mysticism in Anatolia but on a more popular level; he was venerated as a saint after his death.

His poems, which are devoted mainly to the themes of divine love and human destiny, are characterized by deep feeling. He wrote in a straightforward, almost austere style and mainly in the traditional syllabic metre of Anatolian folk poetry. His verse had a decisive influence on later Turkish mystics and inspired the poets of the renaissance of Turkish national poetry after 1910.

Yupuru River (South America): see Japurá River

Yuraks (people): see Nenets.

Yurok, Indians of the Northwest Coast of North America who lived in California along the lower Klamath River and the Pacific coast. They spoke a Macro-Algonkian language related to Wiyot (q.v.).

Yurok villages were small; a village was a collection of independent houses owned by individual families rather than a unified community with an overall political authority. Village residents sometimes shared rights to subsistence areas and to the performance of certain rituals, but other rights, such as rights to fishing, hunting, and gathering, generally belonged to particular houses. These rights were acquired by inheritance, dowry, blood money, or sale. In addition to dwellings, villages also had sweathouses that served as dormitories for men of the basic social unit (consisting of relatives reckoned on the paternal side, headed by the senior member). There were also small separate women's menstrual huts.

separate women's menstrual huts.

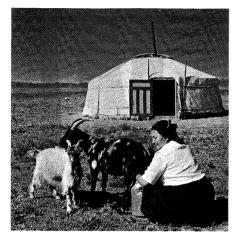

The Yurok, whose economy focused on salmon and the acorn, produced excellent basketry and made canoes from redwood trees, selling them to inland tribes. Wealth was counted in strings of dentalium shells, obsidian blades, woodpecker scalps, and albino deerskins. Acquiring wealth was a major Yurok ideal. Feuds were common, with payments of blood money worked out on a precise scale depending on the seriousness of the offense. The value of a man's life depended on his social status.

Religion was concerned with the individual effort to elicit supernatural aid, especially through ritual cleanliness, and with rituals for the public welfare. The major ceremonies were those of the World Renewal cycle, which assured an abundance of food, riches, and general well-being. These included the recitation of magical formulas repeating the words of an ancient spirit race and other acts. The

spiritual power to cure disease was restricted to women, giving them prestige and a source of wealth.

The Yurok lacked the potlatch masked dances, representative art, and other features typical of most Northwest Coast cultures.

yurt, also spelled YURTA, Mongol GER, tentlike Central Asian nomad's dwelling, erected

Yurt in the Gobi desert, Mongolia George Helton—Photo Researchers

on wooden poles and covered with skin, felt, or handwoven textiles in bright colours. The interior is simply furnished with brightly coloured rugs (red often predominating) decreated with geometric or stylized animal patterns. The knotted pile rug, first known from a nomad burial at the foot of the Altai Mountains (site Pazyryk; 5th–3rd century BC), probably developed as a fur substitute to provide warmth and sleeping comfort.

Other items found inside include saddle bags, drinking gourds, and tools for spinning and weaving. The yurt is pitched wherever the nomad finds good pasture for his herds and is carried from place to place on horseback or on a small wagon.

Yuruá River (South America): see Juruá River.

Yürük rug, floor covering handwoven by nomadic people in various parts of Anatolia.

Detail of the latch-hook motif of a Balıkesir Yürük rug from western Anatolia, 19th century; in the collection of Joseph V. McMullan

Collection of Joseph V. McMullan; photograph, Otto E. Nelson—EB Inc

The Balıkeshir Yürük rugs of western Anatolia, marketed through Bergama, have been considered a subclass of that category. Their diagonal patterns, a maze of latch-hook motifs carried out in red and dark blue with touches of ivory, are highly reminiscent of and sometimes confused with those Baluchi rugs that abjure the use of brown.

Rugs from Eastern Anatolia, many of them Kurdish rugs but classed as Yürük, show a wide range of rich and unusual colour shades; their hexagonal and lozenge patterns are frequently sharpened by the rug's construction, the knots being tied in such a manner (offset) as to produce diagonal rather than vertical rows. The small prayer rugs are nondescript in design and often dismissed as "Anatolian." As with other nomadic rugs, the wool is apt to be more glossy than that in town products and the pile longer and more recumbent, owing to the use of more shoots of weft between the rows.

Yuryev (Estonian S.S.R.): see Tartu.

Yuscarán, capital, El Paraíso department, southeastern Honduras, at the eastern foot of the Montaña (ridge) de Monserrat near the Río Choluteca, at an elevation of 3,379 ft (1,030 m).

Founded between 1730 and 1740, when gold and silver were discovered in the area, Yuscarán was a prosperous mining centre during the colonial period. Mining halted in the 19th tentury but was resumed in the 1940s. The town, which preserves a colonial atmosphere, is also a commercial centre in an area producing mainly timber, grains, and fruits; it also has a liquor distillery. It is accessible by highway from Tegucigalpa, the national capital; a road also leads to the Nicaraguan border. Pop. (1983 est.) 8,337.

Yust, Walter (b. May 16, 1894, Philadelphia—d. Feb. 29, 1960, Evanston, Ill., U.S.),

Yust

U.S. journalist and editor, editor in chief of all publications of the *Encyclopædia Britannica* from 1938 to 1960—longer than any of his predecessors.

A graduate of the University of Pennsylvania, Yust began his journalism career with the *Philadelphia Evening Ledger* in 1917 and later worked for newspapers in New Orleans and for other publications. He became literary editor of the *Philadelphia Public Ledger* in 1926. Three years later, upon writing a review of the new 14th edition of the *Encyclopadia Britannica*, Yust came to the attention of its president, William Cox. The following year he was named advertising manager for the encyclopaedia and its associate editor in 1932. He served as editor in chief from 1938 until his retirement in 1960.

Yūsuf ibn Tāshufīn, Tāshufīn also spelled TĀSHFĪN (d. 1106), Almoravid ruler who, during his reign from 1061 to 1106, expanded Almoravid land holdings from a small, insecurely held area in the Maghrib into a huge empire that included major portions of pres-

ent-day Morocco and Algeria, Muslim Spain as far north as Fraga, and the islands of Majorca, Minorca, and Ibiza. A Berber by origin, Ibn Tāshufin was an excellent general and a devoutly religious ascetic who inspired his followers by example.

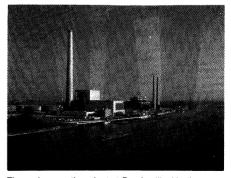

In 1061 Abū Bakr, who was then the leader of the Almoravids, went south into the desert to put down a tribal rebellion. He gave the command of his troops in the Maghrib to Ibn Tāshufin, his cousin. Ibn Tāshufin proved so popular that when Abū Bakr returned he relinquished his power and even his wife to Tāshufin. Ibn Tāshufin went on to found Marrakech (c. 1062) and conquered almost all of Morocco and Algeria. The fall of Toledo in 1085 and increasing Christian aggressiveness led the divided Muslims of Spain to appeal for his aid. Ibn Tāshufin inflicted a serious defeat on Alfonso VI of Castile at az-Zallaqah in 1086, but he returned to Morocco afterwards. He returned to Spain in 1089 to begin his conquest in earnest. By the time of his death, Ibn Tāshufin controlled virtually all of Muslim Spain.

Yuzhno-Sakhalinsk, also spelled IUZHNO-SAKHALINSK, or JUŽNO-SACHALINSK, city and administrative centre of Sakhalin oblast (region), far eastern Russian Soviet Federated Socialist Republic, in the south of Sakhalin Island on the Susuya River. Originally the Japanese settlement of Toyohara, Yuzhno-Sakhalinsk passed to the Soviet Union in 1945 and was given its present name in 1946. It is a communications hub, with railways that extend to Korsakov, to Kholmsk on the west coast, and north to Nysh. There are locomotive and rolling-stock repair shops located in the city. Other industries include the manufacture of furniture and footwear, brewing, and distilling. Pop. (1983 est.) 152,000.

Yuzhny Bug, also spelled IUZHNYI BUG, or JUŽNYJ BUG, river, Ukrainian Soviet Socialist Republic, 492 mi (792 km) in length and draining a basin of 24,610 sq mi (63,740 sq km). It rises in the Volyn-Podolsk Upland and flows east and southeast, first through a narrow valley with rapids and then across rolling steppe (largely under the plow), to enter the Black Sea by a winding estuary 29 mi long. The flow shows great seasonal variation. The Yuzhny (Southern) Bug is navigable to Voznesensk, and on its estuary is the port of Nikolayev.

Yuzovka (Ukrainian S.S.R.): see Donetsk.

Yvelines, département, Île-de-France region, northern France, embracing the western outer suburbs of Paris and the valley of the Seine

Thermal generating plant at Porcheville, Yvelines département, France

Martine Franck—VIVA

between the French capital and Normandy. With an area of 877 sq mi (2,271 sq km), the *département* was created in 1964 from the western part of the former Seine-et-Oise

département, which in 1790 was formed from portions of the historic province of Île-de-France. It takes its name from the vast forest that once covered the whole region. Extensive woods are still found in the département, including those around Versailles (the departmental capital), the national forests of Marly and Saint-Germain-en-Laye in the Paris region, and the national forest of Rambouillet, which occupies more than 30,000 ac (12,000 ha) in the southwest.

The *département* extends across a series of hilly plateaus, indented in the north by the meandering Seine River, which flows around the forest of Saint-Germain and past Poissy, Meulan, and the cathedral city of Mantes-la-Jolie, all of which have become satellite towns of Paris. The climate is mild and equable, with moderate rainfall. Wheat and other cereals are grown in the *département*, particularly in the south and northwest; and market gardening thrives in the valleys, which are less industri-

alized than those of the eastern outer suburbs of Paris

Residential areas, now encroaching on the countryside, have been made more accessible to Paris by the improvement of roads and suburban railway services. The construction of the regional express rail service has improved local communications, especially between Saint-Germain-en-Laye and Versailles. The département has numerous places of historical interest and relaxation, including the châteaus of Versailles, Rambouillet, Maisons-Laffitte (with a racecourse nearby), and Saint-Germain-en-Lave; and the royal park at Marly. The département has four arrondissements: Versailles, Mantes-la-Jolie, Rambouillet, and Saint-Germain-en-Laye. It is in the educational division of Paris. Pop. (1982) 1.196.111.

Yverdon, German IFERTEN, city, Vaud canton, western Switzerland, on the southern shore of Lake Neuchâtel, at the mouth of La Thielle River, north of Lausanne. It originated as the Roman camp Eburodunum, and the ruined Roman walls remain. The castle (1260–

78) of the dukes of Savoy was the seat of the boarding school established in 1805 by the Swiss educator Johann Heinrich Pestalozzi, which flourished for 20 years; it now houses a library, a science-fiction museum, and a historical museum with mementoes of Pestalozzi. The town hall and the parish church both date from the 18th century.

Yverdon-les-Bains, southeast of the town centre, has been known since Roman times for its small alkaline sulfur spring, which is now housed in the Centre Thermal (reconstructed in 1977).

An expanding industrial town, Yverdon has railroad shops and manufactures machinery, precision instruments, and tobacco. Pop. (1981 est.) 28,072.

Yveteaux, Jean Vauquelin de La Fresnaye, sieur des (sire of): see Vauquelin de La Fresnaye, Jean.

YWCA: see Young Women's Christian Association.

Yzdkrt (name of Sāsānian rulers): see under Yazdegerd.

za, in feudal Japan, any of the mercantile or craft guilds that flourished c. 1100-1590. They did not become fully organized until the Muromachi period (1338-1573), when they began to monopolize the production, transport, and sale of merchandise. In exchange for certain fees the za enjoyed official recognition and exemptions from tolls, transit duties, and market taxes. Many za were begun and maintained under the patronage of nobles, or of the zasu (head priests) of Shintō shrines or Buddhist temples. More than 80 guilds situated in the Nara region specialized in the manufacture or conveyance of paper, sake, salt, vegetable oil, and malt. Other guilds were organized by dancers, musicians, carpenters, and blacksmiths. The za gradually declined with the declining authority of their patrons and with the expansion of the market economy. Merchants also often opposed the monopoly development and trade restrictions that characterized the za. Market taxes and za were officially and nationally abolished by the feudal lords Oda Nobunaga and Toyotomi Hideyoshi in about 1590.

Zaanstad, gemeente (commune), Noordholland provincie, western Netherlands. It lies along the Zaan River near its junction with the North Sea Canal. An industrial area 6 miles (10 km) northwest of Amsterdam, Zaanstad was created in 1974 at the merger of the former gemeenten (communes) of Zaandam, Koog aan de Zaan, Zaandijk, Wormerveer, Krommenie, Assendelft, and Westzaan. Zaandam was an important shipbuilding centre in the 17th century; some 17th-century windmills survive, and there is a mill museum at Koog aan de Zaan. Zaanstad is a rail junction and important seat of the Dutch lumber trade and has food and paint industries. Pop. (1986 est.) 128,248.

Zab River, either of two tributaries of the Tigris River in southwest Asia. The Great Zab (Arabic: az-Zāb al-Kabīr) rises along the Turkish-Iranian border east of Lake Van and flows southward across southeastern Turkey and northern Iraq to join the Tigris downstream from Mosul, near the site of the ancient Assyrian town of Nimrūd (Kalakh), after a course of 265 miles (426 km). The Little Zab (az-Zāb aṣ-Ṣaghīr) originates in western Iran near Lake Urmia and flows generally southwestward for 250 miles (400 km) into Iraq, where it empties into the Tigris west of Kirkūk. Both streams have been dammed to increase irrigated crop acreage (mainly for wheat, rye, cotton, tobacco, and rice) as well as to provide flood control and hydroelectric power for valley settlements. The valley of the Little Zab is an important oil-producing region, the Kirkūk oil fields being the most productive in Iraq.

Za'ba, byname of ZAINAL 'ABIDIN BIN AHMAD (b. Sept. 16, 1895, Batu Kikir, Negeri Sembilan, Malaya [now in Malaysia]—d. Oct. 18, 1973, Kuala Lumpur, Malaysia), Malay language scholar and journalist who published comment on public affairs and politics for more than half a century.

Za'ba began his working life as a school-teacher in Johore and at the Malay college, Kuala Kangsar (the "Malay Eton"), before being appointed head in 1924 of the newly created Malay Transition Bureau, attached to Sultan Idris Training College, the cradle of Malay-language nationalism. There, for about 16 years, he and his small staff were responsible for the translation into Malay of a wide range of materials in English (from works by Shakespeare and Mark Twain to contemporary detective stories) and for the production of many school textbooks—reading materials for a whole generation of Malay schoolchildren. Long active as a polemical journalist (usually under pseudonyms, as a government servant), he spent his years at the Translation

Bureau working also on more scholarly material, publishing the first Malay grammars in Malay in 1926 and 1934 and a major work on orthography in 1941.

After the war Za'ba was appointed lecturer in Malay at the School of Oriental and African Studies, University of London, and while there obtained his B.A. in 1953, at the age of 58. Returning to Malaya, he was made first head of the Department of Malay Studies at the University of Malaya.

Zaberma (people): see Zerma.

Zabīd, also spelled ZEBID, town, western Yemen (Ṣan'ā'). It lies on the bank of the Wadi Zabid and at the eastern fringe of the Tihāmah coastal plain, about 10 miles (16 km) from the Red Sea coast. An ancient Yemeni centre. Zabīd was refounded in AD 820 by the 'Abbāsids under Muhammad ibn Ziyād, emissary of the caliph al-Ma'mūn. From there the Ziyādi dynasty, his successors, ruled over large parts of southwestern Arabia. Upon the conquest of Yemen by the Ayyūbids under Tūrān Shāh, brother of Saladin, in 1173-74, the capital was moved to Ta'izz. The city flourished again under the Tāhirid dynasty (late 15th century); many public buildings, including mosques, were erected, and madrasahs (theological schools) were founded there. Zabīd was one of the religious centres of the Shāfi'ī school of Sunnī Islām, which is dominant along the Yemeni coast.

A thick wall surrounds Zabīd. Its Great Mosque, once the site of a well-known Shāfi'ī madrasah, is prominent. Zabīd was formerly important as a weaving and dyeing centre (cotton, indigo) and for tanneries and leatherwork, but its handicraft industries have not been able to compete with imported machinemade textiles and other manufactured goods. Pop. (1977 est.) 7,559.

Zabrze, German HINDENBURG (1915–45), town, Katowice województwo (province), southwestern Poland. It is situated in the Upper Silesian industrial district. A major industrial and cultural centre, Zabrze is also one of Poland's oldest mining settlements, the first mine having opened there in 1790. The modern town is economically dependent upon the coal and coke industry, metalworks, chemical plants, and plants producing electrical power. It contains an academy of medicine, a museum, and a large sports stadium.

The town was held by Prussia between 1742 and 1921 and then passed to Germany. Severely damaged during World War II, it was returned to Poland in 1945. Pop. (1987 est.) 198,900.

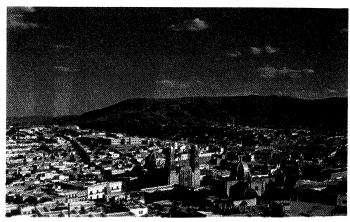

Zacapa, town, eastern Guatemala. It lies at 738 feet (225 m) above sea level along the San José River. Although the town is old, it grew greatly in size and importance only after the Puerto Barrios-Guatemala City railroad was

completed in 1896; it is the junction of the line from El Salvador. Zacapa is also a commercial and manufacturing centre for the agricultural and pastoral hinterland, which yields principally sugarcane, corn (maize), beans, and livestock. The town is locally renowned for cheese and cigars. Buildings in the town suffered much structural damage in the earthquake of 1976. The city is south of the highway that links Puerto Barrios with Guatemala City. Pop. (1981) mun., 33,693.

Zacapú, in full zacapú de MIER, city, northcentral Michoacán estado ("state"), westcentral Mexico. It is in the Sierra de Nahuatzén, 6,500 feet (1,980 m) above sea level and west of Morelia, the state capital. Agriculture and livestock raising are the principal sources of income, the main crops being wheat, beans, and especially corn (maize). The remains of several Tarascan Indian buildings are nearby. The Heroica Nogales-Guadalajara-Mexico City highway passes through Zacapú, which is also accessible by railroad. Pop. (1980) 39,570.

Zacatecas, estado ("state"), north-central Mexico. It is bordered by Coahuila on the north, San Luis Potosí on the east, Aguascalientes and Jalisco on the south, and Durango on the west. Its 28,283-square-mile (73,252-square-kilometre) territory lies wholly within the central plateau and is traversed by several mountain ranges. The average elevation in the state is about 7,700 feet, (2,350 m), and the climate is dry and generally healthful, being warm in the valleys and temperate in the mountains. The state's major rivers are the Aguanaval, Jerez, Juchipila, Tlaltenango, and Valparaiso. Rainfall averages about 20 inches (500 mm) per year. Much of the state's income comes from mining (silver, gold, mercury, copper, iron, zinc, and other minerals). Its mineral wealth was discovered soon after the Spanish conquest, and some of its mines date from the mid-16th century. Agriculture (cereals, alfalfa, sugarcane, and maguey, from which the beer called pulgue is made) is also an important occupation, but the low rainfall limits crop yields, and only a small proportion of the state's farmland is irrigated. Cattle are raised and meat processing is important. Manufactures are limited chiefly to the reduction of mineral ores, the extraction of rubber from guayule, the refining of sugar, and the manufacture of rum, pulque, mescal (from pulque), and woolen and cotton textiles. The rail, highway, and air routes traversing the state link Zacatecas city, the state capital, with El Paso (Texas) and Mexico City. Pop. (1986 est.) 1,235,200.

Zacatecas, city, capital of Zacatecas estado ("state"), north-central Mexico. It lies in a

Zacatecas, Mex.
Walter Aquiar—EB Inc.

deep, narrow ravine, 8,189 feet (2,496 m) above sea level. Founded in 1548 (by Juan de Tolosa, Cristóbal de Oñate, Diego de Ibarra, and Baltasar Tremiño), two years after silver was discovered in the area, it was given city status in 1585. The name means "place where zacate grass grows." Until the 19th century, the mines around Zacatecas yielded one-fifth of the world's silver. Still a mining centre, the city is also a commercial and manufacturing centre for the agricultural hinterland. Zacatecas' cathedral, noted for its highly carved portico, was begun in 1612 and completed in 1752. It contained European paintings and elaborate silverwork and goldwork until the reforms of the 1850s and 1860s, when most of them were confiscated. The extensive Indian ruins of Chicomóztoc are 28 miles (45 km) south-southwest of the city. The major high-way and railroad linking Ciudad Juárez and Mexico City pass through Zacatecas, which also has an airport. Pop. (1980) 80,088.

Zacatecoluca, city, southern El Salvador. It lies in the Lempa River Valley, at the foot of San Vicente Volcano. A commercial centre for the surrounding agricultural area, it also trades in cotton goods, baskets, salt, and lumber and produces cement. An earthquake in 1932 caused severe damage to the city. Zacatecoluca was the birthplace of José Simeón Cañas, who fought successfully to end slavery in Central America. Pop. (1984 est.) 25,650.

Zaccaria, Saint Antonio Maria (b. 1502, Cremona, duchy of Milan-d. July 5, 1539, Cremona; canonized May 27, 1897; feast day July 5), Italian priest, physician, and founder of the congregation of Clerks Regular of St. Paul, or Barnabites, a religious order devoted to the study of the Pauline Letters.

Receiving his doctorate in medicine from the University of Padua in 1524, he practiced at Cremona for three years. He then studied theology and was ordained in 1528, later being transferred to Milan, where, under the influence of his confessor, he organized (1530) the Barnabites.

Zaccaria's congregation preached and administered charitable work among the Milanese and was approved by Pope Clement VII in 1533. Zaccaria later founded the Angelicals of St. Paul, a similar order for women, which Pope Paul III approved in 1535. The two congregations performed missionary and educational work in Milan and elsewhere, using the teachings of the Apostle St. Paul as their guide.

Toward the end of his life Zaccaria secured for his order's headquarters the ancient Milanese church of St. Barnabas, from which their popular name derives. There are Barnabite monasteries in Italy, Austria, Belgium, Spain, and South America. G. Chastel's Saint Antoine-Marie Zaccaria, Barnabite appeared in 1930.

Zaccaria, Benedetto (b. Genoa—d. c. 1307. Genoa), Genoese merchant, diplomat, and admiral, hero of a decisive Genoese naval victory over Pisa at Meloria (1284)

In 1264 Zaccaria was named Genoese ambassador to the Byzantine emperor, Michael VIII Paleologus, who bestowed on him and his brother Manuele the fief of Phocaea, north of Smyrna, with its alum mines. On this foundation the brothers built a commercial empire, trading in North Africa, Spain, France, Flanders, Constantinople, and the Black Sea. Zaccaria returned to Genoa in 1284 and took command of a fleet that blockaded Pisa's Tyrrhenian port, the Porto Pisano, a naval maneuver that led to Pisa's committing its fleet to combat. In the resulting Battle of Meloria, Zaccaria's tactics produced a Genoese victory from which Pisa never recovered.

Leaving Genoa in 1290, Zaccaria served as grand admiral of the fleet of Sancho IV of Castile. Four years later he commanded the fleet of Philip IV of France against England, blockading Flanders in 1299. In about 1301 Zaccaria sailed for Phocaea to protect it against the inroads of Turkish and Catalan pirates and seized the nearby island of Chios. He returned a few years later to Genoa, where he died.

Zacconi, Lodovico (b. June 11, 1555, Pesaro, Papal States [Italy]-d. March 23, 1627, Firenzuola, near Pesaro), Italian musicologist, last of a distinguished line of Renaissance writers on music.

Zacconi became a priest, later an Augustinian, and studied music with Andrea Gabrieli in Venice, where he was musical director for his order. He went to Vienna in 1585 at the invitation of the archduke Charles. In 1592 he published the first part of his Prattica di musica, dedicated to William V, duke of Bavaria, whose service he had entered three years earlier. In 1596 he returned to Italy and in 1622 published the second part of his treatise in Venice.

Zacconi's lucidly written work is an authoritative and encyclopaedic summary of the theory and practice of Renaissance music. His handling of theoretical matters is illuminated by the practical nature of the book. His descriptions of contemporary instruments, their construction, compass, and use, and his discussion of improvised ornamentation are particularly valuable to the modern scholar and performer. Zacconi's compositions include a set of *ricercari* (fugal pieces) for organ and four books of canons. His autobiography (1626), in which he describes himself as a musician, painter, and poet, is in the Liceo Musicale, Bologna.

Zach, Franz Xaver, Freiherr von (baron of) (b. June 4, 1754, Pest or Bratislava, Hung.—d. Sept. 2, 1832, Paris), German-Hungarian astronomer patronized by Duke Ernst of Saxe-Gotha-Altenburg.

Zach built an observatory on the Seeberg near Gotha and directed the observatoryone of the most important of the time—from 1791, when it was completed, until 1806. During this period Zach enlisted 24 astronomers throughout Europe in making a systematic search for new comets and for the planet between Mars and Saturn expected on the basis of Bode's law (the Titius-Bode law). The principal result was the discovery of several minor planets (commonly called asteroids). Zach's most lasting achievement was the editing of three scientific journals during the interval 1798-1826.

Zacharias (Jewish prophet): see Zechariah.

Zacharias, SAINT, English ZACHARY (b. San Severino, duchy of Benevento [Italy]d. March 14/22, 752, Rome; feast day March 15), pope from 741 to 752.

Of Greek parentage, he was supposedly a Roman deacon when he succeeded Pope St. Gregory III in November/December 741. His pontificate was devoted to diplomatic relations with the Lombard and Frankish kingdoms and with the Byzantine Empire. He initiated a policy of conciliation with the Lombards while endeavouring to dissuade their rulers, Liudprand and Rachis, from conquering the Byzantine exarchate of Ravenna. Successful, he thus made peace with the Lombards. He maintained amiable relations with the Byzantine emperor Constantine V Copronymus, whom he advised to restore the veneration of

Zacharias' relations with the Franks were similarly cordial, and his correspondence with St. Boniface, the apostle of Germany, shows how great his influence was on contemporary events in the Frankish kingdom. In 741 he made Boniface legate and charged him

with the reformation of the whole Frankish Church. He supported the deposition (751-752) of Childeric III, the last Merovingian king, and authorized the Frankish Church to anoint Pepin III the Short as king of the Franks. Zacharias' action in the transference of the royal crown from the Merovingians to the house of Pepin (Carolingians) began a new era for church and state by establishing the Carolingian-papal alliance, which was to be of the greatest significance in future relations between pope and emperor and was of extreme importance to the theorists and controversialists of the Investiture Controversy (11th and 12th centuries). The latter dispute concerned secular rulers' right to invest bishops and abbots, which right became one of the paramount aspects in the struggle for power between the papacy and the Holy Roman Empire.

Zacharias is known especially in the East for his Greek translation of the Dialogues of Pope St. Gregory I the Great.

Zacharias, Basileios: see Zaharoff, Sir Basil.

Zacynthus, also spelled ZAKYNTHOS, Modern Greek zákinthos, French zante, Italian zacinto, island, southernmost and third largest of the Ionian Islands (q.v.) of Greece, lying off the west coast of the Peloponnese. Including the tiny Strotádhes Islands to the south, it constitutes the nomós (department) of Zákinthos. Zacvnthus is indented by a deep bay with high cliffs on its south coast. The island has an area of 155 square miles (402 square km), the nomós 157 square miles (407 square km). The centre of Zacynthus is a fertile plain bounded on the west by barren limestone hills, 700 to 1,600 feet (200 to 500 m) high, with many sinkholes and steep sea cliffs. The hills culminate in the 2,480-foot-(756-metre-) high Mount Vrakhiónas. The plain is bounded on the east by a low range of hills. The capital of the island and nomós, Zákinthos town, lies on the east coast on the site of ancient Zacynthus; it is the seat of a metropolitan bishop.

Zacynthus was named for an ancient Arcadian chief; the 5th-century-BC historian Thucydides said that it was colonized by Achaeans from the Peloponnese. The island was used by the Athenians during the Peloponnesian War and again in 374 BC. The Romans captured it in 211 and 191, annexing Zacynthus to keep

it out of the Achaean League.

Zacynthus was repeatedly pillaged by the Vandals and Saracens, and in 1185 it was taken, along with the islands of Corfu, Cephalonia, and Leucas, by Margarito of Brindisi. From 1194 to 1328 it was held by the Orsini and from 1328 to 1482 was in the possession of the counts of Tocchi. Venice was granted the island in 1485, to prevent its falling to the Turks, and held it until 1797, when it was ceded to France by the Treaty of Campo Formio. After a short Russian occupation, it became (1815) part of the British protectorate of the Ionian Islands: it prospered with the revival of Greek culture. In 1864 Zacynthus was ceded, with the other Ionian Islands, to Greece.

Both the central plains and eastern hills are cultivated. The chief exports are currants. olive oil, wines, and fresh fruit. Destructive earthquakes were experienced in 1514, 1893, and 1953. The island's buildings were extensively rebuilt after the last earthquake disaster. Pop. (1981) nomós and island, 30,014; city,

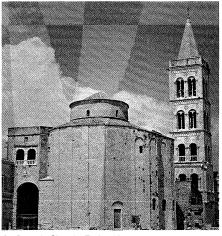

Zadar, Italian zara, Latin Jadera, picturesque historical town in Croatia, Yugoslavia, the former capital of Dalmatia. It is located on the end of a low-lying peninsula that is separated by the Zadar Channel from the islands of Ugljan and Pašman. The inlet between the peninsula and the mainland creates a natural deepwater harbour.

The old town on the peninsula dates from the 9th century BC, when it was a Liburnian settlement called Jadera. The town became Roman in the 1st century BC. Spared in the Avar and Slavic invasions of Dalmatia (c. 5th-6th century AD), it remained a thriving commercial, cultural, and artistic centre of Byzantine Dalmatia. Between 1045 and 1358 the town was intermittently at war with Venice, and in 1409 it was sold to Venice. From this point the town was oppressed by the Venetians from within and the Turks from without. It withstood a Turkish attack in 1571, and in the succeeding period Zadar became the most heavily fortified town on the Adriatic until its fortifications were partly demolished in the late 19th century.

It was an Austrian possession from 1797 to 1920, except for a brief French interregnum between 1808 and 1813. By the Treaty of Rapallo (1920) it became Italian, thereby losing further ground to Split as the chief town of Dalmatia. During World War II, Allied bombing destroyed 75 percent of Zadar's buildings and damaged the port facilities. Liberated in 1944, it became part of Yugoslavia.

Most new construction has taken place on the mainland. Zadar's industries now include distilling of liqueurs (notably maraska [cherry]), canning and processing of fish, and the production of rope, cotton, and synthetic textiles, cigarettes, plastics, leather, and household appliances. The Zadar Riviera is a developing resort centre for water sports. The town has excellent road, rail, air, and ferry connections with the rest of Yugoslavia and with Italy.

Old Zadar is especially noted for the many fine churches that survived the air raids during World War II, as did the Roman forum and several of the old, narrow cobbled streets. St. Donat's remarkable circular church dates

St. Donat's Church, Zadar, Yugos.

Art Resource—EB Inc.

from the 9th century; St. Mary's Church (1091) has one of the most important church treasuries in Yugoslavia; and the Romanesque church of St. Krševan was consecrated in 1175. There are also the 13th-century cathedral of St. Stošija (Anastasia), the largest and finest Romanesque church in Dalmatia, and the Franciscan church and monastery (1282). Zadar has an archaeological museum, the state archives, a theatre, and a small branch of the University of Zagreb. Pop. (1981 prelim.) mun., 116,174.

zaddik (Judaism) see tzaddiq.

Zadkine, Ossip (b. July 14, 1890, Smolensk, Russia—d. Nov. 25, 1967, Paris), Russianborn French sculptor and a member of the School of Paris group. Marked by highly original liberties with figure and form but never losing recognizability, his work is epitomized in the Rotterdam monument "The Destroyed City" (1951).

Zadkine, photograph by Yousuf Karsh, 1965 © Karsh—Woodfin Camp and Associates

As a boy, Zadkine, son of a professor of Greek and Latin, much preferred clay modeling to his studies. Sent to England by his father to learn "English and good manners," he eventually worked for an ornament maker there. After living alternately in London and Smolensk, he moved to Paris, where he studied at the École des Beaux-Arts and in 1911 had a show of his sculpture.

A Cubist at the outset of his career but influenced also by classical Greek sculpture, Zadkine in 1920 began to develop the individuality manifest in his graceful "Musicians" (1924). In 1939 he executed from elm wood his haunting, seemingly writhing "Christ," whose arms suggest the limbs of a bare tree.

During World War II Zadkine, because of his Jewish ancestry, fled to unoccupied France and then to the United States, where he taught at the Art Students League in New York City. After the war he returned to France and visited bombed Rotterdam, the ruinous state of which made a deep impression on him. In the resultant "Destroyed City" the arms of a larger-than-life-size man are outstretched in horror.

Zadkine's technique, as in the complex "Birth of Forms" (1947), includes the use of convexities, concavities, lines, and parallel planes to achieve a freshness of rhythm and multidimensional unity. He received the grand prize for sculpture at the 1950 Venice Biennale, the 1960 grand prix of the city of Paris, and (in the 1960s) commissions for statues in Jerusalem, Amsterdam, and other cities.

Zadokite Fragments: see Damascus Document.

Zaehner, R(obert) C(harles) (b. April 8, 1913—d. Nov. 24, 1974, Oxford), British historian of religions and educator, who investigated the evolution of ethical systems and forms of mysticism, particularly in Eastern religions.

The son of Swiss parents who had immigrated to England, Zaehner studied Oriental languages at the University of Oxford, specializing in Persian, Armenian, and Avestan. He became a Roman Catholic in 1946. During and immediately after World War II, he served in the British Army as a press attaché in Tehrān. After resuming his academic career, he succeeded Sir Sarvepalli Radakrishnan as Spalding Professor of Eastern Religions and Ethics in the University of Oxford (1952), enduring criticism at the time because the chair was considered reserved for Asians.

With his magisterial Zurvan; a Zoroastrian Dilemma (1955), he began publishing the results of a lifelong study in the history of

religions, including Mysticism Sacred and Profane (1957), Hindu and Muslim Mysticism (1960), Hinduism (1962), and a translation of Hindu Scriptures (1966). Other works on Zoroastriansm include The Teachings of the Magi (1956) and The Dawn and Twilight of Zoroastrianism (1961).

Among his later works were Evolution in Religion (1971); Dialectical Christianity and Christian Materialism (1971); and Drugs, Mysticism, and Make Believe (1972). His last book, Our Savage God (1974), a philosophical and somewhat provocative view of the ills of modern society, aroused controversy among its critics.

Zaenredam, Pieter Jansz(oon) (Dutch painter): see Saenredam, Pieter Jansz(oon).

Zafār, biblical SEPHAR, classical SAPPHAR, or SAPHAR, ancient Arabian site located southwest of Yarīm in southern Yemen. It was the capital of the Himyarites, a tribe that ruled much of southern Arabia from c. 115 Bc to C. AD 525. Up until the Persian conquest (c. AD 575), Zafār was one of the most important and celebrated towns in southern Arabia—a fact attested to not only by Arab geographers and historians but also by Greek and Roman authors. After the extinction of the Himyar kingdom and the rise of Islām, Zafār gradually fell into decay.

Zafarin Islands (Morocco): see Chafarinas Islands

Zafrulla Khan, Sir Muhammad, original name CHAUDHRI MUHAMMAD ZAFRULLA (b. Feb. 6, 1893, Siālkot, India—d. Sept. 1, 1985, Lahore, Pak.), Pakistani politician, diplomat, and international jurist, known particularly for his representation of Pakistan at the United Nations (UN).

The son of the leading attorney of his native city, Zafrulla Khan studied at Government College in Lahore and received his LL.B. from King's College, London University, in 1914. He practiced law in Sialkot and Lahore, became a member of the Punjab Legislative Council in 1926, and was a delegate in 1930, 1931, and 1932 to the Round Table Conferences on Indian reforms in London. In 1931-32 he was president of the All-India Muslim League, and he sat on the British viceroy's executive council as its Muslim member from 1935 to 1941. He led the Indian delegation to the League of Nations in 1939, and from 1941 to 1947 he served as a judge of the Federal Court of India.

Prior to the partition of India in 1947, Zafrulla Khan presented the Muslim League's view of the future boundaries of Pakistan to Sir Cyril Radcliffe, the man delegated to decide the boundaries between India and Pakistan. Upon the independence of Pakistan, Zafrulla Khan became the new nation's minister of foreign affairs and served concurrently as leader of Pakistan's delegation to the UN (1947-54). From 1954 to 1961 he served as a member of the International Court of Justice at The Hague. He again represented Pakistan at the UN in 1961-64 and served as president of the UN General Assembly in 1962-63. Returning to the International Court of Justice in 1964, he served as the court's president from 1970 to 1973. He was knighted in 1935 and was the author of Islam: Its Meaning for Modern Man (1962), and a translation of the Qur'ān (1970).

Zagazig (Egypt): see Zaqāzīq, az-.

Zaghlūl, Sa'd, in full sa'd zaghlūl pasha IBN IBRĀHĪM (b. July 1857, Ibyānah, Egypt—d. Aug. 23, 1927, Cairo), Egyptian statesman and patriot, leader of the Wafd party and of the nationalist movement of 1918–19, which led Britain to give Egypt nominal independent.

dence in 1922. He was briefly prime minister in 1924.

Zaghlūl was from a well-to-do peasant family in Ibyānah in the Nile Delta. He was educated at the Muslim university of al-Azhar in Cairo and at the Egyptian School of Law, then practiced as an advocate and also dabbled in journalism. Becoming a judge in the Court of Appeal in 1892, he married, in 1895, a daughter of Muṣṭafā Pasha Fahmī, the prime minister of Egypt. In 1906 he was made head of the newly created Ministry of Education and, soon after, took a leading part in the formation of the Hizb al-Ummah (People's Party), which, at a time when Egyptian nationalism was beginning to assert itself against the British occupation, was referred to appre-

Zaghlūl AP/Wide World

ciatively by Evelyn Baring, 1st earl of Cromer, the British consul general and virtual ruler of the country, as advocating a policy of "cooperation with Europeans in the introduction of Western civilization into the country."

He remained as minister of education until 1910, when he became minister of justice, a post from which he resigned in 1912 after a disagreement with the khedive 'Abbās Hilmī II. During his six years as a minister he had served in a series of governments that had collaborated with the British occupiers and the members of which were thus regarded almost as traitors by the extreme nationalists. In 1912, however, Zaghlūl's attitude changed. Elected to the Legislative Assembly, a unicameral parliament with limited powers, in 1913, he became its vice president and in the course of one year rehabilitated himself in the eyes of the nationalists by his criticisms of the government.

With the outbreak of World War I in 1914, Egypt became a British protectorate. The khedive was deposed, martial law declared, and the Legislative Assembly dissolved. For the next four years overt political activity in Egypt was at a standstill. Ordinary Egyptians suffered from the effects of inflation, requisitioning, and conscription, and the intelligentsia and the professional classes were frustrated by restrictions on personal freedom and by the evident British intention to convert a temporary protectorate into a permanent colony. By the time the armistice was signed in November 1918, the country was seething with discontent.

Zaghlūl and several former members of the defunct Legislative Assembly, free of the taint of collaboration, had spent the war years forming activist groups throughout Egypt for the ultimate purpose of political agitation and action. On Nov. 13, 1918, two days after the armistice, a delegation (Wafd) of three prominent former members of the Legislative Assembly, led by Zaghlūl, called on Sir

Reginald Wingate, the high commissioner (as the British representative in Egypt was now called). They informed him that they regarded themselves and not the government as the true representatives of the Egyptian people and demanded that the protectorate be abolished and replaced by a treaty of alliance. They also demanded that they should be allowed to proceed to London to negotiate such a treaty directly with the British government.

When these demands were refused, widespread disorder broke out, organized through the clandestine bodies set up by Zaghlūl and his associates. In March 1919 Zaghlūl and three of his associates were arrested and deported to Malta, an act that increased the disorder. The British government dismissed Wingate and replaced him with General Allenby, the wartime conqueror of Palestine. Allenby, faced with the resignation of the government and the prospect of a continuing military campaign to put down a countrywide rebellion, released Zaghlūl and his associates in an attempt to appease Egyptian opinion. Zaghlūl immediately proceeded to Paris, where the Peace Conference was in session, to present Egypt's case to the Allies. He met with very little success there, but in Egypt he had become a national hero and the master of the situation.

Zaghlūl's release put a temporary end to public disorder in Egypt, and in the fall of 1919, on Allenby's recommendation, a mission headed by Lord Milner, the British colonial secretary, proceeded to Egypt to make recommendations for the future relationship between the two countries. Zaghlūl, determined that nobody but himself should negotiate with the British, saw to it that the mission was boycotted by all shades of Egyptian opinion. In the summer of 1920 he himself had a series of meetings with Milner in London, at which Milner agreed—unofficially—to the essence of what Zaghlūl himself had demanded of Wingate in November 1918—the substitution of a treaty of alliance for the protectorate. But Zaghlūl had come to fear that any agreement he made with the British would undermine his position in Egypt, which was based on opposition to the British. So he refused to endorse any agreement and returned to Egypt, where he was greeted with wild enthusiasm. The Milner Report, recommending the end of the protectorate and the negotiation of a treaty, was published in February 1921. A government formed by 'Adlī Pasha Yakan, one of Zaghlūl's rivals, spent most of the year trying to negotiate such a treaty but was inhibited by Zaghlūl's virtual veto power. When Adlī consequently resigned, Zaghlūl brought his supporters onto the streets to prevent the formation of any alternative government. Allenby then had Zaghlūl arrested and deported to the Seychelles and prevailed on a reluctant British government to promulgate a unilateral declaration that incorporated the Milner recommendations and conferred a limited measure of independence on Egypt (February 1922)

By this time, a number of Egyptian politicians, including some of Zaghlūl's previous supporters, alarmed at the social implications of the agitation that Zaghlūl had released, were prepared to cooperate with the British under the new dispensation. A new party, the Liberal Constitutionalists, was formed and a constitution promulgated. But the forces unleashed by Zaghlūl could not so easily be suppressed, either by his opponents or even by Zaghlūl himself. Zaghlūl was released to take part in the first elections under the new constitution. His party, the Wafd, swept the board, and in January 1924 he became prime minister. In office, he showed himself quite unable to control the violent agitation he had set in motion. In November 1924, after a vear in which numerous British officials and Egyptian "collaborationists" had been mur-

dered by extremists, the British commander in chief of the Egyptian Army was assassinated. After the receipt of what amounted to an ultimatum from Allenby, Zaghlūl resigned. The shock resulting from the violent British reaction rallied the moderates and discouraged the extremists-though, in a general election held in May 1926, the Wafd still held the allegiance of the country. But Zaghlūl, an old man of nearly 70, was no longer anxious for office. Under pressure from Lord Lloyd, the new British high commissioner, he agreed to the formation of a coalition government and contented himself with the presidency of the Chamber. In this capacity he succeeded, by and large, in controlling the actions of his more extreme followers until his death.

Zaghlūl was not a constructive statesman. Rather, he was the catalyst whose injection into Egyptian political life set in motion that long course of popular protest against foreign occupation, indigenous despotism, and social feudalism whose end product was the revolution of 1952. His influence resided both in his eloquence and in the fact that—unlike most of his generation in positions of power, which were mainly occupied by members of the old, Turkish-descended aristocracy—he was a purebred Egyptian of peasant stock, a man of the people who became the incarnation of their virtues and their limitations.

(Io.Ma.)

BIBLIOGRAPHY. Abbas Mahmud al-Aqqad, Sa'd Zaghlūl (1936), a full-length biography (in Arabic and not available in translation), is uncritically favourable to the subject. In English see E. Kedourie, "Sa'ad Zaghlul and the British," in A. Hourani (ed.), Middle Eastern Affairs: Number Two, pp. 139–160 (1961), written by a hostile critic with a wide knowledge of Arabic sources; and the reasonably impartial obituary notice in The (London) Times (Aug. 24, 1927).

Zaghwān, also spelled ZAGHOUAN, town, northeastern Tunisia. It lies on the fertile, northern slope of Mount Zaghwan at an elevation of 4,247 feet (1,295 m). It is built on the ancient Roman site of Zigus. Parts of a Roman aqueduct and canal network built in the 2nd century BC under Hadrian are still used to bring water from Zaghwan to Tunis. The importance of Zaghwan water is reflected in the location there of a Roman temple of water, as well as a local proverb: "He who drinks from Zaghwan water will return to Tunisia.' Other points of interest are the mausoleum of the marabout (holy man) Sīdī 'Alī Azūz that has green tiles on its domes and its interior. Zaghwān is about 50 miles (80 km) south of Tunis. The town was the scene of bitter fighting during World War II when the Germans retreated toward Tūnis. The Dorsale Mountains lie to the west of Zaghwān. The fertile soil and ample water sources of the area in which the town is situated have made the region an agricultural greenbelt. The chief crops are grapes, olives, and vegetables. Local industries in the region include food processing and textile manufacturing. Pop. (1975) town,

Zagorsk, formerly (until 1930) sergiyev, city, Moscow oblast (administrative region), western Russian Soviet Federated Socialist Republic, northeast of Moscow city. The city developed around the fortified walls of the Trinity-St. Sergius monastery, founded there in 1337-40 by St. Sergius of Radonezh. A theological seminary founded in 1742 remains the principal seminary of the Soviet Union. The monastic buildings, much visited by tourists, include the Trinity Cathedral (1422-23), containing the tomb of St. Sergius and icons attributed by some scholars to the medieval artist Andrey Rublyov; the Church of the Holy Spirit (1476-77), with its later tower; the Cathedral of the Assumption (1559-85), containing frescoes of 1684; the late 17thcentury refectory; and the 18th-century bell

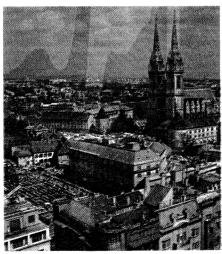

Cathedral of the Assumption in Zagorsk, Russian S.F.S.R.

tower. There is a museum of toys in the monastery. Modern Zagorsk has engineering and diverse light industries. The city still holds an annual international fair. Pop. (1983 est.) 111.000.

Zagreb, capital of the historical state of Croatia and second city of modern Yugoslavia, situated on the slopes of Medvednica Mountain (Zagrebačka Gora) and the Sava River floodplain. The city has many open squares

The Cathedral of St. Stephen (top right), Zagreb, Yugos.

W. Lehmann-Bruce Coleman Inc

and parks. As the cultural centre of Croatia, Zagreb is the seat of the Yugoslav Academy of Sciences and Arts and of the University of Zagreb (1669). Several art galleries have both old and modern collections, and there are various museums and academies of art, theatre, and music. Many buildings survive from the Middle Ages.

The old town consists of two medieval settlements on the hill: Grič, the civil settlement, which was renamed Gradec (Fortress) when it was encircled by walls built to defend against the Turks in the 13th century; and Kaptol, the ecclesiastical settlement, which was fortified in the 16th century. These continued as

rival entities until the 19th century, when a spate of new building joined them together and expanded south onto the Sava floodplain, with a rectilinear new town of squares and public buildings. Rapid growth occurred from 1860 to 1914. Development in the 20th century proceeded eastward and westward, and after 1945 new residential construction went up on the right (south) bank of the Sava River. North of Medvednica Mountain is the Zagorje region of woodlands, vineyards, picturesque villages, and ancient châteaus.

The site of modern Zagreb was first mentioned in 1093, when a Roman Catholic bishopric was established there. After the Mongol invasion of 1241-42, Gradec became a royal free town and was fortified; several of the towers have survived. As a political centre, Zagreb played an important role in the history of Croatia, which struggled first against Turkey and later against attempted Germanization by Austria. At the time of the Croatian national revival in the 19th century, it was the centre of a pan-Yugoslav movement and of a Croatian independence movement.

In October 1918 the Croatian Diet, meeting in Zagreb, severed all links with Austria-Hungary, proclaiming Croatia, Slavonia, and Dalmatia an independent state. In December the new Croatia entered into a state union with Serbia, Slovenia, and Montenegro. Between World Wars I and II serious differences continued between aspirants for Croatian national autonomy and Serbian tendencies toward centralization, and Zagreb was a centre of urban membership in the Croatian Peasant Party. In April 1941, during World War II, Zagreb became the capital of a puppet Croatian state under rule of the Axis powers. The city was freed from Axis rule by Yugoslav Partisans under Marshal Tito in May 1945, and the Croatian state collapsed shortly after the surrender of Germany.

The city is now an important junction of roads and rail lines from west and central Europe to the Adriatic and the Balkans; Pleso airport has services to most of Europe. Zagreb is the biggest industrial and manufacturing centre in Yugoslavia, manufacturing heavy machinery, rolling stock, electrical and metal consumer products, cement, textiles, footwear, chemicals, pharmaceuticals, paper and newsprint, and foods. The extensive chemical industry is based on exploitation of local reserves of petroleum and natural gas. Zagreb is host to an annual International Trade Fair. Pop. (1981 prelim.) metropolitan area, 768, 700.

Zagreus, according to Orphic myth, the son of Zeus (as a snake) and his daughter Persephone. Hera in jealousy urged the Titans to attack him while she beguiled him with toys. The Titans tore Zagreus to pieces and consumed him apart from his heart. Athena brought the heart to Zeus, who swallowed it and destroyed the Titans with his thunderbolts. From the Titans' remains mankind arose, partly wicked and partly divine, since the Titans had eaten Zagreus. Zeus then begot Zagreus on Semele and the child was reborn. Zagreus was identified with Dionysus and first mentioned by Aeschylus.

Zagros Mountains, mountain range in southwestern Iran, extending northwest—southeast from the Sīrvān (Diyala) River to Shīrāz, about 550 mi (900 km) long and over 150 mi wide. Peaks rise above 12,000 ft (3,600 m) and have permanent snow cover. Passes are best used for reaching the fertile intermontane plains, the vines of which grow at elevations of over 5,000 ft. Rivers are strong and perennial, flowing through enclosed plains or

The Zagros Mountains, Iran

ravines. Rainfall is about 40 in. (1,000 mm) annually.

Zague DYNASTY, also spelled ZAGWE, line of 12th- and 13th-century Ethiopian kings who combined a nomadic military life with an impassioned desire to build monuments to their religion. Their tenuous pretensions to succession, based on a legendary marriage to a daughter of one of the last Aksumite kings, the line they deposed, was subsequently confirmed by the church; in return for its support, liberal royal endowments were granted.

The House of Zague originated in the district of Bugna, and the kings moved Bugna's administrative capital to Roha, a high and almost inaccessible region of the Lasta Mountains. Though the Zague kings ruled an area that extended from Tigre to Shewa (Shoa) and from Begemdir to Angot, any pretensions that they may have had to control the hilly country east of the Shewa Plateau lapsed in the face of the region's increasing occupation by such Muslim states as Ifat and Hadya.

Of the Zague emperors, Lalibela is the best known. He ruled at the turn of the 13th century and is best known as the builder of the monolithic rock-hewn churches at the Zague capital, later named Lalibela after him. Zague rule was destined to be short-lived, for at the end of the 13th century Yekuno Amlak, a prince of the Amhara, incited so successful a rebellion in Shewa that the Zague king was driven out and murdered. Though a new Zague king succeeded in stirring up a counter-rebellion among the people of the Shimezana region, he, too, was defeated.

Later legends, modifying the circumstances of the Zagues' overthrow, attribute much importance to Yasus Moa, a monk from Debre Damo who founded a new community near Debre Egziabeher (in the region of Lake Haik) and who, the legends maintain, greatly influenced Yekuno Amlak in his bid for the throne. The usurpation of the throne and the murder of the king are obscured still further by later legends, which tell how another monk, Tekle Haimanot, persuaded the King of Lasta to abdicate in Yekuno Amlak's favour.

Zaharias, Babe Didrikson, byname of MILDRED ELLA ZAHARIAS, *née* DIDRIKSON (b. June 26, 1914, Port Arthur, Texas, U.S.—d. Sept. 27, 1956, Galveston), U.S. sportswoman, one of the greatest woman athletes, a remarkable performer in basketball and in track and field and afterward the leading U.S. woman golfer.

In 1930 and 1931 she was a member of the women's All-America basketball team. From 1930 through 1932 she won eight events and tied for a ninth in national championship competition in track and field. In the 1932 Olympic Games in Los Angeles she won the 80-metre hurdles and the javelin throw and was deprived of a third gold medal only because she had used the then-unorthodox Western roll in winning the high jump. She also excelled in baseball and softball, swimming, figure skating, billiards, and even football.

figure skating, billiards, and even football.
Didrikson began to play golf casually in 1932, but from 1934 she played that game exclusively. Restored to amateur status after some years as a professional, she won the U.S. Women's Amateur tournament in 1946. The next year she won 17 straight golf champi-

Babe Didrikson Zaharias
UPI--EB Inc.

onships, including the British Ladies' Amateur, of which she was the first U.S. holder. As a professional again from 1948, she won the U.S. Women's Open in that year, in 1950, and, after what appeared to be a successful operation for cancer, in 1954. From 1948 through 1951 she was the leading money winner among woman golfers.

In 1938 Didrikson married George Zaharias, a professional wrestler. Her autobiography, *This Life I've Led*, appeared in 1955.

Zaharoff, Sir Basil, original name BASILEIOS ZACHARIAS (b. Oct. 6, 1849, Muğla, Tur.—d. Nov. 27, 1936, Monte Carlo), international armaments dealer and financier. Reputedly one of the richest men in the world, he was described as a "merchant of death" and the "mystery man of Europe."

He was the son of poor Greek parents who had Russified the family name during years spent in exile in Russia. As a young man he worked for his uncle in the cloth trade in Istanbul. In 1866 he was sent to England for further schooling, and in 1870 he became the representative in London for his uncle's firm. Two years later his uncle accused him of embezzlement, but he was acquitted of the

Zaharoff left England for the eastern Mediterranean area under an assumed name. For a time he lived in Athens, where he met Stefanos Skoulodis, a financier and diplomat. On the recommendation of Skoulodis he was named agent of Thorsten Nordenfelt, the

Zaharoff BBC Hulton Picture Library

Swedish gun designer, for the Balkans area. In 1888 Hiram Stevens Maxim, inventor of the machine gun, joined Nordenfelt in business, and Zaharoff became the firm's representative for all of eastern Europe and Russia. When the Vickers Company of England purchased Maxim-Nordenfelt in 1895, Zaharoff's area of operations was extended even farther. Zaharoff became a millionaire from arms sales, and in 1913 he took out French citizenship.

During World War I Zaharoff became an Allied agent working on the highest levels. Following the war, France recognized his services by making him a grand officer of the Legion of Honour, and Britain honoured him with a knight grand cross of the Order of the Bath.

Zaharoff's first wife, deserted, died in London in the 1890s. Meanwhile, he carried on a liaison for a number of years with the Duchess de Villafranca, whose husband, Francisco de Borbón, Duke de Marchena, a member of the Spanish royal house, was mentally deranged. When the duke died in 1923, Zaharoff married the widow. Following her death in 1926, he retired to Monte Carlo, where he controlled the casino (but never gambled).

Zāhedān, city, southeastern Iran, at an elevation of 4,435 feet (1,352 m). The population comprises Shī'ite Muslim Persians and Sunnite Muslim Baluchs. It is one of the more economically backward cities in Iran; local industry produces bricks, milled rice, livestock feed, processed foods, mats and baskets, embroidered articles, and ceramics. Roads link it with Zābol, Īrānshahr, Chāh Bahār, and Sarārān. It is the terminus of the Trans-Iranian Railway near the Pakistani border and has an airfield. There is a ruined citadel, in the centre of the city, and the Friday Mosque (Masjide Jom'eh). Pop. (1985 est.) 220,500.

Zahir Shah, Mohammad (b. Oct. 15, 1914, Kābul, Afg.), king of Afghanistan from 1933 to 1973, providing an era of stable government to his country.

The sons of Mohammed Nāder Shāh, Zahir Shah and his brothers reasserted central government control during a period of anarchy and banditry in the late 1920s. Zahir Shah came to the throne at the age of 19, after the assassination of his father in November 1933, having previously served as a Cabinet minister. For a number of years Zahir Shah remained in the background while his relatives ran the government, but he asserted his power through the constitution of 1964, which established a constitutional monarchy and prohibited royal relatives from holding public office.

Zahir Shah undertook a number of economic-development projects, including irrigation and highway construction, backed by foreign aid, largely from the United States and the Soviet Union. He was also able to maintain Afghanistan's neutral position in international politics. His reforms seemed to have little effect outside the Kābul area, however. In the early 1970s the country suffered drought and famine. Pashto tribes along the Pakistan bor-

der continued to press for autonomy, and the political structure in the capital was unable to deal with the country's economic problems. In a bloodless coup on July 17, 1973, Zahir Shah was deposed. The leader of the coup, General Mohammad Daud Khan (the king's brother-in-law), proclaimed Afghanistan a republic with himself as its president. Zahir Shah formally abdicated on Aug. 24, 1973.

Zahīr-ud-Dīn Muḥammad (emperor of India): *see* Bābur.

Zāhirīyah (Arabic: "Literalists"), followers of an Islāmic legal school that insisted on strict adherence to the literal text (zāhir) of the Qur'ān and Ḥadīth (sayings and actions of the Prophet Muḥammad) as the only source of Muslim law. Founded in Iraq by Dāwūd Khalaf in the 9th century, it spread to Iran, North Africa, and Muslim Spain, where the philosopher Ibn Ḥazm was its chief exponent. Although it was strongly attacked by orthodox theologians, the Zāhirī school nevertheless survived for about 500 years in various forms and seems finally to have merged with the Ḥanbalī school.

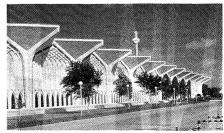

Zaḥlah, also spelled Zahlé, town, central Lebanon. It lies on the eastern slopes of the Lebanon Mountains, at an elevation of 3,150 feet (960 m) above sea level. An agricultural market centre for the broad al-Biqā' Valley, it is also a popular summer resort on the Beirut-Damascus railroad. Zaḥlah is noted for its fruits, vineyards, and arrack (a type of alcoholic beverage). Pop. (1985 est.) 200,000.

Zahn, Ernst (b. Jan. 24, 1867, Zürich—d. Feb. 12, 1952, Zürich), Swiss writer, one of the contributors to the Heimatkunst ("homeland") movement—a literature striving for the reproduction of the life and atmosphere of the provinces. His realistic prose, though conventional, shows insight into the daily life of the Alpine people.

Zahn was at first president of the Diet of the canton of Uri and then manager of a railway restaurant at Göschenen. After 1917 literary success enabled him to devote his life solely to writing, and he moved to Meggen, near Luzern. His more popular works include collections of short stories, Bergvolk (1896; "Mountain Folk") and Helden des Alltags (1906; "Weekday Heroes"), and the novels Albin Indergand (1901), Herrgottsfäden (1901; Golden Threads), Frau Sixta (1926), and Die grosse Lehre (1943; "The Large Lesson"). Zahn's Was das Leben zerbricht (1912; "What Life Breaks") is about the middle-class society of Zürich.

Zahrā', az- (c. 616–633): see Fāṭimah.

Zahrān, az-, also spelled DHAHRAN, town, northeastern Saudi Arabia, in the Dammām oil field, just south of the Persian Gulf port of ad-Dammām. Near the scene of the original discovery of oil in Saudi Arabia in 1938, it is now a modern community that serves as the administrative headquarters of the Arabian American Oil Company (Aramco). A major United States Air Force Base was built in 1945 and continues in use. The town has petroleum-extraction and shipping facilities, a stabilizing plant, a modern international air-

The airport buildings, az-Zahrān, Saudi Arabia J. Allan Cash—EB Inc.

port, and rail connections to Riyadh and ad-Dammām. The government-sponsored College of Petroleum and Minerals was founded there in 1963. Pop. (latest est.) 12,500.

zaibatsu (Japanese: "wealthy clique"), any of the large capitalist enterprises of Japan before World War II, similar to cartels or trusts but usually organized around a single family. One zaibatsu might operate companies in nearly all important areas of economic activity. The Mitsui combine, for example, owned or had large investments in companies engaged in banking, foreign trade, mining, insurance, textiles, sugar, food processing, machinery, and many other fields as well. All zaibatsu owned banks, which they used as a means for mobilizing capital.

The four main zaibatsu were Mitsui, Mitsubishi, Sumitomo, and Yasuda, but there were many smaller concerns as well. All of them developed after the Meiji Restoration (1868), at which time the government began encouraging economic growth. The zaibatsu had grown large before 1900, but their most rapid growth occurred in the 20th century, particularly during World War I, when Japan's limited engagement in the war gave it great industrial and commercial advantages.

In 1946, after the end of World War II, the Allied occupation authorities ordered the *zaibatsu* dissolved. Stock owned by the parent companies was put up for sale, and individual companies of the *zaibatsu* empires were freed from the control of parent companies. The management of the individual companies, however, was not radically changed, and to some extent the coordination and control of the previous organization remained.

After the signing of the peace treaty in 1951, many companies began associating into what became known as enterprise groups (kigyō shūdan). Those created with companies that were formerly part of the big zaibatsuthe Mitsubishi, Mitsui, and Sumitomo groups (qq.v.)—were more loosely organized around leading companies or major banks; they differed most significantly from the old, centrally controlled zaibatsu in the informal manner that characterized each group's policy coordination and in the limited degree of financial interdependency between member companies. The cooperative nature of these groups became a major factor in Japan's tremendous postwar economic growth, because, in the pooling of resources, the investments made by these groups in developing industries were large enough to make these industries competitive worldwide.

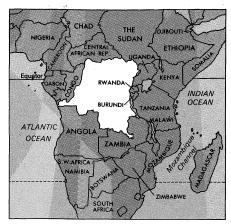

Zainal 'Abidin bin Ahmad: see Za'ba.

Zaire, officially REPUBLIC OF ZAIRE, French RÉPUBLIQUE DU ZAÏRE, formerly BELGIAN CONGO, OF (1961-71) DEMOCRATIC REPUB-LIC OF THE CONGO, third largest country in Africa, straddling the Equator in west-central Africa and covering an area of 905,365 square miles (2,344,885 square km). The capital is Kinshasa. Zaire is bounded on the west by the Congo; by Angola's coastal enclave of Cabinda; and by its own 25-mile- (40-kilometre-) long strip of the Atlantic coast. On the south it is bordered by Angola; on the southeast by Zambia; on the east by Tanzania, Burundi, Rwanda, and Uganda; and on the north by The Sudan and the Central African Republic. The population in 1988 was estimated to be 32,559,000.

A brief treatment of Zaire follows. For full treatment, *see* MACROPAEDIA: Central Africa. For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. Zaire occupies the heart of the Congo River basin, which comprises about three-fifths of the country's total area. The cuvette (central basin), a major depression in the northwestern quarter of the country.

is formed as the Congo River turns from its northerly course to arch west above the Equator, then turns southwestward toward the Atlantic Ocean. High plateaus rise in every direction from the central basin. In the north-

Zaire

east and east they rise to elevations between 3,000 and 4,000 feet (900 and 1,200 m) before merging with the Mitumba Mountains at the western rim of the Rift Valley and rising above 16,000 feet (5,000 m) in the Ruwenzori Massif astride the Ugandan border in the northeast. The plateaus to the south and southeast culminate in the mountain peaks of Shaba, rising to 5,250 feet (1,600 m) in the extreme southeast between Zambia and Tanzania. At Zaire's narrow strip of Atlantic coast the Congo River empties into the sea.

The Congo is one of the world's major rivers. With a length, including its headstream the Lualaba, of about 4,000 miles (6,400 km), it ranks with the Amazon, the Nile, and the Mississippi as one of the world's longest rivers. Its drainage area of about 1,335,000 square miles (3,457,000 square km) is second to the Amazon, and its discharge rate into the south Atlantic is also second highest after the Amazon. The Congo descends across a succession of plateau escarpments, limiting its navigational possibilities but enhancing the country's hydroelectric potential. Lake Tanganyika, lying in the western trough of the Great Rift Valley along Zaire's eastern boundary with Burundi and Tanzania, is one of the world's largest (about 12,700 square miles [32,900 square km]) and deepest (about 4,700 feet [1,400 m]) lakes.

Temperatures throughout Zaire reflect the country's humid tropical climate. Daytime highs average between 79° and 91° F (26° and 33° C) throughout the year, and nighttime lows rarely fall below 68° F (20° C) except in the far south, where they may drop slightly more during the winter months. The annual average rainfall in the central basin exceeds 80 inches (2,000 mm); the surrounding area receives about 60 inches (1,500 mm). Along the Equator there is essentially no dry season; but in the north it is dry in winter (December through February) and in the south it is dry in summer.

Zaire's central basin is characterized by one of the world's most extensive rain forests, which merges generally into the savannas to the east and south in the higher plateau areas. There is a diversity of animal life in Zaire: gorillas (considered to be among the Earth's endangered species) are most abundant in the eastern highlands; elephants and baboons are found on the wooded savanna; and okapi, giraffes, lions, and cheetahs in the grasslands. Less than 3 percent of Zaire's land area is considered arable.

Zaire's reserves of high-grade copper ore and cobalt are among the world's most important. There are also substantial reserves of low-grade

industrial diamonds, zinc, cadmium, and silver. Offshore petroleum reserves are exploited mainly for export rather than domestic needs.

The people. Bantu-speakers form a majority of the country's population and occupy about two-thirds of its area. They include the Mongo, Kongo, Luba, Lunda, Kwango, and Kasai peoples. Among non-Bantu speakers are Sudanese groups of the north (including the Azande, Mangbetu, Banda, and Abarambo) and the Nilotic peoples of the northeast. The Pygmies, the earliest settlers, who came perhaps in late Paleolithic times, inhabit forest and river sites about the country. The linguistic categories of Bantu, Nilo-Saharan, and Pygmy together comprise more than 200 languages and dialects spoken in Zaire. Swahili, Tshiluba (Kiluba), Lingala, and Kikongo are the four national languages. They are used in local trading and radio broadcasting. French is the official language and the language of instruction, business, administration, and international communications. Lingala is the official language of the military and is widely spoken in Kinshasa. In religious affiliation, Roman Catholics predominate, followed by Protestants and members of a local Christian sect, the Church of Simon Kimbangu. There are also about 400,000 Muslims. The remainder of the African population continues to follow traditional beliefs.

Demographic trends in Zaire are similar to those in other developing countries. High birth and death rates are characteristic, although since the 1950s there has been a considerable decline in the relatively high rate of infant mortality. The country's natural rate of population increase is also high by world standards but is about average for sub-Saharan Africa.

Economy. Zaire has a mixed, developing economy that is largely based on mining and agriculture. Inflation has risen rapidly, and the economic growth rate, partly because of a drop in the price of copper, is in decline. The country's gross national product (GNP) per capita, which has had a negative real growth rate since the early 1970s, is among the lowest in the world.

Agricultural activity is largely subsistenceoriented and accounts for about one-seventh of the GNP; it employs nearly three-fourths of the nation's work force, however, many of them utilizing primitive, traditional farming methods. Export crops produced on plantations include palm products, coffee, tea, cocoa, rubber, and cotton. Of its basic foodstuffs, the country produces most of its cassava but only a small portion of its corn (maize) and rice; bananas are also grown.

Forests cover more than three-fourths of the total land area but are mostly untapped as an economic resource. About three-fourths of the lumber produced is used domestically.

The government invests heavily in mining, which supplies about two-thirds of the country's export earnings and is the main source of foreign currency. Most important are the Shaba copper mines in the south, which rely heavily on imported capital and foreign personnel. Zaire is also among the world's top producers of cobalt and industrial diamonds. Other minerals produced include gold, tin, cadmium, and, more recently, petroleum.

Although industry accounts for only a small fraction of the GNP, with construction it employs about one-tenth of the paid work force. Manufacturing output is almost wholly for the domestic market and is composed mainly of consumer goods such as beverages, textiles, foodstuffs, leather goods, tobacco, and paint.

Zaire's hydroelectric potential amounts to about one-eighth of the world's total capacity and half of Africa's capacity. Almost the entire annual production of electricity in Zaire is from hydroelectric plants; this is supplemented

by thermal power production in towns and cities that cannot be served by hydroelectric stations

Dependence on mineral exports at the expense of domestic agricultural products has left Zaire vulnerable to international price fluctuations. Its principal trading partners include Belgium, France, Germany, the United States, Canada, and Japan. Zaire has had a chronic negative balance of payments, and its steep foreign indebtedness has been exacerbated by frequent and massive devaluations of the nation's currency. Unsound investment policies have increased Zaire's dependence on external markets. The country's infrastructure has deteriorated greatly, and its transport system has been severely neglected and is unable to cope with current demand.

Government and social conditions. Zaire is a one-party republic, ruled by the Mouvement Populaire de la Révolution (MPR), which was dominated by Mobutu Sese Seko in the mid-1980s. He selected the Central Committee that made policy for both the party and the government. Under the constitution adopted in 1978, the president (Mobutu) appointed a National Executive Council to function as a cabinet.

Zaire has a National Legislative Council whose 210 members are elected by universal adult suffrage from the MPR's list of candidates. Political opposition is not permitted. The only national institutions independent of the MPR are Catholic, Protestant, and Kimbanguist religious organizations. Zaire's military force receives aid from France, Belgium, and the People's Republic of China.

Severe mainutrition is prevalent in Zaire, and serious diseases such as acquired immune deficiency syndrome (AIDS), malaria, gastroenteritis, tuberculosis, leprosy, sleeping sickness, and schistosomiasis are common. Life expectancy at birth is about 48 years for males and 52 years for females. Health problems are aggravated by poor sanitary conditions and a shortage of medical personnel in the rural areas.

Zaire's system of education offers six years of primary and four years of secondary education. About three-fourths of all children aged 6 to 11 years attend primary school, but only a small percentage of these advance to secondary school. The quality of education is poor; teachers are largely underqualified and school facilities are poorly maintained. There are universities at Kinshasa, Kisangani, and Lubumbashi.

The news media are rigidly controlled by the government, and journalists who criticize the government are subject to imprisonment.

Cultural life. Surviving national folk traditions in Zaire are evident in pottery and the weaving of raffia, in ceremonial dress and costumes, in dancing styles, and in songs. Zairians still create such traditional objects as masks, figurines, and stone- and nail-studded statues. A unique popular music mixes traditional rhythms and instruments borrowed from other cultures, civilizations, and continents. Zairian music, popular all over Africa, has given birth to a great variety of specific dance steps and styles known as the Zairian dance.

History. The first known state to emerge in what is now Zaire was the Luba kingdom, located in the Katanga (Shaba) region. The Luba kingdom was created in the 16th century when a warrior named Kongolo subdued the small chiefdoms in the area and established a highly centralized state. To the northwest was the Kuba, a federation of numerous chiefdoms that reached its peak in the 18th century. The Kongo and Lunda kingdoms which straddled Zairian territory are more properly considered in the history of Angola.

European penetration into Central Africa was spurred late in the 19th century when King Leopold II of Belgium financed the exploration by Henry Stanley of the Congo River. The 1884–85 Berlin West Africa Conference recognized the Congo Free State with Leopold as its sovereign. The growing demand for rubber occurring at the turn of the 20th century helped finance the economic exploitation of the Congo, but abuses growing out of the extraction of rubber there outraged Western nations and forced Leopold to grant the Free State a colonial charter as the Belgian Congo (1908).

Kimbanguism, a prophetic religious movement that rallied the people of the Belgian Congo against European culture and Christian missions, appeared in 1921. Nationalism developed late and grew slowly; it was not until 1957 that any inhabitants of the Congo, white or black, were given the vote in any elections. Once nationalist sentiment had begun, however, it grew dramatically, and Belgium agreed to grant independence to the Congo on June 30, 1960. The Congo, under the inexperienced leadership of Patrice Lumumba, was ill-prepared for self-government. Within two weeks of independence, army and police officers mutinied and the Katanga (now Shaba) region seceded. The Congo called in UN peace-keeping forces in an effort to avert civil war. The active involvement of the UN forces aroused some controversy, and they were particularly criticized for not having prevented the murder of Lumumba in Katanga by a rival government faction. The UN forces stayed until 1964, but their departure was followed by widespread rebellion. In 1965 a military coup took place in which General Mobutu Sese Seko overthrew president Joseph Kasavubu. Mobutu was able to restore political stability to the Congo, and by 1967 the Katanga rebellion had also been quelled. Under Mobutu, the name of the country was changed to Zaire in 1971. In 1977 Katangese rebels from Angola invaded the Shaba region but were repelled. By the late 20th century, several decades of economic mismanagement and political corruption had devastated the Zairian infrastructure and economy to the point that the country had one of the lowest standards of living in the world.

Zaire River (Central Africa): see Congo River.

Zajsan, Ozero (Kazakh S.S.R.): see Zaysan, Lake

Zakarpatskaya, also spelled ZAKARPATSKA-IA, Or ZAKARPATSKAJA, oblast (province), western Ukrainian Soviet Socialist Republic. It has an area of 4,950 square miles (12,800 square km) and is bounded by Czechoslovakia and Hungary on the west and Romania on the south. The *oblast* extends from the east-westtrending Carpathian mountain crestline on the Vodorazdelny (Watershed) Range, across the parallel Polonina and Uzhgorod-Khust Range, and southwestward down to the Great Hungarian Plain, which is drained by the Tisa River and its tributaries. Deep, longitudinal troughs separate these mountain ranges, while a number of important and fairly easy passes across the Carpathians long have given the area considerable strategic significance. The highest point of the oblast is Mount Goverla (6,762 feet [2,061 m]) in the Polonina Range. Most of the *oblast* is densely forested, but the highest areas are in Alpine meadows.

The area, part of Hungary before World War I, was incorporated into Czechoslovakia in 1920 as the province of Ruthenia. In 1945 Ruthenia was ceded to the Soviet Union, and the present *oblast* was formed. Most of the population are Ukrainians (including the Hutsul), with some Magyars, Russians, Romanians, Jews, and Slovaks.

The modern economy is dominated by highly

developed lumbering and timber-working industries; some coal (lignite) is mined near Mukachovo. Agriculture is confined to the valleys and plain, but in the latter it is intensive, with about four-fifths of the land under the plow. Corn (maize), wheat, oats, rye, potatoes, and tobacco are the main crops. There are many orchards and vineyards in the Tisa Valley and on the lower slopes. Cattle use the mountain meadows for summer pasture, and pig raising is important in the valleys. Cities, including the administrative centre, Uzhgorod (q.v.), are small; Chop, in the southwestern corner of the oblast, is the chief point of entry to the Soviet Union from Czechoslovakia and Hungary. Pop. (1987 est.) 1,206,000

zakat, Arabic ZAKĀT, an obligatory tax required of Muslims, one of the five Pillars of Islām. The zakat is levied on five categories of property—food grains; fruit; camels, cattle, sheep, and goats; gold and silver; and movable goods—and is payable each year after one year's possession. The tax levy required by religious law varies with the category. Recipients of the zakat include the poor and needy, the collectors themselves, and "those whose hearts it is necessary to conciliate," e.g., discordant tribesmen, debtors, volunteers in jihad (holy war), and pilgrims.

Under the caliphates, the collection and expenditure of zakat was a function of the state. It became progressively more difficult, however, to regulate the zakat effectively or collect in full as secular taxation has increased. In the modern Muslim world it has been left up to the individual, except in such countries as

Saudi Arabia where the Sharī'ah (Islāmic law) is strictly maintained.

The Qur'ān and Ḥadīth (sayings of Muḥammad) also stress ṣādaqah, or voluntary almsgiving, which like zakat is intended for the needy.

Zakavkazye (Soviet Union): see Transcauca-

Zákinthos (Greece): see Zacynthus.

Zakopane, city, Nowy Sącz województwo (province), south-central Poland. The city is situated in the Carpathian Mountains near the Czechoslovakian border. Its location at the foot of the Alpine-like Tatras Mountains makes it a major winter-sports and health-resort centre. Situated on good rail and high-way routes, Zakopane also serves as the cultural centre for the area. The Chałubiński Memorial Tatra Museum, containing ethnographical and geological displays, was opened in 1888. Zakopane is also the location of the Exhibition Hall of the Union of Polish Arts, and it has several notable monuments and a public garden.

Settlement rights were granted in 1578, but Zakopane did not become Polish in character until 1889, when the area was purchased at public auction from a Berlin businessman

Houses in Zakopane, Pol., at the foot of the Tatras Gianni Tortoli—Photo Researchers/EB Inc.

by the Polish patriot Władysław Zamoyski. In 1924 he donated this property to form the basis of Tatra National Park. The town's growth began in 1889 with the extension of a rail line to Zakopane; it was stimulated greatly by the creation of the park and the influx of visitors attracted by the area's winter-sports and mountaineering opportunities. Pop. (1987 est.) 30,000.

Zakynthos (Greece): see Zacynthus.

Zala, megye (county), western Hungary. Zala has an area of 1,461 square miles (3,784 square km) and consists of wooded undulating hill country. The Yugoslav border, partly defined by the Drava River, is on the southwest. There is a high incidence of soil erosion on the valley slopes, but along the valley floors are wet meadows and pastures. There has been some canalization of the rivers in Zala, together with reclamation and soil conservation. Agricultural production is low, but the megye is a major source of medicinal herbs. Racehorse breeding is important. Zala contains large petroleum and natural gas deposits. From around Budafapuszta crude oil is piped to Almásfüzitő, Budapest, and Várpalota. Production from the Nagylengyel field is refined at Zalaegerszeg (q.v.), the megye seat. Zalakaros is a recently developed spa for the treatment of rheumatic diseases. Pop. (1987 est.) 311,000.

Zalaegerszeg, town and seat of Zala megye (county), western Hungary. It lies on the right bank of the Zala River. The town was of medieval origin and was a frontier fort in Hungary's wars with Turkey (16th-17th century). It was never occupied by the Turks. The town's notable buildings include the Göcsej Múzeum, with a rich historical and ethnographic collection; the twin-spired Baroque parish church (1750-60); and the County Council House Chapel (1761-77). On the banks of the Zala River there is an open-air Göcsej village museum. (The Göcsej is the local region of southwestern Hungary noted for the peculiarities of its dialect.) The museum displays more than 30 buildings, including timber houses, stables, and a water mill. Zalaegerszeg has a large clothing factory. Pop. (1987 est.) 62,000.

Zalău, town, capital of Sălaj județ (county), northwestern Romania. It is situated in an isolated part of the country on the northwestern slopes of the Mezes Mountains. It is the terminal of a branch line railway and a local market centre for the district's agricultural produce. A furniture factory in Zalău uses timber from the surrounding hills. The town has an archaeological museum that contains artifacts dating from prehistoric times, as well as materials from the Roman occupation. Highways and a railway connection pass through Zalău. Pop. (1985 est.) 52,864.

Zalṭan, also spelled ZELTEN, town site at the first exploited oil field in Libya. Located 105 miles (169 km) south of the Mediterranean port of Marsā al-Burayqah on the Gulf of Sidra, at the foot of the Zalṭan Mountains, the town is in the centre of the so-called oasis group of oil fields that includes Jālū (Gialo), Waha, and ar-Rāqūbah (Raguba). Discovered in 1959 and recognized as the nation's first large strike (17,500 bbl per day), the Zalṭan oil field is connected to Marsā al-Burayqah by pipeline (completed 1961). The attendant natural gas was burned off until the opening of a gas recovery plant at Marsā al-Burayqah in 1969. Pop. (1972 est.) 19,473.

žaltys, in ancient Baltic traditions, a harmless green snake highly respected as a symbol of fertility and wealth. To ensure the prosperity of family and field, a *žaltys* was kept in a special corner of the house, and the entire household gathered at specified times to recite prayers to it.

On special occasions the snake was asked to

the table to share the family meal from their plates; should he refuse, misfortune was imminent. To encounter a snake accidentally was also considered auspicious and portended a marriage or a birth. Paralysis or great misfortune awaited anyone who dared kill a žaltys, the "sentinel of the gods" and a favourite of Saule, the goddess of the sun.

Zama, Battle of (202 BC), victory of the Romans led by Scipio Africanus over the Carthaginians commanded by Hannibal. It was the last and decisive battle of the Second Punic War. The battle took place at a site identified by the Roman historian Livy as Naraggara (now Sāqiyat Sīdī Yūsuf, Tunisia). The name Zama was given to the site (which modern historians have never precisely identified) by the Roman historian Cornelius Nepos about 150 years after the battle.

By the year 203 Carthage was in great danger of attack from the forces of the Roman general Publius Cornelius Scipio, who had invaded Africa and had won an important battle barely 20 miles (32 km) west of Carthage itself. The Carthaginian generals Hannibal and his brother Mago were accordingly recalled from their campaigns in Italy; Hannibal returned to Africa with his 12,000-man veteran army and soon gathered a total of 37,000 troops with which to defend the approaches to Carthage. Scipio, for his part, marched up the Bagradas (Medjerda) River toward Carthage, seeking a decisive battle with the Carthaginians. Scipio had no more troops than did Hannibal, but his 6.000 Numidian cavalrymen led by Prince Masinissa were superior to the Carthaginian

As the two armies approached each other, the Carthaginians unloosed their 80 elephants into the ranks of the Roman infantry, but the great beasts were soon dispersed. Masinissa's cavalry then charged the opposing Carthaginian cavalry on the wings; the latter fled and were pursued by Masinissa's forces. The Roman infantry legions then advanced and attacked Hannibal's infantry, which consisted of three consecutive lines of defense. The Romans crushed the soldiers of the first line and then those of the second, but by this time the legionaries had become nearly exhausted, and they had yet to close with the third line, which consisted of Hannibal's veterans from his Italian campaign, i.e., his best troops. At this crucial juncture Masinissa's Numidian cavalry returned from their rout of the enemy cavalry and attacked the rear of the Carthaginian infantry, who were soon crushed between the combined Roman infantry and cavalry assault. Twenty thousand Carthaginians died in the battle and the rest were captured, while the Romans lost about 1,500 dead.

The Battle of Zama left Carthage helpless, and the city accepted Scipio's peace terms whereby it ceded Spain to Rome, surrendered most of its warships, and began paying a 50-year indemnity to Rome. Scipio was awarded the surname Africanus in tribute of his victory. Hannibal escaped from the battle and soon returned to Carthage.

zamacueca (dance): see cueca.

Zamakhsharī, Abu al-Qāsim Maḥmūd ibn 'Umar az- (b. March 8, 1075, Khwā-rezm—d. June 14, 1144, al-Jurjānīya, Khwā-rezm), Persian-born Arabic scholar, theologian, and philologist whose chief work is his commentary on the Qur'an.

As a theologian, he was one of the Mutazilite school. As a philologist, he considered Arabic the queen of languages, in spite of the fact that his own mother tongue was Persian. His commentary on the Quran, al-Kashshāf an Haqā iq at-Tanzīl, was completed in 1134 (published at Calcutta in 1856 in 2 vol.) and, in spite of its Mutazilite bias, was widely read, especially in the East; in the western portions of the Islāmic world, his

dogmatic point of view was offensive to the Mālikī school, though Ibn Khaldūn regarded the work highly. Of Zamakhsharī's grammatical works, al-Muſaṣṣal (written 1119–21, published 1859) is celebrated for its concise but exhaustive exposition. He was also the author of a collection of old proverbs, three collections of apothegms composed by himself, moral discourses, and poems.

Zambales Mountains, volcanic range in the southwestern part of northern Luzon in the Philippines. The range stretches northwest-southeast from Lingayen Gulf in the north to the entrance to Manila Bay in the south. Its greatest elevation is High Peak (6,683 feet [2,037 m]). Lying farther south and across the bay from Manila is Mount Mariveles (4,659 feet [1,420 m]), which marks the southern termination of the range. The Zambales Mountains are rich in minerals, and their slopes are densely forested.

Zambezi River, also spelled ZAMBESI, river in south-central and southeastern Africa, flowing from its source on the Central African Plateau eastward to the Indian Ocean.

A brief treatment of the Zambezi River follows. For full treatment, see MACROPAEDIA: Africa.

The Zambezi River follows an S-shaped double arc from its source about 4,800 feet (1,460 m) above sea level near Kalene Hill, Zambia, south across Angola and western Zambia, then northeastward forming the Zambia-Zimbabwe boundary, and, finally, southeastward across Mozambique to its delta on the Indian Ocean. Among its major tributaries are the Kabompo, Lungwebungu, Chobe, Kafue, and Shire. The Zambezi basin drains the entire south-central region of the continent.

In its upper course through Zambia and Angola, the river drops about 1,000 feet (300 m) in elevation and is met by more than a dozen tributaries of varying sizes. At Kazungula, Zambia, at an elevation of 2,900 feet (880 m), the river reaches its greatest width (4,550 feet [1,380 m]) and its waters plunge over Victoria Falls. For about 450 miles (720 km), the river forms the boundary between Zambia and Zimbabwe, about 175 miles (280 km) of this portion of its course being Lake Kariba, the reservoir impounded by Kariba Dam. In its middle course near the Mozambique border the river enters Cabora Bassa reservoir, about 200 miles (320 km) in length, impounded by Cabora Bassa Dam.

In its lower course, the Zambezi enters the Tete Basin, passes through Lupata Gorge, and emerges onto the Mozambique Plain, where it occupies a broad valley that spreads out in places to a width of three to five miles. Near Vila Fontes, the river receives its last great tributary, the Shire River. At its mouth, the Zambezi splits into a wide, flat, and marshy delta that is obstructed by sandbars. There are two main channels, each again divided into two. The wider, eastern channel splits into the Muselo River to the north and the main mouth of the Zambezi to the south. The western channel forms both the Inhamissengo River and the smaller Melambe River.

The Zambezi has the same types of natural barriers encountered on other African rivers—sandbars at the mouth, shallowness, and rapids and cataracts. About 1,620 miles (2,600 km) of its length, however, are navigable by shallowdraft steamers. The river has four major crossing points, the Victoria Falls Bridge, the dam wall at Kariba, a bridge at Chirundu, Zimb., and a bridge between Vila Nova da Fronteira and Vila de Sena, Mozambique. The Kariba Dam harnesses the Zambezi at Kariba Gorge, producing hydroelectric power. Lake Kariba stretches for 175 miles (280 km) from the dam to Devil's Gorge and is 20 miles (32 km) across

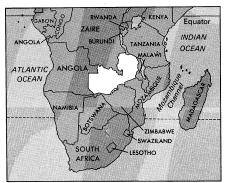

at its widest point. The many peoples who live along the Zambezi River include the Lozi (Barotse), Tonga, Shona, Chewa, and Nsenga. Length 2,200 miles (3,500 km); drainage basin 500,000 square miles (1,295,000 square km); average annual discharge 250,700 cubic feet per second (7,100 cubic m/sec).

Zambia, officially REPUBLIC OF ZAMBIA, formerly (1911-64) NORTHERN RHODESIA, landlocked country in southern Africa, covering an area of 290,586 square miles (752,614 square km). The capital is Lusaka. The country extends at its maximum about 510 miles (821 km) from north to south, and 860 miles (1,385 km) from east to west. It is bordered to the west by Angola, to the northwest by Zaire, to the northeast by Tanzania, to the east by Malaŵi, to the southeast by Mozambique, to the south by Zimbabwe and Botswana, and to the southwest by South West Africa/Namibia. The Zambezi River forms the border with Zimbabwe. The population in 1988 was estimated at 7,384,000.

A brief treatment of Zambia follows. For full treatment, see MACROPAEDIA: Southern Africa.

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. The country largely occupies a plateau lying 3,000 to 5,000 feet (1,000 to

Zambia

1,500 m) above sea level with an almost uniform surface, broken occasionally by widely dispersed hills and ranges. The Muchinga Mountains in the north, forming the Congo-Zambezi watershed, include the highest point (7,100 feet [2,200 m]) in the country. Other higher elevations are in the Mbala Plateau (5,000 to 6,000 feet [1,500 to 1,800 m]) in the north, and the Mufinga Hills (7,000 feet [2,100 m]) in the northeast. Several rift valleys are located within Zambia, the largest being the 350-mile- (560-kilometre-) long Luangwa River valley. The Bangweulu Swamps in the northeast form one of the largest (4,000 square miles [10,400 square km]) inland wetlands in the world. The Zambezi River, with an extensive drainage basin, is the principal river; its rapids and waterfalls, the largest of which is Victoria Falls, limit navigation. Lake Mweru, Lake Bangweulu, and Lake Tanganyika (and nearby Kalambo Falls, the highest [726 feet (220 m)] in the country) are in the north, and the man-made Lake Kariba (170 square miles [440 square km]) is in the south.

Zambia has a subequatorial climate with three distinct seasons: hot and dry (August-October), warm and wet (November-April), and dry and cool (May-July). The average daytime high temperatures in the hottest month (October) range from 102° F (39° C) at Balovale in the southwest to 89° F (31° C) at Mbala in the north, and in the coldest month (June), from 79° F (26° C) at Lusaka in the south to 89° F (31° C) at Mbala. Precipita-

tion, mostly occurring in the form of heavy tropical storms, varies from 23 to 32 inches (600 to 800 mm) in the southern river valleys to 32 to 40 inches in the central and eastern plateau, and to 40 to 55 inches in the north-eastern highlands. Wooded savannah of tall perennial grasses and small trees covers most of the country. Valuable forests of Rhodesian teak are found in the southwest; thickets of papyrus grow on the lake shores. The grasslands support domestic livestock (beef and dairy cattle) as well as wildlife (elephant, genet, hyena, leopard, zebra, giraffe, antelopes, baboon, and monkeys). Several varieties of tsetse fly are widespread. Kafue National Park, 150 miles (240 km) west of Lusaka, is the country's largest and best-known game preserve

The Copperbelt region (70 miles [110 km] long and 30 miles [50 km] wide) of central Zambia, which was opened and developed during the 1930s, is the most important mineral region of the country. Geologically formed of alternating beds of sandstone, shale, and dolomite, the Copperbelt's considerable reserves amount to about one-eighth of the world's known and exploitable copper reserves. Coalfields in the Zambezi Valley and the lead and zinc deposits of the Kabwe (Broken Hill) are also important. Other minerals include vanadium, manganese, cobalt, gemstones (emerald and amethyst), and limestone.

The people. Zambia's ethnic composition is almost entirely Bantu-speaking African, including the Twa (Pygmies), except for a few groups of San (Bushmen). The main Bantu-speaking groups include the Bemba, Nyanja, Barotse, Mambwe, Tumbuka, and Swahili. There are a few Europeans and Asians (mostly Indians). Most of the Indians entered between 1945 and 1954 when immigration was permitted freely. English is the official language, and some 70 local languages and dialects are also spoken. The Bemba, Tonga, Nyanja, Lozi, Kaonde, Lunda, and Luvale languages are used in radio broadcasts.

Zambia's annual rate of population growth is one of the highest in sub-Saharan Africa, mostly because the birth rate is also very high while emigration is negligible and the death rate is comparatively low. Furthermore, the infant mortality rate, while high by world standards, is considerably lower than in most neighbouring African countries. The areas of greatest density and growth have been in the Copperbelt and central provinces because people migrate to those areas with hopes of securing employment and housing. Some four-tenths of the entire populace lives near the railroad on a single 25-mile (40-kilometre) stretch of land within the Copperbelt. Lusaka, the capital, is the country's largest city.

The economy. Zambia has a mixed economy in which both the public and private sectors participate. It is heavily dependent on the production and export of copper, and after the fall of world copper prices in the mid-1970s, the economy faltered and remained in a difficult period of readjustment into the late 1980s. The government's efforts to increase agricultural and industrial output have had only limited success. The gross national product (GNP) per capita, which has had a negative real growth rate since the mid-1970s, is low by world standards but about average for sub-Saharan Africa.

Agriculture accounts for approximately oneeighth of the GNP but employs about twothirds of the work force. Customary tenure predominates; farmers on state land are awarded leases for 100 years. Slash-and-burn agriculture is common. Subsistence farming is widespread and centres on the production of corn (maize), cassava, peanuts (groundnuts), and sorghum. Large commercial farms are controlled mostly by Europeans and account for up to one-half of Zambia's agricultural output.

The raising of cattle is restricted by the

prevalence of the tsetse fly in northern and eastern Zambia. Farmers are often reluctant to slaughter cattle, which are a traditional sign of wealth, and the production of beef and milk falls short of domestic demand. Most forests consist of secondary growth as a result of slash-and-burn agriculture; an extensive afforestation program was initiated in the 1960s.

Mineral industries account for about oneeighth of the GNP. Copper is the most important mineral mined, and in 1969 the government acquired 51 percent of the copper industry.

Manufacturing industries account for approximately one-fifth of the GNP but employ only a small fraction of the work force. The government owns all or part of most large-scale industries. Manufactures include textiles, chemical fertilizers, bricks, explosives, and motor vehicles.

Zambia's electricity is generated almost entirely from hydroelectric power. The Kariba Dam, Victoria Falls, and the Kafue River project are the major producers of hydroelectricity in the country.

Copper dominates exports and is the country's principal source of foreign exchange; capital and consumer goods and fuels are the chief imports. Zambia's balance of trade has gradually deteriorated since the mid-1970s largely because of declines in export revenue. Principal trading partners include Japan, the United Kingdom, Italy, Saudi Arabia, Germany, France, and the United States. The People's Republic of China is an important supplier of consumer goods.

Government and social conditions. Zambia is an independent one-party republic. Its constitution (1973) vests the executive power in the president, elected to a five-year term. The National Assembly is the legislative body from whose elected members the president appoints his cabinet, including the prime minister. The United National Independence Party (UNIP), which has ruled Zambia since independence in 1964, is the sole legal political party in the country, and the cabinet is subordinate to its Central Committee. Furthermore, all candidates for the National Assembly must be approved by the Central Committee. The highest court and the court of appeal is the Supreme Court, and below it are the High Court, Magisterial Court, and the local courts. The law is based on English common law.

Health and medical care is provided through hospitals, rural health centres, urban clinics, and leprosaria. Malnutrition, tuberculosis, parasitic infestations and leprosy are the major health hazards. These have been countered to some degree by clinics for children under five, developed to improve maternal and child health education; by vaccinations and immunizations; and nutritional education. Generally, however, Zambia suffers from a shortage of trained medical staff and poor health-care facilities. In the rapidly growing urban areas some private industries provide medical facilities for employees and dependents. Life expectancy at birth is about 50 years for males and 53 years for females, slightly better than for Africa as a whole.

A contributory National Provident Fund provides retirement benefits for a large number of employees, and many voluntary organizations help government in dealing with juvenile delinquency, adoption, refugee control, and care for the aged, the indigent, and the handicapped. Urbanization has resulted in an acute housing shortage, and the Department of Community Development directs its efforts toward the improvement of both urban and rural housing.

Zambia has one of the highest rates of educational expansion in Africa at the primary and secondary levels. The University of Zambia provides courses in humanities, social and natural sciences, education, law, social work, business and public administration, and agri-

cultural sciences. There are two daily newspapers and a number of provincial newspapers, and the press enjoys a fair amount of freedom. Radio and television are controlled by government. Radio broadcasts include educational and agricultural training programs, and television programs, all in English, are primarily for entertainment.

Cultural life. Traditional Zambian art consists chiefly of wood carving, pottery, basket weaving, and house-wall paintings. Music, dancing, and songs are used in tribal rituals to the accompaniment of drums, stringed bows, flutes, horns and pipes, bells, rattles, and the sansa, or "African piano." In the urban setting, traditional music has often been modified by the use of western instruments, and local dancers perform regularly at the Open Air Museum at Livingstone. There is a national museum at Livingstone, and a small museum on the Copperbelt, displaying artifacts from central African history and prehistory.

History. Archaeological evidence suggests that early man roamed present-day Zambia between 2,000,000 and 1,000,000 years ago. Stone Age sites and artifacts are found in many areas. Early Iron Age peoples settled in the region with their agriculture and domesticated animals about 2,000 years ago. Ancestors of the modern Tonga tribe reached the region early in the 2nd millennium AD, but other modern peoples reached the country only in the 17th and 18th centuries from Zaire and Angola.

A Portuguese trading mission was established in 1798 near Lake Mweru. In 1835 a group of Bantu-speaking Ngoni settled in the Lake Nyasa-Luangwa watershed. The Suto people, the Kololo (Makololo), crossed the upper Zambezi and made themselves mas-ters of Barotseland. The Scottish missionary David Livingstone reached the Upper Zambezi in 1851, discovering Victoria Falls (1855) and subsequently exploring the whole Zambezi Basin and the plateau south of Lake Tanganyika. Emissaries of Cecil Rhodes and the British South Africa Company concluded treaties with most of the Zambian chiefs during the 1890s. The company administered the region until 1924, when it became a British protectorate. In 1911 the territory became known as Northern Rhodesia and about 1.500 Europeans had settled there.

The mining industry began to develop in the early 20th century. By 1924, when the Copperbelt began to develop, there were about 4,000 Europeans in Northern Rhodesia. The British South Africa Company retained mineral rights from 1924 to 1960, reaping large profits. In 1935 the capital was moved from Livingstone to Lusaka. During the early 20th century Africans were barely represented in the political power structure, but after 1930 this began to change as they achieved increased power. During the early 1950s the nationalist movement was launched by the United National Independence Party (UNIP) and the African National Congress (ANC). By 1952 the European population had increased to about 43,000, living mostly in the Copperbelt.

In 1953 Northern Rhodesia, despite strong internal opposition, joined with Nyasaland (Malaŵi) and Southern Rhodesia to form the Central African Federation of Rhodesia and Nyasaland. The federation was dissolved in 1963 and the next year the country achieved independence as the Republic of Zambia within the British Commonwealth. The UNIP became the party in power and Kenneth Kaunda became president.

Kaunda remained the dominant political figure in Zambia into the 1980s. In 1969 he embarked upon a policy of industrial and commercial nationalization that began with the copper industry and was extended to land holdings, cinemas, newspapers, tobacco factories, and rental housing. In 1973 he cemented

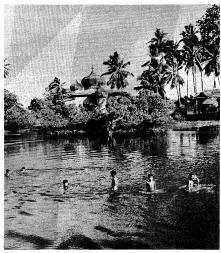

one-party UNIP rule with a new constitution. He also played a prominent role in the country's foreign policy by participating in discussions on Angola and Mozambique independence as well as majority rule for Rhodesia.

Zambia's economy began to suffer when sanctions were levied against neighbouring Rhodesia in 1965, and continued to suffer through the 1970s as the country became more dependent on copper exports as the world price for copper began to decline. The production of corn and other grains declined in the 1970s and early 1980s, particularly after many South African farmers departed the country.

Through the 1970s Zambia was a refuge for guerrillas waging war on the regimes of Angola, Mozambique, South Africa, and Rhodesia (now Zimbabwe). Independence and majority rule in all these countries except South Africa lessened this problem in the early 1980s.

Zamboanga City, chartered city, Zamboanga del Sur province, northwestern Mindanao, Philippines, a busy port strategically located on Basilan Strait and sheltered by Basilan Island, on the southwestern tip of the Zamboanga

Zamboanga City, Mindanao, Phil. C.A. Peterson

Peninsula. The immediate coastal lowlands are narrow, with low, rugged hills located a short distance inland. A large wharf accommodates interisland and oceangoing vessels. Zamboanga exports rubber, pearls, copra, mahogany and other fine hardwoods, fish, abaca, and fruit products; rice is imported. The city is the southern terminus of the Pan-Philippine Highway and has an airport.

Founded by Spaniards in 1635 on the site of a native settlement, its name is derived from the Malay *jambangan* ("place of flowers"); bougainvillea, orchids, and other tropical flowers line its roadsides. Incorporated in 1936, it has an area of 645 sq mi (1,671 sq km), which encompasses 82 barrios (wards) in addition to the administrative centre. The city was largely rebuilt after World War II, and its Spanish-style architecture, fine beaches, and mountainous backdrop combine with a climate that is cooler and less humid than that of Manila to make it a favourite tourist spot. Ft. Pilar, shrine of Our Lady of the Pillar,

Ft. Pilar, shrine of Our Lady of the Pillar, was built in the 17th century for the protection of Christian settlers against Moro (Muslim) pirates; it now houses the Zamboanga High School. The city is also the site of several colleges, including Zamboanga State College.

Rio Hondo, Taluksangay, and Camp Muslim are nearby Muslim villages built on stilts over water. Indigenous peoples include the Tau Sugs, Samals, and Yakans. The colourful Bajau, or sea gypsies, ply the waters of the Basilan Strait for fish, coral, and shells; they live on board their multihued *vintas* (sailboats) and take temporary shelter in stilt-raised homes during storms. Chabacano, the native dialect, is a mixture of Spanish and Cebuano. Zamboanga is also a centre for Moro brassware and bronzeware and a collecting point for shells, which are exported or used locally for button manufacture. Pop. (1980) 343,722.

Zamboanga del Norte, province, northwestern Mindanao, Philippines, occupying the northern portion of the curving Zamboanga Peninsula. It has an area of 2,346 sq mi (6,075 sq km) and is bordered on the north and west by the Sulu Sea. Drained by the Lubungan, Dipolog, and Quipit rivers, its highlands generally descend sharply to the coast. The most populated region is in the northeast, a lowland area of fertile volcanic material from Mts. Ampiro and Malindang. Agriculture (rice, corn [maize], sugarcane, tobacco, abaca), fishing, and logging are the main economic activities. Small sawmills are scattered along the coast. Dipolog, the capital and an interisland port, is in the northeast. A commercial-fishing centre, it is served by an airport and by coastal roads leading south to Kalipunan, Manukan, Sindangan, and Liloy. The port of Dapitan, a chartered city just northeast of Dipolog, was the place where José Rizal, the Filipino patriot, was exiled (1892-96). Rizal National Park is in Dapitan. Pop. (1980) 588,015.

Zamboanga del Sur, province, northwestern Mindanao, Philippines, occupying the southern portion of the arching Zamboanga Peninsula. Its area of 3,319 sq mi (8,595 sq km) includes the offshore islands of Sacol and Olutanga. Its southern coastline, which is deeply indented by the Sibuguey and Dumanquilas embayments, borders on the Moro Gulf. The main rivers are the Subuco, Pangasinan, and Sioco, which form a delta of mangrove forests that are a source of export timber.

Although Muslims are a strong minority, most of the inhabitants are Roman Catholic migrants from the Visayas and, more recently, from Misamis Occidental province (east). The largest lowlands and population centres are in and adjacent to the chartered city of Zamboanga City, on the Sibuguey and Baganian peninsulas, and at the heads of the embayments. Forestry, fishing, agriculture (rubber, corn [maize], rice, fruits, vegetables), and mining are important economic activities. Iron ore and coal are mined near Malangas. In the east, Pagadian, the provincial capital, is a trade centre, shipping rice and corn (maize) to Manila and the Visayas. Dimataling, Kabasalan, and Margosatubig are coastal towns; Molave, Liargao, and Tambulig are inland municipalities. Pop. (1980) 1,183,845.

Zamenhof, L(udwik) L(ejzer), pseudonym DOKTORO ESPERANTO (Esperanto: Doctor Hopeful) (b. Dec. 15, 1859, Białystok, Pol., Russian Empire—d. April 14, 1917, Warsaw), Russian physician and oculist who created the most important of the international, artificial languages—Esperanto.

A Jew whose family spoke Russian and lived in an environment of racial and national conflict on the Polish-Russian borderland, Zamenhof dedicated himself to promoting tolerance, mainly through the development of an international language. After years of experiment in devising such a tongue, working under the pseudonym of Doktoro Esperanto, he published an expository textbook, *Lingvo*

Internacia (1887; Dr. Esperanto's International Language). His pseudonym, Esperanto ("[one] who hopes"), was to become the language's name.

As well as continuing his medical career, Zamenhof worked to develop Esperanto and organize its adherents. The first Esperanto magazine appeared in 1889, the beginnings of formal organization in 1893. With some literary and linguistic skill, Zamenhof developed and tested his new language by translating a large number of works, including the Old Testament, Hamlet, Hans Christian Andersen's Fairy Tales, and plays of Molière, Goethe, and Nikolay Gogol. At the first international Esperanto congress at Boulogne, Fr. (1905), and at successive annual congresses in various European cities, Zamenhof delivered a number of memorable addresses, but he renounced formal leadership of the Esperanto movement at Kraków, Pol., in 1912. His Fundamento de Esperanto (1905; 17th ed., 1979; "Basis of Esperanto") established the principles of Esperanto structure and formation. Marjorie Boulton's biography, Zamenhof, Creator of Esperanto, was published in 1960.

Zamia, a genus of 30 or more species of cycads (family Cycadaceae), small, stocky, fernlike plants native to tropical and subtropical America. They have a turniplike, mostly underground stem that in some species reaches 3 m (10 feet) or more in height. A starchy

Coontie (Zamia floridana)
Walter Dawn

food is obtained from the crushed roots and stems of certain species, among them coontie, or comfortroot (*Z. floridana*), found in the southeastern United States.

Zamiatin, Yevgeny Ivanovich: see Zamyatin, Yevgeny Ivanovich.

zamindar, in India, a holder or occupier (dār) of land (zamīn). The root words were Persian, and the resulting name was widely used wherever Persian influence was spread by the Mughals or other Indian Muslim dynasties. The meanings attached to it were various. In Bengal the word denoted a hereditary tax collector who could retain 10 percent of the revenue he collected. In the late 18th century the British government made these zamindars landowners, thus creating a landed aristocracy in Bengal and Bihār that lasted until Indian independence (1947).

In parts of North India (e.g., Uttar Pradesh), a zamindar denoted a large landowner with full proprietary rights. More generally in North India, zamindar denoted the cultivator of the soil or joint proprietors holding village lands in common as joint heirs. In Marāthā territories, the name was generally applied to all local hereditary revenue officers.

Zamora, town, southeastern Ecuador. It lies in the forested jungles east of the main Andean ranges and is situated at the southeastern foot of the Andean Cordillera (mountains) de Zamora, just south of the Zamora River. The Roman Catholic Church has established a Vicar Apostolic in Zamora, which is considered to be a missionary settlement; the population is almost entirely Indian. The economy is based on local Indian trade, with barter largely supplanting currency. Pop. (1982 prelim.) 6,365.

Consult the INDEX first

Zamora, in full ZAMORA DE HIDALGO, city, northwestern Michoacán state, west-central Mexico. It lies at an elevation of 5,141 feet (1,567 m) above sea level in the Zamora valley, formed by the Duero River. It was founded in 540 as an outpost to guard against Indians. Commerce, agriculture, and livestock raising are the principal sources of income. Corn (maize), wheat, beans, and numerous fruits and vegetables are grown in the surrounding area and flourish in the temperate climate. Dairy products and candy are manufactured in the city, as are various handicraft items, including rebozos (shawls), jewelry, pottery, and sandals. The Heroica Nogales-Guadalajara-Mexico City highway passes through Zamora, linking the city with Morelia, the state capital. Pop. (1979 est.) 90,000.

Zamora, province, in the autonomous community (region) of Castile-León, northwestern Spain. It was formed in 1833 from part of the historic province of León and is bounded by Portugal and Orense (west), by León (north), by Valladolid (east), and by Salamanca (south). It has an area of 4,077 square miles (10,559 square km) and is traversed from east to west by the Duero (Portuguese Douro) River; the Tormes River skirts the southwestern boundary for about 25 miles (40 km). Except in the northwest, where it is entered by two outlying ridges of the Cantabrian Mountains, the surface is a level or slightly undulating plateau. Its plains, especially the Esla Valley, yield much grain and pulse; wine and flax also are produced, and on higher grounds merino sheep and goats are reared. The provincial capital, Zamora, is the main communications centre; other towns include Benavente and Toro. Pop. (1986 est.) 229,526.

Zamora, capital of Zamora province, in the autonomous community (region) of Castile-León, northwestern Spain. It lies along the northern bank of the Duero (Portuguese Douro) River, northwest of Madrid. The city occupies a rocky height overlooking the Duero, a little below its confluence with the Valderaduey River. In the early period of the Christian reconquest (8th-11th century) the city was strategically important and passed between Christian and Moorish rule several times. It finally became subject to Alfonso VI of León and Castile in 1073. In the 15th century it was held for a time by the Portuguese supporters of Princess Juana, claimant to the Castilian throne, but was finally surrendered to Ferdinand II the Catholic in 1475.

Outstanding landmarks include a fine 14th-century bridge across the Duero, consisting of 16 pointed arches; the citadel of Zamora, dating from the 8th century; and the Romanesque cathedral, one of four 12th-century churches, completed c. 1174. The city is primarily an agricultural trade centre. Pop. (1986 est.) 61,899.

Zamość, województwo (province), southeastern Poland. It was established in 1975 and comprises an area of 2,695 square miles

(6,980 square km). Zamość is bordered by the provinces of Lublin and Chelm on the north, Tarnobrzeg on the west, Rzeszów on the southwest, and Przemyśl on the south and by the Soviet Union on the east. The province is drained by the Wieprz River, which flows northwestward through the central part, and by the Huczwa River, which flows northeastward through the eastern part of the province. Other rivers include the Por, the Wolica, and the Tanew. Zamość province embraces the Roztocze Hills and Sandomierz Basin in the south and the Lublin Uplands in the north. The economy is based on agriculture (grains and potatoes), food processing, textile and chemical manufacturing, lumber milling, and building-material production. Zamość (q.v.) city is the provincial capital; other important cities include Bilgoraj, Hrubieszów, and Tomaszów Lubelski. Bełżec (q.v.), about 12 miles (19 km) west of the Ukrainian border and 25 miles (40 km) south of Zamość, formerly in Lublin province but now in Zamość, was the site of a complex of Nazi concentration camps and death camps during World War II. At least 600,000 Jews are believed to have died there. Pop. (1985 est.) 485,700.

Zamość, city, Zamość województwo (province), east-central Poland. One of the few large communities in the Lublin uplands, it was founded on the estates of Polish chancellor Jan Zamoyski (1542–1605) that lay on the trade route between the Black Sea and northern and western Europe. In 1578 the Paduan architect Bernardo Morando conceived and implemented the city's modern design, which remains a fine example of grid-based urban planning. Zamość today is, in its entirety, classified as a historical monument. The city was incorporated in 1580.

For a long period its academy made Zamość the scientific and cultural centre for the region. In 1821 the city was refortified and became Polish territory, but by 1866 it had been abandoned as a defense point and began to develop once again as a free city. During World War II, Zamość was occupied by the Nazis and 8,000 of its inhabitants were slaughtered. Notable sites include the Town Hall (early 17th century, in the Mannerist style) and Morando's Collegiate Church of St. Thomas (1593–1628), one of the finest Renaissance churches in Poland. There is also a branch of the Maria Skłodowska-Curie University. Pop. (1985 est.) 54.800.

Zamoyski FAMILY, great Polish family whose members influenced Polish politics and history for almost 400 years.

The family settled in the 15th century at Laznin in the Mazovia area of Poland. Tomasz Lazninski bought an estate there called Zamość, and his sons Florian (died 1510) and Maciej began to use the name Zamoyski. Florian's grandson Stanisław was the first member of the family to serve as a senator. The Zamoyskis' rise to power dates from the career of Stanisław's son Jan Zamoyski (q, v), who was a major force in the royal politics of Poland throughout his life.

The next major member of the family, Andrzej Zamoyski (1716–92), was one of the authors of a plan for general reform of the nation offered to the Sejm (Diet) in May 1764. It called for improvements in the parliamentary system, a limitation of the power of the nobles, and the abolition of serfdom. On his own estates Zamoyski replaced serfdom. His proposals, however, were finally rejected by the Sejm in 1780.

His son Stanisław Kostka Zamoyski (1775–1856) received the title of count. During the insurrection of 1830–31 against Russian rule Stanisław's son, the second Andrzej Zamoyski (1800–74), was sent to Austria to gain support for the revolt. The uprising failed, and the young Andrzej retired to his family estates. During the rising against Russian rule in 1861–

63, Andrzej took part in drafting a letter to the Russian tsar calling for Polish autonomy, and, although opposed to armed rebellion, he refused to collaborate with the Russian-controlled Polish government. Andrzej was exiled from Poland in September 1863.

Andrzej's brother Władysław Zamoyski (1803–68) served as an aide-de-camp to Grand Duke Constantine, viceroy of Poland, and then took part in the 1830–31 insurrection. He later emigrated to England, where he represented the interests of the Polish prince Adam Jerzy Czartorski. He organized Polish contingents serving with the Sardinian Army to fight against the Austrians (1848–49), and in 1855 during the Crimean War he commanded a Polish cavalry division in the Turkish Army. Andrzej's second son, Franciszek Tomasz Zamoyski, obtained Russian recognition of his family's title of count in 1884. His son Maurycy Zamoyski (1871–1939) was minister of foreign affairs in the Polish Republic for

Zamoyski, Jan (b. March 19, 1542, Skokówka, Pol.—d. June 3, 1605, Zamość), Polish advisor to King Sigismund II Augustus and Stephen Báthory and later an opponent of Sigismund III Vasa. He was a major force

seven months in 1924.

Jan Zamoyski, portrait, 1600; in the Uffizi, Florence By courtesy of the Galleria degli Uffizi, Florence

in the royal politics of Poland throughout his life.

Educated in France and Italy, he returned to Poland in 1565 and was appointed secretary to King Sigismund II. After Sigismund's death (1572), he became one of the best-liked leaders of the nobility. Opposing the magnates who wished to offer the throne to the Austrian Habsburgs, he supported the candidature of the French prince Henry and, after Henry's flight from Poland, supported the anti-Habsburg Stephen Báthory. One of the latter's closest collaborators, he was made chancellor in 1578 and grand hetman (commander in chief of the armed forces) in 1581. He soon became one of the richest Polish magnates.

Zamoyski energetically helped Stephen Báthory in his efforts to strengthen the royal power. He also distinguished himself during the war of 1579–82 against Muscovy.

After Stephen Báthory's death, Zamoyski opposed the Habsburg candidature of the archduke Maximilian (brother of the Holy Roman emperor Rudolf II) and contributed to the election of Sigismund III Vasa. When Maximilian tried to seize Kraków by force, Zamoyski routed his forces at Byczyna (Jan. 14, 1588) and took him prisoner. Yet from the very beginning of Sigismund III's reign Zamoyski passed to opposition. The King feared the hetman's power, and Zamoyski in turn treated the King as a pawn. Open conflict broke out during the Sejm (Diet) of 1592, when Zamoyski knew that Sigismund was plotting to cede the Polish crown to the Habsburgs in exchange for their support of his

right to the Swedish throne. Zamoyski failed to dethrone Sigismund but won for himself a free hand in Moldavia. He installed a hospodar dependent on Poland in Moldavia and temporarily subjected Walachia to Poland.

In 1600, during the war for Livonia, Zamoyski recaptured some strongholds from the Swedes. The rigours of the campaign, however, were too much for him, and he resigned the command in 1602.

Zampieri, Domenico: see Domenichino.

Zamyatin, Yevgeny Ivanovich, Zamyatin also spelled ZAMIATIN (b. Feb. 1 [Jan. 20, old style], 1884, Lebedyan, Tambov province, Russia—d. March 10, 1937, Paris), Russian novelist, playwright, and satirist, one of the most brilliant and cultured minds of the post-revolutionary period, and creator of a peculiarly modern genre—the anti-Utopian novel. His influence as an experimental stylist and as an exponent of the cosmopolitan-humanist traditions of the European intelligentsia was very great in the earliest and most creative period of Soviet literature.

Educated in St. Petersburg as a naval engineer (1908), he combined his scientific career with writing. His early works were *Uyezdnoye* (1913; "A Provincial Tale"), a trenchant satire of provincial life, and *Na kulichkakh* (1914; "At the World's End"), an attack on military life. The last named was condemned by tsarist censors, Zamyatin was brought to trial and, although acquitted, he stopped writing for some time. During World War I he was in England supervising the building of Russian icebreakers. There he wrote *Ostrovityane* (1918; "The Islanders"), satirizing the meanness and emotional repression of English life. He returned to Russia in 1917.

A chronic dissenter, Zamyatin was a Bolshevik before the Revolution but disassociated himself from the party afterward. His ironic criticism of literary politics kept him out of official favour, but he was influential as the mentor of the Serapion Brothers, a brilliant younger generation of writers whose artistic creed was to have no creeds. His essay Ya boyus (1921; "I Am Afraid"), a succinct survey of the state of post-Revolutionary literature, closed with the prophetic judgment: "I am afraid that the only future possible to Russian literature is its past." During this period Zamyatin wrote some of his best short stories. His most ambitious work, the novel My (1924; We), circulated in manuscript but was never published in the Soviet Union (an English translation appeared in the United States in 1924, and the original Russian text was published in Prague in 1927). It portrays life in the "Single State," where workers live in glass houses, have numbers rather than names, wear identical uniforms, eat chemical foods, and enjoy rationed sex. They are ruled by a "Benefactor" who is unanimously and perpetually reelected. We is the literary ancestor of Aldous Huxley's Brave New World (1932) and George Orwell's Nineteen Eighty-four (1949). In 1923 Zamyatin turned to the theatre, and

In 1923 Zamyatin turned to the theatre, and some of his plays were successfully produced; but the publication of We abroad and his continuous ridicule of artistic orthodoxy made him the victim of a press persecution that resulted in the banning of his works. In 1931, through Gorky's intervention, Stalin granted him permission to leave Russia. The few years that remained of his life were spent in Paris. His works are still virtually unknown in the Soviet Union.

Zanardelli, Giuseppe (b. Oct. 29, 1826, Brescia, Lombardy, Austrian Empire—d. Dec. 26, 1903, Moderno, Italy), Italian prime minister from 1901 to 1903 and an associate of the early-20th-century liberal leader Giovanni Giolitti; Zanardelli was a champion of parliamentary rights and followed a conciliatory policy toward labour in a time of great unrest.

A combatant in the volunteer corps during the war of 1848, he returned to Brescia after the defeat of Novara, and for a time earned a livelihood by teaching law, but was molested by the Austrian police and forbidden to teach because of his refusal to contribute pro-Austrian articles to the press. Elected deputy in 1859, he received various administrative appointments, but attained a political office only in 1876 when the Left, of which he had been a prominent and influential member, came into power. For the next 20 years he served in various ministries, in the justice or the interior posts. He served in the Cabinet of the Marchese di Rudini from 1896, but resigned his position in protest when Rudini declared martial law in places where outbreaks of mob rioting occurred in 1898.

Asked to form a government in 1901 by King Victor Emmanuel III, Zanardelli chose Giolitti as his minister of the interior; although the period was marked by strikes, Zanardelli did ensure proper parliamentary practices, decreased excessive taxes on the poor, and put an end to strikebreaking by the army.

an end to strikebreaking by the army. Extremely anticlerical, Zanardelli was forced to resign (1903) when opposition mounted to his attempts to pass divorce legislation.

Zand DYNASTY (1750-79), Iranian dynasty that ruled southern Iran.

Following the death of the Afshārid ruler Nāder Shāh (1747), Karīm Khān Zand became one of the major contenders for power. By 1750 he had sufficiently consolidated his power to proclaim himself as *vakīl* (regent) for the Şafavid Esmā'il III. Karīm Khān never claimed the title of shāhanshāh ("king of kings"); instead he maintained Esmā'īl as a figurehead. Karīm Khān, with 30 years of benevolent rule, gave southern Iran a much needed respite from continual warfare. He encouraged agriculture and entered into trade relations with Great Britain. His death in 1779 was followed by internal dissensions and disputes over successions. Between 1779 and 1789 five Zand kings ruled briefly. In 1789 Lotf 'Alī Khān (ruled 1789-94) proclaimed himself as the new Zand king and took energetic action to put down a rebellion led by Āghā Mohammad Khān Qājār that had begun at Karīm Khān's death. Outnumbered by the superior Qājār forces, Lotf 'Alī Khān was finally defeated and captured at Kerman in 1794. His defeat marked the final eclipse of the Zand dynasty, which was supplanted by that of the Qajars.

Zand, Lotf 'Alī Khān: see Lotf 'Alī Khān Zand.

Zande (people): see Azande.

Zanesville, city, Muskingum County, east central Ohio, U.S., at the juncture of the Muskingum and Licking rivers (there spanned by the "Y" Bridge [1902]), 52 mi (84 km) east of Columbus. The town was founded (1797) by Ebenezer Zane on land awarded him by the U.S. Congress for clearing a road (Zane's Trace) through the forest to Limestone (now Maysville), Ky. Zane sold the land to his son-in-law, John McIntire, who laid out the village of Westbourne (1799; renamed Zanesville, 1801) and who was instrumental in making it the county seat (1804) and state capital (1810-12). Economic progress started with construction of the first "Y" Bridge (1814), the Ohio and Erie Canal (1829), and a series of locks and dams on the Muskingum (1841), opening transportation to Eastern markets. Abundant clay deposits spurred development of the pottery industry after 1890. Inundating floods (1913) led Congress to authorize a network of 14 reservoirs (completed 1938) in the Muskingum Valley.

The city of Zanesville is located amid abundant natural resources that include deposits of coal, gas, petroleum, clay, and limestone. The city's diversified industries include the manufacture of tile, glass, electrical equipment, sheet metal, alloy steel, batteries, farm machinery, and cement products. A branch (1947) of Ohio University and the Muskingum Area Technical College (1969) are in the city. Zanesville was the birthplace of the architect Cass Gilbert and of the novelist Zane Grey, a descendant of Ebenezer Zane. A museum east of the city commemorates the National (Cumberland) Road, which reached Zanesville in 1826, and displays Zane Grey memorabilia. The Ohio Ceramic Center is 11 miles (18 km) south of the city, near Roseville. Recreational facilities in the area include nearby Dillon Dam and Reservoir and Blue Rock State Park and Forest. Inc. village, 1814; city, 1850. Pop. (1988 est.) 28,333.

Zangī, in full 'IMĀD AD-DĪN ZANGĪ IBN AQ SONQUR, Zangī also spelled ZENGI (b. 1084—d. 1146, Mosul, Iraq), Iraqi ruler who founded the Zangid dynasty and led the first important counterattacks against the crusader kingdoms in the Middle East.

When Zangī's father, the governor of Aleppo, was killed in 1094, Zangī fled to Mosul. He served the Seljuq dynasty, and in 1126 the Seljuq sultan, Mahmūd II, appointed Zangī governor of Basra. When the 'Abbasid dynasty caliph al-Mustarshid rebelled in 1127, Zangī supported the sultan, and the victorious Mahmūd II rewarded Zangī by giving him the governorship of Mosul. Next, the key city of Aleppo submitted to Zangī's authority to secure military protection against a possible Frankish crusader conquest.

Zangī thus came to exercise authority over a considerable geographic area, but he wanted to create a kingdom that would also include Syria and Palestine. He was charged by the sultan with the duty of defeating the Christian crusaders, and he saw himself as the champion of Islām. He was opposed, however, by Muslim princes who refused to accept his authority as well as by the crusaders. To both, Zangī reacted with equal harshness. By diplomacy, treachery, and warfare he steadily extended his authority, with the immediate goal of securing control of Damascus—a goal he never achieved. He did, however, capture Edessa, an important focal point of Frankish authority, in 1144—the crusaders' first serious setback. Zangī could not press his advantage. Returning to Iraq to repress a revolt there, he was killed by a servant who bore him a personal grudge.

Zangid DYNASTY, Muslim Turkish dynasty that was founded by Zangī (q.v.) and which ruled northern Iraq (al-Jazīrah) and Syria in the period 1127–1222. After Zangī's death in 1146, his sons divided the state between them, Syria falling to Nureddin (Nūr ad-Dīn Maḥmūd; reigned 1146–74) and al-Jazīrah to Sayf ad-Dīn Ghāzī I (reigned 1146–49). Nureddin's expansionist policy led him to annex Damascus (1154), subjugate Egypt (1168), and present a broad and competent Muslim front against the crusaders, especially under such generals as Saladin, subsequent founder of the Ayyūbid dynasty of Egypt.

The Syrian branch of the Zangids was reunited with the Iraqi line in 1181 and was eventually absorbed into Saladin's new empire. The Zangids held on to al-Jazīrah and successfully repulsed several attempts made by Saladin to capture Mosul (1182 and 1185); they were, however, forced to accept his suzerainty. The rise to power of Badr ad-Dīn Lu'lu', a former slave, as regent for the last Zangid, Nāṣir ad-Dīn Maḥmūd (reigned 1219–22), marked the end of the dynasty. Lu'lu' ruled Mosul as

atabeg from 1222 to 1259; soon afterward the city fell to the Mongols.

A third branch of the Zangids had established themselves in Sinjār, west of Mosul, in 1170 and ruled there for about 50 years. The Ayyūbids completed several architectural works begun by the Zangids. The most noteworthy is the Great Mosque in Aleppo, completed in 1190. The building, a perfect continuation of the Zangid artistic tradition, demonstrates simplicity in decorative architecture. It is built around a large, open, marble-floored court, with a polychrome mihrab (prayer niche facing Mecca) and a tall, square minaret. Large areas of wall are left undecorated in contrast to the expressive but delicately carved marble inlay ornaments.

The Zangids are famous for their patronage of the 13th-century Mosul schools of metalwork and painting. Mosul produced the finest metal inlay pieces (usually bronze with silver inlay) in the Islāmic world at that time. Their craftsmen carried the technique to Aleppo, Damascus, Baghdad, Cairo, and Iran, influencing the metalwork of those areas for centuries following. The Mosul school of painting was rivaled in Iraq only by the Baghdad school. Stylistically, Mosul miniatures were based heavily on Seljuq traditions, but they had an iconography of their own. Of somewhat less importance were knotted carpets made by Zangid craftsmen, two-coloured silks being the speciality.

Zangwill, Israel (b. Feb. 14, 1864, London, Eng.—d. Aug. 1, 1926, Midhurst, West Sussex), novelist, playwright, and Zionist leader, one of the earliest English interpreters of Jewish immigrant life.

The son of eastern European immigrants, Zangwill grew up in London's East End and

Zangwill, pen-and-ink drawing by A. Wolmark, 1925; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

was educated at the Jews' Free School and at the University of London. His early writings were on popular subjects of his day, but with Children of the Ghetto: A Study of a Peculiar People (1892), he drew on his intimate knowledge of ghetto life to present a gallery of Dickensian portraits of Whitechapel immigrant Jews struggling to survive in a new environment. The novelty of the subject, enhanced by Zangwill's emphasis on the Jews' exotic traits and by his simulation in English of Yiddish sentence structure, aroused great interest. Other works of Jewish content include a picaresque novel, The King of Schnorrers (1894), concerning an 18th-century rogue, and Dreamers of the Ghetto (1898), essays on such famous Jews as Benedict de Spinoza, Heinrich Heine, and Ferdinand Lassalle. The image of America as a crucible wherein the European nationalities would be transformed into a new race owes its origin to the title and theme of Zangwill's play The Melting Pot

Zangwill became a spokesman for Zionism after meeting Theodor Herzl in 1896 but broke with the movement to form the Jewish Territorial Organization for the Settlement of the Jews Within the British Empire, of which he was president (1905–25).

Zanj rebellion (AD 869-883), a black-slave revolt against the 'Abbāsid caliphal empire. A number of Basran landowners had brought several thousand East African blacks (Zanj) into southern Iraq to drain the salt marshes east of Basra. The landowners subjected the Zanj, who generally spoke no Arabic, to heavy slave labour and provided them with only minimal subsistence. In September 869, 'Alī ibn Muhammad, a Persian claiming descent from 'Alī, the fourth caliph, and Fāṭimah, Muhammad's daughter, gained the support of several slave-work crews-which could number from 500 to 5,000 men—by pointing out the injustice of their social position and promising them freedom and wealth. 'Alī's offers became even more attractive with his subsequent adoption of a Khārijite religious stance: anyone, even a black slave, could be elected caliph, and all non-Khārijites were infidels threatened by a holy war.

Zanj forces grew rapidly in size and power, absorbing the well-trained black contingents that defected from the defeated caliphal armies, along with some disaffected local peasantry. In October 869 they defeated a Basran force, and soon afterward a Zanj capital, al-Mukhtārah (Arabic: the Chosen), was built on an inaccessible dry spot in the salt flats, surrounded by canals. The rebels gained control of southern Iraq by capturing al-Ubullah (June 870), a seaport on the Persian Gulf, and cutting communications to Basra. then seized Ahvaz in southwestern Iran. The caliphal armies, now entrusted to al-Muwaffaq, a brother of the new caliph, al-Mu'tamid (reigned 870-892), still could not cope with the rebels. The Zani sacked Basra in September 871, and subsequently defeated al-Muwaf-

faq himself in April 872 Between 872 and 879, while al-Muwaffaq was occupied in eastern Iran with the expansion of the Saffarids, an independent Persian dynasty, the Zanj seized Wāsit (878) and established themselves in Khuzistan, Iran. In 879, however, al-Muwaffaq organized a major offensive against the black slaves. Within a year, the second Zanj city, al-Manī'ah (The Impregnable), was taken. The rebels were next expelled from Khuzistan, and, in the spring of 881, al-Muwaffaq laid siege to al-Mukhtārah from a special city built on the other side of the Tigris River. Two years later, in August 883, reinforced by Egyptian troops, al-Muwaffaq finally crushed the rebellion, conquering the city and returning to Baghdad with 'Alī's

Zanjān, geographic region of northwestern Iran. It lies west of Tehran and is bordered on the northwest by Azerbaijan and on the southwest by Kordestan. The region constitutes one of the uplands that frame central Iran and has an average elevation of 8,200 feet (2,500 m). It forms part of the Caspian Sea basin. The Zanjān River is the only major river in the region. Agriculture is the principal occupation, and crops include rice, corn (maize), oilseeds, fruits, and potatoes. Poultry, cattle, and sheep are raised. Manufactures include bricks, cement, milled rice, and carpets. Chromium, lead, and copper are mined. Roads and rail service link Zanjan, the principal city of the region, with Abhar and Mehrābād.

Zanjān, also spelled ZENJĀN, city, northwestern Iran. It lies in an open valley about halfway along the Tehrān—Tabriz railway line. It is the principal city of the Zanjān region. It was ravaged by Mongols in the 13th century. Once the seat of a lively caravan trade, the city is now the centre of an agricultural area with abundant harvests of grain. Prior to the Iranian Revolution, the city witnessed fighting between the local people and the Iranian army in 1978. Industries produce milled rice and flour, handwoven cloth, metalware, and coarse carpets.

About 20 miles (32 km) southeast of Zan-

jān city is the village of Soltānīyeh (Sulțānīyah), once the capital of Ilkhanid Iran. It was founded in the late 13th century largely by Öljeitü (1304-16), who moved the capital there and whose magnificent mausoleum is practically the only remaining Ilkhan (a Mongol dynasty) architecture. Its dome, 168 feet (51 m) high, rests on an octagonal brick structure decorated with blue faience (earthenware ceramic). Pop. (1985 est.) 205,900.

Zankle (Sicily): see Messina.

zanni, plural zanni, or zannis, stock servant character in the Italian improvisational theatre known as the commedia dell'arte. Zanni were valet buffoons, clowns, and knavish jacks-ofall-trades. All possessed common sense, intelligence, pride, and a love of practical jokes and intrigue; they were, however, often quarrelsome, cowardly, envious, spiteful, vindictive, and treacherous. The term is thought to be a diminutive form of Giovanni common to Bergamo, in Lombardy, where the zanni character originated, and it refers to male servants. Dei Zanni ("the zanni") was a generic term for the commedia dell'arte itself.

The zanni's costumes consisted of a wood or leather half mask with hair and beard glued to it, a loose blouse, wide trousers, and a widebrimmed or tall conical hat with long feathers. Zanni initiated the action of the play and produced comic impact based on repeated comic actions (lazzi), topical jokes, and practical jokes (burle), often directed against the

Zanni (Harlequin, left, and probably Scapin, right) with Pantaloon (centre), detail from "The Gelosi Company," 1580; in the Drottningholm Theatre Museum, Stockholm

By courtesy of the Drottningholms Teatermuseum. Stockholm

smug, the proud, and the pretentious. Zanni were also notable for their feats of acrobatics. In some commedia performances there was only one zanni; in others there might be two to four. The principal character among them was often called simply Zanni, while his companion(s) had various names—Scapin, Scaramouche, Pedrolino, Harlequin (qq.v.), or Pulcinella (see Punch). Frequently two zanni played contrasting roles, the first clever and adept at confounding, the second a dull-witted

Zānskār Range (China): see Zāskār Range. Zante (Greece): see Zacynthus.

Zanthoxylum, the prickly ash genus of the rue family (Rutaceae), comprising about 200 species of aromatic trees and shrubs native to the middle latitudes of North America, South America, Africa, Asia, and Australia. There are both deciduous and evergreen species. They have small, greenish flowers and fruits that consist of groups of two-valved capsules, each containing a single shiny black seed.

Common prickly ash, or toothache tree (Z. americanum), is very hardy, appearing as far north as Quebec. Another well-known cultivated species is Z. clava-herculis, variously

Hercules'-club (Zanthoxylum clava-herculis)

called the Hercules'-club, the sea ash, or the pepperwood. West Indian satinwood, or yellowheart (Z. flavum), produces shiny, goldenbrown timber for cabinetwork.

Zanuck, Darryl F(rancis) (b. Sept. 5, 1902, Wahoo, Neb., U.S.—d. Dec. 22, 1979, Palm Springs, Calif.), Hollywood producer, motionpicture executive for more than 30 years, and an innovator of many trends in film.

Zanuck began his film career in 1924 as a scriptwriter for Warner Brothers studio, but within three years he had advanced to executive producer. He promoted Warner Brothers' conversion to sound, producing The Jazz Singer (1927), the first feature with synchronized speech as well as music. With the production of Little Caesar (1930) and The Public Enemy (1931), he initiated the long series of gangster pictures popular during that decade

In 1933 Zanuck cofounded Twentieth Century Pictures, the company that merged two years later with the Fox Film Corporation. As the controlling executive of Twentieth Century-Fox, Zanuck produced such memorable films as The Grapes of Wrath (1940), How Green Was My Valley (1941), Winged Victory (1944), The Razor's Edge (1946), Gentlemen's Agreement (1947), and Viva Zapata! (1952). Zanuck resigned from Twentieth Century-Fox in 1956. He returned six years later as president of the corporation and engineered the financial recovery of the studio with two box-office hits: The Longest Day (1962) and The Sound of Music (1965). Later, M*A*S*H* (1970) and Patton (1970) were critical and artistic successes. Zanuck announced his retirement in 1971 from the post of chairman and chief executive officer that he had held since 1969. On three occasions Zanuck was awarded the Irving Thalberg Memorial Award of the Motion Picture Academy of Arts and Sciences for outstanding contributions to the industry.

Zanzibar, island in the Indian Ocean 22 miles (35 km) off the coast of east-central Africa. In 1964 Zanzibar, together with Pemba Island (q.v.) and some other smaller islands, joined with Tanganyika on the mainland to form the United Republic of Tanzania. Zanzibar island covers 637 square miles (1,651 square km).

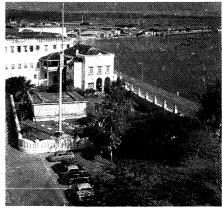

Both Zanzibar and Pemba are believed to have once formed part of the African continent, the separation of Pemba having occurred during the Miocene epoch (23.7 million to 5.3 million years ago) while Zanzibar dates

from the Pliocene epoch (5.3 million to 1.6 million years ago) or even later. Various types of limestone form the base of both islands. Raised sands and sandstones also occur, together with varied residual deposits similar to alluvial strata on the adjacent mainland. Extensive weathering of the limestones combined with erosion and earth movements have resulted in a variety of soils including red earths, loams, clays, and sands. Flat areas of coral limestone occur to the east, south, and north of Zanzibar and on the western islands. In places the coral is overlain by shallow red earth or alluvium.

The general impression of Zanzibar when approached from the mainland is of a long, low island with small ridges along its central north-south axis. Coconut palms and other vegetation cover the land surface. It is 53 miles (85 km) at its greatest length and 24 miles (39 km) broad. The highest point of the central ridge system is Masingini, 390 feet (119 m) above sea level. Higher ground is gently undulating and gives rise to a few small rivers, which flow west to the sea or disappear in the coral country.

The climate is typically insular, tropical, and humid, with an average annual rainfall of 60 to 80 inches (1,500 to 2,000 mm). Rainfall is reliable and well-distributed in comparison with most of eastern Africa. Northeast trade winds blow from December to March and southeast trade winds from May to October. The "long rains" occur between March and May and the "short rains" between October and December.

Small patches of indigenous forest and isolated large trees support the view that much of the island was originally covered by dense ev-

The former sultan's palace, facing the harbour at Zanzibar, Tanzania

ergreen forest. The open coral-outcrop country supports a dense thicket vegetation. The flat clay plains are grass-covered. The major wild animals include leopard (a variety peculiar to Zanzibar), civet cat, mongoose, two species of monkey, lemur, the African pig, forest duiker, pigmy antelope, about 20 species of bats, and 30 forms of snakes. Mosquitoes breed freely during the rainy seasons. Insect pests such as the coreid bug (*Pseudotheraptus wayi*), which attacks coconuts, and animal pests and parasites, such as tsetse fly and ticks (which transmit east coast fever to cattle), have been the subject of research and control.

The southern and eastern portions of Zanzibar island have been mainly populated by a Bantu-speaking people known as the Hadimu; the northern portion of Zanzibar island and the adjacent Tumbatu island have been occupied by another Bantu-speaking people known as the Tumbatu. These two groups represent the earliest arrivals in Zanzibar. Throughout the 19th century, and after, they were expropriated from the western and more fertile parts of the island by later arrivals, notably Arabs. The nationalization of land in 1964, however, was followed by economic reforms that redistributed the land. Fishing has traditionally been highly important in coastal villages and remains so.

The language most widely spoken is a highly Arabicized form of Swahili (Kiswahili). Among the Arabs, the language of the home is usually Swahili and the use of pure Arabic is confined to scholars and recent arrivals from Arabia. Gujarati, Hindi, Urdu, and Konkani are spoken by the Asian communities, and English and Swahili are widely used and understood. Prior to the development of eastern African

mainland ports, Zanzibar was the trade focus of the region and enjoyed an important entrepôt trade. The island's economy now depends

on agriculture and fishing.

Considerable areas of fertile soil and a favourable climate enable the production of a variety of tropical crops, most importantly cloves and coconuts. Local food crops, such as rice, cassava, yams, and tropical fruit, are also important. Fish is an important part of the diet, and local fisheries employ perhaps about one-tenth of the population.

Zanzibar's history was greatly shaped by its geography, the prevailing winds of the region placing it directly on the Indian Ocean trade routes and making it accessible to both traders and colonists from Arabia, south Asia, and the African mainland. The first immigrants were the Africans; the next were the Persians, who began to land in Zanzibar in the 10th century and who, over a brief period, became absorbed into the local population and disappeared as a separate group. Their influence was left in the gradual consolidation of disparate villages and rural populations into what came to be recognized as two peoples, the Hadimu and the Tumbatu. This African-Persian population converted to Islām and adopted many Persian traditions. (Even today, most of Zanzibar's African population calls itself "Shirazi," in echo of the ancient Persian principality of Shīrāz, from which the earliest Persians came.)

Arabs had the deepest influence on Zanzibar, because the island's position made it a perfect entrepôt for Arabs mounting slave expeditions into Africa and conducting oceangoing commerce. Arabs from Oman became especially important, for they began establishing colonies of merchants and landowners in Zanzibar. Eventually they became the aristocracy of the island.

The Portuguese then came in the 16th century and conquered all the seaports on the eastern African coast, including Mombasa, the richest and most powerful, as well as such islands as Zanzibar and parts of the Arabian coast, including the Omani capital of Muscat. The purpose of the Portuguese, however, was largely commercial rather than politically imperial, and, when their power dwindled in the course of the 17th century, they left few marks of their stay.

The Omani Arabs, who expelled the Portuguese from Muscat in 1650 and were the leading force against them in the entire region, gradually established at least nominal control over many settlements, including Zanzibar. After a lengthy turmoil of dynastic wars and losses and gains on the African coast, the ruling sultan of Oman, Saʿīd ibn Sulṭān, decided to relocate his capital from Muscat to Zanzibar. The rapid expansion of the slave trade in the late 18th and early 19th centuries, caused by the demand for plantation slaves in North and South America, made Zanzibar central to the slave (as well as the ivory) trade routes into the interior of Africa. Zanzibar itself also

had significant resources of coconuts, cloves, and foodstuffs. The sultan of Oman made it his capital in 1832.

In 1861 Zanzibar was separated from Oman and became an independent sultanate, which controlled the vast African domains acquired by Saʿīd. Under the sultan Barghash (reigned 1870-88), however, Great Britain and Germany divided most of Zanzibar's territory on the African mainland between them and secured economic control over the remaining coastal strip. In 1890 the British proclaimed a protectorate over Zanzibar itself; the sultan's authority was reduced and the slave trade curtailed.

In 1963 the sultanate regained its independence, becoming a member of the British Commonwealth. In January 1964 a revolt by leftists overthrew the sultanate and established a republic. The revolution marked the overthrow of the island's long-established Arab ruling class by the Africans, who were the majority of the population. In April the presidents of Zanzibar and Tanganyika signed an act of union of their two countries, creating what later in the year was named Tanzania (q.v.). Pop. (1987 est.) including Pemba island, 605,000.

Zanzibar, city and port of the island of Zanzibar, Tanzania, eastern Africa. The island's principal port and commercial centre, it is on the western side of the island behind a wellprotected natural deepwater harbour. In 1824 Sultan Sa'īd ibn Sulţān of Oman established his capital there, shifting it from Muscat on the Arabian Peninsula. During the remainder of the 19th century, the city flourished as the base for Arab and European activities in eastern Africa, becoming infamous for its trade in slaves. Zanzibar subsequently declined in importance as the ports of Dar es Salaam and Mombasa (on the coast of the eastern African mainland) took over much of its trade. Zanzibar's port is still a major exporter of cloves. however, together with coconuts, citrus fruits, and other tropical products. Pop. (1978) 110,-

Zanzibar Treaty, also called HELGOLAND-ZANZIBAR TREATY (July 1, 1890), arrangement between Great Britain and Germany that defined their respective spheres of influence in eastern Africa and established German control of Helgoland, a North Sea island held by the British since 1814. The treaty was symptomatic of Germany's desire for a rapprochement with Great Britain after the abandonment of a Bismarckian entente with Russia.

The treaty provided for Germany's cession to Great Britain of its claims to the Zanzibar protectorate and to the eastern African coast between Witu and the Juba River; for Great Britain's acknowledgment of a German sphere of influence on the eastern African mainland, with a northern boundary extending from Lake Victoria to the Congo state and a southwestern boundary extending from Lake Nyasa to Lake Tanganyika; for British assent to Germany's acquiring the Caprivi Strip, a narrow strip belonging to present-day South West Africa/Namibia, north of what is now Botswana, which gave German South West Africa access to the Zambezi River; and for the British cession to Germany of the island of Helgoland in the North Sea-a prerequisite to German naval development.

Zao Shen (in Chinese mythology): see Tsao Shen.

Zaozhuang (China): see Tsao-chuang.

Západočeský, also called Západní Čechy, English Western Bohemia, *kraj* (region), western Czech Socialist Republic, western Czechoslovakia. Bordered by Germany on the north and on the west and by Severočeský, Středočeský, and Jihočeský kraje on the east. Západočeský has an area of 4,199 square miles (10,875 square km). The region is surrounded by mountains on its external boundaries and contains a series of hilly ranges running southwest to northeast. The region's only lowland areas are the valleys of the Berounka River and its several tributaries which converge in a plain on the regional capital, Plzeň (German Pilsen).

Corn (maize) for animal feed, hay, wheat, barley, oats, potatoes, and rye are the chief crops grown in the lower areas. Apples, plums, pears, and cherries are the principal fruits; and hogs, cattle, and poultry constitute the main livestock. Forestry is important in the mountains. Coal is Západočeský kraj's main mineral resource, but tin, tungsten, building stone, and kaolin are also extracted. The main industrial centre is Plzeň, noted for its Pilsner brewery and for its V.I. Lenin (formerly Skoda) heavy machinery works. A wide variety of other heavy and light industries are found throughout the kraj.

Západočeský kraj is renowned for its thermal and mineral water spas. The most famous is Karlovy Vary, where there are 12 hot mineral springs located along the Czechoslovak–Soviet Friendship Colonnade, and a geyser that shoots as high as 40 feet (12 m). Founded 1347–58 by the Holy Roman emperor Charles IV, the spa has since been visited by many

notable personages.

Plzeň is the region's main cultural centre; it contains the College of Mechanical and Electrical Engineering, a teacher-training college, the State Scientific Library, the West Bohemian Museum and Gallery, the Folklore Museum, and the Skupa Puppet Theatre. Cheb has a folklore museum near which stands the house where the playwright Friedrich Schiller composed the drama *Wallenstein*. Nepomuk, 19 miles (31 km) south of Plzeň, is the birthplace of the 18th-century Czech martyr St. John Nepomuk.

The population of Západočeský kraj is overwhelmingly Czech. Sokolov and Karlovy Vary okresy (districts) have between a 2 and 3 percent German minority population, and there is a Slovak population of 6 percent scattered throughout the kraj. Pop. (1988 est.) 869,996.

Západoslovenský, also called západní SLOVENSKO, English WESTERN SLOVAKIA, kraj (region), southwestern Slovak Socialist Republic, south-central Czechoslovakia. Bordered on the northwest by Jihomoravský kraj, on the southwest by Austria, on the southeast by Hungary, and on the northeast by Stredoslovenský kraj, it has an area of 5,595 square miles (14,492 square km). Plains formed by the Morava (March), Dunaj (Danube), Váh, Nitra, and Hron rivers dominate the southern part of the region. Wheat, rye, barley, corn (maize), vegetables, hemp, grapes, and tobacco are the main crops grown, and pigs, poultry, and cattle are also raised. The Malé and Biele Karpaty (Little and White Carpathians) ring the western and northern parts of the region. The Carpathian slopes are noted for vineyards.

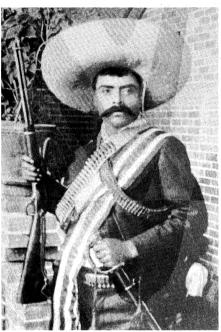

The river valleys of this Slovakian region produce glass sand, ceramic clay, and gravel; dolomite (marble) and limestone are quarried in the mountains; at Pezinok, antimony is mined. In the 1970s deposits of natural gas and oil were found in the Morava River valley. A series of five dams on the Váh River provides hydroelectric energy for industry centred in the Váh valley cities. Trnava, Hlohovec, Pieštany, Nové Mesto nad Váhom, and Trenčín have diversified industries. Šal'a, on the lower Váh River, is the site of Czechoslovakia's largest fertilizer plant.

Bratislava serves as the region's capital, although it is administered separately; it is also a major industrial centre and effectively the cultural capital of Západoslovenský kraj. Západoslovenský kraj has several mineral water spas, of which the best known is Piešt'any. Archaeological remains found around the spas show that they were already known in Roman

The area between the Danube and the Little Danube rivers, called Velký Žitný Ostrov (Great Rye Island) is more than one-half Hungarian, the heaviest concentration of an ethnic minority in Czechoslovakia. Pop. (1984 est.) 1.707.500.

Zapata, Emiliano (b. Aug. 8, 1879, Anenecuilco, Mex.-d. April 10, 1919, Morelos), Mexican revolutionary, champion of agrarianism, who fought in guerrilla actions during the Mexican Revolution and its aftermath (1911-

Early career. Zapata was the son of a mestizo peasant who trained and sold horses. He was orphaned at age 17 and had to look after his brothers and sisters. In 1897 he was arrested because he took part in a protest by the peasants of his village against the hacienda

Zapata, 1912 Archivo Casasola

that had appropriated their lands. After getting a pardon, he continued agitation among the peasants, and so he was drafted into the army. He served six months, until he was discharged to a landowner to train his horses. In 1909 his neighbours elected him president of the board of defense for their village. After useless negotiations with the landowners, Zapata and a group of peasants occupied by force the land that had been appropriated by the haciendas and distributed it among themselves.

Francisco Madero, a landowner of the north, had lost the elections in 1910 to the dictator Porfirio Díaz and had fled to the United States, where he proclaimed himself president and then reentered Mexico, aided by many peasant guerrillas. Zapata and his friends decided to support Madero. In March 1911 Zapata's tiny force took the city of Cuautla and closed the road to the capital, Mexico City. A week later, Díaz resigned and left for Europe, appointing a provisional president. Zapata, with 5,000 men, entered Cuernavaca, capital of the state of Morelos.

Madero entered Mexico City in triumph. Zapata met Madero there and asked him to exert pressure on the provisional president to return the land to the ejidos (the former Indian communal system of landownership). Madero insisted on the disarmament of the guerrillas and offered Zapata a recompense so that he could buy land, an offer that Zapata rejected. Zapata began to disarm his forces but stopped when the provisional president sent the army

against the guerrillas.

The Plan of Ayala. Madero was elected president in November 1911, and Zapata met with him again but without success. With the help of a teacher, Otilio Montaño, Zapata prepared the Plan of Ayala, which declared Madero incapable of fulfilling the goals of the revolution. The signers renewed the revolution and promised to appoint a provisional president until there could be elections. They also vowed to return the stolen land to the ejidos by expropriating, with payment, a third of the area of the haciendas; those haciendas that refused to accept this plan would have their lands expropriated without compensation. Zapata adopted the slogan "Tierra y Libertad" "Land and Liberty").

In the course of his campaigns, Zapata

distributed lands taken from the haciendas, which he frequently burned without compensation. He often ordered executions and expropriations, and his forces did not always abide by the laws of war. But underneath his picturesque appearance—drooping moustache, cold eyes, big sombrero—was a passionate man with simple ideals that he tried to put into practice. The Zapatistas avoided battle by adopting guerrilla tactics. They farmed their land with rifles on their shoulders, went when called to fight, and returned to their plows at the end of a battle or skirmish. Sometimes Zapata assembled thousands of men; he paid them by imposing taxes on the provincial cities and extorting from the rich. Their arms were captured from federal troops.

When Gen. Victoriano Huerta deposed and assassinated Madero in February 1913, Zapata and his men arrived at the outskirts of Mexico City and rejected Huerta's offer to unite with him. This prevented Huerta from sending all his troops against the guerrillas of the north, who, under the direction of a moderate politician, Venustiano Carranza, had organized the Constitutionalist Army to defeat the new dictator. Huerta was forced to abandon the country in July 1914.

Zapata knew that Carranza's Constitutionalists feared him. He attracted some intellectuals from Mexico City, among them Antonio Diaz Soto y Gama, who became his theorist and later established an agrarian party. When Huerta fell, Zapata invited the Constitutionalists to accept his Plan of Ayala and warned them that he would continue fighting independently until the plan was put to practical

In October 1914 Carranza called an assembly of all the revolutionary forces. Pancho Villa, who commanded the most important part of the army of the north, refused to attend because he considered Mexico City as enemy ground. The assembly was moved to Aguas-calientes, where both the Villistas and the Zapatistas attended. These two groups formed a majority, and the convention agreed to appoint Gen. Eulalio Gutiérrez as provisional president. Carranza rejected this decision and marched with his government to Veracruz.

War broke out between the moderates (Carrancistas) and the revolutionaries (Conventionists). On November 24, Zapata ordered his army (now called the Liberation Army of the South and numbering 25,000 men) to occupy Mexico City. The people of the capital watched in astonishment as the peasants went from door to door humbly asking for food and drink, instead of assaulting palaces and violating women.

Two weeks later, Zapata and Villa met on the outskirts of the capital and then visited the National Palace. The two leaders promised to fight together until they put a civilian president in the palace, and Villa accepted the Plan of Ayala.

Agrarian reforms. Zapata created agrarian commissions to distribute the land; he spent much time supervising their work to be sure they showed no favouritism and that the landowners did not corrupt its members. He established a Rural Loan Bank, the country's first agricultural credit organization; he also tried to reorganize the sugar industry of Morelos into cooperatives. In April 1915 U.S. President Woodrow Wilson's personal representative in Mexico met with Zapata; Zapata asked that Wilson receive his delegation, but Wilson had recognized the Carranza government (the convention's government under Gutiérrez had dispersed).

Meanwhile, the war continued. Zapata occupied the city of Puebla and won various battles, advised by some professional soldiers who had joined his side. In 1917 Carranza's generals defeated Villa and isolated Zapata. Carranza then called together a constitutional convention but did not invite Zapata; the convention approved and passed a constitution and elected Carranza as president of the republic.

A new U.S. envoy, William Gates, visited Zapata and then published a series of articles in the United States; he contrasted the order of the Zapata-controlled zone with the chaos of the constitutional zone and said that "the true social revolution can be found among the Zapatistas." When these articles were read to Zapata, he said, "Now I can die in peace. Finally they have done us justice.

Soon afterward Gen. Pablo González, who directed the government operations against Zapata, had Col. Jesús Guajardo pretend to want to join the agrarians and contrive a secret meeting with Zapata at the hacienda of Chinameca in Morelos. There, Zapata was ambushed and shot to death by Carrancista soldiers. His body was carried to Cuautla and buried there.

BIBLIOGRAPHY. John Womack, Zapata and the Mexican Revolution (1969), is an excellent study of the life of the peasant leader. Another creditable portrayal of Zapata and his times is Roger Parkinson, Zapata (1976).

Zapolska, Gabriela, pseudonym of MARIA GABRIELA KORWIN-PIOTROWSKA (b. March 30, 1857, Podhajce, Galicia, Hungary—d. Dec. 17, 1921, Lwów, Pol.), Polish novelist and playwright of the naturalist school.

Having tried unsuccessfully to pursue an acting career in Paris, she started writing cheap, sensationalist novels, full of bitterness toward middle-class values, morality, and hypocrisy. Of her several novels written over a period of 20 years, only two have survived in terms of modern readability. Zaszumi las (1899; "The Forest Will Murmur") is a roman à clef about Polish revolutionaries, mostly students and artists, whom she had known or known about in Paris. Sezonowa miłość (1905; "Love in the Season") is a novel about fashionable life among the middle class in the resort town of Zapotane. Zapolska also wrote plays, mostly melodramas, which had the same ephemeral quality as most of her novels, but one is still remembered: Moralność pani Dulskiej (1906; "Mrs. Dulska's Morality"), a comedy-farce about a dominating matriarch of a bourgeois family.

Zápolya, János (king of Hungary): see John under John (Hungary).

Zapopan, city, north central Jalisco state, west central Mexico. It is in the temperate Guadalajara Valley, at an altitude of 5,243 ft (1,598 m) above sea level, 4½ mi (7 km) northwest of Guadalajara, the state capital. The city is a commercial and manufacturing centre for the surrounding area that produces grain (principally corn [maize]), sugarcane,

cotton, and fruits and vegetables. Livestock (horses, pigs, and cattle) are raised. Apiculture, aviculture, and tourism are additional sources of income. The 17th-century basilica of Zapopan is the site of annual pilgrimages. Because of its proximity to Guadalajara, it is easily accessible by highway, railroad, and air. Pop. (1970) 45,592.

Zaporozhye, also spelled ZAPOROZHE, or ZAPOROŽJE, oblast (administrative region), Ukrainian Soviet Socialist Republic, with an area of 10,500 sq mi (27,200 sq km) on the northern shore of the Sea of Azov, stretching inland across the coastal plain, the Azov Upland, and the Dnepr Plain to the Dnepr River (and including a very small part of its right-bank area). The entire oblast lies within the steppe zone, although much of the natural grass cover has been plowed and gully erosion is serious. The climate is dry, and many of the rivers are seasonal. Apart from the metallurgy of Zaporozhye city, the administrative centre, and engineering in Melitopol and Berdyansk, there is an iron-mining complex at Dneprorudny on the Kakhovka reservoir. Other industry is concerned chiefly with processing agricultural produce, for agriculture, although susceptible to drought, is highly developed, dominated by grains, notably wheat and corn (maize). Sunflowers, potatoes, melons, and other vegetables are also important, and there are a number of vineyards and orchards. Dairying predominates in the north of the *oblast*, and sheep raising in the Azov coastal plain. Pop. (1983 est.) 2,008,000.

Zaporozhye, also spelled Zaporozhe, or Zaporožje, formerly (until 1921) Aleksandrovsk, city and administrative centre of Zaporozhye *oblast* (administrative region), Ukrainian Soviet Socialist Republic, on the Dnepr River just below its former rapids. In 1770 the fortress of Aleksandrovsk was established to ensure government control over the Zaporozhye Cossacks, whose headquarters were on nearby Khortitsa Island. The settlement became a town in 1806. The growth of the city dates from the construction in 1927–32 of the Dnepr hydroelectric station, then the largest in the world. In World War II the dam was destroyed, but it was subsequently reconstructed.

On the basis of the power, a large metallurgical industry developed, including the Zaporozhstal iron and steel plant, factories specializing in high-grade steels made in electric hearths, ferroalloys, titanium, and aluminum smelting. Zaporozhye has one of the largest strip-rolling mills of the Soviet Union. Coke by-products supply an important chemical industry. A range of engineering and light industries includes the manufacture of automobiles and electrical apparatus. The city stretches for several miles along the Dnepr, with a greenbelt separating its industrial and residential sectors. There are teacher-training, pharmaceutical, and machine-building institutes. Pop. (1983 est.) 835,000.

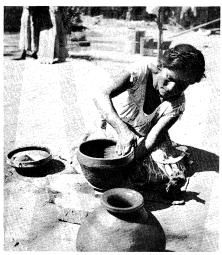

zapote (fruit): see sapote.

Zapotec, Middle American Indian population living in eastern and southern Oaxaca in southern Mexico.

The Zapotec culture varies according to habitat—mountain, valley, or coastal—and according to economy—subsistence, cash crop, or urban; and the language varies from pueblo to pueblo, existing in several mutually unintelligible dialects, better called distinct languages. In general, however, Zapotec society is oriented around central villages or towns and has an agricultural base. Staple crops are corn, beans, and squash; market crops such as coffee, wheat, and sugarcane are grown where climate allows. Some hunting, fishing, and

gathering of wild foods is also practiced. Agriculture is based on slash-and-burn clearing of land, and plow and oxen are used to cultivate.

Crafts are still practiced in some areas; these are chiefly pottery, weaving, and palm-fibre weaving. Clothing ranges from traditional (particularly for women) to modern. Traditional dress for women consists of a long skirt, long overtunic (huipil), and a shawl or wraparound headpiece. Male dress, when not modern, consists of wide, loose trousers, loose shirt, sometimes with pleats, sandals, and straw or wool hat. Religion is Roman Catholic, but belief in pagan spirits, rituals, and myths persists, to some extent intermingled with Christianity.

Zapotec Indian making pottery, Oaxaca, Mex.
Donald Cordry

The *compadrazgo*, a system of ritual kinship established with godparents, is important.

Zápotocký, Antonín (b. Dec. 12, 1884, Zakolony, near Kladno, Bohemia, Austria-Hungary—d. Nov. 13, 1957, Prague), political leader, cofounder of the Communist Party of Czechoslovakia, and the native Czech leader who probably contributed most to the successful Communist coup of 1948.

Zápotocký was a member of the Social Democratic Party for 20 years before the founding of the Communist Party in 1921; he engaged in Communist activities while he served in the democratic Czech Parliament. An able organizer and propagandist, he helped set up the party press, form party labour unions and cooperatives, and organize the party during the long presidency of Tomáš Magaryk (1918-15)

Masaryk (1918–35).

Zápotocký served as secretary general of the Communist Trade Unions from 1929 to 1939, an association that gave him political strength and recognition. Thus, after World War II when the Revolutionary Trade Union Movement, composed of all of Czechoslovakia's organized labour, was formed in 1945, Zápotocký became its chairman. After the Communist takeover of the government in 1948, Zápotocký became a member of the political secretariat. He became president of Czechoslovakia, after the death of Klement Gottwald in 1953, a position that he held for the remainder of his life.

Zaqāzīq, az-, also spelled ZAGAZIG, city and capital of ash-Sharqīyah muḥāfazah (governorate), Egypt, on the Nile Delta north-northeast of Cairo. The city dates from the 1820s when cotton cultivation spread to the eastern delta. Located at the junction of two irrigation canals (Tur'at as-Suways al-Ḥulwah [Sweetwater Canal] and Tur'at al-Mu'iz), az-Zaqāzīq is about 1 mi (2 km) north of mounds marking the site of the 4th-dynasty city of Bubastis. An important road and railway junction, the

Canal bridge, az-Zaqāzīq, Egypt
Tor Eigeland—Black Star/EB Inc.

city is a major cotton and grain market. Pop. (1976) 202,575.

Zara (Yugoslavia): see Zadar.

Zara, Siege of (1202), a major episode of the Fourth Crusade; the first attack on a Christian city by a crusading army, it foreshadowed the same army's assault on Constantinople, the Byzantine capital, in 1203–04. Zara (modern Zadar, Yugos.), a vassal city of the Venetian republic, rebelled against Venice in 1186 and placed itself under the protection of King Béla III of Hungary. Anxious to reassert their claims over Zara, the Venetians diverted the Fourth Crusade from its original objectives, Palestine and Egypt, to attack the city.

Pope Innocent III (1198–1216) had learned of the proposed attack before the fleet set sail and sent letters to Venice forbidding the action. Even the threat of excommunication failed to deter the armies, although their reluctance to accede to the papal directive is doubtless a reflection of the severe financial problems that confronted them. The crusaders, who came from France, had agreed to pay the Venetians to transport them to the Holy Land, but they found themselves without sufficient funds. Faced with the threat of abandonment of the crusade and forfeiture of money already paid, they acquiesced to the Venetian proposal to lay siege to Zara. The fleet sailed from Venice in early Octo-

The fleet sailed from Venice in early October 1202, arriving at Zara on November 10. The city surrendered after two weeks of siege and assault; the garrison and the inhabitants were spared. The expedition wintered in Zara, during which time the decision was made to attack Constantinople the following spring.

Zaradros River (Tibet-India-Pakistan): see Sutlej River.

Zaragoza, province, in the autonomous community (region) of Aragon, northeastern Spain. Together with the provinces of Huesca and Teruel, it formed the old kingdom of Aragon. It has an area of 6,639 sq mi (17,194 sq km) and extends north and south of the middle course of the Río Ebro; it reaches the foot of the Pyrenees (north) and is bounded west by the provinces of Navarra, Logroño, and Soria, south by Guadalajara and Teruel, and east and northeast by Tarragona, Lérida, and Huesca. The relief is mostly gently rolling tableland drained by the Ebro and its tributaries. The scarce annual rainfall of less than 15-18 in. (380-460 mm) explains the importance of irrigation. All the main settlements are in the irrigated valleys, the Ebro being the chief link, with the Jalón Valley ranking next in importance.

Cereals, especially wheat and barley, are the mainstay of the economy, followed by alfalfa, stock raising, industrial crops such as sugar beets, and horticulture. From Daroca down the Jiloca Valley into the Jalón Valley is an important fruit-growing district. Industry is largely concentrated in the provincial capital, Zaragoza (q,v) city. Apart from the latter, the main population centres are Calatayud, Tarazona de Aragón, Caspe, Ejea de los Caballeros, and Tauste. Pop. (1982 est.) 828,692.

Zaragoza, English SARAGOSSA, capital of Zaragoza province, in the autonomous community (region) of Aragon, northeastern Spain, lying on the south bank of the Río Ebro (there

Catedral Nuestra Señora del Pilar on the Río Ebro, Zaragoza city, Spain

bridged). Toward the end of the 1st century BC, the Celtiberian town of Salduba at the site was taken by the Romans, who made it a colony under Emperor Augustus with the name of Caesaraugusta (from which its Arabic name Saraqustah and its present name were derived). The chief commercial and military station in the Ebro valley, it was one of the first towns in Spain to be Christianized, and it had a bishop by the middle of the 3rd century AD. In 380 a church synod at Zaragoza condemned the Priscillianist heresy of absolute renunciation of all sense pleasures. After falling to the Germanic Suebi and then to the Visigoths in the 5th century, the town was taken by the Moors c. 714. In 778 it was besieged by the Frankish king Charlemagne, who had to withdraw because of a Saxon rebellion in his domain. After being captured by the Almoravids in 1110, Zaragoza was taken by King Alfonso I of Aragon in 1118 and thereafter enjoyed three and a half centuries of prosperity as capital of Aragon. In the Peninsular War it was famed for the heroic resistance of its citizens under Gen. José de Palafox y Melzi during a protracted siege (1808-09) by the French, who finally took the city. Among the defenders was Maria Augustin, the "Maid of Saragossa," whose exploits are described in Lord Byron's poem Childe Harold.

The seat of an archbishop, Zaragoza has two cathedrals, the older of which is the Catedral de La Seo (Latin sedes), or Catedral del Salvador, chiefly a Gothic building (1119-1520) but showing some traces of the earlier Romanesque church built on the site of the first mosque erected in Spain. The Catedral Nuestra Señora del Pilar, dedicated to the Virgin of the Pillar who is patron of all Spain, commemorates the traditional appearance on Jan. 2, AD 40, of the Virgin Mary standing on a pillar erected in honour of Saint James the Great, whose shrine is at Santiago de Compostela. The cathedral was begun in 1681 to a design by Francisco Herrera the Younger (El Mozo) and contains some frescos by Goya. The 14thcentury Gothic churches of San Pablo and the Magdalena and the Renaissance church of Santa Engracia are also notable. Outstanding secular buildings include La Lonja, or The Exchange, in Plateresque Gothic style; the Palace of the Counts of Luna (1537), in which the Court of Justice sits; and the 17th-century Palace of the Condes de Sástago y Argillo. The Aliafería Palace, to the west of the city. contains an oratory dome and tower that are among Spain's best examples of Islāmic civil architecture. The University of Zaragoza was founded in 1474, the medical school being its most famous faculty, but the buildings date from later periods.

Zaragoza is an industrial centre and the site of the annual National Trade Fair, which be-

gins October 12. Its industries have expanded with the supply of hydroelectric power from the dams in the Aragonese Pyrenees and of oil from the pipeline from Rota (near Cádiz). It is also a busy railway junction and a trade centre for the agricultural products of the surrounding fertile river basin watered by the Canal Imperial and the Ebro, Huerta, and Gállego rivers. Pop. (1982 est.) 608,725.

Zaramo, also spelled DZALAMO, or SARAMO, a people who reside in the area surrounding Dar es-Salaam, Tanzania, and comprise the major ethnic component in the city. The Zaramo are considered to be part of the cluster of Swahili peoples on the coast of East Africa who have incorporated elements from many diverse ethnic backgrounds but who are unified in the Islāmic faith and in the use of the Swahili language.

Swahili–Arab cultural contributions appear in dress and other practices, but longer standing traditions are maintained in such areas as kinship. The Zaramo are organized into 200 to 300 matrilineal clans. Traditional religious beliefs are evident in the *kolelo* fertility cult and in the worship of the deity Mulungu. The Zaramo are not politically centralized traditionally, but they often live in clusters of palisaded villages (*pangone*) led by a headman (*phazi*).

Although they keep some livestock the Zaramo concentrate mainly on agriculture, producing rice, millet, sorghum, corn (maize), peas, cassava, coconuts, and a number of other crops. The proximity of the sea permits fishing by a variety of techniques. In former times the Zaramo fashioned iron implements and even copied European firearms. More recently, Zaramo skill at woodcarving has been displayed in ornamental doors, musical instruments, and other functional creations, as well as in wares prepared for tourists.

The Zaramo, according to traditional explanations, originated as the Kutu in what is today the Morogoro administrative region of Tanzania. Their coastal location close to Dares-Salaam has exposed them to many contacts, especially to trading groups. By means of an arrangement called *utani*, the Zaramo and neighbouring groups are permitted to travel through neighbouring territories; individuals can also claim emergency assistance from their neighbours.

Zárate, city, northeastern Buenos Aires province, Argentina, on the Río Paraná de las Palmas, a channel of the lower Paraná delta emptying into the Río de la Plata northwest of Buenos Aires. Founded in 1825 as Rincón de Zárate, the settlement was given city status in 1909. From 1932 to 1946 it was known as General Uriburu. Although wheat, alfalfa, flax, and potatoes are cultivated and livestock are raised in the hinterland, Zárate is primarily a manufacturing and transportation centre, with meat-packing plants, paper mills, and dairies. A 20-mi (33-km)-long system of bridges, roadways, and railways was completed in the late 1970s extending north from Zárate across the Paraná delta; for the first time, direct transportation links between the Argentine Mesopotamia and Buenos Aires regions were established. A free trade zone for Paraguayan commerce was under construction near Zárate in the early 1980s, but the port of Zárate itself is not navigable to oceangoing vessels. Pop. (1980) 65,504.

Zarathushtra, also spelled ZARATHUSTRA (Iranian religious reformer): see Zoroaster.

Zarcillo, Francisco: see Salzillo (y Alcaraz), Francisco.

Zaria, formerly ZAZZAU, or ZEGZEG, historic kingdom, traditional emirate, and local government council in Kaduna State, northern Nigeria, with its headquarters at Zaria (q.v.) city. The kingdom is traditionally said to date

from the 11th century, when King Gunguma founded it as one of the original Hausa Bakwai (Seven True Hausa States). As the southernmost state of the seven, it had the function of capturing slaves for all Hausa Bakwai, especially for the northern markets of Kano and Katsina. Camel caravans from the Sahara travelled south to Zazzau to exchange salt for slaves, cloth, leather, and grain. Islām was introduced about 1456, and there were Muslim Hausa rulers in the early 16th century. Muḥammad I Askia, a warrior leader of the Songhai Empire, conquered Zazzau c. 1512; the results of that conquest were recorded by the traveller Leo Africanus.

Later in the century, Zazzau's ruler Queen Amina enlarged her domain by numerous conquests, including those of the Nupe and the Jukun kingdoms; even the powerful states of Kano and Katsina were required to pay tribute. By the end of the century, however, Zazzau—renamed Zaria—came under the control of Kororofa (Kwararafa), the Jukun kingdom centred near Ibi to the southeast. Shortly after the decline of Kororofa, Zaria was forced to become a tributary state (c. 1734–1804) of the Bornu kingdom to the northeast.

In 1804 the Muslim Hausa ruler of Zaria pledged allegiance to Usman dan Fodio, the Fulani Muslim leader who was conducting the great *jihād* ("holy war") in northern Nigeria. This resulted in a Fulani becoming ruler of Zaria in 1808. Zaria emirate was created in 1835, retaining some of its old vassal states (including Keffi, Nasarawa, Jemaa, and Lapai to the south); it was governed by a representative of the sultan at Sokoto (216 mi northwest of Zaria city), as well as the local emir.

Zaria's fortunes declined in the late 19th century; the critical blow was the loss in 1899 of Birnin Gwari (a town and Hausa chiefdom 63 mi west of Zaria city) to Kontagora (an emirate to the southwest). In 1901 Zaria sought British protection against slave raids by Kontagora. After the murder in 1902 of Captain Moloney, the British resident at Keffi (154 mi south), by the Zaria magaji ("representative"), the British stripped the emirate of most of its vassal states.

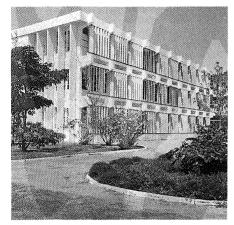

Zaria remains, however, one of Nigeria's largest (about 12,750 sq mi [33,000 sq km]) traditional emirates. A savanna area, it is one of the nation's leading producers of cotton for export. Other significant cash crops include tobacco, peanuts (groundnuts), shea nuts, soybeans, sugarcane (which is processed locally into brown sugar), and ginger. Sorghum, millet, and cowpeas are the staple foods; cattle, chickens, goats, guinea fowl, and sheep are raised for meat. Tin mining has long been important in the south, at the western edge of the Jos Plateau. The population is an ethnic mix in which Muslim Hausa and Fulani people predominate.

Zaria, city, Kaduna State, north central Nigeria, on the Kubanni River (a tributary of the Kaduna). Headquarters of the Zaria Local Government Council and the traditional Zaria (q.v.) emirate, it is served by road and rail and by an airport 3½ mi (5½ km) northwest.

Zaria is an old walled town. Probably founded c. 1536, later in the century it became the capital of the Hausa state of Zazzau. Both town and state were named for Queen Zaria (late 16th century), younger sister and successor of Zazzau's ruler Queen Amina.

Modern Zaria has four main areas: the old walled town, inhabited by Hausa and Fulani peoples, which has numerous Islāmic schools; the residential areas of Tudun Wada (which handles the old section's overflow) and Sabon Gari (the "African strangers' settlement"), which were established early in the colonial period; and the township for the non-African

community. The old walls, the combined length of which is 15 mi, have eight gates; and a large market is still held on an ancient site. Zaria is a major collecting point for coton, tobacco, peanuts (groundnuts), shea nuts, and hides and skins. Cotton, peanuts, and

Biological Science Building, Ahmadu Bello University, Zaria City, Nigeria J. Allan Cash—EB Inc.

shea nuts are processed locally and sent by rail to Lagos (430 mi southwest) for export. There is an important market for sorghum, millet, soybeans, brown sugar, onions, locust beans, baobab leaves and fruit, cowpeas, kola nuts, cloth, cattle, sheep, and goats. Cotton ginning became Zaria's chief economic activity after the opening of the railway in 1910, but leather tanning and cotton weaving and dyeing are traditional crafts of its Hausa and Gbari inhabitants. Other significant industries include railway repairing, furniture making, cloth printing, cigarette and cosmetics manufacturing, basket making, soft drink bottling, bicycle assembly, and publishing. The first northern Nigerian newspaper, written in Hausa, Gaskiya Ta F: Kwabo ("Truth Is Worth More than a Penny"), was launched in Zaria in 1939.

Zaria is the educational centre of the northern states. Located at Samaru, 7 mi westnorthwest, is Ahmadu Bello University (1962), with its associated institutes of education, economic and social studies, administration, and health. Samaru is also the site of the Institute for Agricultural Research and Special Services (1924) and the Leather Research Institute of Nigeria. At Zaria are the Nigerian Civil Aviation Training Centre and a branch of the Katsina College of Arts, Science, and Technology. Zaria also has a commercial institute, a fine arts school, and a school of pharmacy. The city is served by several hospitals and a nursing school. The Northern Peoples Congress, one of the nation's major political parties, developed from a cultural club formed in Zaria in 1949. Pop. (1982 est.) 267,300.

Zariadres (Armenian leader): see Artaxias.

Zariaspa (ancient Asian country): see Bactria.

Zarlino, Gioseffo (b. March 22, 1517, Chioggia, Rep. of Venice—d. February 14, 1590, Venice), Venetian composer and writer on music, the most celebrated music theorist of the mid-16th century.

Zarlino took deacon's orders in 1541 and studied music under Adriaan Willaert at St. Mark's in Venice, where in 1565 he became music director. Although he was esteemed as a composer, few of his works survive. He was offered the bishopric of Chioggia in 1583, but the Venetian senate persuaded him to remain in Venice.

Zarlino's first treatise, Istitutioni harmoniche (1558), brought him rapid fame. It gives a shrewd account of musical thinking during the first half of the 16th century; and Zarlino's thoughts on tuning, chords, and modes anticipate 17th- and 18th-century developments. He discussed the tuning of the first four intervals of the scale (tetrachord), espousing a system that proved reliable in subsequent practice. He stressed the importance of the major and minor third and discussed the nature of the major and minor triads, anticipating the theories of later writers such as Jean-Philippe Rameau. He renumbered the medieval modes, placing the Ionian mode (corresponding to the modern major scale) first. He also gave one of the two earliest accounts of double counterpoint and offered detailed advice on the setting of words to music. His Dimostrationi harmoniche (1571) consists of five dialogues between Willaert and four friends; it amplifies much of the material he had set forth in the Istitutioni.

Zarlino's theories were violently attacked by Vincenzo Galilei, his former pupil and a member of the Florentine Camerata, a group influential in the evolution of opera. Zarlino replied with Sopplimenti musicali (1588) and collected his works into a complete edition in 1589. The Sopplimenti reinforces and develops his previous theories. One passage suggests equally tempered tuning for the lute (in advance of 18th-century experiments with equal temperament on keyboard instruments); another gives valuable descriptions of early organs. Zarlino strongly decried the monodic recitative of the Camerata, insisting that music has its own laws and should not abandon them in order to imitate the spoken word.

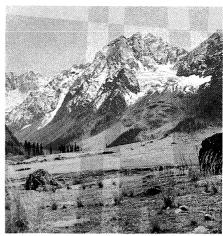

Żarnowiec, city, Gdańsk województwo (province), north central Poland. The city is located near Lake Żarnowieckie, 30 mi (48 km) northwest of Gdańsk, the provincial capital. Zarnowiec is the site of hydroelectric and thermonuclear power plants. The thermonuclear power plant has a capacity of 1,800,000 kW and was the first of its kind built in Poland. In a forest outside Żarnowiec, 12,000 Poles were executed and buried in mass graves by German troops in World War II. Pop. (1980 est.) 5,000.

zarzuela, Spanish musical play consisting of spoken passages, songs, choruses, and dances. It originated in the 17th century as an aristocratic entertainment dealing with mythological or heroic subject matter. The first performances were at the royal residence of La Zarzuela, near Madrid. Writers of zarzuelas included the playwrights Lope de Vega (1562–1635) and Pedro Calderón de la Barca (1600–81) and the composer Juan Hidalgo (c. 1600–85). The form declined in the late 17th and the 18th centuries as Italian opera rose in popularity.

In the mid-19th century the zarzuela was revived as a popular musical play, an expanded version of the similar 18th-century tonadilla. Witty and satirical, it dealt with characters from everyday life and included folk music, dance, and improvisation. Two definite varieties evolved: the género chico, a one-act comic zarzuela, and the grande, a serious musical play in two to four acts, similar to opera but with spoken dialogue.

Zāskār Range, also spelled zānskār, group of Himalayan mountains in northern India and western Tibet (China), extending southeastward for 400 mi (640 km) from the Suru River to the upper Karnali River. Kāmet Peak (25,446 ft [7,756 m]) is the highest point, and

Peaks of the Zāskār Range from the vicinity of Sonāmarg, in Jammu and Kashmir

the most important passes are Shipki, Lipulek, and Mana.

Zasulich, Vera Ivanovna (b. Aug. 8 [July 27, old style], 1849, Mikhailovka, Russia—d. May 8, 1919, Petrograd), Russian revolutionary who shot Gen. Fyodor F. Trepov, the governor of St. Petersburg, and was acquitted by the jury in a much-publicized trial (1878).

The daughter of a nobleman, Zasulich became a revolutionary in 1868, spending many of the succeeding years in prison, in hiding, or in exile. In 1883 she was a founding member of the first Russian Marxist organization, the Liberation of Labour, and corresponded with Marx and Engels. Having joined the Russian Social Democratic Workers' Party, she sided with the Menshevik faction when the party split in 1903. She was a leader of the so-called liquidationists, who favoured legal political activities over underground tactics after 1908. She opposed the Bolshevik seizure of power in 1917.

Zatishye (Russian S.F.S.R.): see Elektrostal.

Zátopek, Emil (b. Sept. 19, 1922, Kopřivnice, Czech.), Czech long-distance runner who won three gold metals in the 1952 Olympic Games at Helsinki: in the 5,000- and 10,000-metre races and in the marathon. During his career he set 18 world records, holding the 10,000-metre record from 1949 to 1954, his best time being 28 min 54.2 sec. He also set world records for 5,000 metres, 10 miles, one hour, 20,000 metres, 15 miles, 25,000 metres, and 30,000 metres.

Zátopek began to run early in the 1940s and

Zátopek (left), 1952 AP/Wide World Photos

first attracted international attention in 1946, as a private in the Czech Army, when he bicycled from Prague to Berlin to enter the 5,000-metre race in an Allied Occupation Forces meet and won it. His best record in 1951 was for 20,000 metres in 59 min 51.8 sec. In the 1952 Olympic Games at Helsinki, he set Olympic records for the 5,000- and 10,000-metre races and ran the fastest marathon ever run to that time.

Zátopek retired as a runner in 1958. In 1969 he was deprived of his colonelcy in the Czech Army and of his Communist Party membership when he spoke out against the Soviet takeover of Czechoslovakia in the previous year, but from 1970 he worked with the Czechoslovak Physical Training Association and by the late 1970s was associated with the Czech national sports institute.

Zauffely, Johann Joseph, Zauffely also spelled ZAUPHALY (painter): see Zoffany, John.

Zavadsky, Yury Alexandrovich (b. June 30, 1894, Moscow—d. April 5, 1977, Moscow), Soviet actor, director, and teacher whose eclectic vision ranged from foreign classics to modern heroic drama.

Zavadsky made his debut while studying with Eugene Vakhtangov, at whose theatre he played Anthony in Maurice Maeterlinck's The Miracle of St. Anthony (1915). He continued with Vakhtangov and was a principal in his final and most acclaimed production, Turandot (1922). Zavadsky made his directorial debut with Nikolay Gogol's The Marriage (1924), and the conscious theatricality of his staging demonstrated his debt to his teacher. Zavadsky worked with the Moscow Art Theatre (1924-31) and became head of the Central Theatre of the Red Army (1932). While at the Central Theatre, Zavadsky began to meld the avant-garde lessons of Vakhtangov with the precepts of Konstantin Stanislavsky; his productions of patriotic dramas, such as Aleksandr Korniychuk's The Destruction of the Squadron, revealed a new emphasis on clarity of form and ensemble acting.

After directing the Gorky Theatre in Rostov from 1936 to 1940. Zavadsky returned to Moscow to begin teaching at the State Institute of Theatre Arts and to become chief director of the Mossovet Theatre. He joined the Communist Party in 1944 and was made a full professor at the State Institute in 1947. He continued a series of foreign classics at the Mossovet, including a Merry Wives of Windsor (1957), and he produced works on patriotic themes, such as A. Surov's Dawn Over Moscow (1950). He revived plays by 19thcentury Russian playwrights; his Masquerade by M. Lermontov won him a Lenin Prize (1965). In all his later productions, special music elaborately employed and meticulous ensemble acting were hallmarks.

zāwiyah (Arabic), Persian KhānQāh, Turkish Tekke, generally, in the Muslim world, a monastic complex, usually the centre or a settlement of a Şūfi (mystical) brotherhood. In some Arabic countries the term zāwiyah is also used for any small, private oratory not paid for by community funds.

The first North African $z\bar{a}wiyah$, dating from about the 13th century, was akin to a hermitage ($r\bar{a}bitah$), housing an ascetic holy man and his disciples. Linked as it was to the immensely popular Şūfi movement that was making its way westward across North Africa at the same time, the $z\bar{a}wiyah$ seems to have proliferated rapidly. Eventually it became an extensive centre of religious and paramilitary power. The essential structure of the medieval $z\bar{a}wiyah$ has survived into the 20th century. It may include an area reserved for prayer, a shrine, a religious school, and residential quarters for students, guests, pilgrims, and trayelers.

In the mid-19th century the Sānusīyah, a religious brotherhood of Cyrenaica (modern Libya), by establishing a network of zāwiyahs in areas remote from central authority, attained political, as well as religious, control of the province. In World War I the Sānusīyah was able to marshal members of the zāwiyahs into war against the Italians. In their subsequent occupation of Libya, the Italians wiped out most of the zāwiyahs in that country.

Zāwiyah, az-, town, situated on the Mediterranean coast about 30 mi (50 km) west of Tripoli, northwestern Libya. Lying on al-Jifārah plain, it is near the site of an important oil field and has the country's first oil refinery. Agriculture is prominent in the area because of the ample groundwater resources. The main crops are potatoes, onions, and tomatoes; livestock are also raised. The coastal highway connecting Tripoli with Banghāzī and Cairo passes through the town. Pop. (1979 est.) 48,000.

Zāwiyat al-Baydā', also spelled zāwiyat EL-BĒDĀ, also called BAIDA, town, northeastern Libya. It is a new town lying on a high ridge 20 mi (32 km) from the Mediterranean Sea. Built in the late 1950s on the site of the tomb of Rawayfi ibn Thābit (a Companion of the Prophet Muhammad), it was planned as the future national capital. Although al-Baydā' contains a parliament building, ministerial offices, a campus of Gar Younis University, and a centre for Islāmic studies, Tripoli remains Libya's capital. The town is served by a modern airfield and has highway links to Banghāzī, 100 mi west-southwest. The ruined ancient Greek city of Cyrene (q.v.) is nearby. Pop. (1979 est.) mun., 38,800.

Zayas y Sotomayor, María de (b. Sept. 12, 1590, Madrid—d. c. 1661), the most important of the minor 17th-century Spanish novelists and one of the first women to publish prose fiction in the Castilian dialect.

Little is known of her life except that she was born into a noble family in Madrid and may have lived in Zaragoza, where her work was published. It is not known whether she married or when and where she died.

Her novels about love and intrigue, which used melodramatic and frequently horrific elements, were widely read and very popular. Novelas amorosas y ejemplares (1637; "Novels of Romance and Exemplary Tales") are an evening's exchange by men and women of the romantic complications of married life. The stories are mostly about women who are mistreated by husbands or seducers. Novelas y saraos (1647; "Novels and Soirees") and Parte segunda del sarao y entretenimientos honestos (1649; "Soiree Part Two and Decorous Amusements") are sequels. In many of her stories Zayas accused Spanish society of leaving women without the information or emotional strength to resist seduction and abuse.

Zaydīyah, also spelled ZAIDIYA, or ZAIDĪS, English ZAYDIS, a sect of the Shī'ah (one of the major branches of Islām), owing allegiance to Zayd ibn 'Alī, grandson of Ḥusayn ibn 'Alī. Doctrinally the Zaydīyah are closer to the majority Sunnah than are the other Shī'ah. Early in the 10th century the Zaydīyah became dominant in Yemen, and thereafter Zaydī imāms were the spiritual rulers of that area. From the departure of the Turks in 1917 until 1962, they were also the temporal rulers of Yemen

Zaysan, Lake, also spelled ZAISAN, or ZAJSAN, Russian OZERO ZAYSAN, freshwater body in eastern Kazakh Soviet Socialist Republic, in a hollow between the Altai and Tarbagatay mountains at an altitude of 1,266 ft (386 m). Formed by the Irtysh River, which enters the lake in the east, it was originally 60 mi (100 km) long, 20 mi wide, and 26 ft deep, with a

surface area of about 718 sq mi (about 1,860 sq km). Its level has been raised 20 ft since it became part of the Bukhtarma Reservoir downstream, which is 375 mi long and has a total area of 2,125 sq mi. Fishing—sturgeon, sterlet, carp, and others—is important, and there are shipping services.

Zayyānid DYNASTY (Berbers): see 'Abd al-Wādid dynasty.

zazen, in Zen Buddhist meditation, sitting; this form of spiritual exercise is most characteristic of the Sōtō sect. The instructions for *zazen* direct the disciple to sit in a quiet room, breathing rhythmically and easily, with legs fully or half crossed, spine and head erect, hands folded one palm above the other, and eyes open. Logical, analytical thinking should be suspended, as should all desires, attachments, and judgments, leaving the mind in a state of relaxed attention.

The most outstanding advocate of zazen was the 13th-century Zen master and founder of the Sōtō sect in Japan, Dōgen (q.v.). He considered zazen not only to be a method of moving toward Enlightenment but also, if properly experienced, to constitute Enlightenment itself. Compare kōan.

Zazzau (historic kingdom in Nigeria): see Zaria.

Zdarsky, Matthias (b. Feb. 25, 1856, Trebitsch, Moravia, Austrian Empire—d. June 20, 1940, Sankt Pölten, Austria), ski instructor, considered the father of Alpine skiing, who was probably the first regular ski instructor in Austria.

Zdarsky became interested in skiing after reading Fridtjof Nansen's Auf Schneeschuhen durch Grönland (1891; Across Greenland on Snowshoes) and taught himself to ski as the easiest way to reach the market village of Lilienfeld in winter from his mountain pastures of Habernreith, which he had bought in 1889. He had to adapt the Nordic skiing techniques used on relatively flat ground to the Alpine terrain. In 1897 he published Die alpine Lilienfelder Skifahrtechnik, the first ski instruction book. In it he publicized the technique of requiring one ski to be extended at an acute angle to the fall line, a line from an upper point to a lower directly below on a slope. He first used a single pole to help in steering and turning but soon changed to two poles, which became standard. Stemming, as his steering moves were called, was performed by turning one ski to the side, in whichever direction the turn was intended, and quickly bringing the other ski into parallel position, a maneuver known as the stem Christiania. Zdarsky also improved ski design and ski bindings and organized downhill races. He was a ski instructor for the Austrian Army during World War I and survived an avalanche that caused 80 fractures and dislocations. He invented devices that allowed him to ski again.

Zea, genus of large grasses of the family Poaceae, order Poales. The two best known species are *Zea mays* (see corn) and *Z. mexicana* (see teosinte).

Zealand (Denmark): see Sjælland.

Zealot, member of a Jewish sect noted for its uncompromising opposition to pagan Rome and the polytheism it professed. The Zealots were an aggressive political party whose concern for the national and religious life of the Jewish people led them to despise even Jews who sought peace and conciliation with the Roman authorities. A census of Galilee ordered by Rome in AD 6 spurred the Zealots to

rally the populace to noncompliance on the grounds that agreement was an implicit acknowledgment by Jews of the right of pagans to rule their nation.

Extremists among the Zealots turned to terrorism and assassination and became known as Sicarii (Greek sikarioi, "dagger men"). They frequented public places with hidden daggers to strike down persons friendly to Rome. In the first revolt against Rome (AD 66-70) the Zealots played a leading role, and at Masada (q.v.) in 73 they committed suicide rather than surrender the fortress, but they were still a force to be reckoned with in the first part of the following century. A few scholars see a possible relationship between the Zealots and the Jewish religious community mentioned in the Dead Sea Scrolls.

Zeami Motokiyo, Zeami also spelled SEAMI, original name ONIYASHA, later FUJIWAKA, also called KANZE MOTOKIYO (b. 1363/64, Japan—d. Sept. 1, 1443, Kyōto?), the greatest playwright and theorist of the Japanese Nō Theatre. He and his father, Kan'ami (1333–84), were the creators of the Nō drama in its present form.

Under the patronage of the shogun Ashikaga Yoshimitsu, whose favour Zeami enjoyed after performing before him in 1374, the No was able to shake off the crudities of its past and to develop as a complex and aristocratic theatre. After his father's death, Zeami became the chief figure in the No. He directed the Kanze school of No that his father had established and that had profound and lasting influence. Zeami not only continued to perform brilliantly but also wrote prolifically. He is credited with about half (and most of the greatest) of the approximately 230 plays in the present repertoire. In 1422 he became a Zen monk, and his son Motomasa succeeded him. But Ashikaga Yoshinori, who became shogun in 1429, favoured On'ami (Zeami's nephew) and refused to allow the son to perform before him. Motomasa died in 1432, and Yoshinori exiled Zeami in 1434. After the shogun died in 1441, Zeami returned to Kyōto.

In his treatises—of which the most important is the collection Fūshi kaden (1400–18; "Appearance of Flower Transmission"), popularly Kadensho—written as manuals for his pupils, Zeami said the actor must master three basic roles: the warrior, the woman, and the old person, including the singing and dancing appropriate to each. The two main elements in No acting were monomane, "an imitation of things," or the representational aspect, and yūgen, the symbolic aspect and spiritual core of the No, which took precedence and which became the touchstone of excellence in the No. Zeami wrote, "The essence of yūgen is true beauty and gentleness," but not mere outward beauty: it had to suggest behind the text of the plays and the noble gestures of the actors a world impossible to define yet ultimately real. Such plays as *Matsukaze* ("Wind in the Pines"), written by Kan'ami and adapted by Zeami, have a mysterious stillness that seems to envelop the visible or audible parts of the work. In other of Zeami's dramas there is less yūgen and more action and, occasionally, even realism.

Zebi, Sabbatai (Jewish false messiah): *see* Shabbetai Tzevi.

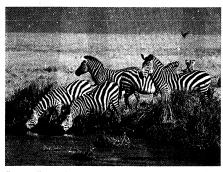

Zebid (Yemen [Ṣan'ā']): see Zabīd.

zebra, any of three species of strikingly black-and-white-striped mammals of the horse family Equidae and genus Equus: Burchell's zebra, or bonte quagga (E. quagga), found in rich grasslands over much of eastern and southern Africa; Grevy's zebra (E. grevyi), of arid, sparsely wooded areas in parts of Kenya, Ethiopia, and Somalia; and the mountain ze-

bra (E. zebra), of dry upland plains in South West Africa/Namibia and a few scattered areas in western South Africa.

Zebras are horselike animals, standing about 120 to 140 centimetres (47 to 55 inches) at the shoulder. The species are easily distinguished by the pattern of stripes. These are individually wide and widely spaced in Burchell's zebra, some races of which have lighter "shadow stripes" between the main stripes. The northern races of this species are more fully striped than the southern ones, in which the striping of the lower legs tends to give way to white. In the extinct quagga (E. q. quagga), the striping was confined to the head, neck, and forequarters, the back being solid brown. The stripes of Grevy's zebra are narrow and closely spaced, and the belly is white. The mountain zebra is small and has a peculiar gridlike pattern of stripes on the rump.

Zebras live in small family groups consisting of a stallion and several mares with their foals. In Grevy's zebra the mares may form separate groups from the stallions. Under good food conditions, small groups may coalesce into large herds, but the smaller groups retain their

Burchell's zebra, or bonte quagga (Equus quagga)

identities. Zebras often form mixed herds with antelopes, such as wildebeest, which gain protection from predators by the alertness of the zebras. Herds may migrate long distances to find suitable grasses on which to feed.

All three zebra species have decreased in abundance through human activities, and the mountain zebra and Grevy's zebra are listed as endangered in the *Red Data Book*. The readiness with which most zebras breed in captivity offers hope of maintaining reservoirs of zebras from which wild populations might be restored.

zebra fish, any member of either of two unrelated groups of fishes, the freshwater species in the genus *Brachydanio* (family Cyprinidae; order Cypriniformes) and the saltwater species in the genus *Pterois* (family Scorpaenidae; order Scorpaeniformes). The zebra danio (*B. rerio*), a popular freshwater aquarium fish originally from Asia, is small (up to about 4 centimetres [1½ inches] long) and has dark-blue and silvery longitudinal stripes.

The distinctive saltwater zebra fishes (*Pter ois*), used in marine aquariums, have extremely large pectoral fins, numerous extremely poisonous spines, and colourful vertical stripes. Some species are more commonly known by the names lion-fish (q, v) and turkeyfish.

zebra swallowtail butterfly (Iphiclides marcellus, Graphium marcellus, or Papilio marcellus), large, familiar North American swallowtail butterfly of the family Papilionidae (order Lepidoptera), similar to the related European scarce swallowtail (I. podalirius). Wing patterns of both species are reminiscent of a zebra's stripes, with a series of longitudinal black bands forming a pattern on a greenish-white or white background. There are several generations in a single year, spring broods being rather smaller than summer broods. Adult forms that emerge at different seasons

Zebra swallowtail butterfly (Iphiclides marcellus, Graphium marcellus, or Papilio marcellus)

vary considerably in their markings. The span of the forewings is 6 to 9 centimetres $(2^{1}/2 \text{ to } 3^{1}/2 \text{ inches})$; the hindwings bear streamers 15 to 25 millimetres long. The principal food plant of the larvae is the pawpaw.

Zebrina, genus of trailing herbaceous plants in the spiderwort family (Commelinaceae) native to Mexico and Guatemala but widely grown as indoor foliage plants in baskets.

Authorities disagree over the number of species but several distinct kinds are used in the florist trade. One of the so-called wandering Jews, or inch plants, is *Z. pendula*, with an array of colourful-leaved varieties including *Z. pendula* 'Purpusii,' with dark red or bronzy leaves, and *Z. pendula* 'Quadricolor,' with metallic-green leaves striped with green, red, and white. They are often grown as ground cover in warm climates.

Zebrinas are often confused with members of the genus Tradescantia (q.v.).

Zebrzydowski Rebellion (1606–07), armed uprising of Polish nobles led by Mikołaj Zebrzydowski against their king Sigismund III (ruled 1587–1632). Despite its failure to overthrow the King, the rebellion firmly established the dominance of the Catholic gentry over the monarch in the Polish political system.

After Louis I (king of Poland, 1370–82, and of Hungary, 1342–82) concluded the Pact of Koszyce with the Polish nobility and gentry (1374), guaranteeing them broad rights and privileges, the Polish gentry gradually acquired an increasing degree of political power, culminating in the Henrician Articles (1573), which effectively converted the already limited monarchy of Poland into a republic of the gentry with an elective chief magistrate (i.e., the king).

When Sigismund, son of John III of Sweden, was elected to the Polish throne (1587), however, he tried to increase the power of the monarchy. His efforts to reduce the nobles' parliamentary prerogatives became identified with his particularly unpopular policies—e.g., the involvement of Poland in his personal dynastic struggle in Sweden, the establishment of close relations with the Habsburgs of Austria, and his hostile attitude toward non-Catholics. Opposition to Sigismund thus was mounting when, while he was fighting his uncle Charles IX, who had seized the Swedish throne, he requested that the Polish Sejm (legislature) authorize a permanent army as well as funds to maintain it (March 1606). The members of the Sejm interpreted his request as an attempt to usurp their authority and reduce their control over his actions. Mikołaj Zebrzydowski, the palatine (the king's governor) of Kraków, accused the King of breaking the basic laws of Poland and claimed that in doing so Sigismund had forfeited his monarchial right to

demand obedience and loyalty from the no-

Gathering a following of both political and religious dissidents, Zebrzydowski held a series of conventions during 1606 and for-mulated a set of demands. When the King failed to satisfy them, Zebrzydowski led his 60,000 supporters into armed rebellion. The insurgents, who declared the King deposed in 1607, presented a sufficient threat to Sigismund to compel him to reduce his military activities against Sweden and to prevent him from pursuing the advantage he had gained in that war. Although the King's forces were of questionable loyalty, the rebels went into a panic as the royal troops advanced at Guzów and were decisively defeated (July 6, 1607). Despite that defeat and the decline of the political influence of the religious dissidents, the Sejm of 1609 granted a general amnesty and also guaranteed the constitution of Poland, forcing Sigismund to abandon his efforts to make the Polish monarchy more absolute.

zebu (cattle): see Brahman.

Zebulun, one of the 12 tribes of Israel that in biblical times comprised the people of Israel who later became the Jewish people. The tribe was named for the sixth son born of Jacob and his first wife. Leah. After the Israelites took possession of the Promised Land, Joshua divided the new territory among the 12 tribes, assigning to the tribe of Zebulun a fertile section of land roughly northeast of the Plain of Jezreel. After the death of King Solomon (922 BC), the Israelites separated into the northern Kingdom of Israel (representing 10 tribes) and the Kingdom of Judah in the south. The northern kingdom was conquered by the Assyrians in 721 BC, and its tribes dispersed. Jewish legends thus consider the tribe of Zebulun as one of the Ten Lost Tribes of Israel.

Zechariah, also spelled ZACHARIAS (fl. 6th century BC), Jewish prophet whose preachings are recorded in one of the shorter prophetical books in the Old Testament, the Book of Zechariah (q, v).

Zechariah, Book of, also spelled ZACHARIAS, the 11th of 12 Old Testament books that bear the names of the Minor Prophets, collected in the Jewish canon in one book, The Twelve. Only chapters 1–8 contain the prophecies of Zechariah; chapters 9–14 must be attributed to at least two other unknown authors. Scholars thus refer to a "second" and "third" Zechariah: Deutero-Zechariah (chapters 9–11) and Trito-Zechariah (chapters 12–14).

According to dates mentioned in chapters 1-8, Zechariah was active from 520 to 518 BC. A contemporary of the prophet Haggai in the early years of the Persian period, Zechariah shared Haggai's concern that the Temple of Jerusalem be rebuilt. Unlike Haggai, however, Zechariah thought that the rebuilding of the Temple was the necessary prelude to the eschatological age, the arrival of which was imminent. Accordingly, Zechariah's book, and in particular his eight night visions (1:7-6:8), depict the arrival of the eschatological age (the end of the world) and the organization of life in the eschatological community. Among Zechariah's visions was one that described four apocalyptic horsemen who presaged God's revival of Jerusalem after its desolation during the Babylonian Exile. Other visions announced the rebuilding of the Temple and the world's recognition of Yahweh, Israel's God.

Deutero- and Trito-Zechariah, each of which has an introduction setting it apart from the rest (9:1 and 12:1), are separate collections of sayings usually dated in the 4th and 3rd centuries BC, respectively. These sayings further elaborate the eschatological themes of Zechariah and provide many images of a messianic figure that were borrowed by New

Testament writers and applied to the figure of Jesus (e.g., Matthew 21:5 and 13:7, Mark 14:27, and Matthew 26:31).

Zechariah, Song of (hymn): see Benedictus.

Zedekiah, original name MATTANIAH (fl. early 6th century BC), king of Judah (597–587 BC) whose reign ended in the Babylonian destruction of Jerusalem and the deportation of most of the Jews to Babylon.

Mattaniah was the son of Josiah and the uncle of Jehoiachin, the reigning king of Judah. In 597 BC the Babylonians under King Nebuchadrezzar besieged and captured Jerusalem. They deported Jehoiachin to Babylon and set Mattaniah up in his place as regent of the Kingdom of Judah under the name Zedekiah. Zedekiah thus held his throne as a vassal under an oath of allegiance to Nebuchadrezzar, but under local pressure he began to intrigue against the latter in concert with the neighbouring states of Moab, Edom, Ammon, Tyre, and Sidon. The prophet Jeremiah vigorously denounced these intrigues.

In the ninth year of Zedekiah's rule a Babylonian army lay siege to Jerusalem after he had conspired to revolt against the Babylonians with Egypt's help. During the siege Jeremiah constantly urged patient submission to the dominion of the Babylonians, which he regarded as the will of God, but the royal officials and Jewish notables denounced him for this. Jeremiah was accused of desertion

and was imprisoned.

In the sixth month of the siege a breach was made in the city walls. Zedekiah and his men fled by night toward the Jordan River, but they were soon captured in the Jordan valley. He and his leaders were taken before King Nebuchadrezzar at Riblah, in Syria, where Zedekiah's sons were slain in his presence and he, a disloyal vassal, was blinded and carried in chains to Babylon, where he was imprisoned until his death. The walls and houses of Jerusalem were destroyed, its temple was sacked and burned, and the people of Judah, except for the poorest of the land, were deported to Babylon. Thus began the Babylonian Exile. Judah lost its status as a kingdom and became a Babylonian province.

The story of Zedekiah is told in the Old Testament in the Second Book of Kings, chapters 24 and 25, in the Second Book of Chronicles, chapter 36, and in various passages in the Book of Jeremiah.

Zedhor (king of Egypt): see Tachos.

Zedī (religious sect): see Yazīdī.

Zeebrugge (Flemish), French BRUGES-SUR-MER, port, West Flanders province, northwestern Belgium. It lies along the North Sea, 10 miles (16 km) north of Brugge (Bruges), for which it is the port. It is an artificial port that was built because the marine channel to Brugge had silted up. The 1.5-mile- (2.5kilometre-) long mole that creates and protects Zeebrugge's harbour was constructed between 1895 and 1907. A 7-mile- (12-kilometre-) long canal was also built around that time to connect Zeebrugge with Brugge. In April 1918, during World War I, British naval forces sank blockships in Zeebrugge's harbour and canal to deny the use of the port to German submarines. The port was again blocked by the Allies in May 1940 for a similar purpose, and Zeebrugge itself was destroyed by the retreating Germans in 1944. The harbour was reopened in 1957 after the last of the old Allied blockships had been removed. Zeebrugge subsequently grew into a bustling port handling regular and container cargoes, as well as passengers and car ferries bound to and from Britain. By the 1980s it had become one of the busiest passenger ports in Europe.

Zeeland, maritime *provincie* (province), southwestern Netherlands. It occupies the delta lands of the Scheldt (Schelde) and Maas

(Meuse) rivers. The *provincie* has an area of 691 square miles (1,790 square km) and comprises Zeeuwsch-Vlaanderen, a strip of the Flanders mainland between the Westerschelde (Western Scheldt) and Belgium, plus six former islands: Schouwen en Duiveland, Tholen, Noord-Beveland, Walcheren, Zuid-Beveland, and Sint Philipsland. None of these has preserved a true insular character, all being connected to each other or to Noordbrabant province inland by dams or bridges.

Zeeland was disputed between the counts of Flanders and Holland until it was annexed by the latter in 1323. It was finally joined to the United Provinces under Stadholder William III (1672-1702). Its history has been marked by a permanent struggle against the sea, indicated by its name, meaning "sea land," and by its heraldic device: Luctor et emergo ("I struggle and emerge"). The coastline of Zeeland has changed continually as islands have been enlarged by alluvial deposition, united and protected by dikes, or washed away by floods. In spite of the dikes, the province was severely damaged by the flood disaster of Feb. 1, 1953, which killed more than 1,800 persons. As a result the Dutch government started the implementation of the Delta Project (q.v.), to dam the major sea channels and further connect the islands with one another and with the mainland, thus diminishing the isolation of the province.

After repair to the dikes following the 1953 flood, extensive rural reconstruction was carried out, and the resettlement of many Zeeland farmers in the Northeast Polder of the IJsselmeer allowed the land they had left to be used to enlarge other farms. Farming is now highly mechanized, with efficient methods and high yields per acre. The greater part of Zeeland's marine clay soil is arable land supporting cereals, potatoes, sugar beets, and other cash crops, such as flax, rapeseed, maw seed, and caraway. About 15 percent of the cultivated land is used as pasture for dairy cattle and the few remaining draft horses and about 9 percent for horticulture (onions, vegetables, and fruit). Zeeland also has traditional oyster culture and shrimp and mussel fisheries, as well as seaside resorts that have profited from improvements in Zeeland's road network owing to the Delta Project.

One of the smallest in population of the Dutch provinces, Zeeland has few industries and no large towns. Vlissingen, Middelburg (the capital), Goes, Terneuzen, and Sas van Gent are the principal population centres. Two nature reserves in Zeeland protect dune areas and wildlife. Pop. (1986 est.) 355,781.

Zeeman, Pieter (b. May 25, 1865, Zonnemaire, Neth.—d. Oct. 9, 1943, Amsterdam), Dutch physicist, joint winner, with Hendrik A. Lorentz, also of The Netherlands, of the Nobel Prize for Physics in 1902 for his discovery of the Zeeman effect (a.v.).

Zeeman, who had been a student of Lorentz at the University of Leiden, began lecturing at Leiden in 1890. Six years later, at the sugestion of Lorentz, he investigated the effect of magnetic fields on a source of light and found that each of the lines in the spectrum of emitted light split into several lines; this became known as the Zeeman effect. Zeeman was appointed professor of physics at the University of Amsterdam in 1900 and director of its Physical Institute in 1908. Remaining there until his death, he conducted research on the propagation of light in moving media, such as water, quartz, and flint.

Zeeman effect, in physics and astronomy, the splitting of a spectral line into two or more components of slightly different frequency when the light source is placed in a magnetic field. It was first observed in 1896

by the Dutch physicist Pieter Zeeman as a broadening of the yellow D-lines of sodium in a flame held between strong magnetic poles. Later the broadening was found to be a distinct splitting of spectral lines into as many as 15 components.

Zeeman's discovery earned him the 1902 Nobel Prize for Physics, which he shared with a former teacher, Hendrik Antoon Lorentz, another Dutch physicist. Lorentz, who had earlier developed a theory concerning the effect of magnetism on light, hypothesized that the oscillations of electrons inside an atom produce light and that a magnetic field would affect the oscillations and thereby the frequency of the light emitted. This theory was confirmed by Zeeman's research and later modified by quantum mechanics, according to which spectral lines of light are emitted when electrons change from one discrete energy level to another. Each of the levels, characterized by an angular momentum (quantity related to mass and spin), is split in a magnetic field into substates of equal energy. These substates of energy are revealed by the resulting patterns of spectral line components.

The Zeeman effect has helped physicists determine the energy levels in atoms and identify them in terms of angular momenta. It also provides an effective means of studying atomic nuclei and such phenomena as electron paramagnetic resonance. In astronomy, the Zeeman effect is used in measuring the magnetic field of the Sun and of other stars. See also Stark effect.

Zefat, also spelled SAFAD, or SAFED, city of Upper Galilee, Israel; one of the four holy cities of Judaism (Jerusalem, Hebron, Tiberias, Zefat).

First mentioned at the time of the Jewish revolt against Rome (AD 66-70), it is thereafter frequently referred to in rabbinic literature. Strategically situated in scenic hill country, Zefat passed from hand to hand during the Crusades until captured by Baybars I, who razed its citadel (1266). Zefat achieved renown in the late Middle Ages as the principal centre of the Kabbala, the occult theosophy and interpretation of the Scriptures forming the principal mystical system of Judaism. Important Kabbalists such as Isaac ben Solomon Luria and Joseph Karo lived in the city, and the doctrines expounded there spread throughout the Jewish world. The Hebrew printing press established in Zefat in 1577 was the first in all Asia to use movable type. In the 18th and 19th centuries the city suffered from wars and insurrections on the part of the Druzes and local Bedouin tribes, and from the destructive earthquake of 1837.

Just before Israel's independence (May 1948), the population of Zefat was predominantly Arab. The British, evacuating the area, gave the Arabs the fortified police post on nearby Mount Canaan (Har Kena'an), 3,149 feet (960 m) above sea level and 500 feet (150 m) above the old Jewish section. The city was nevertheless taken on May 12, 1948, by the Haganah, the Jewish defense forces, and the Arab population fled. Subsequently, mountainous Upper Galilee attracted painters and other artists, many of whom now live in Zefat's artists' colony. Four ancient synagogues, associated with past masters of the Kabbala, survive. The city's economy is based on light industry (textile weaving, metalworking factories, and diamond polishing), resorts, and tourism. Pop. (1985 est.) 17,200.

Zehlendorf, district of Berlin, Germany, covering 27.25 square miles (70.5 square km) in the southwestern corner of the city. It is a prosperous residential district of detached houses. The Free University (1948), parts of the Berlin Technical University, several branches

of the Max-Planck-Institute, and the Dahlem art museums occupy the grounds of the former Dahlem manorial estate, broken up in 1901. More than half the district is preserved as parkland or water. Along its northwestern boundary runs the Havel River, with a southward bay called the Grosser Wannsee, that is popular with boaters and swimmers. On its shores the Düppel and Grunewald forests include fens and nature reserves stocked with roe deer and mouflon. In the extreme southwestern portion of the district, a park surrounds the Kleinglienicke Palace, which was built in 1826 for Prince Carl of Prussia. Pfaueninsel (Peacock Island) in the Havel, with a castle and nature reserve, is known for its rare birds. Pop. (1986 est.) 85,161.

Zeila (Somalia): see Seylac.

Zeisler, Fannie Bloomfield, née BLUMEN-FELD (b. July 16, 1863, Bielitz, Silesia, Austrian Empire—d. Aug. 20, 1927, Chicago), Austrian-born American pianist noted for her formidable technique and extensive repertoire.

She went as a child of five with her parents to the United States. Her family settled in Chicago in 1868, where her early teachers were Carl Wolfsohn and Bernhard Ziehn. Her concert debut took place in Chicago on Feb. 26, 1875. In 1878 she went to Vienna to study with Theodor Leschetizky. Beginning in 1883, she made highly successful annual tours of the United States; her European tours began with a series of concerts in Austria and Germany in 1893. Zeisler retired with a farewell concert appearance in Chicago on Feb. 25, 1925. She was married to Sigmund Zeisler, a lawyer, in 1885.

Zeiss, Carl (b. Sept. 11, 1816, Weimar, Thuringian States—d. Dec. 3, 1888, Jena), German industrialist who gained a worldwide reputation as a manufacturer of fine optical instruments.

In 1846 Zeiss opened a workshop in Jena for producing microscopes and other optical instruments. Realizing that improvements in optical instruments depended on advances in optical theory, he engaged as research worker Ernst Abbe, a physics and mathematics lecturer (later professor) at the University of Jena, who in 1866 became Zeiss's partner. They engaged Otto Schott, a chemist, who developed about 100 new kinds of optical glass and numerous types of heat-resistant glass. After the death of Zeiss, Abbe donated the Zeiss firm and his share in the glassworks to the Carl Zeiss Foundation. In 1923 Schott added his share in the glassworks to the foundation. In 1945 U.S. forces evacuated the board of management and about 100 scientists and technicians of the Carl Zeiss firm (Jena) to West Germany, where it was firmly reestablished.

Zeist, gemeente (municipality), Utrecht provincie (province), central Netherlands. Since 1746 it has been the headquarters of the Dutch Province of the Moravian Church, a Protestant refugee group from Herrnhut (Saxony), which bought the 17th-century Zeist castle. Zeist is mainly a residential and resort town in a wooded region; it has some industry, producing optical instruments and gold and silverware. Pop. (1984 est.) 60,478.

Zeit, Die (German: "The Times"), weekly newspaper published in Hamburg, a review of the week in politics and public affairs as they affect Europe and especially Germany. Die Zeit includes a weekly newsmagazine that gives extended treatment to major economic, political, and cultural topics beyond the coverage of related subjects in the newspaper itself. The paper's editorial position is moderate, and its contributors are drawn from the first ranks of German journalists and authors. It is generally regarded as one of the leading weekly reviews in Germany.

Zela (Turkey): see Zile.

Zelaya, José Santos (b. Nov. 1, 1853, Managua, Nicaragua—d. May 17, 1919, New York City), Nicaraguan politician and dictator from 1893 to 1910, noted for his hostility toward the United States and for his effort to unify Central America in 1907. During his rule he all but monopolized his country's economic resources

In 1893 Zelaya came to power through a successful Liberal revolt that ended 30 years of Conservative dominance. In 1906 he refused to send delegates to the San José conference convened for the purpose of maintaining

Zelaya

By courtesy of the Library of Congress, Washington, D.C.

peace in Central America; instead he invaded Honduras, overthrowing its government, and then tried to start a revolution in El Salvador. His efforts brought the area to the verge of war, prompting both Mexico and the United States to intervene. The Washington Conference of 1907 ensued, at which all five Central American states signed an agreement pledging to maintain peace among themselves. Zelaya, however, quickly broke the treaty.

Zelaya's attitude was based on his fear of U.S. economic domination and of the alleged U.S. intention to separate Nicaragua's eastern coast from the rest of the country. In 1909 the U.S. government supported a Conservative effort to unseat Zelaya; and when, in December of that year, the dictator executed U.S. soldiers of fortune for serving in the revolutionary army, the United States broke off diplomatic relations. Early in 1910 Zelaya was finally forced to flee to Mexico.

Zelenodolsk, city, Tatar Autonomous Soviet Socialist Republic, western Russian S.F.S.R. It is a port on the Volga River. The milling of grain from the nearby agricultural area and woodworking based on the forests to the north are the main economic activities. Food processing and the manufacture of agricultural machinery are also important. Two technical colleges are located in the city, which was incorporated in 1932. Pop. (1985 est.) 89,000.

Zelkova, genus of about five species of trees and shrubs in the elm family (Ulmaceae) native to Asia. The Japanese zelkova, or keaki (Z. serrata), up to 30 m (100 feet) tall and with sharply toothed deep green leaves, is an important timber tree and bonsai subject in Japan. It is widely planted elsewhere as a shade tree substitute for the disease-ravaged American elm, and while not as cold-hardy as the latter, it is more resistant to Dutch elm disease. Z. carpinifolia, from the Caucasus, and Z. sinica, from China, are somewhat shorter trees with wavy-toothed leaves.

Zell, city, Rhineland-Palatinate Land (state), western Germany. The city lies along the right bank of the Moselle (Mosel) River, in the Hunsrück (hills), southwest of Koblenz. It was chartered in 1222 and historically served as a residence of the electors of Trier; their palace (1542) is now a hotel. Across the bridge over the Moselle is a fortress of the electors of Trier that was built in the 12th century. The famous Moselle wine Schwarze

Katz (Black Cat) is made in Zell, which also produces a number of wood products. Pop. (1989 est.) 4,527.

Zell, Matthew (b. Sept. 21, 1477, Kaysersberg, Alsace—d. Jan. 9, 1548, Strassburg), German author and religious leader who was responsible for initiating the Protestant Reformation at Strassburg.

He became a lecturer (1511) and rector (1517) at Freiburg im Breisgau, moving to Strassburg in 1518 to become minister of the Roman Catholic cathedral there. In 1521, however, he accepted the Reformation doctrines of Martin Luther and began to preach in an evangelical manner to his congregation. Although condemned by the Catholic clergy, he continued as cathedral minister with the protection of the magistrates and parishioners. He replied to the attacks by his bishop in his Christliche Verantwortung (1523; "Christian Responsibility"), a discussion of the scriptural basis for the Reformation. He also assembled a number of his writings in the form of a catechism, Frag und Antwort (1536; "Question and Answer").

Zell am See, town, *Bundesland* (federal province) Salzburg, west central Austria, on the west shore of the Zeller See (lake). Founded by monks in the 8th century and named Cella in Bisoncia, it has an old Romanesque and Gothic parish church and a Renaissance castle, Schloss Rosenberg. It did not achieve town status until 1927. Zell am See is a popular winter and summer resort at the foot of the Schmittenhöhe (6,447 ft [1,965 m]), a famous Alpine viewpoint whose summit is reached by aerial ropeway. Copper working and tanning are local occupations. Pop. (1981) 7,959.

Zelle, Margaretha Geertruida: see Mata Hari.

Zelten (Libya): see Zaltan.

Zemes māte (Latvian), Lithuanian žemyna, the Earth Mother of Baltic religion. Zemes mate represents the female aspect of nature and the source of all life—human, animal, and plant. Interacting with Dievs (the sky), Zemes mate stimulates and protects the power of life. Libations of beer were offered to her at the opening of every festival, and such products of the earth as bread, ale, and herbs were buried in the ground or thrown into rivers and lakes or tied to trees in her honour. The birth of a child was also celebrated with an offering to the Earth Mother. The various functions of Zemes mate were eventually assumed by demigoddesses of forests, fields, stones, animals, water, and, in the Christian period, by the Virgin Mary.

The male counterpart of Zemes māte is Zemnieks (Latvian), known as Žemninkas or Žemėpatis among the Lithuanians. Žemėpatis was considered the brother of Zemyna and functioned as master of the earth and guardian of farms.

Zemlya i Volya, English LAND AND FREE-DOM, first Russian political party to openly advocate a policy of revolution; it had been preceded only by conspiratorial groups. Founded in 1876, the party two years later took its name from an earlier (1861-64) secret society. A product of the Narodnik (Populist) movement, the party maintained that the peasantry would be the source of social revolution. Its members, especially doctors and teachers. settled among the peasants and encouraged them to improve their condition by changing the social system. The party also had groups operating among the intelligentsia and urban workers and had administrative and "disorganizing" sections; all its activities were coordinated by a central "basic circle.'

By 1878-79 many of those working among the peasantry had become frustrated by police repression, which convinced them of the need for political as well as social reform. They

favoured emphasis on the party's "disorganizing" activities (i.e., terrorism) to bring about reforms that would in the end result in revolution. The reforms first would provide the political freedom to conduct agitation leading to the undermining of the state structure, and thus publicly exposing the state's vulnerability and encouraging revolution. Disagreeing over tactics, the members of Zemlya i Volya split into two groups in 1879. Those favouring terror formed the Narodnaya Volya (People's Will), which was effectively crushed by the police after it assassinated Alexander II (1881). The others, preferring to emphasize direct agitation among the people, became the Chorny Peredel (Black Repartition), which operated until several of its leaders left it (1883) to form a Social-Democratic organization abroad.

zemsky sobor ("assembly of the land"), in 16th- and 17th-century Russia, an advisory assembly convened by the tsar or the highest civil authority in power whenever necessary. It was generally composed of representatives from the ecclesiastical and monastic authorities, the boyar council, the landowning classes, and the urban freemen; elections for representatives and the sessions of each group were held separately.

Zemskie sobory were first called by Ivan IV the Terrible, and the assemblies met often during his reign; the most important one (1566) considered the Livonian War against Poland. After a zemsky sobor confirmed the accession of Fyodor I in 1584, none was called until the assembly that elected Boris Godunov tsar in 1598. During the Time of Troubles (1598–1613), the assemblies were again convened frequently and were highly influential; the zemsky sobor that assembled in 1613 elected Michael Romanov tsar. Several others subsequently assisted with internal reforms, but after 1622 the zemsky sobor declined in importance; the last one was convened in 1653.

In the 19th century the Slavophiles revived the concept of the zemsky sobor, considering it a reflection of the ideal union between the tsar and the Russian people; a proposal to reestablish the institution resulted in the dismissal of the minister who suggested it, N.P. Ignatiev.

zemstvo, plural zemstva, organ of rural self-government in the Russian Empire and the Ukraine; established in 1864 to provide social and economic services, it became a significant liberal influence within imperial Russia. Zemstva assemblies existed on two levels, the uyezd (district) and the province; the uyezd assemblies, composed of delegates representing the individual landed proprietors and the peasant village communes, elected the provincial assemblies. Each assembly appointed an executive board and hired professional experts to carry out its functions.

Generally dominated by the nobility, the zemstva suffered after 1890 from legislation that restricted their authority, from insufficient revenue, and from administrative controls of a hostile bureaucracy. Nevertheless, they expanded the network of elementary schools, constructed roads, provided health care, and instructed the peasantry in agricultural techniques. From the late 1890s onward they also agitated for constitutional reform and, through a union organized by the zemstva and their professional employees, stimulated revolutionary activity in 1904-05 and 1917. Reorganized on a democratic basis in 1917, the zemstva were abolished after the Bolshevik party came to power later that year. The term zemstvo also referred to a 16th-century institution for tax collection.

Zemyna (Baltic deity): see Zemes māte.

Zen, Chinese CH'AN (from Sanskrit *dhyāna*, "meditation"), important school of Buddhism in Japan that claims to transmit the spirit or essence of Buddhism, which consists in expe-

riencing the enlightenment (bodhi) achieved by the Gautama Buddha. The school arose in the 6th century in China as Ch'an, a form of Mahāyāna Buddhism; its development in Japan dates from the 12th century. In its secondary developments of mental tranquillity, fearlessness, and spontaneity—all faculties of the enlightened mind—the school of Zen has had lasting influence on the cultural life of Japan.

Zen teaches that the Buddha-nature, or potential to achieve enlightenment, is inherent in everyone but lies dormant because of ignorance. It is best awakened not by the study of scriptures, the practice of good deeds, rites and ceremonies, or worship of images but by a sudden breaking through of the boundaries of common, everyday, logical thought. Training in the methods leading to such an Enlightenment (Chinese wu; Japanese Satori, q.v.) is best transmitted personally from master to disciple. The methods recommended, however, differ among the various sects of Zen.

The Rinzai (Chinese Lin-chi) sect, introduced to Japan from China by the priest Ensai in 1191, emphasizes sudden shock and meditation on the paradoxical statements called kōan. The Sōtō (Chinese Ts'ao-tung) sect, transmitted to Japan by Dogen on his return from China in 1227, prefers the method of sitting in meditation (zazen). A third sect, the Obaku (Chinese Huang-po), was established in 1654 by the Chinese monk Yin-yüan (Japanese Ingen). It employs the methods of Rinzai and also practices nembutsu, the continual invocation of Amida (the Japanese name for the Buddha Amitābha), with the devotional formula namu Amida Butsu (Japanese: "homage to Amida Buddha").

During the 16th-century period of political unrest, Zen priests not only contributed their talents as diplomats and administrators but also preserved the cultural life; it was under their inspiration that art, literature, the tea cult, and the Nō theatre, for example, developed and prospered. Neo-Confucianism, which became the guiding principle of the Tokugawa feudal regime (1603–1867), also was originally introduced and propagated by Japanese Zen masters.

In modern Japan, Zen sects and subsects claim some 9,600,000 adherents. Considerable interest in various aspects of Zen thought has developed also in Western countries in the latter half of the 20th century, and a number of Zen groups have been formed in North America and Europe.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Zend-Avesta (Zoroastrian scripture): see Avesta.

Zend language: see Avestan language.

zen'ei ikebana, also called zen'eibana (Japanese: "avant-garde flower arranging"), in Japanese floral art, modern style in which freedom of expression takes precedence over classic rules. Zen'ei ikebana was established in 1930 by a group of art critics and floral masters led by Teshigahara Sōfū, founder of the Sogetsu school (1927). In the spirit of the less formal nageire and moribana styles, it broke established rules governing the natural placement of materials and the choice of vases harmonious with the arrangement. Zen'ei ikebana masters crossed stems, used even numbers of branches rather than the odd numbers prescribed by tradition, cut leaves into artificial shapes, applied paint to the arrangement, visibly wired the arrangement together, and

Zen'ei ikebana arrangement of the Ohara school using anthurium, Japanese yew, and aluminum-sheathed wood

By courtesy of the International Society for Educational Information, Tokyo

often included such materials as plastic, glass, and feathers.

Zeng Guofan (Chinese leader): *see* Tseng Kuo-fan.

Zenger, John Peter (b. 1697, Germany—d. July 28, 1746, New York City), New York printer and journalist whose famous acquittal in a libel suit (1735) established the first important victory for freedom of the press in the English colonies of North America.

Emigrating to New York City at 13, Zenger was indentured for eight years as an apprentice to William Bradford, pioneer printer of the middle colonies, and established his own printing by property in 1726.

printing business in 1726.

On Nov. 5, 1733, Zenger published his first issue of the New York Weekly Journal-the political organ of a group of residents who opposed the policies of the colonial governor William Cosby. Although many of the ar-ticles were contributed by his more learned colleagues, Zenger was still legally responsible for their content as publisher. For a year the paper continued its scathing attacks on Cosby until, on Nov. 17, 1734, Zenger was arrested for libel. Remaining in prison for nearly 10 months, he was finally brought to trial in August of the following year. Disregarding the judge's admonition, his brilliant Philadelphia defense attorney, Andrew Hamilton, argued that the jury itself was competent to decide the truth of Zenger's printed statements. To the acclaim of the general public and the spectators, the colonial jury acquitted Zenger on the ground that his charges were based on fact—a key consideration in libel cases since that time.

Zenger subsequently served as public printer in both New York and New Jersey. His account of the trial was published in 1736 in the *Journal* and was widely circulated in both the United States and England.

Zengi (Iraqi ruler): see Zangī.

Zengzi (Confucianist philosopher): *see* Tseng-tzu.

zenith, point on the celestial sphere directly above an observer on the Earth. The point 180° opposite the zenith, directly underfoot, is the nadir. Astronomical zenith is defined by gravity; *i.e.*, by sighting up a plumb line. If the line were not deflected by such local irreg-

ularities in the Earth's mass as mountains, it would point to the geographic zenith. Because the Earth rotates and is not a perfect sphere, the geocentric zenith is slightly different from the geographic zenith except at the Equator and the poles. Geocentric zenith is the intersection with the celestial sphere of a straight line drawn through the observer's position from the geometric centre of the Earth.

Zenjān (Iran): see Zanjān.

Zenjirli Hüyük (Turkey): see Zincirli Hüvük.

Zennichi (Buddhist prophet): see Nichiren.

Zeno (b. Isauria, Diocese of the East—d. April 9, 491), Eastern Roman emperor whose reign (474–491) was troubled by revolts and religious dissension.

Until he married the Eastern emperor Leo I's daughter Ariadne (in 466 or 467), Zeno had been known as Tarasicodissa. As such he led an Isaurian army that the Emperor relied upon to offset the influence of German troops under the powerful patrician Aspar. In 469 Zeno was appointed consul and master of the soldiers. On the death of Leo I early in 474, Zeno's seven-year-old son reigned as Leo II; the child died before the end of the year, after having appointed his father co-emperor.

Zeno made a lasting peace with the Vandals in Africa but soon encountered difficulties at home when his most trusted adviser, the Isaurian Illus, plotted a coup d'etat with Leo I's brother-in-law Basiliscus. The Emperor, with many of his followers, was forced to flee to Isauria. Basiliscus reigned at Constantinople for 20 months, but his religious beliefs

made him highly unpopular.

With the help of Illus, who changed his allegiance, Zeno returned to Constantinople in August 476. Illus, who had gained great influence in the government, raised a rebellion in Asia Minor (484) and, though severely defeated, held out against the Emperor until captured and beheaded in 488. During those years Zeno also had to deal with revolts of the Ostrogoths under Theodoric. By appointing Theodoric to replace Odoacer as king of Italy (489), Zeno was able to persuade the Ostrogoths to leave the Eastern Empire.

Although the rest of Zeno's reign was free from revolts and invasions, there were bitter disputes between the orthodox Christians and Monophysites, a heretical faction that believed the divine and human natures of Christ were one. The Emperor sought to reconcile the two groups with his letter, the *Henotikon*, addressed to the church in Egypt (482). The doctrines expressed in this document were acceptable to the Monophysites and brought measure of religious peace to the East, but they resulted in a schism with the church at Rome that lasted from 484 to 518.

Zeno OF CITIUM (b. c. 335 BC, Citium, Cyprus—d. c. 263, Athens), Greek thinker who founded the Stoic school of philosophy, which influenced the development of philosophical and ethical thought in Hellenistic and Roman times.

He went to Athens c. 312 BC and attended lectures by the Cynic philosophers Crates of Thebes and Stilpon of Megara, in addition to lectures at the Academy. Arriving at his own philosophy, he began to teach in the Stoa Poikile (Painted Colonnade), whence the name of his philosophy. Zeno's philosophical system included logic and theory of knowledge, physics, and ethics—the latter being central. He taught that happiness lay in conforming the will to the divine reason, which governs the universe. In logic and the theory of knowledge he was influenced by Antisthenes and Diodorus Cronus, in physics by Heracleitus. None of his many treatises, written in harsh but forceful Greek, has survived save in fragmentary quotations.

Zeno OF ELEA (c. 495 BC-c. 430 BC), Greek philosopher and mathematician, whom Aristotle called the inventor of dialectic. He is especially known for his paradoxes that contributed to the development of logical and mathematical rigour and that were insoluble until the development of precise concepts of continuity and infinity.

Zeno was famous for the paradoxes whereby, in order to recommend the Parmenidean doctrine of the existence of "the one" (i.e., indivisible reality), he sought to controvert the common-sense belief in the existence of "the many" (i.e., distinguishable qualities and things capable of motion). Zeno was the son of a certain Teleutagoras and the pupil and friend of Parmenides. In Plato's Parmenides, Socrates, "then very young," converses with Parmenides and Zeno, "a man of about forty"; but it may be doubted whether such a meeting was chronologically possible. Plato's account of Zeno's purpose (Parmenides), however, is presumably accurate. In reply to those who thought that Parmenides' theory of the existence of "the one" involved inconsistencies, Zeno tried to show that the assumption of the existence of a plurality of things in time and space carried with it more serious inconsistencies. In early youth he collected his arguments in a book, which, according to Plato, was put into circulation without his knowledge.

Zeno made use of three premises: first, that any unit has magnitude; second, that it is infinitely divisible; and third, that it is indivisible. Yet he incorporated arguments for each: for the first premise, he argued that that which, added to or subtracted from something else, does not increase or decrease the second unit is nothing; for the second, that a unit, being one, is homogeneous and that therefore, if divisible, it cannot be divisible at one point rather than another; for the third, that a unit, if divisible, is divisible either into extended minima, which contradicts the second premise or, because of the first premise, into nothing. He had in his hands a very powerful complex argument in the form of a dilemma, one horn of which supposed indivisibility, the other infinite divisibility, both leading to a contradiction of the original hypothesis. His method had great influence and may be summarized as follows: he continued Parmenides' abstract, analytic manner but started from his opponents' theses and refuted them by reductio ad absurdum. It was probably the two latter characteristics which Aristotle had in mind when he called him the inventor of dialectic.

That Zeno was arguing against actual opponents, Pythagoreans who believed in a plurality composed of numbers that were thought of as extended units, is a matter of controversy. It is not likely that any mathematical implications received attention in his lifetime. But in fact the logical problems which his paradoxes raise about a mathematical continuum are serious, fundamental, and inadequately solved by Aristotle. See also paradoxes of Zeno.

Zeno, Carlo (b. 1334, Venice—d. March 8, 1418, Venice), Venetian admiral whose victory over the Genoese at Chioggia, near Venice, in 1380 was a turning point in the struggle between the two great maritime republics.

Briefly a student at the University of Padua, Zeno was forced by poverty to become a soldier, but later he became a merchant. During commercial voyages to Constantinople and Crete, he acted as envoy for his native city in negotiations with the Byzantine emperor John V Paleologus. In 1378, when the War of Chioggia broke out, he was sent to defend Treviso (north of Venice); and, after the defeat of a Venetian fleet at Pola (across the Adriatic from Venice), he harassed the Genoese in the Ligurian Sea and the Aegean. His ships were off Cyprus when he learned that a Genoese fleet under Adm. Pietro Doria had

taken Chioggia and was threatening Venice. Hastening home, he found that the Venetians, commanded by Vettor Pisani, had managed to blockade the port of Chioggia by sinking ships in the channel. In the ensuing battle, Doria was killed, and the Genoese were encircled. On June 24, 1380, the Genoese, reduced to starvation, surrendered. When Pisani died in August, Zeno became grand admiral.

On retiring to civilian life, Zeno served in embassies to France and England and in the Venetian government. In 1403 he was once more called to military service, first against a French fleet off Genoa and then fighting on land against Francesco I Carrara, lord of Padua. Accused of having taken part in the sack of Carrara's palace, he was imprisoned for two years. After his release he went to the Holy Land and, visiting Cyprus, took over command of its army against the Genoese, whom he expelled from the island. In 1410 he returned to Venice.

Zeno, paradoxes of: see paradoxes of Zeno.

Zenobia, in full SEPTIMIA ZENOBIA, Aramaic ZNWBYĀ BAT ZABBAI (d. after 274), queen of the Roman colony of Palmyra, in present-day Syria, from 267 or 268 to 272; she conquered several of Rome's eastern provinces before she was subjugated by the emperor Aurelian (ruled 270-275).

Zenobia, portrait bust; in the Vatican Museum, Rome

Giraudon from Art Resource/EB Inc

Zenobia's husband, Odaenathus, Rome's client ruler of Palmyra, had by 267 recovered the Roman East from Persian conquerors. After Odaenathus and his eldest son (by his former wife), Herodes (or Herodianus), were assassinated in 267 or 268, Zenobia became regent for her own young son Wahballat (called Vaballathus in Latin, Athenodorus in Greek). Styling herself queen of Palmyra, she had Vaballathus adopt his father's titles of "king of kings" and corrector totius Orientis ("governor of all the East"). Nevertheless, unlike Odaenathus, Zenobia was not content to remain a Roman client. In 269 she seized Egypt, then conquered much of Asia Minor and declared her independence from Rome. Marching east, Aurelian defeated her armies at Antioch (now Antakya, Tur.) and at Emesa (now Homs, Syria) and besieged Palmyra. Zenobia and Vaballathus tried to flee from the city, but they were captured and taken to Rome (272). The Palmyrenes soon surrendered. When they revolted again in 273, the Romans recaptured and destroyed the city. Zenobia and two of her sons, Herennianus and Timolaus, graced the triumphal procession that Aurelian celebrated at Rome in 274. Vaballathus' fate is unknown, but Zenobia married a Roman senator and presumably spent the rest of her life at his villa near Tibur (now Tivoli, Italy).

Zenodotus of EPHESUS (fl. late 3rd century BC), Greek grammarian and first superintendent (from c. 284 BC) of the library at Alexandria, noted for editions of Greek poets and especially for producing the first critical edition of Homer.

Zenodotus lived during the reigns of the first two Ptolemies and was a pupil of Philetas of Cos. While serving as superintendent of the library at Alexandria, he directed the work of editing the Greek epic and perhaps the lyric poets. After comparing different manuscripts of Homer, he deleted doubtful lines, transposed others, made emendations, and divided the *Iliad* and the *Odyssey* into 24 books each.

Zenodotus' edition—knowledge of which is derived almost entirely from later scholia on Homer—was severely attacked for its subjectivity by later scholars, notably one of his successors at the library, Aristarchus of Samothrace (c. 220-c. 143 BC) who modified Zenodotus' work.

Zenodotus also compiled a Homeric glossary. edited the Theogony of Hesiod, and published studies of Pindar, traces of which survive in a papyrus from Oxyrhyncus. He is also said to have written epic poetry.

Zenshōbō Renchō (Buddhist prophet): see Nichiren.

Zenta, Battle of (Sept. 11, 1697), decisive military victory of Austrian forces over an Ottoman army at Zenta (now Senta, Yugos.) on the Tisza River during a war (1683-99) between the Ottoman Empire and the Holy League (Austria-Poland-Venice-Russia), a victory that made Austria the foremost power in central Europe.

In September 1697 the Ottoman army, led by Sultan Mustafa II, was overtaken by the Austrians under Prince Eugene of Savoy as it was crossing the river at Zenta. The Ottomans were panic stricken, and the Grand Vizier was killed on the battlefield by mutinous Janissaries; the Ottomans lost all their artillery as well as the Sultan's treasure box to the Austrians. Mustafa II, who faced desertion by his ally France and had lost Azov to Russia (1696), was compelled to sue for peace (Treaty of Carlowitz, 1699).

zeolite, any member of a family of hydrated aluminosilicate minerals that contain alkali and alkaline-earth metals. The zeolites are noted for their lability toward ion-exchange and reversible dehydration. They have a framework structure that encloses interconnected cavities occupied by large metal cations (positively charged ions) and water molecules.

A brief treatment of zeolites follows. For full treatment, see MACROPAEDIA: Minerals and

The essential structural feature of a zeolite is a three-dimensional tetrahedral framework in which each oxygen atom is shared by two tetrahedra. If all tetrahedra contained silicon the framework would be neutral; substitution of aluminum for silicon creates a charge imbalance and requires other metal ions to be present in relatively large cavities of the framework. In naturally occurring zeolites these metal ions are typically monoor di-valent ions such as sodium, potassium, magnesium, calcium, and barium. Zeolites are similar to feldspar minerals except that cavities are larger in zeolites and water is generally present. Structurally, zeolites are classified by the types of structural units that compose the framework, such as rings or polyhedra types. The cavities formed by the framework units have diameters ranging from about 2 to 8 angstroms, which permits relatively easy movement of ions between cavities.

This ease of movement of ions and water within the framework allows reversible dehydration and cation exchange, properties which vary considerably with chemical and structural differences. Dehydration character varies with the way water is bound in the structure. For those zeolites in which water is tightly bound, dehydration occurs at relatively high temperatures; by contrast, in certain zeolites with large cavities, some of the water can be released at low temperatures. The rate of ion exchange depends on the size and connections between cavities. Some ions are excluded because of specific structural properties.

Zeolite properties are exploited through commercial production of zeolites with particular structural and chemical features. Some commercial uses include separation of hydrocarbons, such as in petroleum refining; drying of gases and liquids; and pollution control by selective molecular adsorption.

Natural zeolites occur in basic volcanic rocks as cavity fillings, probably as a result of deposition by fluids or vapours. In sedimentary rocks zeolites occur as alteration products of volcanic glass and serve as cementing material in detrital rocks; they also are found in chemical sedimentary rocks of marine origin. Extensive deposits of zeolites occur in all oceans. Metamorphic rocks contain a sequence of zeolite minerals useful for assigning relative metamorphic grade; these minerals form at the expense of feldspars and volcanic glass. For a table of zeolites, see page 908.

zeolitic facies, one of the major divisions of the mineral facies classification of metamorphic rocks, the rocks of which formed at the lowest temperatures and pressures associated with regional metamorphism. It represents the transition between the sedimentary processes of diagenesis and the distinct regional metamorphism exhibited by the greenschist facies. This facies was first proposed for rocks that were buried at depths of six to nine kilometres (approximately 10 to 14 miles), where they are subject to a load pressure of about one-fifth of a kilobar (about 3,000 pounds per square inch) and temperatures of 200°-300° C (400°-575° F). Minerals typically found under these conditions include the zeolites, albite, quartz, and prehnite. Volatile components are very important in the chemistry of this facies because, under zeolitic facies, the temperature and pressure can change the chemical potentials of water and carbon dioxide so as to produce the mineralogy of the greenschist facies.

zeon, in the Orthodox Eastern Church, a part of the Eucharistic liturgy in which the deacon pours a few drops of hot water (known as the zeon, or "living water") into the chalice. The origin of the rite is not known, though it is clearly very ancient. It is explained as symbolizing the fervour (i.e., heat) of faith or the descent of the Holy Spirit.

Zephaniah, also spelled sophonias (fl. 7th century BC), Israelite prophet, said to be the author of one of the shorter Old Testament prophetical books, who proclaimed the approaching divine judgment. The first verse of the Book of Zephaniah makes him a contemporary of Josiah, king of Judah (reigned c. 640-609 BC). The prophet's activity, however, probably occurred during the early part of Josiah's reign, for his criticism of the worship of certain gods in Jerusalem (Baal, Milcom, and the host of the heavens) would have been meaningless after Josiah's reform, which took place c. 623/622 BC.

Zephaniah, Book of, also called sophonias, the ninth of 12 Old Testament books that bear the names of the Minor Prophets, collected in one book, The Twelve, in the Jewish canon. The book consists of a series of independent sayings, many of which are rightly attributed to Zephaniah, written probably around 640-630 BC. The actual compilation and the ex-

pansion of the sayings is the work of a later editor.

The dominant theme of the book is the "day of the Lord," which the prophet sees approaching as a consequence of the sins of Judah. A remnant will be saved (the "humble and lowly") through purification by judgment. It is not clear whether the day of judgment is conceived of as historical or eschatological. In any case, the conception was originally developed by Amos and Isaiah, and Zephaniah's resumption of the theme may have influenced his younger contemporary Jeremiah. His description of the "day of the Lord," however, has entered deeply into the popular conception of the judgment day through the great medieval hymn Dies irae ("Day of Wrath"), which apparently was inspired by the selections from Zephaniah employed in the responses of the Office of the Dead.

Zephyrinus, SAINT (b. Rome?—d. c. 217, Rome?; feast day August 26), pope from c. 199 to 217.

Of humble birth, he succeeded Pope St. Victor I and is believed to have appointed his own successor St. Calixtus I (Callistus) as his chief deacon. During Zephyrinus' pontificate, the Roman priest St. Hippolytus vigorously opposed the spread of Monarchianism, a Trinitarian heresy that affirmed the sole deity of God the Father. Zephyrinus failed to condemn Monarchianism or favour the Logos doctrine (emphasizing the distinction of the Persons of the Trinity), of which Hippolytus was the passionate champion. Opposing Zephyrinus, Hippolytus thus started the first schism in the history of the Christian Church.

Unfortunately, the primary source of information on Zephyrinus is Hippolytus' *Philosophoumena*, in which he describes the Pope as a weak man "unskilled in the church's rule" and dominated by Calixtus. Hippolytus considered both men culpable for being unwilling to enter the theological debate on the Trinity. Zephyrinus died during the persecution of Christians that was instigated by the Roman emperor Lucius Septimius Severus.

zeppelin, rigid airship of a type originally manufactured by Luftschiffsbau-Zeppelin and consisting of a cigar-shaped, trussed, and covered frame supported by internal gas cells. The first Zeppelin airship was designed by Ferdinand, Graf von Zeppelin, a retired German army officer, and made its initial flight from a floating hangar on Lake Constance, near Friedrichshafen, Ger., on July 2, 1900. Beneath the 420-foot (128-metre) craft a keellike structure connected two external cars, each of which contained a 16-horsepower engine geared to two propellers. A sliding weight secured to the keel afforded vertical control by raising or lowering the nose, while rudders were provided for horizontal control. The craft attained speeds approaching 20 miles per hour (32 km/h).

During World War I the Germans achieved moderate success in long-range bombing operations with the zeppelin-type rigid airship, which could attain higher altitudes than the airplanes then available. On two occasions during 1917, German Zeppelins made flights of almost 100 hours' duration. Such performances led many people to believe that large airships would play a prominent part in aviation development. A number of Zeppelins were distributed to the Allied countries as a part of postwar reparations by Germany.

Of many subsequent zeppelins, the two most famous were the *Graf Zeppelin*, completed in September 1928, and the giant *Hindenburg*, first flown in 1936. The *Graf Zeppelin* inaugurated transatlantic flight service, and by the time of its decommissioning in 1937 had made 590 flights, including 144 ocean crossings, and had flown more than 1,000,000 miles (1,600,000 km). In 1929 the craft covered about 21,500 miles (34,600 km) in a world

flight that was completed in an elapsed time of approximately 21 days. The *Hindenburg*, 804 feet (245 metres) long, was powered by four 1,100-horsepower diesel engines, giving it a maximum speed of 84 miles per hour (135 km/h). In 1936 this airship carried a total of 1,002 passengers on 10 scheduled round trips between Germany and the United States. On May 6, 1937, while landing at Lakehurst, N.J., the hydrogen-inflated craft burst into flames and was completely destroyed, with a loss of 36 lives. The Zeppelin airship works were destroyed by Allied bombing during World War II, and building of the huge rigid airships was never resumed.

Zeppelin, Ferdinand (Adolf August Heinrich), Graf von (count of) (b. July 8, 1838, Konstanz, Baden—d. March 8, 1917, Charlottenburg, near Berlin), first notable builder of rigid dirigible airships, for which his surname is still a popular generic term.

Zeppelin received a military commission in 1858. He made the first of several balloon ascensions at St. Paul, Minn., while acting as a military observer (1863) for the Union Army during the American Civil War. He saw military action in 1866 during the Seven Weeks' War and in 1870–71 during the Franco-German War, serving successively in the armies of Württemberg, Prussia, and imperial Germany. He retired in 1890 and devoted the rest of his life to the creation of the rigid airship for which he is known.

Zeppelin struggled for 10 years to produce his lighter-than-air craft. The initial flight (July 2, 900) of the LZ-1 from a floating hangar on Lake Constance, near Friedrichshafen, Ger., was not entirely successful, but it had the effect of promoting the airship to the degree that public subscriptions and donations thereafter funded the count's work. The German government was quick to perceive the advantage of airships over the as yet poorly developed airplanes, and when Zeppelin achieved 24hour flight in 1906, he received commissions for an entire fleet. More than 100 zeppelins were used for military operations in World War I. A passenger service known as Delag (Deutsche-Luftschiffahrts AG) was established in 1910, but Zeppelin died before attaining his goal of transcontinental flight.

Zera'im (Hebrew: "Seeds"), the first of the six major divisions, or orders (sedarim), of the Mishna (codification of Jewish oral laws), which was completed early in the 3rd century AD by Judah ha-Nasi. Zera'im contains 11 tractates (treatises), the first of which (Berakhot, "Blessings") deals with public worship and private prayer. The other 10 tractates all deal with laws regarding agriculture and are called: Pe'a ("Corner"), Demai ("Dubiously Tithed Produce"), Kilayim ("Mixed Kinds"), Shevi't ("Seventh Year"), Terumot ("Heave Offerings"), Ma'aserot ("Tithes"), Ma'aser sheni ("Second Tithe"), Halla ("Dough Offering"), 'Orla ("Uncircumcision"—applied to restricted fruit), and Bikkurim ("Firstfruits"). The Palestinian Talmud has Gemara (critical commentaries) on all 11 tractates of Zera'im, but the Babylonian Talmud has Gemara only on Berakhot.

Zeravshan Range, Russian ZERAVSHANSKY KHREBET, also spelled ZERAVŠANSKIJ CHREBET, mountain range in the Tadzhik and Uzbek Soviet Socialist republics, forming a part of the Gissar-Alay system. It extends for more than 230 miles (370 km) east-west parallel to the Turkistan Range between the Zeravshan Valley on the north and the Yagnob and Iskanderdarya valleys on the south. The range is split into four parts by the Fandarya, Kshtut, and Magian rivers. Many peaks rise more than 16,500 feet (5,000 m), the highest being Chimtorga, at 18,009 ft (5,489 m).

Zeravshan River, also spelled ZERAVŠAN, river rising in the eastern Turkistan Range and

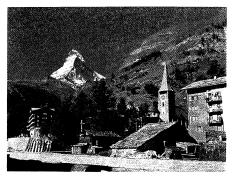

flowing 545 miles (877 km) west through the Tadzhik Soviet Socialist Republic and south-eastern Uzbek S.S.R. to disappear in the desert north of Chardzhou near the Amu Darya, of which it was at one time a tributary. The river supplies water to a vast irrigation district, including the Karshi Steppe to the south (which receives water from the Zeravshan by a canal). The Zeravshan Valley is densely populated, particularly within Uzbekistan.

Zerma, also spelled DJERMA, or DYERMA, also called ZABERMA, a people of westernmost Niger, including also a few who live in neighbouring areas of Burkina Faso (formerly Upper Volta) and Nigeria. Zerma speak a dialect of Songhai, one of the languages of the Nilo-Sarahan family, and are considered to be a branch of the Songhai (q.v.) people.

The Zerma live in the arid lands of the Sahel. Many live in the Niger River Valley and exploit the river for irrigation. They grow milet, sorghum, rice, corn (maize), and tobacco and raise cotton and peanuts (groundnuts) as cash crops. Cattle are owned but are given to Fulani (Fulbe) or Tuareg to tend; milk is an important element of the daily diet. Horses are kept by important persons, and in the past the Zerma were skilled cavalrymen. Horses and especially cattle are an important source of wealth for the Zerma, and there has long been a trade pattern whereby cattle are driven south for sale in coastal countries.

Niamey, the capital of Niger, and the towns of Dosso and Tillabéry are in Zerma territory. For a long time Zerma have migrated to coastal countries, especially to Ghana, in search of work. The Zerma numbered 850,000 in Niger in the late 20th century.

Zermatt, town, Valais canton, southern Switzerland. It lies at the head of the Mattervisp Valley and at the foot of the Matterhorn (14,692 feet [4,478 m]), 23 miles (37 km) southeast of Sion. Its name is derived from its position Zur Matte ("in the Alpine meadow") at an elevation of 5,302 feet (1,616 m). A yearround resort surrounded by mountains and glaciers, it commands some of the finest views in Switzerland and is also a popular centre

Zermatt village and church, Switz., with the Matterhorn in the background

for Alpine mountaineering and winter sports. Cableways are numerous, and the highest in Europe leads up the Klein-Matterhorn. Zermatt is reached by rail from Brig. Automobiles are not permitted in Zermatt and the valley road stops at Sankt Niklaus. The population is German speaking and Roman Catholic. Pop. (1980) 3,548.

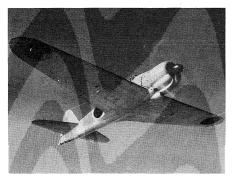

Zernike, Frits (b. July 16, 1888, Amsterdam—d. March 10, 1966, Groningen, Neth.), Dutch scientist, winner of the Nobel Prize for Physics in 1953 for his invention of the phase-contrast microscope, an instrument that permits the study of internal cell structure without the need to stain and thus kill the cells.

Zernike joined the faculty of the State University of Groningen as professor of mathematical physics and theoretical mechanics in 1915 and served as a full professor from 1920 to 1958. His earliest work in optics was concerned with astronomical telescopes. While studying the flaws that occur in some diffraction gratings because of the imperfect spacing of engraved lines, he discovered the phase-contrast principle. He noted that he could distinguish the light rays that passed through different transparent materials. He built a microscope using that principle in 1938. In 1952 Zernike was awarded the Rumford medal of the Royal Society of London.

Zero, also called MITSUBISHI A6M, OF NAVY TYPE 0, fighter aircraft, a single-seat, lowwing monoplane used with great effect by the Japanese during World War II. The Zero was made in two conformations: as a land-based fighter and, with folding wingtips for stowage, for carrier use. It was designed to specifications written in 1937, was first tested in 1939, and was placed in production and in operation in China in 1940. Although Allied forces codenamed the aircraft "Zeke," it was generally known as the Zero, a term derived from one of its Japanese names—Reisen Kanjikisen (Zero Celebration Carrier-based Fighter Airplane), abbreviated Reisen. The year its production began, 1940, was the 2,600th anniversary of the ascension to the throne of Japan's legendary first emperor, Jimmu, hence the "zeroyear" celebration.

The Zero was made by Mitsubishi Heavy Industries and was first powered by a Nakajima Sakae radial air-cooled engine of 14 cylinders (two staggered rows of seven) that developed 1,020 horsepower. Later it used a 1,130-horsepower engine to turn its three-blade constant-speed propeller. Its top speed was 350 miles per hour (565 km/h) at nearly 20,000 feet (6,100 m), and it was armed with two 7.7-millimetre machine guns and two 20-millimetre cannons in its wings; it could carry two 132-pound (59.9-kilogram) bombs under the wings.

When it first appeared, the Zero could outmaneuver every airplane it encountered. Moreover, its 156-gallon (591-litre) internal fuel tank was augmented with a 94-gallon external tank that could be dropped when empty, thus enabling the Zero to fly far be-

Japanese Zero, also called Mitsubishi A6M

yond its expected range. The Allies did not field fighters that could defeat it in aerial combat until 1943. Many Zeros were converted to kamikaze craft in the closing months of the war. In all, nearly 10,430 of them were built.

zero-point energy, vibrational energy that molecules retain even at the absolute zero of temperature. Temperature in physics has been found to be a measure of the intensity of random molecular motion, and it might be expected that, as temperature is reduced to

absolute zero, all motion ceases and molecules come to rest. In fact, however, the motion corresponding to zero-point energy never vanishes.

Zero-point energy results from principles of quantum mechanics, the physics of subatomic phenomena. Should the molecules ever come completely to rest, their component atoms would be precisely located and would simultaneously have precisely specified velocities, namely, of value zero. But it is an axiom of quantum mechanics that no object can ever have precise values of position and velocity simultaneously (see uncertainty principle); thus molecules can never come completely to rest.

Żeromski, Stefan (b. Nov. 1, 1864, Strawczyn, Pol., Russian Empire—d. Nov. 20, 1925, Warsaw), Polish novelist admired for his naturalistic and lyrical style.

After attending the Gymnasium at Kielce and the veterinary college in Warsaw, Zeromski worked at first as a resident tutor in country houses and then as an assistant librarian in Switzerland and at the Zamoyski Library in Warsaw (1897–1903). From 1905, while living at Nałęczów, he furthered the cause of education for the masses and was arrested by the Russian authorities in 1908 for these ac-

Żeromski, pastel by Leon Wyczótłkowski, 1904; in the Muzeum Narodowe, Kraków, Pol.

tivities. Żeromski subsequently lived in Paris (1909–12) and in Warsaw. Zeromski's first short stories were published in 1889. His first novel, *Syzyfowe Prace* ("Sisyphean Labours"), appeared in 1897. *Popioty*, 3 vol. (1904; *The Ashes*) finally established his reputation. His last novel, *Przedwiośnie* (1925; "Springtime"), is about the first fruits of Polish national independence.

Zerubbabel, also spelled ZOROBABEL (fl. 6th century BC), governor of Judaea under whom the rebuilding of the Jewish Temple at Jerusalem took place. Of Davidic origin, Zerubbabel is thought to have originally been a Babylonian Jew who returned to Jerusalem at the head of a band of Jewish exiles and became governor of Judaea under the Persians. Influenced by the prophets Haggai and Zechariah, he rebuilt the Temple. As a descendant of the House of David, Zerubbabel rekindled Jewish messianic hopes.

Zethus (Greek mythology): see Amphion and Zethus.

Zetkin, Clara, née EISSNER (b. July 5, 1857, Wiederau, Saxony—d. June 20, 1933, Arkhangelskoye, Russian S.F.S.R.), German feminist, Socialist, and Communist leader, who after World War I played a leading role in the new Communist Party of Germany (Kommunistische Partei Deutschlands; KPD) and the Comintern (Third International).

Clara Eissner was educated at the Leipzig

Teachers' College for Women, and while at school she established contacts with the infant Sozialdemokratische Partei Deutschlands (SPD; Social Democratic Party). Her association with Russian revolutionaries led to her marriage with an exile, Ossip Zetkin (1848–89). She spent most of the 1880s in self-imposed exile in Switzerland and Paris, writing and distributing illegal literature and meeting many leading international Socialists.

Clara Zetkin

By courtesy of the Portratsammlung Deutsche Staatsbibliothek, East Berlin

After participating in the founding congress of the Second Socialist International (1889), she returned to Germany and from Stuttgart edited the Socialist women's paper *Die Gleichheit* ("Equality") from 1892 to 1917. In 1907 she was a cofounder of the International Socialist Women's Congress.

A personal friend of Lenin and of the revolutionary writer and activist Rosa Luxemburg, Clara Zetkin organized the first international women's conference against World War I (Bern, 1915), was a cofounder in 1916 of the radical Spartacus League (Spartakusbund), and joined the new Communist Party of Germany in 1919, becoming a member of the party's central committee and serving in the Reichstag (federal lower house) from 1920.

Elected to the presidium of the Third International (1921), she spent more and more of her time in Moscow. After Lenin's death in 1924, she began to lose much of her influence. Three volumes of collected works, Ausgewählte Reden und Schriften ("Selected Speeches and Writings"), were published in East Berlin from 1957 to 1960.

Zeuglodon (extinct whale): see Basilosaurus.

Zeus, in ancient Greek religion, chief deity of the pantheon, a sky and weather god who was identical with the Roman god Jupiter (q.v.). Zeus was regarded as the sender of thunder and lightning, rain, and winds, and his traditional weapon was the thunderbolt. He was called the father (i.e., the ruler and protector) of both gods and men.

According to a Cretan myth that was later adopted by the Greeks, Cronus, king of the Titans, upon learning that one of his children was fated to dethrone him, swallowed his children as soon as they were born. But Rhea, his wife, saved the infant Zeus by substituting a stone wrapped in swaddling clothes for Cronus to swallow and hiding Zeus in a cave on Crete. There he was nursed by the nymph (or female goat) Amalthaea and guarded by the Curetes (young warriors), who clashed their weapons to disguise the baby's cries. After Zeus grew to manhood he led a revolt against the Titans and succeeded in dethroning Cronus, perhaps with the assistance of his brothers Hades and Poseidon, with whom he then divided dominion over the world.

As ruler of heaven Zeus led the gods to victory against the Giants (offspring of Gaea and Tartarus) and successfully crushed several revolts against him by his fellow gods. According to the Greek poet Homer, heaven was located on the summit of Olympus, the highest mountain in Greece and the logical

home for a weather god. The other members of the pantheon resided there with Zeus and were subject to his will. From his exalted position atop Mount Olympus Zeus was thought to omnisciently observe the affairs of men, seeing everything, governing all, and rewarding good conduct and punishing evil. Besides dispensing justice, Zeus was the protector of cities, the home, property, strangers, guests, and supplicants.

Zeus was well-known for his amorousness a source of perpetual discord with his wife. Hera-and he had many love affairs with both mortal and immortal women. In order to achieve his amorous designs, Zeus frequently assumed animal forms, such as that of a cuckoo when he ravished Hera, a swan when he ravished Leda, or a bull when he carried off Europa. Notable among his offspring were the twins Apollo and Artemis, by the Titaness Leto; Helen and the Dioscuri, by Leda of Sparta; Persephone, by the goddess Demeter; Athena, born from his head after he had swal-

Zeus hurling a thunderbolt, bronze statuette from Dodona, Greece, early 5th century BC; in the Staatliche Museen zu Berlin, Germany

By courtesy of the Staatliche Museen zu Berlin, Antikenabteilung

lowed the Titaness Metis; Hephaestus, Hebe, Ares, and Eileithyia, by his wife, Hera; Dionysus, by the goddess Semele; and many others.

Though regarded by Greek religionists everywhere as omnipotent and the head of the pantheon, Zeus's very universality tended to reduce his importance compared to that of powerful local divinities like Athena and Hera. Although statues of Zeus Herkeios (Guardian of the House) and altars of Zeus Xenios (Hospitable) graced the forecourts of houses, and though his mountaintop shrines were visited by pilgrims, Zeus did not have a temple at Athens until the late 6th century BC, and even his temple at Olympia postdated that of Hera.

In art Zeus was represented as a bearded, dignified, and mature man of stalwart build; his most prominent symbols were the thunderbolt and the eagle.

Zeus, Statue of, at Olympia, Greece, one of the Seven Wonders of the World. The statue was one of two masterpieces by the Greek sculptor Phidias (the other being the statue of Athena in the Parthenon) and was placed in the huge temple of Zeus at Olympia in western Greece. The statue, almost 40 feet (12 m) high and plated with gold and ivory, represented the god sitting on an elaborate cedarwood throne ornamented with ebony, ivory, gold, and precious stones. On his outstretched right hand was a statue of Nike (Victory), and in the god's left hand was a sceptre on which an eagle was perched. The statue, which took eight years to construct, was noted for the divine majesty and goodness it expressed. The discovery in the 1950s of the remains of Phidias' workshop at Olympia confirmed the statue's date of about 430 BC. The temple was destroyed in AD 426, and the statue, of which no accurate copies survive, may have been destroyed then or in a fire at Constantinople (now Istanbul) about 50 years later.

Zeuxis (fl. late 5th century BC, Heraclea, Magna Graecia [Italy]), one of the best-known painters of ancient Greece, who seems to have carried a trend toward illusionism to an unprecedented level.

Zeuxis was, in one ancient account, a pupil of Demophilus of Himera in Sicily; other sources refer to him as a pupil of Neseus of Thasos (an island in the northern Aegean). He seems to have been a panel painter rather than a wall painter; he preferred small compositions, often a single figure, and broke with a lofty tradition by introducing genre subjects

into monumental painting.

Although none of his works survives, the subject matter of several have been recorded by ancient writers: they include pictures of the gods, such as Zeus surrounded by other deities, Eros crowned with roses, and Pan; pictures of other mythological figures, such as Marsyas bound, a Centaur family, and the infant Heracles strangling two serpents in the presence of his parents Alcmene and Amphitryon; portraits of the Homeric figures Helen, Menelaus, and Penelope; and genre pictures: an athlete, an old woman, a boy with grapes, and a still life of grapes. There are also references to his monochrome paintings and to

Ancient records also describe his technique. Following the initiative of his Athenian contemporary Apollodorus, Zeuxis used shading to produce a rudimentary form of chiaroscuro, as opposed to the older method of merely filling in the outlined figures with flat washes of colour. The interior modeling of Zeuxis' figures would appear strongly realistic as compared with the flat volumes of the older method, and this revolutionary illusionism was probably the basis of such stories as that of the pictorial contest in which Zeuxis painted a bunch of grapes so realistic that birds flew toward it to take a nibble.

Zeyārid DYNASTY, also spelled ZIYĀRID (927-c. 1090), Iranian dynasty that ruled in the Caspian provinces of Gurgan and Mazandarān. The founder of the dynasty was Mar-dāvīz ebn Zeyār (reigned 927-935), who took advantage of a rebellion in the Sāmānid army of Iran to seize power in northern Iran. He soon expanded his domains and captured the cities of Hamadān and Esfahān. Mardāvīz was murdered in 935, and Zeyārid power thereupon disintegrated.

During subsequent hostilities between the Sāmānid and the Būyid dynasties, the Zeyārids changed their allegiance several times and thus were able to maintain their autonomy. But with the consolidation of Ghaznavid power, the Zeyārids acknowledged that dynasty's suzerainty and entered into various marriage alliances with it. When the Seljuqs occupied Māzandarān in the mid-11th century, the Zeyārids were forced to withdraw into the mountainous territory on the southern Caspian shores, where they ruled until about 1090.

The Zeyārids were distinguished patrons of the arts. The noted Islāmic geographer and scientist al-Bīrūnī resided for many years at the court of Qābūs I ebn Voshmagīr (reigned 978-1012). Keykāvūs (reigned 1049-90) himself was the author of a famous manual for princely behaviour, the Qābūs-nāmeh ("Mirror for Princes").

Zhang (Chinese surname): see under Chang, except as below.

Zhang Jun-xiang, Wade-Giles romanization CHANG CHÜN-HSIANG (b. 1909, Chenchiang, Kiangsu province, China), leading playwright and motion-picture director in Nationalist China and later in the People's Republic.

Zhang was educated at Tsinghua University, Peking, and at Yale University and then

studied film technique in Hollywood. Returning to China during the Sino-Japanese War (1937–45), he directed several successful plays in Chungking and rose to preeminence in the Chinese film industry. After the establishment of the communist regime in 1949, Zhang became a director of the governmental Central Motion Picture Company. His film Red Banner on the Emerald Ridge won acclaim throughout China

Zhang's first published play, Tales of a Small Town (1941), is a comedy about the psychological conflicts of a woman in love; Model Teacher of Myriad Generations, considered his best play, concerns a group of Chinese intellectuals from 1919 to 1937.

Zhang Tianyi, Wade-Giles romanization CHANG TIEN-I (b. 1907, Chiang-ning Inow Nanking], Kiangsu province, China), Chinese writer whose brilliant, socially realistic short stories achieved considerable renown in the 1930s.

Zhang Tianyi was born into a scholarly family whose fortunes had declined. He received his education while wandering with his family throughout China, learning the various dialects of the country and meeting people of all social backgrounds.

In 1924 Zhang moved to Peking. Stimulated by the intellectual activity there, he began to write and produced his first short story, the quite successful "San-jih-pan chih meng ("A Dream of Three-and-a-Half Days"). This story, like the many others he was to create over the next 15 years, was written in a realistic and direct manner, reproducing flawlessly the dialects and social patterns that he had observed as a child.

Zhang Tianyi's career as a short-story writer was curtailed in 1943, when tuberculosis forced him to retire. After recuperating, he was assigned to a trusted position in the new communist regime as a writer of children's plays. He also served as editor in chief of the magazine Jenmin wen-xue ("People's Literature") from 1957.

Zhangjiakou (China): see Kalgan.

Zhangzhou (China): see Chang-chou.

Zhanjiang (China): see Chan-chiang.

Zhao (Chinese surname): see under Chao, except as below.

Zhao Ziyang, Wade-Giles romanization CHAO TZU-YANG, original name ZHAO XIU-SHENG, Wade-Giles CHAO HSIU SHENG (b. November 1919, Hua xian [county], Honan province, China), premier of China from 1980 to 1987 and general secretary of the Chinese Communist Party from 1987 until he was dismissed in 1989.

Born into a landlord family in Honan province, Zhao joined the Young Communist League in 1932 and became a member of the Chinese Communist Party in 1938. During World War II he served in local party organizations in northern China. After the establishment of the People's Republic in 1949, he was moved to Kwangtung province, where he became provincial first party secretary in 1965. Purged in 1967 during the Cultural Revolution, he was later rehabilitated and sent as first party secretary in 1975 to Szechwan, China's most populous province, where he greatly increased industrial and agricultural production. These results were achieved through such innovative policies as rewarding workers on the basis of work performance rather than need and relying on material incentives that encouraged individual initiative rather than on quotas set by central authorities. In addition, factory managers were given much greater autonomy, and peasants were allowed to expand their private plots of land. Such achievements caught the attention of Deng Xiaoping, the de facto leader of the Chinese Communist Party, and Zhao was quickly made a Politburo alternate in 1977 and a full member in 1979, becoming a member of that body's powerful Standing Committee in February 1980.

Early in 1980 he was appointed vice premier and then, in September, premier, replacing Hua Guofeng. An economic experimenter, Zhao advocated "any structure, system, policy, or measure" that might stimulate the forces of production. As premier he was able to extend his Szechwan policies to the whole of China. Thousands of industrial enterprises were given limited self-management, and peasants achieved increased control over and responsibility for their production and profits. Throughout the 1980s Zhao's pragmatic measures led to rapid increases in both agricultural and light-industrial production, and his policies became the guiding principles for China's future economic development. Zhao was appointed acting general secretary of the Communist Party upon Hu Yaobang's forced resignation from that office in January 1987. In November he officially became general secretary, with Li Peng taking over the premier-

As general secretary, Zhao continued to favour the loosening of government controls over industry and to advocate the creation of special free-enterprise zones in China's coastal regions as a means of hastening economic development. Premier Li, on the other hand, favoured a cautious approach that relied more on government planning and guidance.

In April 1989 massive student demonstrations calling for more democratic government broke out in Peking. As the protests continued and grew in size, a serious split developed in the Chinese Communist leadership between those who, like Zhao, were somewhat sympathetic to the protesters' demands and those who, like Li, favoured using force to suppress the demonstrations. As the protest movement spread to other cities and threatened to immobilize the central government, Deng Xiaoping, China's paramount leader, threw his support to Li, who thereupon imposed martial law and used the armed forces to crush the protests. On June 24, 1989, Zhao was formally dismissed from his top party and government posts and was replaced as general secretary by Jiang Zemin.

Zhaoqing (China): see Chao-ch'ing.

Zhdanov (U.S.S.R.): see Mariupol.

Zhdanov, Andrey Aleksandrovich (b. Feb. 26 [Feb. 14, Old Style], 1896, Mariupol, Ukraine, Russian Empire [now Ukrainian S.S.R.]—d. Aug. 31, 1948, Moscow, Russian S.F.S.R.), Soviet government and Communist Party official.

A member of the Bolsheviks from 1915, Zhdanov rose through the party ranks after the October Revolution of 1917 and eventually became political boss of Leningrad, leading the city's defense during the 1941-44 siege by the Germans. He was a close associate of Stalin and reached the peak of his career after World War II, when as a full member of the Politburo (from 1939) he severely tightened the ideological guidelines for postwar cultural activities (see Zhdanovshchina). In 1947 he oversaw the founding of the international Soviet propaganda arm, the Cominform (Communist Information Bureau). Zhdanov's death in 1948 is shrouded in mystery, but it seems to have been inopportune for his allies and followers, since it was followed by the notorious Leningrad Affair (q.v.), in which as many as 2,000 persons, many of them Zhdanov's associates and subordinates, were purged, probably through the efforts of his enemies G.M. Malenkov and L.P. Beria.

Zhdanovshchina, English zhdanovism, cultural policy of the Soviet Union during the Cold War period following World War II, calling for stricter government control of art and promoting an extreme anti-Western bias. Originally applied to literature, it soon spread to other arts and gradually affected all spheres of intellectual activity in the Soviet Union, including philosophy, biology, medicine, and other sciences. It was initiated by a resolution (1946) of the Central Committee of the Communist Party of the Soviet Union that was formulated by the party secretary and cultural boss Andrey Aleksandrovich Zhdanov. It was directed against two literary magazines, Zvezda and Leningrad, which had published supposedly apolitical, bourgeois, individualistic works of the satirist Mikhail Zoshchenko and the poet Anna Akhmatova, who were expelled from the Union of Soviet Writers. The union itself underwent reorganization, but the aims of the resolution were more far-reaching: to free Soviet culture from "servility before the West."

As the campaign accelerated, all vestiges of Westernism, or cosmopolitanism, in Soviet life were ferreted out. Earlier critics and literary historians were denounced for suggesting that Russian classics had been influenced by Jean-Jacques Rousseau, Molière, Lord Byron, or Charles Dickens. Western inventions and scientific theories were claimed to be of Russian origin. Although Zhdanov died in 1948, the campaign against "cosmopolites" continued until the death of Stalin in 1953, acquiring increasingly anti-Semitic overtones.

This period (1946-53) is generally regarded as the lowest ebb of Soviet literature, and, short though it was, it created a barrier in Soviet-Western cultural interchange that was difficult to overcome.

Zhe school (painters): see Che school.

Zhejiang (China): see Chekiang.

Zheleznogorsk, city, Kursk oblast (province), Russian S.F.S.R. It is located 80 miles (130 km) northwest of Kursk and was founded in 1958 in connection with the development of the KMA (Kursk Magnetic Anomaly), one of the Soviet Union's largest iron-ore-mining basins. It is now one of the leading KMA mining centres and has some light industries and a metallurgical institute. Zheleznogorsk achieved city status in 1962. Pop. (1989 prelim.) 81,000.

Zhelyabov, Andrey Ivanovich (b. Aug. 29 [Aug. 17, Old Style], 1851, Nikolayevka, Crimea, Russian Empire [now in Ukrainian S.S.R.]—d. April 15 [April 3], 1881, St. Petersburg [now Leningrad, Russian S.F.S.R.]), Russian revolutionary and a leading Narodnik.

Born to a family of serfs shortly before emancipation, Zhelyabov entered the law school at Novorossiysk University in Odessa but was expelled for his part in student disturbances of October 1871. He continued to be a member of revolutionary circles in Kiev and Odessa, being arrested for his activities but acquitted.

In June 1879 he took part in a congress of political terrorists and became an advocate of such a policy. He helped found the worker, student, and military arms of the extremist organization People's Will and the newspaper of that organization in 1880 and wrote several of the organization's manifestos. One of the organizers of the assassination of Alexander II (March 1, 1881), he was arrested on February 27, demanded to be tried together with his subsequently captured compatriots, and was found guilty and executed.

Zhen Zong (Chinese emperor): see Chentsung.

Zheng (Chinese surname): see under Cheng.

Zhengzhou (China): see Cheng-chou.

Zhenjiang (China): see Chen-chiang.

Zhitomir, oblast (province), Ukrainian S.S.R., occupying an area of 11,550 square miles (29,900 square km). Its northern half lies in the swampy and forested Pripet Marshes; part of the swamp has been reclaimed. The southern half lies on the Volyn-Podolsk Upland, which is greatly dissected by deep river valleys and gullies resulting from erosion.

The economy is largely agricultural, and half of the population is rural. Wheat and sugar beets are the main crops, with hops, flax, and livestock raised in the northern lowland, where timberworking is also important. Apart from Zhitomir, the *oblast* headquarters, its cities are small and engaged in processing farm produce. The production of china and glass is a specialty of cities in the west, notably Gorodnitsa. Pop. (1989 prelim.) 1,545,000.

Zhitomir, city and administrative centre of Zhitomir *oblast* (province), Ukrainian S.S.R. It lies along the Teterev River where it runs between high, rocky banks. Zhitomir is believed to date from the 9th century, but the first record of it is from 1240, when it was sacked by the Tatars.

For long a major trade focus and a seat of provincial government, Zhitomir today is an important junction where the main rail and road routes westward from Kiev are crossed by north-south routes. Its light industries chiefly process wood for furniture and flax for linen. Synthetic fibres are a recent extension of the city's textile industry. Musical instruments, notably accordions, are a specialty. Zhitomir has agricultural and teacher-training institutes. Pop. (1989 prelim.) 292,000.

Zhivkov, Todor (Khristov) (b. Sept. 7, 1911, Pravets, near Botevgrad, Bulg.), first secretary of the Bulgarian Communist Party's Central Committee (1954–89) and president of Bulgaria (1971–89).

Zhivkov, the son of a poor peasant family, drifted to the Bulgarian capital of Sofia in his youth and, in the late 1920s, joined the Komsomol, the youth league of the outlawed Communist Party. He rose in the party and during World War II helped organize the resistance movement known as the People's Liberation Insurgent Army. After the war and the institution of a Soviet-sponsored communist government in Bulgaria, Zhivkov held increasingly important posts, including the command of the People's Militia, which arrested thousands of political opponents. He became a full member of the Politburo in 1951. In March 1954 he was made first secretary of the Central Committee-the youngest leader of any nation in the Soviet bloc-and, as a protégé of the Soviet leader Nikita S. Khrushchev, emerged as the strongman in the internal party struggles that followed

From 1962 to 1971 Zhivkov served as premier of Bulgaria and in the latter year was elected president of the State Council formed by Bulgaria's new constitution. In 1965 he survived an attempted coup d'état by dissident party members and military officers—the first ever within a communist regime.

Zhivkov hewed closely to the Soviet line in both domestic and foreign affairs. He proved to be a competent economic manager, and under his leadership industrialization proceeded steadily in Bulgaria and the living standards of its people rose substantially.

But when a wave of democratization swept across the Soviet-bloc nations of eastern Europe in 1989, the aged Zhivkov resigned all his posts in November of that year in order to make way for a more moderate communist leadership. He was subsequently expelled from the Bulgarian Communist Party in December and was placed under arrest in January 1990.

Zhob, formerly FORT SANDEMAN, town and district of Quetta division, Baluchistan Province, Pakistan. The town lies on an open plain just east of the Zhob River. Originally called Apozai (the name still used locally), it was renamed Fort Sandeman for Sir Robert Sandeman in 1889 and was so-called until the 1970s. To the north is a ridge rising 150 ft (45 m) above the plain; on it stands the Castle, the political agent's residence during the time of British rule. A communications centre and district headquarters, Zhob is connected by rail and road with Quetta and by road with Bannu and Peshāwar.

Zhob district was constituted in 1890 and consists of a mountainous region (area 10,475 sq mi [27,130 sq km]) intersected by the 219-mi (352-km) Zhob River in the south and the Kundar River, which rises in the Roba Kākar Range, in the north. The Sulaiman Range forms the eastern quarter. The Zhob River Valley, an alluvial plain forming the shortest route between the North-West Frontier Province and Quetta, is the most fertile area. Wheat, corn (maize), rice, barley, millet, and fruit (melons, grapes, apricots, pomegranates) are the chief crops. Deposits of chromite (at Hindubāgh) and coal are abundant. Pashtuns of the Kakar tribe are the dominant ethnic group. The district, successively under Mughal and Durrānī Afghan rule, was under British administration from 1889 until Pakistan became independent in 1947. Pop. (1981 prelim.) town, 33,000; district, 360,000.

zhong (Chinese bell): see chung.

Zhong Yong (Confucian text): see Chung yung.

Zhongli Quan (in Chinese mythology): see Chung-li Ch'üan.

Zhongshan (China): see Chung-shan.

Zhou (Chinese surname): see under Chou, except as below.

Zhou DYNASTY (China): Chou dynasty.

Zhou Enlai, Wade-Giles romanization CHOU EN-LAI (b. 1898, Huaian, Kiangsu Province, China-d. Jan. 8, 1976, Peking), leading figure in the Chinese Communist Party, premier (1949-76) and foreign minister (1949-58) of the People's Republic of China who played a major role in the Chinese revolution and later in the conduct of China's foreign relations. He played a leading role in the Chinese Communist Party (CCP) from its beginnings in 1921 and became one of the great negotiators of the 20th century and a master of policy implementation, with infinite capacity for details. He survived internecine purges, always managing to retain his position in the party leadership. Renowned for his charm and subtlety, Zhou was described as affable, pragmatic, and persuasive.

Zhou was born to a gentry family and was reared by his uncle in Shao-hsing, Chekiang Province, where he received his elementary education. He was graduated from a wellknown middle school in Tientsin and went to Japan in 1917 for further studies. He returned to Tientsin in the wake of the student demonstrations in Peking that became known as the May Fourth Movement of 1919. He was active in student publications and agitation until arrested in 1920. After his release from jail that fall, he left for France under a work-and-study program. It was in France that Zhou made a lifelong commitment to the Communist cause. He became an organizer for the CCP in Europe after its founding in Shanghai in July 1921

In the summer of 1924 Zhou returned to China and took part in the National Revolution, led by Sun Yat-sen's Kuomintang (KMT, or Nationalist Party) in Canton with CCP collaboration and Russian assistance. It was at this time, in 1925, that he married Deng

Yingchao, a student activist who later became a prominent member of the CCP. Zhou was appointed deputy director of the political department of the Whampoa Military Academy, where Chiang Kai-shek was the commandant. Early in 1927 Zhou became director of the military department of the CCP Central Committee.

Zhou Enlai P. Ramrakha

When Chiang's troops were on the outskirts of Shanghai in March 1927, Zhou organized the workers' seizure of that city for the Kuomintang. But Chiang soon afterward purged his former Communist allies, and Zhou barely escaped with his life to Wu-han, the new centre of Communist power, where the CCP was still working closely with the left-wing branch of the KMT. There, in April 1927, during the party's Fifth National Congress, Zhou was elected to the CCP Central Committee and to its Politburo.

Following the left-KMT split with the Communists, Zhou took a major role in organizing the Communist insurrection known as the Nan-ch'ang Uprising (August 1927). Upon the Kuomintang's recapture of the city of Nanch'ang, Zhou retreated to eastern Kwangtung and then escaped to Shanghai via Hong Kong.

Zhou was confirmed in his party leadership posts during a visit to Moscow in 1928 for the Sixth National Congress of the CCP, after which he returned to China to help rebuild the battered CCP organization. In the late 1920s the CCP centre, operating underground in Shanghai, continued to stress urban uprisings, but Communist attempts to seize major cities failed repeatedly, with great losses. Zhou left Shanghai in 1931 for Kiangsi, where Zhu De and Mao Zedong had been developing Communist rural bases (soviets) since 1928. In 1932 the party centre, under increasingly heavy police pressure in Shanghai, also moved to Kiangsi, and Zhou succeeded Mao as the political commissar of the Red Army, which was commanded by Zhu De.

Although Zhou initially allied himself with the CCP leaders who wrested control of policymaking in the Kiangsi soviet from Mao's hands, the two men eventually entered into a close association that would last unbroken until their death. Chiang Kai-shek's campaigns finally forced the Communists to retreat from Kiangsi and other Soviet areas in south central China in October 1934 and begin the Long March to a new base in northern China. Mao gained control of the party apparatus during the Long March; he also took over Zhou's directorship of the Central Committee's military department. Zhou thenceforth faithfully supported Mao's leadership in the party.

The Long March ended in October 1935 at Yen-an in northern Shensi Province, and with the securing of the Communists' base there, Zhou became the party's chief negotiator and was set to the difficult task of forming a tactical alliance with the Kuomintang. Exploiting the growing national sentiment against Japanese aggression and carrying out Moscow's new so-called popular-front strategy against Fascism, the CCP in late 1935 proposed to unite with

the KMT and all patriotic Chinese in order to resist Japan. When in December 1936 Chiang Kai-shek was arrested in Sian (in Shenshi) by his generals, who wanted to stop the CCP-KMT civil war, Zhou immediately flew to that city. He persuaded the dissident commanders not to kill Chiang and helped obtain the Kuomintang leader's release on condition that he cease military attacks against the Communists and cooperate with them in the United Front against Japan.

Zhou helped negotiate the formation of the United Front after the outbreak of the Sino-Japanese War in July 1937, and from then until 1943 he was the CCP's chief representative to the Nationalist government. Two weeks after the Japanese surrender in August 1945, Zhou accompanied Mao Zedong to Chungking for peace talks with Chiang Kaishek. When Mao returned to Yenan six weeks later, Zhou remained in Chungking to continue the negotiations. Zhou was also a leading participant in the unsuccessful peace negotiations with the Nationalists in 1946 that were sponsored by the United States and held under Gen. George C. Marshall. Zhou's skillful cultivation of the Communists' image among liberal politicians and intellectuals who had become disenchanted with the Kuomintang at this time became an important factor in Chiang's eventual downfall after the resumption of full-scale civil war in 1947.

As premier of the People's Republic of China from its inception in October 1949, Zhou became the chief administrator of the huge civil bureaucracy of the People's Republic of China. Serving concurrently as foreign minister, he also bore heavy responsibilities in foreign affairs and continued to play a key role in diplomacy after relinquishing the post of foreign minister. On Feb. 14, 1950, Zhou signed in Moscow a 30-year Chinese-Soviet treaty of alliance, and in 1954 he headed the Chinese delegation at the conference on Korea and Indochina held at Geneva. At the 1955 Afro-Asian conference that convened at Bandung, Indonesia, he offered China's support to Asian nonaligned nations. Between 1956 and 1964 Zhou traveled widely throughout Europe, Asia, and Africa, proclaiming the latter continent "ripe for revolution." Though Zhou visited Moscow in 1964, he was unable to resolve the fundamental differences that had arisen between China and that country. After the American envoy Henry A. Kissinger made a dramatic visit to him in Peking in July 1971, Zhou's reputation as a diplomat and negotiator was widely noted by the American press. The historic meeting between Mao Zedong and U.S. Pres. Richard Nixon that took place in Peking in February 1972 was, to a great extent, arranged and implemented by Zhou Enlai.

Zhou meanwhile maintained his leading position in the CCP. In 1956 he was elected one of the party's four vice chairmen. Although Lin Piao emerged after the Cultural Revolution of the late 1960s as the only vice chairman of the party, Zhou remained the third-ranking member of the Standing Committee of the Politburo. During the Cultural Revolution he played a key role in exercising restraints on the Maoist extremists and was probably the single most important stabilizing factor during that chaotic period. During the waning of the Cultural Revolution in the early 1970s Zhou sought to restore Deng Xiaoping and other former moderate leaders to positions of power.

BIBLIOGRAPHY. Basic data on Zhou Enlai is given in the Biographic Dictionary of Chinese Communism, 1921–1965, vol. 1, pp. 204–219 (1971); Quotations from Premier Chou En-lai (1973); three book-length biographies of uneven quality in English are Kai-yu Hsu, Chou En-lai: China's

Gray Eminence (1968), Li Tien-min, Chou En-lai (1970), and John McCook Roots, Chou: An Informal Biography of China's Legendary Chou En-lai (1978); R.S. Chavan, Chinese Foreign Policy: The Chou En-lai Era (1979).

Zhoukouzhen (China): see Chou-k'ou-chen. Zhoushan Qundao (China): see Chou-shan Archipelago.

Zhu (Chinese surname): see under Chu, except as below.

Zhu De, Wade-Giles romanization CHU TEH (b. Dec. 18, 1886, I-lung, Szechwan province, China—d. July 6, 1976, Peking), one of China's greatest military leaders and the founder of the Chinese Communist Army.

Born into a peasant family, Zhu was initially a physical education instructor. But he then attended the Yunnan Military Academy, from which he graduated in 1911, taking part that same year in the revolution that overthrew the Ch'ing dynasty. For the next 10 years Zhu served as a middle-ranking officer and then a brigade commander in the armies of warlords in Szechwan and Yunnan provinces in southern China. Becoming disillusioned with warlordism and the chaotic politics of republican China in general, he went to Europe in 1922 and studied in Berlin and at the University of Göttingen. While in Germany he joined the Chinese Communist Party.

Expelled from Germany for his political activities, Zhu returned in 1926 to China. where, concealing his Communist affiliation, he became an officer in the Nationalist (Kuomintang) Army. In August 1927 he took part in the Communist-led Nan-ch'ang Uprising against the Nationalists, an event that is regarded by Communists as marking the birth of the Chinese Red Army. When the Nanch'ang Uprising was crushed by the Nationalists, Zhu led his remaining troops south to Hunan province, where they linked up with Mao Zedong's small guerrilla forces. The two formed the 4th Red Army, with Zhu De as commander and Mao Zedong as political commissar. They established a base, or soviet, in Kiangsi province, and Zhu built up the Red Army from 5,000 troops in 1929 to 200,000 in 1933. He commanded the Red Army's successful defense of the Kiangsi soviet against the Nationalists' first four campaigns (1931-33) to annihilate it. Zhu then served as commander in chief of the Red Army throughout the Communists' 6,000-mile-long retreat (1934-35) to Shensi province, a journey known as the Long March.

Upon the Communists' alliance with the Nationalists to resist the Japanese invasion of China in 1937, Zhu directly commanded the Red Army's northern forces, renamed the Eighth Route Army. He retained overall command of all Communist military operations against the Japanese from 1937 to 1945. Upon the Japanese surrender and the resumption of the civil war between the Nationalists and the Communists in 1946, Zhu commanded the renamed People's Liberation Army (PLA). which defeated the Nationalists and drove them from the mainland. He retained command of the PLA of the new People's Republic of China until 1954. Although a Politburo member from 1934, Zhu was never regarded as a contender for political power. When ranks were initiated in the army he was made a marshal, and from 1959 he served as chairman of the Standing Committee of the National People's Congress, the nominal legislature.

Zhu De, along with Mao Zedong, was primarily responsible for the Chinese Red Army's major contribution to modern warfare—the elevation of guerrilla warfare from a minor supplement of conventional forces to a major strategic concept, particularly for revolution-

ary armies. Under Zhu, the Red Army developed as a highly mobile, flexible, and selfsufficient force that operated throughout the countryside and won the support of the rural population through its discipline, courage, and responsiveness. Zhu's strategy was customarily to destroy the enemy's forces piecemeal and by attrition rather than by fighting pitched battles with massed troops. Control of the countryside was regarded as more important in the long run than costly attempts to overrun and hold large cities. Zhu's perfection of virtually all aspects of large-scale guerrilla warfare was a major factor in the Red Army's crushing defeat of the Nationalist forces in the period from 1946 to 1949.

Zhuang (people): see Chuang.

Zhuangzi (Taoist teacher): see Chuang-tzu.

Zhuge Liang (Chinese sage): see Chu-ko Liang.

Zhukov, Georgy Konstantinovich (b. Dec. 1 [Nov. 19, Old Style], 1896, Kaluga province, Russia [now in Russian S.F.S.R.]—d. June 18, 1974), marshal of the Soviet Union, the most important Soviet military commander during World War II.

Having been conscripted into the Imperial Russian Army during World War I, Zhukov joined the Red Army in 1918, served as a cavalry commander during the Russian Civil War, and afterward studied military science at the Frunze Military Academy (graduated 1931) as well as in Germany. During the late 1930s he participated in clashes against the Japanese along the Mongolian–Manchurian border. He won recognition as an expert in the employment of armour and in 1939 was placed in command of the Soviet forces in the Manchurian border region.

During the Winter War, which the Soviet Union fought against Finland at the outset of World War II, Zhukov served as chief of staff of the Soviet army; he was then transferred to command the Kiev military district and in January 1941 was appointed chief of the General Staff. After the Germans invaded the Soviet Union (June 1941), he briefly commanded the defense of Leningrad, then became commander in chief of the western front and directed the defense of Moscow (autumn 1941) as well as the counteroffensive that was launched against the Germans in December 1941. After being named a marshal of the Soviet Union in January 1943, Zhukov became the chief member of Stalin's personal supreme headquarters and subsequently figured prominently in the planning or in the execution of almost every major engagement in the war. In April 1945 he personally commanded the final assault on Berlin and then remained in Germany as commander of the Soviet occupation force and Soviet representative on the Allied Control Commission for Germany

Zhukov, 1966 Tass—Sovfoto

Upon Zhukov's return to Moscow in 1946, however, his extraordinary popularity apparently caused him to be regarded as a potential threat by Stalin, who assigned him to a series of relatively obscure regional commands. Only after Stalin died (March 1953) did the new political leaders, wishing to secure the support of the army, appoint Zhukov a deputy minister of defense (1953). He subsequently supported Khrushchev against the chairman of the Council of Ministers, Georgy Malenkov, who favoured a reduction in military expenditures. When Khrushchev forced Malenkov to resign and replaced him with Nikolay Bulganin (February 1955), Zhukov succeeded Bulganin as minister of defense; at that time he was also elected an alternate member of the Presidium.

Zhukov then undertook programs to improve the professional calibre of the armed forces. Because this effort involved a reduction in the role of the party's political advisers and, consequently, in the party's control of the army, his policies brought him into conflict with Khrushchev. Nevertheless, when a majority of the Presidium (called the "anti-party" group) tried to oust Khrushchev, Zhukov provided the airplanes that transported members of the Central Committee from distant regions of the country to Moscow, thus shifting the political balance in Khrushchev's favour (June 1957). As a consequence, Zhukov was promoted to full membership in the Presidium (July 1957). But Khrushchev could not tolerate the marshal's persistent efforts to make the army more autonomous; as a result, on Oct. 26, 1957, Zhukov was formally dismissed as minister of defense and a week later was removed from his party posts. Remaining in relative obscurity until Khrushchev fell from power (October 1964), Zhukov was later awarded the Order of Lenin (1966) and allowed to publish his autobiography in 1969.

Zhukovsky, Vasily Andreyevich (b. Feb. 9 [Jan. 29, Old Style], 1783, Tula province, Russia [now in Russian S.F.S.R.]—d. April 24 [April 12], 1852, Baden-Baden, Baden [now in Germany]), Russian poet and translator, one of Aleksandr Pushkin's most important precursors in forming Russian verse style and language. Zhukovsky, the illegitimate son of a landowner and a Turkish slave girl, was educated in Moscow. He served in the Napoleonic War of 1812 and in 1815 became a member of the tsar's entourage, being appointed tutor to the heir to the throne in 1826. In 1841 he retired to Germany.

Zhukovsky was a follower of Nikolay Karamzin, the head of a Romantic-oriented literary movement that countered the classical emphasis on reason with the belief that poetry should be an expression of feeling. Zhukovsky was a founder of a semihumorous, pro-Karamzin literary society, Arzamas, established to oppose the classicists. Like Pushkin, Zhukovsky was interested especially in personal experience, Romantic conceptions of landscape, and folk ballads. His first publication was a translation of Gray's "Elegy Written in a Country Church Yard" (1802), and the bulk of his work consists of free translations. He introduced into Russia the works of such German and English contemporaries as Gottfried Bürger, Friedrich von Schiller, Johann Wolfgang von Goethe, Sir Walter Scott, Lord Byron, and Robert Southey, as well as such classic works as Homer's Odyssey (1849)

His collected works were published in four volumes in 1959-60.

Zhuzhou (China): see Chu-chou.

Zi Si (Confucian philosopher): see Tzu Ssu. Zia-ul-Haq, Mohammad (b. Aug. 12, 1924, Jullundur, Punjab [now in India]—d. Aug. 17, 1988, near Bahāwalpur, Pakistan), Pakistani chief of Army staff, chief martial-law administrator, and president of Pakistan (1978–88).

Zia was commissioned in 1945 from the Royal Indian Military Academy in Dehra Dun and served with the British armoured forces in Southeast Asia at the end of World War II. After 19 years spent in various staff and command appointments he was made an instructor at the Command and Staff College in Quetta. He successively commanded a regiment, brigade, division, and a corps during the period 1966-72. A major general from 1972, he was president of the military courts that tried several Army and Air Force officers alleged to have plotted against the government of Prime Minister Zulfikar Ali Bhutto in 1972. Bhutto promoted him to lieutenant general in 1975 and made him chief of Army staff in 1976.

Zia seized power from Bhutto in a bloodless coup on July 5, 1977, and became chief martial-law administrator while retaining his position as Army chief of staff. He assumed the presidency after Fazal Elahi Chaudhry resigned. Zia tightened his hold on the government after having the charismatic and stillpopular Bhutto executed on charges of attempted murder in 1979. Zia suspended political parties in that year, banned labour strikes, imposed strict censorship on the press, and declared martial law in the country (nominally lifted 1985). He responded to the Soviet Union's invasion of neighbouring Afghanistan in 1979 by embarking on a U.S.-financed military buildup. He also tried to broaden his base of support and worked for the Islamization of Pakistan's political and cultural life. He died in an airplane crash.

Ziba (people): see Haya. **Zibo** (China): see Tzu-po.

Ziegfeld, Florenz (b. March 21, 1869, Chicago—d. July 22, 1932, Hollywood), American theatrical producer who brought the revue to spectacular heights under the slogan "Glorifying the American Girl."

Ziegfeld EB.Inc.

During the World's Columbian Exposition in Chicago in 1893, Ziegfeld managed Sandow, the strong man. In 1896 he turned to theatrical management. His promotion of a French beauty, Anna Held, with press releases about her milk baths brought her fame and set a pattern of star making through publicity. In 1907 he produced in New York City his first revue, The Follies of 1907, modeled on the Folies-Bergère of Paris but less risqué. The revue's combination of seminudity, pageantry, and comedy was repeated successfully for 23 more years, until the advent of the Great Depression ended the annual spectacles. Four other editions appeared after his death, the last in 1957.

Among the stars developed by Ziegfeld were Marilyn Miller, Will Rogers, Leon Errol, Bert Williams, Fanny Brice, and Eddie Cantor. In addition to the *Follies*, Ziegfeld also produced the stage successes *Sally* (1920), *Show Boat* (1927), *Rio Rita* (1927), and *Bitter Sweet* (1929). Ziegfeld married Anna Held in 1897 and, after their divorce in 1913, the actress Billie Burke.

Ziegler, Karl (b. Nov. 26, 1898, Helsa, near Kassel, Ger.—d. Aug. 12, 1973, Mülheim,

Ziegler Bavaria-Verlag

W.Ger.), German chemist who in 1963 shared the Nobel Prize for Chemistry with Giulio Natta for research that greatly improved the quality of plastics.

After receiving his doctorate (1923) from the University of Marburg, Ziegler held academic appointments at the universities of Frankfurt am Main, Heidelberg, and Halle. In 1943 he became director of the Kaiser Wilhelm (later Max Planck) Institute for Coal Research at Mülheim an der Ruhr.

Ziegler was the first to explain the reactions involved in the synthesis of rubber (c. 1928). His researches with lithium in organic chemistry produced compounds more reactive than the Grignard reagents on which they were modeled. His work on cyclic carbon compounds found use in synthesizing the aroma of musk for perfumes.

After World War II he concentrated on organoaluminum compounds. Ziegler's most important discovery was made in 1953. He and a student, E. Holzkamp, set out to repeat a preparation of higher aluminum alkyls by heating ethylene and aluminum triethyl; unexpectedly they obtained a complete conversion of the ethylene monomer $(CH_2 = CH_2)$ to the dimer, 1-butene (CH₃CH₂CH = CH₂). The explanation was found in the presence of a trace of colloidal nickel derived from the catalyst used previously in the autoclave for hydrogenation experiments. This led to the discovery that substances made by mixing organometallic compounds with compounds of certain heavy metals permitted the fast polymerization of ethylene at atmospheric pressure to a linear polymer of high molecular weight having valuable plastic properties (other processes used high pressure and produced a partly branched polymer). The catalyst derived from aluminum alkyl and titanium tetrachloride proved especially useful. It formed the basis of nearly all later developments in the production of long-chain polymers of hydrocarbons from such olefins as ethylene and butadiene; the resulting products came into widespread use as plastics, fibres, rubbers, and

Ziegler-Natta catalyst, any of an important class of mixtures of chemical compounds remarkable for their ability to effect the polymerization of olefins (hydrocarbons containing a double carbon-carbon bond) to polymers of high molecular weights and highly ordered (stereoregular) structures.

These catalysts were originated in the 1950s by the German chemist Karl Ziegler for the polymerization of ethylene at atmospheric pressure. Ziegler employed a catalyst consisting of a mixture of titanium tetrachloride and an alkyl derivative of aluminum. Giulio Natta, an Italian chemist, extended the method to other olefins and developed further variations of the Ziegler catalyst based on his findings on the mechanism of the polymerization reaction. The Ziegler-Natta catalysts include many mixtures of halides of transition metals, especially titanium, chromium, vanadium, and zirconium, with organic derivatives of nontransition metals, particularly alkyl aluminum compounds.

Zielona Góra, województwo (province), westcentral Poland, established 1975, encompassing an area of 3,424 square miles (8,868 square km). It is bordered by the provinces of Gorzów Wielkopolski on the north, Poznań on the northeast, Leszno on the east, Legnica on the southeast, and Jelenia Góra on the south and by Germany on the west. The Oder River, flowing generally from east to west, divides the province. Other rivers in the province include the Nysa Łużycka (Lusatian Neisse) and the Bóbr. The sandy soils of the province produce rye and potato crops. The mining of lignite deposits that underlie most of the region is responsible for much of the economic development of the area.

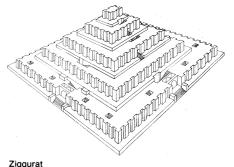

The province also has a textile industry and food-processing and machinery factories. Plants producing porcelain, glass, and cement are located in the southwestern and southern parts of the province. The provincial capital is Zielona Góra (*q.v.*) city; other important industrial centres are Nowa Sól, Żary, Żagań, and Świebodzin. Pop. (1987 est.) 650,400.

Zielona Góra, German GRÜNBERG, city, capital of Zielona Góra województwo (province), west-central Poland. It is an important industrial (textile and metal production) and cultural centre, having for centuries nurtured the theatre arts and a lively folk culture. Beginning with the coming of Flemish weavers in the 13th century; the city prospered as a textile centre, its economic development reaching its zenith in the 15th century. Thereafter, it was devastated several times by fires and wars, and during World War II about 30 percent of the city was damaged by the Germans.

Zielona Góra lies in a hollow surrounded by vineyards—which are rare in the region winding across the hills. A vintners' festival is held annually in the fall. The city was the birthplace of the painter Tadeusz Konicz in 1733. Zielona Góra's medieval town hall includes an 18th-century addition (housing a museum) and a 15th-century tower. Pop. (1987 est.) 112,200.

ziggurat, pyramidal, stepped temple tower that is an architectural and religious structure characteristic of the major cities of Mesopotamia (now in Iraq) from about 2200 until 500 Bc. The ziggurat was always built with a core of mud brick and an exterior covered with baked brick. It had no internal chambers and was usually square or rectangular, averaging either 170 feet square or 125×170 feet $(40 \times 50$ metres) at the base. Approximately 25 ziggurats are known, being equally divided in number among Sumer, Babylonia, and Assyria.

No ziggurat is preserved to its original height. Ascent was by an exterior triple stairway or by a spiral ramp, but for almost half of the known ziggurats, no means of ascent has been discovered. The sloping sides and terraces were often landscaped with trees and shrubs (hence the Hanging Gardens of Babylon). The

From E. Porada and R. Dyson, Art of Ancient Iran: Pre-Islamic Cultures; Crown Publishers, Inc.

best-preserved ziggurat is at Ur (modern Tall al-Muqayyar). The largest, at Choga Zambil in Elam, is 335 feet (102 m) square and 80 feet (24 m) high and stands at less than half its estimated original height. The legendary Tower of Babel has been popularly associated with the ziggurat of the great temple of Marduk in Babylon.

Zigong (China): see Tzu-kung.

Ziguinchor, town, southwestern Senegal. Lying along the Casamance River, it is a riverport town that has long been known and visited by European mariners. In 1457 the Venetian navigator Alvise Ca Da Mosto, envoy of the Portuguese prince Henry the Navigator, reconnoitred the harbour. In 1886 the Portuguese ceded Ziguinchor to the French. The town's industries include a peanut-oil-processing plant. East of Ziguinchor is the National Park of Basse-Casamance. Pop. (1985 est.) 106,500.

Zikmund (Czech personal name): see under Sigismund.

zikr (Muslim ritual): see dhikr.

Zile, historically ZELA, town, east-central Turkey. Lying in a fertile plain crossed by the Yeşil River, the town is at the foot of a hill crowned by a ruined citadel. Zela, the ancient temple state of Pontus, was famous as the site where Julius Caesar defeated Pharnaces II, son of Mithradates VI of Pontus, and said of his victory, "Veni, vidi, vici" ("I came, I saw, I conquered").

The town is an important local commercial and agricultural market for such regional products as cereals and sugar beets. The latter are sent to the refinery at nearby Turhal. Zile is linked by highways with Tokat and Amasya and is near the Sivas-Samsun railway. Pop. (1985) town, 37,097.

Žilina, German SILLEIN, Hungarian zsol-NA, town, Stredoslovenský kraj (region), Czechoslovakia. The town lies along the Váh River at its confluence with the Kysuca and Rajčianka rivers. Originally a Slavic trading settlement dating from the early 13th century, Žilina became a free royal town in 1312. It has an arcaded marketplace and medieval buildings, including the Romanesque Church of St. Stephen with Gothic elements, the parish church, and an isolated Renaissance tower. Budatín Castle is just north of the city.

Žilina is now a busy rail junction where the branch line from Ostrava joins the main eastwest electrified line; it is also a road intersection on the state highway. The University of Transport dates from 1953; there is also a conservatory of music and a centre for the treatment of eye diseases. Industries include wood processing, engineering, and the manufacture of cellulose and plastics. Pop. (1987 est.) 93,998.

Ziller, Tuiskon (b. Dec. 22, 1817, Wasungen, near Meiningen, Saxe-Meiningen [Germany]—d. April 20, 1882, Leipzig), German educator noted for his application of Johann Friedrich Herbart's educational precepts to the German elementary school.

Ziller attended the University of Leipzig, where he came under the influence of followers of Herbart, and in 1853 became a lecturer there. In 1862 he opened his own pedagogical seminary, and in 1869 he established the Association for Scientific Pedagogy—a centre for German Herbartians. Ziller was a strong proponent of Herbart's emphasis on the moral end of education, and Ziller attempted to show how every part of elementary instruction could contribute to the forming of a strong character.

Zimba (people): see Tabwa.

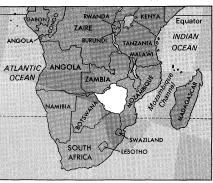

Zimbabwe, officially REPUBLIC OF ZIMBABWE, formerly (1911–64) SOUTHERN RHODESIA, (1964–79) RHODESIA, or (1979–80) ZIMBABWE RHODESIA, landlocked country of southern Africa, covering an area of 150,873 square miles (390,759 square km). The capital is Harare (formerly Salisbury). It is bordered on the south by South Africa, on the southwest and west by Botswana, on the north by Zambia, and on the northeast and east by Mozambique. The population in 1990 was estimated to be 9,369,000.

A brief treatment of Zimbabwe follows. For full treatment, *see* MACROPAEDIA: Southern Africa.

For current history and for statistics on society and economy, *see* BRITANNICA WORLD DATA ANNUAL.

The land. A dominant feature of Zimbabwe's landscape is the Highveld, a broad ridge lving between 4,000 and 5,000 feet (1,200 and 1,500 m) above sea level, which covers about a fourth of the country. The Highveld begins in the southwest and extends the length of the country, joining the Inyanga Mountains in the northeast. On each side of this central spine lies the wider plateau of the Middle Veld, which, at an elevation between 3,000 and 4,000 feet (900-1,200 m), accounts for about two-fifths of Zimbabwe's land area. Farther northwest and southeast lies the Lowveld, which comprises about a fourth of the country and lies mostly above 1,000 feet (300 m) in elevation.

The Zambezi River forms the country's northwestern boundary with Zambia along a trough formed by major faulting. In 1959 a

Zimbabwe

major dam was completed on the Zambezi that created Lake Kariba, which, at more than 2,000 square miles (5,200 square km), is one of the world's largest man-made lakes. The Highveld forms the watershed separating the Zambezi basin in the northwest from the Limpopo and Sabi river basins in the southeast. Much of the country's total runoff is carried by these three rivers, eastward through Mozambique, to the Indian Ocean.

An extended winter dry season occurs throughout the country from May through August; annual average precipitation increases generally from southwest to northeast, averaging less than 16 inches (400 mm) along the South African border and more than 40 inches (1,000 mm) in the eastern highlands. Zimbabwe enjoys a subtropical climate yearround, with average temperatures between 60° and 70° F (16° and 21° C).

Zimbabwe is mostly savanna (tropical grassland) country, with a generous tree growth encouraged by the wet summers. Hwange (formerly Wankie) National Park has much of its area devoted to game reserves. The country's rich and diverse animal life includes lion and other cats, hyena, jackal, elephant, hippopotamus, baboon, many antelope species, crocodile, and snakes.

The people. The predominant ethnolinguistic groups in Zimbabwe are the Shona, who comprise about 70 percent of the population,

and the Ndebele, who number about 16 percent of the total; whites comprise about 2 percent of the population. English is the official language; both Shona and Ndebele are Bantu languages. About half of the population is Christian; the remainder is either animist or Muslim. Three-fourths of the population is rural.

During the politically turbulent modern period since 1960, the in- and out-migration of whites has varied significantly with the country's political situation. After 1976 the white population diminished continuously until 1980, when the country received internationally recognized independence.

Zimbabwe's birth and death rates remain relatively high; the birth rate is among the highest in eastern Africa, but the death rate is somewhat lower than the average for eastern Africa. The annual rate of the population's natural increase is one of the highest in the world. During the 1980s, family-planning programs and efforts to improve living standards were continued in an effort to reduce the birth rate.

The economy. Zimbabwe has a semideveloped mixed economy with some state participation. The gross national product (GNP) is not growing as rapidly as the population, and the GNP per capita remains relatively low by world standards. Average annual change of the real GNP was negative between 1970 and 1980 (because of both civil war and economic embargo), but, with independence in 1980, the GNP began to grow, although unevenly, once again.

Agriculture produces about 10 percent of the GNP and employs 26 percent of the labour force, but an equal number of people are involved in subsistence and part-time farming. Commercial crop production, primarily on large farms (mostly white-owned), which occupy about half the total farmland, includes corn (maize), sugarcane, wheat, seed cotton, tobacco, sorghum, and soybeans. The remaining land, mainly black-owned, is in small farms raising subsistence crops, including corn, millet, peanuts (groundnuts), cassava, potatoes, dry beans, bananas, and oranges. Coffee and tea have been introduced in order to diversify crop production. Zimbabwe's agriculture is plagued by cyclical droughts. In 1980 the government began a program to settle more black farmers on land bought from emigrating white farmers, but it avoided forcible expropriation even after emigration slowed. Rangeland and pastures occupy about one-eighth of Zimbabwe's land area. The principal livestock include cattle, goats, and sheep. About half of the cattle are held by blacks practicing traditional pastoralism.

Zimbabwe has good mineral reserves, and mining produces about 6 percent of the GNP while employing about 5 percent of the labour force. Gold is the leading mineral (by value) produced in Zimbabwe, followed by asbestos and nickel; coal, copper, chrome, iron ore, silver, and tin are also produced.

Manufacturing is fairly well diversified, largely because sanctions against Rhodesia until 1980 compelled the country to become largely self-sufficient. Manufacturing produces about 28 percent of the GNP and employs about 16 percent of the labour force. About half of all industry processes agricultural products. Other industrial output includes crude steel, pig iron, and steel semimanufactured products; cement; electrical and other machinery; cotton textiles and clothing; chemicals, plastics, and rubber products; and fertilizers and pesticides. Three-fourths of the country's electrical power is generated by hydroelectric plants and the remainder by thermal plants. Tourism, which had fallen during the civil war of the late 1970s, rose sharply in 1980, but subsequent hostilities between the Shona and Ndebele peoples again cut the number of visitors; the industry was revived in the mid-1980s. The Zimbabwe Congress of Trade Unions, located in Harare, is the principal labour federation, to which all unions organized by industry are affiliated.

Since independence, government has gradually assumed a larger role in controlling industry. A government-controlled agency was created to market mine production (except gold), and all new mining ventures require government participation. In agriculture a plan was adopted to settle farmers on better land and give them technical assistance, seed, and fertilizer. Purchase prices for crops have been raised, and wage rates and working conditions have been equalized for blacks and whites. A major goal has been to disarm the former guerrillas and settle them as farmers.

Zimbabwe's government-operated railway network covers more than 2,000 miles (3,200 km), about one-tenth of it electrified. Almost one-fifth of the road network is paved; most rural areas suffer from poor roads. There is an international airport at Harare, and there is domestic air service among the principal cities

Trade deficits after independence were worsened by sharply rising consumer demand and a worldwide recession, but by the mid-1980s the nation's trade balance had become favourable. Zimbabwe's principal exports include tobacco; gold, iron, steel, and ferroalloy products; corn; and cotton, mainly shipped to the United Kingdom, South Africa, Germany, and The Netherlands. Imports consist mainly of machinery and transport equipment, petroleum products, chemicals, and basic manufactures, which are obtained mostly from the same trading partners.

Government and social conditions. Zimbabwe is a one-party state—an independent republic with the president as head of state and a parliament consisting of a Senate and a House of Assembly. A cabinet, led by the prime minister, is chosen from the parliament. The president is elected by the parliament for a term of 6 years, and the members of both houses of parliament serve for 5 years. The judiciary is appointed by the president on the advice of the Judicial Service Commission. The armed forces of the country comprise a national-security force consisting of an army and a small air force.

Medical and public-health facilities include mother and child care, disease control, school health, environmental sanitation, and rural health immunization programs, provided through hospitals and district and rural health centres. Malaria is a problem, and measles and pneumonia are major causes of death. Life expectancy is about 60 years. There is a severe housing shortage in urban areas, and new houses are constructed for lower-paid workers to alleviate the shortage. There is a three-tiered system of education, comprising primary (which is free, but not compulsory), secondary, and university education. The University of Zimbabwe, originally chartered in 1955 as the University College of Rhodesia and Nyasaland, is located in Harare. The news media are strictly controlled by the government. Radio Zimbabwe broadcasts are in

Cultural life. The architectural heritage of the country is evident in the Great Zimbabwe, the ancient stone citadel, located in south-central Zimbabwe, that has given the country its name. Handicraft items are made of woven or plaited fibres, grasses, and reeds. The tradition of oral literature in Zimbabwe, especially poetry, is rich. Novels centre on the conflict between traditional, rural culture and modernizing urban life. There is a National Gallery of Zimbabwe, and museums are at Harare, Mutare (formerly Umtali), Nyanda (formerly Fort Victoria), and Bulawayo. The National Archives is one of the major sources for historical material.

Shona, English, and several other local lan-

guages.

History. Remains of Stone Age cultures dating back 500,000 years have been found in present-day Zimbabwe. The first Bantuspeaking peoples reached the region between the 5th and 10th centuries AD, driving the San (Bushmen) inhabitants into the desert. A second migration of Bantu-speakers, fleeing the Zulu chief Shaka, began about 1830. One tribe, called the Ndebele, carved out a kingdom in the Zulu pastoralist tradition, in the process mastering the Shona tribes. During this period British and Afrikaner hunters, traders, and prospectors moved up from the south with missionaries.

In 1889 the British South Africa Company was formed by Cecil Rhodes to colonize and promote trade in the region. During the 1890s additional European settlers began to arrive and lay claim to prospecting rights. This caused armed uprisings by the Ndebele and the Shona, but by 1897 the region had been pacified. The country continued to be governed by the company until 1923. In a referendum in 1922, the 34,000 Europeans chose to become a self-governing British colony instead of joining the Union of South Africa. In 1923 Southern Rhodesia was annexed by the British crown

The interwar period was one of material progress and a reasonably prosperous economy under white domination. In 1953 the colony united with Nyasaland (Malaŵi) and Northern Rhodesia (Zambia) to form the Central African Federation of Rhodesia. During the 10 years of the federation, the black African nationalist movement, led by the National Democratic Party (NDP), intensified. The NDP was subsequently banned and split into the Zimbabwe African People's Union (ZAPU), led by Joshua Nkomo, and the Zimbabwe African National Union (ZANU), led by Ndabaningi Sithole and later by Robert Mugabe. The federation dissolved in 1963, and Southern Rhodesia reverted to its former colonial status.

In 1965 the conservative white Rhodesian Front government, led by Ian Smith, unilaterally declared independence from Britain for the country. This act led to the installation of economic sanctions against Rhodesia, first by the United Kingdom and later by the United Nations. The economy suffered from these sanctions during the 1960s and '70s but survived with the help of South Africa.

ZAPU and ZANU guerrilla organizations were formed in Mozambique and Zambia, from which they launched numerous attacks on Rhodesian security forces. Sporadic warfare over nearly a decade caused thousands to die and almost a million persons to be uprooted. The white minority finally consented to hold multiracial elections supervised by the British in 1980, and Robert Mugabe of the Shona-based ZANU won a landslide victory. Mugabe assumed the duties of prime minister and defense minister and for a time admitted former guerrilla rivals into the government. Mugabe eventually established a oneparty Marxist-oriented state, which, however, liberally included former foes.

Zimbabwe (Bantu: "Stone Dwelling"), also called GREAT ZIMBABWE, extensive stone ruin in southeastern Africa situated southeast of Nyanda (formerly Fort Victoria), Zimbabwe. The Zimbabwe is the largest of many stone ruins scattered across the countries of Zimbabwe and Mozambique. Its oldest parts date from the 8th century AD, although the site had been occupied for about 600 years before that. In the 11th to 15th century it was a centre (possibly religious) of a great inland empire ruled by the Karanga people. They smelted gold there and traded it on the shores of the Indian Ocean for glass beads and porcelain from China. Copper coins and birds carved in soapstone were also among their treasures. The centre remained in use at least until the 17th century. The rediscovery of the ruins in 1867 attracted much archaeological research.

The Zimbabwe ruin is a vast complex extending over more than 60 acres (24 hectares). A large defensive hilltop fortification has many rooms and a mazelike pattern of passageways. In the valley below, a thick wall of large stone blocks forms an elliptical enclosure around a conical tower. Both inside and outside the enclosure there are foundations of smaller stone buildings. The stones of the entire complex stay in place without mortar. Throughout the ruin are the remains of an extensive drainage system.

Zimmermann, Arthur (b. Oct. 5, 1864, Marggrabowa, East Prussia [now Olecko, Pol.]—d. June 6, 1940, Berlin), German foreign secretary during part of World War I (1916–17), the author of a sensational proposal to Mexico to enter into an alliance against the United States.

After a career in the consular service, Zimmermann won transfer to the diplomatic branch in 1901. Because of the retiring nature of Gottlieb von Jagow, who became foreign secretary in 1913, Zimmermann conducted a large share of the relations with foreign envoys. As acting secretary in Jagow's absence, he participated, with Emperor William II and Chancellor Theobald von Bethmann Hollweg, in Germany's decision of July 5, 1914, to support Austria-Hungary when, after the assassination of Archduke Francis Ferdinand at Sarajevo, Austria-Hungary put pressure on Serbia, thus angering Russia. Zimmermann drafted the telegram to Vienna embodying Germany's decision, which precipitated the crisis that culminated in the outbreak of war.

When, in 1916, the German High Command insisted on the resumption of unrestricted submarine warfare as the only remaining weapon to defeat the Allies, even at the risk of provoking the United States into belligerency, Jagow resigned; and, on November 25, Zimmermann, who was regarded as "pro-U-boat," was appointed to succeed him. In an effort to nullify or at least to reduce U.S. intervention in Europe by engaging U.S. arms and energies elsewhere, Zimmermann planned to embroil the United States in war with Mexico and Japan. In pursuit of this goal, on Jan. 16, 1917, he sent a secret telegram in code (through the German ambassador in Washington, D.C.) to the German minister in Mexico, authorizing him to propose an alliance to Mexico's President Venustiano Carranza. The offer included "an understanding on our part that Mexico is to reconquer her lost territory in Texas, New Mexico, and Arizona." Carranza was also asked to "invite the immediate adherence of Japan." Intercepted and decoded by British Admiralty intelligence, the telegram was made available to President Woodrow Wilson, who caused it to be published on March 1, 1917. In convincing Americans of German hostility toward the United States, the "Zimmermann Note" became one of the principal factors leading to the U.S. declaration of war against Germany five weeks later.

Zimmermann lost office just after the fall of Bethmann Hollweg's government in the summer of 1917 and never held it again.

BIBLIOGRAPHY. A narrative of the events is found in Barbara W. Tuchman, *The Zimmermann Telegram* (1958).

Zimmermann, Dominikus (b. June 30, 1685, Gaispoint, near Wessobrunn, Bavaria [Germany]—d. Nov. 16, 1766, Wies), Bavarian Baroque architect and stuccoist whose church at Wies (now in Baden-Württemburg, Ger.) is considered one of the finest accomplishments of Baroque architecture.

Zimmermann was taught stucco work by Johann Schmutzer and initially worked as a stuccoist. His earliest independent building design is the Dominican convent church at Mödingen (1716–21), in which he was aided by his brother Johann Baptist Zimmermann (1680–1758), a notable Bavarian court stuccoist and a fresco painter.

Much of Zimmermann's career was spent in the building of two *Gesamtkunstwerke* ("total art works") for which he and his brother designed and executed nearly every aspect of construction and decoration. Both are pilgrimage churches. The first, in Steinhausen, was begun in 1727. The floor plan is an oval, with 10 slender, free-standing piers supporting a vault painted in exemplary style by Zimmermann's brother. This structure has been regarded by some as the first truly Rococo church because of its light, airy structure and its delicately coloured, flowing, undulating decorations in coloured stucco and painted frescoes.

The second church, at Wies (1746-54), has a rather drab and demure exterior but an even richer interior. The plan is again oval, with eight piers supporting a sumptuous entablature and vault, decorated this time with unmistakably Rococo motifs and a delicate ceiling fresco by Johann Baptist. The interior is remarkable for the rich colour harmonies and the swirling, controlled movement of its decoration, which obliterates the previously clearly demarcated zones of pillar, capital, entablature, and vault.

Upon his retirement in 1752, Zimmermann chose the town of Wies as his home.

Consult the INDEX first

Zimorowic, Józef Bartłomiej, Zimorowic also spelled ZIMOROWICZ, original name JÓZEF BARTŁOMIEJ OZIMEK (b. Aug. 20, 1597, Lwów, Pol. [now Lvov, Ukrainian S.S.R.]—d. Oct. 14, 1677, Lwów), Polish-Latin Baroque writer, prolific author of satirical and erotic epigrams.

When well-advanced in years, he published a series of descriptions of Ukrainian peasant life, *Sielanki nowe ruskie* (1663; "New Ruthenian Idylls"), under the name of his more gifted younger brother Szymon (1608–29). As burgomaster of Lwów for many years, he witnessed the Cossack rebellion against Polish rule in the Ukraine (1648–49) and wrote two versified relations of the event: *Kozaczyzna* ("The Cossacks") and *Burda Ruska* ("The Ruthenian Affray").

zinc (Zn), chemical element, low-melting metal of Group IIb (zinc group) of the periodic table, essential to life, and one of the most widely used metals. Zinc was known in Roman times only in combination with copper as the alloy brass. The metallurgists of India seem to have isolated the individual metal as early as the 13th century, and those of China had achieved large-scale production of zinc by the 16th century. In the West, commercial zinc production got under way by the middle of the 18th century in England under the leadership of William Champion.

Occurrence, uses, and properties. A little more abundant than copper, zinc makes up an average of 65 grams (2.3 ounces) of every ton of the Earth's crust. The chief zinc mineral is the sulfide sphalerite (zincblende), which, together with its oxidation products smithsonite and hemimorphite, constitute nearly all of the world's zinc ore. (The unique deposits of the zinc minerals franklinite, willemite, and zincite at Ogdensburg, N.J., in the United States, are no longer important commercially.) Native zinc has been reported from Australia, New Zealand, and the United States, but

no occurrence is well authenticated. For its mineralogical properties, *see* native element (table).

Zinc is an essential trace element in the human body, where it is found in high concentration in the red blood cells as an essential part of the enzyme carbonic anhydrase, which promotes many reactions relating to carbon dioxide metabolism. The zinc present in the pancreas may aid in the storage of insulin. Zinc is a component of some enzymes that digest protein in the gastrointestinal tract. Zinc deficiency in nut-bearing and fruit trees causes such diseases as pecan rosette, little leaf, and mottle leaf. Zinc functions in the hemosycotypsin of snails' blood to transport oxygen in a way analogous to iron in the hemoglobin of human blood.

Metallic zinc is produced by thermal reduction of the oxide with carbon, followed by condensation of the zinc vapour and by electrolysis of purified zinc sulfate solutions. For specific information on the mining, recovery, and refining of zinc, see MACROPAEDIA: Industries, Extraction and Processing.

For statistical data on mine production of ore, refining of metal, reserves (or production capacity), and trade worldwide and for major national industries, see mining (table).

The major uses of zinc metal are in galvanizing iron and steel and in making brasses and alloys for die-casting. The negative electrode (outside can) in one common type of electric dry cell is composed of zinc.

Freshly cast zinc has a bluish silver surface but slowly oxidizes in air to form a grayish protective oxide film. Highly pure zinc (99.99 percent) is ductile; the so-called prime western grade (99.8 percent pure) is brittle when cold but above 100° C (212° F) can be rolled into sheets that remain flexible. Zinc crystallizes in the hexagonal close-packed structure. When iron and zinc together are exposed to a corrosive medium, they constitute an electrolytic cell, and the zinc is attacked (oxidized to the Zn²⁺ ion) preferentially and sacrificially because of its higher electrode potential. This reaction, coupled with the much greater corrosion resistance of zinc under atmospheric conditions, is the basis for galvanizing.

Natural zinc is a mixture of five stable isotopes: ⁶⁴Zn (48.89 percent), ⁶⁶Zn (27.81 percent), ⁶⁷Zn (4.11 percent), ⁶⁸Zn (18.57 percent), and ⁷⁰Zn (0.62 percent).

Compounds. In chemical compounds, zinc exhibits almost exclusively a +2 oxidation state. A few zinc(I) compounds have been reported, but never any compounds of zinc(III) or higher.

Zinc oxide, ZnO, is one of the most important zinc compounds. It can be prepared in a state of high purity and in a variety of crystal shapes and sizes by burning zinc vapour in air. Because of its high heat conductivity and capacity, zinc oxide is frequently incorporated into rubber as a heat dissipater. In the crystal of zinc oxide, the lattice (i.e., the orderly structure formed by the ions) is an open one in which the zinc and oxygen ions occupy only 44 percent of the volume. Defects can be created in the lattice by specific treatments such as the introduction of foreign atoms or of zinc atoms in the vacancies of the lattice. Such treatment of zinc oxide crystals produces various electrical, photoelectrical, and catalytic properties. As a result, zinc oxide is used as a semiconductor in the production of phosphors for television tubes and fluorescent lamps. Its effects on the reactivity of many compounds make it useful as a catalyst in such operations as the manufacture of synthetic rubber and methanol. Because under the influence of light the electrical conductivity of zinc oxide can be increased many times, it is employed in certain photocopying processes.

Zinc sulfate, ZnSO₄, is an intermediate compound in the production of zinc from its ores by the electrolytic process. It is used as a weed

killer, in the manufacture of viscose rayon, and in dyeing, in which it functions as a mordant. Zinc chloride, ZnCl₂, can be prepared by a direct reaction or by evaporating the aqueous solution formed in various reactions. It is strongly deliquescent (water-absorbing) and is utilized as a drying agent and as a flux. In aqueous form it is used as a wood preservative. Zinc sulfide, ZnS, occurs in nature as the mineral sphalerite and may be prepared by treating solutions of zinc salts with hydrogen sulfide. It was long used as a white pigment but has been gradually replaced by titanium dioxide. Zinc sulfide has luminescent properties when activated by the addition of small quantities of copper, manganese, silver, or arsenic and so has been used in X-ray screens and in luminous dials for clocks and watches. Zinc phosphide (Zn₃P₂), produced by direct combination of the two elements, is employed primarily as a rodent killer.

atomic number atomic weight 65.37

melting point 419° C (790° F)

boiling point 900° C (1,665° F)

specific gravity valence 2
electronic config. 2-8-18-2 or (Ar)3d104s2

zinc-group element, any of three metals that comprise Group IIb of the periodic table of elements—namely, zinc (Zn), cadmium (Cd), and mercury (Hg).

A brief treatment of the zinc group elements follows. For full treatment, see MACROPAEDIA: Chemical Elements. See also MICROPAEDIA for entries on each member of this element family.

All three zinc group elements are found in the Earth's crust, but never in the free state (uncombined). They are silvery white in colour and have comparatively low melting points and boiling points. The boiling point of mercury—the only common metal that is liquid at room temperature—is lower than that of any other metal.

The zinc elements exhibit similar chemical behaviour because of certain affinities in their atomic structure. The atoms of these elements are able to lose two electrons in their outermost shells to form divalent positive ions, thereby exposing the next innermost shell with a stable configuration of 18 electrons in each case. Ordinary chemical reactions cannot supply enough energy to remove more than two electrons and thus increase the valency above 2. The zinc elements tend to utilize their two outer electrons for covalent bonding. This tendency is most distinct in the case of mercury, less so in that of zinc, and least with cadmium.

zincblende (mineral): see sphalerite.

Zincirli Hüyük, Zincirli also spelled ZEN-JIRLI, SENJIRLI, or ZINJERLI, ancient SAMAL, archaeological site in the foothills of the Anti-Taurus Mountains, south-central Turkey. Samal was one of the Late Hittite city-states that perpetuated the more or less Semitized southern Anatolian culture for centuries after the downfall of the Hittite empire (c. 1190

The oval-shaped mound, excavated by the German Oriental Society, was found to be occupied by a walled citadel, divided into different sections and containing several important buildings, including the upper and lower palaces, showing the characteristic bit hilani (or "pillared porch") architectural type. Immediately surrounding the citadel was the city itself, enclosed by a circular fortification wall topped by 100 towers. The identity with ancient Samal was confirmed by the discovery of a victory inscription of the Assyrian king Esarhaddon from 670 BC. The importance of Zincirli as a settled community came to an end with the downfall of Assyria in the late 7th century BC.

zincite, mineral consisting of zinc oxide (ZnO), usually found in platy or granular masses. Its blood-red colour and orange-yellow streak are characteristic, as is also its common

Zincite in white calcite from Franklin, N.J.

association with black franklinite and white calcite. Notable specimens have been found at Franklin and Sterling Hill, near Ogdensburg, N I

Zincite crystallizes in the hexagonal system. Distinct crystals are rare; they are hemimorphic and consist of a single basal plane and a hexagonal pyramid. Manganese may partially replace zinc in some specimens.

Zinder, département, central Niger, directly north of Nigeria, West Africa, with an area of 56,151 sq mi (145,430 sq km). It is bounded by the départements of Agadez (north), Diffa (east), and Maradi (west). The generally flat sandy plains of the south (about 1,150 ft [350 m] in elevation) give way to numerous low, flat-topped hills capped with hard layers of laterite in the north. Intermittent streambeds (gulbis) in southern Zinder département are fertile areas for cultivation. Rainfall varies from 24 in. (600 mm) in the southwest to less than 6 in. (150 mm) in the northeast. Peanuts (groundnuts), millet, and sorghum are grown where rainfall reaches 16 in. (400 mm)roughly the northern limit of cultivation in the country. Pastoral nomadism is the only occupation in most of the central semi-desert zone, where cram cram (a prickly grass) provides feed for herds of cattle, sheep, goats, camels, and horses; the northeast is an extremely arid desert area. Artesian wells are found near Guidimouni, a permanent waterpool in the south; some irrigated rice is cultivated in the area surrounding Zinder. A millet flour mill, a tannery, some meat factories, and potteries are located at Zinder; mills processing peanut oil are at Matameye and Magaria. There is a big trade in leather and hides; basket weaving is also important.

The region is inhabited by the Hausa (sedentary farmers) in the southwest, the Kanuri in the southeast, and the Fulani (pastoral nomads involved in animal breeding) in the central semi-desert region. Zinder, a highway junction and a terminal point of the trans-Saharan road from Laghouat, Algeria to Zinder, is the administrative headquarters and the second largest city after Niamey, the capital. There is an airfield at Zinder. Pop. (1977) 1,003,748.

Zinder, town, capital of Zinder département, south central Niger, West Africa. The coun-

Watering hole, Zinder, Niger Dominique Darbois

try's second largest town, it was the capital of a Muslim dynasty established in the 18th century, was occupied by French troops in 1899, and was the capital of Niger (in French West Africa) until 1926.

In the centre of an important peanut (groundnut) producing region, it is a major processing centre and market, with a peanut-processing mill, a tannery, and a thermoelectric power plant. Zinder lies at the crossroad of the main east-west road through Niger and the northsouth route from Agadez to Kano, Nigeria. It has an airport. Pop. (1981 est.) 74,600.

Zinder, Norton David (b. Nov. 7, 1928, New York City), U.S. biologist who discovered the occurrence of genetic transduction—the carrying of hereditary material from one strain of microorganisms to another by a filterable agent such as a bacteriophage, or bacterial virus—in species of the Salmonella bacteria.

After attending Columbia University, Zinder studied under Joshua Lederberg at the University of Wisconsin (Ph.D., 1952) and then joined the staff at the Rockefeller Institute for Medical Research (now Rockefeller University) in New York City, where he became a professor in 1964.

Zinder hoped to go beyond Lederberg's 1946 discovery of mating in the bacterium Escherichia coli. By allowing species of Salmonella to conjugate (to exchange genetic material in a kind of reproduction) in a special nutritional medium, Zinder hoped to obtain a large number of mutant bacteria to use in his experiments. Instead of conjugating, however, the bacteria exhibited another form of genetic exchange, genetic transduction. Using bacterial transduction, later experimenters were able to show that bacterial genes affecting selected physiological processes were clustered together in what are now known as operons. Zinder's experiments also led to the discovery of the only known phage containing ribonucleic acid (RNA) as its genetic material.

Zingarelli, Nicola Antonio (b. April 4, 1752, Naples—d. May 5, 1837, Torre del Greco, near Naples), one of the principal Italian composers of operas and religious music of his time.

Zingarelli studied at the conservatory at Loreto and earned his living in his youth as a violinist. His first opera, *Montesuma*, was

Zingarelli, engraving after a portrait by Giuseppe Cammarano, 1817

G. Ricordi & Co.

successfully produced at the San Carlo Theatre in Naples in 1781. Alsinda, given at La Scala, Milan, in 1785, was the first of a series of his operas produced there until 1803.

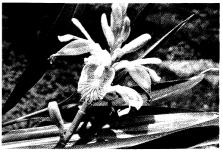

In 1789 Zingarelli was invited to Paris to compose Antigone to a libretto by Jean-François Marmontel for the Opéra. The French Revolution drove him to Switzerland, and from there he returned to Milan, where in 1792 he was appointed music director of the cathedral. His later works for La Scala included the comic opera Il mercato di Monfregoso (1792), based on a play by Goldoni, which became popular in Germany, and Giulietta e Romeo (1796), after Shakespeare, held to be his finest

work. From 1794 to 1804 he was music director at Loreto, where he composed a large number of sacred works (still in manuscript) and continued to write operas for production in Milan and other Italian cities. In 1804 he was music director at the Sistine Chapel in Rome, where he composed cantatas on poems by Tasso and Dante. He also wrote two operas for production in Rome; the second of these, *Berenice* (1811), achieved great popularity. This was the last of his 37 operas.

In 1811, for patriotic reasons, Zingarelli refused to conduct a *Te Deum* in honor of Napoleon's son, the "King of Rome." He was arrested and taken to Paris, where the Emperor, an admirer of his music, released him with a pension. In 1813 he was director of the Reale Collegio di Musica in Naples and in 1816 succeeded Giovanni Paisiello as music director of the cathedral there. In 1829 he composed a sacred work for the Birmingham Festival, which was conducted by his pupil Michele (later Sir Michael) Costa. Other pupils of Zingarelli were Vincenzo Bellini and Saverio Mercadante.

Zingiberaceae, largest family of the ginger order (Zingiberales), containing about 45 genera and more than 1,000 species. These aromatic herbs grow chiefly in moist, swampy areas of the tropics and subtropics.

Members of the family are perennials that frequently have sympodial (forked) fleshy rhizomes (underground stems). They may grow

Common, true, or Canton ginger (Zingiber officinale)
Helen Cruickshank—The National Audubon Society Collection/Photo

to 6 metres (20 feet) in height. A few species are epiphytic; *i.e.*, supported by other plants and having aerial roots exposed to the humid atmosphere. The rolled-up sheathing bases of the leaves sometimes form an apparent short aerial stem. The commonly green sepals differ in texture and colour from the petals. Bracts (leaflike structures) are spirally arranged, and the flower clusters are spiral and conelike. The Zingiberaceae flower resembles an orchid because of its labellum (two or three fused stamens) joined with a pair of petallike sterile stamens. Nectar is present in the slender flower tubes. The brightly coloured flowers may bloom for only a few hours and are thought to be pollinated by butterflies. One genus, Achasma, exhibits an unusual growth pattern. The floral parts grow below ground except for a circle of bright red, petallike structures that emerge from the ground, yet the leafy shoots rise to 5 m.

Many species are economically valuable for their spices and perfume. The dried, thick rhizome of Curcuma longa is turmeric. The seeds of Elettaria cardamomum are the source of cardamom. Ginger is obtained from the rhizomes of Zingiber officinale. Several species of shellflower (Alpinia) are cultivated as ornamentals. Ginger lily (Hedychium) produces beautiful flowers that are used in garlands and other decorations.

Zingiberales, order of flowering plants belonging to the class called monocotyledon

(q.v., characterized by the presence of a single seed leaf). Zingiberales is comprised of 89 genera and 1,800 species in eight families. Among its best known members are bananas, gingers, and cannas.

A brief treatment of Zingiberales follows. For full treatment, see MACROPAEDIA: An-

giosperms.

Like other monocots, members of this order lack a cambium. Even though plants in this group are very diverse in gross aspect, one nearly universal feature exists: cross sections of leaf stalks of most members display vascular bundles (conducting strands) in prominent arcs, interspersed with air canals.

Plants assigned to the Zingiberales range in size from herbs a few centimetres in height to the traveler's tree (Ravenala madagascariensis), which grows to a height of 26 feet (8 metres), displaying a fan-shaped array of 20 or more leaves which are 13 to 16 ft long.

Zingiberales are widely distributed in the tropics, but individual families are limited in range. Several genera belonging to the Zingiberales are of major economic importance. Foremost are the hybrids of banana (Musa paradisiaca), which yield the edible banana and plantain fruits. Manila hemp is the name given to the strong fibres of the leaf stalks of Musa textilis, an inedible banana native to the Philippine Islands. These fibres are made into ropes and twine. Arrowroot starch, used in special diets and in fine baking, is extracted from the rhizomes (stocky underground stems) of Maranta arundinacea, cultivated mainly in the West Indies. Rhizomes of Canna are also edible, but many cultivars are most noted for their showy flowers. Most plants in the large ginger family (Zingiberaceae) have aromatic leaves and flowers. Zingiber officinale yields true ginger; other genera are the source of additional spices, medicinal products, dyes, and condiments. Most Zingiber members are native to tropical Asia, though several species are grown as ornamentals in greenhouses and can survive winters in mild temperate regions.

The traveler's tree and related plants develop thin stems surmounted by the current crop of leaves. Encircling scars indicate the position of leaf sheaths already shed by the mature stems. The most common type of stem in this order is short and below ground. In many gingers, all leaves arise at ground level, their clasping sheaths and leaf bases hiding the stem. In the bananas, the vegetative stem is a stocky, subterranean structure that extends above the level of the soil for a short distance; it is surrounded by massive leaves and is never visible. Each new leaf grows inside the sheath of the preceding one. One edge of the leaf overlaps the other resulting in a slight dwarfing of the edge that is lowermost. What appears to be the stem of the banana plant is, in reality, a false trunk consisting of many leaf sheaths which are rolled up longitudinally to form a cylinder.

In Zingiberales, branches arise from underground stems and are known as rhizomes (when elongate) or suckers (when short and bulky); they produce leaves and eventually emerge above the surface of the soil. When separated from their parents, such units reproduce the species vegetatively. This method of propagation assures the perpetuation of desirable genetic traits; if grown from seed, some expected qualities may be replaced by others that are not as desirable.

When mature enough to flower, plants of some genera (such as the banana), produce flower stalks (inflorescences) at the tip of the vegetative stem; lower portions of this stem are sheathed by leaf bases. A flowering stem may be very long, emerging just below the terminal tuft of current leaf blades. Typically, the inflorescence is an erect axis bearing

bracts (bladeless leaves). The ultimate clusters of flowers arise in conjunction with the bracts and usually are much-branched. The terminal flower of each subunit is the first to open.

The typical flower of this order has three petals, three sepals, six stamens (male), and a pistil consisting of three carpels (and differentiated into a basal ovary); many variations occur. In some species of the banana family, flowers are functionally unisexual (male or female), thus ensuring cross-pollination. Even though cultivated bananas produce flowers with a rank odour and much nectar, fruits develop without pollination; seeds do not develop even if flowers are pollinated. Flowers of wild bananas and those of *Strelitzia* are bird-pollinated. In the ginger family, butter-flies are the pollinators.

zink (musical instrument): see cornett.

Zinn, Walter Henry (b. Dec. 10, 1906, Kitchener, Ont., Can.), nuclear physicist who contributed to the U.S. atomic bomb project during World War II and to the development of the nuclear reactor.

Zinn, an honour student at Queen's University in Kingston, Ont., received his Ph.D. at Columbia University in 1934. He was recruited by Enrico Fermi for the Manhattan Project, and it was he who, at the University of Chicago, withdrew a control rod from the atomic pile that released the world's first self-sustaining nuclear reaction. He later supervised the dismantling of the pile and its removal to the Argonne National Laboratory (near Chicago), of which he became director in 1946. In Idaho in 1951 he designed the first experimental breeder reactor. He also served as chief scientific adviser in the design of the U.S.S. "Nautilus," the first nuclear-powered submarine. In 1960 he won the Atoms for Peace Award of the U.S. government and in 1969 the Enrico Fermi Award for the development, use, and control of atomic energy.

Zinnemann, Fred (b. April 29, 1907, Vienna), Austrian-born U.S. motion-picture director whose films are distinguished by realism of atmosphere and characterization.

Zinnemann studied law at the University of Vienna (1925–27) and then decided he wanted to make movies. In pursuit of this career, he studied cinematography in Paris (1927–28). In 1929 he emigrated to the United States, becoming a citizen in 1937. He worked at several minor jobs in Hollywood before he became an assistant to Robert Flaherty, a pioneer in documentary filmmaking. This experience influenced all of Zinnemann's subsequent feature films, which show a rigorous authenticity in subject matter and style. He spent the next decade making documentaries, eventually earning two Academy Awards for them (That Mothers Might Live, 1938; Benjy, 1951).

He directed several notable feature films, such as The Search (1947), a moving account of refugee children in Europe, which introduced the actor Montgomery Clift. In The Men (1950), Zinnemann employed paraplegic war veterans as actors and provided Marlon Brando with his screen debut. His classic *High* Noon (1952) was one of the first westerns in which the protagonist did not assume the epic proportions usual to this genre. Other films include The Member of the Wedding (1953); From Here to Eternity (1953), for which he received an Academy Award as best director; Oklahoma (1955); A Man For All Seasons (1966), for which he received yet another Academy Award; The Day of the Jackal (1973); and Five Days One Summer (1982). A recurrent theme in Zinnemann's movies is the

crisis of conscience, requiring an individual to choose between maintaining a personal set of values or conforming to external demands.

Zinnia, genus of about 15 species of herbs and shrubs in the family Asteraceae, native primarily to North America. They have stiff, hairy stems and oval or lance-shaped leaves arranged opposite each other and often clasping the stem.

Zinnia elegans
Kenneth and Brenda Formanek—EB Inc

The solitary flower heads have yellow or purplish brown disk and ray flowers in many colours. Each flower grows at the junction of a bract (leaflike structure) and the receptacle. Several species are cultivated as garden ornamentals, especially *Z. angustifolia* and *Z. elegans*.

Zinovyev, Grigory Yevseyevich, Zinovyev also spelled ZINOVIEV, original name OVSEL GERSHON ARONOV RADOMYSLSKY (b. Sept. 23 [Sept. 11, old style], 1883, Yelizavetgrad, Ukraine, Russian Empire—d. Aug. 25, 1936, Moscow), revolutionary who worked closely with Lenin in the Bolshevik Party before the

Zinovyev H. Roger-Violle

Russian Revolution of 1917 and became a central figure in the Communist Party leadership in the Soviet Union in the 1920s. He later was a victim of Stalin's Great Purge.

Zinovyev was born to lower middle-class Jewish parents and received no formal education, but during travels abroad in 1902–05 he attended lectures on law at Bern University. In 1901 he joined the Social Democratic Workers' Party and Lenin's radical Iskra organization within that party. After the party split in 1903 he adhered to the Bolsheviks. He was an agitator among the St. Petersburg workers during the revolution of 1905 and became a member of the party's Central Committee after the London Congress in 1907. He was

arrested in 1908 but shortly released because of ill health.

Zinovyev was Lenin's principal collaborator in the period 1909–17, living in France, Austria, or Switzerland. He took part in the struggles against the militant Bolsheviks who oposed Lenin's leadership and also against the Mensheviks and Leon Trotsky. He was active in directing Bolshevik organizations in Russia and the activities of the Bolshevik deputies in the Duma. During World War I he tried to organize the "internationalists" among the European socialists.

In April 1917, after the February Revolution had overthrown the monarchy, Zinovyev accompanied Lenin on his return to Russia. But in October, when Lenin insisted that the Bolsheviks seize power, Zinovyev and his close associate Lev B. Kamenev opposed him and even leaked information about the proposed coup d'état to the press. Immediately after the October Revolution he again dissented, vainly demanding that his colleagues include members from other socialist parties in the government. To symbolize his protest, he resigned from the Bolshevik Central Committee (November 1917).

Nevertheless, Zinovyev was soon restored to his position as a principal Bolshevik leader. An outstanding orator, he helped win public support for the new regime, and by 1921 he had become head of the Petrograd (later Leningrad) party organization, chairman of the Petrograd Soviet, and a full member of the party's Politburo. In 1919 he also became chairman of the executive committee of the newly established Communist International (Comintern), which, dominated by the Russian Communists, formulated socialist policies and coordinated the activities of its member parties. (In conjunction with that post he achieved international notoriety when in 1924 the London press published a letter, allegedly written by him, instructing British communists to conduct subversive activities. The publication of the letter was considered to be the cause of the downfall of Britain's

first Labour government.)
In the early 1920s Zinovyev formed a coalition in the Politburo with Kamenev and Stalin to prevent Leon Trotsky from succeeding Lenin, who had become seriously ill and died in January 1924. But after the triumvirate had eliminated Trotsky as a serious contender in the power struggle (by early 1925), Stalin turned against his former allies. Neither Zinovyev's control over the Leningrad party organization and the Comintern nor his belated political alliance with Trotsky (1926) proved sufficient to preserve his position of authority and influence in the party. By the end of 1926 he had been forced out of the Politburo and the Comintern, and in 1927 he was expelled from the Communist Party.

Although he was subsequently readmitted to the party, he never recovered his former prestige and was expelled again on two other occasions (1932 and 1934). In 1935 he was arrested, secretly tried for "moral complicity" in the assassination of the party leader Sergey Mironovich Kirov (December 1934), and sentenced to 10 years' imprisonment. The following year, however, he was retried at the first Great Purge trial, found guilty on the fabricated charge of forming a terrorist organization to assassinate Kirov and other Soviet leaders, and executed. In 1988 the Soviet Supreme Court annulled the sentence posthumously.

Zinsou, Émile Derlin (b. March 22/23, 1918, Ouidah, Dahomey [now Benin]), nationalist politician and president (1968-69) of Dahomey, noted for the success of his attempts to solve his country's overwhelming economic and financial problems.

Zinsou, though trained as a physician, became active in journalism and politics after

World War II. He became secretary to Deputy Sourou Migan Apithy of the French National Assembly in 1946 and later served as Apithy's minister of commerce (1957). In 1960 Zinsou was elected to the Dahomeyan Assembly and was also made president of the Supreme Court (1960–62). After independence (Aug. 1, 1960) he held several posts, including that of minister of foreign affairs, and traveled widely, gaining international respect, especially as ambassador to France.

After a period of military rule, the generals called on Zinsou in 1968 to become president. After winning approval in a popular referendum, he threw himself into his new job. The country was divided, there was little respect for governmental authority, the economy was stagnating, and administrative costs were prohibitive. Zinsou was able to reduce the deficit in 1969, but as the year wore on, his stringent economic measures, including an attempt to stop routine border smuggling, eroded his precarious popular support. In December he was overthrown by the army chief of staff but was later permitted to leave the country and take up residence in Paris. In 1975 he was sentenced, in absentia, to death.

Zinzendorf, Nikolaus Ludwig, Graf von (count of) (b. 1700, Dresden, Saxony [Germany]—d. May 9, 1760, Herrnhut), religious

Zinzendorf, 19th-century engraving after an oil painting of about 1748

By courtesy of the Moravian Archives, Winston-Salem,

and social reformer of the German Pietist movement who, as leader of the Moravian church (Unitas Fratrum), sought to create an ecumenical Protestant movement.

Life. Zinzendorf was the son of a Saxon minister of state of Austrian noble descent. His early upbringing was closely supervised by his aristocratic maternal grandmother, Henriette von Gersdorf, a devout Pietist and intimate of a major Pietist theologian, Philipp Spener. This religious training was reinforced by his schooling at Francke's Paedagogium in Halle (1710–16), after which he deferred to his family's wishes and studied law, rather than theology, at Wittenberg. His period of formal education ended with the traditional Grand Tour, in the course of which he became acquainted with many prominent Calvinist and Roman Catholic church figures.

Returning to Dresden in 1721, Nikolaus took up a minor post in the Saxon court, and a year later he married Erdmuthe Dorothea of Reuss, who shared her husband's Pietist convictions and zeal for composing hymns. His government service was short-lived; having inherited part of his grandmother's estate of Berthelsdorf, he became increasingly absorbed in the affairs of his tenants, especially a group of refugees from Bohemia and Moravia. With his assistance, these remnants of the persecuted Unitas Fratrum developed their own Moravian church settlement of Herrnhut in Saxony. Zinzendorf's initial purpose had been strictly ecumenical: following Spenerian precepts, he

had sought to develop ecclesiolae in ecclesia— "little churches within the church"—to act as a leaven, revitalizing and ultimately unifying churches into a single Lutheran communion.

But in the process of remolding the structure of the Moravian church, he found his own views recast along communal lines: "There can be no Christianity without community." The statutes of the Brotherly Agreement of Herrnhut (1727) embodied the count's ideal of a Christian settlement in which all aspects of daily life were subordinated to the imperative of attaining a joyous fellowship with Christ.

In Herrnhut and succeeding Moravian settlements, family loyalties gradually were superseded by allegiance to one's choir—communal groupings rigidly stratified by age, sex, and marital status. These choirs usually provided their members with communal living quarters, food, clothing, and employment; they also accepted full responsibility for child care and education, following Zinzendorf's innovative and effective pedagogical theories. The communitarian ideal, in some instances, led to a communal sharing in production as well as consumption: the community took care of a member's needs in return for his labour.

The very success of Herrnhut in attracting new members intensified the antagonism of the establishment—the aristocracy, the town guilds, and the Lutheran church. Zinzendorf had sought to placate those who saw him as a sectarian and who doubted his allegiance to the Augsburg Confession by having himself ordained in 1734 as an orthodox Lutheran pastor. Nevertheless, two years later, he was banished from his estate by order of the Saxon government. In exile the count, in order to represent the missionary interests of the Moravians abroad more authoritatively, was consecrated a bishop of the Unitas Fratrum (1773). After establishing Moravian settlements at Herrnhaag and Marienborn in Wetteravia and forming new congregations in the Netherlands and the Baltics, he spent time in the West Indies and, subsequently, laid the groundwork for Moravian congregations in England, where he also renewed his contacts with the Methodist clergyman John Wesley. From 1741 to 1743 he traveled in America, setting up Moravian congregations in New York and Pennsylvania (including the major settlement of Bethlehem, Pa.), pioneering in missionary work among the American Indians, and seeking unsuccessfully to unite the various German Protestant churches in Pennsylvania.

On his return to Europe, Zinzendorf's ecumenical passion led him to develop the idea of Tropen (methods of training), according to which the different Protestant churches each represented valid concrete expressions of the one true church of Christ differing only in their modes of apprehending and communicating a shared set of religious truths. In 1747 the Saxon authorities rescinded the count's banishment; two years later they formally recognized the Church of the Unity of the Brethren. The English Parliament bestowed a similar recognition in 1749. But the excesses of the Sifting Time (1740s), a period in which the antirational, emotional, and sensuous elements inherent in Zinzendorfian theology were greatly intensified and which led, particularly in Herrnhaag, to an erotically tinged preoccupation with Christ's wounds, provided new ammunition to his opponents. The last decade of his life was trouble-laden. Debts incurred in pursuit of his worldwide missionary program continued to mount; his son Christian Renatus, whom he hoped would succeed him as leader of the Moravian church, succumbed to a lung ailment at the age of 25; and his wife, Erdmuthe, died in 1756. In the following year he married his lifelong collaborator Anna Nitschmann, who had formerly headed the Single Sisters' Choir in Bethlehem. Three years later, in 1760, Zinzendorf died in Herrnhut and was buried there

Significance. Zinzendorf's influence church history was felt far beyond the boundaries of the Peitistic "heart religion" he had preached so fervently. Opposed equally to the atheistic rationalism of the Enlightenment and the lifeless Protestant dogma of his own day, Zinzendorf emphasized the manifestation of religious feelings and emotions in a communalistic context. His ecumenicism, search for a Christian communitarian brotherhood, and founding of a worldwide missionary network were imperatives repeatedly stressed in his sermons, hymns, litanies, and religious tracts. For all their baroque extravagance, Zinzendorf's religious doctrines and expressive style are more attuned to the contemporary scene than they were to the climate of his own day.

(G.L.Go.) BIBLIOGRAPHY. Hauptschriften, ed. Beyreuther and Gerhard Meyer, 8 vol. (1962-66), represents the most comprehensive collection of Zinzendorf's writings. The Count's official biography, Das Leben des Herrn Grafen Nicolaus Ludwig von Zinzendorf und Pottendorf, 3 vol. (1772–75; abridged Eng. trans., The Life of N.L. Count Zinzendorf, 1838), was written by his collaborator August G. Spangenberg. A more definitive and scholarly treatment is to be found in Erich Beyreuther's trilogy: Der junge Zinzendorf (1957), Zinzendorf und die sich allhier beisammen finden (1959), and Zinzendorf und die Christenheit, 1732-1760 (1961). Works in English include John R. Weinlick, Count Zinzendorf (1956), a popular sketch; and Arthur J. Lewis, Zinzendorf: The Ecumenical Pioneer (1962), which deals primarily with the Count's efforts to unify Protestant denominations

Zion, city, Lake County, northeastern Illinois, U.S., on Lake Michigan, near the Wisconsin border. It was founded in 1901 by John Alexander Dowie as headquarters of his Christian Catholic Church. Until 1935 it was theocratically governed, and the church controlled all business activities. The church schools were closed in 1939, after which a modern educational system was developed.

Zion is now basically residential with expanding industrial development, including a nuclear power plant (1973). The Zion Hotel, planned by Dowie as the Elijah Hospice, has a 367-ft (112-m) frontage and is one of the nation's largest all-frame buildings. Illinois Beach State Park is adjacent to the south. Inc. 1902. Pop. (1980) 17,861.

Zion, in the Old Testament, the easternmost of the two hills of ancient Jerusalem, the site of the Jebusite city captured by David, king of Israel and Judah, in the 10th century BC (II Sam. 5:6-9) and established as his royal capital. Some scholars believe that the name also belonged to the "stronghold of Zion" taken by David (II Sam. 5:7), which may have been the fortress of the city. The Jewish historian Josephus, in the 1st century AD, identified Zion with the western hill of Jerusalem, where most of the city lay in his day. This incorrect identification of the site was retained until the late 19th or early 20th century when the site of Zion was identified as the eastern hill (modern Ophel). It was not included in the walls of the 16th-century fortifications and is still covered with fields and vinevards.

The etymology and meaning of the name are obscure. It appears to be a pre-Israelite Canaanite name of the hill upon which Jerusalem was built; the name "mountain of Zion" is common. In biblical usage, however, "Mount Zion" often means the city rather than the hill itself.

Zion appears in the Old Testament 152 times as a title of Jerusalem; over half of these occurrences appear in two books, the Book of Isaiah (46 times) and that of Psalms (38 times). It appears seven times in the New Testament, five times in quotations from the Old Testament

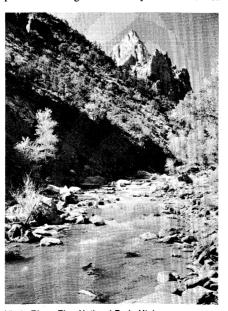

The name is overwhelmingly a poetic and prophetic designation and is infrequently used in ordinary prose. It usually has emotional and religious overtones, but it is not clear why the name Zion rather than the name Jerusalem should carry these overtones. The religious and emotional qualities of the name arise from the importance of Jerusalem as the royal city and the city of the Temple. The city summarizes in itself several of the basic themes of Israelite belief. Mount Zion is the place where Yahweh, the God of Israel, dwells (Isa. 8:18; Ps. 74:2), the place where he is king (Isa. 24:23) and where he has installed his king, David (Ps. 2:6). It is thus the seat of the action of Yahweh in history.

The city of Jerusalem is personified as a woman and addressed or spoken of as "the daughter of Zion," always in a context charged with feeling aroused by either of two ideas that stand in opposition to each other: the destruction of Jerusalem or its deliverance. After Jerusalem was destroyed by the Babylonians in 586 BC, the Israelites could not forget Zion (Ps. 137), and, in the prophecy after the Babylonian Exile of the Jews, Zion is the scene of Yahweh's messianic salvation. It is to Zion that the exiles will be restored (Jer. 3:14), and there they will find Yahweh (Jer. 31). Bearing all these connotations. Zion came to mean the Jewish homeland, symbolic of Judaism or Jewish national aspirations (whence the name Zionism for the 19th-20th-century movement to establish a Jewish national centre or state in Palestine).

While the name of Zion is rare in the New Testament, it has been frequently used in Christian literature and hymns as a designation for the heavenly city or for the earthly city of Christian faith and fraternity.

Zion National Park, national park of deep canyons, high cliffs, and mesas in southwestern Utah, U.S., northeast of St. George. The park was established in 1919 to protect Zion Canyon (about 15 mi [24 km] long and ½ mi deep) from commercial encroachment. The park was enlarged in 1956 by the addition of

Virgin River, Zion National Park, Utah Gene Ahrens-Bruce Coleman Inc.

the adjacent Zion National Monument and occupies an area of 229 sq mi (593 sq km).

Zion Canyon was named in the 1850s by Mormon settlers, who first explored it. Its walls, carved by the Virgin River, contain numerous fossils and evidence of prehistoric cave dwellers. The Great White Throne, a giant monolith on one canyon wall, rises ,394 ft (730 m) above the canyon floor. Zion's wildlife includes mule deer, mountain lions, and other mammals and more than 150 species of birds, including eagles, hawks, and roadrunners. The plants are mainly semi-arid types, such as cactus, but broad-leaved trees and wild flowers grow along the river.

Zionism, Jewish nationalist movement that has had as its goal the creation and support of a Jewish national state in Palestine, the ancient homeland of the Jews (Hebrew Eretz Yisra'el, the Land of Israel). Though Zionism originated in Eastern and Central Europe in the latter part of the 19th century, it is in many ways a continuation of the ancient nationalist attachment of the Jews and of the Jewish religion to the historical region of Palestine, where one of the hills of ancient Jerusalem was called Zion.

In the 16th and 17th centuries a number of "messiahs" came forward trying to persuade Jews to "return" to Palestine. The Haskala (Enlightenment) movement of the late 18th century, however, urged Jews to assimilate into Western secular culture. In the early 19th century interest in a return of the Jews to Palestine was kept alive mostly by Christian millennarians. Despite the Haskala, Eastern European Jews did not assimilate and in reaction to tsarist pogroms formed the Hovevei Ziyyon ("Lovers of Zion") to promote the settlement of Jewish farmers and artisans in Palestine.

A political turn was given to Zionism by Theodor Herzl, an Austrian journalist who regarded assimilation as most desirable, but in view of anti-Semitism, impossible to realize. Thus, he argued, if Jews were forced by external pressure to form a nation, they could lead a normal existence only through concentration in one territory. In 1897 Herzl convened the first Zionist Congress at Basel, Switz., which drew up the Basel program of the movement, stating that "Zionism strives to create for the Jewish people a home in Pales-tine secured by public law." The centre of the movement was established in Vienna, where Herzl published the official weekly Die Welt ("The World"). Zionist congresses met yearly until 1901 and then every two years. When the Ottoman government refused Herzl's request for Palestinian autonomy, he found support in Great Britain. In 1903 the British government offered 6,000 square miles of uninhabited Uganda for settlement, but the Zionists held out for Palestine.

At the death of Herzl in 1904, the leadership moved from Vienna to Cologne, then to Berlin. Prior to World War I Zionism represented only a minority of Jews, mostly from Russia, but led by Austrians and Germans. It developed propaganda through orators and pamphlets, created its own newspapers in many languages, and gave an impetus to what was called a "Jewish renaissance" in letters and arts. The development of the Modern Hebrew language largely took place during this

period.

The failure of the Russian Revolution of 1905 and the wave of pogroms and repressions that followed caused growing numbers of Russian Jewish youth to emigrate to Palestine as pioneer settlers. By 1914 there were about 90,000 Jews in Palestine; 13,000 settlers lived in 43 Jewish agricultural settlements, many of them supported by the French Jewish philanthropist Baron Edmond de Rothschild.

Upon the outbreak of World War I political Zionism reasserted itself, and its leadership passed to Russian Jews living in England. Two such Zionists, Chaim Weizmann and Nahum Sokolow, were instrumental in obtaining the Balfour Declaration from Great Britain (Nov. 2, 1917), which promised British support for the creation of a Jewish national home in Palestine. The declaration was included in Britain's League of Nations mandate over Palestine (1922).

In the following years the Zionists built up the Jewish urban and rural settlements in Palestine, perfecting autonomous organizations and solidifying Jewish cultural life and Hebrew education. In March 1925 the Jewish population in Palestine was officially estimated at 108,000, and it had risen to about 238,-000 (20 percent of the population) by 1933. Jewish immigration remained relatively slow, however, until the rise of Hitlerism in Europe. Nevertheless, the Arab population feared Palestine eventually would become a Jewish state and bitterly resisted Zionism and the British policy supporting it. Several Arab revolts, especially in 1929 and 1936-39, caused the British to devise schemes to reconcile the Arab and Zionist demands.

Hitlerism and the large-scale extermination of European Jews led many Jews to seek refuge in Palestine and many others, especially in the United States, to embrace Zionism. As tensions grew among Arabs and Zionists, Britain submitted the Palestine problem first to Anglo-U.S. discussion for solution and later to the United Nations, which on Nov. 29, 1947, proposed partition of the country into separate Arab and Jewish states and the internationalization of Jerusalem. The creation of the State of Israel on May 14, 1948, brought about the Arab-Israeli war of 1948-49, in the course of which Israel obtained more land than had been provided by the UN resolution, and drove out 800,000 Arabs who became displaced persons known as Palestinians. Thus 50 years after the first Zionist congress and 30 years after the Balfour Declaration, Zionism achieved its aim of establishing a Jewish state in Palestine, but at the same time it became an armed camp surrounded by hostile Arab nations and Palestinian "liberation" organizations engaged in terrorism in and outside of Israel.

During the next two decades Zionist organizations in many countries continued to raise financial support for Israel and to encourage Jews to immigrate there. Most Jews, however, reject the view propagated by many very Orthodox Jews in Israel that the Jews outside Israel were living in "exile" and could live a full life only in Israel.

Zionist church, any of several prophethealing groups in southern Africa; they correspond to the independent churches known as Aladura (q.v.) in Nigeria, "spiritual" in Ghana, and "prophet-healing churches" in most other parts of Africa.

The use of the term Zion derives from the Christian Catholic Apostolic Church in Zion, founded in Chicago in 1896 and having missionaries in South Africa by 1904. That church emphasized divine healing, baptism by threefold immersion, and the imminent Second Coming of Christ. Its African members encountered U.S. missionaries of the Apostolic Faith pentecostal church in 1908 and learned that the Zion Church lacked the second Baptism of the Spirit (recognition of extra powers or character); they therefore founded their own pentecostal Zion Apostolic Church. The vast range of independent churches that stem from the original Zion Apostolic Church use in their names the words Zion (or Jerusalem), Apostolic, Pentecostal, Faith, or Holy Spirit to represent their biblical charter, as for example the Christian Catholic Apostolic Holy Spirit Church in Zion of South Africa. These are known in general as Zionists or Spirit Churches.

The churches were introduced into Rhodesia (Zimbabwe) in the 1920s by migrant workers returning from South Africa; endless schisms and new foundations followed. In the mid-1980s the largest was the African Apostolic Church of Johane Maranke, which claimed about 260,000 adherents in Zimbabwe and many others in surrounding countries.

Since the 1920s the racial and political concerns shared with Ethiopianism (an earlier movement toward religious and political autonomy) have declined, especially in South Africa; the better established Zionists have become Ethiopian in type, or more like white evangelical or revivalist churches. These tendencies are apparent in the two largest South African groups—the Zion Christian Church (founded 1925), whose membership is estimated at 80,000 to 600,000, and Limba's austere Church of Christ (founded 1910), which had about 120,000 members in the 1980s.

Zionist churches include the following features: (1) origination from a mandate received by a prophet in a dream, vision, or death-resurrection experience; (2) a chieflike head, often called a bishop, who is succeeded by his son and who is occasionally regarded as a messiah. Women also figure as founders and leaders; (3) security received by the church's possession of its own holy place, such as a New Jerusalem, Zion, or Moriah City as headquarters; ownership of land in the reserves and sometimes in white areas; organization of farms and other economic activities; (4) healing, through confession, repeated baptisms, purification rites and exorcisms, especially at "Bethesda pools" and "Jordan rivers"; (5) revelation and power from the Holy Spirit through prophetic utterances and pentecostal phenomena; (6) ritualistic and Africanized worship, with special garments and innovative festivals, characterized by singing, dancing, clapping, and drumming; (7) a legalistic and Sabbatarian ethic, which includes taboos against certain foods, beer, and tobacco and which does not admit Western medicines but tolerates polygamy; and (8) repudiation of traditional magic, medicines, divination, and ancestor cults; the Christian replacements for these traditional practices, however, are sometimes similarly used and interpreted.

ZIP Code, in full zone improvement plan CODE, system of zone coding introduced by the U.S. Post Office Department (now the U.S. Postal Service) in 1963 to facilitate the sorting and delivery of mail. After an extensive publicity campaign, the department finally succeeded in eliciting from the public a reasonably widespread acceptance of the ZIP code. Users of the mails were requested to include in all addresses a five number code, of which the first three digits identified the section of the country to which the item was destined and the last two digits the specific post office or zone of the addressee. The primary purpose of the zone coding system was to fully exploit the capabilities of electronic reading and sorting equipment.

The U.S. Postal Service planned to introduce a nine-digit ZIP Code in the 1980s. The new code, composed of the original five digits plus a hyphen and four additional numbers, is designed to speed up automated sorting operations. The first two of the four extra digits specify a particular sector, such as a group of streets or cluster of large buildings. The last two digits of the expanded code represent an even smaller area called a segment, which may consist of one side of a city block, a single floor in a large building, or a group of post office boxes.

zipper, also called SLIDE FASTENER, device for binding the edges of an opening such as on a garment or a bag. A zipper consists of two strips of material with metal or plastic teeth along the edges, and a sliding piece that draws the teeth into interlocking position

when moved in one direction and separates them again when moved in the opposite direction.

The idea of a slide fastener was exhibited by Whitcomb L. Judson at the World's Columbian Exposition of 1893 in Chicago. Judson's fastener, called a clasp locker, was an arrangement of hooks and eyes with a slide clasp for closing and opening. Gideon Sundback, a Swedish engineer working in the United States, substituted spring clips in place of hooks and eyes and in 1912 produced his Hookless #2. In the same year a similar device was patented in Europe by Catharina Kuhn-Moos.

In 1917 the U.S. Navy equipped windproof flying suits with slide fasteners. In the late 1920s and early 1930s they appeared on clothing for both men and women. In 1923 B.G. Work of the B.F. Goodrich Company gave the name zipper to the slide fastener that had just been adopted for closing overshoes.

zircon, silicate mineral, zirconium silicate, ZrSiO₄, the principal source of zirconium. Zircon is widespread as an accessory mineral in acid igneous rocks; it also occurs in metamorphic rocks and, fairly often, in detrital deposits. It occurs in beach sands in many parts

Zircon with quartz from Cheyenne Canyon, Colorado By courtesy of the Field Museum of Natural History, Chicago; photograph, John H. Gerard—EB Inc.

of the world, particularly Australia, India, Brazil, and Florida, and is a common heavy mineral in sedimentary rocks. Gem varieties occur in stream gravels and detrital deposits, particularly in Indochina and Sri Lanka, but also in Burma, Australia, and New Zealand. Zircon forms an important part of the syenite of southern Norway and occurs in large crystals in Quebec. For detailed physical properties, see silicate mineral (table).

The high refractive index and dispersion of zircon cause it to approach diamond in fire and brilliancy. Several varietal names have been applied to coloured gems. Hyacinth (jacinth) includes the clear, transparent red, orange, and yellow varieties. Matura diamond, from Sri Lanka, is clear and colourless, either naturally or made so through heat treatment under oxidizing conditions. The name jargon, like zircon derived from Arabic zargūn, applies to all other colours. A lovely blue stone may be made by heat treatment under reducing conditions.

zirconia, zirconium dioxide, an industrially important compound of zirconium and oxygen usually derived from the mineral zircon (see zirconium).

zirconium (Zr), chemical element, metal of Group IVb of the periodic table, used as a structural material for nuclear reactors.

Properties, occurrence, and uses. Zirconium, obscure before the late 1940s, became a signif-

icant engineering material for nuclear energy applications because it is highly transparent to neutrons. The element was identified (1789) in zircon from its oxide by the German chemist Martin Heinrich Klaproth, and the metal was isolated (1824) in impure form by the Swedish chemist Jöns Jacob Berzelius. The impure metal, even when 99 percent pure, is hard and brittle. The white, soft, malleable, and ductile metal of higher purity was first produced in quantity (1925) by the Dutch chemists Anton E. van Arkel and J.H. de Boer by the thermal decomposition of zirconium tetraiodide, ZrI₄. In the early 1940s, William Justin Kroll of Luxembourg developed his cheaper process of making the metal based on the reduction of zirconium tetrachloride, ZrCl₄, by magnesium. It is relatively abundant in the Earth's crust and is characteristically observed in S-type stars. Zirconium is commercially obtained principally from the minerals zircon and baddelevite.

The most important use of zirconium is in nuclear reactors for cladding fuel rods, for alloying with uranium, and for reactor-core structures because of its unique combination of properties. Zirconium has good strength at elevated temperatures, resists corrosion from the rapidly circulating coolants, does not form highly radioactive isotopes, and withstands mechanical damage from neutron bombardment. Hafnium, chemically similar to zirconium and present in all zirconium ores, must be scrupulously removed from the metal intended for reactor uses because hafnium strongly absorbs thermal neutrons.

Zirconium absorbs oxygen, nitrogen, and hydrogen in astonishing amounts. At about C it combines chemically with oxygen to yield the oxide, ZrO₂. Zirconium reduces such refractory crucible materials as the oxides of magnesium, beryllium, and thorium. This strong affinity for oxygen and other gases accounts for its use as a getter for removing residual gases in electron tubes. At normal temperatures in air, zirconium is passive because of the formation of a protective film of oxide or nitride. Even without this film, the metal is resistant to the action of weak acids and acidic salts. Because of its high corrosion resistance, zirconium has found widespread use in the fabrication of pumps, valves, and heat exchangers. Zirconium is also used as an alloying agent in the production of some magnesium alloys and as an additive in the manufacture of certain steels.

Natural zirconium is a mixture of five stable isotopes: zirconium-90 (51.46 percent), zirconium-91 (11.23 percent), zirconium-92 (17.11 percent), zirconium-94 (17.40 percent), zirconium-96 (2.80 percent). Two allotropes exist: below 862° C (1,584° F) a hexagonal close-packed structure, above that temperature a body-centred cubic.

Compounds. Zirconium is predominantly tetravalent in its compounds. Some less stable trivalent compounds, however, are known.

Various zirconium compounds have important applications in industry. Among these are zirconium dioxide (also called zirconia), ZrO₂, a hard, white or yellow-brown solid with a high melting point—about 2,700° C (4,892° F). It is commonly used as an abrasive, a refractory material, and a component of acidand alkali-resistant glasses and of ceramics employed in fuel cells. Zirconium dioxide occurs in nature as baddeleyite, but the commercial product is more cheaply recovered from zircon.

Other important industrial compounds of zirconium include the tetrachloride ZrCl₄ and the sulfate Zr(SO₄)₂·4H₂O. Prepared by the chlorination of zirconium carbide or oxide, zirconium tetrachloride is used to produce organic zirconium compounds and as a catalyst

in such reactions as the cracking of petroleum and polymerization of ethylene. Zirconium sulfate, produced by the action of sulfuric acid on zirconium hydoxide [Zr(OH)₄], is useful as a lubricant, a chemical reagent, and in the tanning of white leather.

atomic number atomic weight 91.22 melting point 1,852 $^{\circ}$ C (3,366 $^{\circ}$ F) boiling point 3,578 $^{\circ}$ C (6,472 $^{\circ}$ F) specific gravity valence 4 electronic config. 2-8-18-10-2 or (Kr)4 d^2 5 s^2

Zīrid DYNASTY, also called BANŪ ZĪRĪ, Muslim dynasty of Sanhājah Berbers whose various branches ruled in Ifrīqīyah (Tunisia and eastern Algeria) and Granada (972-1152). Rising to prominence in the mountains of Kabylie, Algeria, where they established their first capital, Ashīr, the Zīrids became allies of the Fatimids of al-Qayrawan. Their loyal support prompted the Fatimid caliph al-Mu'izz, when moving to his new capital of Cairo (972), to appoint Yūsuf Buluggīn I ibn Zīrī governor of al-Qayrawān and any other territory the Zīrids might reclaim from their enemies, the Zanātah tribesmen. The Zīrid state under Buluggīn accordingly expanded its boundaries westward as far as Sabtah (now Ceuta, a Spanish exclave in Morocco) on the Strait of Gibraltar; in the reign of Bādīs ibn al-Manṣūr (995-1016) it was divided between the Zīrids at al-Qayrawān in the east and their kinsmen, the Hammādids, at Oal'ah (in Algeria). In 1048, encouraged by economic prosperity, the Zīrids under al-Mu'izz (1016-62) declared themselves independent of the Fātimids and their Shī'i doctrine. The Fātimids responded (1052) by sending the Banū Hilāl and Banū Sulaym Bedouins into the Maghrib. Cut off from traditional routes to the east. North Africa fell into a state of anarchythe countryside was devastated, the peasant economy was ruined, and many settled communities reverted to nomadism. The Zīrids, forced to abandon al-Qayrawan, retreated to Mahdīyah, but their shattered state was not long able to survive coastal attacks by Sicilian Normans and finally fell in 1148. In 1067 the Hammādids managed to relocate in Bejaïa (Bougie), where they carried on a lively trade until conquered by the Almohads in 1152.

Another group of Zīrids, who had gone to Spain to serve in the Berber army of the Umayyad al-Muzaffar (1002-08), established themselves as an independent dynasty (1012-90) in Granada under Zāwī ibn Zīrī. At the beginning of the 11th century the Zīrids were given the province of Ilbīra by the Spanish Umayyad caliph Sulaymān al-Musta'in and by 1038 had extended this kingdom to include Jaén and Cabra. Málaga was taken from the Hammūdids c. 1058 by Bādīs ibn Habbūs and became the second centre of Zīrid rule in Spain. Despite their support of the Almohad Yūsuf ibn Tāshufin at the Battle of Zallāqah in 1086, these Zīrids were overthrown by the Almohads in 1090.

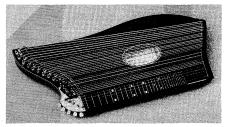

Zirkel, Ferdinand (b. May 20, 1838, Bonn—d. June 12, 1912, Bonn), German geologist and pioneer in microscopic petrography, the study of rock minerals by viewing thin slices of rock under a microscope and noting their optical characteristics.

Zirkel became professor of mineralogy at Lemberg University in 1863. The first edition of his famous Lehrbuch der Petrographie (1866; "Manual of Petrography") was written before he had learned the technique of microscopic petrography, which the geologist Henry C. Sorby was developing in England. After visiting the British Isles in 1868 and becoming acquainted with Sorby, he adopted Sorby's new technique and in 1870 published Untersuchungen über die mikroskopische Zusammensetzung und Struktur der Basaltgesteine

("Inquiry into the Microscopic Composition and Structure of Basaltic Minerals").

Zirkel accepted the chair of mineralogy at the University of Leipzig in 1870 and continued his studies. His Mikroskopische Beschaffenheit der Mineralien und Gesteine (1873; Microscopic Nature of Minerals and Rocks") made the new method of study widely available. In the 1870s Zirkel was engaged by the noted U.S. geologist Clarence King to study the rocks collected during the survey of the 40th parallel in the western United States. In 1876 Zirkel wrote the fourth volume of the survey report and thus introduced microscopic petrography into the United States. During his long tenure at Leipzig, he rewrote his Lehrbuch completely, and it became one of the classics of geology, reappearing in three large volumes in 1894. At that time it was the only complete handbook of petrography.

zither, any of several stringed musical instruments. The European zither consists of a flat, shallow sound box across which gut or metal strings are stretched. The strings nearest the player run above a fretted fingerboard against

Zither made in Vienna

By courtesy of A.V. Ebblewhite, London, photograph, Behr Photography—EB Inc.

which they are stopped by the left hand to provide melody notes; they are plucked by a plectrum worn on the right thumb. At the same time, the right-hand fingers pluck an accompaniment on the farther strings, which remain unstopped. The zither is placed across the player's knees or on a table.

In the late 18th century two principal varieties developed: the Salzburg zither, with a rounded side away from the player; and the Mittenwald zither, with both sides rounded. Tunings vary; a common tuning for the Salzburg zither is 5 melody strings tuned a', d', g', g, and c; and 29 accompanying strings tuned in a cycle of fifths (C, G, D, A, etc.) through the 12 notes of the chromatic scale. Older zithers, such as the Alpine Scheitholt, have narrow rectangular sound boxes and fewer melody strings, their three or more bass strings providing merely a dronelike accompaniment on the tonic and dominant (first and fifth notes of the scale). Their age is unknown; the Scheitholt was described by the German composer Michael Praetorius (1571-1621). They are found from Romania to Scandinavia and Iceland (e.g., the Swedish hummel) and were eventually influenced by the Austrian zither and the Norwegian langleik, in which the pitch of the drone strings is determined by movable bridges. A French form that died out in the 19th century is the miniature épinette des Vosges. With some of these instruments the melody strings are stopped by pressing them against the frets with a short metal bar, a way of playing preserved on the U.S. variety, the Appalachian, or mountain, dulcimer. In Europe and the United States there are also zithers that are bowed rather than plucked.

"Zither" is also a generic term for stringed instruments the strings of which are fastened across a frame that lacks any projecting neck or arms. The resonator may be part of the body or may be attached to it.

Zither-family instruments assume a variety of forms. The body may be a flexible stick, as in the musical bow, or may be a rigid bar, as in many Indian and Southeast Asian and some African zithers. Bar zithers often have high frets; one-stringed varieties may be called monochords. The resonators of bar and stick zithers are usually gourds or the player's mouth. A zither body may be a tube, as in the valiha of Madagascar and parts of Africa, or a tube halved lengthwise or a trough across which strings are laced. On tube zithers the strings may be sliced from the bamboo of the tube and, remaining undetached at the ends, be given tension by bridges inserted under them at each end (idiochord zither); on most zithers, however, strings and body are of separate material (heterochord zither).

Other important forms are a frame with a glued-on soundboard, as in psalteries, dulcimers, and their descendants, the stringed keyboard instruments; and a box, as with the Scheitholt and other European fretted zithers. Large East Asian zithers, such as the Chinese ch'in and the Japanese koto, are called long zithers; their body shape is midway between a board and a half tube.

The prototypes of zithers may be such primitive instruments as the ground bow and ground zither. In both, a piece of bark fastened across a hole in the earth serves as a resonator. In the earth bow a flexible stick is inserted in the ground near the resonator. To its free end is attached a string which runs to the resonator. The player beats the string rhythmically with a stick or sometimes plucks it, varying pitch by bending the stick or stopping the string with his fingers. Ground zithers consist of a string run between two sticks, one situated on either side of the hole; from that string a second string runs vertically down to the resonator. The horizontal string is struck with a stick.

Žitomir (city and oblast, Ukrainian S.S.R.): see Zhitomir.

Zittau, city, Saxony Land (state), eastern Germany, on the Lausitzer Neisse River, near the frontiers of Poland and Czechoslovakia. Originating as the Slav settlement of Sitowir, it was mentioned in 1230 and chartered in 1255, when it belonged to Bohemia. It joined the federation of Lusatian towns in 1346 and fell to Saxony in 1635. Four 13th- and 15thcentury churches still remain. There are training schools for the building trade, electricpower management, and agriculture. A railway and road junction, Zittau is a centre of the textile industry. Lignite (brown coal) is mined nearby, and machinery, chemicals, and vehicles are manufactured. Pop. (1989 est.)

Zittel, Karl Alfred, Ritter von (knight of) (b. Sept. 25, 1839, Bahlingen, Baden-d. Jan. 5, 1904, Munich), German paleontologist who proved that the Sahara had not been under water during the Pleistocene Ice Age.

In 1863 he became an assistant to the royal mineral cabinet of Vienna and professor of mineralogy, geognosy, and paleontology at the Karlsruhe Polytechnic. In 1866 he became professor of geology and paleontology at the University of Munich. His early research was in minerals and petrography. As the geologist of an expedition to Libya in 1873-74, he collected the evidence leading to his conclusion about the Sahara. He later accepted evolution and led in applying the theory to paleontology, especially in his studies of ammonites. In 1876 he began his work on fossil sponges, which established their classification and laid a basis for the classification of modern forms. His principal contributions to vertebrate paleontology dealt with turtle and pterodactyl fossils found in the Bavarian limestones.

His best-known works include Geschichte der Geologie und Paläontologie (1899; History of Geology and Palaeontology) and Handbuch der Palaeontologie (1880-93; "Handbook of Paleontology"), a comprehensive survey of paleobiology

Živković, Petar (b. Jan. 1, 1879, Negotin, Serbia [now in Yugoslavia]—d. Feb. 3, 1947, Paris), dictatorial premier of Yugoslavia from 1929 to 1932.

As a young soldier at the Serbian court, he was involved in 1903 in the assassination of King Alexander, the overthrow of the Obrenović dynasty, and the restoration of the house of Karageorgević in the person of King Peter I. Later he joined the so-called White Hand (Bela Ruka), a group of officers that opposed the Black Hand, an officer group of extreme nationalists.

King Alexander I of the Serbs, Croats, and Slovenes appointed him commander of the Palace Guards in 1921 and prime minister in 1929. He invoked anticommunism to justify the dissolution of political parties and elective local governments, the persecution of the national regime's opponents, and the "reform" of the electoral process to assure a one-party system (all candidates in the 1931 election were approved by the government at Belgrade). His resignation in 1932, though voluntary, may have been a consequence of his inability to solve economic problems.

Founder of the Yugoslav National Party, he became its president in 1936. After the Nazi invasion in 1941, Živković left the country and was in 1943 a member of the Yugoslav government-in-exile.

Ziya, Mehmed: see Gökalp, Ziya.

Ziyādid DYNASTY, Muslim dynasty that ruled Yemen in the period 819-1018 from its capital at Zabīd.

The 'Abbasid caliph al-Ma'mun transferred the rule of Yemen to the Ziyad family to offset the intrigues of the 'Alids—the Shi'ite opponents of the 'Abbāsids-who had made southern Arabia their headquarters. The first Ziyādid, Muhammad ibn Ziyād, firmly established himself along the Yemeni coast (Tihāmah) with the support of a Khorāsānian army and cavalry; he was also recognized by the tribal chiefs along the edges of the highlands. Ṣan'ā' in the interior, however, remained under 'Abbāsid control, and, when the Banū Ya'fur—the pre-Islāmic nobility—set up an independent dynasty there in 859, they soon forced the Ziyādī ruler Ibrāhīm ibn Muhammad (859-902) to cede territory in return for tribute. More territory, including Zabīd itself, was lost to the sectarian Qarmatians after Ibrāhīm's death, and records of his successor have been obscured. Abū al-Jaysh Isḥāq, however, restored Ziyadid power and territory in a celebrated reign (904-981)

In 989 the Ziyādid capital was seized and burned by the Banu Ya'fur, and effective power passed from the Ziyadids to their Ethiopian slave-viziers. The Mamlūk (slave) al-Husayn ibn Salāmah, who had preserved the kingdom from collapse after the Ya'furid attack, was succeeded by his slave Marjān, who divided the government of the kingdom between two other Mamlūks, the northern provinces falling to Najāh, the capital and southern regions coming under the rule of Nafīs. In 1018 the last Ziyādid ruler was murdered by Nafis. Control of Zabid finally fell to Najāh, however, and in 1022 the Najāhids began their rule in Yemen.

zivārah (Arabic: "visit"), in Islām, a visit to the tomb of the Prophet Muhammad in the mosque at Medina, Saudi Arabia; also a visit to the tomb of a saint or holy person. The legitimacy of these latter visits has been questioned by many Muslim religious authorities, particularly by the Wahhābīyah, who consider ziyārah a bid'ah (innovation) that should be condemned by all true believers. The Wahhābīyah maintain, in fact, that such visits to the tombs of saints and the invocation of the names of saints in times of trouble is a form

of polytheism, for God alone can grant salvation to a troubled person.

Such objections notwithstanding, Muslims continue to make such visits in the hope of obtaining cures or of witnessing a miracle or of obtaining the blessings of the saint. Because saints generally have the reputation for curing a specific disease, visits correspond to personal needs. Thus during some ziyārahs, animals are slaughtered as sacrifices and fed to the poor in the name of the visited saint, especially Ahmad al-Badawi and as-Sayyidah Zaynab in Egypt, 'Abd al-Qādir al-Jīlānī in Tunisia, and 'Abd as-Salām al-Asmar in Libya. Almost every Arab town has its own saint, whose tomb is visited by the local inhabitants on various occasions.

Žižka, Jan, Hrabě (Count) (b. c. 1376 d. Oct. 11, 1424, Přibyslav, Bohemia [now in Czechoslovakia]), military commander and national hero of Bohemia who led the victorious Hussite Protestant armies against the German king Sigismund, foreshadowing the

Žižka, stone sculpture by Wendel Roskopf, 1514-16; in the National Museum, Prague

By courtesy of the National Museum, Prague; photograph, Milan Posselt

revolution of military tactics two centuries later in his introduction of mobile artillery.

Žižka grew up at the court of the German king Wenceslas (King Wenceslas IV of Bohemia). He early lost an eye. After spending most of his life as a mercenary for the Poles and fighting with them at the Battle of Grunwald (1410), he returned to Bohemia and became a follower of the religious reformer Jan Hus. When Wenceslas died in 1419, his half-brother Sigismund attempted to ascend the Bohemian throne, but the Bohemians, aware that Sigismund would try to suppress Hussitism, or-ganized a resistance. Žižka became a leader of the Taborites, one of the newly formed peasant military communities that, with their tight discipline and religious and nationalist zeal, were vastly superior to the undisciplined feudal levies that they opposed.

Žižka revolutionized warfare through the introduction of cannon mounted on mobile, armoured farm wagons. He was one of the first commanders to handle infantry, cavalry, and artillery as one tactical body. Reduced to the tactical defensive by his cumbersome wagons, he became a master at forcing his enemies to attack at a disadvantage. Žižka's system proved practically unbeatable. He crushed Sigismund near Prague in 1420. Losing the sight of his remaining eye shortly thereafter, he continued to lead his forces to victory against both Roman Catholics and rival Hussite elements, finally dying of plague in 1424. Hussite armies continued to defeat foreign invaders, finally succumbing after a decade and a half as a result of internal rival-

Despite his obvious success, Europe failed to heed Žižka's military system for 200 years. Lingering feudalism and relatively weak central governmental authority partly explain this lapse. Only with the advent of the Swedish king Gustav II Adolf and his reintroduction of mobile artillery in the 17th century did Ziżka's system become incorporated into European tactics.

Zlatoust, city, Chelyabinsk oblast (province), western Russian Soviet Federated Socialist Republic, on both banks on the Ay River and on the Ufa-Chelyabinsk trunk railway, where river and rail cut through the Urenga Range of the Ural Mountains. In 1754 the Kosotur Iron and Copper Works were established there, and city status was granted in 1865. A major pre-revolutionary steel city noted for its engraved steel and swords, Zlatoust remains one of the most important metallurgical centres of the Urals, specializing in high-grade and stainless steels. Clocks and instruments are also made. Constricted by the narrow Ay River valley, Zlatoust developed a new centre in World War II, some 7 miles (11 km) from the old city. Pop. (1989) 208,000.

Zlín, formerly (1948–90) GOTTWALDOV, city, Jihomoravský *kraj* (region), Czechoslovakia, on the Dřevnice River, near its confluence with the Morava River. Gottwaldov was created in 1948 through a merger of several communities surrounding Zlín, a 14th-century village that had grown rapidly after World War I. The consolidated town was named for Klement Gottwald, the first communist president of Czechoslovakia. In 1990 Gottwaldov as a whole was renamed Zlín.

Zlín is a cultural centre, with a resident orchestra and several film studios. The planning and design of its new sections are, in part, the work of Le Corbusier, the Swiss-French architect. Known internationally as the home of the Bát'a shoemaking enterprise, Zlín also produces knitting machines, leather and rubber goods, and animated films. It is organized as an almost self-sufficient factory community, with workers' educational facilities. At nearby Otrokovice are large tanneries. Pop. (1989 est.) 86,742.

Znaim (Czechoslovakia): see Znojmo.

Znaniecki, Florian (Witold) (b. Jan. 15, 1882, Świętniki, Prussia [now in Poland]—d. March 23, 1958, Champaign, Ill., U.S.), Polish-American sociologist whose theoretical and methodological work helped make sociology a distinct academic discipline. He was a pioneer in the field of empirical investigation and was noted as an authority on Polish peasant culture.

Znaniecki's earliest work was as a poet. After being expelled from the University of Warsaw for his active support of Polish nationalism, he studied at various universities in France and Switzerland and received his doctorate in philosophy from the University of Kraków in 1909. Under the influence of the American sociologist W.I. Thomas, he turned to sociology, joining Thomas at the University of Chicago (1914), where they began their joint work, The Polish Peasant in Europe and America, 5 vol. (1918–20). This work made significant advances in methodology (notably in the use of intensive life histories) as well as in substance (a framework for the sociological view of personality and a study of immigrant social disorganization).

Znaniecki returned to Poland in 1920 and became professor of sociology at Poznań, where in 1922 he founded a sociological institute. He wrote several books in Polish, including an introduction to sociology and a work on the sociology of education; The Laws of Social Psychology (1925); The Method of Sociology (1934); and Social Actions (1936). A series of lectures delivered at Columbia University was published as The Social Role of the Man of Knowledge (1940). The outbreak of World War II prevented Znaniecki's return to Poland, and he joined the faculty at the University of Illinois, Urbana, where he wrote Cultural Sciences, Their Origin and Development (1952) and Modern Nationalities (1952).

Znojmo, German ZNAIM, city, Jihomoravský kraj (region), Czechoslovakia, on the Dyje River, southwest of Brno, near the Austrian border. It originated in the 11th century as a fortified residence and was the stronghold of the Přemyslid princes until the mid-13th century. Many medieval buildings, as well as houses of the Renaissance and Baroque periods, are preserved in the old town, which is designated an ancient monument. Archduke Charles of Austria and Napoleon met at Znojmo after the Battle of Wagram (1809) to arrange an armistice. The modern town has tanneries and factories producing ceramics, footwear, and sports equipment. Winemaking and food processing, notably the canning of fruit, vegetables, and pickles, are significant traditional industries. Pop. (1989 est.) 37,364.

Zoan (ancient Egyptian city): see Tanis.

zoanthid, any member of the order Zoanthidea, a group of about 300 species of marine animals of the class Anthozoa (phylum Cnidaria) characterized by a polyp (i.e., a cylindrical stalklike structure with a mouth and tentacles at the upper end and attached

Zoanthid colony (*Parazoanthus*)
Douglas Faulkner

to a surface at the lower end). The zoanthid closely resembles the sea anemone, differing from it chiefly in being generally smaller and in having a mucous coat to which sand and other materials adhere.

The largest species, Isozoanthus giganteus, grows to about 19 cm (about 7.5 inches) in length and 2 cm (0.8 inch) in width. Many species live on or in close association with sponges or other animals. Epizoanthus americanus, occurring in Atlantic coastal temperate waters off North America, attaches to the seashell inhabited by a hermit crab, dissolves the shell, and eventually encloses the crab.

zodiac, in astronomy and astrology, a belt around the heavens extending 9° on either side of the ecliptic, the plane of the earth's orbit and of the sun's apparent annual path. The orbits of the moon and of the principal

planets (except Pluto) also lie entirely within the zodiac. The 12 astrological signs of the zodiac are each considered to occupy $\frac{1}{12}$ (or 30°) of its great circle. These signs no longer correspond to the astronomical constellations in which the sun actually appears. The constellations are irregular in size and shape, and the sun regularly passes through one constellation (Ophiuchus) that is not considered a member of the zodiac.

Because most of the constellations through which the ecliptic passes represent animals, the ancient Greeks called its zone zōdiakos kyklos, "circle of animals," or ta zōdia, "the little animals." The size and number of zodiacal constellations varied in antiquity and became fixed only with the development of mathematical astronomy. The list below gives the constellations of the zodiac, with the dates of the sun's passage through them in the era when their boundaries were fixed. These dates are still used for the astrological signs, though precession of the equinoxes has shifted the constellations eastward; e.g., on January 1 the direction of the sun is now in Sagittarius instead of Capricornus. The history of the symbols is unknown; they seem to appear first in Greek manuscripts of the late Middle Ages.

zodiacal light, band of light in the night sky, thought to be sunlight reflected from meteoroids concentrated in the plane of the zodiac, or ecliptic. The light is seen in the west after twilight and in the east before dawn, being easily visible in the tropics where the ecliptic is approximately vertical. In mid-northern latitudes it is best seen in the evening in February and March and in the morning in September and October.

The zodiacal light can be followed visually along the ecliptic from a point 30° from the sun to about 90° . Photometric measurements indicate that the band continues to the region opposite the sun where a slight enhancement called the gegenschein, or counterglow, is visible. There is some zodiacal light in all parts of the sky; it can be considered an extension of the F-corona of the sun.

Zoe, also spelled zoë (b. c. 978, Constantinople [now Istanbul, Tur.]—d. 1050, Constantinople), Byzantine empress, by marriage from 1028 and in her own right from 1042.

The daughter of the emperor Constantine VIII, she was married to the heir presumptive, Romanus III Argyrus, in 1028 and became empress consort upon his elevation to the throne the same year. She became self-assertive and jealous, exiling her sister Theodora to a monastery; and, neglected by her husband, became enamoured of Michael, her young Paphlagonian chamberlain. In 1034 the emperor became ill, allegedly poisoned by Zoe; and, upon his death on April 11, she at once took control and married Michael, who was proclaimed Emperor Michael IV. Michael IV died in 1041 and was succeeded by Michael V Calaphates.

When Michael V was deposed by a Byzantine mob, then blinded and exiled to a monastery (April 1042), Zoe and her sister Theodora were proclaimed coempresses on Easter Tuesday, 1042. Quarrels, however, broke out between the sisters; and, in order to secure her position, Zoe married Constantine IX Monomachus, a man of good family, with whom she shared the throne until her death.

Zoe, also called BROTHERHOOD OF THEOLO-GIANS, in Eastern Orthodoxy, a semimonastic Greek association patterned on Western religious orders. Founded in 1907 by Eusebius Matthopoulos, Zoe (Greek: Life) brought together groups of more than 100 unmarried and highly disciplined members, bound by the monastic vows of poverty, chastity, and obedience; approximately half of the brothers were ordained priests, and the rest were laymen. With the exception of one month spent yearly in a common retreat, they were engaged in various religious activities throughout Greece, including teaching, preaching, administration of schools and youth organizations, and publishing. In the years following World War II, Zoe publications numbered hundreds of thousands of copies a year, but its influence has since diminished, especially after several of its members left the brotherhood and created a competing association (Soter).

The Zoe movement initiated a remarkable revival of the liturgy and sacramental practice throughout Greece. It was originally frowned upon by the episcopate, which resented its strong independent organization. Its authority and influence were compromised by its close connections with the dictatorship established in 1967

Zoetermeer, gemeente (municipality), Zuidholland provincie (province), western Netherlands, located about 10 mi (16 km) north of Rotterdam. It is situated on a polder created during the 17th century. Industries in the town produce machinery, tobacco products, and foodstuffs, the latter using cereals and livestock raised in the surrounding agricultural area. Oil and gas fields are worked nearby. Zoetermeer lies on a railway line connecting Amsterdam and The Hague and on a highway between The Hague and Arnhem. Pop. (1983 est.) 74,853.

Zoffany, John, also spelled Johann Zoffani, original name probably Johann Joseph Zauffely, also spelled Zauphaly (b. c. 1733, Frankfurt am Main—d. Nov. 11, 1810, Strand-on-the-Green, Middlesex, Eng.), German-born portrait painter who in late 18th-century England made his reputation with

Zoffany, self-portrait, oil on panel, 1775; in the Uffizi, Florence

SCALA-Art Resource/EB Inc.

paintings depicting episodes from contemporary theatre and with conversation pieces (q, v) and portraits.

Zoffany, after studying in Germany and Italy, went to England about 1758. Following the lead of William Hogarth, he painted scenes from London's theatrical productions.

Notable in this genre are his paintings of the famed actor David Garrick in his numerous West End successes, e.g., "The Farmer's Return" (1762). His portraits were popular with George III, who became his patron and for whom he produced "Queen Charlotte with Her Sons, the Prince of Wales and the Duke of York."

In 1772 Zoffany went to Italy with the King's financial help and there, during a seven-year stay, executed "The Tribuna of the Uffizi" (1780) for the royal family. He worked as a portraitist in India from 1783 to 1789, and when he returned to England he painted such notable portraits as "Charles Towneley Among His Marbles" (1790; Towneley Hall Art Gallery and Museum, Burnley, Lancashire). Zoffany was a founder-member of the Royal Academy (1768). He was buried at the Kew churchyard in London.

Zog I, Albanian in full AHMED BEY ZOGU (b. Oct. 8, 1895, Castle Burgajet, Alb.—d. April 9, 1961, Suresnes, Fr.), president of Albania from 1925 to 1928 and king from 1928 to 1939. Though able to manipulate Albania's

Zog I BBC Hulton Picture Library

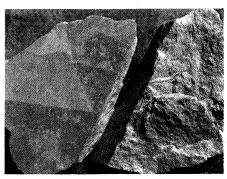

internal affairs to his own advantage, he came to depend heavily on Mussolini's Italy and was eventually ousted by the Italian dictator on the eve of World War II.

Siding with Austria during World War I, Zog thereafter became a leader of the reformist Popular Party. He held ministerial posts from 1920 until he was forced into exile in June 1924, but he returned with Yugoslav assistance in December, was elected president on Feb. 1, 1925, and was proclaimed king on Sept. 1, 1928. Zog ended a period of postwar political turbulence, and Albania enjoyed relative tranquillity under his regime. He began a fateful association with Italy in 1925; a loan in that year was followed in 1926 by a treaty of friendship and security and in 1927 by a 20-year defensive military alliance. Mussolini made Albania his bridgehead to the Balkans. By 1939 Italy controlled the country's finances and army. Zog tried but failed to break that hold from 1932 onward. On April 7, 1939, Mussolini finally made Albania into a protectorate; Victor Emmanuel III became king, and Zog went into exile. His hopes of returning after the war were disappointed by the establishment of a Communist republic under Enver Hoxha in 1945. He formally abdicated on Jan. 2, 1946.

Zohar, Sefer ha- (Jewish mystical text): see Sefer ha-zohar.

Zoigê Zhaoze (China): see Jo-erh-kai Marsh. zoisite, silicate mineral, calcium and aluminum silicate, Ca₂Al₃(SiO₄)₃OH, characteristic of regional metamorphism and of hydrothermal alteration of igneous rocks. A member of the epidote (q.v.) group of nesosilicates, zoisite occurs as white, green-brown, or gray crystals or masses in crystalline schists, often with amphibole minerals; in metamorphosed calcareous shales; very commonly in argillaceous (clayey) calcareous sandstones;

and less commonly in thermally metamorphosed limestone. Occurrences include Italy, Germany, Switzerland, Mexico, Scotland, and

the United States (Massachusetts). Thulite, a manganous variety from Telemark, Nor., and Piedmont, Italy, is pink; tanzanite, a gem variety from Tanzania, is vivid blue. Zoisite has the same chemical formula as clinozoisite but has a different crystal structure. For detailed physical properties, see silicate mineral (table).

Zoji La, pass (la) across the Himalayas in the Ladākh district, in the Indian-held part of Jammu and Kashmir state, in the northern part of the Indian subcontinent. Situated at an altitude of 11,580 ft (3,529 m), Zoji La carries the only road leading from the Vale of Kashmir eastward to Leh, in Ladākh district, and on to Tibet.

Heavily forested, the pass is the lowest in the western axis of the Himalayas but is extremely precipitous on the south side. Numerous snow bridges are located there.

Zola, Émile(-Édouard-Charles-Antoine) (b. April 2, 1840, Paris—d. Sept. 28, 1902, Paris), French novelist and critic, the founder of the Naturalist movement in literature. His

Rougon-Macquart cycle, a sequence of 20 novels described in a subtitle as The Natural and Social History of a Family Under the Second Empire, includes Nana (1880), the life of a courtesan, and Germinal (1885), an exposé of

mining conditions. He is also known for his defense of Alfred Dreyfus in the famous essay "Paccuse"

Early life. Zola was the only child of an Italian father and a French mother: Francesco Zola and Émilie Aubert. (He was naturalized as a French citizen in 1862.) His father, who was of a Venetian family of churchmen and soldiers, served in the Italian artillery and hoped to become an officer in the engineers. but after the fall of Napoleon I he soon found the oppressiveness of the Austrian regime intolerable. He left his native country and settled in France, where he went into practice as a civil engineer. He was a man of considerable energy and vision. His chance came when, thanks to the good offices of the premier Adolphe Thiers, he was entrusted with the task of building a canal to bring water to Aix-en-Provence (in southern France)—the "Plassans" of his son's novels—and the family moved there in 1842. Five years later, he died suddenly.

Francesco Zola left his dependents in straitened circumstances. Émilie Zola returned to Paris in 1857 in order to supervise her interests in the canal. Her son joined her the following year. He finished his education at the Lycée Saint-Louis, where, like some other distinguished writers, he failed his baccalauréat examination in 1859.

He spent the next two years in a vain search for employment. The stories of the future novelist remaining all day in bed wrapped in an eiderdown because he had pawned his trousers or living on sparrows caught outside his attic window have no doubt been exaggerated, but these two years were a period of real hardship. They also provided him with firsthand knowledge of how the poor lived, which was to be of great value to him as a novelist. He eventually secured a clerical post in a shipping firm, and he loathed it. His fortunes took a turn for the better in March 1862 when he moved to the sales department of the publishing house of Louis-Christophe-François Hachette.

Zola, like many other novelists, began by trying his hand at poetry. He wrote two epics on the evolution of man and of love that clearly foreshadowed the form taken by the novels. He showed the second epic to Hachette, who declined to publish it, told him that there was a better market for short stories than for poetry, and doubled his wages. Zola took his advice. His first book, published in 1864, was a collection of short stories called Contes à Ninon. It was followed in 1865 by a grimly sordid autobiographical novel, La Confession de Claude, which attracted the attention of the police. There were no proceedings, but Hachette is said to have offered Zola the choice of giving up literature or resigning. Zola had already begun to supplement his wages by free-lance journalism; so in January 1866 he

Success as a novelist. Thérèse Raquin, a gruesome novel in which he put his scientific theories into practice for the first time, appeared in 1867. Madeleine Férat (Shame), another experiment in scientific fiction, followed in 1868. On May 31, 1870, Zola married Gabrielle-Eléonore-Alexandrine Meley. As he had two women, wife and mother, dependent on him, he was exempt from military service in the Franco-German War and spent the war years outside Paris. Also in 1870, Zola virtually completed the first two novels of an ambitious project. He claimed that the whole of his Rougon-Macquart cycle was planned before he began to write, but this is not accurate. He originally intended to write 10 novels, but in the course of production the number rose to 20.

The opening volume of the cycle, La Fortune des Rougon, was published in book form

in 1871, and five more volumes followed in the next five years. The sales of these six novels were good without being sensational, but the appearance in 1877 of L'Assommoir (Drunkard), a study of alcoholism, put the novelist in the best-seller class. He became the best known writer in France. From this time onward his success was assured, and some of the later novels outsold L'Assommoir. The remaining 13 novels occupied him for another 16 years. They were followed by the two short cycles, Les Trois Villes ("The Three Cities") and Les Quatre Évangiles ("The Four Gospels").

As a writer, Zola was in many respects a typical product of his age. This is most evident in his credulous faith in science and his uncritical acceptance of scientific determinism, which was the prevailing philosophy of the latter part of the 19th century in France. He maintained that Naturalism was indigenous to French life and named the 18thcentury writer Denis Diderot and the 16thcentury essayist Michel de Montaigne among its originators. There were more immediate influences: the 19th-century French philosopher Hippolyte Taine's views on heredity and environment, and Prosper Lucas, a forgotten 19th-century scientist, the author of a treatise on heredity, who is believed to have provided Zola with a model for the character of Dr. Pascal Rougon in the Rougon-Macquart cycle. Zola himself claimed to base his method largely on the French 19th-century physiologist Claude Bernard's Introduction à l'étude de la médecine expérimentale (1865; "Introduction to the Study of Experimental Medicine"), which he did not in fact read until 1878. In his essay on "Le Roman expérimental" (1880; "The Experimental Novel"), he argued seriously that the novelist could perform the equivalent of laboratory or clinical tests on his imaginary characters and that these would provide valuable practical information about the weaknesses and vices that were the source of unhappiness and crime. He believed that human nature was completely determined by heredity. Weakness and vice were the result of an "organic lesion" in one member of a family that was unfailingly transmitted to all his descendants. It was only a fluke if any of them happened, like his own Dr. Pascal Rougon, to escape. Once this was understood, he thought that the inherited weaknesses could be eradicated by the combined efforts of medicine and education, that human nature could be perfected.

At one level, Zola's Rougon-Macquart cycle is a documentary account of French life from the coup d'état that placed Napoleon III on the throne to the defeat at the Battle of Sedan (Sept. 1, 1870) and its aftermath. Zola uses his two families—the violent Rougons and the weak Macquarts—to give continuity to the cycle. In the course of it, he manages to study all the main facets of the Second Empire.

Zola used the Second Empire to create what he described as a "microcosm." His aim was to treat it as an emblem of the human condition at one stage of its evolution, to show fallen humanity engaged in the practice of the seven deadly sins. For the cycle rests on an elaborate system of symbols. The main Christian doctrines are transposed into Naturalist terms. The "organic lesion" is the Naturalist equivalent of original sin. Tante Dide, the ancestor of both families, is a modern Eve. Sin enters this world not through eating the forbidden apple but through drinking from the forbidden cup, or alcoholism. "Redemption" is to come in the person of the child born of the "free union" between Dr. Pascal Rougon, the Saviour figure, and his niece (an allusion to Zola's liaison with Jeanne Rozerot, a laundress, and the hopes it raised). It is thus important to realize that the three cycles stand for three periods in human history: past, present, and future. It is significant that Zola's inspiration failed almost completely when he endeavoured to show the beneficial effects of science in the unfinished *Les Quatre Évangiles*, which is the cycle of the future.

Controversial figure. Throughout his career, Zola had been a controversial figure. He had been an ardent admirer and supporter of the young Impressionist painters, who were treated with hostility by the general public. In 1867 he published a biographical and critical study of the artist Edouard Manet in which he tried to reconcile the public by claiming that the life of the contemporary artist was that of a peaceful bourgeois who paints pictures in his studio as other people sell pepper behind their counters." His relations with another painter, Paul Cézanne, a boyhood friend, were less happy. The friendship came to a sudden end in 1886 because the painter was convinced, not altogether rightly, that Claude Lantier, the tragic hero of L'Oeuvre (The Masterpiece), was a caricature of himself.

Zola did his best to keep his literary controversies going, partly because he enjoyed them and partly because he realized, with his flair for publicity, that it was an excellent way of promoting the sales of his books. As a young man, he had used literary journalism as a means of propagating his theory of Naturalism. His work was constantly denounced by the conservative public as pornography. There was a more serious attack in 1887. The publication of La Terre (Earth), one of his most grim and outspoken novels, was the occasion of an onslaught by five writers of the younger generation in the journal Le Figaro, under the title of "Manifeste des cinq contre La Terre" ("The Manifesto of the Five Against La Terre).

The year 1888 was marked by an upheaval of a different kind, when Zola formed his liaison with Jeanne Rozerot, who was 30 years his junior. One of his great sorrows had been his wife's childlessness. His mistress bore him a daughter in 1889 and a son in 1891. Zola's wife was at first stricken but in time accepted the position and, after her husband's death, recognized the children legally. Although the liaison brought lasting happiness to the man, it was the end of the novelist, whose work began to show a pronounced loss of drive.

Zola's intervention in the Drevfus affairthat of a Jewish French army officer whose trial for treason began a 12-year controversy that deeply marked the political and social history of the period—is the most celebrated episode of his career. At an early stage in the proceedings he had decided rightly that Drevfus was innocent. On Jan. 13, 1898, he published a fierce denunciation of the French general staff in the newspaper L'Aurore. It took the form of an open letter beginning with the words "J'accuse." He was prosecuted for libel and found guilty. He appealed, and his conviction was quashed by the Cour de Cassation on April 2. There was a retrial at Versailles on July 18, but Zola did not wait for the verdict. On the advice of counsel and friends he fled to England. He remained there for 11 months, writing Fécondité (1899; part of Les Quatre Évangiles) and being looked after by Henry Vizetelly, who in 1889 had been imprisoned for translating Zola's novels into English. He returned to France the following June when he heard that the Drevfus case was to be reopened with a possible reversal of the original verdict.

On Sept. 28, 1902, the Zolas returned to Paris from their villa at Médan on the Seine, where they always spent the summer months. That night, a fire was lighted in their bedroom, where they slept with the windows closed. Owing to a defective flue or failure to sweep the chimney, they were overcome during the night by carbon monoxide fumes. (The suggestion has been made that the "accident" might have been engineered by some of the novelist's political enemies, but the case must be regarded

as unproved.) Zola was dead by the time help arrived, but his widow recovered after a few days. He was given a public funeral, and his remains are preserved in the Panthéon, the vast mausoleum reserved for France's great men. His reputation as a pornographic writer prevented him from becoming a member of the Académie Française, for which he stood unsuccessfully on no fewer than 19 occasions.

Evaluation and posthumous reputation. Zola's evident hostility to the Second Empire has encouraged critics to stress his left-wing sympathies, and there are still writers who regard him as a "revolutionary" novelist in the political sense. This has prompted a critic to declare categorically that too much attention has been paid to the novelist's political views, which were in fact those of a moderate socialist, and too little to his use of myths and symbols of his own making. It would, indeed, be a mistake to think that the novels only exist at the documentary level and are primarily political propaganda.

On the face of it, scientific determinism is not the most inspiring kind of philosophy for an imaginative writer, but there is no doubt that, in spite of its limitations, the subjective effect of Zola's belief that everything was scientifically determined, that man was moving in a foursquare world with high hopes for the future, did give him the strength to carry out his immense undertaking. His most effective source of inspiration, however, was not undiluted science. It was the combination of a philosophy that goes back to the 18th-century Enlightenment and early 19th-century Romanticism that produced what has long been known as Zola's "black poetry." For, in the last analysis, what makes him one of the great figures of the European novel is his poetic vision. It is his picture not merely of a gimcrack empire but, further, of a doomed world going down to destruction in flame, smoke, and ashes that gives his most memorable pages their sulfurous, visionary quality.

MAJOR WORKS. Thérèse Raquin (1867; Eng. trans. by L.W. Tancock, 1962); Madeleine Férat (1868; Shame, trans. by L. Marcourt, 1961); La Fortune des Rougon (1871; The Fortune of the Rougons, trans. by E.A. Żółkowski, Alojzy Fortunat, also called FORTUNAT ALOJZY (b. Nov. 2, 1777, near Nowogródek, Pol.—d. Sept. 11, 1822, Warsaw), actor, writer, translator, humorist, and head of a Polish theatrical family.

Zołkowski was born into a noble family and served in the army during the revolt of 1794. He made his acting debut in Warsaw in 1798, toured the country for four years, and then joined the Teatr Narodowy (National Theatre), where he was admired for his comedy roles, including Don Bartholo in Le Barbier de Séville (The Barber of Seville) by Pierre Beaumarchais and Arnolphe in Molière's L'École des femmes (School for Wives). He also wrote several original comedies, translated English and French plays, and edited humorous works, including "Momus" "Potpourri." His wife, Maria Ludwika Żōłkowska (1790-1853), was a popular classical actress with the Teatr Narodowy.

Three of Zōłkowski's children went on the stage, the most notable being his son Alojzy Gonzaga Zōłkowski (1814–89), a highly respected actor and opera singer who spent most of his career at the Warszawskich Teatrach Rządowych (State Theatres of Warsaw); his rich baritone voice and brilliant acting technique made him a success in such varied roles as Dulcamara in Donizetti's *L'elisir d'amore* and Polonius in *Hamlet*. His daughter, the acress Alojza Žōłkowska (1850–1921), continued the family tradition and married into another Polish theatrical family, the Ostrowskis.

Zolli: see Basel Zoo.

Zollinger, Albin (b. Jan. 24, 1895, Zürich—d. Nov. 7, 1941, Zürich), poet and novelist, the leading figure in the revival of Swiss poetry between World Wars I and II.

Zollinger was a primary school teacher who lived in or near Zürich all his life except for four years (1903–07) in Argentina. Three-quarters of his work was written in the last 10 years of his life, during which he consumed himself in creative activity. Following Impressionist trends, he became a master of landscape description, inspired by a refined sensuous delight. He was also preoccupied

with the burning aspiration to reach beyond the narrow limits imposed by the nature of man. For these themes, and encouraged by the examples of Hölderlin, Rilke, and Thomas Wolfe, he created an effusive lyrical imagery. His volumes of verse included *Gedichte*, 1933; Sternfrühe, 1936; Stille des Herbstes, 1939; and Haus des Lebens, 1939. His novels (Der halbe Mensch, 1929; Die grosse Unruhe, 1939; Pfannenstiel, 1940; Bohnenblust, 1942), and his novella (Das Gewitter, 1943) are confrontations with the great movements of his epoch; and while his plots suffer from looseness, his language is rich and evocative.

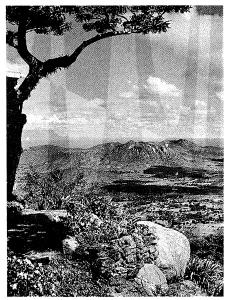

Zollverein (German: Customs Union), German customs union established in 1834 under Prussian leadership. It created a free-trade area throughout much of Germany and was an important step in German reunification.

The free-trade movement in Germany received great impetus from laissez-faire economists such as Friedrich List, its most active advocate in early 19th-century Germany. In 1818 Prussia enacted a tariff law abolishing all internal customs dues and announced its willingness to establish free trade with neighbouring states. A decade later Prussia signed the first such pact with Hesse-Darmstadt. In 1828 a customs union was set up in southern Germany by Bavaria and Württemberg, joined in 1829 by the Palatinate; also in 1828 the central German states established a similar union, which included Saxony, the Thuringian states, electoral Hesse, and Nassau. In 1834 these were among the 18 states that joined in the Zollverein. Hanover and Oldenburg joined in 1854; the two Mecklenburgs, Schleswig-Holstein, Lauenburg, and Lübeck joined in 1867; and thereby all Germany outside Austria was included except Hamburg and Bremen, which adhered in 1888, 17 years after the establishment of the German Empire.

Zomba, city, Zomba District, Southern Region, Malawi, on the lower slopes of Zomba Mountain in the Shire Highlands, 37 mi (60 km) northeast of Blantyre. Established in 1885 as a planters' settlement, from 1891 it was the centre for the administration of the British Central African Protectorate (later Nyasaland) and the capital of Malawi from independence in 1966 until 1975, when the new capital was opened at Lilongwe. The former residency (1887), designed to provide protection from slave traders, still stands by the Mulunguzi River and is now used as a government rest house. The former gardens are now a botanical garden. A new residence was later built at State House, now the seat of the Republic's president. The town still houses the Parliament Building (1957), the Government Press, Geological Survey, National Archives, and Statistics Office. Since the establishment in 1974 of Chancellor College, a new campus of the University of Malawi, Zomba has changed in character from a government and civil service centre to a university town. The town is the centre for the tobacco and dairy farms of Zomba district (994 sq mi [2,580 sq km]), which also produces rice, corn (maize), fish, and softwoods. Pop. (1981 est.) town, 25,000; (1977) district, 352,334.

Zomba Massif, isolated mass of syenite (igneous rock composed chiefly of feldspar) rising from the Shire Highlands, southern Malaŵi. Occupying an area of about 50 sq mi (130 sq km), it reaches an elevation of 6,846 ft (2,087 m) in Zomba Peak. Sheer scarps to the east and south drop 2,500 ft to the surrounding plains, and the western wall (4,000 ft) bounds part of the Shire rift valley. The massif is divided by the deep valley of the Domasi River into two sections—the Zomba Plateau (south)

and Malosa Mountain (north). The tabular surface at 6,000 ft is under softwood afforesta-

Zomba Plateau, part of the Zomba Massif, Malaŵi

tion as well as development as a mountain resort

Zonaras, Joannes (fl. first half of the 12th century), Byzantine historian whose world history, *Historical Epitome*, extending from the creation to 1118, provides valuable information on the 11th century.

After holding high office in Constantinople under Alexius I Comnenus, Zonaras became a monk and retired to a remote island. In Historical Epitome he drew on a rich collection of sources, some of which, notably several books of Dio Cassius' Romaika, are preserved only through him. A Lexicon and theological writings are also attributed to him.

Zond, any of a series of eight unmanned Soviet lunar and interplanetary probes. Zond 1 (launched April 1964) and Zond 2 (November 1964) were aimed at Venus and Mars respectively, but failed to send back data on the planets. Zond 3 (July 1965) transmitted closeup photographs of 3,000,000 square miles (7,800,000 square kilometres) of the lunar surface, including the hidden side, before going into solar orbit. Zond 5 (September 1968) became the first spacecraft to orbit the Moon and return to a soft landing on the Earth. Zond 6 through 8 (November 1968–October 1970) also made circumlunar flights; they carried biological specimens and transmitted photography of the Moon's surface.

zonda, winter foehn (*q.v.*; a warm, dry wind blowing down the side of a mountain) in Argentina, where it blows from the west across the Andes Mountains.

The name zonda in Argentina also refers to a hot, humid wind that blows from the north over the plains and precedes a low-pressure centre.

zone, submarine: see submarine fracture

zone melting, any of a group of techniques used to purify an element or a compound or control its composition by melting a short region (i.e., zone) and causing this liquid zone to travel slowly through a relatively long ingot, or charge, of the solid. As the zone travels, it redistributes impurities along the charge. The final distribution of the impurity depends on

its distribution in the starting charge of material; its distribution between the liquid and solid phase of the material (called its distribution coefficient, k, which is a characteristic of the particular impurity); and on the size, number, and travel direction of the zones.

Zone melting is a means of using the freezing process to manipulate impurities. It combines the fact that a freezing crystal differs in composition from the liquid from which it crystallizes with the idea of passing a short liquid zone along a lengthy solid.

Zone refining is the most important of the zone-melting techniques. In zone refining, a solid is refined by passing a number of molten zones through it in one direction. Each zone carries a fraction of the impurities to the end of the solid charge, thereby purifying the remainder. Zone refining was first described by the U.S. scientist W.G. Pfann and was first used in the early 1950s to purify germanium for transistors. The purity achieved was hitherto unheard of—less than one part of detectable impurity in 10,000,000,000 parts of germanium. The method was adopted in transistor manufacture around the world.

The principles of zone refining are quite general, and so the method has been applied to many substances. More than one-third of the elements and hundreds of inorganic and organic compounds have been raised to their highest purity by zone refining. Many of these were, for the first time, made pure enough for their intrinsic properties to be determined.

Principles of zone refining. When a cylinder of a substance A containing an impurity B is melted and then slowly frozen from one end to the other, as in Figure 1A, the impurity is usually concentrated in the last-to-freeze region of the cylinder. This procedure is normal freezing. Component B is redistributed in this example because the atoms (or molecules) of B at the liquid-solid interface prefer the liquid phase to the solid phase. A measure of this preference is the distribution coefficient, k, defined as the ratio of the concentration of B in the just-forming solid A to that in liquid A. At very slow freezing rates an equilibrium exists; the distribution coefficient under these equilibrium conditions is termed k_0 . At moderate freezing rates, about 1 to 30 centimetres per hour (0.4 to 12 inches per hour), the effective distribution coefficient, k, will lie somewhere between k_0 and unity. This is because, for k less than unity, the rejected impurity Baccumulates in the liquid just ahead of the advancing solid, so that the just-forming solid 'sees" a liquid more impure than the bulk liquid. If freezing is rapid enough, k_0 may approach unity; that is, the impurity concentration would be the same in the liquid and solid phases. Under these conditions, there would be no zone refining, and the interface proba-bly would become dendritic or branching in shape.

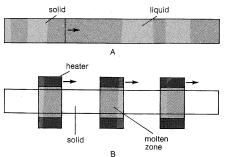

Figure 1: Schematic representation of (A) normal freezing, (B) zone refining

The normal freezing operation is the basis of the long-known technique of repeated fractional crystallizations. Although this technique was employed by the Curies to isolate radium it never became widely used because it en-

tailed a lengthy and troublesome sequence of operations: partial freezing, separation of the crystals from the unfrozen liquid, remelting, and recombining with other fractions.

Zone refining achieves the same result very simply. A series of molten zones traverse the ingot in the same direction, usually through a series of heaters, as suggested in Figure 1B. Each zone takes in impurity at its melting interface and freezes out solid purer than the liquid at its freezing interface. There is no need to separate and recombine fractions, or even to touch or move the charge at all.

The distribution of impurity B after successive zone passes for an ingot 10 zones long and for a distribution coefficient k equal to 0.5 (a value neither especially favourable nor especially unfavourable) is shown in Figure 2.

As more zone passes are made the impurity concentration at the beginning of the ingot drops lower and lower until it eventually reaches a limit called the ultimate distribution. The lowest concentration of impurity B is extremely small, less than 0.0001.

Techniques of zone refining. The liquid zones are formed by heating (and by cooling the adjacent solids). Many practical heating methods have been used: electrical resistance coils, induction heating, electric arc, and electron beam, radiant energy, plasmas (ionized gases), solar heating, lasers, and Peltier heating and cooling (produced by an electric current flowing across the junction between two different materials). For organic compounds resistance-heated coils of wire are most common, although radiant heating has been used. If a compound or element is liquid at room temperature, the operation is conventionally done in a refrigerator.

The usual container is one that will not contaminate the material. Glass, Vycor (heat- and chemical-resistant glass), fused silica, molybdenum, tantalum, and graphite have all been used. If zone refining is done vertically, a transparent container is helpful, but good work has been done using opaque containers such as stainless steel. If the container is a horizontal, semicircular cross-section boat, it can be opaque, because the liquid zone is readily distinguished from the solid. If a filled container, horizontal or vertical, is used, care must be taken to prevent cracking either by change in volume during freezing (or melting) or by differential thermal contraction (if the charge sticks to the containing wall). Various solutions have been found for these problems.

Contamination of the charge by the container is a problem in all purification work, but a unique solution was found for zone refining, namely, float zoning, invented by a U.S. scientist to produce ultrapure silicon. This semiconducting element is even more useful than germanium for most transistor applications. In float zoning, a vertical silicon rod is held by end clamps, and a short molten zone is produced by induction heating (producing heat from electric currents induced by an alternative magnetic field) and moved along the rod. The liquid is held in place by its surface tension, which theoretically limits the stable zone height. Various ingenious induction-heating procedures have been devised for stabilizing zones of greater height. Nearly perfect single crystals of ultrapure silicon have been produced commercially by such means.

Substances that melt at high temperatures also have high surface tension, enabling them to be ultrapurified by float zoning. Examples are tungsten, molybdenum, tantalum, and beryllium. A half-inch bar of beryllium, normally a very hard and brittle metal, has been easily bent 360° by hand after float zoning in a high vacuum using an electron beam to produce the molten zone. Other important factors, however, must be considered in applying zone-melting techniques. These include stirring, natural convection, and the handling of vaporous substances.

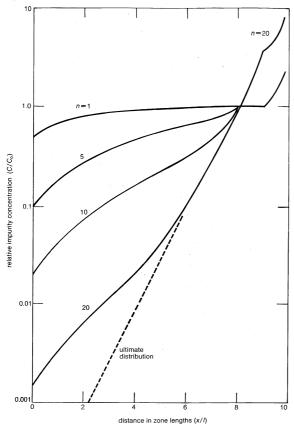

Figure 2: Semilogarithmic plots of relative impurity content along ingot for various numbers (n) of zone passes for a distribution coefficient of 0.5 in an ingot 10 zone lengths long

Practical applications. As a physical separation method, zone refining depends for its success on the difference in concentration of one component between two phases. In distillation if the separation in boiling points is not favourable, the still is made longer; in zone refining if the distribution coefficient is close to unity, the ratio of ingot length to zone length is made larger.

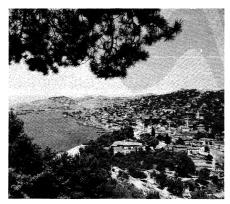

Zone refining has been utilized as the ultimate purification technique for hundreds of substances, but it has the disadvantage of being a relatively slow process. Typical freezing rates are 0.1–2.0 cm/hr (0.04–0.8 in./hr) for organic substances and 0.5–30 cm/hr (0.2–12 in./hr) for inorganic substances. The method has unique advantages of simplicity and of freedom from contamination by the container and by such chemical reagents as the solvents customarily used in crystallization.

Commercially, zone refining is important in the manufacture of semiconductors. Experimental applications of the technique are many and varied, but are particularly useful for preparing very pure materials in limited quantities. Large-scale purification of metals (of the order of tons per day) is not likely to be practical because of the excessive loss of heat due to high thermal conductivity. But zone refining of organic compounds on a tonnage scale is considered feasible, because of their very low thermal conductivity.

The liquid-solid transformation will probably continue as the main thrust of zone melting, but successful zone refining has been demonstrated in vapour-solid and solid-solid transformations. Vapour-solid transformations are restricted practically by the large change in volume on vaporization (as a result of which the charge must move along the containing tube). Solid-solid transformations are restricted by the slow rates of diffusion in solids.

Zonguldak, city, capital of Zonguldak *il* (province), northwestern Turkey, on the Black Sea coast. The well-equipped port is the main

outlet for coal extracted from the basin between Zonguldak and Ereğli. The city's development and rapid rise in population were associated with the growth of this coal industry after the mid-19th century. Mining was extensively developed by the government after 1940, and about 80 percent of the city's labour force is engaged in work related to coal. The Zonguldak Technical School of Mining is in the city. There are also chemical plants and coke ovens. Zonguldak is connected by rail with Ankara and by sea with Istanbul.

Zonguldak, Tur.By courtesy of Turkish Press Broadcasting and Tourist Dept

Zonguldak il, with an area of 3,490 sq mi (9,038 sq km), is well forested and mountainous. It is drained by the Araç, Devrek, Filyos, and Ova rivers, along which are small but fertile lowlands producing corn (maize), flax, and vegetables. It is the centre of Turkish heavy industry, containing the nation's largest iron and steel complexes at Karabük and Ereğli and the largest coalfields near Zonguldak city. A generating plant at Çatalağzı serves a large part of western Turkey. The building of

small sailing craft is a tradition at Bartin. Pop. (1980) city, 109,044; (1983 est.) *il*, 1,025,600.

Zonheboto, town, administrative headquarters of Zonheboto district, Nāgāland state, northeastern India. Formerly in the Mokokchūng subdivision, it is situated 41 mi (66 km) northeast of Kohīma town. The town has some cottage industries.

Zonheboto district (about 500 sq mi [1,300 sq km]) was separated from Mokokchung district in 1973 and is located in the central part of the state. It is bounded by Mokokchung district on the north, Tuensang district on the east, Phek district on the south, and Kohīma and Wokha districts on the west. The region is crisscrossed by several faults and is subject to earthquakes. It is hilly and rugged, with an average elevation of from 2,000 ft (600 m) to 3,000 ft. The hills are covered with dense forests of oak, chestnut, birch, and bamboo. The Laniye and the Dikhu, the major rivers, are aligned in a north-south direction and flow through narrow valleys. Agriculture is the mainstay of the economy; shifting cultivation is practiced, and crops include rice, ginger, yams, cotton, corn (maize), potatoes, fruits, sesame, and sugarcane. Pigs and poultry are raised. Cottage industries consist of weaving and dyeing; working of cane, bam-boo, and wood; and pottery making. Timber is seasoned, and there are tufa lime and coal deposits in the district. Its ethnic people are mentioned in Sanskrit literature as the Kirāt; today the Angami, Rengma, Chakhesang, and Zeliang peoples inhabit the district. Transportation by road is difficult because of the terrain. Pop. (1981) town, 7,678; district, 61,-

zoning, the legislative method of controlling land use by regulating such considerations as the type of buildings (e.g., commercial or residential) that may be erected and the population density. Applied primarily to urban areas, it is accomplished by dividing land area into zoning districts, each having specific conditions under which land and buildings may be legally developed and used. In combination with other city-planning techniques, zoning is a major instrument for gaining greater physical order in cities.

The earliest form of zoning was inspired by architectural and urban-design controls introduced in European cities toward the end of the 19th century. In accordance with long-established municipal powers, German and Swedish cities applied zoning regulations about 1875 to new land being urbanized around the older city cores as a way of controlling the heights and concentrations of buildings and avoiding problems of congestion. Much of the orderliness of German and Swedish cities and the consistent quality of building line and height is due to the early establishment of detailed zoning regulations and their widespread application at the time of major building activity growing out of the Industrial Revolution.

Zoning in the United States, in contrast, has been more concerned with the social and economic function for which land is used rather than with architectural and site-planning criteria. The earliest U.S. zoning ordinances—around the turn of the 20th century—were motivated by the need for regulating the location of commercial and industrial activities.

Z00, also called ZOOLOGICAL GARDEN, Or ZOOLOGICAL PARK, place where wild animals and, in some instances, domesticated animals are exhibited in captivity. In such an establishment animals can generally be given more intensive care than is possible in nature reserves or sanctuaries. Most long-established zoos exhibit general collections of animals, but some formed more recently specialize in par-

ticular groups—e.g., primates, big cats, tropical birds, or waterfowl. Marine invertebrates, fishes, and marine mammals often are kept in separate establishments known as aquariums (see aquarium). The word zoo was first used in the late 19th century as a popular abbreviation for the zoological gardens in London.

For information on particular zoos, see articles at their specific names, e.g. Basel Zoo, Lincoln Park Zoological Garden, Prague Zoo.

It is not known when the earliest zoos were established, but it is possible that they were associated with the first attempts at animal domestication. Pigeons were kept in captivity as early as 4500 BC in what is now Iraq, and 2,000 years later elephants were semi-domesticated in India. Antelopes, including the addax, ibex, oryx, and gazelle, are depicted wearing collars on Egyptian tomb pictures at Saqqara, dating from 2500 BC. In China, the Empress Tanki, who probably lived about 1150 BC, built a great marble "house of deer": and Wen Wang, who apparently reigned just before 1000 BC, established a zoo of 1,500 acres in extent, which he named the Ling-Yu, or Garden of Intelligence.

The biblical king Solomon, who also reigned about 1000 BC, was a farmer-zoologist, and he was followed, for at least the next 600 years, by other royal zookeepers, including Semiramis and Ashurbanipal of Assyria and King

Nebuchadrezzar of Babylonia.

Collections of captive animals were in existence in Greece by the 7th century BC, and by the 4th century BC it is probable that such collections existed in most, if not all, of the Greek city-states. Aristotle (384–322 BC) was obviously well acquainted with zoos, his most famous pupil, Alexander the Great, sent back to Greece many animals that were caught on his military expeditions.

The earlier Egyptian and Asian zoos were kept mainly as public spectacles and only secondarily for study, but the Greeks of Aristotle's time were more concerned with study and experiment. The Romans had two types of animal collections: those destined for the arena and those kept as private zoos and aviaries.

With the end of the Roman Empire, zoos went into a decline, but animal collections were maintained by the emperor Charlemagne in the 8th century AD and by Henry I in the 12th century. In Europe Philip VI had a menagerie in the Louvre, Paris, in 1333, and many members of the House of Bourbon kept collections of animals at Versailles.

In the New World Hernán Cortés discovered a magnificent zoo in Mexico in 1519. The collection, which included birds of prey, mammals, and reptiles, was so large that it

needed a staff of 300 keepers.

Modern zookeeping may be said to have started in 1752 with the founding of the Imperial Menagerie at the Schönbrunn Palace in Vienna. This menagerie, which still flourishes, was opened to the public in 1765. In 1775 a zoo was founded in a Royal Park in Madrid, and 18 years later the zoological collection of the Jardin des Plantes, Paris, was begun. The Zoological Society of London established its collection in Regent's Park in 1828, two years after the society itself was founded.

By the mid-19th century zoos were being opened all over the world; among those existing today, more than 40, most of which are in Europe, are more than 100 years old. Since the end of World War II there has been a rapid and worldwide proliferation of zoos, many of which have as their aim not the study of animals but public entertainment and commercial gain. The total number of animal collections open to the public in the world today is not accurately known but exceeds 1,000.

Function and purpose. The primary object of zoos that are in the charge of scientific societies is the study of animals. Thus, the purpose of the Zoological Society of London, as stated in its Royal Charter, is "the advancement of Zoology and Animal Physiology and the introduction of new and curious subjects of the Animal Kingdom." This society has been the model for many other zoological societies throughout the world. In the 19th century the emphasis of the investigations carried out in scientific zoos was mainly on taxonomy, comparative anatomy, and pathology. Today, the opportunities for scientific inquiry are much wider, and a few societies have established special research institutions. In the United States the Penrose Research Laboratory, of the Philadelphia Zoo is particularly concerned with comparative pathology. The New York Zoological Society maintains an Institute for Research in Animal Behavior and, in Trinidad, the William Beebe Tropical Research Station. In Great Britain the Zoological Society of London maintains, in addition to a modern hospital and pathology laboratories, two general research institutes—the Nuffield Institute of Comparative Medicine and the Wellcome Institute of Comparative Physiol-

Many zoos publish scientific journals and periodicals, which range in their contents from the popular to the highly technical. Again, the Zoological Society of London led the way. Its "Proceedings," now known as the *Journal of Zoology*, has appeared uninterruptedly since

1830.

In recent years a few zoos have intensified their efforts, frequently in cooperation with educational authorities, to provide an educational program for school children and students. Some zoos have full-time or voluntary guides on their staff, whose job it is to provide more information for visitors than can be given on labels attached to cages. Others meet this need by providing "talking labels," prerecorded tapes operated by the visitor himself

Since World War II a number of zoos have been developed as breeding centres for animal species in danger of becoming extinct in the wild. Many threatened species have been saved by breeding in captivity. For example, in 1947 it was estimated that there were only 50 nenes, or Hawaiian geese, left on Hawaii and none anywhere else in the world. In 1950 two nenes were housed at the Wildfowl Trust at Slimbridge, Eng., and in 1951 a gander was hatched. The birds continued to breed successfully, and gradually the captive stock in Europe was spread over a dozen different menageries to minimize the risk of losses from disease or predators. Another species that has been saved by breeding in zoos is the European bison, or wisent, the last wild specimen of which died in 1925. Other species that zoos have helped to survive include Père David's deer and many rare game birds. The increasing number of zoo births gives hope that zoos, rather than capturing wild animals for exhibition, will perhaps be able to restock the wild with zoo-born animals.

Design and architecture. Zoo design and architecture must meet two often conflicting needs: those of the animals (and the menagerie staff caring for them) and those of the visiting public. Zoos vary so widely in site, size, layout, age, and climatic conditions that there can hardly be a standard form of architecture.

Urban zoos (perhaps 80 percent of all zoos) are necessarily limited in size and have to make the best possible use of the available space. The animals are usually kept in houses, sometimes with associated outdoor enclosures. Cages, or some form of barrier, are usually necessary to prevent the animals from escaping and to discourage the public from getting too close to the animals. In addition to the simplest equipment in cages, such as scratch-

ing posts for the lions and tigers and branches and suspended chains or ropes for the monkeys, modern materials are increasingly used for the construction of backgrounds, artificial rocks, and trees to simulate a more natural habitat.

Elephants and rhinoceroses, which are among the largest mammals, are often accommodated within the same building, which is sometimes designed also to house hippopotamuses and tapirs. These animals are usually also provided with outdoor paddocks, always incorporating a pool for the hippopotamuses and often for the other species. Giraffes, whose height may exceed 4½ metres (15 feet), obviously need buildings that provide proper headroom, and also outdoor enclosures where they can exercise. Horses, zebras, okapis, camels, pigs, cattle, and antelopes require both houses and paddocks. Only the small mammals can be conveniently housed under one roof without outdoor paddocks.

Nocturnal animals are exhibited successfully in a number of zoos in buildings in which the normal cycle of daylight is reversed by means of artificial light. During daylight hours, when the animals would normally be asleep but when zoos are open to the public, the building is illuminated by dim white light or red light and the animals become active. At nightfall the houses are fully illuminated and the ani-

mals go to sleep.

Aviaries in urban zoos can take a number of forms. They may be a collection of small cages, each containing one or a pair of birds, within a building. They may be considerably larger cages, containing a number of species either representing closely related forms or providing a habitat display of, for example, seashore or woodland birds. There are various ways to keep birds within the aviary and still display them to the public. Wire mesh is the most common means, but a less visible barrier consists of vertically placed piano wire at one-half inch to one inch intervals. Glass is sometimes used, but unless it is very carefully positioned it may give unwanted reflections. Birds can also be confined in aviaries that are "enclosed" simply and effectively by brightly lighting certain portions of the enclosure and darkening the public area. The "walk-through" aviary is one in which the birds are given free run of a large space into which visitors are admitted through "air-lock" type doors. Such aviaries can simulate a natural environment with vegetation and streams.

Water birds and birds of prey are usually housed in outdoor aviaries with an attached shelter. Modern aviaries for these species are very large so that the birds can exercise suffi-

ciently

One of the most magnificent aviaries in the world is in the San Diego Zoo, in California, where it has proved possible to roof over natural canyons, of which one, used as a walk-through aviary, is about 25 m high, 46 m long, and 21 m wide. The walk-through Snowdon Aviary, at the London Zoo, is of a similar size but built over a man-made cliff. Opened in 1965, it is of unique design. Galvanized steel tension cables and aluminum tube shear legs support mesh on tetrahedral frames held in midair. The walk-through path cantilevers 12 m out from the cliff top.

Reptiles may be kept in individual cages in an enclosed reptile house. In subtropical and tropical zoos they are often kept outdoors in

semi-natural enclosures or pits.

When animals are confined in houses, conditions such as ventilation, light, temperature, and humidity are adjusted to the particular needs of the species involved. Central heating plants and humidifiers may have to be installed in each building, with separate control systems for different cages. Many animals like to bask in a "hot spot" and feed in surroundings at a lower temperature. Infrared lamps are sometimes used to this end, and, in species

such as desert-living reptiles, ultraviolet light also is used. Direct sunlight is adequate if the windows allow passage of ultraviolet rays.

A number of open-range zoos have been established since the early 1930s in rural surroundings. The prototype is Whipsnade Park, established by the Zoological Society of London in 1932. Fewer species of animals are exhibited in such zoos than in urban zoos, but they are kept in more natural conditions in large paddocks. Animals are confined by a variety of methods including water-filled moats, dry moats, and wire-mesh fences.

While many open-space zoos exhibit their animals in paddocks containing only a single species—e.g., a pride of lions or a herd of wildebeest or llamas—some try to create habitat displays consisting of mixed groups of animals. One of the best of these is at Borasparken, Swed., where the African exhibit contains elephants, white rhinoceroses, Grant's zebras, reticulated giraffes, white-tailed gnus, crowned cranes, ground hornbills, ostriches, and guinea fowl.

In some modern zoo parks, sometimes called safari parks or lion farms, the animals are confined in very large paddocks through which visitors drive in their cars. While this practice is based on that observed in African nature reserves, it can prove dangerous when the density of traffic is high and when visitors fail to keep the windows of their cars closed or leave their cars. Provided that open-space zoos are run by experienced and properly trained staff, with veterinarians who have specialized in the care of exotic animals in attendance, those zoos could become very important as breeding centres for rare or endangered species.

Procurement and care of animals. It has been estimated that in a good modern zoo, for every 20 animals on display, only about 5 were bred in captivity, the remainder having been collected in the wild and usually purchased through dealers. Equally, for every animal that ends up in a dealer's hands, several others were probably killed in attempts at capture or died before they were sold to a zoo or other purchaser. In the interest of animal conservation, the breeding of captive animals is encouraged.

On arrival, zoo animals are quarantined and acclimatized to their new surroundings. Information on proper nutrition is exchanged between zoos directly or published in the International Zoo Yearbook. Temperature and other environmental requirements are also studied. Certain penguins, for example, have to be kept in refrigerated rooms if they are to thrive and breed. Adequate sleeping quarters, such as dens for foxes and wolves or burrows for rodents, also are provided.

Funding. Zoos are funded in various ways. In the United States most zoos are supported partially or wholly out of public funds by the town, city, or state in which they are located. The National Zoological Park, in Washington, D.C., was founded by Congress in 1889-90. Its site was purchased by the U.S. government, and running expenses are provided from public funds. The Zoological Park in the Bronx, New York City, and the Philadelphia Zoological Garden are managed by zoological societies. Both are supported partly by the subscriptions of members, partly by entrance fees, and partly by annual civic subsidies. In Britain most of the older zoos are maintained by zoological societies or trusts, all of which have an educational purpose. The running costs of the zoos are met by admission charges, membership subscriptions, and gifts

Most European zoos, especially those in Germany, are run as civic institutions, but, in addition, entrance fees are charged. Some famous zoos, including those in Cologne and Frankfurt, are supported by the municipality but are run by zoological societies. The Paris zoo is one of the many institutions directly

supported by the French Ministry of Education, in the same way as the Moscow zoo is a state organization.

In a number of countries zoo associations or federations have been set up. The largest of these is the American Association of Zoological Parks and Aquariums, founded in 1924. Other zoo federations include those of Great Britain and Ireland, Spain and Spanish America, Japan, Poland, and Germany. Related organizations include the International Union of Directors of Zoological Gardens and the Wild Animal Propagation Trust. Federations generally have among their objects the gathering and dissemination of facts and information relating to the management of zoological parks, the maintenance and raising of standards in zoos, the facilitation of the exchange and importation of zoological specimens, and the conservation of wildlife.

> Consult the INDEX first

zoochlorella, plural zoochlorellae, any small green alga (often Chlorella) or, sometimes, flagellate protozoan (e.g., the chlamydomonad Carteria) that lives within the bodies of various freshwater protozoans and invertebrates. Zoochlorellae often colour their hosts green (e.g., green hydra, green Paramecium bursaria). As symbionts, zoochlorellae use carbon dioxide and nitrogenous and phosphorous wastes and provide oxygen and useful nutrients. Sometimes zoochlorellae are digested by the host, and they can survive independently of it. They may be passed from one generation to another in host germ cells.

zooflagellate, any flagellate protozoan that is traditionally of the protozoan class Zoomastigophorea (sometimes called Zooflagellata), although recent classifications of this group have questioned the taxonomic usefulness of the term because some zooflagellates have been found to have photosynthetic capabilities and some phytoflagellates heterotrophic capabilities.

Zooflagellates assimilate organic material by osmotrophy or phagotrophy. The zooflagellate's flexible pellicle (envelope) is sufficiently thin in certain genera to permit pseudopodal projections. Zooflagellates exhibit a considerable variation in form, and they may be free-living, symbiotic, commensal, or parasitic in humans and other animals and in certain plants. For additional information about zooflagellates, see choanoflagellate; Holomastigotoides; hypermastigote; protomonad; trichomonad; trypanosome.

zoogeographic region: see faunal region.

zoology, branch of biology concerned with the members of the animal kingdom and with animal life in general. It embraces all conceivable forms of study, not only of the components of the animal body and the vital processes that sustain it but also of the relations of individual animals or animal groups with one another and the environment. Because of its vast scope, zoology is generally divided into a number of subdisciplines of which the chief ones include cytology, embryology, morphology, physiology, pathology, paleontology, genetics and evolution, taxonomy, ethology (the study of animal behaviour), ecology, and zoogeography.

Zoology is treated in a number of articles in the MACROPAEDIA. For the history and principal treatment of the discipline, see Biological Sciences. For the primary subjects of study, see Behaviour, Animal; Biochemical Components of Organisms; Cells; Coloration, Biological; Evolution, The Theory of; Genetics and Heredity, The Principles of; Growth and

Development, Biological; Learning, Animal; Metabolism; Mimicry; Reproduction and Reproductive Systems. For the practical applications of zoological research, see Farming and Agricultural Technology.

For a description of the place of zoology in the circle of learning and for a list of both MACROPAEDIA and MICROPAEDIA articles on the subject, see PROPAEDIA: Part Ten, Division III.

The science of zoology has its origins in ancient Greece and the Roman Empire, in the works of Hippocrates, Aristotle, and Pliny. Later naturalists continued in the Aristotelian tradition. In the 15th century the invention of the printing press greatly aided the dissemination of information. The contributions of individuals such as William Harvey (the circulation of blood), Carolus Linnaeus (system of nomenclature), Georges-Louis Leclerc de Buffon (natural history), and Georges Cuvier (comparative anatomy) further advanced the

field of zoology.

The identification of the cell as the common structural unit of living things and the advancement of the study of chemistry clarified for Claude Bernard the concept of homeostasis-the stability of the internal bodily environment. As technology progressed, a number of new biological disciplines, such as embryology, began to develop. A major turning point in zoological studies occurred in 1859, when Charles Darwin's On the Origin of Species by Means of Natural Selection was published. In it Darwin formulated his theory of evolution. Since that time the study of genetics has grown essential to a number of biological disciplines. While specialization has increased, the necessity for interdisciplinary studies also has become clear.

Zoomastigophorea, protozoan class also known as Zooflagellata. See zooflagellate.

zoonosis, plural zoonoses, any disease shared by humans and other vertebrate animals. The term was originally defined to describe a group of diseases that humans may acquire from domestic animals. This definition has been modified to include all human diseases that are acquired from or transmitted to any other vertebrate. Examples include rabies (q.v., from small mammals such as the dog, fox, bat, and rodent), tularemia (q.v.) from rabbits and wild rodents), psittacosis (q.v.; from birds of the parrot family), glanders (q.v.; from horses), anthrax (q.v.; from ruminants, horses, and swine), brucellosis (q.v.) from domestic livestock), and a variety of respiratory infections from domestic animals and house pets.

zooplankton, small floating or weakly swimming organisms that drift with water currents and, with phytoplankton, make up the planktonic food supply upon which almost all oceanic organisms are ultimately dependent. Many animals, from single-celled Radiolaria to the eggs or larvae of herrings, crabs, and lobsters, are found among the zooplankton. Permanent plankton, or holoplankton, such as protozoa and copepods (an important food for larger animals), spend their lives as plankton. Temporary plankton, or meroplankton, such as young starfish, clams, worms, and other bottom-dwelling animals, live and feed as plankton until they leave to become adults in their proper habitats.

zooxanthella, any flagellate protozoan, sometimes classified as a yellow-green alga, with yellow or brown pigments contained in chromatophores. Zooxanthellae live in other protozoa (foraminiferans and radiolarians) and in some invertebrates. They use the carbon dioxide and waste materials of the host, supplying, in return, oxygen and food substances. Zooxanthellae spend their resting stage in

the host; at times they escape and become free-swimming, independent flagellates. Examples of zooxanthellae are *Cryptomonas* (see cryptomonad) and *Chrysidella*.

Zophar, also spelled sophar, in the Book of Job (2:11, 11:1, 20:1, 42:9), one of the three comforters of Job, a biblical archetype of the good man whose misfortunes are undeserved. Like the other two comforters, Bildad and Eliphaz, Zophar emphasizes an old Hebrew concept—suffering is the inevitable lot of the evil man; therefore, Job's protests of innocence are deceptive, even sinful. Zophar is portrayed as more hotheaded than his two friends. In 2:11 he is identified as a Naamathite, or one who dwells in Naamah, perhaps a region in Arabia.

His first speech to Job (11:1) stresses three ideas: God's infinite transcendence; the need for Job to repent of the sins he denies having committed, so that God will restore his good fortune; and the ineluctable destruction of the wicked.

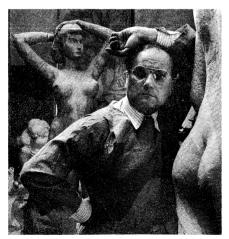

Zophar's second reply to Job (20:1) begins with an admission of agitation. Job's cries for his friends' mercy and the force of some of his arguments have upset Zophar. Controlling his disturbance, he then harangues Job about the evanescence of the evil man's pleasure. Such a man may prosper temporarily but then will inevitably "suck the poison of asps" (20:16) and find that "the earth will rise up against him" (20:27).

Unlike the other two comforters, Zophar does not have a third speech, and some commentators have concluded that parts of Job's speeches constitute this third reply.

Zorach, William (b. Feb. 28, 1887, Eurburg, Lithuania—d. Nov. 16, 1966, Bath, Maine, U.S.), U.S. traditionalist sculptor of simple, figurative subjects who was a leading figure in the early 20th-century revival of direct carving, whereby the sculptor seeks his image directly from the material to be carved, relying on neither the inspiration of models nor the aid of mechanical devices. Zorach's mature work is monumental in form and makes skillful use of the natural colour, veining, and textures of the materials used—usually stone and wood. Often, the marks of the sculptor's tools are left to enrich the surface.

Zorach, photograph by Arnold Newman, 1943 © Arnold Newman

Zorach immigrated to the United States when he was four and was reared in Cleveland. He studied painting at the Cleveland Institute of Art and in Paris (1910–11), where he painted with vivid colours and freely rendered forms in the manner of Matisse and other painters of the Fauve movement. He took up sculpture in 1917 and gave up painting, except for watercolour, in 1922. From 1929 to 1960 Zorach taught sculpture at the Art Students League in New York City, where he inspired many students to take up wood carving.

Among his major public commissions are "Spirit of the Dance" (1932; Radio City Music Hall, New York City), the Mayo Clinic relief "Man and Work" (1953; Rochester, Minn.), and the "Spirit of the Sea" (1962; Bath, Maine).

He wrote two books: Art is My Life (1967), his autobiography, and Zorach Explains Sculpture (1947).

zorapteran, any member of the insect order Zoraptera, consisting of one family and at least 22 described species. They are found on every continent except Europe. They are minute insects, less than 3 millimetres (1/8 inch) long,

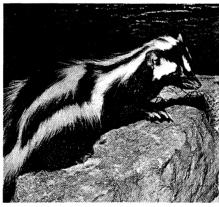

Zorotypus nymph under bark

with chewing mouthparts and nine-segmented antennae. Most species are wingless and blind, although a few have two pairs of sparsely veined membranous wings and eyes.

Zorapterans live in colonies beneath the bark of rotting trees and in humus but have no social organization. They feed on other arthropods and fungal spores and are of little economic importance.

zorille, also spelled zoril, or zorilla, also called striped polecat, african polecat, CAPE polecat, or striped weasel (*Ictonyx* [sometimes *Zorilla*] *striatus*), African carnivore of the weasel family (Mustelidae), fre-

Zorille (Ictonyx striatus)

quenting diverse habitats. It has a slender body, 29-39 centimetres (12-16 inches) long, and a bushy white tail, 21-31 cm long. Its fur is long and black, white striped on the back and white spotted on the face. Usually solitary, the zorille hunts at night, feeding on rodents and insects. A typical litter contains two or three young.

Zorn, Anders (Leonard) (b. Feb. 18, 1860, Mora, Swed.—d. 1920, Mora), Swedish painter and etcher, internationally famed as one of the best genre and portrait painters in Europe at the end of the 19th century.

Zorn studied at the Stockholm academy and

then travelled extensively throughout Europe. After working in England, France, and the United States, he returned to Mora in 1896.

Etching of Ernest Renan by Zorn, 1892; in the Nationalmuseum, Stockholm

By courtesy of the Nationalmuseum, Stockholm

Zorn painted Impressionist landscapes and portraits in both watercolour and oil; he is best known for the vigorous style of his paintings of peasant girls bathing. He did his best work in etching, employing a technique of drawing parallel lines across the plate. He was also a sculptor.

Zoroaster, Old Iranian ZARATHUSHTRA, or ZARATHUSTRA (b. c. 628 BC, probably Rhages, Iran—d. c. 551, site unknown), Iranian religious reformer and founder of Zoroastrianism, or Parsiism, as it is known in India. (See Zoroastrianism; Parsi.)

Life. A major personality in the history of the religions of the world, Zoroaster has been the object of much attention for two reasons. On the one hand, he became a legendary figure believed to be connected with occult knowledge and magical practices in the Near Eastern and Mediterranean world in the Hellenistic Age (c. 300 BC-c. AD 300). On the other hand, his monotheistic concept of God has attracted the attention of modern instorians of religion, who have speculated on the connections between his teaching and Judaism and Christianity. Though extreme claims of pan-Iranianism (i.e., that Zoroastrian or Iranian ideas influenced Greek, Roman, and Jewish thought) may be disregarded, the pervasive influence of Zoroaster's religious thought must nevertheless be recognized.

The student of Zoroastrianism is confronted by several problems concerning the religion's founder. One question is what part of Zoroastrianism derives from Zoroaster's tribal religion and what part was new as a result of his visions and creative religious genius. Another question is the extent to which the later Zoroastrian religion (Mazdaism) of the Sāsānian period (AD 224–651) genuinely reflected the teachings of Zoroaster. A third question is the extent to which the sources—the Avesta (the Zoroastrian scriptures) with the Gāthās (older hymns), the Middle Persian Pahlavi Books, and reports of various Greek authors—offer an authentic guide to Zoroaster's ideas.

A biographical account of Zoroaster is tenuous at best or speculative at the other extreme. The date of Zoroaster's life cannot be ascertained with any degree of certainty. According to Zoroastrian tradition, he flourished "258 years before Alexander." Alexander the Great conquered Persepolis, the capital of the Achaemenids, a dynasty that ruled Persia from 559 to 330 BC, in 330 BC. Following this dating, Zoroaster converted Vishtāspa, most likely a king of Chorasmia (an area south of the Aral Sea in Central Asia), in 588 BC. According to tradition, he was 40 years old when this event occurred, thus indicating that his birthdate was 628 BC. Zoroaster was born into a modestly situated family of knights, the Spitama, probably at Rhages (now Rayy, a suburb of Tehran), a town in Media. The area in which he lived was not yet urban, its

economy being based on animal husbandry and pastoral occupations. Nomads, who frequently raided those engaged in such occupations, were viewed by Zoroaster as aggressive violators of order, and he called them followers of the Lie.

Zoroaster's teachings. According to the sources, Zoroaster probably was a priest. Having received a vision from Ahura Mazdā, the Wise Lord, who appointed him to preach the truth, Zoroaster apparently was opposed in his teachings by the civil and religious authorities in the area in which he preached. It is not clear whether these authorities were from his native region or from Chorasmia prior to the conversion of Vishtāspa. Confident in the truth revealed to him by Ahura Mazdā, Zoroaster apparently did not try to overthrow belief in the older Iranian religion, which was polytheistic; he did, however, place Ahura Mazdā at the centre of a kingdom of justice that promised immortality and bliss. Though he attempted to reform ancient Iranian religion on the basis of the existing social and economic values, Zoroaster's teachings at first aroused opposition from those whom he called the followers of the Lie (*dregvant*).

Ahura Mazdā and the Beneficent Immortals. Zoroaster's teachings, as noted above, centred on Ahura Mazdā, who is the highest god and alone is worthy of worship. He is, according to the Gāthās, the creator of heaven and earth; i.e., of the material and the spiritual world. He is the source of the alternation of light and darkness, the sovereign lawgiver, and the very centre of nature, as well as the originator of the moral order and judge of the entire world. The kind of polytheism found in the Indian Vedas (Hindu scriptures having the same religious background as the Gāthās) is totally absent; the Gāthās, for example, mention no female deity sharing Ahura Mazdā's rule. He is surrounded by six or seven beings, or entities, which the later Avesta calls amesha spentas, "beneficent immortals." The names of the amesha spentas frequently recur throughout the Gāthās and may be said to characterize Zoroaster's thought and his concept of god. In the words of the Gāthās, Ahura Mazdā is the father of Spenta Mainyu (Holy Spirit), of Asha Vahishta (Justice, Truth), of Vohu Manah (Righteous Thinking), and of Armaiti (Spenta Armaiti, Devotion). The other three beings (entities) of this group are said to personify qualities attributed to Ahura Mazdā: they are Khshathra Vairva (Desirable Dominion), Haurvatāt (Wholeness), and Ameretāt (Immortality). This does not exclude the possibility that they, too, are creatures of Ahura Mazdā. The good qualities represented by these beings are also to be earned and possessed by Ahura Mazda's followers. This means that the gods and mankind are both bound to observe the same ethical principles. If the amesha spentas show the working of the deity, while at the same time constituting the order binding the adherents of the Wise Lord, then the world of Ahura Mazdā and the world of his followers (the ashavan) come close to each other. The very significant eschatological aspect of Zoroastrianism is well demonstrated by the concept of Khshathra (Dominion), which is repeatedly accompanied by the adjective Desirable; it is a kingdom yet to come.

Monotheism and dualism. The conspicuous monotheism of Zoroaster's teaching is apparently disturbed by a pronounced dualism: the Wise Lord has an opponent, Ahriman, who embodies the principle of evil, and whose followers, having freely chosen him, also are evil. This ethical dualism is rooted in the Zoroastrian cosmology. He taught that in the beginning there was a meeting of the two spirits, who were free to choose—in the words of the Gāthās—"life or not life." This original choice gave birth to a good and an evil principle. Corresponding to the former

is a Kingdom of Justice and Truth; to the latter, the Kingdom of the Lie (Druj), populated by the daevas, the evil spirits (originally prominent old Indo-Iranian gods). Monotheism, however, prevails over the cosmogonic and ethical dualism because Ahura Mazdā is father of both spirits, who were divided into the two opposed principles only through their choice and decision.

The Wise Lord, together with the amesha spentas, will at last vanquish the spirit of evil: this message, implying the end of the cosmic and ethical dualism, seems to constitute Zoroaster's main religious reform. His monotheistic solution resolves the old strict dualism. The dualist principle, however, reappears in an acute form in a later period, after Zoroaster. It is achieved only at the expense of Ahura Mazda, by then called Ohrmazd, who is brought down to the level of his opponent, Ahriman. At the beginning of time, the world was divided into the dominion of the good and of the evil. Between these, each man is bound to decide. He is free and must choose either the Wise Lord and his rule or Ahriman, the Lie. The same is true of the spiritual beings, who are good or bad according to their choices. From man's freedom of decision it follows that he is finally responsible for his fate. Through his good deeds, the righteous person (ashavan) earns an everlasting reward, namely integrity and immortality. He who opts for the lie is condemned by his own conscience as well as by the judgment of the Wise Lord and must expect to continue in the most miserable form of existence, one more or less corresponding to the Christian concept of hell. According to Avestan belief, there is no reversal and no deviation possible once a man has made his decision. Thus, the world is divided into two hostile blocks, whose members represent two warring dominions. On the side of the Wise Lord are the settled herdsmen or farmers, caring for their cattle and living in a definite social order. The follower of the Lie (Druj) is a thieving nomad, an enemy of orderly agriculture and animal husbandry.

Eschatological teachings. The Gāthās, the early hymns, many of which may have been written by Zoroaster, are permeated by eschatological thinking. Almost every passage contains some reference to the fate awaiting men in the afterlife. Each act, speech, and thought is viewed as being related to an existence after death. The earthly state is connected with a state beyond, in which the Wise Lord will reward the good act, speech, and thought and punish the bad. This motive for doing good seems to be the strongest available to Zoroaster in his message. After death, the soul of man must pass over the Bridge of the Requiter (Činvat), which everyone looks upon with fear and anxiety. After judgment is passed by Ahura Mazdā, the good enter the kingdom of everlasting joy and light, and the bad are consigned to the regions of horror and darkness. Zoroaster, however, goes beyond this, announcing an end phase for the visible world, "the last turn of creation." In this last phase, Ahriman will be destroyed, and the world will be wonderfully renewed and be inhabited by the good, who will live in paradisiacal joy. Later forms of Zoroastrianism teach a resurrection of the dead, a teaching for which some basis may be found in the Gāthās. Through the resurrection of the dead, the renewal of the world bestows a last fulfillment on the followers of the Wise Lord.

Cultic reforms. Zoroaster forbade all sacrifices in honour of Ahriman or of his adherents, the daevas, who from pre-Zoroastrian times had degenerated into hostile deities. In the prevailing religious tradition, Zoroaster probably found that the practice of sacrificing cattle, combined with the consumption of intoxicating drinks (haoma), led to orgiastic excess. In his reform, Zoroaster did not, as some scholars would have it, abolish all

animal sacrifice but simply the orgiastic and intoxicating rites that accompanied it. The *haoma* sacrifice, too, was to be thought of as a symbolic offering; it may have consisted of unfermented drink or an intoxicating beverage or plant. Zoroaster retained the ancient cult of fire. This cult and its various rites were later extended and given a definite order by the priestly class of the Magi. Its centre, the eternal flame in the Temple of Fire, was constantly linked with the priestly service and with the *haoma* sacrifice.

Influence and assessments. After the conversion of Vishtāspa to such teachings, Zoroaster remained at the court of the king. Other officials were converted, and a daughter of Zoroaster apparently married Jāmāsp, a minister of the king. According to tradition, Zoroaster lived for 77 years, thus indicating that he died about 551 BC. After his death, many legends arose about him. According to these legends, nature rejoiced at his birth, and he preached to many nations, founded sacred fires, and fought in a sacred war. He was viewed as a model for priests, warriors, and agriculturalists, as well as a skilled craftsman and healer. The Greeks regarded him as a philosopher, mathematician, astrologer, or magician. Jews and Christians regarded him as an astrologer, magician, prophet, or arch heretic. Not until the 18th century did a more scholarly assessment of Zoroaster's career and influence emerge.

Duchesne-Guillemin, "L'Iran antique et Zoroastre," in *Histoire des religions* 1, vol. 29 of *Encyclopédie de la Pléiade*, pp. 625-695 (1970), and La Religion de l'Iran ancien (1962), two works by a leading Iranist scholar—the first volume includes a selected bibliography, the second volume presents a very large bibliography and an excellent history of studies of Zoroastrianism; G. Dumézil, L'Idéologie tripartie des Indo-Européens (1958), the work of a French scholar of comparative mythology concerning Indo-European culture; R.N. Frye, *The Heritage of Persia* (1963), concentrates on Zoroaster and the respective religious sources, based on the findings of archaeological and epigraphic investigations; J. Gershevitsch, "Zoroaster's Own Contribution," Journal of Near Eastern Studies, 23:12-38 (1964); E. Herzfeld, Zoroaster and His World (1947, reprinted 1974); M. Molé, Culte, mythe et cosmologie dans l'Iran ancien (1963), upholds certain connections between ritual texts and individual and cosmological eschatology; G. Widengren, Die Religionen Irans (1965), by a leading Iranist and Semitist; R.C. Zaehner, Dawn and Twilight of Zoroastrianism (1961), describes the later evolution of Zurvanism and deals with a later stage in the Zoroastrian religion that became the official religion of the Sāsānian period.

Zoroastrianism, the ancient pre-Islāmic religion of Iran that survives there in isolated areas and more prosperously in India, where the descendents of Zoroastrian Iranian (Persian) immigrants are known as Parsis, or Parsees. Founded by the Iranian prophet and reformer Zoroaster in the 6th century BC, this religion, containing both monotheistic and dualistic features, influenced the other major Western religions—Judaism, Christianity, and Islām.

A brief treatment of Zoroastrianism follows. For full treatment, *see* MACROPAEDIA: Zoroastrianism and Parsiism.

Zoroaster's reforms cannot be appreciated without knowledge of the tradition into which he was born and educated. Society tended to be divided into three classes: chiefs and priests, warriors, and husbandmen and cattle breeders. This class structure is reflected in the religion, with particular gods or *daivas* ("heavenly ones") associated with each of the three classes. The *ahuras* ("lords"), for example, which included Mitra and Varuna, seem to have been connected only with the first class.

Zoroaster rejected the cults of all the gods except one *ahura*, Ahura Mazdā, the "Wise Lord." It is not certain that Zoroaster was the first to proclaim Ahura Mazdā. This deity appears as the great god of Darius 1 (522–486 BC), and it is not known whether Darius heard of him through Zoroaster's disciples or independently.

The origin of evil is traced in Zoroaster's system to an exercise of free will at the beginning of creation, when the twin sons of Ahura Mazdā entered into an eternal rivalry. One, Spenta Mainyu (Bounteous Spirit), chose good, thus acquiring the attributes of truth, justice, and life. The other, Angra Mainyu (Destructive Spirit), chose evil and its attendant forces of destruction, injustice, and death.

According to Zoroaster the world was soon to be consumed in a mighty conflagration from which only the followers of the good would rise to share in a new creation. Until this came to pass, the souls of those who died would cross the Bridge of the Requiter from whence the good would be led to wait in heaven, the wicked in hell.

Later Zoroastrian cosmology conceives the history of the world as a vast drama divided into four periods of 3,000 years each. In Infinite Time there existed Ormazd, who dwelt in the light, and Ahriman, who dwelt below him in the darkness. At the end of the first 3,000 years Ahriman crossed the Void that separated them and attacked Ormazd, who, perceiving that their struggle would last forever unless realized in finite terms, made a pact with Ahriman limiting the duration of their struggle. Ormazd then recited the Ahuna Vairya, the most sacred prayer of the Zoroastrians, which is believed to contain the germ of their whole religion. Ahriman, aghast, fell back into the abyss where he lay for another 3,000 years. During this time Ormazd called creation into being, first the spiritual creation including the Beneficent Immortals, then a corresponding material creation—sky, water, earth, plants, the Primeval Ox, and Primeval Man (Gayōmart). Next, to the fravashis (preexistent souls) of men Ormazd offered a choice between staying forever in their embryonic state and becoming incarnate in the physical world in order to secure his triumph over Ahriman: they chose birth and combat. Meanwhile Ahriman generated six demons and an opposing material creation.

At the end of the second period of 3,000 years Ahriman, instigated by Primeval Woman, the Whore, burst through the sky and corrupted the creation of Ormazd. He killed Gayomart, from whose body mankind and the metals were generated, and the Ox, from which arose animals and plants. In the third period Ahriman triumphed in the material world but was unable to escape from it; trapped by Ormazd, he was doomed to generate his own destruction. The beginning of the last period witnesses the coming of religion on earth, namely the birth of Zoroaster. The end of each of its millennia is to be marked by the coming of a new saviour, successor and posthumous son of Zoroaster. The third and last saviour, Saoshyans, will bring about the final judgment, dispense the drink of immortality, and usher in the new world. Thus, Finite Time, which had come forth from Infinite Time, merges with it again after the interval of 12,-000 years.

The literature of Zoroastrianism falls into two distinct parts: the Avesta, the original scriptural work, composed in a form of the ancient Iranian language called Avestan; and the much later texts written in Pahlavi, a dialect of Middle Persian, or in Persian.

After Zoroaster's death his religion slowly spread southward, through what is now Afghanistan, and westward into the territory

of the Medes and Persians. As it did so, it did not remain immune from contamination with the ancient religion, whose gods and goddesses were again worshiped. This development, which seems to have taken place in Achaemenid times (559–330 Bc), is reflected in the later part of the Avesta. For about four centuries after Alexander's conquest (330 Bc), it seems, Iran was more or less hellenized and the indigenous religion neglected; a revival did not come about until toward the end of the Arsacid, or Parthian, Empire (247 BC-AD 224).

With the advent of a new and decidedly national Persian dynasty, the Sāsānian, in AD 224, Zoroastrianism became the official religion. Its hierarchy possessed considerable political power, and other religions (Christianity, Manichaeism, and Buddhism) were persecuted. The Avesta was compiled, edited, and provided with a translation and commentary in the vernacular, Pahlavi. The dualistic, or Mazdean, doctrine, which had gradually replaced the monotheistic system of the Gāthās during the Achaemenid period, became finally accepted as orthodox.

Under Muslim rule the bulk of the population was persuaded or forced to embrace Islām, but Žoroastrianism was tolerated to a certain extent and succeeded in holding its own fairly well for about three centuries. Between the 8th and 10th centuries religious persecution and forced conversion to Islām led some of the remaining Zoroastrians to leave Iran and settle in India, most of them eventually in the region of Bombay. By the 19th century these Zoroastrians, called Parsees, were distinguished for their wealth, education, and beneficence. In the 19th century the Parsees renewed contact with the only remaining Zoroastrians in Iran, the Gabars. These two groups and their emigrants to other countries are today the only surviving practitioners of the religion of Zoroaster. Zoroastrian worship is most distinctively characterized by tendance of the temple fire.

Zorrilla de San Martín, Juan (b. Dec. 28, 1855, Montevideo—d. Nov. 3, 1931, Montevideo), Uruguayan poet famous for a long historical verse epic, *Tabaré* (1886; final edition after several revisions, 1926), a poem in six cantos, based upon a legend of the love between a Spanish girl and an Indian boy.

Zorrilla de San Martín was educated in various Jesuit schools throughout South America (Santiago, Santa Fé, Montevideo). His first work, Notas de un himno (1876; "Notes for a Hymn"), dealing with themes of sadness and patriotism, clearly reflects the influence of the famous Spanish Romantic poet Gustavo Adolfo Becquer and sets the tone for all his poetic work that followed. In 1878 he founded the Catholic periodical El bien público and the next year achieved renown for his patriotic ode La leyenda patria ("The Fatherland Legend"). Throughout his life he held various government posts, including Uruguayan minister to France, Portugal, Spain, and the Vatican.

Zorrilla y Moral, José (b. Feb. 21, 1817, Valladolid, Spain—d. Jan. 23, 1893, Madrid), poet and dramatist, the major figure of the nationalist wing of the Spanish Romantic movement. His work was enormously popular and is now regarded as quintessentially Spanish in style and tone.

After studying law at Toledo and Valladolid, Zorilla y Moral left the university and went to Madrid to devote himself to literature. In 1837 he became an overnight success with his recitation of an elegy at the funeral of the poet Mariano José de Larra. He ran away from his wife and financial distress and was abroad from 1855 to 1866, where he wrote prolifically but remained insolvent. In 1889 he was crowned as the national poet and was granted a government pension.

Zorrilla wrote effortlessly: he was an improviser who made his name with his *leyendas* ("legends"), which told of remote times and places. His first collection of verse legends, *Cantos del trovador* (1841), however, suffered—like much of his other poetry—from its carelessness and verbosity.

Zorrilla's greatest success was achieved with his version of the Don Juan story, the play Don Juan Tenorio (1844). Written while he was in his 20s and later despised by him as a failure, it was the most popular play of 19th-century Spain and is still frequently performed. Like his other works, it exhibits those typically Spanish qualities that have made Zorrilla a uniquely national author: picturesque characters, intrigues and coincidences in its plot, lyrical flights, and great Romantic colouring.

zorrino: see skunk.

Zorzor, town, northwestern Liberia, West Africa. It is situated along the road from Monrovia to Sierra Leone. A local trade centre for agricultural products (rice, cassava, pineaples, and palm oil and kernels) grown by the Kpelle and Loma peoples of the surrounding area, it is the site of an American Lutheran church hospital, a leper colony, and a handicrafts workshop. At Fisebu (3 miles [5 km] northwest) is the Zorzor Rural Teacher Training Institute. Pop. (1974) 4,752.

Zoser (king of Egypt): see Djoser.

Zoshchenko, Mikhail Mikhaylovich (b. Aug. 10 [July 29, Old Style], 1895, Poltava, Ukraine, Russian Empire—d. July 22, 1958, Leningrad), Soviet satirist whose short stories and sketches are among the best comic literature of the Soviet period.

Zoshchenko studied law and then in 1915 joined the army. Between 1917 and 1920 he lived in many different cities and worked at a variety of odd jobs and trades. In 1921 in Petrograd (now Leningrad) he joined the Serapion Brothers literary group. Zoshchenko's tales are primarily satires on contemporary Soviet everyday life. One of his main targets was bureaucratic red tape and corruption, which he attacked with tongue-in-cheek wit, using artificial language and malapropisms that make his works virtually untranslatable. One critic (Gleb Struve) has remarked that it is as difficult to translate Zoshchenko into English or American as it would be to translate Edward Lear or Damon Runyon into Russian.

Beginning in the 1930s, Zoshchenko was subjected to increasingly severe criticism from officialdom. He tried to conform to the requirements of Socialist Realism—notably in Istoriya odnoy zhizhni (1935; "The Story of One Life"), dealing with the construction, by forced labour, of the White Sea–Baltic Waterway—but with little success. In 1943 the magazine Oktyabr began to serialize his psychological-introspective series of episodes, anecdotes, and reminiscences entitled Pered voskhodom solntsa ("Before Sunrise") but suspended publication after the second installment.

In 1946 Zoshchenko published in the literary magazine Zvezda a short story, "Priklyucheniya obezyany" ("The Adventures of a Monkey"), which was condemned by Communist critics as malicious and insulting to the Soviet people. He was expelled (with the poet Anna Akhmatova) from the Union of Soviet Writers, which meant the virtual end of his literary career.

After his death, the Soviet press tended to ignore him; but some of his works were reissued, and their prompt sale indicated his con-

tinuing popularity.

Zosimus, SAINT (b. Greece—d. Dec. 26, 418, Rome; feast day December 26), pope from March 417 to December 418. He was consecrated as Pope St. Innocent I's successor on March 18, 417. His brief but turbulent pontificate was embroiled in conflicts involv-

ing Gaul, Africa, and Pelagianism, a heretical doctrine that minimized the role of divine grace in man's salvation.

Zosimus' first act was to designate Bishop Patroclus of Arles papal vicar in Gaul, based on an alleged historical primacy of the see of Arles. This act provoked a crisis affecting all the churches of southern Gaul. The bishops of Narbonne, Marseille, and Vienne opposed Patroclus' elevation. Zosimus threatened excommunication.

Concurrently, the Pelagians-whose proponent Pelagius had been excommunicated on Jan. 27, 417, by Innocent and who in general were condemned by the African bishops-appealed to Rome, being successfully represented by Celestius (Caelestius). After receiving a profession of faith from Pelagius, Zosimus sent a strongly worded letter to the African bishops on Sept. 21, 417, accusing them of having acted precipitately in their condemnation. However, the next year Zosimus, again doubting Pelagius' orthodoxy, read his commentary on Romans; shocked by its doctrine, he commanded Celestius to appear before him for examination. Celestius fled Rome, thereby appearing self-condemned, and Zosimus issued the *Epistola tractoria* ("Epistolary Sermon") that excommunicated Pelagius and Celestius and condemned their doctrine. Pelagius, horrified by his excommunication, departed, probably for Egypt.

Even though he confirmed Innocent's judgment, Zosimus disturbed the African episcopate in a new controversy by espousing the cause of a disreputable priest called Apiarius, who had been excommunicated by Bishop Urbanus of Sicca Veneria. Defying African canon law, Zosimus dispatched legates to Africa with orders that included reorganizing the method of appeal between Africa and Rome and a threat to excommunicate Urbanus if he did not make amends with Apiarius. Against the Pope's domination, certain Roman clergy appealed to the imperial court at Ravenna, then the capital of the Western Empire, for which act Zosimus excommunicated them. The case regarding Apiarius remained unsettled when, to the relief of both Africa and Gaul, Zosimus died. He was buried in an unknown grave in the basilica of St. Lawrence Outside the Walls, Rome

Zou Yan (Chinese philosopher): *see* Tsou Yen.

Zouche, Richard (b. 1590, Ansty, Wiltshire, Eng.—d. March 1, 1661, Oxford), English jurist, one of the founders of international law, who became regius professor of civil law at Oxford and later practiced successfully in London.

Zouche was appointed a judge of the Court of Admiralty in 1641 and was twice returned to Parliament as a representative for Hythe, Kent. Zouche was a Royalist, and during the Civil War, in 1646, he was one of those who negotiated the surrender of Oxford to the Commonwealth forces. He lost his seat on the bench in 1649 but retained his professorship and was reappointed to the Court of Admiralty after the Restoration (1660).

Zouche is remembered for his treatise on international law, Juris et Judicii Fecialis (1650), the first scientific manual covering the entire field. As custom and contemporary precedents loomed larger in his work than in the work of earlier writers, Zouche is thought by some scholars to have been the first Positivist. Though he did not coin the phrase jus inter gentes ("law among nations") for international law, he first adopted it as a title more apt for the subject than jus gentium ("law of nations").

Zoug (Switzerland): see Zug.

Zouîrât, also spelled zouérate, town, north central Mauritania, West Africa, in the Tiris

Zemmour administrative region. It is the site of iron-mining operations, which account for most of Mauritania's export earnings. It is connected by railway to the Atlantic port of Nouadhibou. Pop. (1977) 17,474.

Zoysia, genus of creeping grasses of the family Poaceae, containing four or five perennial species native to southeastern Asia and New Zealand. They are excellent cover for flat, sandy, open areas.

Japanese, or Korean, lawn grass (Z. japonica), Manila grass (Z. matrella), and Mascarene grass (Z. tenuifolia) were introduced into North America as turf and lawn grasses because of their strong rhizomes (underground stems) and wiry leaves. The leaves are fine-bladed in both the Manila and Mascarene grasses.

Zrínyi, Miklós (b. Jan. 5, 1620, Csákvár, Hung.—d. Nov. 18, 1664, Csáktornya), statesman, military leader, and author of the first epic poem in Hungarian literature.

Born into an extremely wealthy aristocratic family, Zrinyi was educated by the Jesuits and became viceroy of Croatia in 1647. His chief concern was driving the Turks out of Hungary, and he spent his entire life fighting the conquerors, becoming the outstanding Hungarian military leader of his century. Zrinyi also opposed Habsburg rule and sought the unification of his dismembered country and the organization of a modern absolutist state. In 1664 he started an anti-Habsburg organization but was killed that same year by a wild

Zrinyi's finest literary work, and one of the major works of Hungarian literature, is his epic Szigeti Veszedelem (1645–46; Eng. trans., "The Peril of Sziget," in Hungarian Poetry, 1955), which deals with the heroic defense of the fortress of Szigetvár (1566) against the armies of the sultan Süleyman II. The commander of the fortress, the central figure of the epic, was the poet's great-grandfather, who fell during the siege.

Zsigmond (Hungarian personal name): see under Sigismund.

Zsigmondy, Richard (b. April 1, 1865, Vienna—d. Sept. 23, 1929, Göttingen, Ger.), Austrian chemist who received the Nobel Prize for Chemistry in 1925 for research on colloids.

After receiving his Ph.D. from the University of Munich in 1889, he worked in research at Berlin and then joined the faculty of the University of Graz, Austria. He was director of the Institute for Inorganic Chemistry at the University of Göttingen (1908–29).

While employed in a glassworks (1897) Zsigmondy directed his attention to colloidal gold, present in ruby glass, and discovered a water suspension of gold. He theorized that much could be learned about the colloidal state of matter from studying the manner in which the particles scatter light. To facilitate such study, he and Heinrich Siedentopf developed the ultramicroscope (1903), and Zsigmondy used it to investigate various aspects of colloids, including Brownian movement. His work proved particularly helpful in biochemistry and bacteriology.

Zsolna (Czechoslovakia): see Žilina.

Zuara (Libya): see Zuwārah.

Zubatov, Sergey Vasilyevich (b. 1864, Moscow—d. March 15 [March 2, old style], 1917, Moscow), tsarist colonel of the Russian gendarmes known for his establishment of a system of surveillance to monitor the activities of revolutionary organizations.

Zubatov became an agent of the Moscow Okhrana, the tsarist secret police that was a division of the Ministry of the Interior, sometime in the mid-1880s. From 1896 to 1902 he was the head of the Okhrana.

Between 1901 and 1903 he established the legal progovernment workers' organizations that were later given his name. His tactic is now referred to as Zubatovism, or Zubatovshchina. The aim of these organizations was to divert workers from social agitation by drawing them into organizations making purely economic demands for reform and operating under the secret surveillance of the police. The first of these societies was the Society of Mutual Aid of Workers in Mechanical Production, created in 1901 in Moscow and followed in the same year by the Jewish Independent Workers Party in Minsk and Vilna. The rhetoric of their organizers caused the radical press to brand the movement "police socialism." On Feb. 19, 1902, these organizations held a mass demonstration at the monument to Alexander

As Zubatov's organizations attracted more workers, they became more difficult to control. After a series of demonstrations degenerated into the general strike of 1903, the organizations were liquidated, and Zubatov, who had also been involved in unsuccessful intrigues against the interior minister, was relieved of his duties and banished to Vladimir.

His banishment was rescinded the following year. During the revolution of 1917, fearing that he would be the victim of the revolutionaries, Zubatov shot himself.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Zubayr, az-, town, al-Başrah muḥāfazah (governorate), southeastern Iraq. Located just southeast of Hawr (Lake) al-Hammar at the terminus of a railway line to Baghdad, it has long been important in trade with Saudi Arabia and Kuwait to the south. Before the founding of Baghdad in 762, Basra, Kufa, and Wasit were the largest and most important towns in Iraq. The town stands on the original 7th-century site of Basra, now located 8 mi (13 km) to the northeast. At az-Zubayr can still be seen the remains of the mosque dedicated to the memory of Zubayr, one of the companions of Muhammad, who was killed in the Battle of the Camels (658), fought outside the town walls. Over the centuries the city of Basra moved progressively eastward in its search for water, each time abandoning the western quarters, until the city reached its present site. An oil field has been developed at az-Zubayr since 1949. Pop. (1970 est.) 49,-557.

Zubiri, Xavier, in full José XAVIER ZUBIRI APALATEGUI (b. Dec. 4, 1898, San Sebastián, Spain—d. Dec. 21, 1983, Madrid), Spanish Christian Existential philosopher who was known for his analysis of reality in terms of the interrelations of philosophy, science, and religion.

Zubiri studied theology in Rome, philosophy in Madrid (under José Ortega y Gasset) and in Freiburg, Ger., and physics and biology at the University of Louvain, Belg. Influenced by Roman Catholic philosophy and positive science, he created a "religation theory" of reality whereby an individual's relation to God and his sense of self were based on fulfillment of tasks obligatory upon entering the world. He was described as the shaper of Spanish philosophy from 1940 to 1980.

After teaching history of philosophy at the universities in Madrid (1926–36) and Barcelona (1940–42), with a hiatus during the Spanish Civil War, he gained recognition as a private tutor and author. His works include Ensayo de una teoría fenomenológica del juicio (1923; "Essay on a Phenomenological

Theory of Judgment"), Naturaleza, historia, Dios (1944; "Nature, History, God"), Sobre la esencia (1962; "On Essence"), and Cinco lecciones de filosofia (1963; "Five Lessons of Philosophy"). Later works included the trilogy Inteligencia sentiente (1980; "Sentient Intelligence"), Inteligencia y logos (1982; "Intelligence and Logos"), and Inteligencia y razón (1983; "Intelligence and Reason").

Zuccarelli, Francesco, Zuccarelli also spelled ZUCCHERELLI (b. Aug. 15, 1702, Pitigliano, Tuscany—d. Dec. 30, 1788, Florence), Italian Rococo painter who influenced 18th-century English landscape painting.

Zuccarelli apparently began his artistic training very early with Paolo Anesi and later worked in Rome with Giorgio Morandi and his pupil Pietro Nelli. After returning briefly to Florence, he moved to Venice in about 1732 and became associated with the Venetian school.

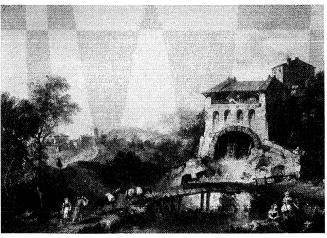

The facile technique, atmospheric light, and classical pastoral character that typify his picturesque Arcadian landscapes were especially appealing to the English. Zuccarelli visited England twice: at the end of 1752, remaining for 10 years with great success at painting landscapes, and again from 1765 to 1771. He was a founding member of the Royal Academy (1768), and he became one of George III's favourite painters. Zuccarelli had been elected to the Venetian Academy in 1763 and became its president in 1772. In addition to doing much work at Bergamo, he was for a time in Paris, and in the last two years of his life he returned to Rome and afterward to his native Tuscany. In addition to landscape paint-

Palazzo Zuccari (now the Biblioteca Hertziana), Rome, by Federico Zuccari, 1593 Photo SASKIA North Amberst Mass.

cari). In 1593 he became the first president of the Academy of St. Luke in Rome, which is to some extent the parent body of modern art academies. He completed some of Taddeo's work at Caprarola and travelled through France and the Netherlands in 1574.

In England in 1575 Zuccari painted portraits

"Landscape with Figures," by Francesco Zuccarelli; in the Museo Poldi Pezzoli, Milan

By courtesy of the Museo Poldi Pezzoli, Milan; photograph, SCALA—Art Resource/EB Inc.

ings, Zuccarelli executed innumerable drawings, a few religious paintings, engravings, and tapestry designs.

Zuccari, Federico, Zuccari also spelled Zuccaro, or Zuccheri (b. c. 1540, Sant'Angelo in Vado, Duchy of Urbino—d. July 20, 1609, Ancona), Italian painter and art theorist who became the central figure of the Roman Mannerist school and, after the death of Titian, possibly the best known painter in Europe.

Until 1561 Zuccari was the helper and pupil of his older brother, the painter Taddeo Zuccari. In 1565 Federico worked in Florence under the painter, architect, and biographer Giorgio Vasari and codified the theory of Mannerism in L'idea de' scultori, pittori e architetti (1607; "The Idea of Sculptors, Painters, and Architects") and in a series of frescoes in his own house in Rome (Palazzo Zuc-

of Queen Elizabeth I and the Earl of Leicester (and probably no one else—the hundreds of portraits in England that bear his name are ascribed without foundation). Later commissions were the painting of the dome of Florence cathedral (1575–79), a large work in the Palazzo Ducale at Venice in 1582, and much work for El Escorial in Spain (1585–88). His late paintings are much quieter and less mannered in style, and he lived to see Mannerism become extinct.

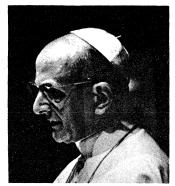

Zuccari, Taddeo, Zuccari also spelled ZUCCARO, or ZUCCHERI (b. Sept. 1, 1529, Sant'-Angelo in Vado, Duchy of Urbino—d. Sept. 1/2, 1566, Rome), Italian painter, leader (with his brother Federico Zuccari) of the Roman Mannerist school of painting.

Largely self-trained at Rome, from the early 1550s he executed many decorative frescoes

for facades and interiors of palaces and a few religious works.

From 1559 until his death he was in charge of his greatest commission, the frescoes and stucco decorations of the Villa dei Farnese at Caprarola, Italy, among the most splendidly ornamented rooms of their time.

zucchetto, small silk skullcap worn by Roman Catholic clergymen. Developed from the pileus (q.v.), a close-fitting, brimless hat commonly worn by the Romans, the zucchetto has probably been worn by ecclesiastics since the 13th century. It was worn under the mitre and biretta to preserve them and is still worn under these headcoverings at services. It is worn alone at other times. The colour depends on the wearer's rank: white for the pope, red

Pope Paul VI wearing a zucchetto

AP/Wide World

for cardinals, violet for bishops, and black for others.

Zucchi, Niccolò (b. Dec. 6, 1586, Parma, Duchy of Parma and Piacenza—d. May 21, 1670, Rome), Italian astronomer who, in approximately 1616, designed one of the earliest reflecting telescopes, antedating those of Gregory and Newton. With this telescope Zucchi discovered the belts of the planet Jupiter (1630) and examined the spots on Mars (1640). He also demonstrated (in 1652) that phosphors generate rather than store light.

Zuckerman, Itzhak, also spelled YIZHAK CUKIERMAN, byname ANTEK (b. 1915, Warsaw—d. June 17, 1981, Tel Aviv, Israel), hero of Jewish resistance to the Nazis in World War II, and one of the few survivors of the Warsaw Ghetto Uprising (q.v.).

Zuckerman was active in a federation of young Zionist organizations, Hehalutz, and had early favoured the idea of armed resistance to Nazi depredations against the Jews. He was quick to interpret the first mass executions of Jews as the beginning of a systematic program of annihilation. Zuckerman represented Hehalutz at a meeting of Zionist groups convened in March 1942 and urged the creation and arming of a defense organization. Others feared resistance would provoke the Nazis to greater violence. But on July 28, soon after the first daily trainload of 5,000 Jews had left the Warsaw Ghetto to be gassed at Treblinka, his views were accepted, and the Jewish Defense Organization (Żydowska Organizacja Bojowa; żob) was created under the leadership of Mordecai Anielewicz (q.v.). Zuckerman became one of his three co-commanders and was also involved in the leadership of a political arm founded at the same time, the Jewish National Committee (Żydowski Komitet Narodwy; żkn). Zuckerman had numerous contacts in the various underground groups on the "Aryan side," i.e., outside the Ghetto, and it was he who negotiated the gift and black market purchase of the pistols and grenades and a few rifles that the ZOB obtained. These, along with messages, he smuggled into the Ghetto through the Warsaw sewers. When the Warsaw Ghetto Uprising broke out he was on

the "Aryan side" and did what he could to get word of the plight of the Ghetto's remaining Jews to the Polish underground and to Poles and Jews abroad. He also smuggled in to the 20B such additional guns and grenades as could be found. After 20 days of battle, Anielewicz and his companions died when the Nazis overcame their command bunker, and Zuckerman returned to the Ghetto to take command. Before the end of the 28-day battle he led some 75 20B fighters, including his future wife, Zivia Lubetkin, through the sewers and into underground havens on the "Aryan side."

Zuckerman continued to lead a Jewish band of guerrillas in the Polish underground and to alert Jewish leaders elsewhere to the situation of Jews inside Nazi Europe. At war's end he took part in organizing underground transportation for Jewish refugees from Europe to Palestine; he and Zivia settled there in 1947. They, with others, were founders of the kibutz Lohamei Hageta'ot (Hebrew: The Ghetto Fighters) north of Haifa, where a memorial museum, Ghetto Fighters' House, was established. Zuckerman and his wife were prosecution witnesses in the 1961 trial of Adolf Eichmann.

Zuckmayer, Carl (b. Dec. 27, 1896, Nackenheim, Ger.—d. Jan. 18, 1977, Visp, Switz.), German playwright whose works deal critically with many of the contemporary problems engendered by two world wars.

Zuckmayer Bavaria-Verlag

Zuckmayer served for four years in the German Army in World War I and thereafter devoted himself to writing. In spite of his association in 1924 with the avant-garde playwright Bertolt Brecht and the innovative director Max Reinhardt, he remained faithful to the techniques of Naturalism.

His first notable dramatic success was the earthy comedy *Der fröhliche Weinberg* (1925; "The Happy Vineyard"), for which he received the Kleist Prize. *Der Hauptmann von Köpenick* (1931; *The Captain of Köpenick*, 1932), one of his most highly regarded works, is a satire on Prussian militarism. In 1933 political pressure forced him to emigrate to Austria, where he wrote *Der Schelm von Bergen* (1934; "The Villain of Bergen").

He fled to the United States in 1939 and became a citizen. There he wrote one of his best known dramas, Des Teufels General (1946; The Devil's General, 1962). With this play, which dramatizes the plight of men torn between loyalty to country and the demands of conscience, Zuckmayer's dramatic career entered a new phase. The zestful, life-affirming spirit of his earlier works was thereafter tempered with critical moral evaluation. In this spirit he wrote Barbara Blomberg (1949), Der Gesang im Feuerosen (1950; "The Song in the Fiery Furnace"), and Das katle Licht (1955; "The Cold Light"), based on the treason case of the atomic scientist Klaus Fuchs.

Zuckmayer took up residence in Switzerland in 1946. In 1952 his collected works received

the Goethe Prize. Zuckmayer's faith in human nature was never totally shaken, and his plays, though often critical, do not have the apocalyptic tone of those by many of his German contemporaries.

Among his other works are essays, dramatic adaptations (as of Maxwell Anderson's What Price Glory?), motion-picture scenarios (as for The Blue Angel, 1930), novels (as Salwàre; oder, die Magdalena von Bozen, 1936; The Moons Ride Over, 1937), and two autobiographical works, Second Wind (1940; only the English version published) and Als war's ein Stück von mir (1966; abridged English version, A Part of Myself, 1970). His collected works, in four volumes, were published in 1961.

Zufar (Oman): see Dhofar.

Zug (German), French zoug, smallest undivided canton of Switzerland, with an area of 92 sq mi (239 sq km), of which 12 sq mi are occupied by Lakes Zug and Ageri. Bounded by the cantons of Luzern and Aargau on the west, Zürich on the north, and Schwyz on the east and south, Zug lies on the hilly central Swiss Plateau, rising to the Hohe Rone mass (3,953 ft [1,205 m]) near the eastern boundary and to the Zugerberg ridge (3,409 ft) of the Rossberg mass in the south between the lakes. Its principal drainage is afforded by the Lorze River, which flows northward from its source in Schwyz through Lake Ägeri to the lowland at the northern end of the Zugerberg, around the foot of which it curves to enter Lake Zug. It leaves the lake slightly west of its point of entrance and flows north-northwest over fertile lowlands to join the Reuss, which forms the northwestern boundary of the canton.

Historically, the canton consists of the lands acquired and ruled by its capital, the town of Zug (q.v.), until 1798. Near the southeastern corner of Lake Ageri is Morgarten, the scene of the great victory of the Swiss Confederation (Schwyz and some confederates from Uri) over the Habsburgs in 1315. In 1798 Zug's inhabitants opposed the French Revolutionary forces, and it formed one of the districts of the huge canton of Waldstätten in the Helvetic Republic until 1803, when it became a separate canton again. As one of the six Catholic cantons, it joined the Sonderbund (separatist Catholic league) in 1845 and took part in the Sonderbund War in 1847. In 1848 and 1874 it voted against the proposed federal constitutions, which were both adopted. Its present cantonal constitution dates from 1894

The economy is largely agricultural, fruit growing being particularly important. Industry includes the manufacture of metal goods, textiles, and alcoholic beverages. The population is German speaking and mainly Roman Catholic. Pop. (1983 est.) 77,234.

Zug (German), French zoug, capital of Zug canton, north central Switzerland, on the northeastern shore of Lake Zug (Zugersee), at the foot of the Zugerberg (3,409 ft [1,039] m]), just south of Zürich. First mentioned in 1242 as a possession of the counts of Kyburg, it was purchased by Rudolf IV of Habsburg (later Rudolf I of Germany) in 1273. It entered the Swiss Confederation in 1352, and after several turbulent decades the Habsburgs renounced all claims to the town. Zug joined the league of Swabian cities against Leopold of Habsburg and shared in the victory at Sempach in 1386. At the time of the Reformation, it remained Roman Catholic and became a member of the Golden, or Borromean, League in 1586. In the 14th and 15th centuries it acquired various districts in its neighbourhood, which it ruled as subject lands until 1798. Historic landmarks include the Zytturm, or Clock Tower (1480), the town hall (1505), St. Oswald's Church (1478–1545), and the Capuchin monastery (1597). An important cattle market, Zug manufactures metal goods, electrical apparatus, and textiles. The population is German speaking and mainly Roman Catholic. Pop. (1983 est.) 21,369.

Zugspitze, mountain, southern Germany, the highest point (9,718 ft [2,962 m]) in the country. Zugspitze is part of the Wettersteingebirge in the Bavarian Alps, lying on the Austrian border. The mountain is approached on the

Eastern summit of the Zugspitze, Germany

west by an aerial tramway (built 1924–26) from the village of Eibsee, and on the northeast by a railway from the town of Garmisch-Partenkirchen, both in Germany. The peak is noted for its scenic beauty and for its winter (skiing) and summer (climbing) activities. There is a meteorological observatory on the mountain.

Zuhayr (ibn Abī Sulmā Rabī'ah ibn Rīyāḥ al-Muzanī) (b. c. 520—d. c. 609, Najd region, Arabia), one of the greatest of the Arab poets of pre-Islāmic times, best known for his long ode in the *Mu'allaqā*t collection.

Zuhayr was from the Muzaynah tribe but lived among the Ghatafan. Zuhayr's father was a poet, his first wife the sister of a poet, and two of his sons were poets. The elder son, Ka'b, is famous for the poem he recited for the Prophet Muhammad, thereby signalling his acceptance of Islām. Zuhayr's poem in al-Mu'allaqāt (see Mu'allaqāt, al-) praises the men who brought peace between the clans of 'Abs and Dhubyan. In the poem, war is compared to a millstone that grinds those who set it moving, and the poet speaks as one who has learned from a long life mankind's need for morality. Zuhayr's extant poetry, available in several Arabic editions, includes other poems of praise and satires.

zuhd (Arabic: "detachment"), in Islām, asceticism. Even though a Muslim is permitted to enjoy fully whatever unforbidden pleasure God bestows on him, Islām nevertheless encourages and praises those who shun luxury in favour of a simple and pious life. The Qur'an (Islamic scripture) is full of verses that remind believers that life is fleeting and the hereafter everlasting. It also holds in great esteem those "servants of God who pass the night prostrating themselves in the worship of their Lord" (25:63-65). There are students of Islām, however, who maintain that zuhd was influenced directly by the Christian hermits, with whom early Muslims had some familiarity. Some scholars also point to the pre-Islamic Arab hanīfs, who practiced the ascetic life and who may have had considerable influence on the Prophet Muhammad. The Prophet himself spent long periods in solitary vigil, fasting and praying, even before his prophetic mission.

Zuhd developed in Islam as a result of the Muslim conquests, which brought with them material wealth and widespread indulgence in luxurious living. Religious Muslims reacted to this by calling for a return to the way of life of the Prophet and his pious Companions. The growth of the Islamic state had also brought with it bitter political disputes that pitted Muslim against Muslim in fierce struggles for

power. The resulting bloodshed spurred men of religion to denounce such actions and to seek peace of mind in abstinence from all that distracts from the worship of God.

The terms zuhd and zāhid (ascetic) were not used by pre-Islāmic Arabs or by early Muslims to describe the elaborate and systematic ascetic doctrines that became characteristic of later periods, from the 8th century on. Among the earliest zāhids was al-Ḥasan al-Baṣrī (d. 728), whose sayings remained for a long time the chief guide of the ascetics. But it was not until after his death that zuhd became a significant and forceful movement in the religious and political life of the Muslim community. Many scholars have referred to Ibrāhīm ibn Adham and to his student and disciple Shaqiq al-Balkhī (d. 810) as the real founders of zuhd, as it became known in later periods. Ibn Adham stressed poverty and self-denial; indeed, he abandoned the wealth of his father and became a poor wanderer.

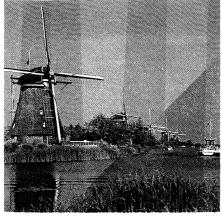

Because of the close ties among these pietists, the zāhids are often regarded as being identical with the early Ṣūfis, whose name, "wool-wear-res," points to the ascetic practice of wearing hair-shirts. Later Ṣūfis, however, dismiss the zāhids as men who worship God not out of love but for fear of hell or expectation of paradise

Zuiderzee, English southern sea, from the 13th to the 20th century, an inlet of the North Sea penetrating the Netherlands and occupying some 2,000 sq mi (5,000 sq km); it was separated from the North Sea by what are now the West Frisian Islands. From about AD 400 these low-lying sandflats (now islands) were inhabited by the Frisians, who in the face of rising sea levels built the first seaworks—dikes and terpen (or werden), mounds to which they retreated during periods of high water. The volume of these terpen ranks them among the great engineering works of mankind.

The territory that subsequently became the Zuiderzee was in the 1st century AD a mixture of lowland and freshwater lakes, including the central and largest of the lakes, called Flevo Lacus by the Romans. These lakes did not connect directly with the sea but emptied by way of a branch of the Rhine. Later, however, during a period of rising sea level (AD 250-600), the river and the central lake were enlarged. A period of lower sea levels followed, but in the 13th century, notably during 1219 and 1282, further flooding submerged wide areas and created the Zuiderzee proper.

By about 1000, however, the terpen area had been completely enclosed by dikes. The controlling of water levels within the dikes developed into the practice of reclaiming tracts of lowland from a body of water (see polder). By 1667 the making of polders had developed to the point that the damming of the Zuiderzee was proposed. A feasible method, however, was not forthcoming until the flood of 1916 hastened the adoption of a plan developed by Cornelis Lely. In 1927-32 a 19-mi- (30-km-) long dam (the Afsluitdijk, or Enclosing Dam) was built across the Zuiderzee, separating it into the outer Waddenzee (open to the North Sea) and the inner IJsselmeer (Lake IJssel). By the early 1980s nearly half of the IJsselmeer of the 1920s had been reclaimed as agricultural land through an elaborately constructed system of pumping stations, dikes, sluices, and locks. The much-reduced IJsselmeer has gradually become fresh water, and the creation of four of the five planned polders is complete. See also IJsselmeer Polders.

Zuidholland, English SOUTH HOLLAND, provincie (province), western Netherlands, bordering the North Sea and adjoining the provinces of Noordholland (north), Utrecht and Gelderland (east), and Noordbrabant and

Windmills along a canal in the province of Zuidholland, Neth.

Zeeland (south). Drained by the ramifications of the Lek, Waal, and Maas (Meuse) rivers, it includes the islands of Dordrecht, IJsselmonde, Hoeksche Waard, Voorne-Putten, and Goeree-Overflakkee and occupies an area of 1,122 sq mi (2,905 sq km). It formed part of the historic county and province of Holland, which was divided officially in 1840 into the provinces of Noordholland and Zuidholland.

The coastal strip of beaches and dunes is mainly used for recreational, resort, and residential purposes. On the lee side of the dunes are the old towns of Leiden, Delft, and The Hague, the last the capital of the province and of the country. The sandy alluvial soil, called geest, is mostly devoted to horticulture, notably flowering bulbs in the Bulbland north of Leiden, vegetables and flowers in the Rijnsburg area to the northwest, and fruit and vegetables (especially tomatoes, cucumbers, and grapes) in the Westland south of The Hague. Farther inland is a region of peat and fertile alluvial clay; agriculture is carried on in the reclaimed lakes (polders) and dairy farming on the older soils, with cheese making in the eastern districts. Gouda is the service centre for this region.

The islands are in rapid transition under the Delta Plan (q, v), which provides for the channels between the delta islands to be dammed against the sea; arable farming predominates on the marine clay soils.

By far the most important part of the province economically is the port and industrial area of Rotterdam, which extends along the New Waterway and the Lek, Noord, and Merwede rivers. Pop. (1983 est.) 3,129,900.

Zukauskas, Joseph Paul (boxer): see Sharkey, Jack.

Zukerman, Pinchas (b. July 16, 1948, Tel Aviv, Israel), Israeli-American violinist distinguished for his virtuoso technique. He also plays the viola.

He began playing at the age of six; when he was eight he entered the Tel Aviv Academy of Music, where he studied with Ilona Feher. In 1962, sponsored by Isaac Stern, he went to New York City to study with Ivan Galamian at the Juilliard School. He remained there until 1967. After sharing the Leventritt Prize in 1967, he appeared as a soloist throughout North America, and after his New York debut in 1969 he toured frequently in Europe. Among his recordings are the complete Beethoven violin sonatas (with Daniel Barenboim) and piano trios (with Barenboim and Jacqueline du Pré). In 1974 he made his conducting debut in London. In 1980 he was appointed musical director of the St. Paul Chamber Orchestra in Minnesota.

Žuknovskij (Russian S.F.S.R.): see Zhu-kovsky.

Zukor, Adolph (b. Jan. 7, 1873, Ricse, Hung.—d. June 10, 1976, Los Angeles), U.S. entrepreneur who built the powerful Famous Players-Paramount motion-picture studio.

Emigrating to the United States at age 15, Zukor entered the penny-arcade business in 1903. Between 1904 and 1912 he and his partner Marcus Loew controlled a chain of theatres; in 1912 he left Loew, bought the American rights to the British-French motion picture La Reine Elisabeth (Queen Elizabeth, or Queen Beth) starring Sarah Bernhardt, and made a fortune as the film's exclusive distributor. Zukor then devised the idea of making films featuring Broadway stage actors in their current successes. He formed Famous Players with the slogan "Famous Players in Famous Plays" and made The Count of Monte Cristo and The Prisoner of Zenda. He later hired Mary Pickford to act in motion pictures in Hollywood.

In 1916 Zukor merged Famous Players with Jesse L. Lasky's Feature Play Company; Zukor became president and, in 1917, head of Paramount, which was Famous Players-Lasky's distribution company. In 1935 he became chairman of the board of Paramount Pictures, a figurehead position but one he retained (emeritus) until his death at the age of 103.

Zukor was one of the first to recognize the potential of the star system and to pay his screen actors large salaries. The other key to his success was the huge number of exhibition outlets he controlled. An autobiography, *The Public Is Never Wrong*, was published in 1953.

Zulia, state, northwestern Venezuela, bounded north by the Golfo de Venezuela and west by Colombia. Except for a narrow corridor on the southeastern shore that lies between the states of Mérida and Trujillo, it surrounds Lake Maracaibo. The state has an area of 24, 363 sq mi (63,100 sq km), composed mainly of lowlands, hot and humid in the south and hot and arid in the north. The land rises in the west into the Sierra de Perijá, in the southeast into the Cordillera de Mérida. Formerly one of Venezuela's poorer states, dependent upon limited agricultural resources, Zulia was radically changed economically af-ter the discovery of oil in 1917 and especially after World War II. The petroleum industry at Lake Maracaibo is located in one of the richest oil-producing regions of the world; it produces about two-thirds of Venezuela's oil. Refineries, pipelines, and thousands of oil derricks dot the landscape, and the population has increased greatly. The largest of the lakeside cities is the state capital, Maracaibo (q.v.), the second largest city of Venezuela. Transportation to the oil centres is excellent. Pop. (1983) 1,847,330.

Zulu, a nation of Nguni-speaking people in Natal, South Africa. They are a branch of the southern Bantu and have close ethnic, linguistic, and cultural ties with the Swazi and Xhosa.

Traditionally grain farmers, they also kept large herds of cattle on the lightly wooded grasslands, replenishing their herds mainly by raiding their neighbours. European settlers wrested grazing and water resources from the Zulu in prolonged warfare during the 19th century, and with much of their wealth lost, modern Zulu depend largely on wage labour on farms owned by whites or work in the cities

Before they joined with the neighbouring Natal Nguni (see Nguni) under their leader Shaka in the early 19th century to form a Zulu empire, the Zulu were only one of many Nguni clans. Such clans continue to be a basic unit of social organization; they comprise several patrilineal households, each with rights in its own fields and herds and under the domestic authority of its senior man. Paternal authority

Zulu chief of Natal, South Africa Authenticated News International

is so strong that the Zulu may be called patriarchal. Polygyny is practiced; a man's wives are ranked by strict seniority under the "great wife," the mother of his heir. The levirate (compulsory marriage of a widow to her dead husband's brother) and ghost marriage (the vicarious marriage of a female to the name of a deceased relative) are also practiced.

The genealogically senior man of each clan is its chief, traditionally its leader in war and its judge in peace. Headmen (*induna*), usually close kin of the chief, continue to have charge of sections of the clan. This clan system was adopted nationwide under the Zulu king, to whom most clan chiefs are related. When the nation was formed, many chiefs were married to women of royal clan or were royal kinsmen installed to replace dissident clan heads.

Although often autocratic and even despotic, the king relied on confidential advisers, and chiefs and subchiefs formed a council to advise him on administrative and judicial matters. Appeals from the chiefs' courts were taken to the king, who was supposed to follow customary law and the people's will, taking fines for more serious offenses. Boys in this highly organized military society were initiated at adolescence in groups called age sets. Each age set constituted a unit of the Zulu army and was stationed away from home at royal barracks under direct control of the king. Formed into regiments (impi), these men could marry only when the king gave permission to the age set as a whole.

Traditional Zulu religion was based on ancestor worship and on beliefs in a creator god, witches, and sorcerers. The king was responsible for all national magic and rainmaking; rites performed by the king on behalf of the entire nation (at planting season, in war, drought, or famine) centred on the ancestors of the royal line. Modern Zulu Christianity has been marked by the growth of independent or separatist churches under prophets, some of great wealth and influence.

The power and importance of the king, chiefs, and military system have declined substantially, and many of the young men leave Natal to seek work elsewhere in South Africa. Knowledge of and strong pride in traditional culture and history are, however, almost universal among contemporary Zulu.

Zulu language, a Bantu language spoken in the Republic of South Africa, especially in the Zululand area of Natal Province. Zulu is a member of the Southeastern, or Nguni, subgroup of the Bantu group of the Benue-Congo branch of the Niger-Congo languages. Other languages of the Southeastern Bantu group are Xhosa, Swazi, Sotho (Basuto), Tswana (Bechuana), Venda, and Ndebele. Zulu and

Xhosa are similar enough to be considered dialects of one language, but speakers of Zulu and Xhosa consider them to be separate languages

Zulu has borrowed many words from other languages, especially from Afrikaans and English. Its sound system contains three types of click sounds probably borrowed from speakers of Khoisan languages. Most words in Zulu end in a vowel.

Zulu War (1879), decisive six-month war in eastern South Africa, resulting in British victory over the Zulus. Before the war the Tugela River formed the boundary between Zululand and the British colony of Natal. Cetshwayo (q.v.) became king of the Zulus in the early 1870s. Unwilling to submit to British hegemony, he assembled a well-disciplined, well-equipped army of 40,000 to 60,000 men. Late in 1878 he received an ultimatum from Natal to disband his army and pay reparations for alleged insults. When he did not respond, British troops invaded under the leadership of Lord Chelmsford. Although the January 1879 rains impeded travel and the tall grasses of Zululand blocked their view, the invaders advanced into Zululand without taking normal precautions (such as scouts and sentries). The Zulu army attacked, killed 800 British soldiers, and took nearly 1,000 rifles, with

Later, British reinforcements arrived and Cetshwayo fled. The British advantage met a setback in April with the unsolicited arrival of a French prince, Napoleon III's son, in search of adventure. He joined a British expedition, underestimated the enemy, and was killed in a surprise attack in June. His death was an embarrassment for the British, who had been unable to protect him. Their victories continued, nevertheless. In July Cetshwayo surrendered. Zululand then came under informal British control. It was annexed to Natal in 1897.

Zululand, historic region in the northeast section of present Natal province, Republic of South Africa, and the home of the Zulu (q.v.) people.

The Zulu belonged to the Mtetwa Empire, under its leader Dingiswayo (reigned 1809-17). On Dingiswayo's death the Zulu leader Shaka (reigned 1816-28) established his people's dominance over their neighbours and, using a well-disciplined and efficient fighting force, conquered most of what is now Natal. During the reign of Shaka's successor, Dingane, the Zulu Empire was penetrated by the Boers, who formed an alliance with Dingane's brother, Mpande, and deposed Dingane in 1840. The state survived, but under King Mpande (1840-72) portions of Zulu territory were taken over by the Boers and by the British, who moved into Natal in 1838 and annexed it in 1843. War broke out when Mpande's successor, Cetshwayo, refused to disband the Zulu army and to place himself under British control in 1878. Despite stiff resistance, the British defeated the poorly armed Zulu in July 1879, occupied the remainder of their country, and divided Zululand into 13 small kingdoms.

Zululand was made a British crown colony in 1887 under the Native Law of Natal, and rebellions were put down in 1888 and 1906. By the Natal Native Code of 1894, two-thirds of the Zulu's land was confiscated, and they were confined to native reserves. The incorporation of Zululand into Natal in 1897 ended its separate existence. The Bantu Homeland (later called a Black state), established for the Zulu in the 1970s and composed of discrete areas of the historical Zululand, is called KwaZulu.

Zumalacárregui y de Imaz, Tomás de (b. Dec. 29, 1788, Ormáiztegui, Spain—d. June 24, 1835, Cegama), superb Spanish military tactician and the most brilliant soldier to fight

for Don Carlos, a Bourbon traditionalist contender for the Spanish throne, in the First Carlist War (1833–39).

Zumalacárregui abandoned his legal studies in 1808 to fight against the French in the Spanish War of Independence, in which he rose to the rank of captain. His royalist sympathies and deep religious convictions, however, made him unpopular and blocked his promotion until after 1823, when he was made a colonel and military governor of El Ferrol del Caudillo.

Zumalacárregui joined the Carlists in December 1833. An energetic organizer, he undertook the unification and disciplining of a Carlist army in Navarre and the Basque Provinces (in northern Spain). He then embarked upon a victorious war marked by brutality on both sides. At the height of his success, Zumalacárregui was ordered, against his better judgment, to besiege the northern seaport of Bilbao, where incompetent medical attention for a minor wound led to his death.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Zumpe, Johann Christoph (b. 1735, Saxony?—d. 1800, Germany), German pianoforte maker and builder of the earliest known British piano (1766).

Zumpe was an apprentice of the renowned German instrument builder Gottfried Silbermann. Migrating to England in the 1750s, he worked for the Swiss-born harpsichord builder Burkat Shudi (Burkhardt Tschudi) before beginning independent work by 1761.

Zumpe made mostly square pianos with a "single action," a simple mechanism well suited to domestic instruments and later widely used by other builders. The quality and economy of Zumpe's pianos earned him a fortune; he had several partners, and, when he returned to Germany in 1784, he left a flourishing business to his successors, Schoene and Company. A Zumpe piano was played by Johann Christian Bach when he performed the first piano solo ever heard in an English concert in London in 1768. Zumpe also engaged in making citterns (guitar-like instruments) and built at least one claviorganum, a combination piano and pipe organ.

zun (Chinese vessel): see tsun.

Zuni, also spelled zuñi, North American Indian pueblo in west central New Mexico, on the Arizona border (see Pueblo Indians). The Zuni speak a language related to Penutian. Their origin and early history are unknown: their mythology pictures their ancestors as emerging from underground and wandering to their present location. When they were first encountered by whites, the Spaniards in the 16th century, they were living in Hawikuh and five or six other towns. Collectively these came to be called the Seven Cities of Cibola, which became the focus of the golden empire sought vainly by Coronado and other explorers. After the Spanish defeat of the Pueblo rebellion in the late 17th century, the Zuni were crowded into one multistoried masonry pueblo.

Thirteen matrilineal clans compose Zuni society, and the major officers are male. The principal masculine occupation is corn (maize) farming, though some men have become excellent silversmiths and turquoise workers. Basketry and pottery are the main feminine crafts. Like other Pueblo Indians, the Zuni are generally peaceful and deeply religious, with a complex ceremonial organization. Men often wear masks and costumes to impersonate gods or spirits called kachinas (katcinas).

Although the Zuni have undergone substantial acculturation to modern American life, some of their traditional culture survives. In

History and Literature") was a wide-ranging work that placed the gamut of Jewish literary activity in the context of European literature and politics. Zunz wrote three important works on the liturgies of Judaism and served as editor in chief of a translation of the Bible

the late 20th century the population of Zuni Pueblo was more than 5,000.

Zunyi (China): see Tsun-i.

Zunz, Leopold, Hebrew YOM-TOB LIPPMANN (b. Aug. 10, 1794, Detmold, Lippe [now in Germany]—d. March 18, 1886, Berlin, Ger.), German historian of Jewish literature who is often considered the greatest Jewish scholar of the 19th century. He began (1819) the movement called Wissenschaft des Judentums ("Science of Judaism"), which stressed the analysis of Jewish literature and culture with the tools of modern scholarship.

Zunz studied classics and history at Berlin University, although he took his doctorate at the University of Halle (1821). Much of his life afterward was a precarious struggle with poverty. He served as a lay preacher for a congregation and worked as a newspaper editor (1824–31) and later as a teacher and principal at the Jewish teachers seminary in Berlin

The Science of Judaism was initiated with his seminal work, Etwas über die rabbinische Litteratur (1818; "On Rabbinic Literature"), which revealed to the interested public, for the first time, the scope and beauty of postbiblical Jewish literature. In 1819, with the noted jurist Eduard Gans and a merchant and mathematician, Moses Moser, Zunz founded the Verein für Kultur und Wissenschaft der Juden ("Society for Jewish Culture and Science"). He and his colleagues hoped that an analysis and exposition of the breadth and depth of Jewish history, literature, and culture would lead to general acceptance of the Jews. From 1822 to 1823, Zunz edited the Society's Zeitschrift (periodical), to which he contributed a classic biography of Rashi, the great medieval commentator on biblical and rabbinical texts. When the society disbanded in 1824, he continued its work alone.

Zunz's Gottesdienstlichen Vorträge der Juden, historisch entwickelt (1832; "The Worship Sermons of the Jews, Historically Developed") is a historical analysis of Jewish homiletical literature and its evolutionary development up to the modern-day sermon. His revelations of the cultural depth of Jewish civilization in the European Middle Ages refuted the views of those who held that Jewish culture and learning ended with the biblical period.

Zur Geschichte und Literatur (1845; "On

(1838), for which he translated the Books of Chronicles. In his last years he wrote a series of essays on the Bible, collected in *Gesammelte Schriften*, 3 vol. (1875–76; "Collected Writings").

Zunzunegui, Juan Antonio de (b. Dec. 21, 1901, Portugalete, Spain), Spanish novelist and short-story writer, noted for his detailed, realistic technique and social criticism of Bilbao and Madrid. A member of the Spanish Academy since 1957, Zunzunegui received the National Prize for Literature for *El premio* (1961; "The Prize"), which, ironically, was itself a satire on literary prizes in Spain.

The novels Zunzunegui produced between 1926 and 1950 generally centre on contemporary life in Bilbao—for example, Chiripi (1925) and El chiplichandle (1940), criticizing Spain's immoral social climate; $Ay \dots estos \ hijos!$ (1943; "Oh, These Children!"), on family life in Bilbao; and two novels on Bilbao bankers entitled La quiebra (1947; "The Bankruptcy"); and La úlcera (1949; "The Ulcer"), a naturalistic novel whose characters are grotesquely deformed.

All of Zunzunegui's works offer a detailed portrait of contemporary Spanish life and often present marginal social characters. His language is generally direct and unadorned his characterization lacking in depth. His narrative technique is in the traditional realistic style of the 19th century.

Beginning with El supremo bien (1951; "The Highest Good"), the setting of Zunzunegui's narratives is Madrid. This work traces a family over three generations. La vida como es (1954; "Life As It Is"), considered his best work, depicts Madrid's underworld and captures its argot and local colour.

Zunzunegui's other works include Las ratas del barco (1950; "The Ship Rats") and El mundo sigue (1960; "The World Continues") and reflect a fatalistic, pessimistic view of society. His Obras completas were in eight volumes by 1976.

Zuo Zhuan (ancient Chinese commentary): see Tso chuan.

Zuo Zongtang (Chinese official and general): *see* Tso Tsung-t'ang.

Zuppke, Bob, byname of ROBERT CARL ZUPPKE (b. July 2, 1879, Berlin, Ger.—d. Dec. 22, 1957, Champaign, Ill., U.S.), American

college football coach, credited with introducing (in the early 1920s) the offensive huddle, enabling the team with the ball to plan each play immediately before executing it.

Emigrating to the United States with his family in 1881, Zuppke was reared in Milwaukee, Wis. After graduation from the University of Wisconsin, he coached in high school until 1913, when he became head football coach at the University of Illinois, Urbana. In 29 seasons his Illinois teams won 131 games, lost 81, and tied 12. Perhaps their greatest victories were upsets of supposedly invincible teams from the universities of Minnesota (1916) and Michigan (1939). Zuppke's 1927 team was named national champion, and his 1923 team was awarded the same honour, retrospectively, by the Helms Athletic Foundation.

Zurbarán, Francisco de (baptized Nov. 7, 1598, Fuente de Cantos, Spain—d. Aug. 27, 1664, Madrid), major painter of the Spanish Baroque, especially noted for religious subjects. His work is characterized by Caravaggesque naturalism and tenebrism, the latter a style in which most forms are depicted in shadow but a few are dramatically lighted.

Zurbarán was apprenticed 1614–16 to Pedro Díaz de Villanueva in Seville, where he spent the greater part of his life. No works by his master have survived, but Zurbarán's earliest known painting, an "Immaculate Conception" dated 1616, suggests that he was schooled in the same naturalistic style as his contemporary Diego Velázquez. From 1617 to 1628 he was living in Llerena, near his birthplace; then he returned to Seville, where he settled at the invitation of the city corporation. In 1634 he visited Madrid and painted a series of "Labours of Hercules" and two scenes of

"A Franciscan Monk," oil on canvas by Francisco de Zurbarán, 1630–32; in the St. Louis Art Museum The St. Louis Art Museum

the "Defense of Cádiz," which formed part of the decoration of the Salón de Reinos in the Buen Retiro palace. The "Adoration of the Kings," from a series painted for the Carthusian monastery at Jerez, is signed with the title "Painter to the King" and dated 1638, the year in which Zurbarán decorated a ceremonial ship presented to the king by the city of Seville. The paintings for the Buen Retiro are the only royal commissions and the only mythological or historical subjects by him that are known. His contact with the court had little effect on his artistic evolution. He remained throughout his life a provincial artist and was par excellence a painter of religious life. In 1658 Zurbarán moved to Madrid.

Zurbarán's personal style was already formed in Seville by 1629, and its development was probably stimulated by the early works of Velázquez and by the works of José de Ribera. It was a style that lent itself well to portraiture and still life, but it found its most characteristic expression in his religious subjects. Indeed Zurbarán uses naturalism more convincingly than other exponents for the expression of intense religious devotion. His apostles, saints, and monks are painted with almost sculptural modelling and with an emphasis on the minutiae of their dress that gives verisimilitude to their miracles, visions, and ecstasies. This distinctive combination of realism and religious sensibility conforms to the Counter-Reformation guidelines for artists outlined by the Council of Trent (1545-63). Zurbarán's art was popular with monastic orders in Seville and the neighbouring provinces, and he received commissions for many large cycles. Of these, only the legends of St. Jerome and of the Hieronymite monks (1638-39) that decorate the chapel and sacristy of the Hieronymite monastery at Guadalupe have remained in situ. Little is known of his production in the 1640s apart from an altarpiece at Zafra (1643-44) and records of a large number of paintings destined for Lima, Peru (1647). By 1658 both the style and the content of Zurbarán's paintings had undergone a change that can be attributed to the influence of Bartolomé Esteban Murillo. In his late devotional pictures, such as "Holy Family" and "Immaculate Conception" (1659 and 1661, respectively; Museum of Fine Arts, Budapest), the figures have become more idealized and less solid in form, and their expression of religious emotion is marred by sentimentality. Zubarán had several followers whose works have been confused with his.

Zürich, canton, northeastern Switzerland, with an area of 668 sq mi (1,729 sq km), of which about 80 percent is reckoned as productive, including about 195 sq mi of forests. Of the rest, 28 sq mi are occupied by lakes, chiefly Greifen and Pfäffikon and part of Lake Zürich. The terrain consists of shallow river valleys draining northward toward the Rhine and separated by ridges trending northwest to southeast. The most important valley is that of the Linth, which expands into Lake Zürich and is continued as the Limmat. East of the lake, separated by successively higher ridges, are the valleys of the Glatt, which flows through the lake called Greifensee, and the more gorgelike Töss, separated from the Toggenburg (valley) by a ridge along the east boundary that reaches 3,717 ft (1,133 m) at the Hörnli. West of the lake is the valley of the Sihl, bounded farther west by the Albis Range, with Albishorn (3,002 ft) as its highest

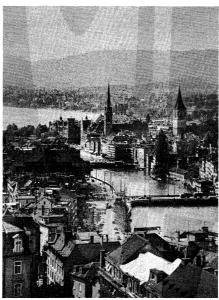

Historically, the canton represents the territories acquired up to 1803 by its capital, Zürich, which officially ranks as the first to join the Swiss Confederation in 1351. The whole of the lower part of Lake Zürich was added in 1362, and the canton reached the Rhine after the purchase of Winterthur from the Habsburgs in 1467. It now extends from its enclave on the right bank of the Rhine in the German state of Baden-Württemberg to about 8 mi (13 km) south of the Pfäffikon See. The present cantonal constitution dates from 1869.

Although the land is highly cultivated, the

canton is essentially a manufacturing area, noted especially for machinery and railway rolling stock; about one-third of the nation's total machine production is situated in the canton. Silk and cotton weaving are widespread. Zürich and Winterthur are the principal centres, while Uster, east of the Greifensee, and Thalwil, Horgen, and Wädenswil, on the western shore of Lake Zürich, are all industrial towns. Railways run through the valleys, and standard lines and mountain railways radiate in all directions from the city of Zürich. The Limmat Valley (Zürich to Baden) carried the first railway line opened (1847) in Switzerland. The population, the largest of any Swiss canton, is German speaking and predominantly Protestant. Pop. (1983 est.) 1,127,996.

Zürich, largest city of Switzerland and the capital of the canton of Zürich. It is a financial and industrial centre located in an Alpine setting at the northwestern end of Lake Zürich.

The first inhabitants of the site were the prehistoric peoples whose settlements of hut dwellings rose from pile foundations driven into the shores of the lake. The Celtic Helvetii

The spires of (centre) the Fraumunster and (right) St. Peter's Church, Zürich, Switz.

Comet—Bavaria-Verlag

founded a community on the right bank of the Limmat River; when the Romans conquered this area in about 58 BC, they made the settlement a customs post. After the collapse of Rome, the community fell first to the Alamannii from the north, and later to the Franks, who made it a royal residence. The community began to flourish as traders settled in the town and took advantage of its position straddling European trade routes. In 1218 Zürich became an imperial free city, and in 1351 an important alliance was made with the Swiss Confederation. In 1336 the citizens accepted a constitution that, based democratically on the guild system, balanced the power of the various crafts, the trades, and the nobility. As the guilds became more powerful—the city was able to purchase its freedom from the emperor in 1400-Zürich became embroiled in conflicts with neighbouring territories, but economic growth continued relatively unimpeded.

On New Year's Day, 1519, Huldrych Zwingli, a priest at the Grossmünster (Great Minster), began to preach a series of sermons that initiated the Swiss Protestant Reformation and transformed the character of Zürich itself. During the Counter-Reformation, the city offered asylum to many refugees from northern

Italy and France, and the new residents further stimulated cultural and economic growth.

A liberal democratic order, with the citizenry electing and exercising strong control over the legislative as well as the executive branches of government, emerged during the 1830s. Zürich thus became well equipped to enter the modern industrial era: as early as 1787, a quarter of the population had been engaged in textile manufacturing, a successor to the medieval silk industry; and the 1830 constitution (further liberalized in 1869) aided an economic expansion centred on manufacturing and service industries. Zürich's historic international links also placed it in the forefront of modern world finance.

By the second half of the 20th century, the once dominant textile industry had lost its former importance, and heavy manufacturing industry—notably machine production—had become dominant. The city also has a vigorous tourist trade, which has made the downtown Bahnhofstrasse one of the world's great shopping streets. International congresses are also important. The city is a major railway centre, and the nearby Zürich–Kloten international airport is the busiest airport in Switzerland.

Zürich has nurtured a rich cultural life, and its theatres and opera have often been characterized by innovation and experiment. Educational institutions include the University of Zürich (1833), maintained by the canton, and the Federal Institute of Technology (1855). The Swiss National Museum (1898) is a treasure-house of historical, artistic, and scientific collections. The architectural legacy of the old city ranges from the Romanesque Grossmünster, built by Charlemagne in the 700s, and the 13th-century St. Peter's Church to the elegant guildhouses and patrician residences, some of which are used as restaurants or for civic functions. There are two great annual festivals: the April Sechseläuten, with a guild procession and the ceremonial burning of a snowman, and the September Knabenschiessen, a youthful sharpshooting contest. Mountain climbing in the nearby Alps is a popular sport. Pop. (1983 est.) city, 367,900; metropolitan area, 839,939.

Zürich, Lake, also called LAKE OF ZÜRICH, German zÜRICHSEE, Swiss lake extending southeast from the city of Zürich. It lies at an altitude of 1,332 ft (406 m) and has an area of about 34 sq mi (88 sq km); its extreme length is 18 mi (29 km), maximum breadth 2½ mi, and maximum depth 469 ft. The Linth River flows into it and emerges as the Limmat. The greater portion of the lake is in the canton of Zürich, but 8 sq mi in Sankt Gallen. The banks rise in gentle slopes, covered with vineyards and orchards, to hills with views of the Alps to the south.

The lake occupies a basin excavated by the Linth and Rhein glaciers flowing northwestward toward what is now Zürich, where a terminal moraine created the lake by damming. Another moraine between Pfäffikon (Schwyz canton) and Raperswil separates the navigable lower portion of the lake (Untersee) from the shallow upper part (Obersee). This moraine, although breached, was formerly a route for pilgrims to the monastery of Einsiedeln, on the island of Ufenau. The breach in the moraine was first bridged in 1358 and the present 3,039-ft causeway of masonry, carrying rail and road traffic, was built in 1878; a swing bridge in its centre permits small vessels to pass. Zürich is the only large city on the lake.

Zürich ware, faience (tin-glazed earthenware), faience fine (lead-glazed earthenware), and porcelain made at a factory near Zürich founded in 1763 by Salomon Gessner and others. The faience was at first painted in a style similar to that of the porcelain, but after

1775 both the faience and the faience fine were decorated by means of transfer printing. Two kinds of floral decoration of tableware prevailed: formal, or indianische Blumen, and naturalistic, or deutsche Blumen. Other decoration included delicately designed and

Zürich porcelain centrepiece decorated with basketwork, shells, and dolphins, c. 1770; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London

painted Swiss landscapes. Porcelain figures were also made, in some cases modelled by Johann Valentin Sonnenschein, who worked at Zürich from about 1775 until 1779. Although the keynote of Zürich ware is finesse and restraint, at least one elaborate dinner service, with the full repertory of basketwork, shells, dolphins, and the like, was made there in about 1770. The factory closed toward the end of the 19th century.

Zürich Zoological Garden, German zool-OGISCHER GARTEN ZÜRICH, privately owned zoological park partially funded by the city and canton of Zürich. Opened in 1929, the 10-hectare (25-acre) zoo exhibits nearly 2,100 specimens of more than 330 species. It has a good ungulate collection and a breeding group of Humboldt's penguins. Its specialties include pygmy hogs, snow leopards, and Rothschild's mynah birds. The zoo also serves as the repository for the vicuna studbook.

Zurita y Castro, Jerónimo de (b. Dec. 4, 1512, Zaragoza, Spain—d. Oct. 31, 1580), Spanish government official who is regarded as the first modern Spanish historian.

A member of a noble Aragonese family, he was educated at the University of Alcalá. Under the Holy Roman emperor Charles V (King Charles I of Spain) and King Philip II of Spain, Zurita held a succession of offices, including the secretaryship of the Inquisition in Madrid. In 1548 he was given the newly created office of historiographer of the kingdom of Aragon, at that time a constituent kingdom of the Spanish monarchy. Subsequently, Philip II commissioned him to collect all state papers in Aragon and in the Italian dependencies of Spain and to deposit them in the castle of Simancas, where the Castilian state papers already were being concentrated. Zurita thus helped to establish the Spanish national archive of Simancas in 1567.

Zurita's research in Spain and Italy resulted

in his major work, the Anales de la corona de Aragón (1562-80). Covering the period from the Moorish invasions (8th century) until the death of King Ferdinand II (1516), this was the first national history of Aragon, and it remains a useful source for Spanish history.

Zurvanism, also spelled ZERVANISM, modified form of Zoroastrianism that appeared in Persia during the Sāsānian period (3rd-7th century AD). It was opposed to orthodox Zoroastrianism, which by that time had become dualistic in doctrine. According to Zurvanism, time alone-limitless, eternal, and uncreated—is the source of all things.

Zurvān, god of time and fate, remotely influences human destinies, appearing under two aspects: Limitless Time (i.e., eternal lord; Zurvān Akarana) and Time of Long Dominion (i.e., lord of the existing world; Zurvān Dareghō-Chvadhāta). His worship is bound up with speculations about astrology and the world-year. He bears the epithets ashōgar, frashōqar, and zarōqar (meanings disputed), and the qualities these apparently indicate were construed as concrete, Zurvān being worshipped in four forms.

In later writings Zurvan is seen as the father of Ormazd and Ahriman (see Ahura Mazdā), perhaps a result of contact between Zoroastrianism and Greco-Babylonian astrological speculations. (Zurvanism appears to have had its stronghold in western Persia, bordering Babylonia.) Some scholars seek an origin for Zurvanism outside Zoroastrianism, in the worship of an ancient Median or pre-Iranian god. Although in its fatalism and pessimism Zurvanism is basically opposed to true Zoroastrianism, it seems probable that in cult and in a large body of doctrine it made few breaks with orthodoxy. It was in Zurvanite form that Zoroastrianism influenced Mithraism (in which Zurvān was an important deity) and Manichaeism

Zutphen, gemeente (municipality), Gelderland provincie (province), east central Netherlands, at the confluence of the IJssel and Berkel rivers. Founded in the 11th century as Zuidveen (meaning "southern peat bog"), it became the seat of a line of independent counts until it passed to the counts of Gelderland in 1190. It was fortified in 1312 and became a member of the Hanseatic League. The town was sacked in 1572 by the Spanish, who occupied it until 1591. Zutphen was held by the French from 1672 to 1673 and again in 1795, after which it remained under French control until 1813. Occupied by the Germans during World War II, it suffered damage. Of the medieval fortifications, the ruined Berkel Gate (1312), the Nieuwestadpoort (gate), and the Drogenapstoren (Rampart Tower; 1444-46) remain. Other landmarks include the Grote Kerk (St. Walburgis; 13th-15th century), with its library folios chained to desks; the Wijnhuistoren (Winehouse Tower; 1627); the town hall (1729); and the 15th-century butter and meat halls (markets).

Zutphen is now a rail junction, market, and inland shipping centre; it has an important timber trade and manufactures paper, metals, and textiles. Pop. (1983 est.) 31,495.

Zutuhil (people): see Tzutujil.

Zuwārah, also spelled zuara, Mediterranean port, northwestern Libya. First mentioned in a Catalan sailing manual (1375) as Punta dar Zoyara, it later served as the western outpost of Italian-controlled Libva (1912-43), being the terminus of the now-defunct railway from Tripoli 65 mi (105 km) east. Its artificial harbour shelters a motorized fishing fleet. Cereals, dates, and esparto grass (used to make cordage, shoes, and paper) are local products. The population contains a small number of settled Berber farmers. Pop. (latest census) 14,578.

Zuylen, Belle van (Swiss novelist): see Charrière, Isabelle-Agnès-Élizabeth de.

Zūzanī, az- (fl. 11th century): see Hamzah ibn 'Alī.

Zvenigorod, city, Moscow *oblast* (administrative region), central Russian Soviet Federated Socialist Republic, located on the Moskva River, 33 mi (53 km) west of Moscow. Archaeological excavations (1943-45 and 1954-57) have revealed the existence of settlement there from the 12th and 13th centuries. The first written mention of Zvenigorod appeared in the 1339 will of Ivan Kalita, prince of Muscovy and Vladimir. From the 14th through the 16th centuries, Zvenigorod served as a defense post on the western approaches to Moscow, from Lithuania and Poland, along the Smolensk-Moscow road. The Gorodok (Citadel), an earth fortification rising about 150 ft (46 m) above the Moskva River, was built during this period. In 1398 the ruling prince, Yuri Zvenigorodsky, founded the Savvino Storozhevskiy Monastery at the confluence of the Storozhka and Moskva Rivers, 0.6 mi (1 km) from Zvenigorod. Peter I the Great, his brother Ivan V, and his sister Sophia found refuge in the monastery during the 1682 rebellion of the Streltsy, the Russian military corps established in the mid-16th century that formed the bulk of the Russian army. The natural environment of hills and forests has made the countryside around Zvenigorod a favorite retreat for such famous Russians as the political thinker Aleksandr Herzen (1812-70), the playwright Anton Chekhov (1860-1904), the short-story writer and novelist Maksim Gorky (1868-1936), and the composer Peter Ilich Tchaikovsky (1840-93).

Today the city's economic activities include the manufacture of furniture, school and office supplies, toys, sporting equipment, and clothing. Zvenigorod also has a technical training school specializing in finance. A fine example of early Moscow architecture in the Gorodok is the Uspenskiy Sobor (Assumption Cathedral) dating from the 14th century. It has a single dome, rectangular floor plan, and frescoes by the Russian painter Andrey Rublyov (1360/70-c. 1430), founder of the Moscow school of painting. Within the nearby Savvino Storozhevskiy Monastery stands the Rozhdestvensky Sobor (Nativity of the Virgin Cathedral; 1405) with an interior of 15th-, 16th-, and 17th-century paintings, and a small palace built for Tsar Alexis Mikhaylovich in 1652-54. The structures of the former monastery now house medical clinics, a sanatorium, and the Zvenigorod Historical Museum, as well as the Museum of Local Lore. Pop. (early 1980s) 10,000 to 30,000.

Zveno Group, small political organization that briefly formed a dictatorial regime in Bulgaria (1934-35); the name Zveno refers to a link in a chain. Founded in 1930, the Zveno Group was led by Col. Kimon Georgiev and was composed primarily of radical civilians, who had become disillusioned with a government hampered by military domination, irresponsible political parties, and uncontrolled terrorist activities. When an associate of the Zveno Group, Col. Damian Velchev, staged a coup d'etat (May 19, 1934), Georgiev became prime minister of Bulgaria.

The Zveno government, advised by Velchev, assumed a dictatorial character, dissolved Parliament, and abolished all political parties. It imposed strict censorship on newspapers, prohibited trade unions, and reorganized the educational system to stimulate the training of more technicians and scientists and to discourage the formation of a large intelligentsia. Shortly after taking office, Georgiev suppressed the terrorist Internal Macedonian Revolutionary Organization, established friendlier relations with Yugoslavia, and resumed diplomatic relations with the Soviet Union. In addition, his government reduced the peasants' debts, reformed the nation's credit system, and encouraged the extension of professional medical care into rural areas.

Despite the Zveno Group's efforts to stabilize Bulgarian politics and improve the country's economy and international position, King Boris III, whose influence had been reduced to a minimum, took advantage of unfounded rumours that the group intended to form a republic, gathered support among military officers, and deposed Georgiev and his government (Jan. 22, 1935).

Zvishavane, formerly shabani, town, south-central Zimbabwe. Its name is derived from shavani, a Sindebele word meaning "finger millet," or "trading together." Surrounded by low hills, it is on direct rail links to Harare (formerly Salisbury) and Bulawayo in Zimbabwe and to Maputo in Mozambique. The adjacent asbestos mine is its major economic asset. Zvishavane was created a village in 1920 and a town in 1930. Pop. (1982) 26,758.

Zwaardecroon, Hendrick (b. Jan. 26, 1667, Rotterdam, Neth.—d. Aug. 12, 1728, Batavia, Java, Dutch East Indies [now Jakarta, Indon.]), governor-general (1718–25) of the Dutch East Indies who introduced the cultivation of export crops there.

Zwaardecroon went to the Indies in 1684 as secretary to the commissioner-general of the Dutch East India Company and advanced steadily until he was appointed governorgeneral in 1718, when the company was in serious financial difficulties. He took harsh steps to halt smuggling and, more constructively, introduced new products into Java and expanded trade with China. He stimulated the production of indigo, improved cotton cultivation, and encouraged the production of sappanwood (from the tree Caesalpina sappan), used for dye. Most important, he imported the coffee tree, a future staple of the economy.

Zwaardecroon also was responsible for the ruthless repression (1721) of the so-called conspiracy of Pieter Erberfelt, who, it was claimed (probably falsely), was plotting to expel the Dutch from the Indies.

Zwangendaba (d. 1848, Mapupo, near Ufipa, Tanganyika [now in Tanzania]), African king (reigned c. 1815–48) who led his Jere people on a monumental migration of more than 1,000 miles, lasting more than 20 years. A leader of incomparable stature, he brought his initially small tribe (later called the Ngoni) from its original home near modern Swaziland to the western part of present-day Tanzania, forming it into one of the most powerful kingdoms of eastern Africa.

Driven from the eastern part of southern Africa in 1818 by the Mfecane (the "Crushing," a period of Zulu wars and migrations), Zwangendaba led the Jere north in search of safety. Adopting the Zulu regimental organization that had defeated him and permitting the adoption of captives into Jere families, Zwangendaba collected an efficient and growing fighting force. In 1822 he crossed into what is now southern Mozambique. Defeated there in 1831 by other fleeing tribes, he followed the Zambezi River into what is now Zimbabwe and brought to an end the 300year-old Changamire empire. The Zambezi was crossed in 1835, and he led his people victoriously through what is now Malaŵi and north of Lake Malawi to the southern end of Lake Tanganyika, where he founded a city, Mapupo. After his death the Ngoni split into five major divisions and continued their travels, occupying areas in present-day Tanzania, Malaŵi, and Zambia.

Zwedru (Liberia): see Tchien.

Zweibrücken, city, Rhineland-Palatinate *Land* (state), southwestern Germany, on the Schwarz River. The name, meaning "two

bridges," appeared in Latin documents as Bipontium and in French as Deux-Ponts. The town is known to scholars for the *Editiones Bipontinae*, early printed volumes of Roman and Greek classics.

Originally an independent countship, Zweibrücken was chartered in 1352 and passed to the Palatinate lands of the Bavarian Wittelsbachs in 1385. From 1410 it was a duchy, and it became the residence of the house of Pfalz-Zweibrücken in 1477. The kings of Sweden between 1698 and 1718 were members of the house of Pfalz-Zweibrücken. The duchy fell to France in 1801, and most of it passed to Bavaria in 1816. Almost completely destroyed in World War II, the town has since been rebuilt. The castle (1720–25) and the late Gothic Church of St. Alexander (1493) survived. The town hall (1779–85) and other buildings are in Rococo and Baroque styles.

Zweibrücken is known as the "town of roses and horses" for its Rose Garden (east of the city) and its horse breeding (since 1744) and racing. Industries include metalworking and the manufacture of machinery, textiles, shoes, and wood products. Pop. (1989 est.) 33,377.

Zweig, Arnold (b. Nov. 10, 1887; Glogau, Silesia, Ger. [now in Poland]—d. Nov. 26, 1968, Berlin), German-Jewish writer best known for his novel Der Streit um den Sergeanten Grischa (1927; The Case of Sergeant Grischa). This novel depicts the social organism of the German army during World War I through the story of the Russian prisoner Grischa's tragic encounter with the vast machine of Prussian military bureaucraev.

Deprived of German nationality by the Nazis, Zweig lived as an émigré in Palestine from 1933 to 1948 and lived in East Germany from 1948. His other works include Junge Frau von 1914 (1931; Young Woman of 1914), De Vriendt kehrt heim (1932; De Vriendt Goes Home), Erziehung vor Verdun (1935; Education Before Verdun), and Einsetzung eines Königs (1937; The Crowning of a King), each of which pursues the fortunes of characters introduced in The Case of Sergeant Grischa.

Zweig, Stefan (b. Nov. 28, 1881, Vienna, Austria—d. Feb. 22, 1942, Petrópolis, near Rio de Janeiro, Braz.), German writer who achieved distinction in several genres—poetry, essays, short stories, and dramas—most notably in his interpretations of imaginary and historical characters.

Zweig studied in Austria, France, and Germany before settling in Salzburg in 1913. In 1934 he was driven into exile by the Nazis and emigrated to England and in 1940 to Brazil. Finding only growing loneliness and disillusionment in their new surroundings, he and his second wife committed suicide.

Zweig's interest in psychology and the teachings of Sigmund Freud led to his most characteristic work, the subtle portrayal of character. Zweig's essays include studies of Honoré de Balzac, Charles Dickens, and Fyodor Dostoyevsky (*Drei Meister*, 1920; *Three Masters*) and of Friedrich Hölderlin, Heinrich von Kleist, and Friedrich Nietzsche (Der Kampf mit dem Dämon, 1925; Master Builders). He achieved popularity with Sternstunden der Menschheit (1928; The Tide of Fortune), five historical portraits in miniature. He wrote fullscale, intuitive rather than objective, biographies of Joseph Fouché (1929), Mary Stuart (1935), and others. His stories include Verwirrung der Gefühle (1925; Conflicts). He also wrote a psychological novel, Ungeduld des Herzens (1938; Beware of Pity), and translated Charles Baudelaire, Paul Verlaine, and Émile Verhaeren. The Royal Game and Other Stories (1981) is a collection of his short stories translated by Jill Sutcliffe.

Zwelitsha, town, provisional capital (since 1981) of the not internationally recognized

republic of Ciskei, directly south of King William's Town, South Africa. It was established in 1946 as a residential area for employees of the nearby Da Gama textile factory owned by the Good Hope Textile Corporation. Most of the housing was built by the South African Bantu Trust. Corn (maize), sorghum, and livestock (cattle, sheep, and goats) are raised in the surrounding area. Industries in Zwelitsha produce furniture, leather goods, handwoven carpets, paints, agricultural equipment, plastic netting, ceramics, and toys. A small-scale industrial complex located in the town engages in wool washing, leather splitting, saw milling, and quarrying. The Ciskeian National Development Corporation operates a business centre in the city to help develop commerce by providing professional services. A trade school giving instruction in welding, woodwork, and sheet-metal work is located at Zwelitska, as is a teacher training centre. The indigenous population comprises two ethnic groups, the Xhosa and the Mfengu, who speak the Xhosa language. The town is connected by road with King William's Town and nearby East London. Bisho, adjacent to Zwelitsha, is the capital of Ciskei. Pop. (1975 est.) 29,816.

Zwickau, city, Saxony Land (state), Germany, on the Zwickauer Mulde River, at the entrance to the western Ore Mountains, south of Leipzig. Slavic in origin, it was mentioned in 1118 as a trading centre. It developed as a German imperial city between 1135 and 1145 and became a royal market about 1150. About 1200 it passed to the Wettin margraves of Meissen. Thomas Müntzer, the German radical reformer, preached there in 1520-21. The composer Robert Schumann was born in Zwickau (1810), and a Schumann Museum was opened in 1955. The city was bombed in World War II, but most of the damage was repaired. The most noteworthy of its churches are St. Mary's Church (1465-1536; restored 1883-91) and the Romanesque-Gothic St. Catherine's Church (1212-19). Other notable buildings are the Gewandhaus (cloth merchants' hall; 1522-36), the 15th-century town hall, and Osterstein Castle (1565-85). Zwickau's industries include coal mining and the manufacture of automobiles, machinery, and cloth. Pop. (1989 est.) 121,749.

Zwicky, Fritz (b. Feb. 14, 1898, Varna, Bulg.—d. Feb. 8, 1974, Pasadena, Calif., U.S.), Swiss astronomer and physicist, who made valuable contributions to the theory and understanding of supernovae (stars that for a short time are far brighter than normal).

Zwicky received a doctorate in physics (1922) from the Swiss Federal Institute of Technology, Zürich, and served on the faculty of the California Institute of Technology, Pasadena, from 1925 to 1972.

During the early 1930s Zwicky contributed substantially to the physics of the solid state, gaseous ionization, and thermodynamics but soon turned to the study of supernovae, novae, and cosmic rays. In 1934, in collaboration with Walter Baade, he proposed that supernovae are a class of stellar explosion completely different from the ordinary novae and occur less often (two or three times every 1,000 years in our galaxy). Zwicky began an extensive search of neighbouring galaxies for supernovae, and from 1937 to 1941 he discovered 18 of them. Only about 12 had been recorded previously in the history of astronomy.

As director of research (1943–46) of the Aerojet Engineering Corporation, Azusa, Calif., and technical adviser thereafter, he developed some of the earliest jet engines, including the JATO (jet assisted take-off) units used to launch heavy-laden aircraft from short runways.

Zwiebel: see Hoffmann, Heinrich.

Zwingli, Huldrych, Huldrych also spelled ULRICH (b. Jan. 1, 1484, Wildhaus in the Toggenburg, Sankt Gallen, Switz.—d. Oct. 11, 1531, near Kappel), the most important reformer in the Swiss Protestant Reformation

Zwingli, detail of an oil portrait by Hans Asper, 1531; in the Kunstmuseum Winterthur, Switz. By courtesy of the Kunstmuseum Winterthur, Switz: photograph, Schweizerisches Institut für Kunstwissenschaft

and the only major reformer of the 16th century whose movement did not evolve into a church. Like Martin Luther, he accepted the supreme authority of the Scriptures, but he applied it more rigorously and comprehensively to all doctrines and practices.

Early life and career. Zwingli was the son of a free peasant who was a village magistrate. His mother, Margaret Meili, was the sister of the abbot of Fischingen in Thurgau, and his uncle Bartholomäus Zwingli was priest of Wildhaus and later dean of Wesen. Huldrych went to school at Wesen, then Basel (1494), and Bern (1496), where his master, Heinrich Wölflin, inspired in him an enthusiasm for the classics and a love of music. The Dominicans were interested in his musical gifts and almost enticed him to enter a convent. But his father and uncle dissuaded him, and, instead, he moved on to university studies at Vienna (1498) and then Basel (1502), where he was graduated in 1504.

Supported by teaching, he read theology and was deeply influenced by the lectures of the teacher and Reformer Thomas Wyttenbach. Ordained to the priesthood, he went, in 1506, to Glarus, where he proved a good pastor, encouraged education, commenced studying Greek and even Hebrew, and read widely in the Church Fathers. He was sympathetic toward the Renaissance movement and valued his correspondence with Erasmus. Service as chaplain with the Swiss Army led him to oppose the mercenary system. His stand provoked hostility at Glarus, and in 1516 he moved to a new charge at Einsiedeln, where he enjoyed both wide opportunities for preaching to the many pilgrims and fine facilities for study at the convent. Zwingli afterwards dated his evangelical understanding of the Scriptures from the period of transition to Einsiedeln. The difficulties at Glarus gave to this development a more than academic significance.

Beginnings of reformation. Zwingli at once began to preach his new convictions. Apart from topical criticism of abuses, he did not at first attack traditional positions, being content to expound the regular Gospel passages. A minor indulgence crisis arose in 1518, but Zwingli's witty castigation of the abuse found ecclesiastical favour and, finally, a titular honour by the papacy, from which he also drew a chaplaincy pension.

In 1518, despite much opposition, he was appointed people's priest at the Grossmünster (Great Minster) at Zürich. The post gave him little income or official influence but great scope for preaching. He commenced a series of expositions of the New Testament enlivened by topical application. Serious plague in 1519 found him faithful in his ministry, and his own illness and recovery, followed by his brother's death in 1520, deepened the spiritual and theological elements in his thinking and teaching that had hitherto been overshadowed to some degree by the humanistic. In 1520 he secured permission from the city's governing council to preach the "true divine scriptures, and the resulting sermons helped to stir revolts against fasting and clerical celibacy that initiated the Swiss Reformation (1522). In pursuance of his view of the supremacy of Scripture, Zwingli preached his now famous sermons at the Oetenbach convent and, despite local opposition to many of his ideas, he secured fresh authorization from his bishop to continue preaching. A tract On Meats and a printed version of the Oetenbach addresses, The Clarity and Certainty of the Word of God, appeared in 1522.

Victory of the Zürich Reformation. The year 1523 was crucial in the Zürich Reformation. In preparation for a disputation with the vicar general of Constance (Konstanz), arranged for January in the town hall of Zürich, Zwingli published his challenging 67 Artikel. His main contentions were adopted by most priests in the district and, in consequence, the celibacy of clergy came to be flouted, liturgical reform was begun, and a plan for the reform of the Grossmünster was drafted. A key part of this program was the reconstitution of the cathedral school as both a grammar school and a theological seminary to train Reformed pastors. The question of removing the images from the churches provoked a second disputation in October, in which Zwingli and his most intimate friend and fellow Reformer Leo Jud carried the day. Successive steps taken during 1524 and 1525 included the removal of images, the suppression of organs, the dissolution of religious houses, the replacement of the mass by a simple Communion service, the reform of the baptismal office, the introduction of prophesyings or Bible readings, the reorganization of the ministry, and the preparation of a native version of the Bible (the Zürcher Bibel appeared in 1529). Zwingli fostered the movement not only by his preaching and influence on the council but also by his various writings—e.g., On Education, On Baptism, On the Lord's Supper, and especially the comprehensive Commentary on True and False Religion (1525). He was publicly married to Anna Reinhard on April 2, 1524

Zwingli's theses. From the city of Zürich the movement quickly spread not only to the canton of Zürich but to neighbouring cantons as well. Aided by the learned Roman Catholic theologian Johann Eck, the five forest cantons of Luzern, Zug, Schwyz, Uri, and Unterwalden resisted the new trend, but important centres like Basel and Bern declared for Zwingli. Zwingli himself, assisted by his fellow Swiss Reformer Heinrich Bullinger, took part in a disputation at Bern (1528) that formally introduced the principles of the Reformation to that city. The main theses he put forth were (1) that the church is born of the Word of God and has Christ alone as its head; (2) that its laws are binding only insofar as they agree with the Scripture; (3) that Christ alone is man's righteousness; (4) that the Holy Scripture does not teach Christ's corporeal presence in the bread and wine at the Lord's Supper; (5) that the mass is a gross affront to the sacrifice and death of Christ; (6) that there is no biblical foundation for the mediation or intercession of the dead, for purgatory, or for images and pictures; and (7) that marriage is lawful to all. With the friendly cantons of Basel and Bern, Zürich negotiated a Christian Civic Alliance (or League) based on the treaty by which Basel had been received into the Swiss confederacy but also including a common profession of faith.

Controversies. From 1525 Zwingli's work was hampered by disagreements, both within Switzerland and with the Lutherans outside. In Zürich itself an extremist group quickly became dissatisfied with the Zwinglian program. desiring the abolition of tithes, a severance of the state connection, the creation of a pure or gathered church of true believers (those who have experienced a conversion according to the moral beliefs and precepts of the New Testament), and the consequent ending of infant Baptism. Disputations were held with the leaders of the Anabaptist group in January and March 1525, but these were abortive. The first rebaptisms took place in February, and widespread propaganda was initiated. Seeing its authority flouted, the council imprisoned the leaders and finally, after a further useless disputation in November 1525, brought them under a capital sentence. In theological refutation of the movement, Zwingli wrote a special work, On Baptism (1525), in which his main emphasis was on the significance of water Baptism as a covenant sign. During the following years he devoted many other tracts to the subject, culminating in his Tricks of the

Catabaptists (1527). Relations with Luther. Meanwhile, his thinking and practice in relation to the mass had led to a sharp disagreement with Martin Luther. The two agreed in rejecting the eucharistic sacrifice. They also agreed in rejecting the medieval notion of a change of substance in the sacrament. Luther, however, felt himself bound by the words "This is my body" to teach the real presence of Christ's body and blood not in place of, but in, with, and under the bread and wine. Zwingli, on the other hand, convinced that the word "is' has the force of "signifies," did not maintain a "real" presence but simply the divine presence of Christ or his presence to the believer by the power of the Holy Spirit, as signified by the elements. He stated his views in two Latin tracts (1525) and the more popular work, On the Lord's Supper (1526). Luther and his supporters responded with much acrimony, refusing to see in the Swiss movement a true work of evangelical reformation. Through the good offices of Philip the Magnanimous, landgrave of Hesse, the Colloquy of Marburg (1529) was arranged with a view to reconciliation; Luther, Zwingli, and Martin Bucer all participated. Cordial agreement was reached on most issues, but the critical gulf remained in relation to the sacramental presence, and Luther refused the hand of fellowship extended by Zwingli and Bucer.

Zwingli would undoubtedly have welcomed agreement with Luther for political as well as theological reasons, for he saw a growing danger in the isolation of the Reforming cantons. The forest cantons had organized themselves against the alliance, and there was a real threat of imperial intervention. In offensive defense, the alliance attacked the forest cantons at Kappel, 10 miles south of Zürich in 1529, and enforced terms on the opposing districts. Attempts also were made to link up with Strassburg and allied reforming cities, but these were at first unsuccessful despite the help of Hesse. The results of division were seen at the Diet of Augsburg (1530), in which the evangelical groups presented three different confessions, including Zwingli's Fidei Ratio.

Lacking other friends, Zwingli turned to Venice and France, partly in view of their political hostility to the empire, partly in the hope of persuading the rulers to accept evangelical views. His Exposition of the Faith (1531) was addressed to Francis I of France to clear up misunderstandings and enlist his sympathy. The project faded, however, and in

1531 Zwingli urged on the alliance a further reduction of the forest cantons. Instead, Bern initiated a useless policy of economic sanctions that simply provoked the foresters to attack Zürich in October 1531. In the resultant Second War of Kappel, Zwingli accompanied the Zürich forces as chaplain and was killed in the battle, the spot where he fell being now marked by an inscribed boulder.

The later preoccupation of Contributions. Zwingli with ecclesiastical politics should not obscure his true contribution to faith and order. He accepted the supreme authority of the Scripture, although he applied it rigorously to all doctrines and practices. He laid influential stress on the divine sovereignty, though this was tempered by a milder view of original sin and a wide hope of salvation. His rejection of the sacraments as means of obtaining grace and as forms of intervention between the soul and God underlay the deepened conception of other Reformation leaders such as Bullinger, Pietro Martire Vermigli, and John Calvin. If he accepted lay authority in church government as exerted through the council, his personal influence averted both the subservient Erastianism (the supremacy of lay authority in ecclesiastical matters) of Lutheranism and exhausting conflict, as at Geneva. Obvious defects of disjointedness and intellectualism mark his writings. Behind them, however, lay an open, warm, and friendly disposition, and they embody a boldly striking attempt to rethink all Christian doctrine in consistently biblical terms. (G.W.B.)

BIBLIOGRAPHY. Editions of Zwingli's works include the Opera, published at Zürich in four volumes (1545 et seq.); the Werke, edited M. Schuler and J. Schulthess, published at Zürich in eight volumes (1828–42); and the Huldreich Zwinglis sämtliche Werke in the Corpus Reformatorum (Berlin, 1904 et seq.). English translations available include Selected Works of Huldreich Zwingli, edited and with notes by S.M. Jackson (1901); Latin Works and the Correspondence of Huldreich Zwingli, edited by Jackson and others and published in three volumes (1912–29); and Zwingli and Bullinger in the "Library of Christian Classics" (1953).

The standard works (all entitled Huldreich Zwingli) are by J.M. Schuler (1818); R. Christoffel (1854; Eng. trans., Zwingli; or, The Rise of the Reformation in Switzerland, 1858); and R. Stähelin, 2 vol. (1895–97). Among the best modern biographies is that of O. Farner, 4 vol. (1943–60), who also wrote a briefer account in 1918 (Eng. trans., Zwingli the Reformer, 1952, reprinted 1968), Perhaps the most comprehensive biography in English is G.R. Potter, Zwingli (1976); another ambitious English version was written by S.M. Jackson, Huldreich Zwingli, the Reformer of German Switzerland (1901, reprinted 1969); a fourth interesting life is J.H. Rilliet, Zwingli, le troisième homme de la Réforme (1959; Zwingli, Third Man of the Reformation, 1964). For Zwingli's theology, see W. Köhler, Zwingli und Luther (1924); and J.M. Usteri, Zwinglis Tauflehre (1882). A deeper appreciation of Zwingli the theologian rather than the humanist may be found especially in A. Rich, Die Anfänge der Theologie Huldrych Zwinglis (1949). For a brief but penetrating study of Zwingli's liturgical contribution, see F. Schmidt-Clausing, Zwinglis liturgische Formulare (1970). Among the various specialized studies of Zwingli, see especially C. Garside, Jr., Zwingli and the Arts (1966); R.C. Walton, Zwingli's Theocracy (1967); and F. Schmidt-Clausing, Zwinglis Humor (1968)

Zwischengoldgläser (German: "gold between glasses"), drinking glasses decorated with engraving in gold leaf laminated between two pieces of glass. The term is usually applied to beakers, goblets, and tumblers produced in Bohemia during the late 17th and early 18th centuries, but examples have been found in Roman catacombs of the 3rd century. These early glasses were made as follows: The inner side of the bottom of the glass was then covered with gold leaf and a design scratched through the gold. A disk of glass was then

fused to the inside bottom, leaving the gold sandwiched between two layers of glass. The 17th- and 18th-century technique was similar: Two glasses were made of identical shape, one slightly larger than the other. Gold leaf was applied to the outside of the smaller one and a design scratched on it; the smaller glass was then fitted into the larger and bonded to it. See also Mildner glass.

Zwolle, gemeente (municipality) and capital, Overijssel provincie (province), north central Netherlands, on the Zwarte Water (river). Chartered in 1230, it was a member of the Hanseatic League in the Middle Ages and a stronghold until its ramparts were destroyed in 1674 during the Anglo-Dutch Wars. It is now a commercial centre and rail junction at the intersection of the northern and eastern Dutch canal systems. Industries include shipbuilding and the manufacture of metal products, chemicals, and building materials.

Notable buildings include the Grote Kerk (St. Michael's Church), the Church of Our Lady, and the town hall, all dating from the 15th century. The Sassenpoort (gate; 1408) is almost all that remains of the medieval ramparts; the Bethlehem Church (1308, 1324) was part of an early convent. The nearby Sint Agnietenberg (Mount St. Agnes) is the historical site of the Augustinian monastery where Thomas à Kempis, the priest and devotional writer, spent most of his life. Pop. (1983 est.) 86,388.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Zworykin, Vladimir Kosma (b. July 30, 1889, Murom, Russia—d. July 29, 1982, Princeton, N.J., U.S.), Russian-born U.S. electronic engineer, inventor, and the father of modern television.

After education at the St. Petersburg (now Leningrad) Institute of Technology and the College de France, in Paris, Zworykin served during World War I in the Russian Signal Corps. He emigrated to the United States in 1919 and became a naturalized citizen in 1924. In 1920 he joined the Westinghouse Electric

Zworykin, 1929
By courtesy of the Westinghouse Electric Corporation

Corporation in Pittsburgh, and in 1923 he filed a patent application for the iconoscope, or television transmission tube, and in 1924 an application for the kinescope, or television receiver. These two inventions formed the first all-electronic television system, as all older systems had been electromechanical, involving a rapidly rotating perforated disk or some similar device.

Although Westinghouse officials expressed

little enthusiasm at the first demonstration of Zworykin's television, an improved system demonstrated in 1929 impressed an official of Radio Corporation of America (RCA). Zworykin was offered a position as director of electronic research of RCA at Camden, N.J., and subsequently at Princeton, N.J., to continue the development of his invention.

Zworykin's television system provided the impetus for the development of modern television as an entertainment and education medium. Although ultimately replaced by the orthicon and image orthicon tubes, the iconoscope was the basis for further important developments in television cameras. The modern television picture tube is basically Zworykin's kinescope. He also developed a colour-television system, for which he received a patent in 1928. His other developments in electronics include an early form of the electric eve and innovations in the electron microscope. His electron image tube, sensitive to infrared light, was the basis for the sniperscope and the snooperscope, devices first used in World War II for seeing in the dark. His secondary-emission multiplier was used in the scintillation counter, one of the most sensitive of radiation detectors.

In later life Zworykin lamented the way television had been abused to titillate and trivialize subjects rather than for the educational and cultural enrichment of audiences.

Named an honorary vice president of RCA in 1954, from then until 1962 Zworykin also served as director of the medical electronics centre of the Rockefeller Institute for Medical Research (now Rockefeller University) in New York City. In 1967 the National Academy of Sciences awarded him the National Medal of Science for his contributions to the instruments of science, engineering, and television and for his stimulation of the application of engineering to medicine. He was also founder-president of the International Federation for Medical Electronics and Biological Engineering, a recipient of the Faradey Medal from Great Britain (1965) and the U.S. Presidential Medal of Science (1966), and a member of the U.S. National Hall of Fame from

Zworykin wrote Photocells and Their Applications (1932), Television (1940; rev. ed., 1954), Electron Optics and the Electron Microscope (1946), Photoelectricity and Its Application (1949), and Television in Science and Industry (1958).

Zygadenus, **Euthymius**: see Zigabenus, Euthymius.

Zygmunt (Polish personal name): see under Sigismund.

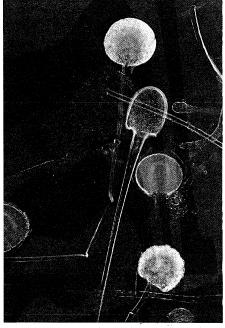

zygomatic arch, bridge of bone extending from the temporal bone at the side of the head around to the maxilla (upper jawbone) in front and including the zygomatic (cheek) bone as a major portion. The masseter muscle, important in chewing, arises from the lower edge of the arch; another major chewing muscle, the temporalis, passes through the arch. The zygomatic arch is particularly large and robust in herbivorous animals, including baboons and apes. In human evolution the zygomatic arch has tended to become more gracile (slender). For example, Australopithecus robustus, an early hominid, had a large zygomatic arch, taken by some scholars to be evidence for a herbivorous diet, while Australopithecus africanus, a later hominid, had a small, fragile-looking arch and is generally believed to have been a hunter and omnivore. In modern humans the zygomatic arch is more prominent in some populations and is larger and more robust in males.

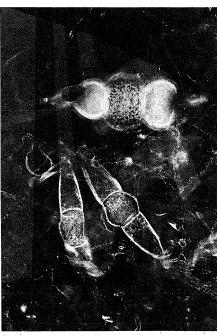

zygomatic bone, also called CHEEKBONE, or MALAR BONE, diamond-shaped bone below and lateral to the orbit, or eye socket, at the widest part of the cheek. It adjoins the frontal bone at the outer edge of the orbit and the sphenoid and maxilla within the orbit. It forms the central part of the zygomatic arch by its attachments to the maxilla in front and to the zygomatic process of the temporal bone at the side. The zygomatic bone forms in membrane (i.e., without a cartilaginous precursor) and is ossified at birth.

Zygomycetes, class of fungi (division Mycota) characterized by sexually produced, resting spores (zygospores). Asexual reproduction

occurs by the formation of nonmotile spores (aplanospores) in fruiting bodies (sporangia). Included in the group is the common bread mold fungus, *Rhizopus. R. stolonifer (nigricans)*, a common parasite of mature fruits and vegetables, causes food spoilage. It is used commercially in the manufacture of alcohol and organic acids. *Pilobolus* is found living on dung; it forcibly discharges its reproductive spores upward to 1.8 metres (6 feet), hence its common name hat thrower or shotgun fungus. The Entomophthorales are parasitic on insects, and the Zoopagales parasitize nematodes, rotifers, and other small animals.

Zygopetalum, genus of about 20 species of tropical American orchids, family Orchidaceae, that are cultivated as ornamentals. All species grow on other plants and have

Reproduction in *Rhizopus nigricans* (left) asexually by means of the release of spores held in the round spore sacs (sporangia) which are attached to stalk-like sporangiophores, (right) sexually by means of the fusion of gametangia to form zygospores

J.M. Langham

egg-shaped pseudobulbs (swollen stems) that bear two or more long, thin leaves. The flowering spike is often 60 centimetres (24 inches) tall.

Zygopetalum flowers have green petals and serels spotted with purple or brown, and a

Zygopetalum flowers have green petals and sepals, spotted with purple or brown, and a white lip streaked with purple. Two similar species, Z. mackayi and Z. intermedium, are commonly cultivated for their long-lasting, fragrant flowers.

zymogen, also called PROENZYME, any of a group of proteins that display no catalytic activity but are transformed within an organism into enzymes, especially those that catalyze reactions involving the breakdown of proteins. Trypsinogen and chymotrypsinogen, zymogens secreted by the pancreas, are activated in the intestinal tract to trypsin and chymotrypsin. Activation is effected by the cleavage of one or more peptide bonds of the zymogen molecule and may be catalyzed by a separate enzyme—e.g., enterokinase converts trypsinogen to trypsin—or by the active form itself-trypsin also converts trypsinogen to more trypsin. Zymogenic cells synthesize and store zymogens in inactive form.

Zyryanovsk, also spelled Zyrianovsk or Zyr'anovsk, city, Vostochno (East)-Kazakhstan oblast (administrative region), Kazakh Soviet Socialist Republic, on the Beryozovka River in the southern Altai Mountains. Zyryanovsk is an important centre of the leadand zinc-mining industry, which first came into being when rich deposits of polymetallic ores were discovered there in 1794 by the exile Gerasim Zyryanov. The city is linked by rail to Ust-Kamenogorsk. Pop. (1983 est.) 53,000.

Żywiec, town, Bielsko-Biała województwo (province), south central Poland, in the Carpathian Mountains on the Sola River near the Czechoslovakian border. It lies at the foot of Grójec Mountain, which has made it an important tourist centre. The town is also known for its large breweries.

Żywiec was first chronicled in the 14th century. Notable sites include the Renaissance Komorowski Castle (16th century), the Holy Cross Church (15th century), and the parish church (15th century), which contains the "Dormant Virgin," sculpted about 1500. Pop.

(1982 est.) 28,800.
