Straight whiskeys are unmixed or mixed only with whiskey from the same distillation period and distiller. Blended whiskeys include mixtures of similar products made by different distillers and in different periods (Scotch) and also whiskeys made with combinations of the neutral whiskeys (which have no distinctive flavour characteristics) and straight whiskeys (U.S. and Canada). Small quantities of other flavouring materials (e.g., sherry, fruit juices) may be included in blends. Governments may require that some whiskeys be aged under their supervision for specific periods.

Scotch whiskeys are somewhat light in body, with a distinctive smoky malt flavour. They are made primarily from barley that is malted and then heated over a peat fire, the oily, acrid smoke of which flavours the malt. Variations among whiskeys of the Highlands, Lowlands, Campbeltown, and Islay regions are caused partly by differences in the amount of heating the malt receives. The flavoured malt is combined with water, producing a mash, and then fermented to make a beer. When the beer is distilled, it produces a whiskey containing 70 percent alcohol by volume (i.e., 140 U.S. proof). This product is successively reduced with water to about 43 percent by volume.

Irish whiskeys taste much like Scotch but without the smoky quality. They are produced by methods similar to those for Scotch whisky, but the malt is not exposed to smoke during roasting. Irish whiskeys pass through three distillations and are sometimes blended with neutral grain whiskeys to produce a lighter-bodied product.

The Canadian whisky industry began in the early 19th century. Canadian whiskeys are light in body and flavour and are always blends of both highly flavoured and neutral grain whiskeys. They are made from mashes composed of combinations of corn, rye, wheat, and barley malt prepared according to the formula of the individual producer. Canadian whiskeys are usually aged for at least six years, then reduced with water to an alcoholic content of about 45 percent by volume before bottling.

In the United States, whiskey production began early in the 18th century. Major distillation centres are established in Kentucky, Pennsylvania, and Indiana. Their product is made with malt and other grains (usually corn or rye), producing a beer that is distilled to make a whiskey of 80 percent alcohol content by volume. This distillate, high in flavouring substances derived from the original raw materials, is reduced with water to about 50–52 percent alcohol and aged in unused charred white-oak barrels. Straight whiskeys may be stored in government-bonded warehouses.

Bourbon is characterized by the flavour of corn (maize), used as the main raw material. It was first produced in Bourbon county, Kentucky, and the name bourbon eventually became a general term for similar corn-mash whiskeys. Sour mashes, used mainly in bourbon production, are fermented with yeast, including a portion of previously fermented yeast; other whiskeys are made from sweet mashes, employing only fresh yeast.

In the United States, straight whiskeys are named for the grains predominating in the mash, with at least 51 percent required for whiskeys designated as straight. If a mash of at least 51 percent barley malt is employed, the product is straight malt whiskey; if rye malt is used, it is straight rye whiskey. Straight bourbon mashes contain at least 51 percent corn; straight corn-whiskey mashes contain at least 80 percent. Combinations of similar traight whiskeys of different distillation periods or from different distillers are designated as blended, rather than straight.

Whiskeys are consumed both unmixed and mixed in cocktails, punches, and highballs. The United States is the world's largest producer and consumer of whiskey.

Whiskey Rebellion (1794), in American history, uprising that afforded the new U.S. government its first opportunity to establish federal authority by military means within state boundaries, as officials moved into western Pennsylvania to quell an uprising of farmers rebelling against the liquor tax. Alexander Hamilton, secretary of the Treasury, had proposed the excise (enacted by Congress in 1791) to raise money for the national debt and to assert the power of the national government. Small farmers of the back country, who distilled and consumed whiskey in prodigious quantities, resisted the tax by attacking federal revenue officers who attempted to collect it.

Enforcement legislation touched off what appeared to be an organized rebellion, and in July of 1794 about 500 armed men attacked and burned the home of the regional tax inspector. The following month President George Washington issued a congressionally authorized proclamation ordering the rebels to return home and calling for militia from four neighbouring states. After fruitless negotiations, Washington ordered some 13,000 troops into the area, but opposition melted away and no battle ensued. Troops occupied the region and some of the rebels were tried, but the two

convicted of treason were later pardoned by the President.

Many Americans, particularly members of the opposition Jeffersonian Republican Party, were appalled by the overwhelming use of governmental force, which they feared might be a first step to absolute power. To Federalists, however, the most important result was that the national authority had triumphed over its first rebellious adversary and had won the support of the state governments in enforcing federal law within the states.

Whiskey Ring, in U.S. history, group of whiskey distillers (dissolved in 1875), who conspired to defraud the federal government of taxes. Operating mainly in St. Louis, Milwaukee, and Chicago, the Whiskey Ring bribed Internal Revenue officials and accomplices in Washington in order to keep liquor taxes for themselves. Benjamin H. Bristow, secretary of the treasury, organized a secret investigation that exposed the ring and resulted in 238 indictments and 110 convictions. Allegations that the illegally held tax money was to be used in the Republican Party's national campaign for the reelection of Pres. Ulysses S. Grant aroused the public. Though Grant was not suspected, his private secretary, Orville E. Babcock, was indicted in the conspiracy but was acquitted after Grant testified to his innocence.

whisky (carriage): see one-horse shay.

whisper, speech in which the vocal cords are held rigid, preventing the vibration that produces normal sounds. In whispering, voiceless sounds are produced as usual; but voiced sounds (e.g., vowels) are produced by forcing air through a narrow glottal opening formed by holding the vocal cords rigid and close together. See also voice; vocal fry.

Whist, card game or any of a family of card games that includes Bridge Whist, Auction Bridge, and Contract Bridge, all of which derived from the original Whist. In the Whist family of card games two play against two, and a 52-card pack is dealt into four hands of 13 cards each; the object of play is to take tricks consisting of one card from each player. Before play begins one suit may be designated trump, in which case any card in that suit beats any card of the other suits. In Whist itself, trump is determined by turning up the last card dealt.

Variations of Whist include Solo Whist, Boston Whist (Boston), and Vint.

whistle, short flute having a stopped lower end and a flue that directs the player's breath from the mouth hole at the upper end against the edge of a hole cut in the whistle wall,

(Top) Modern traffic whistle; (bottom) bone whistle, c. 10,000 BC, in the Pitt-Rivers Museum, Oxford By courtesy of (top) Sports, Inc., (bottom) the Pitt-Rivers Museum, Oxford

causing the enclosed air to vibrate. It has no finger holes and sounds only one pitch. It was made originally in primitive societies from bird bones, and it is considered by many scholars to be the oldest flute type known. It is mainly used for signalling and, in many primitive societies, in music.

If a pellet is enclosed—as in a policeman's whistle—it interferes with the air vibration, causing a warbling sound. In a slide whistle (piston flute or Swanee whistle) the lower end consists of a sliding stopper, allowing change of pitch. Longer, open flutes with the whistle's flue and lateral hole are called fipple, or whistle, flutes.

whistle flute: see fipple flute.

whistler (bird): see thickhead.

whistler (duck): see goldeneye.

whistler, also called WHISTLING ATMOSPHERIC, gliding high-to-low-frequency sound occasionally emitted by a sensitive audioamplifier. It initially lasts about half a second, may be repeated at equal intervals, and grows progressively longer and fainter with time. The origin of these sounds in the atmosphere is lightning discharges, particularly the associated electromagnetic radiation with frequencies of 300 to 30,000 hertz.

These electromagnetic waves cannot be heard directly but are converted into audible sound waves of the same frequency range by the audioamplifier. They are propagated from one hemisphere to another in the ionized portions of the Earth's upper atmosphere (as high as 19,000 to 26,000 kilometres [12,000 to 16,-000 miles] at the magnetic equator). Led by the faster, higher frequency waves, these signals move along the magnetic lines of force until they are reflected at the corresponding geomagnetic latitude in the opposite hemisphere. The arrival at the amplifier of the high-frequency component ahead of the lower pitched sound accounts for the whistle, and the repeated reflections caused by dispersion and absorption of the waves are responsible for the subsequent fainter and longer whistle

Studies of these dispersion effects have been used to determine the electron density at altitudes of 19,000 to 26,000 kilometres, as well as daily, annual, and long-term variations of the electron density in the upper atmosphere.

Whistler, James (Abbott) McNeill (b. July 14, 1834, Lowell, Mass., U.S.—d. July 17, 1903, London), American-born artist noted for his paintings of nocturnal London, for his striking and stylistically advanced full-length portraits, and for his brilliant etchings and lithographs. An articulate theorist about art, he did much to introduce modern French painting into England. His most famous work is "Arrangement in Grey and Black, No. 1: The Artist's Mother" (1871–72; popularly called "Whistler's Mother"). His "nocturnes" include "Old Battersea Bridge: Nocturne—Blue and Gold" (c. 1872–75).

Early years. James Abbott McNeill Whistler was born of Scottish-Irish ancestry. As a boy he spent some time in Russia at St. Petersburg, where his father was a civil engineer; after a short stay in England en route, he was back in the United States by 1849. He attended the United States Military Academy at West Point, but he soon abandoned the army for art.

Like many of his compatriots he was fascinated by Paris, where he arrived in 1855 to study painting. He had read Henri Murger's Scenes de la vie de bohème (1847-49; The Bohemians of the Latin Quarter, 1883) before leaving the United States, and he soon adopted a Bohemian lifestyle. He made friends among the English and French students work-

"The Artist in His Studio," oil on panel by James McNeill Whistler, c. 1867–68; in the Art Institute of Chicago

ing in Paris and won a place as "Jo Sedley, the idle apprentice" in George Du Maurier's novel *Trilby*. He was drawn to the French modern movement, responding to the realism associated with the painters Gustave Courbet, Henri Fantin-Latour, and François Bonvin, all of whom he knew. The realistic streak in his art may be seen in such early works as "Self-Portrait" and the *Twelve Etchings from Nature*.

During the 1860s Whistler moved between England and Paris; he also visited Brittany (1861) and the coast near Biarritz (1862), where he painted with Courbet and evinced that love of the sea that was to mark many of his later small oil studies and watercolours. He settled in London in 1863 where he found congenial themes on the Thames, and the etchings that he did of such subjects won praise from Charles Baudelaire when they were exhibited in Paris.

The move to London. Whistler won considerable success in Paris when "Symphony in White No. 1: The White Girl" was shown at the Salon des Refusés in 1863. This famous painting shows that if he was an exponent of realism, he was also attracted by the Pre-Raphaelite movement, which had begun in England in 1848. It was typical of his eclectic spirit that this should have been so, and he was increasingly drawn toward idealistic painting.

One of his chief claims to fame was his delight in the Japanese arts-then an avant-garde taste that, significantly, was to have many followers in his own country. Paintings such as "Rose and Silver: La Princesse du Pays de la Porcelaine" or "Caprice in Purple and Gold, No. 2: The Golden Screen" indicate his interest in the picturesque rather than the formal aspects of this style. "Symphony in Grey and Green: The Ocean," the result of a trip to Valparaiso, Chile, was, however, more Oriental in mood: the signature on this work is painted in an Oriental fashion. This style received its finest expression in "Old Battersea Bridge: Nocturne—Blue and Gold." His appreciation of Oriental art was complemented by one for earthenware Tanagra figurines from Hellenistic Greece, and their elegant forms influenced his figure painting and drawing; both the Oriental and Hellenistic strains were blended in a series of highly coloured sketches, Six Projects (Freer Gallery of Art, Washington, D.C.). His love of Classical art was stimulated by his friendship with the British painter Albert Moore, one of the few artists with whom he did not have a falling-out.

The 1860s and the 1870s were especially creative for Whistler. It was then that he began to give musical titles to his paintings, such as "Symphony" and "Harmony." In doing so he revealed a dependence on the theory of art for art's sake, which esteemed music as the most abstract of the arts, and on the belief in the "correspondences" between the arts associated with Baudelaire and the French poet Théophile Gautier. It should be emphasized, however, that Whistler was not a lover of music for its own sake. During this period he started to paint his nocturnes-scenes of London, especially of Chelsea, that have poetic intensity and a fin de siècle flavour. These were based on memory or on pencil sketches. For them he evolved a special technique by which paint, in a very liquid state he called a sauce, was stroked onto the canvas in fast sweeps of the brush, somewhat in the manner of Oriental calligraphy, thus anticipating the technique of the Action painting that flour-ished after World War II.

From the 1870s onward he was preoccupied by the problems of portrait painting, creating a number of masterpieces, "Arrangement in Grey and Black, No. 1: The Artist's Mother, "Miss Cicely Alexander: Harmony in Grey and Green," "Arrangement in Grey and Black, No. 2: Thomas Carlyle," and "Symphony in Flesh Colour and Pink: Mrs. Frederick R. Leyland," among others. These are paintings that underline his aestheticism, his liking for simple forms and muted tones, and his dependence on the 17th-century Spanish painter Diego Velázquez; they also show that he was in the line of descent from the court portraiture of the 17th-century Flemish master Sir Anthony Van Dyck.

Whistler touched the artistic life of his time at many points. He engaged in decorative work, as was shown by the stand he executed for the 1878 Paris exhibition (his collaborator was the architect E.W. Godwin) and later his frieze for the Grosvenor Gallery in London. Above all he painted the famous Peacock Room (begun 1876) for No. 49 Prince's Gate, London, the house of F.R. Leyland, a Liverpool shipping magnate. The decoration failed to please his patron, (who felt Whistler had exceeded his commission, particularly in painting over some antique leather. The room was moved in 1919 to the Freer Gallery of Art. Whistler was also a force in book design.

During these years in London he came to know many of the most interesting artists of the day-such as Dante Gabriel Rossetti and Albert Moore-and he was a high priest of bohemianism, living for long with Jo Hiffernan, an Irish woman who served as a model to Courbet as well as to the artist himself. Although often short of money, he entertained considerably and was already becoming one of the most talked-of men in London.

A change occurred in his life in 1877 when he brought a libel suit against John Ruskin, the celebrated writer on aesthetics, for his attack on "Nocturne in Black and Gold: The Falling Rocket." He won the case but received damages of only a farthing (the least valuable coin of the realm). The need to pay substantial costs occasioned his bankruptcy in 1879, and he was forced to move out of his charming home, the White House in Chelsea. He went to Venice with his mistress, Maud Franklin. He remained there for 14 months and soon became a centre of attraction among the many foreign artists who congregated in the city. He seldom painted in oils there, however, and spent most of his time producing pastels and watercolours, exquisite in their colouring. He had arrived with a commission to execute a series of etchings for the Fine Art Society. In all he made just more than 50 etchings of Venetian subjects, which are among the most striking graphic works of the time.

His etchings won him success in London when exhibited upon his return in 1880 and in 1883. He continued to paint portraits—those of Pablo de Sarasate, Lady Archibald Campbell, Théodore Duret, and Robert, comte de Montesquiou-Fezensac are among the finestbut with increasing difficulty, as he was obsessed by the problem of achieving perfection.

The challenge of his final period. Whistler faced many problems in later years. He may have felt that he was out of step with modern movements. For instance, by the 1890s, Impressionism was a dominant style, but he himself, though keen on painting after nature, never used the radiant colours or technique of the Impressionists. He was happiest in painting small studies of townscape and seascape that reflect the influence of the 19th-century French painter Camille Corot. He made many etchings and lithographs, but—significantly at a time when colour lithographs were becoming popular—only three or four of his were in colour. His black-and-white lithographs, however, are delightful. In some of the etchings he made of Dutch scenes in 1889, a development in his art may be observed; for instance, in the "Embroidered-Curtain," an arrangement of flattened space was used, and the eye is drawn to the scene as a whole rather than to any detail of it; in this, it exhibited a relationship with the artistic conceptions of the Nabis. a group of French painters active at that time.

After his return from Venice, Whistler became a great figure in London life, seeking publicity and winning points against Oscar Wilde in controversy. He was a master of personal publicity. In 1888 he married Beatrix Godwin, the widow of E.W. Godwin, with whom he had collaborated for the Paris exhibition. Whistler and his wife spent much time in Paris on the Left Bank. When Beatrix Whistler died in 1896, Whistler was deeply upset, and his final years were sad. Although he kept in touch with his contemporaries and ran an art school in Paris, his productive pe-

riod was over.

Assessment. In the early 1900s many excellent judges of art considered Whistler to be one of the leading painters as well as one of the most fascinating personalities of the day. The influence of this versatile artist was widespread both in Europe and the United States: British artists such as Walter Sickert and Philip Wilson Steer owed much to him. He was a pioneer, for his vision of London by night and his impressionistic etchings of Venice opened the eyes of many in his generation to the unexpected beauties of their surroundings. He was a portrait painter of individuality whose likenesses show him to have been an exponent of the uncompromising modernism advocated by the 19th-century French poet and critic Charles Baudelaire. Whistler was also a brilliant graphic artist, and his prolific etchings and lithographs, noting throughout his career a personality or a scene that took his fancy. reveal much about his artistic character.

Whistler loved to occupy the centre of the stage. He was stylish by nature and a wit by conviction, and he blended both elements in his letters to the press or in such publications as The Gentle Art of Making Enemies (1890). In his famous "Ten O'Clock" lecture (1885) he emphasized his belief in the "art for art's sake" movement. During his later years he served as president of the International Society of Sculptors, Painters and Gravers, did much to introduce a knowledge of modern French painting into England, and revitalized the Society of British Artists. Within a relatively short time, however, the reputation of this versatile artist suffered a decline, and only recently has Whistler begun to receive serious acclaim once again. (D.Su./Ed.)

MAJOR WORKS. Paintings. "Self-Portrait" (c. 1857-58; Freer Gallery of Art, Washington, D.C.); "At the Piano" (1858; Taft Museum, Cincinnati,

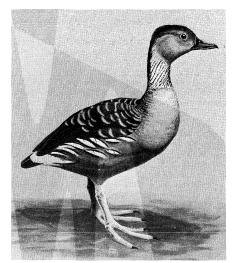

Ohio); "Wapping" (1861; John Hay Whitney Collection, New York); "Coast of Brittany: Alone with the Tide" (1861; Wadsworth Atheneum, Hartford, Conn.); "Symphony in White No. 1: The White Girl" (1862; National Gallery of Art, Washington, D.C.); "Battersea Reach" (c. 1863-65; Corcoran Gallery of Art, Washington, D.C.); "Rose and Silver: La Princesse du Pays de la Porcelaine" ("Portrait of Miss Christine Spartali"; 1864; Freer Gallery of Art); "Caprice in Purple and Gold, No. 2: The Golden Screen" (1864; Freer Gallery of Art); "Lady of the Lang Lijsen" (1864; Philadelphia Museum of Art); "Harmony in Blue and Silver: Trouville" (1865; Isabella Stewart Gardner Museum, Boston); "Valparaiso: Crepuscule in Flesh Colour and Green" (1866; Tate Gallery, London); "Symphony in Grey and Green: The Ocean" (1866-67; Frick Collection, New York City); "Symphony in White No. 3" (1867; Barber Institute of Fine Arts, Birmingham, Eng.); "The Artist in His Studio" (c. 1867-68; Art Institute of Chicago); "Three Figures: Pink and Grey" (c. 1868; Tate Gallery); "Arrangement in Grey and Black, No. 1: The Artist's Mother" (1871-72; Louvre, Paris); "Old Battersea Bridge: Nocturne-Blue and Gold" (c. 1872–75; Tate Gallery); "Miss Cicely Alexander: Harmony in Grey and Green" (c. 1873; Tate Gallery); "Arrangement in Grey and Museum and Art Gallery), "Nocturne in Black and Gold: The Falling Rocket" (c. 1874; Detroit Institute of Arts), "Cremorne Gardens, No. 2." (c. 1875; Metropolitan Museum of Art, New York "The Lagoon, Venice: Nocturne in Blue and Silver" (1880; Museum of Fine Arts, Boston); "Portrait of Théodore Duret" (1883; Metropolitan Museum of Art); "Arrangement in Black: Pablo de Sarasate" (1884; Carnegie Institute, Pittsburgh); "Arrangement in Black: The Lady in the Yellow Buskin-Lady Archibald Campbell" (c. 1884; Philadelphia Museum of Art); "Grey and Silver: The Life Boat" (c. 1884; Freer Gallery of Art); 'The Angry Sea" (c. 1884; Freer Gallery of Art); "George W. Vanderbilt" (c. 1897; National Gallery of Art, Washington, D.C.); "Brown and Gold: Self-Portrait" (c. 1900; National Gallery of Art, Washington, D.C.).

Etchings. Twelve Etchings from Nature ("The French Set") (1858; Freer Gallery of Art); 12 Venetian etchings (1880); 26 Venetian etchings (1886). Interior decoration. The Peacock Room (1876-77; Freer Gallery of Art).

BIBLIOGRAPHY. J. and E. Pennell, The Life of James McNeill Whistler, 2 vol. (1908, reprinted 1973), and The Whistler Journal (1921), contain firsthand accounts of the artist. Though the life contains some inaccuracies, it is a fundamental volume. For catalogs and studies of the artist's graphic work, see Edward G. Kennedy, The Etched Work of Whistler, 4 vol. (1910); Howard Mansfield, A Descriptive Catalogue of the Etchings and Dry-Points of James A. McNeill Whistler (1909); and T.R. Way, Mr. Whistler's Lithographs (1905). A catalog of Whistler's painting is now in preparation. There are modern studies by James Laver, Whistler, 2nd ed. (1951); Hesketh Pearson, The Man Whistler (1952; U.S. ed. 1978); Horace Gregory, The World of James McNeill Whistler (1959, reprinted 1969); Denys Sutton, Nocturne: The Art of James McNeill Whistler (1963) and James McNeill Whistler: Paintings, Etchings, Pastels and Watercolours (1966); Roy McMullen, Victorian Outsider (1973); Stanley Weintraub, Whistler (1974); Gordon H. Fleming, The Young Whistler, 1834-1866 (1978); Hilary Taylor, James McNeill Whistler (1978); and Frances Spaulding, Whistler (1979). Important information is contained in the Arts Council catalog of a Whistler exhibition (1960); and in Whistler's Gentle Art of Making Enemies (1890, reprinted 1967).

whistling duck, also called TREE DUCK (Dendrocygna), any of eight species of long-legged and long-necked ducks that utter sibilant cries and may make whirring wing sounds in flight; these distinctive ducks are separated from other members of the family Anatidae (q.v.;order Anseriformes) as a tribe Dendrocygnini. Whistling ducks are sociable though aggressive. The sexes are nearly identical in plumage

and behaviour, which includes mutual preening in some species. Whistling ducks fly with slow wingbeats and legs trailing. They sometimes perch in trees or on posts and walk

Fulvous tree duck (Dendrocygna bicolor)

readily with an upright stance. Although several species nest in hollow trees, ground sites are more often used. Drakes help build the nest and rear the young; in some species they also share in incubation.

Typical of the tribe is the fulvous tree duck (*Dendrocygna bicolor*), with isolated populations in North and South America, India, and Africa—a most unusual world distribution and, remarkably, without geographic variation. It is mallard-sized, with rusty brown body, white rump, and creamy stripes on the flanks.

Whiston, William (b. Dec. 9, 1667, Norton, Leicestershire, Eng.—d. Aug. 22, 1752, Lyndon, Rutland), Anglican priest and mathematician who sought to harmonize religion

Whiston, oil painting by an unknown artist after a portrait by Sarah Hoadly, c. 1720; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

and science, and who is remembered for reviving in England the heretical views of Arianism.

Ordained in 1693, Whiston served from 1694 to 1698 as chaplain to John Moore, Anglican bishop of Norwich. During this period he wrote A New Theory of the Earth (1696), in which he claimed that the biblical stories of the creation, flood, and final conflagration could be explained scientifically as accounts of events with historical bases. After three years as vicar of Lowestoft (1698–1701), he returned to Cambridge, his alma mater, as assistant to the mathematician Sir Isaac Newton, whom he succeeded as professor in 1703.

From the works of early Christian writers,

Whiston was led to Arianism, a doctrine that denied the divinity of Christ. Deprived of his professorship in 1710 because of his unpopular notions, Whiston organized a society for the revival of primitive Christianity, whose members met weekly in his London home (1715–17). Finally, in 1747, he left the Church of England to join the General Baptists. Among Whiston's other works are *The Accomplishment of Scripture Prophecies* (1708), *Primitive Christianity Revived*, 5 vol. (1711–12), a translation (1737) of the works of the Jewish historian Josephus, a revision (1745) of the King James Version of the New Testament, and his own *Memoirs* (1749–50).

Whitaker, Sir Frederick (b. April 23, 1812, Bampton, Oxfordshire, Eng.—d. Dec. 4, 1891, Auckland, N.Z.), solicitor, politician, and businessman who served twice as prime minister of New Zealand (1863–64; 1882–83). He was an advocate of British annexation in the Pacific and of the confiscation of Maori lands for settlement.

After studying law, Whitaker went to Sydney as a solicitor and then on to Auckland (1841), where he sat as an unofficial member of the governor's Legislative Council and served in the militia (1845–46). He became Auckland's provincial solicitor (1853) and a member of the provincial executive, the first of several political posts that included lengthy service in the Legislative Council (1853–64; 1879–91) and the superintendency of Auckland (1865–67). He held the office of attorney general for more than 20 years under various governments between 1854 and 1891, twice serving while he was prime minister.

Whitaker was deeply involved in land speculation, and the policy of his first government was to suppress the Maori at crown expense, confiscate their land, and then develop it with the aid of a £3,500,000 British loan. After his second premiership he emerged as a strong advocate of British colonial expansion in the Pacific, a stance consistent with his business interests in Fiji and New Zealand.

An efficient rather than a popular leader, Whitaker expressed some political liberalism in his advocacy of universal male suffrage (rather than restricting it to property owners), proportional representation, and an elective upper house. He was knighted in 1884. Whitaker spent the last decade of his life practicing law and was faced with near financial ruin as a result of the depression of the later 1880s.

Whitby, parish (town), Scarborough district, county of North Yorkshire, England. The old North Sea port town is clustered on the east side of the harbour at the mouth of the River Esk, which there breaches the forbidding cliff line. Opposite, on the West Cliff, Victorian seaside resort development took place. On the East Cliff, above the town, is an abbey founded as early as 656. The plowboy Caedmon, acclaimed as the first poet in the English language, died there in 680. Whitby prospered during the Middle Ages as a fishing port and was incorporated by the end of the 12th century. Herring has been its economic mainstay, and for a time it was an important whaling port. It has produced many fine sailors, most famous among them Capt. James Cook, whose wooden ships that took him on his famous voyages around the world (1769-75) were built at Whitby. A range of local minerals have, in succession, also been of economic importance. In the 17th century the alum shales that outcrop on the cliffs nearby were burned with seaborne coal from Newcastle. Whitby ironstone was shipped to Tyneside before the discovery (in 1850) of the Cleveland ore field. Since the 1950s methane gas and deep-seated deposits of potash have been opened up in Eskdale, behind Whitby. The town serves an extensive, if thinly populated, farming area in Eskdale, set amid the North Yorkshire Moors.

Harbour of Whitby, North Yorkshire, seen from the old town

A.F. Kersting

Its harbour and moorland surroundings attract many tourists. Pop. (1981) urban area, 13.377.

Whitby, Synod of, a meeting held by the Christian Church of the Anglo-Saxon kingdom of Northumbria in 663/664 to decide whether to follow Celtic or Roman usages. It marked a vital turning point in the development of the church in England.

Though Northumbria had been mainly converted by Celtic missionaries, there was by 662 a Roman party, which included Queen Eanfled, Bishop Wilfrid, and other influential people. The Celtic party was led by the bishops Colman and Cedd and Abbess Hilda. Two accounts of the synod survive, in Bede's Ecclesiastical History of the English People and in the life of Wilfrid by the monk Eddi. King Oswiu decided in favour of Rome because he believed that Rome followed the teaching of St. Peter, the holder of the keys of heaven. The decision led to the acceptance of Roman usage elsewhere in England and brought the English Church into close contact with the Continent.

White, Andrew Dickson (b. Nov. 7, 1832, Homer, N.Y., U.S.—d. Nov. 4, 1918, Ithaca, N.Y.), American educator and diplomat, founder and first president of Cornell University.

After graduation from Yale in 1853, White studied in Europe for the next three years, serving also as attaché at the U.S. legation at St. Petersburg, Russia, in 1854-55. He returned to the United States to become professor of history and English literature at the University of Michigan, Ann Arbor. In 1865 White's dream of a state university for New York—based on liberal principles with reference to religion, coeducation, race, and the teaching of science unhampered by religious dogma—was realized when Cornell University, Ithaca, was chartered. As Cornell's first president, White devoted his energies and much of his wealth to assure its success and future growth.

Andrew Dickson White, c. 1886

By courtesy of Cornell University Archives, Ithaca, N Y

White served on numerous government commissions and was U.S. minister to Germany (1879-81) and Russia (1892-94) and ambassador to Germany (1897-1902). In 1899 he was president of the U.S. delegation at the Hague Peace Conference. The most outstanding of his works are A History of the Warfare of Science with Theology in Christendom (1896) and Seven Great Statesmen in the Warfare of Humanity with Unreason (1910).

White, Byron R(aymond) (b. June 8, 1917, Fort Collins, Colo., U.S.), associate justice of the United States Supreme Court (from 1962).

Before taking up the study of law in 1940, White achieved a national reputation as a quarterback on the University of Colorado football team and played for one season with the Pittsburgh Pirates (now the Steelers). After a year at Oxford as a Rhodes scholar, "Whizzer" White played two seasons with the Detroit Lions while attending Yale Law School.

White served for a year as law clerk to Chief Justice Fred M. Vinson before joining a law firm in Denver. In 1960 he was active in the presidential campaign of John F. Kennedy, an old friend, and in 1961 was made assistant attorney general under the President's brother Robert Kennedy. In 1962 Pres. Kennedy appointed him to the U.S. Supreme Court. Suprisingly to observers of the Court and to the Kennedy administration, White sided with the conservative bloc from his earliest decisions, taking a very narrow view of protections under the 1st Amendment.

White, E(lwyn) B(rooks) (b. July 11, 1899, Mount Vernon, N.Y., U.S.—d. Oct. 1, 1985, North Brooklin, Maine), leading American essayist and literary stylist of his time.

White, who graduated from Cornell University, Ithaca, N.Y., in 1921, was a reporter and free-lance writer before joining The New Yorker magazine as a writer and contributing editor in 1927 and married Katherine Sergeant Angell, The New Yorker's first fiction editor, in 1929 (he remained with the weekly magazine for the rest of his career). White collaborated with James Thurber on Is Sex *Necessary?* (1929), a spoof of the then-current sex manuals. He also contributed a monthly column to Harper's (1938-43) magazine. In 1935 he published, with William Strunk, Jr., the first edition of The Elements of Style, which became a standard style manual for writing in the English language. In 1941 he edited with his wife A Subtreasury of American Humor. His three books for children-Stuart Little (1945), Charlotte's Web (1952), and The Trumpet of the Swan (1970)—are considered classics. Other of his works include Points of My Compass (1962). Letters of E.B. White, edited by D.L. Guth, appeared in 1976, his collected essays in 1977, and Poems and Sketches of E.B. White in 1981. He was awarded a Pulitzer Prize special citation

White, Edward Douglass (b. Nov. 3, 1845, near Thibodaux, La., U.S.—d. May 19, 1921, Washington, D.C.), ninth chief justice of the United States (1911–21), whose major contribution to U.S. jurisprudence was his "rule of reason" decision in 1911 that federal courts have since applied to antitrust cases.

The son of a judge, U.S. congressman, and Louisiana governor, White received a Roman Catholic Jesuit education and fought briefly for the Confederacy in the Civil War, after which he was trained in a New Orleans law office. Entering Louisiana politics as a Democrat, he was elected a state senator in 1874 and was appointed to the state Supreme Court in 1878. Elected to the U.S. Senate in 1890, he was elevated to the U.S. Supreme Court by Pres. Grover Cleveland in 1894.

As an associate justice, he formulated the concept of the "incorporation" of territories

Edward Douglass White

By courtesy of the National Archives, Washington, D.C.

acquired by the United States in 1898. In a concurring opinion in *Downes* v. *Bidwell* (1901), one of a group called the Insular cases, White argued that "incorporation" into the United States, by treaty or statute, determined the availability of constitutional safeguards to residents of a new U.S. possession. This vague criterion was adopted by a majority of the court in 1905 and was invoked to deny constitutional protection in Hawaii and the territories won from Spain, which were held to be "unincorporated."

Promoted to the chief justiceship by Pres. William Howard Taft in 1910, White assumed office early the next year. In Standard Oil Company of New Jersey v. United States and United States v. American Tobacco Company (both 1911) he promulgated the idea that a restraint of trade by a monopolistic business must be "unreasonable" to be illegal under the Sherman Act. His failure to define a "reasonable" restraint, coupled with the imprecise brevity of the Sherman Act, made subsequent anti-trust decisions exceedingly difficult to predict.

During World War I, White wrote two important decisions in favour of federal emergency powers. Wilson v. New (1917) sustained the Adamson Act of 1916, fixing minimum wages and maximum hours for railroad workers. Military conscription was upheld in the Selective Draft Law Case (Arver v. United States; 1917).

A biography, Edward Douglass White, Chief Justice of the United States, by Sister Marie Carolyn Klinkhamer, appeared in 1943.

White, Edward H(iggins), II (b. Nov. 14, 1930, San Antonio, Texas, U.S.—d. Jan. 27, 1967, Cape Kennedy, Fla.), first U.S. astronaut to walk in space and one of the three-man crew of Apollo 1 who were the first casualties of the U.S. space program, killed during a flight simulation (the others were Virgil I. Grissom and Roger B. Chaffee).

White was graduated from the U.S. Military Academy, West Point, N.Y., in 1952 and was commissioned a second lieutenant in the U.S. Air Force. He took flight training and served in a fighter squadron in Germany. In 1959 he received his M.S. in aeronautical engineering from the University of Michigan, Ann Arbor, and graduated from the Air Force Test Pilot School, Edwards Air Force Base, California.

White was selected in 1962 as a member of the second group of astronauts. Often called the most physically fit astronaut, he was chosen to join James A. McDivitt on the four-day orbital flight of Gemini 4, launched on June 3, 1965. During the third orbit White emerged from the spacecraft, floated in space for about 20 minutes, and became the first person to propel himself in space with a maneuvering unit.

White, Gilbert (b. July 18, 1720, Selborne, Hampshire, Eng.—d. June 26, 1793, Selborne), English naturalist and clergyman, author of *The Natural History and Antiquities* of *Selborne* (1789), the first work on natural history to attain the status of an English classic. White was educated at Oriel College,

Oxford (1740-43), and, although he remained a fellow there until his death, he spent most of his life in Selborne.

In 1751, soon after he was ordained, White began a journal in which he noted observations made in his garden. This account was eventually published as a Calendar of Flora and the Garden (1765), followed by the more sophisticated Naturalist's Journal, begun in 1768. Publication of The Natural History, a composite of 110 of White's letters on the subject to his friends, concluded 20 years of intense effort. It was immediately met with the acclaim of major naturalists, who were impressed by White's methodical approach and keen sense of observation.

White, Helen Magill, née MAGILL (b. Nov. 28, 1853, Providence, R.I., U.S.—d. Oct. 28, 1944, Kittery Point, Maine), educator who was the first woman in the United States to earn a Ph.D. degree.

Helen Magill received an A.B. from Swarthmore College (Swarthmore, Pa.) in 1873. In 1877 she earned a Ph.D. in Greek from Boston University, with a dissertation on Greek drama. For the next four years she studied classics at Cambridge University. On her return to the United States she became a private school principal and, in 1883, was appointed director of the Howard Collegiate Institute of West Bridgewater, Mass., a women's college. From 1887 to 1888 she helped organize the annex for women at Princeton University.

In 1890 she married Andrew Dickson White (1832–1918), then the former president of Cornell University. She ended her academic career as she accompanied him on his travels as minister to Russia (1892–94) and ambassador to Germany (1897–1903).

Helen Magill received her doctorate 16 years after the first U.S. Ph.D.'s were conferred on men (by Yale University).

White, John (d. c. 1593, Kylemore, County Galway, Ire.), British artist, explorer, cartographer, and governor of Roanoke.

He was a member of the Painter-Stainers Company and in May 1577 sailed on the ship Aid as part of an expedition to America commanded by Martin Frobisher. The expedition, sponsored by the Cathay Company in its search for precious metals and a northwest passage to Asia, sailed to Greenland and Baffin Island before returning to England in September 1577. The expedition discovered neither a northwest passage nor precious metals, but White drew some illuminating sketches of the lands and natives encountered on the voyage.

In April 1585 he sailed on an expedition sponsored by Sir Walter Raleigh and commanded by Sir Richard Grenville that planted a settlement in July on Roanoke Island. White executed many paintings and sketches of the lands, native peoples, flora, and fauna of the region, and 23 of his paintings were used later to illustrate Thomas Hariot's A Briefe and True Report of the New Found Land of Virginia. The colony, under the governorship of Ralph Lane, was abandoned in June 1586, and White returned to England.

In May 1587 White sailed with more than 100 colonists as governor of a second colony that Sir Walter Raleigh attempted to found in North America. The colony was established on Roanoke Island that July, but on Aug. 25, 1587, White returned to England. He arrived there in November, but because of the approaching war with Spain, he was unable to secure a relief expedition immediately. When the expedition arrived at the island in August 1590, they found no trace of any colonists, including White's daughter and his granddaughter, Virginia Dare (q.v.). White retired to a

home in Ireland. In February 1593 he wrote an account of his final voyage to Virginia.

White, Joseph Blanco, original name José MARÍA BLANCO Y CRESPO (b. June 11, 1775, Seville—d. May 20, 1841, Liverpool), Spanish-born English poet, journalist, and writer of miscellaneous prose, chiefly remembered as a friend of the leaders of the English Romantic movement and of the High Church Party in the Church of England.

Joseph Blanco White, pencil drawing by J. Slater, 1812; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

White was a Roman Catholic priest who became a freethinker. He began a journalistic career in 1808 during the French invasion of Spain as an advocate of Spanish independence. When, in 1810, the French entered Seville, he fled to England, becoming editor of El español ("The Spaniard"), a periodical that fomented Spanish opposition to the French, and in 1815 received a British government pension. He took Anglican orders, anglicized his name, and became known as a writer of essays, poems, and popular polemical tracts on disputed points of dogma. His sonnet "Night and Death" (1828), highly praised for its grandeur by Samuel Taylor Coleridge, was his only work to be remembered after his death.

Doubt again disrupted his life: he left the church and, finally settling in Liverpool (then a centre of radical Unitarianism), spent his last years as an active Unitarian.

White, Leonard Dupee (b. Jan. 17, 1891, Acton, Mass., U.S.—d. Feb. 23, 1958, Chicago), American political scientist and historian who was a leading authority on public administration.

White graduated from Dartmouth College and received his Ph.D from the University of Chicago in 1921. He served on the University of Chicago faculty from 1920 to 1956 and was chairman of the political science department in 1940-48. He wrote the first textbook on public administration, Introduction to the Study of Public Administration (1926), and a definitive four-volume history of American administration: The Federalists (1948), The Jeffersonians (1951), The Jacksonians (1954), and The Republican Era, 1869-1901 (1958). The last of these was awarded the Pulitzer Prize for history in 1959. In addition to his teaching and writing, he served on numerous administrative boards and commissions. He was one of the founders of the Public Administration Review, serving as its editor-in-chief in 1940-41.

White, Leslie A(lvin) (b. Jan. 19, 1900, Salida, Colo., U.S.—d. March 31, 1975, Lone Pine, Calif.), American anthropologist best known for his theories of the evolution of culture and for the scientific study of culture that he called "culturology."

White firmly supported cultural evolution along the lines laid down by the 19th-century writers Herbert Spencer, Lewis H. Morgan,

and Edward Tylor, even when this view was in great disfavour. For White, cultural evolution was facilitated by technological development, particularly with regard to the increased harnessing of energy per capita. White's evolutionary views put him in conflict with the anti-evolutionary theories of Franz Boas and his supporters, who were then dominant in the field of cultural anthropology.

White considered his greatest contribution to anthropology to be his conception of culturology, outlined in a series of essays called *The Science of Culture* (1949). By culturology, White meant the application to culture of the organismic analogy of structure–function that Spencer had applied to society. This approach to culture was philosophically materialistic and nonreductionist.

After serving in the U.S. Navy, White entered Louisiana State University, but after two years he transferred to Columbia University. He received his B.A. and M.A. in psychology from Columbia, and his Ph.D. in sociology from the University of Chicago. In his early career, White did fieldwork among the Keresan Pueblo Indians of the American Southwest. From 1930 to 1970 he taught at the University of Michigan, where he won great popularity as a teacher and lecturer. In the last years of his life he was associated with the department of anthropology of the University of California, Santa Barbara. His most important works include The Evolution of Culture (1959) and The Concept of Culture (1973, with Beth Dillingham).

White, Minor (b. July 9, 1908, Minneapolis, Minn., U.S.—d. June 24, 1976, Cambridge, Mass.), American photographer and editor, whose efforts to extend photography's range of expression made him one of the most influential creative photographers of the mid-20th century.

White took up photography while very young but set it aside for a number of years to study botany and, later, poetry. He began to photograph seriously in 1937. His early years as a photographer were spent working for the Works Progress Administration (WPA). Many WPA photographers were chiefly concerned with documentation. White, however, preferred a more personal approach.

In 1945 his style was given its definitive form by study with Edward Weston and Alfred Stieglitz. From Weston, White learned the value of realism and tonal beauty in photographic prints, and from Stieglitz he learned the expressive potential of the sequence (a group of photographs presented as a unit) and the equivalent (a photographic image viewed as a visual metaphor). Both in his photographs and in his writing, White became the foremost exponent of the sequence and the equivalent.

In 1946 White moved to San Francisco, where he worked closely with the photographer Ansel Adams. Adams' zone system, a method of visualizing how the scene or object to be photographed will appear in the final print, formed the third major influence on White's work. The next year he succeeded Adams as director of the photography department of the California School of Fine Arts, where, during the course of his teaching, he developed a method of reading photographs called space analysis. He wrote extensively on his theories of photography as editor of the photography magazines *Aperture*, which he and others founded in 1952, and *Image*, which he edited from 1953 to 1957.

White was a meticulous technician who was scrupulously faithful in his work to the tones and textures of nature. Nevertheless, he was one of the leading abstract photographers of the mid-20th century, often giving mystical interpretations to his photographs. His already great position of influence was further enhanced in 1965, when he was made professor of creative photography at the Massachusetts

Institute of Technology, Cambridge, a position from which he retired shortly before his death. *Minor White: Rites and Passages*, a collection of his photographs and a biographical essay by James Baker Hall, was published in 1978.

White, Patrick (Victor Martindale) (b. May 28, 1912, London), the most influential of a group of mid-20th-century writers in Australia, winner of the Nobel Prize for Literature in 1973.

White was born in London while his parents were there on a visit, and he returned to England (after 12 years in Australia) for schooling. He then worked for a time at his father's sheep ranch in Australia before returning to study modern languages at King's College, Cambridge. By the time he served in the Royal Air Force during World War II, he had already published some early work, traveled extensively, and been involved with the theatre. After 1945 he returned to Australia, but also lived intermittently in England and in the United States.

White's first novel, Happy Valley (1939), was set in New South Wales and showed the influence of D.H. Lawrence and Thomas Hardy. The material of White's later novels is distinctly Australian, but his treatment of it has a largeness of vision not limited to any one country or period. White saw Australia as a country in a highly volatile process of growth and self-definition, and his novels explore the possibilities of savagery to be found within such a context. His conception of Australia reflected in The Tree of Man (1955), Voss (1957), Riders in the Chariot (1961), The Solid Mandala (1966), and The Twyborn Affair (1979) is the product of an individual, critical, poetic imagination. His style is dense with myth, symbol, and allegory. His deepest concern is for man's sense of isolation and his search for meaning.

White wrote plays, including *The Season at Sarsaparilla* (produced 1962; published in *Four Plays*, 1965), *Night on Bald Mountain* (produced 1964), and *Signal Driver* (1982); short stories; the autobiographical *Flaws in the Glass* (1980); a screenplay; and a book of poems. He was involved in the 1975 constitutional crisis, concerning the role of Australia's governor general.

White, Pearl Fay (b. March 4, 1889, Green Ridge, Mo., U.S.—d. Aug. 4, 1938, Paris), one of the most successful of the early American film stars, who gained international fame for her work in "chapter stories"—long-running melodramatic serials, such as *The Perils of Pauline*.

White left home at 18 to join a traveling theatre troupe. In 1910 she began her film career with the Powers Film Company in New York City; in the next 13 years she would make more than 100 comedies, serials, and westerns. She was first known for her work in such short slapstick comedies as "The Girl in the Next Room" and "Her Dressmaker's Bill. In 1914 she starred in a 20-episode serial for the American branch of the French film company Pathé Frères. The Perils of Pauline was the most successful example of its genre—the short-episode serial that emphasized suspense, danger, and the cliff-hanger ending that aimed at bringing the audience back for the next sequel. The Perils of Pauline made White an international movie star whose fame for a while eclipsed even that of Mary Pickford. Among the other serials that she made were The Exploits of Elaine (1914-15), The Iron Claw (1916), and The Black Secret (1919-20).

In the 1920s, with the rise of the feature film, serials lost popularity, and White failed in her attempt to make the transition to the new genre. After 1923 she lived in Paris. She was married twice, to the actors Victor Sutherland, in 1907, and Wallace McCutcheon, in 1919.

White, Stanford (b. Nov. 9, 1853, New York City—d. June 25, 1906, New York City), American architect and the most imaginative partner in the influential architectural firm McKim, Mead, and White.

Madison Square Garden (demolished), New York City, designed by Stanford White, 1891

By courtesy of the Museum of the City of New York, the J. Clarence Davies Collection

Stanford White was the son of the essayist, critic, and Shakespearean scholar Richard Grant White. He was carefully trained as an architect by Henry Hobson Richardson. In June 1880 he joined Charles Follen McKim and William Rutherford Mead in founding a new architectural firm that soon became the most popular and prolific one in the country. Until about 1887 their organization concentrated on designing large country and seaside mansions in what was called the Shingle style. White designed one of the subtlest of these informally planned structures, the Casino (1881) at Newport, R.I. Subsequently, the partners, aided by their gifted draftsman Joseph Morrill Wells, led the American trend toward Neoclassicism and away from the more original styles then being developed in Chicago and

White excelled at designing gracefully proportioned structures set off by exquisite Italian Renaissance ornamentation. Among his more important commissions in New York City were the Madison Square Garden (1891), the Washington Memorial Arch (1891), the New York Herald Building (1892), and the Madison Square Presbyterian Church (1906). White was a versatile artist who designed jewelry, furniture, and a wide range of interior decorations. An enthusiastic and extroverted man, he was noted for his lavish entertainments. He was shot to death at Madison Square Garden by Henry Kendall ("Harry") Thaw, the jealous husband of the showgirl Evelyn Nesbit, with whom White had had a love affair.

Charles C. Baldwin, Stanford White (1931; reprinted 1971), deals with White's architectural career. Michael Macdonald Mooney, Evelyn Nesbit and Stanford White: Love and Death in the Gilded Age (1976), does not.

White, T(erence) H(anbury) (b. May 29, 1906, Bombay—d. Jan. 17, 1964, Piraeus, Gr.), English novelist, social historian, and satirist who was best known for his brilliant adaptation of Sir Thomas Malory's 15th-century romance, *Morte Darthur*, into a quartet of novels called *The Once and Future King*.

White was educated at Cheltenham College and at Cambridge. He taught at Stowe School (1930–36), and while there he attained his first real critical success with an autobiograph-

ical volume, England Have My Bones (1936). He afterward devoted himself exclusively to writing and to studying such recondite subjects as the Arthurian legends, which were to provide the material for his books. White was by nature a recluse, for long periods isolating himself from human society and spending his time hunting, fishing, and looking after his strange collection of pets.

The Once and Future King (1958) comprises The Sword in the Stone (1939), The Queen of Air and Darkness—first published as The Witch in the Wood (1940)—The Ill-Made Knight (1941), and The Candle in the Wind. The Once and Future King was adapted in 1960 into a highly successful musical play, Camelot; a motion picture, also called Camelot (1967), was based on the play. White's other works include The Goshawk (1951), a study of falconry, and two works of social history, The Age of Scandal (1950) and The Scandalmonger (1951).

White, Theodore H(arold) (b. May 6, 1915, Boston—d. May 15, 1986, New York City), American journalist, historian, and novelist, best known for his astute, suspenseful accounts of the 1960 and 1964 presidential elections.

of the 1960 and 1964 presidential elections. The son of a lawyer, White grew up in Boston and graduated from Boston Latin School in 1932. After graduating from Harvard in 1938, he served as one of *Time* magazine's first foreign correspondents, being stationed in the Far East from 1939 to 1945. He then served as European correspondent for the Overseas News Agency (1948–50) and for The Reporter (1950-53). With this extensive background in analyzing other cultures, White was well equipped to tackle the American scene in The Making of the President, 1960 (1961) and The Making of the President, 1964 (1965). Accepted as standard histories of presidential campaigns, these books present their subjects by intelligently juxtaposing events and treating politicians as personalities rather than as symbols. White's approach elevated this type of history to an art form and won him the 1962 Pulitzer Prize for general nonfiction for The Making of the President, 1960. White went on to analyze the elections of 1968 and 1972 in later books.

White was the coauthor (with Annalee Jacoby) of Thunder Out of China (1946) and also wrote Fire in the Ashes (1953), The Mountain Road (1958), Breach of Faith: The Fall of Richard Nixon (1975), the autobiographical In Search of History: A Personal Adventure (1978), and America in Search of Itself: The Making of the President, 1956–1980 (1982). His books convey a genuine excitement about American institutions and politics.

White, Walter (Francis) (b. July 1, 1893, Atlanta, Ga., U.S.—d. March 21, 1955, New York City), foremost spokesman for blacks in the United States for almost a quarter of

Walter White, 1942

By courtesy of the Library of Congress, Washington, D.C.

a century and executive secretary (1931-55) of the National Association for the Advancement of Colored People (NAACP). He waged a long and ultimately successful campaign

against the lynching of blacks by white mobs in the United States.

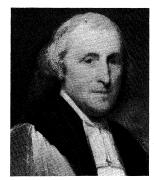

Despite his blond hair and blue eyes, denoting that only a fraction of his ancestry was Negroid, White chose to go through life as a black. At the age of 25 he joined the NAACP national staff as assistant executive secretary under James Weldon Johnson, whom he succeeded as executive secretary. White's principal objective became the abolition of lynching. Aided by his fair skin, he made on-the-spot investigations of more than a score of lynchings and race riots and conducted a vigorous, sustained drive for enactment of a federal antilynching law. Although no such law was enacted, the climate of public opinion was markedly changed by his investigations, exposés, and impassioned propaganda. In 1918, when he joined the NAACP staff, 67 persons, all but 4 of them blacks, were lynched. In the year of his death, 1955, there were only three recorded lynchings, and for the five previous years there had been none. Lynchings had become a rarity and were soon to disappear from the American scene.

In an early assault on discrimination in voting rights, White in 1930 almost single-handedly succeeded in influencing the Senate to reject by a 41–39 vote Pres. Herbert Hoover's nomination of Judge John J. Parker of North Carolina for appointment to the U.S. Supreme Court. (Parker was on record as being opposed to black suffrage.) At the outbreak of World War II White assisted his colleague, labour leader A. Philip Randolph, in pressing for a U.S. Fair Employment Practices Committee (June 1941) that would act to ban discrimination in government and wartime industry.

White's writings include two fictionalized accounts of a Southern lynching: Fire in the Flint (1924) and Rope and Faggot: A Biography of Judge Lynch (1929). His autobiography, A Man Called White, was published in 1948.

White, William (b. April 4, 1748, Philadelphia—d. July 17, 1836, Philadelphia), first bishop consecrated in England for the Protestant Episcopal Church in the United States, and first presiding bishop of that church.

Educated at the College and Academy of Philadelphia (later the University of Pennsyl-

William White, detail from an oil painting by Gilbert Stuart; in the Pennsylvania Academy of the Fine Arts. Philadelphia

vania), White was ordained in England as an Anglican priest in 1772. During the U.S. War of Independence, after the Loyalist rector of Christ Church, Philadelphia, had returned to England, White received the position and held it until his death. After the war he also served as chaplain to the Continental Congress.

In his pamphlet of 1782, The Case of the Episcopal Churches in the United States Considered, he noted that, before the Revolution,

Americans went to England for ordination, and he suggested that if the American church could not obtain bishops from England it would have to establish its own episcopate. Although he favoured a continuation of the spiritual legacy of the Church of England, he preferred to sever jurisdictional connections with it and the crown. After the Revolution the scattered remnants of the Church of England in the U.S. organized as the Protestant Episcopal Church. White was sent to England for consecration as a bishop (1787). Soon after his return he became the first presiding bishop of the church (1787) and served a second time in the same capacity from 1795 until his death.

Highly influential in the development of the new church, White wrote on doctrinal matters and assisted in the revision of *The Book of Common Prayer* for use in the U.S.

small-town American. His editorial writing made his own small-town newspaper, the Emporia *Gazette*, internationally known, and strongly affected at least one U.S. presidential election.

White left the University of Kansas, Lawrence, in 1890 to become business manager of the El Dorado (Kan.) Republican. After writing editorials for the Kansas City Star from 1892 to 1895, he purchased the Emporia Daily and Weekly Gazette. His editorial "What's the Matter with Kansas?" (Aug. 15, 1896) was an impassioned attack on Populism, a political doctrine dedicated to agrarian interests and the free coinage of silver. Reprinted and widely circulated by the national chairman of the Republican Party, the editorial was credited with helping to elect William McKinley as president over William Jennings Bryan, the Democratic candidate and the hero of the Populists.

In 1912 White repudiated the mainstream of Republicanism to support the "Bull Moose" faction (the Progressive Party) led by Theodore Roosevelt. "To an Anxious Friend," an editorial of July 27, 1922, advocating freedom of speech, won the 1923 Pulitzer Prize for editorial writing. In 1924 White unsuccessfully ran as an independent for governor of Kansas. He wrote several novels and short-story collections, biographies of Woodrow Wilson and Calvin Coolidge, and an autobiography (posthumous, 1946).

His son and successor as editor and publisher of the *Gazette*, William Lindsay White (1900–), served as a war correspondent and wrote one of the best-selling books of World War II, *They Were Expendable* (1942).

White, William Hale: see Rutherford, Mark.

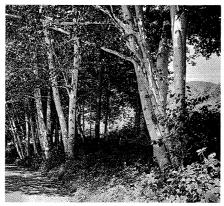

white alder (tree): see Clethra.

White Australia Policy, the anti-Asian immigration policy initiated by the new Commonwealth of Australia in 1901. It reflected a long-standing and unifying sentiment of the various Australian colonies and remained a fundamental commonwealth policy into the mid-20th century.

Each of the Australian colonies had passed restrictive legislation as early as the 1860s. This was directed specifically at Chinese immigrants, but later a popular cry was raised against the increasingly numerous Japaneseespecially after Japan's victory over China in the 1894–95 Sino-Japanese War—and against East Indians and Kanakas (South Pacific islanders) as well. Fear of military invasion by Japan, the threat to the standard of living presented by the cheap but efficient Asian labourers, and white racism were the principal factors behind the White Australia movement. In 1901 the Immigration Restriction Act (q.v.) of the commonwealth effectively ended all non-European immigration by providing for entrance examinations in European languages. Supplementary legislation in 1901 provided for the deportation by 1906 of the commonwealth's Kanakas. Popular support for White Australia, always strong, was bolstered at the Paris Peace Conference in 1919 when the Australian delegation led the fight to defeat a Japanese-sponsored racial-equality amendment to the League of Nations Covenant. From about 1950 on, the policy became less stringent, first under Liberal governments and also (more markedly and remarkably) under Labor, from 1972 to 1975.

white birch, any of several species of ornamental and timber trees of the genus Betula, in the family Betulaceae, native to cool regions of the Northern Hemisphere, with white, peeling bark. The name white birch also refers to paper birch (q.v.).

One of the white birches (B. pubescens), a tree about 18 metres (60 feet) tall, is native

European white birch (Betula pendula)

Arthur Griffin—Photo Researchers/EB Inc.

to Eurasia. It has egg-shaped leaves, usually hairy below. The soft, yellowish- or reddish-white wood is commercially important in construction and in the manufacture of vehicles, furniture, and small articles such as spoons and snowshoes.

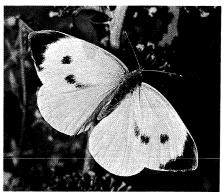

European white birch (*B. pendula*, sometimes erroneously called *B. alba*), also known as silver birch or common birch, has slender, drooping branches and small, sharp-pointed leaves about six centimetres long. It may be

15 m tall on light soils. Cut-leaved, purpleleaved, and weeping birches are popular ornamental varieties of European white birch.

Japanese white birch (B. platyphylla japonica), an 18-m tree native to eastern Asia, has broad leaves about seven centimetres long; its hard, yellow-white wood is used for furniture and woodenware.

white blood cell: see leukocyte.

white butterfly, a member of the cosmopolitan insect family Pieridae (order Lepidoptera) that also includes the sulfur and orangetip butterflies and contains more than 1,000

White butterfly (Pieris brassicae)

species. Adults have a wingspan of 37 to 63 millimetres (1½ to 2½ inches) and have white wings with black marginal markings. Sexual seasonal dimorphism in pattern and colour occur in many species. Many of the green, slender larvae are pests. The majority are covered with a short down, or pile. The pupae are attached to a twig by a posterior spine and held secure by a girdle of silk.

One of the most common whites in North America is the European cabbage butterfly (*Pieris rapae*), whose larva is an important economic pest, attacking cabbage and related plants. It was introduced into North America in about 1860.

White Canon (religious order): see Premonstratensian.

white cedar, in the lumber trade, any American arborvitae (q.v.), some species of false cypress (q.v.), and McNab cypress, incense cedar (q.v.), and California juniper. Nonconiferous trees that are called white cedar include the chinaberry and some members of the flowering plant families Bignoniaceae, Celastraceae, Myristicaceae, Burseraceae, and Dipterocarpaceae.

white cloud, also called WHITE CLOUD MOUNTAIN FISH (Tanichthys albonubes), small aquarium fish of the carp family, Cyprinidae, native to the White Cloud Mountains (Paiyün Shan), Kwangtung Province, China. The

Male white cloud (Tanichthys albonubes)
Painting by Karen Allan

white cloud is a slender, hardy fish, about 4 centimetres (1.5 inches) long. It is greenish brown, with a silvery belly and red patches on its fins. On each side from head to tail, it has a gleaming stripe, brilliant blue in the young fish, golden in the adult. A rather popular fish, the white cloud is unaggressive and easily bred in captivity.

white-collar crime, crime committed by persons of high status in the pursuit of their regular occupational activities. The violations generally involve fraud, embezzlement, swindles, or duplicity in financial dealings. White-collar criminals may otherwise lead conventional lives and may be widely trusted and respected. In the United States the cost to businesses of commercial bribery and kickbacks, securities theft and fraud, and embezzlement (including computer crime) as estimated in 1977 by the American Management Associations, was between \$12,500,000,000 and \$19,000,000,-000 annually. By comparison, the combined cost of larceny, burglary, auto theft, forgery, and robbery was only about \$4,550,000,000, according to the President's Commission on Law Enforcement and Administration of Jus-

white corpuscle (biology): see leukocyte.

white dwarf star, any of a class of faint stars representing the endpoint of the evolution of intermediate- and low-mass stars. White dwarf stars, so called because of the white colour of the first few that were discovered, are characterized by a low luminosity, a mass on the order of that of the Sun, and a radius comparable to that of the Earth. Because of their large mass and small dimensions, such stars are dense and compact objects with average densities approaching 1,000,000 times that of water.

Unlike most other stars that are supported against their own gravitation by normal gas pressure, white dwarf stars are supported by the degeneracy pressure of the electron gas in their interior. Degeneracy pressure is the increased resistance exerted by electrons composing the gas, as a result of stellar contraction. The application of the so-called Fermi-Dirac statistics and of special relativity to the study of the equilibrium structure of white dwarf stars leads to the existence of massradius relationship through which a unique radius is assigned to a white dwarf of a given mass; the larger the mass, the smaller the radius. Furthermore, the existence of a limiting mass is predicted, above which no stable white dwarf star can exist. This limiting mass, known as the Chandrasekhar limit (q.v.), is on the order of 1.4 solar masses. Both predictions are in excellent agreement with observations of white dwarf stars.

The central region of a typical white dwarf star is composed of a mixture of carbon and oxygen. Surrounding this core is a thin envelope of helium and, in most cases, an even thinner layer of hydrogen. Only the outermost stellar layers are accessible to astronomical observations.

White dwarfs evolve from stars with an initial mass of up to three or four solar masses or even possibly higher. After quiescent phases of hydrogen and helium burning in its core separated by a first red-giant phase—the star becomes a red giant for a second time. Near the end of this second red-giant phase, the star loses its extended envelope in a catastrophic event, leaving behind a dense, hot, and luminous core surrounded by a glowing spherical shell. This is the planetary-nebula phase. During the entire course of its evolution, which typically takes several billion years, the star will lose a major fraction of its original mass through stellar winds in the giant phases and through its ejected envelope. The hot planetary-nebula nucleus left behind has a mass of 0.5-1.0 solar mass and will eventually cool down to become a white dwarf.

White dwarfs have exhausted all their nuclear fuel and so have no residual nuclear energy sources. Their compact structure also prevents further gravitational contraction. The energy radiated away into the interstellar medium is thus provided by the residual thermal energy of the nondegenerate ions composing its core. That energy slowly diffuses outward through

the insulating stellar envelope, and the white dwarf slowly cools down. Following the complete exhaustion of this reservoir of thermal energy, a process that takes several additional billion years, the white dwarf stops radiating and has by then reached the final stage of its evolution and becomes a cold and inert stellar remnant. Such an object is sometimes called a black dwarf.

Because of their instrinsically low luminosities, white dwarf stars can be observed only within a few hundred parsecs (1 parsec = 3.26 light-years) from the Earth. They are occasionally found in binary systems, as is the case for the white dwarf companion to the brightest star in the night sky, Sirius (q.v.). White dwarf stars also play an essential role in the outbursts of novae and of other cataclysmic variable stars.

white-eye, any of the 80 to 85 species of birds of the Old World family Zosteropidae (order Passeriformes). They are so much alike that about 60 of them are often lumped in a single genus, Zosterops. White-eyes occur chiefly from Africa across southern Asia to Australia and New Zealand in warm regions.

All of the white-eyes are short-tailed, short-winged birds about 11 centimetres (4½ inches) long. The bill is fine and pointed, and the tongue is brush-tipped. The plumage is

White-eye (Zosterops)
Bruce Coleman Ltd.

plain grayish, brownish, or yellow-green (sexes alike). Its main mark is the eye-ring of tiny, soft, usually white feathers.

White-eyes are strictly arboreal, feeding on insects, nectar, and sweet soft fruits; some, including those the Australians call blightbirds, destroy cultivated figs and grapes. They are active and, except when tending their cuplike nests, highly gregarious. Most have whispery voices, but some warble loudly.

White Father, member of society of mis-SIONARIES OF AFRICA (W.F.), a Roman Catholic international missionary society of priests and brothers whose sole field of activity is Africa, founded in North Africa in 1868 by the archbishop of Algiers, Charles-Martial-Allemand Lavigerie. The society's first missions were in northern Algeria. In 1878 its members founded the first Catholic missions in the Great Lakes region of Central Africa despite great physical sufferings, disease, and persecution; and in 1895 the society extended its work to West Africa. The White Fathers try to live as far as possible in the same manner as the Africans, and their religious habit resembles the traditional clothing worn in North Africa: the white gandoura (a tunic) and burnoose (a hooded cape). The White Sisters, or Missionary Sisters of Our Lady of Africa, were founded by Lavigerie in 1869 to assist the White Fathers in their African mis-

white-flowered gourd: see bottle gourd.

white-footed mouse, also called DEER MOUSE (*Peromyscus*), any of about 60 species of small, delicately built rodents, belonging to the family

Cricetidae (order Rodentia), found in a variety of habitats from Alaska to South America. Abundant animals, white-footed mice often outnumber any other mammals in an area.

White-footed mouse (Peromyscus)
Ken Brate—Photo Researchers

They are large-eyed mice, 8 to 17 centimetres (3 to $6^{1/2}$ inches) long excluding the long tail, and they have soft fur and relatively large ears. Colour ranges from nearly white, through brown, to blackish; underparts and feet are usually white.

White-footed mice are nocturnal animals; they spend the day in burrows or in trees, in nests they construct of plant material. They sometimes come into buildings, nesting in mattress stuffing or other soft materials. They eat both plant and animal matter. White-footed mice can breed continually throughout the year, the females bearing litters of about four after 21 to 27 days' gestation. Because these mice are clean, easily cared for, and prolific, they are often used as laboratory animals.

white fox: see Arctic fox.

white-fronted goose, also called SPECKLE-BELLY, or LAUGHING GOOSE (Anser albifrons), rather small, dark-bodied goose with white forehead, yellow bill, and irregular black patches on the belly; it is classified in the tribe Anserini of the family Anatidae (order Anseriformes). Breeding in the Arctic, the white-fronted goose, which exists in four or five races, is the most widely distributed of the so-called gray geese (see goose). It migrates as far south as Mexico, the Mediterranean Sea, India, and Japan. The European white-fronted goose (Anser a. albifrons) winters in western Europe, the British Isles, and Central Asia. The largest form, the tule goose (A. a. gambelli), winters only in the Sacramento Valley, California.

White Horse, Vale of (district and region, England): see Vale of White Horse.

White House, official residence of the president of the United States at 1600 Pennsylvania Avenue in Washington, D.C. The 3-story, 100-room mansion was designed by the Philadelphia architect James Hoban in the Neoclassical style in 1792 and was completed in 1800. It acquired its name because its white-gray limestone (later painted white) contrasted with nearby red brick buildings. Burned during the British invasion of 1814, the White House was rebuilt and enlarged under Hoban's direction over the next three years. The semicircular south portico and the colonnaded north portico were added in the 1820s. Subsequent changes were minor. The whole building, which is a unit of the National Capital Parks system, was restored in the early

White Island, island in the Bay of Plenty, 43 mi (69 km) west of Cape Runaway, eastern North Island, New Zealand. An active volcano, it is the top of a submarine vent at the northern end of the Taupo-Rotorua Volcanic

Zone. With a total land area of about 1,000 ac (400 ha), it rises to 1,053 feet (321 m) at Mount Gisborne. Scrub vegetation is common on much of the island.

The island was sighted and named by Captain James Cook in 1769. It has numerous hot springs, geysers, and fumaroles; its last eruption took place in 1914. White Island is uninhabited. It is accessible for tourists by charter launch from Tauranga (52 miles [84 km] southwest).

white lead, any of several white pigments used in exterior paints and containing inorganic compounds of lead (q.v.).

White Lotus Rebellion (1796-1804), largescale uprising in the mountainous regions of central China that contributed to the decline of the Ch'ing dynasty. The White Lotus society (Pai-lien chiao) was a religious cult already in existence in the 13th century. When the Manchu tribes of Manchuria (Northeast

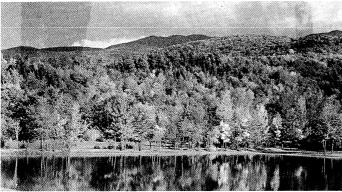

white mica, fine-grained variety of either of the silicate minerals muscovite and paragonite (aa.v.).

white moss: see cushion moss.

White Mountains, segment of the Appalachian Mountains, U.S., extending for 87 miles (140 km) across north-central New

Hampshire and slightly into western Maine. They contain the highest elevations in the northeastern United States. The loftiest peaks, mostly between 5,000 and 6,000 feet (1,500 and 1,800 m), occur in a linear series of distinct summits that are named for U.S. presidents and make up the Presidential Range. The highest point (6,288 feet [1,917 m]) is Mount Washington (see Washington, Mount), which is reached by a highway and cog railway. Other subranges include the Franconia Mountains and the Carter-Moriah and Sandwich ranges. Noteworthy features are the many rounded passes, locally termed notches, that were carved by mountain glaciers; the most scenic are Crawford, Dixville, Franco-

White Mountains, near Gorham, N.H. Eric Carle-Shostal/EB Inc

Provinces) conquered China 400 years later in the 17th century and proclaimed the Ch'ing dynasty, the White Lotus members dedicated themselves to the overthrow of the alien Manchus and to the return of the previous Ming dynasty (1368-1644). In the late 18th century, in response to famine, crowded conditions, and harassment from petty government officials, White Lotus leaders in central China began a rebellion; they promised their followers that there would be the return of the Buddha and the end of suffering

Although the rebellion continued for nine years, it never became an organized attempt to establish a new dynasty. Rather, it consisted of uncoordinated roving bands using hit-andrun guerrilla tactics. Vast sums of money earmarked for the campaign against the rebels, however, were embezzled by the imperial favourite Ho-shen and his friends. Not until the Ch'ien-lung emperor died in 1799 was Hoshen removed and the war really prosecuted. By that time, however, the regular government forces were too ridden with corruption to be of any use. The dynasty had to resort to a strategy of removing all food supplies from the countryside and collecting the peasants into a series of armed stockades. In the stockades they were organized into local militia defense corps. Some of these militia groups were further trained as attack armies to seek out the rebels, whose forces were thinned by offers of amnesty to the rank and file and of rewards for the capture of the leaders. By 1804 the area was again placed under imperial control by the local militia. An independent military force, the militia proved difficult to disband, and frequently it turned against the dynasty in the 20th century.

white maple: see silver maple.

nia, Kinsman, and Pinkham notches. The northeastern edge of the mountains is marked by the Ammonoosuc and Androscoggin river vallevs.

With only the highest summits reaching above the timberline, a large part of the mountains lies within the White Mountain National Forest. More than 1,000 miles (1,600 km) of nature trails and numerous campsites make the region a favourite summer vacation area. The mountains also have fine ski slopes and there are additional facilities for winter sports.

White Nile River, Arabic AL-BAḤR AL-ABYAD, section of the Nile between Malakāl and Khartoum, The Sudan. It is formed by the confluence of the Mountain Nile (Bahr al-Jabal) and the Sobat River above Malakal, and flows for about 500 miles (800 km) northeast and north past ar-Rank, Kūstī (railway bridge), ad-Duwaym, and Jabal al-Awliyā' (irrigation dam) to join the Blue Nile at Khartoum and form the Nile proper. This wide and shallow section of the river runs placidly along a small slope and is frequently fringed with swamps. The total length of the White Nile, including its major tributary, the Mountain Nile, is 1,295 miles (2,084 km).

During flood (June-September) the river provides less than 30 percent of the main Nile flow at Khartoum because the force of the floodwaters of the Blue Nile holds back the White Nile, turning it into a lake. At low water (April-May) the White Nile's flow is uninhibited, and its contribution is more than 80 percent of total volume. The river is navigable all year by river steamer.

white noise, in music, the effect of the complete range of audible sound-wave frequencies heard simultaneously, analogous to white light, which contains all the frequencies of the light spectrum. The sound of cymbals and snare drums has white-noise characteristics. Electronically synthesized white noise can be filtered so as to produce combinations of frequencies not obtainable on traditional musical instruments; or the white noise itself may be used as an element of music.

White noise is aperiodic sound (that is, its wave pattern is not uniform). Its constituent frequencies are of random amplitude and occur at random intervals.

white oak, any member of a group or subgenus (Leucobalanus) of North American ornamental and timber shrubs and trees of the genus Quercus in the beech family (Fagaceae). White oaks have smooth, bristleless leaves, sometimes with glandular margins, and acorns with sweet-tasting seeds that mature in one season. Bur oak and chestnut oak (qq.v.) are members of this group.

Specifically, the name white oak refers to Quercus alba, also called stave oak, which is one of the more important timber trees of the eastern United States. It is 18 to 45 m (60 to 150 feet) tall, with pale-gray, shallowly fissured, scaly bark. The glossy, bright green leaves, about 23 cm (9 inches) long and narrow toward the base, are divided almost to the midrib into seven or nine lobes; they turn wine red in autumn.

The Arizona white oak (Q. arizonica), which is about 18 m (60 feet) tall, is found in the southwestern United States on the slopes of canyon walls, at altitudes from 1,500 to 3,000 m (5,000-10,000 feet). Its narrow leaves are about 8 cm (3 inches) long and persist for one

The shrubby Gambel oak (Q. gambelii) may reach 4.5 m (15 feet) tall. The California white oak (Q. lobata), also called valley oak, is an ornamental and shade tree, often 30 m (100 feet) tall. It has graceful, drooping branches, many-lobed dark green leaves, and distinctive acorns about 5 cm (1.7 inches) long. The ash-gray to light-brown bark, slightly orangetinted, is fissured into irregular cubes. The Oregon white oak (Q. garryana), sometimes shrubby but often more than 24 m (80 feet) tall, has widespreading branches; it is an im-portant timber tree of the Pacific coastal re-

Other timber trees of the white oak group include the chinquapin oak, or yellow chest-

Acorns and leaves of white oak (Quercus alba)

nut oak (O. muehlenbergii), a tree scattered throughout its range; the overcup oak, or swamp post oak (Q. lyrata), the acorn of which is nearly covered by a deep cup; and the post oak (Q. stellata), the leaves of which have square-shaped central lobes. The dwarf chinquapin oak, or dwarf chestnut oak (Q. prinoides), is a shrub that forms dense thickets; it is a useful cover plant on dry, rocky ridges.

Many trees of the white oak group have acorns that germinate soon after they fall and are killed by cold before they can take root. Gray squirrels spread white oaks by carrying acorns to other sites and burying them. A decline in white oak reproduction is often associated with a decreasing squirrel population. Timber from all members of the group is

Timber from all members of the group is known as "white oak" in the lumber trade.

White Plains, city, seat (1778) of Westchester County, New York, U.S., on the Bronx and Hutchinson rivers. Known to the Siwanoy Indians as Quarropas (White Plains), probably for the white balsam growing there, the site was sold twice (in 1661 and in 1683) by them to different groups causing long litigation over the title and delay in settlement of the area. An established community by 1735 within the Town (township) of Rye, it was the centre of the Westchester iron-mining activity and crossroads for several transportation lines. The New York Provincial Congress met there July 10, 1776, approved the Declaration of Independence, and proclaimed the creation of the state of New York. On Oct. 28, 1776, at the battle on Chatterton Hill (commemorated as White Plains National Battlefield Site), Washington outmanoeuvred British general Lord Howe and, though suffering more than 300 casualties, was able to slip away to fortified lines farther north. The Elijah Miller House (1680), which served as Washington's headquarters, has been restored.

Connected by railroad to New York City (21 mi [34 km] southwest) in 1844, it developed as an urban core and as a residential and retail-trade centre. A wide range of light manufactured goods are now produced and the city houses corporate offices and head-quarters for numerous firms. Educational institutions include the New York School for the Deaf (1817) and the Pace University at White Plains. The State University College of New York at Purchase (1971) is nearby. Inc. village, 1866; city, 1916. Pop. (1980) 46,999.

White River, river rising in the Boston Mountains, in northwestern Arkansas, U.S., and flowing northeast into southern Missouri, where it bends southeast and reenters Arkansas, continuing in a southerly direction to join the Arkansas River near its confluence with the Mississippi River, above Arkansas City. The river's descent in the upper course exceeds 25 ft (8 m) per mi. Through the Boston Mountains and the Ozark Plateau of southern Missouri, the White is deeply entrenched in narrow gorges. Much of its middle course is a valley more than 500 ft deep. At Newport, Ark., the White emerges from the highlands onto the Mississippi floodplain, where the stream gradient is less than 3 ft per mi, with numerous meanders, abandoned channels, and swampland. The river is 685 mi (1,102 km) long, drains 28,000 sq mi (73,000 sq km), and is navigable upstream to Batesville, Ark., for about 300 mi.

Major tributaries are the Buffalo River (q.v.) entering from the south and the Cache, Little Red, and North Fork rivers entering from the north. Bull Shoals Dam (1947), on the White River just north of Cotter, Ark., impounds Bull Shoals Reservoir, which extends 37 mi upstream. Forsyth Dam impounds Lake Taneycomo, 5 mi northeast of Branson, Mo.

White River, river rising on the Pine Ridge Escarpment in northwestern Nebraska, U.S., and flowing in a northeasterly direction into South Dakota. Passing across the northern boundaries of the Pine Ridge and Rosebud Sioux Indian reservations, it then turns east and empties into the Missouri River near Chamberlain, S.D., after a course of 325 mi (523 km). Around its upper parts, light rainfall, sparse vegetation, and geologic conditions have created the Badlands, where small intermittent tributaries have carved a labyrinth of pinnacles, valleys, slopes, and fantastic features into the soft-clay formations. Its lower course is a sand-filled, braided, meandering channel more than a mile wide. The river's drainage basin, which covers 10,200 sq mi (26,400 sq km), has deposits of manganese and fuller's earth, a claylike substance used in industry.

White Rock, city, southwestern British Columbia, Canada, just southeast of Vancouver on the northern shore of Semiahmoo Bay at the entrance to the Strait of Georgia. It is named for a large white rock which, according to an Indian legend, was thrown across the water from Vancouver Island (to the west) by a sea god's son who defiantly married the daughter of a Cowichan Indian chief, saying that he and his bride would make their home at the spot where it landed. The rock was used as a navigational aid by early mariners. White Rock is a Pacific port of entry directly northwest of Blaine, Wash., and part of the Vancouver metropolitan area. The site, laid out in 1905, became a vacation area soon afterward. An annual sea festival of aquatic sports is held in July. Peace Arch (1921) and International Park mark the western extremity of the U.S.-Canadian border. The city has a large retired worker community. Pop. (1981) 13,550.

White Russian language: see Belorussian language.

White Sands National Monument, national monument, expanse of dazzling white gypsum sands, in south central New Mexico, U.S., in the Tularosa Basin, between Alamogordo (northeast) and Las Cruces (southwest). Established in 1933, it lies between the San Andres Mountains (west) and the Sacramento Mountains (east). The sand constantly drifts into dunes 10 to 45 ft high. In the southwest corner is Lake Lucero, a marsh encrusted with crystals created by the evaporation of gypsum-laden runoff water. The extensive Alkali Flats, to the north of the lake, are similarly created by underground water drawn to the surface. There is little plant life; the animals, mainly mice and lizards, are light hued, blending with the sand. To the west is the San Andres National Wildlife Refuge. White Sands Missile Range lies to the southwest, and Holloman Air Force Base to the east.

white sanicle (plant): see white snakeroot.

White Sea, Russian BELOYE MORE, Beloye also spelled BELOJE, an almost landlocked extension of the Arctic Ocean indenting the northern shores of the European portion of the Soviet Union. It is connected to the more northerly Barents Sea by a long, narrow strait known as the Gorlo (throat). The boundary between the two seas runs along a line joining Cape (Mys) Kanin Nos and Cape Svyatoy Nos. The area of the White Sea is approximately 35,000 sq mi (90,000 sq km). Its mean depth is 200 ft (60 m), and its maximum depth 1,115 ft in the northeast part of the Kandalaksha Inlet (Kandalakshskaya Guba).

The sea's irregular shape is formed by the large Kandalaksha (Kandalakshskaya), Onega (Onezhskaya), Dvina (Dvinskaya), and Mezen (Mezenskaya) gulfs. The largest of the major islands are Solovetskiye at the entrance to Onega Bay; Morzhovy, at the entrance to the Gorlo Strait (Proliv Gorlo Belogo Morya); and Mudyuga (Mudyugsky), at the entrance to Dvina Bay. The northwest shores are bordered by steep cliffs; the southeast shores are low and flat. Rivers flowing into the sea include the Northern Dvina, Mezen, Onega, Vyg, Niva, Umba, Varzuga, and Ponoy.

The White Sea is situated on a continental shelf whose present form appears as a land's-end depression on the slope of the ancient structural block known as the Baltic Shield. The bottom of the sea is badly broken up. In the northwest lies the Kandalaksha Hollow with its sharply formed sides that apparently originated as a fault. In the southern portion is an elevation known as the Solovetskiye Islands (Ostrova). Many small underwater elevations are found in the Onega Inlet. Sandy

underwater ridges, created by inflowing currents, prevail in the Gorlo Strait, Voronka, and the Mezen mouth. The sea's chief hollow is separated from the Barents Sea by a sill 130 ft deep, which restricts deepwater exchange between the two bodies of water.

There are more than 700 species of multicellular invertebrates, about 60 species of fish, and 5 species of marine mammals in the White Sea. The fishing industry is relatively small, however. Of greatest value as food are the lysun (a kind of Greenland seal) and herring.

The economic value of the region derives from the richness of the neighbouring land, which is heavily forested, and from the elaborate river network that connects remoter regions with the sea. The White Sea has great importance as a route connecting the economically active portions of the north European U.S.S.R. with Soviet Asian ports and with foreign countries. It is also linked to the Baltic Sea by the White Sea-Baltic Waterway and by the Lenin Volga-Baltic Waterway (Volgo-Donskov Kanal Imeni Vladimira Ilicha Lenina) to the Black, Caspian, and Azov seas. Principal ports are Arkhangelsk, Belomorsk, Onega, Mezen, Kem, Kandalaksha, and Umba. With the help of icebreakers in winter, navigation continues throughout the year.

White Sea-Baltic Canal, Russian Belomorsko-baltiysky kanal, system of rivers, lakes, and canals in the Russian Soviet Federated Socialist Republic linking Leningrad on the Baltic Sea to Belomorsk on the White Sea. It was constructed between 1931 and 1933, largely by penal labour. From Leningrad the waterway follows the Neva River, Lake Ladoga, the canalized Svir River, and Lake Onega. From Povenets, at the northern end of Lake Onega, a canal with a flight of seven locks runs to Lake Vygozero, whence the canalized Vyg River leads to the White Sea. It is connected with the Volga River by the Volga-Baltic Waterway and with Moscow by the Moscow Canal.

Between Povenets and Belomorsk, a distance of 141 mi (227 km), are 19 locks, and a maximum height of 335 ft (102 m) above sea level is reached. The system, which can take ships of seagoing size, has both strategic and commercial significance, for it shortens the sea passage from Leningrad to Arkhangelsk by 2,500 mi. The principal cargo on the system is timber, much of it for paper mills and timber-working enterprises along the route.

white shark (Carcharodon carcharias), large, aggressive shark of the family Isuridae, considered to be more dangerous to human beings than any other shark. Also known as white pointer, man-eater, and white death, the white shark is found in tropical and temperate re-

White shark (Carcharodon carcharias)
Painting by Richard Ellis

gions of all oceans. It is noted, aside from its potential as a man-eater, for a voracious appetite and a diet that may include fishes, sea turtles, birds, sea lions, and ship's garbage.

It is a heavy-bodied shark with a crescent-

shaped tail and large, saw-edged, triangular teeth, and the white shark may attain a maximum length of about 11 m (36 feet). It is generally gray, bluish, or brownish, the colour shading suddenly into a whitish belly; large individuals are reported to be paler.

white snakeroot, also called WHITE SANI-CLE (Eupatorium rugosum), poisonous North American herb bearing flat-topped clusters of small white flower heads. It grows up to 1.5 m (5 feet) tall with 18-centimetre (7-inch) leaves opposite each other.

Cattle allowed to pasture on the plant may suffer muscular tremors (the "trembles"), weakness, constipation, and death. Persons who drink the milk of affected cows may experience milksickness, a condition marked by weakness, vomiting, and constipation.

White snakeroot belongs to the family Asteraceae, also called Compositae, in the order Asterales. Like other members of the large genus *Eupatorium*, it is sometimes called boneset, or thoroughwort.

White Springs, resort town, Hamilton county, northern Florida, U.S., on the north bank of the Suwannee River, 65 miles (105 km) west of Jacksonville.

The Indians considered the springs sacred and went there to recuperate after battle; white settlement dates from 1826. During the American Civil War (1861-65) the area was known as Rebel's Refuge because many plantation owners moved there, away from Union invasion routes. The modern town was founded in about 1900 when R.J. Camp promoted the medicinal properties of the clear spring waters. The town is the headquarters of the Suwannee River Water Management District, and phosphate mining is a local industry. The Stephen Foster Memorial is a 243-acre (98-hectare) park with a museum displaying Foster memorabilia; atop a 200-foot (61-metre) tower is a 97-bell carillon, on which the composer's works are performed daily. The Stephen Foster Memorial Week (January) and the Florida Folk Festival (May) are annual events. The Osceola National Forest is a few miles east. Pop. (1984 est.) 822.

White Sulphur Springs, resort city, Greenbrier county, southeastern West Virginia, U.S., in the Allegheny Mountains (elevation 1,923 feet [586 m]), just east of Lewisburg. Settled about 1750, it developed as a health spa in the 1770s. The spring, for which the city is named, is on the grounds of the elegant Greenbrier Hotel, which was built by the Chesapeake and Ohio Railway in 1913. The Grand Central Hotel, known as the "Old White," which preceded the Greenbrier, served as headquarters and hospital to both sides during the American Civil War (1861–65) and also served as the summer home for a line of U.S. presidents from Andrew Jackson to Woodrow Wilson.

Blue Bend and Lake Sherwood recreation areas and Greenbrier State and Jefferson National forests are nearby. Organ Cave, where gunpowder was made during the American Civil War, is 10 miles (16 km) south. One of the first American golf courses was laid out in 1884 at Oakhurst, immediately to the north. Inc. 1839. Pop. (1984 est.) 3,287.

white-tailed deer, also called VIRGINIA DEER (Odocoileus virginianus), common woodland deer, family Cervidae (order Artiodactyla), ranging from southern Canada to South America. "White-tailed deer" refers to the white underside of the tail, which is held aloft like a signaling flag when the animal is alarmed or running. An important game animal, the white-tailed deer generally lives alone or in small groups; in winter, a number may gather together, trampling down the snow in an area that then is known as a deer "yard."

White-tailed deer buck (Odocoileus virginianus)

The white-tailed deer tends to be larger in northern areas and can stand as high as 106 cm (3½ feet) at the shoulder and weigh up to 180 kg (400 pounds). The adult whitetailed deer has a bright reddish brown summer coat and a duller grayish brown winter coat; the underparts are white. The male has forwardly curved antlers that bear a number of unbranched tines. It thrives in open woodland (though not in mature forests), cutover forests, and woodlots on the fringes of urban areas and in farming country, often turning to orchards and other cultivated vegetation for food. Its diet includes leaves, twigs, and fruits or nuts of most vegetation, as well as lichens and other fungi.

Formerly greatly reduced in its range, particularly in the United States, by unrestricted hunting, the white-tailed deer had by the mid-20th century been restored to abundance by game management measures throughout North America. Of the many subspecies, the Key deer of Florida, smallest of the white-tails, stands 76 cm (30 inches) or less at the shoulder and weighs less than 23 kg (50 pounds); formerly close to extinction, the Key deer has recovered in population as a result of protective measures.

Where the same name may denote a person, place, or thing, the articles will be found in that order

White Volta River, also called (in Burkina Faso) NAKAMBE RIVER, French VOLTA BLANCHE, headstream of the Volta River in West Africa. It rises north of Ouagadougou, in Burkina Faso, in a lowland between two massifs, and flows generally southward for about 400 miles (640 km) to empty into Lake Volta in Ghana, a large artificial reservoir created by the Volta River Project and extending just above the former confluence of the Black Volta (or Mouhoun) and White Volta rivers. Innumerable turns along its course gave rise to the name Volta (Portuguese: "Twist"). Its gradient is relatively gentle (about 2 feet per mile [40 cm per km]), and rainfall in its river valley is likewise relatively low. Principal riparian towns (in Ghana) are Daboya and Yapei, the latter marking the limit for canoe traffic.

white-water racing (canoeing): see wild-water racing.

white whale, in common usage, any small, dolphinlike whale. The beluga (q.v.) is often called a white whale. The white whale depicted in the novel *Moby Dick*, by Herman Melville, was a sperm whale (q.v.).

Whitefield, George (b. Dec. 27, 1714, Gloucester, Gloucestershire, Eng.—d. Sept. 30, 1770, Newburyport, Mass. [U.S.]), Church of England evangelist who by his popular preaching stimulated the 18th-century Protestant revival throughout Britain and the British-American colonies.

In his school and college days Whitefield ex-

perienced a strong religious awakening that he called a "new birth." At Oxford he became an intimate of the Methodists John and Charles Wesley, and at their invitation he joined them in their missionary work in Georgia in 1738. He was already known as an eloquent evangelist. The rest of his career was divided between evangelical preaching throughout the American colonies from Georgia to Massachusetts and itinerant preaching in England, Scotland, Wales, and Ireland. He believed that every truly religious person needs to experience a rebirth in Jesus; aside from this, he cared little for distinctions of denomination or geography. He played a leading part in the Great Awakening of religious life in the British-American colonies and in the early Methodist

whitefish, any of several valuable, silvery food fishes (family Salmonidae, or in some classifications, Coregonidae), generally found in cold northern lakes of Europe, Asia, and North America, often in deep water. Whitefish are like trout in having an adipose (fleshy) fin but have larger scales, weaker teeth, and smaller mouths. They eat insect larvae and other small animals and spawn in fall.

Lake whitefishes (Coregonus) are deep-bodied forms. The largest and most valuable, C. clupeaformis, is of the Great Lakes region and is known by such other names as Lake Superior whitefish, whiting, and shad. It averages about 2 kg (4.5 pounds) in weight.

Ciscoes, or lake herring, Leucichthys (in some classifications, Coregonus) artedi, are herring-like food and sport fishes. They live in large schools and grow to a weight of about 1 kg (2.2 pounds). Some other species are called bloater and chub (a.v.).

The round whitefishes (*Prosopium*) are the best sport fishes of the family. The Rocky Mountain whitefish (*P. williamsoni*) weighs approximately 1 kg and is often found in trout streams.

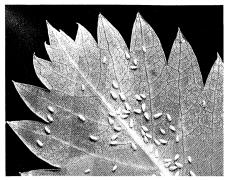

The inconnu, cony, or sheefish (*Stenodus leucichthys*), an oily-fleshed salmonid, is eaten in the far northwestern regions of North America.

Whitefish Bay, southeastern arm of Lake Superior, the centre of which forms the border of Ontario (Can.) and Michigan (U.S.). The bay, 30 miles (48 km) long (northwest to southeast) and 15 to 34 miles (24 to 55 km) wide, is fed by the Tahquamenon River and connects to the southeast with Lake Huron via the St. Marys River. Whitefish Point, a promontory on the west (Michigan) side of the bay's entrance, is an important landmark for shipping on the Great Lakes-St. Lawrence Seaway. Part of the bay's Michigan shoreline lies within the Hiawatha National Forest. The bay is noted for commercial fishing and tourism and was named because of the abundance of whitefish in its waters.

whitefly, any sap-sucking member of the insect family Aleyrodidae (order Homoptera). The nymphs, resembling scale insects, are flat, oval, and usually covered with a cottony substance; the adults, 2–3 mm (0.08–0.12 inch) long, are covered with a white opaque powder and resemble tiny moths. The four wings develop within the insect and evert during the last molt. These pests are abundant in warm climates and are found on houseplants and in greenhouses.

The citrus whitefly (*Dialeurodes citri*) is economically important, sucking sap from orange and date trees and producing honeydew, a sweet by-product of digestion, upon which a sooty fungus grows that ruins the fruit. Control is by oil or parathion sprays.

The citrus blackfly (Aleurocanthus woglumi) is well-established in Mexico and the West Indies. A sooty fungus that grows on the honeydew excreted by the citrus blackfly reduces the host plant's ability to photosynthesize.

Whiteflies (Aleyrodidae)

The greenhouse whitefly (Trialeurodes vaporariorum) is one of the most abundant and destructive members of the family. It damages plants by reducing vigour and causing them to wilt, turn yellow, and die. Sprays that kill both adult and larval stages are necessary to control this pest.

Whitefriars Theatre, private London playhouse located in the priory of the Whitefriars monastery on the north side of the Thames. Michael Drayton and Thomas Woodford converted the refectory hall to a private theatre in 1606, perhaps inspired by the conversion of the Blackfriars 30 years earlier. Both of these early private playhouses were roofed and used artificial light. Although the price of admission was higher than that of public theatres, everyone had a seat. London's private theatres were often used by companies of child actors, and the Whitefriars was no exception. Children of the King's Revels occupied it from 1608 to 1609, succeeded by Children of the Queen's Revels from 1609 to 1613. In the latter year the Queen's Revels merged with an adult company, Lady Elizabeth's Men, but the merger dissolved in 1616, after which time the theatre may have been used by the Prince's Men. By 1629 the Whitefriars had been replaced by the Salisbury Court Theatre.

Whitehall, street in Westminster, London, between Trafalgar Square and Parliament Square, and by extension the cluster of short streets, squares, and governmental buildings adjoining it. Whitehall is the site of principal past and present government offices, the cenotaph war memorial, Downing Street (prime minister's residence), New Scotland Yard, the Horse Guards Parade, and the Banqueting House (1619–22) designed by Inigo Jones.

Whitehall Palace, former English royal residence located in Westminster, London, on a site between the Thames River and the present-day St. James Park. York Place, the London residence of the archbishops of York since 1245, originally occupied the site.

Cardinal Wolsey enlarged the mansion and

Cardinal Wolsey enlarged the mansion and lived there until his fall, when Henry VIII acquired and reconstructed it, employed Hans Holbein the Younger in its decoration, and made it his principal residence. Inigo Jones designed a new palace for James I, but only the Banqueting House was completed (1622); this survived several fires, one of which (1698) destroyed most of the rest of the palace.

Whitehaven, Irish Sea port, Copeland district, county of Cumbria, England. The Lowther family created a new port there in the 17th century as an outlet for shipping coal, especially to Dublin, from their local mines, and they laid out a new town on a regular grid plan. For a time Whitehaven dominated the Irish Sea coal trade, had busy shipyards, and shared in the prosperous American tobacco trade. Following the decline of its old coal-based industries, modern chemical works, based upon local deep-seated anhydrite de-

posits, and also light industries have injected some new life into the local economy. To the south, at Calder Hall, is Britain's first nuclear power station (1956). Pop. (1981 prelim.) 26,-714

Whitehead, Alfred North (b. Feb. 15, 1861, Ramsgate, Isle of Thanet, Kent, Eng.—d. Dec. 30, 1947, Cambridge, Mass., U.S.), English mathematician and philosopher, who collaborated with Bertrand Russell on *Principia Mathematica* (1910–13) and, from the mid-1920s, taught at Harvard University and developed a comprehensive metaphysical theory.

Background and schooling. Whitehead's grandfather Thomas Whitehead was a self-made man who started a successful boys'

Alfred North Whitehead

school known as Chatham House Academy. His father, Alfred Whitehead, an Anglican clergyman, in turn headed the school and later became vicar of St. Peter's in Thanet. His mother, born Maria Sarah Buckmaster, was the daughter of a prosperous military tailor. Alfred North Whitehead was their youngest child. Because they considered him too frail for school or active sports, his father taught him at home until he was 14, when he was sent to Sherborne School, Dorset, which was then one of the best schools in England. Whitehead received a classical education, showing a special gift for mathematics. Despite his over-protected childhood, he showed himself a natural leader. In his last year at school, he was head prefect, responsible for all discipline outside the classroom, and was a highly successful captain of games.

In 1880 Whitehead entered Trinity College, Cambridge, on a scholarship. He attended only mathematical lectures, and his interests in literature, religion, philosophy, and politics were nourished solely by conversation. It was not until May 1884, however, that he was elected to an elite discussion society known as the "Apostles." Whitehead did well in the Mathematical Tripos (honours examination) of 1883-84, won a Trinity fellowship, and was appointed to the mathematical staff of the college. His interest in James Clerk Maxwell's theory of electricity and magnetism (the subject of his fellowship dissertation) expanded toward a scrutiny of mathematical symbolism and ideas. Stimulated by pioneering works in modern algebra, he envisaged a detailed comparative study of systems of symbolic reasoning allied to ordinary algebra. He did not begin to write his Treatise on Universal Algebra (1898), however, until January 1891, one month after his marriage to Evelyn Willoughby Wade. She had been born in France, a child of impoverished Irish landed gentry, and educated in a convent. She was a woman with a great sense of drama and a real and unusual aesthetic sensibility, and she enriched Whitehead's life immensely.

Shortly before his marriage, his long-standing interest in religion had taken a new turn. His background had been solidly tied into the Church of England; his father and uncles had been ordained; so had his brother Henry, who would become bishop of Madras. But Whitehead, under the influence of Cardinal Newman, began to consider the tenets of the Roman Catholic Church. For about eight years he read a great deal of theology. Then he sold his theological library and gave up religion. This agnosticism did not survive World War I, but Whitehead was never again a member of any church.

Whitehead was at work on a second volume of his Universal Algebra from 1898 to 1903, when he abandoned it because he was busy on a related, large investigation with Bertrand Russell. He had spotted young Russell's brilliance when he examined him for entrance scholarships at Trinity College. In 1890 Russell was a freshman studying mathematics there, and Whitehead was one of his teachers. Gradually the two men became close friends. In July 1900 they went to the First International Congress of Philosophy in Paris, where they were impressed by the precision with which the mathematician Giuseppe Peano used symbolic logic to clarify the foundations of arithmetic. Russell at once mastered Peano's notation and extended his methods. By the end of 1900 he had written the first draft of his brilliant Principles of Mathematics (1903). Whitehead agreed with its main thesis-that all pure mathematics follows from a reformed formal logic so that, of the two, logic is the fundamental discipline. By 1901 Russell had secured his collaboration on volume 2 of the Principles, in which this thesis was to be established by strict symbolic reasoning. The task turned out to be enormous. Their work had to be made independent of Russell's book; they called it Principia Mathematica. The project occupied them until 1910, when the first of its three volumes was published. The "official" text was written in a notation, most of which was either taken from Peano or invented by Whitehead. Broadly speaking, Whitehead left the philosophical problems-notably the devising of a theory of logical types—to Russell; and Russell, who had no teaching duties, actually wrote out most of the book. But the collaboration was thorough, and Russell gave Whitehead an equal share of the credit. Whitehead's only large published piece employing the symbolism of the *Principia* is a masterly speculative memoir, "On Mathematical Concepts of the Material World" (1905).

Career in London. In 1903 Trinity College had given Whitehead a 10-year appointment as a senior lecturer, made him the head of the mathematics staff, and permitted his teaching career to run beyond the maximum of 25 years set by the college statutes. Yet Whitehead's future was uncertain: he had not made the sort of discoveries that cause a man to be counted an outstanding mathematician. (His interest was always philosophical, in that it was directed more toward grasping the nature of mathematics in its widest aspects and organizing its ideas than toward discovering new theorems.) There was, thus, little prospect of a Cambridge professorship in mathematics for him at the expiration of his Trinity lectureship. He did not wait for it to expire but moved to London in 1910, even though he had no position waiting for him there. His years of service at Trinity, however, had made him a fellow for life, entitled to twice the regular quarterly dividend paid to fellows. This was scarcely enough to support his family, but Evelyn Whitehead encouraged the venture.

In that first London year, Whitehead wrote the first of his books for a wide audience, An Introduction to Mathematics (1911), still one of the best books of its kind. In 1911 he was appointed to the staff of University College (London), and in 1914 he became professor of applied mathematics at the Imperial College of Science and Technology.

In London Whitehead observed the education then being offered to the English masses. His own teaching had always elicited his pupils' latent abilities to the fullest. Perceiving that mathematics was being taught as a disconnected set of largely unfathomed exercises, Whitehead made occasional addresses on the teaching of mathematics. He stressed getting a living understanding of a few interrelated abstract ideas by using them in a variety of ways so as to develop an intimate sense for their power. Whitehead also perceived that literature was so taught as to preclude its enjoyment, that curricula were fragmented, and that teachers were handcuffed by the system of uniform examinations set by outside examiners. In 1916, as president of the Mathematical Association, he delivered the notable address "The Aims of Education: A Plea for Reform." Whitehead reminded youth's keepers that the purpose of education was not to pack knowledge into the pupils but to stimulate and guide their self-development. "Culture," he said, "is activity of thought, and receptiveness to beauty and humane feeling. Scraps of information have nothing to do with it.' Whitehead's address became a classic in virtue of its unequalled clarity, vigour, and realism and its reconciliation of general with special education. It was followed by penetrating essays on such topics as the rhythm of freedom and discipline. Though Whitehead's essays on education had little effect on British practice, they inspired many teachers in Great Britain, the United States, and elsewhere.

From 1919 to 1924 Whitehead was chairman of the governing body of Goldsmiths' College, London, one of England's major institutes for training teachers. He also served as a governor of several polytechnic schools in London. In the University of London he became a member of the Senate, chairman of the Academic Council, and dean of the Faculty of Science. His shrewdness, common sense, and goodwill put him in great demand as a committeeman.

Whitehead was a pacific man but not a pacifist; he felt that the war was hideous but that England's part in it was necessary. His elder son, North, fought throughout the war, and his daughter, Jessie, worked in the Foreign Office. In 1918 his younger son, Eric, was killed in action, and after that it was only by immense effort that Whitehead could go on working. To Whitehead, Russell's pacifism was simplistic; yet he visited him in prison, remained his friend, and, as Russell later said, showed him greater tolerance than he could return.

During those years, Whitehead was also constructing philosophical foundations for physics. He was led to this by the way in which he wanted to present geometry-not as deduced from hypothetical premises about assumed though imperceptible entities (e.g., points) but as the science of actual space, which is a complex of relations between extended things. From perceivable elements and relations, he logically constructed entities that are related to each other just as points are in geometry. That was only the beginning of his task, for Albert Einstein had revised the ideas of space, time, and motion. Whitehead was convinced that these three concepts should be based upon the general character of men's perception of the external world. In 1919 he published his Enquiry Concerning the Principles of Natural Knowledge; it was both searching and constructive but too philosophical and too complicated to influence physicists.

Whitehead had begun to have discussions of

the perceptual basis of scientific knowledge with philosophers in 1915, and he followed up his Enquiry with a nonmathematical book, The Concept of Nature (1920). Though he rejected Idealistic views of the relation of nature to perceiving minds, neither was he a Realist of the school led by Russell and G.E. Moore. In maintaining that events are the basic components of nature and that passage, or creative advance, is its most fundamental feature—doctrines that foreshadowed his later metaphysics-Whitehead was somewhat influenced by Henri Bergson's antimechanistic philosophy of change. Yet he was something of a Platonist; he saw the definite character of events as due to the "ingression" of timeless entities.

Career in the United States. In the early 1920s Whitehead was clearly the most distinguished philosopher of science writing in English. When a friend of Harvard University, the historical scholar Henry Osborn Taylor, pledged the money for his salary, Harvard early in 1924 offered Whitehead a five-year appointment as professor of philosophy. He was 63 years old, with at most two more years to go in the Imperial College. The idea of teaching philosophy appealed to him, and his wife wholeheartedly concurred in the move. Harvard soon found that it had acquired more than a philosopher of science; it had acquired a metaphysician, one comparable in stature to Gottfried Leibniz and Georg Hegel.

Early in 1925, he gave a course of eight lectures in Boston, published that same year (with additions—among them his earliest writing about God) as Science and the Modern World. In it he dramatically described what had long engaged his meditation; namely, the rise, triumph, and impact of "scientific Materialism"—i.e., the view that nature consists of nothing else but matter in motion, or a flux of purely physical energy. He criticized this Materialism as mistaking an abstract system of mathematical physics for the concrete reality of nature. Whitehead's mind was at home with such abstractions, and he saw them as real discoveries, not intellectual inventions; but his sense for the fullness of existence led him to urge upon philosophy the task of making good their omissions by reverting to the variety of concrete experience and then framing broader ideas. The importance of this book was immediately recognized. What perhaps impressed most readers was Whitehead's appeal to his favourite poets, William Wordsworth and Percy Bysshe Shelley, against the exclusion of values from nature.

In 1926, the compact book *Religion in the Making* appeared. In it, Whitehead interpreted religion as reaching its deepest level in humanity's solitude, that is, as an attitude of the individual toward the universe rather than as a social phenomenon.

In January 1927 the University of Edinburgh invited him to give a set of 10 Gifford Lectures in the ensuing academic year. For this, Whitehead drew up the complex technical structure of "the philosophy of organism" (as he called his metaphysics) and thought through his agreements and disagreements with some of the great European philosophers. It was characteristic of him to insist, against David Hume, that an adequate philosophical theory must build on "practice" and not be supplemented by it. The lectures reflected Whitehead's speculative hypothesis that the universe consists entirely of becomings, each of them a process of appropriating and integrating the infinity of items ("reality") provided by the antecedent universe and by God (the abiding source of novel possibilities). When, in June 1928, the time for delivering the lectures arrived and Whitehead presented this system in its new and difficult terminology, his audience rapidly vanished, but the publication of the lectures, expanded to 25 chapters, gave

Western metaphysics one of its greatest books, *Process and Reality* (1929).

Whitehead had an unwavering faith in the possibility of understanding existence and a superb power to construct a scheme of general ideas broad enough to overcome the classic dualisms. But he knew that no system can do more than make an approach, somewhat more adequate than its predecessors, to understanding the infinitude of existence. He had seen the collapse of the long-entrenched Newtonian system of physics, and he never forgot its lesson. Henceforth dogmatic assurance, whether in philosophy, science, or theology, was his enemy.

Adventures of Ideas (1933) was Whitehead's last big philosophical book and the most rewarding one for the general reader. It offered penetrating, balanced reflections on the parts played by brute forces and by general ideas about humanity, God, and the universe in shaping the course of Western civilization. Whitehead emphasized the impulse of life toward newness and the absolute need for societies stable enough to nourish adventure that is fruitful rather than anarchic. In this book he also summarized his metaphysics and used it to elucidate the nature of beauty, truth, art, adventure, and peace. By "peace" he meant a religious attitude that is "primarily a trust in the efficacy of beauty."

Except for an insufficient familiarity with Karl Marx and Sigmund Freud, Whitehead was at home in both the scientific and the literary cultures of his time. Young people flocked to "Sunday evenings," which his wife skillfully managed. Here the spare, rosy-cheeked man, who might have been of average height if he had not been so stooped, talked to them in a high-pitched but gentle voice—talked not about his system but about whatever was on their minds, sharply illuminating it from a broad and historical perspective.

In his Harvard lectures, as in his books, Whitehead liked best to explore the scope of application of an idea and to show how intuitions that were traditionally opposed could supplement each other, which he did by dint of his own ideas. Most students found attendance at his lectures a great experience. Harvard did not retire him until 1937.

In his first years in the United States, Whitehead visited many eastern and midwestern campuses as a lecturer. Though he loved Americans, he remained always very much an Englishman. A Fellow of the Royal Society since 1903, he was elected to the British Academy in 1931. In 1945 he received the Order of Merit. After his death his body was cremated, and there was no funeral. His unpublished manuscripts and correspondence were destroyed by his widow, as he had wanted.

Assessment. Whitehead has not had disciples, though his admirers have included leaders in every field of thought. His educational and philosophical books have been translated into many languages. His metaphysics has been keenly studied, in the United States most of all. What is now called Whitehead's "process theology" is easily the most influential part of his system; this is partly due to the influence of the U.S. philosopher Charles Hartshorne.

Whitehead's habit of helpfulness made him universally beloved. Though his courtesy was perfect, there was nothing soft about him; never contentious, he was astute, charitable, and quietly stubborn. He had a realistic, well-poised mind and a fine irony free of malice. Whitehead combined singular gifts of intuition, intellectual power, and goodness with firmness and wisdom. (V.Lo./Ed.) BIBLIOGRAPHY. See A.N. Whitehead, "Autobiographical Notes," in P.A. Schilpp (ed.), The Philosophy of Alfred North Whitehead, 2nd ed. (1951), and Essays in Science and Philosophy (1947), which includes "Autobiographical Notes"

and three meditative essays about his boyhood,

and six on education. Victor Lowe and Robert C. Baldwin (comps.), "Bibliography of the Writings of Alfred North Whitehead (with Selected Reviews)," in P.A. Schilpp (op.cit.), except for a few minor items and later reprints and translations, is complete. F.S.C. Northrop and Mason W. Gross (eds.), Alfred North Whitehead: An Anthology (1953), is a fine representative collection of essays and chapters from his books, 1906-38. Charles Hartshorne, Whitehead's Philosophy: Selected Essays, 1935-1970 (1972), offers critical essays. Victor Lowe, *Understanding Whitehead* (1962), explains the development of Whitehead's thought. Ivor Leclerc, Whitehead's Metaphysics (1958, reissued 1975), is a clear exposition of his later thought. Personal accounts include Bertrand Russell, Autobiography, vol. 1 (1967), and his brief article, "Whitehead and Principia Mathematica," in Mind, 57:137-138 (1948); Lucien Price, Dialogues of Alfred North Whitehead (1954, reprinted 1977), which covers Whitehead's last 13 years and presents him as a sage; and William Ernest Hocking, "Whitehead As I Knew Him," in Journal of Philosophy, 58:505-516 (1961), by one of Whitehead's Harvard colleagues.

Whitehead, (John) Henry (Constantine) (b. Nov. 11, 1904, Madras, India—d. May 8, 1960, Princeton, N.J., U.S.), British mathematician who greatly influenced the development of homotopy theory (the theory of a special kind of mapping of topological spaces).

As a Commonwealth research fellow (1929-32), Whitehead studied under the American mathematician Oswald Veblen at Princeton University. Their collaborative publications include The Foundations of Differential Geometry (1932), now regarded as a classic.

Whitehead became tutorial fellow at Balliol College, Oxford, in 1933, and, after serving with various government departments during World War II, he became Waynflete professor

of pure mathematics at Oxford.

Whitehead's work in differential geometry culminated in the paper "On the Covering of a Complete Space by the Geodesics Through a Point" (1935), containing pioneering contributions to this area of mathematics. He always retained his interest in geometry but soon focused on topology. He made substantial contributions to combinatorial homotopy and Stiefel manifolds and set up a school of topology at Oxford. He died while on sabbatical leave at the Institute for Advanced Study.

Whitehead, Robert (b. Jan. 3, 1823, Boltonle-Moors, Lancashire, Eng.—d. Nov. 14, 1905, Beckett, Berkshire), British engineer who invented the modern torpedo.

In 1856, after serving an apprenticeship in Manchester and working in Marseille, Milan, and Trieste, he organized, with local capital, a marine-engineering works, Stabilimento Tecnico Fiumano, in Fiume (now Rijeka, Yugos.). There he successfully designed and built engines for Austrian warships and began to work on a torpedo, which he completed in 1866. In 1872 he bought the firm and turned it into a manufacturer of torpedoes and accessories. In 1876 he improved his vehicles by using a servo-motor that gave them a truer course through the water, and he gradually increased their speed to 29 knots for 1,000 yards. In 1896 he used a gyroscope to control the course of a torpedo.

Whitehorse, city and capital (since 1952) of the Yukon Territory, Canada, on the Yukon (Lewes) River just below Miles Canyon and the former Whitehorse Rapids (now submerged beneath Schwatka Lake, created after 1958 by a hydropower dam). It is the Yukon headquarters of the Royal Canadian Mounted Police and is an important transportation centre on the Alaska Highway, linked by air to major North American cities. It has long been an outfitting base for anglers, big-game hunters, and trappers.

Whitehorse, perhaps so named because the white caps of the rapids on the Whitehorse River resembled the manes of white horses, was founded during the Klondike Gold Rush (1897–98) as a staging and distribution centre; it was the head of river navigation and became the northern terminus of the White Pass and Yukon Route (railway) from Skagway, which suspended service in 1982. McBride Museum in the city houses pioneer relics, and there are many historic log buildings including the Old Log Church Museum, the former Anglican Parish Church, where, for a concert in 1904, Robert W. Service (then parish secretary) composed "The Ballad of Dangerous Dan Mc-Grew" but decided against reciting it because of its ribald character. During World War II, Whitehorse became a construction base for both the Alaska Highway (serving a string of airports) and a crude-oil pipeline from Norman Wells, N.W.T., to a local refinery (now closed). Whitehorse was incorporated as a city in 1950, and in 1971 its metropolitan area was expanded in the river valley to cover 162 square miles (420 square km). The mining economy, stimulated in the 1950s by a federal program of road construction and financial aid, declined in the 1980s. Government and tourism are the economic mainstays, and the population is increased by the seasonal influx of tourists. Pop. (1986) 15,199.

Whitelocke, Bulstrode (b. Aug. 6, 1605, London—d. July 28, 1675, Chilton Park, near Hungerford, Berkshire, Eng.), English republican lawyer, an influential figure in Oliver Cromwell's Commonwealth regime.

Whitelocke was the son of Sir James Whitelocke, a King's Bench judge, and became a barrister in 1626 and served in the Parliament of the same year. He was elected to the Long Parliament in 1640 and took a leading part in the impeachment and attainder (1641) of King Charles I's chief minister, Thomas Wentworth, Earl of Strafford. Yet he opposed the Grand Remonstrance of 1641, which John Pym had carefully engineered. At the outbreak of the Civil Wars in 1642, Whitelocke sided with Parliament against the Royalists; he was sent on three peace embassies to Charles I from 1643 to 1645.

Whitelocke became a commissioner of the Great Seal in 1648 and was elected to the Council of State on the formation of the Commonwealth in 1649. During the next 10 years he served three additional terms as commissioner of the Great Seal. His official position enabled him to draft a new treason law and promote a bill for the use of English in legal proceedings. As ambassador to Sweden in 1653-54, he negotiated a treaty of friendship between England and Sweden. Although his resistance to Cromwell's proposed reform of the Court of Chancery led to his dismissal from the government in 1655, he headed the committee that in 1657 urged Cromwell to become king. Whitelocke's reputation for moderation—viewed by many as political vacillation-saved him from prosecution after the Restoration of King Charles II in 1660.

Whiteman, Paul (b. March 28, 1890, Denver, Colo., U.S.—d. Dec. 29, 1967, Doylestown, Pa., U.S.), American bandleader, called the "King of Jazz" for popularizing a musical style that helped to introduce jazz to mainstream audiences during the 1920s and 1930s.

Whiteman, who was originally a violinist, conducted a 40-piece U.S. Navy band in 1917-18 and then developed a hotel orchestra in California, which he took to New York City in 1920. He hired the best white jazz players, but he allowed little room for improvisation in his arrangements and greatly simplified jazz rhythms. He was successful as a cocomposer of popular songs during the 1920s and led his orchestra in Broadway musicals.

Whiteman commissioned George Gershwin's Rhapsody in Blue and conducted its premiere at Aeolian Hall, New York City, in 1924, with the composer as piano soloist. Whiteman also introduced the Grand Canyon Suite (1931) by

Ferde Grofe, who had arranged the Rhapsody. The *Rhapsody* became Whiteman's theme, and he established the Whiteman Awards for compositions in a "symphonic jazz" style. The 1930 film King of Jazz was the first of four in which his orchestra appeared. Whiteman was the host of several national radio programs during the 1930s, wrote three books (Jazz, with Mary Margaret McBride, 1926; How To Be a Bandleader, with Leslie Lieber, 1941; Records for the Millions, 1948), and recorded extensively. His popularity waned in the late 1940s, but he came back as a television-series host in the 1950s and occasionally led bands up to the time of his death.

whitethroat (Sylvia communis), typical Old World warbler of the family Sylviidae (order Passeriformes); it breeds in western Eurasia

Whitethroat (Sylvia communis) Frank Blackburn—The Natural History Photographic Agency

and northwestern Africa and winters in Africa and India. It is 14 cm (5½ inches) long, with red-brown wing patches and longish whiteedged tail; the male is gray-capped and whitethroated. It sings beautifully from dawn until dusk in woodland border and hedgerows.

whitework, embroidery worked in white thread on white material, originated in India and China and popular in the West since the Middle Ages as decoration for personal, table, and various church linens. Especially favoured in the 15th century as embellishment for underclothing, whitework, sometimes known as filet lace, a forerunner of real lace, was crafted by mounting strips of fine-gauge mesh in light wire frames and embroidering them for use as edgings and insertions.

The two main types are "open," in which holes are drawn or cut in fabric and then overcast, and "close," which is worked flat as in ordinary embroidery. Ayrshire whitework, a popular open type, was used mainly for dress materials in England and on the European continent from the late 1700s and relied on a buttonhole stitch to form geometrical or regularized flower patterns.

Whitfield, Mal, byname of MALVIN G. WHITFIELD (b. Oct. 11, 1924, Bay City, Texas, U.S.), American middle-distance runner, world-record holder for the 880-yard race (1950-54), for the 1,000-metre race (1953), and as a member of the U.S. team for the 4×440 -yard relay race (1952-56) and the 4×880 -yard relay race (1952).

Whitfield ran for Ohio State University (Columbus) and for Los Angeles State College. In the 1948 Olympic Games at London and the 1952 games at Helsinki, he won the gold medals in the 800-metre races, and in 1948 he won a gold medal as a team member of the 4×400 -metre relay race. In the 1952 games he won a silver medal in the same event. He did not qualify for the U.S. Olympic team in

Whitfield, an Air Force sergeant, retired in 1956. He worked for the United States Information Agency and set up a training program and served as track coach for athletes in the new African nations.

Whitgift, John (b. c. 1530, Grimsby, Lincolnshire, Eng.—d. Feb. 29, 1604, London), archbishop of Canterbury who did much to strengthen the Anglican church during the last years of Elizabeth I and to secure its acceptance by her successor, James I. He was the first bishop to be appointed to the Privy Council by Elizabeth, who entirely trusted and supported him, insisting on his ministrations on her deathbed.

Whitgift, detail of a panel painting by an unknown artist; in Lambeth Palace, London

By courtesy of the Archbishop of Canterbury; photograph, Courtauld Institute of Art

Whitgift was the son of a prosperous merchant. He was ordained in 1560 and was appointed regius professor of divinity and chaplain to the queen in 1567. In 1571 he became prolocutor of the Lower House of Convocation. He was bishop of Worcester (1577-83) and vice president of the Marches of Wales (1577–80). As archbishop of Canterbury from 1583, Whitgift at once began to reverse the policy of attempted conciliation with the Puritans adopted by his predecessor, Edmund Grindal. He sent his chaplain to search out secret Presbyterianism and to discover those responsible for the Puritan Marprelate tracts. Once he had secured reasonable conformity, he did not persecute, as is shown by his later treatment of Thomas Cartwright.

Whitgift founded a hospital and a school at Croydon, where he is buried. His reply to those who sought to presbyterianize the Church of England, An Answere to a Certen Libel Intituled, An Admonition to the Parliament (1572), and his subsequent writings against Cartwright constitute his chief Works, which were edited by John Ayre (1851–53).

BIBLIOGRAPHY. V.J.K. Brook, Whitgift and the English Church (1957), examines his political and ecclesiastical roles.

Whithorn, royal burgh in Dumfries and Galloway region, southwestern Scotland, on the peninsula between Luce and Wigtown bays. One of the oldest Christian centres in Britain, it was founded in about AD 397 by St. Ninian, who built a small whitewashed stone church (hence Whithorn, or White House, from the Anglo-Saxon Huitaern) on the site of which a monastery was built in about 1130. St. Ninian's Shrine was a popular place of pilgrimage until the Reformation. Robert I the Bruce visted it in 1329, James IV was a regular visitor, and Mary, Queen of Scots, made the last royal pilgrimage there in 1567. Pop. (1981) 983.

Whiting, city, Lake county, northwestern Indiana, U.S. It lies along Lake Michigan, in the Calumet industrial region, immediately southeast of Chicago. It originated in 1889, when the Standard Oil Company, unable to find

a site in Chicago, constructed "the world's largest complete oil refinery" there. A highly industrialized city (with heavy emphasis on smelting, refining, and chemicals), Whiting has remained small, its population declining from a peak of 10,880 in 1930. Calumet College (1951; Roman Catholic) is in Whiting. Inc. 1895. Pop. (1986 est.) 5,140.

whiting (Gadus, or Merlangius, merlangus), common marine food fish of the cod family, Gadidae. The whiting is found in European waters and is especially abundant in the North Sea. It is carnivorous and feeds on invertebrates and small fishes. It has three dorsal and two anal fins and a chin barbel that, if present, is very small. Its maximum length is about 70 cm (28 inches), and its colour is silvery with a distinctive black blotch near the base of each pectoral fin.

Whitlam, (Edward) Gough (b. July 11, 1916, Kew, Vic., Australia), Australian politician and lawyer whose unsuccessful premiership (1972–75) of his country ended when he was dismissed by the governor-general.

Whitlam was educated at the University of Sydney (B.A., 1938; LL.B., 1946) and became a barrister in 1947. He was a member of Parliament from 1952 to 1978 and served as deputy leader of the Australian Labor Party from 1960 to 1967. He became his party's leader in 1967. Upon becoming prime minister of Australia in 1972, Whitlam ended military conscription, lowered barriers to Asian and African immigration, and promised more independence from the United States in foreign affairs. His government was troubled by administrative blunders and by rising inflation and unemployment, however, and by the summer of 1975 his government had lost the parliamentary support needed to pass government expenditure bills. When Whitlam steadfastly refused to call new elections to resolve the parliamentary deadlock, Australia's British-appointed governor-general dismissed him from office on Nov. 11, 1975, and appointed a caretaker administration led by the political opposition. It was the first time in 200 years that the British crown had exercised its right to remove an elected prime minister. In the general election that followed, the opposition Liberal-National Country Party coalition won a record majority of seats in Parliament. Whitlam subsequently resigned the party lead-

In 1978 Whitlam resigned his seat in his nation's Parliament, retired from politics, and became a lecturer on political science and international relations at Australian National University at Canberra. In 1983 he was appointed Australian ambassador to UNESCO. Among his numerous publications are Road to Reform: Labor in Government (1975), Labor Essays (1980), and The Cost of Federalism (1983).

Whitley Council, also called JOINT INDUSTRIAL COUNCIL, in Great Britain, any of the bodies made up of representatives of labour and management for the promotion of better industrial relations. An original series of councils, named for J. H. Whitley, chairman of the investigatory committee (1916–19) who recommended their formation, were first instituted as a means of remedying industrial unrest. Many of them later developed into wage negotiating bodies.

The Whitley Council principle was extended and applied to nonindustrial sectors as well. Thus in 1919 a National Whitley Council was formed for the entire nonindustrial civil service in Britain.

Whitlock, Elizabeth, née KEMBLE (b. April 2, 1761, Warrington, Eng.—d. Feb. 27, 1836), noted actress in England and the United States.

The fifth child of Roger and Sarah Kemble, Elizabeth took naturally to the stage. She of-

ten went with her elder sisters Sarah Siddons and Frances Kemble Twiss to the Drury Lane Theatre, where she first appeared as Portia in 1783. She was an actress of great promise and was accounted an outstanding tragedienne, but she was eclipsed by the brilliant success of Sarah Siddons. Elizabeth married a theatre owner and manager, Charles Edward Whitlock, and accompanied him to the United States where, as Elizabeth Whitlock, she enjoyed a successful tour. She returned to an enthusiastic London reception at the Drury Lane Theatre in 1807 but thereafter was rarely seen on the stage.

whitlow grass, any plant belonging to either of two genera (Erophila and Draba), of the mustard family (Brassicaceae); some authorities believe that all these plants belong to one genus, Draba. The genus Erophila contains 10 European species, the genus Draba about 300 species distributed throughout the New World in the north temperate region, the Arctic, and mountainous areas. Common whitlow grass (Erophila verna), a low annual with small rosettes of narrow leaves, has clusters of white flowers at the ends of leafless stems and bears spear-shaped fruits on long stalks. It has many varieties and is naturalized from Europe in northern North America, where it grows on mountains, sandy ground, and rock walls. Yellow whitlow grass (D. aizoides) is similar but with yellow flowers; twisted, or hoary, whitlow grass (D. incana) and the smaller D. norvegica have leaves on the stems and white flowers with notched petals. All bloom in the spring.

Whitman, Marcus (b. Sept. 4, 1802, Rushville, N.Y., U.S.—d. Nov. 29, 1847, Waiilatpu, Oregon Territory [now in Washington, U.S.]), American physician, Congregational missionary to the Indians in the territories of present-day Washington and Oregon, and a pioneer who helped open the Pacific Northwest to settlement.

After practicing medicine in Canada and New York, Whitman in 1835 offered his services to the American Board of Commissioners for Foreign Missions. With another missionary, Samuel Parker, he was sent to investigate the possibilities for establishing missions in Oregon country, then jointly occupied by the United States and Great Britain. The friendly interest of the Flathead, Nez Percé, and other Indians they encountered in the territory of presentday Wyoming greatly encouraged the missionaries. Parker continued west, while Whitman returned to New York for additional recruits and assistance. There he married his fiancée, Narcissa Prentiss, who was also registered with the mission board. When the Whitmans set out for the West, they were accompanied by another married couple, the Reverend Henry H. Spalding and his wife, Eliza, and two single men. The two wives were the first white women to cross the continental divide. The party reached Fort Vancouver (now Vancouver, Wash.) in September.

In 1836 Whitman founded a mission among the Cayuse Indians at Waiilatpu, 6 miles (10 km) west of present-day Walla Walla. The Spaldings established a mission among the Nez Percé at Lapwai, Idaho, 125 miles (200 km) northeast of Waiilatpu. The men helped the Indians build houses, till their fields, and irrigate their crops. They also taught them how to erect mills for grinding corn and wheat. The wives established mission schools. Progress was slow, however, and the board in 1842 decided to abandon its missions at Waiilatpu and Lapwai and concentrate on those in what is now the area of Spokane, Wash.

In response, Whitman in the winter of 1842–43 made a 3,000-mile (4,830-kilometre) journey on horseback to Boston to protest the board's decision. After persuading mission authorities to continue support of the Waiilatpu and Lapwai missions, he went to

Washington to inform federal officials of conditions in Oregon country and the possibilities for settlement. Assured of federal aid for immigration, Whitman began his return journey. En route he joined a caravan of 900 immigrants that later became known as the "great westward migration." It was through his determination and courage that the first wagons crossed the mountains to the Columbia River.

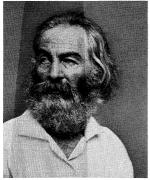

Although Whitman resumed his missionary work at Waiilatpu, he found the Indians apathetic. The more ceremonial form of worship conducted by Roman Catholic missionaries was attractive to the Indians, and competition for their conversion was introduced. Whitman's task was further complicated by the influence of lawless white newcomers.

Sensing a growing coldness toward him on the part of the Cayuse, Whitman resolved to relocate his family, but, before he could do so, an epidemic of measles broke out. Both white and Indian children were afflicted, and Whitman cared for them with equal concern. Because the white children recovered and many of the Indians (lacking any degree of immunity) died, he was suspected of practicing sorcery, in order to remove the Indians to make way for white settlers. On Nov. 29, 1847, the Indians attacked, killing 14 whites, including the Whitmans, and kidnapping 53 women and children. The Whitman Massacre directed national attention to the difficulties faced by settlers in the Far West and contributed to early passage of a bill to organize Oregon Territory (1848). It also led directly to the Cayuse War, which did not end until 1850. Whitman Mission National Historic Site, near Walla Walla, commemorates these pioneers. Biographies include Archer Butler Hulbert and Dorothy Printup (eds.), Marcus Whitman, Crusader (1936), and Clifford Merrill Drury's Marcus Whitman, M.D., Pioneer and Martyr (1937).

Whitman, Walt, in full WALTER WHITMAN (b. May 31, 1819, West Hills, Long Island, N.Y., U.S.—d. March 26, 1892, Camden, N.J.), U.S. journalist, essayist, and poet whose Leaves of Grass (first edition 1855) was so radical in form and content that it made him a revolutionary figure in U.S. literature. "I Sing the Body Electric," for example, in Leaves of Grass, asserted the beauty of the human body, physical health, and sexuality.

Early life. Walt Whitman was born into a family that settled in America in the first half of the 17th century. His father, a carpenter, failed in his attempt at farming and moved

his family from Long Island to Brooklyn in 1823. Walt's five years of public schools, from 1825 to 1830, were followed by four years of learning the printing trade. In 1835 he began

work as a journeyman printer in New York. A year later he began teaching; in 1838 he edited the Long Islander, a weekly published in Huntington, but worked for Martin Van Buren's presidential campaign in 1840 and taught briefly, before returning to printing in New York. From 1842 to 1844 he edited the Aurora, a daily newspaper, and the Evening Tattler. In 1845 he returned to Brooklyn and wrote for the Long Island Star; from 1846 to 1848 he edited the Brooklyn Daily Eagle, then in 1848-49 the Brooklyn Weekly Freeman. He spent nearly four months of 1848 working on the Crescent in New Orleans, returning via the Mississippi and the Great Lakes. From 1850 to 1854 he ran a printing office and stationery store, built houses, and speculated in real estate.

He had spent a great deal of his 36 years walking and observing in New York City and Long Island; he had visited the theatre frequently and seen many plays of Shakespeare; he had developed a strong love of music, especially opera ("But for opera," he once remarked, "I could never have written Leaves of Grass"). He had read Tom Paine; he had been influenced by Elias Hicks, the radical Quaker preacher; and he had a strongly rationalist, liberal outlook. He had read widely: Homer, the Bible, Shakespeare, Coleridge, and Dickens. James Macpherson's translations of Ossianic poems from the Gaelic impressed him, and Sir Walter Scott particularly appealed to him. No publisher's name, no author's name appeared on the first edition of Leaves of Grass in 1855. But the cover had a portrait of Walt Whitman, "broad shouldered, rouge fleshed, Bacchus-browed, bearded like a satyr." He

a red flannel undershirt, open-breasted exposing his brawny neck; striped calico jacket over this, the collar Byroneal, with coarse cloth overalls buttoned to it; cowhide boots; a heavy roundabout, with huge outside pockets and buttons to match; a slouched hat, for house and street alike.

The poems in Leaves of Grass addressed the citizens of the United States, urging them to be large and generous in spirit, a new race of races nurtured in political liberty, possessed of united souls and bodies. The singer of the poems was at once solitary and yet a sharer in the common life around him; he was sounding his "barbaric yawp over the roof of the world." Emerson wrote to him on receiving the poems that it was "the most extraordinary piece of wit and wisdom" America had yet contributed.

Walt Whitman had been practicing his own style of writing in his private notebooks, and in 1856, after much rewriting, the second edition of Leaves of Grass appeared. This collection contained revisions of the poems of the first edition and several new ones, the "Sun-down Poem" (later to become "Crossing Brooklyn Ferry"). The reviews included in the section "Leaves-Droppings" contained some of his own reviews of his work as well as those of others. In these anonymous reviews, he described himself as a genuine "American bard at last," proclaimed himself "One of the roughs," and taught that the body and sex are beautiful. His style, he asserted, was transcendent, new, vigorous; his poetry looked to the future; and he, the "insolent unknown," was only giving a beginning to a succession of American poets.

From 1857 to 1859 Whitman edited the *Brooklyn Times*, and his way of life became bohemian. This period up to 1860, when the third edition of *Leaves of Grass* was published by a Boston firm, was that of the "I" who was "turbulent, fleshy, sensual, eating, drinking and breeding." The 1860 volume contained the "Calamus" poems, which record a personal crisis of some intensity in his life, an apparent homosexual love affair (whether imagined or real is unknown), and "Premo-

nition" (later entitled "Starting from Paumanok"), which records the violent emotions that often drained the poet's strength. "A Word out of the Sea" (later entitled "Out of the Cradle Endlessly Rocking") evoked some sombre feelings, as did "As I Ebb'd with the Ocean of Life." "Chants Democratic," "Enfans d'Adam," "Messenger Leaves," and "Thoughts" were more in the poet's earlier vein.

Civil War years. After the outbreak of the Civil War in 1861, Whitman, now in his 40s, changed in personality, becoming the "Good Gray Poet." His brother was wounded at Fredericksburg, and Whitman went there in 1862, staying some time in the camp, then taking a temporary post in the paymaster's office in Washington. He spent his spare time visiting wounded and dying soldiers in the Washington hospitals, spending his scanty salary on small gifts for Confederate and Unionist soldiers alike and offering his ordinary "cheer and magnetism" to try to alleviate some of the mental depression and bodily suffering he saw in the wards.

In January 1865 he became a clerk in the Department of the Interior; in May he was promoted but in June was dismissed because the Secretary of the Interior thought that Leaves of Grass, which Whitman was revising at the time, was indecent. He then obtained a post in the attorney general's office, largely through the efforts of his friend, the journalist William O'Connor, who wrote a vindication of Whitman in The Good Gray Poet (published in 1866), which aroused sympathy for the victim of injustice. He had made many friends in Washington, including the writer John Burroughs and one Peter Doyle, a young horse-car driver, with whom he had formed an emotional and affectionate relationship. He also kept in close touch with his mother, for whom he cared deeply.

In May 1865 Drum Taps showed Whitman's readers a new kind of poetry, moving from the oratorical excitement with which he had greeted the falling-in and arming of the young men at the beginning of the Civil War to a disturbing awareness of what war really meant. "Beat! Beat! Drums!" echoed the bitterness of the Battle of Bull Run, and "Vigil Strange I Kept on the Field One Night" had a new awareness of suffering, no less effective for its quietly plangent quality. The Sequel to Drum Taps, published in the autumn of 1865, contained his great elegy on Lincoln, "When Lilacs Last in the Dooryard Bloom'd." His horror at the death of democracy's first "great martyr chief" was matched by his revulsion from the barbarities of war. Though it can be argued that they, like the poems, lack the validity of experience, Whitman's prose descriptions of the war, published later in Specimen Days & Collect, in 1882-83, are no less effective in their direct, moving simplicity.

Mature works. The fourth edition of Leaves of Grass, published in 1867, contained much revision and rearrangement. Apart from those on the Civil War, it contained eight new poems, and some poems had been omitted. The quality of Whitman's poetry was variable, and at times his work (such as "O Captain! My Captain!") verged on the maudlin. The war had had its effect on Whitman's larger views, some of which emerged in the prose of Democratic Vistas (1871). Two of its three essays, "Democracy" and "Personalism," had appeared earlier, the first of them begun as a reply to Carlyle's gloomy view of democracy. This essay, however, approached an almost equally pessimistic view of what Whitman thought America was becoming-a drab, vulgar, materialistic society. He did return to the prophetic ideas he had expressed in the first edition of Leaves of Grass, but now he saw the need to spiritualize society; he thought

that manly friendship, a sense of comradeship, could be generated in America and that this in turn could regenerate corrupt government and raise the generally low morale of the people. Although he distrusted politics, he nevertheses felt young men should become involved. His idealism had been tempered; but he still believed in literature and the arts: only they could create a truly democratic society.

In the late 1860s Whitman's work began to receive greater recognition. The early reactions of American critics—with the notably enthusiastic exception of Emerson and, to a lesser degree, of the editor and scholar Charles Eliot Norton, who saw merits as well as failures in Whitman's work-were unsympathetic to both his subject matter and style. Emerson, however, was not always eulogistic; he wrote that he expected Whitman to make the songs of the nation but that he "seemed content to make the inventories." This habit of Whitman's of giving lists of things and his use of place-names probably reflected a sense of American achievement on peopling the continent's vast space, and much can be argued in favour of his frequent use of the particular to make a general point. O'Connor's Good Gray Poet: A Vindication (1866) and John Burroughs' Notes on Walt Whitman as Poet and Person (1867) were followed in 1868 by the expurgated English edition of the poems prepared by William Michael Rossetti, the English man of letters. Algernon Swinburne praised him in 1868 and wrote him a poem in 1870. In Ireland the artist John Butler Yeats and Edward Dowden, the critic, were strong voices in his behalf.

After finishing Democratic Vistas, Whitman wrote "Passage to India," celebrating three events: the opening of the Suez Canal, the meeting of the Union Pacific and Central Pacific railways in Utah, and the laying of the transatlantic cable. This poem moved beyond America, beyond the questions of health, to problems of death and the hereafter. Whitman was ill in 1872, probably as a result of long-experienced emotional strains related to his sexual ambiguity; in January 1873 his first stroke left him partly paralyzed. He recovered sufficiently to travel to his brother's home in Camden, N.J., in May, where his mother was dying. Her subsequent death he called "the great cloud" of his life. He stayed with his brother and lived on the difference between his salary and what he paid a substitute, but his appointment was terminated in 1874 on the grounds of economy.

Another turning point in his life came in 1876. Ill and depressed by fresh American attacks on his work, which were touched off by an article in the West Jersey Press, he was greatly elated by the excellent reception given to the two-volume Centennial edition of his works, especially by his English admirers. In the spring of 1876 he stayed at a farm owned by his friend Harry Stafford and began slowly to overcome the effects of his stroke: he gradually increased his exercise; he swam and sunbathed and found in Stafford someone who filled the gap left by Peter Doyle's absence. He also formed a close friendship with R.M. Bucke, a Canadian admirer who later wrote the first substantial biography of the poet. Whitman's health recovered sufficiently by 1879 for him to make a visit to the West. In 1881 James R. Osgood published a second Boston edition of Leaves of Grass, and the Society for the Suppression of Vice claimed it to be immoral. Because of a threatened prosecution, Osgood gave the plates to Whitman, who, after he had published an author's edition, found a new publisher, Rees Welsh of Philadelphia, who was shortly succeeded by David McKay. Leaves of Grass had now reached the form in which it was henceforth

to be published. The sales of the Philadelphia edition gave Whitman enough money to buy a house in Camden in 1884.

Whitman spent the last years Last vears. of his life in Camden, near the river ferries he loved. After he suffered from sunstroke in 1885, friends bought him a horse and phaeton in which he could drive about. He had many new friends, among them Horace Traubel, who recorded his talk and organized financial help for him after another paralytic stroke occurred in 1888. Whitman seems to have seen Traubel as his Boswell and organized Traubel's work on his biography with great deliberation. His life had now settled into a quiet pattern. He wrote the 62 new poems of *November Boughs*, which appeared in 1888 with a preface entitled "A Backward Glance o'er Travel'd Roads." The Complete Poems and Prose appeared in this year and the eighth volume of Leaves of Grass, to be followed by the "deathbed" edition, on which Whitman worked in 1891.

"Garrulous," in his own words, "to the very last," Whitman continued to write and revise. After completing "Passage to India," his thoughts had turned more toward death and were constantly filled with the wonder that had animated his earlier contemplation of the beauty of the countryside and the complexity of the city. In "Prayer of Columbus" he conveyed the feelings of a "batter'd wreck'd old man," near death, the clouds closing in, yet he was still able to write buoyantly in "Halcyon Days" or "Proudly the Flood Comes In."

Assessment. His reputation continued to grow. George Saintsbury, Havelock Ellis, and John Addington Symonds had paid their tributes, the last with Whitman: A Study (1893), which was more objective than some of the eulogizing that had grown up around Whitman in the United States. In the late 19th century his poems exercised a strong fascination, notably on English readers-mostly those who criticized English society, who found Whitman's championing of the common man idealistic and prophetic. Whitman's aim was to transcend traditional epics, to eschew normal aesthetic form, and yet by reflecting U.S. society to enable the poet and his readers to realize themselves and the nature of their American experience. Ezra Pound approved Whitman's beginnings and shared his ambitions. Other poets—Hart Crane, William Carlos Williams, Wallace Stevens, Allen Ginsberg-followed in his tracks. They shared in Whitman's preoccupation with the problem of preserving the individual's integrity amid the pressures of mass civilization. This problem is Whitman's "One's Self" in relation to "En-Masse": he wanted to be indirect yet natural. He invigorated language; he could be strong yet sentimental, and he possessed scope and inventiveness.

Whitman's itemized view of American development, as well as his dominating aim of reaching his audience, perhaps attracted the attention of Yeats and Eliot to his work. He has continued to hold the attention of very different generations primarily because he offered the welcome conviction that "the crowning growth of the United States" was to be spiritual and heroic, and also because he was able to "articulate and faithfully express in literary, or poetic form," and seemingly never compromised his own personality. He had a candid, comprehensive sense and sufficient universality to be properly considered one of the greatest U.S. poets. (A.N.J.)

MAJOR WORKS. Poems. Leaves of Grass (1855; revised and enlarged several times until the final edition during Whitman's lifetime of 1892, posthumous poems added in 1897), includes "Song of Myself," "I Sing the Body Electric," "There Was a Child Went Forth" (all 1855); "Crossing Brooklyn Ferry," "Miracles," "Salut au Monde!" "Song of the Broad-Axe," "Song of the Open Road" (1856); "I Hear It Was Charged Against Me," "Facing

West from California's Shores," "Once I Pass'd Through a Populous City" (1860); "Come Up from the Fields, Father," "Give Me the Splendid Silent Sun," "O Captain! My Captain!" "Pioneers! O Pioneers!" Whitney, Eli (b. Dec. 8, 1765, Westboro, Mass.—d. Jan. 8, 1825, New Haven, Conn., U.S.), U.S. inventor, mechanical engineer, and manufacturer, best remembered as the inventor of the cotton gin but most important for developing the concept of mass-production of interchangeable parts.

Eli Whitney, detail of an oil painting by Samuel F.B. Morse, c. 1822; in the Yale University Art Gallery, New Haven, Conn.

By courtesy of the Yale University Art Gallery, gift of George Hoadly, Yale 1801

Whitney's father was a respected farmer, who served as justice of the peace. In May 1789 Whitney entered Yale College, where he learned many of the new concepts and experiments in science and the applied arts, as technology was then called. After graduation in the fall of 1792, Whitney was disappointed twice in promised teaching posts. The second offer was in Georgia, where, stranded, without employment, short of cash, and far from home, he was befriended by one Catherine Greene. Phineas Miller, a young man of Whitney's age, Connecticut-born and Yaleeducated, managed Mulberry Grove, Greene's splendid plantation. Miller and Whitney became friends.

At a time when English mills were hungry for cotton, the South exported a small amount of the black-seed, long-staple variety. Though it could easily be cleaned of its seed by passing it through a pair of rollers, its cultivation was limited to the coast. A green-seed, short-staple variety, on the other hand, that grew in the interior resisted cleaning; its fibre adhered to the seed. Whitney saw that a machine to clean the green-seed cotton could make the South prosperous and make its inventor rich. He set to work and constructed a crude model. Whitney's cotton gin had four parts: (1) a hopper to feed the cotton into the gin; (2) a revolving cylinder studded with hundreds of short wire hooks, closely set in ordered lines to match fine grooves cut in (3) a stationary breastwork that strained out the seed while the fibre flowed through; and (4) a clearer, which was a cylinder set with bristles, turning in the opposite direction, that brushed the cotton from the hooks and let it fly off by its own centrifugal force.

After perfecting his machine he secured a patent (1794), and he and Miller went into business manufacturing and servicing the new gins. However, the unwillingness of the planters to pay the service costs and the ease with which the gins could be pirated put the partners out of business by 1797.

The planters' ability to defeat lawsuits brought against them by Whitney for infringement of patent rights and their mounting wealth apparently induced a sense of guilt at denying the inventor any reward: in 1802 the state of South Carolina agreed to pay \$50,000, half the sum asked by Miller & Whitney for the patent rights. The action was followed by similar settlements with North Carolina, Tennessee, and, finally and reluctantly, Georgia. Miller & Whitney grossed about \$90,000; the partners netted practically nothing. When Congress refused to renew the patent, which expired in 1807, Whitney concluded that "an invention can be so valuable as to be worth-less to the inventor." He never patented his later inventions, one of which was a milling machine.

Whitney learned much from his experience. He knew his own competence and integrity, which were acknowledged and respected. He redirected his mechanical and entrepreneurial talents to other projects in which his system for manufacturing gins was applicable. In 1797 the government, threatened by war with France, solicited 40,000 muskets from private contractors because the two national armories had produced only 1,000 muskets in three years. Twenty-six contractors bid for a to-tal of 30,200. Like the government armories, they used the conventional method whereby a skilled workman fashioned a complete musket, forming and fitting each part. Thus, each weapon was unique; if a part broke, its replacement had to be especially made.

Whitney broke with this tradition with a plan to supply 10,000 muskets in two years. He designed machine tools by which an unskilled workman made only a particular part that conformed precisely, as precision was then measured, to a model. The sum of such parts was a musket. Any part would fit any musket of that design. He had grasped the concept of interchangeable parts. "The tools which I contemplate to make," he explained, "are similar to an engraving on copper plate from which may be taken a great number of impressions perceptibly alike.

But 10½ years passed before Whitney delivered his 10,000 muskets. He constantly had to plead for time while struggling against unforeseen obstacles, such as epidemics and delays in supplies, to create a new system of production. Finally, he overcame most of the skepticism in 1801, when, in Washington, D.C., before President-elect Thomas Jefferson and other officials, he demonstrated the result of his system: from piles of disassembled muskets they picked parts at random and assembled complete muskets. They were the witnesses at the inauguration of the American system of mass production.

In 1817 Whitney married Henrietta Edwards, granddaughter of Jonathan Edwards. Of his our children, three survived, including Eli Whitney, Jr., who continued his father's arms manufactory in Hamden, Conn.

(J.Mir./Ed.)

BIBLIOGRAPHY. Jeannette Mirsky and Allan Nevins, The World of Eli Whitney (1952), based upon Whitney's extant papers, other primary sources-official and private-and published material, has the fullest, most detailed account (with bibliography) of both the cotton gin and the beginning of mass production in Whitney's manufacture of arms. A shorter, excellent account is Constance M. Green, Eli Whitney and the Birth of American Technology (1956).

Whitney, Gertrude Vanderbilt, née VAN-DERBILT (b. Jan. 9, 1875, New York Cityd. April 18, 1942, New York City), American sculptor and art patron, founder of the Whitney Museum of American Art in New York

A great-granddaughter of Commodore Cornelius Vanderbilt, she was born into wealth and social prominence—her father, Cornelius Vanderbilt, being a financier and art patron. At age 21 she married Harry Payne Whitney (1872-1930), a financier and sportsman.

From her early years she was interested in painting and, soon after her marriage, began the serious study of sculpture, with teachers in New York City and Paris. In 1907 she opened a studio in Greenwich Village and the following year won her first prize, for a sculpture of "Pan." Among her later notable creations were the "Aztec Fountain" (1912) for the Pan American Building and the "Titanic Memorial" (1914–31), both in Washington, D.C.; the "Victory Arch" (1918–20), the "Washington Heights War Memorial" (1921), and the 'Peter Stuyvesant Monument' (1936–39), all in New York City; the "Saint-Nazaire Monument" (1924) in Saint-Nazaire, Fr.; and the "Columbus Memorial" (1928–33), in Palos, Spain. All her works were simple, direct, and largely traditional in character.

In 1929, believing that American modernists deserved greater recognition, she offered to donate to the Metropolitan Museum of Art her entire collection of about 500 works of American artists. The traditionalist director of the Metropolitan refused the offer, whereupon Whitney set about the next year founding her own institution, the Whitney Museum of American Art, which was founded in 1930 and opened in November 1931 in Greenwich Village (it moved in 1954 to West 54th Street and, then, in 1966 to West 75th Street and Madison Avenue). She also helped fund the Whitney Wing of the American Museum of Natural History in New York City.

Whitney, John Hay, byname Jock WHITNEY (b. Aug. 17, 1904, Ellsworth, Maine, U.S.—d. Feb. 8, 1982, Manhasset, N.Y.), American multimillionaire and sportsman who had a multifaceted career as a publisher, financier, philanthropist, and horse breeder.

After attending Groton Preparatory School and Yale University (1922-26), he entered the University of Oxford; but, upon the death of his father in 1927, he returned to manage the vast family fortune. Meanwhile, he had become a keen sportsman and an internationally ranked polo player, joining the renowned Greentree polo team in 1924 and remaining an active player until the team broke up in 1940. He eventually took a leading role in many horse-breeding and racing organizations, and his own stables, Greentree, produced several notable winning racehorses.

Also interested in the arts and politics, Whitney invested in Broadway plays, including the long-running hit Life with Father; ventured into films with Pioneer Pictures, which demonstrated the value of Technicolor; and, in 1935, helped form the Selznick International Motion Picture Company, which, through Whitney's efforts, obtained screen rights to the novel Gone with the Wind even before its publication. He served as a trustee of the Museum of Modern Art in New York City from its inception in 1931 and himself eventually formed one of the finest art collections in the United States.

With the outbreak of World War II in Europe, Whitney joined Nelson Rockefeller and others in forming what eventually became the U.S. Office of the Coordinator of Inter-American Affairs. In 1942 he joined the Eighth U.S. Army Air Force as a captain in the Combat Intelligence Division and saw duty in England and the Mediterranean before being captured by the Nazis in southern France. He escaped and in 1945 was awarded the Legion of Merit. That year he became special adviser to the U.S. Department of State's Public and Cultural Relations Division and to the International Information Service, and in 1956 he was appointed U.S. ambassador to Great Britain, where he served until 1961

In the years after World War II, Whitney also pursued business opportunities in the communications industry, acquiring interests in numerous newspapers, television and radio stations, and magazines. His greatest disappointment was his inability to revitalize the New York Herald Tribune, which he acquired in 1958 and which he served (1961-66) as publisher and editor in chief until the newspaper folded.

As a philanthropist, he set up in 1946 the John Hay Whitney Foundation, to which he contributed \$1,000,000 annually, and in 1970 he donated \$15,000,000 to his alma mater,

Whitney, Josiah Dwight (b. Nov. 23, 1819, Northampton, Mass., U.S.-d. Aug. 19, 1896, Lake Sunapee, N.H.), American geologist known for his studies of the regional geology of California.

Whitney was an independent consulting expert in mining from 1849 until 1854, when he was appointed chemist for the state of Iowa and professor of mineralogy at the University of Iowa. From 1860 until 1874 he was a member of the Geological Survey of California. He was appointed to the faculty of Harvard University in 1865 and in 1868 opened the Harvard School of Mines; from 1875 to 1896 he was a Sturgis-Hooper Professor of Geology at Harvard. Whitney led the expedition that in 1864 discovered the peak named in his honour, Mt. Whitney. He wrote Metallic Wealth of the United States (1854); The Auriferous Gravels of the Sierra Nevada of California (1880); and Climatic Changes of Later Geological Times (1882).

Whitney, Mount, highest peak (14,494 ft [4,418 m] above sea level) in the 48 coterminous U.S. states. It is the culminating summit of the Sierra Nevada, on the Inyo-Tulare

County line, at the east border of Sequoia National Park in eastern California. The peak was named for Josiah D. Whitney, and it was first climbed in 1873 by A.H. Johnson, C.D. Begole, and J. Lucas. Its summit is a gently sloping tablelike surface not yet dissected by erosion; its slopes are lined with avalanche chutes and blocks of granite and are devoid of glaciation. The Kern River Canyon is on the west and precipitous streams enter Owens Valley on the east.

Whitney, William C(ollins) (b. July 5, 1841, Conway, Mass., U.S.—d. Feb. 2, 1904, New York City), U.S. secretary of the Navy (1885-89) who played a major role in the post-Civil War rebuilding of the Navy

Admitted to the bar in 1865, Whitney practiced law in New York City and became active in local Democratic Party affairs. An opponent of Tammany Hall (the city Democratic organization), he joined Samuel J. Tilden in overthrowing the powerful but corrupt political boss William Marcy ("Boss") Tweed. From 1875 to 1882, Whitney was corporation counsel for the city of New York.

In 1884 he worked to promote the Democratic presidential candidacy of Grover Cleveland, who, upon taking office, appointed Whitney secretary of the Navy. During his four years in that post Whitney strengthened the U.S. fleet, which had been neglected after the Civil War. Under Whitney's leadership, naval appropriations were more than doubled. He undertook a major shipbuilding program, putting to sea the battleship "Maine" and others that were to figure prominently in the war with Spain. With Cleveland's defeat, Whitney returned to New York, where, as a joint owner of the Metropolitan Traction Company, he was charter operator of the city's rapid-transit system. He continued to be active in party affairs but, as a Gold Democrat (i.e., member of the party's anti-free-silver faction), declined to support the candidacy of William Jennings Bryan for president in 1896.

Whitney, William Dwight (b. Feb. 9, 1827, Northampton, Mass., U.S.—d. June 7, 1894, New Haven, Conn.), U.S. linguist and one of the foremost Sanskrit scholars of his time, noted especially for his classic work, Sanskrit Grammar (1879). He also served as editor in chief of The Century Dictionary: An Encyclopedic Lexicon of the English Language, 6 vol. (1889-91), in its time one of the finest general-purpose dictionaries in the United States.

As professor of Sanskrit (1854-94) and comparative language studies (1869–94) at Yale University, Whitney conducted extensive research and published a number of works. These included editions and translations of the Vedas, the ancient Hindu sacred scriptures, written in the oldest form of Sanskrit. He also contributed to the great Sanskrit dictionary of Otto von Böhtlingk and Rudolf von Roth.

Editor of the 1864 edition of Webster's dictionary, he wrote The Life and Growth of Language (1875; reprinted, 1977), Essentials of English Grammar (1877), and Max Müller and the Science of Linguistics: A Criticism (1892). Selected Writings, edited by Michael Silverstein, was published in 1971.

Whitney, Willis Rodney (b. Aug. 22, 1868, Jamestown, N.Y., U.S.—d. Jan. 9, 1958, Schenectady, N.Y.), U.S. chemist and founder of the General Electric Company's research laboratory, where he directed pioneering work in electrical technology and was credited with setting standards for industrial scientific laboratory research in the U.S.

Whitney studied at the Massachusetts Institute of Technology, Cambridge, and earned his Ph.D. from the University of Leipzig in 1896. Upon joining General Electric, Whitney founded (1900) its research laboratory at Schenectady, N.Y., and was its director (1900-28) and later vice president in charge of research (1928-41). There he found, in 1902. that metallized carbon filament for incandescent lamps produced 25 percent more light than had earlier filaments. He also directed work that led to the development of the modern electric light bulb and to improvements in vacuum tubes. He developed an electrochemical theory of corrosion that was widely used in the analysis of corrosion reactions.

Whitney Museum of American Art, collection in New York City of predominantly 20thcentury U.S. art, including painting, sculpture, and graphics. It was founded in 1930 by Gertrude Vanderbilt Whitney, a sculptor and promoter of U.S. art.

Since 1966 the collection has been installed in a Fifth Avenue building designed by Marcel Breuer. It contains the world's largest collections of the works of Alexander Calder and Edward Hopper.

> A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Whitstable, locality on the Thames Estuary in Canterbury district, county of Kent, southeastern England. From Roman times it was known for the oysters gathered from the estuary. In the Middle Ages Whitstable was a port and a stopping place for pilgrims to Canterbury (7 mi [11 km] southeast). In modern times it has grown as a seaside resort and residential town. Pop. (1981 prelim.) 27,896.

Whitsunday (Christian festival): see Pente-

Whitsunday Island, largest of the Cumberland Islands, lying 6 mi (10 km) off the northeastern coast of Queensland, Australia, in the Coral Sea. An inshore, coral-fringed continental island, it measures 12 mi by 8 mi, has an area of 38 sq mi (98 sq km), and rises from steep cliffs of volcanic rock to Mt. Whitsunday, 1,426 ft (435 m). It lies between the coral formations of the Great Barrier Reef and the Whitsunday Passage (20 mi long and a minimum of 2 mi wide). Both the island and the passage, which separates the Cumberlands from the mainland, were reached on Whitsunday 1770 by the British navigator Capt.
James Cook. The explorer Matthew Flinders sailed through the passage in 1802. The island is well forested and once supported a timber industry. It is now a national park and resort, accessible from the mainland by launch.

Whittaker, Charles E(vans) (b. Feb. 22 1901, near Troy, Kan., U.S.-d. Nov. 26, 1973, Kansas City, Mo.), associate justice of the United States Supreme Court (1957-62).

Whittaker was admitted to the bar in 1923 and received his law degree the following year. In 1930 he joined a Kansas City law firm, in which he specialized in corporation law. In 1954 he was appointed federal judge for western Missouri, and in 1956 to the U.S. Court of Appeals for the eighth circuit. The following year he was named to the U.S. Supreme Court to replace Stanley F. Reed. Whittaker served on the Supreme Court bench for five years, writing no major opinions. He is remembered for having cast the deciding vote in a number of decisions, many of which were overruled during or immediately after his tenure. He resigned in 1962 to return to private practice.

Whittaker, Sir Edmund Taylor (b. Oct. 24, 1873, Southport, Lancashire, Eng.—d. March 24, 1956, Edinburgh), English mathematician who made pioneering contributions to the area of the special functions, of particular interest in mathematical physics.

Whittaker became a fellow of Trinity College,

Cambridge, in 1896. After being elected a fellow of the Royal Society of London in 1905. he was appointed the following year professor of astronomy at the University of Dublin and Astronomer Royal of Ireland. He served as professor of mathematics at the University of Edinburgh from 1912 until his retirement in 1946. He was knighted in 1945

Whittaker excelled not only in mathematics but also as a science historian. His prolific mathematical contributions were in mathematical physics as well as in dynamical problems, and his work on differential equations and functions had great influence. His A Course of Modern Analysis (1902; 2nd ed., 1915) advanced the study of functions of a complex variable and their expansions and the study of special functions and their related differential equations. He discovered in 1902 the general solution of Laplace's equation and the following year originated the confluent hypergeometric function, which has found numerous uses and has developed an extensive literature.

In A History of the Theories of Aether and Electricity, from the Age of Descartes to the Close of the Nineteenth Century (1910), expanded in 1953 to include the first quarter of the 20th century, Whittaker showed the philosophic depth behind his mathematical thought. On the eve of the revolution in physics brought on by the theory of relativity, he published A Treatise on the Analytical Dynamics of Particles and Rigid Bodies, with an Introduction to the Problem of Three Bodies (1904), an epoch-making summary of classical dynamics. He also contributed pioneering work on the effects of the relativistic curved space on electromagnetic phenomena. Having adopted the Roman Catholic faith in 1930, he wrote several works on the relationship between science and natural theology.

Whitten Brown, Sir Arthur (aviator): see Brown, Sir Arthur Whitten.

Whittier, city, Los Angeles County, southern California, U.S., at the foot of the Puente Hills. Part of the Rancho Paso de Bartolo Viejo (1847), the site was chosen in 1887 by Aquila H. Pickering for a Quaker community and named for poet John Greenleaf Whittier. It developed as an agricultural and citrus-growing centre, later enmeshed in the expansion of the Los Angeles metropolitan area. Whittier College (alma mater of Pres. Richard M. Nixon) was established in 1901 and Rio Hondo College in 1960. The Pio Pica State Historic Park contains the partially restored mansion of Pio Pica, last Mexican governor of California. Inc. city, 1898. Pop. (1980) 68,872.

Whittier, John Greenleaf (b. Dec. 17, 1807, near Haverhill, Mass., U.S.-d. Sept. 7, 1892, Hampton Falls, Mass.), U.S. author and Abolitionist whose character and significance are partly suggested by titles and subtitles of bi-

Whittier, detail of a portrait by M.G. Torrey, 1835

By courtesy of Donald P. Wright

ographies of him: "Quaker Militant," "Bard of Freedom," "Friend of Man." Many of his poems are sung as church hymns by a number of denominations. In the latter part of his life Whittier shared with Longfellow the distinction of being a household name in both England and the United States.

Born on a farm, of Puritan and Quaker ancestry, he had limited formal education at district school and two terms in Haverhill Academy. The Quaker household loved learning as well as religion. Whittier's early enthusiasm for Burns, Byron, and Scott broadened to include Spenser, Shakespeare, Milton, and Marvell; Wordsworth, Coleridge, and Lamb were lasting favourites. His deepest admiration was for Milton, whose role as apostle of freedom and goad to righteous living he sought to imitate.

Whittier was in turn poet and journalist (1826-32), Abolitionist (1833-42), writer and humanitarian (1843-65), and Quaker poet (1866-92). Encouraged by the Abolitionist William Lloyd Garrison, he wrote copiously and enthusiastically. When his father convinced him of the impracticality of poetry as a vocation, he turned to journalism. He edited newspapers in Boston and Haverhill and by 1830 had become editor of the New England Weekly Review in Hartford, Conn., the most important Whig journal in New England. During this period Whittier was also writing verse, sketches, and tales of New England, and he published his first volume of poems, Legends of New England (1831). By 1832 need for him at home following his father's death, discouragement because of his lack of literary recognition, a failed romance, and ill health caused him to resign and return to Haverhill.

Deciding that his rebuffs had been caused by personal vanity, he resolved to devote himself to more altruistic activity, and soon embraced Garrisonian Abolitionism. His fiery pamphlet "Justice and Expediency" made him prominent in the Abolitionist movement, and for a decade he was probably its most influential writer. He also served a term in the Massachusetts legislature and became well known as a lobbyist in Boston and Washington. After 1836 he lived in Amesbury with his mother, aunt, and sister.

By 1843 Whittier had broken with Garrison but supported antislavery candidates, including Lincoln, and various reforms. Also he became more active in literature. In 1843 he was represented, with Hawthorne and Poe, in Lowell's new magazine, *The Pioneer*, and published *Lays of My Home*. In the next two decades he published eight additional volumes of poems, which included "Songs of Labor" (1850) and "Maud Muller" (1854) with its lines "Of all sad words of tongue and pen/ The saddest are these, 'It might have been' "; "The Barefoot Boy" (1855); and "Barbara Frietchie" (1863). Most of his literary prose, including his one novel, *Leaves from Margaret Smith's Journal* (1849), was published in this period. He also wrote numerous articles and reviews.

The U.S. Civil War encompassed the deaths of his family physician, Elias Weld; his old schoolmaster and historical source, Joshua Coffin, and his beloved younger sister Elizabeth, who with their mother had influenced him greatly. But national and personal grief furthered his literary maturity. The publication in 1866 of his best known poem, Snow-Bound, was followed by other triumphs in The Tent on the Beach (1867), Among the Hills (1868), and The Pennsylvania Pilgrim (1872).

Although he was a poor man most of his life, Whittier received \$10,000 for Snow-Bound, and at his death left an estate of \$134,000 to relatives, friends, and philanthropies. He was a member of the famous Saturday Club of Boston, and his 70th and 80th birthdays were literary events.

Whittington, Dick, byname of RICHARD WHITTINGTON (d. March 1423, London), English merchant and lord mayor of London who became a well-known figure in legend and traditional pantomime.

Whittington, who was the son of a knight

of Gloucestershire, opened a mercer's shop in London, which supplied velvets and damasks to such notables as Henry Bolingbroke (later King Henry IV). He then entered city politics and served three terms as lord mayor of London: 1397-99, 1406-07, and 1419-20. By

Supposed portrait of Dick Whittington and his cat, engraving by Renold (Renier) Elstracke, early 17th century

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

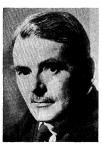

1400 he had acquired immense wealth and commercial prestige. He made large loans to kings Henry IV (ruled 1399–1413) and Henry V (ruled 1413–22) and bequeathed his vast fortune to charitable and public purposes.

Popular legend makes Dick Whittington a

Popular legend makes Dick Whittington a poor orphan employed as a scullion by a rich London merchant. He ventures his only possession, a cat, as an item to be sold on one of his master's trading ships. Ill-treated by the cook, Dick then runs away, but just outside the city he hears the prophetic peal of bells that seems to say "Turn again, Whittington, Lord mayor of great London." He returns to find that his cat has been sold for a great fortune to a Moorish ruler whose dominions are plagued with rats. Whittington marries his master's daughter, succeeds to the business, and subsequently becomes thrice lord mayor of London. The first recorded reference to the tale appears in 1605.

Whittle, Sir Frank (b. June 1, 1907, Coventry, Warwickshire, Eng.), English inventor and aviator who produced the first British jet propulsion unit.

Whittle, the son of a mechanic, entered the Royal Air Force as a boy apprentice and soon qualified as a pilot at the RAF College, Cranwell. He was posted to a fighter squadron

Whittle Camera Press

in 1928, and, after a short period as flying instructor, he served as a test pilot at the Marine Aircraft Experimental Establishment, Felixstowe (1931–32). He then pursued further studies at the RAF engineering school and at

the University of Cambridge (1934-37), where he read mechanical sciences.

As early as his Cranwell days Whittle recognized the potential demand for an aircraft that would be able to fly at great speed and height. He patented his turbo-jet engine in 1930 and in 1936 joined with associates to found a company called Power Jets. From 1937 he was on the RAF Special Duty List, attached to Power Jets, Ltd., to carry out development work on gas turbines for jet propulsion of aircraft. A jet engine of his invention, the first specimen of which was ready for testing as early as 1937, was fitted to the specially built Gloster E28/39 airframe. Its maiden flight took place on May 15, 1941, and by 1944 it was in service with the RAF. The government, which had been niggardly with support in the 1930s, backed the development of Whittle's engine once war had started.

Whittle became technical adviser to the Ministry of Supply in 1946 and retired from the RAF in 1948 with the rank of air commodore. In the same year he was knighted. The British government eventually atoned for their earlier neglect by granting him a tax-free gift of £100,000. He was appointed a Commander in the U.S. Legion of Merit in 1946 and in 1977 became research professor at the U.S. Naval Academy, Annapolis, Md. In 1953 Jet: The Story of a Pioneer was published.

Whittredge, (Thomas) Worthington (b. May 22, 1820, Springfield, Ohio, U.S.—d. Feb. 25, 1910, Summit, N.J.), U.S. landscape painter of the Romantic Hudson River school

"The Trout Pool," oil on canvas by Worthington Whittredge; in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York, gift of Col. Charles A. Fowler, 1921

(q, v,), who as a U.S. Luminist realized the pictorial value of light for setting mood, specifying time, and accentuating detail. Unlike most of the Hudson River school painters, Whittredge selectively composed his landscape scenes, rather than painting precise patches of nature.

Whittredge was originally a house painter. He then became a portraitist and also began painting landscapes influenced by the works of Thomas Cole and Asher B. Durand. Sympathetic sponsors sent him to Europe to study. He spent five years in Düsseldorf, where he was influenced by the Romantic luminism of the Düsseldorf painters, and five years in Rome, where he posed for Emanuel Leutze, who painted him as Washington in "Washington Crossing the Delaware."

On his return to the U.S. (1859), the varied and rich American landscape awakened

his deepest sentiments. In 1865 he went on a 2,000-mile government inspection tour of the Rocky Mountains with the landscape painters John Frederick Kensett and Sanford R. Gifford. His observations on this journey resulted in huge canvases of vast panoramic views like "Crossing the Platte" (1870; Century Association, New York City). His most characteristic works are his poetic forest interiors with their depths of feathery fern and mossy rocks dappled with leaf-filtered light; e.g., "The Trout Pool" and "Camp Meeting" (both in the Metropolitan Museum of Art, New York City). Whittredge did not paint landscapes for nature's sake alone but chose places he loved, giving his works a personal subject matter.

Whitworth, Sir Joseph, BARONET (b. Dec. 21, 1803, Stockport, Cheshire, Eng.—d. Jan. 22, 1887, Monte-Carlo), English mechanical engineer who won international recognition as a machine toolmaker.

After working as a mechanic for various Manchester machine manufacturers, Whitworth went to London in 1825 and at Maudslay & Company devised a scraping technique for making a true plane surface. Returning to Manchester in 1833, he opened his own tool-

Whitworth, detail of an oil painting by an unknown artist

making business. Between 1840 and 1850 he produced an original measuring machine and a system of accurate dimensional standards or master gauges to go with it. Even the common screw was not overlooked. In 1841 Whitworth's standard screw threads were adopted by the Woolwich Arsenal.

By 1851 Whitworth's machine tools had become internationally known for their accuracy and quality. He had exhibited his screw cutting lathes, his planing, drilling, slotting, and shaping machines, and his millionth-part measuring machine. By 1866 his factory employed 700 men and was equipped with 600 machine tools. He also did pioneering work in ordnance, inventing a method for casting ductile steel to replace hard steel, which is subject to fracture.

Whitworth helped found the chair of engineering and laboratories at Owens College, Manchester. In 1868 he established the Whitworth scholarships, setting aside an annual sum of £3,000 for the purpose. In 1869 he was created a baronet.

whole-tone scale, in music, scalar arrangement of pitches, each separated from the other by a whole-tone step, in contradistinction to the chromatic scale (half steps only) and the diatonic scale (intermixing whole and half-tone steps). In Western art music, the whole-tone scale is closely associated with the decline of functional harmony in the late 19th century. Free of the sort of compelling harmonic

implications traditionally associated with half-tone steps, especially in a diatonic context, whole-tone patterning greatly appealed to composers such as Claude Debussy who sought to represent relatively static impressions or moods, rather than dynamic processes or events, in their music. Early examples of the whole-tone scale in an as yet traditional harmonic context are found in certain compositions of Franz Liszt as well as in works by the Russian group of composers known as the Mighty Five.

wholesale price index, measure of changes in the prices charged by manufacturers and wholesalers. Wholesale price indexes measure the changes in commodity prices at a selected stage or stages before goods reach the retail level; the prices may be those charged by manufacturers to wholesalers or by wholesalers to retailers or by some combination of these and other distributors. In the United States, the index measures the price movements of all commodities flowing into primary markets of the United States—whether domestically produced or imported. Primary markets are those in which a good in a given stage of fabrication is first sold in substantial quantities. Because primary markets include goods of all degrees of fabrication, the same commodity is often priced at several stages of processing. Cotton, for example, is priced in the form of raw cotton, cotton yarn, cotton gray goods, cotton piece goods, and cotton clothing.

One of the earliest wholesale price indexes was produced for Great Britain in 1886, covering the period after 1846. The official wholesale price index in the United Kingdom, produced by the Board of Trade, goes back to 1871. In the United States, the first major effort to summarize wholesale price changes through index numbers was published in a report of the U.S. Senate in 1893. The present wholesale price index of the United States, maintained by the Bureau of Labor Statistics, has been computed for the period since 1890. In both the United Kingdom and the United States, economic historians have attempted to reconstruct wholesale price indexes for the 19th century that are superior to the early efforts.

The number and character of the commodities included in wholesale price indexes vary widely from country to country. In large industrial countries like the United Kingdom, the United States, and Germany, the commodities that are included usually number in the thousands; but for most countries it is much smaller, often only 100 or 200. The smaller numbers of products will serve well enough if only a general all-commodities index (or a few subindexes at most) is wanted. Greater numbers are required when many subindexes are desired. The United States, for example, publishes indexes for commodities classified according to stage of processing (crude materials, intermediate materials, and finished goods), according to the durability or nondurability of the products, and according to the economic sector for which goods are intended (consumers, producers, etc.). The commodities are also grouped into 15 categories and nearly 100 subgroups (fresh fruits, grains, etc.) and a large number of product classes (apples, bananas, barley, corn, etc.), for each of which monthly price indexes are published. In addition, there are a number of indexes for special commodity groups such as various categories of pharmaceutical preparations. The number of commodities included in the U.S. index has expanded from 250 when the index was started in 1902 to about 2,400 in the late 20th century. The new commodities have tended to be more highly fabricated and to have more stable prices, and they have therefore dampened the fluctuations in the index. One reason for the inclusion of more commodities was a gradual shift in the conception of the function of the index. Originally it was regarded as a measure of movements in the general price level, but as other indexes became available, such as the consumer price index, less reliance was placed on the wholesale price index for this purpose. At the same time, there was growing demand for subindexes pertaining to particular classes of products for various business and analytical purposes.

Countries in which industrial production is not highly variegated usually have smaller numbers of product classifications; these serve to distinguish between price movements of domestic goods and price movements of imports and between those of food or agricultural products and those of industrial products. Raw materials and standardized products in early processing stages that are easy to price tend to be well represented in the wholesale price indexes of all countries; whereas more complex types of producers' goods, such as heavy electrical equipment, tend to be underrepresented or omitted even in the indexes of the advanced industrial countries. This is a source of upward bias in the general wholesale indexes since there is reason to believe that technological change has been particularly important in bringing about improvements in complex goods.

Price data used to construct the indexes are usually gathered from business firms by mail, less frequently from trade journals and trade associations, and also from government purchasing agents. Weights are generally based on relative sales volume. Data from censuses of production (manufacturing, mining, agriculture, etc.) are used for weights when they are available.

wholesaling, the selling of merchandise to anyone other than a retail customer. The merchandise may be sold to a retailer, a wholesaler, or to an enterprise that will use it for business, rather than individual, purposes. Wholesaling usually, but not necessarily, involves sales in quantity and almost always at a cost that is significantly lower than the average retail price.

Wholesaling became particularly advantageous after the introduction of mass production and mass marketing techniques in the 19th century. Without wholesale organizations, large manufacturers would have to deal with a great many retailers and/or consumers at high unit costs, and retailers or consumers would have to deal with a large number of manufacturers at great inconvenience.

There are three main categories of wholesalers: (1) merchant wholesalers, (2) manufacturers' sales branches, and (3) merchandise agents and brokers. The most important are the merchant wholesalers. These independent businesses buy merchandise in large quantities from manufacturers, process and store that merchandise, and redistribute it to retailers and others. Manufacturers' sales branches are businesses established by manufacturers to sell directly to retailers. They tend to be established by large companies which modify their products frequently and to whom rapid, accurate information on sales and suggestions for improvement are especially valuable. Merchandise agents and brokers represent non-competing products of several manufacturers to a number of retailers. Unlike merchant wholesalers and manufacturers' sales branches they ordinarily do not take title to the merchandise they handle. Rather, they simply arrange for shelf space and the display of merchandise of the manufacturers they represent.

For international statistical data on wholesale trade, see BRITANNICA WORLD DATA in the current Britannica Book of the Year.

whooping cough, also called PERTUSSIS, acute, highly communicable respiratory disease characterized in its typical form by paroxysms of coughing followed by a long-drawn inspiration, or "whoop," and ending with

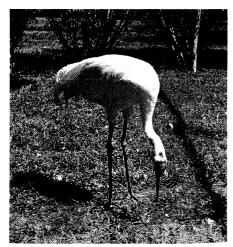

expulsion of clear, sticky mucus, and often vomiting. The disease was first adequately described in 1578; undoubtedly it had existed for a long time before that. About 100 years later, the name pertussis (Latin: "intensive cough") was introduced in England. In 1906 at the Pasteur Institute, the French bacteriologists Jules Bordet and Octave Gengou isolated the bacteria that cause the disease; first called Bordet–Gengou bacilli; later, Hemophilus pertussis; and still later, Bordetella pertussis.

After an incubation period of approximately one week, catarrhal symptoms develop, which resemble an ordinary upper respiratory infection, with a short dry cough that is worse at night. After one to two weeks the catarrhal stage passes into the distinctive paroxysmal period, variable in duration but commonly lasting four to six weeks. Serious complications include bronchopneumonia, suffocative attacks, and occasionally convulsions and indications of brain damage.

Whooping cough is worldwide in distribution and among the most acute infections of children. A vaccine that confers active immunity against whooping cough to children under six years of age is administered, preferably combined with tetanus and diphtheria toxoids and often with poliomyelitis vaccine as well; immunization is routinely begun during the first three months of infancy. A booster dose of pertussis vaccine should be given at 18 months of age, but not generally thereafter, because reactions to the vaccine may be troublesome in older children. Later vaccinations are in any case thought to be unnecessary, because the disease is much less severe when it occurs in older children, especially if they have been vaccinated in infancy.

Treatment includes frequent light feeding to offset the nutritional debility resulting from vomiting; administration of sedatives to induce rest and sleep; and, sometimes, the use of suction apparatus to remove mucus and ease breathing. Antibiotics have little or no effect on the pertussis bacilli but are given to combat secondary infection.

whooping crane (Grus americana), tallest American bird and one of the world's rarest, a member of the family Gruidae (order Gruiformes). The whooping crane, officially listed as an endangered species, is on the verge of

Whooping crane (Grus americana)
H. William Belknap

extinction; the Bureau of Sport Fisheries and Wildlife in the U.S. Department of the Interior is propagating captive whooping cranes in an attempt to increase the wild population, which numbered nearly 100 individuals in the early 1980s, with about 24 more in captivity.

The whooping crane is almost 150 centimetres (5 feet) tall and has a wingspread of about 210 centimetres (7 feet). It is white with black-tipped wings, black legs, and a bare red

face and crown. It has a whooping call purported to be audible for two miles.

It is believed that such birds as the whooping crane have been declining in numbers for some time because of changing ecological conditions, and only partly from hunting and cultivation of land by man. Their gregariousness increases their vulnerability, and the high rate of infant mortality retards recovery of the population.

Whorf, Benjamin Lee (b. April 24, 1897, Winthrop, Mass., U.S.—d. July 26, 1941, Wethersfield, Conn.), U.S. linguist noted for his hypotheses regarding the relation of language to thinking and cognition and for his studies of Hebrew and Hebrew ideas, of Mexican and Mayan languages and dialects, and of the Hopi language.

Under the influence of Edward Sapir, at Yale University, Whorf developed the concept of the equation of culture and language, which became known as the Whorf hypothesis, or the Sapir-Whorf hypothesis. Whorf maintained that the structure of a language tends to condition the ways in which a speaker of that language thinks. Hence, the structures of different languages lead the speakers of those languages to view the world in different ways. This hypothesis was originally put forward in the 18th century by the German scholars Johann Gottfried von Herder and Wilhelm von Humboldt. It was espoused in the United States in the period preceding World War II by Sapir and then in the 1940s by Whorf. Whorf's formulation and illustration of the hypothesis excited considerable interest. On the basis of his research and fieldwork on American Indian languages, he suggested, for example, that the way a people view time and punctuality may be influenced by the types of verbal tenses in their language. Whorf concluded that the formulation of ideas is part of (or influenced by) a particular grammar and differs as grammars differ. This position and its opposite, that culture shapes language, have been much debated. See also ethnolinguistics.

whortleberry: see bilberry.

Who's Who, any of numerous biographical dictionaries that give brief and pertinent information about prominent living persons who are distinguished in a particular field or by official position or public standing and who have, in most cases, supplied data about themselves through publisher questionnaires. Among the most accessible primary sources for biographical information, Who's Who entries may include such personal facts as names of immediate family and salient data about education, business, and military experience; residential and business addresses usually appear. The accuracy of personal information is, however, susceptible to the respondent's whim and is rarely checked.

The first Who's Who was published in London (1849) as a handbook of titled classes, listing only names without biographical sketches. Since 1899 the format has been that of a biographical dictionary, with primarily British emphasis; annual and enlarged publication has continued. Who's Who in America: A Biographical Dictionary of Notable Living Men and Women, first published in Chicago (1899), is issued biennially, thoroughly revised. It is considered the standard, authoritative work of contemporary biography for the United States, and it has included, since 1974, some prominent persons from other countries and representatives to the United Nations. Published as supplements are U.S. regional Who's Whos; Who Was Who, listing deceased persons formerly in Who's Who; and the International Who's Who. In recent decades, national Who's Whos have proliferated in countries throughout the world. Similar biographical dictionaries have emerged focussing on special fields,

e.g., natural sciences, banking, government, and politics.

Whyalla, city and port, southern South Australia, on the east coast of Eyre Peninsula, opposite Port Pirie, northwest of Adelaide. It was created in 1901 by the Broken Hill Proprietary Company, Ltd. (BHP) as the Spencer Gulf terminus of a tramway bringing iron ore from the Middleback Ranges for use as a flux in the lead smelters at Port Pirie. Its name was changed in 1920 from Hummock Hill to Whyalla, an Aboriginal term meaning "place with deep water." Industrial development was stimulated by World War II. Whyalla exports iron ore and steel and had the largest shipyards in Australia until their operations ceased in 1978. It has blast furnaces, steelworks, heavy engineering works, and salt evaporation facilities for the manufacture of industrial chemicals. Lying in an arid region, the city obtains its water from the Murray River via a pipeline 223 mi (359 km) long, completed in 1944; a second, parallel pipeline was completed in 1966. In 1945, Whyalla came under a combined company and public administration. It became a city in 1961 and adopted full local government status in 1970. Pop. (1981) 29,962.

Whydah (Benin): see Ouidah.

whydah, also spelled WHIDAH, or WYDAH, also called WIDOWBIRD, any of several African birds that have long dark tails suggesting a funeral veil. They belong to two subfamilies, Viduinae and Ploceinae, of the family Ploceidae (order Passeriformes). The name is associated with Whydah (Ouidah), a town in Benin where the birds are common.

In the Viduinae, each species of the genus Vidua (probably eight or nine species, including those assigned by some authorities to the genera Steganura, Hypochera, or Tetraenura) is a social parasite, laying its eggs in the nests of a particular species of weaver finch for incubation and development. Males are mostly black and have four central tail feathers greatly elongated; body length is about 10 to 13 centimetres (4 to 5 inches). Common species are the pin-tailed whydah (V. macroura), the shaft-tailed whydah (V. regia), and the broad-tailed paradise whydah (V. orientalis), perhaps a race of the paradise whydah (V. paradisaea).

Male whydahs of the Ploceinae resemble the viduines. An example is the black whydah (Coliuspasser ardens), called red-collared whydah in eastern Africa. The male in Jackson's whydah (C., sometimes Drepanoplectes, jacksoni), clears a dancing ground for himself, leaving a tall bunch of grass in the middle, and is visited there by females; the similarity to bowerbird behaviour is striking. Ploceine whydahs are not parasitic. Because they behave like bishop (q.v.) birds, some authors include them in that genus, Euplectes.

Whymper, Edward (b. April 27, 1840, London—d. Sept. 16, 1911, Chamonix, Fr.), En-

Whymper, engraving, 1881 BBC Hulton Picture Library

glish mountaineer and artist who was associated with the exploration of the Alps and was the first man to climb the Matterhorn (14,691 feet [4,478 metres]).

Privately educated, Whymper entered his father's wood engraving business and ultimately succeeded as head of it. He was sent to Switzerland in 1860 to make sketches for a book on the Alps and became a mountaineer thereafter. In the western Alps he climbed Mont Pelvoux (1861) and Les Écrins (1864). On his eighth attempt to scale the Matter-horn, on July 14, 1865, Whymper made the ascent by the Swiss ridge. On the descent, one member of his party slipped and pulled down three more—all four fell to their deaths. The rope broke, saving Whymper and two guides. One of the best known of all mountaineering accidents, this event is recorded in Whymper's Scrambles Amongst the Alps (1871; condensed as Ascent of the Matterhorn, 1879), which is illustrated with his own engravings.

In 1867 and 1872 Whymper visited Greenland with the intention of crossing its ice cap, but he became convinced that the undertaking would prove too costly for him. In Ecuador (1880) he twice ascended Chimborazo, and he spent a night on the summit of Cotopaxi (19,347 feet [5,897 metres]), the world's highest continuously active volcano. He published Travels Amongst the Great Andes of Ecuador (1892), which contained much valuable information for geographers, geologists, and mountaineers. He also compiled two handbooks on the climbing of Chamonix (1896) and Zermatt (1897; both reprinted 1974). Whymper's last journeys were in the Canadian Rockies (1901-05).

Wibert OF RAVENNA, Italian WIBERTO DI RAVENNA (pope): see Clement (III).

Wichita, North American Indian people of Caddoan linguistic stock who in their early history lived near the Arkansas River in present-day Kansas. They were encountered by the Spanish in the mid-16th century and became the object of the earliest missionary work done among the Plains Indians. Like most Caddoans, the Wichita subsisted largely by farming (corn [maize], pumpkins, and tobacco) but also hunted buffalo. They lived in conical communal lodges resembling haystacks and constructed of poles and thatch; on hunting expeditions they used skin tepees. More given

Conical communal lodges in a Wichita camp in Oklahoma

By courtesy of the Bureau of American Ethnology, the Smithsonian Institution, Washington, D.C.

to tattooing than most Plains Indians, they were known by other groups as the "tattooed people." They performed a ceremonial dance resembling the green corn festivals of the southeastern tribes.

In the late 18th century the Wichita moved south, probably under pressure from hostile tribes in the north. By 1772 they were located near what is now Wichita Falls, Texas. During the Civil War they relocated in Kansas, and in 1867 they were removed to a reservation in Oklahoma. Their estimated population in 1780 was 3,200; in the late 20th century they numbered about 500.

Wichita, city, seat of Sedgwick County, south central Kansas, U.S., on the Arkansas River near the mouth of the Little Arkansas. Founded in 1864 as a trading post on the site of a village of the Wichita Indians, it owed its early development to the Texas cattle trade along the Chisholm Trail and to the rapid spread of agricultural settlement along the Atchison, Topeka and Santa Fe Railway, then under construction. In its early years Wichita was a stopover on cattle drives to Abilene and other points as the railroad moved west; in 1872 the line reached Wichita, and the city became a major cattle-shipping centre. By 1875 farmers' fences obstructed the movement of beef herds, but grain became an important commodity.

The major economic activities of Wichita are aircraft construction, oil refining, grain processing and storage, and livestock marketing. Wichita is the home of Friends University (1898), Berean Christian College (1930), Kansas Newman College (formerly Sacred Heart College, 1933), and Wichita State University (1895). McConnell Air Force Base is nearby. Mid Continent Airport, 6 miles (10 km) west, is the headquarters of the International Flying Farmers. The restored Cow Town is a replica of Wichita in the 1870s. Inc. city, 1871. Pop. (1980) city, 279,272; (1982 est.) metropolitan area (sMsA), 429,200.

Wichita Falls, city, seat (1882) of Wichita County, northern Texas, U.S., on the Wichita River in the Red River Valley, 115 miles (185 km) northwest of Fort Worth. Founded in 1876, it was named for the Wichita Indians and the low-water river falls that once existed there. After the arrival (1882) of the Fort Worth and Denver City Railroad it became a cattle centre.

With the local discovery of oil and gas fields in the 1900s, the city developed petroleum industries. Agriculture (cotton, grains, and cattle), based on the surrounding irrigated region, remains an important part of a balanced economy, which includes the manufacture of glass fibre products, clothing, and electronic components. Midwestern State University was established there as a junior college in 1922. In April 1964 a tornado devastated the city and collapsed a hangar at nearby Sheppard Air Force Base. Inc. 1889. Pop. (1980) city, 94,201; (1982 est.) metropolitan area (SMSA), 125,500.

Wichita orogeny, a period of block faulting in the southern part of the Wichita-Arbuckle System in western Oklahoma and northern Texas. The uplift is dated from the Late Carboniferous epoch (formerly the Pennsylvanian period; the Late Carboniferous epoch occurred from 320 to 286 million years ago). The Apishipa-Sierra Grande uplift in eastern Colorado and northern New Mexico is of similar age and may be a part of the Wichita orogeny.

Wick, royal burgh (1589), fishing port, and seat of the district of Caithness, Highland region, Scotland. An ancient Norse settlement on the North Sea, situated about 14 miles (23 km) south of John o'Groats, Wick developed as a fishing port and centre, expanding rapidly during the herring boom of the 19th century.

Since then herring fishing has declined and been replaced by the smaller whitefish industry. Several light manufacturing industries have been established, including the Caithness glass-blowing factory, which attracts 50,000 visitors each year. Wick airport provides important links with the Orkney and Shetland Isles and major cities to the south. Pop. (1981) 7 9002

wick, thread, strip, or bundle of fibres that, by capillary action, draws up the oil of a lamp or the melted wax in a candle to be burned. By 1000 BC, wicks of vegetable fibres were used in saucer-type vessels containing olive oil or out oil in order to provide light, and by 500–400 BC these wicks were in general domestic use. See lamp.

wickerwork, furniture made of real or simulated osier (rods or twigs) plaited into appropriate shapes. The Egyptians made furniture of this kind in the 3rd millennium BC, and

Roman wickerwork chair, detail from a stone relief showing a woman at her toilet, early 3rd century AD; in the Rheinisches Landesmuseum, Trier,

By courtesy of the Rheinisches Landesmuseum, Trier, Ger.

it has always flourished in those regions in which there is a plentiful supply of riverside vegetation. A well-known example of Roman wickerwork is the chair on a 3rd-century-AD relief in the Rheinisches Landesmuseum at Trier, Ger., showing a woman at her toilet. Furniture of this kind provided the cheapest and most comfortable form of seating, though the material of which it was made has rendered it ephemeral, and knowledge of its early history can only be deduced in the main from illustrations and literary references. There are many of these dating from Elizabethan and Jacobean times, when wickerwork was sometimes referred to as "Twiggie work."

A simple open wickerwork, armless basket

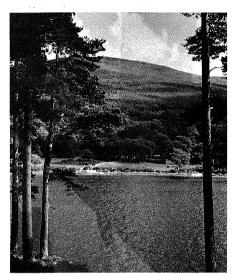

A simple open wickerwork, armless basket chair with a round seat—a type still produced—probably represents the historic shape; but more complex and specialized forms evolved in the 19th century with the increasing demand for lounge chairs and with the closer contacts that were being established with Oriental countries. One particular form, with footrests, arms, and upholstered cushions, was evolved on the ocean liners that sailed to the tropics and was then adapted for domestic use. Although used predominantly for chairs, wickerwork was also employed for beds, cradles, and garden tables.

Wickford, locality, resort village, and administrative centre, administratively part of North Kingstown (*q.v.*), Washington County, south-central Rhode Island, U.S., on an inlet of

Narragansett Bay. It has an unusually large number of restored colonial and 19th-century buildings, an art school and colony, and one of the largest marinas in New England.

Wickham, William of: see Wykeham, William of.

Wicklow, Irish CILL MHANTÁIN, county in the province of Leinster, Ireland. With an area of 782 sq mi (2,025 sq km), it is bounded on the east by the Irish Sea and by Counties Wexford (south), Carlow and Kildare (west), and Dublin (north). County Wicklow includes much of the Leinster Chain mountain range, notably the Wicklow Mountains, and has fertile lowland areas. Much of its coast comprises rocky cliffs and excellent sand beaches. The main summits of the Leinster Chain are

Upper Lake in the Vale of Glendalough, County Wicklow, Ireland

G.F. Allen-Bruce Coleman Inc.

above 2,000 ft, with Lugnaquillia Mountain the highest at 3,039 ft (926 m); in places it is marked by waterfalls and river gorges. South of Lugnaquillia the range is not a significant barrier, but the Wicklow Mountains are nowhere crossed at an altitude of less than 1,000 ft; the Military Road through the mountains, built after the 1798 rebellion, runs at a height of more than 1,000 ft for more than 20 mi (32 km)

The main valleys of the range are those of the Rivers Glencree and Dargle, the deep Lough (lake) Dan valley, and Glenmacnass, Glendasan, and Glendalough. The Avonmore is joined by the Avonbeg where it becomes the Avoca and is subsequently joined by the Aughrim. On the west side, the basin of the upper Liffey is filled largely with the Pollaphuca reservoir, which serves Dublin. Glaciation has strongly influenced the landscape of the county: some of the valleys have been deepened by ice, and many have moraines. Other glacial features include meltwater channels and deltas. Most of the farmland is on soils of glacial or meltwater origin, and improved land is found up to 1,000 ft or more in some valleys.

Containing much wild and inaccessible territory, Wicklow was always a place for fugitives and for those who sought to prey on the inhabitants of the Dublin area. Wicklow town was a Norse harbour, but inland the countryside remained in native hands. MacMurroughs, O'Byrnes, O'Tooles, and others constantly raided the lower lands of the English Pale (territory) until 1601. Wicklow men were involved in the Wexford uprising of 1798.

More than half the population lives in towns and villages. Bray's growth occurred mainly after the railway was built in 1851; it is a seaside resort and residence for Dublin com-

muters, and an industrial centre. Greystones and Delgany are also resorts and residential centres. Wicklow is a coastal market town with some industry. Arklow still has some shipping, a pottery, and a strong market trade. A county council meets in Wicklow town, and there is a county manager. Arklow, Bray, and Wicklow are urban districts.

In the mountains the farms are generally small, with a few acres only given to oats and potatoes. Sheep are kept on the mountains. More than half the land is under crops or pasture. In the lower areas, mixed farming is general, with farms averaging about 70 ac (28 ha). Crops include wheat, barley, and oats; beef and dairy cattle are raised, the former for the export trade or for the Dublin market. At Avoca, pyrites and low-grade copper ore have been mined with fluctuating intensity since the 1940s. There is a large fertilizer factory near Arklow. At Pollaphuca on the River Liffey a large hydroelectric project has been established. Pop. (1981) 87,449.

Wicklow, Irish CILL MHANTÁIN, seaport and county town, County Wicklow, Ireland, south-southeast of Dublin. St. Mantan built a church there in the 5th century; and the town later became a settlement of the Vikings, who renamed it Wykingalo (Vikings' Lough). After the Anglo-Norman invasion in the 12th century, it was granted to Maurice Fitzgerald, who built Black Castle. From then until the 17th century the town suffered many attacks. There are remains of a 13th-century Franciscan friary and an ancient fort. The town is now a coastal holiday resort with some light industry. Pop. (1981) 5,178.

Wicklow Mountains, extensive mountain range in County Wicklow, Ireland, forming part of the Leinster Chain. The mountain area comprises a vast anticline (upwarp of rock strata), with granite exposed at the centre, and also slates and sandstones. Igneous intrusions form the Little Sugar Loaf (1,123 ft [342 m]) and the Great Sugar Loaf (1,654 ft [504 m]). The main summits of the range rise over 2,000 ft and consist of smoothly rounded grante hills, but the highest, Lugnaquillia (3,039 ft [926 m]), is capped with hard mica-schist rocks. There are many fine valleys in the range, including Glenmacnass, Glendasan, Glendalough, Glencree, and those of the Avonmore, Avoca, Aughrim, and Liffev rivers.

Wicksell, (Johan Gustaf) Knut (b. Dec. 20, 1851, Stockholm—d. May 3, 1926, Stocksund, Swed.), Swedish economist, the foremost in his generation and internationally renowned for his pioneering work in monetary theory.

In Geldzins und Güterpreise (1898; Interest and Prices, 1936) he propounded an explanation of price-level movements by an aggregate demand-supply analysis focussed on the relations between prospective profit and interest rates. This made Wicksell a forerunner of modern monetary theory and anticipated the work of John Maynard Keynes in A Treatise on Money (1930). In Über Wert, Kapital und Rente (1893; Value, Capital and Rent, 1954), Wicksell emerged as an originator of the marginal productivity theory. There and in other studies he also made striking advances in capital theory.

Wicksell was professor at the University of Lund from 1900 to 1916.

Wicksteed, Philip Henry (b. Oct. 25, 1844, Leeds, West Yorkshire, Eng.—d. March 18, 1927, Childrey, Berkshire), British economist, classicist, literary critic, and theologian.

Wicksteed, who was for some years a Unitarian minister, was accomplished in literature, classics, theology, and philosophy, and his fame at the time of his death was greater in these contexts than as an economist. He

wrote, among many works, Dante and Aquinas (1913) and Dogma and Philosophy (1920).

His Alphabet of Economic Science (1888) and Common Sense of Political Economy (1910) are works which have helped to preserve his name among economists. Influenced by William Jevons and the Austrian economists, Wicksteed extended the scope of the marginal principal in the theory of economic choice and in the allocation of scarce resources. His most famous contribution, expounded in his Essay on the Coordination of the Laws of Distribution (1894), was the employment of Euler's Theorem to advance the view that distribution according to the principle of marginal productivity exhausted total product. Wicksteed later recanted this view, but it was substantially correct given certain restrictions. Wicksteed had a keen understanding of the powers of market forces and it is believed that it was he who turned George Bernard Shaw and the Fabians away from Marxism.

wickup (plant): see fireweed.

wicky (plant): see lambkill.

Wicliffe, John, Wicliffe also spelled WICLIF (English theologian): see Wycliffe, John.

Widal, (Georges-) Fernand-Isidore (b. March 9, 1862, Dellys, Alg.—d. Jan. 14, 1929, Paris), French physician and bacteriologist who made important contributions to the diagnosis, treatment, and prevention of many diseases.

In 1896 Widal developed a procedure for diagnosing typhoid fever based on the fact that antibodies in the blood of an infected individual cause the bacteria to bind together into clumps (the Widal reaction). A professor of

Widal

By courtesy of the Bibliotheque de l'Academie Nationale de Medicine, Paris

pathology and internal medicine at the University of Paris (1911–29), he also recognized (1906) the body's retention of sodium chloride as a feature of nephritis (inflammation of the kidney) and cardiac edema (accumulation of excessive fluid in tissues as a result of heart disease), recommending salt deprivation in the treatment of both diseases. He demonstrated the increased fragility of red blood cells in cases of hemolytic jaundice and, with the French physician Georges Hayem, described the acquired form of the disease (the Hayem-Widal type, 1907). During World War I, Widal prepared an antityphoid-paratyphoid vaccine that appreciably reduced typhoid contagion among the allied armies.

Widener, George D. (b. Mar. 11, 1889, Philadelphia—d. Dec. 8, 1971, Chestnut Hill, Pa., U.S.), U.S. financier, breeder, owner and racer of Thoroughbred horses.

Scion of a wealthy Philadelphia family, Widener was educated privately and at the deLancey School in Philadelphia. He managed the family's affairs and became a director of the Electric Storage Battery Company and of the Provident National Bank, Philadelphia.

In 1916, continuing the fondness for horses that was a family trait, Widener began to raise Thoroughbreds at Erdenheim Farm in Pennsylvania and also at Old Kenny Farm near Lexington, Ky. Among his best-known horses was Jaipur, who won the Travers Stakes and the Belmont Stakes in 1962. Other outstanding horses were Eight Thirty, Jamestown, What a Treat, and Bold Hour. Until his death at 82, Widener served as honorary chairman of the Jockey Club of New York City and of the New York Racing Association.

Widener, Peter A(rrell) B(rown) (b. Nov. 13, 1834, Philadelphia, Pa., U.S.-d. Nov. 6, 1915, Elkins Park, Pa.), American transportation magnate and philanthropist. Owner of one of the largest art collections in the country, Widener donated the Harry Elkins Widener Library to Harvard University in honour of his grandson, who died aboard the Titanic.

The son of poor parents, Widener began his working career as a butcher, eventually establishing a successful chain of meat stores. At the same time he became active in Philadelphia politics, ultimately rising to the position of city treasurer in 1873. Later, making good use of his political connections, he and William L. Elkins were able to gain control of Philadelphia's street railways, consolidating and modernizing the system in the process. The partners also invested in street railways in New York City, Chicago, and other cities as well as in public utilities around the United States—at their height presiding over holdings worth \$1,500,000,000. Widener also participated in the organization of the United States Steel Corporation and the American Tobacco Company.

The possessor of a fortune estimated at \$35,-000,000, Widener donated more than \$11,-000,000 to various philanthropies, primarily in Philadelphia. In his will he donated his art

collection to the public.

widgeon (duck): see wigeon.

Widin (Bulgaria): see Vidin.

Widmann, Joseph Viktor (b. Feb. 20, 1842, Nennowitz, Moravia, Austrian Empire [now in Brno, Czech.]-d. Nov. 6, 1911, Bern, Switz.), Swiss writer, editor, and critic who encouraged many gifted writers and wrote poetry, drama, and travel books.

As literary editor of the Bern daily Der Bund from 1880 to 1910, Widmann occu-

Widmann, engraving By courtesy of the Bibliotheque Nationale Suisse, Bern

pied an authoritative position in Swiss letters and promoted many talents. He was himself an accomplished though not a strikingly original writer, and he handled such classic forms as the short epic ("Buddha," 1869), the idyll ("Mose und Zipora," 1874), and iambic drama (Oenone, 1880) with charming ease. His travel books, notably Spaziergänge in den Alpen (1885), belong to the best of their kind; his plays include Maikäferkomödie (1897), a pleasant and humorous allegory, and Der Heilige und die Tiere (1905), his profoundest poetic utterance.

Widnes, locality in Halton district, county of Cheshire, England. It is situated on the north bank of the River Mersey at its lowest bridging point and on the periphery of the Liverpool metropolitan region. The modern town is a result of 19th-century industrial expansion and is a principal centre of the British chemical industry, due largely to the proximity of the Cheshire salt fields and the Lancashire coalfield. Pop. (1981) 55,926.

Widor, Charles-Marie (-Jean-Albert) (b. Feb. 21, 1844, Lyon, Fr.—d. March 12, 1937, Paris), French organist, composer, and teacher whose students included two of the greatest organists of his time.

The son and grandson of organ builders Widor began his studies under his father and at the age of 11 became organist at the secondary school of Lyon. After studies in organ and composition in Brussels, he returned to Lyon (1860) to succeed his father as organist at Saint-François, where he remained for a decade. In 1870 the post of organist at Saint-Sulpice in Paris became vacant, and Widor was given the appointment for a year; he left it in 1934. He taught at the Conservatory in Paris, succeeding César Franck as professor of organ in 1890 and Théodore Dubois as professor of composition in 1896.

Among Widor's students at the Paris Conservatory were many of the most distinguished European organists active around the turn of the century, including Louis Vierne and Marcel Dupré. Albert Schweitzer studied organ under him, and Arthur Honegger and Darius Milhaud were among his students in compo-

As a composer Widor is best remembered for his 10 symphonies for organ, although he composed two operas, a considerable body of ballet music, and various other vocal and orchestral works. Individual movements from a number of his organ symphonies have become standard elements in recital repertory, most notably the "Toccata" from the Fifth. With Schweitzer, he edited the first five volumes of a definitive collection of J.S. Bach's works for organ.

widowbird: see whydah.

Widsith, Modern English FAR TRAVELLER, Old English poem, probably from the 7th century, preserved in the Exeter Book. It is an idealized self-portrait of a scop ("minstrel") of the Germanic heroic age who wandered widely and was welcomed in many mead halls where he entertained the great of many kingdoms. Because the heroic figures the minstrel claims to have visited range from the 4th to the 6th century, the poem is obviously a fictitious account; nevertheless, it is an ingenious compendium of the important figures in Germanic hero legend and a remarkable record of the scop's role in early Germanic society.

Wied, Gustav (Johannes) (b. March 6, 1858, Holmegaard, near Nakskov, Den.—d. Oct. 24, 1914, Roskilde), Danish dramatist, poet, novelist, and rational satirist chiefly remembered for a series of what he called satyr-

Although the satyr-dramas were meant to be read rather than performed, one, Skærmydsler (1901; "Skirmishes"), transcended the inherent difficulties of performance to become one of the great successes of the Royal Theatre. A few of his works, the play Ranke Viljer og $2 \times 2 = 5$ (1906; $2 \times 2 = 5$), and two collections of short stories, Menneskenes Børn (1894; Children of Men) and En "Bohéme" (1894; A Bohemian), attained great popularity abroad. Wied committed suicide during the first year of World War I. His novels and bitterly humorous sketches still have considerable popularity in Denmark.

(Alexander Wied-Neuwied, Philipp) Maximilian, Prinz of (b. Sept. 23, 178 Neuwied, Prussia [now in Germany]-d. Feb. 3, 1867, Neuwied), German aristocratic naturalist, ethnographer, and explorer whose observations on a trip to the American West in the 1830s provide valuable information about the Plains Indians at that time.

Maximilian was the prince of the small state of Neuwied and served in the Prussian army. He undertook explorations in Brazil in 1815-17 and in North America in 1832-34. On the latter journey, he took with him the Swiss artist Karl Bodmer to record the landscapes and peoples they encountered. The two men traveled from Boston, Mass., westward along the Ohio River to St. Louis, from where they traveled by steamboat up the Missouri River through what are now Missouri, Nebraska, South Dakota, North Dakota, and Montana. The westernmost point they reached on their journey was Fort McKenzie, a trading post in central Montana. Maximilian made copious notes of his contacts with the Mandan, Hidatsa, and other Indian tribes of the Missouri River area, while Bodmer made hundreds of superb watercolours and drawings of the landscapes and the Indians they encountered.

Maximilian's notes and Bodmer's pictures together form an invaluable account of the language, dress, culture, and customs of several Indian tribes that subsequently almost disappeared owing to disease, war, and white encroachment on their lands. Maximilian wrote up his observations in Reise durch Nordamerika in den Jahren 1832-34, 2 vol. (1838-41; "Travels Through North America in the Years 1832-34"), and a full annotated English translation of his field notes and diary was undertaken for publication in the late 20th century.

Wieland, Christoph Martin (b. Sept. 5, 1733, Oberholzheim, near the Imperial City of Biberach [now in Germany]-d. Jan. 20, 1813, Weimar, Saxe-Weimar), German poet and man of letters of the German Rococo period whose work spans the major trends of his age, from rationalism and the Enlightenment to classicism and pre-Romanticism.

Wieland was the son of a Pietist parson, and his early writings from the 1750s were sanctimonious and strongly devotional. During the 1760s, however, he discovered another, more sensual aspect of his nature and moved toward a more worldly, rationalistic philosophy. Although some of Wieland's work of this period includes erotic poetry, he began to find the balance between sensuality and rationalism that marked his mature writing. Geschichte des Agathon, 2 vol. (1766-67; History of Agathon), which describes the process, is considered the first Bildungsroman, or novel

of psychological development.

Between 1762 and 1766 Wieland published the first German translations of 22 of Shakespeare's plays, which were to be influential models for Sturm und Drang ("Storm and Stress") dramatists. Wieland was professor of philosophy at Erfurt (1769-72) and was then appointed tutor to the Weimar princes. He was not a successful teacher but spent the rest of his life in or near the court circle as an admired man of letters. In 1773 he established Der Teutsche Merkur ("The German Mercury"), which was a leading literary periodical for 37 years. Late in life, Wieland considered himself a classicist and devoted most of his time to translating Greek and Roman authors. His allegorical verse epic Oberon (1780), foreshadows many aspects of Romanticism. This

presagement is ironic: Wieland was highly critical of the tenets of Romanticism, and the movement's foremost writers were largely contemptuous of his work.

Wieland, Heinrich Otto (b. June 4, 1877, Pforzheim, Ger.—d. Aug. 5, 1957, Munich), German chemist, winner of the 1927 Nobel Prize for Chemistry for his research on the bile acids.

Heinrich Wieland, 1928

Working at the University of Munich, he made important contributions to structural organic chemistry with his findings (1911) that different forms of nitrogen in organic compounds can be detected and distinguished from one another. The following year he began his research on bile acids, which are produced by the liver. He found that the three acids then isolated were of similar structure and were also structurally related to cholesterol

His later work led him to believe that oxidation in living tissues is a matter of removing hydrogen atoms (dehydrogenation) and not of adding oxygen. This theory proved of great importance to physiology, biochemistry, and medicine.

Wielopolski, Aleksander, Hrabia (Count), MARGRABIA (margrave) GONZAGA MYS-ZKOWSKI (b. March 13, 1803, Sedziejowice, near Pińczów, Pol., Russian Empire—d. Dec.

Wielopolski, detail from a lithograph by Władysław Dümler, 1862 By courtesy of the National Museum, Warsaw

30, 1877, Dresden, Ger.), Polish statesman who undertook a program of major internal reforms coupled with full submission to Russian domination in order to gain maximum national autonomy.

Born into an impoverished noble family, he studied law as a young man in Warsaw and philosophy in Germany. Returning to Poland, he brought a series of sensational lawsuits against the purchasers of his family's ancestral estates. In 1831, during a revolt against Russian rule, the Polish insurrectionary government sent him to London to ask for British aid, which was refused. When the revolt collapsed, Wielopolski quietly retired to private life.

In 1846 Wielopolski published a pamphlet in which he argued that Poland ought to abandon all dreams of independence and sincerely

submit to Russian rule. The Russians, pleased by his attitude, allowed him to enter the government, in which he sought with some success to gain more autonomy for Poland. When popular disturbances broke out in 1861, he was appointed by the Russians to head the civil government in Poland. He proceeded to purge the administration of Russian officials, reform the educational system, emancipate the Jewish minority, and enact laws aimed at relieving the peasants of oppressive obligations to the landowners.

At the same time Wielopolski relentlessly fought against revolutionaries. His order for the compulsory enrollment of all dissidents into the Russian Army precipitated another insurrection, finally crushed by the Russian Army. Wielopolski's program was wrecked, and he retired to private life in July 1863 and later emigrated to Saxony.

Wien (Austria): see Vienna.

Wien, Wilhelm (Carl Werner Otto Fritz Franz) (b. Jan. 13, 1864, Gaffken, East Prussia—d. Aug. 30, 1928, Munich), German physicist who received the Nobel Prize for Physics in 1911 for his displacement law concerning the radiation emitted by the perfectly efficient blackbody. Because the accuracy of Wien's law declined for longer wavelengths, Max Planck was led to further investigations culminating in his quantum theory of radiation.

Although the radiation emitted from a blackbody is distributed over a wide range of wavelengths, there is an intermediate wave-

Wien
Historia-Photo

length at which the radiation reaches a maximum. In 1893 Wien stated in his law that this maximum wavelength is inversely proportional to the absolute temperature of the body. Wien was appointed professor of physics at the University of Giessen in 1899 and at the University of Munich in 1920. He also made contributions in the study of cathode rays (electron beams), X-rays, and canal rays (positively charged atomic beams). His autobiography was published under the title Aus dem Leben und Wirken eines Physikers (1930; "From the Life and Work of a Physicist").

wiener: see frankfurter.

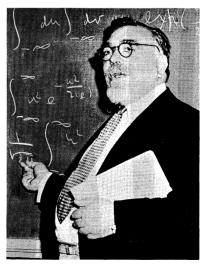

Wiener, Norbert (b. Nov. 26, 1894, Columbia, Mo., U.S.—d. March 18, 1964, Stockholm), U.S. mathematician, who established the science of cybernetics, which is concerned with the common factors of control and communication in living organisms, automatic machines, and organizations. He attained international renown by formulating some of the most important contributions to mathematics in the 20th century.

Youth and education. Wiener, a child prodigy who could read and write at the age of three, was the son of Leo and Bertha Wiener. His father, an immigrant who later became professor of Slavonic languages and literature at Harvard University, was a man of unusual intellectual ability and great determination who personally took charge of his

son's elementary education and, to a large extent, dominated his life well into manhood. The Wieners moved to Massachusetts when Norbert was an infant. They lived in various places, but for three years they settled on a farm in the rural town of Harvard; Norbert apparently enjoyed country life and received his first regular instruction at the high school in the neighbouring town of Ayer. In 1906 he enrolled at Tufts College, from which he was graduated in 1909 with a degree in mathematics at the age of 14. The biological sciences fascinated him, and he spent a year at Harvard as a graduate student in zoology, but quit after he found he was inept at laboratory work. At his father's suggestion, he began to study philosophy and completed a Ph.D. degree at Harvard in 1913, at the age of 18, with a dissertation on mathematical logic.

On a grant from Harvard, Wiener went first to England, to study mathematical logic at Cambridge University under the philosopher and mathematician Bertrand Russell, and then to the University of Göttingen in Germany to study with David Hilbert, one of the greatest and most versatile mathematicians of his time. On the advice of Bertrand Russell he also began a serious study of general mathematics, in which he was strongly influenced by Russell and the English mathematical theorist G.H. Hardy and, to a lesser extent, by Hilbert. He published his first paper in the mathematical journal Messenger of Mathematics in 1913 at Cambridge just as World War I broke out.

He tried to enlist but was rejected because of poor eyesight. For five years he tried a variety of occupations but was unhappy in all of them. He taught at the University of Maine and was miserable; he was a writer for an encyclopaedia, an apprentice engineer, a journalist of sorts, and a mathematician at the Aberdeen (Md.) Proving Grounds. Finally, in 1919, he was hired as an instructor by the mathematics department at the Massachusetts Institute of Technology (MIT), a department with no real tradition of scholarship or research at that time. It turned out, however, to have been the right move for Wiener, for he had entered upon an extremely productive period, just as MIT itself was beginning to develop into a great centre of learning in science and technology. Wiener remained on the MIT

iener

By courtesy of the Library of Congress, Washington, D.C.

faculty, eventually becoming one of its most famous members, until his retirement.

The years between 1920 and 1930 also saw great changes in his personal life. In 1926, after an acquaintanceship of many years, he

married Margaret Engemann, and they had two daughters. He and his family traveled extensively during that decade: to Europe on several occasions, where Wiener worked with leading mathematicians of his time, and to China for a year in 1935.

Work in mathematics and science. During those years Wiener did highly innovative and fundamental work on what is now called a stochastic process and, in particular, on the theory of Brownian motion—that is, the construction of a rigorous mathematical description of a physical process that is subject to random change—and on generalized harmonic analysis—that is, the analysis of functions into periodic components and the generalizations of such an analysis—as well as significant work on other problems of mathematical analysis. From a long list of published works three papers stand out: "Differential Space, Journal of Mathematics and Physics, 58:131-174 (1923); "Generalized Harmonic Analy-Acta Mathematica, 55:117-258 (1930); sis," and "Tauberian Theorems," Annals of Mathematics, 33:1-100 (1932). In 1933 Wiener was elected to the National Academy of Science but soon resigned, repelled by some of the aspects of institutionalized science he encountered in the Academy. In the same year, he shared the Bôcher Prize, offered every five years by the American Mathematical Society. and was honoured by the society by being invited to present the Colloquium Lectures, published (1934) as Fourier Transforms in the Complex Domain, with Raymond E.A.C. Paley (American Mathematical Society Colloquium Publications, vol. 19). Much of the work appearing in this volume had been done in collaboration with Paley, who was killed a year before the book was finished.

During World War II Wiener worked on gunfire control, the problem of pointing a gun to fire at a moving target. The ideas that evolved led to Extrapolation, Interpolation, and Smoothing of Stationary Time Series (1949), which first appeared as a classified report and established Wiener as a codiscoverer, with the Russian mathematician A.N. Kolmogorov, of the theory on the prediction of stationary time series. It introduced certain statistical methods into control and communications engineering and exerted great influence in these areas. This work also led him to formulate the concept of cybernetics.

Creation of cybernetics. In 1948 his book Cybernetics: or, Control and Communication in the Animal and the Machine appeared. For a scientific book it was extremely popular, and Wiener became known in a much broader scientific community. Cybernetics is interdisciplinary in nature; based on common relationships between humans and machines, it is used today in control theory, automation theory, and computer programs to reduce many time-consuming computations and decisionmaking processes formerly done by human beings. Wiener worked at cybernetics, philosophized about it, and propagandized for it the rest of his life, all the while keeping up his research in other areas of mathematics.

After the war Wiener continued to contribute new ideas to widely divergent subjects, including mathematical prediction theory and quantum theory, providing the latter a possible solution to a difficulty that had been debated by the physicists Niels Bohr and Albert Einstein. Applying his theoretical description of Brownian movement to quantum phenomena, he showed how quantum theory, to the extent that it is based on probability, is consistent with other branches of science. He also continued to travel: to Mexico City in 1947, 1949, and 1951 to collaborate with the physiologist Arturo Rosenblueth; to Paris in 1951 as a Fulbright lecturer; to Calcutta in 1955

56; and to Naples in 1962; he was in Sweden when he died in 1964. A few weeks before his death, President Lyndon B. Johnson awarded Wiener the National Medal of Science.

Wiener wrote many other works. He discussed the implications of mathematics for public and private affairs in The Human Use of Human Beings, rev. ed. (1954), and God and Golem, Inc.: A Comment on Certain Points Where Cybernetics Impinges on Religion (1964). His other published contributions to mathematics are The Fourier Integral, and Certain of Its Applications (1933), Nonlinear Problems in Random Theory (1958), and, ed. with J.P. Schade, Nerve, Brain, and Memory Models (1963), and Cybernetics of the Nervous System (1965). Some of Wiener's last contributions, particularly in the areas of prediction and quantum theory, are found in B. Rankin (ed.), Differential Space, Quantum Systems, and Prediction (1966). Wiener also completed two volumes of autobiography, Ex-Prodigy (1953) and I Am a Mathematician (1956).

BIBLIOGRAPHY. Pesi R. Masani, Norbert Wiener, 1894–1964 (1989), is a biography. Steve J. Heims, John Von Neumann and Norbert Wiener: From Mathematics to the Technologies of Life and Death (1980), examines the philosophical differences between the two mathematicians in order to show the changing role of science in modern society.

Wiener Neustadt, city, Bundesland ("federal state") Niederösterreich, northeastern Austria. It lies along the Fischa River south of Vienna. Founded in 1194 by the Babenberg duke Leopold V, it was chartered in 1277 and had a mint at that time. It was most prosperous in the 15th century, when it was the residence of the Holy Roman emperor Frederick III, but it declined to such an extent in the 17th century that emigration was forbidden by imperial decree. The Reckturm, one of three towers surviving from the city's 13thcentury fortifications, has become a museum. Notable buildings include the much-restored 13th-century cathedral (Liebfrauenkirche); the former Jesuit College (1737-43), now the town museum; the 13th-century castle where the Holy Roman emperor Maximilian I (1459-1519) was born and is entombed; and the Neukloster with the former Dominican church (13th century). The castle served as the Theresian Military Academy (1752-1919). The considerable bomb damage that Wiener Neustadt suffered in World War II has led to much new construction, especially in housing. The city has technical and professional colleges, a military academy, and schools for the physically handicapped. Its important industries include metals and textiles. Pop. (1981) 35,050.

Wieniawski, Henryk, Henryk also spelled HENRI (b. July 10, 1835, Lublin, Pol., Russian Empire [now in Poland]—d. March 31, 1880, Moscow), Polish violinist and composer, one of the most celebrated violinists of the 19th century.

Wieniawski was a child prodigy and entered the Paris Conservatory at age 8. He graduated from there with the first prize in violin at the unprecedented age of 11. He became a concert violinist at age 13 and began touring Europe with his brother Joseph, a pianist. His wideranging concert tours brought him international fame. In 1860 he was appointed violin soloist to the tsar of Russia, and from 1862 to 1869 he taught at the St. Petersburg Conservatory. In 1872–74 he toured the United States, playing with the pianist Anton Rubinstein, and he subsequently taught for a time at the Brussels Conservatory.

As a violinist Wieniawski was admired for his rich, warm tone, glowing temperament, and perfect technique. His own compositions for violin are Romantic in style and were intended to display his virtuosity. He composed two violin concerti, one in F-sharp Minor (Opus 14) and a quite popular one in D Minor (Opus 22). His other compositions include

Le Carnaval russe (Opus 11), Legende (Opus 17), Scherzo-tarantelle (Opus 16), and études, mazurkas, and polonaises.

Wierzyński, Kazimierz (b. Aug. 27, 1894, Drogobytsch, Austria-Hungary [now Drogobych, Ukraine, U.S.S.R.]—d. Feb. 13, 1969, London Eng.) Polish poet

London, Eng.), Polish poet.
Wierzyński moved to Warsaw after the restoration of Poland's independence at the close of World War I and became one of the foremost members of the Skamander group of poets. His poetical debut was Wiosna i wino (1919; "Spring and Wine"), followed by Wróble na dachu (1921; "Sparrows on the Roof") and Wielka Niedźwiedzica (1923; "The Great Bear")—all inspired by carefree juvenile optimism. Being interested in sports, he published in 1927 a collection of po-ems, Laur Olimpijski ("The Olympic Laurel Wreath"), for which he won a special gold medal at the 1928 Olympic Games in Amsterdam. When World War II started he left Poland for Paris but in 1940 moved to Rio de Janeiro and later to New York City. After the war he lived mainly in London. In the 1930s and later in exile the poet left the exuberance of his youth behind him and dealt with patriotic and religious themes. Among his collections of dolorous verse from this period are Wolność tragiczna (1936; "Tragic Freedom") and Krzyże i miecze (1946; "Crosses and Swords"). In his later poems, published in Cygańskim wozem (1966; "With a Gypsy Cart"), Czarny polonez (1968; "The Black Polonaise"), and other collections, Wierzyński abandoned traditional metre and rhyme to use more modern poetic devices.

Wiesbaden, city, capital (1946) of Hessen Land (state), southern Germany. It is situated on the right bank of the Rhine River at the southern foot of the Taunus Mountains, west of Frankfurt am Main and north of Mainz. The settlement was known as a spa (Aquae Mattiacae) in Roman times. Its earthen fortifications (12 BC) were replaced by stone in AD 83, and a Roman wall (of which traces remain) was built about 370. The settlement subsequently became the site of a Franconian palace, and the name Wisibada ("Meadow Spring") first appeared in 829. It was made an imperial city in 1241, passed to the counts of Nassau in 1255, and became the capital of the principality of Nassau-Usingen in 1744. It was capital of the duchy of Nassau from 1806 until 1866, when it passed to Prussia; it then became capital of the district of Wiesbaden in Hesse-Nassau province. In 1946 Wiesbaden became the capital of the newly created Land of Hessen and incorporated Kastel, Amoneburg, and Kostheim (former right-bank suburbs of Mainz).

As a spa, Wiesbaden was especially famous during the 18th and 19th centuries, when it was frequented by J.W. von Goethe, Johannes Brahms, and Fyodor Dostoyevsky, as well as various members of royal families. Wiesbaden's 27 hot, saline springs and mild climate, its parklike setting, and other amenities continue to make it a popular resort and conference centre. It holds an annual International Festival of Music, Ballet, and Drama in May. Although the city has a long history, almost no old architecture survives except from the Victorian period: the new town hall (1887), the Kaiser-Friedrich Baths (1913), the Greek Chapel (1855), and the castle (1840), which now houses the Land administration offices. The state theatre opened as an opera house and playhouse in 1894. The municipal museum houses an art gallery. Wiesbaden has various medical facilities, including a special rheumatism clinic and the new German Diagnostic Clinic.

Wiesbaden is a rail junction, with varied industries, including iron foundries, metal and concrete works, printing firms, publishing houses, and film studios. It is also a wine cen-

tre, famous for its Sekt (German champagne). Pop. (1989 est.) 254,209.

Wiesel, Elie, byname of ELIEZER WIESEL (b. Sept. 30, 1928, Sighet, Romania), Romanianborn American novelist whose works provide a sober yet passionate testament of the destruction of European Jewry during World War II. He was awarded the Nobel Prize for Peace in 1986.

Wiesel's early life, spent in a small Hasidic community in the town of Sighet, was a rather hermetic existence of prayer and contemplation and was barely touched by the war. But in 1944 all the Jews of the town, including Wiesel and the other members of his family, were deported by the Nazis to Auschwitz, where his mother and younger sister were killed. He was then sent as a slave labourer to Buchenwald, where his father was killed. After the war he settled in France, studied at the Sorbonne (1948-51), and wrote for French and Israeli newspapers. Wiesel went to the United States in 1956 and was naturalized in 1963. He was a professor at City College of New York (from 1972), and from 1976 he was professor of humanities at Boston College.

During his time as a journalist in France, he was urged by the novelist François Mauriac to bear witness to what he had experienced in the concentration camps. The outcome was Wiesel's first book, in Yiddish, Un Di Velt Hot Geshvign (1956; "And the World Has Remained Silent"), abridged as La Nuit (1958; Night), a semiautobiographical account of a young boy's spiritual reaction to Auschwitz. It is considered by some critics to be the most powerful literary expression of the Holocaust. Other works include La Ville de la chance (1962; The Town Beyond the Wall), a novel examining human apathy; Le Mendiant de Jérusalem (1968; A Beggar in Jerusalem), which raises the philosophical questions of why man kills; Célébration hassidique (1972; Souls on Fire), a critically acclaimed collection of Hasidic tales; and Le Testament d'un poète juif assassiné (1980; The Testament).

All of Wiesel's works reflect, in some manner, his experiences as a survivor of the Holocaust and his attempt to resolve the ethical torment of why the Holocaust happened and what it revealed about the nature of mankind. He became a noted lecturer on the sufferings experienced by Jews and others during the Holocaust, and his ability to transform this personal concern into a universal condemnation of all violence, hatred, and oppression was largely responsible for his being awarded the 1986 Nobel Prize for Peace.

> A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Wiesel, Torsten Nils (b. June 3, 1924, Uppsala, Swed.), Swedish neurobiologist, corecipient with David Hunter Hubel and Roger Wolcott Sperry (qq.v.) of the 1981 Nobel Prize for Physiology or Medicine. All three scientists were honoured for their investigations of brain function, Wiesel and Hubel in particular for their collaborative studies of the structural and functional details of the visual cortex, located in the occipital lobes of the cerebrum.

Wiesel earned a medical degree from the Karolinska Institute in Stockholm in 1954. After remaining there for a year as an instructor in physiology, he accepted a research appointment at the Johns Hopkins University Medical School in Baltimore, Md., where his association with Hubel began. Wiesel moved, along with Hubel, to Harvard University in 1959 and was named the Robert Winthrop professor of neurobiology in 1974. He remained a Swedish subject.

Wiesenthal, Simon (b. Dec. 31, 1908, Buczacz, Austria-Hungary), founder and head (since 1961) of the Jewish Documentation Centre in Vienna. Wiesenthal was a longtime Nazi hunter who, with the cooperation of the Israeli, West German, and other governments, tracked down some 1,000 war criminals, including Adolf Eichmann.

Wiesenthal received a degree in architectural engineering from the Technical University of Prague (1932) and settled in Lwów (Lvov), Poland. When the city was seized by the Soviet Union in 1939, he had to close his "bourgeois" architectural practice but avoided being exiled to Siberia by bribing a commissar of the NKVD (Soviet secret police). After the Germans replaced the Soviet occupiers at Lwów in 1941, he was dragooned into forced labour and spent the last three years of the war miraculously evading death in a series of labour and concentration camps. Eighty-nine members of his and his wife's Jewish families were annihilated by the Nazis, but, after liberation in 1945, he and his wife, who had managed to pass as a Pole for much of the war, were reunited.

As soon as he had recovered his health, Wiesenthal began helping the U.S. Army gather evidence with which to prosecute Nazi war criminals. In Linz, Austria, in 1947, he and 30 volunteers opened the Documentation Centre on the Fate of Jews and Their Persecutors for the purpose of aiding Jewish refugees and providing evidence for war crimes trials. In 1954 the Linz office closed and its files were conveyed to Israel, but Wiesenthal continued free-lance to ferret out former Nazis, culminating, with the help of Israeli agents, in his discovery of Adolf Eichmann in Argentina in 1959. Encouraged by that success, he opened the Jewish Documentation Centre in Vienna in 1961 and, over the years, sought out Gestapo agents, SS officers, and other Nazis for trials, principally in West Germany. In 1967 he was primarily responsible for locating Fritz Stangl, the former commandant of the Treblinka and Sobibor death camps.

Wiesenthal wrote a number of books, including KZ. Mauthausen (1946; "Concentration Camp Mauthausen"), Ich jagte Eichmann (1961; "I Hunted Eichmann"), Verjährung (1964; "Statute of Limitations"), The Murderers Among Us: The Simon Wiesenthal Memoirs (1967), Segel der Hoffnung (1972; Sails of Hope), and Der Fall Jaworska (1975; "The Case of Jaworska").

Wieser, Friedrich von (b. July 10, 1851, Vienna—d. July 23, 1926, Sankt Gilgen, Austria), economist who was one of the principal members of the Austrian school of economics, along with Carl Menger and Eugen von Böhm-Bawerk.

Wieser attended the University of Vienna from 1868 to 1872 and then entered government service. Like his colleague, Böhm-Bawerk, Wieser was permitted to study under Karl Knies at Heidelberg, Wilhelm Georg Roscher at Leipzig, and Bruno Hildebrand at Jena. (Knies, Roscher, and Hildebrand are the three founders of the German school of historical economics.) But it was Menger's work that exercised a profound influence upon Wieser. In 1884 he went to the University of Prague and in 1903 succeeded Menger at the University of Vienna. He later occupied official positions and served as minister of commerce in the last government of the Austro-Hungarian empire.

His two most important works are Der natürliche Wert (1889; "Natural Value") and Grundriss der Sozialökonomik (1914; "Foundations of Social Economy"). In the first of these he developed the Austrian-school theory of costs, building on Menger's subjective-value approach and introducing the concept of opportunity cost. In Sozialökonomik the principle of marginal utility is the starting point for an analysis of successively more elaborate systems of economic relationships.

wig, manufactured head covering of real or artificial hair worn in the theatre or as personal adornment, disguise, or symbol of office. The wearing of wigs dates from the earliest recorded times; it is known, for example, that the ancient Egyptians shaved their heads and wore wigs to protect themselves from the sun and that the Assyrians, Phoenicians, Greeks, and Romans also used artificial hairpieces at times.

It was not until the 16th century, however, that the wig again became a generally acceptable form of adornment or corrective for nature's defects, as in the case of Queen Elizabeth I. Men's perukes, or periwigs, for the first time since ancient Egypt, came into widespread use in the 17th century, after Louis XIII began wearing one in 1624. By 1665 the wig industry was established in France by the formation of a wigmakers guild.

The wig became a distinctive class symbol for more than a century. In the 17th century it attained its maximum development, covering the back and shoulders and flowing down the chest. During the same century, women also wore wigs, though less often than did men. Certain professions established specific wigs as part of their official costume; the practice is retained today only in some legal systems, notably that of the United Kingdom. Men's wigs in various forms were worn throughout the West in the 18th century, until the French and American revolutions swept away these and other symbols of social status.

From the 18th century, women wore wigs and hairpieces, but only surreptitiously. The popularity of women's naturally styled wigs in the 20th century, and candour about wearing them, increased substantially, especially after the development of wigs made from inexpensive synthetic hairs. In the Orient, wigs have been used rarely except in the traditional theatre of China and Japan.

Wigan, district (borough) in the northwestern part of the metropolitan area of Greater Manchester, England, on the River Douglas. Its area is 77 square miles (199 square km). Neighbourhoods within the borough range from large industrial and commercial centres to small rural communities.

The traditional industries of the district are coal and cotton. Coal was being mined in the Wigan area by the 16th century, and the textile industry was then already well-developed. Demand for coal increased in the 18th and 19th centuries, and by 1851 some 5,000 men and women were employed in the pits of what is now Wigan district. The mechanization of the textile industry in the late 18th century brought a great increase in the number of factories and the size of settlements. Industrialization was accelerated by the building of canals and railways to transport the area's coal, textiles, and heavy metals. Textiles and coal mining are still important, but in the period since 1945 there has been an influx of new industries-food processing, paper and packaging, and electrical and general engineering-which have broadened the economic structure. Pop. (1985 est.) 306,700.

wigeon, also spelled WIDGEON, any of four species of dabbling ducks (family Anatidae), popular game birds and excellent table fare. The European wigeon (Anas, or Mareca, penelope) ranges across the Palaearctic and is occasionally found in the Nearctic regions. The American wigeon, or baldpate (A. americana), breeds in northwestern North America and winters along the U.S., Mexican, Central American, and Caribbean coasts as well as on some inland waters. The white crown, green eye stripe, and brown back distinguish the male of this American species from the similar male European wigeon, which has a reddish

head, cream forehead, and gray back. Baldpates often graze like geese on young grasses, and they are fond of eelgrass, which they will steal from diving ducks such as the canvasback. The male Chiloé wigeon (A. sibilatrix) of South America helps raise the young—a rare trait among ducks. The Cape wigeon (A. capensis) of Africa is a nocturnal feeder.

Wiggin, Kate Douglas, *née* smith (b. Sept. 28, 1856, Philadelphia, Pa., U.S.—d. Aug. 24, 1923, Harrow, Middlesex, Eng.), American author who led the kindergarten education movement in the United States.

She was taught by her stepfather and attended private schools and a district school. In 1878 she headed the Silver Street Kindergarten in San Francisco—the first free kindergarten on the west coast of the United States. In 1880 she organized the California Kindergarten Training School. Through her teaching and writing, she helped to spread the educational principles of Friedrich Froebel to American kindergarten proponents. She was married to Samuel B. Wiggin (d. 1889), a lawyer, in 1881 and to George Christopher Riggs, a New York businessman, in 1895.

Wiggin is also known as a prolific writer of children's literature, travel books, and educational texts. They include *The Birds' Christmas Carol* (1887), *Rebecca of Sunnybrook Farm* (1903), *Kindergarten Principles and Practice* (1896, with Nora A. Smith), and *The Republic of Childhood*, 3 vol. (1895–96). Her autobiography, *My Garden of Memory*, was published posthumously in 1923.

Wigglesworth, Michael (b. Oct. 18, 1631, Yorkshire?, Eng.—d. June 10, 1705, Malden, Mass. [U.S.]), British-American clergyman, physician, and author of rhymed treatises expounding Puritan doctrines.

Wigglesworth emigrated to America in 1638 with his family and settled in New Haven. In 1651 he graduated from Harvard College, where he was a tutor and a fellow from 1652 to 1654 and again from 1697 to 1705. He preached at Charlestown, Mass., in 1653-54 and was pastor at Malden from 1656 until his death. In addition to his clerical duties, Wigglesworth practiced medicine and wrote numerous poems, including "A Short Discourse on Eternity," "Vanity of Vanities," and God's Controversy with New England (published 1871). The first two were appended to The Day of Doom: or a Poetical Description of the Great and Last Judgment (1662), a long poem in ballad measure using horrific imagery to describe the Last Judgment. Intended to edify Puritan readers, this work sold 1,800 copies within a year, an unusually high number in its time. Once the most widely read poet of early New England, Wigglesworth declined in popularity together with Puritanism and has since been considered a writer of doggerel verse. A modern edition of The Day of Doom prepared by Kenneth B. Murdock was

Wigglesworth, Sir Vincent (Brian) (b. April 17, 1899, Kirkham, Lancashire, Eng.), British entomologist, noted contributor to the study of insect physiology. His investigations of the living insect body and its tissues and organs revealed much about the dynamic complexity of individual insects and their interactions with the environment. His *Insect Physiology* (1934) is often considered the foundation for this branch of entomology.

published in 1929.

foundation for this branch of entomology.

After military service in France during World
War I, Wigglesworth completed his education at the University of Cambridge and St.
Thomas' Hospital in London. After lecturing
in medical entomology at the London School
of Hygiene and Tropical Medicine, he became
reader in entomology first at the Univer-

sity of London, then at Cambridge. In 1943 Wigglesworth was appointed director of the Agricultural Research Council Unit of Insect Physiology in Cambridge. He was knighted in 1964.

Among Wigglesworth's most significant discoveries were those concerned with metamorphosis, particularly the control of form and growth. In insects such as the South American blood-sucking bug Rhodnius prolixis, Wigglesworth was able to determine that a crucial growth hormone was produced in the neurosecretory cells of its brain, the first experimental demonstration of the function of such cells. He then discovered another hormone that actually prevented the development of adult characteristics in R. prolixis until the insect had reached the appropriate larval stage. Wigglesworth found that this hormone, which he called the juvenile hormone, was produced in the region of the endocrine gland known as the corpus allatum. He found that he could radically distort the developmental phases of his insect subjects by a selective manipulation of their hormonal levels. Finally, Wigglesworth was thus able to formulate a coherent theory of insect metamorphosis involving the selective activation by hormones of the insect's genetic components, which in turn determine its morphology and developmental character. Besides making these discoveries, Wigglesworth isolated the properties of various insect enzymes and the mechanism for the hatching of insect eggs.

Wight, Isle of, island and county lying off the south coast of England, in the English Channel. The island is separated from Hampshire on the mainland by a deep strait known as The Solent. The Isle of Wight is a diamond-shaped island extending 22.5 miles (36 km) from east to west and 13.5 miles (22

Beach at Ventnor, Isle of Wight, Eng. Erika Craddock from TSW—Cuck/Chicago

km) from north to south. It has an area of 147 square miles (381 square km). Administratively, the Isle of Wight was part of the county of Hampshire until the reorganization of 1974, at which time it became a separate county. The county is divided into two districts, Medina and South Wight.

The Isle of Wight's geology and scenery are varied. The backbone of the island is formed by a chalk ridge that extends across the entire breadth of the island, from Culver Cliff in the east to The Needles in the west. This ridge is the thickest bed of chalk in the British Isles. The Needles are three detached masses of chalk that lie off the island's westernmost point and rise to about 100 feet (30 m). In the northern portion of the island, the chalk beds dip steeply beneath heavy soils that support oak woodlands. Southward, the chalk beds dip more gently, and there is a second range of downs in the extreme south of the island. The island's south coast is mostly cliffbound. Three rivers, the Eastern Yar, the Medina, and the Western Yar, flow northward into The Solent. The Medina almost bisects the island, and the Western Yar almost insulates the western Wight.

There are traces of human occupation of the island from the earliest times, but the Early Bronze Age seems to have been the period of most intense prehistoric settlement. There are also Roman remains, Vespasian having annexed the island for the conquerors in AD 43. The island was annexed to Wessex in 661 and subsequently bestowed on the king of Sussex. In 998 it was a headquarters of the marauding Danes. In 1377 the French so devastated the town of Newport (at the island's centre) that it lay uninhabited for two years. Charles I was imprisoned in Carisbrooke Castle in 1647–48 during the English Civil Wars. Osborne House, near Cowes, was a residence of Queen Victoria.

The Isle of Wight has a warm, mild climate and is one of the sunniest areas in the British Isles. Newport, at the head of the Medina Estuary, is now the island's main town, and Cowes, at the Medina's mouth, is the principal port and an internationally famous yachting centre. There are many holiday resorts-notably Freshwater, Yarmouth, Ryde, Sandown-Shanklin, and Ventnor—and tourism is one of the island's main economic bases. Shipbuilding and aircraft construction are also important activities, and fruits and vegetables are grown on the southern part of the island. A major British maximum security prison is at Parkhurst, a suburb of Newport. Pop. (1986 est.) 124,600.

Wightman, Hazel (Virginia) Hotchkiss, née HOTCHKISS (b. Dec. 20, 1886, Healdsburg, Calif., U.S.—d. Dec. 5, 1974, Newton, near Boston, Mass.), American tennis player who dominated women's competition in the game before World War I and was instrumental in organizing the Wightman Cup match between British and American women's teams.

The winner of 45 U.S. titles, she overpowered her opponents in the U.S. championship from 1909 to 1911, winning every event in each year: the women's singles, the women's doubles, and the mixed doubles. She graduated from the University of California at Berkeley in 1911 and married George Wightman in 1912 (divorced 1940). She went on to win another singles title in 1919 and also won six doubles titles (1909–11, 1915, 1924, and 1928), the last two with Helen Wills.

In 1923 she donated a silver cup (the Wightman Cup) to the U.S. Lawn Tennis Association to be used as a prize for an annual match between British and American women's teams. She led the United States to victory in the first match, 7–0, and was captain of the team until 1948.

Wightman Cup, trophy awarded the winner of tennis matches held annually between teams of women from England and the United States. A competition comprises five singles and two doubles matches. The cup itself was donated in 1923 by Hazel Hotchkiss Wightman (q.v.). The first contest, at Forest Hills, N.Y., on Aug. 11 and 13, 1923, was won by the United States. Matches are played in the United States in odd-numbered years and in Great Britain in even-numbered years. For winners, see Sporting Record: Tennis.

Wigman, Mary, original name MARIE WIEGMANN (b. Nov. 13, 1886, Hanover, Ger.—d. Sept. 18, 1973, West Berlin), German dancer, a pioneer of the modern expressive dance as developed in central Europe.

A pupil of Émile Jaques-Dalcroze and Rudolf Laban, she subsequently formulated her own theories of movement, often dancing without music or to percussion only. Although she made her debut as a dancer in 1914, her triumphant career as dancer-innovator-choreographer began after World War I. Her impact on dance throughout Central Europe changed the course of dance history. Her pupils, numbering thousands, included Harald Kreutzberg, Yvonne Georgi, Margarethe Wallmann, and

Hanya Holm, the latter two exerting major influences on the development of American modern dance. She and her company toured the United States in 1930, and in 1931 a Wigman School was established in New York City under the direction of Holm, which, in 1936, became the Hanya Holm School. Among Wigman's most famous works were *The Seven Dances of Life* (1918), *Totenmal* (1930), the entire opera *Orpheus and Eurydice* (1947) of Christoph Gluck, other operas, group works, and solos.

Wigmore, John Henry (b. March 4, 1863, San Francisco, Calif., U.S.—d. April 20, 1943, Chicago, Ill.), American legal scholar and teacher whose 10-volume Treatise on the Anglo-American System of Evidence in Trials at Common Law (1904–05), usually called Wigmore on Evidence, is generally regarded as one of the world's great books on law.

A Harvard graduate (B.A., 1883; LL.B., 1887), Wigmore taught at Keio University in Tokyo (1889–92) and at Northwestern University Law School, Chicago (from 1893; dean, 1901–29). He served as a colonel on the judge advocate general's staff during World War I and as an Illinois commissioner on uniform state laws (1908–24, 1933–43).

Wigmore, Roger Mortimer, 8th Baron of: see March, Roger Mortimer, 1st Earl of.

Wigner, Eugene Paul, Hungarian JENÓ PÁL WIGNER (b. Nov. 17, 1902, Budapest, Hung.), Hungarian-born American physicist, joint winner, with J.H.D. Jensen of West Germany and Maria Goeppert Mayer of the United States, of the Nobel Prize for Physics in 1963. He received the prize for his many contributions to nuclear physics, which include his formulation of the law of conservation of parity.

After lecturing at the Technical Academy in Berlin (1928–30), Wigner went to the United States. Apart from two years (1936–38) as professor of physics at the University of Wisconsin, he spent his academic life at Princeton University, serving as a professor of mathematical physics from 1938 until his

Wigner, 1962

By courtesy of Ulli Steltzer

retirement in 1971. He became a naturalized U.S. citizen in 1937. While still in Europe he had developed the principles involved in applying group theory to quantum mechanics and evolved the concept of the symmetry in space and time that marks the behaviour of subatomic particles. In 1936 he worked out the theory of neutron absorption, which later proved useful in building nuclear reactors.

With Leo Szilard and Edward Teller, both also from Hungary, Wigner in 1939 helped persuade Albert Einstein to write the historic letter to President Franklin D. Roosevelt that set in motion the U.S. atomic-bomb project. During World War II he worked at the Metallurgical Laboratory at the University of Chicago, where he helped Enrico Fermi construct the first atomic pile. Wigner also conducted research on quantum mechanics, the theory of the rates of chemical reactions, and nuclear structure. His publications include Dispersion Relations and Their Connection

with Causality (1964) and Symmetries and Reflections (1967).

Wigston, Oadby and (Leicestershire, Eng.): see Oadby and Wigston.

Wigtown, also called WIGTOWNSHIRE, former county, southwestern Scotland. Since the reorganization of 1975, it has been incorporated within Wigtown district, of Dumfries and Galloway region.

Hill forts and lake dwellings (crannogs) dating from the Iron Age abound in the area. During the early Middle Ages, Wigtown became the heart of Galloway, a district that was ruled by Scottish-Norse kings and that covered most of southern Scotland. In the 1120s Fergus, the ruler of Galloway, reconstituted the area's Anglian bishopric, which was first established in the 8th century, and he built a priory at Whithorn as the bishopric's cathedral. The lands of Fergus's descendants eventually passed by marriage to the Balliol family and then to the Douglases, who purchased the earldom of Wigtown in about 1372. Under that family, the region, which had long been entitled to its own code of laws, came under the general law of Scotland in 1426. After the fall of the Douglases in 1455, the Kennedy family obtained a dominant influence in Wigtown. The region still has many castles dating from the 1470s to the early 17th century.

Consult the INDEX first

Wigtown, district, Dumfries and Galloway region, southwestern Scotland. Created by the reorganization of 1975, it includes the former county of Wigtown and the western part of the former county of Kirkcudbright. The district has an area of 661 square miles (1,713 square km) and is in Scotland's extreme southwest.

In the western part of the district is the distinctive hammerhead peninsula of The Rinns (Norse: "Headlands"). The isthmus connecting The Rinns with the mainland is deeply indented by Luce Bay on the south and by Loch Ryan on the north. The central part of Wigtown occupies a southward-jutting peninsula bounded by Luce Bay on the east. The eastern part of the district is hilly.

The climate is mild and damp, favouring pastoral rather than crop agriculture. Sheep raising predominates on the moors in the northeast. Beef cattle are fattened on lower land. The only significant cash crop is early potatoes. The numerous Ayr dairy cattle support several creameries, the main industry of the area. Many pigs are kept, and some bacon is used locally. Stranraer is the seat of the district authority. Pop. (1987 est.) 30,289.

wigwam, American Indian dwelling, characteristic of the Algonquian-speaking nomadic tribes of what is now the northeastern United States. The wigwam was constructed of tall saplings driven into the ground, bent over, and tied together near the top. This basic structure was covered with large overlapping mats of woven rushes or of sewn bark that were tied to the saplings, which came together to form either a conical or dome shape.

Wihtred (d. April 23, 725), king of Kent who came to the throne in 690 after a period of anarchy.

Wihtred was not sole king until 692 at the earliest, for Bede, the 8th-century historian, states that Swaefred, king of the East Saxons, was joint ruler in this year. Wihtred, however, seems to have become sole king by 694. At his death, 31 years later, he left the kingdom to his sons Aethelberht, Eadberht, and Alric.

During the fifth year of his reign (probably 695), Wihtred issued a code of laws in a council held at a place called Berghamstyde (Barham?). Copies of this code still exist.

A grant of privileges to the Christian church, purportedly issued by Wihtred, follows the

entry for the year 694 in the Angle-Saxon Chronicle. Although scholars do not accept this grant as genuine, the claim that Wihtred issued such a document does illustrate his close ties with the church.

Wilamowitz-Moellendorff, (Emmo Friedrich Richard) Ulrich von (b. Dec. 22, 1848, Markowitz, Prussia—d. Sept. 25, 1931, Berlin, Ger.), German classical scholar and teacher whose studies advanced knowledge in the historical sciences of metrics, epigraphy, papyrology, topography, and textual criticism.

Educated at the universities of Bonn and Berlin, Wilamowitz-Moellendorff served in the Franco-German War (1870) and traveled through Italy and Greece. He taught successively at the universities of Berlin, Greifswald, and Göttingen before accepting the chair of Greek studies at Berlin in 1897. His wife was the daughter of the historian Theodor Mommsen

Among Wilamowitz-Moellendorff's many books were studies and texts of the Greek tragedians, Homer and the *Iliad*, Hesiod, Pindar, Plato, and Aristotle. His *Griechisches Lesebuch* (1902; "Greek Reader"), which became a standard text, was influential in its emphasis on Hellenistic and later Greek writers, including the Church Fathers, as well as classical authors. In 1902 he became editorial director of the *Inscriptiones Graecae*, which benefited greatly as a result. He also was editor of the series *Philologische Untersuchungen* (1880–1925; "Philological Investigations"). His last book was *Der Glaube der Hellenen* (1931–32; "The Religious Belief of the Greeks").

Wilberforce, Samuel (b. Sept. 7, 1805, London, Eng.—d. July 19, 1873, near Leatherhead, Surrey), British cleric, an Anglican prelate and educator, and a defender of orthodoxy, who typified the ideal bishop of the Victorian era. He was a major figure in the preservation of the Oxford Movement, which sought to reintroduce 17th-century High Church ideals into the Church of England.

The son of the politician and antislavery philanthropist William Wilberforce, he was or-

Samuel Wilberforce, detail from a portrait by George Richmond; in the National Portrait Gallery, London By courtesy of the National Portrait Gallery, London

dained an Anglican priest in 1829 and served as rector at Brighstone, Isle of Wight (1830–40), and at Alverstoke, Hampshire (1840–45). In 1845, during the critical period in the Oxford Movement when its leader John Henry Newman converted to Roman Catholicism, Wilberforce was appointed bishop of Oxford. Though only partially supportive of the aims of the Oxford Movement, he exerted his influence to prevent its disintegration.

A frequent critic of liberal bishops, dissenters, and biblical scholars, Wilberforce attacked Charles Darwin's theory of evolution in an exchange with the biologist Thomas Huxley in 1860 and was generally viewed as the loser of

the debate. Like others in the Oxford Movement, he encouraged the revival of religious communities within Anglicanism, and at Cuddesdon, in 1854, he founded one of the first Anglican theological colleges. He was briefly a chaplain to the House of Lords and from 1847 to 1869 served as lord high almoner to Queen Victoria. In 1869 he was named bishop of Winchester, and in 1870 he initiated the movement to modernize the language of the King James Version of the Bible, a project that resulted in the Revised Version (New Testament, 1881; Old Testament, 1885; Apocrypha, 1895). Among Wilberforce's numerous writings are (with his brother Robert) The Life of William Wilberforce, 5 vol. (1838), Agathos, and Other Sunday Stories (1840) and The History of the Protestant Episcopal Church in America (1844).

Wilberforce, William (b. Aug. 24, 1759, Hull, Yorkshire, Eng.—d. July 29, 1833, London), British politician and philanthropist who from 1787 was prominent in the struggle to abolish the slave trade and then to abolish slavery itself in British overseas possessions.

William Wilberforce, detail of an unfinished painting by Sir Thomas Lawrence, 1828; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery. London

At Cambridge, where he became a close friend of the future prime minister William Pitt the Younger, Wilberforce was known as an amiable companion rather than an outstanding student. In 1780 both he and Pitt entered the House of Commons, and he soon began to support parliamentary reform and Roman Catholic political emancipation, acquiring a reputation for radicalism that later embarrassed him, especially during the French Revolution, when he was chosen an honorary citizen of France (September 1792). From 1815 he upheld the Corn Laws (tariffs on imported grain) and repressive measures against working-class agitation.

Wilberforce's abolitionism was derived in part from evangelical Christianity, to which he was converted in 1784–85. In 1787 he helped to found a society for the "reformation of manners" called the Proclamation Society (to suppress the publication of obscenity) and the Society for Effecting the Abolition of the Slave Trade—the latter more commonly called the Anti-Slavery Society. He and his associates— Thomas Clarkson, Granville Sharp, Henry Thornton, Charles Grant, Edward James Eliot, Zachary Macaulay, and James Stephenfirst called the Saints and afterward (from 1797) the Clapham Sect, of which Wilberforce was the acknowledged leader. In the House of Commons, Wilberforce was an eloquent and indefatigable sponsor of antislavery legislation. He achieved his first success on March 25, 1807, when a bill to abolish the slave trade in the British West Indies became law. This statute, however, did not change the legal position of persons enslaved before its enactment, and so, after several years in which Wilberforce was concerned with other issues, he and Sir Thomas Fowell Buxton urged (from 1821) the immediate emancipation of all slaves. In 1823 he aided in organizing and became a vice president of the Society for the Mitigation and Gradual Abolition of Slavery Throughout the British Dominions—again, more commonly called the Anti-Slavery Society. Turning over to Buxton the parliamentary leadership of the Abolition Movement, he retired from the House of Commons in 1825; the Slavery Abolition Act he had sought was passed one month after his death.

Samuel and Robert Wilberforce wrote *The Life of William Wilberforce*, 5 vol. (1838; abridged edition by Samuel alone, 1868) and edited their father's *Correspondence*, 2 vol. (1840). Later biographies are Sir Reginald Coupland, *Wilberforce* (1923; 2nd ed., 1945); Oliver Warner, *William Wilberforce and His Times* (1962); and Audrey and Herbert Lawson, *The Man Who Freed the Slaves* (1962). John Pollock's *Wilberforce* (1977) is a scholarly biography.

Wilbrord, Saint: see Willibrord, Saint.

Wilbur, Richard (Purdy) (b. March 1, 1921, New York City), American poet associated with the New Formalist movement.

Wilbur was educated at Amherst College, Amherst, Mass., and Harvard, where he studied literature. He fought in Europe during World War II and earned a master's degree from Harvard in 1947. With the appearance of *The Beautiful Changes and Other Poems* (1947) and *Ceremony and Other Poems* (1950), he established himself as an important young writer. These early poems are technically exquisite and formal in their adherence to the convention of rhyme and other devices.

Wilbur next tried translating and in 1955 produced a version of Molière's Le Misanthrope, which was followed by Molière's Tartuffe (1963), The School for Wives (1971), and The Learned Ladies (1978) and by Racine's Andromache (1982). In 1957 he won a Pulitzer Prize for poetry for Things of This World: Poems (1956), which was enthusiastically hailed as less perfect but more personal than his previous poetry. Wilbur wrote within the poetic tradition launched by T.S. Eliot, using irony and intellect to create tension in his poems. Some critics demanded more energy from his poems; this complaint was partially assuaged with the publication of Advice to a Prophet and Other Poems (1961), Walking to Sleep (1969), and The Mind Reader: New Poems (1976). He also wrote the lyrics for Leonard Bernstein's acclaimed musical comedy version of Candide (1957), children's books such as Loudmouse (1963) and Opposites (1973), and criticism, collected as Responses: Prose Pieces 1953-1976 (1976). In 1987 he succeeded Robert Penn Warren as poet laureate of the United States.

Wilbye, John (baptized March 7, 1574, Diss, Norfolk, Eng.—d. September 1638, Colchester, Essex), English composer, one of the finest madrigalists of his time.

The son of a successful farmer and landowner, Wilbye's musical abilities early attracted the notice of the local gentry; when one of them married Sir Thomas Kytson of nearby Hengrave Hall, Bury St. Edmunds, Wilbye became (c. 1595) resident musician there. The Kytsons treated him handsomely, leasing him a prosperous sheep farm in 1613; in time he came to own lands in Diss, Bury, and elsewhere. When, on the death of Sir Thomas' widow in 1628, the household broke up, Wilbye was employed by Kytson's younger daughter in Colchester.

Wilbye's fame rests on a mere 66 madrigals, all but two of them published in his volumes of 1598 and 1609 (republished in vol. 6 and 7 of *The English Madrigal School*, ed. by E.H. Fellowes, 1913–24). His achieve-

ment lies in the grave music of his "serious" madrigals, a style then largely unpracticed in England. The "new poetry" of the Italianizing poets Sir Philip Sidney and Edmund Spenser, which flourished from 1580 to 1600, found in Wilbye's settings its perfect musical equivalent. He was far more appreciative of literary excellence in choosing texts for his music than most of his fellow madrigalists and must often have met Sidney, who was a frequent visitor to Hengrave Hall. He also set to music many translations of Italian verse.

Wilbye spread the general emotional purport of his text (usually amorous) over the whole composition; abrupt contrasts and changes of mood were abandoned in favour of a prevailing tone, and this gave his madrigals an artistic unity rarely attained by his English contemporaries. Wilbye was a master of rhythm, and his alert ear for prosody fills his music with passages in which the verbal accent is counterpointed against the musical metre. He also experimented with sequence, recurring refrains, and thematic development in such works as "Adieu, sweet Amaryllis" and the more complex "Draw on, sweet night." The latter and the well-known "Flora gave me fairest flowers" and "Sweet honey-sucking bees" display Wilbye's skill in vocal orchestration: the full number of voices is not kept in constant play, but for much of the time the composer writes for ever-changing smaller groups within the ensemble.

Wild, Jonathan (b. c. 1682, Wolverhampton, Staffordshire, Eng.—d. May 24, 1725, London), master English criminal of early 18th-century London, leader of thieves and highwaymen, extortionist, and fence for stolen goods.

Married while in his teens, Wild at about the age of 21 deserted his wife and child for the life of London, where he quickly learned the criminal trade while held in a debtors' prison. He was a master organizer, eventually directing a large array of thieves and felons and handling the distribution of spoils. Criminals who ignored or resisted his organization were frequently betrayed; some 120 men, it is said, went to the gallows on Wild's testimonies or leaks to the authorities. At last, after some 15 years of criminal lordship, Wild himself was arrested on a minor felony charge, found guilty, and hanged at Tyburn.

wild ass: see ass.

wild boar, also called WILD PIG, any of the wild members of the pig family Suidae, the ancestors of domestic pigs. See boar.

Wild Bunch, a collection of cowboy-outlaws who flourished in the 1880s and '90s in Wyoming, Colorado, Utah, and surrounding states and territories. Their chief hideouts were Hole in the Wall, a nearly inaccessible grassy canyon and rocky retreat in north-central Wyoming; Brown's Hole (now Brown's Park), a hidden valley of the Green River, near the intersection of the borders of Wyoming, Colorado, and Utah; Robbers' Roost, a region of nearly impenetrable rugged canyons in east-central Utah; and the Wilson W.S. Ranch, near Alma, N.M. Each area had cabins and corrals; rustled horses and cattle could be grazed at Hole in the Wall and Brown's Hole.

On Aug. 18, 1896, according to local Western lore (the truth of which cannot be determined), over 200 outlaws from regional gangs gathered at Brown's Hole, where Butch Cassidy (q.v.) proposed to organize a Train Robbers' Syndicate, which became familiarly known as the Wild Bunch. Cassidy and Kid Curry contested for leadership, with the more amiable and more efficiently larcenous Cassidy winning out.

However, the outlaws never constituted a single organized gang. They paired off or grouped for individual robberies of banks, trains, and paymasters and for rustling horses

or cattle. Aside from Cassidy and Kid Curry, other notables in the Wild Bunch were Elzy Lay (q, v.), Harry Longabaugh (the Sundance Kid; q.v.), Ben (the "Tall Texan") Kilpatrick, George Sutherland ("Flat Nose") Curry, Will Carver, and O.C. ("Camilla") Hanks. Soldiers, Pinkerton detectives, and lawmen eventually captured or killed most of the Wild Bunch in the late 1890s and the early 20th century. A few—including Butch Cassidy and the Sundance Kid—renewed their outlaw careers in South America.

wild carrot (plant): see Queen Anne's lace.

wild cucumber, also called BALSAM APPLE (Echinocystis lobata), climbing plant of the gourd family (Cucurbitaceae), native to eastern North America. The true balsam apple is Momordica balsamina.

Wild cucumber (Echinocystis Iobata)

Jeanne White—The National Audubon Society Collection/Photo
Researchers

The wild cucumber has three to seven sharply lobed leaves; forked, coiled tendrils; six- petalled white flowers; and a fleshy, oval, four-seeded fruit that is covered with prickles. It is frequently planted to cover arbors and fences.

wild duck, in the Northern Hemisphere, common name for the mallard (q, v).

wild flower, any flowering plant growing without intentional human aid. Wild flowers are the source of all cultivated garden varieties of flowers. Although most wild flowers are native to the region in which they occur, some are the descendants of flowering plants introduced from other lands. The bright flowers characteristic of the Hawaiian Islands, for example, are nearly all native to other parts of the tropics and subtropics. Most were taken purposely to the islands for cultivation but spread rapidly into the fertile lowlands, displacing the less colourful native species and leaving only the steep mountainsides to the original flora. In the lowlands of the United States and Europe most species are native; others are migrants.

Disturbance of the native flora by humans began in prehistoric times. For example, fires that escaped from the control of their human makers are thought to have burned off native vegetation and made way for aggressive species from the same or other areas. In all probability one of the best known buttercups of northern Europe, *Ranunculus acris*, became more abundant and widespread as the forests were burned away. In the lowlands of north-

ern Europe, this colourful and highly variable species probably became modified during the Stone Age into some new forms better adapted to habitats created by human actions. Two forms occurring in the northern United States and Canada, both introduced into eastern North America at least by the early part of the 19th century, gradually spread across the continent, one becoming common in the state of Washington only within the 20th century.

Distinction of weeds from wild flowers depends upon the purpose of the classification. A weed is a plant that, from a human perspective, is out of place; that is, one growing where it is unwanted. Sunflowers are looked upon as weeds when growing in cultivated fields or on grazing land of the Great Plains of North America but as wild flowers in uncultivated valleys. The sunflower also is a crop plant cultivated for its seeds; in some places it is a garden flower.

There may be as many as 250,000 species of flowering plants, thousands of which are wild flowers. Relatively few occurring on one continent may be found on another, and individual parts of the same continent may have almost wholly different floras, for wild flowers and other plants are affected by many factors, especially moisture and temperature.

Moisture variation may be extreme on the opposite sides of the same mountain range. Temperature changes due to altitude or latitude are marked by corresponding variations in flora. Over long distances from north to south, even in such level areas as the plains that stretch between Saskatchewan and Texas, there is almost a complete change with latitude in wild flowers as well as other plants. Many tropical and subtropical species are limited in northward distribution by the occurrence of any frost.

The distribution of wild flowers and other plants is segregated roughly into those of the tropics and subtropics, the horse latitudes (at about latitude 30° north and south) of both hemispheres, the temperate regions of both the Northern and Southern Hemispheres, and the Arctic and Antarctic and the summits of mountain chains ranging to the southward.

When humans invade an area, conditions change. With the growth of cities and farms, the country becomes restricted, and the wilderness tends to disappear. Some wilderness areas and their native flora have been preserved in national, state or provincial, and local parks and monuments, particularly in the United States and Canada, but in general the once vast areas of wild flowers have not been preserved. These tracts of land were most vulnerable to human destruction because they were easily converted to cropland, grazing land, or settlements.

wild ginger, any member of the genus Asarum, comprising about 75 species of perennial herbs of the birthwort family (Aristolochiaceae), distributed throughout North Temperate areas of the world. The leaves and underground stems (rhizomes) of some Asarum species give off a pleasant odour when

Canadian wild ginger (Asarum canadense) W.H. Hodge

bruised, and dried rhizomes are sometimes used as a substitute for ginger.

Canadian wild ginger, or snakeroot (A. canadense), grows about 15 to 30 centimetres (6 to 12 inches) tall in shady woods in eastern North America. It usually bears two heart-shaped, downy leaves and a single inconspicuous cup-shaped flower. The flower develops in the angle between two leafstalks at the surface of the ground and has three reddish-brown lobes. This plant is a useful but coarse ground cover. European wild ginger, or asarabacca (A. europaeum), a creeping, hairy-stemmed plant with bell-shaped brown flowers, is native to Europe and Asia. It was formerly used in various medicines, particularly purgatives, and in snuff.

wild lavender: see chaste tree.

wild mango, also called DIKA (Irvingia gabonensis), tropical African tree, of the family Ixonanthaceae (Irvingiaceae), notable for its edible yellow fruit, which somewhat resembles the mango. The seed is rich in a fat used locally to make both bread and a type of butter. The wood is very hard and is used locally in building construction.

wild oat, any of several tufted annual grasses of the genus *Avena* (family Poaceae), native to Eurasia. Wild oats are sometimes cut for hay, and young plants provide forage for grazing animals.

Wild oats (Avena fatua)

The best known species is *A. fatua*, which has become a common field and roadside weed in temperate Australia, North America, and southern Africa. It grows in small tufts about 0.9 to 1.2 metres (3 to 4 feet) tall. Mature spikelets are bell-shaped, with bent, bristlelike projections.

wild pig, also called WILD BOAR, any of the wild members of the pig family, Suidae (order Artiodactyla), the ancestors of domestic pigs. See boar.

wild pink (orchid): see dragon's-mouth.

wild pumpkin: see calabazilla.

wild radish, also called Jointed Charlock (Raphanus raphanistrum), widespread annual weed, of the mustard family (Brassicaceae), native to Eurasia and naturalized in North America. It is believed by some authorities to be the ancestor of the domestic radish (R. sativus). Wild radish has a stout taproot, a rosette of unequally divided leaves and very bristly flowering stalks 60 centimetres (2 feet) tall. The four-petalled flowers may be yellow, lilac, white, or violet. The fruits, borne below

the flower head, are narrowly oval and constricted around the 4 to 10 seeds.

wild rice (Zizania aquatica), coarse annual grass of the family Poaceae whose grain, now often considered a delicacy, has long been an important food of North American Indians. Wild rice grows in shallow water in marshes and along the shores of streams and lakes

Wild rice (Zizania aquatica) W.H. Hodge

in northeastern North America. Natural and cultivated stands provide food and shelter for waterfowl and other birds.

A wild rice plant is about 1 to 3 metres (3 to 10 feet) tall, topped with a large, open flower cluster. The ripened grains, dark brown to purplish black, are slender rods 1 to 2 centimetres (0.4 to 0.8 inch) long. A closely related perennial, Z. caducifolia (or Z. latifolia), is cultivated as a vegetable in eastern Asia.

wild rye, also called LYME GRASS, any of about 50 species constituting the genus Elymus (family Poaceae), perennial forage grasses

Canada wild rye (Elymus canadensis)

Alfred C. Tegethoff

native to temperate and cool parts of the Northern Hemisphere. Giant wild rye (*Elymus cinereus*), Virginia wild rye (*E. virginicus*), and Canada wild rye (*E. canadensis*) are the most widespread North American species.

Sea lyme, or dune, grass (*E. arenarius*) is a Eurasian species 0.6 to 2.5 metres (2 to 8 feet) tall, with creeping rootstocks and flowers borne in dense terminal spikes resembling those of rye. It is used as a sand binder on coastal dunes.

wild-water racing, also called WHITE-WATER RACING, canoe or kayak racing down swift-flowing, turbulent streams called wild water (often "white water" in the United States). The sport developed from the riding of rapids in small boats and rafts, a necessary skill for explorers, hunters, and fishermen. Later, it became an increasingly popular form of recreation in parts of Europe and the United States.

International competition, which dates from 1950, has been dominated by Europeans. Streams are graded for difficulty on a six-point scale, from those that are easily negotiable to those that may be attempted only at the risk of life. Contestants wear crash helmets and life jackets. They leave the starting point at intervals, and the person who covers a threeto eight-kilometre (two- to five-mile) course in the least time is the winner. Although they compete in separate classes, the canoes and kayaks used are quite similar—decked over completely except for a hole for the rider, who wraps a plastic spray skirt about his waist to keep out water.

Wild West show, theatrical extravaganza begun in 1883 by William Frederick "Buffalo Bill" Cody. Cody, an Indian scout and Western hero, first turned to acting and then to producing and promoting his own Wild West show. In 1887 his show was performed at Madison Square Garden, New York City, with a cast of 100 Indians (including Sitting Bull); Annie Oakley, the sharpshooter; other trick riders, ropers, and shooters; and such wild animals as buffalo, elk, bear, moose, and deer.

The four-hour spectacle, including Indian war dances and an "attack" on a stagecoach, went on to tour England and Europe with such success that Queen Victoria saw the show three times.

An early rival, Pawnee Bill, merged with Cody in 1908. After Cody died in 1917 his many followers kept alive the tradition of his Wild West shows.

wildcat (Felis silvestris), a small wild member of the cat family (Felidae) native to Eurasia. The name wildcat is also used as a general term for feral domestic cats and for any of the smaller wild species of the cat family.

The European wildcat inhabits forested regions from Scotland through continental Europe to western Asia. It is similar to the domestic cat but has longer legs, a larger, flatter head, and a full, relatively short tail ending in a rounded (not pointed) tip. The coat is yellowish gray with dark stripes and bands in the striped tabby pattern; the tail is black ringed. The adult wildcat is 50 to 80 centimetres (20 to 32 inches) long, excluding a 25- to 35-cm tail; it stands 35-40 cm at the shoulder and weighs from 3 to 10 kilograms (6.6 to 22 pounds).

Reputedly a savage and untamable cat, the European wildcat is a solitary, nocturnal animal. It preys on birds and small mammals and is reported to raid farms, stealing poultry and lambs. It breeds once yearly (in spring) in continental Europe and twice (sometimes three times) yearly in Scotland. A litter consists of three to six kittens; the gestation period is 68 days. The wildcat interbreeds with the domestic cat. Certain authorities believe that the purity of the Scottish wildcat (one of

the several races) is being threatened by interbreeding.

In North America, the lynx and bobcat (q.v.) are sometimes called wildcats. The Caffre cat

Wildcat (Felis silvestris)
Philip Wayre—EB Inc.

(q.v.) of Africa is often referred to as the African, or Egyptian, wildcat.

wildcat bank, unsound bank chartered under state law during the period of uncontrolled state banking (1816–63) in the United States. Such banks distributed nearly worthless currency backed by questionable security (e.g., mortgages, bonds) and were located in inaccessible areas to discourage note redemption. Note circulation by state banks ended after the passage of the National Bank Act of 1863, which provided for the incorporation of national banks under federal law and the issue of bank notes on the security of government bonds. The term wildcat bank was subsequently applied to any unstable bank.

Wilde, Oscar (Fingal O'Flahertie Wills) (b. Oct. 16, 1854, Dublin—d. Nov. 30, 1900, Paris), Irish wit, poet, and dramatist whose reputation rests on his comic masterpieces Lady Windermere's Fan (1892) and The Importance of Being Earnest (1895). He was spokesman for the late 19th-century Aesthetic movement in England, which advocated art for art's sake; and he was the object of cele-

Wilde, 1882

By courtesy of the William Andrews Memorial Library of the University of California, Los Angeles

brated civil and criminal suits involving homosexuality and ending in his imprisonment (1895–97).

Wilde was born of professional and literary parents. His father, Sir William Wilde, was Ireland's leading ear and eye surgeon, who also published books on archaeology, folklore, and the satirist Jonathan Swift; his mother was a revolutionary poet and an authority on Celtic myth and folklore.

After attending Portora Royal School, Enniskillen (1864–71), Wilde went, on successive scholarships, to Trinity College, Dublin (1871–74), and Magdalen College, Oxford (1874–78), which awarded him a degree with

honours. During these four years, he distinguished himself not only as a classical scholar, a poseur, and wit but also as a poet by winning the coveted Newdigate Prize in 1878 with a long poem, Ravenna. He was deeply impressed by the teachings of the English writers John Ruskin and Walter Pater on the central importance of art in life and particularly by the latter's stress on the aesthetic intensity by which life should be lived. Like many in his generation, Wilde was determined to follow Pater's urging "to burn always with [a] hard, gemlike flame." But Wilde also delighted in affecting an aesthetic pose; this, combined with rooms at Oxford decorated with objets d'art, resulted in his famous remark: "Oh, would that I could live up to my blue china!"

In the early 1880s, when Aestheticism was the rage and despair of literary London, Wilde established himself in social and artistic circles by his wit and flamboyance. Soon the periodical Punch made him the satirical object of its antagonism to the Aesthetes for what was considered their unmasculine devotion to art; and in their comic opera Patience, Gilbert and Sullivan based the character Bunthorne, a "fleshly poet," partly on Wilde. Wishing to reinforce the association, Wilde published, at his own expense, *Poems* (1881), which echoed, too faithfully, his discipleship to the poets Algernon Swinburne, Dante Gabriel Rossetti, and John Keats. Eager for further acclaim, Wilde agreed to lecture in the United States and Canada in 1882, announcing on his arrival in New York City that he had "nothing to declare but his genius." widespread hostility in the press to his languid poses and aesthetic costume of velvet jacket, knee breeches, and black silk stockings, for 12 months Wilde exhorted the Americans to love beauty and art; then he returned to Great Britain to lecture on his impressions of Amer-

In 1884 Wilde married Constance Lloyd, daughter of a prominent Irish barrister; two children, Cyril and Vyvyan, were born in 1885 and 1886. Meanwhile, Wilde was a reviewer for the *Pall Mall Gazette* and then became editor of *Woman's World* (1887–89). During this period of apprenticeship as a writer, he published *The Happy Prince and Other Tales* (1888), which reveals his gift for romantic allegory in the form of the fairy tale.

In the final decade of his life, Wilde wrote and published nearly all of his major work. In his only novel, The Picture of Dorian Gray (published in Lippincott's Magazine, 1890, and in book form, revised and expanded by six chapters, 1891), Wilde combined the supernatural elements of the Gothic novel with the unspeakable sins of French decadent fiction. Critics charged immorality despite Dorian's self-destruction; Wilde, however, insisted on the amoral nature of art regardless of an apparently moral ending. Intentions (1891), consisting of previously published essays, restated his aesthetic attitude toward art by borrowing ideas from the French poets Théophile Gautier and Charles Baudelaire and the American painter James McNeill Whistler. In the same year, two volumes of stories and fairy tales also appeared, testifying to his extraordinary creative inventiveness: Lord Arthur Savile's Crime, and Other Stories and A House of Pomegranates.

But Wilde's greatest successes were his society comedies. Within the conventions of the French "well-made play" (with its social intrigues and artificial devices to resolve conflict), he employed his paradoxical, epigrammatic wit to create a form of comedy new to the 19th-century English theatre. His first success, *Lady Windermere's Fan*, demonstrated that this wit could revitalize the rusty machinery of French drama. In the same year, rehearsals of his macabre play *Salomé*, written in French and designed, as he said, to make his audience shudder by its depiction of

unnatural passion, were halted by the censor because it contained biblical characters. It was published in 1893, and an English translation appeared in 1894 with Aubrey Beardsley's celebrated illustrations.

A second society comedy, A Woman of No Importance (produced 1893), convinced the critic William Archer that Wilde's plays "must be taken on the very highest plane of modern English drama." In rapid succession, Wilde's final plays, An Ideal Husband and The Importance of Being Earnest, were produced early in 1895. In the latter, his greatest achievement, the conventional elements of farce are transformed into satirical epigrams—seemingly trivial but mercilessly exposing Victorian hypocrisies.

I suppose society is wonderfully delightful. To be in it is merely a bore. But to be out of it simply a tragedy.

I never travel without my diary. One should always have something sensational to read in the train.

All women become like their mothers. That is their tragedy. No man does. That's his.

I hope you have not been leading a double life, pretending to be wicked and being really good all the time. That would be hypocrisy.

In many of his works, exposure of a secret sin or indiscretion and consequent disgrace is a central design. If life imitated art, as Wilde insisted in his essay "The Decay of Lying" (1889), he was himself approximating the pattern in his reckless pursuit of pleasure. In addition, his close friendship with Lord Alfred Douglas, whom he had met in 1891, infuriated the Marquess of Queensberry, Douglas' father. Accused, finally, by the marquess of being a sodomite, Wilde, urged by Douglas, sued for criminal libel. Wilde's case collapsed, however, when the evidence went against him, and he dropped the suit. Urged to flee to France by his friends, Wilde refused, unable to believe that his world was at an end. He was arrested and ordered to stand trial.

Wilde testified brilliantly, but the jury failed to reach a verdict. In the retrial he was found guilty and sentenced, in May 1895, to two years at hard labour. Most of his sentence was served at Reading Gaol, where he wrote a long letter to Douglas (published in 1905 in a drastically cut version as *De Profundis*) filled with recriminations against the younger man for encouraging him in dissipation and distracting him from his work.

In May 1897, Wilde was released, a bankrupt, and immediately went to France, hoping to regenerate himself as a writer. His only remaining work, however, was The Ballad of Reading Gaol (1898), revealing his concern for inhuman prison conditions. Despite constant money problems he maintained, as George Bernard Shaw said, "an unconquerable gaiety of soul" that sustained him, and he was visited by such loyal friends as Max Beerbohm and Robert Ross, later his literary executor; he was also reunited with Douglas. He died suddenly of an acute brain inflammation brought on by an ear infection. In his semiconscious final moments, he was received into the Roman Catholic church, which he had long admired.

wildebeest (antelope): see gnu.

Wildenvey, Herman, pseudonym of HERMAN THEODOR PORTAAS (b. July 20, 1886, Eikar, Nor.—d. Sept. 27, 1959, Larvik), Norwegian poet whose sunny songs of simple sensual pleasure are unusual in the sombre history of Norwegian verse.

After returning from three years in the United States, Wildenvey published his first collection of verse, Nyinger (1907; "Bonfires"). He developed a technique of constructing his verse so as to give it a lightness matching its mood, as in such collections as Kjærtegn (1916; "Caresses"), Høstens lyre (1931; "The Lyre of Autumn"), and many others. He was able to extract fresh effects from language and give new life to the most hackneyed phrases. In 1935 was published Owls to Athens, a selection of his poems in English translation.

Wilder, Billy, original name SAMUEL WILDER (b. June 22, 1906, Sucha, Austria [now in Poland]), Austrian-born American motion-picture scenarist, director, and producer known for films that humorously treat subjects of controversy and offer biting indictments of hypocrisy in American life.

Wilder attended Viennese schools, including the University of Vienna (which he left after a year), and then was a reporter in Vienna and in Berlin. His first film scenario was a collaboration on the semidocumentary *Menschen am Sonntag* (1929; "People on Sunday"), of which he was also codirector. For the next four years he wrote scripts for German and French films, then went to Hollywood, via Paris and Mexico. The advent of Adolf Hitler in 1933 and Wilder's Jewish background made emigration necessary.

He established his reputation as a director with Double Indemnity (1944), produced by Charles Brackett, with whom he had already written some screenplays. Wilder spent 1945 in Germany in charge of the U.S. Army's Psychological Warfare Division. Then, collaborating first with Brackett until 1950 and then with I.A.L. Diamond from 1957, he wrote the films that he directed and frequently produced, creating a series on subjects that had not been considered as acceptable screen material, including alcoholism (The Lost Weekend, 1945), prisoner-of-war camps (Stalag 17, 1953), and prostitution (Irma La Douce, 1963). A number of his films, such as Sunset Boulevard (1950) and The Apartment (1960), weighed the emptiness of modern life. Later films, such as Avanti! (1972), Fedora (1978), and Buddy Buddy (1981), explore this same theme. Some of Wilder's greatest films were comedies, including Sabrina (1954), The Seven Year Itch (1955), Love in the Afternoon 1957), Some Like It Hot (1959), and One, Two, Three (1961).

In 1986 the American Film Institute awarded him the Life Achievement Award, and in the 1988 Academy Awards he was given the Irving G. Thalberg Award.

Wilder, Laura Ingalls (b. Feb. 7, 1867, Lake Pepin, Wis., U.S.—d. Jan. 10, 1957, Mansfield, Mo.), American author of children's fiction based on her own youth in the American Midwest.

Wilder spent 12 years editing the Missouri

Ruralist before, at the urging of her daughter, she began to write. Her stories centred on the male unrest and female patience of pioneers in the mid-1800s and celebrated their peculiarly American spirit and independence. These were collected in Little House in the Big Woods (1932), Farmer Boy (1933), Little House on the Prairie (1935), On the Banks of Plum Creek (1937), By the Shores of Silver Lake (1939), The Long Winter (1940), Little Town on the Prairie (1941), and These Happy Golden Years (1943). In the 1970s and '80s a popular television series, Little House on the Prairie, was based on her stories.

Wilder, Thornton (Niven) (b. April 17, 1897, Madison, Wis., U.S.—d. Dec. 7, 1975, Hamden, Conn.), American writer, whose innovative novels and plays reflect his views of the universal truths in human nature.

Thornton Wilder

After graduating from Yale University in 1920, Wilder studied archaeology in Rome. From 1930 to 1937 he taught dramatic literature and the classics at the University of Chicago.

His first novel, The Cabala (1926), while set in 20th-century Rome, is essentially a fantasy about the death of the pagan gods. His most popular novel, *The Bridge of San Luis Rey* (1927), which was adapted for film and television, examines the lives of five persons who died in the collapse of a bridge in Peru in the 18th century. The Woman of Andros (1930) is an interpretation of Terence's Andria. Accused of being a "Greek" rather than an American writer, Wilder in Heaven's My Destination (1934) wrote about a quixotically good hero in a contemporary setting. His later novels are The Ides of March (1948), The Eighth Day (1967), and Theophilus North (1973).

Wilder's plays engage the audience in makebelieve by having the actors address the spectators directly and by discarding props and scenery. The Stage Manager in Our Town (1938) talks to the audience, as do the characters in the farcical The Matchmaker (1954). The Matchmaker was made into a film in 1958 and adapted in 1964 into the immensely successful musical Hello, Dolly!, which was also made into a film.

Wilder's other plays include *The Skin of Our Teeth* (1942), which employs deliberate anachronisms and the use of the same characters in various geological and historical periods to show that human experience is much the same whatever the time or place.

BIBLIOGRAPHY. Biographical and critical studies include Gilbert A. Harrison, The Enthusiast: A Life of Thornton Wilder (1983); Donald C. Haberman, The Plays of Thornton Wilder (1967); and Rex Burbank, Thornton Wilder, 2nd ed. (1978).

Wilderness, Battle of the (May 5-7, 1864), in the American Civil War, first stage of a carefully planned Union campaign to capture the Confederate capital at Richmond, Va. Crossing the Rappahannock River near Fredericksburg, Va., early in May, General Ulysses S. Grant advanced with a Union army of 115,000 men. On May 5 he met a Confederate army of 62,000 troops under General Robert E. Lee. The confrontation occurred in dense thickets, called the Wilderness, where orderly movement was impossible and cavalry and artillery were almost useless. Burning brush killed many of the wounded. After indecisive but intense fighting for two days, Grant saw the futility of further hostilities in this area and moved on to do battle at Spotsylvania Court House, nearer Richmond,

Wildfowl Trust, The, centre of the world's largest collection of waterfowl. It was established in 1946 by Sir Peter Scott on 418 acres (169 hectares) along the River Severn near Slimbridge, Gloucestershire, Eng. Nearly a quarter of the land is fenced off for captive birds and breeding stock; the rest of the refuge is traditional wintering ground for many species of ducks and geese. In addition to accommodating true wildfowl (geese, ducks, and swans), the refuge maintains breeding colonies of four of the six known flamingo species and has a special pavilion for exotic ducks and various small birds. The refuge's collection numbers nearly 3,000 birds representing about 200 species; its breeding record is excellent. Greatest success has been with the Hawaiian goose, which had almost become extinct in the 1950s. Financial support comes from grants and from public attendance fees.

Wildgans, Anton (b. April 17, 1881, Vienna, Austria-d. May 3, 1932, Mödling, near Vienna), Austrian dramatist and poet known for his mystical dramas charged with the symbolic messages typical of German Expressionism.

The son of a judge, Wildgans became a lawyer but soon turned to writing. His childhood had been marred by his relations with his stepmother. His early poems, among which was the collection *Herbstfrühling* (1909; "Autumn-Spring"), sold well; they recall the themes of idealism and reality in the late romantic works of Hugo von Hofmannsthal. Wildgans' plays, such as the trilogy Armut (1914; "Poverty Liebe (1916; "Love"), and Dies irae (1918), begin in a realistic world that becomes less and less comprehensible and more and more concerned with feeling as the play goes on, culminating in a mystical, symbolic sensing of truth. As a counterpart to this trilogy of Viennese middle-class family life, he planned another of a mythological or religious character; only the first part, Kain (1920; "Cain"), was published. Wildgans directed the celebrated Vienna Burgtheater in 1921–22 and 1930–31. He also translated Italian and French poets into German. His own collected poems were published in 1929.

wildland fire, uncontrolled fire in a forest,

grassland, brushland, or land sown to crops. Fire danger in a wildland setting varies with weather conditions: drought, heat, and wind participate in drying out the timber or other fuel, making it easier to ignite. Once a fire is burning, drought, heat, and wind all increase its intensity. Topography also affects wildland fire, which spreads quickly uphill and slowly downhill. Dried grass, leaves, and light branches are considered flash fuels; they ignite readily, and fire spreads quickly in them, often generating enough heat to ignite heavier fuels such as tree stumps, heavy limbs, and the matted duff of the forest floor. Such fuels, ordinarily slow to kindle, are difficult to extinguish. Green fuels-growing vegetationare not considered flammable, but an intense fire can dry out leaves and needles quickly enough to allow ready ignition. Green fuels sometimes carry a special danger: evergreens, such as pine, cedar, fir, and spruce, contain flammable oils that burst into flames when heated sufficiently by the searing drafts of a forest fire.

Tools for fighting wildland fires range from the standard equipment of urban fire departments to portable pumps, tank trucks, and earth-moving equipment. Firefighting forces specially trained to deal with wildland fires are maintained by public and private owners of forestlands. Such a force may attack a fire directly by spraying water, beating out flames, and removing vegetation at the edge of the fire to contain it behind a fireline. When the very edge is too hot to approach, a fire line is built at a safe distance, sometimes using strip burning or backfire to eliminate fuel in the path of the uncontrolled fire or to change the fire's direction or slow its progress. Backfiring is used only as a last resort.

Aircraft were first used in fighting wildland fires in California in 1919. Airplanes and helicopters are primarily used for dumping water, for observation, and occasionally for assisting in communication and transporting personnel, supplies, and equipment.

wildlife conservation, the regulation of wild animals and plants in such a way as to provide for their continuance as a natural resource. The term stands for the husbandry and use of natural resources by the present and succeeding generations. Aesthetic, sporting, economic, and ethical use of landscapes, game, minerals, animals, plants, soils, and water is thus implied in the concept. The term wildlife conservation has been used to include an everwidening group of animals—mammals, birds, fish, reptiles, amphibians, arthropods (such as the lobster), and mollusks (such as the oyster)-and includes plants as well. Certain aes-

of animals have tended to dominate the list; but it is expanding as values broaden, interest in science grows, and increasingly subtle but important relationships among animals and plants are reported.

thetically and economically important groups

Animal-conservation problems vary widely depending on the type of animal (whether, for example, it is exploited primarily for commercial or recreational reasons, whether or not it is free to range over national boundaries) and on the social and economic conditions of various countries. In many countries, game animals are widely hunted by sportsmen, over both private and public lands; thus an outstanding factor in wildlife conservation in such regions is the licensing and supervision of hunters. Game birds and mammals whose migrations take them across national boundaries require an international conservation effort. Marine mammals and fish also present the need for international agreement and legislation because they live in waters that know no national boundaries and are exploited commercially by fishermen from many countries. Small mammals that are trapped for their furs must be protected by domestic laws, but seals are the subject of international agreement. Saltwater fish, exploited mainly for commercial reasons, are protected by international agreement; but the exploiters of freshwater fish, chiefly anglers who fish for recreation (except in such large inland water areas as the Great Lakes), are licensed and controlled domestically.

Ethical considerations appear to occupy a central position in wildlife-conservation thinking, but their development has been delayed by the fact that people for so many generations had to fight against nature. Although primitive people had a far more immediate stake in wildlife than modern people do, it is virtually certain that early humans had little concept of conserving game. The disappearance of the moa and the mammoth taught no lessons; the disappearance of the passenger pigeon did. Convinced of the enormous destructive power of humankind, pioneer conservationists of the early 20th century emphasized the ethical responsibility of their own generation to conserve natural resources for posterity. Modern ecologists perceive that nature is a series of complex biotic communities of which the human species is an interdependent part; a spokesman for conservationists, Aldo Leopold, has argued that the Golden Rule applies to the land and to its animals as well as to people. Thus we find ourselves responsible for the fate of many products of nature, guided by a conservation tradition and code of conduct less than a century old.

The problem. During the past 2,000 years the world has lost, through extinction, well over 100 species or subspecies of mammals. Approximately two-thirds of these losses have occurred since the mid-19th century, most since the beginning of the 20th. In addition to those mammals already extinct, many others are vanishing or threatened.

The primary factor in the depletion of the world's fauna has been modern human society, operating either directly through excessive commercial hunting or, more disastrously, indirectly through invading or destroying natural habitats, placing firearms in the hands of peoples who previously were without them, or introducing to the native fauna of certain areas (Australia and various islands) more aggressive exotic (nonnative) mammals. Except in the West Indies, comparatively few species seem to have died out within the past 2,000 years from such natural causes as evolutionary senility, disease, or climatic change.

Persons interested in the conservation of wildlife recognize that much more is required than the mere protection of individual animals from destruction by shooting and other forms of direct action. Animal protection must begin with the conservation of the habitat—the area where animals feed, rest, and breed. This naturally involves the preservation of much besides the animal population itself, including conservation of vegetation cover and soil. The comparatively new science of ecology focuses on the association of living things in natural communities and their mutual interdependence and on the possibility of preserving the conditions under which the variety and abundance of natural living forms may continue to exist. But the immense growth of the world's human population and its expanding economic needs, fostering the consequent extension and intensification of industry and agriculture, have encroached upon remaining natural habitats throughout the world. This has been accompanied by the introduction of new types of cultivation, by the drainage of marshes, by the general lowering of the water table, by pollution of rivers and lakes, by destruction of woodlands, and by indiscriminate use of insecticides and herbicides. In many parts of the world there has also been widespread destruction of forests and other great belts of natural vegetation.

Attitudes toward wild animals liable to be killed for food, oil, skins, feathers, or sport are undergoing considerable change in many countries of the world. An example of earlier attitudes is well illustrated by Great Britain, which passed through two centuries of so-called game protection, the original purpose of which was to create artifically high populations of grouse, partridge, pheasant, mallard, and other sporting species and, at the same time, to reduce the populations of such predators as the stoat, weasel, otter, wildcat, and badger, as well as birds of prey including owls. This alteration of the natural equilibrium had many other consequences, particularly in agriculture and forestry. The rabbit and wood pigeon population increased rapidly and caused widespread damage. In some places in Great Britain the landscape was changed by the planting of woods and the creation of other new areas, including artificial lakes for wildfowl-all with the purpose of creating larger populations of certain species for sport. Sport was the privilege of the affluent. There were strictly kept dates for the shooting of game species, and, most significant, there was very strict etiquette in shooting. Poaching was punished by heavy penalties and was kept under control. As a result, the game species did exceptionally well while the total wildlife resources experienced varied fortunes. The modern view is different: total wildlife conservation is rapidly replacing game protection.

Techniques. Wildlife-conservation techniques have counterparts in forestry and in soil, water, and landscape conservation. They include prohibitions, and controls, restoration, subsidy, sanctuary, and public ownership.

The oldest forms of prohibitions and controls are those that regulate hunting, fishing, and trapping. Although, as already stated, many early regulations resulted in misguided efforts aimed solely at increasing game populations, other early controls did play an important role in protecting wildlife. Especially useful were those limitations on hunting that protected animals during the breeding season. Bag limits—i.e., limits on the number of animals that can be taken by an individual hunter, fisher, or trapper—are also important conservation tools. Although modern limitations on hunting, fishing, and trapping have successfully adjusted available game supplies to mounting human populations in much of North America and Western Europe, they have been less successful in countries where the rural population is poverty-stricken and poorly fed. Moreover, the exploitation of migratory waterfowl has been successfully regulated only in North America, where, because few countries are involved, international treaties are easier to work out than they are elsewhere.

Among the most important modern legal tools in wildlife conservation are those laws that protect threatened and endangered species. In the United States, for example, the Endangered Species Act makes it illegal to hunt, trap, or collect endangered animals and plants. The act also tightly restricts the use of federal funds in projects that are likely to adversely affect endangered species, and it prohibits the importation of endangered species or products made from endangered species.

Perhaps equally important are those laws that mandate pollution controls; the resultant improvements in air and water quality enhance the prospects for wildlife (not to mention human) survival. The amelioration of habitats that have been damaged by pollutants is often a lengthy process, however, and in many cases the implementation of anti-pollution laws has been hampered by litigation and by lax enforcement.

Artificial methods of offsetting resource depletion include programs of population restocking and habitat restoration. Game farms and fish hatcheries, which provide stocks of popular game species, are long-established tools of wildlife management. Of more recent development are those programs designed to restock wild populations of endangered species with individuals raised in captivity. Captive rearing and release is part of the effort being made to save the endangered whooping crane of North America. A similar program has been undertaken in behalf of the California condor, another endangered North American bird. Such efforts depend not only on the successful rearing of the endangered species in captivity but also on the abiltiy of the released individuals to made the transition to life in the wild. An even more ambitious approach is the restoration of degraded habitats. Habitat restoration has frequently proved to be expensive, but its results are dramatic in the restoration of marshes, as is now evidenced in many of the national wildlife refuges in the United States.

The oldest types of subsidies are bounties on predators and crop-destroying species, which were offered at least as early as the Middle Ages in England. Some surviving bounties are deplored by ecologists but sponsored by

politicians as a form of unofficial rural relief. In the United States, federal subsidies are intended to encourage municipalities to construct sewage works and farmers to retire land in the soil-bank program.

Sanctuaries—also called preserves, reserves, and refuges—have been prominent in wildlife conservation since the mid-19th century. With the large national parks, they have provided the protection and space critically needed in America and Africa by the larger predators and grassland-dwelling big game and the freedom from human interference needed by nesting birds during the breeding season; in the United States they also give migratory waterfowl at least partial relief from hunting pressure. In the United States, public ownership, which usually accompanies the establishment of sanctuaries, facilitates the management of wildlife food and cover resources to an extent seldom possible on privately owned lands.

Public ownership finds its soundest manifestations in the development of sanctuaries and in the preservation of wildlife in national parks, though government ownership of forests in Canada and the United States also helps maintain various species of wildlife.

Wildman, Sir John (b. c. 1621–23—d. June 4, 1693), English agitator, a fascinating Leveller who outlasted vicissitudes under three British kings and two protectors.

Wildman was of obscure ancestry. Educated at Cambridge, he first came into prominence in October 1647, when he helped to write The Case of the Army and the first Agreement of the People. These expressed the political program of the democratic republican, or Leveller, section of the army, which opposed all compromise with Charles I. In the debates that took place during 1647 in the general council of the army he defended this program against Henry Ireton and Oliver Cromwell. Afterward he violently attacked these two in Putney Projects and with John Lilburne (q.v.) agitated for the abolition of the monarchy and the House of Lords. He was thereupon imprisoned (January-August 1648). After his release he helped to draw up the second Agreement of the People. He acquiesced in the establishment of the Commonwealth and devoted most of his time to building up a considerable fortune by land speculation.

In 1654 he was returned to the first Protectorate Parliament, but his election was disallowed. Thereupon he began to conspire with malcontent army officers for a rising against Cromwell and was again imprisoned (February–July 1655). Thereafter he occupied himself chiefly in trying vainly to organize a Leveller and Royalist rising with Spanish aid and to get Cromwell assassinated.

After the restoration of Charles II, Wildman obtained great influence in the post office, but was again imprisoned (November 1661) for six years on suspicion of using it as a centre for republican plotting. He owed his release to the Duke of Buckingham, with whom he had intrigued before the Restoration and whom he continued to support. He was again imprisoned in 1683 on suspicion of complicity in the Rye House Plot. He took no active part in Monmouth's rebellion (1685) but afterward fled to Holland.

In 1688 he wrote the influential pamphlet A Memorial of Protestants and, returning to England with William of Orange (William III), became a member of the 1689 Convention Parliament. He was appointed postmaster general in April 1689 but fell once more under suspicion and was dismissed in February 1691. Nevertheless he was knighted in 1692.

Wilfrid, SAINT, also called WILFRID OF YORK (b. 634, Northumbria, Eng.—d. April 24, 709/710, monastery of Oundle, Mercia, Eng.; feast

day October 12), one of the greatest English saints, a monk and bishop who was outstanding in bringing about close relations between the Anglo-Saxon Church and the papacy. He devoted his life to establishing the observances of the Roman Church over those of the Celtic Church and fought a stormy series of controversies on discipline and precedent.

In 648 Wilfrid entered the celebrated monastery of Lindisfarne, off the coast of Northumberland. Later he went to Canterbury and then set out in 652 for Rome. Having spent three years in Lyon, Fr., he returned to Northumbria in 657/658. Soon he received a monastery at Ripon, Yorkshire, from King Oswiu's son, Alhfrith. He was ordained a priest in 663/664 by the Gaulish bishop Agilbert, for whom he acted as spokesman at the Synod of Whitby (664), successfully advocating the rejection of Celtic practices in favour of Roman. Alhfrith had him elected bishop of York, but Wilfrid refused to be consecrated by Celtic bishops and was therefore consecrated at Compiègne. Fr.

Meanwhile, Oswiu appointed St. Chad as bishop of York instead, and Wilfrid on his return lived (666-669) at Ripon. He was restored in 669, when Archbishop St. Theodore of Canterbury deposed Chad, and he thereby became primate of Northumbria. He built a monastery at Hexham and introduced the Benedictine Rule to the kingdom. In 677 Theodore divided Wilfrid's diocese, and Wilfrid appealed to Rome (the first English ecclesiastic to do so), where he arrived in 679 after having helped convert the Frisians (winter of 677-678). Pope St. Agatho and a Roman synod (October 679) ordered his restoration but accepted the division of his diocese on condition that he, with a local council, appoint the new bishops.

King Ecgfrith, Oswiu's successor, refused to obey the papal mandate, however, and apparently imprisoned Wilfrid, who finally took refuge in Sussex, Christianizing its people and founding a monastery at Selsey. In 685 he joined King Caedwalla of Wessex, who gave him a quarter of his conquests in the Isle of Wight. Aldfrith, Ecgfrith's successor, recalled him in 686/687. Although his deposition and its nullification following Agatho's injunctions were reissued by popes SS. Benedict II and Sergius I, Wilfrid still remained improperly restored. Demanding the fulfillment of his rights granted by Agatho, he spent 11 years in exile, acting as bishop in Mercia. A council was held in 702, but Wilfrid, refusing to promise unconditional acceptance of the Archbishop's rulings, went again to Rome, where his case was debated during 704. Though the Roman synod cleared Wilfrid of charges against him, it referred the question back to an English synod that met in Yorkshire in 705. Wilfrid, no longer insisting on York, was given his monasteries of Ripon and Hexham, becoming bishop of Hexham in 705 and retaining his monasteries in Mercia. He was buried at

Wilfrid spread the knowledge of the Benedictine Rule, brought religious treasures from the Continent, and helped improve the chanting of the liturgy. He was a great builder at York, Ripon, and Hexham. He was one of the first to conceive the idea of Anglo-Saxons evangelizing the Germanic peoples. St. Willibrord, the apostle of Friesland and patron saint of Holland, was his devoted pupil, and he also consecrated St. Swithberht. In ecclesiastical policies, he fought steadily against the setting aside of papal authority by a local church subjected to secular power; rare for his time and place, he upheld utter papal supremacy. A life of Wilfrid by his disciple Eddi was translated into English in 1927 by B. Colgrave.

Wilhelm (German personal name): see under William.

Wilhelmina, German in full WILHELMINE FRIEDERIKE SOPHIE (b. July 3, 1709, Berlin—d. Oct. 14, 1758, Bayreuth, Upper Franconia), sister of Frederick the Great of Prussia and margravine of Bayreuth (from 1735).

She shared the unhappy childhood of her brother, whose friend and confidante she remained most of her life. She married Frederick, hereditary prince of Bayreuth, in 1731; when he became margrave in 1735, the pair set about making Bayreuth a miniature Versailles. They rebuilt the Bayreuth palace and the Bayreuth opera house, as well as other structures, and founded the University of Erlangen. The Margravine made Bayreuth one of the intellectual centres of Germany, surrounding herself with a little court of wits and artists which gained added prestige from the occasional visits of Voltaire and Frederick the Great. With the outbreak of the Seven Years' War, Wilhelmina's interests shifted from dilettantism to diplomacy. She acted as eyes and ears for her brother in southern Germany until her death.

Wilhelmina, in full WILHELMINA HELENA PAULINE MARIA (b. Aug. 31, 1880, The Hague—d. Nov. 28, 1962, Het Loo, Neth.), queen of The Netherlands from 1890 to 1948, who, through her radio broadcasts from London during World War II, made herself the symbol of Dutch resistance to German occupation.

The daughter of King William III and his second wife, Emma of Waldeck-Pyrmont, Wilhelmina became queen on her father's death (Nov. 23, 1890) under her mother's regency. She was inaugurated Sept. 6, 1898, at Amsterdam's Nieuwe Kerk and soon gained widespread popular approval. On Feb. 7, 1901, she married Duke Henry of Mecklenburg-Schwerin and gave birth to a daughter, Princess Juliana, on April 30, 1909. During World War I, Wilhelmina was influential in maintaining The Netherlands' neutrality.

When Germany invaded The Netherlands on May 10, 1940, Wilhelmina issued a proclamation of to her nation of "flaming protest" and a few days later left for England with her family and members of the Cabinet. Throughout the war, she exhorted her people over Radio Orange to maintain their spirit until the nation's liberation, and she was welcomed back with enthusiasm when the German occupation was ended in 1945. After abdicating the throne to Juliana on Sept. 4, 1948, because of poor health, Wilhelmina retired to her palace, Het Loo, near Apeldoorn. Her memoirs, Eenzaam maar niet alleen (1959; Lonely but Not Alone, 1960), reveal the deep religious feeling that dominated her life.

Wilhelmina Gebergte, mountain range in central Suriname, forming part of South America's granitic Precambrian Guiana Shield, extending about 70 mi (113 km) from west to east. The range divides Suriname's western district of Nickerie from the eastern districts of Saramacca, Brokopondo, and Marowijne. The Wilhelmina Gebergte descends gradually into two lesser ranges of hills to the norththe Bakhuis Gebergte (west) and Emmaketen (east). To the south the range connects with the broad plateau formed by the Eilerts de Haan and Kayser ranges. The Wilhelmina Gebergte is itself a broad plateau region that reaches its highest point at Juliana Top (4,199 ft [1,280 m]). The terrain rises gradually from the coastal lowlands into grassland, becoming hilly and then densely forested with over 2,000 varieties of trees. The land on either side of the range is densely covered in tropical rain forest, exhibiting a profuse indigenous wildlife, including scarlet macaws, howler monkeys, and peccaries.

Wilhelmj, August (Emil Daniel Ferdinand Viktor) (b. Sept. 21, 1845, Usingen, Ger.—d. Jan. 22, 1908, London), German violinist whose most famous work is his arrangement of the air from Bach's orchestral Suite in D major, which became known as the "Air on the G Strine."

A prodigy, he gave his first concert at the age of nine in Wiesbaden. He studied with Ferdinand David at the Leipzig Conservatory from 1861 to 1863, and with Joachim Raff in Frankfurt in 1864. In 1865 he began his concert career, and eventually made a number of world tours. He was the concertmaster for the first performance of Wagner's *Ring* in Bayreuth in 1876. In 1885, at the invitation of the Sultan of Turkey, he played for the ladies of the Sultan's harem. He was appointed professor of music at the Guildhall School in 1894. Late in life, he became interested in the construction of violins.

Wilhelmshaven, city and port, Lower Saxony Land (state), northwestern Germany, on the Jadebusen, a North Sea inlet on the coast of Ostfriesland (East Frisia). Founded in 1853 by Wilhelm I on land bought by Prussia from Oldenburg, it was given its present name in 1869. In 1937 it was united with Rüstringen and returned to Oldenburg Land. As the principal naval base for the Prussian (later German) navy, it suffered heavy damage in World War II, and its naval installations were demolished or dismantled after 1945. A complete reorientation of its industry (formerly based on naval construction) followed. There is now an oil harbour connected by pipeline with Cologne, and industries include metalworking and the manufacture of machinery, equipment, and textiles. Wilhelmshaven is the site of the Max Planck Institute of Marine Biology, an ornithological station, a teachers' college, and institutes for geology, labour, politics, and economy. It is also a major tourist and health resort (mud baths). Pop. (1989 est.) 89,892.

Wilhelmus Rubruquis: see Willem van Ruysbroeck.

Wilkes, Charles (b. April 3, 1798, New York City—d. Feb. 8, 1877, Washington, D.C.), U.S. naval officer who explored the region of Antarctica named for him.

Wilkes entered the navy as a midshipman in 1818, became a lieutenant in 1826, and

in 1830 was placed in charge of the depot of instruments and charts from which the Naval Observatory and Hydrographic Office developed. From 1838 to 1842 he commanded an exploring and surveying expedition that took

him ultimately into the Antarctic Ocean and along the Antarctic barrier, where he reported land at a number of points in the region subsequently known as Wilkes Land. He visited islands in the Pacific, explored the West Coast of the United States, then recrossed the Pacific and reached New York in June 1842, having sailed completely around the world. He was advanced to the rank of commander in 1843. From 1844 to 1861 he prepared the report of his expedition, writing himself 7 of its 19 volumes.

Assigned to the "San Jacinto" during the U.S. Civil War (1861-65), Wilkes caused an international incident by stopping the British mail steamer "Trent" (Nov. 8, 1861) and removing two Confederate commissioners en route to Europe. His action was later disavowed by President Lincoln to avoid a break with Great Britain. Commissioned commodore in 1862, he commanded a squadron sent to the West Indies to protect U.S. commerce there. His actions brought protests of neutrality violations from several foreign governments, and he was court-martialled in 1864 for insubordination and conduct unbecoming an officer and suspended from duty. He was commissioned rear admiral, retired, on July 25, 1866.

Wilkes also wrote Western America, Including California and Oregon (1849); Voyage Around the World (1849); and Theory of the Winds (1856).

Wilkes, John (b. Oct. 17, 1725, London—d. Dec. 26, 1797, London), outspoken 18th-century journalist and popular London politician who came to be regarded as a victim of persecution and as a champion of liberty

John Wilkes, engraving from a manifesto commemorating his fight against general warrants and for the liberty of the press, 1768

By courtesy of the trustees of the British Museum; photograph, J.R. Freeman & Co. Ltd.

because he was repeatedly expelled from Parliament. His widespread popular support may have been the beginning of English Radicalism.

Early life. Wilkes was the second son of Israel Wilkes, a successful malt distiller. He was educated at an academy at Hertford and afterward privately tutored. His marriage on May 23, 1747, to Mary Meade, heiress of the manor of Aylesbury, brought him a comfortable fortune and an assured status among the gentry of Buckinghamshire.

A profligate by nature, Wilkes became a member of the congenial society of the "Medmenham Monks," members of the so-called Hell-Fire Club who met occasionally in the ruins of St. Mary's Abbey at Medmenham, Buckinghamshire, to indulge in debauchery and the performance of Black Masses. In 1754, at the suggestion of Earl Temple, Wilkes stood for election to Parliament for Berwick-upon-Tweed—unsuccessfully, despite his bribing a captain to land a shipload of opposition voters from London in Norway instead of at Berwick. In 1757, after an election campaign said to have cost him £7,000, much of it in bribes to voters, he was returned to Parliament for Aylesbury. Recklessly overspending, and ever deeper in debt, he hoped to retrieve his fortunes by political advancement.

The North Briton. In 1762, as author of a political newspaper, the North Briton, he began to give rancorous journalistic support to Earl Temple's campaign against the ministry of Lord Bute, not hesitating to evoke popular English hatred for the Scots and to write libellous innuendos about Bute's relations with George III's mother. His incitement of antiministerial feeling was partly responsible for Bute's decision to retire in April 1763. Temple, equally hostile to the new ministry formed by George Grenville, encouraged Wilkes to publish (April 23) the now famous "No. 45" of the North Briton, a devastating attack upon ministerial statements in the King's speech, which Wilkes described as false. The new ministers, anxious to rid themselves of so vituperative a critic, and encouraged by the King's personal animus against the traducer of his mother, instituted immediate proceedings against him. A general warrant (one that did not name the persons to be arrested) was issued. Forty-eight persons were seized in the search for evidence before Wilkes himself was arrested. He was thrown into the Tower of London, but a week later, to the public delight, Lord Chief Justice Pratt ordered his release on the ground that his arrest was a breach of parliamentary privilege. Wilkes and others instituted actions for trespass against the secretary of state, the Earl of Halifax, and his underlings that led to awards of damages and established the illegality of general warrants. Assuming his immunity, Wilkes prepared to continue his campaign. Asked by a French acquaintance how far liberty of the press extended in England, he said: "I cannot tell, but I am trying to find out."

Expulsion from Parliament. A second attack on him was now more carefully prepared by Wilkes's former friend in the Medmenham set, Lord Sandwich, now secretary of state, who planned to strip Wilkes of immunity from prosecution by ousting him from Parliament. The government secured from Wilkes's private press the proof sheets of "Essay on Woman," an obscene parody on Alexander Pope's "Essay on Man," which had been written by Wilkes and Thomas Potter years before. Wilkes had commenced, but not completed, printing 12 copies, probably for the "Monks." At the start of the parliamentary session in November 1763, the essay was read by Sandwich to the House of Lords, who voted it a libel and a breach of privilege. At the same time the Commons, on a government motion, declared "No. 45" a seditious libel. During the Christmas vacation Wilkes, recovering from a wound sustained in a duel provoked by exchanges in the House, stole off to Paris to visit his daughter and decided not to return to face prosecution. On Jan. 20, 1764, the ministers carried the motion for his expulsion from the Commons. In February he was tried in absentia and found guilty of publishing a seditious libel ("No. 45") and an obscene and impious libel (the "Essay"). Sentence was deferred pending his return, and in due course he was pronounced an outlaw for impeding royal justice.

The Middlesex elections. For the next four years Wilkes pursued a profligate career on the Continent, chiefly in Paris, vainly hop-

ing that a change of ministry would bring in friends who would secure him relief and advancement. The ministries of Rockingham, Chatham, and Grafton all failed him, and in 1767 his disappointments had led to a slashing attack on Chatham in his "Letter to the Duke of Grafton." Early in 1768, in desperation. his indebtedness making a longer stay in Paris unsafe, he staked all on the hazardous chance of securing reelection to Parliament and determined to stand for London as an opponent of the government in the name of public liberty. The ministers, perhaps unwisely, failed to arrange his immediate arrest. Though defeated in London, he was elected for Middlesex, amid a rising tide of popular antiministerial fervour. At the end of April he gave himself up to the authorities, and early in June his outlawry was reversed on a technical point. Then, waiving his privilege as a member of Parliament, he submitted to sentences totalling two years in jail and fines of £1,000 on the two charges on which he had been convicted in 1764.

Having made this gesture he wanted a pardon and restitution, and he was ready to bully the ministers if he did not get them. In the following months he published inflammatory squibs against their use of the military against rioters, and he attempted to reopen the whole question of his conviction by a petition to the Commons complaining of illegality in the proceedings against him. The ministers once more secured his expulsion from the Commons on Feb. 3, 1769. The popularity in the metropolis of his stand against the government ensured his reelection for Middlesex on February 16, and again on March 16 after a further expulsion, regardless of a Commons' resolution that he was incapable of being elected to serve in the present Parliament. After a last reelection, on April 13, the House declared his defeated opponent, Henry Luttrell, the duly elected member. Wilkes was finally expelled on inconclusive precedents and by a method undoubtedly fraught with danger to the constitution, since it set aside in the name of parliamentary privilege the right of the elector to choose his representative.

Career in London. Friends and sympathizers of Wilkes early in 1769 formed the Society for the Defence of the Bill of Rights to uphold his cause and pay his debts. During 1770 it became a political machine at his command. Shut out of Parliament he pursued his ambitions and his vendetta with the ministers in the City of London, becoming an alderman in 1769, sheriff in 1771, and lord mayor in 1774. It may be that expediency rather than principle made him embrace the radical program adopted in 1771 by the Bill of Rights men, which called for shorter Parliaments, a wider franchise, and the abolition of aristocratic "pocket boroughs." In 1771 he successfully exploited the judicial privileges of the city to prevent the arrest for breach of privilege of printers who reported parliamentary debates. As a magistrate of the city he frequently showed himself to be conscientious and enlightened, though he remained characteristically irresponsible in financial matters. Reelected for Middlesex in 1774, after pledg-

Reelected for Middlesex in 17/4, after pledging himself to the radical program, he spoke on a number of occasions against the American Revolutionary War and once (1776) in support of parliamentary reform. He soon acquired a reputation for insincerity and was reported to have admitted that his speeches against the ministers were solely to retain his popularity in London. From about 1779 his popularity noticeably waned. In 1780, during the Gordon Riots against Roman Catholics, he took firm action to put down the rioters, from whom a few years before he had been glad to receive support. In Middlesex he re-

mained popular, being reelected on his radical platform in 1780 and in 1784. In 1782 the expunging from the Commons journals of the resolution of 1769 against him vindicated his defense of the rights of parliamentary electors. After 1784 the issues that had made him popular were cold, his fire was spent, and in 1790 he found so little support in Middlesex that he declined to fight the election. He died in London in 1797.

Character. Wilkes was extremely ugly, with a hideous squint, but had a charm that carried all before it. He boasted that it "took him only half an hour to talk away his face' and would declare that "a month's start of his rival on account of his face" would secure him the conquest in any love affair. He had a gift for the bon mot: once during his fight with George III's government, when invited to make up a table at cards, he replied: "Do not ask me, for I am so ignorant that I cannot tell the difference between a king and a knave." Sandwich's laughing assertion that Wilkes would die either of the pox or on the gallows brought the lightning response: "That depends, my lord, whether I embrace your mistress or your principles." When one of his city associates lost patience and declared in a rage, "I'll be your butt no longer"—"With all my heart," said Wilkes, "I never like an empty one." Loaded often with malice, his jokes told against his enemies but also lost him friends. As an opposition journalist and pamphleteer he was hard-hitting and incisive, but he lacked either voice or talent for debate in the House of Commons. His real achievement lay in extending the liberties of the press. His challenge led to the court findings that general warrants as hitherto used by government against the press were illegal, and he effectively destroyed the power of the Houses of Parliament to exact retribution for the reporting of parliamentary debates. (I.R.C.)

Chenevix Trench, Portrait of a Patriot (1962), add etails. All are defective in understanding of the political background, on which see: G.F.E. Rude, Wilkes and Liberty: A Social Study of 1763 to 1774 (1962); and I.R. Christie, Wilkes, Wyvill and Reform: The Parliamentary Reform Movement in British Politics, 1760–1785 (1962).

Wilkes-Barre, city, seat (1786) of Luzerne County, northeastern Pennsylvania, U.S., in the Wyoming Valley, on the Susquehanna River, 18 mi (29 km) southwest of Scranton. It is the hub of a metropolitan district embracing about 30 contiguous municipalities. Permanent settlement began in 1769 when Maj. John Durkee, a veteran of the French and Indian Wars, settled a band of Connecticut colonists in the Wyoming Valley under grants issued by the Susquehanna Company. He named the town after John Wilkes and Isaac Barré, British politicians who were defenders of the American colonies in Parliament. The community survived two major threats to its existence: (1) the Pennamite-Yankee Wars, fought (1769-84) between Pennsylvania and Connecticut settlers over rival land claims, and (2) conflicts with the Tories and Iroquois Indians during the Revolution, which culminated in the slaughter of settlers in the Wyoming Massacre (July 3, 1778). The punitive expedition of 1779, led by Gen. John Sullivan against the Iroquois, was formed at Wilkes-Barre. Further trouble between warring settlers occurred, but by 1805 Connecticut had relinquished all its claims. Major growth of the community came with the development of the coal industry in the early 19th century, which brought transportation facilities and an influx of European immigrants. Coal mining waned from the 1930s, and the city developed a highly diversified economy with manufactures including footwear, pencils, glass, boilers, furniture, toys, steel fabrications, airplane parts, and electronic equipment. It is the seat of Wilkes (1933) and King's (1946) colleges, College Misericordia (1924), and the Wilkes-Barre campus of Pennsylvania State University (1916). Tablets mark the sites of Ft. Wilkes-Barre, Forty Fort, and the Wyoming Massacre. Harvey Lake and Pocono mountain resorts are nearby. A flooding of the Susquehanna in 1972 resulted in widespread property damage. Inc. borough, 1806; city, 1871. Pop. (1980) 51,551; (1982 est.) Scranton-Wilkes-Barre metropolitan area (smsa), 727,200.

Wilkes Land, region in Antarctica, bordering the Indian Ocean between Queen Mary and George V coasts (100°-142°20′ E). The region is almost entirely covered by a featureless ice cap averaging from 6,000 to 9,500 ft (1,800 to 2,900 m) above sea level. First sighted (1838-42) by the U.S. Naval commander Charles Wilkes, after whom the land is named, it was not explored until the late 1940s. Included in the region are the coasts of Clarie, Banzare, Sabrina, Budd, and Knox, all claimed by Australia, and Adélie Coast, claimed by France. Australia, France, and the United States maintain stations along the Wilkes Land coasts.

Wilkie, Sir David (b. Nov. 18, 1785, Cults, Fife, Scot.—d. June 1, 1841, at sea near Gibraltar), British genre and portrait painter and printmaker known for his anecdotal style.

Wilkie, who had studied in Edinburgh, entered the Royal Academy schools in London in 1805, exhibited there from 1806, and was elected royal academician in 1811. His first important painting, "Pitlessie Fair" (1804; National Gallery of Scotland, Edinburgh), was a genre picture in the Dutch manner owing much to the works of David Teniers the Younger and Adriaen van Ostade. It set the style that Wilkie was to pursue for the next 20 years, raising genre painting in Great Britain to a level usually associated with historical painting. His genre pictures achieved such success that the "Chelsea Pensioners Reading the Gazette of the Battle of Waterloo," when exhibited in the Royal Academy exhibition of 1822, had to be protected by barriers from the crowds of admirers.

A crucial change in his style occurred in 1825–28, when for reasons of health he visited Italy, Germany, Switzerland, and Spain. Particularly impressed by the Spanish painters Velázquez and Murillo, he developed a broader and bolder style and a stronger use of colour. This second manner was regretted by many of his contemporaries including his friend the painter and writer Benjamin Haydon.

Wilkie succeeded Sir Thomas Lawrence as painter to the king in 1830 and was knighted in 1836. In 1840 he visited the Holy Land to discover the true background to religious painting, thereby anticipating William Holman Hunt. He died on the return journey, and his burial at sea is commemorated in J.M.W. Turner's "Peace: Burial at Sea."

Wilkins, Sir George Hubert (b. Oct. 31, 1888, Mount Bryan East, South Australia, Australia—d. Dec. 1, 1958, Framingham, Mass., U.S.), Australian-born British explorer who advanced the use of the airplane and pioneered the use of the submarine for polar research

An early aviator, Wilkins accompanied explorer-ethnologist Vilhjalmur Stefansson in the Canadian Arctic (1913–16), was second in command of the British Antarctic expedition to Graham Land (1920–21), and also was naturalist on Sir Ernest Shackleton's last Antarctic expedition (1921–22). In 1926 he began a series of trial flights to test the feasibility of air exploration of the then unknown Arctic region north of Point Barrow, Alaska.

Sir George Wilkins BBC Hulton Picture Library

On April 16, 1928, he and his copilot flew over unknown seas from Point Barrow to the Svalbard (Spitsbergen) archipelago north of Norway, completing the 2,100-mile (3,400-kilometre) journey in 20½ hours. For this feat he was knighted. In the Antarctic (December 1928), he flew 600 mi south from Deception Island, across Graham Land, and discovered several new islands. In 1931 he took the U.S. submarine "Nautilus" and navigated it under the Arctic Ocean to latitude 82°15′ N. He was manager of Lincoln Ellsworth's U.S. Antarctic expedition (1933–39) and subsequently acted as consultant and geographer to the U.S. armed services.

Wilkins, Mac (b. Nov. 15, 1950, Eugene, Ore., U.S.), U.S. world-record-holding discus thrower (1976–78). He was the first man ever to break the 70-metre barrier.

Wilkins took part during his college years (1969–73) at the University of Oregon (Eugene) in all weight-throwing events—discus, hammer throw, shot put, and javelin—which earned him the nickname "Multiple Mac." In 1973 he won the Amateur Athletic Union (AAU) championship in the discus and was second in 1974 and 1975.

Wilkins set the world record in May of 1976 and a week later, in June, broke his own record three times, the farthest throw being 70.86 m (232 ft 6 in.). In the 1976 Olympic Games at Montreal he won the gold medal, after which he denounced the U.S. Olympic Committee (Usoc) for having tried to force him to live in the Olympic Village during the week before competition. He later criticized the AAU and Usoc for failing to recognize the importance of medical research in athletic performance and to provide adequate coaching and support for postgraduate athletes. His criticisms were supported by a report of the President's Commission on Olympic Sports in 1977.

In 1980 Wilkins' form seemed as good as ever, and he achieved a throw of 70.98 m (233 ft), then the second furthest ever. The U.S. boycott of the Olympic Games that year (in protest of the Soviet invasion of Afghanistan) prevented him from defending his title.

Wilkins, Mary Eleanor (writer): see Freeman, Mary Eleanor Wilkins.

Wilkins, Maurice (Hugh Frederick) (b. Dec. 15, 1916, Pongaroa, N.Z.), New Zealand-born British biophysicist whose X-ray diffraction studies of deoxyribonucleic acid (DNA) proved crucial to the determination of DNA's molecular structure by James Watson and Sir Francis Crick. For this work the three scientists were jointly awarded the 1962 Nobel Prize for Physiology or Medicine.

Wilkins, the son of a physician (who was originally from Dublin), was educated at King Edward's School, Birmingham, Eng., and St. John's College, Cambridge. After research into the luminescence of solids at Birmingham University, he participated for two years during World War II in the Manhattan Project at the University of California, Berkeley, work-

ing on mass spectrograph separation of isotopes for use in the atomic bomb.

Üpon his return to Great Britain, Wilkins lectured at St. Andrews University, Scotland. In 1946 he joined the Medical Research Council's Biophysics Unit at King's College, London; in 1955 he became its deputy director. From 1970 to 1980 he served as the unit's director (during this time the unit's name was changed twice, first to the Neurobiology Unit, then to the Cell Biophysics Unit). There he began the series of investigations that led ultimately to his X-ray diffraction studies of DNA. He received the Albert Lasker Award from the American Public Health Association in 1960. At King's College proper, Wilkins was pro-

At King's College proper, Wilkins was professor of molecular biology, 1963–70; of biophysics, 1970–81; and emeritus professor, thereafter. While there he published important literature on light microscopy techniques for cytochemical research. His concern lest scientific advance get out of hand is reflected in his presidency of the British Society for Social Responsibility in Science (1969) and his membership (from 1981) of the Russell Committee Against Chemical Weapons.

Wilkins, Roy (b. Aug. 30, 1901, St. Louis, Mo., U.S.—d. Sept. 8, 1981, New York City), U.S. civil-rights leader who served as the executive director (1955–77) of the National Association for the Advancement of Colored People (NAACP). He was often referred to as the senior statesman of the U.S. Civil Rights Movement.

After graduation from the University of Minnesota, Minneapolis (1923), Wilkins became a reporter and later managing editor of the Kansas City Call, a newspaper serving the black community. Joining the staff of the NAACP in 1931, he edited its official publication, The Crisis, between 1934 and 1949 and simultaneously directed the NAACP antidiscrimination program across the United States. In 1949-50 he was chairman of the National Emergency Civil Rights Mobilization, an organization composed of more than 100 local and national groups.

Appointed to the NAACP's highest administrative post during a period of racial turbulence and mass protest, Wilkins directed the organization on a course that sought equal rights through legal redress. In August 1963 he helped organize and later addressed the historic civil rights March on Washington. Devoted to the principle of nonviolence, he rejected racism in all its forms, including black separatism. Nevertheless, the pressure of activist groups prompted the NAACP, under his leadership, to diversify its activities to include nonviolent direct action and to extend legal aid to other, frequently more militant, groups.

In 1968 Wilkins served as chairman of the U.S. delegation to the International Conference on Human Rights. Among his many honours were the U.S. Medal of Freedom (1968) and the Joseph Prize for Human Rights (1975). He was made director emeritus of the NAACP in 1977.

Wilkinson, Sir Geoffrey (b. July 14, 1921, Todmorden, Yorkshire, Eng.), British chemist, joint recipient with Ernst Fischer of the Nobel Prize for Chemistry in 1973 for work in organometallic chemistry.

After studying at the Imperial College of Science and Technology, University of London, Wilkinson worked with the Atomic Energy Project in Canada from 1943 to 1946. He aught at the University of California, Berkeley (1946–50), the Massachusetts Institute of Technology (1950–51), and Harvard University (1951–55) before returning to the University of London in 1956. His research on metal-to-hydrogen bonding, particularly his discovery of chlorotris, a homogeneous hydrogenation catalyst for alkenes often called Wilkinson's catalyst, had widespread signifi-

cance for organic and inorganic chemistry and proved to have important industrial applications. He was knighted in 1976.

Wilkinson, James (b. 1757, Calvert County, Md., U.S.—d. Dec. 28, 1825, Mexico City), U.S. soldier and adventurer, a double agent whose role in the Aaron Burr conspiracy still divides historians. Wilkinson served in the U.S. War of Independence (1775–83) as adjutant general under Gen. Horatio Gates (1777–78). In 1784 he settled in Kentucky, where he was active in the movement for independent statehood. In 1787 he took an oath of allegiance to Spain and began intrigues to bring the western settlements of Kentucky under the influence of the Louisiana authorities. Until

1800 he received a Spanish pension and was officially known as "Number Thirteen."

At the same time, however, he worked against the Spaniards. In October 1791 he was given a lieutenant colonel's commission in the U.S. Army and after the U.S. purchase of Louisiana he became governor of that portion of the territory above the 33rd parallel.

In his double capacity as governor of the territory and commanding officer of the army, he attempted to realize his ambition to conquer the Mexican provinces of Spain and perhaps set up an independent government. In an agreement with Aaron Burr he sent Zebulon M. Pike in 1806 to explore the most favourable route for the conquest of the Southwest. Wilkinson, however, betrayed Burr's plan to Pres. Thomas Jefferson, reached an agreement with the Spaniards to neutralize the Texas frontier, placed New Orleans under martial law, and apprehended Burr. In the ensuing trial (for treason) at Richmond, Va., Burr was found not guilty. Wilkinson himself was under suspicion and subjected to a series of courts-martial and congressional investigations. Nevertheless, he succeeded so well in hiding traces of his duplicity that in 1812 he resumed his command at New Orleans and in 1813 was promoted to the rank of major general. Later in the same year, by making a fiasco of the campaign against Montreal, he finally brought his military career to a dishonourable end. He obtained a Texas land grant shortly before he died in Mexico City. A comprehensive biography is T.R. Hay and M.R. Werner, The Admirable Trumpeter: A Biography of James Wilkinson (1941).

Wilkinson, John (b. 1728, Clifton, Cumberland, Eng.—d. July 14, 1808, Bradley, Staffordshire), British industrialist known as "the great Staffordshire ironmaster" who found new applications for iron and who devised a boring machine essential to the success of James Watt's steam engine.

James Watt's steam engine.
At the age of 20 Wilkinson moved to Staffordshire and built Bilston's first iron furnace. It was at his father's factory at Bersham,

Denbigh, Wales, that he constructed his new machine (1775) that could bore engine cylinders and cannon barrels with unequalled ac-

curacy. Its precision enabled Watt to perfect his steam engine. Wilkinson, in turn, used the first steam engine built by Watt and James Moulton to drive a large air pump in his large-scale manufacture of wrought iron at Broseley, Shropshire. His works supplied many of the castings used by Abraham Darby III, who in 1779 completed an iron bridge of historical significance across the Severn at Broseley.

Another Wilkinson innovation (1787) was an iron-hulled barge—a sensation at the time—to transport the heavy ordnance he was manufacturing for the government. Wilkinson taught the French how to bore cannon from solid castings; and he cast all the tubes, cylinders, and ironwork required for the Paris waterworks. Fittingly, he was buried in a cast-iron coffin of his own design.

will, also called TESTAMENT, legal means by which an owner of property disposes of his assets in the event of his death. The term is also used for the written instrument in which the testator's dispositions are expressed. There is also an oral will, called a nuncupative will, valid only in certain jurisdictions, but otherwise often upheld if it is considered a death-bed bequest.

A will is valid if it meets the formalities of the law, which usually, but not always, requires that it be witnessed. The advantage of having a will drawn by an attorney arises from his knowledge of what the law requires. A holograph will, for example, which is usually unwitnessed, is an instrument wholly written in the handwriting of the signer, and it may be accepted as legally binding upon the law to carry out its dispositions, barring the findings of anything that could render it invalid. A will may be considered invalid if, among other instances, the testator was mentally incapable of disposing of his property; if the will imposed unreasonable or cruel demands as a condition of inheritance; or if the testator did not have clear title to the bequeathed assets. Business partners often draw up "mutual wills" involving transfer of business assets upon the death of one partner. See also probate.

Willading, Johann Friedrich (b. 1641—d. Dec. 5, 1718), Swiss statesman who played a significant role in securing the transfer of the principality of Neuchâtel to the Prussian House of Hohenzollern (1707).

Descended from a Bernese patrician family, Willading had, by 1694, become the leader of Bern's anti-French party and for several years helped to secure asylum for fugitive French Huguenots. Between 1694 and 1707 he directed Bernese policy in the question of the

Neuchâtel succession, opposing the interests of France as represented by the claims of the Prince of Conti upon the principality. Before the adjudicating body, the "Tribunal of the Three Estates," and with widespread Swiss Protestant support, he successfully pressed the claims of King Frederick I of Prussia. Willading was frequently charged with diplomatic missions and regularly represented his canton in the Swiss Confederation Diet. During the last 10 years of his life, he served as Schultheiss (chief magistrate) for Bern.

Willaert, Adriaan (b. c. 1490, Bruges, Flanders?—d. Dec. 8, 1562, Venice), Flemish composer who contributed significantly to the development of the Italian madrigal, and who established Venice as one of the most influential musical centres of the 16th century.

Willaert studied law at the University of Paris but abandoned this in favour of music, studying with the composer Jean Mouton. In 1527 he became music director of St. Mark's, Venice, where he created a school that attracted musicians from all over Europe. His students included de Rore, Zarlino, and Andrea Gabrieli.

Willaert's madrigals show a gradual synthesis of the contrapuntal style of the Franco-Netherlandish school and the growing Italian emphasis on harmonic colour and expressiveness. His chansons reflect a similar development.

Adriaan Willaert, detail of a woodcut, 1559; in the Bayerische Staatsbibliothek, Munich

By courtesy of the Bayerische Staatsbibliothek. Munich

As a composer of sacred music he is known primarily for his motets. Probably inspired by the two opposing choir lofts at St. Mark's, he developed a style of polyphony in which two four-part choirs sing alternately, but occasionally combine in an eight-part section. This led directly to the polychoral writing that characterized Venetian music in the second half of the 16th century. Willaert was also one of the earliest composers to write purely instrumental works: canzoni, ricercari, and fantasies for organ and for instrumental ensembles.

Willamette River, river formed by the confluence of the Coast and Middle forks southeast of Eugene in western Oregon, U.S. It flows northward for 183 mi (295 km) past Corvallis, Albany, Salem, and Oregon City into the Columbia River near Portland. It is navigable downstream by steamer to Eugene. The drainage basin extends between the Cascade Range on the east and other Pacific Coast ranges on the west, forming the 30-mi-wide Willamette Valley, which holds the state's most populous cities. Tributaries have many dams, which regulate the flow of water for flood control and navigation and supply hydroelectric power to the region.

An eight-month growing season, an annual rainfall of 40 in. (1,000 mm), and a variety

of soils produce a diversity of more than 100 crops, with fruit growing, truck gardening, and dairying being the most important agricultural activities. The region also benefits from use of the extensive lumber resources found in the surrounding national forests: Willamette, Mt. Hood (east), and Siuslaw (west). The name Willamette is of uncertain Indian origin and meaning.

Willard, Emma, née HART (b. Feb. 23, 1787, Berlin, Conn., U.S.—d. April 15, 1870, Troy, N.Y.), U.S. educator whose work in women's education spurred the establishment of high schools for girls and of women's colleges and coeducational universities.

In 1807 Willard became principal of a girls' academy at Middlebury, Vt., and in 1814 she opened a boarding school of her own. Her "Plan for Improving Female Education" (1819), first addressed to the New York state legislature, was an appeal for state aid in founding schools for girls and for educational equality for women. It was rejected by the legislature but found favour with Gov. De Witt

Clinton, who invited her to move her school to Waterford, N.Y. In 1821 the school was moved to Troy, which had offered a building and grounds, and was named the Troy Fe-

male Seminary (now called the Emma Willard School). In 1854, with the educator Henry Barnard, she represented the United States at the World's Educational Convention in London. She was the author of several widely used textbooks and a volume of poems.

Willard, Frances (Elizabeth Caroline) (b. Sept. 28, 1839, Churchville, N.Y., U.S.—d. Feb. 18, 1898, New York City), U.S. educator, reformer, and founder of the World's Woman's Christian Temperance Union (1883). An excellent speaker, a successful lobbyist, and an expert in pressure politics, she was a leader of the national Prohibition Party.

Frances Willard

By courtesy of the National Woman's Christian
Temperance Union, Evanston

She was a teacher after graduation from the Northwestern Female College, Evanston, Ill., in 1859. In 1871 she became president of the new Evanston College for Ladies. When that school was absorbed by Northwestern University in 1873, she was appointed dean of women, a post she resigned in 1874 to become corresponding secretary of the newly founded National Woman's Christian Temperance Union (WCTU). From 1879 until her death she served as president of the national organization. She was also the first president of the worldwide WCTU. In addition to temperance, she advocated woman suffrage and safety codes for women in industry.

Willard, Jess (b. Dec. 29, 1881, Pottawatomie County, Kan., U.S.—d. Dec. 15, 1968, Los Angeles), U.S. prizefighter, world heavyweight boxing champion from April 5, 1915, when he knocked out Jack Johnson in 26 rounds in Havana, to July 4, 1919, when he was knocked out by Jack Dempsey in three rounds in Toledo, Ohio.

A wheat farmer in Kansas, Willard, at a

A wheat farmer in Kansas, Willard, at a comparatively advanced age, entered professional boxing in the "White Hope" era, when promoters were seeking white contenders for the title held by Johnson, a black who was the focus of much racial animosity. At 6 feet 6 ¹/₄ inches, Willard was the tallest man to win the heavyweight championship.

Willard was not an active champion, defending the title successfully against Frank Moran (another leading "White Hope") in 1916, and subsequently fighting only a few exhibition matches until his bout with Dempsey. Aged 37, and not well trained, he was an easy mark for Dempsey's furious attack.

for Dempsey's furious attack. In 1923, at the age of 41, Willard returned to the ring. He scored one knockout and then fought well against the powerful Luis Angel Firpo before being knocked out in the eighth round. From 1911 to 1923 Willard had 36 bouts, winning 24, 20 by knockouts.

Willard, Simon (b. April 3, 1753, Grafton, Mass., U.S.—d. Aug. 30, 1848, Roxbury, Mass.), U.S. clockmaker, creator of the timepiece that came to be known as the banjo clock, and a member of a Massachusetts family of clockmakers designing and producing brass-movement clocks from 1765 to 1850.

Around 1780 Willard moved from Grafton,

On Feb. 8, 1802, Willard patented a spring-driven, pendulum clock housed in a case having a round top portion bearing the dial, an elongated central portion curving inward, and a rectangular base. It is possible that the shape of the case inspired the term banjo clock, a name Willard did not use.

Other items patented by Willard include a device for roasting meat, operated by a clock mechanism (1784), and an alarm clock (1819).

Willard's brother Benjamin (1743–1803) began manufacturing clocks in Grafton c. 1765 and was known for the quality of his tall-case clocks (a style later called grandfather clock). Another brother, Ephraim (1755–1805), apparently worked with Benjamin. The youngest brother, Aaron (1757–1844), also a clockmaker, worked in Roxbury until 1790, when he established a prosperous business in Boston, producing various types of clocks, including banjo styles usually having painted lower panels.

Simon's business was continued for several years by his son, Simon, Jr. (1795–1881). Aaron's son, also named Aaron (1783–1864), worked as a clockmaker until about 1850.

Willcocks, Sir William (b. Sept. 27, 1852, India—d. July 28, 1932, Cairo), British civil engineer who proposed and designed the first Aswān (Assuan) Dam and executed major irgation projects in South Africa and Turkey. In 1872 he entered the Indian Public Works Department and in 1883 began work in the Egyptian Public Works Department. While serving as director general of reservoirs for Egypt, he completed studies and plans on the Aswān Dam, which was completed in 1902.

Willcocks retired from his Egyptian post in 1897 and four years later went to South Africa to plan irrigation systems for the arid regions. Part of his scheme was implemented and brought him a knighthood. He became head of irrigation for the Turkish government and in 1911 proposed a plan to bring water to the area of ancient Chaldea, now southern Iraq. As a result, the Hindiyah Barrage was built on the Euphrates River, near the site of ancient Babylon, and 3,500,000 acres were brought under irrigation.

Wille, Ulrich (b. April 5, 1848, Hamburg—d. Jan. 31, 1925, Meilen, Switz.), Swiss military leader and commander in chief of the Swiss Army during World War I who made major federal military reforms.

Wille studied the organization of the Prussian Army in Berlin and attempted various changes in the federal army along Prussian lines. He reorganized the process of recruit instruction and in 1881, while a lieutenant colonel, undertook the reform of the cavalry, subsequently publishing a new cavalry code (1892). The "Wille spirit" was often publicly attacked, however, and, when a military law favoured by him failed to win popular support (1895), he resigned his recently acquired positions as head and chief instructor of the army. In 1900, however, he resumed active service. At the outbreak of World War I, he was-in an act of doubtful constitutionality (August 1914)—named general and appointed commander in chief of the Swiss Army and directed the occupation of the frontiers until the war's end. He is generally credited with having replaced the old tradition of the Swiss citizens' army with the concept of strict military duty and discipline.

Willem (Dutch personal name): see under William, except as below.

Willem VAN RUYSBROECK, Latin WILHELMUS RUBRUQUIS, English WILLIAM OF RUBROUCK (b. c. 1215—d. c. 1295), French Franciscan friar whose eyewitness account of the Mongol realm is generally acknowledged to be the best written by any medieval Christian traveller. A contemporary of the English scientist and philosopher Roger Bacon, he was cited frequently in the geographical section of Bacon's Opus majus.

Willem was probably from the village of Rubrouck, near Saint-Omer, Fr. In 1253 King Louis IX of France (St. Louis), who was then at Acre, Palestine, dispatched him on an informal mission to the Mongol Empire. Departing from Constantinople on May 7, 1253, he and his party reached the Crimean town of Sudak. There they secured oxen and carts for their long trek across the steppes to the encampment of Batu Khan, the Mongol ruler of the Volga River region. Following their arrival five weeks later, they were ordered to begin a journey of some 5,000 miles to the court of the Great Khan at Karakorum in central Mongolia.

The Christians set off on horseback on Sept. 16, 1253, their route taking them north of the Caspian and Aral seas to the Talas River, to the Cailac Valley, and to the great plains of Mongolia, and came upon the Great Khan's camp, which lay about 10 days' journey south of Karakorum.

Willem and his companions were received courteously and remained with the Khan until about July 10, 1254. They followed a more northerly route on their outward journey, reaching Tripoli on Aug. 15, 1255, where they found that King Louis had returned to France in 1254.

Willem wrote about his Mongolian experiences for the French king. His narrative is free from legend and shows him to have been an intelligent and honest observer. Nothing is known about his later life, except that he was alive when Marco Polo returned from the East in 1295. After Bacon's copious use of the narrative, it was neglected, though five manuscripts survive. One copy was imperfectly reproduced by Richard Hakluyt in 1598 and 1599. A more recent Hakluyt Society edition is The Journey of William of Rubruck to the Eastern Parts of the World, 1253–55... (1900), prepared by W.W. Rockhill.

Willem Lodewijk (Dutch statesman): see William Louis.

Willem Pretorius Game Reserve, game sanctuary in Orange Free State, South Africa, adjoining Allemanskraal Dam northeast of Bloemfontein. Established in 1956, it occupies 46 sq mi (120 sq km) in the Highveld plateau typical of the Orange Free State. It includes the Doringberg hills, a storage reservoir above the dam, and many deep ravines. The reserve is particularly known for its herds of black wildebeest; other wildlife include the white rhinoceros, giraffe, zebra, red hartebeest, impala and other antelopes, and varied birdlife. Recreational facilities have been developed.

willemite, white or greenish-yellow silicate mineral, zinc silicate, $Z_{n_2}SiO_4$, that is found as crystals, grains, or fibres with other zinc ores in many deposits. Included are various localities in Sussex County, N.J., where it occurs in crystalline limestone and constitutes an important zinc ore; it was worked at Nutley for more than 100 years before the reserve was exhausted in 1954. Occurrences outside the United States include Belgium, Algeria,

South West Africa/Namibia, and Greenland. Its brilliant green fluorescence led to its use in early television tubes. For detailed physical properties, *see* silicate mineral (table).

Willems, Jan Frans (b. March 11, 1793, Boechout, Brabant, Austrian Netherlands—d. June 24, 1846, Ghent), Flemish poet, playwright, essayist, polemicist, and the most important philologist of the Dutch language of his time.

Willems was appointed assistant city archivist of Antwerp in 1815 and registrar in 1821. During these years he also wrote plays, poems, and essays in the style of the rederijkers ("rhetoricians") and began his work as a philologist. His Verhandeling over de nederduytsche tael- en letter-kunde. . . (2 vol., 1819; 1820-24), is a milestone in the history of literary studies in The Netherlands. He published a modern Flemish translation of the 13th-century Van den vos Reinaerde ("Reynard the Fox") with an epoch-making introduction (1834), followed by a scholarly edition (1836), which won him fame abroad. In 1835 he moved to Ghent, where he became active as a scholar and leader of the Flemish national and Romantic revival. Among other activities, he founded the periodical Belgisch museum (1837–46), a repository of information on medieval Flanders.

Willemstad, chief town of Curaçao and capital of the Netherlands Antilles (q.v.) in the Caribbean Sea, on the southern coast in the southeastern corner of Curaçao. It is divided into two parts by the Sint Anna Baai (Saint Anne Bay) leading to Schottegat Harbour. The two halves, Punda and Otrabanda (Other Side), are joined by the Koningin Emma Brug, or Queen Emma Pontoon Bridge, built in 1888. A fixed bridge was completed in 1974.

The town has many Dutch-style gabled houses. Important buildings include Ft. Amsterdam, which once guarded the entrance to Schottegat Harbour and is now the seat of government; the Dutch Reformed Church (1769); and the Mikve Israel Synagogue (1732), the oldest in the Western Hemisphere. There is also an old slave market and the Curaçao Museum. Pop. (1970 est.) 50,000.

willet (Catoptrophorus semipalmatus), large, long-billed shorebird of America, belonging to the family Scolopacidae (order Charadri-iformes), which also includes the snipes, turn-stones, and curlews. The willet is named for its loud call. Willets are about 40 centimetres (16 inches) long and gray, with striking black and white wings. With the wings closed, they resemble the greater yellowlegs. Once a declining species, willets have revived under protection of their breeding places, around ponds, from southwestern Canada to Colorado and south to Mexico, and from Nova Scotia to

Willet (Catoptrophorus semipalmatus) Alice B. Kessler

Florida and the West Indies. In winter, willets are found on seacoasts from California and the Carolinas to Peru and French Guiana.

AQUITAINE

• William IX (b. Oct. 22, 1071—d. Feb. 10, 1127, Poitiers, Fr.), medieval troubadour, count of Poitiers and duke of Aquitaine and of Gascony (1086-1127), son of William VIII and grandfather of the famous Eleanor of Aquitaine.

William IX spent most of his life in warfare, including leading an unsuccessful Crusade to the Holy Land (1101–02) and battling the Moors near Cordova (1120–23). His fame rests chiefly, however, on his being the first poet in the Provençal language whose works have come down to us. His chansons, or songs, are boisterous, amorous, humorous, usually delicate but sometimes coarsely obscene and tend, in the fashion of courtly love, to idolize one's lady love.

• William X (b. 1099, Toulouse, Fr.—d. April 9, 1137, Santiago de Compostela, Spain), duke of Aquitaine and of Gascony (1127-37), son of William IX.

In 1131 he recognized the antipope Anaclet and supported him until 1134. In 1136 he ravaged Normandy. The following year he went on a pilgrimage to Santiago de Compostela in Galicia, where he died. His daughter, Eleanor of Aquitaine, inherited all his lands and, first, through her marriage to Louis VII of France, united Aquitaine with the Capetian line and, then, through her marriage to Duke Henry of Normandy (the future Henry II of England) united Aquitaine to the Plantagenet line.

ENGLAND, GREAT BRITAIN, UNITED KINGDOM

• William I, byname WILLIAM THE CON-QUEROR, OF THE BASTARD, OF WILLIAM OF NORMANDY, French GUILLAUME LE CON-QUÉRANT, OF LE BÂTARD, OF GUILLAUME DE NORMANDIE (b. c. 1028, Falaise, Normandyd. Sept. 9, 1087, Rouen), duke of Normandy (as William II) from 1035 and king of England from 1066, one of the greatest soldiers and rulers of the Middle Ages. He made himself the mightiest feudal lord in France and then changed the course of England's history by his conquest of that country.

Early years. William was the elder of two children of Robert I of Normandy and his concubine Herleva, or Arlette, the daughter of a burgher from the town of Falaise. In 1035 Robert died when returning from a pilgrimage to Jerusalem, and William, his only son, whom he had nominated as his heir before his departure, was accepted as duke by the Norman magnates and his feudal overlord, King Henry I of France. William and his friends had to overcome enormous obstacles. His illegitimacy (he was generally known as the Bastard) was a handicap, and he had to survive the collapse of law and order that accompanied his accession as a child.

Three of William's guardians died violent deaths before he grew up, and his tutor was murdered. His father's kin were of little help; most of them thought that they stood to gain by the boy's death. But his mother managed to protect William through the most dangerous period. These early difficulties probably contributed to his strength of purpose and his dislike of lawlessness and misrule.

Ruler of Normandy. By 1042, when William reached his 15th year, was knighted, and began to play a personal part in the affairs of his duchy, the worst was over. But his attempts to recover rights lost during the anarchy and to bring disobedient vassals and servants to heel inevitably led to trouble. From 1046 until 1055 he dealt with a series of baronial rebellions, mostly led by kinsmen. Occasionally he was in great danger and had to rely on Henry of France for help. In 1047 Henry and William defeated a coalition of Norman rebels at Val-ès-Dunes, southeast of Caen. It was in these years that William learned to fight and rule.

William soon learned to control his youthful recklessness. He was always ready to take calculated risks on campaign and, most important, to fight a battle. But he was not a chivalrous or flamboyant commander. His plans were simple, his methods direct, and he exploited ruthlessly any advantage gained. If he found himself at a disadvantage, he withdrew immediately. He showed the same qualities in his government. He never lost sight of his aim to recover lost ducal rights and revenues, and, although he developed no theory of government or great interest in administrative techniques, he was always prepared to improvise and experiment. He seems to have lived a moral life by the standards of the time, and he acquired an interest in the welfare of the Norman church. He made his half brother, Odo, bishop of Bayeux in 1049 at the age of about 16, and Odo managed to combine the roles of nobleman and prelate in a way

William I the Conqueror (centre), detail from the Bayeux Tapestry, 11th century; in the Broderie-Tapisserie de Bayeux, Bayeux, Fr.

that did not greatly shock contemporaries. But William also welcomed foreign monks and scholars to Normandy. Lanfranc of Pavia, a famous master of the liberal arts, who entered the monastery of Bec about 1042, was made abbot of Caen in 1063

According to a brief description of William's person by an anonymous author, who borrowed extensively from Einhard's Life of Charlemagne, he was just above average height and had a robust, thick-set body. Though he was always sparing of food and drink, he became fat in later life. He had a rough bass voice and was a good and ready speaker. Writers of the next generation agree that he was exceptionally strong and vigorous. William was an out-of-doors man, a hunter and soldier, fierce and despotic, generally feared; uneducated, he had few graces but was intelligent and shrewd

and soon obtained the respect of his rivals.

New alliances. After 1047 William began to take part in events outside his duchy. In support of his lord, King Henry, and in pursuit of an ambition to strengthen his southern frontier and expand into Maine, he fought a series of campaigns against Geoffrey Martel, count of Anjou. But in 1052 Henry and Geoffrey made peace, there was a serious rebellion in eastern Normandy, and, until 1054 William was again in serious danger. During this period he conducted important negotiations with his cousin Edward the Confessor,

king of England, and took a wife.

Norman interest in Anglo-Saxon England derived from an alliance made in 1002, when King Ethelred II of England married Emma, the sister of Count Richard II, William's grandfather. Two of her sons, William's cousins once removed, had reigned in turn in England, Hardecanute (1040-42) and Edward the Confessor (1042-66). William had met Edward during that prince's exile on the Continent and may well have given him some support when he returned to England in 1041. In that year Edward was about 36 and William 14. It is clear that William expected some sort of reward from Edward and, when Edward's marriage proved unfruitful, began to develop an ambition to become his kinsman's heir. Edward probably at times encouraged William's hopes. His childlessness was a diplomatic asset.

In 1049 William negotiated with Baldwin V of Flanders for the hand of his daughter, Matilda. Baldwin, an imperial vassal with a distinguished lineage, was in rebellion against the Western emperor, Henry III, and in desperate need of allies. The proposed marriage was condemned as incestuous (William and Matilda were evidently related in some way) the Emperor's friend, Pope Leo IX, at the Council of Reims in October 1049; but so anxious were the parties for the alliance that before the end of 1053, possibly in 1052, the wedding took place. In 1059 William was reconciled to the papacy, and as penance the disobedient pair built two monasteries at Caen. Four sons were born to William and Matilda: Robert (the future duke of Normandy), Richard (who died young), William Rufus (the Conqueror's successor in England), and Henry (Rufus' successor). Among the daughters was Adela, who was the mother of Stephen, king of England.

Edward the Confessor was supporting the Emperor, and it is possible that William used his new alliance with Flanders to put pressure on Edward and extort an acknowledgment that he was the English king's heir. At all events, Edward seems to have made some sort of promise to William in 1051, while Tostig, son of the greatest nobleman in England, Earl Godwine, married Baldwin's half sister. The immediate purpose of this tripartite alliance was to improve the security of each of the parties. If William secured a declaration that he was Edward's heir, he was also looking very far ahead.

Between 1054 and 1060 William held his own against an alliance between King Henry I and Geoffrey Martel of Anjou. Both men died in 1060 and were succeeded by weaker rulers. As a result, in 1063 William was able to conquer Maine. In 1064 or 1065 Edward sent his brother-in-law, Harold, earl of Wessex, Godwine's son and successor, on an embassy to Normandy. William took him on a campaign into Brittany, and in connection with this Harold swore an oath in which, according to Norman writers, he renewed Edward's bequest of the throne to William and promised to support it.

When Edward died childless on Jan. 5, 1066, Harold was accepted as king by the English magnates, and William decided on war. Others, however, moved more quickly. In May Tostig, Harold's exiled brother, raided England, and in September he joined the invasion forces of Harald III Hardraade, king of Norway, off the Northumbrian coast. William assembled a fleet, recruited an army, and gathered his forces in August at the mouth of the Dives River. It is likely that he originally intended to sail due north and invade England by way of the Isle of Wight and Southampton Water. Such a plan would give him an offshore base and interior lines. But adverse winds detained his fleet in harbour for a month, and in September a westerly gale drove his ships up-Channel.

The Battle of Hastings. William regrouped his forces at Saint-Valery on the Somme. He had suffered a costly delay, some naval losses, and a drop in the morale of his troops. On September 27, after cold and rainy weather, the wind backed south. William embarked his army and set sail for the southeast coast of England. The following morning he landed. took the unresisting towns of Pevensey and Hastings, and began to organize a bridgehead with between 4,000 and 7,000 cavalry and in-

William's forces were in a narrow coastal strip, hemmed in by the great forest of Andred, and, although this corridor was easily defensible, it was not much of a base for the conquest of England. The campaigning season was almost past, and when William received news of his opponent it was not reassuring. On September 25 Harold had defeated and slain Tostig and Harald Hardraade at Stamford Bridge, near York, and was retracing his steps to meet the new invader. On October when Harold emerged from the forest, William was taken by surprise. But the hour was too late for Harold to push on to Hastings, and he took up a defensive position. Early the next day William went out to give battle. He attacked the English phalanx with archers and cavalry but saw his army almost driven from the field. He rallied the fugitives, however, and brought them back into the fight and in the end wore down his opponents. Harold's brothers were killed early in the battle. Toward nightfall the King himself fell and the English gave up. William's coolness and tenacity secured him victory in this fateful battle, and he then moved against possible centres of resistance so quickly that he prevented a new leader from emerging. On Christmas Day 1066 he was crowned king in Westminster Abbey. In a formal sense the Norman Conquest of England had taken place.

King of England. William was already an experienced ruler. In Normandy he had replaced disloyal nobles and ducal servants with his own friends, limited private warfare, and recovered usurped ducal rights, defining the feudal duties of his vassals. The Norman church flourished under his rule. He wanted a church free of corruption but subordinate to him. He would not tolerate opposition from bishops and abbots or interference from the papacy. He presided over church synods and reinforced ecclesiastical discipline with his own. In supporting Lanfranc, prior of Bec,

against Berengar of Tours in their dispute over the doctrine of the Eucharist, he found himself on the side of orthodoxy. He was never guilty of the selling of church office (simony). He disapproved of clerical marriage. At the same time he was a stern and sometimes rough master, swayed by political necessities, and he was not generous to the church with his own property. The reformer Lanfranc was one of his advisers; but perhaps even more to his taste were the worldly and soldierly bishops Odo of Bayeux and Geoffrey of Coutances.

William left England early in 1067 but had to return in December because of English unrest. The English rebellions that began in 1067 reached their peak in 1069 and were finally quelled in 1071. They completed the ruin of the highest English aristocracy and gave William a distaste for his newly conquered kingdom. Since his position on the Continent was deteriorating, he wanted to solve English problems as cheaply as possible. To secure England's frontiers, he invaded Scotland in 1072 and Wales in 1081 and created special defensive "marcher" counties along the Scottish and Welsh borders.

In the last 15 years of his life he was more often in Normandy than in England, and there were five years, possibly seven, in which he did not visit the kingdom at all. He retained most of the greatest Anglo-Norman barons with him in Normandy and confided the government of England to bishops, trusting especially his old friend Lanfranc, whom he made archbishop of Canterbury. Much concerned that the natives should not be unnecessarily disturbed, he allowed them to retain their own

laws and courts.

William returned to England only when it was absolutely necessary: in 1075 to deal with the aftermath of a rebellion by Roger, earl of Hereford, and Ralf, earl of Norfold, which was made more dangerous by the intervention of a Danish fleet; and in 1082 to arrest and imprison his half brother Odo, bishop of Bayeux and earl of Kent, who was planning to take an army to Italy, perhaps to make himself pope. In the spring of 1082 William had his son Henry knighted, and in August at Salisbury he took oaths of fealty from all the important landowners in England, whosoever's vassals they might be. In 1085 he returned with a large army to meet the threat of an invasion by Canute II (Canute the Holy) of Denmark. When this came to nothing owing to Canute's death in 1086, William ordered an economic and tenurial survey to be made of the king-dom, the results of which are summarized in the two volumes of Domesday Book.

William was preoccupied with the frontiers of Normandy. The danger spots were in Maine and the Vexin on the Seine, where Normandy bordered on the French royal demesne. After 1066 William's continental neighbours became more powerful and even more hostile. In 1068 Fulk the Surly succeeded to Anjou and in 1071 Robert the Frisian to Flanders. Philip I of France allied with Robert and Robert with the Danish king, Canute II. There was also the problem of William's heir apparent, Robert Curthose, who, given no appanage and seemingly kept short of money, left Normandy in 1077 and intrigued with his father's enemies. In 1081 William made a compromise with Fulk in the treaty of Blancheland: Robert Curthose was to be count of Maine but as a vassal of the count of Anjou. The eastern part of the Vexin, the county of Mantes, had fallen completely into King Philip's hands in 1077 when William had been busy with Maine. In 1087 William demanded from Philip the return of the towns of Chaumont, Mantes, and Pontoise. In July he entered Mantes by surprise, but while the town burned he suffered some injury from which he never recovered. He was thwarted at the very moment when he seemed about to enforce his last outstanding territorial claim.

Death. William was taken to a suburb of Rouen, where he lay dving for five weeks. He had the assistance of some of his bishops and doctors, and in attendance were his half brother Robert, count of Mortain, and his younger sons, William Rufus and Henry. Robert Curthose was with the King of France. It had probably been his intention that Robert, as was the custom, should succeed to the whole inheritance. In the circumstances he was tempted to make the loyal Rufus his sole heir. In the end he compromised: Normandy and Maine went to Robert and England to Rufus. Henry was given great treasure with which he could purchase an appanage. William died at daybreak on September 9, in his 60th year, and was buried in rather unseemly fashion in St. Stephen's Church, which he had built at Caen.

BIBLIOGRAPHY. David C. Douglas, William the Conqueror (1964); and Frank Barlow, William I and the Norman Conquest (1965), are the definitive biographies. Earlier works still of value are E.A. Freeman, *The History of the Norman Conquest of England*, vol. 1-2, 2nd ed. (1870); 3-5, 1st ed. (1869-75); and F.M. Stenton, *William the* Conqueror and the Rule of the Normans (1908, revised 1967). Among the standard textbooks on William and the Norman Conquest of England are F.M. Stenton, Anglo-Saxon England (1943); and Frank Barlow, The Feudal Kingdom of England, 1042-1216 (1955). There is a vast literature on the Conquest. A useful introduction is provided by Dorothy Whitelock et al., The Norman Conquest: Its Setting and Impact (1966); and C. Warren Hollister (ed.), The Impact of the Norman Conquest

• William II, byname william rufus, French GUILLAUME LE ROUX (b. c. 1056d. Aug. 2, 1100, near Lyndhurst, Hampshire, Eng.), son of William I the Conqueror and king of England from 1087 to 1100; he was also de facto duke of Normandy (as William

William II, drawing by Matthew Paris from a mid-13th-century manuscript; in the British Library (Ms. Royal 14 cvii)

Reproduced by permission of the British Library

III) from 1096 to 1100. He prevented the dissolution of political ties between England and Normandy, but his strong-armed rule earned him a reputation as a brutal, corrupt tyrant. Rufus ("the Red"—so named for his ruddy complexion) was William's third (second surviving) and favourite son. In accordance with feudal custom, William I bequeathed his inheritance, the Duchy of Normandy, to his eldest son, Robert II Curthose; England, William's kingdom by conquest, was given to

Nevertheless, many Norman barons in En-

gland wanted England and Normandy to remain under one ruler, and shortly after Rufus succeeded to the throne, they conspired to overthrow him in favour of Robert. Led by the Conqueror's half brother, Odo of Bayeux, earl of Kent, they raised rebellions in eastern England in 1088. Rufus immediately won the native English to his side by pledging to cut taxes and institute efficient government. The insurgency was suppressed, but the King failed to keep his promises. Consequently, a second baronial revolt, led by Robert de Mowbray, earl of Northumberland, broke out in 1095. This time William punished the ringleaders with such brutality that no barons dared to challenge his authority thereafter. His attempts to undermine the authority of the English church provoked resistance from St. Anselm, archbishop of Canterbury, who, defeated, left the country for Rome in 1097; Rufus immediately seized the lands of Canterbury.

Meanwhile, Rufus was engaged in military operations in Scotland, Wales, and particularly in Normandy. In 1091 he compelled King Malcolm III of Scotland to acknowledge his overlordship. Malcolm revolted in November 1093, but Rufus' forces quickly killed him near Alnwick, Northumberland. Thereafter, Rufus maintained the Scottish kings as vassals, and in 1097 he subjugated Wales.

William Rufus' chief interest, however, lay in the recovery of Normandy from the incompetent Robert. After waging war on Normandy for seven years (1089–96), Rufus reduced his brother to the role of a subordinate ally. When Robert left for a crusade in 1096, he mortgaged his kingdom to Rufus, who quickly added Maine to his possessions. In 1100 Rufus was shot in the back with an arrow and killed while hunting in the New Forest in Hampshire. The incident was probably an assassination, and Rufus' alleged slayer, Walter Tirel, lord of Poix in Ponthieu, may have been acting under orders from the King's younger brother, Henry. Henry promptly seized the English throne as King Henry I.

• William III, byname WILLIAM OF ORANGE, also called WILLIAM HENRY, PRINCE OF ORANGE, Dutch WILLEM HENDRIK, PRINS VAN ORANJE (b. Nov. 14 [Nov. 4, old style], 1650, The Hague—d. March 19 [March 8, O.S.],

William III painting after W. Wissing; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

1702, London), stadholder of the United Provinces of the Netherlands (1672–1702) and king of Great Britain (1689–1702), reigning jointly with Queen Mary II (until her death in 1694). He directed the European opposition to Louis XIV of France and, in Great Britain, secured the triumph of Protestantism and of Parliament.

Early life. The son of William II, prince of Orange, and of Mary, the daughter of Charles I of England, William was born at The Hague in November 1650, eight days after his father's death. As stadholder of five of the United Provinces of the Netherlands, William II had recently incurred the enmity of a powerful minority of a republican oligarchy that dominated the province of Holland and the city of Amsterdam. After his death this party determined to exclude the House of Orange from power, and the Act of Seclusion (1654) debarred the Prince of Orange and his descendants from holding office in the state.

William III's education, nevertheless, was, from the first, the training of a ruler. Contemporaries agree that he was a boy of great vivacity and charm, but frequent quarrels between his mother and his paternal grandmother disturbed his childhood and may have helped to breed the habit of reserve that was intensified by the difficulties of his later life. In 1660, after his uncle Charles II's restoration to the English throne, the Act of Seclusion was rescinded. Shortly afterward his mother died, leaving him to the guardianship of his grandmother and of his uncle Frederick William, elector of Brandenburg.

Early in 1666 he was made a ward of the States General, the representative assembly of the United Provinces. Under Johan de Witt, the grand pensionary of Holland, he acquired a specialized knowledge of public business. His exceptional promise and the popular devotion he had inherited made it impossible to deny him all advancement, but the Perpetual Edict (1667) decreed that the offices of stadholder and captain general, formerly held simultaneously by the princes of Orange, should never again be held by the same person.

Stadholder. In 1671 it became clear that Louis XIV of France and Charles II of England were planning a joint attack on the United Provinces, and demands for William's appointment as captain general became insistent. He was appointed in February 1672, though at first with very limited authority. In March and April Charles and Louis declared war, and in June French troops crossed the Rhine and overran three provinces in as many weeks. The Dutch navy was able to hold the English in check, but the army had been neglected and was ill-trained and ill-equipped. As a last expedient the polders, or low-lying areas, were flooded, and William, with his few unseasoned troops, was left to defend the 'water line.

Panic broke out in the country, and there were angry demands for the Prince's elevation to the stadholderate. The few dissenters were overruled, and on July 8 he was proclaimed stadholder by the States General, later ratified by the provincial estates of the occupied provinces. One of his first acts, done with the States' approval, was to refuse the ruinous peace terms offered by the two kings. Civil disorders, however, were not over. On August 20 Johan de Witt and his brother, who were unjustly suspected of treachery, were murdered by an infuriated mob at The Hague. William was in no way implicated in the crime and was enraged when he heard of it, but, because of the number of the murderers, and perhaps because of the general revolutionary situation, he failed to bring them to justice.

In a few weeks the country settled down and for a year held out almost alone. Although in the autumn of 1672 William had enlisted the aid of the emperor Leopold I and the elector of Brandenburg, and in 1673 Spain joined the alliance, their help was not immediately effective. William, meanwhile, was steadily rebuilding his army and in September 1673 was able to recapture the key fortress of Naarden. He then moved swiftly into the territory of Cologne, joined his forces to those of the Emperor, and on November 12 captured Bonn. The French, threatened with

encirclement, hurriedly evacuated the United Provinces. Charles II and Louis's minor allies were forced to make peace early in 1674. Louis's Dutch adventure had failed and had turned half of Europe against him, but he still held many places in Germany and the Spanish Netherlands, so the war continued and spread into remoter parts of the Continent. William's chief concern for the next four years was the command of the Dutch armies in Flanders, though Dutch domestic affairs and repeated attempts to find an acceptable formula of peace occupied much of his time. Peace was finally made by a series of treaties in 1678 and 1679.

King of England. In November 1677 William had married his cousin Mary, daughter of James, duke of York (later King James II of England). William himself stood fourth in the English succession, and this marriage with the heiress presumptive gave him added importance in England, though during Charles II's reign his role in English affairs was that of an anxious spectator rather than of a participant. During the 1680s Louis's numerous minor aggressions kept the Continent in a continual state of tension, but William's efforts to build up a new coalition against him were repeatedly frustrated, largely by the activities of a small but powerful pro-French party in Holland and by the equivocal attitude of England. Eventually, however, the English king James II, a Roman Catholic, had so antagonized his subjects by his despotic and romanizing policies that by 1687 many of them were urging William to intervene. In 1688 the birth of a son to James, which opened the possibility of a Roman Catholic succession, finally brought matters to a head.

An invitation, signed by a representative selection of James's opponents, was dispatched on July 10, and on November 15 William and his army landed at Tor Bay in Devon and proceeded almost unopposed to London. James fled to France, and the so-called Convention Parliament, summoned in January 1689, declared that the King had abdicated and offered the vacant throne, with an accompanying Declaration of Right, to William and Mary. They were proclaimed in February and crowned on April 21. The crown of Scotland was offered to them in the same month.

The Glen Coe massacre. The revolution in England had been accomplished almost without bloodshed, but in Scotland and Ireland there was armed resistance. This collapsed in Scotland in 1689, but the country remained troubled and unsettled throughout William's reign. In 1692 Alexander MacDonald of Glen Coe and some of his clansmen were murdered in cold blood for tardiness in taking the oath of allegiance to William, William ordered an inquiry but took no further action until in 1695 the Scottish parliament demanded a public investigation. He then showed culpable leniency to the offenders, merely dismissing from his secretaryship Sir John Dalrymple, on whom responsibility for the massacre was finally placed. In Ireland war formally broke out in 1689, when James landed there with French support. But the successful defense of Londonderry and of Enniskillen, and William's own victory at the Boyne on July 1, 1690, ensured the reconquest of Ireland and set him free to turn his attention to the Continent. Here, after a series of minor attacks on the empire, Louis XIV had invaded the Palatinate in 1688. The Dutch and the Emperor concluded the Treaty of Vienna (May 1689) and declared war on Louis; during the following 18 months William's rare diplomatic skill brought into the alliance Brandenburg, Hanover, Saxony, Bavaria, Savoy, and Spain, as well as England, which now became its linchpin.

From 1691 William spent much time campaigning on the Continent with varying degrees of success; but by 1696 a number of

factors made both sides anxious for peace, and the Treaties of Rijswijk were signed in 1697. The question, vital for a European balance of power, of who was to succeed the childless king Charles II of Spain remained unsettled, however, and William had good cause to fear that the peace would be no more than a truce. The English Parliament, on the contrary, was convinced that it would be lasting, insisted on cutting down the size of the army, and resolutely turned its back on foreign affairs. William, in the hope of averting a new war, entered into two Spanish Partition treaties (1698-99) with Louis—measures that involved him in serious frictions with Parliament. But when the Spanish king died on Nov. 1, 1700, Louis, ignoring his agreements, accepted the crown of Spain for his grandson and soon showed that he had not relinquished his plans for French aggrandizement.

William, though hampered by English apathy, set himself to rebuilding the Grand Alliance and to preparing his two countries for the now inevitable conflict. In September 1701 the exiled James II died, and Louis XIV proclaimed his son king of England, contrary to his agreement in one of the Rijswijk treaties, and thus roused the English to an enthusiasm for war. William did not live to see this war declared. His health had long been declining, and in March 1702 he died. His plans for a European settlement were largely carried out by the Treaty of Utrecht (1713). His ideal, which he had pursued doggedly for 30 years, was an international order in which no single power was able to tyrannize the rest.

Assessment. Holland, by the time of William's death, was ceasing to be a great power, for reasons for which he cannot be held responsible. That it remained free, independent, and prosperous was in no small measure due to him. In England he remained to the last an alien, unpopular with the ruling classes, though the common people always looked on him as the Protestant hero and hailed his appearances with enthusiasm.

His reign was of great importance in the constitutional history of the country, and his own contribution to these developments was far from negligible. By moderation and good faith in his exercise of the royal prerogative, he preserved the crown and with it those elements of stability and continuity that have been the peculiar strength of Great Britain. William hated faction, and his influence brought to an end a long period of murderous party strife. He sponsored the reform of the currency and promoted the Irish linen trade. The Toleration Act (1689) fell short of his wishes, but in spite of many frustrations he did his utmost to promote religious toleration. In 1689, of his own free will, he granted independence to the judiciary, a grant later given statutory permanence by the Act of Settlement (1700-01).

Contemporaries acclaimed William a great soldier, although he was not, in fact, a very fortunate general. But the Dutch and British armies that Marlborough inherited to continue the war against Louis were at least in part his creation. Though a martinet with his soldiers, he won and kept their devotion by his personal bravery and his concern for their well-being. A life of gruelling public activities left him little leisure for other pursuits, but he deserves mention as a patron of the arts. On his private estates he was an enlightened lord of the manor in his concern for the welfare of his tenants and the maintenance of his lands: in his private charities he was particularly concerned to help refugees.

Though reserved in manner, and sometimes irritable and ungracious, partly as a result of ill health and overwork, he could also show himself kindly, courteous, and forbearing, and he had the gift of winning and keeping love. His wife, Mary, was devoted to him, and he to her, although he was not always an easy nor

a strictly faithful husband. He became more withdrawn after the shock of her death in 1694. Of his mistress Elizabeth Villiers little is known, except that she was loyal, discreet, and apparently not unduly mercenary. A legend of William's homosexuality does not stand up to examination. (N.A.R.) BIBLIOGRAPHY. William's life between 1672 and 1702 is so closely interwoven with the history of Europe that most historians of the period dealt with some of its aspects. The more recent biographies in English are Nesca A. Robb, William of Orange: A Personal Portrait, 2 vol. (1963-66); and Stephen B. Baxter, William III (1966), which together give a fairly rounded picture. The bibliography of the latter work has been published separately. N. Japikse, Prins Willem III, de Stad-

with some of its aspects. The more recent biographies in English are Nesca A. Robb, William of Orange: A Personal Portrait, 2 vol. (1963-66); and Stephen B. Baxter, William III (1966), which together give a fairly rounded picture. The bibliography of the latter work has been published separately. N. Japikse, Prins Willem III, de Stadhouder-Koning, 2 vol. (1930-35), is the standard life in Dutch. In English no full-scale life of William has appeared since A.H. Trevor, Life and Times of William III, 2 vol. (1835-36), a very inaccurate work. Brief lives exist by H.D. Traill, William the Third (1888); G.J. Renier, William of Orange (1932); and David Ogg, William III (1956). N. Japikse (ed.), Correspondentie van Willem III en van Hans Willem Bentinck, 5 vol. (1927-37), is invaluable for the period.

• William IV, also called (1789–1830) PRINCE WILLIAM HENRY, DUKE OF CLARENCE, German WILHELM HEINRICH, byname THE SAILOR KING (b. Aug. 21, 1765, London—d. June 20, 1837, Windsor Castle, near London), king of Great Britain and Ireland and king of Hanover

William IV, detail from a painting by Sir Martin Archer Shee; in the National Portrait Gallery, London

from June 26, 1830. Personally opposed to parliamentary reform, he grudgingly accepted the epochal Reform Act of 1832, which, by transferring representation from depopulated "rotten boroughs" to industrialized districts, reduced the power of the British crown and the landowning aristocracy over the government.

The third son of King George III, he entered the Royal Navy at the age of 13, fought in the American Revolution, and, while serving in the West Indies, formed a close friendship with the future naval hero Horatio (afterward Viscount) Nelson. When he left the sea in 1790, however, he had become unpopular with many other fellow officers and had angered his father by his numerous love affairs. Between 1794 and 1807 he had 10 illegitimate children (surnamed FitzClarence) by the Irish comedienne Dorothea Jordan. His marriage (July 11, 1818) to Princess Adelaide of Saxe-Meiningen produced two daughters, both of whom died in infancy. On William's death, therefore, the British crown passed to his niece Princess Victoria, and the Hanoverian crown passed to his brother Ernest Augustus, duke of Cumberland.

The Duke became heir presumptive on the death (Nov. 6, 1817) of Princess Charlotte Augusta, only legitimate child of his older brother, the Prince Regent (afterward King George IV, reigned 1820–30). In April 1827 the new prime minister, George Canning, revived for him the office of lord high admiral, but he was forced to resign in August 1828,

when the Duke of Wellington was premier. After succeeding George IV as king, William proved to be less brilliant but also less selfish and more attentive to official business than his brother had been.

In May 1832 the prime minister, Charles Grey, the 2nd Earl Grey, asked the King to create at least 50 new peers to overcome the House of Lords majority hostile to parliamentary reform. At first William refused, but after Wellington had failed to form a Tory (Conservative) ministry, Grey's Whigs resumed office with the King's written promise to create enough peers to carry the Reform Bill. The Lords, sufficiently threatened, allowed the bill to pass. As a consequence of redistricting, Sir Robert Peel's Tories were unable to gain a Commons majority in the election of January 1835; and from April of that year the King had to deal with an uncongenial Whig premier, William Lamb, 2nd Viscount Melbourne, whom he had previously dismissed.

GERMAN EMPIRE

• William I, German in full WILHELM FRIEDRICH LUDWIG (b. March 22, 1797, Berlin—d. March 9, 1888, Berlin), German emperor from 1871, as well as king of Prussia from 1861, a sovereign whose conscientiousness and self-restraint fitted him for collaboration with stronger statesmen in raising his monarchy and the house of Hohenzollern to predominance in Germany.

He was the second son of the future king Frederick William III of Prussia. In 1814 he fought at Bar-sur-Aube in the German War of Liberation against Napoleon I. Subsequently he devoted himself to the Prussian Army and military affairs. In 1840, on the accession of his childless elder brother, Frederick William IV, he became prince of Prussia and heir presumptive.

When revolution broke out in Berlin in March 1848, the conservative William's advocacy of force earned him the sobriquet of "Kartätschenprinz" (Prince of Grapeshot). After a brief exile in England, he returned to Prussia in June 1848, and in 1849 he commanded the troops sent to suppress an insurrection in Baden.

William I, detail from a portrait by Gustav Richter in the Nationalgalerie, Berlin

William's mistrust of constitutionalism was mitigated by the lessons of 1848, by his exposure to English political ideas, and by the influence of his consort, Augusta of Saxe-Weimar-Eisenach. (He married this witty and temperamental princess in 1829, after renouncing a youthful love affair with Eliza Radziwill.) Appointed military governor of Rhineland Province in 1849, he made his residence at Coblenz, a centre of opposition

to the reactionary policies of Berlin. He described Otto von Bismarck's ideas as "schoolboy's politics.

From October 1858 William was regent for his ailing brother, and, on Jan. 2, 1861,

William succeeded to the Prussian throne. As regent he made himself popular by proclaiming a "New Era" of liberalism, but he appointed a ministry comprising pronounced conservatives as well as moderate liberals.

The problems raised for Prussia in 1859 by the wars for Italian independence were beyond his capacity: while he favoured an alliance with Austria against the France of Napoleon III, he insisted that Prussia have the supreme command on the Rhenish front; and the Austro-French armistice of Villafranca took him by surprise.

On internal affairs William's fundamental conservatism reasserted itself. Backed by his war minister, Albrecht von Roon, and by the chief of the military cabinet, Edwin von Manteuffel, the King insisted on a three-year term of military conscription, which the liberal lower chamber rejected in 1862. William thereupon was ready to abdicate but was dissuaded by Bismarck, whom he installed as prime minister during this crisis.

After the Prussian victory in the Seven Weeks' War against Austria in 1866, the King, despite their frequent disagreements, realized that Bismarck was more necessary to Prussia than he himself was. In 1870, when the Hohenzollern candidature to the Spanish throne was leading to the Franco-German War, William was far more cautious than Bismarck; during the war, he arbitrated between his chief advisers, Bismarck and Helmuth von Moltke. He was distressed by the Kulturkampf that Bismarck and the liberals conducted against the Roman Catholic Church, but in 1877, when Bismarck made his last appeal to be relieved of office, William answered: "Never."

William was so imbued with the traditions of the Prussian monarchy that it was painful for him to accept Bismarck's foundation of the German Reich and the imperial title, which came to him by a sham offer (arranged by Bismarck) from the German princes. William was acclaimed German emperor (not "emperor of Germany," which he thought more suitable) at Versailles, in conquered France, on Jan. 18, 1871. General indignation at the two attempts made on his life in 1878 (by Max Hödel on May 11 and by K.E. Nobiling, who seriously wounded him, on June 2) was expressed in popular support for Bismarck's anti-Socialist legislation.

The standard biography, Kaiser Wilhelm I, by Erich Marcks, was published in 1897 (9th ed., 1943).

Consult the INDEX first

• William II, German in full FRIEDRICH WIL-HELM VIKTOR ALBERT (b. Jan. 27, 1859, Potsdam, near Berlin-d. June 4, 1941, Doorn, Neth.), German emperor (kaiser) and king of Prussia from 1888 to the end of World War I in 1918, known for his frequently militaristic manner as well as for his vacillating policies.

Youth and early influences. William was the eldest child of Crown Prince Frederick (later Emperor Frederick III) and Victoria, the eldest child of Britain's queen Victoria. He was born with a damaged left arm; the limb never grew to full size, and some historians have found the clue to his behaviour in this disability

A more influential cause lay in his parentage. His father was honourable, intelligent, and considerate but had neither the will nor the stamina needed to dominate. That lack was not shared by his wife, who had acquired from

William II, detail of an oil painting by Paul Beckert, 1890; in the Nationalgalerie.

By courtesy of the Staatliche Museen zu Berlin, Germany

her father, the Prince Consort, seriousness of purpose and from her mother, emotion and obstinacy. Her intellect was hopelessly at the mercy of her feelings, and she took rapid likes and dislikes. She tried to force on her son the outlook of a 19th-century British Liberal and bring him up as an English gentleman. The result, however, was to make him sympathetic to those who were urging him to fulfill the ideal that the Prussian people had formed of a ruler—firm, brave, frugal, just and manly, self-sacrificing but also self-reliant.

Difficult as William's relations with his mother were, she left a deep and lasting mark on him. He was never able to shake off the respect instilled into him in the nursery for liberal values and habits of life. To be the tough warrior-king did not come naturally to him, yet this was the role to which he felt he must live up, and the result was that he overdid it. Inclination and a sense of duty (inculcated by a Calvinist tutor) were alternating in him continually, each managing to frustrate the other. The tension between the two, superimposed on his physical disability, is the ultimate explanation of his taut, restless, and irresolute character. In 1881 William married Princess Augusta Victoria of Schleswig-Holstein-Sonderburg-Augustenburg, a plain, unimaginative person with few intellectual interests and no talents, who bored him and encouraged his reactionary tendencies but all the same represented a point of stability in his life, besides presenting him with six sons and a daughter.

William as emperor. Seven years later, William's grandfather William I died at the age of 90. Liberals had long hoped, and conservatives feared, that when the Crown Prince came to the throne, he would alter the constitution by making the chancellor responsible to the Reichstag. But by the time Frederick became emperor, he was dying of cancer. Thus, William, who showed little sympathy for his parents in their bitter crisis, found himself

kaiser at the age of 29.
In March 1890 William drove Bismarck into resigning as chancellor. Bismarck had found brilliant answers to the problems facing him when he first took office but in doing so had given the Prussian upper classes a veto on political change and had made France Germany's implacable enemy. He was not at 75 the man to solve the problems he had largely brought about in creating the German Empire, so that William's action would have been justifiable if he himself had been in possession of a solution. As it was, however, he dropped vague plans for helping the working classes as soon as he ran into court opposition, and he allowed Bismarck's successors to decide against renewing his 1887 Reinsurance Treaty with Russia. Superficially, this decision again could be justified, but it opened the way for Russia in 1891 to make its alliance with France.

For four years after Bismarck's departure, Leo, Graf von Caprivi, as chancellor, tried unsuccessfully to find a policy that would be acceptable both to the Reichstag (lower house of the parliament) and to the ruling classes. He was followed by the aged prince Chlodwig von Hohenlohe-Schillingsfürst, who fared no better. In 1897 William appointed the debonair Bernhard, Fürst von Bülow, as foreign secretary and in 1900 made him chancellor; the intention was that Bülow would persuade the Reichstag to accept the policies that the Kaiser and the upper classes chose to adopt. This did little or nothing to bring about the political changes that Germany's very rapid industrialization called for. Instead, Bülow was allowed to divert attention by an exciting foreign pol-

Foreign policies. British anger had already been aroused by a telegram that, on the advice of his foreign secretary, William had sent in 1896 to Pres. Paul Kruger of the South African Republic, congratulating him on defeating the British-led Jameson raid; and alarm followed anger as the implications of the German Naval Bills of 1897 and 1900 sank in. The Kaiser often indignantly denied that Germany was challenging Britain's domination of the seas, but there is clear evidence that this was in fact the aim of Adm. Alfred von Tirpitz, whom he made secretary of the navy in 1897. When in 1904 Britain settled its outstanding disputes with France, the Kaiser, at Bülow's suggestion, went to Tangier the following year to challenge France's position in Morocco by announcing German support for Moroccan independence. His hopes of thereby showing that Britain was of no value as an ally to France were disappointed at the 1906 Algeciras Conference, at which the Germans were forced to accept French predominance in Morocco

In 1908 William caused great excitement in Germany by giving, after a visit to England, a tactless interview to The Daily Telegraph, telling his interviewer that large sections of the German people were anti-English. He had sent the text beforehand to Bülow, who had probably neglected to read it and who defended his master very lamely in the Reichstag. This led William to play a less prominent role in public affairs, and, feeling that he had been betrayed by Bülow, he replaced him with Theobald von Bethmann Hollweg. Bethmann's attempts to reach agreement with Britain failed because Britain would not promise neutrality in a war between Germany and France unless Germany would limit its fleet. This the Kaiser and Tirpitz refused to allow. The Moroccan (Agadir) crisis of 1911, in which Germany again tried to intervene in Morocco against French encroachment, might have led to war if Germany (with the encouragement of the

Kaiser) had not given way.

Role in World War I. World War I began as an attempt to save Austria-Hungary from collapse; it was transformed into a world conflict by Germany. William, having encouraged the Austrians to adopt an uncompromising line, took fright when he found war impending but was not able to halt the implementation of the mobilization measures that he had allowed his generals to prepare. During the war, although nominally supreme commander, he did not attempt to resist his generals when they kept its conduct in their own hands. He encouraged, instead of challenging, the grandiose war aims of the generals and of many politicians that ruled out all chance of a compromise peace. By the autumn of 1918 he realized that Germany had lost the war but not that this had made the loss of his throne inevitable. Refusing to abdicate, his hand was finally forced on November 9, when he was persuaded to seek asylum in The Netherlands. He thus avoided captivity and perhaps death but also by this move made impossible the retention of a monarchy in Germany. He lived quietly as a country gentleman in The Netherlands until his death in 1941.

Assessment. William often bombastically claimed to be the man who took the decisions. It is true that the German constitution of 1871 put two important powers in his hands. First, he was responsible for appointing and dismissing the chancellor, the head of the civil government. Admittedly, the chancellor could only govern if he could get a majority in the Reichstag, but this limitation on the emperor's freedom of choice was more apparent than real, because most members of the Reichstag felt it their loyal duty to support whomever the Kaiser appointed. Secondly, the German Army and Navy were not responsible to the civil government, so that the Kaiser was the only person in Germany who was in a position to see that the policy followed by the soldiers and sailors was in line with that pursued by the civil servants and diplomats. Thus, British journalists and publicists had some justification when during and immediately after the war they portrayed the Kaiser as Supreme War Lord, and therefore the man who, more than anyone else, decided to make war.

As time passes, however, historians are increasingly coming to see William as an accomplice rather than an instigator. In the years after 1890 the German upper and middle classes would have wanted a larger say in the world's councils no matter who had been on the throne, and this "urge to world power" was almost bound to bring them into collision with some of the existing great powers. The chief real criticism to be made of the Kaiser is that, instead of seeing this danger and using his influence to restrain German appetites, he shared those appetites and indeed increased them, particularly by his determination to give Germany a navy of which it could be proud. He was a quick-witted, well-meaning man who went with the stream instead of having the vision and strength of judgment to stand out against it.

BIBLIOGRAPHY. Biographies. E. Ludwig, Wilhelm der Zweite (1926; Kaiser Wilhelm II, 1926, reprinted 1970 as Wilhelm Hohenzollern, the Last of the Kaisers), is very good. M.L.G. Balfour, The Kaiser and His Times (1964, new ed. 1972), tries to put the Kaiser in his historical context; V.S. Cowles, The Kaiser (1963), is a more personal account; Alan W. Palmer, The Kaiser: Warlord of the Second Reich (1978), is a highly readable popular biography based on a combination of primary and secondary sources.

GERMANY/HOLY ROMAN EMPIRE

• William, also called WILLIAM OF HOLLAND, German WILHELM VON HOLLAND (b. 1228—d. Jan. 28, 1256, near Hoogwoude, Holland), German king from Oct. 3, 1247, elected by the papal party in Germany as antiking in opposition to Conrad IV and subsequently gaining general recognition. As William II he was also count of Holland, succeeding his father, Count Floris IV, in 1234.

William was elected German king to succeed Henry Raspe (died Feb. 16, 1247), Pope Innocent IV's nominee to replace Conrad, whom the Pope had declared deposed in 1245. Although crowned at Aachen on Nov. l, 1248, William was king of a minority of the German states until King Conrad decided, late in 1251, to leave Germany for Italy (where he became king of Sicily). On March 25, 1252, William was recognized as king by Albert, duke of Saxony, and by John and Otto, margraves of Brandenburg; further support came in 1254, from the Rhenish League of Cities.

William's growing strength in the Rhineland caused Archbishop Conrad of Cologne (who had crowned him) to plan his deposition in favour of Otakar II of Bohemia. That conspiracy (late 1254) was checked by Pope Alexander IV.

As count of Holland, William promoted the urban development of Haarlem, Delft, Middelburg, and Alkmaar, all of which became trading centres. While trying to secure his rule over the Frisians, he was killed in battle.

HESSE-KASSEL

• William IV, byname WILLIAM THE WISE, German WILHELM DER WEISE (b. June 24, 1532, Kassel, Hesse-Kassel—d. Aug. 25, 1592,

William IV, detail from an engraving by P. Tröschel By courtesy of the Staatliche Kunstsammlungen, Kassel, West Germany

Kassel), landgrave (or count) of Hesse-Kassel from 1567 who was called "the Wise" because of his accomplishments in political economy and the natural sciences. The son of the landgrave Philip the Magnanimous, he participated with his brother-in-law Maurice of Saxony in the princely rebellion of 1552 that liberated Philip from his five-year captivity by the Holy Roman emperor Charles V.

On the death of Philip (1567) the partition of the Hessian lands among his four sons left William with little basis for a forceful foreign policy. Domestically, he sought a compromise between Lutherans and Calvinists. He was an outstanding organizer and a skilled economist. The Ökonomische Staat (1585), a territorial survey compiled for him, is a model of administrative statistics.

William also pursued scientific studies and perhaps owes his lasting fame to his research

in astronomy. On friendly terms with the great Danish astronomer Tycho Brahe, he constructed numerous astronomical instruments and calculated many stellar positions.

Luxembourg

- William I-III: see William I-III under William (Netherlands: kings).
- William IV, German in full WILHELM ALEXANDER (b. April 22, 1852, Biebrich, Nassau, Ger.—d. Feb. 25, 1912, Schloss Berg, near Luxembourg), grand duke of Luxembourg (1905–12), eldest son of grand duke Adolf of Nassau. Falling severely ill soon after his accession, he eventually on March 19, 1908, had his consort Maria Anna of Braganza named regent, or governor (Statthalterin). Also, having no sons and wishing to secure the succession of his daughters Marie-Adélaide and Charlotte, he had the Luxembourg Parliament allow succession in the female line.

NETHERLANDS: STADHOLDERS

• William I, in full william, prince of orange, count of nassau, byname william the silent, Dutch willem, prins van oranje, graaf van nassau, or willem de zwijger (b. April 24, 1533, Dillenburg, Nas-

William I, painting by Adriaan Thomasz Key, 1581; in the Mauritshuis, The Hague

By courtesy of the Foundation Johan Maurits van Nassau, The Hague

sau—d. July 10, 1584, Delft, Holland), first of the hereditary stadholders (1572–84) of the United Provinces of the Netherlands and leader of the revolt of the Netherlands against Spanish rule and the Catholic religion.

Family and inheritance. William, the eldest son of William, count of Nassau-Dillenburg, grew up in a cultivated Lutheran environment. Far richer than his father's ancestral possessions in the region of the Lahn River in Nassau were the estates that, since 1404, another branch of the family had obtained in Brabant and elsewhere in the Low Countries, where its main seat was at Breda. At the time of William's birth, the Brabant branch was represented by his father's elder brother Henry and by Henry's only son, René, who in 1530 had inherited from a maternal uncle the domains of the House of Chalon-Arlay, so becoming the greatest seigneur of the Franche-Comté and ruler of the Provençal principality of Orange. René of Orange was killed in 1544, leaving the combined wealth of the houses of Nassau-Breda and of Chalon-Orange to his cousin William, then aged 11.

In view of the importance of this heritage, the lord of the Burgundian Netherlands, the Habsburg emperor Charles V, stipulated that William's parents should renounce his guardian-

ship and that the young prince should be educated in his new fatherland as a Catholic. So William passed his formative years at Breda and Brussels, under the guidance of suitable tutors, and was duly imbued with the principles proper to a youth of his standing. French became his daily language, and he acquired a colloquial command of Dutch.

In spite of his immense landed property, his financial circumstances were straitened from the beginning. Scarcity of liquid assets continued to hamper him, even after his marriage (July 8, 1551) to a wealthy heiress, Countess Anne of Egmond-Buren, who brought him several additional baronies, mainly in Holland. These "structural" pecuniary straits he shared with most of his class and with the

Burgundian government itself.

A favourite with Charles V and with the court at Brussels, the Prince faithfully discharged the social, military, and diplomatic duties that were expected of him. He continued to do so under Philip II, the Emperor's son and successor as king of Spain and lord of the Burgundian dominions. Together with his later enemies Antoine Perrenot de Granvelle, bishop of Arras, and the Duque de Alba, he was a negotiator of the Treaty of Cateau-Cambrésis (1559), which, in ending prolonged strife between Burgundy-Habsburg and France, released from French occupation his princedom of Orange and made the Netherlands accessible to Calvinist preachers from France. Philip II, at his accession in 1555, had admitted William to the Council of State, and, now before his departure to Spain, the King appointed him his stadholder (governor and commander in chief) in Holland, Zeeland, and Utrecht (August 1559) and afterward in Franche-Comté (February 1561).

Loyal opposition to the King's government. From about 1561 William, the prince of Orange, together with other great lords who felt themselves excluded from their rightful share in the country's government, began to protest openly against the conduct of the Brussels administration, in which Granvelle, the principal adviser of the regent Margaret, duchess of Parma, was the most powerful figure. At first religious questions were not prominent among the causes of discontent, but they gradually became so with the spread of Protestant ideas and the determination of Philip II not to tolerate any deviation from the strictest Catholic orthodoxy. The Prince and his associates, in varying degrees influenced by the comprehensive views of the Humanist Desiderius Erasmus, shared in this respect the feelings of the majority of their countrymen, who, while remaining conventional Roman Catholics, resented religious persecution. Besides, several of the nobles had, as had William, friends and parents among the Protestants. On Aug. 25, 1561, the Prince, a widower since 1558, reinforced his Lutheran and German connections by taking as his second wife Anna of Saxony.

In the mind of William, the prince of Orange, the religious issue gradually assumed paramount importance. In a sensational speech in the Council of State, he argued that it was not feasible to enforce religious unity and that it was not right for princes to presume to rule over the consciences of their subjects. But the King in October 1565 gave strict orders that the ordinances against heretics should be inexorably applied.

Consequently, the situation became increasingly dangerous. The leadership of the opposition was now taken over by a confederation of lesser nobles and gentlemen, some of them Calvinists, who were more desperate than the magnates and less averse to a violent solution; they and their followers soon came to be called the Gueux (Beggars). The great lords kept aloof, but William and a few others showed

sympathy for the movement, with which the Prince was personally in touch through his brother, Count Louis of Nassau, a Lutheran with Calvinistic leanings. Orange persuaded the confederates not to resort to armed action but instead to petition the regent Margaret for a suspension of the decrees against Protestants. The Duchess did indeed promise a moderation of the antiheretical measures, but it was already too late for minor relaxations to avert trouble. Misery caused by the economic depression contributed to the violent explosions of religious fanaticism that shook the Low Countries in August 1566. Calvinist mobs forcibly entered churches, smashing the images and destroying the furnishings. Besides causing irreparable damage, these excesses had a threefold effect: peaceful coexistence of Catholics and Protestants became more difficult; the opposition movement was weakened because its responsible members felt it necessary to defend the church; and, finally, it caused King Philip to resort to force in an attempt to crush heresy and rebellion at one blow. To this end, in December 1566, he appointed the Duque de Alba as his captain general in the Netherlands.

Orange seems to have contemplated immediate active resistance but in the end did nothing because the popular hero Lamoral, graf van Egmond, stadholder of Flanders and Artois, would not support him. He allowed the Protestants, now openly rebellious, to hail him as their defender, but he upheld public order. As hereditary viscount of Antwerp he quelled an insurrection of the numerous Calvinists there, and he kept the city gates closed to rebels and government forces alike. He protested his loyalty to the king, yet he refused to take the new oath of unconditional obedience that the Regent required from all officeholders and prudently retired in April 1567 to the family seat at Dillenburg. Many thousands followed William's example or had preceded him; a general exodus to England, Germany, and France took place

Open revolt and alliance with Calvinism. By May 1567 order was everywhere restored. Nevertheless, in August Alba entered Brussels at the head of a well-trained army and inaugurated a reign of terror. In September a special court, the Council of Troubles, was set up to try all cases of rebellion and heresy, and more than 1,000 executions took place (including those of the counts of Egmond and Hoorne). Orange, summoned to appear before the court, replied with a dignified Justification of his conduct. But his possessions in Philip's dominions were confiscated, and his son Philip William, a student at Louvain, was

deported to Spain.

Once again the cause of liberty, no less than that of religion, was clearly seen to be at stake. The opposition, however secret, became much more widespread, and Orange was justified in expecting a general rising when he should appear as a liberator. He saw his own fortunes irrevocably bound up with those of the Netherlands, and he no longer hesitated to proceed to military action. Though disappointed in his hopes of substantial support from the Lutheran German princes (he himself had reverted to the creed of his childhood) or from the emperor Maximilian II, he managed, mainly through the aid of his relatives, to raise a number of troops. In April 1568 two invasions of the Low Countries were inaugurated, but both badly miscarried. One of the attacking forces was destroyed by Alba on the banks of the Ems River. The Prince himself took the field in the beginning of October and marched toward Brabant, but the expected rising did not materialize, and he was obliged to retire to France. There he stayed for a time with the Huguenots, the Calvinist party then in rebellion against the royal government, before returning, in October 1569, to Germany. Count Louis remained

in France as his personal representative. The abortive campaigns had at least popularized Orange as the champion against oppression. The Calvinists were ready to forgive him for failing to take up arms in 1566, while he had come to appreciate them as the hardcore of the resistance movement, though he disliked their Puritanism and intolerance. Moreover, Calvinism was an "international" power, and from its adherents in Germany and France he had hitherto received his most effective support. So a rapprochement took place, but it was not until 1573 that he finally joined the Reformed Church.

These were his darkest years. With Alba securely in power and his own designs frustrated, having lost a brother (Adolph) and many of his friends, and bereft of his son, his estates, and his offices, he was also harassed by financial difficulties and by the wayward conduct of his wife, Anna of Saxony, whom he divorced in 1571. Orangist propaganda was active, but military operations were mainly confined to the exploits of the Sea Beggars, who had taken to the sea to combat the King of Spain from foreign bases. Their blockading activities contributed to the economic malaise in the Netherlands and so to the discontent nourished by Alba's harsh administration. This was especially the case in the seafaring province of Holland.

For the summer of 1572 Orange planned a number of coordinated attacks, counting on help from France, but on April 1, well ahead of any officially planned move, a fleet of Sea Beggars, driven from English ports, surprised and captured the port of Brielle in Zuid-Holland. Their success triggered off the desired popular rising in Holland and Zeeland, most towns declaring themselves for the Prince, so that by July only Amsterdam, Middelburg, and two other towns in Zeeland remained in loyalist hands. By the initiative of Orange, the provincial States of Holland met at Dordrecht (July 19-23) and recognized the Prince as still being their stadholder, nominally on behalf of the King, and they themselves assumed an effective share in the government. Equal rights for Catholics and Calvinists were proclaimed, pending a decision by the States General, the joint assembly of all the provinces.

Meanwhile, large parts of Gelderland and Friesland joined the revolt, as Alba and his army were retained in the south to counter the main attack, which had been launched from France. Louis of Nassau had captured Mons and was besieged there by the Spanish. Orange himself marched into Brabant, and several towns opened their gates to him. Hopes of French support were soon dashed, however, when the Massacre of St. Bartholomew's Day destroyed Huguenot influence at the French court. Louis was obliged to capitulate in September, and Orange disbanded his mercenaries. The fighting in the south had at least provided breathing space for the two rebellious northern provinces to consolidate their position. The Prince decided to join them, landing at Enkhuizen on October 21.

For four heroic years (1572-76), William, the prince of Orange, led the desperate resistance of the two maritime provinces against the Spanish armies sent to subdue them. Two more of his brothers-Louis and Henry-fell in a serious defeat near Nijmegen in April 1574. Meanwhile, his agents were active in the subdued provinces, in England, Germany, and France, and on June 12, 1575, he married Charlotte of Bourbon-Montpensier, a former abbess who had joined the Reformed Church. The Prince needed all his authority, tact, and tenacity of purpose to hold his followers together and prevent their pursuing divisive interests. He tried to check the excesses and mitigate the intolerance of the Protestants but was unable to maintain the equality of the Catholic and Reformed churches that he had previously advocated, and in 1573 Catholic worship was forbidden. In the closer unions Orange brought about between the different parts of Holland (July 1575) and between Holland and Zeeland (April 1576), he was recognized as "Chief and Supreme Authority" for the duration of the war, but liberty of worship was specifically excluded, though liberty of conscience was recognized.

The Prince's triumph. A temporary collapse of Spanish power in the Low Countries in 1576 gave the Prince a fresh chance. In the absence of a governor general after the death of Alba's successor, Luis de Requesens y Zúñiga, and confronted with mutinous Spanish troops, the Council of State ventured to convene the States General. These, pretending to act in the name of the King but in fact usurping viceregal powers, immediately opened negotiations with the rebellious provinces. The Pacification of Ghent (Nov. 8, 1576) was the result. It has been supposed that Orange's influence and agents were primarily responsible for this achievement. Certainly this peace. supplemented by the first Union of Brussels (January 1577), heralded the realization of his ambitions and ideals: not only were his governorships confirmed and his possessions restored to him, but the union of the so-called 17 Netherlands under a national government seemed about to be accomplished. But the idea of a "common fatherland," though steadily growing, was not yet strong enough to overcome particularistic or religious divisions. Because of the Perpetual Edict of 1577, the treaty the States General concluded with the new governor general, Don John of Austria, specified that the Catholic religion was to be maintained all over the country, and because of the absence of provisions for the maintenance of the Pacification, the deputies of Holland and Zeeland left the assembly.

In July 1577, however, Don John attempted to renew hostilities, thus driving more and more people to support the Prince. Those towns of Holland and Zeeland that had always opposed Orange or had been recovered by Spanish arms now recognized his authority; the last to accede (February 1578) was Amsterdam. The town and province of Utrecht followed suit, and in Flanders, Brabant, Groningen, and elsewhere the radical Orangists, mostly Calvinistic burghers and craftsmen, gained the upper hand. In September 1577 the States General, to which the representatives of Holland and Zeeland had now returned, invited Orange to come south to Brussels, where he was triumphantly received. Under his influence a new union came into being, providing for joint action by both Catholics and Protestants against "the com-mon enemy of the fatherland." Meanwhile, the States General, continuing to act with sovereign power, had formed a government headed by the young archduke Matthias, an Austrian nephew of King Philip. Matthias agreed to conditions laid down by the Prince guaranteeing a constitutional system of government. Moreover, in January 1578, Orange was commissioned to act as lieutenant general for Matthias.

The Prince's failure. Orange was now at the zenith of his career, but his triumph proved as short-lived as was the general union of the provinces. His failure to consolidate the newly won unity was primarily due to the excesses of his Calvinist supporters who forcibly introduced popular and intolerant regimes. Thus, the revolutionaries played into the hands of King Philip's new governor general, Alessandro Farnese, the son of the former regent Margaret, who on Oct. 1, 1578, had taken office after the death of Don John.

The Catholic but still anti-Spanish reaction made itself felt first in the southern, French-speaking provinces. Not unnaturally, when seeking for help, their thoughts turned to France, but it was on the Prince of Orange's advice that the States General in August 1578

adopted the Catholic duc d'Anjou, brother of Henry III of France, as "Defender of the Liberty of the Netherlands." Soon afterward, the formation of specific unions by smaller groups of provinces began to compromise the general union, which was irrevocably compromised in May 1579 when the Prince gave qualified support to the "Union of Utrecht," principal promoter was his brother John, governor of Gelderland and a staunch Calvinist. On March 15 the Prince was outlawed by Philip II and a reward offered for his assassination. He answered the charges of treason with a vehement Apologie, written for him by his court chaplain, and he continued to put his trust in France. Against much Protestant opposition, in 1580 he persuaded the States General to give the Duc d'Anjou the hereditary sovereignty of the Netherlands, and a year later they solemnly renounced their allegiance to the King of Spain. Meanwhile, the provinces of Holland and Zeeland, unwilling to grant the French prince any direct authority, planned to create Orange their hereditary count.

Anjou, however, far from aiding the cause of liberty, added to the prevailing confusion. With great difficulty Orange effected his reconciliation with the States General. His own continuing reliance on France is shown by his fourth marriage (1583), to Louise de Coligny, a daughter of the murdered Huguenot leader the Comte de Coligny.

As a result of the ban pronounced by Philip II, an attempt was made on the Prince's life at Antwerp in March 1582. With Parma advancing from the south, he retired in July 1582 to Holland, where he moved into his old quarters in a former convent at Delft. There, in 1584, he was shot by a fanatical Catholic, the Franc-Comtois Balthasar Gérard. His last words were a prayer for the people he had tried to lead for so long. The family seat of Breda being then in enemy hands, he was buried in the New Church at Delft.

Blok, Willem de Eerste, Prins van Oranje, 2 vol. (1919–20). A shorter biography is C.V. Wedgwood, William the Silent (1944). See also Koenraad W. Swart, William the Silent and the Revolt of the Netherlands (1978).

• William II (b. May 27, 1626, The Hague-d. Nov. 6, 1650, Aldaar, Neth.), prince of Orange, count of Nassau, stadholder and captain general of six provinces of the Netherlands from 1647, and the central figure of a critical

William II, detail of a painting by Gerrit van Honthorst; in the Rijksmuseum, Amsterdam

By courtesy of the Rijksmuseum, Amsterdam

struggle for power in the Dutch Republic. The son of Frederick Henry, prince of Orange, he was guaranteed, in a series of acts from 1630 onward, succession to all his father's offices. On May 12, 1641, William married Mary Stuart (1631-60), eldest daughter of Charles I of England. After his father's death (March

1647), William succeeded to the title of prince of Orange, to the stadholdership of all the provinces except Friesland, and to the offices of captain general and admiral general of the Union.

Early in the following year peace was concluded at Münster, ending the Eighty Years' War for Dutch independence. The treaty, however, was concluded despite William's wrathful opposition. He did not abandon his dynastic and military ambitions. He corresponded with the French government and planned to resume the war in order to conquer part of the Spanish Netherlands; he also supported his brother-in-law Charles II, hoping to restore him to the throne of England. The States (assembly) of Holland, fearing that William's high ambitions would lead to war, disbanded some of the troops paid by them (June 4, 1650). William then turned to the States General, most of whom were jealous of Holland's influence, which granted him extraordinary power. On July 30, William imprisoned six leading members of the States of Holland and ordered his army to march on Amsterdam. The attempt to occupy Amsterdam failed, but the States accepted a compromise. William then met much opposition in trying to implement his foreign policy. He died of smallpox before his influence could really be tested.

• William III: see William III (England, Great Britain, United Kingdom).

• William IV, Dutch in full WILLEM KAREL HENDRIK FRISO (b. Sept. 1, 1711, Leeuwarden, Neth.—d. Oct. 22, 1751, The Hague), prince of Orange and Nassau, general hereditary stadholder of the United Netherlands. The posthumous son of John William Friso (q.v.) of the House of Nassau-Dietz, William became stadholder of Friesland and then later also of Groningen and of Gelderland, assuming his full functions in 1729–31. On March 25, 1734, he married Anne of Hanover (1709–59), eldest daughter of George II of Great Britain. By the extinction of other branches of the Ottonians of Nassau he aquired a number of territories in Germany.

In April 1747, during the War of the Austrian Succession, the French invaded Dutch territory. A spontaneous popular movement arose, first in Zeeland, then in Holland, in Utrecht, and in Overijssel, for the elevation of William to the stadholdership in these provinces, vacant since William III's death (1702), and to the ranks of captain general and admiral general. William was indeed appointed, and all his offices were made hereditary. The first man to be stadholder of all seven provinces, William IV now had more power than any of his predecessors; but he proved incompetent as a leader, and peace was signed in 1748.

The Dutch people expected reforms to make the rule of the urban oligarchies in Holland less absolute. William, who was intelligent and industrious, made attempts to abolish the greatest abuses; but when he died, the most urgent problems were unsolved. He left a three-year-old son, William V.

• William V (b. March 8, 1748, The Hague—d. April 9, 1806, Brunswick, Ger.), prince of Orange and Nassau and general hereditary stadholder of the Dutch Republic (1751–95). When his father, William IV, died (1751), he was but three years of age, and his mother, Anne of Hanover, acted as regent for him until her death (Jan. 12, 1759); then the provincial States (assemblies) acted as regents. Duke Louis Ernest of Brunswick-Wolfenbüttel (1718–88) acted as William's guardian and gained such influence that when William was declared of age in 1766, he asked the Duke to remain as his adviser. On Oct. 4, 1767.

William married Wilhelmina of Prussia, sister of the future Frederick William II.

William V, detail of a painting by J.G. Ziesenis; in the Rijksmuseum, Amsterdam

By courtesy of the Rijksmuseum, Amsterdam

Politically and militarily incompetent, William pursued an Anglophile policy, arousing the hostility of large sections of the population. He was, moreover, unable to prevent the Anglo-Dutch War of 1780–84, stirring the vehement opposition of the Patriot Party (nationalists desiring reform). When the war was over, William left The Hague (1785), returning only after a Prussian force had expelled the Patriots (1787).

William's conservatism made all reforms impossible. In 1795, because of the French invasion, he left the Netherlands with his family (January 18) and emigrated to England. William was dismissed from his office as stadholder (February 23), and his rule was succeeded by the Batavian Republic (1795–1806). In November 1802 he went to his dynastic Nassau possessions in Germany.

NETHERLANDS: KINGS

• William I, Dutch in full WILLEM FREDERIK (b. Aug. 24, 1772, The Hague—d. Dec. 12, 1843, Berlin), king of The Netherlands and grand duke of Luxembourg (1815–40) who sparked a commercial and industrial revival

William I, detail of a painting by J.A. Kruseman; in the Rijksmuseum, Amsterdam

By courtesy of the Rijksmuseum, Amsterdam

following the period of French rule (1795–1813), but provoked the Belgian revolt of 1830 through his autocratic methods.

The son of William V, prince of Orange, William married Wilhelmina, daughter of his uncle, Frederick William II of Prussia, in 1791 and emigrated with his family to England in 1795 after the French invasion of the Dutch Republic. He gained title to the bishopric of Fulda and other smaller areas in Germany in negotiations with the French emperor Napoleon I in 1802 but lost all his German titles in 1806, when he sided with Prussia against Napoleon. Except for some service with the Austrians against Napoleon

in 1809, he lived in exile at the Prussian court until 1812.

After the Dutch revolt against French rule in 1813, William accepted the provisional government's offer to become sovereign prince of the Dutch Republic, and in 1815 he became king of the United Netherlands, which included Belgium, Liège, and the Grand Duchy of Luxembourg. He soon undertook an economic recovery program for the kingdom, founding a bank in 1822 to finance industrial expansion in Belgium and forming The Netherlands Trading Society in 1824 to facilitate long-distance commerce in the north. The Belgians, however, objected to the union with the northern Netherlanders because the two groups were given equal representation in the Parliament and charged equal taxes, although the Dutch had a far greater accumulated debt and a far smaller population.

The Belgian Catholic clergy were alienated by William's policy of state supremacy in ecclesiastical matters. He placed the universities of Ghent, Louvain, and Liège under state control and required seminary students to attend a new "philosophical college" at Louvain. The Belgians were further antagonized by the decision to make Dutch the administrative language throughout the kingdom and by the Dutch insistence on free trade when protection was needed by Belgian industries.

The Belgian Liberal and Catholic factions opposed to William's rule joined in 1828 (the "union of parties") and petitioned the King for political and religious reforms. Inspired by the revolution in Paris in July 1830, a rebellion broke out in Brussels the following month. After initial rebel military successes, a conference of the leading European powers decided in January 1831 that Belgium should be an independent state. William refused to accept the Belgian separation and anticipated renewed warfare. Aware that the Dutch people were increasingly opposed to his autocratic methods, he abdicated in October 1840 and spent the rest of his life in Berlin.

• William II, Dutch in full WILLEM FRED-ERIK GEORGE LODEWIJK (b. Dec. 6, 1792, The Hague—d. March 17, 1849, Tilburg, Neth.), king of The Netherlands and grand duke of Luxembourg (1840–49) whose reign saw the reestablishment of fiscal stability and the transformation of The Netherlands to a more liberal monarchy through the constitution of 1848.

Exiled to England with his family in 1795, William served in the British Army (1811–12) as the Duke of Wellington's aide-de-camp in the Peninsular War (1808–14); he also commanded the Netherlands troops in the Battle of Waterloo (1815). In 1816 he married the grand duchess Anna Pavlovna, sister of the Russian emperor Alexander I. Popular in the

Belgian part of the United Kingdom of the Netherlands, he was sent to Brussels by his father, William I, after the outbreak of the Belgian Revolution of 1830. His concessions to the rebels failed to quell the revolt, and he retired to England until August 1831, when he returned to Belgium, leading a Dutch army to victory over the forces of the new king of the Belgians, Leopold I, before French intervention stopped his advance.

William II became king of The Netherlands in October 1840 on his father's abdication. Although he lacked William I's abilities as a statesman and financier, he was fortunate in his choice of F.A. van Hall as finance minister. Van Hall stabilized the public finances and, helped by profits from Dutch colonial ventures in the East Indies, achieved the country's first surplus in 70 years in 1847.

William was tolerant toward Roman Catholics and Separatists (dissident Calvinists), but was opposed by the Liberals who wanted a more representative form of government. Afraid that the European revolutionary movements of 1848 would sweep across The Netherlands also, he authorized the leading Liberal statesman, Johan Thorbecke, and his associates to draft a new constitution, approved in November 1848. The constitution expanded the power of the ministers and the National Assembly, established the principle of direct elections, and secured basic civil liberties. William died a few months later.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

• William III, Dutch in full WILLEM ALEXANDER PAUL FREDERIK LODEWIJK (b. Feb. 19, 1817, Brussels—d. Nov. 23, 1890, Apeldoorn, Neth.), conservative king of The Netherlands and grand duke of Luxembourg (1849–90)

William III, detail from an oil painting by Nikolaas Pieneman, 1849; in the collection of the Royal Military Academy, Breda, Neth.

By courtesy of the Iconographisch Bureau, The Hague

who was influential in forming Dutch ministries until 1868 but was unable to prevent Liberal control of the government.

The eldest son of King William II, William married his cousin Sophia, daughter of King William I of Württemberg, in 1839 and succeeded to the throne in 1849. He opposed the constitution of 1848, which created a parliamentary form of government, but was nevertheless forced to allow Johan Thorbecke, major proponent of the constitution, to head the new government. Thorbecke resigned in 1853 when William adopted, against the government's wishes, an anti-Catholic posture in the dispute over the proposed reestablishment of a Roman Catholic archbishop at Utrecht. Between 1862 and 1868 he was able to rule through the Cabinet.

In 1867 William tried to sell his sovereignty over Luxembourg to France but yielded to Prussia's demand that the area be independent. At the same time he incorporated part of Limburg into The Netherlands. Following the Luxembourg crisis, his influence in Parliament declined markedly. After his first wife died in

1877, he married Emma of Waldeck-Pyrmont (1879), who served as regent in 1890 during the King's illness. Wilhelmina, his daughter by Emma, succeeded to the throne of The Netherlands on his death.

NORMANDY

- William also called WILLIAM LONGSWORD, French GUILLAUME LONGUE-É-PÉE (d. Dec. 17, 942, Picardy, Fr.), son of Rollo and second duke of Normandy (927-942). He sought continually to expand his territories either by conquest or by exacting new lands from the French king for the price of homage. In 939 he allied himself with Hugh the Great in the revolt against King Louis IV; through the mediation of the Pope, the war ended, and Louis renewed William's investi-ture of Normandy (940). William, however, continued his territorial ambitions, especially northward. Drawn to a conference on an island in the Somme, he was assassinated on the orders of the count of Flanders, Arnulf I.
- William II: see William I (England, Great Britain, the United Kingdom).
- William (III): see William II (England, Great Britain, the United Kingdom).
- William (III or IV): see William the Aetheling; William Clito.

SCOTLAND

• William I, byname WILLIAM THE LION (b. 1143—d. Dec. 4, 1214, Stirling, Stirlingshire, Scot.), king of Scotland from 1165 to 1214; although he submitted to English overlordship for 15 years (1174–89) of his reign, he ultimately obtained independence for his kingdom.

William was the second son of the Scottish Henry, earl of Northumberland, whose title he inherited in 1152. He was forced, however, to relinquish this earldom to King Henry II of England (ruled 1154–89) in 1157. Succeeding to the throne of his elder brother, King Malcolm IV, in 1165, William joined a revolt of Henry's sons (1173) in an attempt to regain Northumberland. He was captured near Alnwick, Northumberland, in 1174 and released after agreeing to recognize the overlordship of the king of England and the supremacy of the English Church over the Scottish Church.

Upon Henry's death in 1189, William obtained release from his feudal subjection by paying a large sum of money to England's new king, Richard I (ruled 1189–99). In addition, although William had quarrelled bitterly with the papacy over a church appointment, Pope Celestine II ruled in 1192 that the Scottish Church owed obedience only to Rome, not to England, During the reign of King John in England, relations between England and Scotland deteriorated over the issue of Northumberland until finally, in 1209, John forced William to renounce his claims.

In his effort to consolidate his authority throughout Scotland, William developed a small but efficient central administrative bureaucracy. He chartered many of the major burghs of modern Scotland and in 1178 founded Arbroath Abbey, which had become probably the wealthiest monastery in Scotland by the time of his death. It is doubtful that William exhibited enough military prowess to merit the sobriquet "the Lion." He was succeeded by his son Alexander II.

• William II: see William III (England, Great Britain, United Kingdom).

SICILY

• William I, byname william the BAD, Italian Guglielmo il Malo (b. 1120—d. May 7, 1166, Palermo), Norman king of Sicily, an able ruler who successfully repressed the conspiracies of the barons of his realm. His epithet was bestowed on him by his hapless

enemies. He patronized science and letters and showed religious tolerance; among those who frequented his court were many Muslims.

The deaths of William's three elder brothers made him heir apparent in 1148; associated in kingship in 1151 with his father, Roger II, he was crowned king after Roger's death in the cathedral of Palermo on Easter Sunday, April 4, 1154.

On the advice of his minister, Maione of Bari, William energetically pursued his father's policy of strengthening royal authority over the towns and the barons, who rallied around his cousin Robert of Loritello and looked to the German king Frederick I Barbarossa for help. When Frederick's projected expedition to Italy came to naught, the rebels sought support from the Byzantine emperor Manuel I Comnenus. In 1155 the Byzantines invaded southern Italy and overran Apulia, but William won a resounding victory at Brindisi and reconquered the province. He next settled his disputes with Pope Adrian IV with the Concordat of Benevento (1156), winning papal acknowledgment of his authority over all the territories that had come under Norman control.

The loss of the kingdom's African possessions (1158-60) weakened William's prestige, and the assassination of Maione in November 1160 exposed him to new danger from the conspiring barons, led by a Norman noble, Matteo Bonello. An attempt to depose him nearly succeeded, and rebellions broke out in Sicily and on the mainland. The royal palace in Palermo was plundered of its treasures, including the silver planisphere of the great Arab geographer al-Idrīsī, who was forced to flee Sicily as the island's Muslims became targets of mob attacks. But William quickly suppressed the disorders. He imposed stern punishment on the dissidents, who this time received no help from abroad, William having established friendly relations with both the Pope and the Byzantine Emperor. At his death his kingdom passed intact to his young son, William II.

• William II, byname WILLIAM THE GOOD, Italian GUGLIELMO IL BUONO (b. 1154—d. Nov. 18, 1189, Palermo), the last Norman king of Sicily; under a regency from 1166, he ruled in person from 1171. He became known

William II, detail of a mosaic, 12th century; in the Church of Monreale, Sicily

Alinari-Art Resource/EB Inc.

as William the Good because of his policy of clemency and justice toward the towns and the barons, in contrast with his father, William I the Bad.

After the regency of his mother, Margaret of Navarre, had ended, William II at first continued his father's policy of friendship with Pope Alexander III and with the Byzantine emperor Manuel I Comnenus. In 1172, however, the proposed marriage of William to Manuel's daughter Maria was thwarted by the Emperor, and William immediately turned against the Byzantines. In 1177 he concluded a truce with

his father's old enemy, the German king Frederick I Barbarossa, who had been defeated by the Lombard League at Legnano in 1176 and no longer seemed dangerous to Sicily. Also in 1177, on February 13, William married Joan, daughter of King Henry II of England. After the death of Pope Alexander III in 1181, William felt freer to exploit disorders in the Byzantine Empire, and he sought even closer relations with Frederick I. William agreed that his aunt Constance should marry Frederick's son Henry (later Henry VI); because William's own marriage was childless, this betrothal (Oct. 29, 1184) gave Henry a strong claim to the Sicilian succession, an arrangement disliked by the Norman national party.

In June 1185 William commenced a great campaign against the Byzantines. His forces crossed Macedonia and captured Thessalonica (modern Salonika), but when his fleet was in sight of Constantinople, his army was ambushed and defeated. Previously (1174–75) William had unsuccessfully attempted conquests on the North African coast. He died while planning to join the Third Crusade.

William CLITO, French GUILLAUME CLITON (b. c. 1101—d. July 28, 1128, Aalst, Flanders), count of Flanders and titular duke of Normandy (as William IV, or as William III if England's William Rufus' earlier claim to the duchy is not acknowledged).

Son of Duke Robert II Curthose (and grandson of William the Conqueror and Matilda of Flanders), William Clito was supported by Louis VI of France in claiming the duchy when his father was imprisoned (1106) by the English. Henry I of England, however, had his own son William the Aetheling recognized as heir to Normandy and, in 1119, decisively defeated Louis VI and Clito at Bremule. When the Aetheling was drowned (1120), Clito made further trouble in Normandy but died in 1128.

William DE HAUTEVILLE, byname WILLIAM IRON ARM, Italian GUGLIELMO D'ALTAVILLA, OF GUGLIELMO BRACCIO-DI-FERRO, French GUILLAUME DE HAUTEVILLE, OF GUILLAUME BRAS DE FER (b. Hauteville-la-Guichard, Normandy—d. 1046), Norman adventurer, the eldest of 12 Hauteville brothers, a soldier of fortune who led the first contingent of his family from Normandy to southern Italy; he undertook its conquest and quickly became count of Apulia.

William and his brothers Drogo and Humphrey responded (c. 1035) to an appeal for reinforcements in Italy by the Norman Rainulf of Aversa. William earned his sobriquet "Iron Arm" during the Norman-Byzantine siege of Muslim-occupied Syracuse (Sicily) when he charged and killed the amīr of the city. He served as a captain of the Norman army that joined the Lombards in invading Apulia, in southern Italy, and was proclaimed count of Apulia in 1042. The title was confirmed later that year by Gaimar V, the Lombard prince of Salerno, who arranged a marriage between William and his own niece, daughter of the Duke of Sorrento. Emerging as the most powerful leader in southern Italy, William, allied with Gaimar, invaded Calabria (the toe of Italy) two years later. After his death, his brother Drogo was invested as count of Apulia.

William DE LA MARE (b. England—d. c. 1290), English philosopher and theologian, advocate of the traditional Neoplatonic–Augustinian school of Christian philosophy, and leading critic of the Aristotelian thought introduced by Thomas Aquinas.

A member of the Franciscan order, William became a master of theology at the University of Paris c. 1275 and subscribed to the Augustinian school as expressed by the celebrated

Italian Franciscan Bonaventure. While lecturing at Paris, William wrote his Commentarium super libros sententiarum ("Commentary on the Books of Sentences"—i.e., annotations on Peter Lombard's 12th-century collection of patristic and early medieval theology). Reflecting his Augustinian intellectual development, William considered the knowing process to be the operation of an inherent power in the human spirit given by God at creation. According to William, man's intrinsic desire to reunite with God, and an inner enlightenment of the soul (illuminationism) by which eternal ideas are recognized, constituted the essence of human psychology.

On returning to England William wrote his chief work, Correctorium fratris Thomae (1278; "Corrective of Brother Thomas"), a critique of the writings of Thomas Aquinas. The introduction of Aristotelian thought into theology drew a volatile reaction from the traditional Neoplatonic thinkers, who had dominated Western thought since Augustine. Desirous of providing students with a guide to control these new thoughts, William chose 118 articles from Aquinas' writings, mostly from his celebrated Summa theologiae ("Sum of Theology"), and noted points at which Aristotelian influence produced concepts or interpretations contrary to orthodox formulas. Historians of philosophy, however, observe that William failed to analyze the basic questions causing conflict between Thomistic Aristotelians and Neoplatonists—i.e., the distinction between essence and existence, time and eternity, matter and spirit.

William's Correctorium was approved for the entire Franciscan order in 1282, when the Franciscan minister general Bonagratia forbade the study of Aquinas' Summa theologiae except by scholars using the critical standard of William's Correctorium. After publication, the Correctorium, in a publicized polemic, was in turn corrected by Thomists, notably the English Dominicans Richard Clapwell and Thomas Sutton and the French Dominican John of Paris. Entitling their response Correctorium corruptorii fratris Thomae ("Corrective of the Corruptor of Brother Thomas"), the Thomists emphasized William's failure to comprehend both Aquinas and Aristotle. The surviving texts of the Correctoria, edited by P. Glorieux (1927), with comments by F. Pelster (1956), probably do not give William's original version but only preserve a revision that he completed c. 1284.

Of parallel importance were William's contributions to biblical studies. His Correctio textus bibliae ("Corrective of the Text of the Bible") and the De Hebraeis et Graecis vocabulis glossarum bibliae ("On the Hebrew and Greek Terms of Biblical Annotations") are considered among the most learned from the medieval period.

William Longsword: see William I under William (Normandy).

William OF AUVERGNE, also called WILLIAM OF PARIS, OR WILLIAM OF ALVERNIA, French GUILLAUME D'AUVERGNE, OR DE PARIS (b. after 1180, Aurillac, Aquitaine—d. 1249, Paris), the most prominent French philosopher-theologian of the early 13th century and one of the first Western scholars to attempt to integrate classical Greek and Arabic philosophy with Christian doctrine.

William became a master of theology at the University of Paris in 1223 and a professor by 1225. He was named bishop of the city in 1228. As such he defended the rising mendicant orders against attacks by the secular clergy, which impugned the mendicants' orthodoxy and reason for existence. As a reformer he limited the clergy to one benefice

(church office) at a time if it provided them sufficient means.

William's principal work, written between 1223 and 1240, is the monumental Magisterium divinale ("The Divine Teaching"), a seven-part compendium of philosophy and theology: De primo principio, or De Trinitate ("On the First Principle," or "On the Trinity"); De universo creaturarum ("On the Universe of Created Things"); De anima ("On the Soul"); Cur Deus homo ("Why God Became Man"); De sacramentis ("On the Sacraments"); De fide et legibus ("On Faith and Laws"); De virtutibus et moribus ("On Virtues and Customs").

After the condemnation of Aristotle's *Physics* and *Metaphysics* in 1210 by church authorities fearful of their negative effect on the Christian faith, William initiated the attempt to delete those Aristotelian theses that he saw as incompatible with Christian beliefs. On the other hand, he strove to assimilate into Christianity whatever in Aristotle's thought is consistent with it.

Influenced by the Aristotelianism of Avicenna (Ibn Sīnā), an 11th-century Islāmic philosopher, and by the Neoplatonism of Augustine and the school of Chartres, William, nevertheless, was sharply critical of those elements in classical Greek philosophy that contradicted Christian theology, specifically on the questions of human freedom, Divine Providence, and the individuality of the soul. Against Avicenna's determinism, he held that God "voluntarily" created the world, and he opposed those proponents of Aristotelianism who taught that man's conceptual powers are one with the single, universal intellect. William argued that the soul is an individualized, immortal "form," or principle, of intelligent activity; man's sentient life, however, requires another activating "form.

The complete works of William of Auvergne, edited in 1674 by B. Leferon, were reprinted in 1963. A critical text of *De bono et malo* by J.R. O'Donnell appeared in 1954.

William OF AUXERRE, French GUILLAUME D'AUXERRE (b. c. 1150, Auxerre, Bishopric of Auxerre—d. Nov. 3, 1231, Rome), French philosopher-theologian who contributed to the adaptation of classical Greek philosophy to Christian doctrine. He is considered the first medieval writer to develop a systematic treatise on free will and the natural law.

Probably a student of the Parisian monk and Humanist Richard of St. Victor, William became a master in theology and later an administrator at the University of Paris. After a long career at the university, he was commissioned in 1230 to serve as French envoy to Pope Gregory IX to advise Gregory on dissension at the university. William pleaded the cause of the students against the complaints of King Louis IX.

In 1231 William was appointed by Gregory to a three-member council to censor the works of Aristotle included in the university curriculum to make them conform sufficiently to Christian teaching. Contrary to the papal legate Robert of Courcon and other conservatives, who in 1210 condemned Aristotle's Physics and Metaphysics as corruptive of Christian faith, William saw no intrinsic reason to avoid the rational analysis of Christian revelation. Confident of William's orthodoxy, Gregory urged the King to restore him to the university faculty so that he and Godfrey of Poitiers might reorganize the plan of studies. William fell ill and died before any of these projects were begun.

William's principal work is the Summa super quattuor libros sententiarum ("Compendium on the Four Books of Sentences"), usually called the Summa aurea ("The Golden Compendium"), a commentary on early and medieval Christian theological teachings assembled by Peter Lombard in the mid-12th

century. Written between 1215 and 1220, the *Summa aurea*, in four books, selectively treated such theological matters as God as one nature in three persons, creation, man, Christ and the virtues, sacramental worship, and the Last Judgment.

William's emphasis on philosophy as a tool for Christian theology is evidenced by his critique of Plato's doctrine of a demiurge, or cosmic intelligence, and by his treatment of the theory of knowledge as a means for distinguishing between God and creation. He also analyzed certain moral questions, including the problem of human choice and the nature of virtue.

William also wrote a Summa de officiis ecclesiasticis ("Compendium of Church Services"), which treated liturgical, or common, prayer, sacramental worship, and the annual cycle of scripture readings and chants. This systematic study served as the model for the late-13th-century noted work on divine worship, Guillaume Durand's Rationale divinorum officiorum ("An Explanation of the Divine Offices"). The 16th-century edition of the Summa aurea was reprinted in 1965.

William OF CHAMPEAUX, French GUILLAUME DE CHAMPEAUX, Latin GUGLIELMUS DE CAMPELLIS (b. c. 1070, Champeaux, Fr.—d. 1121, Châlons-sur-Marne), French bishop, logician, theologian, and philosopher who was prominent in the Scholastic controversy on the nature of universals (i.e., words that can be applied to more than one particular thing).

After studies under the polemicist Manegold of Lautenbach in Paris, the theologian Anselm of Laon, and the philosopher Roscelin at Compiègne, William taught in the cathedral school of Notre Dame, Paris, where he had Peter Abelard among his pupils. He became head of the school and archdeacon of Paris c. 1100, but retired in 1108, probably because of the violent polemics between him and Abelard over the doctrine of universals.

William withdrew to the nearby abbey of Saint-Victor, where—at the school he established with Anselm's aid—he taught rhetoric, logic, and theology, again having Abelard as his pupil. The abbey flourished under William's direction, contributing significantly to the mystical trend characteristic of St. Victor. He was consecrated bishop of Châlons-sur-Marne in 1113 and initiated a reform, becoming an advocate of clerical celibacy and a champion of orthodoxy and ecclesiastical investiture. In 1115 he ordained the great Bernard of Clairvaux, who probably studied under him.

William's surviving works are all theological. The fragmentary De sacramento altaris ("On the Sacrament of the Altar"), the possibly apocryphal De origine animae ("On the Origin of the Soul"), the De essentia Dei ("On the Essence of God"), and the Dialogus seu altercatio cujusdam Christiani et Judaei de fide Catholica ("A Dialogue or Argument of a Certain Christian and Jew on the Catholic Faith") are printed by J.-P. Migne in Patrologia Latina ("Works of the Latin Fathers"). His logical works are not extant. William's Sententiae seu Ouaestiones ("Sentences or Ouestions") is an early systematization of classical Christian doctrine. Georges-Joseph Lefèvre's Les Variations de Guillaume de Champeaux et la question des universaux ("The Variations of William of Champeaux and the Question of Universals") appeared in 1898, followed by Heinrich Weisweiler's Das Schrifttum der Schule Anselms von Laon und Wilhelms von Champeaux in deutschen Bibliotheken ("The Writings of the School of Anselm of Laon and William of Champeaux in German Libraries")

William OF CONCHES, French GUILLAUME DE CONCHES (b. c. 1100, Conches, Fr.—d. 1154), French Scholastic philosopher and a leading member of the School of Chartres.

A pupil of the philosopher Bernard of Chartres, he taught at Chartres and Paris and was tutor to Henry (later Henry II of England), son of Geoffrey Plantagenet.

William, a realist whose ideas leaned toward pantheism, gave an atomistic explanation of nature, the four elements (air, water, fire, earth) being regarded as combinations of homogeneous individual atoms. He wrote explanations of Plato's *Timaeus* and Boethius' *De consolatione philosophiae* ("The Consolation of Philosophy"), and composed two original works, *Philosophia Mundi* ("Philosophiae ("The Business of Philosophy"). He is also considered to be the author of the *Summa Moralium Philosophorum* ("The Substance of the Ethical Philosophies"), the earliest medieval treatise on ethics.

William OF HIRSAU, German WILHELM VON HIRSAU (b. Bavaria—d. July 4, 1091, Württemberg, Duchy of Swabia), German cleric, Benedictine abbot, and monastic reformer, the principal German advocate of Pope Gregory VII's clerical reforms, which sought to eliminate clerical corruption and free ecclesiastical offices from secular control.

William was sent as a child to the monastic school of Sankt Emmeran in Gegensburg. In 1069 he was appointed abbot of the monastery of Hirsau in Württemberg, following the de-position of the Abbot Frederick; William, however, refused to take office until Frederick died in 1071. After a visit to Rome in 1075, William won from Gregory a decree exempting the abbey from the authority of the local bishop, who often represented political interests. In turn, William became the leading agent of the Gregorian reform in Germany. He supported the papacy in the investiture controversy, a dispute regarding the right of the pope to make ecclesiastic appointments without political interference. He was also severely critical of the German bishops who aligned themselves with the papacy solely because of their political and economic interests, observing that disentanglement from such interests was a major tenet of the reform.

With papal encouragement, William, in 1079, adapted for Hirsau the regimen and customs of Cluniac monasticism. William established an elaborate daily liturgy along the lines of that developed at the Benedictine abbey of Cluny in France. His Constitutiones Hirsaugienses ("Constitutions of Hirsau") went beyond his model, establishing a stricter discipline in common prayer and silence. In 1077 William instituted a new category of monks, the *fratres exteriores* (literally, "external brothi.e., lay brothers), to perform manual tasks in the monastery; these monks assumed less stringent monastic vows than their clerical brethren and had a smaller role in liturgical worship. The practice spread to the Cluniac monasteries and eventually became the norm at Benedictine monasteries across Europe

William's reforms proved so popular that he was compelled, in 1083, to construct a second monastery nearby to accommodate the increasing numbers of monks at Hirsau. Other abbeys became associated with Hirsau, transforming it into a major monastic centre; more than 100 houses following Hirsau's rule were established during William's lifetime.

In furthering the scholarly learning of Hirsau, William wrote Dialogi de musica ("Dialogues on Music") and De astronomia ("On Astronomy"). These treatises, together with the Constitutiones Hirsaugienses, are contained in the series Patrologia Latina, J.P. Migne (ed.), vol. 150 (1854). The primary source for the life of William is in the collection Monumenta Germaniae Historica, Scriptores ("Historical Records of Germany, Writers"), W. Wattenbach (ed.), vol. 12 (1856).

William OF HOLLAND: see William under William (Germany/Holy Roman Empire).

William OF MOERBEKE, French GUILLAUME DE MOERBEKE (b. c. 1215, Moerbeke, Brabant—d. c. 1286, Corinth, Greece), Flemish cleric, archbishop, and classical scholar whose Latin translations of the works of Aristotle and other early Greek philosophers and commentators were important in the transmission of Greek thought to the medieval Latin West.

William entered the Dominican priory at Ghent and later studied in Paris and Cologne, where he presumably worked with Albertus Magnus. After an assignment c. 1260 to the priory in Thebes, and in Nicaea, near Constantinople, he was appointed chaplain and confessor to Pope Clement IV (1265–68), and to five succeeding popes. A proponent of reunion between the Eastern and Western churches, William took part in the Council of Lyon (1274) as an adviser to Pope Gregory X. On April 9, 1278, Pope Nicholas III named him archbishop of Corinth, where he lived until his death. The neighbouring Greek village of Merbeke is a memorial to him.

At the urging of Thomas Aquinas, whom he knew at the Italian Dominican houses at Viterbo and Orvieto, William in 1260 made a literal Latin translation of Aristotle's On the Heavens and Meteorology. During the next two decades he translated parts of Aristotle's Metaphysics, Politics, Rhetoric, and History of Animals, together with cognate treatises on animal psychology and physiology, concluding in 1278 with Poetics. He revised existing Latin versions of other Aristotelian writings, including On Memory and Recall, Physics, Posterior Analytics, and possibly the Nichomachean Ethics.

The more important early commentaries on Aristotle's works that William also translated include those by Alexander of Aphrodisia (2nd century) on *Metaphysica* and *De sensu (On Sensation)*, Ammonius Hermiae (5th century) on *Peri hermeneias* ("On Interpretation"), and those by Themistius (4th century) and John Philoponus (6th century) on *De anima (On the Soul)*. Most of these translations were done in 1268.

William's translations of such leading early Neoplatonist writers as the 5th-century philosopher Proclus' Elementatio theologica (Elements of Theology), as well as his commentary on Plato's Timaeus, revealed to 13thcentury Scholastic philosophers and theologians the Platonic basis of treatises formerly and incorrectly attributed to Aristotle. The discovery of this literature by Western philosophers also gave great impetus to Neoplatonism in the Middle Ages. Using a rigidly literal style, William rendered the Greek texts into Latin with a fidelity that not only helped his contemporaries grasp Aristotle's exact meaning but also established his translations as the standard for the medieval Latin world

Other classical Greek texts that William translated include works of Ptolemy and Hippocrates' De prognosticationibus aegritudinum secundum motum lunae (On Predicting Illnesses According to the Phases of the Moon).

William OF NewBurgh (b. 1136, Bridlington, Yorkshire, Eng.—d. c. 1198, Newburgh Priory), English chronicler who is remembered as the author of one of the most valuable historical works on 11th- and 12th-century England. He entered the Augustinian priory of Newburgh as a boy to study theology and history and apparently remained there the rest of his life, gaining information from travellers and from neighbouring abbeys.

Written at the request of Ernald, abbot of Rievaux, William's Historia rerum Anglicarum (1196–98; "History of English Affairs") covers the period from 1066 to 1198. William's erudition included knowledge of the classical writers Virgil, Horace, Cicero, and Livy; the early church historians Eusebius, Gregory, and Augustine; and the English chroniclers Bede, Henry of Huntingdon, Simeon of Durham,

and Anselm of Canterbury. The history was primarily a compilation of other English chronicles, except for his original treatment of the period from 1154 to 1173.

William's dependence on oral tradition and legend resulted in some vagueness and error, but the history is extremely valuable both as a source of English domestic history, at that time overshadowed by news of the Crusades, and for its unusually acute commentary and critical analysis of cause and effect in the anarchic reign of King Stephen (1135–54).

William OF SAINT-AMOUR, French GUIL-LAUME DE SAINT-AMOUR (b. c. 1200, Saint-Amour, Kingdom of Arles—d. September 1272, Saint-Amour), French philosopher and theologian who led the opposition at the University of Paris to the 13th-century rise of the newly formed mendicant religious orders.

A protégé of the Count of Savoy, who supported his doctoral studies in canon law and theology at the University of Paris, William was chosen dean of the theology masters c. 1250. During that period he wrote a significant commentary on the logical treatises *De Analytica priora et posteriora* ("On the Prior and Posterior Analytics") of Aristotle.

Disdaining the mendicant religious orders, William initiated the attack on their representatives and theological scholars at the university, notably the Franciscan Bonaventure and the Dominican Thomas Aquinas. At William's instigation, the university suspended the Dominican masters in the winter of 1254. He also obtained from Pope Innocent IV in July 1254 a decree limiting each religious order to one university master's chair. In November of the same year, Pope Innocent rescinded certain privileges of the orders to minister the sacraments.

The following month, however, the new pope, Alexander IV, abrogated these restrictions and ordered the masters at Paris to receive again the Dominicans into the university. William resisted these rulings and disputed the very legitimacy of the mendicant orders by relating their purpose to the apocalyptic teaching of Joachim of Fiore. Intending to taint the mendicants by association, William attacked Joachim's prophecy of a new theocratic age that would dispense with political and ecclesiastical structures. In 1255 William wrote the Liber de Antichristo et ejusdem ministris ("The Book of Antichrist and His Ministers"), in which he attempted to show that the Dominicans were the forerunners of the catastrophic age of Antichrist. After an investigation of the issue, Pope Alexander in June 1256 suspended William from all academic and ecclesiastical offices and sought his expulsion from France. Following a review of his case by the French bishops, which elicited a promise to correct in his writings whatever was contrary to church teaching, William, in September 1256, obtained the collaboration of other Parisian masters in a denunciation of the mendicant orders, the De periculis no-vissimorum temporum ("On the Dangers of Recent Times"). When this work also was condemned by Pope Alexander in October 1256, William presented a defense early in 1257 but was judged again to be in error and was exiled from France. On an appeal to Pope Clement IV, William was permitted to return to France late in 1266 and retired to his home at Saint-Amour. Although forbidden by the pope to continue the controversy with the religious orders, William maintained correspondence with his colleagues at Paris, who subsequently revived the polemic. The complete works of William of Saint-Amour were published in 1632.

William OF SAINT CARILEF, also called WILLIAM OF SAINT CALAIS, OF BISHOP WILLIAM (d. Jan. 2, 1096, Windsor, Eng.), Norman-French bishop of Durham (1081–96), adviser to William I the Conqueror, and chief minister to William II Rufus (1088).

Bishop William distinguished himself in his early years as a diligent and practical monk and abbot at the monasteries of St. Carilef (later named St. Calais) and St. Vincent, respectively. William I the Conqueror, taking notice of his abilities, made him bishop of Durham on Jan. 3, 1081, and retained him as a close adviser.

Upon ascending the throne, William II Rufus made Bishop William his chief minister (1088), an act that, in part, caused Odo of Bayeux (William the Conqueror's half brother) to rebel. Bishop William sided with Odo and, after Odo's defeat, was stripped of his see and castle and forced to take refuge in Normandy. After spending three years in exile, Bishop William succeeded in regaining the king's favour and recovered his bishopric and property.

For the next four years Bishop William devoted himself to the rebuilding of Durham Cathedral. He sided with the king against St. Anselm, archbishop of Canterbury, at the Synod of Rockingham (March 1095) and unsuccessfully advocated the archbishop's removal. Ailing, William was summoned to Windsor in late 1095 and died there shortly after his arrival.

William OF SAINT-THIERRY, French GUILLAUME DE SAINT-THIERRY (b. c. 1085, Liège, Lower Lorraine—d. probably Sept. 8, 1148), French monk, theologian, and mystic, leading adversary of early medieval rationalistic philosophy.

William studied under Anselm of Laon, a supporter of the philosophical theology (later called scholasticism) advanced by St. Anselm of Canterbury. After entering a Benedictine abbey in Reims in 1113, William became thoroughly versed in scriptural and patristic writings. Elected abbot of the Abbey of Saint-Thierry, near Reims, in 1119, he expressed his preference for contemplation and writing rather than ecclesiastical administration, but he remained in office at the urging of his friend Bernard of Clairvaux. During that period William wrote two works fundamental to his theological system, De natura et dignitate amoris ("On the Nature and Dignity of Love") and De contemplando Deo ("On the Contemplation of God"). De sacramento altaris ("On the Sacrament of the Altar"), a treatise on the Eucharist, he dedicated to Bernard, who earlier had dedicated two of his own works to William.

From 1128 to 1135 William compiled several treatises and biblical commentaries attempting to synthesize the theology and mysticism of Western and Eastern Christianity, specifically an integration of the thought of St. Augustine, Origen, and Gregory of Nyssa. William's Meditativae orationes ("Meditative Prayers") expressed spiritual concerns with an intensity comparable to Augustine's in his Confessions. In 1135 he withdrew to the meditative life of the Cistercian Monastery of Signy in the Ardennes, where he addressed questions of

the spiritual life and the problem of faith in his Speculum fidei (The Mirror of Faith) and Aenigma fidei ("The Enigma of Faith"), written in 1144. In the same year, after visiting the Charterhouse of Mont-Dieu, near Reims, he composed the Epistola ad fratres de Monte Dei ("Letter to the Brothers of Mont-Dieu"), called the "Golden Epistle" (Eng. trans., 1930), one of the most significant medieval works on the value of the contemplative life.

Elaborating the essential elements of his doctrine on mysticism, William proposed that the soul, although alienated from God, is also intrinsically empowered to experience a mystical creturn" to its divine origin during its earthly existence, a return effected in stages. Thus is man progressively liberated from his material and temporal impediments, eventually undergoing an experiential knowledge of God by a process of reminiscence, understanding, and love.

The writings of William of Saint-Thierry are contained in the series *Patrologia Latina*, J.-P. Migne (ed.), vol. 180 (1890). His *Speculum fidei* was edited in an English version, *The Mirror of Faith*, by Geoffrey Webb and Adrian Walker in 1959.

William OF SALICETO: see Saliceto, William of

William OF SENS, French GUILLAUME DE SENS (d. Aug. 11, 1180, France), French master-mason who built the first structure in the Early Gothic style in England.

William is one of the first cathedral architects to be known by name. Exact knowledge of his contribution was preserved in the report of an eyewitness, the monk Gervase, who described the destruction by fire (1174) of Canterbury Cathedral's choir and its subsequent rebuilding by William. He was already famous at that time as a leading builder and "most subtle artisan" of Sens, Fr. Called to Canterbury in 1175, he was given the task of using the remaining foundation of the choir and extending it toward the east.

William probably planned the whole choir, as well as other structural alterations, including the flying buttresses copied from Notre-Dame, which may still be seen on the north side. It is the interior design that is most significant, however. Here William introduced sexpartite vaulting, the form of the high arcades, and columns of stone in contrasting colours. His innovations at Canterbury are considered an early step toward the High Gothic practice of "dissolving" the walls between supporting verticals.

As work began on the vault of the eastern part of the choir, William was incapacitated by a fall from a scaffold. He probably continued to direct the work from his sickbed, but this was impractical, and so he gave up and returned to France, where he died. His successor, William the Englishman, seems to have followed his plans.

Because of similarity in design, especially in the construction of the choir, William is thought to have participated in building the Cathedral at Sens (begun 1130), one of the first churches in which Gothic architecture appears as a coherent style.

William OF TYRE (b. c. 1130, Syria—d. 1185, Rome), Franco-Syrian politician, churchman, and historian whose experiences in the Latin kingdom of Jerusalem inspired him to write a history of medieval Palestine.

Probably born to a French family that had settled in Frankish Syria during the 12th century, William was educated in France and Italy and knew Latin, Greek, and Arabic. He returned to Palestine in 1160 and was made archdeacon of Tyre in 1167. In the same year, he was sent on several diplomatic missions to Constantinople and Rome. Three years later he was made tutor to Baldwin, son of King Amalric I of Jerusalem. When Baldwin suc-

ceeded to the throne as Baldwin IV in 1174, he appointed William chancellor of the kingdom and archdeacon of Nazareth. He was promoted to archbishop of Tyre in June 1175 and in 1179 went to Rome to attend the third Lateran Council. On his return he was received by the Byzantine emperor Manuel I Comnenus in Constantinople.

William retired to Rome in 1183 after failing in his bid to be elected patriarch of Jerusalem (1180), taking the manuscripts of two books with him. His first, Gesta orientalium principum ("Acts of the Eastern Kingdoms"), a history of the Arab East, has been lost; but his second work, Historia rerum in partibus transmarinis gestarum ("History of Matters Done in Foreign Parts"), a history of the Latin kings of Jerusalem, has been preserved. It is a scholarly account of the history of the Latin East from 614 to 1184.

William RUFUS: see William II under William (England, Great Britain, United Kingdom).

William THE AETHELING, French GUILLAUME AETHELING (b. 1103—d. Nov. 25, 1120, at sea off Barfleur, Fr.), Anglo-Norman prince, only son of Henry I of England and recognized duke of Normandy (as William IV, or as William III if the earlier claim of his uncle, William Rufus, is not acknowledged). He succeeded his uncle, the imprisoned Duke Robert II Curthose.

In successful battles in Normandy and France, Henry I forced the Norman barons to give homage to his son William the Aetheling (1115); and in 1119 Pope Calixtus II, in an interview with Henry at Gisors, recognized both the rightful imprisonment of Duke Robert and the succession of William the Aetheling (excluding William Clito, the candidate of Louis VI of France). However, on the night of Nov. 25, 1120, the "White Ship" carrying William to England foundered as it left the port of Barfleur, with all lives lost save one. The notoriety of the wreck is due to the large number of the royal household on board, including not only the king's son and heir but also two royal bastards and several earls and barons. Its long-range significance lay in that it left Henry I without an heir, bolstered William Clito's claims in Normandy, and resulted in a period of anarchy after Henry's death.

William, Fort, citadel of Calcutta, named after King William III of England. The English East India Company's main Bengal trading station was moved from Hooghly to Calcutta in 1690 after a war with the Mughals. Between 1696 and 1702 the first fort was built in Calcutta, with the nawab of Bengal's permission.

In 1700 Calcutta became a separate presidency accountable to London; until 1774 its governors, and thereafter until 1834 its governors-general, were given the added title "of Fort William in Bengal." In 1756 the fort was taken by Sirāj-ud-Dawlah, nawab of Bengal. After the recovery of Calcutta (1757), this fort was demolished and a new one constructed farther south, with an unobstructed field of fire. The latter fort, completed in 1773, still stands.

William and Mary, College of, a state coeducational university of liberal arts at Williamsburg, Va., U.S. The second oldest institution of higher education in the United States (after Harvard College), it was chartered in 1693 by cosovereigns King William III and Queen Mary II of England to develop clergymen and civil servants for the colony. The scholastic honour society Phi Beta Kappa was organized there as a social fraternity in 1776. Seven signers of the Declaration of Independence, including its author, Thomas Jefferson, Chief Justice John Marshall, and President James Monroe, were college alumni, as were President John Tyler, General Winfield Scott, and John Randolph subsequently. George Washington was the college's first American chancellor, from 1788 to 1799

In the period after the U.S. War of Independence under the influence of the Enlightenment and the French Revolution, William and Mary reformed its curriculum. Two divinity professorships were dropped, and the study of law, political economy, history, mathematics, and modern languages, particularly French, was emphasized. Jefferson was instrumental in this process of secularization. William and Mary pioneered in the elective system (allowing students to choose their own programs). The modern college has a faculty of arts and sciences and schools of business administration, education, law, and marine science.

William and Mary style, style of decorative arts produced during the reign (1689–1702) of William III and Mary II of England. When William came to the English throne from the house of Orange, he encouraged many Dutch artisans to follow him. In addition to these craftsmen, Huguenot refugees from France worked in the cabinetmakers' and designers'

American colonial William and Mary furniture (Left to right) Tall-backed caned maple chair, Massachusetts, 1700–25, with canvaswork embroidery (needlepoint) squab; burled walnut veneer high chest, probably from Massachusetts, 1700–10; and a walnut, pine, and butternut gate-leg table, New England, 1700–25; in the Henry Francis du Pont Winterthur Museum, Delaware

shops of London during this time. Their influence was strongly felt under William, who was partial to the florid effects of French style.

The excesses of the heavy English Restoration mode, nonetheless, were tempered by a plainer fashion in decoration. A new, intimate style of life that created smaller rooms demanded a more modest scale of furniture. Comfort became important too, as attested by the upholstered needlepoint chair seats of the day.

Although the underlying contours of William and Mary furniture are quite simple, they are embellished with delicate ornament. Marquetry in ivory and coloured woods or metal inlay frequently is found in arabesque patterns resembling seaweed and spiders' webs.

Highboys and lowboys are major pieces for the period, and serpentine stretchers and spiral turnings are typical. Walnut superseded the use of oak as the basic wood of English cabinetry during this period, and a number of exotic woods such as acacia and olive, which reached the country via new East-West trade routes, were put to use in the veneers and inlays. Japanning, the popular Oriental lacquerwork, also remained in vogue.

Characteristic of William and Mary style are the scallop shell, C- and S-scrolls, and the acanthus leaf of classical tradition. Daniel Marot, a Huguenot, was designer general to the royal couple; but his work is overshadowed by the skillful inventions of Gerrit Jensen, the most fashionable furniture designer of his day, whose inspiration seems to have been mainly French.

William Henry, PRINCE OF ORANGE: see William III under William (England, Great Britain, United Kingdom).

William Louis, Dutch WILLEM LODEWIJK (b. March 13, 1560, Dillenburg, Hesse [Germany]—d. July 13, 1620, Leeuwarden, Neth.), count of Nassau, stadholder of Friesland, Groningen, and Drenthe, who with his cousin, Maurice of Nassau, prince of Orange, formulated the military strategy of the United Provinces of the Netherlands, or Dutch Republic (now The Netherlands), against Spain from 1588 to 1609. He formed, with Maurice and with Johan van Oldenbarnevelt, advocate of Holland, the triumvirate that ruled the Dutch Republic (1588–1618).

The eldest son of John, Count of Nassau, William was reared a Calvinist and educated at the University of Heidelberg. His military ability was first shown in 1579, when at the siege of Steenwijk he defeated Georges de Lalaing, Count of Rennenberg, then stadholder of the provinces of Friesland and Groningen, who had defected to the pro-Spanish forces. William Louis was appointed captain general and stadholder of Friesland in 1584.

After the States-General granted Maurice military control of the republic, William Louis rose in power as Maurice's chief military adviser. Reorganizing the army on principles of Roman military science, he led the republic's forces to a series of victories (1590-97) and drove the last Spanish troops from the republic in 1597. Groningen and Drenthe, two of the provinces that he cleared of Spanish forces, appointed him stadholder in 1594. When he and Maurice attempted to liberate the southern Netherlands from Spanish control, however, they met with little success; the net result of nine campaigns (1598-1606) was the capture of a few towns (Grave and Rheinberg in 1602; Sluis and Ardenburg in 1604).

Though Maurice opposed the Twelve Years' Truce with the Spanish Netherlands (1609–21), William worked actively for it. During the religious controversy over doctrines of predestination between the Gomarists (extreme Calvinists) and Arminians (Protestants opposed to the idea of complete predestination), he persuaded Maurice to support the Gormarists (1617). When the Arminian Oldenbarnevelt was sentenced to death, however, William Louis unsuccessfully tried to persuade Maurice to spare his life (1619).

William Tell (legendary hero): see Tell, William.

Williams, Allen Lane: see Lane, Sir Allen. Williams, Bert (b. c. 1876, New Providence, Bahamas—d. March 4, 1922, New York City),

American comedian who portrayed the slowwitted, shuffling black man that was then a standard role in vaudeville.

As a child Williams went to California with his family and worked in the mining and lumber camps of the West. In 1895 his partnership with George W. Walker began. They became one of the most successful comedy teams of their era; within a year they were appearing in New York City, where their song "Good Morning Carrie" became famous. In 1903 the partnership had graduated to full-scale musical comedy. The all-black show In Dahomey was a Broadway success and in London the following year played a command performance at Buckingham Palace. Other successes followed, notably Abyssinia (1906), Bandanna Land (1908), and Mr. Lode of Koal (1909). After Walker's death in 1909, Williams became a regular comic in the shows of Florenz Ziegfeld, starring in the Follies from 1910 through 1919 and writing much of his own material. Of his many musical compositions, "Nobody" (1905), with its wry, fatalistic lyric, is probably the best example of his work. Nobody, a biography by Ann Charters, appeared

Williams, Betty, byname of ELIZABETH WILLIAMS (b. May 22, 1943, Belfast, N.Ire.), Northern Irish peace activist who, with Mairéad Corrigan, founded the Community for Peace People in 1976 and with her shared the 1976 Nobel Prize for Peace.

Williams, an office worker and wife and mother, took little part in public life until August 1976, when she witnessed an incident that moved her to speak out. An Irish Republican Army terrorist was shot by British troops while fleeing in a car; the car went out of control and struck several people, killing three children. Williams immediately began circulating petitions in Protestant neighbourhoods calling for an end to sectarian violence. This activity soon brought her into association with Mairéad Corrigan, an aunt of the slain children, who had been similarly galvanized into action. Together they founded the Community for Peace People to provide services for victims of the Northern Ireland conflict.

In 1978 Williams and Corrigan resigned their positions of leadership in the Community and by 1980 had become estranged. In 1982 Williams married and moved to Florida, U.S.

Williams, Daniel Hale (b. Jan. 18, 1858, Hollidaysburg, Pa.—d. Aug. 4, 1931, Idlewild, Mich.), American physician and founder of Provident Hospital in Chicago, credited with the first successful heart surgery.

Williams graduated from Chicago Medical College in 1883. He served as surgeon for the South Side Dispensary (1884–92) and physician for the Protestant Orphan Asylum (1884–93). In response to the lack of opportunity for blacks in the medical professions, he founded (1891) the nation's first interracial hospital, Provident, to provide training for black interns and the first school for black nurses in the United States. He was a surgeon at Provident (1892–93, 1898–1912) and surgeon in chief of Freedmen's Hospital, Washington, D.C. (1894–98), where he established another school for black nurses.

It was at Provident Hospital that Williams performed daring heart surgery on July 10, 1893. Although contemporary medical opinion disapproved of surgical treatment of heart wounds, Williams opened the patient's thoracic cavity without aid of blood transfusions or modern anesthetics and antibiotics. During the surgery he examined the heart, sutured a wound of the pericardium (the sac surrounding the heart), and closed the chest. The patient lived at least 20 years following the surgery. Williams' procedure is cited as the first recorded repair of the pericardium; some sources, however, cite a similar operation performed by H.C. Dalton of St. Louis in 1891.

Williams later served on the staffs of Cook County Hospital (1903–09) and St. Luke's Hospital (1912–31), both in Chicago. From 1899 he was professor of clinical surgery at Meharry Medical College in Nashville, Tenn., and was a member of the Illinois State Board of Health (1889–91). He published several articles on surgery in medical journals. Williams became the only black charter member of the American College of Surgeons in 1913.

Williams, (George) Emlyn (b. Nov. 26, 1905, Mostyn, Flintshire, Wales—d. Sept. 25, 1987, London), Welsh actor and playwright, author of some highly effective, often macabre

Williams was educated in Geneva and at Christ Church, Oxford. In the 1930s and 40s he wrote some immensely successful plays, which contained starring parts for himself. The best-known of these was Night Must Fall (performed 1935) in which he played the baby-faced killer, Danny, and which was later made into two film adaptations. Williams' other plays include A Murder Has Been Arranged (1930), The Corn Is Green (1938), also made into a film (1945), and The Druid's Rest (1944). He acted in many films and was also renowned for his public readings from the works of Charles Dickens, Dylan Thomas, and Saki. He wrote two volumes of autobiography, George (1961) and Emlyn (1973). Beyond Belief (1967) and Headlong (1980) are adventure novels.

Williams, Eric (Eustace) (b. Sept. 25, 1911, Port of Spain, Trinidad—d. March 29, 1981, St. Anne, near Port of Spain), first and long-time prime minister of independent Trinidad and Tobago (1962–81), who founded (1955) his party, the People's National Movement

(PNM), and led his country to independence. Williams was educated at Queen's Royal College, Port of Spain, and at the University of Oxford, from which he received a B.A. in 1932 and a D.Phil. in 1938, with studies in history and political science. In 1939 he went to the United States and joined the faculty of social and political science at Howard University. While he was at Howard, Williams became associated with the Caribbean Commission that was established by the United States, Great Britain, France, and The Netherlands in an effort to coordinate the economic development of the Caribbean area. His aggressive, commanding role in the commission, however, tended to alienate the national powers, especially the United States, and in 1955 he returned to Trinidad to organize the PNM party. His party made only a fair showing during the period of the short-lived West Indies Federation (1958-62), but in the national elections of December 1961 for Trinidad and Tobago, the PNM won a landslide victory. Williams became prime minister of the colony and then of the new republic upon its achieving independence in August 1962.

As prime minister, Williams practiced what was called "empirical socialism," which stressed social services, improved education, and economic development through the cautious attraction of foreign investment capital. The policy was fruitful in making Trinidad and Tobago the wealthiest Commonwealth Caribbean nation. He was successively reelected and served as prime minister until his death.

Williams was the author of a number of books, among which were The Negro in the Caribbean (1942), Capitalism and Slavery (1944), History of the People of Trinidad and Tobago (1962), British Historians and the West Indies (1964), Inward Hunger: The Education of a Prime Minister (1969), and From Columbus to Castro: The History of the Caribbean, 1492–1969 (1970).

Williams, Sir Frederic (Calland) (b. June 26, 1911, Stockport, Cheshire, Eng.—d. Aug. 11, 1977, Manchester), British electrical engineer who invented the Williams tube store, a cathode-ray-tube memory system that heralded the beginning of the computer age.

Educated at the University of Manchester and at Magdalen College, Oxford, Williams in 1939 joined the staff of the Bawdsey Research Station, University of Manchester, where he developed the first practical system of radar identification of friendly aircraft. His system was the forerunner of modern systems using intricate codes and varying radar frequencies. In the early 1940s he perfected the first fully automatic radar for use in fighter aircraft. In 1946, the year in which he became professor of electrotechnics at Manchester, he invented the Williams tube. Although superseded by the magnetic-core memory, the Williams tube was used in first-generation digital computers throughout the world. Shortly thereafter he became professor of electrical engineering at the University of Manchester, where he developed his memory system further and applied it to early computers. He was knighted in 1976.

Williams, George Kofi Awoonor: see Awoonor, Kofi.

Williams, George Washington (b. Oct. 16, 1849, Bedford Springs, Pa., U.S.—d. Aug. 2, 1891, Blackpool, Eng.), American historian, clergyman, politician, lawyer, lecturer, and soldier who was the first person to write an objective and scientifically researched history of black people in the United States.

The son of a laborer, Williams enlisted at age 14 in the Union Army and fought in the Civil War. Upon leaving the army in 1868, he underwent training as a minister at the Newton Theologial Institution and was ordained in 1874. In the following years he served as pastor of several churches, edited and published several short-lived journals, and served in the Ohio House of Representatives from 1879 to 1881. By this time he had become interested in the study of history, and after doing copious research he had his History of the Negro Race in America from 1619 to 1880 published in 1882. There had been several previous works written on this subject by black historians, but Williams' work was the first relatively objective account that strove for historical accuracy rather than functioning as a work of black apologetics or propaganda. Williams' research for his next work, A History of the Negro Troops in the War of the Rebellion (1888), involved the gathering of oral histories from black Civil War veterans and the culling of newspaper accounts, both techniques which subsequently became basic resources in American historiography.

During the 1880s Williams worked on his books, practiced law, and gave lectures. In 1889 he became interested in the prospect of employing black Americans in the Congo Free State under the auspices of the Belgian king Leopold. But a visit to the Congo in 1890 shocked him into an appreciation of Leopold's brutal exploitation of the people of the Congo, and Williams spent the short remainder of his life publicizing the outrages that were being perpetrated there.

Williams, Hank, byname of HIRAM KING WILLIAMS (b. Sept. 17, 1923, Georgiana, Ala., U.S.—d. Jan. 1, 1953, Oak Hill, W.Va.), American singer and guitarist, one of the leading figures in country and western music who was also successful in the popular music market.

Williams began playing the guitar at the age of 8, made his radio debut at 13, and formed his first band, Hank Williams and his Drifting Cowboys, at age 14. His series of recordings in 1947 on the M-G-M label won for him national, then international, fame. His "Lovesick

Blues" recording in 1949 was a smash hit, and he joined the Grand Ole Opry in Nashville that year. Among his best-selling recordings were "Cold, Cold Heart," "Your Cheatin' Heart," and "Hey, Good Lookin'." His death of an apparent heart attack may have been the result of drug and alcohol abuse. His son Hank Williams, Jr., sang his songs in a film biography, Your Cheatin' Heart (1964).

Williams, John Henry (b. June 21, 1887, Wales—d. Dec. 24, 1980, Southbridge, Mass., U.S.), American economist, banker, and government adviser who achieved world renown as an expert on international trade.

Williams was educated at Brown University and Harvard, where he obtained his Ph.D. (1919). He was a professor of economics at Harvard (1921–57) and then became professor emeritus. For 10 years (1937–47) Williams served as the first dean of the Harvard Graduate School of Public Administration. He also taught at the Fletcher School of Law and Diplomacy (1957–63). Outside of academia, Williams was economic adviser to the Federal Reserve Bank of New York (1933–56) and vice president (1936–47). Throughout World War II and afterward, he was a top government adviser on economics.

Williams' principal fame as an economist rests upon his writings in the field of international trade. A major early work was Argentine International Trade under Inconvertible Paper Money (1920), which successfully tested the classical theory of international transfer and takes its place alongside classic studies by Frank Taussig and Jacob Viner. He had earlier produced, with others, pioneering data on the historical development of the U.S. balance of payments. He contributed vigorously to the debates during and after World War II on the postwar monetary arrangements and is regarded as the inventor of the key-currency principle that stressed the pivotal role of the dollar in the international monetary system.

Williams, Ralph Vaughan: see Vaughan Williams, Ralph.

Williams, Roger (b. 1603?, London—d. Jan. 27/March 15, 1683, Providence, R.I.), English colonist in New England, founder of the colony of Rhode Island and pioneer of religious liberty.

The son of a merchant tailor, he was a protégé of the jurist Sir Edward Coke and was educated at Cambridge. In 1630 he left his post as chaplain to Sir William Masham, which had brought him into contact with such politically active Puritans as Oliver Cromwell and Thomas Hooker, to pursue his by-then completely Nonconformist religious ideals in New England.

Arriving in Boston in 1631, Williams refused to associate himself with the Anglican Puritans and in the following year moved to the separatist Plymouth Colony. In 1633 he was back in Salem after a disagreement with Plymouth in which he insisted that the king's patent was invalid and that only direct purchase from the Indians gave a just title to the land.

Invited by the church at Salem to become pastor in 1634, Williams was banished from Massachusetts Bay by the civil authorities for his dangerous views: besides those on land rights, he held that magistrates had no right to interfere in matters of religion. Consequently, in January 1636 Williams set out for Narragansett Bay, and in the spring, on land purchased from the Narragansett Indians, he founded the town of Providence and the colony of Rhode Island. Providence became a haven for Anabaptists, Quakers, and others whose beliefs were denied public expression. Williams was briefly an Anabaptist but in 1639 declared himself a Seeker. He remained a steadfast believer in Calvinist theology. Williams went to England in 1643 to obtain a charter for Rhode Island and again in 1651-54 to have it confirmed, during which visit he became a friend of the poet, John Milton. He was the first president of Rhode Island under its charter and until his death always held some public office. He was of constant service to Rhode Island and neighbouring colonies as a peacemaker with the Narragansett Indians, whose language he knew and whose trust he had earned, although he helped defend Rhode Island against them during King Philip's War (1675-76). From 1636 until his death he supported himself by farming and trading.

Williams was a vigorous controversialist and a prolific writer. His greatest work was *The Bloudy Tenent of Persecution* (1644).

BIBLIOGRAPHY. S.H. Brokunier, Irrepressible Democrat: Roger Williams (1940); O.E. Winslow, Master Roger Williams (1957); C. Covey, The Gentle Radical (1966).

Williams, Ted, byname of THEODORE SAMUEL WILLIAMS (b. Aug. 30, 1918, San Diego, Calif., U.S.), U.S. professional baseball player who compiled a lifetime batting average of .344 as a left-handed hitting outfielder with the Boston Red Sox from 1939 to 1960. He twice won the Triple Crown (best batting average, most home runs, and most runs batted in during a single season). He also hit a total of 521 home runs, although he lost five years of his career to service as a flyer in World War II and the Korean War. He was elected to the Baseball Hall of Fame in 1966. He was the last of the .400 hitters in the 20th century (.406 in 1941).

Williams returned to the major leagues from retirement in 1969 to manage the Washington Senators. In his first year he was named American League Manager of the Year, but he left the franchise in 1972, after it had become the Texas Rangers. After his retirement as a manager, he occasionally worked as a batting coach and became a consultant for a line of fishing equipment. His autobiography, written with John Underwood, My Turn at Bat, was published in 1969 and The Science of Batting in 1971.

Williams, Tennessee, original name THOMAS LANIER WILLIAMS (b. March 26, 1911, Columbus, Miss., U.S.—d. Feb. 25, 1983, New York City), U.S. dramatist whose plays reveal a world of human frustration in which sex and violence underlie an atmosphere of romantic gentility.

Tennessee Williams

By courtesy of New Directions; photograph, Angus McBean

Williams became interested in playwriting while at the University of Missouri (Columbia) and Washington University (St. Louis) and worked at it even during the Depression while employed in a St. Louis shoe factory. Little theatre groups produced some of his work, encouraging him to study dramatic writing at the University of Iowa, where he earned a B.A. in 1938.

His first recognition came when American Blues (1939), a group of one-act plays, won a Group Theatre award. Williams, however, continued to work at jobs ranging from theatre usher to Hollywood scriptwriter until success

came with *The Glass Menagerie* (1944). In it, Williams portrayed a declassed Southern family living in a tenement. The play is about the failure of a domineering mother, Amanda, living upon her delusions of a romantic past, and her cynical son, Tom, to secure a suitor for Tom's crippled and painfully shy sister, Laura, who lives in a fantasy world with a collection of glass animals.

Williams' next major play, A Streetcar Named Desire (1947), won a Pulitzer Prize. It is a study of the mental and moral ruin of Blanche Du Bois, another former Southern belle, whose genteel pretensions are no match for the harsh realities symbolized by her brutish brother-in-law, Stanley Kowalski. In 1953, Camino Real, a complex and bizarre work set in a mythical, microcosmic town whose inhabitants include Lord Byron and Don Quixote, was a commercial failure, but his Cat on a Hot Tin Roof (1955), which exposes the emotional lies governing relationships in the family of a wealthy Southern planter, was awarded a Pulitzer Prize and was successfully filmed, as was The Night of the Iguana (1961), the story of a defrocked minister turned sleazy tour guide, who finds God in a cheap Mexican hotel. Suddenly Last Summer (1958) deals with lobotomy, pederasty, and cannibalism, and in Sweet Bird of Youth (1959), the gigolo hero is castrated for having infected a Southern politician's daughter with venereal disease.

Williams was in ill-health frequently during the 1960s, compounded by years of addiction to sleeping pills and liquor, problems that he struggled to overcome after a severe mental and physical breakdown in 1969. His later plays were unsuccessful, closing soon to poor reviews. They include Vieux Carré (1977), about down-and-outs in New Orleans; A Lovely Sunday for Crève Coeur (1978–79), about a fading belle in St. Louis during the Great Depression; and Clothes for a Summer Hotel (1980), centring on Zelda Fitzgerald, wife of novelist F. Scott Fitzgerald, and on the people they knew.

Williams also wrote two novels, *The Roman Spring of Mrs. Stone* (1950) and *Moise and the World of Reason* (1975), essays, poetry, film scripts, short stories, and an autobiography, *Memoirs* (1975). His works won four Drama Critics' awards and were widely translated and performed around the world.

Williams, William, also called WILLIAMS PANTYCELYN (b. 1717, Cefn Coed, Llanfair-ar-y-bryn, Carmarthenshire, Wales—d. Jan. 11, 1791, Pantycelyn), leader of the Methodist revival in Wales and its chief hymn writer.

His parents were Nonconformists, and he was educated at a Nonconformist academy at Llwyn-llwyd, near Hay. While there he was converted by the preaching of the religious reformer Howell Harris (1714–73) and in 1740 was ordained deacon; he became a curate, but because of his Methodist affinities he was finally refused priestly orders in 1743. Although he still considered himself an Anglican clergyman, he spent the rest of his life in evangelistic tours as a Methodist preacher and in writing hymns, religious poems, and prose treatises. After his marriage (c. 1748) he lived at Pantycelyn, near Llandovery, his mother's home, and became known as "Williams Pantycelyn."

Williams has been called the first Welsh Romantic poet. In more than 800 hymns, published in booklets between 1744 and 1787, and in an "epic" poem, Bywyd a Marwolaeth Theomemphus, he interpreted the religious experience of the Methodist movement with sensitivity and intense feeling. Earlier Welsh poetic tradition was almost unknown to him, and his bare metre, burning sincerity of language, mystical reflection, and spiritual longing were new to Welsh poetry. Many of his prose works and pamphlets complement his

hymns, but he was aware of contemporary secular studies in English, and some of his books were written to educate the Welsh in their own tongue and for his own use in teaching them to read. In *Pantheologia* (1762–c. 1799) he attempted a history of world religions. Many of his hymns remain in regular use, the best known in English being "Guide me, O Thou Great Jehovah," in a considerably altered version.

Williams, William Carlos (b. Sept. 17, 1883, Rutherford, N.J., U.S.—d. March 4, 1963, Rutherford), U.S. poet who succeeded in making the ordinary appear extraordinary through the clarity and discreteness of his imagery.

William Carlos Williams

By courtesy of the New Jersey State Library, Trenton

After receiving an M.D. from the University of Pennsylvania in 1906 and after internship in New York and graduate study in pediatrics in Leipzig, he returned in 1910 to a lifetime of poetry and medical practice in his hometown. In Al Que Quiere! (1917; "To Him Who Wants It!") his style was distinctly his own. Characteristic poems that proffer Williams' fresh, direct impression of the sensuous world are the frequently anthologized "Lighthearted William," "By the Road to the Contagious Hospital," and "Red Wheelbarrow."

In the 1930s during the Depression, his images became less a celebration of the world and more a catalog of its wrongs. Such poems as "Proletarian Portrait" and "The Yachts" reveal his skill in conveying attitudes by presentation rather than explanation.

In Paterson (5 vol., 1946-58), Williams expressed the idea of the city, which in its complexity also represents man in his complexity. The poem is based on the industrial city in New Jersey on the Passaic River and evokes a complex vision of America and modern man.

A prolific writer of prose, Williams' In the American Grain (1925) analyzed the American character and culture through essays on historical figures. Three novels form a trilogy about a family—White Mule (1937), In the Money (1940), and The Build-Up (1952). Among his notable short stories are "Jean Beicke," "A Face of Stone," and "The Farmers' Daughters." His play A Dream of Love (published 1948) was produced in off-Broadway and academic theatres. Williams' Autobiography appeared in 1951, and in 1963 he was posthumously awarded the Pulitzer Prize in poetry for his Pictures from Brueghel, and Other Poems (1962). William Carlos Williams, by the poet Reed Whittemore, was published in 1975.

Williams College, private coeducational institution of higher learning founded in 1793 at Williamstown, Mass. Like many other New England colleges, Williams was established by the Congregational Church, but it is now non-denominational. It offers undergraduate liberal arts and graduate programs in fine and applied arts and social sciences. There are special accelerated and honours programs, as well as opportunities for independent study and

study abroad. Cross-registration arrangements are maintained with North Adams State and Bennington Colleges.

Williamsburg, city, seat, but administratively independent, of James City County, southeastern Virginia, U.S., on a tidewater peninsula, between the James and York rivers, 28 mi (45 km) northwest of Newport News. First

The restored Capitol, Williamsburg, Va. Arthur Griffin—EB Inc.

settled in 1633 as Middle Plantation, it originally stood within a 6-mi (10-km) stockade and served as a refuge from Indian attacks. The College of William and Mary, second oldest (after Harvard University) in the United States, was founded there in 1693. In 1699, after the burning of nearby Jamestown, the city became the capital of Virginia and was renamed to honour William III. It subsequently became the political, social, and cultural centre of the colony. There Virginia's first theatre was organized (1716), first successful printing press set up (1730), first newspaper published (1736), and first paper mill established (1744). In the Capitol, Patrick Henry presented his historic speech against the Stamp Act (1765), and on May 15, 1776, the Virginia Convention passed resolutions urging the Continental Congress to declare for independence. Williamsburg declined in importance after the state government was moved to Richmond in 1780. Confederate forces were defeated at the Battle of Williamsburg in 1862, and the city remained in Federal hands until the end of the American Civil War.

Colonial Williamsburg, a restoration of a large section of the early colonial area, was begun in 1926, when the Rev. William A.R. Goodwin, rector of Bruton Parish Church (1705–11; restored 1905–07), originated the idea and interested John D. Rockefeller, Jr., the wealthy philanthropist, in sponsoring the project. Since then, more than 3,000 ac (1,200 ha) of land have been acquired and nearly 150 major buildings restored or reconstructed. The exhibition buildings, which include the Capitol and Governor's Palace, are furnished as they were in the 18th century, and the entire area is landscaped as it was in colonial times. Hostesses, craftsmen, militiamen, and attendants costumed in the style of the period give a flavour of living history. Part of the city is included in the Colonial National Historical Park.

Williamsburg's economy depends mainly on services to Eastern State Hospital (founded there in 1773), the College of William and Mary, and tourism. Inc. city, 1722. Pop. (1980) 9,870.

Williamson, city, seat (1896) of Mingo County, southwestern West Virginia, U.S., on Tug Fork near the Kentucky border and in the centre of the Tug Valley coalfield, popularly known as the "Billion Dollar Coalfield." Established in 1892, the town was named for Wallace J. Williamson, a prominent landowner. The arrival of the Norfold and Western Railway in the 1890s opened the vast bituminous coal resources and stimu-

lated the town's development. Natural gas and oil wells, lumbering, and machine armature plants also contribute to the economy. The Coal House, headquarters of the local chamber of commerce, has walls made from coal blocks. Southern West Virginia Community College: Williamson was opened in 1971. Inc. town, 1892; city, 1905. Pop. (1980) 5,219.

Williamson, Alexander William (b. May 1, 1824, London—d. May 6, 1904, Hindhead, Surrey, Eng.), English chemist whose research on alcohols and ethers clarified organic molecular structure.

From 1849 to 1887 Williamson served on the faculty of University College, London. In 1850 he discovered the structural relation between ethers and alcohols: in ethers the oxygen atom links two hydrocarbon groups, whereas in alcohols the oxygen is bonded to a hydrocarbon group and a hydrogen atom. In further studies, Williamson created an understanding of reversible reactions. He also was the first to explain the state of dynamic equilibrium, in which two opposing reactions have equal rates, resulting in no net change in concentration for any of the reactants.

In 1854 Williamson described the process

In 1854 Williamson described the process of making ether from alcohol and revealed why an acid is needed as a catalyst. This was the first time that catalytic action was clearly explained. He was also responsible for the Williamson synthesis of mixed ethers (ethers that contain two different hydrocarbon groupings)

Williamson, Henry (b. Dec. 1, 1895, Bedfordshire, Eng.—d. Aug. 13, 1977, Berkshire), English novelist who is known for his sensitive but unsentimental handling of nature themes.

After World War I service, Williamson became a journalist in London, but he disliked city life and moved to England's West Country. He tried farming and ultimately settled at Georgeham, in Devon. He first came to notice as a writer with four novels written between 1921 and 1928 and published under the title of The Flax of Dream (1936). Tarka the Otter (1927), however, was the book that established his reputation and that was awarded the Hawthornden Prize in 1928. Its nonhuman hero was presented without any of the mawkish sentiment that mars many 'animal" stories. Williamson later produced another ambitious series of novels under the general title was A Chronicle of Ancient Sunlight (1951-69).

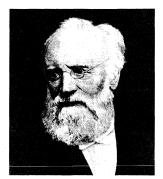

Williamson, Sonny Boy, byname of JOHN LEE WILLIAMSON (b. March 30, 1914, Jackson, Tenn., U.S.—d. June 1, 1948, Chicago), U.S. black blues vocalist and the first influential harmonica virtuoso, a self-taught player who developed several technical innovations on his instrument.

Williamson travelled through Tennessee and Arkansas with mandolinist Yank Rachell and guitarist John Estes, working in bars, on the streets, and at parties from the late 1920s until he settled in Chicago in 1934. Continuing his travels in the Midwest, Williamson began recording in 1937, using small bands composed of a guitar, string bass, and sometimes a piano. Characteristically, he alternated vocal phrases with harmonica phrases, built melodic solo choruses, and preferred fast "jump" tempos. Every aspect of his style, including his slight speech impediment, has been imitated.

Working in Chicago blues clubs, Williamson prefigured the post-World War II electric blues; he performed with Muddy Waters, an adherent of electronic amplification, in 1943. At the height of his popularity, Williamson was robbed and murdered while walking home from a blues bar. Alex "Rice" Miller, also a blues singer and harmonica player, took Sonny Boy Williamson's name, insisting that he had invented it, and performed, toured, and recorded under it until his death in 1965.

Williamson, William Crawford (b. Nov. 24, 1816, Scarborough, Yorkshire, Eng.—d. June 23, 1895, London), English naturalist, a founder of modern paleobotany.

Apprenticed to an apothecary in 1832, Williamson, during his spare time, studied natural history and wrote several outstanding papers on fossils. In 1835 he was appointed curator of the museum of the Manchester Natural History Society. He left the museum to complete his medical training at University College, London, and then returned to Manchester, where he established his practice.

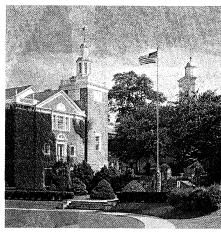

William Williamson, oil painting by A. Brothers, 1887; in the University Library, Manchester

By courtesy of the University Library, Manchester

In 1845 Williamson initiated the study of deep-sea deposits when he wrote a paper on the microscopic organisms found in the mud of the eastern Mediterranean region. Between 1840 and 1850 he introduced a new technique for the study of marine protozoans (Foraminifera) and demonstrated plantlike characteristics of *Volvox*, which is a colonial protozoan. Six years later he was appointed professor of natural history, anatomy, and physiology at Owens College in Manchester. In 1880 he became professor of botany there, a position he held until 1892.

As a founder of paleobotany, Williamson demonstrated that certain fossils containing secondary wood (then considered a characteristic of the phanerogams, or seed plants and flowering plants) were really cryptogams (or lower plants without seeds or flowers, such as algae, ferns, and mosses). Williamson published this controversial material in the first of 19 memoirs gathered under the title On the Organization of the Fossil Plants of the Coal Measures (1872–94).

Williamsport, city, seat (1796) of Lycoming County, north central Pennsylvania, U.S., on the Susquehanna River, opposite South Williamsport, and in the foothills of the Allegheny Mountains, 75 mi (121 km) north of

Clarke Chapel, Lycoming College, Williamsport, Pa. P. Vannucci—Shostal/EB Inc.

Harrisburg. Founded in 1795, it was supposedly named for William Russell, who had a boat landing on the river. It became a centre for lumber operations in the 1860s. The "Sawdust War" erupted (1872) as workers sought a 10-hour day. The militia put it down. As the timber supply diminished, the economy diversified, and manufactures came to include metal and leather products, furniture, and textiles. The seat of Lycoming College (1812) and Williamsport Area Community College (1920), Williamsport is the site of Little League Baseball International Headquarters, the World Series being held there annually (in August) in the World Series Little League Stadium. Inc. borough, 1806; city, 1866. Pop. (1980) 33,401.

Williamstown, town (township), Berkshire County, northwestern Massachusetts, U.S., on the Hoosic River, 18 mi (29 km) north of Pittsfield. Settled as West Hoosac in 1749, it was incorporated in 1765 and renamed for Col. Ephraim Williams, killed in the French and Indian Wars, who had bequeathed money in his will to establish a "free school" there provided the town bear his name. The school was eventually founded in 1790 and was chartered as Williams College in 1793. Prominent graduates include the poet William Cullen Bryant (who is said to have written his "Thanatopsis" while a student there) and Pres. James A. Garfield. Notable campus buildings include the Gothic Chapel, the Chapin Library (with rare-book displays) and Lawrence Hall (housing an art museum). Haystack Monument in Mission Park claims to mark the birthplace of American foreign missions (it commemorates a prayer meeting there in 1806 [for the establishment of overseas missions] by a student group who sought shelter in a haystack during a sudden rainstorm). The town's Sterling and Francis Clark Art Institute has a notable collection of French Impressionists, old silverware, and sculpture. The town's life centres around the college; its economy is supplemented by a few light industries (including wire making) and tourism, attracted by the Williamstown Summer Theater and the Berkshire Hills resort area (nearby Taconic Trail and Clarksburg state parks and Mt. Greylock State Reservation). Pop. (1980) 8,741.

Willibrord, SAINT, also called WILLIBRORD OF UTRECHT, Willibrord also spelled WILBRORD (b. 658? Northumbria, probably near York, Eng.—d. Nov. 7, 739, Echternach, Austrasia; feast day November 7), Anglo-Saxon bishop and missionary, apostle of Friesland, and patron saint of Holland.

The son of the hermit St. Wilgis, Willibrord was sent by him to the Benedictine monastery of Ripon, Eng., under Abbot St. Wilfrid of York. After Wilfrid was deposed and exiled in 677/678, Willibrord also went into exile, spending 12 years in Ireland, where he became a disciple of St. Egbert. He was ordained priest in 688.

In 690 Egbert sent Willibrord with 11 companions to undertake the Christianization of the Frisians, whose districts had recently been conquered (689) by Pepin II the Young. Willibrord began the policy of mutual cooperation between the English missions and the Carolingian dynasty. He went to Rome in 690 for a commission from Pope St. Sergius I and was later sent again by Pepin for his consecration (Nov. 21, 695) as archbishop of the Frisians, with a see to be established at Utrecht, Neth. On that occasion, Sergius renamed him Clement. Willibrord's unusual respect for Roman authority had established a precedent that greatly increased papal influence in the affairs of the Frankish Church.

ence in the affairs of the Frankish Church. In 698 Willibrord established his second missionary base, the important monastery of Echternach. Having extended his apostolate into Friesland, he attempted to evangelize Denmark, where he instructed and baptized 30 boys; returning with them, he made dramatic stops on the Frisian islands of Heligoland and Walcheren. In 714 he baptized Pepin III the Short, heir to the Merovingian kingdom. Upon the death of Pepin II, the pagan Frisian king Radbod launched a highly destructive campaign against the Christians and banished Willibrord.

After Radbod's death in 719, Willibrord, with the aid of the Frankish king Charles Martel, regained his apostolate. From 719 to 722, he was assisted in his missionary work by the man who carried on his work after 739, Wynfrith (St. Boniface), apostle of Germany. While training a native clergy, he established in the Frankish kingdoms an English cultural influence that was to dominate Charlemagne's court through the extensive labours of later missionaries. He began in the West the appointment of chōrepiscopoi ("country bishops"), or suffragan bishops (i.e., bishops of sees under an archbishop, or metropolitan), and he introduced into the Franks' dominions the practice of dating by the Christian Era.

Willibrord was buried in the abbey church of Echternach. The "Calendar of St. Willibrord" (a calendar of saints, with some lines attributed to Willibrord) was printed in facsimile in 1918. A. Grieve's Willibrod, Missionary in the Netherlands 691–739, appeared in 1923, followed by G.H. Verbist's Saint Willibrod: Apôtre des Pays-Bas et fondateur d'Echternach ("St. Willibrord; Apostle of the Low Countries and Founder of Echternach") in 1939, and by C. Wampach's Sankt Willibrord in 1953.

Willimantic, city and principal community in the town (township) of Windham, Windham County, east central Connecticut, U.S., at the junction of the Willimantic and Natchaug rivers. Known as "Thread City," it is the home of the American Thread Company, established in 1854, the first company in the United States to make acceptable cotton thread. The site was settled c. 1686 and developed because of the availability of waterpower for grismills and sawmills. Eastern Connecticut State College was opened in 1889 as a state normal school. Inc. borough, 1833; city, 1893. Pop. (1980) 14,652.

Willingboro, residential township, Burlington County, New Jersey, U.S., midway between Camden and Trenton on Rancocas Creek in the Delaware Valley. English Quakers settled there about 1677. The community, which originally included what is now Edgewater Park Township, Delanco Township, and Beverly, was called Willingboro (corrupted from Wellingborough, Eng.) in 1682 and was incorporated in 1688. In 1959 the name was changed to Levittown after Levitt & Sons, Inc., a building firm that had participated in community development; in 1963 the name Willingboro was restored. The Little Red Schoolhouse (1866) has a display of artifacts. Pop. (1980) 39,912.

Willis, Bailey (b. May 31, 1857, Idlewild-on-Hudson, N.Y., U.S.—d. Feb. 19, 1949, Palo Alto, Calif.), U.S. geologist known for his structural and geomorphological analysis of the Appalachian Mountains.

Willis was a member of the U.S. Geological Survey from 1884 until 1916, when he became professor of geology at Stanford University, Palo Alto, Calif., where he retired as professor emeritus in 1922. His work included studies of denudation (a form of erosion) chronology in North and South America and Africa, model experiments of folding and deformation, paleogeographic mapping of North America, and theories of the differentiation of the Earth's crust. Willis wrote The Mechanics of Appalachian Structure; Living Africa; African Plateaus and Rift Valleys; Earthquake Conditions in Chile; Earthquakes in the Holy Land; and Geological Map of North America.

Willis, Henry (b. April 27, 1821, London—d. Feb. 11, 1901, London), British organ builder, a meticulous craftsman and designer whose splendid instruments, though limited and perhaps decadent in comparison with the 18th-century German classical organ, were perfectly suited to the music played in England during his time.

Willis was the son of an organ builder and showed extraordinary inventiveness while still an apprentice. He also learned to play the instrument well and served as a church organist for most of his life; thus, he understood the instrument from a performer's viewpoint. His early instruments, among them a large one for the Crystal Palace of the Great Exhibition (1851), gained him a wide reputation, and thereafter he built or restored perhaps 1,000 church and concert hall instruments, including a number outside England.

Willis' organs may be called "orchestral" in that they made some use of pipe ranks designed to imitate orchestral instruments and were well suited to the organ arrangements of orchestral works then popular in England. But although they were expressive in the Romantic sense, his organs were also well balanced tonally, with an abundance of traditional, characteristic organ voices. Willis' reed stops were particularly renowned, and the specifications for his instruments included rather more of the critical higher pitched stops and mixtures (stops comprising two or more ranks, or sets, of pipes sounding simultaneously) than was common in his time.

Willis' sons, Henry II and Vincent, and his grandchildren carried on the family profession, making notable improvements in tone and mechanism.

Willis, Thomas (b. Jan. 27, 1621, Great Bedwyn, Wiltshire, Eng.—d. Nov. 11, 1675, London), British physicians, leader of the English iatrochemists, who attempted to explain

Thomas Willis, engraving by G. Vertue, 1742, after a portrait by D. Loggan, c. 1666

Archiv fur Kunst und Geschichte, West Berlin

the workings of the body from current knowledge of chemical interactions; he is known for his careful studies of the nervous system and of various diseases. An Oxford professor of natural philosophy (1660-75), he opened a London practice in 1666 that became the most fashionable and profitable of the period. In his Cerebri Anatome, cui accessit Nervorum descriptio et usus (1664; "Anatomy of the Brain, with a Description of the Nerves and Their Function"), the most complete and accurate account of the nervous system to that time, he rendered the first description of the hexagonal continuity of arteries (the circle of Willis) located at the base of the brain and ensuring that organ a maximum blood supply, and of the 11th cranial nerve, or spinal accessory nerve, responsible for motor stimulation of major neck muscles. Willis also was first to describe myasthenia gravis (1671), a chronic muscular fatigue marked by progressive paralysis, and puerperal (childbed) fever, which he named.

Williston, city, seat of Williams County, northwestern North Dakota, U.S., on the Missouri River. Originally called Little Muddy, it was first settled in the 1870s by Robert Matthews, who cut hay for cavalry horses at Ft. Buford (now restored as a state historic site), southwest of the city. An important factor in the community's growth was the arrival of the Great Northern Railway (1887) and the location there of division headquarters. It was then renamed by James J. Hill, builder and first president of the railway, for a stockholder friend, S. Willis James of New York City. The economy, once heavily dependent on agriculture, has become diversified. The development of oil wells and refineries, following the discovery of oil (1951) in the Williston Basin, has given the economy new impetus. Livestock raising and the growing of grain, especially wheat, are still important, with water from the Garrison Dam project easing the threat of drought, such as that which ravaged the area in the 1930s. The Williston Center of the University of North Dakota was opened in 1957. Fort Union Trading Post National Historic Site is nearby to the west. Inc. village, 1894; city, 1904. Pop. (1980) 13,336.

Articles are alphabetized word by word, not letter by letter

Williston Basin, large sedimentary basin along the eastern edge of the Rocky Mountains in western North Dakota, eastern Montana, and southern Saskatchewan, Can. The basin is characterized by thick sequences of sediments that underlie an area of about 285,000 square kilometres (110,000 square miles), and it is geologically closely related to the Alberta Basin in Canada. It was formed by a gentle downwarping of the land that began in the Middle Ordovician Period (about 465,000,000 years ago). Rising seas covered the basin at various intervals during the next 400,000,000 years, resulting in the gradual buildup of marine sediments there.

The Williston Basin is an important source of petroleum. Oil is recovered from the basin's deep limestone strata and natural gas from its uppermost layers of sand. Petroleum accumulation in the basin is largely attributable to structural traps produced by the folding and faulting of rock that occurred during the formation of the Rocky Mountains.

Willkie, Wendell L(ewis) (b. Feb. 18, 1892, Elwood, Ind., U.S.—d. Oct. 8, 1944, New York City), U.S. Republican presidential candidate in 1940, who tried unsuccessfully to

Willkie

By courtesy of the National Archives, Washington, D.C.

unseat Pres. Franklin D. Roosevelt. He subsequently became identified with his famous "One World" concept of international cooperation. Willkie earned his law degree from Indiana University in 1916 and practiced law with his father before entering the U.S. Army during World War I. After the war he entered corporate law practice, moving to New York City in 1929 to work in the legal department of Commonwealth and Southern Corporation; four years later the dynamic lawyer was president of the huge utilities holding company. After 1933 he gained national prominence as leader of the battle of privately owned utilities against competition from the federal government's Tennessee Valley Authority.

Although Willkie had been a Democrat in the early 1930s, he turned Republican a few years later because of what he felt to be unwise government restraints on business enterprise. His effective criticism of Roosevelt's New Deal administration made him a dark horse candidate for the Republican nomination in 1940. Spontaneously, hundreds of grass-roots "Willkie for President" clubs sprang up throughout the country. Despite a late start, limited organization, and opposition from a large segment of party leadership, he was nominated on the sixth ballot. Campaigning until he was hoarse, Willkie stressed the need to create more jobs through policies fostering business expansion and investment—at the same time preserving the best of the New Deal reforms. He also supported aid to the Allies as World War II engulfed Europe. The opposition capitalized on Willkie's Wall Street background and the critical nature of the world situation, however, with the result that he carried only 10 states (82 electoral votes to Roosevelt's 449); nevertheless, his popular vote of more than 22,000,000 was the largest ever received by a Republican to that time.

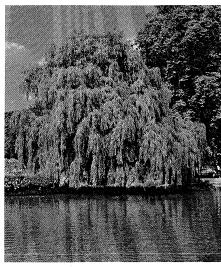

Willkie went on to stress the need for a "loyal opposition" in a two-party system; he visited England (1941) and the Middle East, the Soviet Union, and China (1942). In 1942 he became chairman of the board of 20th Century-Fox Film Corporation. His book, *One World* (1943), largely an outgrowth of his travels, made a strong plea for postwar cooperation and was influential in turning many Republicans away from isolationism.

Support of Roosevelt's war policies brought considerable opposition to Willkie's renomination in 1944, and after his defeat in the Wisconsin primary, he withdrew from the race. In 1952 Joseph Barnes wrote his biography, Willkie.

Willmar, city, seat of Kandiyohi County, southwest central Minnesota, U.S., on Foot and Willmar lakes in the Little Crow lake region. An early settlement (1856) was deserted because of the Sioux uprising of 1862. In 1869 a railhead construction camp was established and named for Leon Willmar, an agent of the St. Paul and Pacific Railroad. It became a railroad division headquarters and a shipping point for grain and livestock. Subsequent development included a large turkey-processing plant and industries ranging from clothing to farm machinery. The city is the site of Willmar Area Vocational-Technical Institute (1962). A state mental hospital is nearby. Inc. village, 1874; city, 1901. Pop. (1980) 15,895.

Willoughby (of Parham), Francis Willoughby, 5th Baron (b. c. 1613, England—d. July 1666, at sea between Barbados and St. Kitts), governor of Barbados who in 1651 brought about the settlement of Suriname (then nominally Spanish territory) by immigrants from Caribbean and other South American colonies. Originally a supporter of Parliament in the English Civil War, he joined the Royalist side in 1648 and was appointed governor of Barbados by Charles II in 1650. He left Barbados in 1652, after the colony surrendered to a Cromwellian fleet. After the restoration of the monarchy, he was given joint proprietorship of Suriname with Lawrence Hyde.

willow, shrubs and trees of the genus Salix, family Salicaceae, mostly native to north temperate areas, valued for ornament, shade, erosion control, and timber. Salicin, source of salicylic acid used in pain relievers, is derived

Weeping willow (Salix babylonica) showing (top) form and (bottom) leaves

(Top) A to Z Botanical Collection—EB Inc., (bottom) Kenneth and Brenda Formanek

from certain willows. All species have alternate, usually narrow leaves and catkins, male and female on separate trees; the seeds have long, silky hairs.

Three of the largest willows are black (S. nigra), crack, or brittle (S. fragilis), and white (S. alba), all reaching 20 metres (65 feet) or more; the first named is North American, the other two Eurasian but naturalized widely. All are common in lowland situations.

Widespread from Mexico to Chile, the Chilean willow (S. chilensis) reaches 18 m; the columnar Xochimilco willow (S. chilensis fastigiata) is a variety especially common at Xochimilco near Mexico City.

The shrubby common, or silky, osier (S. viminalis) supplies twigs used for basketmaking in Europe. Woolly willow (S. lanata), of northern Eurasia, to over 1 m, has woolly white leaf buds.

Several species and hybrids with drooping habit are called weeping willows, especially *S. babylonica* and its varieties from East Asia.

From northern Asia, S. matsudana has sharply toothed leaves, whitish beneath. One variety, S. matsudana tortuosa, is called corkscrew willow for its twicted by necket

willow for its twisted branches.

Pussy willows, the male form of several shrubby species, have woolly catkins that are considered a harbinger of spring. The catkins are formed before the leaves appear. The North American S. discolor is slightly smaller than the Eurasian species, which attain a maximum 7.5 m.

There are numerous shrubby willows common along watercourses (e.g., S. purpurea and S. sericea) and several range to the tundra, where they grow as small matted woody plants (e.g., S. arctica and S. glacialis).

willow oak, any of several species of North American ornamental and timber trees belonging to the red oak group of the genus *Quercus*, in the beech family (Fagaceae), which have willowlike leaves.

Specifically, willow oak refers to Quercus phellos, native to poorly drained areas of the Atlantic and Gulf coastal plains and the Mississippi Valley region. About 18 metres (60 feet) tall, it has drooping lower branches and slender side branches, with spurlike branchlets similar to those of pin oak. The trunk has an almost conical symmetrical crown; the smooth grayish-black bark becomes roughly ridged on older trees. The pale-green, tapering leaves turn yellow in autumn. Willow oak is widely planted as an ornamental and street tree in the southern United States; it grows quickly and has a shallow root system.

Water oak (Q. nigra), laurel oak (Q. laurifolia), shingle oak (Q. imbricaria), and live oak (see live oak) are other willow oaks planted as

ornamentals in the southern U.S.

Water oak, also known as possum oak and spotted oak, is a bottomland species of the southeastern U.S. coastal plains, up to about 25 m tall. Its glossy, blue-green leaves vary in shape and size but are usually spoon-shaped or oblong, slightly lobed at the apex. They turn yellow in autumn and persist into winter. The small acorns are set in shallow, scaly or hairy cups.

Laurel oak, sometimes called Darlington, diamond-leaf, or water oak, is a stately tree, up to 18 m tall, found on sandy soils of the Atlantic and Gulf coastal plains. It produces a large annual crop of dark-brown or black,

egg-shaped acorns.

Shingle oak, a similar tree with longer and wider leaves, was a source of roofing and siding shingles for the early pioneers; its timber is still used in construction.

Willow Palisade, Wade-Giles romanization LIU-T'IAO PIEN, Pinyin LIUTIAOBIAN, ditch and embankment planted with willows built across part of southeastern Manchuria during the early Ch'ing (1644-1911/12) dynasty. The Chinese (Han) in Manchuria, possibly from as early as 1,000 BC, were localized almost entirely in a triangular area in southern Manchuria centring about the alluvial basin of the lower Liao Ho (river) and the uplands of the Liaotung Peninsula. Willow walls or palisades were built along the western side of this area in southern Manchuria as early as the Ming (1368-1644) dynasty. The Willow Palisade of the Ch'ing dynasty was constructed as a 500-mi (800-km-) long northeastward extension of the Great Wall from Shan-hai-kuan to the Sungari River north of Ch'ang-ch'un, thereby separating the Chinese in southern Manchuria from the Mongol-occupied steppes to the west. The southeastern 300-mi-long portion of the palisade, built eastward from northwest of Shen-yang and then south to where the Yalu River meets Korea Bay, formed the frontier between the Chinese and the Koreans (east) and the Manchu (north). After 1688, Chinese under the Manchu-ruled Ch'ing dynasty were prohibited from crossing the palisade without authorization and from settling in the Manchu homeland.

Willow pattern, landscape design developed by Thomas Turner at Caughley, Shropshire, Eng., in 1779 in imitation of the Chinese. Its classic components are a weeping willow, pagoda-like structures, three men on a

Willow pattern on a creamware teapot attributed to John Warburton, Staffordshire, England, c. 1800; in the Victoria and Albert Museum, London

quaint bridge, and a pair of swallows, and the usual colour scheme is blue on white, though there are variants. Very similar land-scape patterns in the Chinese taste had been used earlier. In the late 18th century, Willow patterns were produced at Lowestoft, Suffolk, New Hall, Staffordshire, and elsewhere. A legend of lovers transformed into swallows associated with the Willow pattern is English, not Chinese. "Nanking" porcelain, often confused with Blue Willow ware, was export ware decorated in blue on white, made at Ching-te-chen and shipped from the port of Nanking; polychromed export porcelain was shipped through Canton.

Wills, Helen (Newington), in full HELEN NEWINGTON WILLS MOODY ROARK (b. Oct. 6, 1905, Berkeley, Calif., U.S.), outstanding U.S. tennis player who was the top female competitor in the world for eight years (1927–33 and 1935).

Although she did not own her own racket until age 14, Wills won the first of her seven U.S. singles titles just three years later, in 1923, and repeated this feat in 1924, 1925, 1927–29, and 1931. She was known for her seriousness, in part responsible for her rapid climb, and was often referred to as "Little Miss Poker Face." Her powerful overheads and serves made up for her lack of speed.

From 1927 to 1932 she won every set in singles play and took the Wimbledon title eight times (1927-30, 1932-33, 1935, and 1938). In addition to her U.S. and British victories, Wills won (from 1923 through 1939) four French singles titles and 12 U.S., Wimbledon, and French doubles championships. In 10 Wightman Cup tournaments, she won 18 out of 20 singles matches. She was also the gold medalist for women's singles and doubles in the 1924 Olympics in Paris, the only Olympic tennis competition held during her career.

In 1926, before her game had reached its peak, Wills was defeated by five-time Wimbledon champion Suzanne Lenglen of France in their only meeting. Subsequently, she engaged in a bitter rivalry with the great U.S. player Helen Hull Jacobs.

Wills, Maury, byname of MAURICE MORNING WILLS (b. Oct. 2, 1932, Washington, D.C.), U.S. professional baseball player and manager, who set base-stealing records in his playing career.

Wills was a star football quarterback and baseball pitcher for Cardozo High School (Washington, D.C.), and was signed to a contract by the National League Brooklyn (later Los Angeles) Dodgers in 1950. He batted both right- and left-handed and threw right-handed. He played for their minor league teams

(1951–59) as a second baseman before he was called up to the parent club in 1959, where he played shortstop until he was traded to the Pittsburgh Pirates (1967–68) and drafted in the expansion of the league by the Montreal Expos (1969). He was traded back to the Dodgers in that year and played with them until his retirement in 1972.

Wills led the league in stolen bases in six seasons (1960-65), establishing a season record of 104 in 1962 (surpassed in 1974 by Lou Brock's 118). After his retirement as a player Wills managed four seasons in the Mexican League during the 1970s, served as base-stealing instructor for five major league clubs in spring training, and did some sports announcing. He was manager of the American League Seattle Mariners (1980-81).

Willstätter, Richard (b. Aug. 13, 1872, Karlsruhe, Baden—d. Aug. 3, 1942, Locarno, Switz.), German chemist whose study of the structure of chlorophyll and other plant pigments won him the 1915 Nobel Prize for Chemistry.

Willstätter obtained his doctorate from the University of Munich (1894) for work on the structure of cocaine. While serving as assistant to Adolf von Baeyer at Munich he continued research into the structure of alkaloids and

synthesized several.

In 1905 he was given a professorship at Zürich and began working on chlorophyll. He elucidated its structure and showed that the blood pigment heme bears a structural resemblance to the porphyrin compound found in chlorophyll. He was professor of chemistry in the University of Berlin and director of the Kaiser Wilhelm Institute at Berlin (1912–16), where his investigations revealed the structure of many of the pigments of flowers and fruits. When his work was interrupted by the war, at the behest of Fritz Haber he turned his attention to developing a gas mask.

In 1916 Willstätter succeeded Baeyer at Munich. During the 1920s he investigated the mechanisms of enzyme reactions and did much to establish that enzymes are chemical substances and not biological organisms. His view of enzymes as nonprotein in nature was widely held until disproved in 1930. Being a Jew, in 1924 he resigned his post at Munich in protest against anti-Semitic pressures. He continued his work privately, first in Munich and, from 1939, in Switzerland.

willy-willy, in western Australia, any large, travelling tropical cyclone (q, v).

Wilmette, village, Cook County, northeastern Illinois, U.S., on Lake Michigan, northern residential suburb of Chicago. Laid out in 1869, it was named for Archange Ouilmette, the half-breed Potawatomi Indian wife of Antoine Ouilmette. The U.S. government ceded to her much of the land now within the village boundaries. It is the site of the Baha'i House of Worship (1930), a nine-sided, mosquelike temple that is the centre of the Baha'i faith in North America, and Mallinckrodt College (1918). Inc. 1872. Pop. (1980) 28,229.

Wilmington, largest city in Delaware, U.S., and seat of New Castle County at the influx of the Christina River and Brandywine Creek into the Delaware River. It is the state's industrial, financial, and commercial centre and main port.

The oldest permanent settlement in the Delaware Valley, the site was settled by Swedes in 1638. Called Fort Christina, it was captured by Peter Stuyvesant's Dutch forces in 1655. The Dutch, who named the place Altena, were ousted by the English in 1664. A small agricultural hamlet for its first 100 years, it developed into a prosperous port and market town after the Quakers moved there in the

1730s. The Quakers secured a borough charter from Thomas Penn, the proprietor, who named the town (1739) for his friend Spencer Compton, earl of Wilmington.

By the time of the American Revolution, Wilmington was the largest town in Delaware. Following the Battle of the Brandywine (Sept. 11, 1777), the British captured John McKinly, the state president, in Wilmington and occupied the town. Subsequent growth was due to accessibility to other ports (especially Philadelphia, 25 mi [40 km] northeast), abundance of water power in nearby creeks, and the fertility of nearby farmlands. Sawmills, gristmills, and paper mills were built along the Brandy-wine, just north of Wilmington, and by the 1790s its flour mills were the largest in the United States. In 1802 a French immigrant, Eleuthère Irénée du Pont de Nemours, established a gunpowder mill, the forerunner of the modern gigantic and diversified Du Pont industries with their experimental laboratories in Wilmington. The city's industrial development was given impetus by the completion (1837) of the Philadelphia, Wilmington, and Baltimore (now Penn Central) Railroad. Besides chemical products, manufactures now include automobiles, leather goods, textiles, iron and steel goods, vulcanized fibre, industrial and domestic hose, and processed foods.

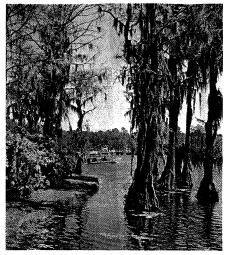

Main exhibit building of the Hagley Museum, Wilmington, Del.

Milt and Joan Mann from CameraMann

Among the city's historic sites and museums are the Fort Christina Monument (by Swedish sculptor Carl Milles), marking the site of the original settlement; Old Swedes Church (Holy Trinity; 1698); Old Town Hall (1798), headquarters of the Historical Society of Delaware; Hagley Museum, occupying the original Du Pont powder mill complex and featuring exhibits dramatizing the industrial history along the Brandywine; Henry Francis du Pont Winterthur Museum, which is a collection of early American interior architecture, furniture, and accessories; and the Delaware Art Museum (opened 1938). Wilmington is the seat of Brandywine College (founded 1966) and Goldey Beacom College (1886). Inc. 1832. Pop. (1980) 70,195; (1982 est.) metropolitan area (SMSA), 464,000.

Wilmington, city, seat of New Hanover County, chief seaport of North Carolina, U.S., on Cape Fear River, 30 mi (50 km) above its mouth. Formed in the 1730s from New Liverpool and New Carthage, it was incorporated (1740) as New Town (Newton) and later renamed to honour Spencer Compton, earl of

Greenfield Gardens, a noted beauty spot in Wilmington, N.C.

Wilmington. The first armed resistance to the Stamp Act occurred there in November 1765. A British effort to conquer the colonies by division was frustrated at the Battle of Moore's Creek Bridge (February 1776); the site, 18 mi west, is now a national military park. In 1781 Wilmington was used by the British general, Lord Cornwallis, as his headquarters. During the Civil War it was a centre for blockade-running and was the last Confederate port to close, holding out until the fall of Ft. Fisher (22 mi south) on Jan. 15, 1865. After suffering severe hurricane damage in the 1950s, the city recovered economically with its shipping, truck farming, tourism, and manufacturing (especially textiles, baked goods, chemicals, containers, and refrigeration equipment). A branch of the University of North Carolina (1947), Wilmington College (1947), and Cape Fear Technical Institute (1959) are there. The uss "North Carolina" Battleship Memorial of World War II is moored on the river. Inc. city, 1866. Pop. (1980) city, 44,000; (1982 est.) metropolitan area (SMSA), (1982 est.) 107,300.

Wilmington, Spencer Compton, earl of, VISCOUNT PEVENSEY, also called (1728-30) BARON WILMINGTON (b. 1673?—d. July 1743), British politician, favourite of King George II and nominal prime minister of Great Britain from February 1742 to July

Third son of James Spencer, 3rd earl of Northampton, he first entered Parliament in 1698; in 1715 he became speaker of the House of Commons and in 1716 a member of the privy council. In 1730 he was created earl of Wilmington by a king who befriended him and exaggerated his abilities. He became an aging compromise candidate for the prime ministry in 1742, when the real power lay with the Duke of Newcastle and John Carteret (later Earl Granville). Wilmington was deemed mediocre and dull by the public and peers alike and was the frequent target of satirists and caricaturists. He died unmarried at the age of 70, his titles becoming extinct.

Wilmot, John: see Rochester, John Wilmot, 2nd earl of.

Wilmot Proviso, in U.S. history, important congressional proposal in the 1840s to prohibit the extension of slavery into the territories, a basic plank upon which the Republican Party

was subsequently built. Soon after the Mexican War, Pres. James K. Polk asked Congress for \$2,000,000 to negotiate peace and settle the boundary with Mexico. In behalf of anti-slavery forces throughout the country, a Democratic congressman from Pennsylvania named David Wilmot offered an amendment (Aug. 8, 1846) to the bill forbidding slavery in the new territory, thus precipitating bitter national debate in an atmosphere of heightening sectional conflict. Despite repeated attempts, the Wilmot Proviso was never passed by both houses of Congress. But out of the attempt by both Democrats and Whigs to subordinate or compromise the slavery issue grew the Republican Party, founded in 1854, which specifically supported the Wilmot principle.

Wilson, city, seat (1855) of Wilson County, east central North Carolina, U.S. A leading market for bright-leaf tobacco, it was incorporated in 1849 and was named for Gen. Louis D. Wilson (1789-1847), who died at Vera Cruz during the Mexican War. Light manufacturing augments its tobacco economy. Wilson is the seat of Atlantic Christian College (founded 1902) and Wilson County Technical Institute (1958). Pop. (1980) 34,424

Wilson, Alexander (b. July 6, 1766, Paisley, Renfrew, Scot.—d. Aug. 23, 1813, Philadelphia), Scottish-born ornithologist and poet whose pioneering work on North Amer-

Alexander Wilson, detail of an engraving by W.H. Lizars **BBC Hulton Picture Library**

ican birds, American Ornithology, 9 vol., (1808-14), established him as a founder of American ornithology and one of the foremost naturalists of his time.

During his early years in Scotland he wrote poetry while working as a weaver and peddler. His best known production, a comic, dramatic ballad, Watty and Meg, was published anonymously; its popularity may have been the result of the belief that the poet Robert Burns was its author. Wilson apparently was never financially successful in publishing verse. In 1792 his satirical writings to aid the cause of the weavers led to a fine, imprisonment, and

political troubles.

Impoverished, he emigrated in 1794 to the United States, where he became a teacher. Influenced by the naturalist William Bartram, he decided in 1804 to write on North American birds. After studying art and ornithology in his leisure time, he became assistant editor of Rees's Cyclopedia and in 1808 published the first volume of American Ornithology. He spent much of the remainder of his life selling subscriptions for his expensive work and collecting specimens for the remaining volumes. During his travels he met the U.S. naturalist John J. Audubon, who was then a merchant. Later, the success of Wilson's work encouraged Audubon to continue to paint birdlife and to publish the results of his studies.

Wilson, Sir Angus (Frank Johnstone) (b. Aug. 11, 1913, Bexhill, East Sussex, Eng.), British writer whose fiction—sometimes serious, sometimes richly satirical—portrays conflicts in contemporary English social and intellectual life.

Wilson was the youngest of six sons born to an upper middle-class family who lived a shabby-genteel existence in small hotels and boarding houses, chiefly in London. This unsettled world on the fringe of society is featured in many of his short stories, and he describes it in his autobiographical Wild Garden (1963). He was educated at Westminster School, London, and Merton College, Oxford, and went to work as a cataloger at the British Museum Reading Room. His mother died when he was 15 years old, and he and his father developed a close companionship that left an emotional void at the latter's death in 1939. A nervous breakdown while working for the Foreign Office during World War II led him to conclude that he had kept himself in a state of childlike innocence about the world and that it was necessary to become an adult, no matter how painfully. Several of the central characters in his novels and stories are also faced with this problem. He returned to the British Museum after the war, becoming deputy to the superintendent of the Reading Room until he left in 1955 to devote himself to writing. He was professor of English literature at the University of East Anglia (1966-78), becoming emeritus thereafter.

Death Dance: 25 Stories (1969) is a collection of early stories. His first novel, Hemlock and After (1952), is regarded by some critics as his best. Before that he had already been noticed by the reading public with the stories collected as The Living Set (1949) and Such Darling Dodos (1950). Anglo-Saxon Attitudes (1956) and The Old Men at the Zoo (1961) offer acute pictures of a wide array of characters, chiefly learned or propertied, in British life. The Middle Age of Mrs. Eliot (1958) is a psychological portrait. Later novels include Late Call (1965), As If By Magic (1973), and Setting the World on Fire (1980). The World of Charles Dickens (1970) and The Strange Ride of Rudyard Kipling (1977) are notable biographies. Wilson became president of the Kipling Society in 1980 and received a knighthood that same year.

Wilson, C(harles) T(homson) R(ees) (b. Feb. 14, 1869, Glencorse, Midlothian, Scot.—d. Nov. 15, 1959, Carlops, Peeblesshire), Scottish physicist, joint recipient, with Arthur H. Compton of the U.S., of the Nobel Prize for

C.T.R. Wilson, 1927

Physics in 1927 for his invention of a device called the Wilson cloud chamber, widely used in the study of radioactivity, X-rays, cosmic rays, and other nuclear phenomena.

Wilson began studying clouds as a meteorologist in 1895. In an effort to duplicate the effects of certain clouds on mountaintops, he devised a way of expanding moist air in a closed container. The expansion cooled the air so that it became supersaturated, and moisture condensed on dust particles.

Wilson noted that when he used dust-free air the air remained supersaturated and that clouds did not form until the degree of supersaturation reached a certain critical point. He believed that in the absence of dust the clouds formed by condensing on ions (charged atoms or molecules) in the air. Hearing of the discovery of X-rays, he thought that ion formation as a result of such radiation might bring about more intensive cloud formation. He experimented and found that radiation left a trail of condensed water droplets in his cloud chamber. Perfected by 1912, his chamber proved indispensable in the study of nuclear physics and eventually led to the development (by Donald A. Glasser in 1952) of the bubble chamber.

From 1916 Wilson became involved in the study of lightning and in 1925 was appointed Jacksonian professor of natural history at Cambridge. Applying his studies of thunderstorms, he devised a method of protecting British wartime barrage balloons from lightning, and in 1956 he published a theory of thunderstorm electricity.

Wilson, Colin (Henry) (b. June 26, 1931, Leicester, Leicestershire, Eng.), English novelist and writer on philosophy, sociology, music, literature, and the occult.

Wilson left school at age 16. He subsequently worked as a laboratory assistant, civil servant, labourer, dish washer, and factory worker. For a short while, until discharged on medical grounds, he served in the Royal Air Force (1949-50). He lived in Paris and Strasbourg (1950-51) and was working in a coffee bar while he wrote his first book, The Outsider (1956). The book was a study of the alienation of modern man as glimpsed through the lives and writings of some of the principal intellectual figures of the 20th century. It was at first acclaimed for its brilliance, and this initial critical response catapulted Wilson to fame at the age of 24, in the process making The Outsider a best-seller.

By the time Wilson's Religion and the Rebel was published in 1957, however, the literary establishment had changed its opinion of his talent, and the new book was dismissed as unoriginal and superficial. This negative criticism dogged Wilson until his first novel, Ritual in the Dark (1960), was published. When his second novel, Adrift in Soho, appeared in 1961, Wilson was well on his way to repairing his initial reputation.

his initial reputation.

Many of Wilson's books deal with the psychology of crime, the occult, human sexuality, or with Wilson's own original form of Existential philosophy. An extremely prolific author, he wrote more than 50 books by the early 1980s. Among his works are Necessary Doubt (1964), The Mind Parasites (1967), A Casebook of Murder (1970), Starseekers (1980), The Quest for Wilhelm Reich (1981), and Poltergeist! (1981).

Wilson, (John) Dover (b. July 13, 1881, London—d. Jan. 15, 1969, Balerno, Midlothian, Scot.), British Shakespearean scholar and educator.

Educated at the University of Cambridge, Wilson was professor of education at King's College, London (1924–35), and regius professor of English literature at the University of Edinburgh (1935–45). Besides serving as chief editor of the New Cambridge edition of Shakespeare's plays (from 1921), he was a trustee of Shakespeare's birthplace and also of the National Library of Scotland. Wilson made important if controversial contributions to Shakespearean scholarship by a bold elucidation of textual obscurities and original, stimulating interpretations of the plays. His critical judgments have been variously labelled extreme, faulty, or inspired. His intensive study

of Elizabethan handwriting proved helpful in reconstructing Shakespeare's text. His most famous book, What Happens in Hamlet (1959), was an original reading of that play, and The Fortunes of Falstaff (1943) presented a picture of Falstaff as a force of evil ultimately rejected by the king. His other works include Life in Shakespeare's England: A Book of Elizabethan Prose (1911); The Essential Shakespeare: A Biographical Adventure (1932); Shakespeare's Happy Comedies (1962); and Shakespeare's Sonnets (1963).

Wilson, Edmund (b. May 8, 1895, Red Bank, N.J., U.S.—d. June 12, 1972, Talcottville, N.Y.), critic and essayist recognized as the leading man of letters in the United States in his time.

Edmund Wilson

Educated at Princeton, Wilson moved from newspaper reporting in New York to become managing editor of *Vanity Fair* (1920–21) and associate editor of *The New Republic* (1926–31). An internationalist as a critic, Wilson's book Axel's Castle (1931) was an important survey of the Symbolist poets. His attention then shifted to politics and economics, in To the Finland Station (1940), a historical study of the thinkers who laid the groundwork for the Russian Revolution. For a time he became a Marxist of his own variety. Much of these two books originally appeared in the pages of The New Republic. Until late in 1940 he was a contributor to that periodical, and much of his work for it was collected in Travels in Two Democracies (1936), dialogues, essays, and a short story about the Soviet Union and the U.S.; The Triple Thinkers (1938), which dealt with writers involved in multiple meanings; The Wound and the Bow (1941), about art and neurosis; and The Boys in the Back Room (1941), a discussion of such new U.S. novelists as John Steinbeck and James M. Cain. From 1944 to 1948 Wilson regularly reviewed books for The New Yorker, and major articles by him appeared in the magazine until the year of his death, including serialization of Upstate: Records and Recollections of Northern New York (1972), a collection from his journals.

After World War II Wilson wrote The Scrolls from the Dead Sea (1955), for which he learned to read Hebrew; Red, Black, Blond and Olive: Studies in Four Civilizations: Zuni, Haiti, Soviet Russia, Israel (1956); Apologies to the Iroquois (1960); Patriotic Gore (1962), an analysis of American Civil War literature; and O Canada: An American's Notes on Canadian Culture (1965). In this period five volumes of his magazine pieces were collected: Europe Without Baedeker (1947), Classics and Commercials (1950), The Shores of Light (1952), The American Earthquake (1958), and

The Bit Between My Teeth (1965).

In other works Wilson gave evidence of his crotchety character: A Piece of My Mind: Reflections at Sixty (1956), The Cold War and the Income Tax (1963), and The Fruits of the MLA (1968), a lengthy attack on the Modern Language Association's editions of American authors, which he felt buried their subjects in pedantry. His plays are in part collected in Five Plays (1954) and in The Duke of Palermo and Other Plays with an Open Letter to Mike Nichols (1969). His poems appear in Notebooks of Night (1942) and in Night Thoughts (1961); an early collection, Poets, Farewell, appeared in 1929. Memoirs of Hecate County (1946) is a collection of short stories that encountered censorship problems when it first appeared. Wilson edited the posthumous papers and notebooks of his friend F. Scott Fitzgerald, The Crack-Up (1945), and also edited the novel *The Last Tycoon* (1941), which Fitzgerald had left uncompleted at his death. Wilson wrote one novel himself, I Thought of Daisy (1929). The Twenties: From Notebooks and Diaries of the Period, edited by Leon Edel, was published posthumously in 1975. His widow Elena edited Letters on Literature and Politics 1912-1972 (1977), and his correspondence with Vladimir Nabokov, the novelist, appeared in 1979.

Wilson concerned himself with both literary and social themes and wrote as historian, poet, novelist, editor, and short-story writer. He covered a multitude of subjects, probing each with an expansiveness that was firmly rooted in scholarship and common sense, and he expressed his views in a prose style noted for its clarity and precision. His critical writings on the American novelists Ernest Hemingway, John Dos Passos, F. Scott Fitzgerald, and William Faulkner attracted public interest to their early work and guided opinion toward

their acceptance.

Wilson, Edmund Beecher (b. Oct. 19, 1856, Geneva, Ill., U.S.—d. March 3, 1939, New York, N.Y.), American biologist known for his researches in embryology and cytology.

In 1891 Wilson joined the faculty of Columbia University, where he elevated the department of zoology to a peak of international prestige. His first experimental studies, in embryology, led him to investigations at the cellular level. He became established as an outstanding pioneer in work on cell lineage,

Edmund Beecher Wilson By courtesy of Columbia University

i.e., the tracing of the formation of different kinds of tissues from individual precursor cells. His interest then extended to internal cellular organization; publication of his Cell in Development and Inheritance (1896) deeply influenced the trend of biological thought. The problem of sex determination became his next concern, and his cytological studies, culminating in a series of papers on the relation of chromosomes to the determination of sex, the first published in 1905, represented the pinnacle of his scientific achievement. Having recognized the importance of Gregor Mendel's

earlier findings on heredity when they were rediscovered in 1900, Wilson realized that the role of chromosomes went far beyond the determination of sex; he envisioned their function as important components in heredity as a whole. His ideas exerted a powerful force in shaping future research in genetics.

Wilson, Edward O(sborne) (b. June 10, 1929, Birmingham, Ala., U.S.), American biologist recognized as the world's leading authority on ants. He was also the foremost proponent of sociobiology, the study of the genetic basis of the social behaviour of all animals, including humans.

Wilson devoted much of his early career at the University of Alabama (B.S., 1949; M.S., 1950) to the study of ants. In the same year that he gained his doctorate (1955) at Harvard University, he completed an exhaustive taxonomic analysis of the ant genus *Lasius*. In collaboration with W.L. Brown, he developed the concept of "character displacement," a process in which two closely related species populations undergo rapid evolutionary differentiation after first coming into contact with each other, in order to minimize the chances of both competition and hybridization between them.

After his appointment to the Harvard faculty in 1956, Wilson made a series of important discoveries, including the determination that ants communicate primarily through the transmission of a chemical substance known as a pheromone. In the course of revising the classification of ants in the South Pacific, he formulated the concept of the taxon cycle, in which speciation and species dispersal are linked to the varying habitats that organisms encounter as their populations expand. In 1971 he published *The Insect Societies*, his definitive work on ants and other social insects. The book provides a comprehensive picture, treating the ecology and population dynamics of innumerable species in addition to their societal behaviour patterns. In his second major work, Sociobiology: The New Synthesis (1975), Wilson presented his theories about the biological basis of social behaviour. It contained a chapter proposing that the essentially biological principles on which animal societies were based applied to human social behaviour. This inflamed certain scientists and groups that regarded such ideas as politically provocative. Actually, Wilson maintained that he saw perhaps as little as 10 percent of human behaviour as genetically induced, the rest being attributable to environment. In his 1979 Pulitzer Prize-winning book On Human Nature (1978), Wilson explored the implications of sociobiology in regard to human aggression, sexuality, and ethics. His book The Ants (1990) was a monumental summary of contemporary knowledge of those insects.

One of Wilson's most notable theories is that even a characteristic such as altruism may be genetically based and may have evolved through the process of natural selection. Traditionally, natural selection has been thought to foster only those physical and behavioral traits that increase an individual's chances of reproducing. Thus, an altruistic behaviour, as when an organism sacrifices itself in order to save other members of its immediate family, would seem incompatible with natural selection. Wilson maintains, however, that much altruistic behaviour is consistent with natural selection in that the sacrifice is made to save closely related individuals—i.e., individuals who share many of the sacrificed organism's genes. Thus, in Wilson's theory, the preservation of the gene, rather than the preservation of the individual, becomes the focus of evolutionary strategy

At Harvard, Wilson was professor of zoology (1964-76) and F.B. Baird, Jr., professor of science thereafter. He was also curator of entomology at the Museum of Comparative

Zoology from 1972 on. In 1990 he shared Sweden's Crafoord Prize with the American biologist Paul Ehrlich.

Wilson, Godfrey (b. 1908—d. May 19, 1944), British anthropologist and analyst of social change in Africa.

In 1938 Wilson was appointed the first director of the Rhodes-Livingstone Institute in Northern Rhodesia (now Zambia). The institute was the first local anthropological research facility to be set up in an African colony. Wilson and his wife worked as a team in their examination of social conditions resulting from the rapid economic, political, and cultural change in the British colonies of Tanganyika, Nyasaland, and Northern Rhodesia. Wilson's book, *The Analysis of Social Change* (1945; written with his wife, Monica Wilson), is based on this experience.

Wilson studied anthropology at the London School of Economics and Political Science under Bronisław Malinowski. He directed the Rhodes-Livingstone Institute until 1942, when he joined the staff of the South African Medical Corps. His work was particularly influenced by his interest in the effects of industrialization on primitive peoples.

Wilson, (James) Harold, BARON WILSON OF RIEVAULX, also called (1976–83) SIR HAROLD WILSON (b. March 11, 1916, Huddersfield, Yorkshire, Eng.), Labour Party politician, prime minister of the United Kingdom (1964–66, 1966–70, 1974, 1974–76).

Harold Wilson
Central Press—Pictorial Parade/EB Inc.

Son of an industrial chemist, Wilson was educated at the University of Oxford, where, as a fellow of University College (1938–39), he collaborated with Sir William (afterward 1st Baron) Beveridge on work that led to Beveridge's epochal report (1942) advocating social insurance and other welfare measures. On the outbreak of World War II, Wilson was drafted into the civil service. As director of economics and statistics (1943–44) at the Ministry of Fuel and Power, he produced a study of the mining industry. His book *New Deal for Coal* (1945) was the basis of the Labour Party's plans for nationalizing the mines.

Elected to the House of Commons in 1945, Wilson became president of the Board of Trade in October 1947, resigning in April 1951 in protest against the introduction of national health service charges to finance rearmament for the Korean War. He was associated with a left-wing challenge to Hugh Gaitskell, the Labour leader, in 1960. This failed, but, after Gaitskell died in 1963, Wilson was elected leader of the Labour Party. He worked to consolidate the party and formed a Labour government the next year. In October 1965 Wilson unsuccessfully tried to avert an illegal declaration of independence by the white minority government of the British colony of Rhodesia; his subsequent efforts to restore legality by economic sanctions and negotiation failed.

In the late 1960s Wilson's popularity declined, partly because of his assumption of direct responsibility for the economy shortly before the pound was devalued (Nov. 18, 1967). His peacemaking journeys to the Soviet

Union and the United States in 1968 had no effect on the war in Vietnam. In June 1969, after declaring that his government would stand or fall on the issue of trade union reform, he abandoned the proposed legislation. A year later the Conservatives won the general election, and Wilson resigned.

In February 1974 the Conservative government called a general election in the face of industrial unrest and a fuel crisis. The Conservatives won a plurality of the popular vote but were unable to form a coalition; Wilson was asked to form a government on March 4 and did so on March 5-6. This administration lasted until October, when he won a clear majority after the second general election in eight months. Wilson's adroitness in holding together a party of mixed-economy social democrats on the right extending to declared Marxists on the left and relying on the support of the trade union movement was never more severely tested than in 1975. His party was deeply divided on British membership in the European Economic Community (EEC) and on inflation and incomes policy. By the June referendum on EEC membership, Wilson was able not only to confirm the British role in Europe by an overwhelming majority but also to end an acrimonious, long-running quarrel inside the party. In Britain, however, economic difficulties continued, and on March 16, 1976—with the pound floundering and a crucial budget soon to be presented-Wilson announced his resignation to a stunned Cabinet. In April the Queen appointed him a Knight of the Garter. In 1983 he was created

His own version of politics in his time may be found in his The Labour Government, 1964–1970 (1971), The Governance of Britain (1976), and Final Term: The Labour Government 1974-76 (1979).

Wilson, Henry, original name JEREMIAH JONES COLBATH (b. Feb. 16, 1812, Farmington, N.H., U.S.—d. Nov. 22, 1875, Washington, D.C.), U.S. Republican senator and vicepresident of the United States (1873-75) who was a national leader in the antislavery cause.

Indentured as a farm labourer at the age of 10, the youth legally changed his name to Henry Wilson when he was freed at 21. He learned to make shoes and became a smallscale manufacturer at Natick, Mass. After visiting Washington, D.C., and listening to slavery debates and observing slave auctions, he determined to devote his life to emancipation. He attracted attention as a stump speaker and was elected as a Whig to the Massachusetts

Henry Wilson By courtesy of the Library of Congress, Washington,

legislature in 1840, serving almost continuously for the next 12 years. Disappointed at the Whigs' ambivalent stand on the slavery issue, he helped form the Free-Soil Party in 1848. He then joined the antiforeign Know-Nothing Party (1854) but was converted to

the Republican Party a few years later. Elected to the U.S. Senate (1855-73), he served as chairman of the Committee on Military Affairs during the Civil War (1861-65) and opposed Pres. Andrew Johnson's postwar policy of accommodation toward the defeated South. Defeated for the vice-presidential nomination in 1868, he was chosen four years later and served during the second term of Pres. Ulysses S. Grant. He died in office of a stroke.

Wilson wrote on the war and Reconstruction and is best known for History of the Rise and Fall of the Slave Power in America, 3 vol.

Wilson, Sir Henry Hughes, BARONET (b. May 5, 1864, near Edgeworthstown, County Longford, Ire.—d. June 22, 1922, London), British field marshal, chief of the British imperial general staff, and principal military adviser

Sir Henry Hughes Wilson, detail of a painting by John Singer Sargent; in the National Portrait Gallery, London By courtesy of the National Portrait Gallery, London

to Prime Minister David Lloyd George in the last year of World War I. While serving in the War Office as director of military operations (1910-14), he determined that Great Britain should support France in a war against Germany on the basis of French requirements, a policy that many British leaders did not

A soldier from the early 1880s, Wilson rose to the command of the Staff College at Camberley, Surrey (1907-10). During this period he cultivated the friendship of his counterpart at the French war college, General (afterward Marshal) Ferdinand Foch—an association that may account for Wilson's readiness to involve Great Britain in French strategy. He played a dubious part in the Curragh incident (March 1914), surreptitiously encouraging some British Army officers who refused to lead troops against Ulster opponents of Irish Home Rule.

On the outbreak of World War I, the British government chose Wilson's policy of fighting in France alongside French armies in preference to attacking the German invaders in Belgium, the strategy of the commander in chief, Field Marshal Earl Roberts. Wilson agreed with Roberts, however, on the necessity of military conscription (not instituted until 1916). The smooth mobilization of the standing army and its rapid movement to France in August 1914 may be credited largely to

Wilson's prewar planning.

Wilson himself soon went to France as assistant chief of the general staff. His only field command in the war (December 1915-December 1916) was marked by the loss to the Germans of a sector of Vimy Ridge, near Arras, by his IV Corps. In September 1917 he took over the Eastern Command, a position that enabled him to live in London and ingratiate himself with Lloyd George. As chief of the imperial general staff (from Feb. 18, 1918), he aided the Prime Minister in securing Foch's appointment as supreme commander of the Allied armies on the Western Front.

Disagreeing with the government's postwar Irish policy, Wilson, who had been promoted to field marshal and created a baronet (1919), was refused reappointment as chief of staff by Lloyd George. Wilson thereupon left the Army and entered the House of Commons as a Conservative member for an Ulster constituency (all in February 1922). A flambovant personage and an eloquent speaker on behalf of Anglo-Irish Unionism, he evoked the hatred of his nationalist countrymen and was assassinated on his doorstep by two members of the revolutionary Irish Republican Army.

Wilson left no child, and the baronetcy became extinct upon his death. A biography by Maj. Gen. Sir C.E. Callwell, Field-Marshal Sir Henry Wilson, 2 vol. (1927), contained extracts from Wilson's diaries-extreme denunciations of individuals and erroneous military ideas—that damaged his professional reputation. A more recent biography is Brasshat (1961), by Basil Collier.

Wilson (of Libya and of Stowlangtoft), Henry Maitland Wilson, 1st Baron (b. Sept. 5, 1881, London-d. Dec. 31, 1964, Chilton, Aylesbury, Buckinghamshire, Eng.), British field marshal, commander in chief in the Middle East (February-December 1943), and supreme Allied commander in the Mediterranean (December 1943-November 1944), popularly known as "Jumbo" because of his great height and bulk.

In 1939 Wilson was placed in command of British troops in Egypt. With Gen. Archibald Percival (afterward 1st Earl) Wavell and Gen. Richard Nugent O'Connor, he routed the Italian Army in Cyrenaica (Bargah, Libya) in the winter of 1940-41. He led an unsuccessful expedition to Greece in March 1941 and also led the force of British Commonwealth and Free French troops that took Syria from the Vichy French in the summer of that year. After the Italian armistice of Sept. 8, 1943, Wilson seized the Italian-controlled Dodecanese (Dhodhekánisos) Islands, but without adequate reinforcements he soon lost them to the Germans. As supreme commander in the Mediterranean, succeeding Gen. Dwight D.

1st Baron Wilson

Eisenhower, he maintained excellent relations between British and U.S. forces. From 1945 to 1947 he headed the British joint staff mission in Washington, D.C

Wilson, J(ohn) Tuzo (b. Oct. 24, 1908, Ottawa), Canadian geologist and geophysicist who established global patterns of faulting and the structure of the continents. His studies in plate tectonics have had an important bearing on the theories of continental drift, seafloor spreading, and convection currents within the

The son of a Scottish engineer who had immigrated to Canada, Wilson in 1930 became the first person at any Canadian university to graduate in geophysical studies (B.A., Trinity College, University of Toronto). He then studied at St. John's College, Cambridge (B.A., 1932), Princeton University (Ph.D., 1936), and Cambridge University (M.A., 1940; Sc.D., 1958). He worked with the Geological Survey of Canada (1936-39) and served with the Royal Canadian Engineers during World War II, rising to the rank of colonel. After the war, in 1946, Wilson became professor of geophysics at the University of Toronto, where he remained until 1974, when he became director general of the Ontario Science Centre. He was president of both the Royal Society of Canada (1972-73) and the American Geophysical Union (1980-82). Among his major publications were One Chinese Moon (1959), IGY: Year of the New Moons (1961), A Revolution in Earth Science (1967), and Continents Adrift and Continents Aground (1977).

In the early 1960s Wilson became the world's leading spokesman for the revived theory of continental drift, at a time when prevailing opinion held that continents were fixed and immovable. His paper entitled A New Class of Faults and Their Bearing on Continental Drift (1965) introduced the concept of the transform fault. Whereas previous theories of continental drift had conceived of plates as either moving closer together (convergent plates) or further apart (divergent), Wilson asserted that a third kind of movement existed whereby plates slide past each other. This theory became one of the bases for plate tectonics, which revolutionized the geophysical sciences in the 1970s

Wilson, Jack (American Indian religious leader): see Wovoka.

Wilson, James (b. Sept. 14, 1742, Carskerdy, Fife, Scot.—d. Aug. 21, 1798, Edenton, N.C., U.S.), colonial American lawyer and political theorist, signer of the Declaration of Independence, and member of the Constitutional Convention of 1787.

James Wilson, portrait by Philip Fishbourne Wharton, 1783; in Independence National Historical Park, Philadelphia

By courtesy of the Independence National Historical Park Collection, Philadelphia

Emigrating to North America in 1765, Wilson taught Greek and rhetoric in the College of Philadelphia and then studied law under John Dickinson, statesman and delegate to the First Continental Congress. Wilson's fame spread with publication in 1774 of his treatise Considerations on the Nature and Extent of the Legislative Authority of the British Parliament. In this work he set out a scheme of empire in which the British colonies would have the equivalent of dominion status. In 1774 he became a member of the Committee of Correspondence in Cumberland County, Pa., and a delegate to the Continental congresses (1774; 1775-77). In 1779 he was appointed advocate general for France and represented that country in cases rising out of its alliance with the American colonies. He became a champion of the Bank of North America and an associate of merchant-banker Robert Morris in his struggle for currency reform after 1781. As a member of the federal Congress (1783; 1785–86), he pressed for an amendment to the Articles of Confederation to permit Congress to levy a general tax.

During the Constitutional Convention in 1787 Wilson helped to draft the U.S. Constitution; he then led the fight for ratification in Pennsylvania. In 1790 he engineered the drafting of Pennsylvania's new constitution and delivered a series of lectures that are landmarks in the evolution of American jurisprudence. He was appointed an associate justice of the U.S. Supreme Court (1789–98), where his most notable decision was that on Chisholm v. Georgia. In the winter of 1796–97 financial ruin brought on by unwise land speculation shattered his health and ended his career.

Wilson, John Anthony Burgess: see Burgess, Anthony.

Wilson, Kenneth Geddes (b. June 8, 1936, Waltham, Mass., U.S.), American physicist who was awarded the 1982 Nobel Prize for Physics for his development of a general procedure for constructing improved theories concerning the transformations of matter called continuous or second-order phase transitions. Wilson's work provided, among other things, a mathematical strategy for dealing with effects that involve neighbouring atoms or molecules as well as those that influence a specimen of material large enough to be observed experimentally.

Wilson was graduated from Harvard University in 1956. In 1961 he received a Ph.D. from the California Institute of Technology, where he completed a dissertation under Murray Gell-Mann (winner of the Nobel Prize for Physics in 1969) and Francis Low. After a year at the European Council for Nuclear Research, Wilson was appointed assistant professor at Cornell University in 1963; he was named professor of physics in 1971.

Wilson, Mount, peak (5,710 feet [1,740 m]) in the San Gabriel Mountains of the Angeles National Forest, southern California, U.S. It lies just northeast of Pasadena. A highway leads to the summit, an eroded plateau, which is the site of the famous astronomical observatory, the Mount Wilson Observatory (established 1904), one of the Hale Observatories. The mountain was named for Benjamin Davis Wilson, who blazed a "burro" trail to the summit in 1864.

Wilson, Richard (b. Aug. 1, 1714, Penegoes, Montgomeryshire, Wales—d. May 15, 1782, Llanberis, Carnarvonshire), one of the earliest major British landscape painters, whose works combine a mood of classical serenity with picturesque effects.

In 1729 Wilson studied portraiture with Thomas Wright in London and after about 1735 worked on his own in this genre. From 1746 his work shows a growing interest in landscape that, soon after his arrival in Italy late in 1750, became almost exclusive. Staying at first in Venice, he met the landscape painter Francesco Zuccarelli. Early in 1752 he went to Rome and became part of an art circle that included the painters Joseph Vernet and Anton Raphael Mengs. He remained in Rome until 1757, working mostly for aristocratic English tourists. He produced not only large landscapes in the manner of Nicolas Poussin, Salvator Rosa, and Claude Lorrain but also numerous drawings of Roman sites and buildings, which he used in composing Italianate landscapes after his return to England. The finest of these is a set of drawings made for Lord Dartmouth and dated 1754. They show how Wilson tempered his delicate observation of light and distance with the discipline of such 17th-century classical Baroque painters as Poussin and Claude. Returning to London probably in 1757, he became influential as a teacher and, after 1760, as an exhibitor with the Society of Artists and the Royal Academy. He was a founding member of the Academy in 1768 and, from 1776, its librarian, a post he took to relieve his poverty.

Though continuing to produce Italian landscapes, Wilson now turned to depicting his own country, especially Wales and the rural en-

"Snowdon," oil painting by Richard Wilson, c. 1770; in the Walker Art Gallery, Liverpool

virons of London. The order and clarity rather than the classical apparatus of Italy survive, and Wilson's exact and tranquil recording of clear or suffused air, distance, and varied lights predominates, as in his famed "Snowdon." His landscapes of this period exerted considerable influence on J.M.W. Turner, John Constable, and John Crome. Wilson's later works, such as "Minchenden House," tend to abandon formal composition, using tonal methods of recording space. Many works ascribed to him, especially late ones, are partly the work of his pupils.

Wilson, Robert Woodrow (b. Jan. 10, 1936, Houston, Texas, U.S.), American radio astronomer who shared, with Arno Penzias, the 1978 Nobel Prize for Physics for a discovery that supported the "big bang" theory of creation.

Educated at Rice University, Houston, and the California Institute of Technology, Pasadena, where he received his doctorate in 1962, Wilson then worked (1963–76) at the Bell Telephone Laboratories at Holmdel, N.J., where, in collaboration with Penzias, he began monitoring radio emissions from a ring of gas encircling the Milky Way Galaxy. The two scientists detected an unusual background radiation that seemed to permeate the cosmos uniformly and indicated a temperature of 3 K. This radiation appeared to be a remnant of the big bang, the primordial explosion billions of years ago from which the universe originated.

From 1976 Wilson was head of Bell's Radio Physics Research Department. He contributed to many scientific journals on such subjects as background temperature measurements and millimetre-wave measurements of interstellar molecules. He became a member of the U.S. National Academy of Science in 1979.

Wilson, (Thomas) Woodrow (b. Dec. 28, 1856, Staunton, Va., U.S.—d. Feb. 3, 1924, Washington, D.C.), 28th president of the United States (1913–21), an American statesman remembered for his high-minded and sometimes inflexible idealism, who led his country into World War I and became the leading advocate of the League of Nations at the Paris Peace Conference. He suffered a nervous collapse and stroke of paralysis while vainly seeking American public support for the Versailles Treaty (September-October 1919).

Early life, education, and governorship. Wilson had two older sisters, Marion and Anne, and a younger brother, Joseph. The stern Presbyterianism of Woodrow's father,

Joseph Ruggles Wilson, a minister of in-domitable character and theological distinction, left an indelible impression upon the character of the future president. Wilson's early years were spent in Georgia and South Carolina, where he was deeply affected by the ravages of the Civil War and the suffering of the South during the postwar Reconstruction period. After a brief stay at Davidson College in North Carolina he entered what is now Princeton University in 1875, took a prominent part in debate, literary activities, and the administration of student athletics, and was graduated in about the middle of his class. His most notable undergraduate achievement was the publication of an article that skillfully analyzed the committee system of the U.S. Congress and foreshadowed his more mature political principles. After graduation he studied law at the University of Virginia until poor health cut short his residence. Following an unsuccessful attempt at legal practice in Atlanta, Ga., he pursued advanced studies in government and history at Johns Hopkins University, where, in 1886, he received a Ph.D.

Wilson's doctoral dissertation, Congressional Government, developed his attack upon the congressional committees. In the same year he married Ellen Louise Axson of Savannah, Ga., and began a teaching career at Bryn Mawr College as associate professor of history and political economy.

In 1888 he became a professor at Wesleyan University in Connecticut; two years later he joined the Princeton faculty as professor of jurisprudence and political economy, in which capacity he served until 1902, when he was chosen president of the university.

At Princeton, Wilson achieved a national reputation by his addresses and articles on political questions of the day, and in September 1910 he was offered the Democratic nomination for the governorship of New Jersey. The offer came at a moment when prospects for the success of his policies at Princeton seemed most discouraging, and he readily accepted. Conducting a dynamic and fearless campaign, he won the support of progressive elements throughout the state and was elected.

Wilson's rapid and resounding success in New Jersey brought him into the arena of national politics, and when the Democratic National Convention met in June 1912 to select a presidential candidate, Wilson was nominated. In the presidential campaign that followed, the clarity and positive quality of Wilson's domestic program won him the leadership of the Democratic Party and of the progressive movement throughout the country.

First term as president. Once in the White House, Wilson proceeded with amazing vigour to initiate and carry through major items of legislation he had advocated in his campaign. He delivered his first message to Congress in person, thus renewing the custom that had

lapsed with John Adams. In this session and later he constantly intervened to influence individual senators and representatives on behalf of his programs. Wilson's legislative record in his first two years of office was impressive. His first major victory came with passage of the Underwood Tariff, which reduced customs levies despite the bitter opposition of varied industrial interests. To counterbalance the downward drift of tariff funds, the act levied a federal income tax, under authority of the then recently adopted 16th Amendment to the constitution. The new tariff act was followed by a broad measure of currency reform—the Federal Reserve Act, signed Dec. 23, 1913. Designed to supplant the alleged dictatorship of private banking institutions by the creation of a Federal Reserve Board, which would control the expansion and contraction of currency, it was destined to become the pediment of the national financial structure. The establishment of the Federal Trade Commission in 1914, the same year in which his wife died, provided for the use of federal powers to assure competitive conditions in trade. In the same year the Clayton Anti-Trust Act strengthened labour organization by prohibiting the use of injunctions in labour disputes (unless they were necessary to prevent irreparable damage) and legalizing strikes and boycotts. The achievement in these four fields helped create a new social and economic atmosphere.

Wilson's foreign policy was characterized, at least in principle, by a refusal to exert material power against weaker countries and by a studied respect for the rights and interests of small ones. Steps were taken, for example, to prepare the people of the Philippines Islands for self-government. At Wilson's urgent request, Congress repealed the law that exempted U.S. shipping from Panama Canal tolls, thereby greatly relieving tension with the British. Confronted with disturbing conditions in the Caribbean, the United States tightened its vigilance. By a treaty signed on Sept. 16, 1915, the United States assumed a virtual protectorate over Haiti. Precautionary visits of U.S. cruisers to Santo Domingo were followed in the summer of 1916 by the landing of marines and in November by proclamation of a military government under U.S. auspices. Revolutionary Mexico confronted Wilson with a dangerously chaotic situation. Unable to depose Gen. Victoriano Huerta from his dictatorship, Wilson resigned himself to a policy of "watchful waiting"; he opposed the formal intervention being urged on him by U.S. and European business interests. In April 1914, following affronts to U.S. sailors for which no apology was forthcoming, and to

facilities of Veracruz.

The overthrow of Huerta brought no settlement of the civil war, which continued to threaten U.S. business interests, and Wilson's recognition of the government of Venustiano Carranza did not end the problem. The raids of the guerrilla leader Pancho Villa into U.S. territory in March 1916 led Wilson to authorize a punitive expedition under Gen. John J. Pershing. The Mexican revolution was to plague Wilson to the end of his administration.

prevent the landing of munitions from a Ger-

man ship, a U.S. naval force seized terminal

United States foreign affairs after July 1914 were dominated by Wilson's efforts to protect the rights of the country as a neutral in World War I. A formal proclamation of neutrality was emphasized by a more personal appeal, in which he adjured Americans to remain neutral in thought as well as in behaviour. Meanwhile, his offer of mediation evoked no favourable response, and his attempts to initiate secret peace negotiations failed. On Feb. 4, 1915, the government in Berlin, declaring the waters around the British Isles a war zone, threatened to sink all belligerent ships within

that zone and gave warning that neutral ships might also be sunk. Wilson replied in a vigorous note on February 10, warning Germany that it would be held to "strict accountability" for the lawless acts of its submarine commanders. Destruction of a U.S. vessel or of American lives, Wilson said, would be regarded as an "indefensible violation of neutral rights." The Germans, nevertheless, maintained their position, and on May 7 the British liner "Lusitania" was sunk without warning by a German submarine; more than 1,000 persons were drowned, among them 128 Americans.

Determined to avoid war, Wilson displayed long-suffering patience in the negotiations of the ensuing weeks, but his will to compel Germany to abide by the established rules of cruiser warfare was unshakable. His protest to Germany was, in fact, so strongly worded that Secretary of State William Jennings Bryan resigned rather than sign it. Following the sinking of the "Arabic" in August 1915, the German government promised that in the future liners would not be attacked without warning. In the spring of 1916, when a rupture with Germany was imminent because of the torpedoing of the steamer "Sussex," son protested in terms that amounted to an ultimatum and finally drew from Berlin a more comprehensive pledge to abandon their submarine campaign altogether. For the next seven months, relations with Germany were less disturbed.

Second term as president. This diplomatic victory not only postponed U.S. intervention in the war but was of political value in Wilson's reelection campaign of 1916. It gave strength to the argument that he had vindicated the rights of the country successfully and had "kept us out of war." The slogan had strong popular appeal, especially west of the Mississippi. The Republicans, who nominated Charles Evans Hughes, denounced Wilson as hesitating and cowardly, both in his dealing with Germany and in his handling of the Mexican problem. They criticized his legislative reforms as demagogic and cited the Adamson Act, which Wilson had urged upon Congress to avert a railroad strike, as an untimely surrender to labour. On the eastern seaboard and in most of the industrial centres of the Midwest the reunited Republican party could count on success, but in the farming districts west of the Mississippi and on the Pacific coast Wilson showed great strength drawing largely from the Progressives, who refused to follow Theodore Roosevelt back into the Republican fold. The result of the election was so close that for hours Republican victory was generally conceded. Only as returns from the west came in was it determined that Wilson had been reelected.

Wilson's drive for peace negotiations was frustrated by the German decision on Jan. 9, 1917, to renew the unrestricted submarine campaign. Wilson was willing to negotiate everything except the sinking without warning of passenger and merchant ships, but the Germans showed no sign of weakening. Opinion in the United States was exasperated by the formal declaration of the renewal of the submarine warfare and especially by the virtual blockade of cargoes in U.S. ports held there by fear of submarine attacks. It was infuriated by publication of the so-called Zimmermann Telegram that suggested a German-Mexican-Japanese alliance and a Mexican reconquest of Texas, New Mexico, and Arizona and by the sinking of the "Laconia" with the loss of American lives. Unable to resist longer the pressure of events and public opinion, Wilson asked Congress on April 2 for a declaration of war, which was passed by an overwhelming maiority

The United States was ill prepared for war,

a condition for which Wilson carried a heavy share of responsibility, but once in the war he displayed outstanding qualities of leadership. In a speech on Jan. 8, 1918, he enumerated the Fourteen Points that he regarded as being an essential basis of a just and lasting peace, and in the course of the following eight months he elaborated on them. It was natural that, when the Germans faced complete defeat in early October 1918, they should turn to Wilson and offer to accept his Fourteen Points and later speeches as the basis of peace. Though the British and French were by no means prepared to accept the peace, the Fourteen Points (with certain exceptions) were accepted by the Allied chiefs and Germany as the basis of the forthcoming settlement. This strategic advantage to Wilson in the coming peace negotiations was offset by the congressional elections in November 1918 whereby his party lost control of the Senate in the new Congress; he also had to face the fact that the vitally important Senate Foreign Relations Committee was henceforth to be controlled by his adversaries.

Wilson was determined to go himself to the peace conference at Paris and to lead the battle for the principles he had been advocating. These principles constituted a threefold and interlocking concept: the liberation of peoples, justice to friend and enemy alike, and the assurance of peace through the establishment of a League of Nations. The President arrived at Brest, Fr., on Dec. 13, 1918. He was received in France, England, and Italy with enthusiasm, but his prestige became clouded when he confronted the nationalistic aspirations of individual peoples. The President achieved a triumph at the conference in winning acceptance of the principle that a League of Nations should be an integral part of the treaties, but his success in the establishment of the League was obscured by the concessions he was forced to make to national territorial and economic demands. On June 28, 1919, the Versailles Treaty with Germany was signed, and on the following day Wilson sailed for home.

The strain of the conference had told upon the President's physical and nervous strength, and he was not well equipped to carry on the contest with his opponents in the Senate that was to develop upon his presentation of the treaty. In search of popular support that would overwhelm the Senate, he set forth on a crusade in behalf of the treaty and the League. In Colorado, on Sept. 25, 1919, after 34 major addresses and scores of interviews, parades, and rear platform talks, he was compelled to give up his tour. He returned to Washington, D.C., in a state of collapse and shortly suffered a thrombosis that impaired control over the left side of his body.

No one else was capable of leading the fight for ratification, and efforts to arrange a compromise proved fruitless. With something of his physical health regained, with his mind nervously active, but with his grasp of affairs unrealistic. Wilson drafted a far-fetched plan to submit the issue to popular vote at a special election—"a great and solemn referendum." Efforts to achieve agreement made in a bipartisan conference of the Senate foundered on the bitter-end opposition of Republican irreconcilables. On March 19, 1920, the final vote was taken on the ratifying resolution that again contained a strong enough reservation on Article X (providing for collective security) to evoke Wilson's condemnation. Once more he urged his followers to vote against ratification and 23 of them did so. The United States was thus ironically kept out of the League of Nations at the behest of the man who had

done more than any other to create it. Election, 1920. Wilson's physical condition

in 1920 prevented him from taking an active role in the presidential campaign. The Democrats chose Gov. James M. Cox of Ohio as their presidential candidate. Wilson's hope that the election would serve as a popular referendum settling the issues between himself and Sen. Henry Cabot Lodge, leader of the opposition to the League of Nations, was not fulfilled. Indeed, many influential advocates of the League supported the Republican candidate, Warren G. Harding, and the election proved an overwhelming victory for the Republicans. The bitterness of Wilson's disappointment over the election was to some extent alleviated by the 1919 Nobel Prize for Peace awarded him in December 1920. His annual message to Congress made no reference to what always lay nearest his heart—the League of Nations. This reticence on world affairs he maintained until the end of his administration, March 4, 1921.

Wilson lived quietly in Washington, D.C., refraining from political comments and avoiding political contacts, for the remaining three years of his life. The legal and the literary activities that he had anticipated lay beyond his waning physical powers. He died in 1924. He was survived by his second wife, Edith Bolling Galt Wilson, whom he had married on Dec. 18, 1915. During the worst of his illness in the White House she had sought to spare him every political anxiety and in the process had assumed much of the responsibility belonging to the presidential office. She lived until Dec. 28, 1961.

Evaluation. Woodrow Wilson was qualified in the highest degree for a career in public affairs by his personal and mental qualities and especially by his sense of responsibility to the public welfare. To those who worked sympathetically with him and under him, he displayed a magnetic personality. He was genial, humorous, and considerate and had broad cultural interests. From his subordinates he evoked admiration and affection, but in dealing with men whom he did not like or trust he could not capitalize upon his personal assets.

The depth of his idealistic fervour gave force to his political leadership, which was further strengthened by his outstanding oratorical capacity, but the intensity of that fervour crippled his ability for effective compromise. He was impatient of partisan opposition, and there was much of the intolerant Calvinist in his refusal to deviate from the path that he believed himself appointed by providence to tread. His illusion that the nobility of ideals would suffice to obliterate the stubborn facts of political life took his international policy down the road to bankruptcy. Though a great leader, he lacked the political intuition and definess that might have saved him at Princeton, strengthened his contribution to the peace League of Nations.

conference, and brought his country into the (C.Se./Ed.) BIBLIOGRAPHY. The authorized edition of Wilson's state papers and addresses is The Public Papers of Woodrow Wilson, 3 vol., ed. by Ray Stannard Baker and William E. Dodd (1925-27). Arthur S. Link is editing a complete edition of his letters and papers, The Papers of Woodrow Wilson. The 42 first volumes (1966-82) cover the years 1856-1917. For his campaign speeches of 1912 outlining the principles of the New Freedom, see John W. Davidson (ed.), A Crossroads of Freedom (1956). The authorized biography is Ray Stannard Baker, Woodrow Wilson: Life and Letters, 8 vol. (1927–39; reprinted 1968). Arthur C. Walworth, Woodrow Wilson, 3rd ed. (1978), is comprehensive, thoroughly documented, and carefully balanced. John M. Mulder, Woodrow Wilson (1978), is an account of his early intellectual and religious development; Edwin A. Weinstein, Woodrow Wilson (1981), is a psychobiography. Arthur S. Link, Wilson: vol. 1, The Road to the White House (1947); vol. 2, The New Freedom (1956), vol. 3, The Struggle for Neutrality, 1914-1915 (1960); vol. 4, Confusions and Crises, 1915-1916 (1964); and vol. 5, Campaigns for Progressivism and Peace, 1916-1917 (1965), comprise the most definitive biography.

Wilson's Creek, Battle of (Aug. 10, 1861), in the American Civil War, successful Southern engagement fought between 5,400 Union troops under Gen. Nathaniel Lyon and a combined force of more than 10,000 Confederate troops and Missouri Militia commanded by Gen. Benjamin McCulloch and Gen. Sterling Price, 10 miles southwest of Springfield, Mo. Union Gen. Franz Sigel attacked the rear of the Confederate forces with 1,200 men while Lyon led a frontal attack with the main Union force. Sigel was repulsed, and after several hours of fighting Lyon was killed. With casualties heavy on both sides, the Union forces retreated toward Springfield.

Wilson's disease, also called HEPATOLEN-TICULAR DEGENERATION, a hereditary defect associated with the metabolism of copper and characterized by the progressive degeneration of the basal ganglia of the brain, the development of a brownish ring at the margin of the cornea, and the gradual replacement of liver cells with fibrous tissue. The disorder, which usually first appears in the second or third decade of life, is also associated with tremor, incoordination, and personality changes. It is caused by a deficiency in the circulation of the copper-binding protein, ceruloplasmin. This deficiency in turn results in an excess of free copper in the body, and the copper is deposited in the affected structures, giving rise to the characteristic symptoms. In treatment a high-protein, low-copper diet is usually combined with administration of a chelating substance such as penicillamine, which removes the copper from the tissues for excretion into the urine.

Wilson's Promontory, southernmost point of the Australian mainland, in Victoria, 110 mi (177 km) southeast of Melbourne. A granite peninsula, 22 mi long with a maximum width of 14 mi, it projects into Bass Strait and is almost an island, being linked to the mainland by beach ridges. From a spectacular scenic 80-mi coastline, it rises to a mountainous interior; its highest point is Mt. Latrobe, at 2,475 ft (754 m). There is a lighthouse at its southern tip. The vegetative cover, which tends toward the xerophytic (adapted to a dry climate) on the west, is periodically swept by fires. Visited in 1798 by the English explorer George Bass, the promontory was first called Furneaux Land, after a member of Capt. James Cook's second (1772) expedition. It was renamed for Thomas Wilson, an English merchant. In 1905 the entire promontory was made a national park. It is notable for its beaches, fern gullies, more than 700 species of plants, and a variety of animals, including emus, koalas, and wombats. Tourist access is gained with some difficulty via the South Gippsland Highway.

wilt, common symptom of plant disease resulting from a water loss in leaves and stems. Affected parts lose their turgidity and droop. Specific wilt diseases—caused by a variety of fungi, bacteria, and viruses—are easily confused with root and crown rots, stem cankers, insect injuries, drought or excess water, soil compaction, and other noninfectious problems.

Verticillium wilt is a very destructive fungal disease in cool climates. It affects several hundred species of trees, shrubs, vines, flowers, house plants, vegetables, fruits, field crops, and weeds. The causal agent is the soil-inhabiting fungus Verticillium albo-atrum (V. dahliae). In hot weather, the leaves on one or more branches turn dull green to yellow, wilt, and wither, often from the base upward. Annuals and young trees are often stunted and usually die; perennials may die branch by branch over a period of from several weeks to years or apparently recover. The sapwood (just beneath

the bark) of wilted branches, when cut lengthwise, usually shows dark streaks. Infections occur through roots and wounds. Control can be obtained by growing disease-free and resistant or immune plants; rotating with highly resistant or immune plants for five years or longer; destroying infected plants and susceptible weeds; fertilizing and watering to encourage vigour; removing wilted branches on trees and shrubs (sterilizing tools between cuts); and avoiding the wounding of roots or stems when planting or cultivating. Soil known to harbour Verticillium can be fumigated or heat-treated to kill the disease organisms.

Oak wilt, caused by the fungus Ceratocystis fagacearum, is a serious disease in the eastern half of the United States. All oaks (Quercus) are susceptible, as are Chinese, European, and American chestnuts; tan oak (Lithocarpus densiflorus); and bush chinquapin. Trees in the red- and black-oak group usually die within several weeks during late spring and summer. Their leaves turn pale or dull green, look water-soaked, curl upward, and often become yellowed or bronzed from the margins inward; the upper branches are usually affected first. White and bur oaks commonly die back slowly over several years. Their leaves usually wilt, turn light brown, curl, and cling to their stems. The disease is spread from tree to tree by natural underground root grafts, sap- and fungus-feeding insects, and possibly by squirrels. Control measures include prompt removal of diseased trees; injecting Vapam (sodium methyldithiocarbamate) into the soil midway between healthy and recently infected trees; avoidance of injuring or pruning of trees from budbreak to midsummer; and painting wounds promptly with tree wound dressing.

Bacterial wilt, caused by numerous species of the genera Corynebacterium, Erwinia, Pseudomonas, and Xanthomonas, induces stunting, wilting, and withering, starting usually with younger leaves. Stems, which often shrivel and wither, show discoloured water-conducting tissue. A bacterial ooze is often evident when infected stems are cut and squeezed. Rapidly expanding, dark green, water-soaked areas or streaks may develop first in leaves.

Bacterial wilt may be managed by growing resistant varieties; planting disease-free materials in well-drained, fertile soil that is clean or sterilized; observing stringent sanitation including weed- and insect-control measures; and rotating susceptible crops.

Spotted wilt, caused by a virus, is transmitted by the larvae of several species of insect called thrips. Plants commonly are stunted and bunchy. Brown, purplish, pale-green, red, yellow, or white rings (often zoned) and spots form in leaves, flowers, and fruit; long streaks may develop in petioles and stems. Leaves are distorted, sometimes mottled, and may turn yellow or bronze. Tops may wilt and wither; fruit is often rough and distorted. Control includes growing resistant varieties and disease-free stock; spraying or dusting during thrips infestations; promptly destroying infected plants and crop debris after harvest; and observing stringent weed control. See also Fusarium wilt; Panama disease; Dutch elm disease.

Wilton, parish (town), Salisbury district, county of Wiltshire, England. The parish is internationally known for its carpets. The Royal Carpet Factory was built there in 1655, and the production of Wilton and Axminster carpets became the town's main industry. Felts and agricultural machinery are other products. Since ancient times Wilton has also been a centre for the sheep trade. Pop. (1981 prelim.) 4,005.

Wiltshire, county of southern England, in a watershed separating the basins of the Bristol Channel, the English Channel, and the eastward-flowing River Thames. Its area is 1,344 sq mi (3,481 sq km). Trowbridge is the

administrative centre. Wiltshire is divided into five districts—Salisbury in the south, West Wiltshire, Kennet (named for a major tributary of the Thames), Thamesdown, and North Wiltshire in the north.

Chalk uplands constitute much of the county. Salisbury Plain occupies central Wiltshire, and north of the River Kennet are the Marlborough Downs. Along the county's western border rise parts of the Cotswolds, a range of limestone hills. Between these two upland areas lie the clay vales of Wardour and Pewsey. South of Trowbridge the vales are fairly heavily wooded, in marked contrast to the open, rolling countryside of the uplands. Parts of the Marlborough Downs, the Cotswolds, and the Vale of Pewsey have been designated Areas of Outstanding Natural Beauty.

In prehistoric times the chalk uplands were the most heavily populated parts of England, and Wiltshire has many prehistoric monuments. Stonehenge, 8 mi (13 km) north of Salisbury, dates from the Neolithic period; its position relative to the solar and lunar cycles remains controversial. Nearby lie other important Neolithic monuments, including those at Avebury and Windmill Hill. The latter is believed to have been a centre of ritual and of seasonal tribal fasting in the 4th millennium BC. Long Neolithic burial mounds, or barrows. abound, as do round burial mounds from the Bronze Age. Durrington Walls, a large ditch-enclosed ceremonial earthwork, dates from the late 3rd millennium BC. During the Iron Age hill forts were constructed, such as those at Yarnbury Castle, near Berwick St. James, and at Old Sarum, outside Salisbury. In historic times the county has played a relatively minor role in national affairs. There is little evidence of Roman occupation, and in the Middle Ages sheep farming by Cistercian monks was probably the most important activity. Salisbury has long been the ecclesiastical centre of the county, however, and is renowned for its 13th-century cathedral. The cathedral and many other buildings in the county have been designated as being of spe-

Outside Salisbury and industrial Swindon agriculture is the most important activity. A large part of Salisbury Plain is occupied by the Ministry of Defense for military purposes. Sand and gravel, chalk, limestone, and clay are worked in various parts of the county. Pop. (1983 est.) 532,100.

cial architectural and historic interest.

Wimbledon, former municipal borough of the county of Surrey, England; since 1965, part of Merton, one of the 32 London boroughs in Greater London. Located south of the River Thames, about 8 mi (13 km) southwest of the City of London, it is the site of the annual All-England Championships, better known as the Wimbledon Championships, in lawn tennis. The national tournament is part of the Grand Slam of tennis.

The first Wimbledon championship was held on one of the croquet lawns of the All-England Croquet and Lawn Tennis Club in 1877. It was won by Spencer W. Gore, a Harrovian rackets player. In 1884 a women's championship was introduced at Wimbledon, and the national men's doubles was transferred there from Oxford. Mixed doubles and women's doubles were introduced in 1913. In 1920 Suzanne Lenglen, of France became the first woman to win three Wimbledon championships in a single year; in 1938 J. Donald Budge of the United States became the first man to win three championships in a single year. In 1980 Björn Borg set a record in winning the singles for a fifth consecutive year (a feat not achieved since the abolition of the challenge-round system in 1922 requiring the defending champion of play all rounds).

The Wimbledon championships, originally played by amateurs, were opened to professional players in 1968; Rod. G. Laver of

Australia and Billie Jean Moffitt King of the United States won the singles events that year. The current championships, in addition to men's and women's singles and doubles and mixed doubles, include events for junior boys and girls and for senior players. A total of more than 250,000 spectators attend the two-week event, which begins at the end of June. For winners, see Sporting Record: Tennis.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Wimborne, district, county of Dorset, southern England, occupying an area of 137 sq mi (355 sq km) in the northeastern corner of the county directly above the English Channel resorts of Bournemouth and Poole. Wimborne district is a low-lying plain descending from the southerly slopes of Cranborne Chase, a chalk ridge to the northwest. Dairy cattle and cereals (particularly barley) are raised on the generally fertile soils of Cranborne Chase; the infertile sand-and-clay terrain farther southeast is given over to rough pasturage, heath, or woodland. Residential growth, extending north from Bournemouth and Poole onto the heathland of the extreme east and south, has occurred at West Moors, Ferndown, and farther west at the old parish (town) of Wimborne Minster, the district seat. Wimborne Minster is located amidst a market-gardening area for fruits and vegetables; watercress is harvested locally. The Badbury Rings 4 mi (6 km) northwest of the town are an ancient Iron Age fortification with three concentric trenches enclosing a wooded hilltop. The Romans evidently used the rings as a juncture point for their road system. Pop. (1983 est.) 71,600.

Wimborne Minster, parish (town), Wimborne district, county of Dorset, England, on the River Allen. Cuthburga and Cwenburh, sisters of King Ine of Wessex, founded a convent there in 718; the present minster, reputedly occupying the same site, is dedicated to St. Cuthburga and dates from 1120. The chantry and seminary, founded in 1496, were reestablished as a grammar school by royal charter of Elizabeth I (reigned 1558–1603). St. Margaret's Leper Hospital (13th century) has been converted to almshouses. Wimborne Minster's industries are market and nursery gardening and fruit growing. Pop. (1981 prelim.) 5.531.

Wimmera, region, west central Victoria, Australia. First surveyed (1836) by Thomas Mitchell, the area was settled in the 1860s. Its generally level terrain, in the basin of the north-flowing, dissipative Wimmera River, is bounded by the Murray River on the north and the Eastern Highlands to the south and covers an area of about 9,200 sq mi (23,800 sq km). Receiving 15 to 25 in. (380 to 635 mm) of rainfall annually, it produces grains and supports livestock raising. Irrigated farming, largely developed since 1953 and centred on Horsham (q, v), is supplied by the state-controlled Wimmera-Mallee Domestic and Stock (Water) Supply System and yields fruits and vegetables.

wimple, headdress worn by women over the head and around the neck, cheeks, and chin. From the late 12th until the beginning of the 14th century, it was worn extensively throughout medieval Europe, and it survived until recently as a head covering for women in religious orders.

The wimple originally was adopted as a chin veil by Western women after the crusaders

brought back from the Near East such fashions as the veil of the Muslim woman. The wimple, usually made of fine white linen or

silk, framed the face and covered the neck and sometimes part of the bosom.

Winam Gulf, formerly KAVIRONDO GULF, gulf of the northeastern corner of Lake Victoria, southwestern Kenya, East Africa. It is a shallow inlet, 35 mi (56 km) long and 15 mi wide, and is connected to the main lake by a channel 3 mi wide. The port of Kisumu stands on its northeastern shore.

Winchcombe, parish, Tewkesbury district (borough), county of Gloucestershire, England, on the River Isbourne, near the Cotswolds. The site was first settled when Cenwulf, king of Mercia (reigned 796–821), founded a Benedictine abbey there in the 8th century; it was twice rebuilt before the dissolution of the monasteries (1536–38). The parish Church of St. Peter, standing on the site of a former church, is Perpendicular in style. The Cistercian abbey (1246) at Hailes, now a National Trust property, is 2 mi (3.2 km) northeast. Belas Knap, an important restored Stone Age burial mound, lies southeast. Pop. (1981 prelim.) 5,531.

Winchell, Walter, original name WALTER WINCHEL (b. April 7, 1897, New York City—d. Feb. 20, 1972, Los Angeles), U.S. journalist and broadcaster whose newspaper columns and radio broadcasts containing news and gosip gave him a massive audience and much influence in the United States in the 1930s, '40s, and '50s.

Winchell was raised in New York City, and when he was 13 he left school to go into vaudeville with Eddie Cantor and George Jessel. Then he teamed with a singer named Rita Greene (whom he later married and still later divorced) as Winchel and Greene. During this period an extra L was added to his name by accident on a theatre marquee. After two years of service in the U.S. Navy during World War I. he returned to the Winchell and Greene act. Ouick-witted and inquisitive, Winchell rapidly learned personal and family background and gossip about others with him on the vaudeville circuit, and he took to posting such intelligence, neatly typed and punctuated and with often far-fetched puns, on theatre bulletin boards. One of these documents reached the publisher of Vaudeville News, and he became its Western correspondent. This evolved into a full-time job in 1927, and Winchell's career as a gossip columnist was launched. In 1924 he was given a show-business column, "On-Broadway," in the New York Evening Graphic, which he conducted for five years. He moved to the New York Daily Mirror, where his widely syndicated column appeared until 1963. He introduced a weekly radio program in 1932, continuing it until the early 1950s. Winchell's news reports, always very opinionated, brought him both admirers and detractors. But the reports interested millions of people, as did the Broadway idiom in which he wrote and spoke. He was viewed by authorities as one of the nation's most prolific phrase-makers.

In 1940 Winchell broke the news of Pres. Franklin D. Roosevelt's decision to seek a third term. By the 1950s he had turned arch-conservative, supporting Sen. Joseph McCarthy and noting with approval the increased blacklisting of actors, writers, and technicians in radio and television on suspicion of being Communists or Communist sympathizers. He was the friend or acquaintance of hundreds of celebrities. He served as the unseen narrator of the television drama series "The Untouchables" from 1959 to 1963.

Winchelsea, site in Rother district, county of East Sussex, England, with historical importance as a former English Channel port and as an example of medieval town planning. Old Winchelsea, reputed to have consisted of 700 houses, 50 inns, and numerous churches, was destroyed by the sea in 1287. New Winchelsea was then built by Edward I (reigned 1272-1307) on higher ground and was laid out in a grid pattern, with the Church of St. Thomas Becket at the centre. Three town gates still stand. From the 12th century Winchelsea was one of the Cinque Ports (q.v.). Marshes adjoin the spur on which the new town was built. Until the 15th century these were a sea inlet that provided a good harbour, but during the 16th century the inlet became silted up, destroying the port. Only a small village re-

Winchelsey, Robert (d. 1313, Otford, Kent, Eng.), archbishop of Canterbury who was a champion of clerical privilege and a leading opponent of kings Edward I and Edward II of England.

Winchelsey became chancellor of Oxford University by 1288, and in 1293 he was elected archbishop of Canterbury. He clashed with Edward I by publishing Pope Boniface VIII's bull Clericis Laicos (1296) forbidding the clergy to pay taxes to lay rulers. Edward, who desperately needed money for his foreign wars, retaliated by outlawing the entire English clergy. Winchelsey remained defiant until Boniface agreed (1297) to permit clerical taxation for national defense. Further disputes arose between the King and Winchelsey, and in 1306 Pope Clement V allowed Edward to banish the Archbishop. On the accession of Edward II, Winchelsey was recalled. Nevertheless, he soon joined the baronial opposition to the royal favourite Piers Gaveston. Winchelsey was one of the lords ordainers who seized control of the administration in 1310, and two years later he excommunicated Gaveston.

At the time of his death, Winchelsey was popularly equated with Thomas Becket, the archbishop of Canterbury martyred by King Henry II.

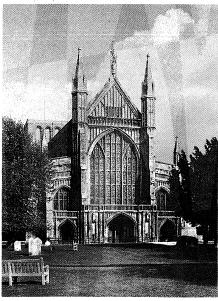

Winchester, district (city), in the central part of the county of Hampshire, England, best known for its cathedral. It lies in the valley of the River Itchen. Although few traces of the ancient Venta Belgarum remain, its central position in the Roman road system points to its early importance. The West Saxon episcopal see was removed there from Dorchester in

the 7th century, and under the Saxon bishops and Alfred the Great (ruled 871-899) Winchester became a centre of learning. It was the seat of the Danish king Canute's government (ruled 1016-35), and several early kings, including Alfred and Canute II, were buried there. Its prosperity continued after the Norman Conquest (1066), when it benefitted from its proximity to the English Channel port of Southampton (12 mi [19 km] south), which provided a close association with the royal possessions in Normandy. One of the earliest seats of the English wool and cloth tradeits merchant guild dates to Saxon times-it gained further importance with William II's 11th-century grant to Bishop Walkelin of the Fair of St. Giles, which was maintained until the 19th century. In the 13th century, Winchester contained a large Jewish community, commemorated in the street name Jewry. During the civil wars of Stephen's reign (1135-54) the city was burned, and thereafter London, with greater geographical advantages, superseded it as England's leading city.

Winchester has grown only modestly in modern times. It remains an important agricultural market centre, and its administrative functions as the long-established county town have grown. There is little manufacturing. The residential attractiveness of Winchester has brought commuters and retired persons in increasing numbers.

The glory of the historic city is its great cathedral, the longest (556 ft [169 m]) in England. The original Saxon Cathedral Church of St. Swithun was replaced by the Norman structure of Bishop Walkelin (1070-98). The nave is Perpendicular work of the great 14thcentury bishops William of Edington and William of Wykeham. The cathedral was built on piles in the alluvium of the Itchen Valley floor and has required extensive 20th-century restoration, including underpinning of its insecure foundations. Of the Norman castle, only the great hall remains. King's Gate and West Gate are surviving gateways of the medieval city wall, and there is a graceful city cross. The Hospital of St. Cross (1136) is a unique example of a medieval almshouse still maintained. Among many educational institutions the most famous is the boys' school, Winchester College, founded by William of Wykeham in 1382

The district, with 255 sq mi (659 sq km), extends well beyond the historic cathedral town to include a broad rural area. There are army and navy establishments within the district.

The west front of the cathedral at Winchester, Hampshire, England
Howard Moore/Woodmansterne

Trout fishing is popular in the Itchen Valley. Pop. (1981 prelim.) city, 30,642; (1983 est.) district, 92,300.

Winchester, city, seat, but administratively independent, of Frederick County, northern Virginia, U.S., at the northern end of the Shenandoah Valley, 70 mi (113 km) northwest of Washington, D.C. It was founded as Fredericktown by Col. James Wood in 1744, near the site of a Shawnee Indian village, on lands belonging to Thomas, Lord Fairfax; since 1751 it has been the site of the county courthouse. Renamed in 1752 for Winchester, Eng., it served as George Washington's headquarters when he surveyed lands west of the Blue Ridge Mountains and again when he commanded Virginia troops during the French and Indian War. Washington's surveying office, which he used while constructing Ft. Loudoun (1756; a remnant remains), is now a museum. During the Civil War, Winchester changed hands repeatedly; it was the site of three important battles and served as the headquarters for generals "Stonewall" Jackson (Confederate) and Philip Sheridan (Federal).

The city, in the heart of an apple-growing region, is a processing centre. The Shenandoah Apple Blossom Festival is an annual event in April-May. Manufactures include rubber goods, plastics, steel conveyers, tin cans, and textiles. Winchester is the home of Shenandoah College and Conservatory of Music (1875) and is the birthplace of Adm. Richard E. Byrd, the polar explorer, and of the writer Willa Cather. Inc. town, 1779; city, 1874. Pop. (1982 est.) 20,300.

Winchester, Hugh Le Despenser, earl of: see Despenser, Hugh Le and Hugh Le.

Winchester, Oliver Fisher (b. Nov. 30, 1810, Boston—d. Dec. 11, 1880, New Haven, Conn., U.S.), U.S. manufacturer of guns and ammunition who developed the Winchester rifle and made the Winchester Repeating Arms Company a success by the shrewd purchase and improvement of the inventions of other men.

As a young man, Winchester moved to Baltimore and operated a men's furnishing store there until 1848, when he set up a factory in New Haven to manufacture dress shirts. His financial success enabled him, in 1857, to purchase the Volcanic Repeating Arms Company of New Haven, successively reorganized as the New Haven Arms Company, and, in 1867, the Winchester Repeating Arms Company.

B.T. Henry, whom he retained as plant manager and chief gun designer, had designed the lever-action Henry repeating rifle and patented it in 1860. Widely used in the Civil War, it was the foreunner of a long line of Winchester guns, including the famous Model 73, a favourite weapon of the settlers in the American West.

Winchester augmented his line by purchasing the patents of the American Repeating Rifle Company, the Spencer Repeating Rifle Company, and the bolt-action repeating rifle of Benjamin B. Hotchkiss. Winchester was also noted for his philanthropy, particularly to Yale University.

Winchester College, one of the oldest of the great public schools of England, in Winchester, Hampshire. Its formal name, St. Mary College of Winchester near Winchester, dates from 1382, when it was founded by Bishop William of Wykeham (q.v.) to prepare boys for his New College, Oxford, known as St. Mary College of Winchester in Oxford. The organization of the school, established as a self-governing and sovereign body, was the pattern for Henry VI's foundation at Eton College and, more generally, the pattern for other English public schools.

Winchester school, painting style of English illuminated manuscripts produced primarily

at Winchester but also at Canterbury and in various southern monasteries in the 10th and early 11th centuries. The Winchester style is

Baptism of Christ, page from the Benedictional of St. Aethelwold (folio 25), Anglo-Saxon, Winchester school, c. 963–984; in the British Library

Reproduced by permission of the British Library

characterized by boldness, incisiveness, and sumptuous ornament, many of the pages featuring a heavy border enlivened by acanthus designs. The masterwork of Anglo-Saxon art in this period is the Benedictional of St. Aethelwold (10th century; British Museum), in which heavy borders dominate the page designs, creating a low-relief ornamental effect. The colours are rich: purple, green, gold, and blue. The limitation of the style was that it treated both ornament and figures in the same sumptuous, monumental manner. Ultimately, however, the style was modified by the influence of a contemporary trend in drawing (based on the Utrecht Psalter, c. 830) that featured sketchy, agitated figures. The result was a combination of the active figure style and the grand and graceful Winchester decoration, a synthesis seen in the Sacramentary of Robert of Jumièges (c. 1008; Rouen, Fr.).

Winckelmann, Johann (Joachim) (b. Dec. 9, 1717, Stendal, Prussia—d. June 8, 1768, Trieste), German archaeologist and art his-

Winckelmann, oil painting by Anton Raphael Mengs, 1758; in the Metropolitan Museum of Art, New York City

torian whose writings directed popular taste toward classical art, particularly that of ancient Greece, and influenced not only Western painting and sculpture but also literature and even philosophy.

Winckelmann was the son of a cobbler. His formative years were deeply influenced by the study of Greek, particularly of Homer, whom he first read in Alexander Pope's English translation. Later he studied theology at the University of Halle (1738) and medicine at the University of Jena (1741-42). But it was not until 1748, as librarian to Count von Bünau at Nöthnitz near Dresden, that he came into contact with the world of Greek art. There he wrote the formative essay, Gedanken über die Nachahmung der griechischen Werke in der Malerei und Bildhauerkunst (1755; Reflections on the Painting and Sculpture of the Greeks, 1765), in which he maintained, "The only way for us to become great, or even inimitable if possible, is to imitate the Greeks." His essay became a manifesto of the Greek ideal in education and art and was soon translated into several languages. Under the influence of the Saxon court, he embraced the Catholic faith: and, entering the service of the future cardinal Achinto, he exchanged his homeland for the city of Rome, second only to Paris as a cultural centre. There he rose to the position of librarian of the Vatican, president of Antiquities, and, later, secretary to Cardinal Albani, who had one of the great private collections of classical art. Winckelmann's position and influential patronage gave him access to the art treasures of Rome and the freedom to develop his talents as art critic and consultant to visitors from among the European nobility. His works were widely read and earned him the respect of the intellectual world of the day, including, somewhat later, the poet Goethe, who said

Winckelmann is like Columbus, not yet having discovered the new world but inspired by a premonition of what is to come. One learns nothing new when reading his work, but one becomes a new man!

His general Geschichte der Kunst des Altertums (1764; "History of the Art of Antiquity") is virtually the first work to define in ancient art an organic development of growth, maturity, and decline; to include such cultural and technical factors as climate, freedom, and craftsmanship in explaining the art of a people; or to attempt a definition of ideal beauty. This work inaugurated the division of ancient art into periods—a pre-Phidian (or archaic), the high or sublime style of the great Greek sculptors Phidias and Polyclitus of the 5th century BC, the elegant or beautiful style of the sculptor Praxiteles and the painter Apelles (both flourishing in Greece in the 4th century BC), and the imitative period, corresponding to the Greek-tinctured Hellenistic and the Roman—that have passed into the common parlance of Greek art history. But his fame rests chiefly upon his descriptions of individual works of art, combining meticulous, firsthand observation with a warm and spontaneous style. His remarks on the Laocoon, the Apollo Belvedere, the Niobids, and the Belvedere Torso have become landmarks alike in the history of German literature and art criticism. The study of art history as a distinct discipline and of archaeology as a humane science may be said to date from Winckelmann.

His observations, however true to the spirit of Greek art, are derived almost entirely from later Hellenistic works or Roman copies of Greek masterpieces. He died short of his ambition to visit Greece, in spite of repeated invitations from his friends to undertake the somewhat hazardous venture. The world of Greek art, like the land of Greece itself, remained for him always an ideal, more of the mind than of the eye—a conception that has persisted in varying degrees to the present day.

The circumstances leading to Winckelmann's death are obscure and have given rise to much conjecture about his complex, apparently homosexual, personality. In 1768 he revisited Dresden and Vienna for the first time since his long sojourn in Italy. On his way back to Rome he was murdered at Trieste by a chance acquaintance whom he had befriended. He was buried there in the churchyard of the Cathedral of San Giusto.

The genius and writings of Winckelmann, more than of any other single critic, reawakened the popular taste for Classical art and were instrumental in generating the Neoclassical movement in the arts. Winckelmann's two most influential works were the Reflections

and the "History."

The Reflections, essentially a philosophical definition of the Greek aesthetic, contains his often-quoted dictum on the "noble simplicity and quiet grandeur" of Greek sculpture. It also contains a description of the Greek statue of Laocoön that profoundly influenced the German playwright and critic Gotthold Ephraim Lessing as well as much subsequent discussion on the relation between art, literature, and the emotions. The "History," though now long antiquated, is significant for having given the study of the history of art its foundations and a scientific methodology. Winckelmann's visits to Pompeii and Herculaneum during the early years of their discovery led to his communications in the form of "open letters, which exposed the blunders of amateur treasure seekers and helped put these excavations into competent hands. For this and his catalog of ancient gems, he has been called the "father of modern archaeology." BIBLIOGRAPHY. The older, standard biography is K. Justi, Winckelmann und seine Zeitgenossen, 3 vol., 5th ed. (1956), detailed and generally idealistic; recent and more critical is W. Leppmann, Winckelmann (1970), with a list of his works and further bibliography. Important and appreciative essays may be found in W.H. Pater in Studies in the History of the Renaissance (1873); E.M. Butler, The Tyranny of Greece over Germany (1935); H.C. Hatfield, Winckelmann and His German Critics, 1755-1781 (1943); and Johann Joachim Winckelmann, 1768-1968 (Inter Nationes, 1968)

Winckler, Hugo (b. July 4, 1863, Gräfenhainchen, Saxony [Germany]—d. April 19, 1913, Berlin), German archaeologist and historian whose excavations at Boğazköy, in Turkey, disclosed the capital of the Hittite Empire, Hattusa, and yielded thousands of cuneiform tablets from which much of Hittite history was reconstructed.

Winckler's primary interest was in the language and writing of the ancient Middle East. Prior to his appointment as professor of Oriental languages at the University of Berlin (1904), he had written extensively on Assyrian cuneiform and on Old Testament subjects. He also wrote a history of Babylonia and Assyria (1891) and made translations of the Code of Hammurabi and of the Amarna letters.

Under the auspices of the German Orient Society, in 1906 Winckler began excavating at Boğazköy, where he met with extraordinary success. In ruined storage chambers, very likely royal archives, that appeared to have been destroyed by a great fire, he found thousands of hardened clay tablets. Most were in an unknown language, which was later shown to be Hittite. A few, in Akkadian, included a cuneiform version of a peace treaty between the Egyptian pharaoh Ramses II and the Hittite king Hattusilis, which Winckler translated. He continued excavating in cooperation with the Turkish archaeologist Theodore Makridi Bey until 1912, revealing the remains of a city whose temples, palaces, fortifications, and gateways left little doubt that this was the site of a mighty capital. From his findings, Winckler was able to draw a preliminary outline of the history of the Hittite Empire in the 14th and 13th centuries BC. His accounts of his work may be found in Vorläufige Nachrichten über die Ausgrabungen in Bog-haz Köi im Sommer 1907 (1907; abstracted as "Excavations at Boghaz-Keui in the Summer of 1907, in the Smithsonian Institution annual report for 1908 [1909]) and in Nach Boghasköi! Ein nachgelassenes Fragment (1913).

wind, the movement of air relative to the surface of the Earth. Winds play a significant role in determining and controlling climate and weather.

A brief treatment of winds follows. For full treatment, see MACROPAEDIA: Climate and Weather.

Wind occurs because of horizontal and vertical differences (gradients) in atmospheric pressure. Accordingly, the distribution of winds is closely related to that of pressure. Near the Earth's surface, winds generally flow around regions of relatively low and high pressurecyclones and anticyclones, respectively. They rotate counterclockwise around lows in the Northern Hemisphere and clockwise around those in the Southern Hemisphere. Similarly, wind systems rotate around the centres of

highs in the opposite direction.

In the middle and upper troposphere, the pressure systems are organized in a sequence of high-pressure ridges and low-pressure troughs, rather than in the closed, roughly circular systems nearer the surface of the Earth. They have a wavelike motion and interact to form a rather complex series of ridges and troughs. The largest of the wave patterns are the socalled standing waves that have three or four ridges and a corresponding number of troughs in a broad band in middle latitudes of the Northern Hemisphere. The westerlies of the Southern Hemisphere are much less strongly affected by standing disturbances. Associated with these long standing waves are the short waves (several hundred kilometres in wavelength) called traveling waves. Such traveling waves form the upper parts of near-surface cyclones and anticyclones to which they are linked, thus guiding their movement and development. At high latitudes the winds are generally easterly near the ground. In low, tropical, and equatorial latitudes, the northeasterly trade winds north of the intertropical convergence zone (ICZ), or thermal equator, and the southeasterly trade winds south of the ICZ move toward the ICZ, which migrates north and south with the seasonal position of the Sun. Vertically, winds then rise and create towering cumulonimbus clouds and heavy rain on either side of the ICZ, which marks a narrow belt of near calms known as the doldrums. The winds then move poleward near the top of the troposphere before sinking again in the subtropical belts in each hemisphere. From here, winds again move toward the Equator as trade winds. These gigantic cells with overturning air in each of the hemispheres in low latitudes are known as the Hadley cells. In the mid-latitudes, oppositely rotating wind systems called Ferrel cells carry surface air poleward and upper tropospheric air toward the Hadley cells. The three-dimensional pattern of winds over the Earth, known as general circulation, is responsible for the fundamental latitudinal structure of pressure and air movement and, hence, of climates.

On a smaller scale are the local winds, systems that are associated with specific geographic locations and reflect the influence of topographic features. The most common of these local wind systems are the sea and land breezes, mountain and valley breezes, foehn winds (also called Chinook, or Santa Ana, winds), and katabatic winds. Local winds exert a pronounced influence on local climate and are themselves affected by local weather conditions.

Wind speeds and gustiness are generally strongest by day when the heating of the ground by the Sun causes overturning of the air, the descending currents conserving the angular momentum of high-altitude winds. By night, the gustiness dies down and winds are generally lighter.

wind-bell, also called WIND CHIME, a bell or a cluster of resonating pieces that are moved and sounded by the wind. The wind-bell has three basic forms: (1) a cluster of small pieces of metal, glass, pottery, bamboo, seashell, or wood that tinkle when blown by the wind; (2) a cluster of chimes that are rung by a central clapper, to which is attached a flat plate to catch the wind; and (3) a bell whose clapper is attached to a flat plate to catch the wind.

Although the wind-bell has existed from prehistoric times in many cultures, it received its most elegant and prolific development in east and south Asia, from Bali to Tibet and Japan, where it was often elaborately decorated, cast, or carved and was hung from the eaves of sacred structures. Buddhists especially made use of wind-bells, attaching them profusely by the hundreds or even thousands to the eaves of temples, shrines, and pagodas, causing during breezy moments an almost overwhelming volume of tintinnabulation. In Asia—and also in the ancient Mediterranean-wind-bells served to attract beneficent spirits. In China and Japan (where they are known as feng-ling and fūrin, respectively—literally "wind-bell"), they became a decorative art on private homes as well as on sacred structures, and in the 19th and 20th centuries their popular use spread more widely among Western countries.

> A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

wind-blown moss, also called fork moss, any plant of the genus Dicranum (order Bryales), numbering several hundred species distributed primarily throughout the Northern Hemisphere. They form dense cushions on soil, logs, or rocks. More than 20 species are native to North America. The most common is D. scoparium, sometimes called broom moss because of its broomlike or brushlike tufts. Its erect, often forked caulids (stems) may be 5 to 12 cm (2 to 5 inches) high; the yellow or yellow-green, glossy phyllids (leaves) and longbeaked capsules (spore cases) usually point in one direction. Broom moss is sometimes used by florists for window displays.

Wind Cave National Park, national park in southwestern South Dakota, U.S., established in 1903 to preserve a series of limestone caverns and a tract of unspoiled prairie grassland in the Black Hills. The park's surface area is 28,060 acres (11,355 hectares), and the caves contain 43 miles (69 km) of explored passages. The caverns have two unusual features: a reversible wind that flows alternately in and out of the cave according to outside air pressure, which suggested the name; and beautiful rock formations called boxwork, formed by calcite deposition in unique patterns. The cave's entrance is an artificial one; the only natural entrance is a small hole in the rocks.

A game sanctuary like all national reserves, the park has antelope, deer, and even buffalo herds and many species of birds. Vegetation, besides the grassland, includes deciduous and coniferous trees, cactus and other arid-type plants, and wildflowers.

wind chill: see windchill.

wind instrument, musical instrument that uses air as a primary vibrating medium for the production of sound and helps make up the second section of the Western orchestra. In the West the wind instruments were traditionally divided into woodwinds (clarinet,

oboe, flute, and saxophone) and brass (trumpet, trombone, French horn, and tuba), but this system is not consistent (saxophones are made of brass, and flutes can be made of silver or gold) and does not take into account the method of sound production.

A brief treatment of wind instruments follows. For full treatment, see MACROPAEDIA: Musical Instruments.

According to the classification of Hornbostel and Sachs (1914), now widely accepted by organologists, winds, or aerophones, may be divided into free aerophones (bull-roarer, ribbon reed, orchestral whip, mouth organ, accordion, and a reed stop on an organ), which do not contain the vibrating air, and wind instruments proper, which contain the air. Wind instruments (flute and open flue organ stop), trumpets (lip-vibrated instruments), and reedpipes (single- or double-reeds).

The category of free aerophones includes some of the oldest instruments known to man. The bull-roarer may date back about 25,000 years and in most cultures is associated with the supernatural. It consists of a thin piece of wood, bone, or ivory attached to a long cord. The instrument is swung around the player's head, causing the disk to rotate on its axis and produce tone. The mouth organ is classified as a free aerophone with sets of free reeds. This family includes modern harmonicas and melodicas as well as the ancient Oriental types, the Chinese *sheng*, the Japanese $sh\bar{o}$, and the southeast Asian *kaen*. These Asian instruments consist of a gourd or wooden windchest from which a clustered set of long bamboo tubes extend, each enclosing a reed

The most common edge instrument is the flute. The Western orchestral version is sideblown (transversely), but many folk and non-Western types are end-blown (extending outward from the face)—for example, the Middle Eastern nāy and the Swazi umtshingo. Sets of end-blown flutes are known as panpipes. These may be arranged in the form of a bundle or a raft (with one or two rows of pipes) or fashioned from a single block of pottery. Panpipes are common in Latin America, Asia, and the Pacific Islands. Fipple flutes (also called duct flutes) have an internal plug that focuses a thin stream of air against a hard edge. Some, like the European recorder, have a beak-shaped mouthpiece. Double and triple fipple flutes are common in Latin America and eastern Europe. One pipe is usually unfingered and serves as a drone, while the melody is played on the remaining pipe (or pipes). Ocarinas and vessel flutes are globular rather than tubular and may have fingerholes and a mouthpiece.

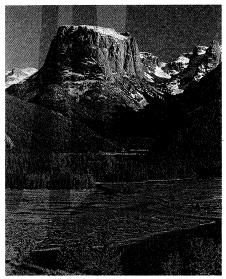

Trumpets are one of the most diverse types of wind instrument; they range from the sophisticated orchestral valve trumpet, French horn, tuba, and slide trombone to simple conchshell trumpets of Asia and the Pacific and natural ivory and horn trumpets of Africa. For all of these instruments the sound is produced by an airstream passing through the player's vibrating lips, and for this reason some organologists refer to this family as lip reeds. Long trumpets such as the Swiss alphorn, the Tibetan Buddhist dung-chen, and the South American bark trumpet are traditionally used for signaling across long distances.

Members of the clarinet family all have a single beating reed, usually made of dried and scraped bamboo cane. They include the orchestral clarinet, saxophone, and basset horn. Folk clarinets are found in Europe, North and West Africa, and South America. Hornpipes may be single or double. Shawms and oboes have double reeds. Western types include the Renaissance cornemuse, crumhorn, and racket and the modern oboe, English horn, and bassoon. Folk shawms are found throughout the world, for example, the Middle Eastern zurna, the Indian shahnāī, the Chinese so-na, and

the Thai *pī-nai*, the last unusual because it has a quadruple reed made of dried palm leaf.

Wind River, river in west-central Wyoming, U.S. It rises in several branches at the northern edge of Wind River Range in the Shoshone National Forest and flows generally southeast past Dubois through the Wind River Indian Reservation to Riverton, where, after a course of 110 miles (177 km), it joins the Popo Agie River. The combined streams continue through Boysen Reservoir and Wind River Canyon to Thermopolis (hot springs) to form the Bighorn River. Wind River Dam, impounding Boysen Reservoir 35 miles (56 km) northwest of Riverton, is part of the Riverton power and irrigation project. The river was named for the prevailing strong northwesterly wind currents that sweep its valley between the Shoshone and Wind River mountain ranges.

Wind River Range, mountain range in the central Rocky Mountains, west-central Wyoming, U.S. The range extends for 100 miles (160 km) northwest-southeast to the Sweetwater River and is part of the Continental Divide. The range contains many peaks above 12,000 feet (3,658 m) including Mount

Green River headwaters in Wind River Range, Wyoming

Warren (13,720 feet), Fremont Peak (13,730 feet), and the highest point in Wyoming, Gannett Peak (13,804 feet). In the north is Togwotee Pass (9,662 feet), and at the southern end of the range is the historic South Pass (7,743 feet), through which ran the old Oregon Trail. Parts of Bridger and Shoshone national forests and Wind River Indian Reservation are included in the range. The Wind River and its branches flow from the east side of the range into the Bighorn River; the Green River rises on the range's western slopes.

wind rose, map diagram that summarizes information about the wind at a particular location over a specified time period. A wind rose was also, before the use of magnetic compasses, a guide on mariners' charts to show the directions of the eight principal winds. The modern wind rose used by meteorologists gives the percentage of the time the wind blows from each direction during the observation period; it sometimes shows the strengths of these winds and the percentage of the time calm air or light winds are observed. This wind rose usually has eight radiating lines, whose lengths are proportional to wind frequency, and shows wind strength by the thickness of the lines or by feathers attached to them. The frequency of calm or nearly calm air is given as a number in the centre.

The earliest-known wind roses appeared on navigation charts used in the 13th century by Italian and Spanish sailors. The eight points were marked with the initials of the principal winds; sometimes the east point had a cross, and the north point had a fleur-de-lis. When the magnetic compass began to be used in navigation, the wind rose was combined with it and used as a compass card.

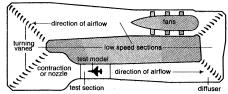

wind scorpion: see sunspider.

wind shear, rate of change of wind velocity with distance perpendicular to the wind direction. A very narrow zone of abrupt velocity change is known as a shear line. Wind shear is observed not only near the ground but also in jet streams, where it may be associated with clear-air turbulence. Vertical wind shear is closely associated with the vertical flux of momentum, heat, and water vapour.

wind tunnel, device for producing a controlled stream of air in order to study the effects of movement through air or resistance to moving air on models of aircraft and other machines and objects. Provided that the airstream is properly controlled, it is immaterial whether the stationary model under testing is designed to move through the air, as an aircraft, or to withstand wind pressures while standing in place, as a building.

standing in place, as a building.
In open-ended wind tunnels of the early 20th century, air traveled slowly through a largebore section of the tunnel, was accelerated in the nozzle-like test section, and slowed again in the large-bore diffuser section before being released into the atmosphere. Because little control could be exercised over the pressure, temperature, and humidity of the air in such an open-circuit tunnel, it was supplanted by a closed-circuit design in which air blown through the test section was contained in the circular or rectangular tunnel, passed through fans, and cycled back to the test section with the aid of turning vanes. Air velocity is controlled by changing the speed of the rotating fans or by adjusting the angle of the fan blades. In high-velocity tunnels water cooling systems are installed in the low-speed sections to cool the recycled air.

Wind tunnels are classified as low speed, subsonic, or high speed, transonic (approximately the speed of sound), supersonic (up to five times the speed of sound), and hyper-

General arrangement of a closed-circuit wind tunnel

sonic (the highest speed level). To duplicate temperatures of flight at speeds of 10,000 miles (16,000 kilometres) per hour and more, the test air must be heated well above the melting point of ordinary structural materials; consequently, such tunnels are operated on an impulse principle and only for extremely short periods of time on the order of a few thousandths of a second.

Applications of wind-tunnel research range from routine testing of airframes to fundamental research on the boundary layer, the slow-moving layer of air adjacent to any wind-exposed body surface. Measurements of air pressure and other characteristics at many points on the model yield information about how the total wind load is distributed. In addition to aircraft and spacecraft, aerodynamic studies in wind tunnels have been highly profitable devices for solving design problems in

automobiles, boats, trains, bridges, and building structures.

Windau (Latvian S.S.R.): see Ventspils.

Windaus, Adolf (b. Dec. 25, 1876, Berlin, Ger.—d. June 9, 1959, Göttingen, W.Ger.), German organic chemist, winner of the Nobel Prize for Chemistry in 1928 for research on substances, notably vitamin D, that play important biological roles.

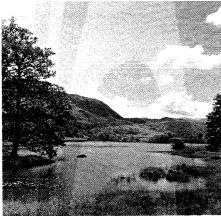

Windaus switched from medical to chemical studies. After receiving his Ph.D. from the University of Freiburg (1899), he held positions there and at Innsbruck, Austria, before his appointment as head of the chemical institute at the University of Göttingen (1915-44). His work establishing the structure of cholesterol, begun in 1901, spanned some 30 years. This work was part of his study of the complex alcohols known as sterols. In attempting to discover whether cholesterol was transformed into vitamin D by ultraviolet radiation, he discovered the chemical precursor of the vitamin, 7-dehydrocholesterol. His research also helped establish the chemistry of the sex hormones and advanced the development of drugs used to treat heart ailments.

windchill, also spelled wind CHILL, also called WINDCHILL FACTOR, measure of the cooling power of the air on bare skin in relation to temperature and wind speed. Windchill can be expressed by various formulas, one of which

$$K = (10.45 + 10\sqrt{v} - v)(33 - t),$$

wherein K is the heat (in kilogram calories) lost by one square metre of skin in one hour. v is the wind speed (in metres per second), and t is the air temperature (in degrees Celsius). Humidity is not considered. Sweating and rapid movements such as downhill skiing increase the cooling power, whereas bright sunshine decreases it. While it may give a more accurate sense of what the temperature feels like to the skin, the windchill does not take into account many other significant factors such as humidity and sunlight.

Windermere, lake, largest in England, in the southeastern part of the Lake District, in the county of Cumbria. The lake is 10.5 miles (17

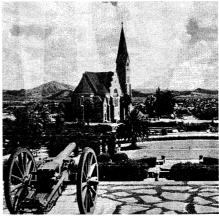

Windermere, Cumbria J. Carr—Bruce Coleman Inc./FB Inc.

km) long and 1 mile (1.6 km) wide; its area is 6 square miles (16 square km). It lies in two basins, separated by a group of islands opposite the town of Bowness on the eastern shore, and is drained by the River Leven. Part of the Lake District National Park, Windermere is a popular tourist centre with facilities for yachting and steamers operating in the summer. The town of Windermere is adjacent to Bowness.

windflower: see anemone.

Windham, town, Windham county, eastcentral Connecticut, U.S. It is situated in an area drained by the Willimantic and Natchaug rivers, which merge southeast of Willimantic to form the Shetucket. The original Indian land granted by Joshua, son of the Mohegan subchief Uncas, was opened to white settlement in 1686, and the community was incorporated as a town in 1692. It was named either for Wyndham in Sussex or Wymondham in Norfolk, Eng. The town includes the industrial city of Williamtic and the industrial villages of North Windham and South Windham, which produce paper-industry machinery. Pop. (1986 est.) 20,870.

Windhoek, town, capital of Namibia, located roughly in the centre of the country. It lies at an elevation of 5,428 feet (1,654 m) and is about 400 miles (650 km) north of the Orange River and 760 miles (1,225 km) north of Cape Town, S.Af. The town is surrounded by dry, arid country, but a circular chain of hills protects it from excessive dry winds. Before European settlement began, the town was known as Aigams, meaning "hot water," in reference to the hot springs in the region. The area was initially settled by Khoikhoin and Herero peoples. In 1890 the site of the present town was claimed for the German government. In 1915 South African forces occupied

Christus Church, Windhoek, Namibia

Windhoek and initiated their claim for the country, then known as South West Africa. When Namibia became independent in 1990, Windhoek transformed from a territorial capital into a national capital.

Windhoek is the main commercial centre of Namibia, being linked by road and railway to the port of Walvis Bay and to South Africa. It is located in the midst of Karakul grazing lands (for Persian lamb), and a number of furriers who process and transport the pelts are located in the town. The processing of cattle and sheep is also an important industry. There are administration buildings, hospitals, a state museum, and secondary schools, including the large African Augustinian High School. An international airport provides service to Johannesburg and Cape Town. Pop. (1988 est.) 114,500.

Windischgrätz, Alfred, Fürst zu (Prince of) (b. May 11, 1787, Brussels, Austrian Netherlands [now in Belgium]-d. March 21, 1862, Vienna, Austria), Austrian field marshal who was the leader of the reactionary faction of the Habsburg empire during the 1848 revolutions

Of a Styrian noble family, Windischgrätz was appointed lance officer in the Habsburg imperial army in 1804, and, as a regimental commander, he served with distinction during the wars of liberation against Napoleon. Raised to lieutenant field marshal and division commander in 1833, he was named military commander for Bohemia in 1840.

A notorious reactionary, widely feared and hated, Windischgrätz was briefly accorded full civil and military powers in Vienna after the outbreak of revolution in March 1848. In June 1848 he subdued revolutionary Prague with the threat of bombardment, and in October he was secretly given authority to assume supreme command of all imperial troops outside Italy in case of an emergency. Appointed field marshal in October 1848, he finally was given a free hand to crush the revolution in Vienna. He counseled the abdication of Emperor Ferdinand and the subsequent accession of the young Francis Joseph (December 1848) and defended the traditional prerogatives of imperial divine right ("If not by the Grace of God, then by the grace of cannon"). In January 1849 he occupied Budapest and drove the Hungarian rebels beyond the Tisza River; but his gifts as supreme commander were mediocre, and differences with his brotherin-law, the Habsburg prime minister, Felix, Prince zu Schwarzenberg, resulted in his recall (April 1849). Thereafter Windischgrätz retired to Bohemia

windmill, device for tapping the energy of the wind by means of sails mounted on a rotating shaft. The sails are mounted at an angle or are given a slight twist so that the force of wind against them is divided into two components, one of which, in the plane of the sails, imparts rotation.

Like waterwheels, windmills were among the original prime movers that replaced human beings as a source of power. The use of windmills was increasingly widespread in Europe for 650 years, from the 12th century until the early 19th century. Their slow decline, because of the development of steam power, lasted for a further 100 years. Their rapid demise began following World War I with the development of the internal-combustion engine and the spread of electric power; from that time on, however, electrical generation by wind power has served as the subject of more and more experiments.

The earliest-known references to windmills are to a Persian millwright in AD 644 and to windmills in Seistan, Persia, in AD 915. These windmills are of the horizontal-mill type, with sails radiating from a vertical axis standing in a fixed building, which has openings for the inlet and outlet of the wind diametrically opposite to each other. Each mill drives a single pair of stones directly, without the use of gears, and the design is derived from the earliest water mills. Persian millwrights, taken prisoner by the forces of Genghis Khan, were sent to China to instruct in the building of windmills; their use for irrigation there has lasted ever since.

The vertical windmill, with sails on a horizontal axis, derives directly from the Roman water mill with its right-angle drive to the stones through a single pair of gears. The earliest form of vertical mill is known as the post mill. It has a boxlike body containing the gearing, millstones, and machinery and carrying the sails. It is mounted on a well-supported wooden post socketed into a horizontal beam on the level of the second floor of the mill body. On this it can be turned so that the sails can be faced into the wind.

The next development was to place the stones and gearing in a fixed tower. This has a movable top, or cap, which carries the sails and can be turned around on a track, or curb. on top of the tower. The earliest-known illustration of a tower mill is dated about 1420. Both post and tower mills were to be found throughout Europe and were also built by settlers in America.

To work efficiently, the sails of a windmill must face squarely into the wind, and in the early mills the turning of the post-mill body, or the tower-mill cap, was done by hand by means of a long tailpole stretching down to the ground. In 1745 Edmund Lee in England invented the automatic fantail. This consists of a set of five to eight smaller vanes mounted on the tailpole or the ladder of a post mill at right angles to the sails and connected by gearing to wheels running on a track around the mill. When the wind veers it strikes the sides of the vanes, turns them and hence the track wheels also, which turn the mill body until the sails are again square into the wind. The fantail may also be fitted to the caps of tower mills, driving down to a geared rack on the curb.

The sails of a mill are mounted on an axle, or windshaft, inclined upward at an angle of from 5° to 15° to the horizontal. The first mill sails were wooden frames on which sailcloth was spread; each sail was set individually with the mill at rest. The early sails were flat planes inclined at a constant angle to the direction of rotation; later they were built with a twist like that of an airplane propeller.

In 1772 Andrew Meikle, a Scot, invented his spring sail, substituting hinged shutters, like those of a Venetian blind, for sailcloths and controlling them by a connecting bar and a spring on each sail. Each spring had to be adjusted individually with the mill at rest according to the power required; the sails were then, within limits, self-regulating.

In 1789 Stephen Hooper in England utilized roller blinds instead of shutters and devised a remote control to enable all the blinds to be adjusted simultaneously while the mill was at work. In 1807 Sir William Cubitt invented his "patent sail" combining Meikle's hinged shutters with Hooper's remote control by chain from the ground via a rod passing through a hole drilled through the windshaft; the operation was comparable to operating an umbrella; by varying the weights hung on the chain the sails were made self-regulating.

The annular-sailed wind pump was brought out in the United States by Daniel Hallady in 1854, and its production in steel by Stuart Perry in 1883 led to worldwide adoption, for although inefficient, it was cheap and reliable. The design consists of a number of small vanes set radially in a wheel. Governing is automatic: of yaw by tail vane, and of torque by setting the wheel off-centre with respect to the vertical yaw axis. Thus, as the wind increases the mill turns on its vertical axis, reducing the effective area and therefore the speed.

The most important use of the windmill was for grinding grain. In certain areas its uses in land drainage and water pumping were equally important. The windmill has been used as a source of electrical power since P. La Cour's mill, built in Denmark in 1890 with patent sails and twin fantails on a steel tower. Interest in the use of windmills for the generation of electric power, on both single-user and commercial scales, revived in the 1970s.

window, opening in the wall of a building for the admission of light and air; windows are often arranged also for the purposes of architectural decoration. Since early times, the openings have been filled with stone, wooden, or iron grilles or lights (panes) of glass or other translucent material such as mica or, in the Far East, paper. Modern windows are almost always filled with glass, though a few use transparent plastic. A window in a vertically sliding frame is called a sash window: a single-hung sash has only one half that moves; in a double-hung sash, both parts slide. A casement window (q.v.) opens sideward on a hinge.

Windows are a very ancient invention, probably coincident with the development of fixed and enclosed houses. Representations of windows occur in early wall paintings in Egypt and in reliefs from Assyria. The Egyptian examples show openings in house walls cov-

ered with mattings, like the doors themselves. Assyrian windows were almost always wider than they were high and were subdivided by little colonnettes.

The devotion of the ancient Greeks to the house built around a court led to an almost total disappearance of windows in their architecture, since each room was lighted by a door to the central, colonnaded court. In Roman imperial times, however, the glazed window first definitely appeared, and fragments of glass in a bronze frame have been found in Pompeii, among other sites. It is obvious, moreover, that the great windows in the baths of Rome must have been enclosed in some way, in order to retain the heat. The general hypothesis is that these great clerestory openings were filled, originally, with frames of bronze which subdivided the whole into small areas, each of which held a pane of glass. In general, however, glazed windows were very exceptional in Roman times; marble, mica, and shell were most often used to fill window

In Early Christian and Byzantine churches, windows became more numerous and were often glazed. Thus, it is known that the windows of Hagia Sophia at Constantinople (begun 532) were filled with pierced marble frames enclosing panes of glass. Islāmic mosque builders copied this Byzantine technique of small pieces of glass inserted in a masonry frame and, by substituting cement for marble in the frame, obtained great freedom and richness in pattern design, so that with the use of different colours of glass in the small openings, brilliant effects were produced. Islāmic builders of Egypt and Syria also developed an extremely rich type of domestic window that was usually unglazed. This consisted of a projecting, bracketed, framework of wood with its sides entirely filled by intricate grillwork formed by carved, turned, wooden spindles. It was not until the 12th and 13th centuries in western and northern Europe, however, that this stained-glass technique reached its most distinguished development. Instead of marble or cement, European glaziers used strips of lead, called cames, to separate the different pieces of coloured glass. Because of the softness of the lead, the cames could be shaped into any pattern. Thus, it was possible to adorn the windows of Gothic cathedrals with detailed pictorial designs. Moreover, with the introduction of stone mullions (slender vertical supports that form a division between glazed areas) and a system of tracery in about 1250, church windows became increasingly larger.

The arch-shaped window, which during the Byzantine period had superseded the segmental and square-headed window common in Roman work, became the governing form for important masonry buildings in medieval European and Islāmic architecture. Domestic windows were most often rectangular and were closed with shutters, lattices, or grilles. During the late Middle Ages in Europe, however, the growing cheapness of glass and the development of the fixed glazed sash resulted in a gradual increase in the number of glazed windows in domestic and civil buildings. Because the sashes were small, the desire for light and air was satisfied by the use of mullions and transoms (horizontal supports) to subdivide large window openings. Initially, sashes were set only in the upper portion of the window, with the lower portion still closed with shutters. By the 15th century, however, solid shutters were being replaced by hinged glazed sashes, or casements, which led to the standard use of rectangular openings in all buildings because of the ease with which the casements could be framed in them.

During the High Renaissance in Italy and France, window openings conformed to classical proportions and were divided by a single mullion and a single transom forming a

cross. They were frequently decorated with an architrave, and a cornice and pediment. Pilasters and columns were often added at the sides. During the Baroque period these decorative window enclosures were often elaborately scrolled and ornamented with fantastic cartouches, consoles, masks, and human figures.

In the later Renaissance the French produced and developed the type of large casement window that has remained the accepted form on the continent of Europe ever since—popularly known as the French window. In this type of casement window the opening is longfrequently extending down to the floor-and comparatively narrow and is glazed with two large, hinged, wooden sashes, arranged to swing in, each subdivided into three or more lights of comparatively large size. An iron railing or stone balustrade is built on the outside for safety. In the 17th century the vertical sliding sash window and the double-hung window were developed in England, becoming standard in that country and in the United States during the 18th and 19th centuries.

In modern architecture the impact of industry on many processes of contemporary building has led to the use of metal frames for windows in most residential construction, and it has made possible the use of ever greater areas of glass. Windows are often wall to wall and floor to ceiling, and frequently when the building is air-conditioned they no longer have opening sash members. Shop windows and other similar large glass areas are, in fact, both wall and window, and to withstand wind pressures they must be of a prescribed thickness per square foot of exposed area. Skyscrapers have been covered completely in glass; though at first these window sidings were simply "curtain walls" or unopenable windows, subsequent energy-saving requirements made necessary the use of openable and often tinted sections of these glass walls. Modern windows are often made with double or triple thicknesses of glass separated by air space for insulation; these are called double- or tripleglazed windows.

Window Rock, capital of the extensive Navajo Indian Reservation, Apache county, northeastern Arizona, U.S. It lies 23 miles (37 km) northwest of Gallup, N.M. Established in 1936 as the Central Agency Headquarters to consolidate the many Indian agencies scattered throughout the reservation (which overlaps into New Mexico and Utah), the town was named for the huge wind-eroded opening in the sandstone cliffs that overlook the administrative buildings from the north. The focal point is the octagonal Navajo Council House where the tribal council meets. Pop. (1989 est.) 2,885.

window-winged moth, any of the several hundred species of tropical insects constituting the family Thyrididae (order Lepidoptera). They are generally dark-coloured and small to medium-sized, with a wingspan of from 10 to 30 mm (0.4 to 1.2 inches). The middle area of each wing usually has a characteristic translucent yellow or whitish area of exposed membrane, hence the name window. Larvae are leaf rollers; *i.e.*, they live within a tunnel formed by spinning together the edges of a leaf. For pupation they make a cocoon on the ground. Some authorities consider the Thyrididae to be closely related to ancestral butterflies.

windrower, self-propelled or tractor-drawn farm machine for cutting grain and laying the stalks in windrows for later threshing and cleaning. The modern descendant of the header, the windrower is used to harvest grain in parts of the United States, Canada, and the "new lands" in Siberia in which certain

conditions, such as high moisture content and uneven ripening, make direct combine harvesting impractical. Because grain cut by windrowers dries to a moisture content suitable for threshing, harvesting may be done a week or 10 days earlier than by combine, reducing grain losses considerably.

A windrower usually consists of a cutter bar driven by an engine or powered by a shaft from the tractor, a reel to sweep the grain onto

A windrower in operation

a platform, and a canvas conveyor to carry it to one side and deposit it in a windrow for drying.

Winds, Tower of the, also called Horologium, Greek Horologion ("Timepiece"), building in Athens erected about 100–50 Bc by Andronicus of Cyrrhus for measuring time. Still standing, it is an octagonal marble structure, 42 feet (12.8 m) high and 26 feet (7.9 m) in diameter. The building's eight sides, which face points of the compass, are decorated with a frieze of figures in relief representing the winds; below it, on the sides facing the sun, are the lines of a sundial. The Horologium was surmounted by a weathervane in the form of a bronze Triton and contained a water clock (clepsydra) to record the time when the sun was not shining.

Windscale, nuclear reactor facility and plutonium production plant in the county of Cumberland (now part of Cumbria), in northwestern England, that in 1957 was the site of the United Kingdom's most serious nuclear power accident. The Windscale plant consisted of two gas-cooled nuclear reactors. The accident occurred on Oct. 8, 1957, when a routine heating of the No. 1 reactor's graphite control blocks got out of control, causing adjacent uranium cartridges to rupture. The uranium thus released began to oxidize, releasing radioactivity and causing a fire that burned for 16 hours before it was put out. The fire left about 10 tons of radioactive fuel melted in the reactor core. The fire also caused the release of sizable amounts of radioactive iodine into the atmosphere. As a consequence, the government banned the sale of milk produced in a 200-square-mile (500-square-kilometre) area around the reactor site for several weeks. At the time the British government released only sketchy details of the accident and in general tried to minimize its seriousness. The contaminated Windscale reactor was subsequently sealed until a cleanup of it was begun in the

Windsor, town, part of the Richmond-Windsor urban area, New South Wales, Australia, on the Hawkesbury River. In 1794, Major Francis Grose, then acting governor, placed 22 settlers in the riverside district known as Green Hills. In 1810 Governor Lachlan Macquarie founded a township (named for Windsor, Eng.) above flood level on higher ground. The modern town has several buildings dating

from the period of initial settlement in the early 19th century. Hawkesbury Agricultural College at Richmond was founded in 1888; the School of Arts, in 1861; and the National School, in 1870. Windsor's manufactures include clothing and plastics. Many workers commute to Sydney, 30 miles (50 km) southeast. Windsor was proclaimed a municipality in 1871. Pop. (1986) including Richmond, 17,088.

Windsor, town, seat of Hants county, Nova Scotia, Canada. It lies at the confluence of the Avon and St. Croix rivers, 41 miles (66 km) northwest of Halifax. The site was settled as Piziquid by the French in 1703. Fort Edward was built in 1750 by Major Charles Lawrence to protect British property, and in 1755 the French Acadians were deported from the area. Loyalist families from New England moved in shortly afterward, and in 1764 the community was renamed after Windsor, Eng. It became a port for shipping gypsum from nearby quarries to the United States. The Bay of Fundy tides of its harbour, an inlet of Minas Basin, range from 60 feet (18 m) at high water (ample for oceangoing vessels) to almost no water at low tide. The town's chief manufactures are lumber products, textiles, fertilizers, insecticides, ground limestone, rock wool, and plaster. Inc. 1878. Pop. (1986) 3,665.

Windsor, city, seat of Essex county, southern Ontario, Canada. Windsor is situated on the left (south) bank of the Detroit River, opposite Detroit, Mich. Settled by French farmers shortly after 1701, when a fort was established at Detroit, the city was known as "the Ferry and later as Richmond before it was renamed in 1836 for Windsor (New Windsor), Eng. Because of Windsor's strategic location on a navigable waterway opposite the heart of Detroit, the city soon developed into both an important railway terminal and a Great Lakes port, attracting many industries, including several large U.S. branch industrial plants. It annexed the adjoining cities of East Windsor, Walk-erville, and Sandwich in 1935 and Riverside in 1966.

The city is a commercial and manufacturing centre serving a rich farming area that produces fruits, vegetables, corn (maize), soybeans, grain, tobacco, and potatoes. Industries include the manufacture of motor vehicles and parts, foods and beverages, medicinal and pharmaceutical preparations, salt, industrial machinery, and other iron and steel products. Windsor is also Canada's leading port of entry from the United States; two tunnels, car ferries, and a suspension bridge connect it with Detroit. The city is the site of the University of Windsor, founded in 1963 when Assumption College (1857) federated into a university, and of St. Clair College of Applied Arts and Technology. Fort Malden National Historic Park is 16 miles (26 km) south. Inc. village, 1854; town, 1858; city, 1892. Pop. (1986) city, 193,111; (1986) metropolitan area, 253,988.

Windsor, also called NEW WINDSOR, locality, Windsor and Maidenhead district, county of Berkshire, England. Windsor is situated on the south bank of the River Thames and lies to the west of London. The modern town is dominated by the royal castle (see Windsor Castle) standing on the outcrop of chalk on which William I the Conqueror (reigned 1066–87) built the original fortress. The castle is in regular occupation as a royal residence and is a conspicuous landmark for travelers approaching nearby Heathrow Airport. A succession of town charters dates from 1277 to 1685.

Windsor is today a residential and local service centre, with many commuters to London and to nearby Slough. It has a variety of light metal industries and printing. Almost surrounding the town is the great royal park where, from Saxon times, the kings hunted.

Nearby are Eton College and Ascot racecourse. Pop. (1981) Windsor/Eton, 31,544.

Windsor, town (township), northern suburb of Hartford, northern Connecticut, U.S. It was the site of the first English settlement

The Joseph Loomis House, Windsor, Conn.

Mark Sexton

in Connecticut—a trading post established in 1633 at the junction of the Farmington and Connecticut rivers by a company from the Plymouth Colony, led by Captain William Holmes. The community was called Matianuck until 1635, when it was permanently settled by Puritans from Dorchester, Mass. In 1637 it was renamed Windsor for the royal English borough. Windsor (which was never officially incorporated) originally comprised a much larger area, which included the present townsites of Windsor Locks, East Windsor, South Windsor, Simsbury, Bloomfield, and Ellington. Several colonial buildings remain in the town, including the Joseph Loomis House, near which a boulder marks the spot where the first colonists settled. After 1950 the town's traditional farm economy was augmented by light industrial development. Pop. (1988 est.) 27,053.

Windsor, HOUSE OF, formerly (1901–17) SAXE-COBURG-GOTHA, or SAXE-COBURG AND GOTHA, the royal house of the United Kingdom, which succeeded the house of Hanover on the death of its last monarch, Queen Victoria, on Jan. 22, 1901. The dynasty has included Edward VII (reigned 1901–10), George V (1910–36), Edward VIII (1936), George VI (1936–52), and Elizabeth II (1952–). The heir apparent is Charles, Prince of Wales.

The dynastic name of Saxe-Coburg-Gotha (German: Sachsen-Coburg-Gotha, or Sachsen-Coburg und Gotha) was that of Victoria's German-born husband, Albert, prince consort of Great Britain and Ireland. Their eldest son was Edward VII. During the anti-German atmosphere of World War I, George V declared by royal proclamation (July 17, 1917) that all descendants of Queen Victoria in the male line who were also British subjects would adopt the surname of "Windsor."

Queen Elizabeth II's children would normally have borne their father's surname, Mountbatten (which itself had been anglicized from "Battenberg"). In 1952, soon after her accession, however, she declared in council that her children and descendants would bear the surname Windsor. This decision was modified (Feb. 8, 1960) to the effect that issue other than those styled prince or princess and royal highness should bear the name Mountbatten-Windsor.

Windsor, Alice de: see Perrers, Alice.

Windsor, Prince Edward, Duke of: see Edward VIII under Edward (England and the United Kingdom).

Windsor, Wallis Warfield, Duchess of, née BESSIE WALLIS WARFIELD, also called (1916–27) WALLIS WARFIELD SPENCER, OR (1928–37) WALLIS WARFIELD SIMPSON (b. June 19, 1896, Blue Ridge Summit, Pa., U.S.—d. April 24, 1986, Paris, Fr.), American socialite who became the wife of Prince Edward, Duke of Windsor (Edward VIII), after the latter had abdicated the British throne to marry her.

Born into an old established American family, Warfield moved in Baltimore social circles and married an American naval aviator. Earl Winfield Spencer, Jr., in 1916; they were divorced in 1927. In 1928 she married the Briton Ernest Aldrich Simpson, with whom she moved to London. Wallis Simpson met Edward, who was then the Prince of Wales, while moving in fashionable British society. The two became friends and gradually fell in love. Wallis sued for divorce from her second husband in July 1936, with the apparent intention of marrying Edward (who had become King Edward VIII), but as a woman twice divorced she was socially and politically unacceptable as a prospective British queen. Edward renounced the British throne on Dec. 10, 1936 (confirmed by the Declaration of Abdication Act the following day), in order to marry Simpson. In referring to the reason for his abdication, he said in a famous radio broadcast: "I have found it impossible to carry the heavy burden of responsibility and to discharge my duties as King, as I wish to do, without the help and support of the woman I love.

He became the Duke of Windsor, and they were married on June 3, 1937, after she had received her final decree of divorce; Wallis thus became the Duchess of Windsor. The

couple remained happily married and lived largely in France after World War II. She had a sense of fashion and style; credited to her is the phrase, "One can never be too rich or too thin."

Windsor and Maidenhead, district (royal borough), county of Berkshire, southern England, occupying an area of 76 square miles (197 square km) about 40 miles (64 km) west of central London. The district is bordered on the northwest and bisected in the northeast by the River Thames.

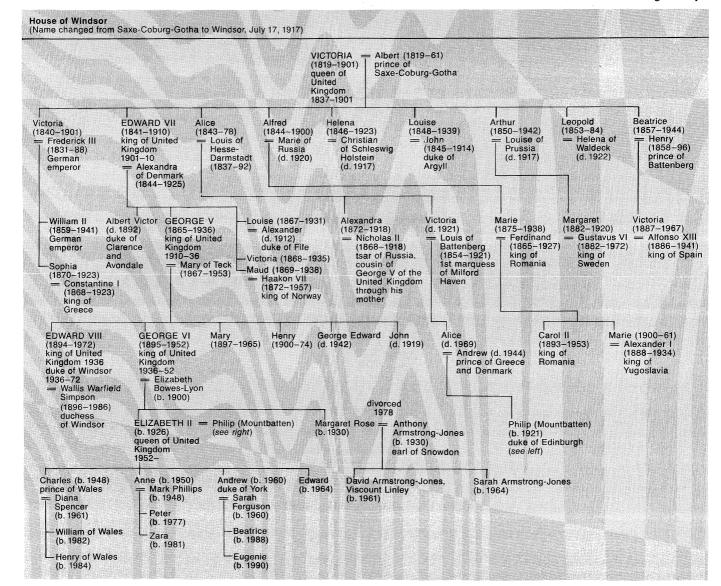

The district contains the ancient towns of Windsor and Maidenhead, as well as Windsor Castle, long-time residence of British royalty. In addition to the castle, located just northeast of Windsor, there are other historical structures in the area and scenic stretches of the Thames near Maidenhead that attract many tourists.

A border of chalk hills fronts the river near the parish (town) of Cookham in the northwest. The district is not particularly productive agriculturally, but the sandy and clay soils of the valley support a growth of heath, parkland (e.g., Windsor Great Park), and Windsor Forest. Eton town and college lie across the Thames from Windsor, and the entirety is a historical conservation area. Maidenhead is the district seat. Pop. (1986 est.) 132,400.

Windsor Castle, English royal residence that stands on a ridge at the northeastern edge of the district of Windsor and Maidenhead in the county of Berkshire, England. The castle occupies 13 acres (5 hectares) of ground above the north bank of the Thames River. Windsor Castle comprises two quadrilateral-shaped building complexes, or courts, that are separated by the massive Round Tower. The latter is a massive circular tower that is built on an artificial mound and is visible for many miles over the surrounding flatland. The court west of the Round Tower is called the lower ward, while the court to the east is called the upper ward.

There was a royal residence at Windsor in Saxon times (c. 9th century). William I the Conqueror developed the present site, constructing a mound with a stockade about 1070. Henry II replaced this with the stone Round Tower and added outer walls to the north, east, and south. In the 13th century Henry III completed the south wall and the western end of the lower ward and built a royal chapel on the site of the present-day Albert Memorial Chapel. Edward III made this chapel the centre of the newly formed Order of the Garter in 1348 and converted the fortress buildings in the upper ward to residential apartments for the monarchs. These apartments were rebuilt by Charles II and later reconstructed by George IV for use by visitors of state in addition to the monarchs.

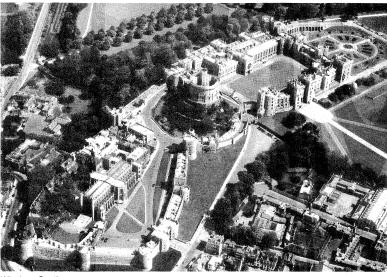

The lower ward includes St. George's Chapel

and the Albert Memorial Chapel. St. George's Chapel, designed to be the chapel of the Order of the Garter, was begun by Edward IV and is one of the best examples of Perpendicular Gothic-style architecture. It was completed in 1528 and restored between 1921 and 1930. It ranks next to Westminster Abbey as a

one of three basic categories: the low back, the high back with a straight top piece known as a "comb," and the high back curved into a semicircular shape known as a "hoop."

The name is said to derive from one of George III's excursions into the homes of his humbler subjects, when he became so captivated by this type of chair that he immediately ordered several made for Windsor Castle. The name, however, was in use before he was

Windsor Castle
Hunting Aerofilms

royal mausoleum and contains the bodies of Henry VI, Edward IV, Henry VIII and Jane Seymour, Charles I, Edward VII, and George V. The chapel also contains the impressive insignia of the Knights of the Garter. Albert Memorial Chapel, built by Henry VII as a royal mausoleum, was restored by Queen Victoria and named in memory of her consort. In this chapel are buried George III, George IV, and William IV.

The upper ward includes the private apartments of the monarch and private apartments for visitors. The state apartments in the upper ward include the Waterloo Chamber, St. George's Hall, and the grand reception room. The upper ward is also the site of the royal library, which contains a priceless collection of drawings by Leonardo da Vinci, Michelangelo, Raphael, Hans Holbein the Younger, and other Old Masters.

Lying adjacent to the castle on the south, east, and north is Home Park, which consists of about 500 acres (200 hectares) of parkland. Frogmore, the site of the mausoleum of Queen Victoria and Prince Albert, lies within the park. South of the castle lies the Great Park, with about 1,800 acres (700 hectares). The Long Walk, a 3-mile (5-kilometre) avenue leading into the Great Park, was planted by Charles II in 1685; its aging elm trees were replaced by younger trees in 1945. Virginia Water, an artificial lake, lies at the southern boundary.

Windsor chair, popular type of wooden chair constructed of turned (shaped on a lathe), slender spindles that are socketed into a solid, saddle-shaped wooden seat and that extend downward to form the legs and upward to form the back and arm rests. The Windsor chair has been produced in innumerable local variations and is extremely popular in both Great Britain and the United States. It appeared in the mid-18th century as a rural version of the desk chair, although the basic elements of its construction are found in older prototypes.

Some of the variants of the chair include the brace back, Philadelphia, smoker's bow, wheel back, and white Wyscombe, but all fit into

born; indeed, the Royal Household Accounts for 1729 contain a reference to "2 Mahogany Windsor Chairs richly carved."

The Windsor chair was produced in many variations in the United States, beginning in Philadelphia in about 1725. These variations, which were generally lighter than English designs, were frequently painted green—as they were often used in parks and gardens as well as indoors—but increasingly they came to be stained and varnished.

From the Windsor family of chairs developed a wide variety of "rural" chairs with rush seating, constructed on the same basic principle but usually less complex in design, and

Hoop-back Windsor armchair with a "comb," American, 18th century; in the Metropolitan Museum of Art, New York City

intended for use at table. Mounted on rockers, the Windsor design was also made into a rocking chair.

Windsor Locks, urban town ("township"), Hartford county, northern Connecticut, U.S., on the Connecticut River. Originally settled as part of Windsor in 1663, it was known as Pine Meadows and Enfield Falls (for the rapids on its east side). Commercial development began after 1829 with the completion of the canal and locks, built to allow river traffic to bypass the rapids. The community, renamed Windsor Locks in 1833, was separately incorporated in 1854. Early industrial activity consisted primarily of sawmill and gristmill operations and the manufacture of paper, lathe chucks, tinsel, and metallic threads. The town's economic base changed considerably during World War II with the construction of Bradley Field, a military airbase that is now an international airport with an air museum. Aircraft and aerospace industries are significant. A Trolley Museum, the Hatheway House (1760), and Old New Gate Prison are nearby points of interest. Pop. (1988 est.) 12,145.

windsurfing, also spelled wind surfing, also called sailboarding, sport that combines aspects of sailing and surfing in a one-person craft called a Windsurfer (trademark), or sailboard. The sailboard is a 12-foot, 60-pound polyurethane board that is fitted with a single rotating mast, to which is attached a triangular sail that can be controlled by a double boom. The board resembles a long surfboard and has a small keel, or centreboard, and a skeg (rear bottom fin) but no rudder. The boat is steered by changing the sail's position relative to the wind and to the centreboard. This is accomplished by adjusting one's hold on the double boom in order to rake the sail forward or aft, windward or leeward. The Windsurfer was invented in the United States in 1967 and rapidly became a popular pastime among surfers and sailors. The most frequent problem with windsurfing, capsizing, is not serious, since the boat can be easily righted again. Sailboards are capable of only modest speeds and are usually used close to shore.

Windthorst, Ludwig (b. Jan. 17, 1812, Kaldenhof, near Osnabrück, Hanover [Germany]—d. March 14, 1891, Berlin), promi-

Windthorst, 1891

Archiv fur Kunst und Geschichte, Berlin

nent German Roman Catholic political leader of the 19th century. He was one of the founders of the Centre Party, which aimed at the unification of German Catholics and the defense of Roman Catholic interests.

In 1836 Windthorst settled at Osnabrück as an attorney. He became a member of the diet of the Hanover kingdom in 1849 and was later appointed the kingdom's minister of justice. Subsequently elected to the North German Parliament, to the German Reichstag, and to the Prussian Diet, he became the leader of the Centre Party, which gained considerable strength from its struggle against the Kulturkampf—Chancellor Otto von Bismarck's attempt to separate German Catholics from Rome. Because of a general distrust of political Roman Catholicism and because the Centre Party gained 58 seats in the Reichstag, Bismarck and Windthorst fell into antagonistic roles.

In the parliamentary fight against the Kulturkampf, Windthorst's brilliant debates pro-

vided cartoonists with an intriguing contrast between his dwarfish figure (earning him the nickname die kleine Exzellenz) and the gi-ant "Iron Chancellor." Bismarck attacked the Centre Party, saying of Windthorst, "I have my wife to love and Windthorst to hate.' Windthorst cooperated with Bismarck, however, on some political matters. Bismarck finally agreed to rescind most of the Kulturkampf laws, partly because the Centre Party's votes were usually crucial for his majority. His attempt, however, to undermine Windthorst's position and the Centre Party through direct negotiations with Pope Leo XIII was unsuccessful. By 1890 most of the anti-Catholic laws had been repealed. Windthorst's meeting with the German emperor William II in March of that year played a part in Bismarck's dismissal, though Windthorst denied any such intention. While he was undoubtedly one of the greatest German parliamentary leaders, most of his life was spent in the opposition.

Windward Group (French Polynesia): see Vent, Îles du.

Windward Islands, French îles du vent, Spanish ISLAS DE BARLOVENTO, a line of West Indian islands constituting the southern arc of the Lesser Antilles, at the eastern end of the Caribbean Sea, between latitudes 12° and 16° N and longitudes 60° and 62° W. They include, from north to south, the Englishspeaking island of Dominica; the French département of Martinique; the English-speaking islands of Saint Lucia, Saint Vincent, and Grenada; and, between Saint Vincent and Grenada, the chain of small islands known as the Grenadines. Though near the general area, Trinidad and Tobago (at the south end of the group) and Barbados (just east) are usually not considered part of the Windward Islands. Dominica is sometimes classified as part of the Leeward Islands (q.v.), rather than the Windwards.

The geology of the Windwards is volcanic, with craters, hot springs, and sulfuric vents found in the mountainous central ribs of the islands. On May 8, 1902, the eruption of Mount Pelée on Martinique was one of the most destructive in modern history, killing about 30,000 people. The climate of the Windwards is everywhere marine, and the extreme heat is greatly tempered by the steady tradewinds and by the daily sea breezes. A dry season alternates with a wet season, with the eastern sides of the islands receiving more rainfall because of the prevailing northeasterly tradewinds. Hurricanes are a threat from June to October.

The population is predominantly black or mulatto, with an admixture of East Indians, Portuguese, French, and British.

Windward Islands, Portuguese ILHAS DE BARLAVENTO, island group in the Atlantic Ocean off the West African coast, comprising one of two island groups of Cape Verde (q.v.) and consisting of the following islands: Boa Vista, Sal, Santa Luzia, Santo Antão, São Nicolau, and São Vicente. The landscape is generally barren and the climate always hot. The Windward Islands suffer from constant drought due to poor rainfall.

Windward Passage, strait in the West Indies, connecting the Atlantic Ocean with the Caribbean Sea. It is 50 miles (80 km) wide and separates Cuba (west) from Hispaniola (southeast). It has a threshold depth of 5,500 feet (1,700 m) and is on the direct shipping route between the east coast of the United States and the Panama Canal. The Jamaica Channel, between Jamaica (west) and Hispaniola (east), forms a southwest extension of the Windward Passage.

wine, alcoholic beverage made from the fermented juice of grapes. The term may be applied to products made from other fruits, vegetables, herbs, and even flowers, but used alone it applies only to the grape product.

A brief treatment of wine follows. For full treatment, see MACROPAEDIA: Beverage Production

The major constituents of wine are water, sugar, and alcohol. More than 400 known compounds contribute to the flavour, aroma, and colour of wine. Wines may be classified according to colour as red, rosé (pink), or white. Wines described as white actually range from straw colour through brown. Wine taste is described as sweet or dry. Sweet wines are high in sugar content; dry wines, the opposite of sweet, are not sour but lack sweetness because they contain little or no sugar. High acidity may also contribute to dryness.

Wines are also classified as table, sparkling, or fortified. Table wines, the natural or still wines, may be red, rosé, or white, with alcoholic content from about 7 to 15 percent. Sparkling wines, effervescent or bubbling, are most frequently white, but may be red or rosé, and have alcoholic content similar to that of table wines. Fortified, or dessert, wines contain added brandy and may be red or white, with alcoholic content from about 16 to 23 percent. Fortified wines with additional flavouring are called aromatic wines.

The leading wine-producing countries include France, Italy, Spain, the Soviet Union, Argentina, Portugal, West Germany, South Africa, and the United States. Wines may be named for place of origin or grape variety used, or may bear generic names. Most European wines take place-names, usually the most specific to which they are entitled. The words Appellation d'Origine Contrôlée (controlled place of origin) on the label of a French wine guarantee that the wine has been produced at the stated location and has met with rigid French laws controlling production.

In the United States varietal names are increasingly used; the law requires that the variety named must comprise at least 75 percent of the grapes used to produce the wine. Certain European place-names are used as generic terms for American wines resembling the original, but, although the same grape variety may be used, soil, climate, and processing variations result in a different wine.

Wine labels may show the vintage, meaning the year in which the grapes used were harvested. The vintage is an important indicator of the wine's value because seasonal variations in weather affect harvest quality from year to year. Wines blended from several vintages bear undated labels.

History. Wine had a history by the time the Old Testament was written; in Genesis 9:20 it is ascribed to Noah. In ancient Greece wine was dark and usually drunk with water; to drink it unmixed was regarded as riotous. At that time wine was kept in casks, goatskins, or earthenware amphorae and stoppered with oil or a greasy rag; effectively, air was working on it all the time. There was little change in Roman days, though with greater wealth there came an approach to connoiseurship. But the full maturing of wine was impossible until the bottle and the cork were generally used.

During the European Middle Ages, the production and quality of wine, so far as can be ascertained, fell steadily from classical days. The Romans had planted vines wherever the climate would tolerate it—in North Africa, Spain, Gaul, Britain, and Illyria in particular. Their cultivation continued for local consumption, and because of the need of wine for the communion service, the care of the vineyards was particularly an ecclesiastical preoccupation. The reappearance of good wines and famous vineyards invariably resulted from the efforts of monks or of monarchs distinguished by their devotion to the church.

The planting of vines in some of the most famous Rhenish and Burgundian vineyards is traditionally ascribed to Charlemagne, but it was not until the 12th century that the great wine-growing areas were planted and found a larger market. Owing to the limits of medieval transport, vineyards had to be by riversides; and the most famous wines came from lands along the Rhine, the Garonne, and the Loire rivers

The use of wine bottles and corks as it is known in modern times seems to have become common toward the end of the 17th century, the development of both resulting largely from the work of Dom Pierre Pérignon of Hautvillers, the father of the champagne trade. Another important change was the discovery, by accident in the year 1775 in the Rheingau, that grapes left to rot on the vines produced a sweetness and bouquet unobtainable otherwise. In the mid-1750s the Madeira shippers first began scientifically fortifying their wines by adding a proportion of brandy to them, a process essential for the manufacture and maturing of almost all dessert wines.

European vineyards were visited by a disaster that threatened at one time to wipe them out completely when, in 1863, there was accidentally imported an American louse of the genus *Phylloxera*, which fed upon the roots of vines. Large wine-growing areas were devastated as the pest spread; 2,500,000 acres (1,000,000 hectares) were thought to have been ruined in France; and in Madeira and the Canary Islands wine production ceased completely. The ravages were checked eventually by the importation of louse-resisting stocks from California, on which the older vines were grafted.

Manufacture. The manufacture of wine varies in detail according to the type of wine to be produced, but it usually follows a standard pattern. The grapes are crushed and the grape must is allowed to ferment in vats, usually after the addition of sulfur dioxide to suppress wild yeasts and organisms other than the true wine yeast Saccharomyees ellipsoideus. A selected strain of wine yeast may be added at this point. Heat is produced by the fermentation, and the temperature may have to be controlled within optimum limits. Air is excluded from the vats as much as possible to discourage the action of Acetobacter, the vinegar-forming bacterium, and other harmful organisms. When fermentation is well advanced, the "free-run" wine is drawn off. Fermentation continues and is completed after several weeks. The wine is racked (drawn) off to separate it from the lees, or sediment of yeast, acid potassium, tartrate, and other matter; in the case of quality wines, racking may be repeated at intervals for several years during the aging period in wood. Before bottling, the wine is cleared by the addition of fining agents such as bentonite to precipitate particles of suspended matter. During aging, and subsequent maturation in bottles, many reactions including oxidation occur, which enhance the taste, aroma, and preservative properties of the wine.

During storage, wine requires protection from temperature extremes, from light, and from vibration; bottles containing table wine are laid on their sides during storage to keep their corks moist.

wing, in zoology, one of the paired structures by means of which certain animals propel themselves in the air. Vertebrate wings are modifications of the forelimbs. In birds the fingers are reduced and the forearm is lengthened. The primary flight feathers on the distal portion of the wing create most of the propelling force in flight, while on the less mobile upper wing the secondaries provide the greater portion of the lift. Adaptations include the high-speed wings of swallows and the slotted, soaring wings of vultures. The wings of pen-

guins, which lack primary flight feathers, are used only for swimming. Bats, the only mammals capable of true flight, have wings formed of a flight membrane stretched over slender, elongated arm and hand bones. The so-called flying squirrel does not actually fly but is capable of gliding, using paired membranes attached to the forelegs and hind legs. Likewise the colugo, or flying lemur, has membranous structures that function in gliding.

Insect wings are formed of folds of integument. Most insects have two pair of wings, although flies use only the first pair and beetles only the second. The two wings on a side are usually moved together, but in the dragonfly they work independently.

wing, in aeronautics, an airfoil that helps lift a heavier-than-air craft. When positioned above the fuselage (high wings), wings provide an unrestricted view below and good lateral stability. Parasol wings, placed on struts high above the fuselage of seaplanes, help keep the engine from water spray.

Midwings, positioned in the middle of the fuselage, leave the airplane belly free of spars, with room for bombs or cargo. Placed below the fuselage, low wings reduce height of the undercarriage and simplify engine main-

wing chair, also called GRANDFATHER CHAIR, or SADDLE CHEEK CHAIR, a tall-backed, heavily upholstered easy chair with armrests and wings, or lugs, projecting between the back and arms to protect against drafts. They first

Queen Anne style wing chair with bargello or flame-stitch, American, needlepoint upholstery c. 1725; in the Metropolitan Museum of Art, New York

appeared in the late 17th century—when the wings were sometimes known as "cheeks" and they have maintained their popularity ever since. Often they form part of a set, or suite.

Wingate, Orde Charles (b. Feb. 26, 1903, Naini Tal, India-d. March 24, 1944, Burma [now Myanmar]), British soldier, an outstanding "irregular" commander and unconventional personage in the tradition of General Charles George Gordon and Colonel T.E. Lawrence ("Lawrence of Arabia"). His "Chindits," or "Wingate's Raiders," a brigade of British, Gurkha, and Burmese guerrillas, harassed much stronger Japanese forces in the jungles of northern Burma (now Myanmar) during World War II.

Educated at Charterhouse and the Royal Military Academy, Woolwich, he was commissioned in the Royal Artillery in 1923, serving in the Sudan and making some exploration of the Libyan desert (1928-33). In 1936-39, while serving as an intelligence officer in Palestine, Wingate organized night patrols to repel Arab raids on Jewish communities along the Mosul-Haifa oil pipeline, successfully testing his "penetration" method of light infantry operations against the enemy's rear. From January to May 1941 he led an Ethiopian-Sudanese force that took Addis

Orde Wingate, 1943 William Vandivert, Life © Time Inc.

Ababa from the Italians. Sent to India, he organized the "Chindits" and helped to train a similar U.S. force, "Merrill's Marauders," commanded by Frank Dow Merrill. During February-May 1943, the "Chindits" entered Japanese-held Burma from the west, crossed the Chindwin River, and, receiving supplies from the air, conducted effective guerrilla operations against the Japanese until they reached the Irrawaddy River. On crossing that river in an attempt to cut Japanese communications with the Salween River front to the east, they found the terrain unfavourable and were forced to return circuitously to India.

Given command (as acting major general) of airborne troops invading central Burma in March 1944, Wingate severed the important Mandalay-Myitkyinā railway, but soon afterward he was killed in an airplane crash.

Wingate, Sir (Francis) Reginald, 1st BARONET (b. June 25, 1861, Port Glasgow, Renfrew, Scot.-d. Jan. 28, 1953, Dunbar, East Lothian), British general and imperial administrator, principal founder and governorgeneral (1899-1916) of the Anglo-Egyptian Sudan (from 1956 the independent Republic of The Sudan). Under his direction the Sudan developed a sound government, and, in part because of his influence, the country remained loyal to Great Britain and its allies in World War I.

Commissioned in the British artillery in 1880, Wingate was assigned to the Egyptian army in 1883. Six years later he became director of Egyptian military intelligence. He fought in several battles against adherents of al-Mahdī (Muḥammad Aḥmad, a nationalist rebel against the British-supported Egyptian overlordship of the Sudan), and on Nov. 24, 1899, he defeated and killed the Khalifa 'Abd Allāh ibn Muḥammad, successor to al-Mahdī. The next month he was appointed governorgeneral of the Sudan and sirdar (commander in chief) of the Egyptian army. From June 1916 Wingate, in Khartoum, assisted Saudi

Reginald Wingate, 1919 BBC Hulton Picture Library

rebels in Arabia against the rule of Turkey, with which Great Britain was at war. In January 1917 he was named British high commissioner for Egypt. Although his sympathy with the Egyptian Nationalist Party led to his dismissal in October 1919, subsequent British policy in Egypt generally followed his recommendations.

wingless cricket (insect): see leaf-rolling grasshopper.

Winisk River, river, Kenora district, northcentral Ontario, Canada, emptying into Hudson Bay. Arising from Wunnummin Lake, it flows eastward to Winisk Lake and then north and east for 295 miles (475 km) to its mouth on the bay, draining an area of 24,000 square miles (62,000 square km). Major tributaries include the Pipestone, Asheweig, and Shamattawa rivers. The Winisk (Indian for "woodcock") lies in a region that is uninhabited except for a few small trading posts. A 250mile (400-kilometre) stretch of the river lies in Winisk River Provincial Park (672 square miles [1,740 square km]), and its lower course passes through Polar Bear Provincial Park (11,233 square miles [29,093 square km]).

Winkler, Clemens Alexander (b. Dec. 26, 1838, Freiberg, Ger.-d. Oct. 8, 1904, Dresden), German chemist who discovered the element germanium.

After 12 years managing a cobalt-glass works, Winkler joined the faculty of the Freiberg School of Mining in 1873. In 1886, while analyzing the mineral argyrodite, he discovered germanium. It proved to be the element predicted in 1871 by Dmitry I. Mendeleyev, who had called it ekasilicon.

Winkler Prins Encyclopaedie, the standard Dutch encyclopaedia, published by Elsevier in Amsterdam. The first edition (1870-82) was based on the German Brockhaus Enzyklopädie (q.v.). The 6th edition (1947-54) appeared in 18 volumes. A new, 25-volume, thoroughly revised edition was published in 1979-84 and entitled Grote Winkler Prins.

The later editions of the encyclopaedia are known for their well-balanced articles, some of which are signed. Illustrations and maps are frequently in colour and in foldout form. Bibliographies contain works in various languages. The final volume includes an index.

Winneba, coastal town, southern Ghana, western Africa. It lies along the Gulf of Guinea near the mouth of the Ayensu River. It was originally a roadstead port, dependent upon the forest products of the Agona state, with its capital at Swedru (15 miles [24 km] northnorthwest). All port activities ceased in 1962, however, with the opening of Tema Harbour, and Winneba has since relied upon its fishing industry, agriculture (coconut palm), and some tourism, since it has a bathing beach. Pop. (1984 est.) 26,200.

Winnebago, a Siouan-speaking tribe of North American Indians who lived in what is now eastern Wisconsin when first encountered by the French explorer Jean Nicolet in 1634. Settled in permanent villages of dome-shaped wigwams, the Winnebago cultivated corn (maize), squash, beans, and tobacco. They also participated in communal bison hunts in the prairies to the southwest. They were divided into exogamous clans that were grouped into two major divisions, or phratries. The Upper (Air) division contained four clans, the Lower (Earth) division eight. Some clans had special functions, such as the adjudication of disputes, and each clan had customs relating to life crisis events. The major summer ceremonial was the Summer Medicine Dance, which included a secret ceremony for members of the Medicine Dance Society (a secret religious society open to both men and women), as well as public rituals. The Winter Feast was a clan ceremonial intended to increase war

Yellow Thunder, a Winnebago chief By courtesy of the State Historical Society of Wisconsin, Madison

and hunting powers; the spring buffalo dance was a magical ceremonial for calling the bison herds

In response to the fur trade, the Winnebago began a westerly expansion during the mid-17th century. By the early 19th century they claimed most of southwestern Wisconsin and the northwestern corner of Illinois. This land was ceded to the U.S. government in a series of treaties. The Winnebago were involved in the Black Hawk War of 1832, after which the majority of the tribe was removed by the government to Iowa, then to Missouri and to South Dakota. In 1865 about 1,200 of the Winnebago settled in Nebraska near their old friends and allies the Omaha; the population of the Winnebago Reservation in Thurston county, Neb., in the late 20th century was less than 1,200. The larger body of Winnebago finally were moved back to Wisconsin, where, from 1875, they were allowed to remain. The present Winnebago Reservation in Wisconsin consists of portions of 10 counties in the southern part of the state and had a population of less than 400 in the late 20th century. The total number of Winnebago, including those living outside the reservations, has been estimated to be 2,000.

Winnetka, village, Cook county, northeastern Illinois, U.S. It lies along Lake Michigan and is a northern residential suburb of Chicago. Settled in 1840 by New Englanders and immigrants from Germany, it was laid out in 1854. The name probably derives from an Indian word meaning "beautiful land." Winnetka's public school system gained national recognition for its innovative experiments in teaching (often called the Winnetka Plan). New Trier Township High School is there, as are the North Shore Country Day School and the Hadley School for the Blind, a privately supported institution (established in 1922 by William A. Hadley) that teaches by mail. Inc. 1869. Pop. (1988 est.) 12,306.

Winnipeg, city, capital (1870) of Manitoba, Canada. It lies at the confluence of the Red and Assiniboine rivers, 40 miles (65 km) south-southwest of Lake Winnipeg and 60 miles (95 km) north of the Minnesota (U.S.) border. After the establishment of Fort-Rouge in 1738 on the site by the French voyageur La Vérendrye, there were later trading posts on the site: Fort Gibraltar (built by the North West Company in 1804) and Fort Garry (by the Hudson's Bay Company, 1821). These, together with the Red River Settlement of Scottish colonists (founded in 1811-12) formed the nucleus of the new city, the name of which was taken from that of Lake Winnipeg and derived from the Cree Indian words win nipee ("muddy water")

The arrival in 1881 of the Canadian Pacific, the first Canadian transcontinental railroad, led to Winnipeg's becoming the major grain

market and warehousing and distributing point for the Prairie Provinces. The city also serves the mining districts of the north and is now one of Canada's largest industrial, communications, commercial, financial, and insurance centres. The city's economic activities include flour milling, meat-packing, printing, food processing, brewing, and the manufacture of clothing, automobiles, and farm machinery. Winnipeg's industrial growth has been stimulated by the availability of cheap hydroelectric power (from plants on the Winnipeg River) and natural gas and of excellent transportation facilities. A major junction on two transcontinental rail lines and the Trans-Canada Highway, Winnipeg also has a busy international airport. Following disastrous floods in 1950, the 30-mile (48-kilometre) Red River Floodway was built (completed 1967), allowing that river's floodwaters to bypass the city.

A cosmopolitan city of many ethnic groups,

A cosmopolitan city of many ethnic groups, Winnipeg dominates Manitoba's cultural life. It is the home of a symphony orchestra, the Royal Winnipeg Ballet, and the Manitoba

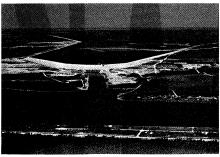

The Legislative Building (centre), Winnipeg, Man. Tourism Canada: photograph, E. Bork

Theatre Centre. It is the seat of the University of Manitoba (1877) and its affiliated colleges of St. Boniface (1818), St. John's (1866), St. Paul's (1926), and St. Andrew's (1946) and of the University of Winnipeg (1947, formerly United College). The provincial Legislative Building (1920) is a neoclassical structure with the well-known Golden Boy (a bronze statue of a youth carrying a torch in his right hand and a sheaf of wheat over his left arm) on top of its dome. The city's Centennial Centre includes the Manitoba Museum of Man and Nature and a planetarium. Winnipeg plays host to an annual (August) international festival of folk arts.

On Jan. 1, 1972, the municipalities that comprised the Metropolitan Corporation of Greater Winnipeg (including Saint Boniface [q.v.], Saint James, East and West Kildonan, Transcona and Saint Vital) were absorbed into the city. Inc. 1873. Pop. (1986) city, 594,551; metropolitan area, 625,304.

Winnipeg, Lake, lake in south-central Manitoba, Canada, at the southwestern edge of the

Grand Rapids power development at the influx of the Saskatchewan River at the northwestern end of Lake Winnipeg, Manitoba

George Hunte

Canadian Shield, the rocky, glaciated region of eastern Canada. Fed by many rivers, including the Saskatchewan, Red, and Winnipeg, which drain a large part of the Great Plains, the lake is drained to the northeast by the Nelson River into Hudson Bay. Lake Winnipeg, at an altitude of 713 feet (217 m), is 264 miles (425 km) long and up to 68 miles (109 km) wide and has an area of 9,417 square miles (24,-390 square km). Visited in the 1730s by the son of La Vérendrye (the French voyageur) and named from the Cree Indian words for "muddy water," the lake is a remnant of glacial Lake Agassiz. With an average depth of about 50 feet (713 feet at its deepest point), it is important for shipping and commercial fishing (based at Gimli), while its southern shore is a major resort area serving Winnipeg, 40 miles (64 km) south. Major islands include Hecla, Deer, and Black, which form part of Hecla Provincial Park (333 square miles [862 square km]).

Winnipeg Free Press, daily newspaper published in Winnipeg, Manitoba, Can., whose outspoken independence and championship of public service and minority causes have made it known as "Canada's Gadfly."

Established in 1872 by William F. Luxton and John A. Kenny as the *Manitoba Free Press*, the paper grew in circulation and influence during Canada's westward expansion in the 1880s. From 1901 its editor was John Wesley Dafoe, who guided the paper for more than 40 years and established its political independence and commitment to public service. The coverage of local, national, and international news in the *Free Press* is widely respected, and its editorials have won international recognition.

Winnipeg River, river in southeastern Manitoba and western Ontario, Canada. The river issues from the Lake of the Woods along the Canada-U.S. border and flows generally northwestward through several lakes for about 200 miles (320 km), draining an area of 48,-880 square miles (126,600 square km) before it enters the southeastern end of Lake Winnipeg near Pine Falls. One of its tributaries, the Firesteel River, rises near Lake Superior; together, the rivers served as a 475-mile (765kilometre) route for explorers and fur traders after they had been navigated in 1733 by the French voyageurs La Vérendrye and La Jemerave. Numerous falls and rapids on the Winnipeg's lower course hinder navigation but provide hydroelectric power for most of Manitoba. Power plants are located at Seven Sisters Falls, Great Falls, Pointe du Bois, Slave Falls, Pine Falls, and McArthur Falls. Canada's only tantalum mine operates at Bernic Lake, north of Whiteshell Provincial Park (1,056 square miles) and southeast of Nopiming Provincial Park (550 square miles).

Winnipegosis, Lake, lake in western Manitoba, Canada, between Lake Winnipeg and the Saskatchewan border, a remnant of glacial Lake Agassiz. Supplied by numerous small streams on the west, the 2,075-square-mile (5,374-square-kilometre) lake is drained southeastward into Lake Manitoba and thence into Lake Winnipeg. Lake Winnipegosis is more than 150 miles (240 km) long, is up to 32 miles (51 km) wide, and has a maximum depth of 833 feet (254 m). Winnipegosis (a Cree Indian term meaning "little muddy water") is an island-strewn lake that is navigable only by small vessels. It was explored in 1739 by the French voyageur La Vérendrye and later served as part of a furtrading route. The lake is now important for commercial fishing, centred at Winnipegosis, which is situated on the lake's southern shore at the mouth of the Mossy River. Winnipegosis is the largest riparian settlement and is the terminus of a branch of the Canadian National Railway from Dauphin (35 mi south).

Winnipesaukee, Lake, lake in Belknap and Carroll counties, east central New Hampshire, U.S., at the foothills of the White Mountains east of Laconia. The state's largest lake, it is 20 mi (32 km) long by 12 mi wide and is dotted with 274 islands, the largest of which is Long Island (3 by 1.5 mi). The lake is a popular summer recreation area, with a steamboat service, an annual regatta, 283 mi of wooded shoreline, and many coves and bays. Its outlet, the Winnipesaukee River, flows about 20 mi southwest to Franklin, where it enters the Merrimack River. Paugus Bay and Lake Winnisquam are also connected by the Winnipesaukee River. The meaning of its Indian name is much disputed, but a commonly accepted translation is "good outlet."

Winogradsky, Sergei Nikolaevitch (b. Sept. 1, 1856, Kiev—d. Feb. 25, 1953, Brie-Comte-Robert, Fr.), Russian microbiologist whose discoveries concerning the physiology of the processes of nitrification and nitrogen fixation by soil bacteria helped to establish bacteriology as a major biological science.

After studying natural sciences at the University of St. Petersburg in 1881, Winogradsky went (1885) to Strassburg, Ger. In 1887 he established the specific physiology of sulfur bacteria, by demonstrating that the colourless form of these bacteria can obtain energy by oxidizing hydrogen sulfide to sulfur and then to sulfuric acid in the absence of light.

In 1888 Winogradsky went to the University of Zürich, where he discovered (1889-90) the microbial agents responsible for nitrification (the oxidation of ammonium salts to nitrites and nitrites to nitrates). He established two genera-Nitrosomonas (nitrite formers) and Nitrosococcus ([Nitrobacter] nitrate formers)-for the two new types of organisms concerned in the process. He returned to St. Petersburg and worked for the Imperial Institute of Experimental Medicine until his first retirement in 1905. Forced out of Russia by the October Revolution of 1917, he resumed his career in 1922 at the Pasteur Institute in Paris, where he remained until he again retired in 1940.

While at the Imperial Institute, Winogradsky proposed new methods of studying soil micro-organisms, particularly those that fix nitrogen symbiotically in legumes as well as those dispersed in soil. In 1893–95 he also discovered Clostridium pasteurianum, an anaerobic organism (i.e., able to grow in the absence of oxygen) that is able to utilize free nitrogen from the atmosphere in metabolic processes.

Winona, city, seat of Winona County, southeastern Minnesota, U.S., on high bluffs above the Mississippi River, in a mixed-farming area. Founded in 1851 by New Englanders, it was called Montezuma when laid out in 1852 but

The "Julius C. Wilkie," Steamboat Museum, Winona, Minn.

Milt and Joan Mann from CameraMann

was renamed to honour a legendary Indian princess. Its early growth as a river port and wheat-shipping and logging-sawmilling centre was boosted by the arrival of the railroads in the 1860s. After 1900 timber and wheat operations declined, and diversified industries, notably the manufacture of chains and pharmaceuticals, arose. Limestone quarries are worked. Winona State University (1860), St. Mary's College (1912), and the College of St. Teresa (1907) are there, and the stern-wheeled steamboat "Julius C. Wilkie" is preserved as a museum of river lore. Sugar Loaf Hill, a limestone formation (500 ft [150 m] above the Mississippi) was a river pilot's landmark. Inc. 1857. Pop. (1980) 25,075.

Winooski, city, Chittenden County, northwestern Vermont, U.S., on a steep side hill rising from the Winooski River, just northeast of Burlington. It was founded in 1787 by Ira Allen and Remember Baker, Vermont pioneers who were attracted by the waterpower potential of the river's lower falls. Known as the "Mill City," its development as an industrial community began with the establishment of a woollen mill in 1835. Textile manufacturing, once a large industry, is no longer a factor. The present economy depends chiefly on woodworking and tool and die industries. St. Michael's College (1904) is in Winooski. Inc. 1922. Pop. (1980) 6,318.

Winooski River, river in north central Vermont, U.S., rising near Cabot in Washington County and flowing southwest, then northwest across the state through the Green Mountains, past Montpelier and Waterbury, to drain into Lake Champlain near Winooski after a course of about 90 mi (45 km). The river's name comes from an Indian word for "onion." Flood-control and hydroelectric-power projects on the river and its tributaries include the East Barre Dam on the Jail Branch (1935).

Winslow, city, Navajo County, east central Arizona, U.S., in the valley of the Little Colorado River. Founded in 1882 as a divisional terminal of the Santa Fe Railway, it was named for Edward F. Winslow, a railroad official. Its economy is based upon railroad services, lumbering, livestock raising (mainly by the Indians), and tourism. Meteor Crater is a few miles west. To the north is the extensive Navajo Indian Reservation, which includes Monument Valley and Canyon de Chelly National Monument and which encloses the Hopi Indian Reservation. Inc. town, 1900; city, 1957. Pop. (1980) 7,921.

Winslow, Edward (b. Oct. 18, 1595, Droitwich, Worcestershire, Eng.—d. May 8, 1655, at sea, near Jamaica, British West Indies), English founder of the Plymouth colony in Massachusetts.

In 1617 Winslow moved to Holland, where he united with John Robinson's church at Leiden, and in 1620 he was one of the "Mayflower" pilgrims who emigrated to New England. His first wife, Elizabeth (Barker) Winslow, died soon after their arrival at Plymouth. In May 1621 he married Mrs. Susanna White, the mother of Peregrine White (1620–1704), who was the first child born among the New England colonists. Winslow's marriage was the first in New England.

Winslow was delegated by his associates to deal with the Indians in the vicinity (the Wampanoag) and succeeded in winning the friendship of their chief, Massasoit. He served as a member of the governor's council from 1624 to 1647, except in 1633–34, 1636–37, and 1644–45, when he was governor of the colony. In 1643 he was one of the commissioners of the United Colonies of New England and on several occasions was sent to England to represent the interests of the Massachusetts Bay and Plymouth colonies.

In October 1646 he left on his last mission as the agent of Massachusetts Bay and spent

Edward Winslow, detail of an oil painting by Robert Walker, 1651; in the Pilgrim Hall Museum, Plymouth, Mass. By courtesy of Pilgrim Hall Museum. Plymouth. Mass.

nine years in England, where he held minor offices under Oliver Cromwell. In 1655 Winslow was chief of the three commissioners that Cromwell sent on his expedition against the West Indies, but he died on board ship near Jamaica.

His writings, though fragmentary, are of great value to the historian of the Plymouth colony. His Glorious Progress of the Gospel Amongst the Indians in New England (1649) led to the founding of the Society for the Propagation of the Gospel in New England.

Winslow, Josiah (b. c. 1629, New Plymouth Colony—d. Dec. 18, 1680, Marshfield, New Plymouth Colony), British American military leader and governor of New Plymouth Colony who established the colony's first public school.

Josiah Winslow was the son of Gov. Edward Winslow, an original founder of New Plymouth Colony in 1620. After attending Harvard College, Josiah accompanied his father on a journey to England in 1651. When he returned to New Plymouth the next year, he was appointed militia commander for his hometown of Marshfield, and in 1657 he was chosen to represent the community as an assistant in the New Plymouth legislature. In 1658 he became one of the colony's commissioners in the New England Confederation's directorate, and later he was chosen commander in chief of New Plymouth's military forces, succeeding Miles Standish. As commander, he laboured to prevent Indian uprisings. In 1672 he became a signatory to the new governing articles of the New England Confederation.

Winslow was elected governor of New Plymouth in 1673, and in one of his early administrative actions, he established the first public school in the colony. When King Philip's War erupted in 1675, he became commander in chief of the forces of the United Colonies of New England. Although he defeated the rebellious Indians in a battle and burned many of their villages, his losses were high and illness obliged him to relinquish his command to Capt. Benjamin Church in February 1676. Winslow continued as governor of New Plymouth, nevertheless, and in 1677 he successfully satisfied the inquiries into the colony's activities by Edward Randolph, investigative agent for the Lords of Trade. He was in the process of negotiating a new charter from crown officials in England at the time of his

Winsor, Justin (b. Jan. 2, 1831, Boston—d. Oct. 22, 1897, Cambridge, Mass., U.S.), librarian who, as superintendent of the Boston Public Library (1868–77) and librarian of Harvard (from 1877), came to be regarded as the leading figure of the library profession in the United States.

Winsor, a free-lance writer in Boston, was appointed a trustee of that city's public library (1866) and then became its chief administrator, at first on a temporary basis. During his tenure of office he established numerous

Winsor, engraving by J.A.J. Wilcox
By courtesy of the Library of Congress, Washington,
D.C.

branch libraries in Boston. In 1876 he was a founder of the American Library Association and became its first president, serving until 1885 and again in 1897. Winsor also was a historian; he edited the *Narrative and Critical History of America*, 8 vol. (1884–89), and wrote several books.

Winstanley, Gerrard (baptized Oct. 10, 1609, Wigan, Lancashire, Eng.—d. after 1660), leader and theoretician of the group of English agrarian communists known as the Diggers, who, in 1649–50, cultivated common land on St. George's Hill, Walton-on-Thames, Surrey, and at nearby Cobham until they were dispersed by force and legal harassment. They believed that land should be made available to the very poor.

Of Lancashire origin, Winstanley was a cloth merchant in London until his business failed. In April 1649, in the revolutionary atmosphere of the Commonwealth period, he and William Everard took the lead in establishing the Digger colony, a timely project because of the unprecedented height of food prices in England. Although the colony ceased to exist in March 1650, Winstanley remained prominent as a pamphleteer, foreshadowing later communist and materialist ideas in his vigorous and racy prose.

The Law of Freedom in a Platform (1652), his sketch of a communist society, was dedicated to Oliver Cromwell. Winstanley believed that the English Civil War had been fought against king, landlords, lawyers, and all who bought and sold, these being enemies of the landless and labouring poor, and against priests, whose preaching of heaven and hell diverted men from asserting their rights on Earth and who were an instrument of class rule. He was an advocate of universal religious toleration, and he would have replaced sermons by lectures on the natural sciences and on the English constitution. He may be the Gerard Winstanley, a Quaker, who died in 1676. Winstanley's works were edited by G.H. Sabine (1941); a biography by T. Wilson Hayes, Winstanley the Digger, was published in 1979.

Winsted, city and principal community in the town (township) of Winchester, Litchfield County, northwestern Connecticut, U.S., at the confluence of the Still and Mad rivers. The area was first settled in 1750. Winsted, named from a combination of Winchester and Barkhampsted (which borders it on the east), was incorporated as a borough in 1856 and as a city in 1917. Its site had an abundant supply of waterpower from Highland Lake and Mad River, and in the 19th century a variety of metal, wooden, and leather goods were made. The economy is now based on diversified engineering products. Northwestern Connecticut Community College was founded at Winsted in 1965. Pop. (1980) 8,092.

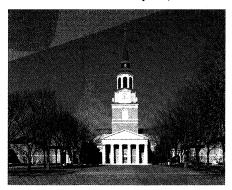

Winstedt, Sir Richard Olof (b. Aug. 2, 1878, Oxford—d. June 2, 1966, London), director of education in British Malaya who shaped Malay education and produced an extensive body of writings on Malaya.

Winstedt first went to Malaya in 1902. As an administrative officer posted to rural districts in Perak and Negeri Sembilan, he immersed himself (with several notable Malay amanuenses) in the study of the language, beliefs, customs, and history of the Malays. His first paper on Malay folklore was published in 1907, and the first edition of his *Malay Grammar* in 1913. As a result of his special interests, Winstedt was made assistant director of education for the Straits Settlements and Federated Malay States, with special responsibility for vernacular (Malay) education. He was director of education from 1924 to 1931.

Though he was responsible for introducing into Malay schools a greater proportion of indigenous materials, vernacular education remained at the most elementary level. Winstedt was accused by some of using education to create a quiescent colonial population rather than to advance the true interests of the Malays in what was fast becoming a multiracial and highly westernized society.

Despite a busy official life, Winstedt was the author of a large series of monographs and articles on the history and culture of Malaya. During the 1930s he wrote histories of several Malay states and in 1935 a general history of the peninsula. He also published a *History of Classical Malay Literature* (1940), a work on Malay magic, and several dictionaries. After his retirement in 1935, he returned to England, was knighted (1935), and from 1937 to 1946 was reader in Malay at the School of Oriental and African Studies, University of London. He was elected a Fellow of the British Academy in 1945.

Winston-Salem, city, port of entry, seat of Forsyth County, on the Piedmont Plateau of North Carolina, U.S. With High Point and Greensboro it forms a tri-city industrial area. Winston-Salem was created in 1913 from two towns originally a mile apart. Winston, founded in 1849 as the county seat, was named

Wait Chapel on the campus of Wake Forest University, Winston-Salem, N.C.

Milt and Joan Mann from CameraMann

in 1851 for Maj. Joseph Winston, a Revolutionary War soldier. Salem (meaning "peace") was laid out in 1766 by Moravian colonists in the centre of their Wachovia land tract; it was incorporated in 1856, when the land was sold to outsiders. R.J. Reynolds founded his tobacco company there in 1875, and tobacco dominates its diversified industries, which include the manufacture of textiles, beer, rubber, leather, and petroleum.

The city is the home of Wake Forest University (1834), Salem College (1772), Winston-Salem State University (1892), Forsyth Technical Institute (1958), North Carolina School of the Arts (1965), and Piedmont Bible College (1945). Old Salem, a replica of the original settlement, is the site of the annual Moravian Easter Sunrise Service. Inc. city, 1913. Pop. (1982 est.) city, 140,846; (1984 est.) Greensboro-Winston-Salem-High Point metropolitan statistical area (MSA), 886,100.

winter, coldest season of the year, between autumn and spring; the name comes from an old Germanic word that means "time of water" and refers to the rain and snow of winter in middle and high latitudes. In the Northern Hemisphere, it is commonly regarded as extending from the winter solstice (year's shortest day), December 22 or 23, to the vernal equinox (day and night equal in length), March 20 or 21, and in the Southern Hemisphere, from June 21 or 22 to September 22 or 23. The low temperatures associated with winter occur only in middle and high latitudes; in equatorial regions, temperatures are almost uniformly high throughout the year. For physical causes of the seasons, see season.

The concept of winter in European languages is associated with the season of dormancy, particularly in relation to crops; some plants die, leaving their seeds, and others merely cease growth until spring. Many animals, of course, also become dormant, especially those that hibernate; many insects die. In many cultures, winter, like the other seasons, has been marked by rites and festivals revolving around the season's importance in food production.

winter aconite, also called NEW-YEAR'S GIFT, any of about seven species of perennial herba-

Winter aconite (Eranthis)

G.E. Hyde from the Natural History Photographic Agency—EB Inc.

ceous plants constituting the genus *Eranthis* of the buttercup family (Ranunculaceae) native to the temperate regions of Europe and widely planted for their early spring flowers.

The solitary blossoms, consisting of five to eight yellow sepals (petals are reduced or absent), arise on short stalks from tuberous roots. *E. hyemalis*, a frequently cultivated species, grows to about 20 centimetres (8 inches) or less and has flowers 2½ cm across.

winter cress, any of about 12 species of the genus Barbarea, weedy herbs of the mustard family (Brassicaceae), native to the north temperate region. Common winter cress, or rocket (B. vulgaris), in early summer bears flower stems 80 centimetres (32 inches) tall with unstalked, small, lobed leaves and branched clusters of small, bright-yellow flowers. The fruits are many-seeded, long, narrow capsules. Early winter cress, or scurvy grass (B. verna), has basal leaves with four to eight pairs of lobes—about twice as many as common winter cress. Both species sometimes are cultivated as salad plants.

Winter Haven, city, Polk County, central Florida, U.S., situated amid a large cluster of small lakes, 14 mi (23 km) east of Lakeland. The first white settlement (1883) on the site was called Harris' Corner (for the F.A.K. Harris Store) but was renamed Winter Haven in 1884. Citrus groves and tomatoes were cultivated, and the settlement developed as a shipping point with railroad connections at Bartow Junction (Lake Alfred). It was incorporated in

1911 and in 1924 amalgamated with nearby Florence Villa to form the City of Winter Haven. Many canning factories and packinghouses process the local citrus crop. Other economic assets are tourism and recreational facilities, largely based on Cypress Gardens (noted for its botanical gardens), Slocum Water Gardens, and the Florida Citrus Showcase. Polk Community College was opened there in 1964. Pop. (1987 est.) city, 24,499; (1988 est.) Lakeland-Winter Haven metropolitan statistical area (MSA), 395,800.

winter hazel, any of about 10 species of the genus Corylopsis, deciduous shrubs or small trees of the witch hazel family (Hamamelidaceae). They are native to eastern Asia and the Himalayas but are planted elsewhere as ornamentals. Their bell-shaped creamy to yellow fragrant flowers appear in hanging clusters in early spring before the leaves. Especially early are the creamy flowers of the buttercup winter hazel (C. pauciflora), which appear in clusters of two or three on the densely branched shrubs up to 2 m (6 feet) tall. Spike winter hazel (C. spicata), about the same height, blooms about the same time but bears lemon-yellow flowers. The fragrant winter hazel (C. glabrescens), up to 6 m tall, is somewhat hardier than the aforementioned species

Winter of Khosrow Carpet: see Spring of Khosrow Carpet.

Winter Park, city, Orange county, central Florida, U.S., just north of Orlando. In 1881 Loreing A. Chase and O.E. Chapman purchased 600 acres (240 hectares) of land on the site and laid out a town that they called Winter Park. The loose-skinned mandarintype Temple orange was first cultivated there. The founding (1885) of Rollins College gave impetus to the community's growth. A chain of four lakes with boating and fishing facilities is within the city, which is now primarily a residential resort. Inc. town, 1887; city, 1925; rechartered 1949. Pop. (1987 est.) 24,036.

Winter War: see Russo-Finnish War.

Winteraceae, family of aromatic trees and shrubs of the order Magnoliales that contains seven or eight genera and 88 to 120 species, depending on the authority consulted. All but four species are native to Southeast Asia and Australasia. Members of the family have wood without water-conducting cells; acrid sap; gland-dotted, leathery, smooth-margined leaves; and small, usually bisexual flowers in clusters, with two to six sepals, petals in two or more series, several stamens, and one to several carpels (structure units of the female flower parts).

Many species have medicinal qualities; the best known is the South American Winter's bark (*Drimys winteri*), a 15-metre (50-foot) tree. It has peppery, hot-tasting leaves and bark. The bark was formerly used as a preventive against scurvy. Winter's bark has leathery, elliptic-shaped leaves; red-tinged shoots; and jasmine-scented, cream-coloured, 8- to 12-petaled, 2.5-centimetre (1-inch) flowers in clusters. A closely related Central American species with similar medicinal attributes, *D. granadensis*, is the only North American member of the family.

Pseudowintera colorata, of New Zealand, has peppery, elliptic, red-blotched leaves on a 10-metre (32-foot) tree. Other genera of the family are Bubbia, Belliolum, Exospermum, Tetrathalamus, and Zygogynum.

Winterbotham, Frederick William (b. April 16, 1897, Stroud, Gloucestershire, Eng.—d. Jan. 28, 1990, Blandford, Dorset), British secret-service official who played a key role in the "Ultra" codebreaking project during World War II.

Winterbotham joined the Royal Gloucestershire Hussars in 1915 but later transferred to the Royal Flying Corps, where he became a fighter pilot. He was shot down, and as a prisoner of war he learned to speak German.

Upon leaving the military he attended the University of Oxford and received a degree in law in 1920. In 1929 he joined the British secret service (sometimes called MI-6) as chief of its air intelligence department. In this capacity he often visited Germany in the 1930s, using a Foreign Office job as cover. By 1939 he had also helped develop a new method of aerial photo-reconnaissance that was very useful to the British in World War II.

In 1938 Winterbotham and his colleagues in MI-6 had become aware of a new mechanical encrypting device developed by the Germans, called Enigma. British codebreaking experts were able to penetrate this top-secret code system by 1940, and were thus enabled to intercept, decode, and read many of the most important messages of the German armed forces. Winterbotham was put in charge of distributing this highly sensitive intelligence data, which was code-named Ultra, to the British leader Winston Churchill and to British field commands around the world. The information that Winterbotham's teams of operatives conveyed helped Allied planners and commanders to proceed against Axis forces with maximum strategic effect.

Winterbotham was made a Commander of the British Empire in 1943 and received the Legion of Merit in 1945. He revealed the story of the Ultra project to the general public in his book *The Ultra Secret* (1974).

wintergreen, any of several evergreen plants, within the heath order (Ericales).

The genus *Pyrola* includes some 12 species, commonly called shinleaf, native to the North Temperate Zone. They are creeping perennials with leaves that usually grow in a rosette at the base of the stem. Several to numerous flowers are borne in a terminal spike. The calyx (sepals, collectively) is 5-lobed; there are 5 petals and 10 stamens. *P. minor* has pinkish globular flowers growing in a dense cluster. The pinkish globular flowers of *P. media* grow in a rather elongated cylindrical cluster. The flowers of *P. rotundifolia* are white, with widely spread petals.

Gaultheria procumbens, also called teaberry and checkerberry, has many short, erect branches with short-stalked, thick, shining tooth-edged leaves in the upper part. Flowers hang singly from the leaf axils and have a pale pink, waxy-looking, urn-shaped corolla. The bright red berrylike fruits, called deerberries, consist of the much-enlarged fleshy calyx, which surrounds the small, many-seeded capsule. The plant is a native of shady woods on sandy soil, particularly in the mountainous areas of the northern United States and southern Canada; it is hardy in England. The leaves, sharply astringent and having a peculiar aromatic smell and taste, yield the pungent oil of wintergreen, a volatile oil used as a flavouring for candies and chewing gum and in the treatment of muscular aches and pains. The active ingredient, methyl salicylate, is also synthe-

Wintergreen (Gaultheria procumbens)
Roger and Joy Spurr—Bruce Coleman Inc./EB Inc.

sized and sold as oil of wintergreen. Mountain tea, an infusion of wintergreen leaves, has been used in some parts of North America as a beverage.

Winterhalter, Franz Xaver (b. April 20, 1805, Menzenschwand, Ger.—d. July 8, 1873, Frankfurt am Main), German painter and lithographer, known for portraits of royalty.

Trained in Freiburg im Breisgau and Munich, Winterhalter entered court circles when in 1828 he became drawing master to Sophie, later grand duchess of Baden, at Karlsruhe. After 1834 he went to Paris and quickly became fashionable, at first under the protection of King Louis-Philippe and later at the court of Napoleon III. He was first summoned to the English court by Queen Victoria in 1841. During his career he painted most of Europe's royalty and leading aristocracy. His style was somewhat pedantic at first, producing a smooth, enamel-like surface; he later developed a freedom of brushwork that engendered the romantic charm (well exemplified in the celebrated portrait of the empress Elizabeth of Austria) that accounts for his popularity. Winterhalter's works, which became widely known through copies and reproductions, are now mainly valued for the picture they give of aristocratic Victorian Europe.

Winters, (Arthur) Yvor (b. Oct. 17, 1900, Chicago, Ill., U.S.—d. Jan. 25, 1968, Palo Alto, Calif.), American poet, critic, and teacher who held that literature should be evaluated for its moral and intellectual content as well as on aesthetic grounds.

Educated at the University of Chicago, University of Colorado (Boulder), and Stanford University (California), Winters taught at the University of Idaho (Pocatello) and at Stanford (1927-66). His attacks on such contemporary literary idols as T.S. Eliot and Henry James aroused much controversy. His collected poems appeared in 1952 (rev. ed., 1960). His major critical works, Primitivism and Decadence, Maule's Curse, and The Anatomy of Nonsense, were collected as In Defense of Reason (1947; rev. ed., 1960). Forms of Discovery: Critical and Historical Essays on the Forms of the Short Poem appeared in 1967.

Winterthur, city, Zürich canton, northern Switzerland. It lies in a wooded basin east of the Töss River, northeast of Zürich city. The Roman settlement of Vitodurum was on the site of the city's northeastern suburb of Ober-Winterthur. Winterthur was founded in about 1175 by the counts of Kyburg, who granted it a charter with extensive privileges. It was inherited in 1264 by the Habsburgs, who sold it to the city of Zürich in 1467. Notable landmarks include the Town Church of St. Laurenz (1264-1515), the town hall (1781-83), and the Assembly Hall (1865-69). Notable among the advanced schools is the Technikum, Switzerland's largest school of technology. The city's Collection Oskar Reinhart am Römerholz picture gallery and its symphony orchestra are well known. A rail and industrial centre, Winterthur has heavyengineering works (primarily the firm of the Sulzer Brothers) and also manufactures cotton textiles. Pop. (1988 est.) 84,884.

Winterthur Museum, in full HENRY FRANCIS DU PONT WINTERTHUR MUSEUM, museum in Winterthur, Del., U.S., near Wilmington, that specializes in American decorative arts and furnishings. Occupying a mansion built in 1839, the museum limits its collections to American domestic architecture, furniture, metalware, textiles, paintings, prints and other objects made in the period from 1640 to 1840. The museum displays much of its collection in period rooms, each complete to the last detail. The mansion was purchased in 1926 by Henry Francis du Pont, who built up the collection and opened the renovated and expanded building as a museum in 1951.

Winthrop, John (b. Jan. 22 [Jan. 12, Old Style], 1588, Edwardstone, Suffolk, Eng.—d. April 5 [March 26], 1649, Boston, Massachusetts Bay Colony [U.S.]), first governor of the Massachusetts Bay Colony, the chief figure among the Puritan founders of New England.

Background and early life. Winthrop's father was a newly risen country gentleman

John Winthrop, detail of an oil painting, school of Sir Anthony Van Dyck, c. 1625–49; in the collection of the American Antiquarian Society, Worcester. Mass.

By courtesy of the American Antiquarian Society, Worcester, Mass.

whose 500-acre (200-hectare) estate, Groton Manor, had been bought from Henry VIII at the time of the Reformation. Winthrop thus belonged to a class—the gentry—that became the dominant force in English society between 1540 and 1640, and he early assumed the habit of command appropriate to a member of the ruling class in a highly stratified society.

At age 15 he entered Trinity College, Cambridge; at age 17 he married the first of his four wives—Mary Forth, daughter of an Essex squire—and the next year the first of his 16 children was born. Like many members of his class, Winthrop studied law, served as justice of the peace, and obtained a government office; from 1627 to 1629 he was an attorney at the Court of Wards and Liveries. For more than 20 years Winthrop was primarily a country squire at Groton, with no discernible interest in overseas colonization.

He was an ardently religious person. From his early teens Winthrop threw himself into scriptural study and prayers, and gradually he trained himself into a full-fledged Purian, convinced that God had elected him to sainthood. His religious experience reinforced his elitist outlook, but it also made him a social activist. Like other prominent Puritans, Winthrop dedicated himself to remaking, as far as possible, the wicked world as he saw it, arguing that "the life which is most exercised with tryalls and temptations is the sweetest, and will prove the safeste."

During the late 1620s, Winthrop felt increasingly trapped by the economic slump that reduced his landed income and by Charles I's belligerent anti-Puritan policy, which cost him his court post in 1629. When, in 1629, the Massachusetts Bay Company obtained a royal charter to plant a colony in New England, Winthrop joined the company, pledging to sell his English estate and take his family to Massachusetts if the company government and charter were also transferred to America. The other members agreed to these terms and elected him governor (October 20).

Journey to America. As Winthrop sailed west on the Arbella the spring of 1630, he composed a lay sermon, "A Modell of Christian Charity," in which he pictured the Massachusetts colonists in covenant with God and with each other, divinely ordained to build "a Citty upon a Hill" in New England. Some critics have seen Winthrop as a visionary utopian,

while others have seen him as a social reactionary; but most obviously he was urging his fellow colonists to adopt the group discipline and individual responsibility that gave Massachusetts such immediate and lasting success as a social experiment.

For the remaining 19 years of his life, Winthrop lived in the New England wilderness, a father figure among the colonists. In the annual Massachusetts elections he was chosen governor 12 times between 1631 and 1648, and during the intervening years he sat on the court of assistants or colony council. His American career passed through three distinct phases. On first arrival, in the early 1630s, he did his most creative work, guiding the colonists as they laid out a network of tightly organized towns, each with its church of self-professed saints. Winthrop himself settled at Boston, which quickly became the capital and chief port of Massachusetts. His new farm on the Mystic River was much inferior to his former estate at Groton, but Winthrop never regretted the move because he was free at last to build a godly commonwealth.

Opposition against him built up after a few years, however, as dissidents kept challenging Winthrop's system in the mid- and late 1630s. He was nettled when the freemen (voters) insisted in 1634 on electing a representative assembly to share in decision making. He found Roger Williams' criticism of church-state relations intolerable, though he secretly helped Williams to flee to Rhode Island in 1636. And he took it as a personal affront when numerous colonists chose to migrate from Massachusetts to Connecticut.

Conflict with Anne Hutchinson. The greatest outrage by far, however, came when Anne Hutchinson, a mere woman, gained control of his Boston church in 1636 and endeavoured to convert the whole colony to a religious position that Winthrop considered blasphemous. It was he who led the counterattack against her. His victory was complete. Hutchinson was tried before the general court—chiefly for "traducing the ministers"—and was sentenced to banishment. Later she was tried before the Boston church and formally excommunicated. She established a settlement on Aquidneck Island (now Rhode Island) in 1638 and four years later, after the death of her husband, settled on Long Island Sound. Winthrop sanctimoniously noted her tragic misfortunes-her deformed stillborn baby and her murder by Indians—as proof of God's judgment against

By 1640 Winthrop had become the custodian of Massachusetts orthodoxy, suspicious of new ideas and influences and convinced that God favoured his community above all others. With the outbreak of the English Civil War in 1642, many New Englanders returned home to fight against Charles I. Winthrop, however, stayed on in America, and he criticized the course of the Puritan Revolution. His own political philosophy was best summed up in a speech of 1645, in which he defined the magistrates' authority very broadly and the people's liberty very narrowly. But Winthrop was never a petty tyrant; the colonists respected and loved him to the end. His tender side is best revealed by the loving letters he exchanged with his third wife, Margaret, who was his helpmate from 1618 to 1647. The most notable of his sons, John Winthrop the Younger (1606-76), was a talented scientist and governor of Connecticut. Later descendants have figured prominently in American politics, science, and business.

After struggling six weeks with "a feverish distemper," he died, age 61, in the spring of 1649. By force of character Winthrop had persuaded the colonists to adopt many—though by no means all—of his pet social and political ideas. The detailed journal that he kept during his years in America is a prime source for the early history of Massachusetts, and

his copious file of correspondence and memoranda gives an exceptionally full impression of his activities and personality. (R.S.Du.) BIBLIOGRAPHY. Edmund S. Morgan, The Puritan Dilemma (1958), is a well-researched, well-written biography. Darrett B. Rutman, Winthrop's Boston (1965), analyzes the community Winthrop founded. Emery Battis, Saints and Sectaries (1962), discusses Winthrop's clash with Anne Hutchinson; and Richard S. Dunn, Puritans and Yankees (1962), traces the Winthrop dynasty in New England through three generations.

Winthrop, John, THE YOUNGER (b. Feb. 22 [Feb. 12, Old Style], 1606, Groton, Suffolk, Eng.—d. April 15 [April 5], 1676, Boston, Massachusetts Bay Colony [U.S.]), lawyer and a colonial governor in British North America.

The son of John Winthrop, the first governor of the Massachusetts Bay Colony, he emigrated to Boston in 1631 and was a member of the governor's council in 1635, 1640, 1641, and 1644-49. He was a founder of Agawam (now Ipswich), Mass., in 1633. He went back to England in 1634 and returned the following year as governor (for one year)

John Winthrop the Younger, detail of a 19th-century painting by G.F. Wright after a contemporary portrait by an unknown artist

By courtesy of the Connecticut State Library, Hartford

of Connecticut. He was again in England in 1641-43 and on his return to Massachusetts established ironworks at Lynn and Braintree.

Winthrop became magistrate of Connecticut in 1651. From 1657 to 1658 he was lieutenant governor and from the following year until his death was annually elected governor of the colony. In 1662 he obtained in England the charter uniting the colonies of Connecticut and New Haven. In 1675 Winthrop was further honoured by being chosen a commissioner of the United Colonies of New England. In England he was elected to membership in the newly organized Royal Society.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Winton, town, central Queensland, Australia. on Western Mills Creek, an intermittent tributary of the Diamantina River. Settled in 1873 and originally called Pelican Waterholes, it became a village in 1875 and a town in 1879. It was later renamed after Winton, Eng., the birthplace of its postmaster. It is at the junction of the Landsborough Highway and the Kennedy Developmental Road, with rail links northwest and east to the coastal towns of Rockhampton and Townsville and air service to Brisbane (700 miles [1,200 km] southeast). Winton is the trucking centre for the pastoral Channel Country, handling cattle and high-quality merino sheep. There are meathandling works in the town. The words to the popular song "Waltzing Matilda" were supposedly composed by A.B. ("Banjo") Paterson at nearby Dagworth Station in about 1898. The airline Qantas was formed as a company in Winton in 1920. Pop. (1981) 1,259.

Winton, Alexander (b. June 20, 1860, Grangemouth, Stirling, Scot.—d. June 21, 1932, Cleveland, Ohio, U.S.), Scottish-born U.S. pioneer automobile manufacturer who put thousands of "Winton Sixes" on the road.

After serving an apprenticeship in Clyde shipyards Winton moved to the United States in 1880, worked in iron mills and as a steamship engineer, and became a bicycle manufacturer in Cleveland in 1890. He built a gasoline-powered car in 1896 and in 1897 formed the Winton Motor Carriage Company. In March 1898 he made the first sale of a regularly produced American automobile, and he remained for some years one of the leading automobile manufacturers in the United States. In 1898, as a demonstration of endurance, he drove one of his models from Cleveland to New York City, a trip lasting from July 28 to August 7. He built four- and six-cylinder engines and was the first in the United States to build a straight eight-cylinder engine. His racing car "Bullet No. 1" set a speed record of one mile in 52.2 seconds at Daytona Beach, Fla., in 1902. In 1912 he founded the Winton Gas Engine Company, now part of General Motors, to do experimental work on diesel engines.

Wintun, groups of Penutian-speaking California Indians originally inhabiting the west side of the Sacramento Valley, some 250 miles from north to south, together with certain stretches of the flanking foothills. Four primary linguistic groupings, each, in fact, speaking a number of dialects, made up the Wintun population: the northern Wintun (Wintu), the central Wintun (Nomlaki), and the two subdivisions of the southern Wintun, the Hill and River Patwin. The Patwin are sometimes classified as a group separate from the Wintun.

The elongated shape of Wintun territory made for considerable cultural diversity; contacts with close neighbours to the east and west were more frequent for most communities than were those with other Wintun at the far extremities of the group's territory. In the north, for instance, basketry was twined in the fashion of that of the Oregon Indians; in the centre it was like that of the Pomo (q.v.); and in the south it had mixed characteristics. Salmon fishing was better in the north, but fishing was pursued everywhere; the gathering of acorns and other wild plant foods was universal, as was the hunting of waterfowl and other game. The house of the River Patwin was domed and earth-covered; that of the hill people was either a conical bark house or a simpler thatched structure; the nature of the northern dwellings is unknown.

Not much is known of Wintun social or political organization; there were apparently autonomous villages or bands, however; and the Patwin are known to have had a community chief with near-absolute power.

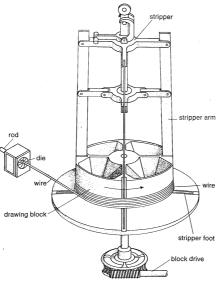

The southern Wintun greatly influenced the development of the Kuksu cult, a religion of secret societies and esoteric rites that spread to various Californian Indians. The cult's main purposes were to bring strength to young male initiates, to bring fertility to natural crops, and to ward off natural disasters. Wintun mythology was based on the existence of a single creator and powerful beings existing in direct natural personifications.

Before the influx of white settlers there were at least 12,000 Wintun; in the late 20th century there were scarcely more than 100 identifiable Wintun left (though many northern Californian Indians have intermarried).

Wiraqoca (Inca religion): see Viracocha.

wire, thread or slender rod, usually very flexible and circular in cross section, made from various metals and alloys, including iron, steel, brass, bronze, copper, aluminum, zinc, gold, silver, and platinum. The processes used are all fundamentally the same.

The first known writing relating to wire and its manufacture appears in the Bible (Ex. 39:3): "And gold leaf was hammered out and

Single-block wiredrawing

cut into threads...." Round wire was probably made by cutting plates into narrow strips, which were then hammered and filed round. These wires were very short, and it was necesary to braze or hammer several pieces end to end to make substantial lengths.

For several centuries wire was drawn through metal dies by hand, in short lengths. The section to be drawn was hammered to a point so that it could be pushed through the hole in the die. The wiredrawer grasped it with his hands or with tongs and pulled it through the die, the amount of reduction being limited by the strength of the wiredrawer. Various means were used to augment his strength, such as seating him in a hanging chair so that by bracing his legs against the die-holding structure he could pull with his arms and push with his legs. Larger wire had to be made by hammering or rolling or both.

In the 19th century requirements for large tonnages and great lengths of steel and copper wire became acute, especially after the invention of wire rope, the development of the telegraph in the 1840s, and the invention of the telephone and barbed wire later in the century. These demands were met by the Bessemer and the open-hearth steelmaking processes and new machinery and methods of rolling rods.

Wire nowadays is drawn from a hot-rolled section of steel called a rod. (Rods of some of the softer metals may be formed by extrusion or casting instead of rolling). The rods are cleaned of scale (oxides that form on the surface) by immersion in dilute sulfuric acid. Other acids or a molten salt bath, such as of sodium hydride, may be used, as may mechanical scalers, depending on the material. Metallic grit blasting is sometimes used to clean spring wire. After acid cleaning, the metal is washed and immersed in a coating solution such as a lime emulsion, borax, or phosphate, to neutralize any remaining acid and act as a lubricant in subsequent wire-drawing operations.

The wire-drawing process consists of pointing the rod, threading the pointed end through the die, and attaching the end to a drawing block as shown in the figure. The block, revolved by an electric motor, pulls the lubricated rod through the die, reducing it in diameter and increasing its length.

For smaller sizes of wire, the reduction cannot be performed in a single draft, and a multiple-block machine is used, consisting of a number of single-block machines built together in one unit.

wirehaired pointing griffon, breed of sporting dog developed as an all-purpose hunting dog by E.K. Korthals, of The Netherlands, around the end of the 19th century. It was bred to point and to retrieve both on land and in water, and it is generally a slow, deliberate hunter. Ideally a vigorous, strong-limbed dog with a rugged constitution, the wirehaired pointing griffon stands about 20 to 24 inches (50 to 60 centimetres) and weighs 45 to 60 pounds (20.5 to 27 kilograms). It is bushy-browed and has a harsh, unkempt-looking coat in various combinations of gray, white, and chestnut brown.

wireworm, any of certain millipede (q.v.) species.

Wirral, district (borough), metropolitan county of Merseyside, England, occupying the major portion of the Wirral Peninsula, which is bounded by the River Mersey, the Irish Sea, and the River Dee. Ferries, road tunnels, and a rail tunnel connect Wirral with the rest of Merseyside. Urban, industrial, and commercial development is concentrated on the northeastern side of the peninsula, along the Mersey, while much of the rest of the borough contains villages and rich agricultural land. The western part includes housing for commuters to Liverpool. The coastal strip from New Brighton to West Kirby is a recreational area, and the golf course of the Royal Liverpool Golf Club is at Hoylake. The area of the borough is 61 sq mi (158 sq km).

Wirral was almost all an agricultural area until the early 19th century, but with the growth of Liverpool, parts of the peninsula became desirable residential areas for Liverpool businessmen. In 1824 William Laird founded the shipyards at Birkenhead and laid out the town on a grid pattern with Hamilton Square as the focus. Later in the century the Birkenhead docks developed a trade independent of Liverpool. Today industries include flour milling, the manufacture of margarine and pharmaceuticals, and marine engineering. The long-established Unilever soap works at Port Sunlight adjoin a model garden village created for employees by the first Lord Leverhulme. Pop. (1983 est.) 338,500.

Wirt, William (Albert) (b. Jan. 21, 1874, Markle, Ind., U.S.—d. March 11, 1938, Gary, Ind.), innovative U.S. educator, best known for his "platoon" system of alternating two groups of students between classroom and recreational or vocational activities.

Wirt graduated from DePauw University (Greencastle, Ind.) in 1898, attended graduate school there and at the University of Chicago, and then went to Europe to study educational methods.

He began his professional career while in college in Indiana; he was superintendent of schools in Redkey (1895–97), taught mathematics at Greencastle (1897–99), then served as superintendent at Bluffton (1899–1907). He introduced his system at Bluffton, but it was as superintendent of the Gary public schools (1907–38) that Wirt attracted national attention with what became known as the Gary Plan: Wirt's idea of splitting the student body

renown as a centre for progressive education. Wirt intended his plan to make more efficient use of school facilities. It led to greater emphasis on recreational and vocational activities in school, lengthened school hours from six to eight, and encouraged teachers in subject-area specialization. In 1914 New York

into platoons. In that time Gary won national

City hired Wirt to implement his system there, but controversy among New York educators over the Gary Plan led to its repudiation in 1918. The number of schools following Wirt's program dwindled from more than 1,000 (in more than 200 cities) in 1930 to a handful within two decades.

Wirt was a conservative Republican who viewed President Franklin D. Roosevelt and the New Deal with hostility and charged that public schools were spreading communist propaganda in the 1930s. This led to a congressional investigation, which found no evidence to support his allegations.

Wirth, (Karl) Joseph (b. Sept. 6, 1879, Freiburg im Breisgau, Ger.—d. Jan. 3, 1956, Freiburg), liberal German statesman and chancellor during the Weimar Republic (1919–33), who advocated a policy of fulfillment of Germany's obligations under the Versailles Treaty

Wirth, charcoal drawing by Sors, 1922
Archiv fur Kunst und Geschichte, West Berlin

settlement and consistently opposed German militarism after both world wars.

Wirth, a member of the left wing of the Roman Catholic Centre Party, was elected to the Reichstag (federal lower house) in 1914 and served in the Weimar national assembly after the revolution of 1918. In 1920 he became minister of finance. After the Cabinet of Konstantin Fehrenbach resigned in protest over the heavy reparations obligations imposed by the Versailles Treaty, Wirth took office as chancellor in May 1921, pursuing a policy of treaty fulfillment. Although he resigned over the loss of much of Upper Silesia to Poland in October 1921, he formed a new Cabinet four days later. With his foreign minister, Walther Rathenau, he negotiated the Treaty of Rapallo with the Soviet Union (April 16, 1922), which broke Germany's postwar isolation, but he then resigned over the reparations question in November 1922. He held a number of responsible posts toward the end of the Weimar period as minister for the provinces occupied by the Allies (1929-30) and minister of the interior in the Cabinet of Heinrich Brüning (1930-31). Retiring in October 1931, he was forced into exile after Adolf Hitler took power (January 1933). Wirth resided first in Paris and later in Switzerland. Returning home in 1948, he opposed West Germany's rearmament and its membership in NATO, and he unsuccessfully called for a reunited, neutral Germany. These efforts gained him the Soviet Union's Stalin Peace Prize for 1955.

Wirth, Louis (b. Aug. 28, 1897, Gemünden, Ger.—d. May 3, 1952, Buffalo, N.Y., U.S.), American sociologist who pioneered in the study of urban problems.

A noted teacher at the University of Chicago from 1926, Wirth blended empirical research and theory in his work and contributed to the emergence of sociology as a profession. Wirth was president (1947) of the American Sociological Society and first president (1949–52) of the International Sociological Association.

He was the chief author of *Our Cities: Their Role in the National Economy* (1937). Written in the name of the U.S. National Resources

Committee, this volume was an important early attempt to outline a national urban policy based on the findings of the social sciences. He also wrote *The Ghetto* (1928); "Urbanism as a Way of Life" (1938), an article published in the *American Journal of Sociology* that became a classic; and many other papers, collected in *Community Life and Social Policy* (1956) and *Louis Wirth on Cities and Social Life* (1964).

Wisbech, town ("parish"), Fenland district, county of Cambridgeshire, England. It lies along the River Nen 11 miles (18 km) above the latter's outlet in The Wash. Wisbech is the trading, administrative, and service centre of the productive agricultural region of the Fenland. The town has canning and brewing activities, as well as light engineering industries. The growing of bulbs and flowers is a special feature of the district, and Wisbech has a school of horticulture. Among the Georgian houses that line the riverside is Peckover House, now owned by the National Trust. Pop. (1981) 17,294.

Wisconsin, constituent state of the United States of America, one of the northern states of the Midwest, bounded on the north by Lake Superior and the Upper Peninsula of Michigan, on the east by Lake Michigan, on the south by Illinois, and on the west by Minnesota and Iowa. The capital is Madison.

A brief treatment of Wisconsin follows. For full treatment, see MACROPAEDIA: United States of America: Wisconsin.

The French explorer Jean Nicolet visited Wisconsin in 1634, and the first permanent European settlement in the region was established in 1717. The area remained under French control until 1763, when it was acquired by Britain. After the American Revolution the region was ceded to the United States, becoming part of the Northwest Territory in 1787 and of the Indiana Territory in 1800. An influx of northern European immigrants began in the 1830s and continued for several decades. In 1836 the Wisconsin Territory was organized, and in 1848 it became the 30th state. The Progressive Movement began in Wisconsin about 1900, resulting in the passage of legislation that made the state a leader in social reform. During the 20th century Wisconsin evolved from an almost entirely rural to a predominantly urban society.

Wisconsin comprises five physical regions: the Northern Highland, the Lake Superior Lowland, the Central Plain, the Western Upland, and the Southeastern Ridges and Lowlands. Northern Wisconsin has one of the greatest concentrations of lakes in the world. It is one of the few states in which essentially all drainage is outflowing. Many unique landforms are found in the state such as the rocky Door Peninsula between Lake Michigan and Green Bay, the broad river gorges between the Mississippi and the Wisconsin rivers, the narrow river gorge known as the Wisconsin Dells, the unglaciated "Driftless Area" in the southwest, and the irregular glacial "kettle moraine" region in the south-central area.

Wisconsin has long, cold winters and warm but relatively short summers. Average January temperatures are between 10° and 22° F (-12° and -6° C), while average July temperatures are between 66° and 72° F (19° and 22° C). The average annual rainfall is about 30 inches (760 mm), and snowfall varies from 30 to 60 inches a year.

Forests, covering about 45 percent of the state, are most heavily concentrated in the Northern Highland and Central Plain. Trees are second-growth hardwoods and evergreens. Much of the pine acreage is plantation growth. Common animals include white-tailed deer, fox, rabbit, skunk, squirrel, chipmunk, and gopher; there are many black bear. Waterfowl are abundant, and migratory geese visit the state twice a year. There are more than 170

species of fish, including all the major freshwater game fish and salmon.

Germans are the most numerous ethnic group in Wisconsin's population, followed by Poles, Scandinavians, and British. The black population increased by about 80 percent in the 1970s and 1980s to nearly 5 percent of the whole in 1990. The vast majority of blacks reside in southeastern lakeshore cities, particularly Milwaukee. American Indians remaining in the state are concentrated largely in Menominee county (the whole of which is a Menominee Indian reservation) and Milwaukee.

The southeastern industrial belt along Lake Michigan is the primary factor in making Wisconsin the 12th largest manufacturing state in the nation. The southern two-thirds of the state supports an agricultural life that makes it the major milk, butter, and cheese producer in the United States. The sparsely settled northern forest and lake country hosts much of the tourist and recreational activity in the upper Midwest.

The greater population density of the southeast is reflected in the focus of major transportation routes around Milwaukee. Intercity and intracity bus service is widespread. Wisconsin ports handle more than one-fourth of the domestic freight tonnage of the Great Lakes. Madison and Milwaukee are served by large commercial airlines and, along with smaller cities, by regional or commuter lines.

Besides being the state's major system of public higher education, with numerous regional campuses plus the original one at Madison, the University of Wisconsin contributes substantially to the arts and culture of the state. The Milwaukee Art Museum has an outstanding collection of 20th-century art. Many local folk festivals are held annually, such as the William Tell Pageant in New Glarus and the Song of Norway in Blue Mounds. Newspapers and commercial television and radio reach all parts of the state; educational television stations are located in Madison and Milwaukee. Area 56,153 square miles (145,436 square km). Pop. (1990 est.) 4,808,000.

Wisconsin, University of, system of higher education of the state of Wisconsin, comprising 13 four-year institutions and 13 two-year educational centres. The original campus of the University of Wisconsin was founded at Madison as a land-grant college in 1849 and attained a firm foundation after the Morrill Act of 1862. It became fully coeducational in 1874 and gained a reputation as an exemplar of democratic education that was open to all "who possess sufficient intellectual endowment."

In 1971 the University of Wisconsin at Madison was merged with the Wisconsin State Universities system. The University of Wisconsin thus became one of the largest state university systems in the nation, with an enrollment of about 160,000 students. All of the system's 13 four-year institutions grant bachelor's and master's degrees, while the main campus at Madison and the one at Milwaukee grant doctoral degrees as well. The Madison campus is one of the world's great university research centres. It has a college of letters and science; undergraduate schools of agriculture and life sciences, health professions, business, education, environmental studies, and consumer sciences; and graduate or first-professional schools of law, pharmacy, medicine, veterinary medicine, and nursing.

Wisconsin Dells, scenic region and city along the Wisconsin River, in Columbia and Sauk counties, south central Wisconsin, U.S. The city of Wisconsin Dells is located 45 mi (72 km) northwest of Madison.

The dells were formed by a strong current that cut a channel as much as 150 ft (45 m) deep through the sandstone and, in the process, carved unusual rock formations along a 15-mi stretch of the river. Early rivermen gave the dramatic shapes descriptive names such as Black Hawk's Head and Chimney Rock, the most famous being Standing Rock, with a natural amphitheatre where the Indian Ceremonial (dance) takes place during the summer. A dam divides the Wisconsin River into the Upper and Lower Dells, which may be seen from the water and are accessible by footpaths from boat landing sites.

The city, called Kilbourn until 1931, has de-

The city, called Kilbourn until 1931, has developed as a tourist centre for the area and has a number of other attractions, including Storybook Gardens, Fort Dells (a frontier-town amusement park), and Wisconsin Deer Park. Pop. (1980) city, 2,521.

Wisconsin Evangelical Lutheran Synod, conservative Lutheran Church in the United States, formed in 1892 as a federation of three conservative synods of German background and then known as the General Evangelical Lutheran Synod of Wisconsin, Minnesota, Michigan and Other States. The Wisconsin Synod had been organized in 1850 and the Minnesota and Michigan synods in 1860. In 1904 the Nebraska Synod joined the federation, which then became known as the Joint Synod of Wisconsin, Minnesota, Michigan, and Nebraska. In 1917 the synods were incorporated into one body, and in 1919 the body's new constitution received final acceptance. The name of the new church was Evangelical Lutheran Joint Synod of Wisconsin and Other States; the present name was adopted in 1959.

The Wisconsin Synod maintains a strict, conservative interpretation of Christian doctrine and the Lutheran confessions and will not coperate with other Lutheran groups without absolute agreement in all matters of doctrine and practice. It cooperated with the Missouri Synod in the Synodical Conference (organized in 1872), an advisory body. In 1961, however, it terminated all fellowship activities with the Missouri Synod, which it accused of cooperating with other Lutheran groups before establishing agreements on doctrine; in 1963 the Wisconsin Synod withdrew from the Synodical Conference.

Church members of the Wisconsin Synod are forbidden to cooperate in any community organizations with members of other church groups if prayers are offered, since the synod maintains that praying with others involves accepting their beliefs. Membership in lodges and the Boy Scouts is forbidden, and pastors may not be military chaplains.

In the synod's government, the local congregation has considerable autonomy. The church is divided into geographical districts, which send delegates to the synodical meeting in odd-numbered years. An extensive parochial school system is maintained. Offices of the synod are in Milwaukee.

Wisconsin Glacial Stage, most recent major division of Pleistocene time and deposits in North America (the Pleistocene Epoch began about 2,500,000 or, according to recent estimates, 1,700,000 years ago and ended about 10,000 years ago). It was named for rock deposits studied in the state of Wisconsin. At least the last half, and possibly all, of the Wisconsin Stage corresponds to the Würm Glacial Stage of classical European usage. The Wisconsin Stage follows the Sangamon Interglacial Stage and represents the last time that

major continental ice sheets advanced across the North American continent. Its end approximately coincides with the close of the Pleistocene Epoch in North America, a somewhat vague termination because the glacial ice did not recede everywhere at the same time. Similarly, there is no conclusive evidence that the ice will not return.

The Wisconsin Glacial Stage is the best known of the glaciations that affected North America, and it has been possible to divide the Wisconsin into early, middle, and late episodes. The beginning of the Early Wisconsin has been dated (during the late 1970s) using cores from the seafloor to about 115,000 years ago. In the Great Lakes region, where deposits of Wisconsin age are well represented, five substages, representing successive advances and retreats of glaciers, are recognized.

The Wisconsin Glacial Stage had a profound effect upon the landscape of North America. The Great Lakes are remnants of glacial lakes that bordered the vast continental ice sheets. Much material was eroded from various areas, only to be deposited elsewhere. The rich soils of the Great Plains, for example, are largely derived from the silt deposited by streams of glacial meltwater. Sequences of pollen grains preserved in sediment have provided much information about the varied environments and conditions of the Wisconsin Stage, especially of the Late Wisconsin. Wisconsin pollen studies indicate the presence of tundra on the fringes of the ice masses that were occupied by the woolly mammoth, caribou, and muskox. Bison, horses, giant ground sloths, and a host of other vertebrates occupied the Great Plains to the southwest, while an equally rich and diverse fauna that included peccaries, sabretoothed cats, mastodons, and camels occupied the region to the southeast. During the Late Wisconsin the first clear traces of human presence in North America became evident, though there are some indications that humans may have arrived even earlier.

A feature of the end of the Wisconsin Glacial Stage, and so of the Pleistocene Epoch as well, was the extinction of numerous species of large mammals in North America, including the horse, mammoth, mastodon, camel, giant armadillo, and sabre-toothed cats. It has been suggested that overhunting by the first humans in the New World was the major factor in this wave of animal extinction. The true answer is probably more complex, involving diverse climatic and environmental factors, in addition to possible human intervention.

Wisconsin River, river rising in the lake region of Vilas County, Wisconsin, U.S., near the Wisconsin-Michigan border. It flows south through central Wisconsin past Wausau, Stevens Point, Wisconsin Rapids, and Wisconsin Dells (site of a scenic gorge). The river then turns southeast past Portage, and then southwest and west to join the Mississippi River near Prairie du Chien after a course of 430 mi (690 km).

The Wisconsin is navigable for light craft as far as Portage, 200 mi from its mouth, but navigation farther upstream is made difficult by shifting sandbars. At Portage the Fox River (connected to the Wisconsin by a canal) is only 1½ mi to the east across low, marshy ground. Lake Wisconsin is formed by a power dam on the river near Prairie du Sac.

Wise, Isaac Mayer (b. March 29, 1819, Steingrub, Bohemia, Austrian Empire—d. March 26, 1900, Cincinnati, Ohio, U.S.), rabbi whose goal of uniting American Jewry made him the greatest organizer of Reform Jewish institutions in the United States.

After serving as a rabbi for two years in Radnice, Bohemia, he immigrated in 1846 to Albany, N.Y., where he was a rabbi for eight years. His congregation there was the first in the United States to employ family

pews; these became a standard institution in Reform Judaism. In 1854 Wise accepted the pulpit of Bene Yeshurun in Cincinnati, a post he retained for the rest of his life.

Although Wise failed in his efforts to unite American Jews of all persuasions, he did bring about great unanimity among Reform Jews. In addition, he succeeded in adapting Reform Judaism to American life. An astute politician, he propagandized tirelessly for centralized Reform institutions in his English-language weekly, the American Israelite; his German-language paper, Die Deborah; and in many rabbinical conferences.

The fruits of his efforts were the Union of American Hebrew Congregations (see American Hebrew Congregations, Union of), a confederation of synagogues in the Middle West and South that grew into an association of American and Canadian Reform congregations; its educational arm, Hebrew Union College (q.v., now Hebrew Union College-Jewish Institute of Religion), the first permanent American rabbinical college, of which Wise was president until his death; and the Central Conference of American Rabbis, which became the legislative body of Reform Judaism. Wise served as president of the Central Conference until his death.

Because of the diversity of Reform prayer books, Wise tried to compile a standard work and in 1857 published the *Minhag America* ("American Usage"). It was superseded in 1894 by the Union Prayer Book, which came into being, in large part, because Wise had emphasized so often and so forcefully the need for a standard text. A believer in the universal mission of Judaism, he was a firm opponent of the establishment of a Jewish state in Palestine.

Wise, John (b. Aug. 15, 1652, Roxbury, Mass.—d. April 8, 1725, Ipswich, Mass.), British American Congregational minister, theologian, and colonial pamphleteer in support of liberal church and civil government.

After graduating from Harvard College in 1673, Wise preached at Branford, Conn., and Hatfield, Mass. In 1680 he accepted a call to the newly organized church at Chebacco in Ipswich, Mass. During the administration of Gov. Sir Edmund Andros, he was arrested, tried, and briefly deprived of his ministry for leading his town's resistance to taxes imposed by the governor. After Andros' overthrow in 1689, Wise was chosen as a representative from Ipswich to the Boston Convention that reorganized the Massachusetts government. In 1690, during King William's War, he was appointed a chaplain on the unsuccessful expedition against Quebec.

The publication in 1705 of Increase Mather's Questions and Proposals, a pamphlet advocating the establishment of Presbyterian-oriented associations of congregational clergymen that would exercise the authority then invested in the individual churches, brought out Wise's more democratic concepts of church polity. He expressed those beliefs in a pamphlet published in 1710, The Churches Quarrel Espoused, which helped defeat Mather's proposals. Seven years later he published A Vindication of the Government of New England Churches, a work that delineated his liberal concepts concerning both civil and ecclesiastical governments. Strongly influenced by Whig political theory, it had a significant influence on patriot leaders of the American Revolution. Wise also wrote a pamphlet in 1721, A Word of Comfort to a Melancholy Country, that supported paper-money issues in Massachusetts. Several years earlier he had been one of the signatories of a petition seeking legislative reversal of Salem witch trial convictions.

Wise, Stephen Samuel (b. March 17, 1874, Budapest—d. April 19, 1949, New York City), Reform rabbi, a leader of the U.S. Zionist movement, and a civic activist who influenced the development of Reform Judaism in the United States.

After serving at Temple Beth Israel in Portland, Ore. (1900–06), where he was active in social welfare issues and was commissioner of child labour for the state of Oregon, Wise went to New York City to found the Free Synagogue (1907), which he led until his death. The synagogue's guiding principles, important in the democratization of Judaism in the United States, were free speech from the pulpit, opening of the pews to all regardless of wealth, and service to the community as well as to the congregation. He became important in civic affairs in New York City in the fight against the Democratic boss Richard Croker, and, as vice chairman of the Civic Affairs Committee in 1931, he attacked the administration of Mayor James J. Walker.

Wise was one of the first Jewish leaders in the United States to become active in the Zionist movement. He attended the Second Zionist Congress in Basel, Switz., in August 1898, meeting there with Theodor Herzl, the father of modern Zionism. A founder of the Zionist Organization of America (ZOA) in 1898, of which he twice served as president (1917, 1936-38), he was also president of the permanent American Jewish Congress and of the World Jewish Congress. As a prominent member of the Democratic Party and an acquaintance of Pres. Woodrow Wilson, Wise influenced the U.S. government toward approval of the Balfour Declaration (q.v.). He also helped to marshal U.S. public opinion against Adolf Hitler in the 1930s.

In 1922 Wise founded the Jewish Institute of Religion in New York City, a rabbinical seminary for social service and Jewish education, which was especially designed to train liberal rabbis for the New York area (see Hebrew Union College).

Wise Men: see Magi.

Wise Men of Gotham, in English legend, wise fools, villagers of Gotham, Nottinghamshire, Eng. The story is that, threatened by

The Wise Men of Gotham, drawing by Harry Pack from the 1900 edition of *The Merry Tales of Gotham*, by Alfred Stapleton

By courtesy of the Folklore Society Library, University College, London; photograph, R.B. Fleming

a visit from King John (reigned 1199-1216), they decided to feign stupidity and avoid the expense entailed by the residence of the court. Royal messengers found them engaged in ridiculous tasks, such as trying to drown an eel and joining hands around a thornbush to shut in a cuckoo. Hence, the King determined to stay elsewhere. The "foles of Gotham" are mentioned in the 15th-century Wakefield plays. Merrie Tales of the Mad-Men of Gottam, a collection of their jests, was published in the 16th century.

Wiseman, Nicholas (Patrick Stephen) (b. Aug. 2, 1802, Seville—d. Feb. 15, 1865, London), first cardinal resident in England since the Reformation and first archbishop of Westminster; one of the chief architects of the 19th-century revival of Roman Catholicism in England. His Irish parents emigrated to Spain, but after his father died, he and his mother went home to County Waterford. He received his doctorate in 1824 and was appointed professor of Oriental languages in the University of Rome and rector of the English College in 1828.

When the Oxford Movement was aiming to restore 17th-century church ideals through a return of the Anglo-Catholic Church in England, Wiseman successfully preached (1835–36) in London on Catholicism and founded the Catholic quarterly *Dublin Review*. Thereafter he devoted his life to the Catholic revival in England. Made bishop in 1840, he was appointed vicar apostolic of the Midland district and president of Oscott College, near Birmingham. His sympathy with the Oxford Movement's doctrine created a rapport with such exponents of it as John Henry Newman, later cardinal, and Edward Pusey.

Because the Catholic revival was gaining impetus through numerous conversions and through a vast immigration of Catholic labourers from Ireland, Wiseman was transferred in 1848 to London as vicar apostolic. Pope Pius IX, deciding in 1850 to restore a hierarchy of dioceses in England, summoned Wiseman to Rome and made him cardinal and first archbishop of Westminster. Pius' creation of English dioceses and Wiseman's declaration of it were denounced as "papal aggression" by the English, who burned the Pope and Wiseman in effigy on Nov. 5, 1850 (Guy Fawkes Day). In reply, Wiseman wrote Appeal to the Reason and Good Feeling of the English People. In 1852 he presided at the first Synod of Westminster.

Wiseman suffered from diabetes, and his later years were darkened by isolation and personal disputes, most notably with his coadjutor George Errington, who attacked Wiseman for his Ultramontanism (a doctrine emphasizing papal authority and centralization of the church). Nevertheless, he was widely respected for his intellect, humanitarianism, and constructive achievements. His celebrated Horae Syriacae (1827; "Syriac Seasons") contained important original research on the Syriac version of the Old Testament, and his historical novel Fabiola (1854) was translated into many languages. Denis Gwynn's Cardinal Wiseman appeared in 1950 and Brian Fothergill's Nicholas Wiseman in 1963.

wisent, oxlike mammal, also known as the European bison. See bison.

Wishart, George (b. c. 1513, Pitarrow, Scot.—d. March 1, 1546, Edinburgh), an early martyr of the Reformation in Scotland.

While a teacher of Greek at Montrose Wishart was accused of heresy and went to Cambridge (1538), where he became acquainted with the Reformer Hugh Latimer, himself later martyred. In 1539 Wishart was sent to preach in Bristol, where he was again accused of heresy, and this time left for the Continent. After serving briefly as tutor at Cambridge (1542–43), he returned to Scotland, where he strongly

influenced John Knox and preached Reformation doctrine. Taken into custody by the Earl of Bothwell on condition that he should not be handed over to Cardinal David Beaton and imprisoned in Edinburgh, he was in fact handed over to Beaton, who had him tried and then burned at the stake at St. Andrews. His translation of the First Helvetic Confession (1536) was published in 1548.

Wiślany, Zalew (Gulf of Danzig): see Vistula Lagoon.

Wislicenus, Johannes (Adolph) (b. June 24, 1835, Kleineichstädt, Thuringia—d. Dec. 5, 1902, Leipzig), German chemist whose pioneering work led to the recognition of the importance of the spatial arrangement of atoms within a molecule.

Wislicenus's education included study at Harvard and Zürich, where he taught, prior to professorships elsewhere. Anticipating the structural theory of Jacobus van't Hoff and Joseph-Achille Le Bel by several years, his work on lactic acid led to his discovery (1873) that two compounds might have the same chemical formula but exhibit different characteristics. Wislicenus attributed this phenomenon (isomerism) to the different molecular structure or arrangement of atoms of the two compounds.

Wismar, city, Mecklenburg-West Pomerania Land (state), northern Germany, on the Wismarbucht, an inlet of the Baltic Sea, east of Lübeck. First mentioned in 1229, it was chartered before 1250. Wismar was a member of the Hanseatic League with most of its trade in herring and beer. In 1648 it passed to Swe-

Fishing boats in the harbour at Wismar, Ger. W. Krammisch—Bruce Coleman Inc./EB Inc.

den, which did not renounce its claims to the city until 1903, although Wismar was administered by Mecklenburg-Schwerin state after 1803. Many historic buildings were destroyed in World War II, but the medieval town centre remains.

Wismar's channel and port facilities were greatly extended after World War II, and important new shipbuilding yards were established. Wismar is a road and rail junction; its industries include fishing, sugar refining, and metalworking. Pop. (1989 est.) 58,058.

Wiśniowiecki, Michael: see Michael Wiśniowiecki.

Wissel Lakes, Bahasa Indonesia DANAU-DANAU WISSEL, chain of three highland lakes located in the Sudirman Range of Irian Jaya propinsi (West Irian province), Indonesia, western New Guinea. They comprise Paniai, the largest and northernmost; Tage, to its south; and Tigi, the southernmost. Situated at an altitude of about 5,750 ft (1,750 m), they were created by tectonic damming of the Arabu River. The lake shores support one of the densest concentrations of agricultural population in the New Guinea highlands, mostly the pygmoid Kapauku, a Papuan-speaking people. Although the area has been populated since prehistoric times, high densities probably date only from the introduction of the

sweet potato in the 16th century. The first European to see the lakes was a Dutch officer, Lieut. Wissel, in 1937.

Wissler, Clark (b. Sept. 18, 1870, Wayne County, Ind., U.S.—d. Aug. 25, 1947, New York City), U.S. anthropologist who developed the concept of culture area and whose *The American Indian* (1917; 2nd ed., 1922), remains a classic in North American ethnology.

Wissler
By courtesy of the American Museum of Natural History, New York

Though educated as a psychologist (Ph.D., Columbia University, 1901), Wissler was drawn to anthropology through the influence of Franz Boas. Curator of the American Museum of Natural History, New York City, for nearly 40 years, he also taught at Yale University (1924–40).

North American Indians of the Plains (1912) reflects the main focus of his fieldwork. He became a leading authority on the Dakota and Blackfoot tribes, writing more than 200 scientific and popular articles. His descriptions particularly noted material culture, myths and tales, art designs, social organization and ethical values, and especially the spectacular Sun Dance religious ceremony.

At the American Museum, Wissler arranged collections and exhibits of arts and crafts according to area and tribe. In *The American Indian* he explored the regional clustering of cultural traits and the relation between culture and physical environment, outlining the main culture areas. The distribution and adaptation of cultural traits and their relative ages were treated in *Man and Culture* (1923) and *The Relation of Nature to Man in Aboriginal America* (1926). Later works include *Indian Cavalcade* (1938) and *Indians of the United States* (1940).

Wissmann, Hermann von (b. Sept. 4, 1853, Frankfurt an der Oder, Brandenburg—d. June 15, 1905, near Liezen, Austria), German explorer who twice crossed the continent of Africa and added to the knowledge of the Upper Congo. His explorations led to the establishment of German colonies in East Africa.

Wissmann left Luanda, Angola, in 1880 and traversed Africa to Sadani, Tanganyika, where he arrived in 1882. In the course of his trip he discovered the Sankuru River (in Zaire) and investigated routes between the Kasai and Congo rivers. In 1884 and 1886 Wissmann undertook missions for King Leopold II of the Belgians to explore the navigability of the Kasai River, and he again explored eastward across the continent to Lake Tanganyika (now in Tanzania) and to Zanzibar.

In 1888 Wissmann was appointed imperial commissioner for East Africa to suppress a rebellion led by Arab slave traders and to establish German control in what is now Tanzania. He resigned in 1891 but in 1895 returned to East Africa as imperial governor.

Wister, Owen (b. July 14, 1860, Philadelphia—d. July 21, 1938, North Kingstown, R.I., U.S.), novelist whose *The Virginian* (1902) helped establish the cowboy as a U.S. folk hero and stock fictional character.

Wister graduated from Harvard in 1882 and studied musical composition in Paris for two years. Ill health forced his return to the United States, and he spent the summer of 1885 in Wyoming. In the fall Wister entered Harvard Law School, graduating in 1888, and after being admitted to the bar in 1889, he practiced for two years in Philadelphia. He continued to spend his summers in the West, and in 1891, after the enthusiastic acceptance by *Harper's* of two of his Western sketches, he devoted himself to a literary career.

The Virginian was the story of a cowboy ranch foreman and was a great popular success. It introduced such themes as the conflict of its genteel heroine, a schoolteacher from

Wister

the East, with her cowboy lover, who depends for his life on a harsh code of ethics. Its climactic gun duel is considered the first such "showdown" in fiction. Wister's other major work was Roosevelt: The Story of a Friendship, 1880–1919 (1930), detailing his long acquaintance with Theodore Roosevelt, a Harvard classmate. He also wrote a number of books for children. Wister's collected writings were published in 11 volumes in 1928. His journals and letters from 1885 to 1895 were published in Owen Wister Out West (1958), edited by his daughter, Fanny Kemble Wister.

Wisteria, also spelled WISTARIA, genus of twining, usually woody vines, of the pea family (Fabaceae), mostly native to Asia and North

Wisteria W.H. Hodge

America but widely cultivated in other regions for their attractive growth habit and beautiful profuse flowers. The alternate leaves are pinnately compound (feather formed). The flowers, which grow in large, drooping clusters, are blue, purple, rose, or white.

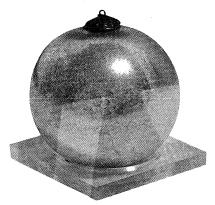

Cultivated species include W. floribunda (Japanese wisteria), native to Japan and the hardiest member of the genus; W. frutescens (American wisteria), native to the southeastern United States; W. macrostachya (Kentucky wisteria), native to the central and southern United States; and W. sinensis (Chinese wisteria), native to China.

witan, also called WITENAGEMOT, the council of the Anglo-Saxon kings in and of England; its essential duty was to advise the king on all matters on which he chose to ask its opinion. It attested his grants of land to churches or laymen, consented to his issue of new laws or new statements of ancient custom, and helped him deal with rebels and persons suspected of disaffection. Its composition and time of meeting were determined by the king's plea-

Usually attended by the greater nobles and bishops, the witan was in no sense a popular assembly. In its composition and duties it closely resembled its successor, the commune concilium of the Anglo-Norman kings, the fundamental difference being that, in the latter body, baronial councillors were bound to the king by feudal ties.

Witbank, town, Transvaal, South Africa, east of Pretoria. Established in 1890, it is at the centre of a coal-mining area in which more than 20 collieries operate. During the South African War, the young soldier Winston Churchill hid in a colliery near Witbank after his escape from Pretoria. Witbank attained town status in 1910. In 1972 the capacity of the Witbank Dam, on the Great Olifants River, was increased from 17,000,000 to 108,000,000 cubic metres. The town has grown rapidly around heavy industry, and a power plant at the dam supplies electricity to a wide area. Pop. (1983 est.) mun., 83,400.

witch ball, possibly a corruption of the 18th-century term watch ball, a hollow glass sphere, sometimes as large as 7 inches (18 centime-

Witch ball, with a silvered interior, English, 19th century; in the Victoria and Albert Museum, London By courtesy of the Victoria and Albert Museum, London; photograph, A.C. Cooper Ltd.

tres) in diameter. Witch balls are made in several colours, among which green and blue predominate

References to witch balls are found from the 18th century onward, but their origin is probably older. In England many examples, striped and spattered with enamel colours, have been attributed to the Nailsea works near Bristol; but they were also made elsewhere in England and, from the 19th century, in the United States. Having some kinship with the glass balls used by fishermen to float their

nets, witch balls have been associated with sea superstitions; it has also been suggested that they were originally hung in windows to ward off misfortune. It seems likely, however, that those that are silvered inside, made from the mid-19th century onward, were hung up for their reflective qualities; they could reflect a whole room in the manner of a convex mirror. They are sought after as curios, and modern examples are still made.

witch doctor, a healer or benevolent worker of magic in a nonliterate society. The term originated in England in the 18th century and is generally considered to be pejorative and anthropologically inaccurate. See also medicine man: shaman.

witch hazel, any of six species of the genus *Hamamelis* (family Hamamelidaceae), all of which are shrubs and small trees that are native to eastern North America and eastern Asia. Some are grown for their yellow flowers, with four narrow, twisted ribbonlike petals, borne on warm winter days or in early spring. Witch hazels produce small clusters of four-petalled flowers borne close to the branches and have deciduous, prominently veined, oval, toothed leaves

Witch hazel (Hamamelis) Shunji Watari—EB Inc.

American, or common, witch hazel (*H. virginiana*), up to $4^{1/2}$ metres (15 feet) tall, bears its flowers in late fall, with the explosive fruits ripening in the following year. Its yellow, cuplike calyx (the collection of sepals) persists through the winter. The common name refers to the forked twigs that were sometimes used for water-witching or dowsing to locate underground water. The fragrant liniment witch hazel is made from the dried leaves and sometimes from the twigs and bark. Vernal witch hazel (*H. vernalis*), about two metres tall, blooms in late winter or early spring.

Witch of Buchenwald: see Koch, Ilsa.

witchcraft, the human exercise of alleged supernatural powers for antisocial, evil purposes (so-called black magic). A female held to have such powers may be called a witch or sorceress, the male counterpart being named wizard, sorcerer, or warlock. Belief in witchcraft survives in modern technologically developed cultures and remains a potent factor in most nonliterate societies.

A brief treatment of witchcraft follows. For full treatment, see MACROPAEDIA: Occultism. In ancient Greece witchcraft is mentioned as early as Homer. The best known sorceress in classical times was the legendary Medea. The Roman poet Horace left an elaborate description in Satires of the proceedings of two witches in the Esquiline cemetery.

The Bible contains a number of references to witchcraft, a notable example being the so-called Witch of Endor consulted by King Saul (I Sam. 28). The early Church Fathers generally held that any so-called witchcraft was a delusion and a deception and that the name of Jesus used by a believing Christian could turn aside attempted witchcraft. This attitude

was accompanied by strong disapproval of the practice, as shown in church canons. Clergy were urged to preach that claims of witchcraft were false, for God alone is powerful, and that there is a sharp distinction between factual evidence and fantasy or dreams.

In the following centuries, however, belief in witchcraft spread, perhaps encouraged by the very sermons preached against it, which put ideas into the heads of simple people who had previously never heard of such possibilities. The connection with Satan was emphasized with the rise of the dualist heresy, which ascribed real power to the devil as an equal opponent of God. Once witchcraft was believed to involve demonic possession, heresy, and the rejection of God, it came within the scope of the Inquisition.

From the late Middle Ages to the early 18th century, vehement opposition to the witch cult was demonstrated throughout Europe in public "trials" and executions, conducted on the basis of the biblical injunction "You shall not permit a sorceress to live" (Ex. 22:18). Many of those who denounced these measures, pointing to psychological factors at the root of alleged evidence, were themselves burned at the stake. Victims of the witchcraft trials have been variously estimated to number from the

Belief in witchcraft was taken to colonial America by English settlers. In 1692, after a prolonged witch trial at Salem, Mass., as a result of accusations by a group of teen-age girls, more than 30 persons were convicted of witchcraft, some after torture. Scattered claims of witchcraft continued to be heard from Europe and the Americas into the 20th century.

hundreds of thousands to the millions.

Belief in witchcraft is almost universal in nonliterate societies. Among some peoples individuals will openly avow that they are witches and make public threats; more frequently, personal knowledge of the techniques is denied, and witchcraft is the subject only of hushed gossip. In the 19th and 20th centuries, the worldwide phenomenon was the subject of extensive anthropological investigation.

witches'-broom, symptom of plant disease that occurs as an abnormal brushlike cluster of dwarfed, weak shoots arising at or near the same point; twigs and branches of woody plants may die back. There are numerous causes, including rust (Gymnosporangi-

Witches'-broom on a birch tree

um and Pucciniastrum); Apiosporina, Exobasidium, and Taphrina fungi; mites; insects; viruses; mycoplasmas; bacteria; and mistletoes. Susceptible plants include alder, alfalfa, Amelanchier, birch, California buckeye, Chamaecyparis, cherry, cherry laurel, elm, fir, hackberry, Holodiscus (ocean spray), honey locust, juniper and red-cedar, manzanita, mountain heath, mulberry, oak, potato, rhododendron, rose, sophora, spruce, and strawberry.

witches' sabbath, nocturnal gathering of witches, a colourful and intriguing part of the lore surrounding them in Christian European tradition. The concept dates only from c. AD 1400, when the Inquisition began investigating witchcraft seriously, although revels and feasts mentioned by such classical authors as

"The Witches' Sabbath," oil painting by Francisco de Goya, 1798; in the Museo Lázaro Galdeano, Madrid SCALA—Art Resource/EB Inc.

the Romans Apuleius and Petronius Arbiter may have served as inspiration. The sabbath, or sabbat, derived probably from the term for the seventh day used by the despised Jews, might be held on any day of the week, though Saturday was considered rare as being sacred to the Virgin Mary.

Reports of attendance at sabbaths varied; one confessed witch reported a gathering of 10,000. Witches reputedly travelled to the sabbath by smearing themselves with special ointment that enabled them to fly through the air, or they rode on a goat, ram, or dog supplied by the devil. Favourite locations included the Brocken, in the Harz Mountains, Germany; the Bald Mountain, near Kiev, Russia; the Blocula, Sweden; and the Département du Puy-de-Dôme, Auvergne, France. Typical dates included the two traditional Druid festivals, the eve of May Day (April 30) and All Hallows Eve (October 31), and the seasonal festivals of winter (February 2), spring (June 23), summer (August 1), and fall (December 21).

Occurrences at the sabbath were represented by inquisitors as including obeisance to the devil by kissing him under his tail, dancing, feasting, and indiscriminate intercourse.

witchweed, any plant of the genus Striga in the figwort family (Scrophulariaceae), including about 50 species of the Old World tropics and one species introduced into the southeastern United States. About 10 species are destructive as parasites on such crops as maize (corn), sorghum, rice, sugarcane, and tobacco.

Witchweeds are branched herbs, 15 to about 75 centimetres (0.5 to 2.5 feet) tall, with opposite or alternate, usually narrow and rough or sometimes scalelike leaves. The two-lipped solitary flowers are red, yellow, purplish, bluish, or white. Witchweed seeds, minute and

produced in great numbers, germinate when in contact with a host root. Roots of the parasite establish and maintain connection with the host. The first four to six weeks of the life cycle are spent underground, where the young plant is entirely dependent upon its host. After emergence the plant can photosynthesize its own food but takes water and minerals from the host. The parasite dies when its seeds mature or when the host is harvested. Host plants appear stunted and chlorotic (yellow), often showing signs of wilting; they may produce no yield, or their yield may be sharply reduced. Severe infestation may kill the host. Members of the genus Alectra (also in the figwort family), some of which parasitize legumes and tobacco in Africa and sugarcane in tropical America, are also sometimes called witchweeds.

witenagemot (Anglo-Saxon council): see wi-

Wither, George, Wither also spelled with-ERS (b. June 11, 1588, Bentworth, Hampshire, Eng.—d. May 2, 1667, London), English poet and Puritan pamphleteer, best remembered for a few songs and hymns.

Wither entered Magdalen College, Oxford, in 1604 but left in 1606 without a degree. In 1610 he settled in London and in 1615 began to study law. His Abuses Stript and Whipt (1613)—with its satiric treatment of lust, avarice, and pride-apparently gave offense, and he was imprisoned for some months. In prison he wrote The Shepherd's Hunting (1615), whose five eclogues are among his finest verse, looking back to Spenser in form and forward to Wordsworth in feeling. Fidelia (1617), an elegiac epistle lamenting a lover's inconstancy, contains in later editions the fa-mous lyric "Shall I, wasting in despair." For Wither's Motto. Nec Habeo, nec Careo, nec Curo (1621; "I Don't Have, I Don't Want, I Don't Care"), an assertion of his own virtue and a lively denunciation of others' vices, he was again imprisoned.

The eulogy Faire-Virtue, The Mistresse of Phil'Arete and the collection of love and pastoral poems, Juvenilia, appeared in 1622. The former became his last contribution to pure literature after he became a convinced Puritan and devoted his writing to religious and political causes. The Hymnes and Songs of the Church (1623) is the first hymnbook in English not based entirely on the Psalms; it contains passages of rugged, simple prose. He was in London during the plague of 1625 and published Britain's Remembrancer (1628), a voluminous poem on the subject, interspersed

with invective and prophecy.

Between taking part in the expedition of Charles I against the Scottish Covenanters and serving on the Parliamentary side in the Civil War, Wither wrote many religious poems and hymns, which were published in 1641 in Haleluiah or, Britans Second Remembrancer. He was imprisoned from 1660 to 1663 for an unpublished poem criticizing the new House of Commons.

Wither's verse has been thought monotonous, but its variety is surprising. In his songs and hymns he blended rustic language and regular rhythm to produce an impressive effect. Although his reputation faded and his name became a synonym for a hack Puritan pamphleteer, he was later restored to favour

witherite, a carbonate mineral, barium carbonate (BaCO₃), that is, with the exception of barite, the most common barium mineral, despite its rarity. It is ordinarily found in fairly pure form in association with barite and galena in low-temperature hydrothermal veins, as in the north of England and in Scotland. Because of its solubility in common acids, witherite is preferred to barite in the preparation of other barium compounds. It is also used in case-hardening steel and in refining sugar. For detailed physical properties, see carbonate mineral (table).

Witherspoon, John (b. Feb. 15, 1723 [Feb. 5, 1722, old style], Gifford, East Lothian, Scot.—d. Nov. 15, 1794, Tusculum, N.J., U.S.), Scottish-American Presbyterian minister and president of the College of New Jersey (now Princeton University); he was the only clergyman to sign the Declaration of Independence.

After completing his theological studies at the University of Edinburgh (1743), he was called to the parish of Beith in 1745 and in 1757 became pastor at Paisley. A conservative churchman, he frequently involved himself in ecclesiastical controversies, in which he proved himself a keen dialectician and an effective speaker. In 1768 he left Paisley to assume the presidency of the College of New Jersey. He was warmly received by the American Presbyterian Church and contributed significantly to its revitalization and growth. He was a vigorous college president, expanding the curriculum, providing scientific equipment, and working to increase the endowment and enrollment.

From his arrival, Witherspoon was an enthusiast about America, and in the dispute with the mother country he ranged himself uncompromisingly on the side of the colonists. He presided over the Somerset County Committee of Correspondence (1775-76), was a member of two provincial congresses, and was a delegate to the Continental Congress (1776-79, 1780-82), where in 1776 he was a persuasive advocate of adopting a resolution of independence.

Witherspoon wrote extensively on religious and political topics. His works include Ecclesiastical Characteristics (1753), Considerations on the Nature and Extent of the Legislative Authority of the British Parliament (1774), as well as numerous essays, sermons, and pam-

Witigis (fl. 536), Ostrogoth soldier who became king of Italy and led his people in an unsuccessful last-ditch struggle against the Eastern Roman Empire.

Witigis was elected king in the autumn of 536 to replace Theodahad, who had been deposed and killed as the Byzantine general Belisarius advanced on Rome. Leaving a small garrison to defend Rome, Witigis massed his forces in Ravenna, where he married Matasuntha, granddaughter of King Theodoric, to strengthen the legality of his own position. In Witigis' absence, Pope Silverius turned Rome over to Belisarius.

In March 537 Witigis returned to besiege Rome, cutting the aqueducts to reduce Belisarius' garrison, a maneuver that back-fired by turning Witigis' own camp into a malaria-breeding marsh. When the Eastern Roman emperor Justinian I sent reinforcements, Witigis was forced to agree to a three-month truce, which Belisarius broke, invading Picenum and threatening Ravenna. In March 538 the Goths abandoned the siege of Rome. They held out in northern Italy for two more years, but, by the spring of 540, they held only the stronghold of Ravenna.

To salvage the situation, Witigis agreed to abdicate, and the Gothic chiefs offered the throne to Belisarius. The General, on pretext of accepting, entered Ravenna; he seized Witigis and Matasuntha, the Gothic nobles, and Theodoric's treasure and bore them off to Constantinople. The fate of Witigis is unknown.

Witkiewicz, Stanisław Ignacy, byname WITKACY (b. Feb. 24, 1885, Warsaw—d. Sept. 18, 1939, Jeziory, Wołyna, Pol.), Polish painter, novelist, and playwright.

After studying at the Academy of Fine Arts in Kraków, he traveled in Germany, France, and Italy. In 1914 he left for Australia as the artist and photographer of an anthropological expedition led by Bronisław Malinowski. Three years later, as a reserve officer in the Russian Army, Witkiewicz witnessed the Russian Revolution, but in 1918 he settled at Zakopane at the foot of the Tatra Mountains. He committed suicide at the beginning of World War II.

Witkiewicz's plays anticipated the Theatre of the Absurd of Ionesco and Beckett in their deliberately contorted characters and plots and their use of grotesque parody. Rapid tempos, warped time juxtapositions, and catastrophic incidents are combined with an original and symbolic use of language in such plays as Kurka wodna (1921; "The Water Hen") and Wariat i zakonnica (1925; "The Madman and the Nun").

His works began to be revived in Poland and the West in the 1950s and are now a permanent feature of Polish theatrical repertoires.

Witos, Wincenty (b. Jan. 22, 1874, Wierzchosławice, Galicia, Pol., Austria-Hungary—d. Oct. 30, 1945, Kraków), Polish statesman and leader of the Peasant Party, who was

Witos By courtesy of the Polish Library, London

three times prime minister of Poland (1920-21, 1923, 1926).

Witos sat during 1908-14 in the Galician Sejm (Diet) of Austria-Poland and in 1911-18 in the Austrian Reichsrat (lower house of parliament). After World War I he was elected to the Sejm of the newly established republic of Poland and soon became the leader of the Peasant Party, then the strongest political group in the Seim. From July 1920 to September 1921 he served as prime minister of an all-party coalition. In May-December 1923 he headed his second government but was unable to halt inflation and national unrest. Although initially identified with the parties of the left, Witos gradually emerged as a force for conservatism and in May 1926 formed his third administration on an exclusively right-of-centre base. Within a few days, however, his Cabinet was overthrown by a coup led by the national hero Józef Piłsudski.

Thereafter, Witos remained in opposition to Piłsudski's thinly veiled dictatorship. He was imprisoned for political reasons in 1930 and again in 1932 was put under sentence, which was quashed as illegal (1933). Fearing a new arrest, however, he fled to Czechoslovakia. He subsequently returned to Poland but was imprisoned by the Germans in 1939. Arrested by the Russians in 1945, he was freed shortly before his death.

Witoto, also spelled HUITOTO. South American Indians of southeastern Colombia and northern Peru, belonging to an isolated language group. There were more than 31 Witotoan tribes in an aboriginal population of several thousand. Exploitation, disease, and assimilation had reduced the Witoto to fewer than 1,000 individuals at the latest estimate. The greatest decline occurred during their exploitation as rubber gatherers at the turn of the 20th century. The most important surviving groups were the Witoto proper, the Bora (Miranna), the Ocaina, and the Orejone, now living along the Putumayo, Apaporis, and Caquetá rivers.

Witoto culture is typical of the tropical forest: they are good farmers and food gatherers as well as proficient hunters and fishermen. The typical settlement consists of a single large round or rectangular hut sheltering many families. They use large, hollow signal drums. Traditionally, women go naked, while men wear only a breechclout; both sexes paint colourful designs on their bodies (sometimes from shoulders to ankles).

Warfare was common among the Witoto, who kept young prisoners but ate older captives. Cannibalism was limited to male participation and was part of a magico-religious celebration. Shamans conjured spirits and healed diseases. Child betrothal and bride service were present. The Witoto household, consisting of the head, his sons, their wives, and unmarried children, was the basic political unit.

Witsieshoek (South Africa, town): see Phuthaditjhaba.

Witt, Johan de (b. Sept. 24, 1625, Dordrecht, Neth.—d. Aug. 20, 1672, The Hague), one of the foremost European statesmen of the 17th century who as councillor pensionary (the political leader) of Holland (1653–72)

De Witt, detail of a painting by Jacobus de Baen; in the Rijksmuseum, Amsterdam

By courtesy of the Rijksmuseum, Amsterdam

guided the United Provinces in the First and Second Anglo-Dutch wars (1652–54, 1665–67) and consolidated the nation's naval and commercial power.

De Witt was a member of one of the old burgher-regent families of his native town of Dordrecht (Dort). His father, Jacob, was six times burgomaster and for many years sat for the town in the States of Holland. He was a strenuous adherent of the republican or oligarchical states-right party in opposition to the princes of the House of Orange, who represented the federal principle and had the support of the masses of the people. De Witt was educated at Leiden and early displayed remarkable talents, especially in mathematics and jurisprudence. His *Elementa curvarum* linearum (written before 1650, but published 1659-61) was one of the first textbooks in analytic geometry. (He later also applied his mathematical knowledge to the financial and budgetary problems of the republic.) In 1645 he and his elder brother Cornelius visited France, Italy, Switzerland, and England, and on his return he lived at The Hague as an

In 1650 he was appointed pensionary of Dordrecht, which made him the leader of the town's deputation in the States of Holland. In this year the States of Holland found themselves engaged in a struggle for provincial supremacy, on the question of the disbanding of troops. The youthful prince of Orange, William II, with the support of the States Gen-

eral and the army, seized five of the leaders of the states-right party and imprisoned them in Loevestein Castle; among these was Jacob de Witt. The sudden death of William, at the moment when he had crushed opposition, led to a reaction. He left only a posthumous child, afterwards William III of Orange; the principles advocated by Jacob de Witt triumphed, and the authority of the States became predominant in the republic.

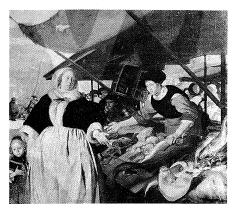

It was his father's position that gave Johan his opportunity, but his own eloquence, wisdom, and business ability caused him to be appointed councillor pensionary (raadpensionaris) of Holland on July 23, 1653, at 28. He was reelected in 1658, 1663, and 1668 and held office until just before his death in 1672. He found in 1653 his country brought to the brink of ruin through the war with England, and he resolved to bring about peace. He rejected Cromwell's suggestion of the union of England and Holland, but in 1654 the Treaty of Westminster was concluded, by which the Dutch made large concessions and agreed to the striking of the flag to English ships in the narrow seas. The treaty included a secret article, which the States General refused to entertain, but which de Witt induced the States of Holland to accept, by which the provinces of Holland pledged themselves not to elect a stadholder or a captain general. This Act of Seclusion was aimed at the young Prince of Orange, whose close relationship to the Stuarts made him an object of suspicion to Cromwell. The policy of de Witt after the peace of

1654 was eminently successful. He restored the finances of the country and extended its commercial supremacy in the East Indies. In 1658-59 he sustained Denmark against Sweden, and in 1662 concluded an advantageous peace with Portugal. The accession of Charles II to the English throne led to the rescinding of the Act of Seclusion; nevertheless de Witt steadily refused to allow the Prince of Orange to be appointed stadholder or captain general. This led to ill will between the English and Dutch governments, and to a renewal of old grievances about maritime and commercial rights, and war broke out in 1665. The councillor pensionary himself went to sea with the fleet, and it was owing to his exertions as an organizer and a diplomat quite as much as to the brilliant seamanship of Admiral de Ruyter that the Treaty of Breda (July 31, 1667), maintaining the status quo, was so honourable to the United Provinces. In 1667 he promulgated his eternal edict for the republican administration of Holland. A still greater triumph of diplomatic skill was the conclusion of the Triple Alliance (Jan. 17, 1668) between the Dutch Republic, England, and Sweden, which checked the attempt of Louis XIV of France to take possession of the Spanish Netherlands in the name of his wife, the infanta Maria Theresa.

In 1672 Louis XIV suddenly declared war and invaded the United Provinces at the head of a splendid army. The voice of the people called William III to the head of affairs, and there were violent demonstrations against Johan de Witt. His brother Cornelius was arrested (July 24) on a charge of conspiring against the Prince. On August 4 Johan de Witt resigned the post of councillor pensionary. Cornelius was put to the torture and on August 19 sentenced to deprivation of his offices and banishment. His brother came to visit him in the Gevangenpoort at The Hague. A vast crowd, hearing this, collected outside and finally burst in, seized the two brothers, and tore them to pieces. Thus perished one of the greatest statesmen of his age and of Dutch history.

Witte, Emanuel de (b. 1617, Alkmaar, Neth.—d. 1692, Amsterdam), Dutch painter whose scenes of church interiors represent

the last phase of architectural painting in the Netherlands.

"Adriana van Heusden and Her Daughter at the Fishmarket in Amsterdam (?)," oil on canvas by Emanuel de Witte; in the National Gallery, London By courtesy of the trustees of the National Gallery, London; photograph, JR. Freeman & Co. Ltd.

His artistic career began in Delft, where he concentrated on historical subjects and portraits. About mid-century he seems to have developed an interest in architectural painting, probably influenced by the example of his contemporaries Gerard Houckgeest and Hendrick Cornelisz van Vliet. By 1652 de Witte was living in Amsterdam, where he spent the remainder of his life.

De Witte depicted the interiors of such Amsterdam buildings as the Nieuwe Kerk (New Church; painting, 1677; Museum of Fine Arts, Boston), the Oude Kerk (Old Church; paintings in the Museum Boymans-van Beuningen, Rotterdam; Museum of Fine Arts, Springfield, Mass.; Akademie des Bildenden Künste, Vienna), and the Portuguese Synagogue (painting, 1680; Rijksmuseum, Amsterdam). His interiors were constructed on a grand scale, using elaborate perspective and relatively large figures. His palette tended toward monochrome tonalities of whitish yellow in areas of sunlight and gray to deep black in the shadows, occasionally accented by a soft green or red. De Witte was also a notable painter of scenes from everyday life such as "The Fish Market" (1672) and "Bourgeois Interior with a Woman at the Virginals" (both in the Museum Boymans-yan Beuningen, Rotterdam).

Witte, Sergey Yulyevich, Graf (Count) (b. June 29 [June 17, old style], 1849, Tiflis, Georgia, Russian Empire—d. March 13 [Feb. 28, O.S.], 1915, Petrograd), Russian minister

Sergey Yulyevich Witte, 1905 H. Roger-Viollet

of finance (1892–1903) and first constitutional prime minister of the Russian Empire (1905–06), who sought to wed firm authoritarian rule to modernization along Western lines.

Life. Witte's father, of Dutch ancestry, directed the agricultural department in the office of the governor general of the Caucasus. His mother came from a high-ranking family of the Russian nobility engaged in state service. Witte's childhood in the Caucasus was a happy one. Following his successful career as a student of mathematics at the Novorossiysky University (now Odessa State University) at Odessa, Witte thought of entering on an academic career. But he followed the advice of a family friend, the minister of communications, and entered the railway administration. It was the beginning of a career that brought Witte to the heart of imperial politics and finance. After a period in the chancellery of the governor general of Odessa and Bessarabia (1871-74), Witte studied railway administration in the Odessa Railway at the Odessa office of the Ministry of Communications. He led a disciplined, orderly life, imposed partly by family poverty and partly by an urge to succeed. By the time of the Russo-Turkish War (1877-78) he had already risen to a position in which he controlled all the traffic passing to the front along the lines of the Odessa Railway. At one critical point he devised a novel system of double-shift working to overcome delays on the line.

Witte showed his freedom from bureaucratic prejudice by appointing men of all nationalities—Jews, Poles, Ukrainians—as his subordinates and by cultivating favourable press relations. His economic acumen was shown in his collection and use of railway statistics and in the implementation of an effective freight tariff whereby he lowered freight rates and increased revenue.

In 1889 Witte was invited to establish a railway department in the Ministry of Finance. He advanced rapidly and became in quick succession minister of communications (February 1892) and minister of finance (August 1892). Far-reaching plans for the economic development of the Russian Empire formed the kernel of Witte's policy. He aimed at "removing the unfavourable conditions which hamper the economic development of the country and at kindling a healthy spirit of enterprise" (Witte's first budget to the Emperor, 1893). Using the full power of the state, Witte unfolded a vast range of activity: a remodelled State Bank made ready capital available to industry; Russian steamship companies and nautical and engineering schools were established; savings banks were encouraged; company law was reformed; and the ruble was made convertible. Witte was also instrumental in raising large loans from investors in France, Britain, Belgium, and Germany to finance Russian industrialization.

He deployed his greatest energy in stimulating railway building, particularly the Trans-Siberian line (actually begun in 1891). He saw it not only as a means to bring urban progress to the countryside but also as an economic stimulus in itself, as a link between European and Asiatic Russia, and as a way of making Russia the chief intermediary between western Europe and the Far East. For almost a decade the "Witte system" enjoyed considerable success, but at the turn of the century international uncertainty (the Boer War, the Spanish-American War, and the Boxer Rebellion in China) reduced the flow of foreign loans to Russia, and strikes and peasant unrest in Russia revealed that the mass of the population would no longer tolerate the reduced living standards that Witte's policy entailed. Moreover, influential agricultural interests, always hostile to Witte's all-out support for industrialization, made their opposition manifest at court. His relationship with Emperor Nicholas II, who feared this dynamic man, was also unhappy. In August 1903 Witte was removed from the Ministry of Finance and appointed to the largely decorative position of chairman of the Committee of Ministers.

He had to look on in impotence as the government blundered into war with Japan. But he was to render highly important services to the empire in 1905 and 1906. In July 1905 he was appointed chief Russian plenipotentiary to conduct peace negotiations with Japan. He obtained unexpectedly favourable terms for Russia, but his achievement did not make him any more popular.

At a political level, Witte, though he detested constitutionalism in any form, used his influence to persuade the Tsar to issue the "October Manifesto" of 1905, which promised to grant a measure of representative government. No less important was Witte's role as prime minister in the new system of government, in organizing the repression of all the forces of disruption in the autumn and winter of 1905–06—e.g., the St. Petersburg Soviet, or workers' council, the troop mutinies in the Far East, strikes in South Russia, and peasant uprisings in the Baltic provinces.

Witte was also instrumental in concluding arrangements in 1906 with a group of European bankers for a series of loans that restored Russian finances, which were in a state of virtual collapse through the effects of defeat in the Far East and the widespread revolts of 1905.

This was Witte's last opportunity to serve the state. He was forced to resign the premiership in April 1906, having lost what little confidence the Tsar had in him. Witte never returned to office, and his efforts to influence policy were ineffectual. Thus, in the summer and winter of 1914–15 he vainly opposed Russian entry into World War I and was sympathetic to peace feelers put out by the German government through Witte's own German banker. He died embittered and dispirited, foreseeing disaster for the tsarist empire.

Assessment. Witte's reputation was at first eclipsed through the collapse of tsarism, but he is now appreciated as a successor to Peter I the Great in the drive to modernize a backward empire and as a forerunner of the Communists in the policy of implementing an industrial revolution from above. The "Witte period" of 1892-1903 may well be compared to the period of the First Five-Year Plan. But Witte worked in an unsympathetic political context that was perhaps incompatible with industrialization and by which he was ultimately defeated. (L.Ko.) BIBLIOGRAPHY. Theodore von Laue, Sergei Witte

and the Industrialization of Russia (1963), is the only study of Witte's career that is commensurate with the importance of the subject, ending with Witte's final fall from power in 1906 (includes a useful bibliography). The Memoirs of Count Witte, trans. and ed. by Abraham Yarmolinsky (1921), remains indispensable, though the emphasis is on Witte's career in 1905–06. The Memoirs in their Russian original were republished in one volume, ed. by A.L. Sidorov (1960).

Witteberg series, uppermost member of the Cape System of sedimentary rocks in South Africa. It consists of about 805 metres (2,640 feet) of shales and sandstones and is transitional between the Late Devonian epoch and the Early Carboniferous epoch (the Carboniferous began about 360,000,000 years ago). Fossil plants are prominent in Witteberg rocks: numerous genera have been described, including Sigillaria, Lepidodendron, Cyclostigma, and the psilophyte Dutoitia.

Wittelsbach, HOUSE OF, German noble family that provided rulers of Bavaria and of the Rhenish Palatinate until the 20th century. The name was taken from the castle of Wittelsbach, which formerly stood near Aichach on the Paar in Bavaria. In 1124, Otto V, count of Scheyern (d. 1155), removed the res-

idence of his family to Wittelsbach and called himself by this name. His son, Otto VI, after serving the German king Frederick I, was invested duke of Bavaria, as Otto I. From that date, 1180, until 1918, Bavaria was ruled by the Wittelsbachs.

The first step toward extending their authority outside Bavaria was made in 1214, when Otto II, through marriage, obtained the Palatinate of the Rhine. A descendant, Louis, became duke of Bavaria in 1294 and Holy Roman emperor, as Louis IV, in 1328. In 1329, by the Treaty of Pavia, Louis IV made the first important division of the Wittelsbach lands by granting the Palatinate of the Rhine and the upper Palatinate of Bavaria to his brother's sons, Rudolf II (d. 1353) and Rupert I. Rupert, who from 1353 to 1390 was sole ruler, was granted the title of elector of the Palatinate of the Rhine in 1356.

Meanwhile, the descendants of the emperor Louis IV retained the rest of Bavaria but made several divisions of their territory, the most important of which was in 1392, when the branches of Ingolstadt, Munich, and Landshut were founded. Three generations later, however, after much contention, ducal Bavaria was reunited by Albert IV (d. 1508), who introduced the rule of primogeniture.

The Wittelsbachs of the Palatinate provided a German king, Rupert, who reigned from 1400 to 1410, but their lands continued to be subdivided among themselves, creating a profusion of branches of the family. A Wittelsbach of one of the Palatinate branches became king of Sweden as Charles X in 1654; Charles XI and Charles XII continued this Wittelsbach kingdom until 1718.

The Bavarian dukes had also become electors, beginning in 1623. The Bavarian elector Charles Albert (d. 1745) was Holy Roman emperor, as Charles VII, from 1742. With his son Maximilian III Joseph the Bavarian line of Wittelsbachs died out in 1777. The elector Palatine, Charles Theodore, also a Wittelsbach, then succeeded to Bavaria, by virtue of a dynastic treaty of 1724. On his death (1799) the Palatinate and Bavaria were reunited under Duke Maximilian IV Joseph of Zweibrücken, who in 1806 became king of Bavaria as Maximilian I.

Maximilian I's descendants were kings of Bavaria until Louis III abdicated in 1918. Louis III's son, Prince Rupert (d. 1955), a potential pretender to the British crown through his female descent from the Stuarts, led Bavarian monarchist opinion against Hitler.

Prince Adalbert of Bavaria (a grandson of King Maximilian I), his son Louis Ferdinand, and his grandson Ferdinand all married Spanish infantas (1856, 1883, and 1906). Their branch had a contingent interest in the succession to the Spanish crown.

Witten, city, North Rhine-Westphalia Land (state), northwestern Germany, on the Ruhr River, bordering Dortmund (north) and Bochum (northwest). Chartered in 1825, it was severely damaged in World War II but has been rebuilt along modern lines with numerous commercial enterprises.

Witten's heavily wooded surroundings to the south are a favourite Ruhr recreation area. The city has a museum of graphic arts and an archive. Industries include steel manufacturing, the extraction of coal-tar products, glassworks, and machine building. Pop. (1989 est.) 103,637.

Wittenberg, city, Saxony-Anhalt Land (state), north-central Germany, on the Elbe River, southwest of Berlin. First mentioned

in 1180 and chartered in 1293, it was the residence of the Ascanian dukes and elec-

The medieval town hall (right) facing the marketplace in Wittenberg, Ger.

W. Krammisch-Bruce Coleman Inc./EB Inc.

tors of Saxony from 1212 until it passed. with electoral Saxony, to the House of Wettin in 1423. Wittenberg University, made famous by its teachers, the religious reformers Martin Luther and Philipp Melanchthon, was founded by the elector Frederick the Wise in 1502 and was absorbed by the University of Halle in 1817. In 1547, when John Frederick the Magnanimous signed the Capitulation of Wittenberg, the electorate passed from the Ernestine to the Albertine line of the Wettins, and the town ceased to be the official residence. The city was occupied in 1806 by the French, who strengthened its fortifications in 1813; the fortress was stormed by the Prussians in 1814, and the city was assigned to them in 1815.

The Reformation started in Wittenberg on Oct. 31, 1517, when Luther nailed his famous Ninety-five Theses to the wooden doors of the castle Church of All Saints. The doors were destroyed in a fire of 1760, and the church, containing the graves of Luther and the Reformers, was seriously damaged then and in 1813-14. It has been restored, and the bronze doors of 1858 bear the Latin text of Luther's Theses. Other notable buildings include the castle (1490-99), the town hall (1524-40), the residences of the Reformers, and the town church (1300), which houses an altarpiece by Lucas Cranach the Elder (1472-1553), court painter to the Saxon electors and a town councillor and burgomaster of Wittenberg.

Wittenberg's river harbour and its position as a railway junction aided its industrialization. The chemical industry, especially the nationally owned nitrogen works at Piesteritz, is important; a large fertilizer plant was built in the late 1970s. Pop. (1989 est.) 53,358.

Wittgenstein, Ludwig (Josef Johann) (b. April 26, 1889, Vienna—d. April 29, 1951, Cambridge, Cambridgeshire, Eng.), Austrianborn English philosopher, who was one of the most influential figures in British philosophy during the second quarter of the 20th century and who produced two original and influential systems of philosophical thought—his logical theories and later his philosophy of language.

Early life through World War I. Wittgenstein, the son of a leading Austrian steelmaker, was the youngest of eight children, all of whom were generously endowed with artistic and intellectual talent. Both parents were musically gifted, and their home was a centre of musical life. Educated at home until the age of 14, Wittgenstein then studied for three years in an Austrian school, where the emphasis was on mathematical and natural sciences. after which he studied mechanical engineering for two years in Berlin. In 1908 he engaged in aeronautical research in England, experimenting with kites at an upper atmosphere station. His interest soon turned toward developing an engine that would propel an airplane. Working in an engineering laboratory of the University of Manchester, where he was registered as a research student, he conceived the idea of placing a reaction jet at the tip of each blade of a propeller. He designed an experimental engine, supervised its construction, and tested it successfully. Problems relating to the design of a propeller aroused his interest in mathematics, and this soon produced a desire to understand the foundations of mathematics. Bertrand Russell's book The Principles of Mathematics (1903) had a decisive influence on him. Abandoning his engineering studies at Manchester in 1911, he went to Cambridge to study with Russell. He progressed rapidly in mathematical logic; according to Russell, he "soon knew all that I had to teach." Russell remarked that getting to know Wittgenstein was "one of the most exciting intellectual adventures" of his life. Wittgenstein, he said, had "fire and penetration and intellectual purity to a quite extraordinary degree.

Wittgenstein remained at Cambridge through most of 1913, working with unrelenting intensity at problems in and about logic and engaging in prolonged discussions with Russell. He then went to Skjolden, Nor., where he lived in seclusion, working hard at logic. Upon the outbreak of World War I, Wittgenstein enlisted in the Austrian army, serving first on a river vessel and later in an artillery workshop. In 1916 he served in a howitzer regiment on the Russian front as an artillery observer, winning several decorations for bravery. He was then sent to be trained as an artillery officer, was commissioned, and continued to serve on the eastern front until 1918, when he was transferred to a mountain artillery regiment

on the Italian front.

Period of the "Tractatus." Throughout the war, Wittgenstein worked on problems of logic and philosophy, writing his thoughts in notebooks that he carried in his rucksack. When he became a prisoner of the Italians at the end of the war, he had a completed manuscript, which he sent to Russell in England. After his release, Wittgenstein tried in vain to find a publisher for his book. Its eventual publication, due to Russell's influence, occurred in 1921 under the title Logisch-philosophische Abhandlung (Tractatus Logico-Philosophicus, 1922). The Tractatus is universally accepted as novel, profound, and influential. The book is a series of remarks, carefully ordered and numbered in a decimal notation. Although only 75 pages, it sweeps over a vast range of topics: the nature of language; the limits of what can be said; logic, ethics, and philosophy; causality and induction; the self and the will; death and the mystical; good and evil. The central question of the *Tractatus* is: How is language possible? How can a man, by uttering a sequence of words, say something? And how can another person understand him? Wittgenstein was struck by the fact that a man can understand sentences that he has never previously encountered. The solution that burst upon him was that a sentence that says something (a proposition) must be "a picture of reality." "A proposition shows its sense," he wrote; it shows a situation in the world. His picture theory seemed to explain the "connection between the signs on paper and a situation outside in the world." Not realizing that propositions are pictures comes from failing to consider them in their "completely analyzed" form, in which they are arrangements of simple signs that are correlated with simple elements of reality so that "the picture touches reality.

One of the most striking features of the *Trac*-

tatus is its conception of the limits of language. Not only must a propositional picture contain exactly as many elements as does the situation that it represents but, furthermore, all pictures and all possible situations in the world must share the same logical form, which is at once "the form of representation" and "the form of reality." But this form that is common to language and reality cannot itself be represented. Propositions can represent the whole of rehe wrote, "but they cannot represent what they must have in common with reality in order to be able to represent it-logical form." "What can be said can only be said by means of a proposition, and so nothing that is necessary for the understanding of all propositions can be said."

There are other things that cannot be represented ("said"): the necessary existence of simple elements of reality; the existence of a thinking, willing self; and the existence of absolute value. These things are also unthinkable, since the limits of language are the limits of thought. Thus Wittgenstein's remark, "Unsayable things do indeed exist," is itself something that cannot be said or thought; it may give insight, but it is actually nonsensical and eventually must be "thrown away." The final sentence of the book ("Whereof one cannot speak thereof one must be silent") is no truism. It is a highly metaphysical remark that attempts to convey the unsayable, unthinkable doctrine that there is a realm about which one can say nothing.

Upon returning to civilian life in 1919, Wittgenstein gave away the large fortune inherited from his father. He once said that he had done this to avoid having friends for the sake of his money, but it is also true that he disliked ease and luxury. His mode of life came to be characterized by extreme simplic-

ity and frugality.

Feeling that the Tractatus had exhausted his contributions to philosophy, Wittgenstein sought some other vocation. He became an elementary school teacher and beginning in 1920 taught in various tiny villages in Lower Austria. During this period he was severely unhappy and frequently thought of suicide. He was helped, however, by his relationship with his young pupils. Painful frictions eventually developed between Wittgenstein and some of the other teachers and villagers, and in 1925 he abandoned his career as a school teacher. For a few months he served as a gardener's assistant in a monastery near Vienna. When he was invited to undertake the building of a mansion in Vienna for one of his sisters, he accepted the task. This project, which occupied his time for two years, was carried through with typical concentration and originality.

Wittgenstein's musical gifts were considerable. He played the clarinet when a young man, and throughout his life he had the rare ability to whistle difficult classical music, sometimes whistling long passages from memory. Wittgenstein's musical sophistication as well as the peculiar authority of his intelligence and personality are reflected in an incident that occurred when a well-known string quartet was rehearsing in a home where Wittgenstein was one of a small group of listeners. Extremely reserved at first, he offered a few modest remarks about the interpretation of the music; but eventually, according to the account of a witness, "he was carried away by passion and intervened in the rehearsal. The musicians reacted with polite disdain, but at a later rehearsal, the account continues, "Wittgenstein, now completely accepted by the four musicians, did most of the talking, and his objections and advice were heard as deferentially as if Gustav Mahler himself had interrupted their rehearsal."

For a decade after World War I, Wittgen-

stein did not engage in philosophical studies. He did, however, occasionally meet with other philosophers: the brilliant young philosopher Frank Ramsey and a few members of the so-called Vienna Circle, which gave birth to Logical Positivism.

Period of the "Philosophical Investigations." Suddenly Wittgenstein felt that once again he could do creative work in philosophy. He returned to Cambridge early in 1929, where he was made a fellow of Trinity College. Through his lectures and the wide circulation of notes taken by his students, he gradually came to exert a powerful influence on philosophical thought throughout the English-speaking world. Those who attended his discussions were impressed by the force of his intellect, his passionate seriousness, and the novelty of his ideas and methods. Through these lectures, which were extemporaneous, often taking the form of responses to his own questions, he was creating a new philosophical outlook.

From his return to Cambridge in 1929 until his death 23 years later, Wittgenstein wrote prodigiously. A large number of his notebooks, manuscripts, and typescripts have been preserved. The crown of this work was the *Philosophische Untersuchungen* (1953; *Philosophical Investigations*), which, in accordance with his wishes, was published only after his death. Subsequently, a number of related writings have been edited and published.

The thinking that began afresh in 1929 gradually arrived at a very different outlook from that of the *Tractatus*. Wittgenstein came to reject such former conceptions as that a proposition has one and only one complete analysis; that every proposition has a definite sense; that reality and language are each composed of simple elements; that there is an essence of language, of propositions, of thought; that there is an a priori order of the world. With the rejection of the assumption that all representations must share a common logical form, the conception of the unsayable disappeared.

In the Tractatus Wittgenstein had believed that the endless variety of kinds of uses of language is misleading—hidden beneath this diversity there must be a unifying essence to which a philosopher tries to penetrate. In the Investigations he held that this belief is an illusion. There is no unity hidden in the diversity. The perplexities that the philosopher feels about the nature of memory, of thinking, of understanding a word, or of following a rule and his insistence on asking "What is knowledge?" "What is an intention?" "What is an assertion?" are eased, or quieted, by descriptions, or reminders, of what lies open to view, namely the ranges of differing cases in which one applies these words as he uses language, or works with it, in the daily traffic of speech and communication. These descriptions break the hold of the preconceptions that falsify philosophical thinking; they destroy the obsessive belief that there must be an essence of knowledge, of intention, of assertion.

Wittgenstein employed the example of games and tried to get his reader to rid himself of the assumption that there is a common nature of games. Some but not all games are amusing or involve competition or winning and losing; there is only a network of "overlapping and criss-crossing" similarities between games, not some common feature running through all games. Wittgenstein used the term "family resemblance"; he held that just as the word "game" is applied to a range of cases that have only a family resemblance, so it is with the words that loom so large in philosophy: "knowledge," "proposition," "memory," "intention," "thought," "rule," and "belief." Something is called a belief, for example, perhaps because it has similarities with some of the things that were previously called beliefs. The application of a term is extended from previous cases to new cases "as in spinning a thread we twist fibre on fibre. And the strength of the thread does not reside in the fact that some one fibre runs through its whole length, but in the overlapping of many fibres.

An outstanding feature of Wittgenstein's second philosophical position is his concern to show how concepts are linked to actions and reactions, to the expression of the concepts in human life. "What we are supplying," he wrote, "are really remarks on the natural history of human beings." The perplexity that a man feels about the meaning of a form of words may be relieved if he asks himself, "On what occasion, for what purpose, do we say this? What kind of actions accompany these words? (Think of a greeting.) In what scenes will they be used; and what for?" Wittgenstein's aim was to display the function and significance of concepts as due not to an inangible realm of mind but to the human forms of life in which they are embedded.

Whereas the *Tractatus* is regarded with universal admiration, the reception of the *Investigations* has been mixed. Some students of philosophy are perplexed by the enigmatic style and the seeming lack of organization. Some think it is inferior to the *Tractatus* in both precision and seriousness, but for others it has radically transformed and enriched philosophy.

In 1939 Wittgenstein was appointed to the chair in philosophy at Cambridge University previously held by that master of philosophical analysis G.E. Moore. During World War II he left Cambridge to serve as a porter in Guy's Hospital in London and later worked as a laboratory assistant in the Royal Victoria Infirmary. As in his previous war service, he continued to think and write on philosophical problems. In the autumn of 1944 he returned to Cambridge to resume his lectures and discussions. He grew more and more restive, however, as a professor of philosophy, and at the end of 1947 he resigned his chair. He wanted to devote his time and strength to completing the *Investigations*, and also he felt a need for "thinking alone, without having to talk to anybody." He stayed in a cottage on the west coast of Ireland until his health would no longer permit it. Thereafter he lived most of the time with various friends in the United States and England. He was frequently ill, and in the autumn of 1949 he was found to have cancer-a discovery that did not disturb him since he had "no wish to live on." He continued to do intensive work, however, until his death two years later.

Assessment. It is not easy to characterize Wittgenstein's attitude toward his own philosophical creation. He regarded the Philosophical Investigations as imperfect; he tried with fierce energy and concentration to perfect it, yet despaired of success. He was inclined to be pessimistic about the fate of his work. "It is not impossible," he wrote, "that it should fall to the lot of this work, in its poverty and in the darkness of this time, to bring light into one brain or another-but, of course, it is not likely." He regarded his own thinking as being alien to the scientific and mathematical spirit of the age in which he lived. He felt as if he were writing for people who belonged to a different culture.

It cannot be doubted that Wittgenstein has made philosophy more self-conscious and has introduced a new conception of its nature. In his view a philosophical problem is not something for which a solution must be sought: no theorem is to be proved nor any hypothesis tested. Instead, the problem is a confusion, an entanglement of one's own thoughts. "Why is philosophy so complicated?" he wrote. "It ought to be *entirely* simple.—Philosophy unties the knots in our thinking that we have, in a senseless way, put there. To do this it must make movements that are just as complicated

as these knots. Although the result of philosophy is simple, its method cannot be if it is to succeed. The complexity of philosophy is not a complexity of its subject matter, but of our knotted understanding." The result of philosophical thinking of the right kind is not a truth discovered but a confusion dissolved. In all of his conceptual studies, Wittgenstein was searching for *das erlösende Wort*, the word that unties one's knotted understanding.

(N.A.M./Ed.)

MAJOR WORKS. Important works by Wittgenstein include Logisch-Philosophische Abhandlung (1921; Tractatus Logico-Philosophicus, trans. by C.K. Ogden, 1922, reissued 1983; trans. by D.F. Pears and B.F. McGuinness, 1961); *Philosophis*che Bemerkungen, ed. by Rush Rhees (1964; Philosophical Remarks, 1975, reissued 1980); Preliminary Studies for the "Philosophical Investigations": Generally Known as "The Blue and Brown Books" (1958, reissued 1972), notes dictated in English to Cambridge students in 1933-35; Bemerkungen über die Grundlagen der Mathematik, ed. by G.H. von Wright, R. Rhees, and G.E.M. Anscombe (1956; Remarks on the Foundations of Mathematics, trans. by G.E.M. Anscombe, rev. ed., 1978, reprinted 1983), a selection from his writings on the philosophy of logic and mathematics between 1937 and 1944; Philosophische Untersuchungen (1953; Philosophical Investigations, trans. by G.E.M. Anscombe, 1953, reissued 1984). BIBLIOGRAPHY. Biographical works and studies of his writings include Anthony Kenny, Wittgenstein (1973, reissued 1976), an overview of his thought and works; K.T. Fann, Ludwig Wittgenstein: The Man and His Philosophy (1967, reissued 1978), an anthology of memoirs and essays; Norman Malcolm, Ludwig Wittgenstein: A Memoir, 2nd ed. (1984), recollections of Wittgenstein from 1938 to 1951, with a biographical sketch by G.H. von Wright; Brian McGuinness, Wittgenstein: A Life: Young Ludwig, 1889-1921 (1988), based on all known existing documents; Peter Winch (ed.), Studies in the Philosophy of Wittgenstein (1969), a collection of essays on both the earlier and later philosophy; Gerd Brand, The Essential Wittgenstein (1979), an attempt to demonstrate the unity in Wittgenstein's thought; Irving Block (ed.), Perspectives on the Philosophy of Wittgenstein (1981, reprinted 1983); Derek Bolton, An Approach to Wittgenstein's Philosophy (1979); Max Black, A Companion to Wittgenstein's "Tractatus" (1964), an informative commentary; Irving M. Copi and Robert W. Beard (eds.), Essays on Wittgenstein's "Tractatus" (1966); H.O. Mounce, Wittgenstein's "Tractatus" (1981); J.F.M. Hunter, Understanding Wittgenstein: Studies of "Philosophical Investigations" (1985); Anthony Kenny, The Legacy of Wittgenstein (1984, reprinted 1987); and Stuart Shanker (ed.), Ludwig Wittgenstein: Critical Assessments, 4 vol. (1986). Further research information may be found in François H. Lapointe, Ludwig Wittgenstein: A Comprehensive Bibliography (1980).

Wittig, Georg (b. June 16, 1897, Berlin—d. Aug. 26, 1987, Heidelberg, W.Ger.), German chemist whose studies of organic phosphorus compounds won him a share (with Herbert C. Brown) of the Nobel Prize for Chemistry in 1979.

Wittig graduated from the University of Marburg in 1923, received his doctorate there in 1926, and remained as a lecturer in chemistry until 1932. He taught at the Technical University in Braunschweig and at the universities of Braunschweig, Freiburg, and Tübingen before joining the faculty of the University of Heidelberg in 1956, where he became emeritus in 1965 but continued to pursue research.

In investigating reactions involving carbanions, negatively charged organic species, Wittig discovered a class of compounds called ylides mediating a particular type of reaction that became known as Wittig reactions and that proved of great value in the synthesis of numerous organic compounds.

Wittingau (Czechoslovakia): see Třeboň.

Wittlin, Józef (b. Aug. 17, 1896, Dmytrów, Austria-Hungary [now in Ukrainian S.S.R.]—d. Feb. 29, 1976, New York, N.Y., U.S.), Polish novelist, essayist, and poet, a master of the Polish language.

Having graduated from the classical gimnazjum in Lemberg (modern Lwów), he studied philosophy at the University of Vienna. Mobilized in 1914 in the Austro-Hungarian army as a soldier, he took part in a few battles on the Russian front but two years later was freed from military service because of his poor health. He started writing, and in the collection of his Hymny (1920; "Hymns") he voiced a humanistic protest against the debasement of man as the victim of powerful states and social systems. He undertook to translate anew into Polish Homer's Odyssey (1924).

The work that ensures him a place in Polish literature is Sól ziemi (1935; Salt of the Earth). The book is a tale of a "patient infantryman," an illiterate Polish peasant. The novel treats not war itself but the bewilderment of man, involved in fighting against will and national interest. Wittlin left Poland a few weeks before World War II started; he stopped in Paris and then in London. From 1941 he lived in New York City, where he wrote a warm book of yearning for his native city, Mój Lwów (1946; "My Lwów"). He became a U.S. citizen in 1940

Wittstock, Battle of (Oct. 4, 1636), military engagement of the Thirty Years' War, the greatest victory of the Swedish general Johan Banér, pupil of Gustavus II Adolphus. The battle took place at a time when the Swedish army in Germany desperately needed a victory to improve the prospects of the Protestant cause since the overwhelming defeat at Nördlingen in 1634.

In the fall of 1636, Banér, with about 18,-000 men, sought a battle. An imperial-Saxon army of about 25,000 men took up a position on wooded hills south of Wittstock, 58 miles (93 km) northwest of Berlin. Banér boldly sent about half of his force on a 7-mile (11kilometre) march, in a wide encircling maneuver to the enemy's rear, while he led the other half to seize and hold a hill in front of the enemy's position. Although outnumbered by 50 squadrons to 17, the Swedish cavalry held off the imperial forces' attacks from 3 PM to sunset. Banér's front was on the point of being overrun at 6 PM, when his flanking forces arrived to attack the imperial-Saxon army from their rear and flank. Attacked from three sides, they soon collapsed and fled in panic. Contrary to the practice of the time, the pursuit was vigorously pushed the next day. When it ceased, the remains of the imperialist army were unfit for action.

Witu Islands, also spelled VITU, volcanic island group of the Bismarck Archipelago, eastern Papua New Guinea. The islands lie 40 miles (65 km) north of New Britain Island in the Bismarck Sea, southwestern Pacific. The group, with a total land area of 45 square miles (117 square km), includes the main islands Garove (Deslacs; 26 square miles), Unea (Merite; 11 square miles; the highest, rising to 1,935 feet [590 m]), and Mundua (2 square miles) and five smaller islands. Generally forested, they produce some copra and cocoa. Pop. (1980 prelim.) 8,599.

Witwatersrand, also called THE RAND, ridge of gold-bearing rock in southern Transvaal, South Africa. Its name means "ridge of white waters." The highland, which forms the watershed between the Vaal and Limpopo rivers, is about 62 miles (100 km) long and 23 miles (37 km) wide; its average elevation is about 5,600 feet (1,700 m). Its rich gold de-

posits, occurring in conglomerate beds known as reefs, were discovered in 1886. A heavy in-migration of miners followed, and the city of Johannesburg grew near the centre of the Witwatersrand. The tailing dumps of the gold mines stretch the entire length of the ridge, and chains of lakes created by water pumped from the mines occupy adjoining valleys. The politically defined Witwatersrand region consists of 14 magisterial districts extending from Randfontein in the west to Delmas in the east. Pop. (1980 prelim.) 3,491,577; whites constitute one-third of the population.

Witwatersrand System, major division of Precambrian rocks in South Africa (the Precambrian began about 3.8 billion years ago and ended 570 million years ago). The Witwatersrand rocks overlie rocks of the Dominion Reef System, underlie those of the Ventersdorp System, and occur in an east-west band from Randfontein to Springs and from the Vaal River in the region of Klerksdorp in the north to Ventersdorp in the south. The rocks actually occupy a much larger area; much of the Witwatersrand System is covered by later deposits, and the subsurface areal extent of Witwatersrand rocks has been delimited by exploratory geophysical and drilling studies be-cause the Witwatersrand is of great economic importance due to its valuable deposits of gold and uranium. In all, the Witwatersrand System consists of about 8,100 m (26,600 feet) of rocks that have been segregated into an upper and lower division, each of which is further divided into series. Three series are recognized in the lower division: the lowermost Hospital Hill Series, the Government Reef Series, and the Jeppestown Series, respectively. The upper division is divided into the lower Main-Bird Series, followed by the Kimberley-Elsburg Series. The Government Reef Series consists of alternating shales and quartzites in addition to pebbly layers that contain gold deposits; it also contains indications of a period of extensive glaciation. The most economically important series is the Main-Bird Series, largely quartzitic conglomerates that are extremely rich in uranium and gold. Large quantities of gold are also found in the Kimberley-Elsburg Series of shales, quartzites, and dolomites.

Witz, Konrad (b. c. 1400, Imperial Free City of Rottweil [now in Germany]—d. c. 1445, Basel or Geneva, Swiss Confederation [now Switzerland]), late Gothic Swiss painter

The "Miraculous Draft of Fishes," tempera on panel by Konrad Witz, 1444; in the Musée d'Art et d'Histoire, Geneva

By courtesy of the Musee d'Art et d'Histoire, Geneva

who was one of the first European artists to incorporate realistic landscapes into religious paintings.

Little is known about Witz's life or training, but in 1434 he entered the painters' guild in Basel, where he worked most of his life. The Heilsspiegel altarpiece (c. 1435; now dispersed), generally agreed to be his earliest surviving work, displays numerous monumental,

sculpturelike figures in small, bare rooms. In this altarpiece, such figures as the personification of "The Synagogue" are placed diagonally to the picture-plane in a simple, graceful pose, revealing Witz's youthful ability to manipulate space, despite the panel's inaccurate perspective.

Three panels from around 1440-43 are probably from a dispersed altarpiece. The Catherine and Mary Magdalene," the "Meeting of Joachim and Anna," and the "Annunciation" display a highly original handling of linear perspective, a sculptural sense of form, and a great sensitivity to the play of light upon the various textures of cloth, stone, and wood. The significance of these scenes is conveyed not through the use of the mystic symbolism prevalent in the art of northern Europe but through the faithful rendering of natural phenomena, making the scenes immediate and convincing. That aspect of Witz's art is best exemplified by his masterpiece, the "Miraculous Draft of Fishes" (1444). In this work, Witz's realism is so precise that he carefully distinguishes between the light reflected off the water's surface and the light reflected off the stones beneath the shallow water. He convincingly renders the reflections of the disciples, the boat, and the buildings on the shore, as well as accurately recording in the background the landscape around Geneva.

Wivallius, Lars (b. 1605, Wivalla, Swed.—d. April 6, 1669, Stockholm), Swedish poet and adventurer, whose lyrics show a feeling for the beauties of nature new to Swedish poetry in his time.

Wivallius studied at Uppsala and in 1625 left Sweden to travel in Germany, France, Italy, and England. Frequently posing as a nobleman, he swindled his way across Europe, being imprisoned for a time in Nürnberg. Back in Sweden (1629), by false pretenses he succeeded in marrying the daughter of a nobleman but was found out and again imprisoned. In 1634 he was deported to Kajaneborg, northern Finland, where he spent seven years of severe hardship. Subsequently he became an advocate in Stockholm.

Though unscrupulous and antisocial, Wivallius in his youth was full of gaiety. Of his many ballads, written mainly in prison, the best are those inspired by longing for freedom (for example, "Ack Libertas," an ode to liberty) and love of nature, in which, with grace and feeling, he sings of the creatures of field and forest, of May rain, and of wanderings under the stars.

Wiyot, southernmost of the Indians of the North Pacific Coast of North America. They lived along the lower Mad River, Humboldt Bay, and lower Eel River of California and spoke Wiyot, a Macro-Algonkian language. They were culturally and linguistically related to the Yurok (q, v).

Wiyot settlements were located on streams or bays, rather than on the ocean itself. The Wiyot rarely used the ocean for subsistence or for travel, preferring still water. Villages consisted of from 4 to 12 houses, probably averaging 30 people; there were also scattered settlements of one or two houses. In addition there were men's sweathouses, used for sleeping, working, and leisure as well as for regular sweat baths and purifications.

The Wiyot were mainly fishers, catching salmon and other fish on the rivers and ocean shore. They also collected mollusks, especially clams, and trapped land mammals. Houses and canoes were made of coast redwood.

Wealth was reckoned in dentalium shells, long obsidian knives, woodpecker scalps, white deerskins, and other objects. There were no formal chiefs, or individuals vested with significant political authority, but wealthy men

were influential as advisers. Disputes, even murder, were settled by the payment of dentalium shells as blood money.

Wiyot shamans were mainly women; they acquired their powers on mountaintops at night. Some shamans only diagnosed disease; others cured by sucking out disease objects and blood. Although the Wiyot belonged to the Northwest Coast cultural area, their religion contained elements from the culture of central California, including a creator-god and many animal characters.

wizard, one who practices magic (see magician) or sorcery (q.v.).

Władysław (Polish personal name): see under Vladislas, except as below.

Władysław, English VLADISLAS, OR VLADISLAUS, Hungarian ULÁSZLÓ, Czech VLADISLAV, name of Polish rulers grouped below chronologically and indicated by the symbol •.

• Władysław I, byname Władysław THE SHORT, Polish Władysław ŁOKIETEK (b. 1260/61, Poland—d. March 2, 1333, Poland), king of Poland (1320–33), a ruler who succeeded in bringing together a series of Polish principalities into a kingdom and laying the foundations for a strong Polish nation.

Władysław I, sarcophagus figure, 14th century; in Wawel Cathedral, Kraków, Poland

By courtesy of the Panstwowe Zbiory Sztuki na Wawelu, Krakow

Władysław was the son of Casimir I of Kujawy, the ruler of one of the numerous small principalities formed after the Old Polish realm had been divided up two centuries earlier. Władysław succeeded his father in 1275 and was elected by the nobles of Great Poland as their prince in 1296; however, they later transferred their allegiance to King Wenceslas II of Bohemia, who was then crowned king of Poland at Gniezno in 1300.

Władysław, seeking to press his claim to the throne, went to Rome and secured the support of Pope Boniface VIII. Then, in 1305, with Hungarian help, he began a war with Wenceslas II. He occupied Little Poland in 1305 and Great Poland in 1314 and also gained control of the northern areas along the Baltic Sea, including Pomerania and Gdańsk (Danzig). The Knights of the Teutonic Order, however, captured Pomerania in 1308, and, despite a good deal of maneuvering by Władysław, it remained in German hands. Having partially reunited the Polish lands, Władysław was crowned king of Poland on Jan. 20, 1320, at

Władysław became involved in further conflicts with the Knights of the Teutonic Order. In September 1331 war again broke out between Poland and the Teutonic Order, and at the Battle of Płowce on Sept. 27, 1331, Władysław inflicted a serious defeat on the Knights.

On the diplomatic front Władysław sought to strengthen his friendship with Hungary, and for a time he was able to halt Lithuanian raids into Poland by marrying his son to a daughter of a Lithuanian nobleman. When Władysław died, he had established a solid base for the future growth of the Polish nation.

• Władysław II Jagiełło, Lithuanian Jo-GAILA, OR IOGAILA, English JAGIELLO, OR JA-GELLO (b. c. 1351—d. May 31/June 1, 1434, Grodek, near Lwów, Galicia, Pol. [now in Ukrainian S.S.R.]), grand duke of Lithuania

Władysław II Jagiełło, sarcophagus figure, second quarter of the 15th century; in Wawel Cathedral,

By courtesy of Panstwowe Zbiory Sztuki na Wawelu, Krakow

(as Jogaila, 1377–1401) and king of Poland (1386–1434), who joined two states that became the leading power of eastern Europe. He was the founder of Poland's Jagiellon dynasty (q.v.).

Early life. Jogaila (Jagiełło in Polish) was one of the 12 sons of Algirdas (Olgierd), grand duke of Lithuania, who named him his heir apparent. When his father died in 1377, Jogaila's title of grand duke was disputed by his relatives, and only after several years and some ruthless actions—such as the imprisonment and murder of his uncle Keştutis (Kejstut)—did his rule become as secure as his father's had been. Part of this reign had to be devoted to winning over Keştutis' son Vytautas (Witold in Polish), who, with the backing of the Teutonic Order, was a rival candidate for the throne of Lithuania. In the decades that followed, Jogaila and his cousin were alternately allies and foes.

In 1384 Polish nobles, who wanted a strong ruler who could help them in their attempts at recovering territory from Hungary, offered Jogaila marriage to the young Polish queen, Jadwiga (Hedwig, born in 1373 or 1374), to share her throne on the condition that he Christianize Lithuania and unite it completely with Poland. Jogaila considered the plan strategically advantageous. The agreements were set forth in the Treaty of Krewo (1385). Elected king of Poland on Feb. 2, 1386, Jogaila was baptized as a Roman Catholic, taking the name Władysław II, on February 15, married Jadwiga on February 18, and was crowned king on March 4 in Cracow. He began at once to convert Lithuania to Roman Catholicism.

As long as Queen Jadwiga lived, Władysław, though not content to play the role of prince consort, nevertheless was regarded as a foreigner and had to come to terms with a queen who had the prerogative of acting in her own right. Not until Jadwiga died childless in 1399 did he really become the leading personality in Poland, and even then many months were to pass before a second event turned his leadership to good advantage. The Teutonic Order had been successfully exploiting further dissension between him and Vytautas, but this subsided when, by the Treaty of Vilnius in 1401, Władysław recognized Vytautas as supreme duke of Lithuania on the condition that Poland and Lithuania be indissolubly united by a common foreign policy.

Rule of Poland and Lithuania. In foreign policy Władysław had four major problems to be solved: restoring Lithuania's and Poland's

position vis-à-vis the Teutonic Order: halting aggression by the Tatars; regaining Ruthenia, occupied by Hungary; and expanding Poland's influence in the southeast against its Hungarian rival. In all areas Władysław was successful—thanks, in regard to the first two problems, to the military help of the energetic Vytautas. In a series of wars (1409-11, 1414, 1422, 1431-32)—the first of which included the Battle of Tannenberg (Polish Grunwald; July 15, 1410)—the Teutonic Order was defeated and lost its leading position in northeastern Europe. The territorial losses of the order were small (Samogitia to Lithuania and a little territory on the Vistula River to Poland), but its military and financial power was weakened once and for all.

As for the Tatars, they defeated Vytautas in 1399 at the Battle on the River Vorskla, at the cost of a decisive check on their own territorial expansion. For Władysław this was a double victory: the Tatars were weakened, and Vytautas' endeavours to become a fully independent ruler of a more powerful Lithuania were brought to an end by the defeat.

Ruthenia was recovered from Hungary as early as 1387, and Poland grew strong enough to make the prince of Moldavia its vassal. In 1412 Władysław even came to terms with Hungary, formerly an ally of the Teutonic Order, in exchange for a loan. Continually, he played his hand cautiously: although he supported the Hussites in their struggle against King Sigismund of Bohemia and Hungary, for example, he refrained from intervention. Władysław ended his reign with good relations between Poland and Hungary.

In domestic policies Władysław was less successful. He energetically Christianized those parts of Lithuania still pagan, but he was unable to incorporate Lithuania into Poland as he had promised and was forced to let Vytautas act virtually as a sovereign. After Vytautas' death in 1430, Władysław was still unable to restore his authority in Lithuania, and, after a period of civil war, Vytautas' brother became governor in Lithuania. In Poland the nobility strengthened its position, especially dur-ing the latter part of Władysław's reign, and Władysław was unable to win the burghers to his side and use them politically as a counterweight to the nobles. In questions of national religion the king showed resoluteness, particularly in his attempt to suppress the Polish followers of Jan Hus.

Władysław died in 1434. Subsequent to his marriage to Jadwiga he had married three times. His fourth wife became the mother of the future kings Władysław III and Casimir IV. (G.K.S.R.)

BIBLIOGRAPHY. K. Szajnocha, Jadwiga i Jagiełło, 1374–1413, 2nd rev. ed., 2 vol. (1861, reprinted 1969; in Polish), an extensive survey, is still regarded as the standard work, although only vol. 2 treats Jogaila and does not cover the last two decades of his reign. A. Prochaska, Król Władysław Jagiełło, 2 vol. (1908); and O. Halecki, "Problems of the New Monarchy: Jagello and Witold, 1400–34," in The Cambridge History of Poland, vol. 1, pp. 210–231 (1950), deal with Lithuanian as well as Polish history. For the relationship of Jogaila and Witold, see Josef Pfitzner, Grossfürst Witold von Litauen als Staatsmann (1930).

• Władysław III Warneńczyk (b. Oct. 31, 1424, Kraków, Pol.—d. Nov. 10, 1444, Varna, Bulg.), Polish king (1434–44) who was also king of Hungary (as Ulászló I; 1440–44) and who attempted unsuccessfully to push the Ottoman Turks out of the Balkans. His reign was overshadowed by the presence of his adviser, Zbigniew Oleśnicki.

At the age of 10 he succeeded to the throne of Poland on the death of his father, Władysław II. During his 10 years as king, however, most

of the major decisions were either made or manipulated by Oleśnicki, who was a powerful Polish noble, bishop of Kraków, the first Polish cardinal, and also a close adviser to his father

Working successfully to bring the crown of Hungary to the young king, Oleśnicki set up Władysław's election through the anti-Habsburg faction within the Hungarian nobility, and in July 1440 Władysław was crowned Ulászló I of Hungary at Buda. Three years of warfare followed, however, as supporters of the Habsburg king Albert's widow sought to gain control of the kingdom. Finally Pope Eugenius IV made peace between the rivals so that Władysław could lead a crusade against the Turks.

In 1443 Władysław and János Hunyadi, his chief Hungarian supporter, led an army of 40,000 into the Balkans. They forced Sultan Murad II to conclude the Peace of Szeged on July 1, 1444. Under its terms Turkey was to evacuate Serbia and Albania along with any other territory taken from Hungary as well as to pay an indemnity of 100,000 florins in gold. Two days after the peace was signed Władysław broke it in the name of religion and continued his invasion of the Balkans, but the whole campaign ended in disaster when the Poles and Hungarians were defeated by the Turks in the Battle of Varna. Władysław died in the fighting.

• Władysław IV Vasa (b. June 9, 1595, Kraków, Pol.—d. May 20, 1648, Merecz), king of Poland (1632–48), a popular monarch who did much to heal the wounds and solve the problems created by his father, Sigismund III

Władysław IV Vasa, detail of a painting by Tommaso Dolabella after a portrait from the Rubens atelier; in the State Collections of Art in the Wawel, Kraków, Pol.

Pedzlem rozmatiym

Vasa, an obstinate man and religious bigot who created internal friction in Poland and pursued a series of profitless wars abroad. Władysław sought to make Poland secure during a period of change in northern Europe and Russia.

When Władysław was 15, his father manipulated the youth's election as tsar of Russia while Polish forces held Moscow during the Time of Troubles following the death of Boris Godunov. His election, which never resulted in his assumption of the Muscovite throne, was part of an unsuccessful plan by Sigismund to conquer all of Russia and convert the population to Catholicism. As a young man Władysław showed ability as a military leader in operations against Muscovy (1617–18) and the Ottoman Empire (1621).

He succeeded to the Polish throne on his father's death in 1632. In an attempt to take advantage of confusion expected after the death of the Polish king, a Muscovite army of

40,000 crossed Poland's eastern frontier and laid siege to Smolensk (ceded to Poland by Russia in 1618). Władysław broke the siege in March 1633 and then launched an offensive, capturing the Russian commander in February 1634. By the Peace of Polyanov that followed, Tsar Michael Romanov confirmed all earlier cessions of territory to Poland and agreed to pay 200,000 rubles in exchange for Władysław's renunciation of all claims to the tsardom.

Władysław then moved his army south and forced the Turks to come to terms with him. By agreement Poland and the Ottomans retained their respective control over the Cossacks and the Tatars, and the two countries shared joint suzerainty over Moldavia and Walachia.

Władysław won an advantageous peace from Sweden in the Armistice of Stuhmsdorf in September 1635, following a war undertaken to exploit Sweden's difficulties during the Thirty Years' War. He failed, however, to find any method for regaining the Swedish crown, which had been held and then lost by his father. He suffered continuing difficulties caused by the efforts of the Polish Seim (Diet) to check the King's power and limit his dynastic ambitions. In 1637 Władysław married Cecilia Renata of Austria, sister of the Holy Roman emperor Ferdinand III. When she bore him a son, Sigismund Casimir, in 1640, Władysław once more tried to assert his personal power. His attempts to mediate between the warring German and Scandinavian powers came to nothing, and he finally planned to use the Cossacks to provoke the Turks into attacking Poland so that his military leadership would be indispensable. The plan, however, failed before it got underway. Brokenhearted at the death of his son in 1647, Władysław died at the moment when the Cossacks, angered because his promises had failed to materialize, were beginning their greatest revolt against Polish rule.

Włocławek, województwo (province), central Poland, established 1975, comprising an area of 1,700 sq mi (4,402 sq km). It is bordered by the provinces of Toruń on the north, Ciechanów and Płock on the east, Konin on the south, and Bydgoszcz on the west. The Vistula River flows through the central part of the province from southeast to northwest. Other rivers include the Ruziec, the Zgłowiaczka, and the Ochnia. The Gostynin Scenic Park (Gostyniński Park Krajobrazowy), covering 193 sq mi, is located on the banks of the Vistula in the southeastern part of the province.

The economy of the province is based on the production of cellulose, chemicals, pottery, and glass. Food-processing and building-material plants are located throughout the province. Włocławek city, the provincial capital, is located on the Vistula. Other important industrial centres are Lipno, Rypin, and Ciecho-cinek. Pop. (1982 est.) 415,400.

Włocławek, city, capital of Włocławek województwo (province), northern Poland, on the Vistula River. An industrial centre specializing in the production of cellulose, it also contains chemical, pottery, and food-processing plants.

Włocławek was the seat of the Kujavian bishops during the 11th century, becoming one of the earliest developed towns in Wielkopolska (Great Poland); it was incorporated in 1256. The astronomer Copernicus studied there between 1489 and 1491. The town became a major industrial centre during the 19th century after the establishment of Poland's first paper mill and cellulose plant. Developing greatly after 1945, Włocławek in the 1960s became the largest cellulose-production centre in Poland. Pop. (1982 est.) 110,000.

woad, also called DYERSWOAD (Isatis tinctoria), biennial or perennial herb, of the mustard family (Brassicaceae), formerly grown as a source of the blue dye indigo and now sometimes cultivated for its clusters of small.

Woad (Isatis tinctoria)
Shunii Watari—EB Inc.

four-petalled yellow flowers. It is a summer-flowering native of Eurasia, now naturalized in southeastern North America. Woad reaches 90 centimetres (3 feet) and produces clusters of dangling, winged, oval, single-seeded fruits. The hairy stem leaves have arrow-shaped bases; the long basal leaves are downy and lance shaped. The ground and dried leaves, when wetted and fermented, produce indigo.

Wobbly: see Industrial Workers of the World.

Woburn, city, Middlesex County, northeastern Massachusetts, U.S., just northwest of Boston. The community, named for Woburn, Eng., was set off from Charlestown and incorporated as a town in 1642. Aided by construction of the Middlesex Canal (1803), it changed its economic base from agriculture to industry during the first half of the 19th century. Shoe manufacturing and leather tanning were the predominant industries. Modern manufactures include pharmaceutical, chemical, and photographic supplies, leather goods, and gelatin. Woburn was the birthplace (1753) of Sir Benjamin Thompson (later Count von Rumford), a noted physicist and a founder of Britain's Royal Institution; the scientist's home, Rumford House, is maintained as a museum with models of his experiments and inventions. The city's old burial ground contains the graves of the ancestors of four U.S. presidents (Cleveland, Benjamin Harrison, Pierce, and Garfield). Pop. (1980) 36,626.

Woburn Abbey, Bedfordshire, Eng., seat of the dukes of Bedford, with a house that was rebuilt from a medieval Cistercian abbey by Henry Flitcroft (in 1747-61) and Henry Holland (in 1787-88). Its approximately 3,000-acre (1,000-hectare) park is the home of a magnificent collection of rare animals and birds.

The 13th Duke of Bedford, succeeding to the title and to severe death duties (inheritance taxes) in 1953, determined to realize to the full the potential earning power of a "stately home" and opened it as a paying tourist atraction. He was a resourceful publicist, and by the end of the 1950s Woburn Abbey was a name well known to the British public; by the 1960s it was almost as well known abroad.

Wodan (Norse god): see Odin.

Wodehouse, Sir P(elham) G(renville) (b. Oct. 15, 1881, Guildford, Surrey, Eng. Feb. 14, 1975, Southampton, Long Island, N.Y., U.S.), English-born comic novelist, short-story writer, lyricist, and playwright, best

Wodehouse The Daily Telegraph

known as the creator of Jeeves, the supreme "gentleman's gentleman." He was the author of more than 90 books, collaborated on more than 30 plays and musical comedies, and

wrote more than 20 film scripts.

Wodehouse was educated at Dulwich College, London, and, after a period in a bank, took a job as a humorous columnist on the London Globe (1902) and wrote free-lance for many other publications. After 1909 he lived and worked for long periods in the United States and in France. He was captured in France by the Germans in 1940 and spent much of the war interned in Berlin. In 1941 he made five radio broadcasts from there to the United States in which he humorously described his experiences as a prisoner and subtly ridiculed his captors. His use of enemy broadcasting facilities evoked deep and lasting resentment in Britain, however, which was then practically under siege by Germany. After the war Wodehouse settled in the United States, becoming a citizen in 1955

Wodehouse began by writing public-school stories and then light romances. It was not until 1913 (in Something New; published in England as Something Fresh, 1915) that he turned to the farce, which became his special strength. He had a scholar's command of the English sentence. He delighted in vivid, farfetched imagery and in slang. His plots are highly complicated and carefully planned. Whatever the dates of publication of his books, Wodehouse's English social atmosphere is of the late Edwardian era. The young bachelor Bertie Wooster and his effortlessly superior manservant, Jeeves, were still together, their ages unadvanced, in Much Obliged, Jeeves (1971), though they first appeared in a story in The Man with Two Left Feet (1917

Wodehouse was knighted in 1975, the year of his death.

Wodzisław Śląski, city, Katowice województwo (province), south-central Poland. Located in the Rybnik Coal Fields, it is 6 miles (10 km) north of the Czechoslovakia-Poland border and 30 miles (48 km) southwest of Katowice, the provincial capital. First chronicled in the 12th century as a crafts and commercial centre, Wodzisław Śląski received its city rights

in 1257. Franciscan monks, under the patronage of Polish rulers, founded a monastery and church there in the 15th century. After passing to Prussia in 1875, it was returned to Poland in 1921. In World War II, most of the city's industrial plants were destroyed. Extensive postwar building and restoration made it again a major industrial and transportation centre in south-central Poland. Its economy is based on coal mining, coke production, and food processing. Several pipelines move natural gas from local fields to Katowice and other cities of the Polish interior. Pop. (1988 est.) 111,500.

Woestijne, Karel van de (b. March 10, 1878, Ghent, Belg.—d. Aug. 23, 1929, Zwijnaarde), Flemish poet whose work constitutes a symbolic autobiography of a typical turnof-the-century personality—the sophisticated, world-weary sensualist striving after spiritual detachment.

Woestijne studied German philology and became a journalist and government official in Brussels (1907-20) and a professor of literature at Ghent from 1920 until his death. His early, subjective poetry includes *Het vader-huis* (1903; "The Father House"), about his childhood; De boomgaard der vogelen en

Woestijne Edgar Barbaix, Ghent, Belg.

der vruchten (1905; "The Orchard of Birds and Fruit"), on his youth and courtship; and De gulden schaduw (1910; "The Golden Shadow"), on his marriage and fatherhood.

The tormented awareness of the conflict between sense and spirit, inherent in all his works, reaches a bitter climax in De modderen man (1920; "The Man of Mud"). His poetrypowerfully conveying the spirit's longing for liberation from the compulsive desires of the flesh—is one of the highest achievements of European Symbolism.

Woffington, Peg, byname of MARGARET woffington, also called the woffington (b. c. 1714, Dublin, Ire.—d. March 28, 1760, London, Eng.), Irish actress whose beauty, vi-

Peg Woffington as Mistress Ford in The Merry Wives of Windsor, engraving by J. Faber after a painting by E. Haytley

By courtesy of the Mander and Mitchenson Theatre Collection, London

tality, and wit made her one of the outstanding theatrical personalities of her time.

Woffington became a street singer to support her mother and sister and made her stage debut at 10 as Polly Peachum in a juvenile production of The Beggar's Opera, in which, as Macheath, she first played in London, in 1732. Her real career began with her success as Ophelia in 1737; by 1740 she was Dublin's leading actress, and her Sylvia in George Farquhar's Recruiting Officer and her Sir Harry Wildair in The Constant Couple—her most famous "breeches part"—made her Dublin's darling. London audiences were equally enthusiastic when, in November 1740, she appeared in the same parts at Covent Garden.

Woffington could now command theatres, parts, and lovers; and at Drury Lane (1740-46) she gained new fame in parts ranging from Sir John Vanbrugh's Lady Brute and Clarissa to William Shakespeare's Rosalind and Mistress Ford. In 1742 she acted in Dublin with David Garrick (q.v.), until 1745 the most important man in her life. But Garrick wanted her to play, as leading lady and wife, under his direction, and Peg could never long adapt herself to his or any other man's ideal. At Covent Garden (1747-50) she showed his successful teaching in tragic parts, and in Dublin (1750-54) she enjoyed social as well as professional triumph. The only woman member of the Beefsteak Club, she was praised for an "understanding rare in females.

At Covent Garden (1754-57) she revived old parts, created new ones, and made new friends, among them the statesman Edmund Burke, thought to have been one of her many lovers. In this, as in much else, tradition exaggerates: she can be certainly described as mistress to only four men. In 1756 illness began to be visible, and on May 3, 1757, she collapsed in Rosalind's epilogue at "I would kiss as many...," after which she retired

from the stage.

Wöhler, Friedrich (b. July 31, 1800, Eschersheim, near Frankfurt am Main [Germany]d. Sept. 23, 1882, Göttingen, Ger.), German chemist, first to synthesize (1828) an organic

Wöhler, detail of a lithograph by R. Hoffmann, 1856

compound (urea) from an inorganic substance. About the same time, he developed a process for preparing metallic aluminum.

Wöhler was educated at the Frankfurt Gymnasium. In 1820 he entered the University of Marburg, intending to become a physician. In the following year he moved to Heidelberg, where he came under the influence of one of the most prominent chemists of Germany, Leopold Gmelin. Gmelin recognized Wöhler's ability and advised him to make chemistry his career. Accordingly, though the young man received a medical degree in 1823, he decided to give up practical medicine and take up the study of chemistry with the leading chemist of Europe, Jöns Jacob Berzelius,

in Stockholm. He worked with the latter for nearly a year, from 1823 to 1824. He not only absorbed the techniques and the interest in the chemistry of new elements, for which Berzelius was famous, but he also developed a lifelong friendship with his master. His correspondence with Berzelius throws much light on the personalities of both men. Wöhler later translated the major reviews and textbooks of Berzelius into German.

Upon his return to Germany Wöhler began in 1825 to teach chemistry at the municipal technical school in Berlin. He remained at this institution until 1831 and there made two of his major discoveries. In 1828 he synthesized urea, considered a purely animal product, from ammonium cyanate, an inorganic compound. This achievement has been hailed by older historians of science as an important step in the overthrow of the doctrine of vitalism, the theory that a special life force directs the processes in living bodies. More recently it has been recognized that Wöhler was more interested in the chemical reactions of urea than in the philosophical significance of its synthesis.

At about the same time that he synthesized urea, Wöhler developed a method for the preparation of metallic aluminum on a small scale. The method was later expanded to an industrial process.

In 1831 Wöhler was called to the technical school in Kassel. He had married his cousin, Franziska Wöhler, in 1829, and the couple had a son. In 1832 his wife died in giving birth to a daughter. Wöhler had previously become acquainted with his contemporary Justus von Liebig, who taught at Giessen, and Liebig suggested that Wöhler might better endure the loss of his wife if he joined his friend in research. The two chemists took up the study of the chemistry of oil of bitter almonds (benzaldehyde). From this investigation came the theory of radicals, the first attempt to understand the structure of organic compounds. An even more important result of the study was the cementing of the friendship of these two leading investigators. Their relationship was of great benefit to each man. Their letters, which have been published, tell much of the characters of both. Liebig was a remarkable experimentalist, but he tended to be opinionated and rather quarrelsome. Wöhler was

much more restrained.

In 1834 Wöhler married Julie Pfeiffer, a friend of his first wife. There were two daughters by this marriage. In 1836 he was appointed professor of chemistry at the University of Göttingen, and there he remained for the rest of his life. He continued his studies in both inorganic and organic chemistry. He isolated several elements and new minerals and investigated compounds of physiological importance, such as uric acid and cocaine. He continued to carry out some of his studies jointly with Liebig.

Wöhler's fame did not grow as rapidly as that of Liebig, whose laboratory at Giessen was a centre for chemical research. After 1850 more and more students were attracted to Göttingen, not only because of the research reputation of the laboratory but also because of the personality of Wöhler. He was above all an outstanding teacher, and teaching was his favourite occupation. He was less interested in the laboratory side of instruction, allowing his assistants to direct much of the thesis work. Students were given great freedom to choose their own problems and to publish their results under their own names. Wöhler devoted himself to lectures, in which he excelled. He also drew his students to him by his personal kindliness and his interest in their lives and problems. His correspondence with many of them has been preserved, and it shows that he continued to be interested in their careers long after they had left him.

Wöhler's publishing activities were also im-

portant. Besides his translations of the major works of Berzelius, which resulted in their wide currency, he wrote a number of important textbooks in organic, inorganic, and analytical chemistry. He served as one of the editors of *Justus Liebigs Annalen der Chemie*, the major chemical journal of its day. He was an honorary member of nearly every scientific society and received many medals and awards. (H.M.L.)

BIBLIOGRAPHY. A good general biography is A.W. von Hoffmann, "Friedrich Wöhler," in Eduard Farber (ed.), *Great Chemists* (1961). Wöhler's relations with his students are documented by H.S. van Klooster, in "Friedrich Wöhler and His American Pupils," *J. Chem. Ed.*, 21:158–170 (1944).

Wohlgemuth, Michael, Wohlgemuth also spelled WOLGEMUT or WOHLGEMUT (b. 1434—d. 1519), leading late Gothic painter of Nürnberg in the late 15th century.

After an obscure early period Wohlgemuth married (1472) Barbara, widow of the Nürnberg painter Hans Pleydenwurff, and in the next 40 years produced a series of large altarpieces, rich with carving and gilding, as well as portraits and book illustrations. The altarpiece of St. Jacob, Straubing, is attributed to the beginning of this activity (c. 1475–76), and

"The Risen Christ," panel painting from the St. Jacob altarpiece by Michael Wohlgemuth, c. 1475–76; in Straubing, Ger.

those of the Marienkirche, Zwickau (1476–79), the Stiftskirche, Feuchtwangen (1484), the Heiligkreuzkirche, Nürnberg (1486), and the Stadtkirche of Schwabach (1506–08) are all known to be products of his workshop. With his stepson Wilhelm Pleydenwurff, Wohlgemuth completed the designs for the 650 woodcuts of Hartmann Schedel's Weltchronik in 1492 and the woodcuts of Schatzbehalter der wahren Reichtümer des Heils (1491).

No powerful artistic personality emerges from these works. As a painter, Wohlgemuth was a competent technician, adapting 15th-century early Netherlandish styles to local taste. His designs for woodcut extended the range of that medium but were rapidly surpassed by his most famous pupil, Albrecht Dürer.

Wojciechowski, Stanisław (b. March 15, 1869, Kalisz, Pol., Russian Empire—d. April 9, 1953, Golabki, Pol.), one of the leaders in the struggle for Polish independence from Russia in the years before World War I. He later served as the second president of the Polish Republic (1922–26).

While a student at the University of Warsaw,

Wojciechowski worked for the Polish Socialist movement, a major force in the independence effort. He was arrested in 1891; on his release

Wojciechowski

By courtesy of S. Kirker, Lond

a year later he went to Paris and then to London. In England he helped publish the Polish Socialist periodical *Przedświt* ("The Dawn") and became friends with Józef Piłsudski. He also studied the cooperative movement, and on returning to Poland in 1906 he spent his time working to develop Polish cooperatives.

During World War I, because he saw Germany as Poland's main enemy, Wojciechowski in 1915 went to Moscow and there in 1917 he was elected president of the Council of Polish Parties' Union. He returned to Warsaw at the end of the war and from January 1919 to July 1920 served as minister of the interior in three separate cabinets of the new Polish Republic. He was elected to the Sejm (Diet) as a member of the Polish Peasant Party in November 1922. When Gabriel Narutowicz, president of the republic, was assassinated in December 1922, Wojciechowski was chosen to succeed him.

In the new government Wojciechowski and Piłsudski, then military chief of staff, differed as to the direction the nation should take. Wojciechowski supported continued parliamentary government, while Piłsudski favoured a more authoritarian approach. In May 1926, Piłsudski staged a successful coup d'etat. Wojciechowski then retired to private life.

wok, thin-walled cooking pan, shaped like a shallow bowl with handles, widely used in Chinese-style cooking. The wok has a round bottom that concentrates heat, cooking food quickly with relatively little oil. Food when cooked may be moved up the sloping side of the wok to stay warm without cooking further, while other food is cooked at the bottom. The wok was developed as an implement to conserve scarce fuel. It is generally made of iron, carbon steel, copper, or aluminum. Although woks come in sizes ranging from 10 to 32 inches (25 to 80 centimetres) in diameter, household woks average from 12 to 14 in.

Woks have been used for some 3,000 years in China for a variety of cooking methods, including stir-frying, boiling, and stewing. The addition of a rack and cover converts the wok into a steamer. Originally designed for use on wood- or charcoal-burning Chinese stoves, woks have been adapted for Western use by the addition of a metal ring, which is set on top of a gas or electric stove to hold the wok and prevent it from tipping. Electrically heated woks, with a removable heating element and thermostat, may be used for cooking oriental meals at the dining table.

Wokha, town, administrative headquarters of Wokha district, Nāgāland state, northeastern India, at the foot of the Wokha Hills, 50 mi (80 km) north of Kohīma town. A scene of much British colonial military activity in the 1880s, it formed part of the Mokokchung sub-

division in 1890; it is now sparsely populated. Wokha district, separated from Mokokchung district in 1973, has an area of about 620 sq mi (1,600 sq km). It is bounded by Assam state on the northwest, Mokokchung and Zonheboto districts on the east, and Kohīma district on the south. The region is hilly and rugged; the folding at places has been so intense that rock beds stand up vertically, resulting in stark, bare hillsides. Elsewhere the hills are covered with dense forest growth including bamboo, oak, chestnut, and maple. Agriculture is the principal occupation, and the predominant Lhotā people mostly practice shifting cultivation. Crops grown include rice, cotton, ginger, chilies, pumpkins, watermelons, yams, potatoes, and millet. Cattle breeding, beekeeping, and poultry farming are important. Cottage industries include weaving, pottery making, blacksmithing, dyeing, cane working, woodworking, wood carving, and soapmaking. Some rice is milled, and there is a printing press in the district. The Lhotā warred with the Ahom immigrants in the 13th century and with the British in the 19th century. The Border Roads Task Force has built many roads in the region. Pop. (1981) town, 8,180; district, 57,583.

Woking, district (borough), county of Surrey, England, about 25 mi (40 km) southwest of London. It developed as a residential town in an attractive setting of heathlands and pinewoods after the establishment of a railway connection with London (1838). It is notable for its mosque (1889), headquarters of the Muslim community in Great Britain, and for its crematorium (1885), the first set up in England. It has light industry and a major shopping centre. Its area is 25 sq mi (64 sq km). Pop. (1983 est.) 83,900.

Wokingham, district, county of Berkshire, England, 33 mi (53 km) west of London. The town of Wokingham, which lay in Windsor Royal Forest, was granted a market in 1219, and Elizabeth I gave it its charter in 1583. Brickworks were once active southwest of the town, and there is some light engineering today, but the town is now primarily a residential community for people who commute to work in Reading and Bracknell. The district covers an area of 69 sq mi (179 sq km). Pop. (1981 prelim.) town, 24,320; (1983 est.) district, 124,400.

Wolcot, John: see Pindar, Peter.

Wolcott, Oliver (b. Nov. 20, 1726, Windsor, Conn.—d. Dec. 1, 1797, Litchfield, Conn., U.S.), U.S. public official who signed the Declaration of Independence (1776) and helped negotiate a settlement with the Iroquois (1784). Descended from an old Connecticut family long active in public affairs, he was the son

Oliver Wolcott, oil painting by Gilbert Stuart; in the Yale University Art Gallery

By courtesy of the Yale University Art Gallery, gift of George Gibbs, M.A. (Hon.) 1808 of Roger Wolcott, colonial governor (1750-54). Settling in Litchfield County, where he practiced law and was made sheriff (1751), he became a member of the Connecticut council (1771-86) and a delegate to the Continental Congress in Philadelphia. At the beginning of the Revolution, Wolcott signed the Declaration of Independence, then returned home to raise a state militia, which he commanded in defense of New York City (August 1776). The following year he organized more Connecticut volunteers and took part in the successful campaign against Gen. John Burgoyne. In 1779 he commanded Continental troops during the British invasion of his home state.

Wolcott had been appointed a commissioner for northern Indian affairs in 1775; after the war he helped negotiate the Second Treaty of Ft. Stanwix, which redrew the western boundaries of the Six (Iroquois) Nations. He went on to serve as lieutenant governor (1787–96) and governor (1796–97), as well as a member of the Connecticut convention that ratified the new federal Constitution.

His son, Oliver Wolcott (1760–1833), continued the family tradition of public service as U.S. secretary of the treasury (1795–1800) and governor of Connecticut (1817–27).

Wolcott, Roger (b. Jan. 4, 1679, Windsor, Conn.—d. May 17, 1767, East Windsor, Conn.), British American colonial justice, military officer, and governor of Connecticut, author of the first book of verse published in Connecticut (1725).

After service as a clothier's apprentice, Wolcott became a successful tradesman. In 1707 he entered public life as a selectman for the town of Windsor. He was admitted to the bar in 1709 and in the same year was elected to the lower house of Connecticut's legislature. Wolcott became a justice of the peace (1710), a judge of thartford's county court (1721), and judge of the Hartford superior court (1732), and chief justice of that court in 1741. He also served as clerk of the legislative assembly (1710–11), was elected to the Upper House of Assistants in 1714, and became deputy governor in 1741.

Wolcott was elected governor of Connecticut in 1750 and served for four years until his defeat by Thomas Fitch. He was an important member of colony committees concerned with boundary disputes, Indian affairs, paper currency issues, and law code revisions.

His military service started with his appointment as captain in 1722; 17 years later he had risen to the rank of colonel, commanding Connecticut's First Regiment. He was commissioned a major general in 1745 and was second in command of the successful Anglo-American expedition that captured the French fortress of Louisbourg.

In addition to his military and political achievements, Wolcott was a prosperous farmer and a poet. His *Poetical Meditations, Being the Improvement of Some Vacant Hours* was printed in 1725.

wolf, wild doglike carnivore of the family Canidae. The gray, or timber, wolf (Canis lupus) is the best known species. An inhabitant of both open and timbered areas, the gray wolf once was found throughout North America and Eurasia. It has been eliminated from much of its range, however, and is now found primarily in Asia and in North America from Alaska to the northern plains states. Its numbers are dwindling in many areas.

The gray wolf is a powerful animal with a broad head, robust limbs, large feet, and deep but narrow chest. It differs from the smaller coyote in having shorter ears and a wider nose pad and in carrying its tail high when running. Excluding certain domestic breeds of dogs, it is the largest living canid. A large northern male may be about 2 metres (6.6 feet) long, including the bushy, 50-centimetre (20-inch) tail, and may weigh about 45-55 kilograms

Male gray wolf (Canis lupus)

(100–110 pounds). Females are smaller than males, southern races smaller than northern. The fur of the gray wolf is dense, long, and soft and, although usually gray, may be brown, reddish, black, or whitish; it is used in trimming clothing.

An intelligent, social animal that was admired by the American Indians, the gray wolf usually lives in packs of several to two dozen or more and is thought to mate for life. It feeds on many animals, including mice, rabbits, and birds; but its primary prey appears to be larger herbivores, such as deer, moose, and caribou, that it catches by a stalk and a chase. It gorges when food is available, usually reducing the carcass to hair and a few bones. In its hunting the gray wolf performs an important natural function in controlling the numbers of large herbivores and in weeding out those less fit for survival. Unfortunately, it may attack domestic livestock and has thus undergone persecution by man.

Until, and often after, sexual maturity at two or three years, the gray wolf remains with the family group. Breeding occurs between December and April, and 4 to 14 pups are born after a gestation period of 63 days. Members of a family group are friendly to each other but rarely accept an interloper; all members care solicitously for the young.

The red wolf (*C. rufus*) is a tawny, reddish, or black canid of the south central United States. It was formerly called *C. niger* but may not be a distinct species separable from the gray wolf and coyote. It grows to a length of about 105–125 centimetres, excluding the tail, which is 33–43 centimetres long, and weighs about 14–37 kg. It is an endangered species; the total population in the 1970s appeared to be fewer than 100.

The largest known wolf, the dire wolf (*C. dirus*), was common in Western North America during the Pleistocene; it was half again as large as the modern gray wolf.

The coyote (q.v.), a North American canid, is sometimes called prairie, brush, or little, wolf. For other animals known as wolves but not of the genus *Canis, see* maned wolf; aardwolf; Tasmanian wolf.

The Antarctic wolf, now extinct, was a South American fox (q.v.) of the Falkland Islands.

Wolf, Christian, Freiherr von: see Wolff, Christian, Freiherr von.

Wolf, Friedrich August (b. Feb. 15, 1759, Hagenrode, near Nordhausen, Brandenburg—d. Aug. 8, 1824, Marseille), German classical scholar, considered the founder of modern philology, but best known for his *Prolegomena ad Homerum* (1795), which created the "Homer question" in its modern form.

Extremely precocious, Wolf learned Greek, Latin, and French as a child. He was largely self-taught when in 1777 he became the first

to be admitted to the University of Göttingen as a student of philology, then a minor branch of theology. From 1783 to 1806 he was prosessor at the University of Halle, where he raised philology to an independent branch of knowledge, and his intense lectures inspired a generation of students. Though the authorship of the Homeric poems had been questioned by some since antiquity, it was Wolf's *Prolegomena* that jolted scholars out of their acceptance of the ancient blind bard as the sole author of the *Iliad* and *Odyssey*. Wolf's theory that the poems were composed orally by more than one author and that their artistic unity was imposed on them at a later date opened the way to the modern understanding of epic tradition and the origins of poetry.

Wolf, Hugo (Philipp Jakob) (b. March 13, 1860, Windischgraz, Austria [now Slovenj Gradec, Yugos.]—d. Feb. 22, 1903, Vienna), composer who brought the 19th-century German lied, or art song, to its highest point of development.

Wolf studied at the Vienna Conservatory (1875–77) but had a moody and irascible temperament and was expelled from the conser-

Hugo Wolf, 1895

By courtesy of the Osterreichische Nationalbibliothek, Vienna

vatory following his outspoken criticism of his masters. In 1875 he met the composer Richard Wagner, from whom he received encouragement. He met Johannes Brahms in 1879, and from him also he received encouragement and the urging to broaden his musical focus and his career. He was also a friend of Gustav Mahler as a young man. In the late 1870s Wolf apparently contracted the syphilis that was to cripple and kill him. In the repeated relapses of the disease, Wolf would enter deep depressions and was unable to compose, but during remissions he was radiant and highly inspired. In 1883 Wolf became music critic of the Wiener Salonblatt; his weekly reviews provide considerable insight into the Viennese musical world of his day.

His early songs include settings of poems by J.W. von Goethe, Nikolaus Lenau, Heinrich Heine, and Joseph von Eichendorff. In 1883 he began his symphonic poem Penthesilea, based on the tragedy by Heinrich von Kleist. From 1888 onward he composed a vast number of songs on poems of Goethe, Eduard Friedrich Mörike, and others. The Spanisches Liederbuch, on poems of P.J.L. von Heyse and Emanuel von Geibel, appeared in 1891, followed by the Italienisches Liederbuch (part 1, 1892; part 2, 1896). Other song cycles were on poems of Henrik Ibsen and Michelangelo. His first opera, Corregidor (1895; composed on a story by Pedro Antonio de Alarcón), was a failure when it was produced at Mannheim in 1896; a revised version was produced at Strasbourg in 1898. His second opera, Manuel Venegas, also after Alarcón, remained unfin-

Wolf's reputation as a song composer resulted in the formation in his lifetime of Wolf societies in Berlin and Vienna. Yet the meagre income he derived from his work compelled him to rely on the generosity of his friends. In 1897, ostensibly following upon a rebuke

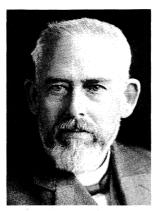

from Mahler but actually on account of growing signs of insanity and general paresis, he was confined to a mental home. He was temporarily discharged in 1898, but soon afterward he unsuccessfully attempted to commit suicide, and in October 1898 he requested to be placed in an asylum in Vienna.

Wolf wrote about 300 songs, many published posthumously. Of his first 100-from his early years—he only counted a handful worthwhile. But his output in the mature years was supremely original, in the finest tra-dition of the German lied. Wolf excelled at creating vocal melodic lines that express every emotional nuance of a given poetic text. The atmosphere of his songs ranges from tender love lyrics to satirical humour to deeply felt spiritual suffering. The vocal melodic line is subtly combined with strikingly original harmonies in the piano accompaniment, resulting in Wolf's remarkable fusion of music and speech. His instrumental works were more interesting for their underlying ideas than for their execution; they included the Italienische Serenade for orchestra (1892; a transcription of the serenade for string quartet of 1887).

Wolf, Max, in full MAXIMILLIAN FRANZ JOSEPH CORNELIUS WOLF (b. June 21, 1863, Heidelberg, Baden [Germany]—d. Oct. 3, 1932, Heidelberg), German astronomer who applied photography to the search for asteroids and discovered 228 of them.

Wolf showed an early interest in astronomy; he was only 21 years old when he discovered a comet, now named for him. In 1890 he was appointed *Privatdozent* (lecturer for fees) at the University of Heidelberg. One year later he adapted a camera to a motor-driven telescope to seek out asteroids. (All previous discoveries had been made one by one by direct observation.) Using a time exposure of the heavens, Wolf demonstrated that the faster moving asteroids would show up in the photograph as a short line rather than a point of light, which denoted a star.

In 1893 Wolf became director of the new Königstuhl Observatory and was appointed to an extraordinary professorship in astrophysics at Heidelberg; nine years later he was elected to the chair of astronomy at Heidelberg. Through his photographic studies he

Max Wolf

Archiv fur Kunst und Geschichte, Berlin

established the presence of dark clouds of interstellar matter in the Milky Way Galaxy, and he was the first to use the stereocomparator (a type of stereoscopic viewer), which greatly helps in discovery and identification of variable or moving objects in celestial photographs. In 1906 he discovered Achilles, the first of the Trojan Planets, two groups of asteroids that move around the Sun in Jupiter's orbit: one group 60° ahead of Jupiter, the other 60° behind.

Wolf, (Johann) Rudolf (b. July 7, 1816, Fällenden, near Zürich, Switz.—d. Dec. 6, 1893,

Zürich), Swiss astronomer and astronomical historian.

Wolf studied at the universities of Zürich, Vienna, and Berlin and in 1839 went to the University of Bern as a teacher of mathematics and physics; he became professor of astronomy there in 1844. In 1855 he accepted a professorship of astronomy at both the University of Zürich and the Federal Institute of Technology in Zürich. At his instigation an observatory was opened at Zürich in 1864.

Wolf confirmed S.H. Schwabe's discovery of a cycle in sunspot activity and by use of earlier records defined the cycle's length more accurately, at an average of 11.1 years. Wolf also correlated this solar cycle with the observations of the Earth's magnetism made by Johann von Lamont. In 1849 he devised a system, still in use, of gauging solar activity by counting sunspots and sunspot groups, which are known as Wolf's sunspot numbers.

Wolf Creek Crater, huge meteorite crater 65 miles (105 km) south of Halls Creek, Western Australia. It is on the edge of a little-explored desert and was first sighted from an airplane in 1937. It is 2,799 feet (853 m) in diameter and 151 feet (46 m) deep, with a rim standing 60–100 feet (18–30 m) above ground level. Only decayed meteoritic fragments have been found. It is considered an explosion crater because of its size.

Wolf-Ferrari, Ermanno (b. Jan. 12, 1876, Venice, Italy—d. Jan. 21, 1948, Venice), Italian operatic composer who followed both the comic and the realistic traditions.

The son of a German father and an Italian mother, Wolf-Ferrari studied music in Munich and then returned to Venice, where he became director of the Liceo Benedetto Marcello in 1902. He wrote Italian operas, of which five are based on the comedies of Carlo Goldoni. His humour, however, was Germanic rather than Italian, and most of his works were produced in Germany. His most successful comic operas, I quattro rusteghi (1906; The School for Fathers) and Il segreto di Susanna (1909; The Secret of Susanne), presented 18thcentury styles orchestrated in the manner of the 20th century. Comic points in these operas are delicately underlined. In Sly (1927; based on the opening scenes of The Taming of the Shrew) and in his only tragic opera, I gioielli della Madonna (1911; The Jewels of the Madonna), he was influenced by the realistic, or verismo, style of Pietro Mascagni. He also composed chamber, instrumental, and orchestral works and a violin concerto.

wolf herring (Chirocentrus dorab), species of fish belonging to the family Chirocentridae (order Clupeiformes). It is exclusively marine in habitat, occurring in the Indian Ocean and in the western Pacific to Japan and eastern Australia. In contrast to other herrings, which feed on plankton, wolf herrings are carnivorous, attacking and eating other fish. Their jaws are equipped with fanglike teeth for catching and holding prey. Otherwise, they superficially resemble members of the herring family, Clupeidae, having elongate, silvery bodies with forked tails. Because of their large size (average length about 1.5 m [5 feet]) and predatory habits, wolf herrings are a threat to many other species of fish.

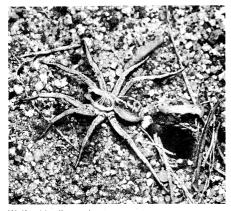

Wolf-Rayet star, any of a class of extremely hot, white stars having peculiar spectra thought to indicate either great turbulence within the star or a steady, voluminous ejection of material. A typical Wolf-Rayet star is several times the diameter of the Sun and thousands of times more luminous. Only a few hundred are known, located mostly in the spiral arms of the Milky Way Galaxy. The type was first distinguished in 1867 by the French as-

tronomers Charles-Joseph-Étienne Wolf and Georges-Antoine-Pons Rayet.

wolf snake, any of a number of nonvenomous members of the family Colubridae, named for enlarged teeth at the front of both jaws. Southeast Asian wolf snakes are placed in the genera Cercaspis and Lycodon; African species, in Lycophidion.

The Cape wolf snake (Lycophidion capense), abundant from Egypt to South Africa, is a small, drab species with a metallic sheen and lives chiefly on lizards. The Indian wolf snake (L. aulicus) is a small, brown, nocturnal serpent of southeastern Asia that eats mice, geckos and lizards.

wolf spider, also called GROUND SPIDER, or HUNTING SPIDER, any member of the spider family Lycosidae (order Araneida), a large and widespread group. They are named for the

Wolf spider (Lycosa)

Anthony Bannister from the Natural History Photographic Agency—EB Inc.

wolflike habit of chasing and pouncing upon prey. About 125 species occur in North America, about 50 in Europe. Numerous species occur north of the Arctic Circle. Most are small to medium sized. The largest has a body about 2.5 centimetres (1 inch) long and legs about the same length.

Most wolf spiders are dark brown. The hairy body is long and broad, with stout, long legs. Wolf spiders, noted for their running speed, are easily identified by the number and arrangement of the eyes: four small eyes in the lowest row, two very large eyes in a middle row, and two small or medium-sized eyes in a top row. The jaws are prominent and strong.

Wolf spiders, which commonly occur in grass or under stones, logs, or leaf litter, are especially active at night or if the sky is overcast. The eggs are contained in a gray silk sac attached to the female's spinnerets, or silk-producing organs, so that she appears to be dragging a large ball. After hatching, the young spiders ride on the mother's back for several days.

Most species build silk-lined, tubular nests in the ground. Some conceal the entrance with rubbish; others build a turret-like structure above it. A few species spin webs.

Wolf spiders of the genus *Pirata*, often found near ponds or streams, have a V-shaped pale mark on the back. The abdomen often has chevron-like marks and paired yellow spots. Thin-legged wolf spiders (*Pardosa*), which have a lens-shaped, greenish or gray egg sac, have relatively long legs with long spines on the "foot." Burrowing wolf spiders (*Geolycosa*), which spend most of their lives in burrows, have heavy front legs that are used for digging. The wolf spiders with the largest bodies are mostly of the genus *Lycosa*, a large group that includes *L. tarentula* of southern Europe (*see* tarantula).

Wolfcampian Stage, lowermost stage of the Lower Permian Series of rock strata in the United States, especially well developed in the Southwest. (The Permian Period began about 280,000,000 years ago and lasted about 55,000,000 years.) The stage name is derived from exposures in the Wolfcamp Hills in the Glass Mountains, Texas, where some 65 kilometres (40 miles) of exposures parallel the shoreline of the former Early Permian sea. There Wolfcampian strata exhibit varying thicknesses and complicated facies relationships in which coarse limestone conglomerates grade laterally into shales. Wolfcampian strata are more evenly bedded in the Hueco Mountains, where they occur as limestones and interbedded shales of the Hueco Formation. The Wolfcampian contains an abundant fusulinid fauna characterized by the genus Pseudoschwagerina, permitting worldwide correlation of Wolfcampian rocks with rocks elsewhere.

Wolfdietrich, Germanic hero of romance, who appears in the Middle High German poems of Ortnit and Wolfdietrich in Das Heldenbuch (see Heldenbuch, Das) as the son of Hugdietrich, emperor of Constantinople. Repudiated by his father, who mistakenly believes him illegitimate, he is brought up by the Emperor's faithful retainer Berchtung von Meran. Berchtung and his 16 sons support Wolfdietrich, who, after his father's death, is driven from his inheritance by his own brothers. After a long exile in Lombardy at the court of King Ortnit, the hero returns to liberate Berchtung's imprisoned sons and regain his kingdom. Among the exploits of Wolfdietrich is his killing of the dragon that had slain Ortnit.

The story of Wolfdietrich attached itself to the family of Clovis, king of the Franks. Some critics believe Hugdietrich to be the epic counterpart of Theodoric (Dietrich); the name might be a Latinized form of Hugo Theodericus, eldest son of Clovis. Wolfdietrich would thus represent Theodoric's son Theodebert (died 548), whose succession was disputed by his uncles. But father and son are merged by a process of epic fusion, so that Wolfdietrich appears to be the counterpart sometimes of Theodoric and sometimes of Theodebert.

The story of how Hugdietrich won his bride Hildburg, daughter of the King of Salonika, forms in one manuscript version a separate introduction to the Wolfdietrich romance.

Consult the INDEX first

Wolfe, Charles (b. Dec. 14, 1791, Dublin—d. Feb. 21, 1823, Queenstown, County Cork, Ire.), Irish poet and clergyman, whose "Burial of Sir John Moore" (1817), commemorating the commander of the British forces at the Battle of Corunna (La Coruña, Spain) during the Peninsular War, is one of the best known funeral elegies in English. Wolfe attended Trinity College, Dublin, was ordained in 1817, and held curacies in County Tyrone.

Wolfe, James (b. Jan. 2, 1727 [Dec. 22, 1726, old style], Westerham, Kent, Eng.—d. Sept. 13, 1759, Quebec), commander of the British Army at the capture of Quebec from the French (under the Marquis de Montcalm, 1759), a victory that led to British supremacy in Canada. The elder son of Lieut. Gen. Edward Wolfe, he was commissioned in the Royal Marines in 1741 but transferred almost immediately to the 12th Foot. After a distinguished military career in Europe, he served as brigadier general under Maj. Gen. Sir Jeffrey Amherst in an expedition against the French at Cape Breton Island (1758). The capture of Louisbourg, a fortress on the island, was largely attributed to Wolfe. He went back to England to restore his failing health but returned to America in 1759 as the choice of William Pitt to command the Quebec expedition. After a costly failure in the assault on the Beauport shore east of the city, Wolfe surprised the French on the Plains of Abraham, level fields near the upper part of the city. On September 13, after a battle lasting less than an hour, the French fled. Wolfe, wounded twice early in the battle, died of a third wound, but not before he knew Quebec had fallen to his troops. Montcalm survived him by only a few hours.

James Wolfe, painting attributed to J.S.C. Schaak; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Biographies of Wolfe include Francis Parkman's Montcalm and Wolfe (1855, reprinted 1964); Robin Reilly's The Rest to Fortune: The Life of Major General James Wolfe (1960); and W.T. Waugh's James Wolfe, Man and Soldier (1928).

Wolfe, Thomas (Clayton) (b. Oct. 3, 1900, Asheville, N.C., U.S.—d. Sept. 15, 1938, Baltimore), U.S. writer best known for his first novel, *Look Homeward, Angel* (1929).

His father, William Oliver Wolfe, the Old Gant of his novels, was a stonecutter of Pennsylvania descent, while his mother, Julia Elizabeth Westall Wolfe, the Eliza of the early novels, came from a family prominent in Appalachian North Carolina affairs. Educated privately, he entered the University of

Thomas Wolfe By courtesy of Charles Scribner's Sons

North Carolina in 1916, where he wrote and acted in several one-act plays. In 1920 he enrolled in George Pierce Baker's 47 Workshop at Harvard, intending to become a playwright. Several of his plays were produced at Harvard, including Welcome to Our City (1923), in which the town of Altamont (Asheville) first appeared. There, too, he began the play Mannerhouse (published 1948; never produced during his life). Look Homeward, Angel was successfully dramatized for Broadway in 1957.

In 1923 Wolfe left Harvard for New York City where, except for trips to Europe and elsewhere, he resided most of his life. Some of his stories, notably "Only the Dead Know Brooklyn," contain observations of city life. Still intending to be a playwright, he taught at the Washington Square College of New York University, described in several of his novels. In 1926, while abroad, he began work on what eventually became Look Homeward, Angel, in which he recounted the growth of an autobiographical protagonist, Eugene Gant, in the mountain town of Altamont. Its publication caused a great furor in Asheville. During the late 1920s he was the close friend of the theatrical designer Aline Bernstein, who appeared as Esther Jack in his last two novels, and who wrote of their friendship in the novel The Journey Down (1938).

After publication of Look Homeward, Angel, Wolfe quit teaching to write full time. Of Time and the River (1935) is perhaps the most turbulent of his books. The events of those years are described in his memoir, The Story of a Novel (1936), in which he describes his close working relation with the editor Maxwell Perkins to bring the enormous manuscripts of the first two works into manageable novelistic proportions.

Wolfe did not publish another novel during his lifetime, though at his death he left a prodigious quantity of manuscript, from which the editor Edward Aswell extracted two more novels, *The Web and the Rock* (1939) and *You Can't Go Home Again* (1940), and a collection of shorter pieces and chapters of an uncompleted novel, *The Hills Beyond* (1941). Wolfe's *Letters to His Mother* (1943) were also published, as well as his *Selected Letters* (1956). A large collection of Wolfe papers is preserved at Harvard.

Wolfenbüttel, city, Lower Saxony Land (state), northwestern Germany, on the Oker River, just south of Brunswick. First mentioned in 1118, it grew around the castle that became a favourite Welf residence c. 1283. Chartered in 1540, it was captured by the Protestant Schmalkaldic League in 1542 and was transferred to Brunswick in 1753–54. The old town has many Renaissance and Baroque half-timbered houses, including the house of Gotthold Lessing, the 18th-century critic and dramatist. Larger buildings include the castle residence of the duke of Brunswick-Wolfenbüttel and St. Mary's Church (1604–23). Wolfenbüttel's Herzog-August Library contains a notable collection of medieval manuscripts.

Industries include canning and the manufacture of agricultural machinery and chemical and musical equipment. Pop. (1989 est.) 50,-960

Wolfenden Report, a study containing recommendations for laws governing sexual behaviour, published in 1957 by the Committee on Homosexual Offences and Prostitution in Great Britain. Using the findings of psychoanalysis and social science, the report urged that public statutes avoid the attempt to legislate morality and that they concern themselves only with sexual acts that offend public decency or disrupt order. The committee therefore recommended that private homosexual liaisons between consenting adults be removed from the domain of criminal law. Legislation implementing these recommendations was enacted in the Sexual Offences Act (1967).

Wolff, Betje, in full ELIZABETH WOLFF-BEK-KER (b. July 24, 1738, Vlissingen, Neth.—d. Nov. 5, 1804, The Hague), Dutch writer and collaborator with Aagie Deken (q.v.) on the first Dutch novel, De historie van mejuffrouw Sara Burgerhart, 2 vol. (1782; "The History of Miss Sara Burgerhart").

Wolff, the daughter of a prosperous family, ran away with a naval officer at the age of

Betje Wolff, detail of an engraving by L. Portman after a drawing by A. Teerlink after a painting by P. Groenia

By courtesy of the Iconographisch Bureau, The Hague

17, only to return home in a few days, deeply hurt by the experience. In 1759 she married Adriaan Wolff, a minister more than 30 years her senior.

The first writing she did was classical poetry in imitation of Alexander Pope; she also wrote lyrical poetry and satire. She directed most of her satire at her conservative, provincial neighbours. From 1767 to 1769 Wolff contributed to the periodical Gryzaard. By the time she met Aagje Deken in 1776, she was a well-known and widely discussed writer. After the death of her husband, Wolff set up house with Deken. Five years later Sara Burgerhart, an epistolary novel inspired by Samuel Richardson's Pamela, was published. It was a realistic, subtly developed character study and included circumstances drawn from the lives of both women—particularly from Wolff's youthful adventure with the ensign.

After the success of Sara Burgerhart, the two women continued to work together, producing among other works three more epistolary novels. The nature and extent of their literary collaboration remains in dispute. Some critics, reflecting on Deken's mediocre output prior to Sara Burgerhart, maintain that Wolff was the principal author of the joint works. Wolff in fact had a far greater catalogue and reputation.

Wolff, Christian, Freiherr von (baron of), Wolff also spelled wolf (b. Jan. 24, 1679, Breslau, Silesia—d. April 9, 1754, Halle, Prussia), philosopher, mathematician, and scientist who worked in many subjects but who is best known as the German spokesman of the Enlightenment, the 18th-century philosophical movement characterized by Rationalism.

Wolff was educated at the universities of Breslau, Jena, and Leipzig and was a pupil of the philosopher and mathematician Gottfried Wilhelm Leibniz. On the recommendation of Leibniz he was appointed professor of mathematics at the University of Halle in 1707, but he was banished in 1723 as a result of theological disputes with Pietists, who were followers of the German movement for an increase of piety in Lutheran churches. He became pro-

Christian von Wolff, engraving by J.M. Bernigeroth, 1755

Archiv fur Kunst und Geschichte, Berlin

fessor of mathematics and philosophy at the University of Marburg, Hesse (1723–40), and, as science adviser to Peter the Great (1716–25), helped found the St. Petersburg Academy of Sciences in Russia. After returning to the University of Halle, at the request of the king of Prussia, Frederick II the Great, he became chancellor (1741–54).

Wolff wrote numerous works in philosophy, theology, psychology, botany, and physics. His series of essays all beginning under the title Vernünftige Gedanken ("Rational Ideas") covered many subjects and expounded Leibniz's theories in popular form. Wolff emphasized that every occurrence must have an adequate reason for happening or there arises the impossible alternative that something might come out of nothing. He applied the rational thought of the Anglo-French Enlightenment and of Leibniz and René Descartes in the development of his own philosophical system, the Wolffian philosophy. Rationalism and mathematical methodology formed the essence of this system, which was a major force in the development of German philosophical thought.

Wolff, Magda: see Lupescu, Magda.

Wolffian duct, also called ARCHINEPHRIC DUCT, one of a pair of tubes that carry urine from primitive or embryonic kidneys to the exterior or to a primitive bladder. In amphibians the reproductive system encroaches on the Wolffian duct; in some it carries both urine and sperm, but most amphibians develop a separate tube to carry urine from the kidney.

In advanced vertebrates the Wolffian duct develops in conjunction with the embryonic kidneys. The final kidney drains through the ureter, and the Wolffian duct develops into parts of the male reproductive system, such as the epididymis and the vas deferens.

wolffish, any of nine species of large, long-bodied blennies of the family Anarhichadidae (order Perciformes), found in northern

Wolf-eel (Anarhichthys ocellatus)
Douglas Faulkner

Atlantic and Pacific waters. Wolffishes are much larger than most other blennies, the largest species growing to a length of about 2.3 metres (7.5 feet). Wolffishes have a large head and a long, tapered body surmounted by a single, long dorsal fin. Their formidable teeth consist of large canines and heavy molars capable of handling a diet of crabs, starfishes, sea urchins, and other prey.

Wolffishes are found from the shoreline to depths of 300 metres or more. Known as

catfishes in Europe, they are taken there and in the United States for food. Species include the wolffish (Anarhichas lupus), a vertically banded North Atlantic species; the spotted wolffish, or spotted catfish (A. minor), also of the North Atlantic; and the wolf-eel (Anarhichthys ocellatus), a black-spotted form found in the eastern Pacific.

Wölfflin, Heinrich (b. June 21, 1864, Basel, Switz.—d. July 19, 1945, Basel), writer on aesthetics and the most important art historian of his period writing in German.

Wölfflin was educated at the universities of Basel, Berlin, and Munich. His doctoral thesis. Prolegomena zu einer Psychologie der Architektur (1886), already showed the approach that he was later to develop and perfect: an analysis of form based on a psychological interpretation of the creative process. He pursued this method in books particularly on the Renaissance and Baroque periods and on Dürer: Renaissance und Barock (1888); Die klassische Kunst (1899; The Art of the Italian Renaissance, 1913; Classic Art, 1952); and Die Kunst Albrecht Dürers (1905). His chief work was Kunstgeschichtliche Grundbegriffe (1915; Principles of Art History, 1932), which synthesized his ideas into a complete aesthetic system that was to become of great importance in art criticism.

Beginning with the aesthetic theories of his teacher, Jacob Burckhardt, and particularly his doctrine of "equivalents" in art, whereby visual and ideal values are seen as interchangeable, Wölfflin evolved the concept of "intuitive forms"—that is, the formal disposition of a picture in a manner common, generally speaking, to a particular period. In its turn, Wölfflin's school evolved from this the theory of "prefigurations," taking intuitive forms to include all types of artistic preparation, whether of form or of content. Thus the system formulated by Wölfflin can be applied also to modern abstract art.

Wölfflin's work as a professor at the universities of Basel (1893–1901), Berlin (1901–12), Munich (1912–24), and Zürich (1924–34) contributed greatly to the spread of his ideas.

wolfram: see tungsten.

Wolfram VON ESCHENBACH (b. c. 1170—d. c. 1220), German poet whose epic *Parzival*, distinguished alike by its moral elevation and

Wolfram von Eschenbach, miniature from the Heidelberger Liederhandschrift; in the University Library, Heidelberg, Ger.

By courtesy of the Universitatsbibliothek, Heidelberg, Ger.

its imaginative power, is one of the most profound literary works of the Middle Ages.

An impoverished Bavarian knight, Wolfram apparently served a succession of Franconian lords: Abensberg, Wildenberg, and Wertheim are among the places he names in his work. He also knew the court of the landgrave Hermann I of Thuringia, where he met the great medieval lyric poet Walther von der Vogelweide. Though a self-styled illiterate, Wolfram shows an extensive acquaintance with French and German literature, and it is probable that he knew how to read, if not how to write.

Wolfram's surviving literary works, all bearing the stamp of his unusually original personality, consist of eight lyric poems, chiefly Tagelieder ("Dawn Songs," describing the parting of lovers at morning); the epic Parzival; the unfinished epic Willehalm, telling the history of the crusader Guillaume d'Orange; and short fragments of a further epic, the so-called Titurel, which elaborates the tragic love story of Sigune from book 3 of Parzival.

love story of Sigune from book 3 of Parzival. Parzival, probably written between 1200 and 1210, is a poem of 25,000 lines in 16 books. Based on an unfinished romance of Chrétien de Troyes, Perceval, ou Le Conte du Graal, it introduced the theme of the Holy Grail into German literature. Its beginning and end are new material, probably of Wolfram's own invention, although he attributes it to an unidentified and probably fictitious Provençal poet, Guiot. The story of the simpleton Parzival, who sets out on his adventures without even knowing his own name, employs the classic fairy-tale motif of "the guileless fool" who, through innocence and artlessness, reaches a goal denied to wiser men.

Wolfram uses Parzival's dramatic progress from folk-tale dunce to wise and responsible keeper of the Grail to present a subtle allegory of man's spiritual education and development. Parzival also figures as the hero of Wagner's last opera, *Parsifal* (1882). The profundity of Wolfram's theme is matched by his language, which is rhetorical and complex and requires concentrated attention; his train of thought, too, is often original to the point of obscurity.

Wolfram's influence on later poets was profound, and he is a member, with Hartmann von Aue and Gottfried von Strassburg, of the great triumvirate of Middle High German epic poets.

wolframite, chief ore of tungsten, commonly associated with tin ore in and around granite. Such occurrences include Cornwall, Eng.; northwestern Spain and northern Portugal; eastern Germany; Myanmar (Burma); the Malay Peninsula; and Australia.

Wolframite consists of a mixture in varying proportions of the tungstates of iron and manganese, FeWO₄ and MnWO₄; varieties with dominant iron (Fe:Mn≥4:1) are called ferberite, and those with dominant manganese (Mn:Fe≥4:1) are called hübnerite. Wolframite's colour is brown to black, and it has a submetallic to metallic lustre and a perfect cleavage. The Mohs hardness is 5-5½; specific gravity, 7-7.5; and crystal system, monoclinic.

wolfsbane (plant): see monkshood.

Wolfsburg, city, Lower Saxony Land (state), northern Germany, on the Mittelland Canal, about 43 miles (70 km) east of Hannover, the state capital. A modern industrial community founded in 1938, it is dominated by the Volkswagen plant, where much of the working population is employed.

The village of Hesslingen, dating from c. 700, was the first settlement near the site of Wolfsburg; the town was first mentioned in 1132. There is a 14th-century castle. Pop. (1989 est.) 125.831.

Wolgemut, Michael: see Wohlgemuth, Michael.

Wolin, island off the northwestern coast of Poland, in Szczecin województwo (province), surrounded by the Baltic Sea on the north, the Dziwna River on the east, the Zalew (lagoon) Szczecinski on the south, and the Świna River on the west. Its area is 95 sq mi (245 sq km). The main towns are Wolin in the south and Międzyzdroje in the north. The central area contains the Wolin National Park.

Wolin, town and *powiat* (county) capital, is situated on the Dziwna. An ancient Slavic stronghold, the town is over 1,000 years old. In the 10th and 11th centuries it served as an important trade centre for the Oder Basin and was administered by Pomerania. The modern town was laid out in 1279. In 1630 it was seized by Sweden and passed to Prussia in 1730, becoming part of Poland in 1945. Pop. (1970) island, 17,763; town, 3,022.

Wollaston, Lake, lake, northeastern Saskatchewan, lying in the southern part of the Barren Grounds (a subarctic prairie region of northern Canada), 30 mi (50 km) northwest of Reindeer Lake. It is 70 mi long and 25 mi wide, has an area of 1,035 sq mi (2,681 sq km), and drains through two outlets: one northwestward through Fond du Lac River to Lake Athabasca and the Mackenzie River system, the other northeastward via Caochraine River to Reindeer Lake and the Churchill River system. Used as a link between the two river systems after it was discovered by Peter Fidler around 1800, Lake Wollaston was named (1821) by the explorer Sir John Franklin for William Hyde Wollaston (1766-1828), the English scientist. The lake is noted for commercial and sport fishing.

Wollaston, William (b. March 26, 1659, Coton Clanford, Staffordshire, Eng.—d. Oct. 29, 1724, London), British Rationalist philosopher and moralist, whose ethical doctrines influenced subsequent philosophy as well as that of his own time.

After studies at Cambridge, Wollaston became a schoolteacher in Birmingham (1682) and soon afterward was ordained a priest. In 1688 he inherited the major part of his family's fortune from a cousin and was able to move to London to devote his life to scholarship and philosophy. There he and his wife lived a secluded life among a few friends; he wrote prolifically, but his exaggerated standards of taste caused him to destroy many of his manuscripts. His penchant for literary elegance is evident from his major work, *The Religion of Nature Delineated* (1724).

Though some critics have seen seeds of some 20th-century ethical theories in his views, his theism was subjected to severe attacks by the end of the 18th century, notably by David Hume in his *Dialogues Concerning Natural Religion* (1779).

Wollaston, William Hyde (b. Aug. 6, 1766, East Dereham, Norfolk, Eng.—d. Dec. 22, 1828, London), British scientist whose original powder-metallurgy techniques served as a

William Hyde Wollaston, detail of a pencil drawing by J. Jackson; in the National Portrait Gallery, London

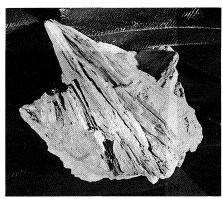

By courtesy of the National Portrait Gallery, London

model for the modern industrial processing of platinum, tungsten, molybdenum, and other transition metals. His studies of platinum also resulted in his discovery of two related elements, palladium (1803) and rhodium (1804).

Though he was formally educated as a physician, his great curiosity led him into the study of chemistry, physics, astronomy, and botany. His work with platinum, completed in 1804, came at a time when large quantities of platina (crude platinum) remained unused for lack of an efficient method of obtaining the pure metal in the malleable form valuable in chemical research and manufacture. The success of his method, which he kept secret until shortly before his death, yielded him financial independence for the rest of his life.

The amount and variety of his research made Wollaston one of the most influential scientists of his time. Of his 56 papers in chemistry, mineralogy, crystallography, physics, astronomy, botany, physiology, and pathology, many represented notable scientific advances. He anticipated the concept of the three-dimensional molecule by about 50 years, discovered the amino acid cystine, developed a goniometer for measuring crystal angles, and noted the dark (Fraunhofer) lines in the solar spectrum. The mineral wollastonite is named for him.

wollastonite, white, glassy silicate mineral that commonly occurs as masses or tabular crystals with other calcium-containing silicates (e.g., diopside, tremolite, garnet, and epidote) in metamorphosed limestones. Deposits are found in Ciclova Romînă, Rom.; Monte Somma, Italy; and Pargas, Fin. Occurrences in the United States include Utah; Isle Royale,

Wollastonite from Utah

Mich.; Riverside, Calif.; and Essex County, N.Y., where it is mined. For detailed physical properties, *see* silicate mineral (table).

Wollastonite, the commonest of the three forms of calcium silicate, CaSiO₃, is used in many ceramic products, including floor and wall tiles, electrical insulators, and porcelain fixtures. It is also used in welding rod coatings and in paints.

Wollega (Ethiopia): see Welega.

Wollo (Ethiopia): see Welo.

Wollomombi Falls, set of two cataracts on the Wollomombi River, a headstream of the Macleay River, in northeastern New South Wales, Australia. The falls lie 22 mi (35 km) east of Armidale in the New England Range of the Eastern Highlands. The falls rank among the highest in the world, with an uninterrupted leap of 1,100 ft (335 m) and a total fall of 1,580 ft.

Wollongong, city, coastal New South Wales, Australia, in the Illawara district. The village of Wollongong (founded 1816) became a town in 1843, a municipality in 1859, and a city in 1942. It was amalgamated with other municipalities and shires in 1947 to form the City of Wollongong, which extends for 30 mi (48 km) along the coast and occupies 276 sq mi (715 sq km). Originally dependent upon grazing and lumbering, the area early became the focus of prosperous dairy farming.

Heavy industries have been increasingly attracted by the rich Bulli coal deposits; much of the coal is exported. Wollongong manufactures metallurgical products, including steel, refined copper, and brass as well as bricks, fertilizers, machinery, processed foods, chemicals, clothing, and coke. A fishing fleet operates from the artificial harbour of Port Kembla. Linked to Sydney (40 mi north) by road and rail, it is the site of the University of Wollongong (until 1975, Wollongong College of the University of New South Wales) and a college of technical and further education. Pop. (1981 est.) 208,651.

Wollstein, Martha (b. Nov. 21, 1868, New York City—d. Sept. 30, 1939, New York City), U.S. physician and investigator in pediatric pathology

atric pathology.
Wollstein graduated from the Woman's Medical College of the New York Infirmary in 1889. In 1890 she joined the staff of the Babies Hospital in New York City, where she was appointed pathologist in 1892. Her first experimental work involved infant diarrhea and confirmed earlier studies relating the dysentery bacillus to the disease. Her study brought her to the attention of the Rockefeller Institute of Medical Research in New York City, where she collaborated on the first experimental work on polio in the United States. There she also worked on an early investigation of pneumonia and developed, with Harold Amoss, a method for preparing antimeningitis serum. She also pioneered in early research on mumps, indicating, though not proving, its viral nature.

After 1921, Wollstein investigated pediatric pathology at the Babies Hospital, especially jaundice, congenital anomalies, tuberculosis, meningitis, and leukemia. Her publications and reports during that period are considered her greatest contribution, for she deeply influenced the physicians affiliated with the hospital during her tenure there. Wollstein published 80 scientific papers during her lifetime.

Wollstonecraft, Mary (b. April 27, 1759, London—d. Sept. 10, 1797, London), English writer, noted as a passionate advocate of educational and social equality for women. Her early Thoughts on the Education of Daugh-

Mary Wollstonecraft, miniature by Reginald Easton, after 1841; in the Bodleian Library, Oxford By courtesy of the curators of the Bodleian Library, Oxford

ters (1787) foreshadowed her mature work on woman's place in society, A Vindication of the

Rights of Woman (1792); the core of the Vindication is educational, and its central plea is for the illumination of woman's mind.

Wollstonecraft worked for the London publisher James Johnson, but in 1792 she left England to observe the French Revolution in Paris, where she passed as the wife of an American, Capt. Gilbert Imlay. In the spring of 1794 she gave birth to a daughter, Fanny. The following year, distraught over the breakdown of her relationship with Imlay, she attempted suicide.

She returned to London to work again for Johnson and became one of the influential radical group that centred upon his home and that included William Godwin, Thomas Paine, Thomas Holcroft, William Blake, and, after 1793, William Wordsworth. In 1796 she began a liaison with Godwin, and on March 29, 1797, Mary being pregnant, they were married. The marriage was happy but brief; Mary Wollstonecraft died 11 days after the birth of her second daughter, Mary (see Shelley, Mary Wollstonecraft).

The life of Mary Wollstonecraft has always been of interest to biographers, beginning with her husband. Biographies in the 19th century tended to emphasize the scandalous aspects of her life at the expense of the intellectual. With the renewed interest in women's rights in the later 20th century, she became the subject of a number of books, among them *One Woman's "Situation"* (1970), by Margaret George; *Mary Wollstonecraft* (1972), by Eleanor Flexner; and *The Life and Death of Mary Wollstonecraft* (1975), by Claire Tomalin.

Wolof, also spelled OUOLOF, a Muslim people of Senegal and The Gambia speaking a language of the West Atlantic branch of the Niger-Congo family.

The typical rural community is small (about 100 persons). Most Wolof are farmers, growing groundnuts (peanuts) as a cash crop and millet and sorghum as staples; many, however, live and work in Dakar and Banjul as traders, goldsmiths, tailors, carpenters, teachers, and civil servants. Traditional groups were characterized by a markedly hierarchical social stratification, including royalty, an aristocracy, a warrior class, commoners, slaves, and members of despised artisan castes; at their head was a paramount chief.

The Wolof have traditionally observed double descent; *i.e.*, descent has been traced through both the male and female lines. Islamic influence, however, has tended to make the male line dominant. A household unit may consist of a nuclear family (husband, wife, and minor children) or a polygynous family (a husband, his several wives, and their children); other close kin may, however, sometimes be found together with the nuclear family. Wolof women are renowned for their elaborate hair styles, abundant gold ornaments, and voluminous dresses.

Wolof empire, also spelled OUOLOF (fl. 14th-16th century), state that dominated what is now inland Senegal during the early period of European contact with West Africa. Founded soon after 1200, the Wolof state was ruled by a king, or burba, whose duties were both political and religious. During the 14th century, it began to develop satellite states, of which the most important was Cayor. During the 15th century Wolof was a powerful empire, on the border of which lay the tributary state of Sine-Solum, ruled by the Serer, a kindred people to the Wolof.

With the advent of the Portuguese in c. 1440, the Wolof were drawn first into a profitable trading partnership and then into a political alliance—though they remained sufficiently independent to repel Portugal's more blatant

attempts at infiltration.

In 1556 the nobles of Cayor threw off Wolof domination and established an independent state of their own on the Senegal coast. This action cut off Wolof's access to the sea and to the European trade; its importance subsequently declined.

Wolseley, Garnet Joseph Wolseley, 1st Viscount (b. June 4, 1833, Golden Bridge, County Dublin, Ire.—d. March 26, 1913, Mentone, Fr.), British field marshal who saw service in battles throughout the world and was instrumental in modernizing the British Army.

Entering the army as second lieutenant in 1852, he fought with distinction in the Second Anglo-Burmese War, the Crimean War, and the Indian Mutiny. Surviving many wounds, which cost him the sight of one eye, Wolseley became at 25 the youngest lieutenant colonel in the British Army. As a staff officer under Sir James Hope Grant, he sailed to China in 1860. His planning and deeds are described in his Narrative of the War with China in 1860 (1862).

Late in 1861 the U.S. seizure of two Confederate agents on the British ship "Trent" created a temporary crisis. Wolseley was then sent to Canada to improve that colony's defenses in case of war with the United States. In 1870 he led the Red River expedition through 600 miles of wilderness to suppress the rebel Louis Riel, who had proclaimed a republic in Manitoba. Success in the field and dedication

Wolseley, detail of a painting by A. Bernard, 1880; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

to improvement of the service, as revealed in his *Soldier's Pocket-book for Field Service* (1869), led to his appointment (May 1871) as assistant adjutant general at the War Office.

A highly efficient commander with an admiring public, Wolseley was employed by successive governments as chief troubleshooter of the Empire. In 1873 he was sent to West Africa to lead a punitive expedition against the Ashanti kingdom, resulting in the destruction of its capital at Kumasi. Two years later he was sent to Natal in southern Africa to induce the colonists to surrender some of their political rights to promote federation in South Africa. When calamity struck the British forces battling the Zulus in 1879, Wolseley was given command in South Africa. After restoring order in Zululand, he moved on to the Transvaal, where he discouraged rebellion among the Boers.

Returning to the War Office, first as quartermaster general (1880) and then as adjutant general (1882), he devoted himself to reform until interrupted by a nationalist uprising in Egypt under 'Urabī Pasha. In his most brilliant campaign, Wolseley swiftly seized the Suez Canal and, after a night march, surprised and defeated 'Urabī at Tall al-Kabīr (Sept. 13, 1882). Gladstone rewarded him with a barony. Back in Egypt in 1884, he organized

and headed an expedition to the Nile to rescue his friend Gen. Charles "Chinese" Gordon, besieged at Khartoum in the Sudan. An advance party arrived on Jan. 28, 1885, two days after the city had fallen and Gordon had been killed. For his efforts, Wolseley was elevated to viscount. (The title devolved on his only daughter upon his death.)

After serving as commander of the troops in Ireland (1890–94), he became a field marshal and commander in chief of all Britain's forces (1895–1901). In that office his greatest contribution was in mobilizing the army with characteristic thoroughness for the South African War (1899–1902).

Two biographies are *The Life of Lord Wolseley* (1924) by Sir George Arthur and Sir F. Maurice and *The Model Major-General: A Biography* of *Field Marshal Lord Wolseley* (1964) by J.H. Lehmann.

Wolsey, Thomas, Cardinal (b. c. 1475—d. Nov. 29, 1530, Leicester, Leicestershire, Eng.), cardinal and statesman who dominated the government of England's King Henry VIII (ruled 1509–47) from 1515 to 1529. His un-

Wolsey, detail of a painting by Sampson Strong, 1526; in Christ Church, Oxford

popularity contributed, upon his downfall, to the anticlerical reaction that was a factor in the English Reformation.

The son of a butcher from Ipswich, Suffolk, Wolsey was educated at the University of Oxford. In 1498 he was ordained a priest, and five years later he became chaplain to Sir Richard Nanfan, deputy lieutenant of Calais, who recommended him to King Henry VII (ruled 1485–1509). When Nanfan died in 1507 Wolsey became Henry VII's chaplain and, shortly before the King's death in April 1509 he was appointed dean of Lincoln. His energy and self-confidence soon won him the favour of Henry VII's son and successor, Henry VIII.

Appointed royal almoner in November 1509, Wolsey easily persuaded the pleasure-loving young monarch to surrender more and more of the unwelcome cares of state. The ties between the two men became particularly close after Wolsey organized Henry's successful expedition against the French in 1513. On Henry's recommendation Pope Leo X made him bishop of Lincoln (February 1514), archbishop of York (September 1514), and cardinal (1515). In December 1515 Wolsey became lord chancellor of England. Three years later the Pope appointed him a special papal representative with the title legate a latere. Wolsey used his vast secular and ecclesiastical power to amass wealth second only to that of the

The first priority for both Wolsey and Henry was to make England the arbiter of power in Europe. At that time western Europe was split into two rival camps, with France, England's traditional enemy, on the one side and the Holy Roman Empire of the Habsburgs on the other. Wolsey attempted to make peace with France by promoting a European-wide peace treaty in 1518 and by arranging meetings between Henry and the French king Francis I

and between Henry and the emperor Charles V in 1520. Nevertheless, war broke out between France and the Empire in 1521, and two years later Wolsey committed English troops against France. In order to finance this campaign Wolsey raised taxes, thereby arousing widespread resentment. In 1528 he sided with the French against Charles, but by August 1529 France and the Emperor had made peace, and England was diplomatically isolated.

Although Wolsey had obtained his legatine commission with the intent of reforming the English Church, his incessant diplomatic activities left him little time for ecclesiastical concerns. Besides, he was worldly, greedy for wealth, and unchaste—he had an illegitimate son and daughter. Nevertheless, he did at least propose some monastic reforms and even suppressed about 29 monasteries, mainly to obtain the revenues he needed to found Cardinal's College (later Christ Church) at the University of Oxford.

Wolsey's influence on England's judicial institutions was far more substantial. Possessed of a great legal mind, he extended the jurisdiction of the Star Chamber—the King's Council sitting as a court—and used it to impose Henry's justice on lawless nobles. The conciliar committee that he delegated to hear suits involving the poor soon evolved into the Court of Requests (1529).

The immediate cause of Wolsey's fall from power was his failure to persuade Pope Clement VII to grant Henry an annulment of his marriage to Catherine of Aragon. There had long been a party of nobles who hated the lowborn, overbearing cardinal. When his final attempt to obtain the annulment collapsed in July 1529, these enemies easily turned the King against him. In October Wolsey was indicted on a praemunire charge of having overstepped his legatine authority. Stripped of all his offices and preferments except York, he left London for York in April 1530. Nevertheless, Henry was led to believe that he was conspiring to recover his position. Wolsey was arrested on November 4 on charges of treason (for corresponding with the French court), but he died at the end of the month while on his way south to face the King.

Wolstonian Glacial Stage: see Gipping Glacial Stage.

Wolverhampton, district (borough), metropolitan county of West Midlands, England, with an area of 27 sq mi (69 sq km). It lies on the northwestern perimeter of the industrial "Black Country," near the farmlands of Shropshire and Staffordshire. The early town was mainly an agricultural centre. With the development of the Staffordshire coal and ironstone deposits, Wolverhampton became known for its metal manufactures, especially from the 18th century.

A wide range of products is produced today, including paints and rubber tires, as well as the output of the metal foundries. The town centre has been transformed by the construction of two large traffic-free shopping precincts. Wolverhampton has many nonwhite immigrants from Commonwealth nations. Pop. (1983 est.) 255,400.

wolverine, also called GLUTTON, CARCAJOU, or SKUNK BEAR (Gulo gulo, or sometimes G. luscus in North America), member of the weasel family (Mustelidae) that lives in cold northern latitudes, especially in timbered areas, around the world. It resembles a small, squat, broad bear 65–90 centimetres (26–36 inches) long, excluding the bushy, 13–26-cm tail; shoulder height is 36–45 cm, and weight is 9–30 kilograms (20–66 pounds). The legs are short, somewhat bowed; the soles, hairy;

Wolverine (Gulo gulo) Alan G. Nelson-Root Resources

the semiretractile claws, long and sharp; the ears, short; and the teeth, strong. The coarse, long-haired coat is blackish brown with a light brown stripe extending from each side of the neck along the body to the base of the tail. It has anal glands that secrete an unpleasantsmelling fluid.

The wolverine is noted for its strength, cunning, fearlessness, and voracity. It may follow traplines to cabins and devour food stocks or carry off portable items; its offensive odour permeates the invaded cabin. It is a solitary, nocturnal hunter, preying on all manner of game and not hesitating to attack sheep, deer, or small bears. No animal except humans hunts the wolverine. Its fur is valued for trimming parkas, as frost and frozen breath can easily be brushed off the smooth hairs. Solitary during most of the year, the wolverine has a short courtship in February or March. A litter contains one to five young, which are born in late spring and are cared for until late summer; the female's gestation period is about nine months.

woman suffrage, the right of women by law to vote in national and local elections.

The question of women's voting rights became an issue in the 19th century, and the struggle was particularly intense in Great Britain and the United States; but these countries were not the first to grant women the right to vote, at least not on a national basis. By the early years of the 20th century, women had won the right to vote in national

British suffragette under arrest after participating in an attack on Buckingham Palace, London, in 1914

elections in New Zealand (1893), Australia (1902), Finland (1906), and Norway (1913). In Sweden and the United States, they had voting rights in some local elections.

World War I and its aftermath speeded up the enfranchisement of women in the countries of Europe and elsewhere. In the period 1914-39, women in 28 additional countries acquired either equal voting rights with men or the right to vote in national elections. These countries included Soviet Russia (1917); Canada (1918); Germany, Austria, Poland, and Czechoslovakia (1919); the United States and Hungary (1920); Great Britain (1918 and 1928); Burma

(1922); Ecuador (1929); South Africa (1930); Brazil, Uruguay, and Thailand (1932); Turkey and Cuba (1934); and the Philippines (1937). In many of these countries, women were initially granted the right to vote in municipal or other local elections or perhaps in provincial elections; only later were they granted the vote in national elections.

Immediately after World War II, France, Italy, Romania, Yugoslavia, and China had been added to the group. Full suffrage for women was introduced in India by the constitution in 1949; in Pakistan women received full voting rights in national elections in 1956. In another decade the total had reached more than 100, partly because nearly all countries that gained independence after World War II guaranteed equal voting rights to men and women in their constitutions. By 1971 Switzerland allowed women to vote in federal and most cantonal elections, and in 1973 women were granted full voting rights in Syria. Women continue to be denied voting rights in the conservative Arab countries bordering the Persian Gulf. The United Nations Convention on the Political Rights of Women, adopted in 1952, provides that "women shall be entitled to vote in all elections on equal terms with men, without any discrimination.

Historically, the United States and the United Kingdom provide characteristic examples of the struggle for woman suffrage in the 19th and 20th centuries. From the founding of the United States, women were almost universally excluded from voting. The movement for woman suffrage started in the early 19th century during the agitation against slavery. Such women as Lucretia Mott showed a keen inter-

est in the antislavery movement and proved to be admirable public speakers. When Elizabeth Cady Stanton joined the antislavery forces, she and Mott decided that the rights of women, as well as those of black slaves, needed redress. In July 1848 they issued a call for a convention to discuss the issue of women's rights; this convention met in Stanton's hometown, Seneca Falls, N.Y., on July 19-20, 1848, and issued a declaration that called for woman suffrage and for the right of women to educational and employment opportunities. (See Seneca Falls Convention.) It was followed in 1850 by the first national convention of the women's movement, held in Worcester, Mass., by Lucy Stone and a group of prominent Eastern suffragists. Another convention, this one held in Syracuse, N.Y., in 1852, was the occasion of the first joint venture between

Stanton and the dynamic suffragist leader Susan B. Anthony; together these two figures led the American suffragist movement for the next 50 years. Other woman suffrage conventions were held

as the movement gained its first mass strength, but at first no way of extending the vote to women was known except by amendments to the constitutions of the various states. Several attempts were made in this regard after the American Civil War (1861-65), but even though the Territory of Wyoming granted women the right to vote in all elections in 1869, it soon became apparent that an amendment of the federal Constitution would be a preferable plan. Accordingly, the National Woman Suffrage Association was formed in 1869 with the declared object of securing the ballot for women by an amendment to the Constitution. Anthony and Stanton were the leaders of this organization, which held a convention every year for 50 years after its founding. In 1869 another organization, the American Woman Suffrage Association, was founded by Lucy Stone with the aim of securing woman suffrage by securing amendments to that effect in the constitutions of the various states. In 1890 the two organizations united under the name of the National American Woman Suffrage Association and worked

together for almost 30 years.

When Wyoming entered the Union in 1890, it became the first state whose constitution accorded women the right to vote. Subsequently, vigorous campaigns were conducted to persuade state legislatures to submit to their voters amendments to state constitutions conferring full suffrage to women in state affairs. Efforts were also made to give women the right to vote in presidential elections and, in some states, the right to vote in municipal and local elections. In the next 25 years, various individual states yielded to the movement's demands and enfranchised their women; each such state increased the members of Congress elected partly by women. These members were thus at least partly obliged by the nature of their constituency to vote for a woman suffrage amendment to the United States Constitution. By 1918 women had acquired equal

suffrage with men in 15 states.

World War I, and the major role played in it by women in various capacities, broke down the remaining opposition to woman suffrage in the United States. Amendments to the federal Constitution concerning woman suffrage had been introduced into Congress in 1878 and 1914, but the 1878 amendment had been overwhelmingly defeated, and the 1914 amendment had narrowly failed to gain even a simple majority of the votes in the House of Representatives and the Senate (a two-thirds majority vote in Congress was needed for the amendment to be sent to the state legislatures for ratification). By 1918, however, both major political parties were committed to woman suffrage, and the amendment was carried by the necessary two-thirds majorities in both the House and Senate in January 1918 and June 1919, respectively. Vigorous campaigns were then waged to secure ratification of the amendment by two-thirds of the state legislatures, and on Aug. 18, 1920, Tennessee became the 36th state to ratify the amendment. On August 26 the 19th Amendment was proclaimed by the secretary of state as being part of the Constitution of the United States. Women in the United States were enfranchised on an equal basis with men.

In Great Britain, woman suffrage was first advocated by Mary Wollstonecraft in her book A Vindication of the Rights of Woman (1792) and was demanded by the Chartist movement of the 1840s. The demand for woman suffrage was increasingly taken up by prominent liberal intellectuals in England from the 1850s on, notably by John Stuart Mill and his wife, Harriet. The first woman suffrage committee was formed in Manchester in 1865, and in 1867 Mill presented to Parliament this society's petition, which demanded the vote for women and contained about 1,550 signatures. The Reform Bill of 1867 contained no provision for woman suffrage, but meanwhile woman suffrage societies were forming in most of the major cities of Britain, and in the 1870s these organizations submitted to Parliament petitions demanding the franchise for women and containing a total of almost 3,000,000 signatures.

The succeeding years saw the defeat of every major suffrage bill brought before Parliament. This was chiefly because neither of the leading politicians of the day, William Gladstone and Benjamin Disraeli, cared to affront Queen Victoria's implacable opposition to the women's movement. In 1869, however, Parliament did grant women taxpayers the right to vote in municipal elections, and in the ensuing decades women became eligible to sit on county and city councils. The right to vote in parliamentary elections was still denied to women, however, despite the considerable support that existed in Parliament for legislation to that effect. In 1897 the various suffragist societies united into one National Union of

Women's Suffrage Societies, thus bringing a greater degree of coherence and organization to the movement. Out of frustration at the lack of governmental action, however, a segment of the woman suffrage movement became more militant under the leadership of Emmeline Pankhurst and her daughter Christabel. After the return to power of the Liberal Party in 1906, the succeeding years saw the defeat of seven suffrage bills in Parliament. As a consequence, many suffragists became involved in increasingly violent actions as time went on. These women militants, or suffragettes, as they were known, were sent to prison and continued their protests there by engaging in hunger strikes. Meanwhile, public support of the woman suffrage movement grew in volume, and public demonstrations, exhibitions, and processions were organized in support of women's right to vote. When World War I began, the woman suffrage organizations shifted their efforts to aiding the war effort, and their effectiveness did much to win the public wholeheartedly to the suffragist cause. The need for the enfranchisement of women was finally recognized by most members of Parliament from all three major parties, and the resulting Representation of the People Act was passed by the House of Commons in June 1917 and by the House of Lords in February 1918. Under this act, all women aged 30 or over received the complete franchise. An act to enable women to sit in the House of Commons was enacted shortly afterward. In 1928 the voting age for women was lowered to 21 to place women voters on an equal footing with male voters.

womb (anatomy): see uterus.

wombat, either of the two species of Australian mammals constituting the family Phascolomyidae, or Vombatidae, of the superorder Marsupialia. They are virtually tailless animals, 70 to 120 cm (28 to 47 inches) long and of heavy, woodchucklike build. Unlike other marsupials they have continuously growing, rootless teeth; the incisors are rodentlike. The eyes are small, and the ears are rather short. The pouch opens rearward. Wombats bear one young at a time, which develop in the pouch five months or longer.

Wombats are chiefly nocturnal and strictly herbivorous, eating grasses and the inner bark of tree and shrub roots. They make a grassy nest at the end of a large underground burrow, which may be 30 m (100 feet) long. Wombats are considered pests because they dig in cultivated fields and pastures and because their burrows harbour rabbits.

The common wombat (*Phascolomis*, or *Vombatus*, *ursinus*) has coarse dark hair and small

Common wombat (Vombatus ursinus)
Warren Garst—Tom Stack and Associates

ears. It occurs in southeastern Australia and Tasmania; the mainland population is sometimes called *V. hirsutus*. The rare Queensland hairy-nosed wombat (*Lasiorhinus barnardi*) has fine grizzled fur and longer ears; it is protected by law, and most of the population lives within a national park.

women's liberation movement, also called FEMINIST MOVEMENT, social movement that seeks equal rights for women, giving them equal status with men and freedom to decide their own careers and life patterns.

Concern for women's rights dates from the Enlightenment, when the liberal, egalitarian, and reformist ideals of that period began to be

extended from the bourgeoisie, peasants, and urban labourers to women as well. The period's nascent ideas concerning women's rights were fully set forth in Mary Wollstonecraft's A Vindication of the Rights of Woman, published in England in 1792, which challenged the idea that women exist only to please men and proposed that women receive the same opportunities as men in education, work, and politics. In the 19th century, however, the awareness of women's need for equality with men crystallized in the movement to obtain woman suffrage (q, v), rather than in any fundamental or far-reaching reevaluation of women's social status, roles, and their place in the economy. In the later 19th century a few women began to work in the professions, and women as a whole achieved the right to vote in the first half of the 20th century. but there were still distinct limits on women's participation in the workplace, as well as a set of prevailing notions that tended to confine women to their traditional roles as wives, mothers, and homemakers.

Meanwhile, the economic conditions underlying women's inferior (or at least dependent) status were changing as women had fewer children and as household appliances freed them from many of the labour-intensive chores formerly associated with housekeeping. The growth of the service sector in the Western world's economies in the decades following World War II also helped create new types of jobs that could be done as well by women as by men. All these factors made growing numbers of women aware that society's traditional notions of them had failed to change as rapidly as women's actual living conditions had. In addition, the Civil Rights movement in the United States during the 1960s inspired women to try to obtain better conditions for themselves through similar campaigns of mass agitation and social criticism.

A milestone in the rise of modern feminism was Simone de Beauvoir's book Le Deuxième Sexe (1949; The Second Sex), which became a worldwide best-seller and raised feminist consciousness by appealing to the idea that liberation for women was liberation for men too. Another major work was The Feminine Mystique, published in 1963 by Betty Friedan, an American. She attacked deadening domesticity—the conditioning of women to accept passive roles and depend on male dominance. In 1966 Friedan and other feminists founded the National Organization for Women. Other women's organizations for equal rights proliferated in the United States and in western Europe immediately thereafter. These organizations sought to overturn laws and practices that enforced the inferior status of women by discrimination in such matters as contract and property rights, employment and pay issues, and management of earnings and in matters related to sex and childbearing (i.e., contraception and abortion).

More broadly, the growing feminist movement sought to change society's prevailing stereotypes of women as relatively weak, passive, and dependent individuals who are less rational and more emotional than men. Feminism sought to achieve greater freedom for women to work and to remain economically and psychologically independent of men if they chose. Feminists criticized society's prevailing emphasis on women as objects of sexual desire and sought to broaden both women's selfawareness and their opportunities to the point of equality with men. Another of feminism's aims was to advance women's participation in political decision-making and all areas of public life.

The goals of the women's liberation movement have varied widely from country to country. In the United States, where the feminist movement was the strongest, reaching its peak in the 1970s, feminists concentrated their efforts on the passage of the Equal

Rights Amendment (q.v.). Feminists in the United States and western Europe agitated against mass-media presentations of women that seemed biased, stereotypical, or discriminatory. In parts of Africa, feminists' goals may be more basic—such as removal of the bride-price. In the Muslim Middle East, they may seek relaxation of the dress code and the code of seclusion. In many countries they may decry the wife's need to get her husband's permission to sign a contract or bring a lawsuit. For information on the political, educational, and economic status of women in various countries, see the Table.

wondjina style, also spelled WANDJINA, depiction in Australian cave paintings of figures that represent mythological beings associated with the creation of the world. Called wondjina figures, the images are believed by modern Aborigines to have been painted by the Wondjinas, prehistoric inhabitants of the Kimberley region in northwest Australia, the only area where cave paintings in the wondjina style have been found. It is believed that in the very early days of the world, the mythical Wondjinas created a home for the Aborigines in this area. When each Wondjina completed his terrestrial responsibilities, he painted his image on the cave wall and descended into a nearby waterhole, which has remained his home to the present day. Annually, however, he must renovate his painting to ensure the onset of the rainy season that will bring fertility, plentiful crops, and health. If the Wondjina vanishes, leaving his painting to fade, hunger and drought will be the natural result. In reality, it is expected that the wondjina image will be renewed by the oldest living member supposedly descended from its originator.

Monumental and ghostlike, the figures are without mouths, as was common in cave paintings of central and northern Australia, and the enlarged face is always painted white. The head is usually surrounded with a red halo or horseshoe motif with lines radiating outward. The limbs of the figures are portrayed in a summary manner, and the feet are often shown as footprints, an indication of the importance a hunting culture places on the identifying track. Smaller, incomplete wondjina figures sometimes accompanying the main image seem to represent children of the Wondjina or the spirits of human beings descended from these mythical ancestors.

The wondjina figures have a predominately white and ochre coloration because they are thought to contain the essence of water and blood. Water, which is necessary if living things are to grow, is symbolized by the white face. The red blood of men's strength is represented by the red halo surrounding the head.

wongar (mythology): see Dreaming, the.

Wonhyŏ Daisa, also called wonhyŏ (b. 617, Korea—d. 686, Korea), Buddhist priest who is considered the greatest of the ancient Korean religious teachers and one of the Ten Sages of the Ancient Korean Kingdom.

A renowned theoretician, Wonhyŏ was the first to systematize Korean Buddhism, bringing the various Buddhist doctrines into a unity that was sensible to both the philosophers and the common people. The comprehensibility of his doctrines is seen in the five commandments he formulated for the people to follow in order to achieve Nirvāṇa. These commandments are noteworthy not only for the systematic way in which they show how to achieve the final land of true peace, unity, and freedom but also for their common-sense approach to the everyday problems of achieving spiritual harmony.

Wonhyo's realization of the need to practice a life that maintained harmony between the ideal and the real is illustrated by an anecdote that tells how he, as a priest, assumed to be practicing asceticism, one night slept with a beautiful royal princess. Rather than chastise himself the next morning, he merely admitted that true spirituality was obtained not by pursuing unreal ends but by admitting the limitations of one's person. He is said to have led the people in dancing and singing in the streets in order to demonstrate how to lead this harmonized life of the present and the eternal.

His works had profound influence on Chinese and Japanese as well as on Korean Buddhists. Most famous among them are "A Commentary on the Awakening of Faith in the Mahāyāna," "A Commentary on the Avataṃsaka-sūtra," "A Study on the Diamond Samādhi Sūtra," and "The Meaning of Two Desires."

Woni (people): see Hani.

Wŏnju, city, Kangwŏndo (province), northcentral South Korea. Historically, its location in the eroded basin of the T'aebaek Mountains on the South Han River has been militarily strategic. After the Korean War (1950–53), it developed as a military base.

Wönju, a transportation junction, is connected with Seoul, Pusan, and Taegu by rail and road and is a market and processing centre for forest products from the nearby mountains. Most of the city's other industries are related to military use. Traditional lacquerware from the vicinity, made with inlaid mother-of-pearl, is famous. Pop. (1985 prelim.) 151,372.

Wŏnsan, city, southeastern North Korea. Situated on the coast of the Sea of Japan (East Sea), about 80 miles (130 km) east of Pyŏngyang, it is protected by two promontories and 20 islands in the Yŏnghŭng Bay and has the

Sports centre and harbour at Wŏnsan, North Korea

best natural harbour along the east coast of Korea. During the Yi dynasty (1392–1910) it was a market, fishing, and warehousing centre under the name of Wönsanjin. It became a commercial port in 1880. Rail lines were constructed to the southwest to Seoul in 1914, to northeastern cities in 1928, and west to P'yŏngyang in 1941.

After independence in 1945 the city's major economy shifted from trade to fishing and marine products. Its petroleum refineries and other facilities, damaged by bombing during the Korean War, have been rebuilt. Wönsan's industries include shipbuilding and railway, chemical, and textile manufacturing. Wönsan

has also become a cultural, educational, and medical centre. The beaches of Songdowön, Myŏngsan, and Simp'o-ri, on the eastern coast of the city, are known for bathing and recreation. Pop. (1981 est.) 240,000.

Wonthaggi, town, southern Victoria, Australia, 5 miles (8 km) inland from the coast on Bass Strait. The explorers Hamilton Hume and William Hovell discovered black-coal deposits at nearby Cape Paterson in 1824, but early attempts at mining were unsuccessful. Coal deposits at Wonthaggi were known by the 1850s, but development was delayed until 1909, when a labour strike in the Newcastle fields of New South Wales forced the Victorian railroads to turn to new sources of coal.

The town, whose name is derived from an Aboriginal term meaning "to drag," or "to pull along," was founded in 1910 and was made a borough and municipality in 1911. As the railroads are now diesel-powered, the Wonthaggi's coal reserves are no longer actively exploited. The town, however, manufactures metallurgical goods, farm implements, automobile parts, and clothing and is the service centre for the Bass Valley and Glen Alvie dairy districts. Connected to Melbourne (65 miles [105 km] northwest) by rail and the Bass Highway, it is closely linked to the growing resort of Cape Paterson. Pop. (1984 est.) 5,890.

wood, hard, fibrous substance, technically known as xylem, that is the principal strengthening and water-conducting tissue found in the stems and roots of trees and shrubs.

A brief treatment of wood follows. For full treatment, *see* MACROPAEDIA: Forestry and Wood Production.

Wood is one of the most abundant and versatile natural materials on Earth, and unlike such resources as coal, ores, and petroleum, it is renewable. It has been utilized by man since the earliest days of human existence, first as a source of fuel and later for an enormous variety of uses. Despite the widespread use of metals and synthetics in modern society, the demand for such wood products as lumber, plywood, paper, and chemical derivatives of cellulose continues to increase annually.

The most widely used woods come from two groups of trees: the conifers, or softwoods, such as pine, spruce, or fir, and the broadleaves, or hardwoods, which include such trees as oak, walnut, and maple. Trees classified as hardwoods are not necessarily harder than softwoods: balsa, for example, is a hardwood but is one of the softest woods. Hardwoods and softwoods differ, rather, in their cellular form and structure. The cells of hardwoods consist of vessel members, fibres, and parenchyma; those of softwoods are tracheids and parenchyma.

The three basic parts of a tree—the bark, wood, and pith—can easily be seen in cross section; the fourth, the cambium, is a thin layer of living cells between the bark and the wood where tree growth takes place. The wood forms around the pith (the central core) in a series of concentric layers, called growth rings, which usually represent the yearly or seasonal cycle of growth. Each ring is composed of two parts: the inner part, called earlywood, or springwood, is lighter and softer and is produced in the spring; the outer part, called latewood, or summerwood, is added later in the growing season.

Another characteristic of wood evident in cross section is the distinction between heartwood and sapwood. Heartwood, the central portion, is darker in colour and composed of inactive cells that do not participate in the life processes of the tree. Sapwood, the lighter area surrounding the heartwood, contains cells that conduct water and dissolved minerals up to

the leaves and store food after photosynthesis. The wood in most trees exhibits a radiating pattern from pith to bark, with rays varying in size from species to species; many softwoods also possess visible resin canals.

Other identifying physical characteristics of wood include colour, varying from the white of a holly tree to the red of a redwood or the black of an ebony; odour, especially noticeable in such trees as the cedar but indiscernible in others; texture, the uniformity of a wood's surface; and grain, the direction of the wood fibres.

Wood is also hygroscopic (moisture-absorbing) to varying degrees among different species. The water content in harvested wood causes shrinkage and swelling and affects weight, volume, density, hardness, strength, heat-producing capacity, and resistance to decay.

The mechanical properties of wood include strength, stiffness, relative lightness in weight, and flexibility. Different woods vary considerably in their degrees of strength, and the strength of an individual piece will change according to the direction in which a load is applied—a board, for example, is strongest along the grain (axially) but when subjected to bending is strongest perpendicular to the grain (transversely). Commercial producers evaluate these basic properties to determine the best use for a particular wood.

Two important steps in wood processing are drying and preservation. Wood is dried in the open air or in kilns in order to reduce shrinkage, swelling, and weight and to better prepare it for finishing. Wood must also be protected from deterioration and decay, which is caused by such agents as insects and fungi. Chemical preservatives, including oils and water-soluble salts, are most commonly used; the methods of application include spraying, brushing, and immersion.

After a tree is felled, the wood is processed for roundwood products (such as poles and posts) or as sawnwood (sawed lumber). Logs for roundwood are ready for use after simply being debarked and treated with preservatives. Sawnwood is treated and cut at a sawmill and then transported to other manufacturing facilities to be fashioned into particular wood products. Some basic wood products include veneer, a thin layer sliced from a larger piece of wood; plywood, a laminated panel made of a wood core that is glued between layers of veneer; particleboard, a processed board or panel made by gluing chunks, shavings, and splinters of wood together; and fibreboard, a panel formed from wood-pulp fibres.

There are an estimated 10,000 different wood products commercially available, ranging from fine furniture to toothpicks. Wood and wood residues are also the basic materials used in the manufacture of many chemically derived products, including cellophane, charcoal, dyestuffs, explosives, lacquers, turpentine, and yeast.

Wood pulp is also the chief constituent used in the manufacture of paper and packaging materials. Pulp is produced by either mechanically grinding up wood, cooking it with chemicals, or pretreating it with chemicals and then reducing it mechanically. Finished products range in quality from fine stationery to newsprint and corrugated cardboard boxes.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Wood FAMILY, celebrated English family of Staffordshire potters, a major force in the development of Staffordshire wares from peasant pottery to an organized industry; the family's most prominent members were Ralph Wood (1715–72), the "miller of Burslem"; his brother Aaron (1717–85); and his son Ralph, Jr. (1748–95). Through his mother, Ralph,

Shakespeare, bust by Enoch Wood, *c.* 1810; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London, Crown copyright reserved

Jr., was related to Josiah Wedgwood, and the two names were on a number of occasions associated professionally.

In 1730, Ralph Wood was apprenticed to John Astbury, and he subsequently worked with Thomas Whieldon at Fenton Low, there learning the manufacture of coloured glazes. He began producing his own salt-glazed wares in 1754 at Burslem, where he also practiced as a block cutter (i.e., a carver of the original patrix from which the potters' workingmolds were taken). Aaron apprenticed with the Thomas Wedgwood, Jr., firm from 1731 to 1746, when he left to work with Whieldon.

He opened his own pottery four years later. By about 1760 Ralph Wood was making extremely well-modeled figures with coloured glazes. These started with a manganese-brown, to which he added greens, blues, and a greyish olive. Subjects were in great variety; the best is probably the equestrian "Hudibras" glazed in manganese and orange. The "Vicar and Moses," afterward repeated by his son and many other potters, appeared at this time and enjoyed great popularity. Of the animals, the stags are particularly well-known. Wood was among the first of English potters to impress his name on his wares, and he is credited with introducing the Toby jug, his first model of the kind being "Toby Philpot" about 1762.

Ralph, Jr., produced many figures, both from his father's molds and from new ones of a variety of subjects. His figures were coloured with enamels instead of glazes, and many were impressed with the mold number in the base. An extant invoice shows him supplying figures to Josiah Wedgwood in 1783. About this time or soon afterward, Wood appears to have employed Jean Voyez (c. 1740–after 1791), a modeler of French extraction who had been briefly employed by Wedgwood. Voyez probably modeled his "Fair Hebe" jug for Wood, and several models in the style of Paul-Louis Cyfflé of Lunéville may also be his.

Specimens made by the Woods, father and son, are sometimes impressed with a name, R. WOOD or R. WOOD BURSLEM being associated with the father and Ra. Wood/Burslem with the son, but this is uncertain.

For some years Ralph, Jr., was in partnership with his brother John (1746–97), but in 1787 John started his own pottery at Brownhills; 10 years later he was murdered by a rejected suitor for his daughter's hand. Ralph Wood III (1781–1801) continued the firm after his father's death.

William Wood (1746-1808), son of Aaron, was employed as a modeler by Wedgwood.

His brilliant younger brother, Enoch (1759–1840), apprenticed with Wedgwood for a time and later with Humphrey Palmer. By 1783 Enoch was established in Burslem as an independent potter in partnership with his cousin Ralph Wood, and in 1790 he entered a partnership with James Caldwell, when the style of the firm became Wood & Caldwell.

In 1818 Enoch Wood continued alone, under the style Enoch Wood & Sons. The firm made all the wares that were current in Staffordshire at the time, including black basaltes, jasper, and probably porcelain. Large quantities of blueprinted earthenware were produced, much of which was exported to the United States. Busts modeled by Enoch Wood himself are fairly numerous. The Wood factory closed in 1846.

Wood, Anthony, byname ANTHONY À WOOD (b. Dec. 17, 1632, Oxford, Oxfordshire, Eng.—d. Nov. 29, 1695, Oxford), English antiquarian whose life was devoted to collecting and publishing the history of Oxford and its university.

Wood's historical survey of the University of Oxford and its various colleges was published as *Historia et Antiquitates Universitatis Oxoniensis* (1674; *History and Antiquities of the University of Oxford*). His vast biographical dictionary of the writers and ecclesiastics

Anthony Wood, detail of a watercolour drawing by an unknown artist, 1677
By courtesy of the curators of the Bodleian Library, Oxford

who had been educated at Oxford appeared as *Athenae Oxonienses* (1691–92). Wood lived in Oxford as a near recluse close to Merton College, where he matriculated and in whose chapel he was buried.

A deaf, bitter, and suspicious man, Wood quarreled with his family, patrons, and the fellows of his college. His biographical sketches contain many spiteful criticisms of contemporaries. One such passage in the Athenae Oxonienses accused the 1st Earl of Clarendon of corruption, and it led to Wood's conviction of libel and his expulsion from the university. At his death he left his papers (including correspondence, an autobiography, and diaries) to Oxford's Ashmolean Library. The autobiography and diaries were edited by Andrew Clark as The Life and Times of Anthony Wood (1891–1900) and abridged by L. Powys (1932, 1961). Wood's Survey of the Antiquities of the City of Oxford was edited by Andrew Clark and published in 1889–99.

Wood, Evelyn, *née* NIELSEN (b. Jan. 9, 1909, Ogden, Utah, U.S.), American educator who developed a widely used system of high-speed reading.

The daughter of Mormon parents, she graduated from the University of Utah in 1929 and married Douglas Wood that same year. In the 1930s she helped her Mormon husband in his missionary activities and then began teaching in a Mormon high school in Utah. She received a master's degree from the University of Utah in 1947. While teaching remedial reading at various high schools in the 1950s, she began developing techniques to help slow readers read more quickly with increased com-

prehension. She undertook a systematic study of high-speed reading and its associated skills, and by 1958 she was teaching students at the University of Utah to read at speeds of several thousand words per minute. The key technique in her system, which she called Reading Dynamics, was the use of the hand as a pacer as the eyes followed its rapid zigzag motion down each page. In 1959 she opened the first Evelyn Wood Reading Dynamics Institute, in Washington, D.C., which was followed by many more such learning centres. Wood's system stressed overall improvements in reading efficiency, including comprehension and word retention, as well as large increases in reading speeds.

Wood, Fernando (b. June 14, 1812, Philadelphia, Pa., U.S.—d. Feb. 14, 1881, Hot Springs, Ark.), American congressional representative and mayor of New York City who led the Northern peace Democrats—or "Copperheads"—during the American Civil War.

Wood grew up in Philadelphia and New York City, acquiring considerable wealth as a merchant and real estate investor. He entered politics as a Democrat in 1834 and shortly thereafter emerged a leader of Tammany Hall. He served one term in Congress (1841–43), and he was defeated in his first run for mayor of New York City in 1850.

He triumphed in the 1854 mayoral election, however, and he was reelected in 1856 and 1859. Although upstate Republicans accused Wood of graft and Tammany Hall charged him with failing to award patronage to his own party, Wood did succeed in creating Central Park and making important reforms. When he lost the backing of Tammany Hall, Wood formed his own powerful political organization, Mozart Hall.

In 1860 Wood led a pro-Southern delegation to the Democratic National Convention, and as civil war loomed early in 1861, he called for New York City to secede and become a free city. Although he briefly supported President Abraham Lincoln and the Northern war effort, by 1863 he was organizing the peace Democrats (called "Copperheads" by Republicans) and demanding that the North negotiate an immediate end to the war.

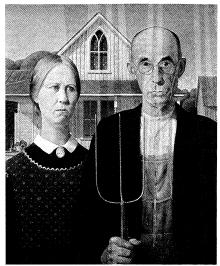

Elected to Congress in 1862 and again from 1866 to 1880, Wood opposed Republican Reconstruction policies but generally supported Republican fiscal measures. His independence alienated fellow Democrats, and they refused to elect him speaker of the House in 1875. But in 1877 Wood was elected majority floor leader and made chairman of the Ways and Means Committee. He served in the House of Representatives until his death.

Wood, Grant (b. Feb. 13, 1892, near Anamosa, Iowa, U.S.—d. Feb. 12, 1942, Iowa City, Iowa), American painter who was one of the major exponents of Midwestern Regionalism, a movement that flourished in the United States during the 1930s.

United States during the 1930s.
Wood was trained as a craftsman and designer as well as a painter. After spending a year (1923) at the Académie Julian in Paris, he returned to Cedar Rapids, Iowa, where in 1927 he was commissioned to do a stained-glass window. Knowing little about stained glass, he went to Germany to seek craftsmen to assist him. While there he was deeply influenced by the sharply detailed paintings of various German and Flemish masters of the 16th century. Wood subsequently abandoned his Impressionist style and began to paint in the sharply detailed, realistic manner by which he is now known.

A portrait of his mother in this style, "Woman with Plants" (1929), did not attract attention, but in 1930 his "American Gothic" caused a sensation when it was exhibited at the Art Institute of Chicago. The hard, cold realism of this painting and the honest, direct, earthy quality of its subject were unusual in

American art. The work ostensibly portrays a farmer-preacher and his daughter in front of their farmhouse, but Wood actually used his sister, Nan, and his dentist, B.H. McKeeby,

"American Gothic," oil painting by Grant Wood, 1930; in the Art Institute of Chicago

By courtesy of the Art Institute of Chicago, collection of the Friends of American Art

as models. As a telling portrait of the sober and hard-working rural dwellers of the Midwest, the painting has become one of the bestknown icons of American art.

Wood became one of the leading figures of the Regionalist movement. Another well-known painting by him is "Daughters of Revolution" (1932), a satirical portrait of three unattractive old women who appear smugly satisfied with their American Revolutionary ancestry. In 1934 Wood was made assistant professor of fine arts at the University of Iowa, Iowa City. Among his other principal works are several paintings illustrating episodes from American history and a series of Midwestern rural landscapes that communicate a strong sense of American ambience by means of a skillful simplification of form.

Wood, Mrs. Henry, née ELLEN PRICE (b. Jan. 17, 1814, Worcester, Worcestershire, Eng.—d. Feb. 10, 1887, London), English novelist who wrote the sensational and extremely popular East Lynne (1861), a melodramatic and moralizing tale of the fall of virtue. Translated into many languages, it was dramatized with great success, and its plot has been frequently imitated in popular fiction.

Other highly successful novels followed, and in some of them (notably *The Channings*, 1862) Wood showed great ability in storytelling and in creating natural middle-class

Mrs. Henry Wood, engraving by L. Stocks after a portrait by R. Easton The Mansell Collection

characters and relationships. In 1867 she became proprietor and editor of *Argosy* magazine.

Wood, Sir Henry J(oseph), pseudonym PAUL KLENOVSKY (b. March 3, 1869, London—d. Aug. 19, 1944, Hitchin, Hertfordshire, Eng.), conductor, the principal figure in the popularization of orchestral music in England in his time.

Originally an organist, Wood studied composition at the Royal Academy of Music,

Sir Henry J. Wood, drawing by Edmond X. Kapp, 1913; in a private collection

London, from 1886. In 1889 he toured as a conductor with the Arthur Rousbey Opera Company and later appeared with other opera companies. In 1894 he helped to organize a series of Wagner concerts at the Queen's Hall, London, and on Oct. 6, 1895, established there a nightly season of Promenade Concerts. The success of the annual season of these concerts (the "Proms") had a wide influence on English musical life. Beginning with a popular repertory, Wood systematically broadened the appeal of his concerts to include the entire range of 18th- and 19th-century orchestral music. Later he introduced the works of prominent contemporary figures, among them Richard Strauss, Debussy, and Schoenberg. The Promenade Concerts were managed from 1927 by the British Broadcasting Corporation and after the destruction of the Queen's Hall in World War II were transferred to the Royal Albert Hall. In 1898 Wood married the Russian singer Olga Urusova, who had been his pupil; after her death he married, in 1911, Muriel Greatorex.

He published a mass, songs, arrangements of works of Handel and Purcell, an orchestral arrangement of a toccata and fugue of J.S. Bach (which appeared under the pseudonym Paul Klenovsky), and the books *The Gentle Art of Singing*, 4 vol. (1927–28), *My Life of Music* (1938), and *About Conducting* (1945). Wood was knighted in 1911.

Wood, John, THE ELDER, byname wood of BATH (b. c. 1704, Yorkshire?, Eng.—d. May 23, 1754, Bath, Somerset), English architect and town planner, a resident of Bath from 1727 who fixed the physical character of that resort city. Though some of his individual buildings were noteworthy exercises in Palladianism (a kind of 16th-century Italian Renaissance Classicism), he was most highly regarded for his planning of streets and groups of houses as visual units.

After helping to build the Cavendish-Harley housing estate in London, Wood designed his first important "townscapes" in Bath, the North and South Parades (1728). These were followed by Queen Square (1735), Prior Park (1735–48), the Royal Mineral Water Hospi-

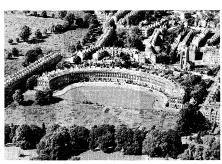

Prior Park, Bath, Eng., by John Wood the Elder, 1735-48

By courtesy of the National Monuments Record, London

tal (1738), the Circus (completed in 1764, after his death, by his son John Wood the Younger), and the Royal Crescent (1767–69; executed by the younger Wood from his father's design). Afterward a school, Prior Park was originally the residence of Ralph Allen, Wood's chief patron and the principal supplier of Bath building stone (an oolitic limestone).

Wood's major works outside Bath were the exchanges in Bristol (1740–43) and Liverpool (1748–55; with his son). His *Description of the Exchange at Bristol* (1745) was reprinted in 1969. Among his other projects were the Bath-Bristol Canal and the Llandaff cathedral (restoration, from 1735; now incorporated into Cardiff, Glamorgan).

Wood, John, THE YOUNGER (b. Feb. 25, 1728, Bath, Somerset, Eng.—d. June 18, 1782, Batheaston, Somerset), British architect whose work at Bath represents the culmination of the Palladian tradition initiated there by his

The Royal Crescent, Bath, designed by John Wood the Younger

Aerofilms Ltd., London

father, John Wood (called "the Elder" and "Wood of Bath"). Bath is one of the most celebrated achievements in comprehensive town design.

The younger Wood apparently served as assistant to his father, being entrusted with completion of the elder Wood's design for the Exchange, Liverpool (1748–55). Upon his father's death in 1754, Wood became Bath's principal architect. He completed the work on the Circus, after his father's design, and planned the Royal Crescent (1767-75), the latter being an enormous semicircle of 30 attached townhouses facing a broad park. The unified facade of the imposing structure conveys a palatial effect; it was the first such design in English town architecture and was widely imitated. A well-known individual structure by Wood at Bath is the Assembly Rooms (1769-71), which were partially destroyed by bombing in 1942 but later extensively reconstructed and restored.

Wood, Leonard (b. Oct. 9, 1860, Winchester, N.H., U.S.—d. Aug. 7, 1927, Boston), medical officer who became chief of staff of the U.S. Army and governor general of the Philippine Islands (1921–27).

A graduate of Harvard Medical School

(1884), Wood began his military career the next year as a civilian contract surgeon with the U.S. Army in the Southwest, achieving the rank of captain and assistant surgeon by 1891. He was awarded a Medal of Honor for his service with the expedition against the Apache Indians who were resisting the capture of their leader, Geronimo (1886).

After the outbreak of the Spanish-American War (1898), Wood and his friend Theodore Roosevelt recruited the 1st U.S. Volunteer Cavalry (the famous "Rough Riders"), of which Wood was the commanding officer. Meritorious conduct at the battles of Las Guasimas and San Juan Hill, Cuba, brought him promotion to brigadier general. After the war he served as military governor of Cuba (1899–1902). He earned a notable reputation there as an administrator, establishing modern

Leonard WoodBy courtesy of the Library of Congress, Washington, D.C.

educational, judicial, and police systems and overseeing great advances in sanitation.

In 1903 Wood became a major general in

In 1903 Wood became a major general in the regular army and was appointed governor of Moro Province in the Philippine Islands. He commanded the Philippine division of the army (1906–08), after which he returned home to the army's Eastern Department and then became chief of staff (1910–14). He was passed over, however, by the Democratic administration for a command post either at home or abroad during World War I (1917–18). A strong advocate of preparedness, Wood was largely responsible for establishment of the summer camp at Plattsburg, N.Y., to give civilians officer training—a model for similar camps elsewhere.

Regarded by many as the political heir of Theodore Roosevelt, Wood became an active candidate for the Republican presidential nomination in 1920. Despite a large following, however, he lost to Warren G. Harding on the tenth ballot. The following year, President Harding—recognizing Wood's administrative talent and experience—appointed him to the Wood-Forbes Mission to the Philippines. The mission reported that a grant of immediate independence to the islands would be premature and urged the U.S. government not to be left in a position of responsibility without authority. Wood was then appointed governor general of the Philippines, a post he held until forced to resign by a terminal illness in 1927. An authoritative biography in two volumes was written by Hermann Hagedorn in 1931.

Wood, Matilda Alice Victoria (entertainer): see Lloyd, Marie.

Wood, Robert E(lkington) (b. June 13, 1879, Kansas City, Mo., U.S.—d. Nov. 6, 1969, Lake Forest, III.), U.S. business executive under whose leadership Sears, Roebuck and Co. grew to become the world's largest merchandising company.

Wood, a graduate of the U.S. Military

Wood, a graduate of the U.S. Military Academy in 1900, was sent in 1905 to the Panama Canal Zone and worked with Gen. George W. Goethals, then in charge of constructing the canal. After completion of the

Robert E. Wood

By courtesy of Sears, Roebuck and Co

canal late in 1914, Wood resigned his army commission and entered private business in 1915. During World War I, he returned to the service as a lieutenant colonel with the Rainbow Division in France. In April 1918 he returned to the U.S., was promoted to brigadier general, and served briefly as acting quartermaster general. Leaving the army again in 1919 to enter private industry, Wood worked for five years with Montgomery Ward & Company. He then moved to Sears, Roebuck and Co., where he became president in 1928, chairman of the board in 1939, and continued as a director of the company after his retirement in 1954. Active in public affairs, Wood supported Pres. Franklin D. Roosevelt's New Deal policies in the early 1930s but denounced them toward the end of the decade as "disastrous." During the period immediately preceding entry of the U.S. into World War II, he headed the America First Committee, whose purpose was to keep the nation out of war. In December 1941 Wood left Sears temporarily to serve as a civilian adviser to the army. The company continued to grow, and in December 1967 Sears became the first retailer to record a single month's sales of more than \$1,000,000,000.

Wood, Robert Williams (b. May 2, 1868, Concord, Mass., U.S.—d. Aug. 11, 1955, Amityville, N.Y.), U.S. physicist who extended the technique of Raman spectroscopy, a useful

Robert Williams Wood

By courtesy of the Johns Hopkins University
Baltimore

method of studying matter by analyzing the light scattered by it.

In 1897 Wood was the first to observe field emission, charged particles emitted from a conductor in an electric field. This electrical phenomenon is used in the field-emission microscope for studying atomic structure. From 1901 he was at Johns Hopkins University, Baltimore, Md., as professor and, later, research professor of experimental physics. In addition to his fundamental discoveries in physical optics, he introduced improvements in the ruling of closely spaced lines in diffraction gratings and in other spectrometric methods used in astronomical studies. Wood also made important contributions to the fields of supersonics and biophysics. His publications include Physical Optics (1905) and a book of nonsense verse, How To Tell the Birds from the Flowers (1907).

wood alcohol: see methyl alcohol.

wood-boring beetle: see long-horned beetle.

Wood Buffalo National Park, park in northern Alberta and southern Northwest Territories, Canada, between Athabasca and Great Slave lakes. It has an area of 17,300 sq mi (44,807 sq km) and was established in 1922. A vast region of forests and plains crossed by the Peace River, it has many lakes (including Lake Claire) and is the world's largest park. It is the habitat of the largest remaining herd of plains and wood buffalo (bison) on the North American continent, as well as of bears, caribou, moose, deer, and beavers. In the park are nesting grounds for the whooping crane, on the verge of extinction.

wood duck, also called woodie (Aix sponsa), small colourful North American perching duck (family Anatidae), a popular game bird. Once in danger of extinction from overhunting and habitat destruction, the species has been saved by diligent conservation efforts. Wood ducks nest in tree cavities up to 15 me-

Drake wood duck (Aix sponsa)

tres (50 feet) off the ground. The construction of artificial nest boxes, placed atop poles over and about bodies of water, was instrumental in halting the decline of breeding populations.

The wood duck is about 43–52 centimetres (17-20.5 inches) long. Both male and female have a characteristic head crest (absent in eclipse—or summer—plumage). The crest of the male has two longitudinal white stripes. His purple and green head, red-brown breast flecked with white, and bronze sides are readily identifiable. The distinguishing feature of the female is a white eye-ring; her body is a sooty gray-brown, with white throat and white streaked breast. An average clutch contains about 12 eggs; the ducklings hatch in about 30 days, and the next day they follow the female from the nest, jumping as far as 15 m to the ground unharmed. The ducklings eat aquatic insects and other small organisms; adult woodies prefer acorns-or other nuts, depending on habit—to other foods.

wood engraving, a printmaking technique in which a print is made from a design incised on the transverse section, or end, of a hardwood block. The technique was developed in England in the last half of the 18th century, and its first master was the printmaker Thomas Bewick, whose illustrations for such natural history books as A History of British Birds (1797 and 1804) were the first extended use of the technique. After Bewick's death, however, wood engraving served merely as a method to reproduce other works of art. The English poet and artist William Blake (1757-1827) engraved his own designs on wood, but his work is an isolated example of original work done in the technique in his day.

"Head of a Man," wood engraving by Leonard Baskin, 1961

By courtesy of the Art Institute of Chicago

In 19th-century France and Germany, it became the most general means of illustrating books, magazines, and even newspapers. Gustave Doré in France and Adolf Menzel in Germany produced enormous quantities of drawings for illustration that were engraved by artisans. Although in the late 19th century photoengraving began to replace wood engraving for reproduction, the other technique survived and was used to great advantage in the mid-20th century by such artists as M.C. Escher, Leonard Baskin, and Misch Kohn.

wood fern: see shield fern.

Wood-Forbes Mission (1921), fact-finding commission sent to the Philippines by newly elected U.S. president Warren Harding in March 1921, which concluded that Filipinos were not yet ready for independence from the United States.

In 1913 Woodrow Wilson had appointed the liberal Francis B. Harrison as governor general of the Philippines. Harrison was convinced that the best method of preparing Filipinos for independence was to give them as wide a latitude as possible in managing their internal affairs. Passage of the Jones Act in 1916, which announced the U.S. intention of granting Philippine independence, encouraged Harrison in his policy of replacing Americans in the Philippine civil service with Filipinos.

Republicans in the United States argued that Harrison's policy of Filipinization was premature and that the takeover of jobs by Filipinos resulted only in a marked deterioration of services. To support this position, Harding sent out Gen. Leonard Wood and W. Cameron Forbes. The two reported in October 1921 that the islands were not prepared for independence and that many educated Filipinos wished to remain under American tutelage.

News of the Wood-Forbes report was received with anger in the Philippines. Wood, who served as governor general for the next six years, though an honest and efficient administrator, remained highly unpopular with Filipinos.

wood frog (Rana sylvatica), terrestrial frog (family Ranidae) found from the southeastern United States to Alaska. In the United States and parts of Canada the wood frog generally inhabits damp woodlands; in the north it frequents areas that, in spring, are supplied with water for breeding.

The wood frog can change from yellowish to

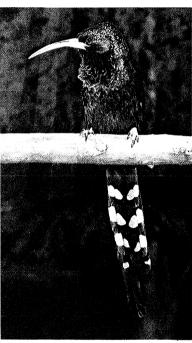

Wood frogs (Rana sylvatica)

tres (3¹/₄ inches). The voice is a duck-like quack.

wood hoopoe, also called KAKELAAR, family name PHOENICULIDAE, any of 6 species of tropical African birds (order Coraciiformes). Sometimes they are placed in the hoopoe familv. Upupidae.

Ranging in length from 22 to 38 centimetres (8.5 to 15 inches), all are predominately

Wood hoopoe (Phoeniculus purpureus) Anthony Mercieca from Root Resources-FB Inc.

greenish or purplish black with long, graduated tails, sometimes tipped with white. The bill is slender, pointed, and slightly to strongly downcurved. The two species of Rhinopomastus are often called scimitarbills, or scimitar-billed hoopoes, from the shape of the bill.

wood louse, plural wood LICE, either of two related terrestrial crustaceans, the pill bug (q.v.) and the sow bug (q.v.).

wood mouse: see field mouse.

wood oil: see tung oil.

wood oil tree: see varnish tree.

wood owl, any of 11 species of birds of prey of the genus Strix, family Strigidae, characterized by a conspicuous facial disk but lacking ear tufts. Wood owls occur in woodlands and forests in the Americas, Europe, and Asia. The name wood owl is also applied to members of the genus Ciccaba, found in Africa and the

Barred owl (Strix varia) Karl Maelowski

Americas. They eat insects, birds, and small mammals, primarily rodents and hares.

The barred owl (Strix varia) of eastern North America has an overall barred pattern in brown and white. It is about 40 to 50 centimetres (1.3 to 1.7 feet) long.

The great gray owl (S. nebulosa), of northern Europe, Asia, and North America, is among the largest owls, often over 70 cm long. Much of its apparent size results from its thick plumage. It is gray to brownish in colour. barred underneath, and heavily streaked.

The spotted owl (S. occidentalis), of western North America, spotted above and barred beneath, is about 40 to 50 cm long.

The tawny owl (S. aluco), of Europe, Asia, and Africa, is brown or tawny, spotted with white, and barred in dark brown.

wood pigeon (Columba palumbus), bird of the subfamily Columbinae (in the pigeon family, Columbidae), found from the forested areas of Europe, North Africa, and western Asia east to the mountains of Sikkim. It is about 40 centimetres (16 inches) long, gravish with a white collar and white bars on the wings. Mating is preceded by "courtship feeding" of the female by the male. They lay two eggs per clutch and may raise three broods a year. This large pigeon is a ground feeder, eating seeds, grains, and berries; it has been known to hold more than 60 acorns in its crop. It may be a pest in agricultural areas

Some other members of the Columbinae are also called wood pigeons, e.g., the speckled wood pigeon, ashy wood pigeon, purple wood pigeon, Japanese wood pigeon, and others, all Columba species. They are widely distributed in Southeast Asia and the Pacific.

wood rat, also called PACK RAT, or TRADE RAT (Neotoma), any of 22 species of North

Eastern wood rat (Neotoma floridana)

John H. Gerard

and Central American rodents, belonging to the family Cricetidae (order Rodentia), found from deserts and forests to high, rocky mountainsides. Wood rats are pale buff, gray, or reddish brown, usually with white undersides and feet. They have relatively large ears and, usually, hairy or bushy tails. They are 23 to 47 centimetres (9 to 18½ inches) long, including the 8- to 24-cm tail.

Basically nocturnal and vegetarian, wood rats live in nests built of plant material, such as twigs or cactus. The nest, which may be more than one metre (three feet) across, is placed in a tree, or on the ground at the base of a tree, rock ledge, or cactus. The nests of desert-dwelling wood rats, built in and of cactus, may present an impregnable barrier to predators.

Wood rats are commonly called pack, or trade, rats because they collect various bits of material to deposit in their dens. They sometimes pick up shiny objects in camps and may at the same time leave something they were carrying, thus giving the impression that they are "trading" one item for the other.

Wood River, city, Madison County, south-western Illinois, U.S., near the confluence of the Wood and Mississippi rivers. It was from the mouth of the Wood River that Meriwether Lewis and William Clark embarked on their trip to the Pacific Northwest (May 14, 1804).

Wood River was founded and incorporated as a village in 1908 with the establishment in the vicinity of a Standard Oil Company refinery. After joining with two other communities (East Wood River in 1911 and Benbow City in 1917) Wood River was chartered as a city in 1923. Now part of the Wood River-East Alton industrial complex, its economy depends mainly on petroleum and the manufacture of tank cars, as well as stone, clay, and glass products. Pop. (1980) 12,449.

wood sorrel, any plant of the genus Oxalis, numbering several hundred species, within the family Oxalidaceae. The name is chiefly

Wood sorrel (Oxalis europaea)

used for O. montana, a stemless trifoliate (i.e., with three leaflets) herb native to North America from southern Canada southward to Tennessee and westward to Minnesota. It grows about 15 centimetres (6 inches) tall, has pink-tinted stems, and white or reddish flowers that appear from May until August.

The name wood sorrel is also sometimes applied to sheep sorrel (Rumex acetosella) of the family Polygonaceae and to a West Indian begonia, Begonia acutifolia, of the family Begoniaceae.

wood spirit: see methyl alcohol.

wood tar, liquid obtained as one of the products of the carbonization, or destructive distillation, of wood. There are two types: hardwood tars, derived from such woods as oak and beech; and resinous tars, derived from pine wood, particularly from resinous stumps and roots. Crude wood tar may be used as fuel or for preserving rope and wood and for caulking. The tar may be fractionated to yield creosote, oils, and pitch.

Hardwood tars are obtained from pyroligneous acid, either as a deposit from the acid or as a residue from the distillation of the acid. Crude pyroligneous acid is the condensed, volatile product of wood distillation. Resinous wood tars differ from hardwood tar in containing the pleasant-smelling mixture of terpenes known as turpentine. Pine-wood tar, commonly called Stockholm, or Archangel, tar, is made extensively in the forests of the Soviet Union, Sweden, and Finland. It is the residue after the turpentine has been distilled, usually with the aid of steam. It is widely used in manufacturing tarred ropes and twine and in impregnating hemp fibre for oakum. In pharmacy, it has some slight use as a component of some ointments and antiseptics. Distillates of pine-wood tar, particularly the creosote fraction, are used in metallurgy in the froth flotation processes.

wood thrush (bird): see nightingale thrush.

wood turtle (Clemmys insculpta), long-tailed turtle of the family Emydidae, found from Nova Scotia through the eastern and central United States. The rough upper shell of the wood turtle is about 15–20 cm (6–8 inches) long and bears concentrically grooved pyramids on each of the large plates (scutes). The upper shell is brown, and the neck and legs are reddish.

The wood turtle is partly terrestrial. Although it is a capable swimmer, it often strays into meadows and woody regions to feed on soft vegetation and small invertebrates. It makes a satisfactory pet and was formerly marketed as food.

wood wasp, insect belonging to any of three families of the order Hymenoptera: Xiphydridae, Orussidae (sometimes spelled Oryssidae), and Syntexidae. Orussidae are known as parasitic wood wasps; Syntexidae are known as cedar wood wasps.

Xiphydriids, found in Europe and North America, are about 20 to 25 mm (about 0.8 to 1 inch) long, cylindrical in shape, and blackish in colour. The larvae bore into the wood of dead or dying deciduous trees.

Parasitic wood wasps are relatively rare but are widely distributed over the world. In North America and Europe one genus, *Orussus*, occurs. Adults are black and about 8 mm (0.3 inch) in length; larvae are parasitic on woodboring beetles (Buprestidae).

The cedar wood wasps, represented in North America by the species *Syntexis libocedrii*, are found in the Pacific coastal states. Adults are about 8 to 14 mm (0.3 to 0.5 inch) in length. The larva bores into the wood of the incense cedar (*Calocedrus decurrens*).

woodbine, any of many species of vines belonging to a number of flowering-plant families, especially the Virginia creeper (q, v, Parthenocissus quinquefolia) of North America and a Eurasian species of honeysuckle (q, v, Lonicera periclymenum).

Woodbridge, parish (town) in Suffolk Coastal district, county of Suffolk, England, at the head of the River Deben estuary. The community was originally a Saxon settlement near the site of the Sutton Hoo ship burial, which yielded one of England's greatest archaeological treasures. Woodbridge developed into a market town, and ships for the British Royal Navy were at one time built there. The town was also well known for rope and sail-cloth manufacture. Boatbuilding at Woodbridge is now restricted to the construction of pleasure craft. Horticulture is also carried on. Pop. (1981) 7.263.

Woodbridge, township, Middlesex County, New Jersey, U.S. It lies across the Arthur Kill (a narrow channel) that separates New Jersey from Staten Island and immediately north of Perth Amboy. Founded as a farming community in the 17th century, it now has heavy industries, including oil refining and plastic and chemical production. The community, settled in 1665 by Puritans from Massachusetts Bay and New Hampshire, was incorporated in 1669. It includes the industrial villages of Fords and Sewaren

Woodbridge township is where the first cloverleaf highway interchange in the United States was constructed in 1929. Woodbridge State School for mentally retarded children was established in the township in 1965. Pop. (1984 est.) 93,401.

Woodbury, Levi (b. Dec. 22, 1789, Francestown, N.H., U.S.—d. Sept. 4, 1851, Portsmouth, N.H.), American politician who was an associate justice of the Supreme Court from 1846 to 1851.

Woodbury graduated from Dartmouth College in 1809, and after studying law he was admitted to the bar in 1812. He thereafter served as an associate justice of the New Hampshire Superior Court (1817–23), was governor of New Hampshire (1823–25), and sat in the U.S. Senate from 1825 to 1831. He served as secretary of the Navy from 1831 to 1834 and was appointed secretary of the Treasury in 1834. In this post he assisted President Andrew Jackson in the latter's opposition to the rechartering of the Bank of the United States. During the Panic of 1837 Woodbury was able to maintain the credit of the federal government and benefited many state banks by doing so. He headed the Treasury until he left the Cabinet in 1841, upon which he was reelected to the Senate.

In 1845 President James K. Polk appointed him to the Supreme Court, and he was confirmed in January 1846. He served on the Court until his death. Woodbury had always been rather conservative for a New Englander, and on the Court he took a strictly constructed view of the Constitution. He was best known for his dissenting opinions, in which he frequently upheld the states' rights over those of the federal government.

Consult the INDEX first

woodchuck, also called GROUNDHOG, or WHISTLE-PIG (Marmota monax), stout-bodied marmot of the family Sciuridae (order Rodentia). Woodchucks are black-footed, reddishbrown or brown animals, ranging from 42 to 51 cm (17 to 20 inches) in length, with 10- to 15-centimetre (4- to 6-inch) tails. They weigh between 2 and 6 kg (4 and 14 pounds). Found from the eastern and central United States northward across Canada and into Alaska, woodchucks are animals of open fields and woodland edges, where they feed mainly on low green vegetation. They are mainly terrestrial but are good swimmers and climbers. They feed heavily in summer, storing fat to see them through their winter hibernation. They are also excellent diggers, constructing a burrow with a main entrance and an escape tunnel. Woodchucks are solitary except during the spring, when litters of four to five young are born. The young stay with the mother for about two months.

Woodchucks are sometimes destructive to gardens and pasture lands. They are edible, and their abandoned burrows provide shelter for rabbits, foxes, and other small animals. According to popular legend in the United States, the groundhog emerges from hibernation each year on February 2, designated as Groundhog Day, and the duration of winter

may be foretold from that day's conditions: the presence of the groundhog's shadow warns of continued cold weather, while its absence signals an early spring.

woodcock, any of five species of squat-bodied, long-billed birds of damp, dense woodlands, allied to the snipes in the waterbird family Scolopacidae (order Charadriiformes). The

Eurasian woodcock (Scolopax rusticola)

D. Middleton—Bruce Coleman Inc.

woodcock is a startling game bird: crouched among dead leaves, well camouflaged by its buffy-brown, mottled plumage, a woodcock remains motionless until almost stepped upon and then takes off in an explosive movement. With its eyes set farther back on the head than those of any other bird, a woodcock has a 360° field of vision. The ear opening is located below, rather than behind, the eye socket.

A solitary bird that is most active at dusk, the woodcock lives chiefly on earthworms; it attracts the worms to the suface by drumming with its feet and then extracts them from the ground with its long, sensitive bill, which opens at the tip like a forceps. This feeding habit makes it necessary for woodcocks to migrate; they leave an area as soon as the ground starts to freeze. A single bird may eat twice its weight, or about 450 g (1 pound), in worms per day.

Woodcock nest in early spring. The female alone incubates the clutch of about four eggs, laid in a leaf nest, often at the foot of a tree. If alarmed, the female may fly off, carrying a chick between her legs. The young reach full size within a month.

The female American woodcock (Scolopax, or Philohela, minor) is about 28 cm (11 inches) long, including the bill. Her mate is slightly smaller. The wings are very rounded, and the outermost wing feathers are attenuated to produce vibratory sounds during flight, apparently at will. The male's aerial song, a sweet and varied whistling, accompanies his courtship display—a spiraling flight upward to 60–90 m (200–300 feet) followed by a fluttering drop back to the starting point. The display takes place at dusk, and the soaring and dropping sequence may be performed repeatedly for a period of 30 minutes. The American woodcock breeds in temperate North America, and it winters in the southeastern United States.

The Eurasian woodcock (Scolopax rusticola) breeds in the temperate Old World from Great Britain to Japan; occasional migrants wander to the eastern United States. Its colouring differs from that of the American woodcock in that the pale underparts of the European species are barred with brown. Both sexes are approximately the same in size, about 35 cm long. In the courtship display, known as roding, the male utters croaking sounds as he flies

low over the treetops, following a triangular path.

Other woodcocks are found in India and the East Indies.

Woodcock, George (b. Oct. 20, 1904, Bamber Bridge, Lancashire, Eng.—d. Oct. 30, 1979, Epson, Surrey), English labour leader who was general secretary of the Trades Union Congress (Tuc) from 1960 to 1969.

A weaver at the age of 12, Woodcock won a scholarship to Ruskin College in 1927 and then received high honors in philosophy and political economy at Oxford in 1933. He joined the TUC staff in 1936 and became assistant general secretary in 1947 and general secretary in 1960. In 1969 he resigned to become chairman of a new Commission on Industrial Relations and held that post until 1971.

As TUC general secretary, Woodcock was known as an adroit administrator and conciliator who fought to make the TUC more of a partner of government and industry in solving national economic ills. He was successful in convincing English unions to accept wage restraints and higher productivity standards. Woodcock was made a Commander of the British Empire in 1953 and appointed a Privy Councillor in 1967.

Woodcock, George (b. May 8, 1912, Winnipeg, Man., Can.), Canadian poet, critic, historian, travel writer, playwright, scriptwriter, and editor, whose work, particularly his poetry, reflects his belief that revolutionary changes would take place in society.

Woodcock was educated in England at Sir William Borlase's school and Morley College, London. He worked as farmer, railway administrator, and freelance writer before he became a lecturer in English at the University of Washington, Seattle (1954–56), then taught at the University of British Columbia, Vancouver, where he became an associate professor. He stopped teaching in 1963 to concentrate on writing and his work as an editor.

Woodcock published dozens of books. His poetry, particularly that published before World War II, expressed his anarchistic, rather than communistic, expectation of revolutionary changes in society. His poetry includes The White Island (1940), The Centre Cannot Hold (1943), Imagine the South (1947), Selected Poems (1967), and Notes on Visitations: Poems 1936–1975 (1975). Among his travel books are To the City of the Dead (1956) and Incas and Other Men (1959). Anarchism: A History of Libertarian Ideas and Movements appeared in 1962, and he produced a volume of essays, The Rejection of Politics in 1972. He also published biographies of Mordecai Richler (1970) and Herbert Read (1972).

woodcreeper, also called woodhewer, any of about 48 species of tropical American birds comprising the family Dendrocolaptidae, order Passeriformes. Woodcreepers work their way up the trunks of trees, probing the bark and leaves in search of insects. Most are 20-38 centimetres (8-15 inches) long (some smaller) and have brownish body plumage (often olive tinged) with pale streaks or bars on head and underparts; the wings and tail usually are reddish brown. In most species the laterally compressed bill is stout and moderately long; in a few it is strongly downcurved or else wedge shaped. The tail feathers are broad and stiff and serve as a prop in climbing. Flight from tree to tree is undulating.

Woodcreepers are solitary birds of forests, where they are detected by voice; some repeatedly utter harsh or sad notes and others trill. Their reproductive habits are little known, except that some species make nests of plant materials in tree cavities.

A widespread, typical form is the barred

Ivory-billed woodcreeper (Xiphorhynchus flavigaster)
Painting by H. Jon Janosik

woodcreeper (Dendrocolaptes certhia), of southern Mexico to northern Brazil; it is 28 cm (11 in.) long, heavy billed, and with scalloped, black markings. The great reddish-hued woodcreeper (Xiphocolaptes major), ranging from Bolivia to Argentina, feeds on the ground. The plain brown woodcreeper (Dendrocincla fuliginosa), of Honduras to northeastern Argentina, often follows marching ant columns. See also scythe bill.

woodcut, technique of printing designs from planks of wood incised parallel to the vertical axis of the wood's grain. It is one of the oldest methods of making prints from a relief surface, having been used in China to

"The Kiss," coloured woodcut by Edvard Munch, 1902

By courtesy of the Victoria and Albert Museum, London; photograph, John Webb

decorate textiles since the 5th century AD. In Europe, printing from wood blocks on textiles was known from the early 14th century, but it had little development until paper began to be manufactured in France and Germany at the end of the 14th century. Cuts with heavy outline and little shading, as the "Christ Before Herod" (British Museum), may date from 1400, while the earliest dated print of German origin is the Buxheim St. Christopher of 1423. In Bavaria, Austria, and Bohemia, religious images and playing cards were first made from wood blocks in the early 15th century, and the development of printing from movable type led to widespread use of woodcut illustrations in the Netherlands and in Italy. With the 16th century, black-line woodcut reached its greatest perfection with Albrecht Dürer and his followers Lucas Cranach and Hans Holbein. In the Netherlands Lucas van Leyden and in Italy Jacopo de' Barbari and Domenico Campagnola, who were, like Dürer, engravers on copper, also made woodcuts.

As a medium for popular illustrations, the woodcut process was widely used in the 17th century, but no major artist employed it. In the early 19th century, it was completely replaced by wood engraving (q.v.), which reproduced paintings and sculpture more easily and accurately than did woodcuts. With the mid-19th-century development of photoengraving, however, wood engraving lost its popularity. At about the same time major artists rediscovered the expressive potential of woodcuts. Instead of the fine-grained hardwoods traditionally used in woodcuts, the Norwegian artist Edvard Munch began to incorporate the grain of softwood into his designs and the French painter Paul Gauguin achieved new tones and textures by treating the wood surface with sandpaper. In Germany, woodcut became an important medium to the German Expressionists, who, inspired by the vitality of medieval woodcuts, gouged and roughly hewed the wood to achieve the brutal effect they desired. In the U.S., woodcuts gained importance in the 1920s and 1930s through the illustrations of Rockwell Kent and artists working in the Work Projects Administration. After World War II, the artists Misch Kohn, Leonard Baskin, and Carol Summers further developed the woodcut medium in the United States.

Woodcuts also play an important role in the history of Japanese art. During the 16th and 17th centuries, a style of genre art called Ukiyo-e (q.v.) was prominent in Japan. Produced to please popular tastes, woodcuts served as a convenient and practical way of filling the large demand for inexpensive Ukiyo-e pictures. The creation of the Ukiyo-e woodcut is attributed to Hishikawa Moronobu (c. 1618-c. 1694), whose designs for illustrations of popular literature were immediately successful. A special branch of Ukiyo-e was the making of miniature prints, called suri-mono, to commemorate special occasions. They usually carried a poem and were made on special paper decorated with gold or silver dust. In the 18th century, Ukiyo-e culminated in the landscapes of Hokusai and Hiroshige. Many Ukiyo-e woodcuts found their way to the West in the late 19th century and influenced avant-garde artists.

In the 20th century the technique was revived by such Japanese *hanga* masters as Munakata Shiko, Hiratsuka Un'ichi, Maekawa Sempan and Onchi Kōshirō.

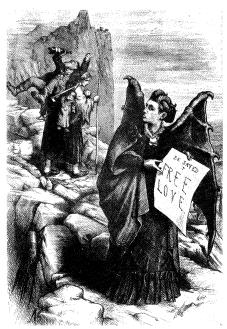

Wooden, John (Robert) (b. Oct. 14, 1910, near Martinsville, Ind., U.S.), U.S. basketball coach who directed teams of the University of California at Los Angeles (UCLA) to eight National Collegiate Athletic Association championships, six of them consecutive, in nine years (1964–65, 1967–72). Several of his UCLA players became professional basketball stars, notably Lew Alcindor (afterward Kareem Abdul-Jabbar) and Gail Goodrich.

At Purdue University, West Lafayette, Ind., Wooden, a guard, gained All-America honours as a basketball player for three seasons (1930–32) and won a Western Conference (Big Ten) medal for athletic and scholastic excellence. He coached high school basketball in Kentucky and Indiana before entering the U.S. Navy in 1943. After World War II, in which he served as a physical education instructor, he was head basketball coach and athletic director at Indiana State Teachers' College (now Indiana State University), Terre Haute, from 1946 to 1948. He was appointed head coach at UCLA in 1948 and retired in 1975, his record there being 620 wins and 147 losses for an

.808 percentage. His 40-year record was 885 wins and 203 losses, a percentage of .813. He is the only person named in the Basketball Hall of Fame, Springfield, Mass., as both a player and a coach.

woodhewer (bird): see woodcreeper.

Woodhull, Victoria, née CLAFLIN (b. Sept. 23, 1838, Homer, Ohio, U.S.—d. June 10, 1927, Norton Park, Bremons, Worcestershire, Eng.), unconventional American reformer who at various times championed such diverse causes as woman suffrage, free love, mystical

Victoria Woodhull, engraving from Harper's Weekly, 1872

socialism, and the Greenback Movement. She was also the first woman ever to run for the U.S. presidency (1872).

Reared in an atmosphere of spiritualism, Victoria and her sister Tennessee traveled in a family medicine and fortune-telling show, offering psychic and other remedies to the public. Even after her marriage to Canning Woodhull at the age of 15, she continued to give demonstrations in clairvoyance with her sister. After divorcing Woodhull in 1864 (though continuing to use his name), she was said to have been married to Colonel James H. Blood, who introduced her to a number of 19th-century reform movements.

In 1868 the entire family moved to New York City, where the two sisters gained the favour of Cornelius Vanderbilt, the railroad promoter, through their mutual interest in spiritualism. With Vanderbilt's support and guidance, they established a successful stockbrokerage firm (Woodhull, Claflin, & Co.). Woodhull was also influenced by Stephen Pearl Andrews, an aberrant philosopher who involved her in his socialist group called "Pantarchy"—a theory rejecting conventional marriage and advocating a perfect state of free love combined with communal management of children and property. She espoused Andrews' views in a series of articles collected as Origin, Tendencies and Principles of Government (1871).

In 1870 the sisters began to publish Wood-hull and Classin's Weekly, advocating among other things equal rights for women and a single standard of morality for both sexes. At first Woodhull's advocacy of free love made her suspect by leaders of the woman suffrage movement, but she won their support after pleading for woman suffrage before the Judiciary Committee of the U.S. House of Representatives. When a dissident group called the

National Radical Reformers broke away from the National Woman Suffrage Association in 1872, Woodhull—by now an accomplished public speaker—was nominated for the presidency by the Equal Rights Party.

Theodore Tilton, a prominent sympathizer in the woman suffrage movement, became interested in Woodhull, and, as a result of their relationship, the widely rumoured charges of a love affair between Henry Ward Beecher and Tilton's wife were first printed in the sisters' weekly (Nov. 2, 1872), creating a national scandal. The sisters claimed that it proved the need for a single standard of morality. They were indicted for sending improper material through the mails but were acquitted the following year. In 1872 they published in their weekly the first English translation of Karl Marx and Friedrich Engels' Communist Manifesto.

Woodhull divorced Blood in 1876, and when Vanderbilt died, in the following year, the sisters went to England—the trip apparently financed by the Vanderbilt heirs to prevent a challenge to the will. In London a lecture by Woodhull charmed a wealthy English banker, John Biddulph Martin, who proposed to her. Objections by his family, however, prevented their marriage until 1883. (Two years later Tennessee Claflin married Francis Cook, an English merchant and art collector, and she later became Lady Cook.) Both sisters became widely known for their philanthropy and were largely accepted in high British social circles. With the help of her daughter, Zula Maud Woodhull, Mrs. Martin published *Humanitarian* (1892–1910), a journal emphasizing eugenics. She also became an early patron of aviation, offering a prize of \$5,000 in 1914 for the first transatlantic flight. Both sisters outlived their husbands, who left them well provided for.

A biography, published in 1928 by Emanie Sachs, is entitled *Terrible Siren*, *Victoria Woodhull* (1838–1927).

woodie: see wood duck.

Woodland cultures, prehistoric cultures of eastern North America dating from the 1st millennium BC. A variant of the Woodland tradition was found on the Great Plains. Over most of this area these cultures were replaced by the Mississippian culture (q.v.) in the 1st millennium AD, but in some regions they survived until historic times.

The Woodland cultures were characterized by the raising of corn (maize), beans, and squash, the fashioning of particular styles of pottery, and the building of burial mounds.

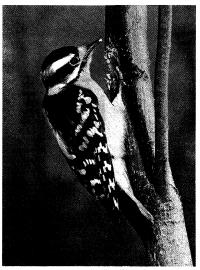

Woodlark Island, also called MURUA, coral formation in Papua New Guinea, situated approximately 150 miles (240 km) northeast of the southeasternmost point of the island of New Guinea, Solomon Sea, southwestern Pacific. Woodlark Island measures about 44 miles by 5–18 miles (70 km by 8–29 km). Its rough surface of raised coral pinnacles (rising to 1,200 feet [365 m] in the south) is covered by dense jungle growth. The major anchorages, along the south coast, are Guasopa and Suloga harbours; here also is Kolumadau, the principal settlement.

Gold was mined on Woodlark from 1934 to 1938, but mining has not resumed since the end of World War II, during which the island was an Allied air base; there are promising outcrops of ironstone containing magnetite ore. The island is named after the Australian ship *Woodlark*, which anchored there in 1836. Pop. (1980 prelim.) 3,811.

woodpecker, any of about 180 species of birds that constitute the subfamily Picinae (order Piciformes), noted for probing for insects in tree bark and for chiseling nest holes in dead wood. Woodpeckers occur nearly worldwide, except in the region of Australia and New Guinea, but are most abundant in South

America and Southeast Asia. A few temperatezone forms are migratory.

Most woodpeckers spend their entire lives in trees, spiraling up the trunks in search of insects; only the few ground-feeding forms are capable of perching crosswise, as passerine birds do. In spring the loud calls of woodpeck-

Downy woodpecker (Dendrocopos pubescens)
Kenneth and Brenda Formanek

ers, often augmented by drumming on hollow wood or occasionally on metal, are the sounds of males holding territories; at other seasons woodpeckers are usually silent.

The following are some well-known wood-pecker species:

Acorn woodpecker (*Melanerpes formicivorus*), 20 cm (8 inches); deciduous woodlands; western North America south to Colombia.

Black woodpecker (*Dryocopus martius*), 46 cm (18 inches); coniferous and beech woodlands of temperate Eurasia.

Crimson-backed woodpecker (*Chrysocolaptes lucidus*), 30 cm (11.8 inches); open woodlands from India to the Philippine Islands.

Downy woodpecker (*Dendrocopos pubescens*), 15 cm (6 inches); woodlands and gardens of temperate North America.

Great spotted woodpecker (*Dendrocopos major*), 23 cm (9 inches); forests and gardens of west temperate Eurasia, south to North Africa. Green woodpecker (*Picus viridis*), 32 cm (12.5 inches); woodlands of temperate Eurasia, south to North Africa.

Hairy woodpecker (*Dendrocopos villosus*), 20–25 cm (8–9.8 inches); temperate North America.

Ivory-billed woodpecker (q.v.; Campephilus principalis).

Pileated woodpecker (*Dryocopus pileatus*), 40–47 cm (15½–18¼ inches); mature forest of much of temperate North America.

Red-bellied woodpecker (*Centurus carolinus*), 20–25 cm (8–9.8 inches); deciduous forests of southeastern U.S.

Red-headed woodpecker (Melanerpes erythrocephalus), 19–23 cm (7.5–9 inches); open woodland, farmland, orchards; sparsely distributed; temperate North America east of the Rocky Mountains.

Three-toed woodpeckers (*Picoides*, two species), 19–23 cm (7.5–9 inches); northern three-toe (*P. tridactylus*) across subarctic Northern Hemisphere, south in some mountains; black-backed three-toe (*P. arcticus*) across forested central Canada.

woodpecker finch, species of Galápagos finch (q, v_{\cdot}) .

woodruff (Asperula), any of various species of plants belonging to the madder family, Rubiaceae. The woodruff is found growing wild in woods and shady places in many countries of Europe, and its leaves are used as herbs. The genus Asperula includes annuals and perennials, usually with square stems. Their small, funnel-shaped flowers are clustered, and a few species are cultivated for ornamental uses. Sweet woodruff (Galium odoratum) is in a separate genus; it was formerly classified as A. odorata.

Woodruff, Wilford (b. March 1, 1807, Farmington, Conn., U.S.—d. Sept. 2, 1898, San Francisco, Calif.), fourth president of the Church of Jesus Christ of Latter-day Saints (Mormons), who issued the proclamation that relinquished the church practice of polygyny, or polygamy as it was popularly called.

Converted in 1833, Woodruff joined the Mormons in Kirtland, Ohio, moved with them to Missouri, to Nauvoo, Ill., and finally to Utah (1847). Woodruff, whose journal has been an important source for Mormon history, was appointed official church historian in 1875. A practicing polygynist as he entered his presidential term (1889–98), he published in 1890 a "revelation," known as the Manifesto, officially ending plural marriage for Mormons.

Woods, Lake of the, scenic lake astride the Canadian-United States boundary where the provinces of Ontario and Manitoba and the state of Minnesota meet. Relatively shallow and irregular in shape, it is 70 miles (110 km) long and up to 60 miles (95 km) wide and has an area of 1,679 square miles (4,349 square km). The lake has an estimated 25,000 miles (40,000 km) of shoreline and more than 14,000 islands. Fed from the southeast by the Rainy River, the lake drains northwestward through the Winnipeg River into Lake Winnipeg. Its elevation is 1,060 feet (323 m) above sea level, and the drainage area is 27,170 square miles (70,370 square km). Visited by the French explorer Jacques de Noyon in 1688, the lake later became an important fur-trading route between the Great Lakes and western Canada. It is now the site of four Ontario provincial parks. Kenora, at its northern end, is the chief lakeside city. Separated from the remainder of Minnesota by a part of the lake is the Northwest Angle (Lake of the Woods county), which is the northernmost point of the coterminous United States

Woods, William B(urnham) (b. Aug. 3, 1824, Newark, Ohio, U.S.—d. May 14, 1887, Washington, D.C.), associate justice of the United States Supreme Court (1880–87).

After being admitted to the bar in 1847, Woods entered private practice, in which he remained until the outbreak of the American Civil War. In the prewar years he served first as mayor of Newark and then as a state legislator. He joined the Union army in 1862 and saw action repeatedly, rising to the rank of brigadier general. His wartime experiences caused him to become a Republican, and he subsequently settled in Alabama, where he resumed his practice, engaged in cotton planting, and took an active role in Reconstruction activities. In 1869 he was appointed a judge of the Circuit Court for the fifth circuit by President Ulysses S. Grant and moved to Atlanta.

In 1880 Woods was appointed to the U.S. Supreme Court by President Rutherford B. Hayes to take the seat vacated by William Strong. In six years on the bench he wrote 218 opinions, many of them in patent and equity cases that revealed his rare ability to analyze cogently an intricate record. His two most memorable opinions were in *United States* v. *Harris*, which struck down the Ku Klux Klan Act on grounds that the government had no

right, under the 14th Amendment, to regulate the activities of individuals, and in *Presser* v. *Illinois*, which declared that the Bill of Rights limited the power of the federal, but not a state, government. Both positions were later reversed.

Woods Hole, unincorporated village in Falmouth town (township), Barnstable county, southeastern Massachusetts, U.S. It lies at the southwestern tip of Cape Cod. Woods Hole is the cape's principal port and a point of departure for the islands of Martha's Vineyard and Nantucket. The Woods Hole Oceanographic Institution (1930), the Marine Biological Laboratory, the cape's Coast Guard units, and the National Marine Fisheries Services' Laboratory and Aquarium are located there. The Nobska Light, off the coast, was installed in 1829. Pop. (1980) 1,080.

Woodson, Carter G(odwin) (b. Dec. 19, 1875, New Canton, Va., U.S.—d. April 3, 1950, Washington, D.C.), American historian who first opened the long-neglected field of black studies to scholars and also popularized the field in the schools and colleges of black people. To focus attention on black contributions to civilization, in 1926 he founded Negro History Week.

Of a poor family, Woodson supported himself by working in the coal mines of Kentucky and was thus unable to enroll in high school until he was 20. Graduated in less than two years, he taught high school, wrote articles, studied at home and abroad, and received his Ph.D. from Harvard University (1912). In 1915 he founded the Association for the Study of Negro Life and History to encourage scholars to engage in the intensive study of the black past. Prior to this work, the field had been largely neglected or distorted in the hands of historians who accepted the traditionally biased picture of blacks in American and world affairs. In 1916 Woodson edited the first issue of the association's principal scholarly publication, The Journal of Negro History, which, under his direction, remained an important historical periodical for more than 30 years.

Woodson was dean of the College of Liberal Arts and head of the graduate faculty at Howard University, Washington, D.C. (1919-20) and dean at West Virginia State College, Institute, W.Va. (1920-22). While there, he founded and became president of Associated Publishers to bring out books on black life and culture, since experience had shown him that the usual publishing outlets were rarely interested in scholarly works on blacks.

Important works by Woodson include the widely consulted college text *The Negro in Our History* (1922; 10th ed., 1962); *The Education of the Negro Prior to 1861* (1915); and *A Century of Negro Migration* (1918). He was at work on a projected six-volume *Encyclopaedia Africana* at the time of his death.

Woodspring, district, county of Avon, southwestern England. It occupies an area of 145 square miles (375 square km) on the Bristol Channel in the southwestern part of the county. Before 1974 the area was part of the county of Somerset. It is a low-lying area of high limestone plateaus descending from 500 feet (150 m) toward the west into marshlands and mud flats at the Bristol Channel. A variety of crops and livestock (especially cereals and beef and dairy cattle) are raised in the fertile eastern soils. The marshlands are primarily used for pasture. The town ("parish") of Long Ashton southwest of Bristol is a centre for cider production. Weston-super-Mare (the district seat), Clevedon, and Portishead developed in the 19th century as coastal resorts. Weston-super-Mare has fine beaches and elaborate resort and entertainment facilities

The greatest tidal range in the British Isles at mean spring tide (more than 36 feet [11 m])

occurs near Portishead. Commercial dock facilities at Portishead were expanded in the late 1970s. Rare plants (including the wild peony) are protected on the Bristol Channel islets of Flat Holm and Steep Holm. Pop. (1986 est.) 177 800

Woodstock, city, seat of Oxford county, southeastern Ontario, Canada, on the Thames River. The first settler was Zacharius Burtch, a Loyalist from New York state, who built a log cabin (1798) on a hill overlooking the townsite. The actual founder, however, was Rear Admiral Henry Vansittart of the Royal Navy, who formed the nucleus of a village in 1834, which he named for Woodstock, Eng.

The city hall (1853), housing the Oxford Museum, and Old St. Paul's Church (1834) are historic buildings. Dairying and livestock rearing are important activities in the area, and Woodstock's manufacturing is well diversified. Oil was discovered just east of the city. Pop. (1986) 26,385.

Consult the INDEX first

Woodstock, town (township) in Ulster county, southeastern New York, U.S. It lies in the foothills of the southern Catskills near the Ashokan Reservoir, 10 miles (16 km) northwest of Kingston. A year-round resort, the village is also a noted artists' colony, which developed after 1902 when Ralph R. Whitehead, inspired by William Morris and John Ruskin, established a handicraft community, Byrdcliffe, just north of the village. In 1906 L. Birge Harrison moved the summer school of the Art Students' League of New York there. Artists such as George Bellows were attracted to the colony, which has flourished ever since.

A rock festival held at the Woodstock Music and Art Fair near Bethel, N.Y., in neighbouring Sullivan county, Aug. 15-17, 1969, occasioned the harmonious gathering of a crowd of from 300,000 to 500,000 young rock-music devotees. The festival marked the high point of the American youth counterculture of the 1960s. The festival was documented in the motion picture *Woodstock* (1970) and the book *Woodstock: The Oral History* (1989).

Woodstock town has art and craft galleries, a theatre school, and frequent music concerts. Dairy, poultry, and fruit farms are in the area. (1986 est.) 6,590.

Woodstock, Thomas of: see Gloucester, Thomas of Woodstock, Duke of.

woodswallow, also called swallow-shrike, family name artamidae, any of 10 species of songbirds (order Passeriformes), found from eastern India, Southeast Asia, and the Philippines, south to Australia and Tasmania. They

Woodswallow (Artamus)
Graeme Chapman—Ardea, London

resemble swallows in wing shape and aerial feeding habits. All are gray, with white, black, or reddish touches (sexes alike). They have stout, wide-gaped bills and brush-tipped tongues

These noisy, belligerent birds capture insects in midair in open country and roost in close bodily contact; some species breed in colonies. Australian examples are the 15-centimetre (6-inch) little woodswallow (Artamus minor) and the 22-centimetre (9-inch) white-browed woodswallow (A. superciliosus)—among the smallest and largest members of the family.

Woodville, Anthony: see Rivers, Anthony Woodville, 2nd Earl.

Woodville, Elizabeth (b. 1437—d. June 7/8, 1492, London), wife of King Edward IV of England. After Edward's death popular dislike of her and her court facilitated the usurpation of power by Richard, Duke of Gloucester (King Richard III).

A woman of great beauty, she was already a widow with two sons when Edward IV married her in May 1464. The match was repugnant to the ruling nobility of the House of York because she was a daughter of the Lancastrians, the traditional enemies of the Yorkists, and because she was not of royal rank. Her penchant for procuring high offices and titles of nobility for her relatives increased her widespread unpopularity.

Because Elizabeth bore Edward two surviving sons and five daughters, the Yorkist succession seemed secure. Within three months after the death (on April 9, 1483) of Edward IV, however, Gloucester had defeated Elizabeth's party and seized the throne from Edward IV's son and successor, the 12-year-old Edward V. It is not entirely clear why Elizabeth, who had taken sanctuary, surrendered her younger son (on June 16) and later her daughters to Richard III. Soon both sons disappeared from Richard's custody, presumably murdered.

After Henry Tudor became king as Henry VII in 1485, he married Elizabeth's eldest daughter, but in 1487 Elizabeth was disgraced—probably for treasonable activities—and forced to withdraw to a convent, where she died five years later. David MacGibbon's biography, Elizabeth Woodville, 1437–1492, was published in 1938.

Woodville, Richard: see Rivers, Richard Woodville, 1st Earl.

woodwarbler, any of several members of the songbird family Parulidae (formerly Compsothlypidae or Mniotiltidae, order Passeriformes). They are New World birds distinct from the true warblers of the Old World (see warbler).

The more than 100 species of woodwarblers are small, active birds commonly found in woodlands but present also in marshes and dry scrub. Most are brightly coloured, at least in the breeding season. All have short thin bills. Typically, parulids glean insects from foliage. Their songs tend to be buzzy and monotonous.

Female and male myrtle warblers (Dendroica coronata) at nest

S. Roberts-Ardea London

The usual nest is a tidy cup in a bush or a tree; some (e.g., ovenbird; q.v.) make a domed nest on or near the ground. Woodwarblers lay two to five (rarely six) speckled eggs.

Best-known is the yellow warbler (Dendroica petechia), breeding from Alaska and Newfoundland to the West Indies, Peru, and the Galápagos Islands; sometimes miscalled the wild canary, it is 13 cm (5 inches) long, yellow, with faintly red-streaked underparts (males). It belongs to the largest, and chiefly North American, genus of woodwarblers; this genus has 27 species, most of which have contrasting plumage, such as the black, white, and yellow of the myrtle warbler (D. coronata). A common but less striking species is the blackpoll warbler (D. striata). Some authors merge Dendroica in Vermivora, a less colourful genus of 11 species, most of them well known in the United States. The family's namesake, the northern, or American, parula warbler (*Parula americana*), breeding in eastern North America, is pale blue, with white wing bars, partial white eye-ring, and yellow breast crossed by a narrow dark band. The black and white warbler (*Mniotilta varia*), common east of the Rockies, is streaked and has creeperlike habits. A large tropical genus is *Basileuterus*; the 22 species are typified by the golden-crowned warbler (B. culicivorus), found from Mexico to Argentina.

The yellowthroats, any of the eight species of the genus *Geothlypis*, live in marshes and wet thickets. The male of the common yellowthroat (*G. trichas*)—often called Maryland yellowthroat in the United States—is yellow with a black mask; his song, a strong, repeated "wicheree," is heard from Alaska and Newfoundland to Mexico. The other species are resident in the tropics. For other woodwarblers *see* chat; redstart.

Woodward, city, seat (1907) of Woodward County, northwestern Oklahoma, U.S. The city lies along the North Canadian River. It was originally a train stop, settled in 1893 when the Cherokee Strip was opened for homesteading, and was probably named for Brinton W. Woodward, an official of the Santa Fe Railway.

Woodward is a marketing and processing centre for a wheat and cattle region and is the base for several oil and gas companies. The U.S. Great Plains Experiment Station at Woodward is concerned primarily with crops and range pasturing. A tornado destroyed much of Woodward on April 9, 1947. Boiling Springs State Park is nearby. Inc. 1907. Pop. (1986 est.) 15,351.

Woodward, C(omer) Vann (b. Nov. 13, 1908, Vanndale, Ark., U.S.), American historian and educator who became the leading interpreter of the post-Civil War history of the American South.

Woodward graduated from Emory University, Ga., in 1930, took a master's degree from Columbia University in 1932, and received a Ph.D. from the University of North Carolina in 1937. After holding various teaching positions, he was a member of the history faculty at Johns Hopkins University from 1946 to 1961 and was a professor of history at Yale University from 1961 until his retirement in 1977

Woodward's writings represented an extremely subtle and thoughtful revision of the history of the American South. In his first major work, the biography *Tom Watson, Agrarian Rebel* (1938), he interpreted the conversion of that fiery agrarian reformer into a racist demagogue as reflecting the defeat of the Populist reform movement in Southern political in *Origins of the New South 1877–1913*, he examined the disenfranchisement of Southern blacks in the 1890s in the light of political struggles between poor white farmers, agrarian reformers, and Populist politicians on the one hand and the large mercantile, industrial, and

landholding interests on the other. His analysis of the political deals associated with the contested Hayes-Tilden presidential election, Reunion and Reaction: The Compromise of 1877 and the End of Reconstruction (1951). emphasized the economic motives that influenced that historic compromise. Woodward's most widely read book was The Strange Career of Jim Crow (1955). In this book he showed that the legal segregation of whites and blacks was not rooted in "time immemorial" as had been routinely claimed by Southerners, but was actually a relatively recent phenomenon that had been erected in the South following the defeat of the Populist movement in the 1890s. The book helped provide a rationale for attempts at desegregation attempts in the 1950s and '60s because it showed that whites had lived on basically equal terms with blacks for two decades even after the end of Reconstruction in 1876.

Woodward's other works include his reediting of some important original Civil Warera manuscripts, published as Mary Chesnut's Civil War (1981), and his autobiographical work Thinking Back: The Perils of Writing History (1986).

Woodward, R(obert) B(urns) (b. April 10, 1917, Boston—d. July 8, 1979, Cambridge, Mass., U.S.), American chemist best-known for his syntheses of complex organic substances, including quinine (1944), cholesterol and cortisone (1951), and vitamin B_{12} (1971). He was awarded the Nobel Prize for Chemistry in 1965.

Education and early career. Woodward was attracted to chemistry at an early age and entered the Massachusetts Institute of Tech-

R.B. Woodward, 1966

By courtesy of the Harvard University News Service

nology in 1933. Involvement with chemistry at the expense of other subjects caused his suspension for a semester but also resulted in his collaboration on three research papers. Awarded the B.S. degree in 1936 and the Ph.D. degree a year later, he immediately became associated with Harvard, becoming professor (1950–60) and Donner Professor of Science (1960–79). He was uniquely honoured by the founding of the Woodward Research Institute in Basel, Switz., by the Ciba pharmaceutical company in 1963. He then directed research activities both in Cambridge and in Basel. Woodward was married in 1938 to Irja Pullman and in 1946 to Eudoxia Muller; he had three daughters and a son.

The chemistry of natural products served as the base for Woodward's broad engagement in organic chemistry. The first result of this involvement was a series of four papers (1940–42), based on work in the steroid field, delineating rules for the correlation of ultraviolet spectra with molecular structure. His early

recognition that physical measurement had greater power than chemical reaction to reveal structural features led to his development of those rules (Woodward's rules). During World War II, the extensive research in England and the United States to unravel the structure of penicillin foundered on incorrect deductions from misleading chemical behaviour until it was ultimately clarified by spectroscopic measurements. Woodward correlated the work of this project into a final deduction of structure (1945) and, during the next two decades, championed the development of several spectroscopic techniques, which have reduced the problem of structure determination to a relatively commonplace procedure.

Woodward's achievements in the field of structure determination were more than mere solutions of particular problems: they were demonstrations of new approaches and reasoning that have guided others and increased the power of the discipline. The structures of complex natural products deduced by Woodward include those of penicillin (1945), patulin (1948), strychnine (1947), oxytetracycline (1952), cevine (1954), carbomycin (1956), gliotoxin (1958), ellipticine (1959), calycanthine (1960), oleandomycin (1960), streptonigrin (1963), and tetrodotoxin (1964). His delineation of the structure of magnamycin revealed a previously unknown family of natural products, the macrolide antibiotics, for which he also proposed a mode of formation in nature. He also first proposed the correct biosynthetic pathway to the steroidal hormones in living organisms.

Woodward, widely considered the father of modern organic synthesis, was, without doubt, the most accomplished synthesist of complex molecules. Beginning with his synthesis of quinine in 1944, he demonstrated that the understanding of chemical reaction mechanisms made possible the planning and successful execution of extended sequences of reactions to build up complex compounds in the laboratory. The conception and planning of these elaborate programs, requiring a balanced utilization of all the tools and knowledge of the subject, is considered by many the most demanding form of organic chemical research. The requisite intellectual discipline, largely initiated by Woodward, did indeed become a major endeavour in organic chemistry.

Synthesis of steroids. Following the synthesis of quinine, he undertook and completed the first total synthesis of the steroids cholesterol and cortisone (1951) and then the related terpene lanosterol (1954). In 1954 syntheses of strychnine and lysergic acid were announced, followed in 1956 by a synthesis of reserpine that has become a model of elegant technique and has been used commercially for reserpine production. Subsequent achievements included the synthesis of chlorophyll (1960), tetracycline (1962), colchicine (1963), and cephalosporin C (1965). In collaboration with Albert Eschenmoser of the Federal Institute of Technology in Zürich (and, over a decade, about 100 co-workers in the two laboratories), Woodward completed in 1971 the synthesis of the complicated co-enzyme vitamin B₁₂ (cyanocobalamin) by a sequence of more than 100 reactions. This monumental work involved a scale of concerted activity quite unprecedented in any previous synthetic effort in chemistry. The work on vitamin B₁₂ led to the recognition and formulation, with Roald Hoffmann, of the concept of conservation of orbital symmetry, explicating a broad group of fundamental reactions-probably the most important theoretical advance of the 1960s in organic chemistry. At the time of his death Woodward was working on the synthesis of erythromycin.

Woodward's work was central to the chemical thought of the times, and his influence on other organic chemists was greater than that of any other. He was awarded numerous honorary degrees and held many honorary lectureships. His other honours included the Davy Medal of the Royal Society (England, 1959), the Pius XI Gold Medal (Pontifical Academy of Science, Vatican, 1961), the National Medal of Science (United States, 1964), the Order of the Rising Sun (Japan, 1970), the Nobel Prize for Chemistry (1965), and other medals and awards. Woodward was a member of the National Academy of Sciences, Washington, D.C.; the Royal Society, London; and honorary member, or fellow, of several other scientific societies in various countries.

(J.B.He.)

Woodward, William (b. April 7, 1876, New York City—d. Sept. 26, 1953, New York City), U.S. banker and an influential breeder, owner, and racer of horses.

Woodward was educated at Groton School, Groton, Mass., and Harvard College and, upon graduation from Harvard Law School in 1901, became secretary to Joseph H. Choate, U.S. ambassador to the Court of St. James. In 1903 he returned to New York to join the Hanover Bank, where he became vice president in 1904 and president in 1910. He also became a member of the first Federal Reserve Board in 1914 and, from 1927 to 1929, was president of the New York Clearing House. Thereafter, he served as board chairman of Central Hanover Bank and Trust but retired in 1933 to devote his time to his stud farm and Thoroughbred nursery, Belair, near Annapolis, Md., where the first English Thoroughbred racehorses imported into Maryland had been bred. At Belair, with the help of the outstanding trainer James ("Sunny Jim") Fitzsimmons, he bred two winners of the U.S. Triple Crown: Gallant Fox, who captured the three events in 1930, and Gallant Fox's colt Omaha, who won in 1935. Among his other successful horses were Happy Gal, Faireno, Granville, Vagrancy, and Nashua. In 1939 Woodward's horse Johnstown won the Kentucky Derby and the Belmont Stakes. Woodward also entered horses in the English classic races. Every year he sent some of his yearling foals to his English trainer Cecil Boyd-Rochfort. Among his winners in the English classic races were Boswell, 1936, the Saint Leger; Black Tarquin, 1948, the Saint Leger; Hycilla, 1944, the Oaks; and Flares, 1938, the Ascot Gold Cup

A member of the U.S. Jockey Club from 1917, Woodward served as chairman of the board of stewards from 1930 until 1950. During this time horse racing turned from a questionable gambling operation into a major spectator sport.

Articles are alphabetized word by word, not letter by letter

woodwind, any of a group of wind musical instruments, composed of the flutes and reed pipes (*i.e.*, clarinet, oboe, bassoon, and saxophone). Both groups were traditionally made of wood, but now they may also be constructed of metal.

Woodwinds are distinguished from other wind instruments by the manner in which the sound is produced. Unlike the trumpets or other instruments of the brass family, in which the airstream passes through the player's vibrating lips directly into the air column, the flutes are sounded by directing a narrow stream of air against the edge of a hole in a cylindrical tube. With the reed pipes (e.g., clarinets and saxophones), a thin strip of flexible material, such as cane or metal, is placed against the opening of the mouthpiece, forcing the airstream to pass through the reed before it reaches the column of air that is to vibrate.

In double-reed instruments (oboes and bassoons), two thicknesses of reeds are used. The woodwind section of a band or orchestra usually consists of three flutes, one piccolo, three oboes, one English horn, three clarinets, one bass clarinet, three bassoons, and one contrabassoon

Woodworth, Robert S(essions) (b. Oct. 17, 1869, Belchertown, Mass., U.S.—d. July 4, 1962, New York City), U.S. psychologist who conducted major research on learning and developed a system of "dynamic psychology" into which he sought to incorporate several different schools of psychological thought.

Woodworth worked as a mathematics instructor before turning to psychology. He pursued graduate studies under William James at Harvard University and James McKeen Cattell at Columbia University, where he received his Ph.D. in 1899. In 1901 Woodworth and Edward Lee Thorndike demonstrated that training could not be transferred; learning one subject did not produce an overall improvement in learning ability. He continued his research at Columbia and became professor of psychology there in 1909.

Woodworth asserted that both behaviour and consciousness were the subject matter of psychology. He believed that behaviour was a function of both environmental stimuli and the makeup of the organism. He also suggested that a mechanism (how a thing is done) can take on the function of a drive (the motive force for doing it).

Woodworth designed the first questionnaire to detect and measure abnormal behaviour; it served as a rough screening device for behavioral disorders. His *Dynamic Psychology* (1918) attempted to explain behaviour by combining theories of motivation, perception, learning, and thinking, while his *Psychology* (1921) became a standard textbook. Throughout his career, he attempted to develop a unified theory of psychology based on thorough scientific observations and cautious generalizations from them.

woof (weaving): see filling.

wool, animal fibre forming the protective covering, or fleece, of sheep or of other hairy mammals, such as goats and camels. Prehistoric man, clothing himself with sheepskins, eventually learned to make yarn and fabric from their fibre covering. Selective sheep breeding eliminated most of the long, coarse hairs forming a protective outer coat, leaving the insulating fleecy undercoat of soft, fine fibre.

Wool is mainly obtained by shearing fleece from living animals, but pelts of slaughtered sheep are sometimes treated to loosen the fibre, yielding an inferior type called pulled wool. Cleaning the fleece removes "wool grease," the fatty substance purified to make lanolin (q, v), a by-product employed in cosmetics and ointments.

Wool fibre is chiefly composed of the animal protein keratin. Protein substances are more vulnerable to chemical damage and unfavourable environmental conditions than the cellulose material forming the plant fibres. Coarser than such textile fibres as cotton, linen, silk, and rayon, wool has diameters ranging from about 16 to 40 microns (a micron is about 0.00004 inch). Length is greatest for the coarsest fibres. Fine wools are about 1.5 to 3 inches (4 to 7.5 centimetres) long; extremely coarse fibres may be as much as 14 inches in length. Wool is characterized by waviness with up to 30 waves per inch (12 per centimetre) in fine fibres and 5 per inch (2 per centimetre) or less in coarser fibres. Colour, usually whitish, may be brown or black, especially in coarse types, and coarse wools have higher lustre than fine types.

Single wool fibres can resist breakage when subjected to weights of 0.5 to 1 ounce (15 to 30

grams) and when stretched as much as 25 to 30 percent of their length. Unlike vegetable fibres, wool has a lower breaking strength when wet. The resilient fibre can return to its original length after limited stretching or compression, thus imparting to fabrics and garments the ability to retain shape, drape well, and resist wrinkling. Because crimp encourages fibres to cling together, even loosely twisted yarns are strong, and both crimp and resilience allow manufacture of open-structured yarns and fabrics that trap and retain heat-insulating air. The low density of wool allows manufacture of lightweight fabrics.

Wool fibre has good to excellent affinity for dyestuffs. Highly absorbent, retaining as much as 16 to 18 percent of its weight in moisture, wool becomes warmer to the wearer as it absorbs moisture from the air, thus adjusting its moisture content and, consequently, its weight, in response to atmospheric conditions. Because moisture absorption and release are gradual, wool is slow to feel damp and does not chill the wearer by too-rapid drying.

Wool that has been stretched during yarn or fabric manufacture may undergo relaxation shrinkage in washing, with fibres resuming their normal shape. Felting shrinkage occurs when wet fibres, subjected to mechanical action, become matted into packed masses. Wool has good resistance to dry-cleaning solvents, but strong alkalies and high temperatures are harmful. Washing requires the use of mild reagents at temperatures below 20° C (68° F), with minimum mechanical action. The performance of wool has been improved by development of finishes imparting insect and mildew resistance, shrinkage control, improved fire resistance, and water repellency.

Woolen yarns, usually made from shorter fibres, are thick and full and are used for such full-bodied items as tweed fabrics and blankets. Worsteds, usually made from longer fibre, are fine, smooth, firm, and durable. They are used for fine dress fabrics and suitings. Wool that has had no previous use is described as new wool, or, in the United States, as virgin wool. The limited world supply results in the use of recovered wools. In the United States, wool recovered from fabric never used by the consumer is called reprocessed wool: wool recovered from material that has had use is called reused wool. Recovered wools, employed mainly in woolens and blends, are often of inferior quality because of damage suffered during the recovery process.

Australia, the U.S.S.R., and New Zealand lead in fine-wool production, and India leads in the production of the coarser wools known as carpet wools. Leading consumers include the United Kingdom, the United States, and Japan.

Woolf, Arthur (baptized Nov. 4, 1766, Camborne, Cornwall, Eng.—d. Oct. 26, 1837, Guernsey), British engineer who pioneered in the development of the compound steam engine.

Woolf began as a carpenter and then worked for the engineer and inventor Joseph Bramah. As engineer for a London brewery, he began experimenting with steam power and patented the Woolf high-pressure compound engine in 1804 and 1805. Its thermal efficiency was 7.5 percent, almost twice that of James Watt's expansion engine. In 1810, after Watt's patent expired, Woolf revived and improved Jonathan Hornblower's compound engine of 1781. He returned to Cornwall in 1812 to introduce his engine for pumping mines. It was widely used until it was superseded in the next decade by Richard Trevithick's more efficient high-pressure engine.

Woolf, Leonard (Sidney) (b. Nov. 25, 1880, London—d. Aug. 14, 1969, Rodmell, Sussex, Eng.), British man of letters, publisher, political worker, journalist, and internationalist who influenced literary and political life and

thought more by his personality than by any one achievement.

Woolf's most enduring accomplishment was probably his autobiography, an expression of the toughness of moral fibre and quality of mind and spirit that made him one of the outstanding men of his time. Its first three volumes, Sowing (1960), Growing (1961), and Beginning Again (1964), re-create the world of liberal Jewry into which he was born, the intellectual excitement of life at the University of Cambridge in the early years of the

20th century, the experience as a civil servant in Ceylon (1904–11) that made him an anti-imperialist, and the atmosphere of the Bloomsbury group of artists and writers, in which he and his wife, novelist Virginia Woolf, played a formative part. In 1917 they founded their own publishing house, the Hogarth Press, and their discerning understanding encouraged such writers as T.S. Eliot and E.M. Forster.

The last volumes of the autobiography (Downhill All the Way, 1967; The Journey Not the Arrival Matters, 1969) span the years 1919 to 1969, a period during which Woolf exercised a certain amount of political influence through editorial activity on left-wing and internationalist journals and through his writings. His work helped to lay the foundations of the policy of the League of Nations and the United Nations and of the welfare state.

BIBLIOGRAPHY. Biographical studies include George Spater and Ian Parsons, A Marriage of Two Minds: An Intimate Portrait of Leonard and Virginia Woolf (1977); and Duncan Wilson, Leonard Woolf: A Political Biography (1978).

Woolf, (Adeline) Virginia, née STEPHEN (b. Jan. 25, 1882, London—d. March 28, 1941, near Rodmell, Sussex, Eng.), British author who made an original contribution to the form of the novel and was one of the most distinguished critics of her time.

She was educated at home by her father, Sir Leslie Stephen, and, after his death in 1904, lived in Gordon Square, London, which became the centre of the Bloomsbury group (q.v.). In 1912 she married Leonard Woolf, and in 1917 they founded the Hogarth Press, which published her books.

After her novels The Voyage Out (1915) and

Virginia Woolf Gisele Freund

Night and Day (1919) appeared, she began to experiment. She wanted to stress the continuous flow of experience, the indefinability of character and external circumstances as they impinge on consciousness. She was also interested in the way time is experienced both as a sequence of disparate moments and as the flow of years and of centuries. From Jacob's Room (1922) onward, she tried to convey the impression of time present and of time passing in individual experience and also of the characters' awareness of historic time.

In Mrs. Dalloway (1925) and To the Lighthouse (1927), she extended her technical mastery; above all, she gave to each of these novels a tightly organized form, partly by using poetic devices such as recurrent images and partly by restricting the time of the action. Orlando (1928) is a historical fantasy with evocations of England, and especially literary England, from Elizabeth I to 1928. In her long essay, A Room of One's Own (1929), she described the difficulties encountered by women writers in a man's world.

Returning to the novel, in The Waves (1931) she confined herself to recording the stream of consciousness. The reader lives within the minds of one or the other of six characters from their childhood to their old age. Human experience of the "seven ages of man," rather than character or event, is paramount. The Years (1937) is more expansive and traditional. In Between the Acts (1941), the action, as in Mrs. Dalloway, occurs on a single day, but extended time is suggested by the staging of a village pageant recording English history, while the reader is also kept aware of impending war. In a recurrence of mental illness, after finishing Between the Acts, she drowned herself near her Sussex home.

Woolf wrote two biographies: one is fanciful, a fragment of the life of the Brownings through the imagined memories of Elizabeth Barrett Browning's dog (Flush; 1933); the other is a full-length biography of the art critic Roger Fry (1940). Her best critical studies are in The Common Reader (1925), The Common Reader: Second Series (1932), The Death of the Moth (1942), and Granite and Rainbow (1958).

BIBLIOGRAPHY. Woolf's diaries and correspondence have been collected in A Writer's Diary (1953, reprinted 1975), ed. by Leonard Woolf, The Diary of Virginia Woolf, 5 vol. (1977–84), ed. by Anne Olivier Bell; and The Letters of Virginia Woolf, 6 vol. (1975–80), ed. by Nigel Nicolson and Joanne Trautmann. Biographies include Quentin Bell, Virginia Woolf, 2 vol. (1972, reissued 1987); and Phyllis Rose, Woman of Letters: A Life of Virginia Woolf (1978, reprinted 1987). Criticism and interpretation of her work can be found in Patricia Clements and Isobel Grundy (eds.), Virginia Woolf: New Critical Essays (1983); and Jane Wheare, Virginia Woolf: Dramatic Novelist (1989).

Woollcott, Alexander (Humphreys) (b. Jan. 19, 1887, Phalanx, N.J., U.S.—d. Jan. 23, 1943, New York City), American author, critic, and actor known for his acerbic wit. A large, portly man, he was the self-appointed leader of the Algonquin Round Table, an informal luncheon club at New York City's Algonquin Hotel in the 1920s and '30s.

After graduating from Hamilton College, Clinton, N.Y., in 1909, he joined the staff of *The New York Times* as cub reporter and succeeded to the post of drama critic in 1914. After a brief stint (1917–18) in the U.S. Army, reporting for *The Stars and Stripes*, he returned to the *Times* and subsequently worked for the *New York Herald* and the *New York World*. He also wrote for *The New Yorker*, and in 1929 he branched out into the radio field as "The Town Crier" of the air, establishing a nationwide reputation as raconteur,

gossip, conversationalist, wit, and man-abouttown. As a literary critic he wielded great influence on the nation's book-buying public.

Woollcott played the title role of *The Man Who Came to Dinner* (1940), a play by George S. Kaufman and Moss Hart in which the bilious and autocratic Woollcott was himself lampooned. He was the author of *Mrs. Fiske, Her Views on Actors, Acting, and the Problems of Production* (1917), *Two Gentlemen and a Lady* (1928), and *While Rome Burns* (1934) and publisher of two anthologies, *The Woollcott Reader* (1935) and *Woollcott's Second Reader* (1937).

Woolley, Frank Edward (b. May 27, 1887, Tonbridge, Kent, Eng.—d. Oct. 18, 1978, Chester, Nova Scotia, Can.), Canadian cricketer, one of the greatest of all time, remembered especially for his graceful left-handed batting. His impressive record in first-class cricket included an aggregate of 58,969 runs, 145 centuries (100 runs in a single innings), more than 2,000 wickets, and 1,018 catches, which remains a world record. In each of three successive seasons, he scored 2,000 runs and took 100 wickets.

During his career (1906–38), Woolley played for the Kent County Cricket Club, and in 64 Test (international) matches he scored 3,283 runs for England. After retirement he coached at King's School, Canterbury, and later moved to Canada.

Woolley, Sir (Charles) Leonard (b. April 17, 1880, London—d. Feb. 20, 1960, London), British archaeologist whose excavation of the ancient Sumerian city of Ur (in modern Iraq) greatly advanced knowledge of ancient Mesopotamian civilization. His discovery of geological evidence of a great flood suggested a possible correlation with the deluge described in Genesis.

From 1907 to 1911 Woolley served with an archaeological expedition near Wadi Halfa, Sudan, an area rich in Egyptian antiquities. With T.E. Lawrence ("Lawrence of Arabia"), he conducted the principal excavation of the Hittite city of Carchemish in northern Syria (1912–14) and recorded his findings in *Carchemish* (part 2, 1921, and part 3, with R.D. Barnett, 1953). He then worked at Tell el-Amarna, capital of the Egyptian king Akhenaton.

His excavation of Ur (1922–34), conducted for the British Museum, London, and the University of Pennsylvania, Philadelphia, enabled scholars to trace the history of the city from its final days during the 4th century BC back to its prehistoric beginnings (c. 4000 BC). Woolley's findings revealed much about everyday life, art, architecture, literature, government, and religion in what has come to be called "the cradle of civilization."

One of his most dramatic discoveries, royal tombs dating from about 2700 BC, disclosed the practice of the sacrificial burial of a deceased king's personal retinue. With the help of contributors, he began publishing a projected 10 volumes of *Ur Excavations* in 1927. His other books include *The Sumerians* (1928), *Ur of the Chaldees* (1929), and *Digging up the Past* (1930).

Woolley also sought to establish a relationship between the civilizations of Mesopotamia and those of Greece and the Aegean. To this end, he excavated at Tell Atchana (ancient Alalakh) in southeastern Turkey north of Antioch (1937–39 and 1946–49). There he discovered the remains of a small kingdom of largely Hurrian population and levels of habitation dating back to the 4th millennium BC. His findings appeared in Alalakh, an Account of the Excavations at Tell Atchana in the Hatay, 1937–1949 (1955) and A Forgotten Kingdom (1953). He was knighted in 1935.

woolly monkey (Lagothrix), any of two or three species of South American monkeys, family Cebidae, found in forests along the Amazon basin and becoming increasingly rare

Humboldt's woolly monkey (*Lagothrix lagotricha*) George Holton—Photo Researchers/EB Inc.

as their habitat is destroyed. Woolly monkeys average 40–60 cm (16–24 inches) in length excluding the somewhat longer tail. As the name implies, they have short, dense fur, which, depending on the species, is tan, gray, reddish, or black and in some forms is darker on the head. They have big, round heads; bare, black or brown faces; sturdily built limbs; and heavy, prehensile tails. Their bodies are thick, and their protruding bellies have given them the Portuguese name barrigudo, or "big belly."

Woolly monkeys are active during the day. Gregarious, they live in small groups and are often found in company with capuchins, howlers, and other monkeys. They are rather slow in their movements and generally travel on all fours, although they often swing by their hands, feet, and tail or by their tail alone. On the ground they stand erect, using the tail for support.

support.
Woolly monkeys mature at about four years. They bear single young after about 225 days' gestation. Food in the wild is primarily fruit and leaves, but in captivity these monkeys accept almost any food and for that reason often have nutritional problems. They are placid and gentle, but they need attention and must be coddled to some extent. They weep when upset. Pets have appeared to enjoy playing hide-and-seek.

The woolly spider monkey (q.v.), is intermediate in form between these and spider monkeys.

woolly rhinoceros, extinct genus (*Coelodonta*) of Pleistocene rhinoceros, found in fossil deposits in Europe, North Africa, and Asia

Woolly rhinoceros (Coelodonta)

of the Pleistocene epoch (1,600,000 to 10,000 years ago). The genus probably evolved from an earlier form, *Dicerorhinus*, somewhere in northeastern Asia, entered the European region, and became extinct at the end of the most recent glacial period. Frozen carcasses of woolly rhinoceroses have been found preserved in Siberia, and others have been found well preserved in oil seeps in central Europe. The animal was massive, with two large horns

in the anterior region of the skull, and was covered with a thick coat of hair.

The woolly rhinoceros was also present in more temperate, nonglacial regions, where it inhabited grasslands. It was a popular subject for Stone Age painters and sculptors; representations of the woolly rhinoceros, some of which are very accurate, are known from several localities.

woolly spider monkey (Brachyteles arachnoides), extremely rare Brazilian monkey, family Cebidae, confined primarily to mountain forests of southeastern Brazil. It is listed in the Red Data Book as critically endangered. The woolly spider monkey is intermediate in structure and appearance between woolly (Lagothrix) and spider (Ateles) monkeys. Its thick fur, heavy body, and protruding abdomen are similar to those of woolly monkeys, while its reduced thumbs and long limbs resemble those of spider monkeys. The woolly spider monkey is 45-63 cm (17-25 inches) long excluding the 65-80-centimetre (25–30-inch) tail. It is yellowish or brown with a hairless face and a prehensile tail. Little is known of its habits. It is active by day and moves among the treetops, gathering its food of leaves, seeds, and fruit.

Woolman, John (b. Oct. 19, 1720, Ancocas, N.J. [U.S.]—d. Oct. 7, 1772, York, Yorkshire, Eng.), British-American Quaker leader and Abolitionist whose *Journal* is recognized as one of the classic records of the spiritual inner life

Until he was 21 Woolman worked for his father, a Quaker farmer. He then moved to Mount Holly, N.J., to enter trade. At that time he made his first appearance as a preacher of Quaker doctrine, exercising his ministry without financial remuneration, in keeping with his religion's practice. In 1743 he took up tailoring, which afforded a modest income, augmented at times by other work. From 1743 he made frequent and often arduous preaching journeys, visiting, among other places, Maryland's east shore, where he carried his message against slaveholding, and the Rhode Island coast, where he brought his antislavery doctrine to the attention of shipowners. In Indian villages of the Pennsylvania frontier, he supported Moravian missionary attempts, sought to curtail the sale of rum to the Indians, and worked for a more just Indian land policy.

Woolman maintained a strict manner of life, making his trips on foot whenever possible, wearing undyed garments, and abstaining from the use of any product connected with the slave trade. He was successful in getting Quaker communities to go on record against slavery and in persuading many individuals to free their slaves.

His *Journal*, published in 1774, was begun in his 36th year and continued until his death; it is a major document of his religious experience, written in a style distinguished by purity and simplicity of expression. He also wrote several other works expressing his spiritual and antislavery convictions. All his writings were collected in *The Works of John Woolman* (1774). The most complete edition of the *Journal* is that of A.M. Gummere (1922).

Woolsey, Theodore Dwight (b. Oct. 31, 1801, New York City—d. July 1, 1889, New Haven, Conn., U.S.), American educator and scholar, president of Yale (1846–71), whose many innovations later became common in institutions of higher learning.

Woolsey graduated as head of his class at Yale in 1820, and in 1831 he was appointed professor of Greek there. Elected president of Yale in 1846, Woolsey improved scholarly standards and expanded the university. Under his leadership the scientific school was founded, the first American Ph.D. was awarded (1861), the first college school of fine arts was established, the law and divinity schools were rejusive to the scientific schools were rejusive to the school of the school of the schools were rejusive to the school of the schoo

venated, the corporation was reorganized, and the "government of the faculty" was affirmed. Woolsey's editions of the Greek tragedies brought the advanced methods of German scholarship to American colleges, and his *Introduction to the Study of International Law* (1860) and *Essay on Divorce and Divorce Legislation* (1869) went through many editions. After retirement he wrote *Political Science* (1877) and *Communism and Socialism* (1880) and headed an American commission for revision of the New Testament.

woolsorters' disease: see anthrax.

Woolston, Thomas (b. 1670, Northampton, Northamptonshire, Eng.—d. Jan. 27, 1733, London), English religious writer and an extremist among English Deists who generally acknowledged the existence of God but denied divine intervention in human affairs.

Woolston became a fellow at the University of Cambridge in 1691. After studying the work of Origen, a 3rd-century theologian of Alexandria who in his allegorical interpretation of Scripture stressed the spiritual qualities of creation over the material, Woolston also began to interpret Scripture allegorically rather than literally. This approach he advocated in his first book, The Old Apology for the Truth of the Christian Religion Against the Jews and Gentiles Revived (1705).

As one of several Deists who openly challenged the practices and privileges of the established clergy, Woolston soon came into conflict with the government. When it was reported that his mind had become defective, his fellowship was taken away, and in 1721 he went to live in London. He formally entered into the Deist controversy with his book The Moderator Between an Infidel and an Apostate (1725). In addition to questioning prophecies and the Resurrection of Christ, Woolston insisted on an allegorical interpretation of biblical miracles, holding that they could not offer sufficient proof of the Christian faith. He applied his principles in detail to A Discourse on Our Saviour's Miraculous Power of Healing (1730), which reportedly sold 30,000 copies. In 1729 Woolston was arrested and tried for publishing the series, sentenced to a year's imprisonment, and ordered to pay a fine, with imprisonment until the fine was paid. Unable to raise funds to pay the penalty, he died in confinement.

Woolworth Co., in full F.w. woolworth co., multinational company of retail stores that was incorporated on Dec. 15, 1911, in the consolidation of five American retail chains, the largest of which was headed by Frank Winfield Woolworth (1852–1919), the founder of the modern "five-and-ten" variety stores.

By the late 20th century the company included retail and department stores in the United States, Canada, Great Britain, Germany, Spain, and Mexico; Kinney Shoe Corporation stores in the United States, Canada, and Australia; and Richman Brothers Company apparel stores in the United States. Woolworth's headquarters are in the Woolworth Building, New York City.

Frank Woolworth founded his first five-and-

tens in Utica, N.Y., and Lancaster, Pa., in 1879; the former failed, but the latter was so successful that he opened some 21 more stores in the next decade in various towns in Pennsylvania, New Jersey, New York, Delaware, and Connecticut, the majority of which were highly successful and were financed and managed in partnerships. By the end of 1904 there were 120 stores in 21 states and the District of Columbia, extending westward as far as Colorado. Woolworth founded his success on volume buying, counter-display merchandising, and cash-and-carry transactions.

In 1905 he incorporated, as F.W. Woolworth & Co., at a capitalization of \$10,000,000. Five years later, in 1909, he founded F.W. Woolworth and Co., Limited, to serve Great Britain and Ireland. Then in 1911, he invited four of his rival retailers together at the Waldorf Astoria Hotel in New York City for the purpose of merging his and their businesses into a single national corporation. They were Seymour Horace Knox (Woolworth's first cousin), with 108 five-and-tens; Fred Morgan Kirby, with 84; Charles Sumner Woolworth (Frank's brother), with 14; and Earle Perry Charlton, with 48. Woolworth's own giant company at the time of the merger had 319 stores, from Maine to North Carolina, New York to Colorado. Agreements were signed on Nov. 12, 1911; the new consolidated company was incorporated on December 15, capitalized at \$65,000,000; and on March 1, 1912, all 596 stores, coast to coast, assumed the F.W. Woolworth Co. name.

Over the years the stores proliferated in North America and Great Britain, and in 1962 Woolworth opened Woolco department stores to compete with discount stores. By the end of the 1960s, the company had subsidiaries in Germany (F.W. Woolworth Co., GmbH), Canada (F.W. Woolworth Co., Limited), Mexico (F.W. Woolworth Co., SA de CV), and Spain (Woolworth Española, SA). It purchased the shoe manufacturer and retailer G.R. Kinney Corporation (founded 1894) in 1963 and the apparel retailer Richman Brothers Company in 1969. In 1982 it sold its British operation.

Woomera, town, developed since 1948, south-central South Australia, west of Lake Torrens, 270 miles (435 km) northwest of Adelaide. It is part of a British-Australian guidedmissile test range established in 1947, and its name means "spear-throwing stick." Extending 1,200 miles (1,900 km) northwest into the Great Victoria Desert and Western Australia, the test range has outlying tracking stations at The Island Lagoon (south of Woomera) and Red Lake (north). Situated on a branch line connecting with the Trans-Australian Railway at nearby Pimba, Woomera is associated with the Weapons Research Establishment based at Salisbury (just north of Adelaide). It is also a site for testing, launching, and tracking space satellites of ELDO (European Space Vehicle Launcher Development Organization), a joint British, French, West German, Dutch, Belgian, and Italian undertaking established in the early 1960s. The first successful launch was made in 1964. The town is inhabited chiefly by range employees and their families. Pop. (1981) 1,658.

Woonsocket, city, Providence county, Rhode Island, U.S., on the Blackstone River, just south of the Massachusetts border. The first European settlement on the site was made by Richard Arnold, who built a sawmill in 1666. Waterpower inspired a cotton-spinning mill about 1810, and the first plant for spinning and weaving wool was erected by Edward Harris in 1840. Many of Woonsocket's residents are Franco-Americans whose forebears came from Canada to work in the textile industry. French is still the second language of the city. Woonsocket, which was once part of Cumberland and Smithfield and not set off as

a separate town until 1867, was incorporated as a city in 1888. Its name has been conjectured to derive from the Indian word *miswosakit*, meaning "at the very steep hill," or "thunder mist." Although textile manufacturing has declined, it is still the leading industry in Woonsocket. Footwear, clothing, electronic products, machinery and machine tools, and rubber and plastic goods are also produced. Pop. (1987 est.) 45,479.

Wooster, city, seat (1811) of Wayne county, north-central Ohio, U.S., on Killbuck Creek, 28 miles (45 km) southwest of Akron. The site was laid out in 1808 by John Bever, William Henry, and Joseph Larwill and named for the Revolutionary War general David Wooster. The community claims to have had the first Christmas tree in America, introduced (1847) by a German immigrant, August Imgard. It is the home of the College of Wooster (1866, United Presbyterian) and the Ohio State University Agricultural Technical Institute (1972); the Ohio Agricultural Research and Development Center is just southeast. The Wayne County Historical Society Museum houses

The Wayne County Historical Society Museum, Wooster, Ohio

Milt and Joan Mann from CameraMann

natural-history specimens and pioneer relics. A manufacturing economy (including the production of paint equipment, steel tubes, rubber and plastic housewares, cooking utensils, automotive parts, hydraulic pumps, and metallurgical items) prevails. Inc. town, 1817; city, 1869. Pop. (1987 est.) 19,526.

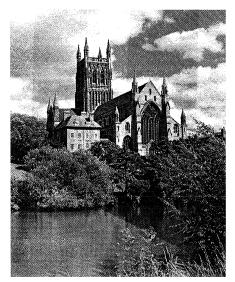

Worcester, district (city), county of Hereford and Worcester, England; Worcester was historically the county town of the former Worcestershire. Except for the small residential suburb of St. John's, it lies on the east bank of the River Severn. The city has little river frontage because much of the land adjacent to the river is liable to flooding. Pitchcroft Meadow (on the east bank) is one of the oldest racecourses in England. The city covers 12 square miles (32 square km).

The first recorded occupation of the site was prior to AD 680, and the "cester" in its name (from Latin *castra*, "camp") suggests earlier Roman habitation. In 1086 the town consisted of a castle, cathedral, and small settlement, all surrounded by a wall and deep ditch. The River Severn was forded at Worcester until 1313, when the first bridge was built.

During the Middle Ages Worcester was an important wool town, and glove making has been important since the 13th century. Berrow's Worcester Journal, Britain's oldest surviving newspaper, was founded in 1690. In 1750 John Wall founded the porcelain industry for which the town is now famous. Various light-engineering concerns are also found in the modern town.

The town played a crucial role in English history with the Battle of Worcester (1651), which brought to an end the English Civil Wars. Charles II, in an attempt to regain the throne, had gathered together a Scottish army and marched south with it. It reached Worcester on August 22, and the king selected the Com-

mandery (a 16th-century structure located east of the cathedral) as his headquarters. Oliver Cromwell, the leader of the Parliamentary faction, with forces far outnumbering those of the King, attacked the town from both east and west and finally captured it. Charles II managed to escape to France.

The cathedral at Worcester, Hereford and Worcester, on a ridge above the River Severn

The cathedral has dominated every stage of Worcester's history. Bosel, a monk from Whitby, became the first bishop in 679. In 983 Bishop Oswald (St. Oswald) constructed a new cathedral, but little remains of this except the crypt. The present building was begun by Bishop Wulfstan (St. Wulfstan) in 1084. There have been many additions and alterations over the centuries: in 1224 the Early English-style Lady Chapel and choir were begun, while the present nave and the tower were completed in 1317 and 1374, respectively. A thorough restoration, internal and external, was carried out between 1857 and 1874.

The town has two long-established grammar schools: the Cathedral Grammar School (King's School) was founded in 1541, and the Royal Grammar School was given a charter by Queen Elizabeth I in 1561. Pop. (1983 est.) 76,000.

Worcester, town, southwestern Cape Province, South Africa, in the Breë River Valley, between the rugged Dutoits and Hex River mountains, east—northeast of Cape Town. It was founded in 1820 and attained municipal status in 1842. It is a prominent viticultural centre, and fruit processing and canning, brandy distilling, wool milling, and light manufacturing are its economic mainstays. The town has schools for the blind and the deaf. The Karoo (or Karroo) Botanic Garden (264 ac [107 ha]), just north of the town, specializes in succulent plants indigenous to the Karroo (q.v.). Pop. (1983 est.) mun., 50,851.

Worcester, city, seat (1731) of Worcester County, central Massachusetts, U.S., on the Blackstone River, midway between Boston and Springfield. A major commercial and industrial centre and the state's second largest city, it is the hub of an urbanized area composed of a number of towns (townships) including Holden, Shrewsbury, Boylston, Millbury, Auburn, and Leicester. The original settlement (1673) was disbanded during King Philip's (Indian) War (1675–76) against the colonists, and permanent settlement was not realized until 1713. The community was in-

corporated as a town in 1722 and named for Worcester, Eng.

Textile manufacturing began in 1789 and the first corduroy cloth in the United States was produced there. Early economic development was hindered by a lack of waterpower, but, with the advent of steam power and the opening (1828) of the Blackstone Canal linking the community to Providence, R.I., a period of expansion and industrialization began; the building of railway connections further stimulated the city's growth. Modern industries are highly diversified and include the production of primary and fabricated metals, textiles, clothing, paper, leather, electrical machinery, stone, clay products, glass, and precision instruments. State hospitals located there also contribute to the economy.

The city was an early centre of Abolitionist sentiment and became an important stop on the Underground Railroad, a route for escaped slaves. The Free-Soil Party in Massachusetts, which opposed the extension of slavery, evolved out of a meeting held in Worcester (1848). The city, a noted educational and cultural centre, is the seat of the College of the Holy Cross (1843; the oldest New England Catholic college), Worcester Polytechnic Institute (1865), the Worcester State College (1871), Clark University (1887), Assumption College (1904), Becker Junior College (1887), Worcester Junior College (1905), and Central New England College of Technology (1971). Other institutions include the Worcester Art Museum, Worcester Science Center, the Worcester Historical Society Museum, and the John Woodman Higgins Armory (with a notable collection of medieval armour). The annual (October) Worcester Music Festival (begun in 1858) is the oldest such festival in the United States. Lake Quinsigamond and the Quinsigamond State Park are nearby. Inc. city, 1848. Pop. (1980) city, 161,799; metropolitan area (SMSA), 372,940.

Worcester, EARLS AND MARQUESSES OF, titled English nobility of several creations, grouped below chronologically and indicated by the symbol •.

• Worcester, Thomas Percy, earl of (b. c. 1344—d. July 23, 1403), English noble, brother of Henry Percy, 1st earl of Northumberland, and uncle of Sir Henry Percy, called "Hotspur," and a party to their rebellions against Henry IV of England.

Thomas Percy served with distinction in France during the reign of Edward III; he also held an official position on the Scottish borders, and under Richard II he was the admiral of a fleet. He deserted Richard II in 1399 and was employed and trusted by Henry IV, but in 1403 he joined the other Percys in their revolt; he was taken prisoner at the Battle of Shrewsbury (July 21, 1403) and subsequently beheaded, the earldom becoming extinct.

• Worcester, John Tiptoft, 1st earl of, Tiptoft also spelled TIBETOT (b. c. 1427, Everton, Bedfordshire, Eng.—d. Oct. 18, 1470, London), noted English Yorkist leader during the Wars of the Roses, known for his brutality and abuse of the law and called the "butcher of England."

The son of the 1st Baron Tiptoft, he was educated at Oxford, and in 1449 he was created earl of Worcester. In 1456–1457 he was deputy of Ireland, and in 1457 and again in 1459 he was sent on embassies to the pope. He was abroad three years, during which he made a pilgrimage to Jerusalem; the rest of the time he spent in Italy, at Padua, Ferrara, and Florence, studying law, Latin, and Greek. He returned to England early in the reign of Edward IV and on Feb. 7, 1462, was made constable of England. In 1462 he condemned John de Vere, 12th earl of Oxford, and in 1464 Sir Ralph Grey and other Lancastrians. In 1467 he was again appointed deputy of

Ireland. During a year's office there he had the Earl of Desmond attainted and cruelly put to death the earl's two infant sons. In 1470, as constable, he condemned 20 of the Earl of Warwick's adherents and had them impaled. On the Lancastrian restoration Worcester fled into hiding but was discovered and tried before John de Vere, 13th earl of Oxford, son of the man whom he had condemned in 1462. He was executed on Tower Hill.

On the death of his son, Edward, in 1485 the earldom reverted to the crown.

• Worcester, Edward Somerset, 2nd marquess of, also called (1628–44) LORD HERBERT OF RAGLAN, also called EARL OF GLAMORGAN (b. 1601—d. April 3, 1667, Lambeth?, near London), prominent Royalist during the English Civil Wars.

His father, Henry Somerset, 5th earl of Worcester, advanced large sums of money to Charles I at the outbreak of the wars and was created marquess of Worcester in 1643. In the following year, Edward was created earl of Glamorgan, though by somewhat irregular patents, and on the death of his father in 1646 succeeded to the marquessate of Worcester.

Somerset became very prominent in 1644 and 1645 in connection with Charles's scheme for obtaining military help from Ireland and abroad, and in 1645 he signed at Kilkenny, on behalf of Charles, a treaty with the Irish Roman Catholics; but the King was obliged by the opposition of Ormonde and the Irish loyalists to repudiate his action. Under the Commonwealth he was formally banished from England and his estates were seized. At the Restoration his estates were restored, and he claimed the dukedom of Somerset promised to him by Charles I, but he did not obtain this, nor was his earldom of Glamorgan recognized.

Worcester was greatly interested in mechanical experiments, and his name is intimately connected with the early history of the steam engine.

Worcester, Hereford and (county, England): see Hereford and Worcester.

Worcester, Joseph Emerson (b. Aug. 24, 1784, Bedford, N.H., U.S.—d. Oct. 27, 1865, Cambridge, Mass.), U.S. lexicographer whose dictionaries rivalled those of Noah Webster in popularity and critical esteem from about 1830 to 1865. His introduction of synonyms to definitions, as well as other innovations, was assimilated by later lexicographers.

Beginning in 1817 Worcester wrote several

Joseph Worcester, detail of an oil portrait by Cephas Giovanni Thompson; in the collection of the Massachusetts Historical Society By courtesy of the Massachusetts Historical Society; photograph, George M. Cushing

works that were widely used as textbooks, including A Gazetteer of the United States (1818) and Elements of History, Ancient and Modern (1826). From about 1828 until his death, however, he devoted himself almost entirely to lexicography. His abridgment of Webster's large American Dictionary of the English

Language in 1829 was followed by his own Comprehensive Pronouncing and Explanatory Dictionary of the English Language (1830), which introduced the "compromise vowel" in such words as half, past, and dance, a sound intermediate between the a in "cat" and the a in "father." The later work also elicited a charge of plagiarism from Webster and thus began a bitter publishing battle known as the "Dictionary War," which lasted until Worcester's death.

His Universal and Critical Dictionary of the English Language (1846) was followed by enlarged editions of the 1830 Comprehensive. Most notable among them was the 1855 edition with the new title A Pronouncing, Explanatory, and Synonymous Dictionary of the English Language. In addition to its pioneering introduction of synonymy, it also included, for the first time in an English dictionary, given names and their etymological derivations. Worcester's largest and most successful work was the illustrated quarto Dictionary of the English Language (1860).

In the second half of the 19th century Worcester's dictionaries gradually lost out in competition with those of Webster, and they eventually ceased to be published. This was due largely to the more enterprising promotional and editorial policies undertaken by the publisher of the Webster dictionaries.

Worcester Art Museum, in Worcester, Mass., one of the finest small art museums in the United States, whose chronologically arranged collections span 50 centuries and whose exhibitions are often major events in the art world. The John Chandler Bancroft collection of some 3,000 Japanese prints is internationally renowned, as is the reconstructed 12th-century Romanesque chapter house from a French monastery near Poitiers. The museum opened in 1898.

Worcester porcelain, pottery ware made, under various managements, at a factory in Worcester, Eng., from 1751 until the present; the factory became the Worcester Royal Porcelain Company in 1862. Although the technical level of Worcester has been high at all periods, that between 1752 and 1783

Worcester porcelain mug; transfer-printed outlines were used for the chinoiserie design that is surrounded by a gilded scroll frame and contained within a fish-scale-patterned, "wet blue" ground, c. 1770; in the Victoria and Albert Museum, London

marks the highest level of excellence. This era is called the Wall period, after John Wall, the founder of Worcester's porcelain industry; it embraces the directorship of William Davies as well.

Of the many Worcester styles of the Wall period, a few examples may be singled out: painting in underglaze blue on vessels either molded or plain; from about 1756, transfer-printed designs in black, over the glaze, and later in blue under the glaze; transfer-printed outlines filled in by hand with over-

glaze colours by semiskilled workers; Japanese patterns of conventionalized plum blossoms, chrysanthemums, fish, and the like on panels alternating with panels of a wide range of formal or geometric patterns; and exotic birds, also in "reserves," or panels, on coloured grounds, especially a deep-blue ground heightened with gilding.

The ground colours of Worcester were an especial achievement, several shades being developed in emulation of Sèvres. Blue and other background colours were often painted in a way suggestive of fish scales. The Worcester palette also included a near-vermilion; reddish brown; pink and claret; sea green, leaf green, and pea green; pale yellow; turquoise; blues from pale sky to deepest cobalt. The gilding that often formed scrolls and curls defining the designs was delicate. In the 19th century Worcester remained one of the principal makers of ornamental porcelain, with many designs inspired by the Aesthetic Movement. In the 20th century their production included the American birds of Dorothy Doughty.

Worcestershire, former county of England, located in the West Midlands. The county was abolished in the administrative reorganization of 1974 and became part of the new county of Hereford and Worcester (q, v) and part of the new area of West Midlands.

Worcestershire was mostly wooded in early times and is consequently not rich in prehistoric remains. There are, however, great Iron Age earthworks on the Malvern and the Bredon Hills that have been dated to the 2nd-1st century BC. A few traces of the area's Roman occupation have been found at Worcester city. The earliest Anglo-Saxon settlers of the area were the Hwicce (q.v.) in the 6th century AD. By 679 the Hwiccean kingdom formed a separate diocese with its seat at Worcester, and from that time the town of Worcester, in addition to its ecclesiastical functions, became the chief point of trade and military communications between England and Wales. The region was subsequently part of the kingdom of Mercia and was then temporarily conquered by the Danes in the 9th century. The shire (county) itself originated as an administrative area after the Anglo-Saxons had recovered Mercia from the Danes.

The monastic movement played an extremely important part in Worcestershire's history during the Middle Ages. No less than 13 monastic foundations existed in the county in the period between the 8th and 13th century, and the ruins of those at Worcester, Evesham, Pershore, and Malvern are still impressive. The cultivation of the Vale of Evesham for flowers, fruit, and vegetables was begun by the monks of Evesham and Pershore. By the time of Domesday Book (1086), more than half of Worcestershire was owned by the church, and this prevented the rise of a local aristocracy.

Two decisive battles in English history were fought in Worcestershire. At Evesham in 1265 Simon de Montfort was slain by the forces of Edward (later Edward I), and at Worcester in 1651 a Parliamentary army led by Oliver Cromwell resoundingly defeated Charles II's Scottish forces and thus brought to an end the English Civil Wars.

The subsequent history of the county was unexceptional. Owing to its ecclesiastical past, Worcestershire is studded with old churches, abbeys, and priories, and it also has many fine half-timbered country houses dating from the 15th and 16th centuries.

Word (theology and philosophy): see logos.

word processing, operation by which written, verbal, or recorded information is transformed into typewritten or printed form. A word-processing system can produce a wide variety of documents, including letters, memoranda, and manuals, rapidly and at relatively low cost. It is so versatile that it can be employed by any type of business firm, government agency, or organization in which large volumes of written communications are issued.

The precursor of the modern word-processing system was developed in 1936. This device consisted of a kind of automatic typewriter, called an autotypist, that could store and reproduce simple form letters and certain paragraphs of longer documents. The autotypist used punched paper tape for its storage medium. In 1964 researchers at International Business Machines (IBM) produced the Magnetic Tape/Selectric Typewriter, a relatively high-speed, automatic typewriter that had a magnetic tape data storage unit and retrieval device. This machine constituted the first true modern word processor. The development of electronic digital minicomputers and microcomputers during the late 1960s and 1970s gave rise to faster word-processing systems with greater capabilities.

A typical advanced word-processing system consists of an automatic typewriter or highspeed printer that is linked to a computer that has an auxiliary storage unit. In many such systems the input terminal consists of an alphanumerical keyboard and a visual display composed of a cathode-ray tube (CRT). The CRT display enables the keyboard operator to input and also check, edit, or revise the information to be entered. The text of the document, including all corrections, additions, and deletions made by the keyboard operator, is recorded by the computer. When the final draft is ready to be prepared, the computer activates and operates the typewriter or printer, which produces as many copies of the document as required. The information can be stored for reuse in the auxiliary memory of the computer or on storage devices such as a magnetic disk.

A word-processing system sharply reduces the time required to prepare documents. Some such systems are capable of typing or printing more than 350 words per minute. Moreover, changes can be made without having to retype an entire page as in manual operations.

Worde, Wynkyn de, original name JAN VAN WYNKYN (d. 1534/35), Alsatian-born printer in London, an astute businessman who published a large number of books (at least 600 titles from 1501). He was also the first printer in England to use italic type (1524).

He was employed at William Caxton's press, Westminster (the first printing enterprise in England), from its foundation in 1476 until Caxton's death in 1491, when he assumed control of the business. In 1500/01 he moved his press from Westminster to Fleet Street, London. Whereas Caxton and numerous continental European contemporaries were also editors and translators, Wynkyn was purely a commercial printer.

Worden, John L(orimer) (b. March 12, 1818, Westchester county, N.Y., U.S.—d. Oct. 18, 1897, Washington, D.C.), U.S. naval officer who commanded the Union warship *Monitor* against the Confederate *Virginia* (formerly *Merrimack*) in the first battle between ironclads (March 9, 1862) in the American Civil War (1861–65).

Appointed a midshipman in 1834, Worden received his early naval training with the Brazilian squadron (1835–38). He served on the Pacific Coast during the Mexican War (1846–48) and afterward in both the Mediterranean and the home fleets.

On Jan. 16, 1862, Worden was appointed to command John Ericsson's experimental ship, the *Monitor*. In March he took the cumbersome "cheese box on a raft" down the Atlantic Coast in perilous, stormy weather and engaged the larger ironclad *Virginia* at the

mouth of the James River. The three-hour battle ended when both withdrew from the conflict. Worden, stationed in the pilothouse, had been wounded in the face, however, and nearly blinded by a shell.

John L. Worden, detail from an engraving by J.C. Buttre after a portrait by R.A. Lewis

By courtesy of the U.S. Navy

For the rest of the war, he commanded monitors stationed with the South Atlantic blockading squadron. Afterward he was promoted to rear admiral (1872) and commanded the European squadron (1875–77). He was retired by Congress in 1886 at full pay for life.

Wordsworth, Dorothy (b. Dec. 25, 1771, Cockermouth, Cumberland, Eng.—d. Jan. 25, 1855, Rydal, Cumberland), English prose writer whose Alfoxden Journal 1798 and Grasmere Journals 1800–03, published after her death, are read today for the imaginative power of their description of nature, their perfection of style, and their revelation of a personality of unusual quality. They are also important for the light they throw on her brother william, who, with Samuel Taylor Coleridge, was responsible for the poetic revolution that initiated the English Romantic movement.

The descriptions in her *Journals* gave inspiration to Coleridge and Wordsworth, but she had no thought of professional authorship, writing only to please William. Her prose is spontaneous, transparent, and completely

Dorothy Wordsworth, detail of an oil painting by Samuel Crosthwaite, 1835 By courtesy of Gordon Wordsworth; photograph, Hammonds, Hereford

natural. As a record of her brother's life and the dates and circumstances of writing of almost all his poems in the years of his greatest poetic achievement, the *Grasmere Journals* is invaluable. The *Alfoxden Journal* is a record of William's friendship with Coleridge that resulted in their *Lyrical Ballads* (1798), with which the Romantic movement began; and the *Grasmere Journals* provides a picture of early 19th-century cottage life in a remote part of England.

Their mother's death in 1778 separated Dorothy from her brothers, and from 1783

they were without a family home. The sympathy between William and Dorothy was strong; she understood him as no one else could, and provided the "quickening influence" he needed. When in 1795 he was lent a house in Dorset, she made a home for him there. At Alfoxden, Somerset, in 1796–98, she enjoyed with Wordsworth and Coleridge a companionship of "three persons with one soul." She went with them to Germany (1798–99), and in December 1799 she and William settled for the first time in a home of their own, Dove Cottage, Grasmere, in the Lake District, remaining there after his marriage (1802) until 1808, when she moved with the family to Rydal.

In 1829 she was dangerously ill and henceforward was obliged to lead the life of an invalid. Her ill-health apparently affected her intellect, and during the last 20 years of her life her mind was clouded.

None of her writings was published in her lifetime. The fullest edition of the *Journals*, with shorter descriptive pieces, is that by Ernest de Selincourt (1941). Helen Derbishire's edition of *The Alfoxden and Grasmere Journals*, and of poems by Wordsworth mentioned in them (1958), has an excellent introduction.

E. de Selincourt's *Dorothy Wordsworth: A Biography* was published in 1933.

Wordsworth, William (b. April 7, 1770, Cockermouth, Cumberland, Eng.—d. April 23, 1850, Grasmere, Westmorland), major English Romantic poet and poet laureate of England (1843–50). His *Lyrical Ballads* (1798), written with Samuel Taylor Coleridge, helped launch the English Romantic movement.

Education and early travels. Wordsworth was born in the Lake District of northern England, the second son of John Wordsworth, a business agent of Sir James Lowther, later earl of Lonsdale. His mother was Ann, daughter of William Cookson, a linendraper in nearby Penrith. The Wordsworths were originally a Yorkshire family; the poet's grandfather was the first of the line to move to Cumberland. John and Ann Wordsworth had five children: Richard, William, Dorothy, John, and Christopher. The mother died when William was only eight, and their father died five years later leaving barely enough for his children's education. (Although the sum of nearly £5,000 was owed to him by his employer, this debt was not discharged until 1802 by the Earl's successor.) The children were placed under the guardianship of two uncles, who later reluctantly supported both William and Christopher through their time at Cambridge

Wordsworth first, however, attended the excellent grammar school at Hawkshead, near Windermere, Westmorland, as a boarder. This period he called "fair seed-time" for his soul. Through William Taylor, the young headmaster, he became familiar with the best poetry of the earlier 18th century and also with more recent poets. Even more important than this formal schooling was the Vale of Esthwaite and the surrounding fells, where nature herself began to take the leading part in his education. Separated from his beloved sister, Dorothy, since their mother's death, and cold-shouldered by his money-minded Penrith kinsfolk, he found in nature the love that was denied him at home and learned at an early age to feel "the self-sufficing power of Solitude.

Wordsworth went to St. John's College, Cambridge, in October 1787 on a scholarship obtained largely through the influence of his uncle, William Cookson, who was a fellow of the college. The family hoped Wordsworth, too, would obtain a fellowship and take holy orders, but this rugged and strong-willed northern youth was incapable of adapting himself to a world so different from his own. Cambridge,

where his academic performances were largely mediocre, failed to turn him either into a don or a parson. He disliked the narrowness of the curriculum and the hardness, worldliness, and sophistication of the intellectual climate there. Though he indulged in much good-natured "lounging" with his friends, his inmost self was afraid that the exalted moods of solitude might give way to "empty noise and superficial pastimes." His guardian uncles, however, saw only a young man wasting his time and their money. They were incensed when he gave up all idea of reading for honours and consequently all chance of a fellowship. He finally took a pass degree in January 1791.

It was the "memorable pomp" of a summer dawn, seen while he was walking back to Hawkshead from a village dance in 1788, that filled his heart with the assurance that he was to be a "dedicated spirit." His first long poem to be published, *An Evening Walk* (1793), was composed during these years.

In 1790 Wordsworth and a friend made a walking tour through France, Italy, Switzerland, and Germany (commemorated in Descriptive Sketches, 1793). A year later Wordsworth went to France again, on the pretext of improving his qualifications as a potential teacher. He spent a year there, and this stay proved significant in ways other than those contemplated by his guardians. For now his earlier formed republican sympathies were raised to a new intensity by his friendship with Michel de Beaupuy, later a general in the republican army, and he also fell in love with Annette Vallon, by whom he had a daughter, Caroline. All thoughts of offering his services to the Girondins, a revolutionary political group, or of marrying Annette were overcome by shortage of funds and by the refusal of his uncles to sanction a further stay abroad. In December 1792 he reluctantly returned to England but later came to regard this "harsh necessity" as providential, for, within two months, England and France were at war and except for one brief lull in 1802 were to remain so for more than 20 years.

The next three years, until the end of 1795, were to be the unhappiest of Wordsworth's life. His loyalties and affections were hopelessly divided between England and France; he had no settled home and no livelihood; he was in disfavour with his guardians; and he had not yet discovered the true nature of his poetic vocation. Deep in despair at the turn of events in France, he became influenced by William Godwin's Political Justice, a work that attracted him by its lofty philanthropy and its opposition to war and all injustice, but which in its disembodied rationality was hostile to his deepest instincts. To recover poise, he needed to break the spell of France, forgive his own country for fighting the Republic and

himself for having loved Annette not wisely but too well, as well as to renew his links with his own happier past and with the English countryside.

The West Country period. A friend's legacy helped Wordsworth and his sister realize their long-cherished dream of setting up house together (October 1795). They settled at Racedown Lodge in Dorset. Here, in the depth of the country and in the society of Dorothy, Wordsworth recovered his habits of tranquil meditation and recollection. While at Racedown he wrote his one and only play, a blank-verse tragedy, The Borderers.

Wordsworth's arrival in the West Country brought him within the orbit of the poet Samuel Taylor Coleridge, who was then living in Bristol, and their acquaintance soon ripened into the friendship that has linked their names, together with Dorothy's, in a spiritual partnership unique in literary biography. Their qualities were complementary: Coleridge ardent, animated, brilliant, unstable; Wordsworth solemn, withdrawn, introspective, deliberate. In their walks and talks, attended by Dorothy, each stimulated the other. These three extraordinary people soon became so necessary to each other that, when Coleridge settled at Nether Stowey in Somerset, he persuaded the Wordsworths to come and live close by at Alfoxden (now spelled Alfoxton) Park. The grandeur and romantic seclusion of Alfoxden Park, set amid the Quantock Hills, provided a perfect setting for a perfect human relationship and for the birth of a new school of poetry.

In 1798 Lyrical Ballads appeared anonymously. All but four of the poems were by Wordsworth; Coleridge's main contribution was "The Rime of the Ancient Mariner," which stood at the beginning of the book. Lyrical Ballads, considering its importance as a turning point in the history of English poetry, created little stir. As Wordsworth had foreseen, many readers were outraged by poems like "Simon Lee" and "The Idiot Boy"; what is far more extraordinary is that so few recognized the surpassing merit of "The Rime of the Ancient Mariner." There was general approval for Wordsworth's "Lines Written a Few Miles Above Tintern Abbey," in blank verse, elevated yet free from poetic cliché, impassioned yet austere and pure.

A second and enlarged edition of Lyrical Ballads, in two volumes, appeared in January 1801 (dated 1800) under the name of Wordsworth alone—although all Coleridge's contributions were reprinted and his poem "Love" was added. Coleridge, it seems, found satisfaction in effacing himself so as to magnify his friend. This second edition was accompanied by an important explanatory "Preface." Although Wordsworth actually wrote it, it was (as Coleridge said) "half a child of my own brain." Yet Coleridge was "far from going all lengths with Wordsworth," and years later in the Biographia Literaria, he stated his objections to some of Wordsworth's theories and to certain aspects of his poetry that exemplified them.

The "Preface," however, contained much to which neither Coleridge nor anyone since need take exception. When he is expounding the nature of poetry itself or describing the processes of its making and when he is declaring what manner of man a poet is, Wordsworth speaks with a confidence born of experience. And though later times have evolved other notions about poetry and the poet, Wordsworth's account retains, quite apart from its period interest, much that is of permanent truth and value: his assertions, for example, that "Poetry is the most philosophic of all writing: . . . its object is truth . . . carried alive into the heart by passion"; and that it is "the spontaneous overflow of powerful feelings: it takes its origin from emotion recollected in tranquility.

Wordsworth and his sister, accompanied by Coleridge, spent the winter of 1798-99 in Germany. The idea originated with Coleridge, who needed to learn German; in this he succeeded, while Wordsworth and Dorothy did little outwardly but stagnate, in bitter cold, at the remote little town of Goslar. Wordsworth, however, driven in upon himself, turned his isolation to good account by beginning a "poem to Coleridge." It was the story of the growth of Wordsworth's mind, which eventually became *The Prelude*. During this time he also wrote several of his finest lyrics (the "Lucy" series): "She Dwelt Among the Untrodden Ways," "Strange Fits of Passion Have I Known," "A Slumber Did My Spirit Seal," and "Three Years She Grew in Sun and Shower."

Who was "Lucy"? Nobody knows: probably a creature of Wordsworth's imagination, though perhaps deriving (as Coleridge believed) some substance from broodings on the notion of his own plight should Dorothy die. The poem "I Travelled Among Unknown Men" that—though written two years later—is akin to this series shows that exile had taught Wordsworth how much, despite his former French sympathies, he really loved England.

The Lake District period. On Dec. 21, 1799, Wordsworth and Dorothy returned to the Lake District and took possession of Dove Cottage, at Grasmere, Westmorland. Then in October 1802 Wordsworth brought his bride to Grasmere. She was Mary Hutchinson, a friend from early schooldays who had become his loving admirer and Dorothy's intimate friend, and here at Dove Cottage their first three children were born. Life was a daily round of plain living and high thinking, walks, talks, reading, composition, and hospitality: Dorothy described it all in detail in her beautifully written Grasmere Journal.

Critics speak of roughly this period (1796–1806) as Wordsworth's "great decade," and it is true that nearly all his best work was done by the time *The Prelude* and the "Ode: Intimations of Immortality" were completed (1805–06). However, he subsequently much revised *The Prelude*, which was not published until 1850, just after his death.

In 1808 Wordsworth moved to Allanbank, the cottage at Grasmere being no longer large enough for the needs of the growing family. Here he stayed until 1811, and thence (after a brief sojourn at Grasmere rectory) they settled at Rydal Mount, which was the poet's home for the rest of his life. Much has been written about the decline of his poetic powers during these years. It has been suggested that he had stifled his own imaginative life when he renounced France, tore Annette from his heart, and settled down to ossify gradually in an atmosphere increasingly Anglican and Tory. This notion, like all caricatures, is an exaggerated and distorted view of what happened. As Wordsworth himself claimed, it was not he that had changed, but events. He renounced France only when the French had become oppressors in their turn, ... losing sight of all which they had struggled for." He never renounced Annette: he conscientiously did everything he could to support her and their child. He went to see them during 1802 (a visit made possible by the short-lived Peace of Amiens) before he would marry Mary Hutchinson. As for the theory of ossification, it must be remembered that Wordsworth lived to a great age, and the kind of inspiration he enjoyed, connected as it was with childhood and youth and the vivacity of the senses, is not likely to persist in full force long past middle life. He himself was well aware, by 1805 or before, that his imaginative powers were declining: indeed, his greatest single poem, the Intimations" ode, is a lament on the passing of the "visionary gleam": "The things which I have seen I now can see no more.

In 1813 he accepted the post of distributor

of stamps for the county of Westmorland, a sinecure that carried a salary of £400 a year. After *The Excursion* appeared in 1814, he continued to publish a quantity of poetry but only occasionally recaptured the distinctive inspiration of his earlier work. He was poet laureate from 1843, when he succeeded his friend Robert Southey, until his death seven years later. (B.W./Ed.)

MAJOR WORKS. Poetry. An Evening Walk and Descriptive Sketches (1793); Lyrical Ballads (first published 1798, revised between 1800-05), the edition dated 1800 including Wordsworth's important "Preface"; Lyrical Ballads contains the poem "Lines Written a Few Miles Above Tintern Abbey"; Poems, 2 vol. (1807), including "Ode: Intimations of Immortality from Recollections of Early Childhood," "Ode to Duty," and many well-known sonnets; The Excursion (1814, as part of an ambitious work to be called The Recluse, a plan never carried out); Poems, 2 vol. (1815), a collection of his works; The White Doe of Rylstone (1815); Thanksgiving Ode (1816); Peter Bell and The Waggoner (1819); The River Duddon (1820); Ecclesiastical Sketches and Memorials of a Tour on the Continent, 1820 (1822); Yarrow Revisited, and Other Poems (1835); a collection of Sonnets (1838); The Borderers, a Tragedy (1842, but written c. 1796); The Prelude, or Growth of a Poet's Mind (1850).

Prose. Apart from the "Preface" to Lyrical Ballads, it is worth mentioning among Wordsworth's prose output: Concerning the Relations of Great Britain, Spain and Portugal, to Each Other, and to the Common Enemy, at This Crisis, and Specifically as Affected by the Convention of Cintra (1809), a political essay; A Description of the Scenery of the Lakes in the North of England (1810, written as the introduction to J. Wilkinson's Select Views in Cumberland, but later revised and published in 1822).

BIBLIOGRAPHY. A standard edition of Wordsworth's poetical works is The Poetical Works of William Wordsworth, edited from the manuscripts with textual and critical notes by E. de Selincourt and H. Darbishire, 5 vol. (1940-49). This, together with de Selincourt's edition of The Prelude, giving the texts of 1805 and 1850 on opposite pages (1926; new ed. with additional material by H. Darbishire, 1959; 2nd ed. corrected by Stephen Gill, 1970); and the edition of the letters—The Early Letters of William and Dorothy Wordsworth, 1787-1805, ed. by E. de Selincourt (1935; rev. by C.L. Shaver, 1967); The Letters of William and Dorothy Wordsworth: The Middle Years, ed. by E. de Selincourt, 2 vol. (1937; rev. by M. Moorman and A.G. Hill, 1968); ... The Later Years, 3 vol., ed. by E. de Selincourt (1939)-constitutes a major editorial achievement. A standard edition of the prose works is The Prose Writings of William Wordsworth, ed. by W.J.B. Owen and J.W. Smyser (1971). See also L. Cooper (ed.), A Concordance to the Poems of William Wordsworth (1911); and bibliographies by T.J. Wise (1916 and 1927). A critical edition (1963) of Lyrical Ballads, by R.L. Brett and A.R. Jones, gives the 1798 text with additional poems and the "Preface" of 1800, with main variants.

Among the many biographical and critical studies, the following may be specially mentioned: Christopher Wordsworth, Memoirs of William Wordsworth, 2 vol. (1851), the official Victorian biography; Matthew Arnold, preface to his volume of selections (1879; reprinted in Essays in Criticism, 2nd series, 1888), the standard 19th-century appraisal; E. Legouis, The Early Life of William Wordsworth (1897; originally published in French, 1896); G.M. Harper, William Wordsworth: His Life, Works and Influence, rev. ed., 2 vol. (1929); A. Beatty, William Wordsworth: His Doctrine and Art in Their Historical Relations, 2nd ed. (1927), useful for the poet's relationship to Hartley and Godwin; E.C. Batho, The Later Wordsworth (1933); G.W. Meyer, Wordsworth's Formative Years (1943); H. Darbishire, The Poet Wordsworth (1950); J. Jones, The Egotistical Sublime: A History of Wordsworth's Imagination (1954); B.R. Schneider, Wordsworth's Cambridge Education (1955); M. Moorman, William Wordsworth: A Biography,

2 vol. (1957-65); J. Wordsworth, *The Music of Humanity* (1969), a masterly study of the early poetry and of the poet's early philosophy; S. Prickett, *Coleridge and Wordsworth: The Poetry of Growth* (1970), a study of the romantic imagination and its philosophical background; and Hunter Davies, *William Wordsworth* (1980), a narrative account of his life.

work, in economics and sociology, the activities and labour necessary to the survival of society.

A brief treatment of work follows. For full treatment, see MACROPAEDIA: Work and Employment.

The major activity of early humans was hunting and gathering food. As early as 40,000 BC, hunters began to work in groups to track and kill animals. Younger or weaker members of the tribe were more naturally suited to gathering food. It seems likely that women, because of the requirements of pregnancy and nursing, did not generally participate in hunting.

Some primitive peoples demonstrated an aptitude for making weapons, thus providing an early instance of the division of labour. When agricultural cultivation replaced simple gathering, the resulting modest surplus of food freed some members of the tribe to pursue more intently crafts such as pottery making, textiles, and metallurgy.

A sufficient food supply and the development of copper and bronze tools laid the groundwork for more complex societies that could support larger populations; as towns were established, new specialized occupations developed in commerce, law, medicine, and defense. The increasing complexity of these economies required permanent records; thus, writing and bookkeeping evolved.

These civilizations, and the later societies of Greece and Rome, were characterized by rigid, hereditary, hierarchical class structures. Kings and nobles ruled, supported by warriors; priests served as government officials; merchants dealt in the products of artisans and craftsmen; peasants worked family farms; and slaves worked in mines and craft workshops. These craft workshops were prototypes of the modern factory, producing metal weapons and tools with fewer than a dozen workers under the direction of a master craftsman. Larger projects, such as pyramids and aqueducts, were directed by master builders, who were assisted by foremen and scribes. The work required labourers of varying degrees of skill ranging from craftsmen to slaves.

Some of this organizational sophistication was lost in Europe immediately after the disintegration of the Roman Empire, as social life contracted into smaller, self-enclosed spheres. Nobles owned tracts of land that were farmed by peasants, who were bound to their plots by inheritance. The peasants turned over much of their produce to the nobles in return for military protection. The church was also an important feature of the medieval economy, offering work to masons, carvers, and glaziers.

As town life grew more vigorous, craft guilds assumed greater importance, reaching their peak in the 14th century. Their purpose was to limit the supply of labour in a profession and to control production. Guild members were ranked according to experience: masters, journeymen, and apprentices. Strains developed within the guilds as some masters discovered that trading in raw materials and finished products held greater rewards than craftsmanship; others discovered that they could secure greater profits by excluding journeymen from promotion to the master class. Thus, apprentices and journeymen became a class of free labourers, and the employer-employee relationship was established.

Beginning around AD 1000, wind and water

power replaced or assisted human labourers in tanning, grain processing, olive pressing, and operation of bellows in mines and blast furnaces. Mechanization had little effect on large construction projects; churches and castles were built by strongly individualistic craftsmen under the direction of a master mason who not only designed the building but handled accounts and bought raw materials.

Technological advances, however, combined with worldwide exploration and colonization by European powers, did change economic life profoundly. Some guild masters were able to accumulate large amounts of capital, forcing less successful masters to become wage labourers. This transition was most pronounced in England, where it was encouraged through the granting of monopolistic charters, the evolution of finance and trade, and the development of machinery, particularly steam power, in the 18th century.

Early factories divided the work previously done by a single craftsman into a number of distinct tasks, each performed by low-paid unskilled or semiskilled workers with the assistance of machinery. This new organization shortened the time required to produce an item, lowered its cost, and often improved its quality. Workers, however, who previously had controlled production, rebelled at the discipline required in such factories, and it became necessary to install a supervisory hierarchy far more complex than that required for pre-industrial management.

The factory system both encouraged and required the growth of large cities. Urbanization demanded greater agricultural productivity, which was achieved through the use of fertilizers, scientific breeding practices, and mechanization. The colonies of the New World provided Europe's cities with agricultural products, often produced by slaves.

The production of large quantities of goods at low cost through the use of standardized parts and extensive division of labour was made possible by the development of machine tools (lathe-like machines for shaping metals) in the 19th century. Mass production encouraged manufacturing firms to grow much larger, demanding ever more specialized positions for managers, supervisors, accountants, scientists, salesmen, and industrial psychologists. Clerical work in some cases came to be organized according to principles similar to those of the industrial assembly line.

Continuing trends toward specialization and professionalization of work gave rise in industrial nations in the 20th century to a number of disciplines concerned with various aspects of work, including personal comfort and motivation of workers, efficiency of technology, efficiency of entire systems, productivity, and the application of science to industry. Among these disciplines, some of whose functions overlap, are production management, industrial relations, personnel administration, research and development, human-factors engineering, operations research, and systems engineering.

work, in physics, measure of energy transfer that occurs when an object is moved over a distance by an external force at least part of which is applied in the direction of the displacement. If the force is constant, work may be computed by multiplying the length of the path by the component of the force acting along the path. Work done on a body is accomplished not only by a displacement of the body as a whole from one place to another, but also, for example, by compressing a gas, by rotating a shaft, and even by causing invisible motions of the particles within a body by an external magnetic force.

No work, as understood in this context, is done unless the object is displaced in some way and there is a component of the force along the path the object is moved. Holding a heavy object stationary does not transfer energy to it, because there is no displacement. Holding the end of a rope on which a heavy object is being swung around at constant speed in a circle does not transfer energy to the object, because the force is toward the centre of the circle at a right angle to the displacement. No work is done in either case.

The mathematical expression for work depends upon the particular circumstances. Work done in compressing a gas at constant temperature may be expressed as the product of pressure times the change in volume. Work done by a torque in rotating a shaft may be expressed as the product of the torque times the angular displacement.

Work done on a body is equal to the increase in the energy of the body, for work transfers energy to the body. If, however, the applied force is opposite to the motion of the object the work is considered to be negative, implying that energy is taken from the object. The units in which work is expressed are the same as those for energy, for example: in the metre-kilogram-second system, joule (newton-metre); in the centimetre-gram-second system, erg (dyne-centimetre); and in the English system, foot-pound.

work function, electronic: see electronic work function.

work hardening, in metallurgy, increase in hardness of a metal induced, deliberately or accidentally, by hammering, rolling, drawing, or other physical processes. Although the first few deformations imposed on metal by such treatment weaken it, its strength is increased by continued deformations. The reason for this seeming paradox lies in the crystalline structure of metal. As stresses are exerted, the crystals slip against each other; but because of the complexity of the crystal structure, the more such slips are multiplied, the more they tend to place obstacles in the way of further slippage, because the various dislocation lines crisscross each other. See also tempering.

Work Projects Administration: see Works Progress Administration.

work song, any song that belongs to either of two broad categories: songs used as a rhythmic accompaniment to a task and songs used to make a statement about work. Used by workers of innumerable occupations worldwide, work songs range from the simple hum of a solitary labourer to politically and socially conscious protests against working conditions or the quality of workers' lives.

Distinctive songs exist for different kinds of work and in different geographical variations. The gayap are traditional agricultural working songs of Trinidad; Japanese labourers sing min-yo, work cooperatives in the Dominican Republic rally around the plena. During the era of slavery and afterward, black American workers developed a vast repertoire of spirituals and, ultimately, the blues, out of older work song traditions. Rarely have work songs been written down. Even as recently as 100 years ago the majority of labourers were illiterate.

Work songs sung on the job usually are intended to relieve the boredom of a repetitive task or to increase efficiency by maintaining a regular rhythm. These songs often incorporate the grunts and movements of workers and the sounds of their implements as counterpoint. The words of such songs may reflect the nature of the work (as in the "mark twain quarter twain" of Mississippi River boatmen) or tell a story little related to the task except in its rhythm (e.g., the shanty; q.v.). The advent of loud machinery drastically diminished the use of on-the-job work songs.

Songs of the second type voice commonly held feelings of exploitation, pride, bitterness, and boredom and have in recent centuries been widely used to disseminate ideas or generate support. In 16th- and 17th-century England ballads and topical political songs often had to be kept secret; they gathered listeners with opening lines such as "Come lad and listen to my song, a song of honest toil." Songs of American blacks frequently expressed despair and sadness over the oppressed labourer's plight (e.g., "What's the use of working so hard in the morning?/ My gal works in a white man's yard").

American industrial workers in the early 20th century rallied around songs calling the workers to progressive action. Immigrant groups, textile workers, and notably the Industrial Workers of the World organization, or "Wobblies," gave rise to numerous such songs, often associated with leftist movements.

Worker, The (newspaper): see Daily World,

worker-priest, in the Roman Catholic Church, member of a movement, especially in France and Belgium after World War II, seeking to reach the working classes, who had become largely alienated from the church. The worker-priests set aside their clerical garb and left their clerical dwellings to take jobs in factories and on construction sites, sharing the living conditions and social and economic problems of their co-workers. The movement was given support by Cardinal Emmanuel Suhard of Paris. Their experiences impelled some of the worker-priests to become politically active, joining their fellow workers in various demonstrations regarding such matters as housing, antiracism, and peace. The movement was ordered discontinued in 1954 by Pius XII and again in 1959 by John XXIII. In 1965 Paul VI approved it in modified form.

worker's compensation, also called work INJURY COMPENSATION, social welfare program through which employers bear some of the cost of their employees' work-related injuries and occupational diseases. Worker's compensation was first introduced in Germany in 1884, and by the middle of the 20th century most countries in the world had some kind of worker's compensation or employment injuries legislation. Some systems take the form of compulsory social insurance; in others the employer is legally required to provide certain benefits, but insurance is voluntary. Employment injury benefits are financed by employers in most countries.

In common-law countries such legislation is based upon a doctrine of strict liability, or liability without fault. This is a departure from the principle of tort law, in which the injured party receives no damages unless it can be shown that someone else maliciously or negligently caused the damage. The rationale for the "social fault doctrine" is that, under conditions of modern industrial employment, employers are in the best position to prevent accidents and disease and should therefore be given economic incentive to take preventive action.

Because the older common law made it difficult for a worker to obtain compensation from an employer, there was a movement in the latter part of the 19th century in Great Britain and the United States to modify, by court decisions and by employer liability statutes, the common-law defenses of the employer and to specify, through safety codes, the employer's particular duties to provide safe working conditions. The system of worker's compensation gradually displaced the safety codes.

Workers' Opposition, Russian RABOCHAYA OPPOZITSIYA, in Soviet history, group within the Communist Party that achieved prominence in 1920–21 as a champion of workers' rights and trade union control over industry. Its defeat contributed to the ease with which the government launched the New Economic Policy (1921) and also established a precedent for suppressing dissent within the party, thus

enabling Stalin eventually to establish his dictatorial control.

The group began to develop in 1919, resisting the domination of central party organs over local party units and trade unions, the party's minimization of the role of workers in controlling industrial enterprises, the increasing use of so-called bourgeois specialists in industry, and the party's efforts to replace group control of enterprises with one-man management. It became a distinct opposition group in 1920–21 when it objected to Leon Trotsky's plan to transform trade unions into state organs.

The Workers' Opposition, composed largely of trade unionists and led by A.G. Shlyapnikov, S.P. Medvedev, and later Aleksandra Kollontay, not only objected to the subordination of the trade unions, but also insisted that the unions, as the institutions most directly representing the proletariat, should control the national economy and individual enterprises. Although the group received substantial support from the rank-and-file party membership, no major leaders joined its cause.

At the 10th Party Congress (March 1921) its platform was rejected, its ideas were condemned, and it was ordered to disperse. Its members, nevertheless, continued to agitate, complaining particularly about the lack of democracy within the party, the central leadership's lack of respect for the workers and local autonomy, and the manner in which the party leaders were endeavouring to break up the opposition by transferring its adherents to remote regions.

In February 1922 the Workers' Opposition unsuccessfully petitioned the Executive Committee of the Communist International to direct the Russian party to correct itself and to stop abusing the Opposition (Declaration of the Twenty-two). The 11th Party Congress (March-April 1922) refrained from expelling the opposition leaders from the party but censured them and forced them to curtail their activities. In 1926 the remaining members of the Workers' Opposition briefly joined other opposition elements in an unsuccessful effort to prevent Stalin from gaining complete control over the party. By 1933 all the leaders of the Workers' Opposition had been expelled from the party; with the purges of the 1930s all except Kollontay disappeared.

workhouse, institution to provide employment for paupers and sustenance for the infirm, found in England from the 17th through the 19th century and also in such countries as The Netherlands and in colonial America. Because they often housed not only paupers but also orphans, lunatics, and criminals, workhouses were difficult to distinguish from houses of correction. According to prevailing social conditions, inmates might be let out to contractors or kept idle to prevent competition on the labour market.

The Poor Law of 1601 in England assigned responsibility for the poor to parishes, which later built workhouses; by the early 19th century, groups of parishes were combined into unions responsible for workhouses. In the 20th century, the system of social security supplanted the workhouses.

Where the same name may denote a person, place, or thing, the articles will be found in that order

Workingmen's Party, first labour-oriented political organization in the United States. Established first in Philadelphia in 1828 and then in New York in 1829, the party emanated out of the concerns of craftsmen and skilled journeymen over the rise of capitalism and industrialization. The "Workies" feared loss of their independent status, dependence on wages from merchant capitalists, and re-

placement of their labour and jobs by faster and cheaper machines.

The Philadelphia party agitated for free public education and an end to competition from prison contract labour. The New York party, when under the leadership of radical Thomas Skidmore, demanded equal distribution of property in addition to the ten-hour working day, abolition of imprisonment for debt, and an effective lien law for labourers on buildings. When the New York party came under the leadership of Frances Wright and Robert Dale Owen, it added a demand for universal secular education at public expense.

Party member George Henry Evans established the *Working Man's Advocate*, the first labour newspaper, in 1829. The party grew rapidly, but factional disputes over doctrine and leadership split the ranks early in the 1830s. Some members formed the short-lived Equal Rights Party in 1833; others joined the reform wing—called Locofocos—of New York's Democratic Party.

Workington, town and port in Allerdale district, county of Cumbria, northwestern England, on the Solway Firth where it joins the Irish Sea. The town lies at the mouth of the River Derwent. It grew up around a medieval castle, and has mining and iron and steel industries. The port is centred on the Prince of Wales Dock, opened in 1927, and exports coal and imports iron ore. Pop. (1981) 26,123.

Works Progress Administration (WPA), also called (1939–43) WORK PROJECTS ADMINISTRATION, work program for the unemployed created in 1935 under U.S. Pres. Franklin D. Roosevelt's New Deal. While critics called the WPA an extension of the dole or a device for creating a huge patronage army loyal to the Democratic Party, the stated purpose of the program was to provide useful work for millions of victims of the Great Depression, and thus to preserve their skills and self-respect; the economy would in turn be stimulated by the increased purchasing power of the newly employed, whose wages under the program ranged from \$15–\$90 per month.

During its eight-year existence the WPA put some 8,500,000 people to work (over 11,-000,000 were unemployed in 1934) at a cost to the federal government of approximately \$11,000,000,000. The agency's construction projects produced more than 650,000 miles (1,046,000 kilometres) of roads; 125,000 public buildings; 75,000 bridges; 8,000 parks; and 800 airports. The Federal Arts Project, Federal Writers' Project, and Federal Theater Project-all under wpa aegis-employed thousands of artists, writers, and actors in such cultural programs as the creation of art work for public buildings, the documentation of local life, and the organization of community theatres. The WPA also sponsored the National Youth Administration, which sought part-time jobs for young people.

In 1939 the Works Progress Administration altered its name to Work Projects Administration. In that year increasing charges of mismanagement and of abuse of the program by workers led to a reduction in appropriations, and a strike by construction workers against wage cuts was unsuccessful. In 1943, with the virtual elimination of unemployment by a wartime economy, the wpa was terminated.

Worksop, town in Bassetlaw district, county of Nottinghamshire, England, on the Chesterfield Canal close to Sherwood Forest. Granted a royal charter in 1296, Worksop became a centre of coal mining in the 19th century when the deep coal seams of the area began to be exploited. Industry has expanded since World War II. The 100-ac (400-ha) Dukeries Industrial Area is named for a group of former

ducal estates, parts of which are still preserved as parkland. Pop. (1981) 34,993.

World Alliance of Reformed Churches (Presbyterian and Congregational), cooperative organization formed in Nairobi, Kenya, in 1970, by merger of the International Congregational Council and the Alliance of the Reformed Churches Throughout the World Holding the Presbyterian Order (also called the World Presbyterian Alliance and World Alliance of Reformed Churches).

The International Congregational Council, organized in London in 1891, was an association of Congregational and some Independent and United churches. Its purpose was to foster fellowship and service among its members, but it had no authority over them.

The Alliance of the Reformed Churches Throughout the World Holding the Presbyterian Order was organized in London in 1875 by Presbyterian and Reformed churches. A voluntary organization, it encouraged fellowship and cooperation among its member churches and promoted their common interests

World Bank: see International Bank for Reconstruction and Development.

World Book Encyclopedia, The, encyclopaedia, published in Chicago, designed to meet the curriculum needs of elementary through high-school students. It is probably the most widely sold encyclopaedia in the world

World Book was first published in 1917–18 and was revised annually from 1925. This 22-volume specific-entry reference work emphasizes geography and social sciences and gives broad treatment to such subject areas as business, psychology, government, energy, ecology, and criminology. Patterns of use by students are tested continually in classrooms throughout the United States and Canada. Contributors include numerous major authorities in the physical, biological, and social sciences and other fields.

World Book features thorough cross-references, and lists of related articles are included at the end of entries on major subjects. A general index is augmented by some 200 reading and study guides on important subjects. Illustrations and maps are extensive and of high quality.

A Braille edition, the first of such scope, was issued in 1961 (145 volumes), and a special large-type edition appeared in 1964 (30 volumes). Yearbooks are issued.

World Community of Al-Islām in the West: see Islam, Nation of.

World Confederation of Labour (wcl.), labour confederation founded as the International Federation of Christian Trade Unions in 1920 to represent the interests of Christian labour unions in western Europe and Latin America. It was reconstituted under its present name in 1968. Although the confederation seeks national, regional, and international economic integration, its influence is primarily limited to domestic policies and local affairs in member countries. The WCL is the smallest international labour federation.

World Convention of Churches of Christ, international agency of the Disciples of Christ with headquarters in New York City. It exercises no authority over its member churches but provides a means for fellowship and mutual activities for the various national churches. It first met in Washington, D.C., in 1930 and was scheduled to meet at five-year intervals.

was scheduled to meet at five-year intervals. Because of World War II, the 1940 meeting was postponed until 1947.

Many of the churches outside the United States that are members of the agency are known as Churches of Christ in their own countries. These should not be confused with the American Churches of Christ, which generally do not participate in this agency.

World Council of Churches (wcc), ecumenical organization founded in 1948 in Amsterdam as "a fellowship of Churches which accept Jesus Christ our Lord as God and Saviour." The WCC is not a church, nor does it issue orders or directions to the churches. It works for the unity and renewal of the church and offers the churches a forum in which they may talk together, pray together, and work together in the spirit of tolerance and mutual understanding.

The WCC originated out of the ecumenical movement, which, after World War I, resulted in two organizations. The Life and Work Movement concentrated on the practical activities of the churches, and the Faith and Order Movement focused on the beliefs and organization of the churches and the problems involved in their possible reunion. Before long, the two movements began to work toward establishing a single organization. In 1937 the Faith and Order Conference at Edinburgh and the Life and Work Conference at Oxford accepted the plan to create one council. A conference of church leaders met in 1938 in Utrecht, Neth., to prepare a constitution; but World War II intervened, and the first assembly of the WCC could not be held until 1948. In 1961 the International Missionary Council united with the WCC.

Members include most Protestant and Eastern Orthodox bodies but not the Roman Catholic church. The Southern Baptists are among Protestant nonmembers. The controlling body of the WCC is the assembly, which meets at intervals of approximately six years at various locations throughout the world. The assembly appoints a large central committee that in turn chooses from its membership an executive committee of 26 members, which, along with specialized committees and 6 copresidents, carries on the work between assemblies. The headquarters of the council, in Geneva, has a large staff under a general secretary.

The work of the WCC is divided into three main divisions: church relations; ecumenical study and promotion; and interchurch aid and service to refugees. Under these divisions are a number of groups and commissions, such as faith and order, the commission on the life and work of the laity in the church and on the cooperation of men and women in church and society. Identifications with various revolutionary movements by WCC groups has occasioned criticism by some constituent churches from time to time.

World Council of Young Men's Service Clubs, cooperative organization formed in 1946 by several international associations of young men's service clubs for the purpose of furthering international cooperation and understanding and to encourage the extension of such clubs. Service clubs for young men were seen as instrumental in developing a sense of civic responsibility in their members.

World Cup, formally Jules RIMET TROPHY, in association football (soccer), trophy symbolizing the world championship. The first competition for the cup was organized in 1930 by the Fédération Internationale de Football Association (FIFA) and won by Uruguay. Held every four years since that time, except during World War II, the competition consists of international sectional tournaments leading to a final elimination event made up of 16 national teams. Unlike Olympic association football, World Cup teams are not limited to amateur players, and so the competition is more nearly a contest between the world's best players. Referees are chosen from lists submitted by all the national associations.

The Jules Rimet Trophy

The formal name of the World Cup is the Jules Rimet Trophy, named for the Frenchman who proposed the tournament. The original cup was permanently awarded in 1970 to three-time winner Brazil (1958, 1962, and 1970) and a new trophy was put up for competition. For winners see Sporting Record: Football.

World Cup, formerly (until 1967) CANADA CUP, in golf, trophy awarded to the winner of an annual competition for two-man professional teams representing nations. It was initiated in 1953 by the Canadian industrialist John Jay Hopkins. The event involves teams from more than 40 nations in a fourday, 72-hole stroke competition. The team with the lowest final total is the winner. An award is also made to the individual with the lowest score. For winning teams, see Sporting Record: Golf.

World Cup, in skiing, trophy awarded annually since 1967 to the top male and female alpine skiers. In World Cup competition, skiers accumulate points in the three alpine events (downhill, slalom, and giant slalom) at designated meets throughout the winter. The winners are the male and female skiers with the highest point totals. The World Cup competition is supervised by the Fédération Internationale de Ski. For winners, see Sporting Record: Skiing.

world dawn (mythology): see Dreaming, the.

World Evangelical Fellowship, international fellowship of organizations that hold biblically conservative interpretations of the Christian faith. See Evangelical Alliance.

World Federation of Trade Unions (WFTU), French FÉDÉRATION SYNDICALE MON-DIALE, Soviet-oriented international labour organization founded in 1945 by the World Trade Union Congress. Its principal organizers were the British Trades Union Congress, the U.S. Congress of Industrial Organizations, and the All-Union Central Congress of Trade Unions. Despite vigorous attempts to reconcile the differences between the communist and noncommunist factions, the intensification of the Cold War finally led to a split. The noncommunist elements withdrew from the WFTU and in 1949 formed the International Confederation of Free Trade Unions (q.v.). The largest WFTU affiliates are in the U.S.S.R. and the eastern European satellite nations, although France and Italy also have sizable affiliates. The WFTU maintains its headquarters in Prague.

World Food Council, French CONSEIL MONDIAL DE L'ALIMENTATION, United Nations organization established by the UN General Assembly in December 1974 upon recommendation of the World Food Conference. The council meets annually and consists of 36 members, elected by the General Assembly.

Rome-based, the organization coordinates information and suggests strategies for food policy, which it reports to the General Assembly. The council's priorities divide into five major categories within the developing countries: (1) increased food production, (2) increased and more efficient food-aid systems, (3) improved international nutritional conditions, (4) buildup of an international grain reserve as part of a global food security system, and (5) reduced food-trade barriers between developing and developed countries.

World Food Programme (WFP), French PROGRAMME ALIMENTAIRE MONDIAL, United Nations organization established in 1961 and operational in 1963. As a joint project of the UN General Assembly and the Food and Agriculture Organization (FAO) of the UN, it seeks to stimulate economic development through food aid and emergency relief. Its chief organs are the Committee of Food Aid Policies and Programmes (CFA) and the joint UN/FAO Administrative Unit.

WFP's objectives are specifically geared to eliminate the emergency situations that arise from insufficient food sources. WFP activities, which include contributions of commodities, cash, and services (primarily shipping), are designed to enable beneficiaries to maintain balanced diets and to further land reclamation and irrigation.

world grief (critical term): see Weltschmerz.

World Health Organization (WHO), French ORGANISATION MONDIALE DE LA SANTÉ, specialized agency of the United Nations established in 1948 to further international cooperation for improved health conditions. Although it inherited specific tasks relating to epidemic control, quarantine measures, and drug standardization from the Health Organization of the League of Nations (set up in 1923) and the International Office of Public Health at Paris (established in 1909), who was given a broad mandate under its constitution to promote the attainment of "the highest possible level of health" by all peoples. Who defines health positively as "a state of complete physical, mental, and social well-being and not merely the absence of disease or infirmity."

With administrative headquarters in Geneva, who operates through three principal organs: the World Health Assembly, which meets annually as the general policymaking body; an Executive Board of health specialists elected for three-year terms by the assembly; and a Secretariat, which has regional offices and field staff throughout the world. The organization is financed primarily from annual contributions made by member governments on the basis of relative ability to pay. In addition, after 1951, who was allocated substantial resources from the expanded technical assistance program of the UN.

The work of who may be divided into three categories:

1. It provides a central clearinghouse and research services. It established a codified set of international sanitary regulations, for example, designed to standardize quarantine measures without interfering unnecessarily with trade and air travel across national boundaries. The central who Secretariat also keeps member countries informed of the latest developments in the use of vaccines, cancer research, nutritional discoveries, control of drug addiction, and health hazards of nuclear radiation.

2. It sponsors measures for the control of epidemic and endemic disease by promoting mass campaigns involving nationwide vaccination programs, instruction in the use of antibiotics and insecticides, the improvement of laboratory and clinical facilities for early diagnosis and prevention, assistance in providing pure-water supplies and sanitation systems, and health education for people living in rural communities.

These campaigns have had some success against tuberculosis, malaria, and venereal disease. There has also been considerable progress against cholera, trachoma, yellow fever, and yaws. In May 1980 smallpox was proclaimed to be globally eradicated, a feat due largely to the efforts of who.

3. It encourages efforts to strengthen and expand the public health administrations of member nations. The organization, on request, provides technical advice to governments in the preparation of long-term national health plans, sends out international teams of experts to conduct field surveys and demonstration projects, helps set up local health centres, and offers aid in the development of national training institutions for medical and nursing personnel. It also makes teachers available for on-the-spot training, and grants travelling-fellowship awards to doctors, public-health administrators, nurses, sanitary inspectors, and laboratory technicians.

World Intellectual Property Organization (WIPO), French ORGANISATION MONDIALE DE LA PROPRIÉTÉ INTELLECTUELLE, organization designed to promote the worldwide protection of both industrial property (inventions, trademarks, and designs) and copyrighted materials (literary, musical, photographic, and other artistic works). The organization was established by a convention signed in Stockholm in 1967 and came into force in 1970. It became a specialized agency of the United Nations in December 1974. It is headquartered in Geneva.

The origins of WIPO can be traced to the United International Bureau for the Protection of Intellectual Property (BIRPI). BIRPI, in turn, grew out of the merger of the secreteriats of the Paris Union (International Union for the Protection of Industrial Property, 1883), and the Berne Union (International Union for the Protection of Literary and Artistic Works, 1886). The policy-making body of the WIPO, its General Assembly, convenes every three years; WIPO'S conference meets simultaneously.

The aims of wipo are twofold. Through international cooperation, wipo promotes protection of intellectual property. Secondly, the organization supervises administrative cooperation between the Paris, Berne, and other intellectual unions regarding agreements on trademarks, patents, and protection of artistic and literary work.

World Meteorological Organization (WMO), French ORGANISATION MÉTÉOROLI-GIQUE MONDIALE, specialized agency of the United Nations created to promote the establishment of a worldwide meteorological observation system, the standardization and international exchange of observations, the application of meteorology to other fields, and the development of national meteorological services in less developing countries.

wmo was preceded by the International Meteorological Organization, a nongovernmental organization of the heads of various national weather services founded in 1873. In 1947 a conference of these directors adopted the World Meteorological Convention, which provided for the establishment of a new organization. The World Meteorological Organization began operations in 1951.

The World Meteorological Congress, consisting of representatives of all members, meets at least every four years and sets general

policy and adopts regulations. A 29-member Executive Committee meets at least annually and implements general policy. The Secretariat, headquartered in Geneva, serves as the administrative centre of the organization. There are six regional associations in which members discuss problems peculiar to their regions. Various technical commissions have been instituted to investigate the applications of meteorology to agriculture, aeronautics, water resources, pollution control, oceanography, and several other fields.

World Methodist Council (wMC), cooperative organization of Methodist churches that provides a means for consultation and cooperation on an international level. It maintains various committees that are concerned with doctrine, evangelism, education, lay activities, youth, publications, and social and international affairs. wMC has offices in Geneva, Switz., and at Lake Junaluska, N.C., the head-

Originally called the Ecumenical Methodist Conference, the organization's first meeting was held in London in 1881. Subsequently, meetings were held every 10 years until 1951, when it was decided to meet at five-year intervals. The present name was adopted in 1951.

World Series, in baseball, a postseason play-off match between champions of the two major professional baseball leagues of the United States, the American League (AL) and National League (NL).

The World Series began in 1903 after the cessation of hostilities between the National League and the newly formed American League. Boston (AL) defeated Pittsburgh (NL) 5 to 3 in a best-of-nine series. Attendance was just over 100,000 and the players' shares of receipts were slightly more than \$1,000 each. In 1904 the New York Giants (NL) refused to play Boston, again the American League champion; but the series resumed in 1905 and has continued annually since then. A seven-game format has been standard since 1922. Total attendance for the 1980 series was more than 360,000, with total receipts, including television and radio revenues, above \$6,000,000, and winning players' shares of more than \$31,000. The New York Yankees of the American League have won the most World Series championships.

The World Series name has been applied to several baseball championships of lesser import, including the Junior World Series played between champions of the International League and American Association (both American professional minor leagues), and the Little League World Series, an annual event for teams of boys and girls 9 to 18 years old with international representation. For major league World Series results, see Sporting Record: Baseball.

World-Soul, soul ascribed to the physical universe, on the analogy of the soul ascribed to human beings and other living organisms. This concept of a spiritual principle, intelligence, or mind present in the world's body received its Classical Western expression in the writings of Plato (5th century BC) and Plotinus (3rd century AD). It may be related to the common archaic notion of the ensoulment of all things (see animism). A possible Eastern analogue may be seen in the Indian notion of Atman (q.v.), the supreme cosmic Self.

world tree, also called COSMIC TREE, centre of the world, a widespread motif in many myths and folktales among various preliterate peoples, especially in Asia, Australia, and North America, by which they understand the human and profane condition in relation to the divine and sacred realm. Two main forms are known and both employ the notion of the

world tree as centre. In the one, the tree is the vertical centre binding together heaven and earth; in the other, the tree is the source of life at the horizontal centre of the earth. Adopting biblical terminology, the former may be called the tree of knowledge; the latter, the tree of life.

In the vertical, tree of knowledge tradition, the tree extends between earth and heaven. It is the vital connection between the world of the gods and the world of man. Oracles and judgments or other prophetic activities are performed at its base.

In the horizontal, tree of life tradition, the tree is planted at the centre of the world and is protected by supernatural guardians. It is the source of terrestrial fertility and life. Human life is descended from it; its fruit confers everlasting life; and if it were cut down, all fecundity would cease. The most common occurrence of the tree of life is in quest romances in which the hero seeks the tree and must overcome a variety of obstacles on his

World War I, also called FIRST WORLD WAR, or GREAT WAR, an international conflict that in 1914-18 embroiled most of the nations of Europe along with Russia, the United States, the Middle East, and other regions. The war pitted the Central Powers-Germany, Austria-Hungary, and Turkey—against the Allies-France, Great Britain, Russia, Italy, Japan, and, from 1917, the United States. It ended with the defeat of the Central Powers.

A brief treatment of World War I follows. For full treatment, see MACROPAEDIA: World Wars, The.

By 1910 the major nations of Europe had aligned themselves into two potentially hostile alliances, with Germany and Austria in one and France, Great Britain, and Russia in the other. When a Serbian nationalist assassinated Archduke Francis Ferdinand of Austria at Sarajevo on June 28, 1914, a chain of threats, ultimatums, and mobilizations was set in motion that resulted in a general war between these two alliances by the end of August.

Germany had long been prepared to fight a land war on two fronts—i.e., against France on the west and against Russia on the east. In the west its armies outflanked France's main defensive forces and swept westward through Belgium, thereby bringing Great Britain into the war by treaty obligation. The German armies then turned south toward Paris. The French, reinforced by a British Expeditionary Force, managed to stabilize their defensive lines by November along the Aisne River, thereby saving Paris, but this meant that the rest of the war in that theatre was fought on French territory. Because of the tremendous firepower of modern artillery and machine guns, the war quickly evolved into one of attrition fought from lines of trenches. Frontal infantry assaults typically gained ground only by yards, and these attacks were enormously costly in human life whether successful or not. A deadlock soon ensued on the Western Front that could not be broken even by the enormous battles of the Somme and Verdun (both 1916) or by the massive German offensives of early 1918.

In the east an early Russian offensive in 1914 drove deep into East Prussia, German Poland, and Galicia, but the Russians were stopped by German and Austrian forces by the end of the year, and in a startling German offensive begun in May 1915 they were thrown back into their own territory. Though it mounted several more offensives and suffered enormous casualties, the Russian Army proved unable either to break through the German defensive lines or to take any German territory.

Other fronts in the war were to a greater or

lesser extent peripheral to the main theatres but were nonetheless bloody. They included Gallipoli and the Dardanelles, where Britain unsuccessfully attempted to invade Turkey proper; the Caucasus and Persia, where Russia and Turkey fought; Mesopotamia and Egypt, where British forces (and, in Egypt, the Arabs organized by T.E. Lawrence) fought the Turks; and the Isonzo valley of northern Italy, where Italian and Austrian troops fought a long series of costly battles.

At sea only Germany and Great Britain had substantial fleets. Britain attempted, with considerable success, to blockade Germany and cut off its maritime access to food and raw materials from overseas. In response Germany turned to one of its newest weapons, the submarine, to interrupt the maritime supply lines of the British Isles. Germany's policy of unrestricted submarine warfare, however, which led to the sinking of much neutral shipping, ultimately persuaded the United States to enter the war against Germany in 1917. The major naval engagement of the war-indeed, the biggest naval battle in history—was the inconclusive Battle of Jutland fought between the British Grand Fleet and the German High Seas Fleet in May 1916.

Russia's poor performance in the war and its grievous losses inspired widespread domestic discontent that led to the overthrow of the Russian monarchy in early 1917 and to the Bolshevik Revolution in November of that year. At the Bolshevik leader Lenin's order, Russia unilaterally ceased hostilities on November 26 and a month later signed a formal armistice with Germany, thus withdrawing from participation in the war. The release of German forces in the east for service on the deadlocked Western Front, however, was offset by the arrival of U.S. troops in France. Used tentatively at first, the rapidly reinforced American forces-1,200,000 by September 1918proved their worth.

By autumn 1918 the position of the Central Powers had deteriorated rapidly. The Austro-Hungarian Empire, shaken by military defeats and by nationalist uprisings encouraged by the Russian Revolution, virtually disintegrated during October. Germany's great offensives on the Western Front during April-July failed, and the Allied forces then began a steady advance that recovered almost all of German-occupied France and part of Belgium by October 1918. German military and civilian morale thereupon collapsed, and amid widespread political unrest the German kaiser William II abdicated on November 9. Two days later an Armistice was signed between Germany and the Allies at Rethondes, Fr., thus ending World War I.

World War II, also called SECOND WORLD WAR, a conflict that involved virtually every part of the world during the years 1939-45. The principal belligerents were the Axis Pow-Germany, Italy, and Japan—and the Al- France, Great Britain, the United States, the Soviet Union, and, to a lesser extent, China. The war was in many respects a continuation, after an uneasy 20-year hiatus, of the disputes left unsettled by World War I.

A brief treatment of World War II follows. For full treatment, see MACROPAEDIA: World Wars, The.

German bitterness over their defeat in World War I and the harsh terms of the Treaty of Versailles, together with the social unrest and political instability that beset the Weimar Republic, resulted in the coming to power of Adolf Hitler, leader of the intensely nationalistic and anti-Semitic National Socialist (Nazi) Party. Given dictatorial powers in 1933, Hitler began the secret rearmament of Germany almost immediately. Playing on the reluctance of other European powers to actively oppose him, he ordered the military occupation of the Rhineland, in contravention of the Treaty of Versailles, in March 1936. Later that year Benito Mussolini, the Fascist dictator of Italy, who had already embarked on aggression in Ethiopia, declared a Rome-Berlin "axis"; the next year Italy joined the 1936 Anti-Comintern Pact between Germany and Japan. Germany and Italy both intervened, in the name of anti-Communism, in the Spanish Civil War from 1936.

In March 1938 Hitler sent German troops to occupy Austria, which was promptly incorporated into Germany. By a combination of external and internal pressures he succeeded in annexing or neutralizing all of what had been Czechoslovakia by March 1939. In April 1939 Italy annexed Albania. On September 1, secure behind the new German-Soviet Nonaggression Pact that had stunned the world in August, Hitler began an invasion of Poland. Great Britain and France declared war on Germany two days later.

By the end of 1939 Germany and the Soviet Union had divided Poland between themselves, and the Soviets had occupied Estonia, Latvia, and Lithuania and had attacked Finland, which they finally defeated in March 1940. For some months Germany's main activities were at sea, including a very effective submarine campaign against merchant shipping bound for Britain. In April 1940 Germany occupied several Norwegian ports and all of Denmark. On May 10 the major German offensive in the west began with a lightning sweep through The Netherlands and Belgium into France: by June 22 three-fifths of France. including Paris, was occupied and the rest had become a neutral state with its government at Vichy. During August-September the German Luftwaffe (Air Force) launched massive bombing raids on Great Britain in an attempt to soften it up for a cross-Channel invasion. The Battle of Britain was won by the Royal Air Force, however, and Hitler postponed the invasion indefinitely.

Following Italy's abortive invasion of Greece in November 1940, Hitler drew Hungary, Romania, and Slovakia into the Axis; Bulgaria joined in March 1941. In April Germany attacked Yugoslavia and Greece, both of which were overrun by the end of the month. In June Hitler abandoned the Nonaggression Pact of 1939 and launched a massive surprise invasion of the Soviet Union. German armoured units drove deep into Soviet territory and at one point reached the outskirts of Moscow before Soviet counterattacks and winter weather slowed the offensive to a halt.

Japan, the other Axis member, had meanwhile been tiring of its long, unproductive war in China and decided to take advantage of the situation in Europe to seize European colonial holdings in the Far East. To cripple what it foresaw would be its main opponent in a Pacific war of aggrandizement, Japan attacked United States installations at Pearl Harbor, Hawaii, and the Philippines on Dec. 7-8, 1941. Within days the United States was at war with all the Axis powers. Japan swiftly invaded and occupied the Philippines, most of Southeast Asia and Burma, the Netherlands East Indies (now Indonesia), and many Pacific Ocean islands. Despite the enormous initial advantage gained by its sudden offensives, Japan lost the crucial sea battle of Midway in June 1942. The American strategy in the Pacific was to use naval and amphibious forces to advance up the chains of islands toward Japan while smaller land forces cooperated with Chinese and British efforts on the Asian mainland.

In North Africa the British, who in 1940-41 had defeated much larger Italian forces, were locked in a seesaw battle with the German Afrika Korps. In November 1942 the first Allied offensive began with U.S.-British landings in North Africa. German forces were gradually squeezed into Tunisia and were finally eliminated in May 1943. In July Allied troops from North Africa landed in Sicily and thence invaded Italy in September. The fascist government was overthrown, and in October Italy joined the Allies; fighting against German troops continued in Italy for the rest of

After a bitterly opposed and finally unsuccessful attack on Stalingrad (August 1942-February 1943), German forces in the Soviet Union lost momentum, and, as the Red Army continued to draw on its huge manpower reserves, it began during 1943 to push the Germans back from the western portions of the Soviet Union. Germany was mean-while preparing for an expected Allied invasion of western Europe. The invasion came on June 6, 1944—D-Day—on the beaches of Normandy in northern France, where 156,-000 British, Canadian, and U.S. troops under the command of the U.S. general Dwight D. Eisenhower were landed. With command of the air the Allies quickly consolidated their foothold and began the advance eastward that ended in the occupation of the German homeland in March-April 1945. Meanwhile, the Soviet forces in 1944 had pushed the Germans completely out of the Soviet Union and had advanced into Poland, Czechoslovakia, Hungary, and Romania. In early 1945 they occupied the eastern one-third of Germany. At the climax of the German collapse, with Berlin encircled by Soviet troops, Hitler committed suicide on April 30; on May 8 the surrender of all German forces was signed.

In the Pacific the "island-hopping" strategy of the U.S. general Douglas MacArthur led to the Allied invasion of the Philippines by October 1944. The naval battle in Leyte Gulf that followed all but eliminated the Japanese navy. The capture, after bitter fighting, of the islands of Iwo Jima and Okinawa in March and June of 1945 opened the way for both the heavy strategic bombing of Japan itself and a possible invasion. The war in the Pacific came to a sudden and dramatic close after the atomic bombing of Hiroshima and Nagasaki on Aug. 6 and 9, 1945; Japan's formal surrender was signed on September 2.

World Weather Watch, program established in 1961–62 by the World Meteorological Organization to improve the global system for meteorological observation and prediction. It is designed to avoid duplication in preparing analyses and prognoses, while still providing each meteorological service with the data and background information it requires to carry out its responsibilities. The system is based on the establishment of world and regional centres at strategic locations around the globe. A selected, representative sample of various sources of global conventional and satellite meteorological observations, enough to establish the broad picture of the world weather situation, is transmitted to world centres where world and hemispheric analyses are prepared both for climatological and research uses and for transmission to the various research centres. The latter select from the daily output of world observations the data required for preparing regional analyses and prognoses for the benefit of countries within the region.

World's Columbian Exposition, fair held in 1893 in Chicago to celebrate the 400th anniversary of Columbus' discovery of America. In the United States there had been a spirited competition for this exposition among the nation's leading cities. Chicago was chosen in part because it was a railroad centre

and in part because it offered a guarantee of \$10,000,000.

Continuing the precedent set at the Philadelphia Centennial (1876) of creating a vast gardened layout containing numerous separate buildings rather than a single great hall, the World's Columbian Exposition was planned to spread over 686 acres (278 hectares) along the city's south lakefront area; part of this location is now Jackson Park in Chicago. The chief planner was the Chicago architect Daniel H. Burnham; Charles B. Atwood was designer in chief; and Frederick Law Olmsted was entrusted with landscaping. The fair's new buildings had impressive Classical facades with a uniform cornice height of 60 feet (18.25 m). The plaster palace fronts bore little functional relationship to exhibition halls inside; but the grandeur of the "White City," electrically lighted at night, temporarily led to a resurgent interest in Classical architecture.

Behind the calm pillared facades and Classical porticoes of the great "White City" the visitor found unexpected excitement and novelty. The Ferris wheel (invented by G.W.G. Ferris, a Pittsburgh engineer) and a dazzling new wonder-electricity-were presented for the first time in America. Electricity had been introduced and exploited at the Paris Exposition of 1889, but in 1893 it was still unfamiliar to most Americans. The exposition was opened by a dramatic act when President Grover Cleveland pushed a button in the White House and set the great Allis engine in motion in Chicago, turning on the electric power for the exposition. The engine, the dynamo, and the alternating-current generator displayed for the first time by George Westinghouse later became the basic tools of the electric power industry.

The Columbian Exposition gross outlays amounted to \$28,340,700, of which \$18,678,-000 was spent on grounds and buildings. More than 21,400,000 visitors attended the exposition, and the cash balance remaining at closing was \$446,832, making it the first American international exposition to close with a profit. The Palace of Fine Arts, a 600,000-square-foot building, was rebuilt in permanent limestone in 1928-32 to house the public exhibitions of the Museum of Science and Industry.

worm, any of the members of several invertebrate phyla, including Platyhelminthes (flatworms), Annelida (segmented worms), Nemertea (ribbonworms), Aschelminthes (roundworms, pinworms, eelworms, threadworms, hairworms, etc.), Sipuncula (peanutworms), Echiura (spoonworms), Acanthoceph-(spiny-headed worms), Pogonophora (beardworms), and Chaetognatha (arrowworms).

The term is also loosely applied to centipedes and millipedes; to larval (immature) forms of other invertebrates, particularly those of certain insects; and to some vertebrates—e.g., the blindworm (Anguis fragilis), a limbless, snakelike lizard. At one time all phyla of wormlike animals were classed as Vermes, a term no longer in common use.

Worms in the zoological sense include various species of flatworm, annelid, ribbonworm, spiny-headed worm, and aschelminth (qq.v.). Worms typically have an elongated, tubelike body, usually rather cylindrical, flattened, or leaflike in shape and often without appendages. They vary in size from less than 1 mm (0.04) inch) in certain aschelminths to more than 30 m (100 feet) in certain ribbonworms.

Worms are universal in distribution, occurring in marine, freshwater, and terrestrial habitats. Some types of worms are parasitic, others are free-living. From a human perspective, worms are important as soil conditioners (e.g., annelids, aschelminths), and as parasites of people and domestic animals (e.g., platyhelminths, aschelminths), and of crops (e.g., aschelminths). Ecologically, worms form an important link in the food chains in virtually all ecosystems of the world.

worm lizard (Rhineura floridana), lizard that is a North American member of the family Amphisbaenidae, found burrowing in soil, sand, and leaf mold on the Florida peninsula. When disturbed, this pinkish, 18-35centimetre- (7-12-inch-) long, wormlike creature backs into its hole tail first. The worm

lizard has no limbs or external eyes or ears. It spends most of its life underground, eating spiders, worms, and termites.

worm shell, any marine snail of the family Vermetidae (subclass Prosobranchia, class Gastropoda). The shell of these snails consists of an irregularly coiled, narrow tube that resembles a worm. Most species of both families live cemented to rock or coral substrates, and many are found in coral reef habitats. They feed on suspended particulate matter in seawater, which they obtain by secreting a mucous net from a gland in the foot. This net spreads out in the current, and food particles stick to it. After a few minutes the net is pulled in by the mouth and ingested and a new net spread. The snails often form a distinct zone on tropical shores and reach densities of more than 60,000 per square metre, producing thick deposits of intertwined shells.

worm snake, any of various harmless burrowing snakes of wormlike appearance. This name is often given to blind snakes of the family Typhlopidae. The American worm snake (Carphophis amoena), of the eastern United States, of the family Colubridae, is brown or blackish, with a pink belly. Adults usually are

American worm snake (Carphophis amoena)

less than 25 cm (10 inches) long. The Oriental worm snakes of the genus Trachischium resemble the American species.

Wormley Conference (Feb. 26, 1877), in American history, meeting at Wormley's Hotel in Washington, D.C., at which leaders of the Republican and Democratic parties resolved the disputed Rutherford B. Haves-Samuel J. Tilden presidential election of 1876.

Democrat Tilden had won a 250,000-vote popular plurality, but he fell one electoral vote short of a majority. The electoral votes of Florida, South Carolina, and Louisiana (as well as one vote in Oregon) were in dispute as a result of widespread vote fraud on both sides.

After the selection of a special group called the Electoral Commission (q.v.) and several meetings between Republicans and Democrats, the Wormley Conference reached a compromise. The Democrats gave up their claim to the presidency in return for promises from the Republicans to withdraw the remaining federal troops from the former Confederate states, to end Northern interference in local Southern politics, to share Southern patronage with Democrats, and to appoint at least one Southern Democrat to the cabinet. Perhaps the most important concession of all was the Republicans' vow to support congressional appropriations for much-needed railroad construction and other internal improvements to help the war-struck Southern economy. This plan was facilitated by Hayes's sympathy with Southern whites and his desire to end Radical Reconstruction, as well as by general agreement among Southern whites with Hayes's conservative economic views.

Hayes was declared the winner on March 2, 1877, and was inaugurated three days later. In April he withdrew the troops, marking the end of Radical Reconstruction and signalling the return of white rule in the South.

Consult the INDEX first

Worms, city, Rhineland-Palatinate Land (state), southwestern Germany, a port on the left bank of the Rhine, just northwest of Mannheim. Known originally as Celtic Borbetomagus, by Julius Caesar's time it was called Civitas Vangionum, the chief town of the Vangiones. In AD 413 it became the capital of the Burgundians until it was destroyed in 436 by the Huns, who were subsequently defeated (451) by the Romans. The Hun destruction of Worms and the Burgundian kingdom inspired heroic legends in the Nibelungenlied, an epic poem (c. 1200).

Rebuilt by the Merovingian kings, Worms became a bishopric c. 600 and a favourite residence of the Carolingian and Salian emperors. The bishopric (secularized in 1803) grew steadily in temporal power and territory, particularly under Bishop Burchard I (1000–1025), and Worms became a free imperial city of the Holy Roman Empire in 1156, remaining free until 1801 in spite of the bishops.

More than 100 diets (assemblies) were held in the city. The Concordat of Worms closed the investiture controversy in 1122, the "perpetual public peace" (Ewiger Landfriede) was proclaimed by the emperor Maximilian I at the Diet of 1495, and Luther appeared before the famous Diet of 1521 to defend his doctrines to Charles V. Worms became Protestant in 1525 and was the site of religious conferences in 1540 and 1557. It suffered severely during the Thirty Years' War and was looted and burned by the French in 1689. These events led to a precipitous decline, until the city revived and expanded under the stimulus of industrial development in the 19th century. It was annexed to France in 1797 and passed to Hesse-Darmstadt in 1816. Although Worms was severely damaged in World War II, it has been rebuilt.

The Cathedral of SS. Peter and Paul ranks with those of Speyer and Mainz as one of the finest Romanesque churches of the Rhine. The original building was consecrated in 1018 and was completed and remodelled in the 12th century. Additions were made in the 13th and 14th centuries, and the whole has often been damaged and restored. In the crypt are tombs of the Dukes of the Salian line. Other noteworthy churches include the Church of Our Lady (Liebfrauenkirche; consecrated 1467) whose vineyards produce the famous white wine known as Liebfraumilch: St. Paul's Church (1002); St. Andrew's (1016; now the municipal museum); and the Trinity Church (1726). The old synagogue (1034, restored 13th century), which was destroyed in 1938, has been rebuilt and modernized. The Jewish community of Worms claims to be the oldest in Germany and to have existed since the earliest Christian Era, although the first authenticated mention of it was in 588. Other historic landmarks include the Hagen Monument and the Siegfried Fountain, both commemorating the Nibelungen legends, and the 19th-century Luther Monument.

Worms has an important wine trade. Industries include the manufacture of leather, machinery, chemicals, textiles, paints, ceramics, and electrical appliances. Pop. (1989 est.) 74,809.

Worms, Concordat of, compromise arranged in 1122 between Pope Calixtus II (1119-24) and the Holy Roman emperor

Henry V (reigned 1106-25) settling the Investiture Controversy, a struggle between the empire and the papacy over the control of church offices. It had arisen between Emperor Henry IV (1056-1106) and Pope Gregory VII (1073-85). The concordat marked the end of the first phase of the conflict between these two powers. A similar conflict, between the papacy and the king of England, had been composed in 1107; that settlement provided the basis for the Concordat of Worms, which made a clear distinction between the spiritual side of a prelate's office and his position as a landed magnate and vassal of the crown. Bishops and abbots were to be chosen by the clergy, but the emperor was authorized to decide contested elections. The man chosen was first to be invested with the regalia, or powers, privileges, and lands pertaining to his office as vassal, for which he did homage to the emperor, and then with the spiritualia, or ecclesiastical powers and lands, symbolized by the staff and ring, which he acquired by his consecration and from his ecclesiastical superior, who represented the authority of the church.

Worms, Diet of (1521), meeting of the Diet of the Holy Roman Empire held at Worms, Ger., in 1521; made famous by Martin Luther's appearance before it to defend his beliefs. Because of the confused political and religious situation of the time, Luther was called before the political authorities rather than the Pope or a council of the Catholic Church.

Pope Leo X had condemned 41 propositions of Luther's in June 1520, but Luther continued to produce works critical of the papacy and its teachings. The Pope excommunicated him on Jan. 21, 1521, but it was several months before the condemnation was received in Germany. Luther's prince, Frederick III the Wise, elector of Saxony, refused to take any action against Luther. Frederick negotiated with the Holy Roman emperor, Charles V, and it was agreed that Luther would appear for a hearing at the Diet under the Emperor's safe-conduct.

On April 17, 1521, Luther went before the Diet for the first time. In response to questioning, he admitted that the books displayed before the court were his, but, when asked to repudiate them, he asked for time to consider the question. The next day, again before the assembled Diet, Luther refused to repudiate his works unless convinced of error by Scripture or by reason. Otherwise, he stated, his conscience was bound by the Word of God. According to tradition, he said, "Here I stand; I can do no other." Disorder broke out at the conclusion of Luther's refusal to recant, and the Emperor dismissed the Diet for the day.

A hero to the Germans but a heretic to others, Luther soon left Worms but spent the next nine months in hiding at the Wartburg, near Eisenach. In May the Diet passed the Edict of Worms, which declared that Luther was an outlaw and a heretic who should be captured and turned over to the Emperor and whose writings were forbidden. The edict, never enforced, nevertheless inhibited Luther's travels throughout his lifetime and made him dependent on his prince for protection.

wormwood, any bitter or aromatic herb or shrub of the genus *Artemisia* of the family Asteraceae, distributed throughout many parts of the world. These plants have many small, greenish-yellow flower heads grouped in clusters. The leaves are usually divided and alternate along the stem; they may be green, grayish green, or silvery white.

The leaves of the common wormwood (A. absinthium), probably the best known species, have been used in medicines and such beverages as absinthe (q.v.). Common wormwood is native to Europe but has become naturalized in Canada and the United States. The leaves

Wormwood (Artemisia absinthium)

of the tarragon (A. dracunculus), another well-known species, are employed as a seasoning, and those of the mugwort (A. vulgaris) are often used to flavour beverages.

Worpswede school, group of artists who settled after 1889 in the north German village of Worpswede, near Bremen, in order to paint the local landscape. They depicted the heaths, meadows, forests, streams, bridges, windmills, and peasants of the area in a romantic and sentimental style, somewhat reminiscent of the earlier 19th-century Barbizon school in France. Fritz Mackenson and Otto Modersohn were the first to arrive; during the 1890s they were joined by Paula Becker (who later married Modersohn), Hans am Ende, Fritz Overbeck, and Heinrich Vogeler. Clara Westoff, a talented sculptress, also worked at Worpswede, where she met the German poet Rainer Maria Rilke, whom she married in 1901. Two years later Rilke published a book, Worpswede, discussing the artists and the landscape.

The Worpswede painters exhibited their works at the Glaspalast in Munich in 1895, achieving recognition when Mackenson was awarded a gold medal for his painting "Sermon in the Moors." Although popular with the public during the late 1890s, the Worpswede painters' success did not endure; as regionalist painters they were isolated from the advanced achievements of French art and, with the exception of Paula Modersohn-Becker, were unaware of Postimpressionist painting. Inspired by the works of Vincent van Gogh, Paul Gauguin, and Paul Cézanne, which she saw on her trips to Paris, Modersohn-Becker's style evolved toward flatness and simplification, anticipating the Expressionist movement in Germany.

Worrell, Sir Frank (Mortimer Maglinne) (b. Aug. 1, 1924, Bridgetown, Barbados—d. March 13, 1967, Kingston, Jam.), exceptional all-around cricket player, captain (1960–63) of the West Indies international team, which under his leadership attained world cricket supremacy in the early 1960s. Worrell, Everton D. Weekes, and Clyde L. Walcott (the "Three W's") formed what was considered the best group of mid-order (middle innings) batsmen in cricket.

Educated in England (at the University of Manchester), Worrell played for the West Indies against England in his first Test (international) series (1947-48 season). Afterward he played professional cricket for Radcliffe in the strong Central Lancashire League. In his chief triumph as West Indies captain, his team

defeated England (3 tests to 1, with 1 drawn) in a series played in England, June-August 1963.

Worrell sat in the Jamaican Senate from 1962 to 1964, and subsequently he served as dean of students of the University of the West Indies (Trinidad division). In 1964 he was knighted for his contributions to cricket. He died of leukemia. *Frank Worrell*, a biography by Ernest Eytle, appeared in 1963.

Worsaae, Jens Jacob Asmussen (b. March 14, 1821, Vejle, Den.—d. Aug. 15, 1885, Copenhagen), Danish archaeologist, a principal founder of prehistoric archaeology. His Danmarks Oldtid oplyst ved Oldsager og Gravhøie (1843; The Primeval Antiquities of Denmark)

Worsaae
By courtesy of the Royal Danish Embassy, London

was one of the most influential archaeological works of the 19th century.

At an early age Worsaae studied stone monuments in Denmark and proved them to be tombs rather than altars, as had been supposed. From 1838 to 1843, while a student, he served as an assistant to Christian J. Thomsen, curator of Danish antiquities, and prepared Danmarks Oldtid. He then spent several years in Germany, France, England, and Ireland carrying on stratigraphic study and research that enabled him to refine Thomsen's tripartite (Stone, Bronze, and Iron ages) classification of prehistory.

Appointed inspector of Danish historic and prehistoric monuments in 1847, he discovered early kitchen middens (heaps of refuse from human habitation) in 1851 and thus was able to establish the Old Stone Age (covering human activity before $c.\ 10,000\ Bc)$ as a period of prehistory. He joined the faculty of the University of Copenhagen in 1855 and succeeded Thomsen as curator in 1865.

Throughout his life Worsaae did much to establish scientific methods for archaeology. He considered it essential not only to study excavated artifacts, particularly those that were most commonly found, but also to examine their geographic and stratigraphic contexts. His standards represented a degree of professionalism that was considerably in advance of his time.

worsted knitting yarn, wool yarn made of long-staple fibres that have been combed to remove undesirable short fibres and make them lie parallel. In the spinning operation, which imparts the necessary twist to hold the fibres together, worsted yarns are more tightly twisted than are the bulkier woollen yarns.

Two yarns may be twisted together to form two-ply yarn, or three or four yarns may be twisted together to form three- or four-ply yarn. The soft, heavy yarn is strong and durable and is often used for sweaters.

Wortels, Abraham: see Ortelius, Abraham.

Worth, Charles Frederick (b. Oct. 13, 1825, Bourne, Lincolnshire, Eng.—d. March 10, 1895, Paris), pioneer fashion designer and founder of Parisian haute couture.

Worth was the first to prepare and show a collection in advance, the first man to become

Charles Frederick Worth, detail of an engraving

RBC Hulton Picture Library

prominent in the field of fashion, and the first to use young girls as models. He pioneered in designing dresses to be copied in French workrooms and distributed throughout the world. In 1845 Worth left England, where he had

been an indentured bookkeeper in a London yard-goods firm. He first worked in a Paris dress-accessories shop and then, in 1858, established his own ladies' tailor shop. Through Princess Metternich, wife of the Austrian ambassador to France, he gained the patronage of the fashionable empress Eugénie, wife of Napoleon III of France.

Worth became the dictator of Paris fashion. He is especially noted for designing sumptuous crinolined gowns that reflected the elegance of the Second Empire period (1852–70) and for introducing the bustle, which became a standard in women's fashion throughout the 1870s and 1880s.

Worth, Irene (b. June 23, 1916, Neb., U.S.), American actress who worked extensively on the English stage.

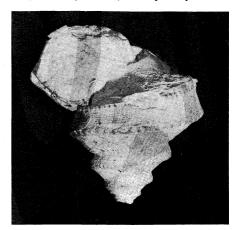

Worth originally trained as a teacher at the University of California, Los Angeles (bachelor of education, 1937), and taught school for a few years before turning to the theatre. She made her stage debut as Fenella in a touring production of Escape Me Never (1942), her Broadway debut as Cecily Harden in The Two Mrs. Carrolls (1943), and her London debut as Elsie in The Time of Your Life (1946). She was a pupil of Elsie Fogerty in London, and her early roles there included Ilona Szabo in The Play's the Thing (1946), Eileen Perry in Edward, My Son (1948), Mary Dalton in Native Son (1948), and Celia Coplestone in The Cocktail Party (1949-50). With the Old Vic Theatre she played Desdemona (Othello), Helena (Midsummer Night's Dream), and many other roles, touring with the company to South Africa in 1953. In 1953 she played Portia in The Merchant of Venice and appeared at the Stratford (Ontario, Can.) Festival in All's Well That Ends Well and Richard III. In 1955 she created the role of Argia in Ugo Betti's *The Queen and the Rebels*, and the following year appeared in London in George Feydeau's Hotel Paradiso. She performed with the Royal Shakespeare Company in King Lear (1962) in London and on a world tour. She premiered the lead role in Edward Albee's Tiny Alice (1965) in New York City and worked with Peter Brook's International Theatre Research Centre in Paris and Iran (1970-71). She then did Hedda Gabler (1970) at Stratford (Ontario), The Seagull (1973) at the Chichester Festival, and Sweet Bird of Youth (1975) in

Worth's motion pictures include *Orders to Kill*, for which she received the British Film Academy Award (1958), *The Scapegoat*, and *King of the Seven Seas*. She performed extensively on radio in England and did television work there and in the United States and Canada. She was equally adept at playing roles in classic drama, standard modern reportory, and avant-garde theatre. She won many awards and was made an honourary Com-

New York City.

mander of the Order of the British Empire in 1975. She continued to act into the 1980s, appearing in such plays as *L'Olimpiade* (1982) at the Edinburgh Festival and such films as *Eyewitness* (1981).

Worthenia, genus of extinct gastropods (snails) preserved as common fossils in rocks of Devonian to Triassic age (190,000,000 to 395,000,000 years old) but especially charac-

Worthenia

teristic of Pennsylvanian deposits (those deposits laid down from 280,000,000 to 325,000,000 years ago) in the midcontinent region of North America. *Worthenia* is characterized by a turban-shaped shell in which a raised ridge follows the margin of the whorls. Small nodes occur along the ridge, and the opening of the shell is oval and large.

Worthing, district (borough), county of West Sussex, England, on the English Channel. Modern communications (including railway links to London, 58 mi [93 km] northwest) have spurred its growth as a seaside resort and increasingly as a residential town for retired people. Its mild and notably sunny climate also favours cultivation of salad crops in the vicinity. Its area is 13 sq mi (33 sq km). Pop. (1983 est.) 93,400.

Worthington, city, Franklin County, central Ohio, U.S., on the Olentangy River, a northern suburb of Columbus. Planned in 1803 by the Scioto Land Company, it was first settled by New England families led by James Kilbourne, who named it for Thomas Worthington, U.S. senator and governor. The city is the site of Worthington College (1819) and of the Ohio Railway Museum (1948). Although mainly residential, there is scattered light industry. Inc. village, 1835; city, 1956. Pop. (1980) 15,016.

Wo'se (ancient Egypt): see Thebes.

Wotan (Norse god): see Odin.

Wotruba, Fritz (b. April 23, 1907, Vienna—d. Aug. 25, 1975, Vienna), Austrian sculptor of spare, architectonic images of the human form.

Wotruba learned engraving at age 14; in 1925–26 he was the student of sculptor Anton Hanak. His early works were representational, but they became more abstract as he struggled to develop a personal style that would express his intellectual as well as aesthetic perceptions. Between 1939 and 1945 Wotruba's technique continued to evolve, and the pieces produced during 1945 were especially significant in his stylistic development. Few of the traditional concepts of form remained in his figures built up like towers from roughly trimmed blocks of stone. The power of these often life-size

Wotton, Sir Henry (b. March 30, 1568, Boughton Malherbe, Kent, Eng.-d. December 1639, Eton, Buckinghamshire), English poet, diplomat, and art connoisseur who was a friend of Donne and Milton.

Of his few surviving poems, "You Meaner Beauties of the Night," written to Elizabeth of

Sir Henry Wotton, detail of an oil painting by Cornelius Johnson, first half of the 17th century; in the Bodleian Library, Oxford By courtesy of the curators of the Bodleian Library,

Bohemia, is the most famous. Izaak Walton's Life of Wotton was prefixed to the Reliquiae Wottonianae (1651), the volume in which most of Wotton's writings first appeared.

Wotton was knighted in 1604, served as ambassador to Venice intermittently from 1604 to 1623, and was a member of Parliament in 1614 and 1625. In 1624 he became provost of Eton and in 1627 he took holy orders.

Long residence in Venice developed in Wotton a taste for architecture and painting far more sophisticated than that of his contemporaries. In The Elements of Architecture (1624) he expresses his views clearly and briefly.

Wouk, Herman (b. May 27, 1915, New York City), U.S. novelist best known for his epic war novels.

During World War II Wouk served in the Pacific aboard the destroyer-minesweeper "Zane". One of his best known novels, The Caine Mutiny (1951), grew out of these years. This drama of naval tradition presented the unforgettable character Captain Queeg and won the Pulitzer Prize for fiction in 1952

Wouk's novels are all meticulously researched, and they provide an accurate and in-depth portrait of a particular slice of the world. They are built on a belief in the goodness of man or, in the case of Marjorie Morningstar (1955), the purity of women, and revolve around moral dilemmas. Wouk wrote with little technical innovation, but his novels have been tremendously popular. Most have been made into screenplays. Popular television mini-series were based on his expansive two-volume historical novel set in World War II: The Winds of War (1971) and War and Remembrance (1978).

wound, a break in the continuity of any bodily tissue due to violence, where violence is understood to encompass any action of external agency, including, for example, surgery. Within this general definition many subdivisions are possible, taking into account and grouping together the various forms of violence or of tissue damage.

The most important distinction is between open and closed wounds. Open wounds are those in which the protective body surface (the skin or mucous membranes) has been broken, permitting the entry of foreign material into the tissues. In closed wounds, by contrast, the damaged tissues are not exposed to the exterior, and the process of repair can take place without the interference that contamination always brings, in greater or lesser degree. Further divisions may be made on the basis of the mode of production of the wound.

Closed wounds. The degree of injury sustained from a direct blow depends upon the force of the blow and its direction. Obviously the degree of damage increases with increasing force; the effects of direction are equally important, although not so readily appreciated. For example, a hammerblow to the side of the head may severely bruise the scalp or, delivered with equal force but directed in a slightly different way, may cause extensive damage to the base of the skull. Anatomic and physiologic factors may also affect the degree of injury. Thus, a fall on the outstretched hand may have extremely different effects on a child, a young man, and an elderly person.

A relatively slight blow may damage the skin and underlying soft tissues, as shown by bruising, or contusion, which results from the infiltration of blood into the tissues from ruptured small vessels and by swelling caused by the passage of fluid through the walls of damaged capillaries. As a rule, the hemorrhage ceases abruptly, the blood and fluid are absorbed within a few days, and the part is restored to normal. When larger vessels are injured, much more blood escapes; it collects in the tissues and forms a mass called a hematoma.

A direct, forceful blow may damage any of the underlying tissues; blood vessels, nerves, muscles, bones, joints, or the internal organs may be affected.

Damage to the deeper tissues may result from the direct impact of the blow upon a tissue, as in the fracturing of a skull by a hammer or, more commonly, from the transmission of the force of impact through the body to a relatively weak point. Thus, a fall on the outstretched hand may injure the flesh and bones of the hand itself, but a common result is a break at some other site in the arm through which the force is transmittedthe scaphoid bone in the wrist; the radius in the forearm just above the wrist; at the elbow; or at the shoulder—the breaking point being determined by the direction of force and the anatomy of the individual.

Other common forms of indirect injury result from twisting, as occurs when a person's foot becomes caught and he or she twists upon it, suffering, if the force is great enough, a sprained or broken ankle or a broken leg or hip; from bending; or from deceleration, a form of injury frequently encountered in automobile and aircraft accidents, where one part of the body is fixed while another is relatively mobile, giving rise, in abrupt stops, to a displacement of the mobile parts, commonly called a whiplash.

When the skin (or, in the Open wounds. case of injuries of the base of the skull or the sinuses, the mucous membrane) is broken, a wound is exposed to additional hazards, since the tissues may be invaded by foreign material such as bacteria, dirt, and fragments of clothing, which may give rise to serious local or general complications from infection. Furthermore, if the break in the skin is large, the resulting exposure of the wounded tissues to the drying and cooling effects of the air may increase the damage caused by the wounding agent itself.

A needle, a sharp knife, or a rifle bullet that passes through the tissues with ease, dividing them cleanly or separating them, will produce relatively little damage except to those tissues directly in its course; and, indeed, unless an important structure is injured, the wounds caused are seldom serious. On the other hand, a bomb fragment, irregular and jagged, will, as it churns and rips through the soft tissues, produce extensive damage for a considerable distance in all directions. Likewise, the injury caused by crushing is frequently serious.

Skin, being sturdy and elastic and well supplied with blood, tolerates injury well and recovers quickly. The subcutaneous fatty tissues are more delicate and more easily deprived of their blood supply. Muscle, likewise, is sensitive to the damaging effect of missiles, being readily torn and unable to survive diminished blood supply for any appreciable time. Muscle, when damaged, is particularly prone to infection.

An injury to bone in an open wound is always serious, for any broken fragment detached from its blood supply will not survive if infection occurs, and it will remain as a foreign body in the wound to cause further complications. Even if the bone is cleanly broken and there are no loose fragments, infection may enter the raw surfaces of the fracture with disastrous results.

Clearly the seriousness of a wound is greatly increased if there is injury to a joint, a nerve, a major blood vessel, or an internal organ.

Contamination of a wound may occur at the moment of wounding or at any time thereafter until healing is complete. The effects of various nonbacterial contaminants vary considerably (e.g., organic substances tend to be more irritating than others); in general, the critical factor for nonbacterial contaminants is the extent of the contamination. In the case of bacterial contaminants the type of contaminant is of greater importance. Infection caused by virulent bacteria nourished by dead tissue and organic foreign material in the wound may take several forms, of which the three most important are gas gangrene, the most dreaded, arising almost exclusively in damaged muscle tissue and spreading with alarming rapidity to cause death if unchecked by surgical or medical treatment; infections caused by such organisms as Streptococcus and Staphylococcus and the coliform bacteria, in which the local production of pus is a prominent feature accompanying a general reaction that may be severe; and tetanus, a treacherous, often fatal infection that becomes evident some days after the wound has occurred, frequently without any marked local manifestations but characterized by generalized muscle spasms.

The final healing of a wound is the result of a series of complex biological events taking place over a long period. Viewed in the simplest way, in an untreated but uncomplicated wound, as from a clean knife cut, the process is as follows: When tissues are cut, the edges of the wound separate, apparently pulled apart by the elasticity of the skin. Blood from the severed blood vessel fills the cavity of the wound and overflows its edges. The blood clots and eventually the surface of the clot dries out and becomes hard, forming a scab. During the first 24 hours the scab shrinks, drawing the edges of the wound closer together. If the scab sloughs off or is removed after about a week, a layer of reddish granulation tissue will be seen to have covered the cut edges of the subcutaneous tissue. Gradually a pearly, grayish, thin membrane extends out from the skin edge; eventually it covers the whole surface. The actual area of the wound, meanwhile, is steadily reduced by a process of contraction; finally, there is no raw surface to be seen.

The thin linear scar that forms is at first red and raised above the level of the surrounding skin but gradually fades until it is considerably paler than the surrounding skin. For many weeks after the scar forms, this process of contracture continues as is shown by the gradual shortening of the wound. Wounds that cross normal "skin lines" tend, after several months, to widen and become depressed below the level of the surrounding skin. Scars do not tan in sunlight, and they produce neither hair nor sweat, all evidences of the failure of the skin to return to full function.

Microscopically one can observe in the clot the whole process of the development of fibrin that causes the clot to contract, the arrival of the white blood cells and the macrophages that digest the debris in the wound, and the growth of blood capillaries followed by the growth inward of fibrous tissue migrating from the cells on the margin of the wound. The fibres arising from these cells can be identified and seen to increase, eventually filling the wound cavity with a network of interlacing threads of the protein collagen that, influenced by lines of tension, finally range themselves in firm bands. Meanwhile, the surface of the wound is being covered by a process of enlargement and flattening and by multiplication of the preexisting skin cells at the edge of the wound. These covering, or epithelial, cells start very early to spread down into the wound, clearing a way for themselves beneath the scab, perhaps by the production of an enzyme that dissolves the deeper layers of the crust. Eventually the proliferating epithelial sheets from the two sides of the wound coalesce to heal the wound superficially.

Wounded Knee, hamlet and creek on the Pine Ridge Indian Reservation in southwestern South Dakota, U.S. It was the site of two conflicts between North American Indians and representatives of the U.S. government.

On Dec. 29, 1890, more than 200 Sioux men, women, and children were massacred by U.S. troops in what has been called the Battle of Wounded Knee, an episode that concluded the conquest of the North American Indian. Reaching out for some hope of salvation from hard conditions, such as semistarvation caused by reduction in the size of their reservation in the late 1880s, the Teton Sioux responded affirmatively to Wovoka, a Paiute prophet who promised the disappearance of the white man and a return of native lands and buffalo if certain rites and dances were performed. These rites, known as the Ghost Dance (q.v.), caused alarm among whites and led to federal military intervention. The army subdued the Ghost Dance movement, but Chief Sitting Bull was killed by reservation police while being arrested (December 14), and a few hundred Sioux left their reservation at Pine Ridge, seeking to hide in the Badlands. Technically classified as hostiles because they had left the reservation, the Indians gathered around Chief Big Foot (who was dying of pneumonia) but surrendered quietly to pursuing troops of the 7th Cavalry on the night of December 28. Following an overnight encampment near Wounded Knee Creek, the Indians were surrounded and were nearly disarmed when a scuffle broke out over a young brave's new rifle. A shot was fired from within the group of struggling men, and a trooper fell. From close range the soldiers, supported by machine guns, fired into the Indians, whose only arms were the clubs and knives that they had hidden in blankets. Fleeing Indians were pursued, and some were killed miles from the camp. Although the number of Indian dead is unknown (the Indians removed some of the dead later), 144 Indians, including 44 women and 16 children, were buried in a mass grave the following spring when the weather permitted the army to return. About 30 soldiers were killed during the hostilities.

On Feb. 27, 1973, some 200 members of the American Indian Movement (AIM), led by Russell Means and Dennis Banks, took the reservation hamlet of Wounded Knee by force, declared it the "Independent Oglala Sioux Nation," and vowed to stay until the U.S. government met AIM demands for a change in tribal leaders, a review of all Indian treaties, and a U.S. Senate investigation of treatment of Indians in general. The Indians were immediately surrounded by federal marshals, and a siege began, ending on May 8, when the Indians surrendered their arms and

evacuated Wounded Knee in exchange for a promise of negotiations on Indian grievances. Two Indians were killed and one federal marshal was seriously wounded during the siege, which alternated between negotiation and exchanges of gunfire.

Wouri River, Wouri also spelled VOURI, or VURI, stream in southwestern Cameroon, whose estuary on the Atlantic Ocean is the site of Douala, the country's major industrial centre and port. Two headstreams—the Nkam and the Makombé—join to form the Wouri, 20 mi (32 km) northeast of Yabassi. The river then flows in a southwesterly direction for about 100 mi to empty into the Gulf of Guinea. It is navigable for 40 mi along its lower course, below Yabassi.

The Portuguese navigator Fernão do Po was probably the first European to reach the estuary of the river, which he named Rio dos Camaroes ("River of the Prawns") because of its abundance of prawns. The Spanish form of the word, camarones, prevailed and later gave rise to the German Kamerun, the English Cameroons, and the French Cameroun.

Wouwerman, Philips, Wouwerman also spelled WOUWERMANS (baptized May 24, 1619, Haarlem, Neth.—d. May 19, 1668, Haarlem), Dutch Baroque painter of animals, landscapes, and genre scenes, best known for his studies of horses.

First trained under his father, Paul Joosten Wouwerman, a painter from Alkmaar, he may also have studied with Pieter Cornelisz., Pieter Verbeeck, and Frans Hals. He appears, however, to have been much influenced by Pieter van Laer (called Bamboccio), a Dutch artist who had lived in Rome and whose pictures of peasants, soldiers, and brigands were influential in northern Europe. Wouwerman became a member of the guild of painters at Haarlem in 1640.

Wouwerman is credited with more than 1,000 pictures, but many of these were painted by his brothers Pieter (1623–82) and Jan (1629–66) and by many other imitators. Three different styles have been observed as characteristic of the various periods of his art. His earlier works are marked by the prevalence of brown tonalities and by a tendency to angularity in draftsmanship; the paintings of his middle period have greater purity and brilliance; and his last and greatest pictures possess more force and breadth and are full of a delicate silvery gray tone.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Wovoka, also called JACK WILSON (b. 1858?, Utah Territory—d. Oct. 1932, Walker River Indian Reservation, Nev.), American Indian religious leader who spawned the second messianic Ghost Dance cult, which swept the reservations in about 1890.

His father, Tavibo, had been an assistant to Wodziwob, the Paiute leader of the first Ghost Dance movement of the 1870s. Himself a Paiute, Wovoka (whose name means "the Cutter") worked during his early teens for a rancher, David Wilson, whose family name he adopted while among whites.

By 1888, having returned to his own people, he had acquired a reputation as a medicine man. In 1889 Wovoka claimed that he had fallen into a trance state during which God informed him that in two years the ancestors of his people would rise from the dead, buffalo once again would fill the plains, and the white man would vanish. But to bring this about, Wovoka warned his increasing numbers of followers, Indians must remain peaceful and profess their faith in the resurrection of the dead, or ghosts, by taking part in a ritual dance, the so-called Ghost Dance. The

cult quickly spread to other tribes, notably the militant Sioux, who saw in it the ultimate revenge against the white man. Wovoka was worshipped far and wide as a new messiah. The religious frenzy engendered by the cult frightened nearby white settlers, as did the prospect that Sitting Bull would try to exploit the movement to engineer an uprising. Hostility between the two cultures grew increasingly, culminating in the massacre by U.S. troops of about 200 Sioux men, women, and children at Wounded Knee (q.v.), S.D. on Dec. 29, 1890. After this tragic incident many of Wovoka's followers despaired of their redemption, and the movement eventually died out.

WPA (U.S.): see Works Progress Administra-

WPA Federal Art Project, first major attempt at government patronage of the visual arts in the United States and the most extensive and influential of the visual arts projects conceived during the Depression of the 1930s by the administration of Pres. Franklin D. Roosevelt. It is often confused with the Department of the Treasury art programs (Treasury Section of Painting and Sculpture, Public Works of Art Project, and Treasury Relief Art Project; qq.v.), but, unlike the Treasury's endeavours the Works Progress (later Projects) Administration Federal Art Project (WPA/ FAP) employed artists with a wide range of experience and styles, sponsored a more varied and experimental body of art, and had a far greater influence on subsequent American movements. This was chiefly the result of the leadership of its national director, Holger Cahill, a former museum curator and expert on American folk art, who saw the potential for cultural development in what was essentially a work-relief program for artists. Cahill and his staff learned from the Public Works of Art Project of 1933-34 that any relief program faced the problem of attempting to produce art of high quality while trying to help the unemployed regardless of talent. In the fall of 1935 a range of creative, educational, research, and service projects was organized to preserve the skills of professional artists in mural, easel, sculpture, and graphic art divisions, of commercial artists in the poster and Index of American Design divisions, and of the less experienced in art education and technical jobs. The project also developed an audience by establishing more than 100 community art centres and galleries across the country in regions where art and artists were almost unknown. Cahill stated in 1936 that "The organization of the Project has proceeded on the principle that it is not the solitary genius but a sound general movement which maintains art as a vital, functioning part of any cultural scheme. Art is not a matter of rare, occasional masterpieces." This was in direct opposition to the philosophy of the Department of the Treasury programs, which sought to commission outstanding works rather than to provide work relief.

The WPA/FAP employed most of its artists from relief rolls, while maintaining a small number of nonrelief artists for supervisory positions. Artists received a basic wage of \$23.50 per week and were expected to turn in one work within a specified number of weeks or to work a certain number of days on a mural or architectural sculpture project. Most easel painters, sculptors, and graphic artists worked at home; muralists and poster artists laboured in the field or in project workshops. The project's greatest problem was to balance the whims and irregular schedules of the creative process with the rigid timekeep-

ing rules of the WPA bureaucracy. Another basic problem arose when budget reductions required the WPA to eliminate artists from its rolls; when too many termination notices were received, riots and sit-down strikes often occurred among the artists. To protect their precarious employment and to improve working conditions, artists organized nationally in an Artists' Union. Its leaders worked with the WPA/FAP administrators and emulated the practices of the labour movement; in 1937 Artists' Union became Local 60 of the United Office and Professional Workers of the CIO.

The project employed more than 5,000 artists at its peak in 1936 and probably double that number over the eight years of its existence. It produced 2,566 murals, more than 100,-000 easel paintings, about 17,700 sculptures, nearly 300,000 fine prints, and about 22,000 plates for the Index of American Design, along with innumerable posters and objects of craft. The total federal investment was about \$35,-000,000, Violins and Shovels: The WPA Arts Projects, by Milton Meltzer, was published in

WPA Federal Theatre Project, national theatre project sponsored and funded by the U.S. government as part of the Works Projects Administration (WPA). The purpose was to create jobs for unemployed theatrical people in the Great Depression years of 1935-39.

Ten thousand professionals were employed in all facets of the theatre. About 1,000 productions were mounted in four years in 40 states, often presented free to the public. These productions included classical and modern drama, children's plays, puppet shows, musical comedies, and documentary theatre known as Living Newspaper (q.v.). Other projects included producing plays by young, unknown American playwrights, establishing black American theatre, and presenting radio broadcasts of dramatic works. Following a series of controversial investigations by the House Committee on Un-American Activities and Subcommittee on Appropriations regarding the Federal Theatre's outspoken leftist commentary on social and economic issues, the Federal Theatre Project was terminated in 1939 by congressional action.

WPA Federal Writers' Project, a program established in the United States in 1935 by the Works Progress Administration (WPA) as part of the New Deal struggle against the Great Depression. It provided jobs for unemployed writers, editors, and research workers. Directed by Henry G. Alsberg, it operated in all states and at one time employed 6,600 men and women. The American Guide series, the project's most important achievement, included guides for every state and territory (except Hawaii), as well as for Washington, D.C., New York City, Los Angeles, San Francisco, New Orleans, and Philadelphia; for several major highways (U.S. 1, Ocean Highway, Oregon Trail); and for scores of towns, villages, and counties. The state guides, encyclopaedic in scope, combined travel information with essays on geography, architecture, history, and commerce. The project also produced ethnic studies, folklore collections, local histories, nature studies—a total of more than 1,000 books and pamphlets.

In accordance with WPA regulations, most of the project's personnel came from the relief rolls. It included such prominent authors of the 1930s as Conrad Aiken, Maxwell Bodenheim, and Claude McKay and such future luminaries as Richard Wright, Ralph Ellison, Nelson Algren, Frank Yerby, Saul Bellow, Loren Eiseley, and Weldon Kees. Congress ended federal sponsorship of the project in 1939 but allowed it to continue under state sponsorship until 1943.

Wrangel, Ferdinand Petrovich, Russian FERDINAND PETROVICH VRANGEL (b. Jan. 9, 1797 [Dec. 29, 1796, Old Style], Pskov, Rus--d. June 6 [May 25], 1870, Tartu, Estonia, Russian Empire), Russian explorer who completed the mapping of the northeastern coast of Siberia (1820–24). Wrangel Island off the Siberian coast was named in his honour. Graduating from the Russian naval academy in 1815, Wrangel sailed around the world in the sloop Kamchatka under V.M. Golovnin (1817-19). After his explorations in Siberia he led another expedition around the world in the sloop *Krotky* (1825–27). He was governor of the Russian settlements in America (1829-35), director of the Russian American Company (1840-49), and naval minister (1855-57), retiring in 1864. A member of the St. Petersburg Academy of Sciences, he helped found the Russian Geographical Society.

Wrangel, Karl Gustav, Greve (Count) (b. Dec. 13, 1613, Skokloster, near Uppsala, Swed.—d. June 25, 1676, Spieker, Rügen Island, off Pomerania [Germany]), Swedish soldier who succeeded Lennart Torstenson as Swedish military and naval commander during the Thirty Years' War (1618-48) and subsequent Baltic conflicts.

Count Wrangel, detail from an oil painting by M. Merian the Younger, 1652; in Gripsholm Castle,

By courtesy of the Svenska Portrattarkivet, Stockholm

Wrangel began his military career in Germany during the Thirty Years' War and by 1638 was a major general. He participated in victories at Wolfenbüttel (1641) and Leipzig (1642) and won a naval victory off Fehmarn (1644). He received successive promotions and, in 1646, returned to Germany as Swedish commander in chief. He proved an able strategist in operations largely coordinated with those of the French commander, Turenne; when the future Charles X of Sweden took his place as commander in chief, Wrangel became governor of Swedish Pomerania.

Although appointed vice admiral in 1653, Wrangel achieved most success with the land forces in the First Northern War (1655-60). He therefore participated prominently in Charles X's wars against Poland, Brandenburg, and Denmark (1655-58). From 1657 he commanded the navy as grand admiral.

During Charles XI's minority, Wrangel sat on the Regency Council (1660-72), first as grand admiral and (from 1664) as grand marshal and president of the War Board. He favoured the French alliance (1672) against the Dutch. Two years later, despite his poor health, he went again to Germany as commander when the Swedes invaded Brandenburg

Wrangel, Pyotr Nikolayevich, Baron (b. Aug. 27 [Aug. 15, Old Style], 1878, Novo-Aleksandrovsk, Lithuania, Russian Empire d. April 25, 1928, Brussels), general who led the "White" (anti-Bolshevik) forces in the final phase of the Russian Civil War (1918-20). A member of an old German baronial family, he served in the Russian imperial guards and became commander of a Cossack division during World War I. He continued to serve in the army after the February Revolution of 1917, which overthrew the Romanov dynasty. However, when General Lavr G. Kornilov, whom he supported, was arrested for attempting to overthrow the provisional government (August 1917), Wrangel resigned his commission and went to the Crimea.

After the Bolshevik coup d'état (October 1917), he joined the White forces of General Anton I. Denikin and was given command of an army. During Denikin's offensive (summer 1919), Wrangel captured Tsaritsyn (now Volgograd; July 2); he succeeded Denikin as commander of the White armies in April 1920, after the Whites had been forced back into the Crimea and Denikin had resigned. Wrangel tried to rally the support of the peasants, Cossacks, and western allies for the Whites, then launched a new offensive in the Ukraine (June 1920). By early November, however, the Red Army had defeated the Whites, who retreated into the Crimea and were evacuated to Constantinople (Nov. 8-16, 1920). After leaving Russia, Wrangel lived in exile in western Europe and wrote his memoirs, which appeared in English translation in 1929.

Wrangel Island, Russian ostrov vrange-LYA, Chukchi autonomous okrug (district), far northeastern Russian Soviet Federated Socialist Republic, in the Arctic Ocean, separating the East Siberian Sea from the Chukchi Sea. The long, narrow island is about 78 miles (125 km) wide and occupies an area of some 2,800 square miles (7,300 square km). It is separated from the Siberian mainland by Long Strait. Wrangel Island is part of the region of Arctic tundra, much of it low-lying lichen. Although the highest part of the island reaches 3,596 feet (1,096 m) at Sovetskaya Mountain, discovered in 1938, there are no glaciers. Geologically, Wrangel Island consists of crystalline slates, granites, and gneisses together with alluvial sands. There are many small lakes, and the northern and southwestern coasts are characterized by numerous sandspits enclosing lagoons. The seas around the island are rarely free from pack ice. The climate is Arctic, with a mean July temperature of 36° F (2.4° C). In summer there is a large bird population, as well as lemmings, Arctic fox, and polar bears.

Soviet writings claim Russian knowledge of the island from the early 18th century. The Russian explorer Ferdinand P. Wrangel, for whom the island was later named, determined its location from accounts of Siberian natives but did not land there during his mapping of the Siberian coast in the early 1820s. Russian fur traders subsequently visited the island, and it was sighted by U.S. vessels in 1867 and 1881. Survivors of a sunken Canadian ship reached Wrangel in 1914, and the leader of the expedition, Vilhjalmur Stefansson, created an international incident in the early 1920s when he claimed Wrangel for Canada without authorization. The Soviet Union then annexed the island, and permanent occupation began with the landing of Chukchi and Russian families in 1926. Wrangel Island State Reserve, established in 1976, occupies 1,730,000 acres (700,000 hectares) and contains polar bears, walruses, and reindeer.

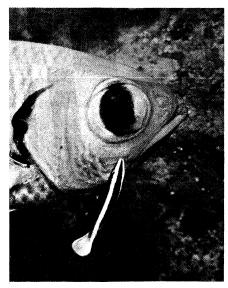

Wrangell Mountains, segment of the Pacific Coast Ranges, western North America, extending southward in southeastern Alaska, U.S., for about 100 miles (160 km), from the Copper River to the St. Elias Mountains near the Yukon border. Many peaks exceed 10,000 feet (3,000 m), including Mount Blackburn (16,390 feet [4,990 m]), the highest point in the range, and Mount Sanford (16,237 feet [4,950 m]). Snowfields drain into glaciers as long as 45 miles (72 km). Most of the summits are extinct volcanoes; Mount Wrangell (14,163 feet [4,320 m]) was the last

to approach the dormant stage. Rich copper deposits were discovered north of McCarthy in the early 20th century, and some gold, copper, and zinc mining continues. The mountains are named for Ferdinand P. Wrangel, a 19th-century Russian explorer, and they form a major part of the Wrangell-Saint Elias National Park and Preserve.

Wrangell-Saint Elias National Park and Preserve, formerly wrangell-saint elias NATIONAL MONUMENT, national park and preserve in southeastern Alaska, U.S., on the Canadian border adjoining Kluane National Park. Proclaimed a national monument in 1978, the area underwent boundary and name changes in 1980. It is the largest unit in the U.S. national park system, with a total area of 12,318,000 ac (4,987,000 ha). At the convergence of the Chugach, Wrangell, and St. Elias mountian ranges, the park includes the largest assemblage of glaciers and the greatest collection of peaks above 16,000 ft (4,880 m) on the continent. Mt. St. Elias, at 18,008 ft (5,489 m), is the second highest peak in the United States. The park has a spectacular array of volcanic peaks, canyons, glacial systems, and broad lowland valleys. Wildlife includes caribou, brown and grizzly bears, Dall sheep, moose, wolves, trumpeter swans and other waterfowl, and marine mammals

wrasse, any of 300 or more species of marine fishes of the family Labridae (order Perciformes). Wrasses range from about 5 centimetres (2 inches) to 2 metres (6.5 feet) or more in length. Most species are elongated and relatively slender. Characteristic features of the wrasses include: thick lips; large scales; long dorsal and anal fins; and large, often protruding canine teeth in the front of the jaw.

Wrasses are found throughout the world in tropical and temperate seas. They are often abundant among coral reefs. Most wrasses are carnivorous and prey on marine invertebrates. Some small wrasses, however, such as young blueheads (*Thalassoma bifasciatum*) and certain *Labroides* species, act as cleaners for larger fishes. They pick off and eat the external parasites of groupers, eels, snappers, and other fishes that visit them periodically. This cleaning service is also performed by various other small fishes and by certain shrimps.

Wrasse (Labroides) cleaning a larger fish Douglas Faulkner

Some wrasses, such as the tautog (Tautoga onitis) of the western Atlantic, are drab or dusky in colour, but many, such as the rainbow wrasse (Coris julis) of the Mediterranean, are brilliantly and often intricately coloured or patterned. Coloration within a species may

be confusingly variable, depending on age and sex. In some species, furthermore, a change in colour accompanies a change in sex, from female to male.

Though often abundant, wrasses as a group are of no great importance to people. Among the better known, or more valuable, species are the hogfish, or capitaine (*Lachnolaimus maximus*), a western Atlantic food species growing to a weight of about 7 kilograms (15 pounds); the moon wrasse (*Thalassoma lunare*), an Indo-Pacific species, green, red, and purplish in colour; the cuckoo wrasse (*Labrus ossiphagus*), an eastern Atlantic and Mediterranean species that is blue and orange if male, orange or reddish if female; and the tautog, or blackfish, a common western Atlantic food fish growing to a maximum of about 90 centimetres and 10 kilograms (22 pounds).

Wray, John (English naturalist): see Ray, John

wreath, circular garland, usually woven of flowers, leaves, and foliage, that traditionally indicates honour or celebration. The wreath in ancient Egypt was most popular in the form of a chaplet made by sewing flowers to linen

"Many Happy Returns of the Day," detail showing a child on her birthday wearing a wreath and seated in the place of honour designated by the wreath surrounding her chair, oil by William Powell Frith, 1856; in the Harrogate Art Gallery, England

bands and tying them around the head. In ancient Greece, wreaths, usually made of olive, pine, laurel, celery, or palm, were awarded to athletes victorious in the Olympic Games and as prizes to poets and orators. Young lovers in ancient Greece hung wreaths on their lovers' doorways as a sign of affection. In Rome also, laurel crowns were bestowed as a mark of honour, especially on civil officials and returning warriors. During the Italian Renaissance (c. 15th-16th centuries), the custom of wearing wreaths on festive occasions was revived. Later, in Victorian England, a floral wreath sometimes surrounded the chair of the guest of honour at a banquet.

Wreaths have traditionally had a religious significance: the writings of Greek and Roman mythology contain references to wreaths as symbols of honour; during the Middle Ages (c. 5th-15th centuries) they were often fashioned in the shape of the rosary; in 18th-century Mexico, nuns wore wreaths on their heads to signify joy on the day they professed their religious vows; the advent wreath with four candles is a Christian symbol of the four Sundays preceding Christmas.

The displaying of a decorative Christmas wreath, usually of holly leaves and berries, is a custom found in northern Europe, the United States, and Canada. It is also customary to hang a funeral wreath on a family's door to indicate sorrow or to place a wreath of flow-

ers at the grave site, where its circular shape signifies continuing life. See also garland.

wreckfish, also called STONE BASS (Polyprion americanus), large, grayish fish of the family Percichthyidae (order Perciformes), found in the Mediterranean and in both sides of the Atlantic, generally in offshore waters. The wreckfish is deep-bodied, with a large head and jutting lower jaw, and attains a length and weight of about 2 metres (6.5 feet) and 36 kilograms (80 pounds) or more. It is named wreckfish because it often lives near floating lumber and other wreckage to feed on the fishes that, in turn, gather to feed on the small organisms found there.

Wrecsam (Wales): see Wrexham.

Wrede, Karl Philipp, Fürst von (prince of) (b. April 29, 1767, Heidelberg, Palatinate—d. Dec. 12, 1838, Ellingen, Bavaria), Bavarian field marshal, allied with Napoleon until 1813, when he joined the coalition against France.

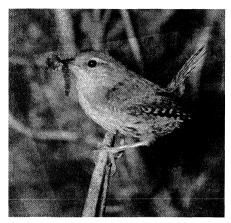

Educated for the career of a civil official in the Palatinate, he raised a volunteer corps that served with the Austrians, beginning in 1799. After the Treaty of Lunéville (1801) he was made lieutenant general in the Bavarian army and opposed the Austrian invasion of 1805. The Bavarians were for several years the active allies of Napoleon, and Wrede was engaged in a number of campaigns, notably in Prussia and the Tirol, even though the French were contemptuous of the Bavarian troops. In 1813 he returned to Bavaria in time to reorganize the Bavarian army when the nation finally resolved to join Napoleon's enemies. In 1814 he led a corps in the invasion of France and supported field marshal Blücher's vigorous policy. Made a prince in 1814, he played no part in subsequent campaigns but entered Bavarian politics as the opponent of Montgelas, whom he succeeded in 1817.

Wrekin, The, also called WREKIN, district, county of Shropshire (formerly Salop), west central England, occupying an area of 112 sq mi (291 sq km) in the east central part of the county. The primarily agricultural district, drained in the south by the River Severn, is a plain covered by glacial drift soils in the north. Historically important iron-manufacturing industrial villages are scattered along the Shropshire Hills in the south.

The place takes its name from The Wrekin, a 1,334 ft (407 m) hill within the industrial villages area in the southern part of the district. The planned, self-contained new town of Telford, established in 1963 to accommodate surplus population from the West Midlands 20 mi (32 km) to the southeast, extends across the industrial villages (including Dawley, Madeley, Ironbridge, Coalport, Coal-brookdale, Wellington, and Oakengates) and encompasses nearly one-third of the district's total area. Historical firsts of the district's iron industry are the smelting of iron with coke (1709), the first iron bridge (cast in Coalbrookdale in 1774 and built at Ironbridge in 1779), and the first iron boat (1787); all are commemorated in a museum of industrial archaeology at Coalbrookdale. Contemporary iron foundry manufactures of the villages include steel furniture, automotive components, and stoves. Cattle and cereals are raised near Newport, a market centre in the northeastern part of The Wrekin. The district seat is at Donnington Wood (within Telford). Pop. (1983 est.) 127,600.

wren, family name TROGLODYTIDAE, any of 59 species of small, chunky, brownish birds (order Passeriformes). The family originated in the Western Hemisphere and only one species, *Troglodytes troglodytes*, which breeds circumpolarly in temperate regions, has spread

to the Old World. This species is called the winter wren in North America; in Eurasia it is known simply as the wren. Typical of the family, it is about 10 centimetres (4 inches) long, dark-barred brown (sexes alike), with short bill slightly downcurved, short rounded wings, and short cocked tail.

Winter, or common, wren (*Troglodytes troglodytes*)
Ronald Thompson—Annan Photo Features

Wrens hunt insects in marshes, rocky wastes, or shrubbery. They reveal their presence by chatter and loud song. Many species nest in holes; some build domed structures in thickets or on ledges. The female lines the nest with soft materials and lays 2 to 10 eggs. There may be three or four broods yearly.

Common everywhere from Canada to Tierra del Fuego is the house wren (T. aedon); this barred gray-brown species is 12 cm long. The largest U.S. species is the 20-cm cactus wren (Campylorhynchus brunneicapillus) of southwestern deserts; it is commoner in Mexico. Tiny wood wrens (Henicorhina) are found in tropical forests and the little marsh wrens (Cistothorus, Telmatodytes) in tropical and temperate wetlands. Exceptional singers include the Carolina wren (Thryothorus ludovicianus) of the eastern U.S.; the canyon wren (Catherpes mexicanus) of arid western North America; and the musician wren (Cyphorhinus arada), often called organbird, of South America. The rock wren (Salpinctes obsoletus), the only U.S. wren with a streaked breast, nests among rocks from the Great Plains westward

A number of unrelated birds of small size or wrenlike appearance are called wrens. For New Zealand wrens, see Xenicidae. For Australian wrens, see emu-wren; fairy wren. In tropical America are gnatwrens (see gnatwren).

Wren, Sir Christopher (b. Oct. 20, 1632, East Knoyle, Wiltshire, Eng.—d. Feb. 25, 1723, London), architect, designer, astronomer, and geometrician, the greatest English architect of his time; Wren designed 53 London churches, including St. Paul's Cathedral, as well as many secular buildings of note. He was a founder of the Royal Society (president, 1680–82), and his scientific work was highly regarded by Newton and Pascal. He was knighted in 1673.

Early academic career and scientific pursuits. Wren, the son of a rector, was the youngest child, the only boy, and delicate in health. Before Christopher was three, his father was appointed dean of Windsor, and the Wren family moved into the precincts of the court. It was among the intellectuals around Charles I that the boy first developed his mathematical interests. The life at Windsor was rudely disturbed by the outbreak of civil war in 1642. The deanery was pillaged and the Dean forced to retire, first to Bristol, then to the country home of a son-in-law, William Holder, in

Oxfordshire. Wren was sent to school at Westminster but spent much time under Holder's tuition, experimenting in astronomy. He translated William Oughtred's work on sundials into Latin and constructed various astronomical and meteorological devices. If the general direction of his studies was toward astronomy, however, there was an important turn toward physiology in 1647 when he met the anatomist Charles Scarburgh. Wren prepared experiments for Scarburgh and made models representing the working of the muscles. One factor that stands out clearly from these early years is Wren's disposition to approach scientific problems by visual means. His diagrams that have survived are beautifully drawn, and his models seem to have been no less elegant. In 1649 Wren went to Wadham College,

Oxford, as a "gentleman commoner," a status that carried certain privileges, and was graduated with a B.A. in 1651. Oxford at that time had passed through a rigorous purgation of its more conservative elements by the parliamentary government. New men had been introduced, some of whom possessed great ability and had a special interest in the "experimental philosophy" so eloquently heralded by the scientific philosopher Sir Francis Bacon.

Receiving his A.M. in 1653, Wren was elected a fellow of All Souls College in the same year and began an active period of research and experiment in Oxford, ending with his appointment as Gresham professor of astronomy in Gresham College, London, in 1657. In the following year, with the death of Oliver Cromwell and the ensuing political turmoil, the college was occupied by the military, and Wren returned to Oxford, where he probably remained during the events that led to the restoration of Charles II in 1660. He returned to Gresham College, where scholarly activity resumed and an intellectual circle proposed a society "for the promotion of Physico-Mathematicall Experimental Learning." After obtaining the patronage of the restored monarchy, this group became the Royal Society, Wren being one of the most active participants and the author of the preamble to its charter.

In 1661 Wren was elected Savilian professor of astronomy at Oxford, and in 1669 he was appointed Surveyor of Works to Charles II. It appears, however, that, having tested himself successfully in so many directions, he still, at 30, had not found the one in which he could find complete satisfaction.

Turn to architecture. One of the reasons why Wren turned to architecture may have been the almost complete absence of serious architectural endeavour in England at the time. The architect Inigo Jones had died 10 vears previously. There were perhaps half a dozen men in England with a reasonable grasp of architectural theory but none with the confidence to bring the art of building within the intellectual range of Royal Society thoughtthat is to say, as an art capable of beneficial scientific inquiry. Here, for Wren, was a whole field, which, given the opportunity, he could dominate; a field in which the intuition of the physicist and the art of a model maker would join to design works of formidable size and intricate construction.

Opportunity came, for in 1662 he was engaged in the design of the Sheldonian Theatre at Oxford. This, the gift of Bishop Sheldon of London to his old university, was to be a theatre in the classical sense, where university ceremonies would be performed. It followed a classical form, inspired by the ancient Theatre of Marcellus in Rome, but was roofed with timber trusses of novel design, thereby combining the classical point of view with the empirical modern, in a way entirely characteristic of a Royal Society mind. At the same time, Sheldon probably was consulting Wren about London's battered, and in parts nearly derelict, St. Paul's Cathedral. So Wren was

drawn, deeply and immediately, into building problems. What he desperately needed at that moment was contact with the European tradition of classicism, and he seized a chance to join an embassy proceeding to Paris.

Wren, detail of an oil painting by Sir Godfrey Kneller, 1711; in the National Portrait Gallery, London

By 1665 architecture at the court of Louis XIV had reached a climax of creativity. The Louvre Palace was approaching completion, and the remodelling of Versailles had begun. Bernini, the great sculptor and architect, was in Paris making designs for the Louvre's east front, and the aged Italian allowed Wren to peruse his drawings. There was considerably more for Wren to see in the French capital, including the domed churches of the Val-de-Grâce and the Sorbonne and a marvellous array of châteaus within easy range of Paris.

At Oxford, in the spring of 1666, he made his first design for a dome for St. Paul's. It was accepted in principle on Aug. 27, 1666. One week later, however, London was on fire. The Great Fire of London reduced two-thirds of the City to a smoking desert and old St. Paul's Cathedral to a ruin. Wren was most likely at Oxford at the time, but the news, so fantastically relevant to his own future, drew him at once to London. Between September 5 and 11 he ascertained the precise area of devastation, worked out a plan for rebuilding the City on new and more regular lines, and submitted it to Charles II. His plan reflected both his familiarity with Versailles and his acquaintance, through engravings, with the Rome of Pope Sixtus V. Others also submitted plans, and the King proclaimed on September 13 that a new plan for London would be adopted. No new plan, however, proceeded any further than the paper on which it was drawn. The problems of survey, compensation, and redistribution were too great. A rebuilding act was passed in 1667. It allowed only for the widening of certain streets, laid down standards of construction for new houses, levied a tax on coal coming into the Port of London, and provided for the rebuilding of a few essential buildings

In 1669 the King's Surveyor of Works died, and Wren was promptly installed. In December he married Faith Coghill and moved into the Surveyor's official residence at Whitehall, where he lived, so far as is known, until his dismissal in 1718.

In 1670 a second rebuilding act was passed, raising the tax on coal and thus providing a source of funds for the rebuilding of St. Paul's Cathedral, churches within the City of London, and a column to commemorate the Great Fire. The city was now being rebuilt at a considerable pace. Wren himself had nothing to do with the general process of rebuilding. He did give occasional advice to the City authorities on their major projects but designed no houses or City companies' halls. He was

the King's Surveyor operating from Whitehall, not an official of the City of London. St. Paul's and the City churches did not fall automatically within the sphere of the royal works, though there was a long tradition of royal responsibility for St. Paul's.

In 1670 the first churches were actually rebuilt. Eighty-seven churches were destroyed in the fire, but some parishes were united so that only 51 new churches were built. Although Wren was personally responsible for all of these, it is not to be supposed that each of them represents his own fully developed design. That there was much delegation is shown by the surviving drawings. Only a few are in Wren's hand. There is no doubt, though, that Wren initiated the design in every case, and in certain churches the impress of his personality is distinct.

Construction of St. Paul's. While the churches were being built, Wren was slowly and painfully evolving designs for St. Paul's. The initial stage is represented by the "First Model" of 1670, now in the trophy room at the cathedral. This plan was accepted, and demolition of the old cathedral began. By 1673, however, the design seemed too modest, and Wren met his critics by producing a design of spectacular grandeur. A wooden model was made of this, and the "Great Model," as it is called, is still preserved at St. Paul's. It failed to satisfy the chapter and clerical opinion generally, however, and Wren was compelled to withdraw from the ideal and compromise with the traditional. In 1674 he produced the rather meagre Classical-Gothic compromise known as the Warrant Design, which was at once accepted by the King, and in 1675 building started.

What happened then is something of a mystery. The cathedral that Wren started to build bears only a slight resemblance to the Warrant Design. A mature and superbly detailed structure began to rise. In 1694 the masonry of the choir was finished and the rest of the fabric well in hand. In 1697 the first service was held in the cathedral. There was still, however, no dome. Building had been in progress for 22 years, and some restless elements in the government seemed to think this too long. As an incentive for more rapid progress, one half of Wren's salary was suspended until the cathedral should be complete. Wren was now 65. In 1711 the cathedral was finished. Wren, 79, petitioned for the withheld moiety of his salary, which was duly paid. The cathedral had been built in 35 years under one architect.

Concurrent projects. Through all those years Wren was not only the architect of St. Paul's and the City churches but also the head of the King's Works and thus the responsible officer for all expenditure on building issuing from the royal Exchequer. He had an able staff to look after routine maintenance, but much business passed through his hands, including the control of building developments in and around Westminster. In about 1674 the University of Cambridge considered building a Senate House for purposes similar to those for which the Sheldonian Theatre had been built. Wren made designs, but the project was abandoned. The master of Trinity College, who had promoted the scheme, was disappointed, but he persuaded his own college to undertake the erection of a new library and to employ Wren to design it. Wren's classicism here is impressive. There is no hint of the Baroque style prevalent in Europe at the time, and the building could well be mistaken for a Neoclassical work of a century later.

At Oxford in 1681 the Dean of Christ Church invited Wren to complete the main gateway of the college. The lower part of this had been built by Cardinal Wolsey and was in a richly ornamental Gothic style. The octagonal tower that Wren imposed illustrates both his respect for Gothic and his reservations about it. His attitude toward Gothic

design was consistent and influenced Gothic construction in England well into the 18th century. In 1682 Charles II founded the Royal Hospital at Chelsea for the reception of veterans superannuated from his standing army. The idea doubtless derived from Louis XIV's Hôtel des Invalides in 1670, but Wren's building, completed in 1685, is very different from its prototype. Charles II died in 1685. In the short reign of his brother, James II, Wren's attention was directed mainly to Whitehall. The new king, a Roman Catholic, required a new chapel; he also ordered a new privy gallery and council chamber and a riverside apartment for the Queen. All these were built by Wren but were destroyed in the Whitehall fire of 1698.

There is not much information about Wren's personal life after 1669. He was knighted in the year of the Great Model, 1673. His first wife died of smallpox in 1675, leaving him with one young son, Christopher (another had died in infancy). His second wife, Jane Fitzwilliam, by whom he had a daughter, Jane, and a son, William, died in 1679. In these years he never wholly abandoned his scientific pursuits. He was still at the centre of the Royal Society group and was president of the society from 1680 to 1682. He was sufficiently active in public affairs to be returned as member of Parliament for Old Windsor in 1680, 1689, and 1690 but did not take his seat.

With the Glorious Revolution of 1688, which drove James II from the throne, Wren found himself chief architect to William of Orange. William III and Mary II proved to be the most active builders of them all. They disliked the palace of Whitehall, and in 1689 Wren was at work on two new palaces: one at Kensington on the outskirts of London and the other at Hampton Court, 15 miles (24 kilometres) away, up the Thames River. Kensington Palace was a piecemeal conversion of an older house, with new courts and galleries added. It is not a totally satisfactory composition, but the south front is a noble piece of brickwork. Hampton Court, on the other hand, started as a project of huge dimensions—nothing less, in fact, than a rebuilding of the entire palace begun by Wolsey. Wren's first designs have survived, and in these he is seen, for the first time, spreading his wings as a palace architect. It was decided to demolish only one half of the old palace, however, and Wren's design was reduced considerably. Nevertheless, he brought to it many innovations and a unique use of English building materials. Hampton Court is a mixture of red and brown brick and Portland stone combined in masterly equilibrium.

Queen Mary died in 1694. The King lost heart, and building at Hampton Court was suspended. Two years before her death the Queen had initiated a scheme for the building of a royal hospital for seamen at Greenwich. For this, Wren made his first plans in 1694. The work began in 1696, but the whole group of buildings was not completed until several years after Wren's death. Greenwich Hospital was Wren's last great work and the only one still in progress after St. Paul's had been completed in 1711.

Queen Anne granted him a house at Hampton Court. He had, besides, a London house in St. James's Street, and it was there that his servant, noticing that he was taking an unusually long nap after dinner one evening, found him dead in his chair. Wren was buried with great ceremony in St. Paul's Cathedral, the tomb being covered by a simply inscribed slab of black marble. Later, his son placed on a nearby wall an inscription that was to become one of the most famous of all monumental inscriptions: Lector, si monumentum requiris, circumspice ("Reader, if you seek a monument, look around").

Assessment. At his death, Wren was 91. He had far outlived the age to which his genius

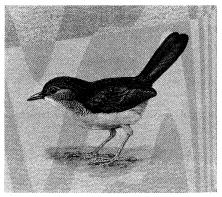

belonged. Even the men he had trained and who owed much to his original and inspiring leadership were no longer young. The Baroque school they had created was already under fire from a new generation that brushed Wren's reputation aside and looked back beyond him to Inigo Jones. Architects of the 18th century could not forget Wren, but they could not forgive those elements in his work that seemed to them unclassical. The churches left the strongest mark on subsequent architecture. In France, where English architecture rarely made much impression, St. Paul's Cathedral could not be easily ignored, and the church of Sainte-Geneviève (now the Panthéon), begun in 1757, rises to a drum and dome similar to St. Paul's. Nobody with a dome to build could ignore Wren's, and there are myriad versions of it, from St. Isaac's (1840-42) in Leningrad to the Capitol at Washington, D.C. (1855-

It is only in the present century that Wren's work has ceased to be a potent and sometimes controversial factor in English architectural design. The last major architect to have been confessedly dependent on him was Sir Edwin Lutyens, who died in 1944. With the virtual elimination of historic influences from contemporary building, the study of Wren became intensified on the academic plane. The Wren Society, founded at the bicentenary of Wren's death in 1923, published 20 volumes of Wren material, the last appearing in 1943.

(J.Sum./Ed.)

BIBLIOGRAPHY. The main biographical source is Christopher Wren (son of the architect), Parentalia; or Memoirs of the Family of the Wrens (1750, partially reprinted as the Life and Works of Sir Christopher Wren, ed. by E.J. Enthoven, 1903). The pioneer biography was J. Elmes, Memoirs of the Life and Works of Sir Christopher Wren, 3 parts (1823), but this contains many errors. Subsequent biographical and critical studies written before the publication of the Wren's Society's work, ed. by A.T. Bolton and H.D. Hendry, 20 vol. (1924-43), are inadequate. Since 1943 many books and articles on Wren have appeared of which the following is a selection: H.M. Colvin, in Biographical Dictionary of English Architects, 1660-1840 (1954; rev. ed. 1978), includes an article on Wren with a complete list of works; E. Sekler, Wren and His Place in European Architecture (1956), excellently illustrated; J.N. Summerson, Sir Christopher Wren (1953, reprinted 1965), which deals more fully than most books with the scientific aspects, and Architecture in Britain, 1530 to 1830, 6th ed. (1977), with bibliographies; and Margaret Whinney, Christopher Wren (English title, Wren, 1971), a well-illustrated survey of his life and works.

wren-babbler, any of about 20 species of small Asian birds belonging to the babbler family Timaliidae (order Passeriformes). They are 10 to 15 centimetres (4 to 6 inches) long,

Streaked long-tailed wren-babbler (Spelaeornis chocolatinus)

Painting by H. Douglas Pratt

rather short-tailed, and have a rather short and straight bill. These features differentiate wren-babblers from the closely related scimitar-babblers. Wren-babblers occur chiefly in southern Asia. An example is the streaked long-tailed wren-babbler (Spelaeornis chocolatinus) of northern Indochina, where it is found in small restless flocks in thickets.

wren-warbler, any of a number of Old World warblers, family Sylviidae (order Passeriformes), that are wrenlike in carrying their tails cocked up. The name also denotes certain birds of the family Maluridae that are found

Gray wren-warbler (Calamonastes simplex) Painting by H. Douglas Pratt

in Australia and New Zealand. Among the sylviid wren-warblers are those of the African genus Calamonastes (sometimes included in Camaroptera), in which the tail is rather long and the underparts are barred. An example is the barred wren-warbler (C. fasciolatus) of south-central Africa, which sews its nest like a tailorbird.

wrench, also called SPANNER, tool, usually operated by hand, for tightening bolts and nuts. Basically, a wrench consists of a stout lever with a notch at one or both ends for gripping the bolt or nut in such a way that it can be twisted by a pull on the wrench at right angles to the axes of the lever and the bolt or nut. Some wrenches have ends with straight-sided slots that fit over the part being tightened; these tools are known as open-end wrenches and are made in various sizes to fit specific bolt and nut sizes.

Box-end wrenches have ends that enclose the nut and have 6, 8, 12, or 16 points inside the head. A wrench with 12 points is used on either a hexagonal or a square nut; the 8- and 16-point wrenches are used on square members. Because the sides of the box are thin, these wrenches are suitable for turning nuts that are hard to reach with an open-end

When a nut or a bolt head is in a recess below the surface of a bolted member, a socket wrench must be used; this is essentially a short pipe with a square or hexagonal hole and either an integral or a removable handle. Modern socket wrenches are made in sets, consisting of a number of short sockets with a square hole in one end that fits a removable handle and 8- or 12-point holes in the other end to fit various bolt and nut sizes. There are several types of handles and extensions, such as a T handle, screwdriver-grip handle, and a ratchet handle (see ratchet).

A useful accessory for a socket-wrench set is a handle equipped with a mechanism that measures the amount of torque, or turning effort, exerted by the wrench on the nut or bolt. One type of torque handle has two arms attached to the head, which carries the socket that fits the bolt or nut to be tightened; one arm carries the torque-indicating scale and remains fixed relative to the head, while the other arm carries the handgrip and is bent, relative to the head and the scale, when a bolt is tightened. A pointer on the bent arm indicates the torque on the scale. The purpose of a torque wrench is to make sure that screws and bolts in bolted assemblies are installed with sufficient tightness to prevent loosening during use, without being overtightened.

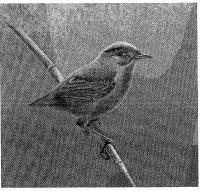

Wrenches with one fixed and one adjustable parallel jaw can be used on various sizes of bolts and nuts within a limited range. On one type the jaws are at right angles to the handle; this wrench, invented by Charles Moncky, is known as a monkey wrench. On another type, originally called a Crescent wrench, the jaws are almost parallel to the handle; on both types the movable jaw is adjusted by turning a worm that engages a rack of teeth cut into the jaw.

The adjustable pipe, or stillson, wrench is used to hold or turn pipes or circular bars. This wrench has serrated jaws, one of which is pivoted on the handle to create a strong gripping action on the work.

Recessed-head screws or set screws commonly have a hexagonally shaped recess and require a special wrench, usually referred to as an allen wrench; it consists of a hexagonal bar of tool steel shaped into the form of an L, either end of which fits into the recess

Power or impact wrenches are used for tightening or loosening nuts quickly. They are essentially small hand-held electric or pneumatic motors that can rotate socket wrenches at high speed. They are equipped with a torquelimiting device that will stop the rotation of the socket wrench when a preset torque is reached. Pneumatic wrenches are commonly used in automobile service stations, where compressed air is available and the sparking of electric motors is a fire hazard.

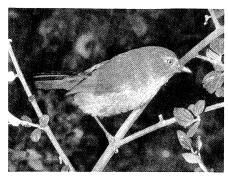

wrenthrush (Zeledonia coronata), bird of the rain forests of Costa Rica and Panama. It resembles the wren in size (11 cm, or 4.5

Wrenthrush (Zeledonia coronata) Drawing by John P. O'Neill

inches), in being brownish and short-tailed, and in its habit of skulking in undergrowth. It is thrushlike in beak and leg structure. The wrenthrush has been classified as a chat-thrush (q.v.; family Turdidae, order Passeriformes) but is now considered to belong nearer the woodwarbler (q.v.) group (Parulidae). Some authors prefer to separate it, provisionally, as the family Zeledoniidae.

wrentit (species Chamaea fasciata), bird of the Pacific coast of North America, believed by some authorities to be the only New World member of the babbler family Timaliidae (order Passeriformes), but often placed in its own family Chamaeidae. A fluffy brown bird about 16 cm (6.5 inches) long with a long tail, the

Wrentit (Chamaea fasciata)

wrentit calls harshly and sings loudly in thick brush, where pairs forage for fruit and insects.

wrestling, sport practiced in various styles by two competitors, involving forcing an opponent to touch the ground with some part of the body other than his feet; forcing him into a certain position, usually supine (on his back); or holding him in that position for a minimum length of time. Wrestling is conducted in various styles with contestants upright or on the ground (or mat).

The three basic types of wrestling contest are the belt-and-jacket, catch-hold, and loose styles, all of which appear to have originated in antiquity. Belt-and-jacket styles of wrestling are those in which the clothing of the wrestlers provides the principal means of taking a grip on the opponent. In many cases this is no more than a special belt worn by both wrestlers, while in others a special belted jacket and special trousers are worn. Catchhold styles require the contestants to take a prescribed hold before the contest begins; often this grip must be maintained throughout the struggle. Loose styles of wrestling, which are used in modern international competition, commence with the wrestlers separated and free to seize any grip that they choose except such as are explicitly forbidden (e.g., taking hold of an opponent's clothing or using a lifethreatening grip, such as a stranglehold).

Wrestling can also be classified in terms of what is required to win. These categories can be graded on an ascending scale of violence as follows: break-stance sports are those that require forcing the opponent to relinquish a certain posture or position; toppling requires that the standing opponent be forced to touch the ground with some part of his body other than his feet; touch-fall wrestling requires that the opponent be forced into a certain position, usually supine, for a brief instant; pin-fall wrestling requires that the opponent be held in such a position for a measurable length of time; and submission wrestling requires the opponent to vocally or visually signal defeat by his own choice.

Early history. No sport is older or more widely distributed than wrestling, often in highly local styles that have persisted to the present day.

Wrestling probably originated in hand-tohand combat, and in particular as a sportive form of combat substituting the submission of a contestant for his death. Works of art from 3000 BC depict belt wrestling in Babylonia and Egypt, and the Sumerian Gilgamesh epic has a description of such wrestling. Loose wrestling in India dates to before 1500 BC. Chinese documents from 700 BC describe loose wrestling, as do Japanese records from the 1st century BC. The belt wrestling practiced locally in the 20th century by the Swiss, Icelanders, Japanese, and Cossacks differs little from that of the Egyptians in 2500 BC.

Wrestling was probably the most popular sport of the ancient Greeks. Young men belonged to palestras, or wrestling schools, as the

focal point of their social life. Illustrations of wrestling on Greek vases and coins are common throughout all periods of ancient Greece, but all that can be told from it is that the style was loose wrestling and that wrestlers, as did all Greek athletes, competed naked. Wrestling was part of the Olympic Games from 776 BC. There were two wrestling championships in these games: a toppling event for the best two of three falls; and the pankration (Latin: pancratium), which combined wrestling and boxing and ended in the submission of one contestant. Upright wrestling was also a part of the pentathlon event in the Olympic Games, a bout being fought to a clear-cut fall of one of the wrestlers. The most famous ancient Greek wrestler was Milon of Croton (q.v.), who won the wrestling championship of the Olympic Games six times. Wrestling was less popular among the Romans than it had been with the Greeks, and with the fall of the Roman Empire, references to wrestling disappeared in Europe until about AD 800.

Middle Ages. When the Islamic rulers of Persia began hiring Turkic mercenaries about AD 800, the soldiers brought with them a style of loose wrestling called koresh, in which grips may be taken on the long, tight leather pants worn by the wrestlers and the bout ends with a touch fall of the loser briefly on his back. Gradually the Turks took over the entire Muslim dominion, and their wrestling style spread. Later Mongolian invasions in the 13th century introduced Mongolian wrestling, which received royal patronage, and wrestling became the national sport of modern Iran.

Sumo (q.v.), a Japanese belt-wrestling style, was a popular spectator sport under imperial patronage (710–1185). Originally a submission spectacle, sumo became highly ritualized as a toppling match with victory coming also from the forcing of an opponent out of a 12-foot (4-metre) circle. By the 17th century sumo wrestling had became a professional sport in Japan. From the samurai martial art jujitsu, judo (q.v.), the other prominent Japanese wrestling style, was derived in the 19th century and became an international sport in the second half of the 20th century.

Wrestling occurred in several styles throughout Europe in the Middle Ages. The first recorded English match was held in London early in the 13th century. In England and Brittany a form of jacket-wrestling commonly called Cornwall and Devon (see Cornish wrestling) survives from at least the 4th or 5th century. Wrestling as a martial skill was taught to the knights of the Holy Roman Empire, and wrestling instruction books appeared in manuscript before the introduction of printing and thereafter in print. Mongolian loose wrestling, introduced to India after the Mongol conquest of 1526, survives in both India and Pakistan in the 20th century. As the modern era began, the English kings Henry VIII and Charles II and the French king Francis I were notable patrons of wrestling.

Modern wrestling. From the 18th century on, a procession of wrestlers or strongmen appeared at fairs, in theatres, and in circuses, challenging all comers, beginning with the Englishman Thomas Topham of London in the 18th century and culminating with Eugene Sandow, the German-born international figure, who continued into the 20th century. Early in the 1800s wrestling became a part of the training regimen of the German turnverein gymnastic movement. In the United States, wrestling was popular as a frontier sport (Abraham Lincoln was a noted local wrestler), bouts usually going until one contestant submitted and with few holds barred.

In the second half of the 19th century, two wrestling styles developed that ultimately dominated international wrestling: Greco-Roman wrestling (q, ν) . and catch-as-catch-can, or freestyle wrestling (q, ν) . Greco-Roman wrestling, popularized first in France, was so

called because it was thought to be the kind of wrestling done by the ancients. Greco-Roman wrestling involves holds made only above the waist and forbids wrapping the legs about an opponent when the wrestlers go down. Originally it was professional and popularized at international expositions held at Paris, but after its inclusion in the revived Olympic Games in 1896, Greco-Roman wrestling events were held at subsequent Olympic Games except in 1900 and 1904.

The second style, catch-as-catch-can, was popularized mainly in Great Britain and the United States, first as a professional sport and after 1888, when it was recognized by the Amateur Athletic Association, as an amateur sport. It was introduced into the Olympic Games of 1904 and contested thereafter except in 1912. Catch-as-catch-can permits holds above the waist and leg grips and is won by a pin-fall.

Freestyle, or international freestyle, wrestling is a synthetic form of catch-as-catch-can that came to be used in the Olympic Games after it first appeared in Antwerp in about 1920. International freestyle is loose wrestling that uses the Greco-Roman touch-fall instead of the pin-fall common to Anglo-American wrestling practice.

Notable professional wrestlers in the late 19th and early 20th centuries included the Russian George Hackenschmidt, originally an amateur Greco-Roman wrestler who turned professional and wrestled catch-as-catch-can from 1900. He was world champion until 1908. The American wrestler Frank Gotch defeated Hackenschmidt in 1908 and again in 1911. After Gotch's retirement in 1913, professional wrestling, which was already fighting a losing battle in popularity with boxing, came to an end as a serious professional sport. Thereafter, though its audience grew, especially in the United States, through radio broadcasts and later even more so through telecasts, it became pure spectacle. The winners, divided deliberately into "heroes" and "villains," were determined by promoters' financial requirements, not skill. Wrestling maneuvers became increasingly extravagant and artificial and lost most of their authenticity.

Amateur wrestling in the 20th century. Though professional wrestling steadily declined in seriousness in the 20th century, significant improvements occurred in amateur wrestling during the same period. Originally there were no weight divisions in wrestling (the only weight in the first Olympic Games was heavyweight), but weight divisions developed in amateur wrestling. (For weight classes, see freestyle wrestling.) Earlier wrestling had been continuous and contested to one or two of three falls, sometimes with a time limit, sometimes without. Amateur wrestling came to be limited to three three-minute rounds effective in all international competition from 1967.

Perhaps most importantly, a system was devised in amateur wrestling to award points, short of a fall, based on one wrestler's being in control of another, so that draw matches were made virtually impossible. This system arose because Greco-Roman wrestling, with its restriction to holds only above the waist and the forbidden use of legs for holds, tended to be dull once the wrestlers were on the mat. In the 1912 Olympic Games two Finnish Greco-Roman wrestlers had a six-hour bout to no decision. In response to this problem, several American colleges introduced the idea of recording the length of time each wrestler was in control of the contest during the course of a bout. (A wrestler is in control when he is applying maneuvers that will eventuate in a pin-fall if his opponent is unable to escape.) In 1928 the National Collegiate Athletic Association adopted the collegiate style of wrestling as a national sport, and this resulted in the formulation of a set of point awards to keep a running score during a bout. The rules and

judging are similar to those used in international freestyle and Greco-Roman bouts and include awarding points based on reversing control, applying a pinning hold, and placing an opponent in danger of pinning. The running point score and the difference in control time are used to decide a victor in no-fall bouts. The collegiate style of wrestling became increasingly popular in the high schools and colleges of the United States after World War II.

In the 20th century a third international style of wrestling, sambo, a kind of jacket wrestling, was created by Anatoly Kharlampiev of the Soviet Union and others after a study of various traditional wrestling styles. Sambo became popular in the Soviet Union, Bulgaria, and Japan and in 1964 was internationally recognized. In sambo a wrestler wins by throwing another cleanly on his back, or if the wrestlers go to the mat, the bout ends with the submission of one opponent. Sambo is much like judo and Mongolian wrestling, and bouts are of three three-minute rounds.

Organization. There was never any attempt to organize professional wrestling in the Western world. Amateur organization was local and national from the early 19th century on, regional competition began late in the 19th century, and in 1911 the International Amateur Wrestling Federation (FILA; Fédération Internationale de Lutte Amateur) was formed (reconstituted in 1920). The FILA regulates international competition, including the Olympic Games, and has held world championships in Greco-Roman wrestling from 1950 and in freestyle from 1951. World championships and Olympic championships in judo, sponsored by the International Judo Federation (formed in 1951), have been held from 1956 and 1964, respectively. For Olympic champions in Greco-Roman and freestyle wrestling and in judo, see Olympic Games. For world champions, see Sporting Record: Judo; Wrestling.

Principles and practice. Under FILA rules, contests of both international freestyle and Greco-Roman styles of touch-fall wrestling are similar, the object being in each case to throw or press the opponent on his back so that his shoulder blades touch the ground simultaneously. This need occur only for an instant, but a continuous roll across the shoulders is not considered a fall.

The competitors meet on a large padded mat and commence by taking holds from a standing position. Their struggle is observed and controlled by officials, one of whom, the referee, stands on the mat with the wrestlers and signals the award of points for maneuvers leading toward a touch-fall. If no fall occurs before the expiration of the match, these points are used to determine a winner. The actual match is continuous except that it is divided into three periods with a brief rest in between. Ties or draws are common in wrestling.

The competitors make use of techniques that are best learned by practice. While standing, they strive to bring each other to the mat with a series of maneuvers known as takedowns, involving lifting, throwing, twisting, tackling, and tripping. When attacked, a wrestler applies counterattacks to convert the situation to his own advantage. If the wrestlers go down on the mat without a touch-fall, they proceed to grapple, seizing each other with various grips and countergrips to work toward a fall. Great strength, though an asset, is not a prerequisite, since most of the maneuvers employ the principle of leverage; quickness and good physical condition are far more essential. The action in wrestling proceeds at a furious pace and involves all muscles of the body. The use of weight classes prevents the pairing of any two

men with more than a few pounds difference between them.

Although the Spartans trained young girls as wrestlers in ancient Greece and an occasional female wrestler, if only legendary, such as Zenobia, has appeared, wrestling by women has occurred in the 20th century only as a novelty spectacle.

Wrexham, Welsh WRECSAM, town, Wrexham Maelor district, Clwyd county, Wales. ham Maelor district, Clwyd county, It is the principal town on the North Wales coalfield, for which it acts as a market centre. An old town, it was granted to Earl Warenne by Edward I. The nearby coalfields began to be exploited in the 19th century, and the town acquired steel, leather, and brewing industries. After World War II its industries diversified and expanded to include engineering, food-processing, and the manufacture of plastics, synthetic fibres, tires, and chemicals. The town is also the administrative seat of Wrexham Maelor district. Wrexham contains the parish church of St. Giles (1472) and, in the churchyard, the tomb of Elihu Yale, the founder of Yale University. The tower of the parish church has been replicated in full scale at Yale University in New Haven, Conn., U.S. Pop. (1981) 40,479.

> Consult the INDEX first

Wrexham Maelor, district, Clwyd county, northeastern Wales. It was created in 1974 and covers an area of 142 square miles (367 square km), sloping westward from the England-Wales frontier lowlands to the peaks of Esclusham and Ruabon. It borders the districts of Alyn and Deeside to the north, Glyndŵr to the west, and the English districts of North Shropshire to the south and Chester to the east. Archaeological excavations in the village of Holt in northeastern Wrexham Maelor have revealed that during the Roman period a tile and pottery factory in the village supplied a Roman legion garrisoned at what is now Chester. According to legend, the village of Bangor Is-coed was the site of the oldest monastery in Britain (c. 180). The monastery was destroyed early in the 7th century by the king of Northumbria in the last great battle of the Saxons, against the Britons of Wales. Hanmer, in southern Wrexham Maelor, is reputed to be the site of the Welsh warrior Owen Glendower's marriage to Margaret, the daughter of Sir David Hanmer.

The region was rapidly industrialized during the 19th century as a result of the exploitation of rich coal deposits, and the town of Wrexham became the principal town of the North Wales coalfield and the main market centre for the region. Pop. (1986 est.) 114,700.

Wright, Sir Almroth Edward (b. Aug. 10, 1861, Middleton Tyas, Yorkshire, Eng.—d. April 30, 1947, Farnham Common, Buckinghamshire), British bacteriologist and immunologist best known for advancing vaccination through the use of autogenous vaccines (prepared from the bacteria harboured by the patient) and through antityphoid immunization with typhoid bacilli killed by heat.

Wright received his medical degree at Trinity College, Dublin, in 1883. He continued his education at Leipzig, Marburg, and Strasbourg and taught at several universities before he was appointed professor of pathology at the Army Medical School, Netley, in 1892. There he developed a vaccine against typhoid that was tested on more than 3,000 soldiers in India and used successfully during the Boer War. As a result Britain was the sole com-

batant to enter World War I with its troops immunized against typhoid fever—a factor that was instrumental in making this the first war in which fewer British soldiers died from infection than from missiles. Wright served in France during the war investigating wound infections.

Wright resigned from the army in 1902 and became a professor of pathology at St. Mary's Hospital in London that same year. Wright conducted research there until his retirement in 1946. Alexander Fleming, who later developed penicillin, was one of his aides. Wright also developed vaccines against enteric tuberculosis and pneumonia and contributed greatly to the study of opsonins, blood enzymes that make bacteria more susceptible to phagocytosis by white cells. He was knighted in 1906.

Wright, Archibald Lee: see Moore, Archie.

Wright, Benjamin (b. Oct. 10, 1770, Wethersfield, Conn. [U.S.]—d. Aug. 24, 1842, New York, N.Y.), American engineer who directed the construction of the Erie Canal. Because he trained so many engineers on that project, Wright has been called the "father of American engineering."

He was trained as a surveyor in his youth, and, after his family moved to the vicinity of Rome, N.Y., in 1789, Wright surveyed about 500,000 acres (200,000 hectares) for farmers in Oneida and Oswego counties. He was elected county judge in 1813 and to several terms in the state legislature.

In 1811 Wright was hired by the New York State Canal Commission to determine a route between Rome (on the Mohawk River) and Waterford (on the Hudson River) for the Erie Canal. Construction began in 1817 and ended in 1825; as chief engineer, Wright himself directed work on the canal's middle division and on the especially difficult eastern division.

Wright resigned from the Erie Canal project in 1827 and served as chief engineer of the Chesapeake and Ohio Canal from 1828 to 1831 and of the St. Lawrence Canal in 1833. He also was consulting engineer to the Welland, Chesapeake and Delaware, Delaware and Hudson, and other canals, and he made land surveys for railroads in New York, Illinois, Virginia, and Cuba.

Wright, Frances, byname FANNY WRIGHT (b. Sept. 6, 1795, Dundee, Scot.—d. Dec. 13, 1852, Cincinnati, Ohio, U.S.), Scottish-born American social reformer whose revolutionary views on religion, education, marriage, birth control, and other matters made her both a popular author and lecturer and a target of vilification.

Daughter of a wealthy Scottish radical, Frances Wright was orphaned at the age of two and reared in London by conservative relatives. She first came to the United States in 1818 and the following year had a play produced and published in New York City.

Wright traveled widely through the United States before returning to England. There, in 1821, she published Views of Society and Manners in America. Shortly afterward, she became friendly with the Marquis de Lafayette and returned to the United States with him in 1824. Through Lafayette she met Thomas Jefferson and James Madison, both of whom approved of her plan to purchase slaves, educate and emancipate them, and then help them to start a colony outside the United States.

In 1825 Wright purchased a tract of land in western Tennessee. She then bought slaves, freed them, and settled them at the community she called Nashoba. The newly emancipated slaves were supposed to work to repay Wright, but the socialist community failed, and in 1828 Wright moved to New Harmony, Indiana.

At New Harmony, she helped Robert Dale

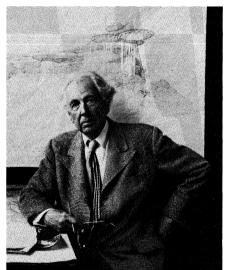

Owen edit the New Harmony Gazette. After a trip to Europe, Wright and Owen settled in 1829 in New York City, where they published a radical newspaper called the Free Enquirer. Wright defied popular convention by taking to the lecture platform to attack slavery, religion, marriage (she wanted moral rather than legal bonds of matrimony), and the unequal treatment of women. Frequently the target of ridicule and riots, she persisted in voicing her opinions and in 1829 published a transcript entitled Course of Popular Lectures.

She and Owen joined the Workingmen's Party and managed to oust its leader, Thomas Skidmore, who had advocated the equal distribution of property. For a time, Wright and Owen won party backing for their program of social reform through free secular education. But later, they, too, were repudiated.

In 1831 Wright married the French physician William P. Darusmont (Guillaume P. D'Arusmont), but the marriage ended in divorce in 1835. She continued writing and lecturing, became an active supporter of Andrew Jackson and the Democratic party, and lived out her final years in Cincinnati, an activist to the end.

Wright, Frank Lloyd, original name FRANK LINCOLN WRIGHT (b. June 8, 1867, Richland Center, Wis., U.S.—d. April 9, 1959, Phoenix, Ariz.), architect and writer, the most abundantly creative genius of American architecture. His "Prairie style" became the basis of 20th-century residential design in the United States.

Early life. Wright's mother, Anna Lloyd-Jones, was a schoolteacher, aged 24, when she married a widower, William C. Wright, an attinerant 41-year-old musician and preacher. The Wrights moved with their infant son,

Frank Lloyd Wright, photograph by Arnold Newman,

© Arnold Newman

Frank Lincoln (he would later change his middle name to Lloyd), to Iowa in 1869 and then lived successively in Rhode Island and Weymouth, Mass., before eventually moving back to Wright's mother's home state of Wisconsin. The young Wright attended the University of Wisconsin at Madison for a few terms in 1885-86 as a special student, but as there was no instruction in architecture, he took engineering courses. In order to supplement the family income, Wright worked for the dean of engineering, but he did not like his situation nor the commonplace architecture around him. He dreamed of Chicago, where great buildings of unprecedented structural ingenuity were rising.

The early Chicago years. Wright left Madison early in 1887 for Chicago, where he found

employment with J.L. Silsbee, doing architectural detailing. Silsbee, a magnificent sketcher, inspired Wright to achieve a mastery of ductile line and telling accent. In time Wright found more rewarding work in the important architectural firm of Dankmar Adler and Louis Sullivan. Wright soon became chief assistant to Sullivan, and in June 1889 he married Catherine Tobin. He worked under Sullivan until 1893, at which time he opened his own architectural practice. His family grew to six children, while his firm grew until as many as 10 assistants were employed.

The first work from the new office, a house for W.H. Winslow, was sensational and skillful enough to attract the attention of the most influential architect in Chicago, Daniel Burnham, who offered to subsidize Wright for several years if Wright would study in Europe to become the principal designer in Burnham's firm. It was a solid compliment, but Wright refused, and this difficult decision strengthened his determination to search for a new and appropriate Midwestern architecture.

Other young architects were searching in the same way; this trend became known as the "Prairie school" of architecture. By 1900 Prairie architecture was mature, and Frank Lloyd Wright, 33 years old and mainly selftaught, was its chief practitioner. The Prairie school was soon widely recognized for its radical approach to building modern homes. Utilizing mass-produced materials and equipment, mostly developed for commercial buildings, the Prairie architects discarded elaborate compartmentalization and detailing for bold, plain walls, roomy family living areas, and perimeter heating below broad glazed areas. Comfort, convenience, and spaciousness were economically achieved. Wright alone built about 50 Prairie houses from 1900 to 1910. The typical Wright-designed residence from this period displayed a wide, low roof over continuous window bands that turned corners, defying the conventional boxlike structure of most houses, and the house's main rooms flowed together in an uninterrupted space.

During this period Wright lectured repeatedly; his most famous talk, "The Art and Craft of the Machine," was first printed in 1901. His works were featured in local exhibitions from 1894 through 1902. In that year he built the home of the W.W. Willitses, the first masterwork of the Prairie school. In 1905 he traveled to Japan.

By now Wright's practice encompassed apartment houses, group dwellings, and recreation centres. Most remarkable were his works for business and church. The administrative block for the Larkin Company, a mail order firm in Buffalo, N.Y., was erected in 1904 (demolished in 1950). Abutting the railways, it was sealed and fireproof, with filtered, conditioned, mechanical ventilation; metal desks, chairs, and files; ample sound-absorbent surfaces; and excellently balanced light, both natural and artificial. Two years later the Unitarian church of Oak Park, Unity Temple, was under way; in 1971 it was registered as a national historic landmark. Built on a minimal budget, the small house of worship and attached social centre achieved timeless monumentality. The congregation still meets in the building's intimate, top-lit cube of space, which is turned inward, away from city noises. The Unity Temple improved on the Larkin Building in the consistency of its structure (it was built of concrete, with massive walls and reinforced roof) and in the ingenious interior ornament that emphasized space while subordinating mass. Unlike many contemporary architects, Wright took advantage of ornament to define scale and accentuation.

Europe and Japan. By 1909 Wright's estrangement from his wife and his relationship with Mamah Cheney, the wife of one of his former clients, were damaging his ability to obtain architectural commissions. In that year

Wright began work on his own house near Spring Green, Wis., which he named Taliesin, before he left for Europe that September. Abroad, Wright set to work on two books, both first published in Germany, which became famous; a grand double portfolio of his drawings (Ausgeführte Bauten und Entwürfe, 1910) and a smaller but full photographic record of his buildings (Ausgeführte Bauten, 1911). With a draftsman, Taylor Willey, and his eldest son, Lloyd Wright, the architect produced the numerous beautiful drawings published in these portfolios by reworking renderings brought from Chicago, Oak Park, and Wisconsin.

By 1911 Wright and Cheney, still unmarried since Wright could not get a divorce, were living at Taliesin. Wright's career suffered from unfavourable publicity generated by his relationship with Cheney, but he found a few loyal clients like the Avery Coonleys, whose suburban estate, west of Chicago, the grand masterwork of the Prairie style, he had designed in 1908. In 1912 Wright designed his first skyscraper, a slender concrete slab, prophetic but unbuilt.

At this time the Japanese began to consider Wright as architect for a new Tokyo hotel where visitors could be officially entertained and housed in Western style. Thus, early in 1913 he and Cheney spent some months in Japan. The following year Wright was occupied in Chicago with the rushed construction of Midway Gardens, a complex planned to include open-air dining, other restaurants, and clubs. Symmetrical in plan, this building was sparklingly decorated with abstract and nearabstract art and ornament. Its initial success was cut short by Prohibition, however, and it was later demolished. Just before Midway Gardens opened, Wright was dealt a crushing blow; Cheney and her children, who were visiting her at Taliesin, and four others were killed by an insane houseman, and the living quarters of the house were devastated by fire. Stunned by the tragedy, Wright began to rebuild his home and was soon joined by a sculptress named Miriam Noel who became his mistress, although Wright was still married to Catherine Wright. In 1916 they went to Japan, which was to be their home for five

The Imperial Hotel (1915–22, dismantled 1967) in Tokyo was one of Wright's most significant works in its lavish comfort, splendid spaces, and unprecedented construction. Because of its revolutionary, floating cantilever construction, it was one of the only large buildings that safely withstood the devastating earthquake which struck Tokyo in 1923. No one still doubted Wright's complete mastery of his art, but he continued to experience difficulty in acquiring major commissions because of his egocentric and unconventional behaviour and the scandals that surrounded his private life.

The '20s and '30s. Wright's transpacific journeys took him to California, where he met a wealthy, demanding client, Aline Barnsdall, who, around 1920, built to Wright's designs a complex of houses and studios amid gardens on an estate called Olive Hill; these now serve as the Municipal Art Gallery in Hollywood. In 1923 and 1924 Wright built four houses in California, using textured concrete blocks with a fresh sense of form.

Late in 1922 Catherine divorced Wright at last. His relationship with Miriam Noel ended, and in 1925 Taliesin again burned, struck by lightning, and again Wright rebuilt it. That same year a Dutch publication, Wendingen, presented Wright's newer work fully and handsomely, with praise from Europeans. In 1924 Wright had met Olgivanna Hinzenberg; soon she came to live with Wright permanently, and they married in 1928. Meanwhile, Wright's finances had fallen into a catastrophic state; in 1926–27 he sold a great collec-

tion of Japanese prints but could not rescue Taliesin from the bank that seized it. Amid these debacles, Wright began to write An Autobiography, as well as a series of articles on architecture, which appeared in 1927 and 1928. Finally, some of Wright's admirers set up Wright, Incorporated—a firm that owned his talents, his properties, and his debts—that effectively shielded him. In 1929 Wright designed a tower of studios cantilevered from a concrete core, to be built in New York City; in various permutations it appeared as one of his best concepts. (In 1956 the St. Mark's Tower project was finally realized as the Price Tower in Bartlesville, Okla.)

The stock market crash of 1929 ended all architectural activity in the United States, and Wright spent the next years lecturing at Princeton, Chicago, and New York City. Meanwhile an exhibition of his architecture toured Europe and the United States. In 1932 An Autobiography and the first of Wright's books on urban problems, *The Disappearing City*, were published. In the same year the Wrights opened the Taliesin Fellowship, a training program for architects and related artists who lived in and operated Taliesin, its buildings, and further school structures as they built or remodeled them. From 20 to 60 apprentices worked with Wright each year; a few remained for decades, constituting his main office staff. In the winter Wright and his entourage packed up and drove to Arizona, where Taliesin West was soon to be built. At this time Wright developed an effective system for constructing low-cost homes and, over the years, many were built. Unlike the Prairie houses these "Usonians" were flat roofed, usually of one floor placed on a heated concrete foundation mat; among them were some of Wright's best works—e.g., the Jacobs house (1937) in Westmorland, Wis., near Madison, and the Winckler-Goetsch house (1939) at Okemos, Mich.

International success and acclaim. Wright gradually reemerged as a leading architect; when the national economy improved, two commissions came to him that he utilized magnificently. The first was for a weekend retreat near Pittsburgh in the Allegheny mountains. This residence, "Fallingwater," was cantilevered over a waterfall with a simple daring that evoked wide publicity from 1936 to the present. Probably Wright's most-admired work, it was later given to the state and was opened to visitors. The second important commission was the administrative centre for S.C. Johnson, wax manufacturers, at Racine, Wis. Here Wright combined a closed, top-lit space with recurving forms and novel, tubular mushroom columns. The resulting airy enclosure is one of the most humane workrooms in modern architecture. Each of these buildings showed Wright to be as innovative as younger designers and a master of unique expressive

Thereafter commissions flowed to Wright for every kind of building and from many parts of the world. His designs for the campus and buildings of Florida Southern College at Lakeland (1940-49) were begun, and the V.C. Morris Shop (1948) in San Francisco was executed. Among Wright's many late designs, executed and unexecuted, two major works stand out: the Guggenheim Museum in New York City and the Marin County government centre near San Francisco. The Guggenheim Museum was commissioned as early as 1943 to house a permanent collection of abstract art. Construction began in 1956, and the museum opened in 1959 after Wright's death. The Guggenheim, which has no separate floor levels but instead uses a spiral ramp, realized Wright's ideal of a continuous space and is one of his most significant buildings. The

Marin County complex is Wright's only executed work for government, and the only one that integrates architecture, highway, and automobile, a concept that had long preoccupied Wright.

A prolific author, Wright wrote An Autobiography (published 1932, revised 1943), An Organic Architecture (1939), An American Architecture (1955), and A Testament (1957).

Wright was a great originator and a highly productive architect. He designed some 800 buildings, of which 380 were actually built and about 280 are still standing. Throughout his career he retained the use of ornamental detail, earthy colours, and rich textural effects. His sensitive use of materials helped to control and perfect his dynamic expression of space, which opened a new era in American architecture. He became famous as the creator and expounder of "organic architecture," his phrase indicating buildings that harmonize both with their inhabitants and with their environment. The boldness and fertility of his invention and his command of space are probably his greatest achievements.

BIBLIOGRAPHY. A reliable biography is Robert C. Twombly, Frank Lloyd Wright: His Life and His Architecture (1979). Robert L. Sweeney, Frank Lloyd Wright: An Annotated Bibliography (1978), contains more than 2,000 books, periodical articles, reviews, catalogs, and other items by and about Wright and covers the years 1886-1977. A classic study of Wright's work is Henry-Russell Hitchcock, In the Nature of Materials, 1887-1941: The Buildings of Frank Lloyd Wright (1942, reprinted 1975). Other valuable works include Grant Carpenter Manson, Frank Lloyd Wright to 1910: The First Golden Age (1958, reissued 1979); Vincent Scully, Frank Lloyd Wright (1960); Arthur Drexler, The Drawings of Frank Lloyd Wright (1962); Olgivanna Lloyd Wright, Frank Lloyd Wright: His Life, His Work, His Words (1966), containing a full but occasionally inaccurate listing of Wright's buildings after 1941; and Thomas A. Heinz, Frank Lloyd Wright (1982).

Wright, James C(laude), Jr. (b. Dec. 22, 1922, Fort Worth, Texas, U.S.), American politician and legislator who became speaker of the U.S. House of Representatives in 1986 but had to resign from office in 1989 owing to charges of financial improprieties.

Wright was educated at Weatherford College and the University of Texas before serving in the Army Air Force during World War II. After the war he entered politics as a Democrat and was elected to the Texas House of Representatives in 1946. He was defeated for reelection after serving one term and subsequently served as mayor of Weatherford, Texas, from 1950 to 1954. He then successfully sought election to the U.S. House of Representatives in 1954 and was reelected consecutively 16 times after that. He made an unsuccessful run for the Senate in 1961.

In 1976 Wright was elected majority leader by his fellow Democrats in the House of Representatives, and in 1986 he was elected speaker to succeed Thomas P. O'Neill. Wright was an aggressive and assertive leader of the House, but in June 1988 the House ethics committee began to investigate allegations of financial improprieties on his part. In April 1989 the committee unanimously accused Wright of five counts comprising 69 separate violations of the House's ethics rules. Wright was accused of having received unusually high fees that in essence violated the House's limits on outside earned income, and with having received discounted housing and other gifts that he had failed to list on his financial disclosure statements. Wright announced on May 31, 1989, that he would resign the speakership and his seat in Congress, and did so a week later when Thomas Foley was elected to succeed him as speaker of the House. Wright was the first speaker of the House to resign his post in midterm because of scandal.

Wright, Joseph, byname WRIGHT OF DERBY (b. Sept. 3, 1734, Derby, Derbyshire, Eng.—d. Aug. 29, 1797, Derby), English painter who was a pioneer in the artistic treatment of industrial subjects. He was also the best European painter of artificial light of his day.

Wright was trained as a portrait painter by Thomas Hudson in the 1750s. Wright's home was Derby, one of the great centres of the birth of the Industrial Revolution, and his depictions of scenes lit by moonlight or candlelight combine the realism of the new machinery with the romanticism involved in its application to industry and science. His pictures of technological subjects, partly inspired by the Dutch followers of Caravaggio, date from 1763 to 1773; the most famous are "The Air Pump" (1768) and "The Orrery" (c. 1763–65). Wright was also noted for his portraits of English Midlands industrialists and intellectuals.

Wright, Judith (Arundell) (b. May 31, 1915, Armidale, N.S.W., Australia), Australian poet whose verse, thoroughly modern in idiom, is noted for skillful technique.

After completing her education at the University of Sydney, Wright worked in an advertising agency and for the University of Sydney as a secretary, in Brisbane as a clerk, and later as a statistician. From 1949 she lectured parttime at various Australian universities, becoming honours tutor in English, University of Queensland, Brisbane, from 1967, and was active as a literary editor.

The first of her several volumes of poetry, The Moving Image (1946), was followed by Woman to Man (1949), The Gateway (1953), The Two Fires (1955), and City Sunrise (1964). A volume of short stories, The Nature of Love, was published in 1966, and her Collected Poems 1942–1970 in 1971. She also wrote several children's books, a biography of the Australian poet Charles Harpur, and a book on the Australian short-story writer Henry Lawson.

Wright, Mickey, byname of MARY KATHERYN WRIGHT (b. Feb. 14, 1935, San Diego, Calif., U.S.), American golfer who won a record number of Ladies Professional Golf Association (LPGA) tournaments (82), including an unmatched 13 in one season (1963).

Wright began playing golf at the age of 11 and won the U.S. Junior Girls' title in 1952. Turning professional in 1954, she became noted for her long drives and superior iron play. The first woman ever to capture both the U.S. Golf Association title and the LPGA championships in the same year (1958), she repeated her feat in 1961. Troubled by an arthritic wrist, she retired from the LPGA tour in 1965 but returned in 1973, crowning her comeback by sinking a 25-foot birdie putt on the final hole to win the Colgate–Dinah Shore Winner's Circle Tournament.

In 1963 and 1964 the Associated Press named her Woman Athlete of the Year, and by the late 1970s she was considered one of the greatest female athletes of the 20th century. She was president of the LPGA in 1964 and author of *Play Golf the Wright Way* (1962). She was inducted into the World Golf Hall of Fame in 1976.

Wright, Orville and Wilbur (respectively b. Aug. 19, 1871, Dayton, Ohio, U.S.—d. Jan. 30, 1948, Dayton; b. April 16, 1867, near Millville, Ind.—d. May 30, 1912, Dayton), American brothers, inventors and aviation pioneers who achieved the first powered, sustained, and controlled airplane flight (1903) and built and flew the first fully practical airplane (1905).

flew the first fully practical airplane (1905). Early years. The sons of a bishop of the Evangelical United Brethren Church, the Wright brothers displayed from their earliest years unusual mechanical aptitude and talent. Mostly self-taught, they began designing and building printing machinery, then went into the business of selling bicycles and later of designing and manufacturing them. It was

Orville Wright Brown Brothers

the income from this business that supported them during the early years of their aeronautical experiments.

The Wrights arrived on the aviation scene at the most opportune moment. Aerodynamics, structural engineering, engine design, and fuel technology had all reached a stage of development at which they could be welded together to produce a practical flying machine. The Wrights, hardworking, pertinacious, and gifted with outstanding mechanical talent, were ideally suited to achieve the final conquest of the

Wilbur first became interested in the idea of mechanical flight after reading of Otto Lilienthal's successful gliding experiments in Germany and then of his crash and death in 1896. But it was not until 1899, after observing how buzzards keep their balance in the air, that Wilbur realized that in order to fly successfully an airplane must operate on three axes. Like a bird, a flying machine must be able to bank to one side or the other, to climb or descend, and to steer to right or left and, if necessary, perform two or all of these operations simultaneously.

To the Wrights, flight control was of prime importance. They had observed that buzzards

Wilbur Wright Brown Brothers

controlled their movement in roll by twisting their wings. So, when the brothers built their first machine in 1899—a biplane kite—they fitted it with wings that could be mechanically twisted. One side could thus produce more lift and the other simultaneously less, which enabled the craft to bank for a turn or to roll back to a level position if disturbed by the wind. Apart from being the first to make a powered airplane fly, the Wrights' achievement of three-axis control was their most significant contribution to aerodynamics and practical flying.

Before attempting powered flight, they decided to master gliding flight and built three biplane gliders—in 1900, 1901, and 1902. The first of these gliders was flown at Kitty Hawk, N.C., and the others at the Kill Devil Hills, five miles to the south. They developed the last glider to a state of full controllability: it had a forward elevator for up-and-down control, a rear rudder for turning right or left, and "wing-warping," or helically twisting for control in roll. Into the building and testing of these gliders went an immense amount of theoretical and experimental work, including testing in a wind tunnel, in Dayton, which the Wrights carried out in the course of their researches.

Before they could build and fly their first powered plane, two formidable difficulties had to be overcome. First, they had to design and construct efficient propellers, which did not exist at the time; and second, they had to design and build a suitable engine because the automobile engines of the day were far too heavy

First powered flight. They completed their first powered machine, "Flyer I" (now popularly called the "Kitty Hawk"), in 1903 and made history's first powered, sustained, and controlled airplane flights—from level ground without any assistance at takeoff—at the Kill Devil Hills on the morning of Dec. 17, 1903. The first lasted 12 seconds; the last, 59 seconds, covered 852 feet of ground, but, because of a head wind, the second flight actually covered more than one-half mile of air distance.

An improved "Flyer II," equipped with a new engine, was flown at Huffman Prairie near Dayton in 1904. In 1905 came "Flyer III," the world's first practical airplane, which could turn, bank, circle, fly figure eights with ease, and stay airborne for more than half an hour.

Because of exasperating and fruitless dealings with the United States Army—which refused to believe that the Wrights had a successful airplane to sell—and also in fear of industrial espionage, the brothers refused to fly again until they were offered a fair financial arrangement, either by the government or a private company. As a result, they never once left the ground between Oct. 16, 1905, and May 6, 1908, but in that period they built several new aircraft and engines.

News and illustrations of the Wright gliders directly precipitated the birth of modern aviation in Europe. At last, in 1908, the brothers were able to conclude an agreement in Europe for the production of Wright airplanes under license; in the United States, the army agreed to take a Wright machine if it passed trials to be conducted by Orville.

After a few secret practice flights in the United States, Wilbur made the first public flight of the new machines at a racecourse near Le Mans, Fr., on Aug. 8, 1908; he continued his exhibition flights at Auvours nearby, to the end of 1908. In those five months Wilbur made more than 100 flights, was airborne for more than 25 hours, took passengers up on some 60 occasions, and made 7 flights exceeding an hour's duration, ending with a record flight of 2 hours and 20 minutes.

In the United States, meanwhile, Orville began making equally spectacular flights in September at Ft. Myer, Virginia; but on September 17 his machine suffered mechanical damage in flight and crashed, injuring Orville and killing his passenger, Lieut. T.E. Selfridge.

Assessment. Between them, the brothers had revolutionized the primitive practice of European aviation of the time and shown the world how to control an airplane in the air. In 1909 the brothers consolidated their triumphs when Wilbur again made exhibition flights in France and Italy. Orville returned to Ft. Myer with his newly built machine and easily won the U.S. Army contract with this,

the world's first military airplane. He went on to Germany and demonstrated brilliantly with another Wright machine.

The Wrights continued to dominate world aviation until the end of 1909, building their machines in both Europe and the United States. Although improved Wright machines continued to appear and make excellent flights in 1910 and 1911, European competition eventually surpassed them.

Wilbur died of typhoid in 1912, but Orville lived on to make valuable contributions to aeronautics until 1948. Both the brothers died bachelors; aviation had been their only passion. Their father's obituary tribute to Wilbur may fittingly be applied to both of these remarkable men:

A short life, full of consequences. An unfailing intellect, imperturbable temper, great self-reliance and as great modesty. Seeing the right clearly, pursuing it steadily, he lived and died.

Kelly, The Wright Brothers (1943), a biography by a friend of the Wrights authorized by Orville in his old age, strong on the personal side but weak on technical history; C.H. Gibbs-Smith, The Wright Brothers: A Brief Account of Their Work, 1899–1911 (1963), an authoritative booklet with more than 50 illustrations; A.G. Renstrom (comp.), Wilbur and Orville Wright: A Bibliography (1968), a full-length bibliography of books and articles on the Wrights to 1968; an invaluable tool for further study.

Wright, Patience, née LOVELL (b. 1725, Bordentown, New Jersey—d. March 23, 1786, London), modeller in wax, well known originally in the British American colonies and later a person of some celebrity in England.

She was born of Quaker parents and was married in 1748 to Joseph Wright. Her portraits in wax became famous, and after she was widowed (1769) she moved in about 1772 to London with her three children. There she opened exhibition rooms, where she showed life-size wax figures and busts of notable contemporary persons as well as persons from history. During the Revolutionary War she acted as a spy for Benjamin Franklin, corresponding regularly with him.

Her only son, Joseph Wright (1756–93), was a portrait painter and also a modeller in wax and a diemaker. The first official coins and medals of the United States were probably his work, and he painted portraits of many of the Founding Fathers, including George Washington.

Wright, (Philip) Quincy (b. Dec. 28, 1890, Medford, Mass., U.S.—d. Oct. 17, 1970, Charlottesville, Va.), U.S. political scientist and authority on international law known for classic studies of war and international relations.

Wright received his B.A. from Lombard College (Galesburg, Ill.) in 1912 and his Ph.D. from the University of Illinois in 1915. He became a research fellow at the University of Pennsylvania and then taught at Harvard University in 1916–19 and at the University of Minnesota in 1919–23. In 1923 he became professor of political science and in 1931 professor of international law at the University of Chicago. Wright served as an adviser to the U.S. Department of State in 1943–45, to UNESCO, and to the International Military Tribunal, sitting in Nürnberg in 1945. Retired in 1956, he subsequently engaged in research and teaching at a number of U.S. and foreign institutions.

In 1942 Wright published A Study of War in two volumes, in which he examined the institution of war, historically, legally, and culturally, and concluded that war could best be eliminated through a world organization that had power adequate to its responsibilities. Wright's Study of International Relations

(1955) presented arguments for a separate discipline of international relations. He was a supporter of the League of Nations in the 1920s and 1930s. In 1963 he attacked as illegal the "quarantine" of Cuba in October 1962. He also opposed U.S. involvement in Southeast Asia.

Wright's other works include The Enforcement of International Law Through Municipal Law in the United States (1916), The Control of American Foreign Relations (1922), Mandates Under the League of Nations (1930), The Causes of War and the Conditions of Peace (1935), Problems of Stability and Progress in International Relations (1954), and The Role of International Law in the Prevention of War (1961).

Wright, Richard (b. Sept. 4, 1908, near Natchez, Miss., U.S.—d. Nov. 28, 1960, Paris), novelist and short-story writer, who was among the first U.S. black writers to protest white treatment of blacks, notably in his novel

Richard Wright

By courtesy of Harper and Row Publishers, Inc.

Native Son (1940). It inaugurated the tradition of protest explored by other black writers after World War II.

Wright's grandparents had been slaves. His father left home when he was five, and the boy, who grew up in poverty, was often shifted from one relative to another. He worked at a number of jobs before joining the northward migration, first to Memphis, Tenn., and then to Chicago. There, after working in unskilled jobs, he got an opportunity to write through the Federal Writers' Project. In 1932 he became a member of the Communist Party and was executive secretary of the local John Reed Club of leftist writers and artists of Chicago. In 1937 he went to New York City, where he became Harlem editor of the Communist Daily Worker and, later, vice president of the League for American Writers.

He first came to the general public's attention with a volume of novellas, *Uncle Tom's Children* (1938), based on the question: How may a black man live in a country that denies his humanity? In each story but one the hero's quest ends in death.

His fictional scene shifted to Chicago in *Native Son*. Its hero, Bigger Thomas, accidentally kills a white girl and his hitherto meaningless awareness of antagonism from a white world becomes intelligible. The book was a best-seller and was staged successfully as a play on Broadway (1941) by Orson Welles. Wright himself played Bigger Thomas in a motion-picture version made in Argentina in 1951.

Early versions of Wright's best novella, "The Man Who Lived Underground" (collected in its final version in a posthumous volume of stories, Eight Men, 1961), appeared in 1942 and 1944. The absurd, isolated subterranean life of its black hero foreshadows the Existentialism that guided Wright's later works.

In 1944 he left the Communist Party because of political and personal differences. The autobiographical *Black Boy*, a moving account of his childhood and young manhood, appeared

in 1945. He settled in Paris as a permanent expatriate. The Outsider (1953), acclaimed as the first American Existential novel, warned that the black man had awakened in a disintegrating society not ready to include him. Three later novels were not well-received. Among his polemical writings of that period was White Man, Listen! (1957), which was originally a series of lectures given in Europe. The autobiographical American Hunger was published posthumously in 1977.

Wright, Sewall (b. Dec. 21, 1889, Melrose, Mass., U.S.—d. March 3, 1988, Madison, Wis.), American geneticist, one of the founders

of population genetics.

Wright was educated at Lombard College, Galesburg, Ill., and at the University of Illinois, Urbana, and after earning his doctorate in zoology at Harvard University (Sc.D., 1915), he worked as a senior animal husbandman for the U.S. Department of Agriculture (1915–25). He was a professor at the University of Chicago (1926–54) and then at the University of Wisconsin, Madison (1955–60). He continued to publish scientific papers after his retirement.

Sewall Wright, 1965
By courtesy of the University of Wisconsin, Madison

Wright's earliest studies included investigation of the effects of inbreeding and crossbreeding among guinea pigs, animals that he later used in studying the effects of gene action on coat and eye colour, among other inherited characters. Along with the British scientists J.B.S. Haldane and R.A. Fisher, Wright was one of the scientists who developed a mathematical basis for evolutionary theory, using statistical techniques toward this end. He also originated a theory that could guide the use of inbreeding and crossbreeding in the improvement of livestock. Wright is perhaps bestknown for his concept of genetic drift, called the Sewall Wright effect, which says that when small populations of a species are isolated, out of pure chance the few individuals who carry certain relatively rare genes may fail to transmit them. The genes may therefore disappear and their loss may lead to the emergence of new species, although natural selection has played no part in the process.

Wright, Warren (b. Sept. 25, 1875, Springfield, Ohio, U.S.—d. Dec. 28, 1950, Miami Beach), American financier, owner and breeder of Thoroughbred racehorses, and pro-

prietor of Calumet Farm.

Wright was educated in public schools and in business college and, starting in 1890, worked for more than 25 years in the firm that his father had founded, the Calumet Baking Powder Company in Chicago. He succeeded to its presidency in 1899. In 1928 the baking powder company was profitably sold to General Foods Corporation, and in 1931 Warren Wright inherited the bulk of his father's estate of about \$30,000,000.

The elder Wright had bought Calumet Farm, near Lexington, Ky., in 1924, and upon his father's death Warren Wright inherited that stud

farm and racing stable. He eventually made Calumet Farm one of the premier American stud farms. From 1941, Calumet Farm consistently produced outstanding horses, including eight winners of the Kentucky Derby. Of these horses, two gained the U.S. Triple Crown by winning the Preakness and the Belmont Stakes as well: Whirlaway in 1941, trained by Ben Jones, and Citation in 1948, trained by Jones's son Jimmy Jones.

Wright, Wilbur: see Wright, Orville and Wilbur.

Wrigley, William, Jr. (b. Sept. 30, 1861, Philadelphia—d. Jan. 26, 1932, Phoenix, Ariz., U.S.), American manufacturer whose company became the largest producer and distributor of chewing gum in the world.

Wrigley went to work as a traveling soap salesman for his father's company at age 13. In 1891 he went to Chicago as a soap distributor and there started offering baking powder as a premium with each box of soap. In 1892 he began selling baking powder as a sideline, offering chewing gum as a premium. The chewing gum proved more popular than the baking powder, so he dropped both soap and baking powder to sell only chewing gum. He also gave dealers premiums, such as clocks, coffee grinders, or fishing tackle, which varied with the size of the order.

Wrigley's Spearmint chewing gum, which he introduced in 1893. By 1908, sales of Wrigley's Spearmint were more than \$1,000,000 a year. In 1911 Wrigley took over Zeno Manufacturing, the company that made his chewing gum, and established the Wm. Wrigley Jr. Company. His company became one of the biggest advertisers in the United States. By 1925, when Wrigley turned the company presidency over to his son, Philip, and became chairman of the board, the Wrigley company had factories in the United States, Canada, and Australia.

Wrigley was the developer of Santa Catalina Island, off the coast of southern California. From 1921 until 1951 (except during the World War II years), a National League baseball club, the Chicago Cubs, a Wrigley family interest, spent its spring-training sessions on Catalina. Wrigley's Chicago headquarters, the Wrigley Building, became a noted architectural landmark of that city.

Wriothesley, Thomas: see Southampton, Thomas Wriothesley, 1st earl of.

wrist, also called CARPUS, complex joint between the five metacarpal bones of the hand and the radius and ulna bones of the forearm. The wrist is composed of eight or nine small, short bones (carpal bones) roughly arranged in two rows. The wrist is also made up of several component joints: the distal radioulnar joint, which acts as a pivot for the forearm bones; the radiocarpal joint, between the radius and the first row of carpal bones, involved in wrist flexion and extension; the midcarpal joint, between two of the rows of carpal bones; and various intercarpal joints, between adjacent carpal bones within the rows. The numerous bones and their complex articulations give the wrist its flexibility and wide range of motion.

A disk of fibrous cartilage between the radius and the ulna separates the radioulnar joint from the rest of the wrist, which is contained within a capsule of cartilage, synovial membrane, and ligaments. Radiocarpal ligaments carry the hand along with the forearm in rotational movements, and intercarpal ligaments strengthen the small wristbones.

The large number of bones in the wrist force blood vessels and nerves in the area to pass through a narrow opening, the carpal tunnel. In carpal tunnel syndrome, a narrowing of this opening painfully compresses the nerves during wrist flexion. Other common wrist problems include bone fractures, dislocations of the various component joints, and inflamed tendons and ligaments from overuse.

writ, in common law, order issued by a court in the name of a sovereign authority requiring the performance of a specific act. The most common modern writs are those, such as the summons, used to initiate an action. Other writs may be used to enforce the judgment of a court (attachment, delivery) or to require a lower court to furnish certain records (error) or perform a certain act (mandamus).

Writs can be traced back to the Anglo-Saxon kings, who used them primarily to convey grants of land, although they also made some effort to employ them for judicial purposes. Three main types of writ were in use by the early 13th century: charters, normally for grants of land and liberties in perpetuity; letters patent, for grants of limited duration and for commissions to royal officials; and letters close, to convey information or orders to a single person or to a definite group of people (differing from the other two types of writ in that the king's seal authenticated and closed the document).

Writs began to be used in judicial matters by the Norman kings, who developed set formulas for them. The most important were original writs, for beginning actions; in many instances they served much the same purpose as the modern summons. They were issued to the defendant, requiring that he make amends or else appear in court. Other important writs were those of assistance, for the transference of property, and entry, for the recovery of land from which one had been wrongfully dispossessed.

The European civil-law system never developed a series of clearly defined writs, although it found other means to accomplish the same ends.

writ of ——: see under substantive word (e.g., mandamus, writ of).

writing, system of human visual communication using signs or symbols that are associated by convention with units of language—meanings or sounds—and are recorded on the surfaces of such substances as paper, stone, clay, or wood.

A brief treatment of writing follows. For full treatment, see MACROPAEDIA: Writing.

The precursor of writing was the use of pictorial signs, graphic representations of objects carrying some conventional meaning. Pictorial, or pictographic, signs differ from pictures in that they contain only what is important for communication and lack aesthetic embellishment. The pictorial sign is, in effect, a symbol used to depict a person or an object for the purpose of identifying it individually. A correspondence is established and gradually conventionalized between certain symbols and certain objects or beings. Because these objects and beings have names in the oral language, the correspondence is further established between the written symbols and their spoken counterparts. Once it was discovered that words could be expressed in written symbols, it was no longer necessary to record an event such as a man killing a lion by drawing the man, spear in hand, killing the lion. Instead, the spoken sentence "man killed lion" could be recorded by three conventional symbols representing the words "man," "killed," and "lion." Accordingly, "five sheep" could be expressed by two symbols corresponding to two words instead of by the five separate pictures of sheep required in the descriptiverepresentational device.

A device in which individual signs express individual words should naturally lead to a complete system of word signs, that is, word writing, or logography. Such a fully developed

system has never existed, either in antiquity or in modern times, for to create and memorize signs for thousands of words and names is wholly impracticable. The solution to this problem is found in the phonographic principle, discovered by both the ancient Egyptians and the Sumerians. By the phonographic principle, a written symbol associated with a particular word comes to be used as well to represent other words that sound the same or similar. In a general application of this principle, written signs may come to represent not words as such but components of words, such as syllables—fixed combinations of consonant and vowel sounds. A syllabic writing system can make do with far fewer signs than a logographic system, for the signs can be combined in countless ways to represent whole words.

If the word alphabet is taken strictly to refer to a writing system that expresses all the single sounds (phonemes) of a language, then the first alphabet was formed by the Greeks. Although throughout the 2nd millennium BC several attempts were made to indicate vowels in syllabaries of the Egyptian-Semitic type, none developed into a full vocalic system. The usual way was to add phonetic indicators as helps in reading the vowels, which normally were left unindicated in the Semitic systems of writing. But although the Semites sparingly employed these phonetic indicators, the Greeks used them systematically after each syllabic (i.e., consonantal) sign. The Greeks, having accepted in full the forms of the West Semitic syllabary, evolved a system of vowel signs which, attached to the syllabic signs, reduced the value of these syllabic signs to simple consonants and thus for the first time created a full alphabetic system of writing.

Chinese writing employs a partly logographic, partly phonographic system of writing in which a character may represent any of several homophonic words (words pronounced alike but having different meanings). Additional strokes in the character or simple context supplies the clue as to which word is intended in a particular instance.

Writings (division of Bible): see Ketuvim.

Wrocław, województwo (province), in southwestern Poland, bordered by the provinces of Leszno on the north, Kalisz on the northeast, Opole on the southeast, Wałbrzych on the southwest, and Legnica on the west. Wrocław province, with an area of 2,427 square miles (6,287 square km), encompasses a region known as Dolny Śląsk (Lower Silesia). The province's topography ranges from the rolling farmland of the Middle Polish Lowlands in the north to the rugged foothills of the Sudeten mountains in the southwest. The province is drained primarily by the Oder River flowing northwestward through the central part, the Barycz River in the northeast, and the Bystrzyca River in the southwest.

Industry includes metalworking, textile and paper milling, and the manufacture of machine tools and glass; chemical factories and food-processing plants are located in the vicinity of Wrocław (q.v.) city, the provincial capital. Paper mills and building-material plants are located in the southwestern part of the province. Agricultural areas, especially along the Oder River in the north, produce wheat, rye, oats, barley, sugar beets, and potatoes; livestock is also raised in the north. The largest cities of the province, apart from Wrocław city, are Oleśnica, Oława, Sobótka, Milicz, and Brzeg Dolny. Pop. (1985 est.) 1,109,200.

Wrocław, German BRESLAU, city, capital of Wrocław województwo (province), southwestern Poland. It lies along the Oder River at its confluence with the Odawa, Ślęza, Bystrzyca, and Widawa rivers. A large industrial centre situated in Dolny Śląsk (Lower Silesia), Wrocław is the fourth largest city in Poland. It contains Poland's largest flour mills, a

modern electronics and data-processing industry, foundries, heavy-machinery plants, textile mills, the "Hutmen" copper plant, and foodprocessing facilities. It is a major communications centre, having international rail connections, an airport, and river transport. A cultural and scientific centre, Wrocław contains eight educational institutions (including Wrocław University, built in 1728–36 and reconstructed after World War II), nine museums, several theatres and music centres, and a botanical garden and zoo. It is the home of the Polish Laboratory Theatre, which became internationally famous for its innovative approaches to actor training and dramatic production.

Archaeological findings indicate settlement on the site as early as the Stone Age, several thousand years ago. Wrocław originated in the 10th century AD at the crossroads of the amber trade route between the Roman Empire and the Baltic Sea and the trade route linking the Black Sea to western Europe; it was administered by the Polish Piast kings. In 1000. King Bolesław I the Brave fortified the place and established a bishopric on Ostrów Tumski (Cathedral Island). In 1109 a major attack by German forces was repelled at nearby Psie Pole. In 1138 Wrocław became the first capital of all Silesia under the rule of Piast prince Władysław II the Exile. Much of the city area south of the Oder was devastated during the Mongol invasion in 1241. At the invitation of Silesian authorities in the 13th century, many Germans migrated to Wrocław. The city received self-governing rights in 1261, when it adopted the Magdeburg Law (Magdeburger Recht), a civic constitution based on German law. Wrocław once again began to flourish as an economic centre. Nearby to the east a "new town" was developed; it was united with the older city area in 1327. In 1335 Wrocław passed to Bohemia with the rest of Silesia: in 1526 it passed to the Habsburgs. In 1741 it fell to Prussia under the rule of Frederick II the Great, and it eventually became part of

The city grew physically with the razing of its fortifications, and by 1910 the population was more than 500,000. By that time its population had become largely German as a result of Bismarck's intention to Germanize the area. During World War II the Nazis refortified the town, holding it until May 1945, when Soviet troops finally defeated the remaining German forces. In August 1945 Wrocław became part of Poland. The city's German inhabitants fled westward during 1944–45 or were evacuated in subsequent years, and thenceforth the population was exclusively Polish.

As a direct result of fighting during World War II, 90 percent of the city's industry and 70 percent of its residential area were heavily damaged or entirely destroyed. Reconstruction of the city began immediately, and by 1950 more than 50,000 new houses had been built, with an additional 50,000 by 1965. The university and many other fine architectural monuments were reconstructed, and modern industrial districts were built to house the growing population. The modern city prides itself on its numerous parks and restored historical treasures. Pop. (1985 est.) 637,200.

wrought iron, one of the two forms in which iron is obtained by smelting; the other is cast iron. Wrought iron contains less than 0.3 percent and usually less than 0.1 percent carbon and 1 or 2 percent slag. It is for most purposes superior and was the first developed of the two forms; the first iron ore smelted in antiquity was heated in a forge with charcoal and, when white-hot, worked (wrought) with a hammer to expel the impurities and weld the iron particles into a coherent mass. In modern times wrought iron has been made in a puddling furnace, where it never becomes truly molten.

Wrought iron began to take the place of bronze in Asia Minor in the 2nd millennium BC; its use for tools and weapons was established in China, India, and the Mediterranean by the 3rd century BC. The chief advantage of iron was simply its far-greater availability in nature than copper and tin. Wrought iron continued to be used for the proliferating implements of peace and the arms and armour of war for many centuries; in the 19th century it began to appear in building construction, where its strength in tension (resistance to pulling apart) made it superior to cast iron for horizontal beams. The invention of the Bessemer and open-hearth processes led to the supplanting of wrought iron by steel for structural purposes. The use of wrought iron in the 20th century has been principally decorative.

Wrought-iron railings, doors, balconies, grilles, and other exterior fittings have been handcrafted since early times; the European Middle Ages were especially rich in handcrafted wrought-iron work. The church screens of the 15th-16th centuries are especially noteworthy, as is the decorative body armour of the same period.

wrybill, also called WRYBILL PLOVER (Anarhynchus frontalis), New Zealand bird of the plover family, Charadriidae (order Charadriiformes), with the bill curved about 20° to the right. This unique bill configuration is present even in the newly hatched chicks. The wrybill feeds by probing under stones and by sweeping its bill like a scythe in shallow, muddy water. About 15 cm (6 inches) long, gray above and white below with a black breast band, it nests along rocky rivers in South Island, laying two eggs. Sizable flocks winter along the coasts of North Island.

wryneck, either of two species of birds that constitute the subfamily Jynginae of the woodpecker family (Picidae) but may be separated as the family Jyngidae. Wrynecks are graybrown birds of open woods and brushlands, named for their habit of twisting their necks snakily when alarmed. They flick up ants from the ground or insects from trees with their long tongues, and they nest in old woodpecker holes. The Eurasian wryneck (*Jynx torquilla*),

Red-breasted wryneck (*Jynx ruficollis*)
Painting by H. Douglas Pratt

16 cm (6¹/₄ inches) long, breeds from England to Japan and winters in the tropics. The redbreasted wryneck (*J. ruficollis*) is African.

wryneck (congenital disorder): see torticollis. wu (Buddhism): see Satori.

Wu, Chien-shiung (b. May 31, 1912, Liuho, Kiangsu Province, China), Chinese-born American physicist who provided the first experimental proof that the principle of parity conservation does not hold in weak subatomic interactions.

Wu came to the United States in 1936 to study with Ernest O. Lawrence at the University of California, Berkeley. After receiving the Ph.D. in 1940, she taught at Smith College, Northampton, Mass., and at Princeton University. In 1944 she undertook work on radiation detection in the Division of War Research at Columbia University. Remaining on the university staff after the war, she became Dupin professor of physics in 1957.

In 1956 Tsung-Dao Lee of Columbia and Chen Ning Yang of the Institute for Advanced Study, Princeton, N.J., proposed that parity is not conserved for weak nuclear interactions. With a group of scientists from the National Bureau of Standards, Washington, D.C., Wu tested the proposal in 1957 by observing the beta particles given off by cobalt-60. Wu observed that there is a preferred direction of emission and that, therefore, parity is not conserved for this weak interaction. The success of this and similar additional experiments brought worldwide acclaim not only to Wu but also to Lee and Yang. In 1958 Richard P. Feynman and Murray Gell-Mann proposed the conservation of vector current in nuclear beta decay. This theory was experimentally confirmed in 1963 by Wu in collaboration with two other Columbia University research physicists. She later investigated the structure of hemoglobin.

Wu was a recipient of both the Woman of the Year Award (made by the American Association of Women) and the National Medal of Science (1975). She served as president of the American Physical Society in 1975.

Wu-ch'ang, Pinyin WUCHANG, industrial city and capital of Hupeh sheng (province), central China. Located on the south bank of the Yangtze River, it is the oldest city of the Wuhan conurbation (Han-kou, Han-yang, Wuch'ang). It is the oldest of the Wu-han cities and served as a capital under the Wu dynasty in the Three Kingdoms period (AD 220–280) and is the administrative and cultural centre of the Wu-han cities. Northeast of the city proper is the huge Wu-han iron and steel complex, built in the 1950s, one of the largest in China. See Wu-han.

Wu Chao (empress of China): see Wu Hou. Wu Chen, Pinyin wu ZHEN (b. 1280, Chiahsing, Chekiang province, China—d. 1354),

with landscapes, especially scenes of fisher-

Wu Ch'eng-en, Pinyin wu CHENGEN (b. c. 1500, Shan-yang, Huai-an, now in Kiangsu province, China—d. c. 1582, Kiangsu), novelist and poet of the Ming dynasty (1368–1644), generally acknowledged as the author of the Chinese folk novel *Hsi-yu chi* (partial Eng. trans., *Monkey*, 1942).

Wu received a traditional Confucian education and became known for his clever composition of poetry and prose in the classical style. Throughout his life he displayed a marked interest in bizarre stories, such as the set of oral and written folktales that formed the basis of Hsi-yu chi, first published in 1592, 10 years after Wu's death. In its 100 chapters Hsi-vu chi details the adventures of a cunningly resourceful monkey who accompanies the Buddhist priest Hsüan-tsang on a journey to India. Like all novels of its time, Hsi-yu chi was written in the vernacular, as opposed to the officially accepted classical style, and therefore had to be published anonymously to protect the author's reputation. As a result, the identity of the novelist was long unknown outside of Wu's native district.

Only two volumes of Wu's other writings have survived. These two works were discovered in the imperial palaces and were reprinted in 1930.

Wu Chiang (China): see Wu River.

Wu ching, Pinyin wu JING (Chinese: "Five Classics"), five ancient Chinese books whose prestige is so great that in the fourfold classification of Chinese writings the ching ("classics") are placed before shih ("history"), tzu ("philosophy"), and chi ("literature"). For 2,000 years these classics, all associated in some way with the name of the ancient sage Confucius (551-479 BC), were invoked as norms for Chinese society, law, government, education, literature, and religion. As such, their influence is without parallel in the long history of China. Chinese students, however, do not generally attempt the Wu ching without having first studied the shorter-and generally speaking less complicated—Confucian texts called Ssu shu ("Four Books").

In 136 BC the Hán-dynasty ruler Wu-ti declared Confucianism to be the state ideology of China. Doctoral chairs (po shih) were thereupon established for the teaching of the Wu

"Fishermen," detail of a hand scroll painted in ink by Wu Chen, 1352; in the Freer Gallery of Art, Washington, D.C.

one of the group of Chinese painters later known as the Four Masters of the Yüan, or Mongol, dynasty (1206–1368). His fame derives particularly from his incorruptible life as a recluse (and diviner) away from the Mongol court.

Wu Chen, like others of the group, sought stylistic inspiration in the past (especially from such Five Dynasties masters as Chü-jan), but his paintings are not overwhelmingly determined by that desire. Rather, they are a combination of the new attitudes of the Yüan period with sometimes conservative tendencies traceable to the Southern Sung dynasty (1127–1279). Wu Chen is generally associated

ching and continued to exist into the 20th century.

In 124 BC the *Wu ching* were accepted by the national university as its core curriculum. Proficiency in interpreting and expounding the texts of the *Wu ching* became a requirement for all scholars who wanted to obtain posts in the government bureaucracy.

The Wu ching collection consists of the I Ching ("Classic of Changes"), Shu Ching ("Classic of History"), Shih Ching ("Classic of Poetry"), Li chi ("Collection of Rituals"), and Ch'un-ch'iu ("Spring and Autumn" [Annals]).

Wu Ching-tzu, Pinyin WU JINGZI (b. 1701, Ch'üan-chiao, Anhwei province, China—

d. Dec. 12, 1754, Yang-chou, Chiang-nan province), author of the first Chinese satirical novel, *Ju-lin wai-shih* (c. 1750; *The Scholars*).

Wu Ching-tzu was a member of a scholarly and well-to-do family. He succeeded neither academically nor financially, however, and he was unable or unwilling to pass the higher official examinations. He mismanaged his inheritance and at the age of 32 was forced by poverty to move to Nanking, where he led a life of drinking and carousing.

Probably around 1740, Wu Ching-tzu began work on the semiautobiographical *Ju-lin waishih*, completing it about 10 years later. In this picaresque romance, he used sharp and effective satire to attack the corrupt official practices and personalities that he observed throughout his life.

Wu-chou, formerly (1913–46) Ts'ANG-WU, Pinyin WUZHOU, or CANGWU, city on the eastern border of the Kwangsi Chuang autonomous $ch'\bar{u}$ (district), southern China. Wuchou is situated at the confluence of the Hsi River with its northern tributary, the Kuei River. The city occupies a location of strategic and economic importance because it dominates the principal route between Kwangsi and southwest China as well as the Canton area along the coast.

The first hsien (county) administration was established there in the 1st century BC under the name of Kuang-hsin. This name was changed to Ts'ang-wu in 589, and the county retained that name until 1946, when it became a municipality under the name of Wuchow, the name of the prefectural government first set up under the T'ang dynasty (618–907). It continued as a superior prefecture (fu), Wu-chou, under the Ming (1368–1644) and Ch'ing (1644–1911/12) dynasties. At this time the county seat of Ts'ang-wu was transferred to Lung-yū on the southern bank of the Hsi River and that town was thereafter called Ts'ang-wu.

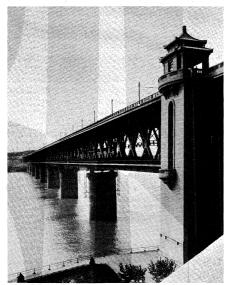

Until the 12th century, Wu-chou was primarily a garrison town controlling the non-Han peoples of Kwangsi. Chinese settlement in the area began on a large scale in the late 12th and 13th centuries, and the section of Kwangsi in which Wu-chou is situated is now almost entirely settled by Cantonese-speaking Chinese. Many of the town's large merchant population are from Kwangtung province, a large number of them from Chiang-men, a town with which Wu-chou has always traded by river.

Wu-chou was opened to foreign commerce in 1897, after which a flourishing trade grew up with Germany and the United Kingdom. Industrial growth began in the 1920s and '30s, when chemical plants that manufactured pharmaceuticals and sulfuric acid were established; these plants were, however, almost entirely destroyed during the Sino-Japanese War (1937-45).

Although Wu-chou remains an important commercial centre, it no longer has a monopoly of trade from the western areas of Kwangsi, since these areas have been served by railways connecting to the system in Hunan province since 1939. Since 1957, moreover, those areas have also had an outlet to the port of Chan-chiang. Wu-chou's commercial hinterland now mainly consists of the eastern and northeastern parts of the Kwangsi region that are served by its river. As a port, Wuchou is accessible by small oceangoing ships of up to about 1,000 tons. Since 1949 industrialization has made further progress. There are various silk-textile factories, chemical works, a large pitch factory, rice mills, sugar refineries, and engineering works (producing agricultural machinery and seamless steel tubes). There is also a ship-repair yard. Wu-chou is the seat of Kwangsi Provincial University. Pop. (1985 est.) 190,300.

Wu Chu (Chinese emperor): see Sun Ch'üan.

Wu-han, Pinyin WUHAN, fifth largest city of the People's Republic of China, in Hupeh Province, located at the confluence of the Han and Yangtze rivers. It is a conurbation of three adjacent cities—Han-k'ou (Hankow), Han-yang, and Wu-ch'ang; the last is the capital of Hupeh Province. Han-k'ou lies on the north bank of the Yangtze at the mouth of the Han. Immediately across the Han from it

Bridge over the Yangtze River at Wu-han, Hupeh Province, China

Paolo Koch-Photo Researchers

is the older city of Han-yang, and across from them on the south bank of the Yangtze is the ancient metropolis of Wu-ch'ang. In 1950 the government of the People's Republic of China merged the three cities into a single city called Wu-han.

The triple city of Wu-han has a geographical centrality that gives its site immense commercial significance. It lies in the very heart of China and is crossed by converging transportation routes from almost every point of the compass. Wu-han is roughly equidistant from the cities of Peking and Canton on a northsouth axis and is equidistant from Shanghai and Chungking on an east-west axis. The Yangtze, the greatest of China's arterial waterways, is navigable for large ocean-going vessels up to the site of Wu-han, which can therefore be considered the head of ocean navigation on the river, although the city is 600 miles (950 km) from the coast. The main northsouth railroad linking Peking and Canton crosses the Yangtze on a bridge (completed 1957) at Wu-han. Another large bridge spans the Han River and connects Han-k'ou with Han-yang. As the meeting point of maritime, river, rail, and road transportation, Wu-han has long been the chief collecting and distribution point for the products of the middle Yangtze River valley and for west and southwest China, particularly for tea, cotton, silk, timber, and tung oil, as well as for a variety of manufactured goods.

The earliest settlement, during the Western Chou period (1111–771 BC), was to the southeast of Wu-ch'ang, which became a capital city of the Wu dynasty during the Three Kingdoms period (AD 220–280). The primarily administrative role of Wu-ch'ang continued throughout the Yüan (1206–1368) and Ming (1368–1644) dynasties, when it served as a district capital.

Han-yang was founded during the Sui dynasty (AD 581-618) but was of minor commercial significance. In contrast, Han-k'ou (then known as Hsia-k'ou) became known during the Sung dynasty (960-1279) as one of China's four major commercial cities. The opening of Han-k'ou to foreign trade under

the terms of the treaties of Tientsin (1858) between China, France, and Great Britain gave added impetus to the commercial and industrial development of the three cities. Concessions in Han-k'ou were granted between 1861 and 1896 to British, French, German, Japanese, and Russian interests. A number of foreign commercial, trading, and shipping firms opened offices in Han-k'ou during this period.

The Wu-han cities played a prominent role in the 20th-century history of China. The Chinese Republican Revolution of 1911, which toppled the Ch'ing (Manchu) dynasty, broke out in the barracks at Wu-ch'ang, and the line of heights overlooking the Han River there was the scene of the principal fighting between the Imperial and revolutionary troops, with the main objective being the government arsenal at Han-yang. Han-k'ou's workers were in the forefront of the general strike of 1923, which was the first large-scale industrial strike in China. The capture of Han-k'ou by the Nationalist (Kuomintang) armies marching northward from Kwangtung in December 1926 marked the extension of Nationalist power to the middle Yangtze River valley. It was followed by a serious mob onslaught on the British concession in Han-k'ou, after which an agreement was reached replacing the British municipal council there with one of mixed Chinese and British composition. The Wu-han cities soon afterward became a centre of conflict between the Nationalists and Communists in their short-lived coalition government. After the split between the Nationalists and the Communists in 1927, a leftwing faction of the Nationalists maintained its headquarters in Han-k'ou. Mao Zedong, the future leader of the Chinese Communists, ran a Peasant Movement Institute in Wu-ch'ang, where the Fifth Congress of the Chinese Communist Party was convened in 1927.

After the fall of the Nationalist capital of Nanking to the invading Japanese in 1937, the Chinese government withdrew to Han-k'ou, which temporarily became the base for Chinese resistance. Han-k'ou fell to the Japanese in October 1938 after a defense that lasted more than four months, and the city was occupied by the Japanese until 1945, after which it reverted to Nationalist control. The Wu-han cities were taken by the Chinese Communists in 1949.

Han-k'ou's development as a port in close contact with European commerce brought the three cities early under the influence of Western industrialism, and in the 1890s Han-yang became the site of the first modern steel plant in China. The Wu-han cities' steel industry declined during the Japanese occupation, and in 1938 the Nationalists dismantled the Hanyang steel plant and relocated it at Chungking. Wu-han's steel industry was gradually revived under the Communist government in the 1950s, and by the late 20th century Wuhan was the second most important metallurgical centre of China (after An-shan). It has several large iron- and steel-producing complexes, including a plant on the south bank of the Yangtze about 25 km (15 miles) east of Wu-ch'ang. Iron ore is obtained from the large mine at Ta-yeh, which is about 65 km (40 miles) southeast of Wu-han. Coal is obtained from the major O-nan field, which lies to the south of the city.

The iron and steel base has attracted other industries producing chemicals, fertilizers, electrical equipment, glass, agricultural machinery, railroad cars, and trucks. Wu-han also has one of the largest heavy-machine-tool factories in China. Its consumer industries produce watches, bicycles, and radios and other electronic instruments. Older industries in Wuhan include rice, oil, and flour mills and the production of cotton and woolen fabrics and other textiles. Cement works, paper mills, distilleries, and soap factories are among Wu-

han's other light industries. It is also the site of one of China's more important arsenals. The surrounding agricultural area produces wheat, tea, rice, and cotton.

Wu-han is the seat of Wu-han University and the Central China Technical University. The Wu-han Medical School is in Han-k'ou, but most of the other institutions of higher education are located on the eastern outskirts of Wu-ch'ang. Among places of historic interest are the Chang Chun Kuan, a Taoist temple rebuilt at the end of the 19th century east of Wu-ch'ang; the Ku Chin T'ai, an 8th-century pavilion in Han-yang; and the Yüan-dynasty temple and shrine in Wu-ch'ang. Pop. (1985 est.) 2,899,000.

A list of the abbreviations used in the MICROPAEDIA will be found at the end of this volume

Wu Hou, Pinyin wu Hou (posthumous name, or *shih*), original name (Wade-Giles romanization) wu Chao, also called wu TSE-T'IEN (b. AD 625—d. Dec. 16, 705), woman who rose from concubinage to become empress of China, ruling effectively for many years, the last 15 (690–705) in her own name. She consolidated the T'ang dynasty and unified the empire.

Wu Hou entered the palace of the T'ang emperor T'ai Tsung as a junior concubine, at the age of 13, in 638. By that time, the T'ang dynasty had recently reunited China, largely through the efforts of the emperor T'ai Tsung. Little is known of Empress Wu's life as a concubine of T'ai Tsung, but, on his death in 649, she is traditionally said to have already entered into intimate relations with his heir, the T'ang emperor Kao Tsung. Relegated to a Buddhist convent on the death of T'ai Tsung, as custom required, the future empress Wu was visited there by the new emperor, who had her brought back to the palace to be his own favourite concubine. She first eliminated her female rivals within the palace, the existing empress and leading concubines, and in 655 gained the position of empress for herself, eventually bearing the emperor Kao Tsung four sons and one daughter.

Wu Hou used her authority to bring about the fall of all the elder statesmen, who had served T'ai Tsung and still exercised great influence over the government. These men opposed her elevation to the rank of empress. mainly because, although she was the daughter of a relatively senior officer, her family was not one of the great aristocratic clans. They also objected to the nature of the relationship between Wu Hou and the emperor Kao Tsung, on the grounds that, as she had been a concubine of T'ai Tsung, it was incestuous. By 660 the empress had triumphed over all opponents, who had been dismissed, exiled, and, in many instances, finally executed. Even the emperor's uncle, the head of the great family of the Chang-sun, of Imperial descent, was hounded to death and his relatives were exiled or ruined.

Virtually supreme power was now exercised by the empress in the name of the sickly emperor, who was often too ill to attend to state affairs for long periods. The emperor, who was weak in character, relied upon her entirely, and, for the last 23 years of his life, the empress Wu was the real ruler of China. She continued to eliminate potential rivals, even when these were her own relations, but she governed the empire with great efficiency, employing able men who clearly felt loyalty to her and stood by her when challenges were made. Her great ability as an administrator, her courage, decisive character, and readiness to use ruthless means against any opponent,

however highly placed, won her the respect, if not the love, of the court. In the years between 655 and 675 the T'ang empire achieved the conquest of Korea, under military leaders who were picked and promoted by the empress Wu. When the emperor Kao Tsung died in 683, he was succeeded by his son (by Wu Chao), the T'ang emperor Chung Tsung. The new emperor had been married to a woman of the Wei family, who now sought to put herself in the same position of authority as that of the empress Wu, for her husband was as weak and incompetent as his father. After one month the empress Wu deposed her son Chung Tsung, exiled him, and installed as emperor her second son, Jui Tsung, whose authority was purely nominal. A revolt was raised by T'ang loyalists and ambitious young officials in the south. It was crushed within weeks with the loyal cooperation of the main armies of the throne. This demonstration of the support she commanded in the public service made the position of the empress unshakable.

Six years later, in 690, at the age of 65, the empress usurped the throne itself. Accepted without revolt, she ruled for 15 years. During this period the question of the succession began to assume great urgency. Her own nephews of the Wu family had hoped that, as she had already changed the name of the dynasty to Chou, she would also displace the T'ang heirs of the Li family and leave the throne to one of the Wu nephews. Neither of them nor their sons was popular or unusually capable; on the other hand, Empress Wu's own sons, the two former emperors Chung Tsung and Jui Tsung, had little support and less ability. But, even among her loyal supporters, there was a growing hope that the T'ang family of Li would not be discarded. In 698 the empress decided to accord with these views; the exiled Chung Tsung was recalled to court and made crown prince. The empress showed her remarkable quality in this decision; she did not place her own family in the line of succession or designate one of her nephews as her heir. She seems to have had no ambition on behalf of her own family, only a determination to retain power for herself to the end.

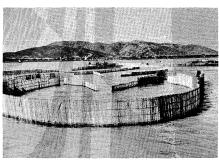

In the last years of her life, from 699, the empress gave her favour to the Chang brothers, artistic but depraved courtiers who engaged her affection by elaborate entertainments and skillful flattery. They were intensely resented by the court and senior officials, many of whom had the temerity-and couragewarn the empress of their pernicious activity. She did not heed these warnings and gradually fell into ill health, dependent more than before on the care of the Chang brothers. In February 705 a conspiracy formed among the leading ministers and generals, who seized the palace, executed the Chang brothers, and compelled the empress, old and ill, to yield power to her son Chung Tsung. She retired to another palace and died there in December of the same year.

The empress Wu was a very competent ruler, using men of her own choice, regardless of their social standing. Although her motives were to secure her own authority, the consequences of her policies were to be of great historical importance. The transformation of Chinese society in the T'ang period from one dominated by a military and political aristocracy to one governed by a scholarly bureaucracy drawn from the gentry was promoted by her policy. The significance of this aspect of her rule was long-obscured by the prejudice of Chinese historians against an usurping empress and her many acts of cruelty toward opponents. She established the new unified empire on a lasting basis and brought about needed social changes that stabilized the dy-

nasty and ushered in one of the most fruitful ages of Chinese civilization. (C.P.F.)

BIBLIOGRAPHY. C.P. Fitzgerald, The Empress Wu, 2nd ed. (1968), a biography written from the Chinese sources in the New and Old T'ang histories—Chinese contemporary or later interpretations of the recorded facts are reexamined; Nghiem Toan and Louis Ricaud, Une Traduction iuxta-linéaire commentée de la biographie officielle de l'Impératrice Wou Tsö-t'ien (1959), an annotated French translation of the official biography of the empress Wu that is included in the Hsin T'ang Shu ("The New T'ang History"), with commentary; and R.W.L. Guisso, Wu Tse-t'ien and the Politics of Legitimation in T'ang China (1978), a study of the empress Wu's reign and her place in Chinese history. Her use of Buddhist ideology is discussed in detail in A. Forte, Political Propaganda and Ideology in China at the End of the Seventh Century (1976).

Wu-hsi, Pinyin WUXI, city in southern Kiangsu sheng (province), China. Wu-hsi is situated along the Grand Canal at that waterway's junction with the Hsi-ch'eng Canal near the northeastern corner of T'ai Lake.

Fish traps on T'ai Lake, Wu-hsi, Kiangsu Province, China

Emil Schulthess-Black Star/EB Inc.

The city is the principal route focus of the dense network of canals and waterways that provides the basic transport system of southern Kiangsu.

Wu-hsi is one of the older cities in the Yangtze River Delta area. It was originally known as a source of tin; but by the time the county was founded under the Former Han dynasty (206 BC-AD 25), the deposits had been exhausted, and the county was named Wu-hsi ("Without Tin"). From the end of the 3rd century the city was subordinated to the commandery (district under the control of a commander) of Pi-ling (or Ch'ang-chou) and remained so except for a brief interval under the rule of the Yüan, or Mongol, dynasty (1206-1368), when it was made an independent prefecture.

Since early times the area around T'ai Lake has been extremely fertile; and after the completion of the Grand Canal in 609, Wu-hsi became a transshipment centre for tax grain destined for the capital. It thus became one of the greatest grain markets in China, handling vast quantities of rice annually, and was the seat of a complex commercial organization of extremely wealthy merchants and middlemen. When the Grand Canal fell into decay after 1850. Wu-hsi retained its importance as a rice market, exporting grain to Shanghai for shipment by sea to Tientsin. The trade in grain increased still further after the completion of the railway link to Shanghai to the east and to Chen-chiang and Nanking to the northwest, in 1908.

Wu-hsi has traditionally been a centre of the textile industry, being engaged in both cotton textiles and silk reeling. Textile mills were established there as long ago as 1894 and silk filatures (establishments for reeling silk) in 1904. This development was largely the work of Shanghai industrialists, many of whom were originally from Wu-hsi merchant families. The two cities have had unusually close links, and Wu-hsi was known colloqui-

ally before World War II as "Little Shanghai." The cotton yarn produced is woven not only in the city itself but also in Ch'ang-chou and Su-chou, whereas the silk reeled in the city is mostly woven into cloth in Su-chou and (in recent times) in Shanghai. Modern Wu-hsi is the greatest silk-reeling centre in China. Cotton textile production is also important and is the city's largest single industry.

Other long-established industries are flour milling, rice polishing, and oil extraction. Industrial development has accelerated since the 1950s. The textile and food-processing industries have been modernized and expanded, and the city has become a centre for the engineering industry, particularly for the manufacture of machine tools and diesel engines. It also manufactures electrical equipment and cables and boiler-plant and textile machinery

of various types.

Since 1949 the city's importance as a commercial centre has declined, although its role as a distribution and collection centre for the T'ai Lake area remains. Tourism is increasingly important. Wu-hsi's surroundings include many well-known beauty spots, carefully preserved together with city parks and historic sites. Industrial development is closely restricted near the lake, the major scenic attraction. New hotels were built in 1961 and 1978. Pop. (1985 est.) 696,300.

Wu-hsien (China): see Su-chou.

Wu-hsing, also called hu-chou, Pinyin wu-XING, or HUZHOU, city in northern Chekiang sheng (province), China. Wu-hsing is situated close to the southern shore of T'ai Lake, some 40 miles (65 km) north of Hang-chou and 39 miles (63 km) west of Chia-hsing. Situated on the Tung-t'iao River, which flows into the lake, Wu-hsing has excellent waterway communications with the whole northern Chekiang plain.

The city was established as a county, Wuch'eng, in the 2nd century BC. In 266 the city became the administrative seat of the commandery (district controlled by a commander) of Wu-hsing. After some temporary changes of name, the city became the seat of Huchou (prefecture) in 602, taking its name from T'ai Lake. In 982 the city was divided into two counties, Wu-ch'eng and Kuei-an. By the 11th century it was a major centre of trade, the biggest centre of commerce in the Yangtze River Delta after Hang-chou and Su-chou. In 25 it was renamed An-chi-chou, but in 1280 the Yüan (Mongol) dynasty (1206-1368) restored the name Hu-chou. Under the Ming (1368-1644) and Ch'ing (1644-1911/12) dynasties, it was the seat of a superior prefecture, Hu-chou, and became a prosperous administrative centre.

In the 1860s, however, the surrounding area was one of the last strongholds of the Taiping Rebellion (1850-64); from 1862 to 1864 the area was under the control of rebel forces, who looted and pillaged the city and its surroundings. After the fall of Nanking to Ch'ing troops in July 1864, the rebel leadership fell back on Hu-chou, which was then occupied by the loyalist armies. During this period the city suffered great damage, and its population was much reduced. After the establishment of the republic in 1911, the superior prefecture was abolished, and the city became the seat of Wu-hsing County. In the 1930s, when the area was badly hit by a depression in the silk handicraft industry, for which Wu-hsing had a world reputation, there was much unrest, several minor uprisings taking place in the district.

Wu-hsing is an important commercial centre. The surrounding area is densely populated and has been intensely farmed since at least the 7th century AD. The area produces rice, oilseeds, mulberries, and silkworms and is also well-known for sheep raising. The chief industries in the city are silk reeling and the

weaving of fine silk fabrics. There are also ricepolishing and oil-extracting works and some minor engineering and chemical industries. A rail line between Ch'ang-hsing and Hang-chou runs about 10 miles (16 km) west of Wuhsing. Pop. (1985 est.) 184,900.

Wu hsing, Pinyin WU XING (Chinese: Five Elements), in ancient Chinese cosmogony, the five basic components of the physical universe: earth, wood, metal, fire, and water. These elements were believed to destroy and succeed one another in an immutable cycle and were correlated with the cardinal directions, seasons, colours, musical tones, and bodily organs.

The Wu hsing cycle served as a broad explanatory principle in Chinese history, philosophy, and medicine; it was first linked to dynastic history by the sage-alchemist Tsou Yen (3rd century BC). The Neo-Confucian philosophers of the Sung dynasty (AD 960–1279) extended the Wu hsing to encompass the Five Virtues (benevolence, righteousness, reverence, wisdom, and sincerity).

Consult the INDEX first

Wu-hu, Pinyin Wuhu, city and river port in southeast Anhwei sheng (province), China. Wu-hu has long been a communication and strategic centre of some importance, being situated at the junction of the Yangtze River with three tributaries—the Yu-hsi River to the north and the Ch'ing-i and Shui-yang rivers to the south. The city is situated on the southeastern bank of the Yangtze, about 100 miles (160 km) upstream from Nanking in Kiangsu Province. Eastward from Wu-hu the Yangtze Delta consists predominantly of flatland, lakes, and canals.

Wu-hu is located in an area of relatively ancient settlement, which, in the 6th century BC, was the site of the city of Chiu-tzu in the state of Wu. A hsien (county) named Wu-hu was founded in the 2nd century BC under the Han dynasty (206 BC-AD 220) at a site some 9 miles (15 km) southwest of the modern town, and it became an administrative centre of some importance in the late 3rd and 4th centuries under the Chin. From the 5th century onward, however, it lost its county status and was merged with neighbouring districts. In the 8th and 9th centuries the area began to develop, and the garrison town of Wu-hu-chen was established on the present site. This became a county in the early 10th century under the rule of the Southern T'ang dynasty (937-975/76). At first subordinated to Sheng-chou (Nanking), it was a part of the superior prefecture of T'ai-p'ing during Ming (1368-1644) and Ch'ing dynasty (1644-1911/ 12) times. From the 10th century onward, the surrounding area grew rapidly in importance, and its population increased.

Under the Ming, from the 15th century onward, it developed into a major commercial centre and river port and was well-known as a centre of the rice trade. In 1876, as a result of the Chefoo Convention between China and the United Kingdom, it was opened to foreign trade, and a modern town began to develop. Before World War II it ranked third in volume of domestic trade after Shanghai and Nanking. Its foreign trade, however, was less than one-tenth of China's total; almost all of it was with Japan, to which it exported rice, tea, beans, oilseed, and iron ore. After its occupation by the Japanese Army in 1938, great quantities of its iron ore were shipped to the Yawata Iron and Steel Company, at Yawata (now part of Kitakyūshū), Japan.

In the 1930s Wu-hu's inland communications were improved, first by the construction of the highway network in the Nanking area and then by the construction of one rail link running from Nanking to T'ung-ling via the city and of another joining Yü-hsi-k'ou on the opposite bank of the Yangtze with the Huainan coalfield in northwest Anhwei. Before World War II, however, there was virtually no industry in the city, apart from the Yu-chung cotton mill and several rice-polishing and oil-extracting plants.

After 1949 the disappearance of the privately organized rice and tea trades considerably reduced Wu-hu's commercial importance, although its role as a communication centre remained. The port facilities both at Wu-hu and at Yü-hsi-k'ou on the opposite bank were rebuilt and improved. The rail line from Wu-hu to Nanking has been double-tracked. Since the early 1950s the existing textile industry has been greatly developed. In the late 1950s and early 1960s, paper mills were also built and a large automobile factory and tractor repair and engineering works begun. Small plants making machine tools and instruments were also established. The developments envisaged under the Second Five-Year Plan (1958-62) laid increasing emphasis on heavy industry. Despite this goal, however, Wu-hu remains primarily a major commercial and collecting centre and in heavy industry is overshadowed by the growth of Ma-an-shan to the north and T'ung-ling to the south. Wu-hu is freely reached by deep-draft shipping carrying out the rice, silk, cotton, tea, wheat, and eggs brought in via the surrounding network of canals and roads. The city is a leading market for rice that is shipped regularly to the lower Yangtze and Canton areas. Pop. (1985 est.) 385,800.

Wu Huang (Chinese emperor): see Hsüan Tsung.

Wu Huang-ti (ruler of China): see Nurhachi.

Wu-i Mountains. Wade-Giles romanization WU-I SHAN, Pinyin WUYI SHAN, mountain range on the border between Fukien and Kiangsi provinces, China. The Wu-i Mountains originally bore the name of a cluster of peaks in northwestern Fukien, but the name is applied as a general term to the southwestnortheast range forming the northern part of the Fukien-Kiangsi border. The southern range, which has a more nearly south-to-north orientation, is known as the Shan-ling range. The individual peaks of the Wu-i range rise up to about 6,000 feet (1,800 m). Situated in an area with many caves and with some spectacular scenery, the Wu-i Mountains have long been associated with cults of Taoism, a philosophy that has influenced all aspects of Chinese culture for the past 2,000 years. In the 18th and 19th centuries, a well-known academy, known as the Tzu-yang Shu-yuan, was established there. The range is crossed by a number of passes and, since 1957, by the railway at the western end of the range, which replaced the Fen-shui Pass as the main route from Fukien into Kiangsi.

To the northeast the range is continued by the somewhat higher and even more rugged Hsienhsia Mountains, which extend into Chekiang Province. This range is heavily forested and rather sparsely populated. A famous area for timber and bamboo, it has also long been renowned for its fine tea. From the 13th to the 17th century the government maintained special offices in the area to control tea production.

Wu Jiang (China): see Wu River.

Wu Jingzi (Chinese author): see Wu Ching-

Wu-kung Mountains, Wade-Giles romanization WUKUNG SHAN, Pinyin WUGONG SHAN, mountain range, chiefly in west-central Kiangsi Province, China, forming a part of the frontier area between Kiangsi and Hunan provinces. The range is about 80 miles (130)

km) long and extends northeastward from Ch'a-ling in Hunan to near I-ch'un in Kiangsi. being divided from the Chiu-ling Mountains farther north by the valley route between Chuchou and I-ch'un. The western section is the highest part of the range, with average heights of up to 5,000 feet (1,500 m). The chief peaks are Mount T'ai-ho, and Mount T'ai-yang on the provincial border. To the east, the range is lower and divides into three more or less parallel ranges, the Ch'en Mountains, the Wukung Mountains proper, and the Yun-hsiao Mountains. The range forms the principal watershed between the Kan River system in Kiangsi, and the Mi River and Lu River tributaries of the Hsiang River in Hunan. The area is heavily forested and produces large quantities of pine and cedar. On its northern flank are the coal mines of P'ing-hsiang; other coal deposits are worked at T'ien-ho, on the southeastern side.

Wu language, variety of Chinese spoken in southeastern Kiangsu Province and in Chekiang Province by more than 8 percent of the population of China. Major cities in which Wu is spoken include T'ai-chou, Shanghai, Soochow, Ning-po, and Wen-chou. The Wu language originally spread from Su-chou, a cultural centre since the 5th century BC, and gained great importance at least as early as the period of the Ming dynasty (1368-1644), when Shanghai became an important metropolitan area. Wu differs from Modern Standard Chinese in preserving the initial voiced stops (sounds formed with complete closure in the vocal tract) and in using seven or eight tones to distinguish meanings between words or word elements that have the same series of consonants and vowels. (Modern standard Chinese uses only four tones for such a purpose.) Like Modern Standard Chinese and the Mandarin language of northern China, the Wu language has lost most of the Ancient Chinese final consonants.

Wu Li, Pinyin wu Li (b. 1632, Ch'ang-shu, Kiangsu Province, China—d. 1718), Chinese painter who, although a convert to Roman Catholicism and later a priest, is remembered as being of the orthodox school of "literati painting" (wen-jen-hua) in the early Ch'ing period

Wu Li became a convert to Catholicism and in 1681 went to Macao Island (on the southeast coast of China), where, without family obligations after the deaths of his mother and wife and the marriage of his two daughters, he entered the Jesuit order. In 1688 he was ordained as a priest under the name Acunha and was posted as a missionary in Kiangsu. While Wu Li saw Western prints and paintings, his own paintings were entirely within the Chinese tradition (and are always signed with his Chinese name). He studied under the great painter Wang Shih-min and was a good friend of the painters Wang Hui and Wang Chien. Wu Li led a rather retiring life and cultivated the proper Confucian virtues in a manner appropriate to the ideal of the cultivated amateur of the literati tradition.

Wu-lieh Ti (Chinese emperor): *see* Li Yüanhao.

Wu-lu-mu-ch'i (China): see Urumchi.

Wu Mountains, Wade-Giles romanization and Pinyin wu shan, mountain complex on the borders of Hupeh, Szechwan, and Kweichow provinces, China. They are often referred to by Western writers as the Gorge Mountains, owing to the fact that the Yangtze River cuts its way through the area from the Szechwan Basin into the central Yangtze Basin, below I-ch'ang, through a series of deep and impressive gorges. The area is one of great

complexity, being a zone of contact between the southeastern extremity of the Ta-pa Shan (mountains; which have a predominant northwest to southeast alignment) and the plateau of northeastern Kweichow. The mountains are predominantly formed of ancient limestones, and it is probable that they were folded in more or less their present major structures in Jurassic times (136,000,000 to 190,000,000 years ago). They have since been worn down by erosion to a nearly flat plain and then deeply dissected by the river system of the area, which cuts across the main structural lines.

The thinly populated area remained a remote border country occupied by its aboriginal inhabitants until the Sung dynasty (AD 960-1279). Even today cultivation is restricted to a few river valleys. The area is warm and wet and has a heavy forest cover. It produces timber, tung oil, tallowseed oil, lacquer, and other forest products. Communications, however, are very poor, apart from the river traffic. The mountains mostly average about 5.000 ft (1.500 m) in height, but individual peaks, particularly in the highest section to the north of the Yangtze Gorges, are considerably higher—Ying-t'iao Ling (mountain) reaching 9,700 ft and Chen-chu Ling 9,518 ft. It is the ruggedness of the terrain, however, rather than sheer altitude that makes the Wu Mountains such a formidable barrier to communications. and the only highway through the area, connecting Wan-hsien (Szechwan) with Pa-tung (Hupeh), has to make a lengthy detour south of the main section of the ranges.

Wu P'ei-fu, Pinyin wu PEIFU (b. April 22, 1873, Shantung Province, China—d. Dec. 4, 1939, Peking), Chinese warlord who dominated Peking from 1917 to 1924.

The son of a tradesman, Wu joined the famous Peiyang Army of Yüan Shih-k'ai, the

Wu P'ei-fu BBC Hulton Picture Library

leading general of the Ch'ing dynasty (1644-1911/12) and the first president of the Republic of China, and rapidly rose to high position. After Yuan's death in 1916, Wu became the chief bulwark of the shaky Peking government. In 1922 Wu came into conflict with Chang Tso-lin, the Manchurian warlord who had begun to extend his control into North China near Peking. Wu secured his position in central China and then in a series of battles drove Chang Tso-lin's army back to its Manchurian base. As a result he became the dominant figure in North China and began to prepare for a campaign to unify all of the country by force. But his stern attitude toward his military associates and his ruthless suppression of a workers' strike on the Hankow-Peking Railroad in 1923 lost Wu much of his popularity, and he was never able again

to consolidate his position. In 1924 Chang Tso-lin launched a new attack and defeated Wu in a great battle near Tientsin.

Wu River, Wade-Giles romanization wu CHIANG, Pinyin WU JIANG, tributary of the Yangtze River in southern China. It rises in the hills of western Kweichow Province and flows east through narrow gorges between steep cliffs. It turns north at Ssu-nan, enters Szechwan Province, and flows into the Yangtze at Fu-ling after a total course of 700 mi (1,100 km). Its drainage basin of 31,000 sq mi (80,-000 sq km), including most of Kweichow, is a region of rugged terrain and an ethnically diverse population. Until the mid-20th century the river did little to reduce the region's isolation, for reefs and rapids prevented navigation for all but a few short stretches. Since the 1950s, however, blasting and dredging have opened more than 300 mi to motorized boats.

Wu San-kuei, Pinyin wu sangui (b. 1612, Liaotung Province, China—d. Oct. 2, 1678, Hen-chou, Hunan), Chinese general who invited the Manchus of Manchuria into China and helped them establish the Ch'ing dynasty in 1644. Later, in southwest China, he led a revolt against the Ch'ing in an attempt to set up his own dynasty.

Wu had been the Ming general in charge of defending the northeast frontier against the Manchus. When the Imperial capital at Peking was attacked by the rebel bandit leader Li Tzuch'eng, Wu's forces were summoned to aid in raising the siege, but the city fell (April 1644) before his arrival. Li then advanced against Wu, who appealed to the Manchus for aid. A combined force of Ming and Manchu troops drove Li from Peking, where the Manchus then set up the Ch'ing dynasty. Although loyal Ming officials beseeched Wu for aid in restoring the Ming dynasty, he accepted high rank from the Manchus and for nearly 30 years fought for the Manchu cause.

In 1659 Wu was put in charge of eliminating the remnants of Ming resistance in the southwest, and to this end he was given civil and military control of the southwestern province of Yunnan. With these powers he created an independent satrapy in Yunnan and neighbouring Kweichow Province, collecting taxes and developing trade monopolies in the area. At the same time two other commanders set up similar satrapies in the neighbouring southern provinces of Kwangtung and Fukien, and South China became an independent power that rivalled the Ch'ing government in the north.

In 1673, when the Ch'ing dynasty tried to check these southern kingdoms, Wu led them in a rebellion. Wu chose the name of Chou for the new dynasty he set up and proclaimed himself emperor. In 1674 he advanced into central China but then hesitated, possibly because the Manchus were holding his son as hostage. The Manchus then seized the initiative, and, soon thereafter, with the battle turning against him, Wu died of dysentery. His grandson continued the rebellion until 1681, when it was finally crushed. The incident is known in Chinese history as the Revolt of the Three Feudatories.

Wu Sangui (Chinese general): see Wu Sankuei.

Wu school, Pinyin wu, group of Chinese painters of the Ming dynasty active in the second half of the 15th and first half of the 16th centuries. They were scholar-artists who, in their "literati painting" (wen-jen-hua [q,v.]), perpetuated the personally expressive styles and attitudes of former artists such as the Four Masters of the Yüan dynasty (q,v.) in contrast to their contemporaries of the Che school (q,v.), who perpetuated more conservative styles.

The Wu school was named after Wu county (hsien) in the region of Soochow (Su-chou), in

"Hermitage by Mountain Stream," hanging scroll by Shen Chou, ink and colour on paper, 1464, Wu school, Ming dynasty; in the Ōsaka Municipal Museum of Fine Arts

By courtesy of the Osaka Shiritsu Bijutsukan

Kiangsu Province, where the painters worked. Among the artists included in the group are Shen Chou and his student Wen Cheng-ming (qq.v.). Generally, their paintings are quite subtle, but that subtlety veils great variety and imagination—with a sure, light brush to define painterly and structural complexity, learned allusions and poetic inscriptions, and very thin, delicate colouring. Their paintings were done more for their own and their peers' intellectual amusement than for a larger public. Some well-known painters, such as T'ang Yin (q.v.) and Ch'in Ying, lived in the area and knew the famous members of the Wu school but cannot easily be grouped with them because of their sometimes differing styles and interests.

Wu Shan (China): see Wu Mountains.

Wu-su-li Chiang (U.S.S.R.-China): see Ussuri River.

Wu-t'ai, Mount, Wade-Giles romanization WU-T'AI SHAN, Pinyin WUTAI SHAN, mountain and mountain chain in northeast Shansi Province, China. The mountain chain is a massif with a southwest-northeast axis, separated from the Heng Shan (mountains) to the northwest by the valley of the Hu-t'o Ho (river), which curves around its southern flank to flow into the North China Plain in Hopeh Province. Mt. Wu-t'ai is actually a cluster of flat-topped peaks from which the mountain takes its name (Five Terraces). The highest peak is 10,033 ft (3,058 m) above sea level.

Mt. Wu-t'ai is particularly famous as one of the great holy places of Chinese Buddhism. Great numbers of temples, including some of the oldest wooden buildings surviving in China, are scattered over the mountain; the largest temples—such as the Hsien-t'ung, the Ta-ta-yüan, and the Pu-sa-ting-shen-jung-yüan—are grouped around the town of T'ai-huai-chen in Wu-t'ai County (hsien).

Mt. Wu-t'ai appears first to have become a holy mountain to the Taoist adepts of the later Han dynasty (AD 25-220) but came into prominence in the 5th century under the Northern Wei dynasty (386-534/35) when, as Ch'ing-liang Shan, it became identified as the dwelling place of Mănjuśrī bodhisattva

(a heavenly being who voluntarily postpones his Buddhahood in order to work for worldly welfare and understanding). The cult of Mānjuśrī was intensified under the T'ang dynasty (618–907). In early T'ang times Mount Wut'ai was closely associated with the patriarchs of the Hua-yen Buddhist school, becoming the principal centre of their teaching. During this period it attracted scholars and pilgrims not only from all parts of China but also from Japan, who continued to visit and study there until the 12th century.

Many of the other monasteries in the region were attached to Ch'an Buddhism, which in the 9th century found patronage in the region from the provincial governors of the neighbouring areas of Hopeh, who were able to protect Mount Wu-t'ai from the worst ravages of the great religious persecution that oc-curred from 843 to 845. Under Mongol rule in the late 13th century, Tibetan Buddhism (Lamaism) was first introduced to Mount Wut'ai. During the Ch'ing dynasty (1644-1911/ 12), when the Tibetan Buddhist religion was an important element in relations between the Chinese court and their Mongol and Tibetan vassals and when the state gave lavish support to monasteries inhabited by lamas (monks), Mount Wu-t'ai was one of the principal monastic centres.

Few of the present buildings are very old, but the main hall of the Hua-kuang Ssu, dating from 857, is the oldest surviving wooden building in China.

Wu Tao-hsüan, also called wu TAO-TZU, Pinyin wu DAOXUAN, or wu DAOZI (fl. c. 700-760), painter of the Chinese T'ang dynasty (618-907) who came to be so praised by later critics that his original contributions are almost buried in myth.

Rubbing of Confucius after a design attributed to Wu Tao-hsüan, Chinese, 19th century

By courtesy of the Museum of Fine Arts, Boston, gift of Robert Treat Paine, Jr.

He is recorded as having painted a wide variety of subjects, perhaps painting large wall compositions of an essentially Buddhist character more than anything else. He is especially noted for his imagination and the expressive vigour of his brush—which is cited even by T'ang critics who lavished a "divine" (shen) rating upon him. There are no known extant works that give anything other than the most hazy impression of his skill and accomplish-

ment. Probably, however, his brush created vividly expressive lines of alternately thick and thin tensions—seen then and remembered still as in distinct contrast to the more preciously coloured and evenly controlled delineations of the contemporary courtly style.

Wu Ti (Chinese god): see Kuan Ti.

Wu-ti, Pinyin wudi, original name Liu Ch'e (b. 156 BC—d. March 29, 87/86 BC), autocratic Chinese emperor (141/140–87/86 BC), who vastly increased the authority of the Han dynasty and extended Chinese influence abroad. He made Confucianism the state religion of China.

Wu-ti was probably the 11th son of Emperor Ching-ti, the fifth ruler of the Han dynasty. Not being the eldest son, he would normally not have ascended the throne, but relatives of the emperor secured his designation as heir apparent at age seven. From his relatives and his teachers, the future emperor absorbed influences from two basically antagonistic schools: the Taoists, inclined to the legalist philosophy favouring an autocratic ruler guided by the rules of expediency, and the Confucianists, who sought through rituals and other means to check the growing power of the Han monarchs.

Emperor Wu-ti began his reign in 141 or 140 BC. During its early years he was under the moderating influence of relatives and court officials; however, by the late 130s he had decided that the essentially defensive foreign policy of his predecessors was not going to solve his foreign problems. In 133 he launched attacks on the nomadic Hsiung-nu people, who constituted China's principal threat on the northern frontier, and thereafter he committed his realm to the expansion of the empire. By 101 Wu-ti's troops, spurred by an emperor heedless of their hardships and intolerant of defeat, had extended Chinese control in all directions.

Southern China and northern and central Vietnam were incorporated into the empire. Northern and central Korea, which had slipped from Chinese control in 128 BC, were reconquered and again administered by imperial governors. Imperial troops were also sent across the Gobi (Desert) in unsuccessful attempts to eliminate the threat from the nomadic people known as the Hsiung-nu.

Han armies were farthest from home when they marched west to Fergana (now in Soviet Uzbekistan). The first expedition, in 104 BC, was a failure, but the emperor refused to accept defeat. His intransigence stemmed from pride and his desire for horses. The horses Wu-ti wanted from Fergana were not principally intended for his war machine (although the Han armies suffered a chronic shortage of horses); rather, they were "blood sweating" horses (infected by a parasite causing skin hemorrhages), which for the emperor had a mystical significance in that possession of them was considered a mark of Heaven's grace. The second expedition returned in 101 BC with some of the famous horses and the head of the ruler of Fergana; furthermore, the small states between China and Fergana had been humbled. Wu-ti had brought to submission all but the most distant parts of the world known to the Chinese.

His wars and other undertakings exhausted the state's reserves and forced him to look for other sources of income. New taxes were decreed and state monopolies on salt, iron, and wine were instituted. Yet, by the latter part of his reign, his regime was in financial difficulties and confronted by popular unrest. The emperor's economic controls were paralleled by his rigid control of the state apparatus. He created institutions for close supervision of the bureaucracy and drew into his personal service men who were outside the normal bureaucratic ranks and who made the bureaucracy more responsive to his will. He usually

selected men whose behaviour was much like his own: harsh, demanding, and merciless.

In spite of his aggressive policies, Emperor Wu-ti is also known for making Confucianism the state orthodoxy. Although he was unimpressed with the image of the ideal Confucian ruler as a benevolent father figure, he nevertheless appreciated the literary grace of the Confucianists and particularly the Confucian emphasis on ritual, which complemented his religious interests.

Most of the rituals performed by Emperor Wu-ti had a dual function; although of dynastic political and religious significance, they frequently manifested his ceaseless search for immortality. He richly rewarded men who he believed could introduce him to immortals who would reveal their secrets to him. He sent men in search of the islands of the immortals and constructed elaborate palaces and towers designed to attract the spirits to him. At great expense he had conquered much of the world, and he invested heavily in the ardent hope that he would not have to leave it.

The last four years of Emperor Wu-ti's life were a time of retreat and regret. His empire could no longer afford an aggressive foreign policy, and he was forced to begin a period of retrenchment. The deeply suspicious emperor suffered intense personal loss when, in 91 BC, his heir apparent was falsely accused by an imperial confidant of practicing witchcraft against the emperor. In desperation, the son led an uprising in which thousands of people were killed and in which the heir committed suicide. Shortly before Emperor Wuti's death, he designated an eight-year-old son as heir apparent; then, anticipating his own death, he had the youth's mother accused of a crime and imprisoned. Reportedly she "died of grief," but Emperor Wu-ti condoned her death, and perhaps caused it, to avoid having the young emperor dominated by relatives as he himself had been. He died in 87 BC.

Emperor Wu-ti is best remembered for his military conquests; hence, his posthumous title Wu, meaning "martial." His administrative reforms left an enduring mark on the Chinese state, and his exclusive recognition of Confucianism had a permanent effect on subsequent East Asian history. (J.L.D.)

BIBLIOGRAPHY. The annals of his reign have been critically translated and annotated by Homer H. Dubs, The History of the Former Han Dynasty, vol. 2 (1944). The foreign policies of the Han rulers are surveyed in Ying-shih Yu, Trade and Expansion in Han China: A Study in the Structure of Sino-barbarian Relations (1967). Michael Loewe, Crisis and Conflict in Han China, 104 BC to AD 9 (1974), studies contemporary reactions to Wu-ti's government.

Wu-ti, Pinyin WUDI (posthumous name, or *shih*), personal name (*hsing-ming*) ssu-MA YEN, temple name (*miao-hao*) (HSI-CHIN) SHIH-TSU (b. 236, China—d. 290, Lo-yang), founder and first emperor of the Western Chin dynasty (265–316/317), which briefly reunited China during the turbulent period following the dissolution of the Han dynasty (206 BC-AD 220).

Ssu-ma Yen was the scion of the great Ssuma clan to which the famous Han historian Ssu-ma Ch'ien belonged. He became the most powerful general of the Wei dynasty (220–265/266), the northernmost of the Three Kingdoms into which China had divided at the end of the Han. In 263/264 the Wei kingdom absorbed the second of the Three Kingdoms, the Shu Han. In 265 Ssu-ma usurped the Wei throne, proclaiming the Chin dynasty. In 280 he conquered Wu, the third of the Three Kingdoms, thus reuniting China.

Ssu-ma attempted to reform the government, disbanding his armies to reduce expenses. He tried to regain control of taxation and to reduce the usurious rent that powerful landowners were extracting from the people. He never really broke the power of the great local families, however, and his reduction of the army left China prey to invasion from foreign tribes. Moreover, he divided his domains into principalities for each of his 25 sons. The son who succeeded him was unable to control his brothers, and Ssu-ma Yen's dynasty came apart in a civil war known as the Revolt of the Eight Kings. Ssu-ma Yen himself was given the posthumous title of Wu-ti (Martial Emperor).

Wu-ti, Pinyin WUDI (posthumous name, or shih), personal name (hsing-ming) HSIAO YEN, temple name (miao-hao) (NAN-LIANG) KAO-TSU (b. 464, China—d. 549, China), founder and first emperor of the Southern Liang dynasty (502–557), which briefly held sway over South China. A great patron of Buddhism, he helped establish that religion in the south of China

Wu-ti was a relative of the emperor of the Southern Ch'i dynasty (479–502), one of the numerous dynasties that existed in South China in the turbulent period between the Han (206 BC-AD 220) and T'ang (618–907) dynasties. He led a successful revolt against the Southern Ch'i after his elder brother was put to death by the emperor. He proclaimed himself first emperor of the Liang dynasty in 502, and his reign proved to be longer and more stable than that of any other southern emperor in this period.

A devout believer, Wu-ti diligently promoted Buddhism, preparing the first Chinese *Tripitaka*, or collection of all Buddhist scripts. In 527 and again in 529 he renounced the world and entered a monastery. He was persuaded to reassume office only with great difficulty. In 549 the capital was captured by a "barbarian" general, and Wu-ti died of starvation in a monastery.

Wu-tou-mi (China): see Five Pecks of Rice. Wu Tse-t'ien (Chinese empress): see Wu Hou.

Wu-t'ung-ch'iao, Pinyin WUTONGQIAO, city in western Szechwan sheng (province), China. Situated between Lo-shan and I-pin on the Min River, Wu-t'ung-ch'iao was formerly a minor market town and briefly achieved status as a municipality from 1952 to 1958. It is chiefly noted as a major salt-producing area, the salt being drawn as brine from wells of medium depth. Barium and calcium chloride are also produced there. Another local industry is the manufacture of woolens, particularly blankets, using wool from neighbouring areas. Wu-t'ung-ch'iao's port is Chu-ken-t'an, located on the Min River a few miles to the west. Pop. (mid-1970s est.) 10,000–50,000.

Wu-wang, Pinyin wuwang (posthumous name, or shih), personal name (hsing-ming) CHI FA (fl. 12th century BC, China), founder and first ruler (reigned 1111-1104 BC) of the Chou dynasty (1111-255 BC). He was regarded by later Confucians as a wise king.

Wu succeeded his father, the famous Wenwang, as head of the semibarbaric state of Chou, located on the western border of China. Wen had assumed the title Hsi Po (King of the West) and had begun to plot against the Chinese Shang dynasty (18th-12th century BC).

Wu continued his father's work and formed a coalition with eight other border states, which defeated the evil last ruler of the Shang. The final battles were said to have been extremely bloody, and Shang survivors may well have served as Chinese culture bearers to places as far removed as Korea.

After establishing the Chou dynasty, Wu, assisted by his brother, known as the duke

of Chou, consolidated his rule by establishing a feudalistic form of government, which parceled out territory to relatives and vassals willing to acknowledge Chou suzerainty. Even descendants of the defeated Shang were allowed to rule over a portion of their former domain.

Wu-wei, Pinyin wuwei, city in Kansu sheng (province), China. Situated at the eastern end of the Kansu Corridor (through which the Silk Road ran southeast to northwest) to the north of the provincial capital, Lan-chou, Wu-wei became an important defensive area under the Han dynasty (206 BC-AD 220). It has kept the same name ever since, having been since T'ang times (618-907) the seat of a prefecture called Liang-chou, known under the Ch'ing dynasty (1644-1911/12) as Liang-chou prefecture. A traditionally strategic point, it is located where roads from Lan-chou in the south and from Yin-ch'uan (in modern times in the Ningsia Hui autonomous region) to the east joined to form the main Silk Road. An ancient city with many monuments, since the late 1950s it has been an important rail junction on the line from Lan-chou to the Sinkiang Uighur autonomous region. A spur line runs east to join the main Lan-chou-Yin-ch'uan-Peking line near the Kansu-Ningsia Hui border. Wuwei is the chief market and collecting centre not only for the irrigated area surrounding the city itself, but also for the products (especially wool) of the pastoral nomads who live in the surrounding grasslands. Pop. (mid-1970s est.) 10.000-50.000.

wu-wei, Pinyin wuwei (Chinese: "nonaction"), in Chinese Taoism, the principle of yielding to others as the most effective response to the problems of human existence. Wu-wei does not mean total passivity. Rather, it is natural, nonaggressive behaviour that compels others (through shame, if for no other reason) to desist voluntarily from violence or overly aggressive conduct. Taoism, therefore, is not indifferent to violence, for it counters violence in its own paradoxical way. Ideally, Taoists do not argue or debate. They rely on proper timing to set forth what they believe to be true, and they speak out against unseemly conduct only when their words are likely to be heeded. Taoists view laws and controls as undesirable repressions of human nature. For them a society with the fewest controls governs itself best. Wu-wei is thus regarded as the secret to human happiness, for through "nonaction" all things can be accomplished.

Wu xing (in Chinese cosmogony): see Wu hsing.

Wular Lake, lake, the largest in the Jammu and Kashmir territory, in the northern part of the Indian subcontinent. Located in the

Resort house on Wular Lake in the Vale of Kashmir, Jammu and Kashmir

D. Chawda—Keystone

Indian-held sector of the territory, the lake is 10 miles (16 km) long and 6 miles (10 km) wide. It lies at the north end of the Vale of Kashmir, 20 miles (32 km) north-northwest of Srinagar. Its areal extent varies from 12 to 100 square miles (30 to 260 square km) according to the season. The lake controls the flow of the Jhelum River, which traverses it. The town of Sopur is on the southwest shore of the lake, and an island to the northeast contains 15th-century ruins.

wulfenite, lead molybdate, PbMoO₄, a minor source of molybdenum and the second most common molybdenum mineral. It occurs in the oxidized zone of lead and molybdenum deposits. Fine crystals have been found at Přibram, Czech.; Yuma County, Ariz., U.S.; and Mapimi, Durango, Mex. Other localities include Germany, Austria, Sardinia, and Australia.

Wulfenite ordinarily crystallizes as thin, beveled, square plates that have a resinous to adamantine lustre, and they are yellow to orange in colour. The Mohs hardness is 3; specific gravity, 6.5–7; and crystal system, tetragonal.

Wulfhere (d. 674), king of the Mercians from 657, who made himself overlord of much of England south of the Humber River. He exercised control over Essex, London, Surrey, and the West Saxon lands, or Wessex, north of the Thames.

He was a younger son of King Penda and was kept in concealment for some time after his father's defeat and death in 654. In 657, however, the Mercians threw off the supremacy of Oswiu, king of Northumbria, and Wulfhere became their king. He took energetic measures to spread Christianity and was greatly helped by his bishop, Jaruman, and afterwards by St. Chad. Outside Mercia he induced the East and the South Saxons to accept Christianity and is said to have founded one or two monasteries. He gained Lindsey from Northumbria in 657 and was successful against Wessex. He extended his borders in all directions and was the founder of the passing greatness of Mercia. His only son Cenred (or Coenred) became king in 704 in succession to his brother Aethelred. His only daughter was St. Werburh, abbess of Ely.

Wulfila (Christian missionary): see Ulfilas.

Wulfstan, pseudonym LUPUS (d. May 28, 1023, York, Eng.), bishop of London, 996–1002, archbishop of York, 1002–23, and bishop of Worcester, 1002–16, the author of many Old English homilies, treatises, and law codes. He was a product of the Benedictine revival and probably had some early connection with one of the Fenland abbeys, but nothing is known of him with certainty before he became a bishop.

Wulfstan wrote in a distinctive style, which has enabled the canon of his work to be established. From 1008 he was adviser to the kings Aethelred and Canute and drafted their laws; it was probably he who inspired the latter to reign as a Christian king and thus prevented the Danish conquest from being a disaster to Anglo-Saxon civilization. He was interested in problems of government and the arrangement of society, as is shown by the work known as Institutes of Polity, which describes the responsibilities of all classes, from the king down, and defines the relative powers of church and state. He was also deeply concerned with the reform of the church. He studied canonical literature, asked Aelfric to write two pastoral letters for him, and was himself the author of the text known as The Canons of Edgar. His most famous work, the Sermo Lupi ad Anglos ("Sermon of Wolf to the English"), is an impassioned call to his countrymen to repentance and reform in 1014, after Aethelred had been driven out by the Danish invasions of King Sweyn.

Wulfstan, Saint, also spelled wulstan (b. c. 1008, Long Itchington, near Warwick, -d. Jan. 19/20, 1095, Worcester; canonized 1203; feast day January 19), bishop of Worcester from 1062, the last surviving English holder of a bishopric after the Norman Conquest (1066). He ended the capture and sale of slaves at Bristol, rebuilt the cathedral at Worcester, helped compile Domesday Book (the record of William I the Conqueror's survey of England), and was noted for his preaching and personal asceticism. Educated at Benedictine abbeys, he joined the Benedictine monastery at Worcester. He was respected as bishop for his able administration, and he frequently served as adviser to King William II Rufus of England.

Wundt, Wilhelm (b. Aug. 16, 1832, Neckarau, near Mannheim, Baden [Germany]—d. Aug. 31, 1920, Grossbothen, Ger.), German physiologist and psychologist who is generally acknowledged as the founder of experimental psychology.

Wundt earned a medical degree at the University of Heidelberg in 1856. After studying briefly with Johannes Müller, he was appointed lecturer in physiology at the University of Heidelberg, where in 1858 he became an assistant to the physicist and physiologist Wilhelm von Helmholtz. There he wrote Beiträge zur Theorie der Sinneswahrnehmung (1858–62; "Contributions to the Theory of Sense Perception").

It was during this period, in 1862, that Wundt offered the first course ever taught in scientific psychology. Until then, psychology had been regarded as a branch of philosophy and, hence, to be conducted primarily by rational analysis. Wundt instead stressed the use of experimental methods drawn from the natural sciences. His lectures on psychology were published as *Vorlesungen über die Menschen und Thierseele* (1863; "Lectures on the Mind of Humans and Animals"). He was promoted to assistant professor of physiology in 1864.

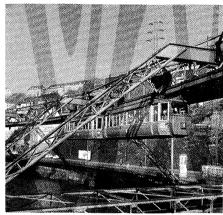

Bypassed in 1871 for the appointment to succeed Helmholtz, Wundt then applied himself to writing a work that came to be one of the most important in the history of psychology, Grundzüge der physiologischen Psychologie, 2 vol. (1873–74; 3 vol., 6th ed., 1908–11; Principles of Physiological Psychology). The Grundzüge advanced a system of psychology that sought to investigate the immediate experiences of consciousness, including sensations, feelings, volitions, and ideas; it also contained the concept of apperception, or conscious perception. The methodology prescribed was introspection, or conscious examination of conscious experience.

In 1874 Wundt went to the University of Zürich for a year before embarking on the most productive phase of his career, as professor at the University of Leipzig (1875–1917). There, in 1879, he established the first psychological laboratory in the world, and two years later he founded the first journal of psychology, *Philosophische Studien* ("Philosophical Studies"). Wundt's most important later works include *Grundriss der Psychologie* (1896; "Outline of Psychology") and *Völkerpsychologie*, 10 vol. (1900–20; "Ethnic Psychology").

Wupatki National Monument, national monument in north-central Arizona, U.S. It lies along the Little Colorado River near the San Francisco Mountains, 30 miles (48 km) north-northeast of Flagstaff. Established in 1924, with an area of 55 square miles (142 square km), it comprises more than 800 pre-Columbian red sandstone pueblos. Studies of tree rings in their ancient wooden beams indicate that they were built between the 11th and the 13th century. Their occupants were farming Indians believed to be the ancestors of the Hopi Indians, who came with corn seed and digging sticks to cultivate the cinder soils

that covered the region after the eruption (c. 1064) of nearby Sunset Crater. The outstanding groups of pueblos are the Wupatki and the Citadel, built near the rim of a sinkhole.

Wuppertal, city, North Rhine-Westphalia Land (state), northwestern Germany. The city extends for 10 miles (16 km) along the steep banks of the Wupper River, a right-bank tributary of the Rhine, northeast of Düsseldorf. Formed as Barmen-Elberfeld in 1929 through the amalgamation of the towns of Barmen,

Monorail suspension railway, Wuppertal, Ger. S. Kuebe—7FFA/FB Inc.

Elberfeld, Beyenburg, Cronenberg, Ronsdorf, and Vohwinkel, the name was changed to Wuppertal ("Wupper Valley") in 1930. Barmen and Elberfeld, mentioned in the 11th and 12th centuries, jointly received the monopoly for yarn bleaching for the Bergisches Land in 1527. The introduction of ribbon making and linen weaving in the 16th century, lace making (1750), silk weaving (1775), and red dyeing (1785) gave added impetus to these towns' textile industries.

The system of civic poor relief introduced in Elberfeld in 1853 was long regarded as a model throughout the world. A unique monorail suspension railway was built along the Wupper River at the turn of the 20th century in order to serve Barmen, Eberfeld, and the other towns. Wuppertal was severely damaged in World War II but was subsequently rebuilt in parallel terraces on the river valley's slopes, with numerous parks and public gardens and a well-known zoo. Wuppertal is the centre of textile manufacturing in the region. The city also manufactures chemicals, rubber, machinery, vehicles, tools and printing equipment and has breweries, printing works, and publishing houses. Pop. (1989 est.) 371,283.

Wurlitzer FAMILY, American family of musical-instrument makers and dealers.

Rudolph Wurlitzer (b. Jan. 30, 1831, Schöneck, Saxony [Germany]—d. Jan. 14, 1914, Cincinnati, Ohio, U.S.), emigrated to the United States in 1853, settling in Cincinnati. He began dealing in musical instruments, which had been the traditional family business since the time of lute-maker Heinrich Wurlitzer (1595–1656). By 1861 he was no longer able to fill all his orders with instruments imported from Germany, and he established a factory in Cincinnati that primarily produced band instruments for military use.

In 1865 a branch was established in Chicago, and in March 1890 the firm was incorporated as the Rudolph Wurlitzer Company, with its founder serving as president (1890–1912) and chairman of the board (1912–14). Three sons followed.

His eldest son and successor, Howard Eugene (b. Sept. 5, 1871, Cincinnati—d. Oct. 30, 1928, New York City), joined the firm in 1889 and also became president (1912–27) and chairman (1927–28). Chiefly through Howard's efforts, the company expanded in the field

of automatic and coin-operated instruments. Rudolph Henry Wurlitzer (b. Dec. 30, 1873, Cincinnati—d. May 27, 1948, Cincinnati), Rudolph's second son, studied violin in Berlin and became interested in violin construction. His training led to the establishment of the Wurlitzer Collection of Rare Violins. Rudolph Henry was active in the company from 1894 and served as president (1927-32) and chairman (1932-42). The third son, Farny Reginald Wurlitzer (b. Dec. 7, 1883, Cincinnati d. May 6, 1972, North Tonawanda, N.Y.), was educated in the art and technique of producing modern musical instruments. He returned to Cincinnati in 1904 and in 1909 moved to North Tonawanda, N.Y., to head the manufacturing division that was formed after the purchase of DeKleist, manufacturers of barrel organs. He was president (1932-41), chairman (1942-66), and chairman emeritus (1966-72) of the company.

In 1910 the Wurlitzer Company acquired the Hope-Jones Organ Company of Elmira, N.Y., moving its operations to North Tonawanda. It was there that the pipe organ known as the "Unit Orchestra" and later famous as the "Mighty Wurlitzer" was developed.

"Mighty Wurlitzer" was developed.
With the advent of motion pictures the "Mighty Wurlitzer" theatre organ grew in popularity; it soon appeared as part of the elaborate furnishings in the new movie palaces. Equipped with the sound effects of brass trumpets, tubas, clarinets, oboes, chimes, xylophones, drums, and many other tone colours, the instrument proved to be an attraction in itself, and more "Mighty Wurlitzers" were produced than any other model of pipe organ in history.

Würm glacial stage, major division of late Pleistocene deposits and time in Alpine Europe (the Pleistocene epoch began about 1,600,000 years ago and ended about 10,000 years ago). The Würm glacial stage followed the Riss-Würm interglacial and is correlated with the Weichsel glacial stage of northern Europe and the Wisconsin glacial stage of North America. The Alpine glaciations of the Pleistocene were early recognized and formed the basis of modern Pleistocene glacial theory. The Würm glacial stage began about 70,000 years ago and is divided into early, middle, and late phases. The end of the Würm and the retreat of the final glaciers was a complex of minor retreats and advances.

Württemberg, former German state, successively a countship, a duchy, a kingdom, and a republic before its partition after World War II. Its territory approximated the central and eastern areas of present-day Baden-Württemberg (q.v.) Land (state), of Germany. For the last period of its separate existence, Württemberg was bounded northeast and east by Bavaria, southeast by Bavaria and Lake Constance (Bodensee), and southwest, west, and northwest by Baden, except where Hohenzollern (Prussian from 1849) was enclaved across the frontier in the south. The capital was Stuttgart. Except for the Rhine plain, Württemberg is a mountainous and hilly region that includes the Swabian Jura and the Black Forest and that is drained by the Neckar River.

In the earlier Middle Ages, Württemberg was part of the region known as Swabia (q.v.). The Wirtembergs (Württembergs), a local dynasty of counts established by the late 11th century, began from the mid-12th century to extend their control over large sections of Swabia. By the time Württemberg was made a duchy in 1495, the Estates (representative assembly) had come to play an important role in its government. Duke Ulrich, who became a vassal of the house of Habsburg in 1534, introduced Lutheranism into the duchy

and confiscated church lands. His son Duke Christopher (reigned 1550-68) set up a centralized state church and became the leader of German Protestantism; his judicial and civil reforms, which included recognition of the Estates' control over finances, endured for two centuries. Duke Frederick (1593-1608) secured the duchy's release from Habsburg overlordship and was a pillar of the Evangelical Union of Lutheran and Calvinist Princes (1608). Württemberg was devastated in the Thirty Years' War (1618-48) and fell prey to French invasions from 1688 until 1693 during the War of the Grand Alliance. Yet the country enjoyed progressive government. Compulsory education was introduced in 1649. Duke Eberhard Louis (reigned 1693-1733) improved the duchy's defenses and schools, built the celebrated Ludwigsburg Palace, and admitted Waldensian refugees from France, who introduced the textile and other industries into the duchy.

Württemberg was an ally of France from 1802 to 1813 and was rewarded by Napoleon with large grants of territory, including many Habsburg lands in Swabia and numerous free imperial cities and ecclesiastical territories. These additions doubled Württemberg's size by 1810, and the duchy was successively raised to the status of an electorate (1803) and a kingdom (1806), which it remained after Napoleon's downfall. Political unrest in Württemberg from 1815 until 1819 resulted in the issuance in 1819 of a constitution by King William I (reigned 1816–64), establishing a bicameral legislature. Württemberg was a centre of liberalism in 19th-century Germany. It joined the Zollverein (Customs Union) with Prussia in 1834, but King Charles (1864-91) sided with Austria in the Seven Weeks' War (1866) and was forced to pay an indemnity by the victorious Prussians. Württemberg sided with Prussia in the Franco-German War (1870-71) and then joined the new German empire

With Hermann von Mittnacht as chief minister (from 1876 to 1900), Württemberg found a comfortable place in the new Germany, retaining its independence in internal administration, ecclesiastical affairs, and education and also in the management of the postal and railway services. It moreover retained special rights over taxation and the armed forces. Its manufacturing industries were successfully developed—for machinery, motors, precision-engineering, textiles, watches and clocks, musical instruments, and book-production. The previously high rate of emigration declined.

Charles was succeeded in 1891 by his first cousin once removed, William II (reigned 1891–1918), under whom liberal political reforms were inaugurated and arts and drama flourished. Progress, however, was halted by World War I, and the revolution of November 1918 forced William II to abdicate. A republican constitution was promulgated in 1919; but, as a member state of Germany under the Weimar Constitution, Württemberg lost all the special privileges that had been reserved to it under the former system.

Under the Nazi regime a Reichsstatthalter, or lieutenant governor, for Württemberg was appointed in 1933, and the state's government was subordinated to that of the Reich in 1934, while the Landtag, or State Diet, was abolished. After World War II, Württemberg was divided between the U.S. and French occupation zones. Three of the states created in the birth of the Federal Republic of Germany in 1949 were Baden, Württemberg-Baden, and Württemberg-Hohenzollern. These were merged in 1952 to form Baden-Württemberg.

Wurtz, Charles-Adolphe (b. Nov. 26, 1817, Wolfisheim, near Strasbourg, Fr.—d. May 12,

1884, Paris), French chemist and educator noted for his research on organic nitrogen compounds, hydrocarbons, and glycols.

Wurtz
Bover—H. Roger-Viollet

Following medical studies and a period of teaching, he studied at Giessen and then at Strasbourg (1843). He became an assistant (1845) to Jean-Baptiste-André Dumas, whom he succeeded at the École de Médecine (1852). He was the first to occupy the chair of organic chemistry at the Sorbonne (1875).

His work on the acids of phosphorus led him to discover phosphorus oxychloride. In 1849 he synthesized the first organic derivative of ammonia, ethylamine, and six years later devised a method of preparing hydrocarbons from sodium and an alkyl halide, a reaction now known by his name. Study of glycerol led him into researches of glycols and the synthesis of a number of important compounds, including choline. In 1867 he and August Kekule prepared phenol. With Marcellin Berthelot he succeeded in making Paris one of Europe's leading centres of chemical education.

wurtzite, a zinc sulfide mineral that occurs typically in Potosí, Bolivia; Butte, Mont.; and Goldfield, Nev. It is a rare and unstable (at temperatures below 1,020° C, [1,870° F]) hexagonally symmetrical modification of sphalerite, to which it inverts crystallographically; it may be made artificially from sphalerite by rapid cooling from 1,020° C. For detailed physical properties, see sulfide mineral (table).

Würzburg, city, northwestern Bavaria Land (state), south-central Germany. It lies along the canalized Main River. The site of a Celtic settlement and a Roman camp, it was first mentioned as Wirteburch in 704. A bishopric was established there by St. Boniface in 741, and the bishops had acquired ducal authority over eastern Franconia by the 12th century. Repeated revolts against the power of the bishops resulted in the citizens' final submission to their authority in 1400. Several imperial diets (assemblies) and councils were held in

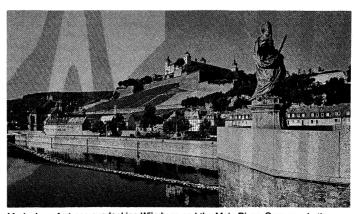

Würzburg, including the one of 1180, when Henry the Lion was placed under the imperial ban and the Bavarian duchy was taken from him and given to Otto, a member of the Wittelsbach family. Würzburg progressed under Bishop Julius (1573–1617), and much building was commissioned by the bishops of the Schönborn family in the 18th century. The bishopric was secularized in 1802, and the city passed to Bavaria in 1803. In 1805 it became the seat of the grand duchy of Würzburg in the Confederation of the Rhine, until it was restored to Bavaria in 1815. A new bishopric was created in 1817.

Much of the city was destroyed in World War II, but its postwar reconstruction has been thorough. Although the splendid Baroque episcopal Residenze (built 1719-44 by Balthasar Neumann) was damaged, its grand staircase, with famous frescoes by Giovanni Tiepolo, survived. Other landmarks are the medieval Main Bridge, the Julius Hospital (1576-85), the town hall, and the Marienberg fortress, originally a Celtic hill fort, which was the residence of the bishops (1261–1720). The round church of the fortress is one of the oldest extant in Germany (706). Würzburg's Romanesque cathedral, begun in 1034, consecrated in 1189, and restored after World War II. recalls the city's former status as the capital of an ecclesiastical principality. Other notable medieval churches include the Marienkapelle, the Neumünster, and St. Burchard's, and among many fine examples of the Baroque and Rococo styles are the Hauger Stiftskirche and the Käpelle, a pilgrimage church (by Neumann). A university was founded at Würzburg in 1403, but it existed for only a few years. The present University of Würzburg was founded by Bishop Julius in 1582.

Würzburg, once the capital of Franconia, is the capital of the Bavarian administrative district of Lower Franconia and is a centre of grape growing and rail and river traffic. Würzburg is a centre for the manufacture of steel and motor vehicles, paper and printing, electronics, wood, leather, and wine. Pop. (1989 est.) 125,589.

Würzburg, University of, German in full BAYERISCHE JULIUS-MAXIMILIANS-UNIVERSITÄT WÜRZBURG, autonomous, state-supported university in Würzburg, Ger., founded in 1582. Early a famous centre for the study of Roman Catholic theology, it was secularized in 1814 and became best known for its medical school. Among its teachers were the philosopher F.W. Schelling, the pathologist Rudolf Virchow, and the physicist Wilhelm Röntgen, who discovered X rays there in 1895.

Wüst, Georg (Adolf Otto) (b. June 15, 1890, Posen, Ger. [now Poznán, Pol.]—d. Nov. 8, 1977, Erlangen, W.Ger.), German oceanographer who, through his collection and analysis of a series of systematic ob-

Marienberg fortress overlooking Würzburg and the Main River, Germany; in the foreground (right) is a statue of Bishop Julius

R. Waldkirch—ZEFA/EB Inc.

servations, developed the first essentially complete understanding of the physical structure and deep circulation of the Atlantic Ocean.

Wüst received his doctorate from the University of Berlin in 1919. After the death of his teacher Alfred Merz, Wüst took over as chief oceanographer on the German Atlantic (1925–27) expedition. He was also in charge of the International Gulf Stream (1938) expedition. The Atlantic expedition, conducted from the research vessel "Meteor," was the first study of an entire ocean, and it remains one of the most extensive oceanographic surveys ever undertaken. From the wealth of data amassed, Wüst constructed cross-sectional profiles that revealed the Atlantic's complex temperature and salinity stratification and its deep-current structure.

After World War II Wüst built up again the Institute for Oceanography, at Kiel, so that it flourished as a research centre. He was the institute's director from 1946 until he retired in 1959.

Wyandot (people): see Wendat.

Wyandotte, city, Wayne County, southeastern Michigan, U.S., on the Detroit River, just southwest of Detroit. Settled in about 1820, it was laid out in 1854 on the site of the Indian village where Chief Pontiac had planned his attack on Detroit in 1763. Its name recalls the Wyandot (Wendat) Indians, a confederation of the Huron nation. The first commercial Bessemer steel in the United States was produced there in 1864, and Wyandotte was noted for Great Lakes shipbuilding (1872–1920). Diversified manufactures now include steel and allied products, cement, plastic pipes, and industrial diamonds; vast salt beds underlying the city are the basis for important chemical industries. Inc. city, 1867. Pop. (1982 est.) 32,526.

Wyandotte Cave, cave in Crawford County, southern Indiana, U.S., near the village of Wyandotte. With 25 mi (40 km) of passages on five levels, it is the largest of the many such caves dissolved out in the horizontally bedded Mississippian limestones that extend southward into the cave-bearing regions of Kentucky and Tennessee. The entrance is about 200 ft (60 m) above the Blue River. The cave was used by Indians and is believed to have been inhabited in prehistoric times. Outstanding features include Rothrock's Grand Cathedral (an enormous room almost 1/4 mi in circumference with a 175-ft-tall rock pile at its centre called Monument Mountain) and the Senate Chamber, an elliptical amphitheatre 145 ft long and 56 ft wide. In the centre of the chamber, a mass of fallen rock supports one of the cave's grandest spectacles, the Pillar of the Constitution—a great fluted column of white calcite, combining a stalactite and a stalagmite and over 70 ft in circumference. The cave also contains many fine examples of helictites (irregular stalactites). The temperature within is a constant 53° F (about 12° C). Little Wyandotte Cave is nearby, and Marengo Cave is 20 mi (32 km) south.

Wyandotte Constitution, in the period immediately preceding the American Civil War, document under which Kansas was admitted to the Union as a free state (Jan. 29, 1861), concluding the struggle known as Bleeding Kansas. Drawn up at Wyandotte (now part of Kansas City) in July 1859, it rejected slavery and suffrage for women and blacks but affirmed property rights for women. The document was approved in a referendum by a

vote of about 10,000 to 5,000 (Oct. 4, 1859). Amended many times (including a universal suffrage amendment in 1912), it is still the constitution of Kansas.

Wyat, Sir Thomas, Wyat also spelled wyatt (b. 1503, Allington, near Maidstone, Kent, Eng.—d. Oct. 6, 1542, Sherborne, Dorset), poet who introduced the Italian sonnet and terza rima verse form and the French rondeau into English literature.

Wyat was educated at St. John's, Cambridge, and became a member of the court circle of Henry VIII, where he seems to have been popular and admired for his attractive appearance and skill in music, languages, and arms. During his career, he served a number of diplomatic missions and was knighted in 1537, but his fame rests on his poetic achievements, particularly his songs. His poems are unusual for their time in carrying a strong sense of individuality. They consist of Certayne Psalmes . . . drawen into Englyshe meter (1549); three satires, and Songes and Sonettes, published in Tottel's Miscellany (1557); and songs identified in manuscript, published in 19th- and 20th-century editions.

Wyat, Sir Thomas, THE YOUNGER, Wyat also spelled WYATT (b. c. 1521—d. April 11, 1554, London), English soldier and conspirator who led an unsuccessful rebellion against Queen Mary I, probably the most formidable uprising ever faced by a Tudor monarch.

Sir Thomas Wyat the Younger, panel painting by an unknown artist; in the National Portrait Gallery, London

By courtesy of the National Portrait Gallery, London

Wyat's father was the renowned poet and diplomat Sir Thomas Wyat. As a young man he acquired a reputation for recklessness, and in 1543 he was briefly imprisoned for taking part in a London street riot. From 1543 to 1549 or 1550, he served in the army abroad—especially in France—achieving recognition as a skillful and daring officer.

Wyat then returned to England and in 1551 served as sheriff in Kent, where he formed his own rudimentary military organization. On King Edward VI's death (July 1553) he supported the accession of Mary, a Roman Catholic, but by the end of the year he turned against the Queen, considering her proposed marriage to the future king Philip II of Spain to be an affront to England's national honour. He accordingly joined several others, including Lady Jane Grey's father, the Duke of Suffolk, in a conspiracy against the crown. The plot was revealed to Mary's lord chancellor, Stephen Gardiner, by the Earl of Devon, one of the conspirators, at the end of January 1554, with the result that of the conspirators only Wyat succeeded in raising an army. At first the government offered to negotiate with him, but it soon decided to suppress the insurgents. A force under the command of Thomas Howard, the aged duke of Norfolk, who was sent to put down the rebellion, largely defected to Wyat.

On Feb. 3, 1554, Wyat entered the outskirts of London with some 3,000 men. He advanced swiftly to the centre of the city, but his troops became disheartened when the populace did not join their cause. Confronted by the royal forces, Wyat surrendered after a brief engagement. He was tried on March 15 and executed less than a month later. To the last, Mary's partisans made strenuous but unsuccessful efforts to persuade him to implicate Princess (afterward Queen) Elizabeth in his conspiracy. After his death he and his followers were widely regarded as patriots and martyrs by a populace that was becoming increasingly repelled by Mary's persecution of Protestants.

Wyatt, James (b. Aug. 3, 1746, Burton Constable, Staffordshire, Eng.—d. Sept. 4, 1813, near Marlborough, Wiltshire), English architect chiefly remembered for his Romantic country houses, especially the extraordinary Gothic Revival Fonthill Abbey.

In 1762 Wyatt went to Italy, where he remained six years. On his return to England, he designed the London Pantheon (opened 1772; later demolished), a Neoclassical building inspired by Hagia Sophia in Istanbul. The Pantheon made Wyatt one of the most fashionable architects in England.

ionable architects in England.
He succeeded Sir William Chambers as surveyor general to the Board of Works (1796) and was engaged in restoring the cathedrals of Durham, Hereford, Lichfield, and Salisbury, as well as Windsor Castle, Westminster Abbey, and Magdalen College, Oxford. These "restorations" later earned him the epithet "the Destroyer" from such medieval revivalists of the 19th century as A.W.N. Pugin, who had a more accurate archaeological approach.

more accurate archaeological approach. In point of originality, Wyatt's severely elegant works in the classical mode, like Heaton Hall, Lancashire (1772), and Heveningham Hall, Suffolk (c. 1788-99), were surpassed by the extravagance of his Gothic Revival buildings, of which the most sensational was Fonthill Abbey (1796-1807), Wiltshire. Initially this was built as a landscape feature and eventually developed into an extraordinary home for the arch-Romantic William Beckford, who supervised its design and construction. The great central tower (270 feet) collapsed in 1807, and after Beckford sold the estate, in 1822, the house further fell into ruin. Today it has mostly disappeared. In John Rutter's Delineations of Fonthill (1823), however, one can still experience some of the building's grotesque, spectacular quality that made it architecturally notorious in the Romantic period. Other notable examples of Wyatt's Gothic country houses include Lee Priory, Kent (1783-90), and Ashridge, Hertfordshire, completed (1808-18) by his nephew, Sir Jeffry Wyatville. A biography of the nephew by Derek Linstrum was published in 1972.

Wyatt, John (b. April 1700, Thickbroom?, Staffordshire, Eng.—d. Nov. 29, 1766, Birmingham, Warwickshire), English mechanic who contributed to the development of power spinning.

Wyatt began his career as a carpenter in the village of Thickbroom, near Lichfield, but by 1730, with financial support from the Birmingham inventor Lewis Paul, he was working on machines for boring metal and making files. The spinning machine, first patented in 1738, was almost certainly Paul's idea, with Wyatt providing the technical skill. The principle was to draw the fibres through sets of rollers turning at different speeds. It was successful for a time but was superseded by Richard Arkwright's water frame in the 1770s. Wyatt later worked at Matthew Boulton's Soho foundry.

Wychavon, district, county of Hereford and Worcester, western England, occupying an area of 257 sq mi (666 sq km) in the eastern part of the county. Wychavon district consists mostly of the fertile clay valleys of the Severn

and (Upper) Avon rivers. The Vale of Evesham in the south and centre has the proper soil and climate for the cultivation of plums and various other fruits and vegetables. The steep limestone scarps of the Cotswold Hills cross into Wychavon near the small parish (town) of Broadway in the extreme southeast. Isolated Bredon Hill in the southwest, nearly 1,000 ft (300 m) high, is a spur of the Cotswolds. Evesham, Pershore (the district seat), and Droitwich are historic towns of Wychavon. Droitwich in the northwest has been known since Roman times for its saline springs and baths, said to be 10 times saltier than sea water. Evesham in southeastern Wychavon has a Tudor Round House (a large building with elaborate woodwork) and a town hall (built 1586; remodelled 1885). Pershore, west of Evesham, has a 17th-century bridge across the Avon and a thousand-year-old Norman abbey. Light industries include canneries at Evesham for locally grown fruits and vegetables. Pop. (1983 est.) 95,900.

Wycherley, William (b. 1640, Clive, near Shrewsbury, Shropshire, Eng.—d. Jan. 1, 1716, London), English dramatist who attempted to reconcile in his plays a personal conflict between deep-seated puritanism and an ardent physical nature. He perhaps succeeded best in *The Country-Wife*, in which satirical comment on excessive jealousy and complacency was blended with a richly comic presentation, the characters unconsciously revealing themselves in laughter-provoking colloquies. It was as satirist that his own age most admired him: William Congreve regarded Wycherley as one appointed "to lash this crying age."

Wycherley was sent to be educated in France at the age of 15. There he became a Roman Catholic, but, on returning to England to study at Oxford University in 1660, he reverted to Protestantism. Leaving Oxford without a degree, he began to study law, although he seems to have preferred a life of pleasure that included study of the theatre. He had earlier drafted a first play, Love in a Wood; or, St. James's Park, and in the autumn of 1671 it was presented in London, bringing its author instant acclaim. Wycherley was taken up by Barbara Villiers, duchess of Cleveland, whose favours he shared with King Charles II, and he was admitted to the circle of wits at court. His next play, The Gentleman Dancing-Master, was presented in 1672 but proved unsuccessful. These early plays-both of which have some good farcical moments-followed tradition in "curing excess" by presenting a satirical portrait of variously pretentious characters—fops, rakes, would-be wits, and the solemn of every kind. The Plain-Dealer, presented in 1676, satirizes rapacious greed. The satire is crude and brutal, but pointed and effective. In The Country-Wife, acted a year earlier in 1675, the criticism of manners and society remains severe, but there is no longer any sense of the author hating his characters.

Wycherley, who had led a fashionably dissolute life during these years, fell ill in 1678. In 1680 he secretly married the Countess of Drogheda, a rigid puritan who kept him on such a short rein that he lost his favour at court. A year later the lady died, leaving her husband a considerable fortune. But the will was contested, and Wycherley ruined himself fighting the case. Cast into a debtor's prison, he was rescued seven years later by King James II, who paid off most of his debts and allowed him a small pension. In old age he married a young wife. On his deathbed, Wycherley received the last rites of the Roman Catholic Church, to which he had apparently reverted after being rescued from prison by James II.

A biography by B. Eugene McCarthy was published in 1980.

Wyckoff, Ralph Walter Graystone (b. Aug. 9, 1897, Geneva, N.Y., U.S.), U.S. chemist, a pioneer in the application of X-ray methods to determine crystal structures and one of the first to use these methods for studying biological substances.

Wyckoff was educated at Cornell University and was an instructor in analytical chemistry from 1917 to 1919. He subsequently worked in the Geophysical Laboratory of the Carnegie Institute of Washington (1919-27). From 1927 to 1937 he was associated with the Rockefeller Institute for Medical Research, after which he joined Lederle Laboratories and then Reichel Laboratories. He subsequently worked for the U.S. Public Health Service and during 1952-54 was attached to the U.S. embassy in London. He conducted work of fundamental importance in crystallography, electron microscopy, and medical research. One of the strongest proponents of the Laue method of X-ray crystal analysis (after the German physicist Max von Laue), he devised techniques for deriving the crystal structure from the complicated X-ray diffraction photographs. His attention shifted to the study of organic substances, and attempts to purify and crystallize proteins resulted in the perfection of ultracentrifuges powerful enough to isolate viruses. The first in vitro vaccine against a virus disease was prepared from one of the viruses isolated, a causative agent of sleeping sickness in horses. The subsequent commercial preparation of this vaccine also led to substantial improvements in the technique of growing viruses in chicken embryos; this technique has become standard in the manufacture of other vaccines

From 1959 to 1981 Wyckoff served as professor of physics at the University of Arizona in Tucson. He compiled *Crystal Structures*, 6 vol. (2nd ed., 1963-71) and is author of *The Biochemistry of Animal Fossils* (1972).

Wycliffe, John, Wycliffe also spelled wycliffe, Wycliff, Wicliffe, or Wicliff (b. c. 1330, Yorkshire, England—d. Dec. 31, 1384, Lutterworth, Leicestershire), English theologian, philosopher, church reformer, and promoter of the first complete translation of the Bible into English. He was one of the forerunners of the Protestant Reformation. The politico-ecclesiastical theories that he developed required the church to give up its worldly possessions, and in 1378 he began a systematic attack on the beliefs and practices of the church. The Lollards, a heretical group, propagated his controversial views

agated his controversial views. Early life and career. Wycliffe was born in the North Riding of Yorkshire and received his formal education at Oxford, where his name has been associated with three colleges, Queen's, Merton, and Balliol, but with some uncertainty. He became a regent master in arts at Balliol in 1360 and was appointed master of the college, but he resigned in 1361 to become vicar of Fillingham, the college's choicest living, or church post. There is some doubt as to whether or not he became soon afterward warden of Canterbury Hall, a house for secular (pastoral) and regular (monastic) clergy; but there was a petition from the university to the Pope in 1362 to "provide" for him, and he was given a prebend (a stipend) at Aust in the church of Westbury-on-Trym. He drew his prebend while residing elsewhere, a practice he condemned in others. In 1363 and 1368 he was granted permission from the bishop of Lincoln to absent himself from Fillingham in order to study at Oxford, though in 1368 he exchanged Fillingham for Ludgershall, a parish nearer the university. He became a bachelor of divinity in about 1369 and a doctor of divinity in 1372

Political activities and theories. On April 7, 1374, Edward III appointed Wycliffe to the rectory of Lutterworth in place of Ludgershall, and about this time the theologian began to

show an interest in politics. He received a royal commission to the deputation sent to discuss with the papal representatives at Bruges the outstanding differences between England and Rome, such as papal taxes and appointments to church posts. In this work, Wycliffe showed

himself to be both a patriot and a king's man. He complemented this activity with his political treatises on divine and civil dominion (De dominio divino libri tres and Tractatus de civili dominio), in which he argued men exercised "dominion" (the word is used of possession and authority) straight from God and that if they were in a state of mortal sin, then their dominion was in appearance only. The righteous alone could properly have dominion, even if they were not free to assert it. He then proceeded to say that, as the church was in sin, it ought to give up its possessions and return to evangelical poverty. Such disendowment was, in his view, to be carried out by the state, and particularly by the king. These politico-ecclesiastical theories, devised with ingenuity and written up at inordinate length, may be criticized as the work of a theorizer with a limited sense of what was possible in the real world. Exhibiting an ingenuousness and lack of worldly wisdom, he became a tool in the hands of John of Gaunt (1340-99), duke of Lancaster and a younger son of Edward III, who, from motives less scrupulous than those of Wycliffe, was opposed to the wealth and power of the clergy.

Wycliffe preached acceptably in London in support of moderate disendowment, but the alliance with Gaunt led to the displeasure of his ecclesiastical superiors, and he was summoned to appear before them in February 1377. The proceedings broke up in disorder, and Wycliffe retired unmolested and uncondemned. That year saw Wycliffe at the height of his popularity and influence. Parliament and the King consulted him as to whether or not it was lawful to keep back treasure of the kingdom from Rome, and Wycliffe replied that it was. In May, Pope Gregory XI issued five Bulls against him, denouncing the errors of his politico-ecclesiastical theories and calling for his arrest. The call went unanswered, and Oxford refused to condemn its outstanding scholar. Wycliffe's last political appearance was in the autumn of 1378 when, after Gaunt's men killed an insubordinate squire who had taken refuge in Westminster Abbey, he pleaded for the crown before Parliament against the Right of Sanctuary. Wycliffe defended the action on the ground that the king's servants might lawfully invade sanctuaries to bring criminals to justice.

Wycliffe's attack on the church. He returned to Lutterworth and, from the seclusion of his study, began a systematic attack on the beliefs and practices of the church. Theologically, this was facilitated by a strong predestinarianism that enabled him to believe in the 'invisible" church of the elect, constituted of those predestined to be saved, rather than in the "visible" church of Rome—that is, in the organized, institutional church of his day. But his chief target was the doctrine of transubstantiation—that the substance of the bread and wine used in the Eucharist is changed into the body and blood of Christ. As a Realist philosopher—believing that universal concepts have a real existence—he attacked it because, in the annihilation of the substance of bread and wine, the cessation of being was involved. He then proceeded on a broader front and condemned the doctrine as idolatrous and unscriptural. He sought to replace it with a doctrine of remanence (remaining)-'This is very bread after the consecration' combined with an assertion of the Real Presence in a noncorporeal form.

Meanwhile, he pressed his attack ecclesiastically. The Pope, the cardinals, the clergy in remunerative secular employment, the monks, and the friars were all castigated in language that was bitter even for 14th-century religious controversy. For this exercise, Wycliffe was well equipped. His restless, probing mind was complemented by a quick temper and a sustained capacity for invective. Few writers have damned their opponents' opinions and sometimes, it would appear, the opponents themselves, more comprehensively.

Yet most scholars agree that Wycliffe was a virtuous man. Proud and mistaken as he sometimes was, he gives an overall impression of sincerity. Disappointed as he may have been over his failure to receive desirable church posts, his attack on the church was not simply born of anger. It carried the marks of moral earnestness and a genuine desire for reform. He set himself up against the greatest organization on earth because he sincerely believed that organization was wrong, and if he said so in abusive terms he had the grace to confess it. Neither must his ingenuousness be forgotten. There was nothing calculated about the way in which he published his opinions on the Eucharist, and the fact that he was not calculating cost him—in all probability—the support of John of Gaunt and of not a few friends at Oxford. He could afford to lose neither.

Translation of the Bible. From August 1380 until the summer of 1381, Wycliffe was in his rooms at Queen's College, busy with his plans for a translation of the Bible and an order of Poor Preachers who would take Bible truth to the people. (His mind was too much shaped by Scholasticism, the medieval system of learning, to do the latter himself.) There were two translations made at his instigation, one more idiomatic than the other. The most likely explanation of his considerable toil is that the Bible became a necessity in his theories to replace the discredited authority of the church and to make the law of God available to every man who could read. This, allied to a belief in the effectiveness of preaching, led to the formation of the Lollards. The precise extent to which Wycliffe was involved in the creation of the Lollards is uncertain. What is beyond doubt is that they propagated his controversial views.

In 1381, the year when Wycliffe finally retired to Lutterworth, the discontent of the labouring classes erupted in the Peasants' Revolt. His social teaching was not a significant cause of the uprising because it was known only to the learned, but there is no doubt where his sympathies lay. He had a constant affection for the deserving poor. The archbishop of Canterbury, Simon of Sudbury, was murdered in the revolt, and his successor, William Courtenay (1347-96), a more vigorous man, moved against Wycliffe. Many of his works were condemned at the synod held at Blackfriars, London, in May 1382; and at Oxford his followers capitulated, and all his writings were banned. That year, Wycliffe suffered his first stroke at Lutterworth; but he continued to write prolifically until he died from a further stroke in December 1384.

Assessment. It is no wonder that such a controversial figure produced—and still produces—a wide variety of reactions. The monks and friars retaliated, immediately and fiercely, against his denunciations of them, but such criticism grew less as the Reformation approached. Most of Wycliffe's post-Reformation, Protestant biographers see him as the first Reformer, fighting almost alone the hosts of medieval wickedness. There has now been a reaction to this, and some modern scholars have attacked this view as the delusion of uncritical admirers. The question "Which is the real John Wycliffe?" is almost certainly unanswerable after 600 years.

Wydeville, Anthony: see Rivers, Anthony Woodville, 2nd Earl.

At most points there is only a narrow strip of farmland between peaty moorlands. Near Rhayader the Wye is joined by the Elan, the upper valley of which has been dammed to form reservoirs for supply of water to Birmingham. Passing Builth Wells, it bends to the northeast at Aberllynfi to skirt the Black Mountains and enters England at Hay. At Hereford it is joined from the north by the Lugg and meanders in a mature valley to Ross. Below Ross it repeatedly engages in the Forest of Dean plateau in deeply entrenched meanders that provide impressive scenery and spectacular viewpoints, notably at Symonds Yat (an opening or pass). Passing the ruins of Tintern Abbey, it enters its tidal estuary at Chepstow. Below Monmouth the river forms the historic frontier between England and Wales. The Wye has rich salmon fisheries.

Wyeth, Andrew (Newell) (b. July 12, 1917, Chadds Ford, Pa., U.S.), U.S. watercolourist and worker in tempera noted primarily for

"Christina's World," tempera on gesso panel by Andrew Wyeth, 1948; in the Museum of Modern Art, New York City

Wydeville, Richard: see Rivers, Richard Woodville, 1st Earl.

Wye, River, river in England and Wales, about 130 mi (210 km) long. It flows from the moorlands of central Wales, generally southeastward through England to its Irish Sea mouth in the Severn Estuary. It is one of the major rivers of Britain.

The Wye rises on the eastern slopes of the uplands of Plynlimon, and its upper valley, which has been glaciated, is deeply cut in the ancient grits and shales of the Welsh upland.

The River Wye curving through Symonds Yat, Hereford and Worcester

painting in a realistic manner the old buildings, the fields and hills, and the people of his private world.

Wyeth's father, N.C. Wyeth, was a wellknown illustrator who had studied under Howard Pyle (q.v.) and who served as his son's only teacher. Andrew Wyeth presented his first one-man show in New York City in 1937. The subject matter of Wyeth's pictures comes almost entirely from two localities, the Brandywine Valley around Chadds Ford and the area near his summer home in Cushing, Maine. Wyeth uses a restricted palette mostly of earth colours but capable of hundreds of muted harmonies. His technique is precise and detailed, yet he lifts his paintings above photographic naturalism with an unreal, visionary quality. His best known painting, "Christina's World" (1948: Museum of Modern Art. New York City), exemplifies his mastery of unusual angles of perspective and his use of light to pinpoint time. Other works include The Trodden Weed" (1951), said to have appealed to the former Soviet leader Nikita Kruschev, and "Nicholas" (1955), admired by U.S. Pres. Dwight D. Eisenhower. Wyeth was the first painter to receive the Presidential Freedom Award (1963) conferred by U.S. Pres. John F. Kennedy. In 1977 he became the first American artist since John Singer Sargent to be elected to the French Académie des Beaux-Arts, and in the next year he became an honorary member of the Soviet Academy of the Arts. In 1980 he became the first living American artist to be elected to Britain's Royal Academy. His exhibition at the Whitney Museum in New York City in

1967 established a new attendance record for that institution.

Wyeth's technical resources are remarkable, but more important are his insight into the accretions of living that have left their mark on the people he paints, his instinct for the bones of the land in his outdoor pictures, and his ability to convey a sense of generations of living in his paintings of old houses and their interiors.

Wykeham, William of, Wykeham also spelled WICKHAM (b. 1324, Wickham, Hampshire, Eng.—d. Sept. 27, 1404, Bishops Waltham, Hampshire), English prelate and

Wykeham, cast of a dripstone head, late 14th century; from the east wall of the chapel of Winchester College, England

By courtesy of the Warden and Fellows of Winchester College, England; photograph, Courtauld Institute Galleries, London

statesman, the founder of Winchester College and of New College, Oxford.

Wykeham evidently came from a very poor family. Wealthy patrons helped him obtain an education, and about 1356 he entered the service of King Edward III. By the mid-1360s he was the King's most trusted assistant. In 1367 he was made chancellor of England and bishop of Winchester, but he lost the former post (1371) in an anticlerical reaction led by the powerful John of Gaunt, duke of Lancaster. He then became a bitter opponent of Gaunt, who had assumed control of the government of the senile king Edward. Gaunt retaliated by hounding Wykeham with charges of corruption. The Bishop received a royal pardon on the accession of King Richard II, whom he served as chancellor from 1389 to 1391.

Meanwhile, Wykeham was working to found his educational institutions. He built New College, beginning in 1380, and in 1382 he founded at Winchester a school (see Winchester College) to prepare boys for study at New College.

Wyler, William (b. July 1, 1902, Mulhouse, Fr.—d. July 27, 1981, Beverly Hills, Calif., U.S.), U.S. director of motion pictures noted for their sensitive portrayal of character.

The son of a Swiss-born merchant in Alsace, Wyler attended the École Supérieure de Commerce in Lausanne, Switz., and the Paris Conservatoire. In New York City he worked in the foreign publicity office of Universal Pictures in 1920–21. He then moved to Hollywood, working as an office boy, property boy, script clerk, assistant casting director, assistant director, and, finally, director of more than 50 westerns between 1925 and 1927.

Counsellor-at-Law (1933) established his reputation as a serious director and initiated a series of box-office successes that included These Three (1936), Dodsworth (1936), Dead

End (1937), Jezebel (1938), Wuthering Heights (1939), The Westerner (1940), The Letter (1940), and The Little Foxes (1941). Wyler developed a characteristic style based on varying the pictorial composition within each frame to create visual variety. Mrs. Miniver (1942) won him an Academy Award, as did two later films—The Best Years of Our Lives (1964) and Ben Hur (1959). During World War II he directed outstanding documentary films such as The Memphis Belle (1944) and Thunderbolt (1945). In the years following the war, his most highly acclaimed pictures included Roman Holiday (1953), The Big Country (1958), The Collector (1965), and Funny Girl (1968).

Wylie, Elinor, née ELINOR MORTON HOYT (b. Sept. 7, 1885, Somerville, N.J., U.S.—d. Dec. 16, 1928, New York City), U.S. poet and novelist whose work, written from an aristocratic and traditionalist point of view, reflected changing American attitudes in the aftermath of World War I.

Wylie came from a prominent Philadelphia family. In New York literary circles she was noted for her beauty as well as for her writing. Her work included four volumes of poetry and four novels. Her poetry, carefully structured and sensuous in mood, shows the influence of 16th- and 17th-century English poetry. Her novels combine gentle fantasy and classical formality with thoroughly researched historical settings. *The Orphan Angel* (1926) imagines the life of the English poet Percy Bysshe Shelley if he had been rescued from drowning and taken to America. Her third husband, William Rose Benét, edited her *Collected Poems* (1932), *Collected Prose* (1933), and *Last Poems* (1943).

Wyndham, most northerly seaport of Western Australia, at the mouth of the King River, on the West Arm of Cambridge Gulf (an inlet of Joseph Bonaparte Gulf of the Timor Sea). Founded in 1885 as a port for the Kimberley goldfield, it was named after the son of Sir Napier Broome, governor at the time. In 1919 the state government selected Wyndham as the site of a meatworks, which now serves the cattle stations of Wyndham-East Kimberley shire. Some crops are grown on irrigated flats bordering the nearby Ord River (q.v.). Terminus of the Great Northern Highway from Perth (2,017 mi [3,246 km] southwest), Wyndham is linked by a dry-season road to the Stuart (transcontinental) Highway at Katherine (N. Terr.). The population fluctuates seasonally, as a major employer is the seasonal meatworks. Pop. (1981) 1,509.

Wyndham, George (b. Aug. 29, 1863, London—d. June 8, 1913, Paris), British Conservative Party politician and man of letters who, as chief secretary for Ireland, was responsible for the Irish Land Purchase Act of 1903, also known as the Wyndham Land Purchase Act, which alleviated the problem of Irish farm ownership with justice to landlords as well as to peasants.

Handsome, athletic, brilliant in conversation, and exceedingly popular, Wyndham was an enthusiast of the British Empire, High Church Anglicanism, and government by a traditional aristocracy. From 1887, when he became the private secretary of Arthur James Balfour, he was a disciple of that future prime minister. Elected to the House of Commons in 1889, he spent much of the next nine years in writing for W.E. Henley's weekly newspapers and in editing (1895–96) Sir Thomas North's translation of Plutarch's *Lives* and a volume (1898) of Shakespeare's poems.

After serving as under secretary at the War Office (1898–1900), Wyndham, through Balfour's influence, became chief secretary for Ireland (Nov. 7, 1900). His 1903 statute, by applying British government funds to Irish land transfers, made the sale of small holdings and even whole estates profitable to land-

lords while guaranteeing purchase terms that peasant tenants could meet. Two years later (March 6, 1905) Wyndham resigned, either because of ill health or because the Conservatives thought that he approved a plan of Sir Antony (afterward Baron) MacDonnell, permanent under secretary for Ireland, which called for a kind of Home Rule compromise called devolution—a limited central administration by Irishmen but no Irish Parliament independent of Westminster.

Wyndham, John, pseudonym of John WYNDHAM PARKES LUCAS BEYNON HARRIS (b. 1903, Birmingham, Warwickshire, Eng.—d. March 11, 1969, London), English science fiction writer who was less concerned with fiction than with the ethical codes.

Educated in Derbyshire, Wyndham tried his hand at various jobs, from farming to advertising. During the mid-1920s he wrote short stories for various U.S. pulp magazines, but not until after World War II did he publish his first novel, *The Day of the Triffids* (1951), which quickly established him as a science fiction writer.

His work includes The Kraken Wakes (1953), The Chrysalids (1955), The Midwych Cuckoos (1957; filmed as The Village of the Damned, 1960), and The Trouble with Lichen (1960). His short stories are collected in Consider Her Ways (1961) and The Seeds of Time (1969).

Wyndham, Sir William, 3RD BARONET (b. 1687, Orchard Wyndham, Somerset, Eng.—d. June 17, 1740, Wells, Somerset), English Tory politician, a close associate of Henry Saint John, 1st Viscount Bolingbroke.

A member of Parliament (1710-40), he was appointed secretary of war in 1712, chancellor of the Exchequer in 1713, and head of the Treasury in 1714, all at Bolingbroke's behest. He was privy to Bolingbroke's intrigues with James Edward, the Old Pretender, and became head of the English Jacobites. He was eventually arrested (September 1715), and, although he escaped, he then voluntarily surrendered, and no proceedings were taken against him. Soon afterward Bolingbroke severed relations with the Pretender, and from 1716 sought to reinstate himself with the English ministry by sending an open letter to Wyndham, painting an ignominious picture of the exiled Jacobite court, and persuading Wyndham to break with them.

Bolingbroke never regained his seat in the House of Lords, and after he had recovered his property in England (1725), Wyndham became his political mouthpiece and the leader of an opposition to Robert Walpole. From 1726 onward this opposition, composed of Tories and discontented Whigs, made great noise with its propaganda, but its parliamentary performance was generally disappointing, though Wyndham himself was a popular leader. In the 1730s Wyndham and Bolingbroke supported Frederick Louis, prince of Wales, in his quarrels with his father, King George II. They also attacked Walpole's foreign policy, but when the tide was turning against Walpole, Wyndham's death in 1740 weakened the cohesion of the combined opposition.

Wynfrid, also spelled WYNFRITH: see Boniface, Saint.

Wynn, Ed, byname of ISAIAH EDWARD LEOPOLD (b. Nov. 9, 1886, Philadelphia—d. June 19, 1966, Los Angeles), U.S. comedian and actor in vaudeville, theatre, and motion pictures and on radio and television. He was also a producer, author, and songwriter.

Wynn made his professional debut with the Thurber-Nasher Repertoire Company in Norwich, Conn., in 1902 and acquired the nickname of the Perfect Fool from a revue of the same name in 1921—a production that he wrote, directed, produced, and starred in. He also toured and finally broadcast this revue (the first complete Broadway show to

be done on radio). Many similarly successful shows followed. During the 1930s he starred in a nationwide radio show, and his voice became familiar to millions of listeners. His style of comedy on stage and in motion pictures, however, was highly visual, often involving the use of bizarre costumes and exaggerated, madcap mannerisms and sight gags. His early films included Rubber Heels (1927), Follow the Leader (1930), and The Chief (1933).

Wynn turned to dramatic acting in the 1950s, playing in Requiem for a Heavyweight (winner of television's 1956 Emmy Award) and in the film The Diary of Anne Frank (1959), for which he was nominated for an Academy Award. His later motion pictures included The Greatest Story Ever Told (1965) and Mary Poppins (1964). His son, Keenan Wynn (1916–86), became a well-known actor and his grandson, Tracy Keenan Wynn, a screenwriter.

Wynne (o Lasynys), Ellis (b. March 7, 1671, Y Lasynys, Merioneth, Wales—d. July 13, 1734, Llanfair, Merioneth), clergyman and author whose Gweledigaetheu y Bardd Cwsc (1703; "Visions of the Sleeping Bard") is generally considered the greatest Welsh prose classic. An adaptation of Sir Roger L'Estrange's translation of the Spanish satirist Quevedo's Sueños (1627; "Visions"), savage pictures of contemporary evils, it followed its original closely. Wynne, however, used colloquial language and transmuted the characters and the scenery of the Spanish work into Welsh characters and scenery of the later 17th century. More than 30 Welsh editions and several English translations of the text exist.

Educated at the University of Oxford, he practiced law before becoming a rector (Llandanwg, 1704, and Llanfair-juxta-Harlech, 1711, both in Merioneth). Other major works include *Rheol Buchedd Sanctaidd* (1701, a translation of *The Rule and Exercises of Holy Living* by Jeremy Taylor) and several hymns and carols.

Wyntoun, Andrew of (b. c. 1350—d. c. 1423), Scottish chronicler whose *Orygynale Cronykil* is a prime historical source for the later 14th and early 15th centuries and is one of the few long examples of Middle Scots writing.

Wyntoun was a canon of St. Andrews, and, from about 1393 to his retirement because of old age in 1421, he served as prior of St. Serf's, Loch Leven (Kinross, Scotland). Written for Sir John Wemyss of Leuchars, Fife, his chronicle is a long (nine books) and prosaic vernacular compendium in octosyllabic couplets that traces the history of mankind (especially in Scotland) from the creation up to 1420. Wyntoun drew freely on ancient monastic records, Latin chronicles, standard ecclesiastical authorities, and other Scottish chronicles. The Orvgynale Cronykil is the original source for the encounter between Macbeth and the weird sisters that appears in Shakespeare's Macbeth. It is valuable for its account of the death of the Scottish hero Robert Bruce.

Wynyard, town, northern Tasmania, Australia, at the mouth of the River Inglis on Bass Strait. Founded in 1841, it was made a municipality in 1856 and named Table Cape for a high promontory (380 feet [116 m]) to the south. It was gazetted a town in 1861, when its name was changed to honour Major General Edward Wynyard, commander in chief in 1850 of British forces in Van Diemen's Land (now Tasmania). Located on a rail line and the Bass Highway to Launceston (80 miles [130 km] southeast) and near the Waratah Highway link to the west coast, Wynyard is a service centre for a dairy, vegetable, and mixed-farming district. It has a vegetable cannery and cheese, butter, and bacon factories. A small fishing fleet operates from its port. Pop. (1986 prelim.) 4,705.

Wyoming, mountain state of the western United States, bounded on the north and northwest by Montana, on the east by South Dakota and Nebraska, on the south by Colorado, southwest by Utah, and west by Idaho. The capital is Chevenne.

A brief treatment of Wyoming follows. For full treatment, see MACROPAEDIA: United

States of America: Wyoming.

Wyoming was populated chiefly by the Shoshoni and Arapaho Plains Indians in 1743, when white explorers first are known to have entered the area from Canada. The first certain white American explorer strayed from the Lewis and Clark expedition in 1806–07. The historic Oregon and Overland trails (and others) crossed through Wyoming, most of which came under U.S. control first as part of the Louisiana Purchase (smaller portions were acquired from Mexico and Great Britain). Later the territory was divided among the Dakota, Nebraska, and (a small segment) Washington territories, until the first transcontinentalrailroad train reached Cheyenne in 1867 and the Wyoming Territory was created in 1868. Wyoming was admitted as a state in 1890 with Cheyenne as its capital. It enfranchised women in 1869 and enshrined the principle in its 1889 constitution, the first state to do so; in 1925 it elected the first woman governor in the United States. Until 1876, when the Plains Indians were decisively defeated, white set-tlement was confined to southern Wyoming. Subsequently ranching became the principal industry until it was displaced by mining in the mid-20th century.

Eastern Wyoming is the westernmost extension of the Great Plains, with the Black Hills rising in the northeast to dominate the quarter. Northward-trending mountains separated by basins and valleys dominate the western three-fourths of the state and give it the second highest mean elevation in the United States-6,700 feet (2,040 m). The most prominent ranges of the Rocky Mountains are the Big Horn, the Tetons, and the Wind River, culminating in Wyoming's highest point, Gannett Peak, 13,804 feet (4,207 m) in the Wind River Range. The Continental Divide follows the Sierra Madre Range, splits around the Great Divide Basin, then passes over the Wind River Range northward over the Washakie Mountains and Yellowstone National Park into Montana. About three-fourths of Wyoming's rivers drain eastward into the Missouri-Mississippi system, while the rest drain westward into the Snake-Columbia system or southward into the Green-Colorado system. Several of the rivers have been dammed for hydroelectric power. The largest lake is Yellowstone Lake in Yellowstone National Park

Wyoming has a continental semiarid climate, with substantial temperature and precipitation variation. January mean temperatures range from a low of 10° F (-12° C) in the mountains to 28° F (-2° C) in the southeast. Mean July temperatures range from 50° F (10° C) in the mountains to 75° F (24° C) in the Big Horn Basin in north-central Wyoming. Annual precipitation varies from 4 inches (100° mm) in the desert areas of the southwest to much greater amounts in the mountains, where annual snowfall can surpass 200° inches (5.100° mm).

Wyoming's population density is one of the lowest in the United States. An increase in population of more than 50 percent in the 1970s, largely because of expanding mining activity, reversed in the 1980s in response to a downturn in the oil industry. Since 1950 the urban population has surpassed the rural, with more than half living in the southeastern quarter of the state. The three largest cities, Casper, Cheyenne, and Laramie, contain about one-fourth of the population. Indians now make up less than 2 percent of the population and live mainly on the Wind River reservation. Whites and Hispanics comprise more than 95

percent of the population, and distinct ethnic groups include Mexicans, Scandinavians, Italians, and Germans.

Agriculture is limited by a lack of water and by temperature extremes, although the soils of the plains and mountains are generally fertile. Less than 5 percent of the land is cropped, of which nearly two-thirds is irrigated. Barley, wheat, corn (maize), hay, oats, sugar beets, dry beans, and potatoes are the leading crops. Grassland pastures occupy about 38 percent of the land, and Wyoming ranks high nationwide in sheep rearing, mainly for wool. Beef cattle are raised in quantity, and apiculture is also important. Forests are limited to mountain areas, but they support a developed lumbering industry. Mining has rapidly expanded and has become the leading component of the state's economy. Wyoming is among the nation's leaders in coal, petroleum, natural-gas, uranium, bentonite, and trona (for soda ash), and iron-ore production. Manufacturing is limited to petroleum refining, chemicals, fertilizer, and glass, but the state is a major producer of electrical energy, both hydroelectric and thermal, much of which it exports. Tourism is important, centring on the state's national parks-including Yellowstone, the first in the United States, and the Grand Teton, Flaming Gorge, and Big Horn national parks-and national forests and privately owned dude ranches. Camping, swimming, fishing, hunting, and hiking, as well as skiing and other winter sports attract millions of visitors annually just to the national parks and forests.

Wyoming's highways, railways, and air transport systems are widely used, and there are more than 100 airports throughout the state. The University of Wyoming, at Laramie, is supplemented by two-year community colleges. Cultural events include the annual state fair at Douglas, Jubilee Days at Laramie, Frontier Days at Cheyenne, county fairs and rodeos, various Indian festivities, and the Grand Teton Music Festival (summer) at Jackson Hole, where there is a resident community of artists, writers, and musicians. Area 97,809 square miles (253,326 square km). Pop. (1990 est.) 502,000.

Wyoming Massacre (July 3, 1778), during the United States War of Independence, killing of 360 American settlers in the Wyoming Valley of Pennsylvania, part of the steppedup British campaign of frontier attacks in the West. In early June, Colonel John Butler led a force of 1,000 Loyalists and Iroquois allies against the 5,000 inhabitants of the valleymostly American women and children gathered at Forty Fort. About 300 men and boys left the protection of the fort to meet the attackers. In the massacre that followed, 360 men, women, and children lost their lives, and many others who escaped to the forests died of starvation or exposure. Butler's forces then moved northward to continue the raids along the frontier settlements of New York, eventually leading to a more aggressive American action against the Iroquois.

Wyong, town, eastern New South Wales, Australia, on the Wyong River, immediately west of the Tuggerah Lakes (coastal lagoons). The district was settled in 1823 for the purpose of exploiting its cedar trees. As the forests were removed, agricultural activities increased, with citrus groves being planted after 1887. The town, proclaimed in 1888, derived its name from an Aboriginal word meaning "place of running water." Wyong, a municipality since 1957, serves an area of mixed farming (dairying, fruit and vegetable growing, seed processing, and poultry raising), rutile and zircon mining, and lumbering. Industries include sawmilling,

fruit packing, and brickmaking. Situated on the main northern rail line (from Sydney, 45 mi [72 km] southwest) and on the Pacific Highway, Wyong is the chief town of the Tuggerah Lakes resort region. The locality yields significant catches of fish and prawns. Pop. (1981) 3,902.

Wyre, district (borough), county of Lancashire, northwestern England, with an area of 109 sq mi (283 sq km), bordering on the Irish Sea north and east of the resort borough of Blackpool. The district, named for the River Wyre which rises in the district and drains it, is generally a low coastal plain; formerly occupied by pockets of marshland, much of the plain has been reclaimed and is now intensively cultivated. Extensive sand beaches have formed offshore of the town of Fleetwood at the mouth of the Wyre in the northwest. The eastern limits of the district extend into the moor uplands of the Pennines. Most of the population is concentrated near the Irish Sea at Fleetwood, Thornton Cleveleys, and Poulton-le-Fylde. Fleetwood is the major fishing port on the west coast of England and is an important port for containerized shipping. It has regular seasonal ferry service to the Isle of Man. Fleetwood is also a holiday retreat. Seaside promenades there and at Thornton Cleveleys are favored by retired people. Chemicals, plastics, and leather goods are the principal products manufactured at Fleetwood. Poulton-le-Fylde is both the local agricultural market centre and district seat. Pop. (1983 est.) 98,400.

Wyre Forest, district, county of Hereford and Worcester, western England, occupying an area of 76 sq mi (196 sq km) in the northern part of the county. Wyre Forest district, named after the remnant woodlands extending across its northwestern boundary with the county of Shropshire (formerly Salop), is a pastoral area of parts of the Stour and Severn river valleys. The rivers and the historically important Staffordshire and Worcestershire Canal merge at the parish (town) of Stourport-on-Severn, the district seat, at the southern tip of the district. Stourport-on-Severn and the old town of Bewdley (also on the Severn) were, during different eras, terminal points of navigation between the Bristol Channel and the Birmingham area. Today the extensive river frontage of the towns is used for recreational purposes. Kidderminster, on the River Stour 3 mi (5 km) north of Stourport-on-Severn, is the birthplace of Sir Rowland Hill, the originator (1840) of Britain's former Penny Post system. It is the principal centre (since 1735) of the British carpet industry; other industries produce electrical equipment, chemicals, and refined sugar.

Stourport, one of England's towns built specifically to accommodate the needs of the canal era, retains many original houses and warehouses dating back to the 18th century; it is occasionally referred to as the "Venice of the Midlands." Pop. (1983 est.) 92,200.

Wyrtgeorn (ancient British king): see Vortigern.

Wyspiański, Stanisław (b. Jan. 15, 1869, Kraków, Pol.—d. Nov. 28, 1907, Kraków), dramatist and painter, considered the creator of modern Polish drama. In his plays, themes from Greek mythology and Polish history are blended to produce a new and highly original form of drama.

Wyspiański's early education included classical literature and fine arts. In 1890 he received a grant, enabling him to visit the art cities of western and central Europe; between 1890 and 1894 he paid several visits to Paris. His first published work, *Legenda* ("A Legend"), a dramatic fantasy, appeared in 1897. It was fol-

Wyspiański, self-portrait; in the Muzeum Narodowe, Kraków, Poland By courtesy of the Muzeum Narodowe, Krakow, Poland

lowed by two tragedies after the Greek pattern, Klatwa (1899; "The Malediction") and Sedziowie (1900; "The Judges"), and Kazimierz Wielki (1900), a poem on patriotic themes. Wesele ("The Wedding"), his greatest and most popular play, was premiered in 1901. Its story was suggested by the actual marriage of the poet Lucjan Rydel to a beautiful peasant girl in a village near Kraków. The marriage is used symbolically to present a sweeping panorama of Poland's past, present, and future. The great emotional and political impact of Wesele shook Kraków at its first performance; the drama was later staged throughout Poland. A successor play, Wyzwolenie ("Liberation"), published two years later, contained ideological commentary on Wesele

In 1905 Wyspiański was appointed professor at the Kraków Academy of Fine Arts. His paintings, especially his designs for stained-glass windows, reveal his genius for dramatic and visionary composition.

Wyss, Johann Rudolf (b. March 4, 1782, Bern—d. March 21, 1830, Bern), folklorist, editor, and writer, remembered for his collections of Swiss folklore and for his completion and editing of his father's novel Swiss Family Robinson.

Wyss became professor of philosophy at the academy at Bern in 1805 and later chief librarian of the municipal library. He was a collector of Swiss tales and folklore, published in Idyllen, Volkssagen, Legenden und Erzählungen aus der Schweiz (1815). He also edited the Alpenrosen almanac (1811-30), with the collaboration of the best Swiss writers of his time. One of his most important contributions was the completion and editing of Der schweizerische Robinson (1812-27), a manuscript originally written by his father, Johann David Wyss, a pastor attached to the minister in Bern, for and with his four sons. Translated into English as Swiss Family Robinson in 1814 and into many other languages, the book became one of the most widely popular novels ever written. Wyss was also the author of the Swiss national anthem, "Rufst du, mein Vaterland" (1811).

Wyszyński, Stefan (b. Aug. 3, 1901, Zuzela, Pol., near Łomża, Russian Empire—d. May 28, 1981, Warsaw), Polish archbishop of Gniezno and Warsaw and primate of Poland.

After study at Warsaw, Łomża, and Włocławek, Wyszyński was ordained on his 23rd birthday, Aug. 3, 1924, and was assigned to the basilica at Włocławek. After gaining a doctorate in sociology and ecclesiastical law at the Catholic University of Lublin, he studied further in France, Italy, and Belgium. Back in Poland, he founded the Christian Workers University in 1935 and directed it until 1939, when the Nazi and Soviet forces invaded Poland. Shortly after, his bishop, Msgr. Michał Kozal, ordered him to leave Włocławek, and he thus escaped the fate of 1,811 Polish priests, including his own bishop, who perished in German concentration camps.

He returned to Włocławek as rector of the

seminary in March 1945; one year later he was appointed bishop of Lublin, and on Nov. 12, 1948, Pope Pius XII transferred him to the primatial see of Gniezno and, ad personam, of Warsaw. On Nov. 29, 1952, he was named cardinal but was unable to go to Rome to receive formal investiture with a cardinal's red hat until 1957. Meanwhile, although he had signed a coexistence agreement with the Communists, he refused to lend the church's authority to the regime's many acts of persecution.

In 1953, during the last repressive spasm of the Stalinist period, he was put under house arrest without trial when the government claimed that he had violated a pledge that the church would punish priests who engaged in anti-government activity. In 1956, shortly after Władysław Gomułka came to power, the Cardinal was released. He concluded an agreement with Gomułka that allowed religious instruction in state schools provided that Communist approval was sought over appointments to higher church offices. szynski's compromise defused a crisis that might have culminated in Soviet invasion and repression, as occurred at that time in Hungary, Gomułka's and Wyszynski's uneasy accord continued even under Gomułka's successor, Edward Gierek, although the Cardinal lent cautious support to such Polish move-ments as the Workers' Defense Committee, Solidarity, and Rural Solidarity, which sought greater freedom from the late 1970s onward. Doctrinally he was a strong conservative. His last major act was to negotiate with the Polish authorities over the visit of Pope John Paul II to Poland in 1979.

Wythe, George (b. 1726, Elizabeth City County, Va.—d. June 8, 1806, Richmond, Va., U.S.), jurist, one of the first U.S. judges to state the principle that a court can invalidate a law considered to be unconstitutional. He also was probably the first great American law teacher, whose pupils included such well-known figures as Thomas Jefferson, John Marshall, and Henry Clay.

Admitted to the bar in 1746, Wythe was a member (1754-55, 1758-68) and clerk (1769-75) of the Virginia House of Burgesses. In 1764 he drew up a forceful remonstrance from Virginia to the British House of Commons against the Stamp Act. In 1776 Wythe, as a delegate to the Continental Congress, signed the Declaration of Independence. Also in that year he was appointed, with Jefferson, Edmund Pendleton, and George Mason, to revise the laws of Virginia. He was a member of the Constitutional Convention (1787) and of the Virginia convention (1788) that ratified the federal Constitution.

A chancery judge from 1778, Wythe became sole chancellor of Virginia in 1788. As an ex officio member of the state supreme court, Wythe, in the case of Commonwealth v. Caton (1782), asserted the power of courts to refuse to enforce unconstitutional laws.

The future President Jefferson studied law in Wythe's office, at Williamsburg, Va., in the 1760s. Appointed through Jefferson's influence, Wythe held (1779–89), at the College of William and Mary, the first U.S. professorship of law. One of his students there in 1780 was John Marshall, later chief justice of the United States. Wythe's appointment as chancellor of Virginia required him to resign from the college and move to Richmond, where he opened a private school of law. Among his pupils in Richmond, and clerk of his court, was the future U.S. senator Henry Clay.

Wythe died of poisoning. A grandnephew and heir, George Wythe Sweeney, was acquitted of the murder in a trial in which the only witness was, as a Negro, disqualified from testifying.

Wyżyna Małopolska (Poland): see Little Poland Uplands.

X-chair: see scissors chair.

x-disease: see hyperkeratosis.

X ray, any electromagnetic radiation of an extremely short wavelength produced by the deceleration of charged particles or the transitions of electrons in atoms. The wavelengths of X rays range from about 0.05 angstrom to hundreds of angstrom units (an angstrom unit is abbreviated A and is equal to 10^{-8} centimetre). Like other forms of electromagnetic radiation (gamma rays, ultraviolet, visible light, infrared, and radio waves), X rays have the same speed *in vacuo* (c, equal to 3×10^{10} centimetres per second [about 186,000 miles per second]) and show phenomena associated with its wavelike nature, such as interference, diffraction, and polarization.

X rays were discovered in Würzburg, Ger., on Nov. 8, 1895, by Wilhelm Conrad Röntgen. Röntgen made his discovery while investigating the effects of cathode rays that were produced by electrical discharges through gases at low pressures (cathode rays are electrons that are emitted from the negative electrode, or cathode, of the discharge tube). Although many scientists had studied the properties of cathode rays, Röntgen discovered an effect that had escaped these earlier investigatorsnamely, that a surface coated with barium platinocyanide placed outside a discharge tube would emit light (fluoresce) even when it was shielded from the direct visible and ultraviolet light of the gaseous discharge. He deduced that an invisible radiation from the tube passed through the air and fluoresced the screen. He named these strange new rays X rays to indicate their unknown nature.

General X-ray phenomena. When a beam of X rays passes through a material, the material becomes a source of secondary X rays and electrons; and, because of these secondary processes, a portion of the primary beam is absorbed. The intensity of the secondary radiations is weak compared with the intensity of the primary X-ray beam, and some of it, too, may not escape from the material.

Two types of secondary X rays are produced when a beam of X rays strikes a material. These are called scattered X rays, which are characterized by an energy that is nearly the same as the primary beam, and fluorescence X rays, which are less energetic than the primary X rays. The scattered X rays are primary X rays that have had their direction (and possibly, to a small extent, their energy) altered by passing through the material. The fluorescence X rays are characteristic of the target material and do not change with change in wavelength of the primary beam as long as the primary-beam wavelength is short enough to excite the fluorescence.

The origin of the scattered X rays can be understood if the primary X rays are thought of as particles. An X-ray particle, called a photon, may be scattered (deflected) when it passes close to an electron. In a small number of these scattering processes the X ray will lose a portion of its energy to the electron.

The fluorescence X rays originate when electrons are ejected from some of the atoms of the target, leaving them in an ionized state i.e., deficient in electrons. As the atoms regain their normal energy state, energy may be liberated in the form of fluorescence X rays. The two main types of fluorescence X rays that can be excited in most of the elements are known as the K and L characteristic X rays. Characteristic X rays are emitted from all elements. The energy of these X rays increases in a regular manner in going from one element to the next in atomic number (nuclear charge). The $K \times X$ rays are the most energetic characteristic X rays emitted from an atom and are due to ejection of the most tightly bound electrons from the atom.

In addition to the emission of secondary X rays from a material when it is irradiated with

X rays, secondary electrons are also ejected. These are classified as recoil electrons and photoelectrons. The recoil electrons obtain energy from the primary X rays in a way that is given by the particle theory of X-ray scattering, whereas the photoelectrons are emitted by the same process that occurs in the photoelectric effect with light.

When X rays are absorbed in gases, they eject photoelectrons from the gas. These electrons in turn ionize the molecules of the gas, thereby amplifying the effect of the primary X rays. When these processes occur in living tissue, the photoelectrons emitted from the complex organic molecules destroy the cells of the tissue.

Dual nature of X rays. Early experiments with X rays presented evidence that is difficult to explain unless one thinks of X rays as consisting of waves. Other experiments, however, indicated that X rays consist of particles. This dual nature is not restricted to X rays; indeed, it is a general property of all forms of energy and matter. X rays (and the other forms of electromagnetic radiation) should be considered as both particles and waves; that is, as consisting of small packets of electromagnetic waves called quanta, or photons.

X rays as waves. According to classical electromagnetic theory, the deceleration of electrons will produce electromagnetic radiation, in the same way that accelerated electrons in a radio antenna produce radio waves. The failure of magnetic fields to deflect an X-ray beam seems to confirm this classical idea of the origin of X rays. Crucial evidence for the existence of waves is obtained if diffraction and interference phenomena are observed, which depend on the superposition of waves. In addition, if polarization effects are observed, the transverse (vibration at right angles to direction of propagation) nature of the waves is established. In the case of light, these effects were well known in 1895, when X rays were discovered. Röntgen's early experiments failed to observe these effects in the case of X rays.

In 1906 a British physicist, Charles Glover Barkla, demonstrated that when X rays are scattered in certain directions by a block of carbon they are polarized. From these experiments it appeared likely that X rays were transverse electromagnetic waves, perhaps of the same nature as light except for wavelength.

Many scientists attempted to show the wave nature of X rays by passing them through narrow slits and looking for diffraction fringes, and there was some evidence that X-ray wavelengths were about one angstrom. In 1912 a German physicist, Max Theodor Felix von Laue, conceived of a way of measuring the wavelength of X rays. Laue used the idea that, in crystals, atoms are regularly arranged throughout the crystal structure with spacings of about one angstrom (10⁻¹⁰ metre) and concluded that the atoms of a single crystal would serve as a grating for the diffraction of X rays. Laue's coworkers directed a narrow beam of X rays at a crystal of zinc sulfide and placed a photographic plate behind it. The resulting photograph consisted of a dark central spot and a complex but symmetrical pattern of dots; the central spot was the result of X rays passing directly through the crystal, whereas the dots were produced by diffraction from the atoms of the zinc sulfide crystal. These experiments established that X rays are waves with wavelengths on the order of one angstrom and confirmed that crystals have their atoms arranged in regular structures, called a lattice.

Shortly after Laue's experiment, an English physicist, William Lawrence Bragg, devised another technique for diffracting X rays. By considering how X rays are scattered from atoms in a crystal lattice, he concluded that, when an X ray of wavelength λ strikes a crystal of interplanar spacing d at an angle θ with respect to the crystal plane, constructive inter-

ference would occur when the product of an integer number n (called order of diffraction) times the wavelength is equal to twice the lattice spacing times the diffraction angle: $n\lambda$ = $2d \sin \theta$. This equation is known as Bragg's law and is the foundation on which X-ray crystaldiffraction spectrometers are based. Using this theory, Bragg obtained a distribution of the intensity of ionization in a detector as a function of angle. This distribution indicated that X rays consist of two types, a line spectrum characteristic of the target material in the tube and a continuous spectrum. From the crystal spacing d, which Bragg obtained from the geometry of the crystal lattice, the density of the crystal, and mass of a single atom, he was able to calculate the wavelengths of the characteristic X-ray lines and to show that these wavelengths varied approximately as the inverse square of the atomic weight of the absorber. These experiments confirmed the earlier results of Barkla, who, by using the fact that short-wavelength X rays are absorbed to a lesser extent than long-wavelength X rays, found two regions of strong maxima. In 1911 Barkla named the long-wavelength maxima the L series and the short-wavelength maxima the K series.

In 1923 the reflection of X rays from a polished surface of glass was demonstrated by an American physicist, Arthur Holly Compton. He found that, for angles of less than 10 minutes of arc, a strong reflected beam could be observed in the direction predicted by the specular-reflection law. The final proof of the wave nature of X rays, their diffraction by a ruled grating, was observed in 1925. Because the line spacing of a ruled grating is accurately known, this method has been used to determine the absolute value of X-ray wavelengths.

X rays as particles. The particle nature of X rays is graphically demonstrated in the photoelectric effect and the Compton effect. In an attempt to explain blackbody radiation (radiation from a theoretically perfectly nonreflecting, or completely absorbing [i.e., "black"] body), Max Planck postulated that energy is radiated in small packets, or quanta, with an energy given by hv, in which v is the frequency of the radiation and h is a constant (now called Planck's constant). One of the most important successes of Planck's postulate, in addition to explaining blackbody radiation, was its use by Einstein in explaining the photoelectric effect. In the photoelectric effect, absorbed electromagnetic radiation ejects an electron from the absorber. Einstein's photoelectric equation gives the kinetic energy, E_{kin} , of the emitted electron as the energy of the incident photon, hv, minus the work required to pull the electron out of the sample, \hat{W}_0 :

$$E_{kin} = hv - W_0.$$

Although this equation was first derived for light photons absorbed on metal surfaces, it also holds for X-ray photons if W_0 is the work required to eject the electron from a bound state of the atom.

A second series of experiments that demonstrated the particle nature of X rays was carried out in 1922-23 by Compton. Using an X-ray spectrometer, he measured the wavelength of X rays scattered from light elements. In addition to scattered X rays that had the same wavelength as the primary beam, he found a second, or "modified," peak at a longer wavelength. The intensity and wavelength of this second peak were functions of the scattering angle from the sample. The explanation of this effect (now known as the Compton effect) was given by Compton and independently by a Dutch scientist, Peter Debye. They proposed that a primary X-ray photon could be considered as a small ball that could collide with one of the electrons in the scattering material

in a manner similar to the collision of two smooth elastic balls of different mass. The photon would then lose some of its energy to the recoiling electron and would be of longer wavelength. By assuming that conservation of energy and momentum (mass times velocity) would hold in the collision between a photon and an electron, they were able to derive the shift of the wavelength of the scattered X ray to give the modified peak at higher wavelength.

Detection and measurement of X rays. A beam of X rays is characterized by its intensity and its spectral (energy) distribution, and a number of methods for measuring these properties have been developed.

There are two methods in general use for detecting X rays. The first method relies on the X rays producing a photochemical change in a photographic emulsion. The blackening of the film is related to the exposure, which is defined as the product of the X-ray intensity and the length of the exposure. The position and degree of blackening on film are determined by optical techniques.

The second method for detecting X rays relies on the ability of X rays either to ionize gases or solids or to produce fluorescence in a crystal. Detectors utilizing these phenomena are called electronic detectors. Electronic detectors come in a wide variety of forms, including the ionization chamber, scintillation counter, and solid-state detector (qq,v).

These devices produce a voltage pulse for every absorbed photon. By counting the number of voltage pulses, the number of photons can be determined. In addition, the voltage pulses from all of the devices can be used in conjunction with a pulse-height analyzer, an electronic device that counts pulses and sorts them according to energy, in order to obtain a spectral distribution.

The various counters described here have also been used as the detectors in X-ray diffraction spectrometers. An X-ray spectrometer basically consists of a source of X rays, a diffracting sample, and a detector system. If X rays of known wavelength are used, they can be used to study crystal structures. By using a diffracting crystal of known structure, X-ray spectrometers can be used for measuring X-ray spectra.

Applications of X rays. Because of the many varied properties of X rays, they have been applied to a wide range of medical, industrial, and scientific problems. Some of these are differential absorption, quantitative measurement of absorption, diffraction by crystals, fluorescence of characteristic radiation, and biological effects produced by X rays.

One of the earliest applications of X rays was to medicine, being used in both diagnosis and therapy. Diagnostics include the detection of bone fractures, foreign objects in the body, dental cavities, and diseased conditions such as cancer, whereas, in therapeutic treatment, X rays are used to stop the spread of malignant tumours.

In industry, X-ray radiographs are used to detect flaws nondestructively in castings that are inaccessible to direct observation and to measure the thickness of materials. X rays have been applied to a wide range of quantitative materials characterization problems. By measuring quantitatively the amount of absorption in a sample of known composition, the thickness can be determined. If the thickness of a sample is known, the absorption can be used to measure accurately its composition even if it contains two elements.

The fluorescence of X rays from a sample is used in many instruments for the qualitative and quantitative analysis of materials. The primary beam may be X rays, gamma rays, electrons, or other charged particles. The en-

ergy of the fluoresced X rays is characteristic of the materials contained in the sample. By using suitable standards, quantitative determinations can be made. This principle is used in the electron microprobe, in which a narrow electron beam (about 0.0001 centimetre [0.00004 inch] in diameter) is used to determine the constituents of a given area of a sample. X rays are used in scanning electron microscopy to obtain a "picture" of an elemental distribution in a sample. Also, Si(Li) detectors may be combined with a fluorescence source as energy analysis detectors for rapid material identification.

X-ray diffraction, a phenomenon in which the atoms of a crystal, by virtue of their uniform spacing, cause an interference pattern of the waves present in an incident beam of X rays. The atomic planes of the crystal act on the X rays in exactly the same manner as does a uniformly ruled grating on a beam of light. See also Bragg law; Laue diffraction pattern.

X-ray source, in astronomy, any of a class of cosmic objects that emit radiation at X-ray wavelength. Because the Earth's atmosphere absorbs X rays very efficiently, X-ray telescopes and detectors must be carried high above it by spacecraft to observe objects that produce such electromagnetic radiation.

A brief treatment of astronomical X-ray sources follows. For full treatment, *see* MACROPAEDIA: Cosmos.

Advances in instrumentation and improved observational techniques have led to the discovery of an increasing number of X-ray sources. By the late 20th century, thousands of these objects had been detected throughout the universe.

The Sun was the first celestial object determined to give off X rays; rocket-borne radia-tion counters measured X-ray emissions from its corona (outer atmosphere) in 1949. The Sun, however, is an intrinsically weak X-ray source, and it is prominent only because it is so close to the Earth. The unambiguous detection of X rays from other more distant ordinary stars was achieved 30 years later by the orbiting HEAO 2 satellite known as the Einstein Observatory. It detected more than 150 ordinary stars by the X-radiation from their coronas. The stars observed cover almost the entire range of star-types-main sequence, red giants, and white dwarfs. Most stars emit only an extremely small fraction of their energy in the form of X rays. Young, massive stars are the most powerful X-ray emitters. They usually occur in nebulas, and their hot coronal gases can expand to make a nebula itself a detectable X-ray source.

A more powerful type of X-ray source is a supernova remnant, the gaseous shell ejected during the violent explosion of a dying star. The first to be observed was the Crab Nebula, the remnant of a supernova explosion whose radiation reached the Earth in AD 1054. It is, however, a very atypical remnant because its X rays are synchrotron radiation produced by high-speed electrons from a central pulsar (q.v.). The X-radiation from most other supernova remnants emanates instead from hot gas. The gases ejected by a supernova explosion are relatively cool, but as they sweep outward at a speed of several thousand kilometres per second they accumulate interstellar gas. The strong shock wave heats this gas to a temperature high enough for X-ray emission—namely, about 10,000,000 K.

The most powerful X-ray sources in the Milky Way Galaxy are certain binary stars. These so-called X-ray binaries have an X-ray output 1,000 times as great as the Sun's output at all wavelengths. X-ray binaries account for most of the sources discovered during the initial years of X-ray astronomy, including Scorpius XR-1 (q.v.). A typical X-ray binary source consists of a close double star system in which one member is a very compact ob-

ject. This object may be a neutron star that contains approximately the mass of two Suns condensed into a sphere only about 20 km (12 mi) across, or alternatively an even more compact black hole, a collapsed star whose gravity is so strong that not even light can escape from it. As gas from the companion star falls toward the compact star, the latter swirls round into an accretion disk. Viscous processes in the disk convert the orbital energy of the gas into heat, and when sufficiently high temperatures are attained large amounts of X rays are emitted.

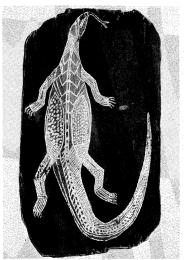

There are several types of X-ray binaries. In an X-ray pulsar, the gas is channeled to the poles of a neutron star and the radiation is given off as pulses in very regular periods. In objects known as bursters, a neutron star's magnetic field suspends the gas until the accumulated weight crushes the field temporarily and the falling gas emits a sudden burst of X rays. A transient occurs in stellar pairs in which the orbit is elongated and gas is only transferred occasionally (i.e., when the component stars are closest together). Astronomers generally classify the compact object in an X-ray binary as a neutron star unless its calculated mass exceeds three solar masses. In such cases, they identify the object as a black hole. Two very strong black hole candidates are Cygnus X-1 (six solar masses) and LMC X-3 (10 solar masses).

Nearby galaxies (e.g., the Andromeda Galaxy) are detected by the emission from constituent X-ray binaries. They are relatively weak sources compared to active galaxies, which fall into various categories such as radio galaxies, Seyfert galaxies, and quasars. These galactic types are all characterized by violent activity at their cores, usually explained as arising from an accretion disk of hot gases that surrounds a central black hole having a mass of about 1.000.000.000 Suns. The X-ray energy of these galaxies is highly variable. The quasar OX 169, for example, has been observed to vary substantially in X-ray output in less than two hours, implying that the region producing this radiation is less than two 'light-hours" across (i.e., smaller than the solar system).

Other powerful extragalactic X-ray sources are galaxy clusters. The X rays from a cluster do not come from its member galaxies but rather from a pool of hot gas between them, which is kept within the cluster by the galaxies' combined gravitational pull. The gas is typically at a temperature of 100,000,000 K, and it may have originated as hot gas ejected by numerous supernovas.

Finally, there is a diffuse background of X-radiation emanating from great distances and from all directions. Although it was discovered in 1962, its nature is still unclear. Such X-radiation could come from very tenuous gas that pervades the entire universe. Currently, however, most astronomers favour the idea that the background consists mainly of X rays from numerous quasars too remote to be observed individually.

X-ray style, manner of depicting animals by drawing or painting the skeletal frame and internal organs, one of the characteristic styles of the art of prehistoric hunting cultures. The origin of the style can be traced to the Mesolithic art of northern Europe, where the earliest examples were found on fragments of bone in southern France dating from the late Magdalenian Period. Animals painted in the X-ray motif have also been discovered in the art of hunting cultures in northern Spain, Siberia, the Arctic Circle, North America, western New Guinea, New Ireland, India, and Malaysia. It is found today primarily in the Aboriginal rock, cave, and bark paintings of eastern Arnhem Land, in northern Australia. Figures painted in X-ray style vary in size up to 8 feet (2.5 metres) in length and are

Painting on bark of a monitor lizard in X-ray style, by Baboa, from Arnhem Land, Australia; in the Städtisches Museum für Völkerkunde, Frankfurt am Main

By courtesy of the Stadtisches Museum fur Volkerkunde, Frankfurt am Main

delicate, polychromed renderings of the interior cavity of the animal. Images are known in which only the outline and skeleton of the bird, fish, or mammal are indicated, and the entire internal system of organs is expressed by a "life line," a single, horizontal line that runs from the animal's mouth to a dot representing the heart or stomach. Whether the depiction of an animal in the X-ray style had particular religious symbolism is not known.

X-ray telescope, instrument designed to detect and resolve X rays from sources outside the Earth's atmosphere. Because of atmospheric absorption, X-ray telescopes must be carried to high altitudes by rockets or balloons or placed in orbit outside the atmosphere. Balloon-borne telescopes are used to detect the more penetrating (harder) X rays, whereas those carried aloft by rockets or in satellites are used to detect softer radiation.

Several types of X-ray detectors have been used, involving Geiger counters, proportional counters, and scintillation counters. These detectors require a large collecting area, because celestial X-ray sources are remote and therefore weak, and a high efficiency for detecting X rays over the cosmic-ray-induced background radiation. Reflecting X-ray telescopes are constructed so that the highly penetrating rays strike the reflective surface at a grazing angle.

X-ray tube, also called ROENTGEN TUBE, vacuum tube that produces X rays by accelerating electrons to a high velocity with a highvoltage field and causing them to collide with a target, the anode. Because X rays can penetrate solid substances to varying degrees, they are applied in medicine and dentistry, in the exploration of the structure of crystalline materials, and in research. The tube consists of a source of electrons, the cathode, which is usually a heated filament, and an anode, usually of tungsten, which is enclosed in an evacuated glass envelope. The X-ray tube functions on the principle that X rays are produced wherever electrons moving at very high speeds strike matter of any kind. The X-ray tube design that became the prototype for subsequent devices was invented by the American engineer William D. Coolidge in 1913.

X trisomy, sex chromosome disorder of human females, in which three X chromosomes are present, rather than the normal pair. More common than Turner's syndrome, where only one X chromosome is present, X trisomy usually remains undetected because affected individuals appear normal, experience puberty,

and are usually fertile. Statistical studies suggest a slightly increased frequency of mental disturbance, retardation, or both.

Xai-Xai, formerly João Belo, port town, southern Mozambique, eastern Africa. Located on the eastern bank of the Limpopo River near its mouth, the town is a market centre for cashew nuts, rice, corn (maize), cassava, and sorghum raised in the surrounding area, which is irrigated by the lower Limpopo irrigation project; dairy cattle also are raised. A light railway system runs inland and provides access to the port, which has declined in importance since the silting in of its harbour and because of competition from truck transport. Xai-Xai is connected to Maputo, the capital of Mozambique, by the major northsouth road along the coast of the Mozambique Channel. Pop. (1986 est.) 51,620.

Xaignabouri, Muang, also spelled saya-BOURY, town, northwestern Laos. Located about 18 miles (29 km) west of the Mekong River, at the base of high hills, Xaignabouri has a sawmill and trades in such forest products as rattan, bamboo, stick lac, and benzoin; vast teak resources are also exploited for export.

The uplands of the area in which Xaignabouri is situated are sparsely occupied by Meo (Miao, or Hmong) and Khmu peoples, who are forest gatherers and followers of shifting cultivation. In the lowlands (particularly around Xaignabouri itself) the valley Lao people live by double-cropping rice and cotton. Pop. (1973 prelim.) town, 13,775.

xanthate, any of a class of organic salts formed by treatment of an alcohol with carbon disulfide in the presence of an alkali. The term is derived from the Greek word *xanthos*, for "yellow," in reference to the compound potassium ethyl xanthate (C₂H₅OCS₂K), which gives a yellow precipitate when combined with copper sulfate. The most important group of xanthates are the sodium salts produced from cellulose; these materials are processed to form the synthetic fibre rayon or the transparent film cellophane, then reconverted to cellulose. The xanthates of some low-molecular-weight alcohols are used as flotation agents for the concentration of ores.

Xánthi, also spelled XANTHE, city and *nomós* (department) in western Thrace (Thráki), Greece. The city, which is situated below the Rhodope massif at the head of the narrow Eskejé (Esketzé) Valley, is the seat of a metropolitan bishop of the Greek Orthodox Church.

Though the city's origins are obscure, it grew up beneath the Byzantine fortress of Xanthea and later became a summer colony of the Turks known as Eskije. It remained insignificant until the arrival of the Thessaloníki-Adrianople railway in the 1890s, when it replaced the nearby Turkish tobacco-trading centre of Yenije in importance. After the Balkan Wars (1912–13) the city passed to Greece.

The department, which is part of Thráki dhiamerisma (region), has an area of 692 square miles (1,793 square km). The agricultural plain southeast of the city of Xánthi grows wheat, sunflower seed, and high-quality tobacco and is watered by an intermittent stream. Lagos, a port serving Xánthi, is on a spur of land between the Aegean and a coastal lagoon. Xánthi has a large Turkish-speaking population. In the 1970s several industries (especially clothing) were established to take advantage of plentiful manpower and government incentives for frontier districts. Pop. (1981) city, 33,897; nomós, 88,777.

xanthinuria, inborn metabolic disorder characterized by an increased concentration of xanthine in the blood and urine. (Xanthine within the body is normally converted by an enzyme, xanthine oxidase, to uric acid, which

is the metabolic end product of purines.) Xanthinuria is a benign condition requiring no special treatment. To prevent the possible formation of urinary xanthine stones, resulting from the poor solubility of xanthine in urine, increased fluid intake and diets low in purines are recommended.

Xanthophyta, division or phylum of algae commonly known as yellow-green algae (q, v).

xanthosis (medicine): see carotenemia.

Xanthus, modern KINIK, principal city of ancient Lycia, situated above the mouth of the Koca (Xanthus) River in what is now western Turkey. The early history of Xanthus is unclear: although it is mentioned in early Lycian inscriptions, no Bronze Age remains have been found within the city. During the Trojan War, Sarpedon led the Lycians, who were the most prominent allies of Troy in that conflict. Xanthus reappears in the historical records of the 6th century BC as the principal city of Lycia. About 540 BC it was besieged by Harpagus, general of the Persian king Cyrus. The Lycians, forced within their walls, collected their wives and children and burned them, together with their slaves and treasure, under their acropolis; then, attacking the Persians, they died fighting to the last man.

Soon rebuilt and repopulated, the city flourished from the 5th century BC to 42 BC, when, besieged by the Romans under the command of Brutus, it repeated its heroic defense. The site has well-preserved ruins of a theatre, temples, and other structures. The most remarkable ruins of the city are huge rock-cut pillar tombs, sculptures from which were sent by the British archaeologist Sir Charles Fellows to the British Museum, where they are exhibited as the Xanthian marbles. Pop. (1980) 12,034.

Xavante (people): see Shavante.

Xavier, Saint Francis, Spanish SAN FRANCISCO JAVIER, or XAVIER (b. April 7, 1506, Xavier Castle, near Sangüesa, Navarre—d. Dec. 3, 1552, Sancian Island, China; canonized March 12, 1622; feast day December 3), the greatest Roman Catholic missionary of modern times, who was instrumental in the establishment of Christianity in India, the Malay Archipelago, and Japan. In Paris in 1534 he pronounced vows as one of the first seven members of the Society of Jesus, or Jesuits, under the leadership of Ignatius of Loyola.

Early life and education. Francis was born in Navarre (now a province of northern Spain), at the family castle of Xavier, where Basque was the native language. He was the third son of the president of the council of the king of Navarre, most of whose kingdom was soon to fall to the crown of Castile (1512). Francis grew up at Xavier and received his early education there. As was often the case with younger sons of the nobility, he was destined for an ecclesiastical career, and in 1525 he journeyed to the University of Paris, the theological centre of Europe, to begin his studies.

In 1529, Ignatius Loyola, another Basque student, was assigned to room with Francis. A former soldier 15 years Xavier's senior, he had undergone a profound religious conversion and was then gathering about himself a group of men who shared his ideals. Gradually, Ignatius won over the initially recalcitrant Xavier, and Francis was among the band of seven who, in a chapel on Montmartre in Paris, on Aug. 15, 1534, vowed lives of poverty and celibacy in imitation of Christ

way for his recurrent mystical experiences. Mission to India. After all the members of the band had completed their studies, they reassembled in Venice, where Xavier was ordained priest on June 24, 1537. Having for more than a year sought passage to the Holy Land in vain, the seven, along with fresh recruits, went to Rome to put themselves at the disposal of the Pope. Meanwhile, as a result of their preaching and care of the sick throughout central Italy, they had become so popular that many Catholic princes sought their services. One of these was King John III of Portugal, who desired diligent priests to minister to the Christians and to evangelize the peoples in his new Asian dominions. When illness prevented one of the two originally chosen for the task from departing, Ignatius designated Xavier as his substitute. The next day, March 15, 1540, Francis left Rome for the Indies, travelling first to Lisbon. In the following fall, Pope Paul III formally recognized the followers of Ignatius as a religious order, the Society of

Francis disembarked in Goa, the centre of Portuguese activity in the East, on May 6, 1542; his companion had remained behind to work in Lisbon. Much of the next three years he spent on the southeastern coast of India among the simple, poor pearl fishers, the Paravas. About 20,000 of them had accepted Baptism seven years before, chiefly to secure Portuguese support against their enemies; since then, however, they had been neglected. Using a small catechism he had translated into the native Tamil with the help of interpreters, Francis travelled tirelessly from village to village instructing and confirming them in their faith. His evident goodness and the force of his conviction overcame difficulties of verbal communication. Shortly afterward the primitive Macuans on the southwestern coast indicated their desire for Baptism, and, after brief instructions, in the last months of 1544 Xavier baptized 10,000 of them. He anticipated that the schools he planned and Portuguese pressure would keep them constant.

In the fall of 1545, news of opportunities for Christianity attracted him to the Malay Archipelago. Following several months of evangelization among the mixed population of the Portuguese commercial centre at Malacca, he moved on to found missions among the Malays and the savage headhunters in the Spice Islands (Moluccas). In 1548 he returned to India, where more Jesuits had since arrived to join him. In Goa the College of Holy Faith, founded several years previously, was turned over to the Jesuits, and Francis began to develop it into a centre for the education of native priests and catechists for the diocese of Goa, which stretched from the Cape of Good Hope, at the southern tip of Africa, to China.

Years in Japan. Xavier's eyes, however, were now fixed on a land reached only five years before by Europeans: Japan. His conversations in Malacca with Anjiro, a Japanese deeply interested in Christianity, had shown that this people was cultured and sophisticated, unlike the fishermen he had known in India or the headhunters of the Moluccas. On Aug. 15, 1549, a Portuguese ship bearing Francis, the newly baptized Anjiro, and several companions entered the Japanese port of

Kagoshima. Xavier's first letter from Japan, which was to be printed more than 30 times before the end of the century, revealed his enthusiasm for the Japanese, "the best people yet discovered." He grew conscious of the need to adapt his methods. His poverty that had so won the Paravas and Malays often repelled the Japanese, so he abandoned it for studied display when this was called for. In late 1551, having received no mail since his arrival in Japan, Francis decided to return temporarily to India, leaving to the care of his companions about 2,000 Christians in five communities.

Back in India, administrative affairs awaited him as the superior of the newly erected Jesuit Province of the Indies. Meanwhile, he had come to realize that the way to the conversion of Japan lay through China; it was to the Chinese that the Japanese looked for wisdom. He never reached China, however. On Dec. 3, 1552, Francis died of fever on the island of Sancian (now Shang-ch'uan Tao, off the Chinese coast) as he attempted to secure entrance to the country, then closed to foreigners.

Assessment. Twentieth-century scholarship has dispelled many of the legends connected with Xavier and has also defended him against his critics. A modern estimate puts the figure of those baptized by him at about 30,000, as opposed to the 1,000,000 asserted by Baroque exaggeration. In reality he had to struggle with language wherever he worked and did not possess the gift of tongues attributed to him. He is justly credited for his idea that the missionary must adapt to the customs and language of the people he evangelizes, and for his advocation of an educated native clergy—initiatives not always followed by his successors.

Research has shown that he always provided for the continuing pastoral care of the communities he founded and did not abandon them after Baptism as some critics maintained. In fact, many of his own efforts were spent instructing those baptized hastily by others. The areas he evangelized in India have remained Catholic to the present day. Vigorous and prolonged persecution in the 17th century did destroy the missions he founded in the Moluccas and Japan but only after thousands had died as martyrs. Even before his death Francis Xavier was considered a saint, and he has been formally venerated as such by the Catholic Church since 1622. In 1927 he was named patron of all missions. (R.L.B.) Xenacanthus, long-surviving but now extinct genus of freshwater sharks. *Xenacanthus* survived from the end of the Devonian Period, 345,000,000 years ago, to about the end of the Triassic Period, 190,000,000 years ago.

the aid of electronic computers and based upon mathematical probability systems.

Xenakis, 1965 Lipnitzki—H. Roger-Viollet

Xenakis was born to a wealthy family of Greek ancestry, and he moved to Greece in 1932. He fought in the Greek resistance movement during World War II, losing an eye in the process. After graduation in 1947 from the Athens institute of technology, Xenakis was exiled from Greece owing to his political activities. He moved to Paris, where he was for 12 years associated with the architect Le Corbusier. During this time he designed the Philips Pavilion for the Brussels International Exhibition of 1958. During his 30s he turned seriously to musical composition, receiving training with Darius Milhaud and studying composition under Olivier Messiaen at the Paris Conservatory (1950-62). In 1954 he began his experiments in stochastic music with the composition Métastasis. Xenakis' article "La Crise de la musique sérielle" (1955; "The Crisis of Serial Music") elucidated his rigorously logical techniques, wherein the performers-mostly on standard instrumentsare directed by a specially devised notation to produce sounds specified by a computer programmed by the composer.

His work Achorripsis (1958), for 21 instruments, led Xenakis to formulate his minimal rules of composition. These rules were expanded in the program for ST/10-1,080262; the symbols of the title indicate that this is a stochastic work, his first for 10 instruments, computed on Feb. 8, 1962. Several other compositions, including ST/4-1,080262 for string quartet, Atrées (Hommage à Blaise Pascal) for 10 instruments, and Morisma-Amorisma for 4 instruments, were based on the same program. For this series of works, he used an IBM 7090 computer to control note se-

Xenacanthus

Xenacanthus had a slim, elongated body with a low dorsal fin that extended down most of it, almost merging with the triangular, pointed tail. From the back of the skull, a long, sharp, movable spine projected.

Xenakis, Iannis (b. May 29, 1922, Brăila, Romania), Romanian-born French composer, architect, and mathematician who originated musique stochastique, music composed with

quence, instrumentation, pitch, duration, and dynamics. The performers have no freedom to improvise, but the resulting sound is fluid, homogeneous, and natural.

Xenakis' long and fruitful association with the Paris Instrumental Ensemble for Contemporary Music led to frequent performances and recordings of his works for chamber ensemble. He established the School of Mathematical and Automatic Music in 1966. Other works by Xenakis include *Polla ta dhina* for children's chorus and orchestra (1962), *Akrata* (1964–65) for 16 wind instruments, and *Cendrées* (1974) for chorus and orchestra.

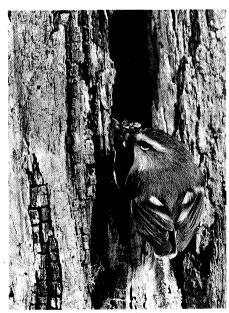

Xenia, city, seat (1804) of Greene County, southwestern Ohio, U.S., near the Little Miami River, 16 mi (26 km) east-southeast of Dayton. It was founded in 1803 by Joseph C. Vance, who gave it a Greek name meaning "hospitality." The arrival of the railroads in The arrival of the railroads in the 1840s provided impetus for its growth as a trading centre for farmers and stock raisers. Small manufactures (furniture, cordage, plastics, castings, and aircraft components) supplement its agricultural base. The log cabin (1799) of James Galloway, frontier scout and Revolutionary War soldier, is preserved as a historic monument. Parts of Xenia were rebuilt after tornadoes in 1974 had destroyed half of the city. Nearby educational institutions include two historically important black universities at

Xenicidae, formerly ACANTHISITTIDAE, bird family of the order Passeriformes; its members are commonly known as New Zealand wrens. The three living species are the rock wren (*Xenicus gilviventris*) and the rare bush wren (*X. longipes*) on South Island and, common to both islands, the rifleman (*Acanthisitta chloris*). A fourth species, the Stephen Island wren (*X. lyalli*), was discovered in 1894 by a lighthouse keeper and killed soon afterward by his

cat. Nine specimens, brought home by the cat, were sent to the British Museum. This

may have been the only flightless passerine bird; certainly its distribution—less than one square mile on an island in Cook Strait—was astonishingly limited.

Xenicids are tiny birds of stout build, with a nuthatch-like bill and an extremely short tail. They vaguely resemble pittas, with which they may share ancestry. The rifleman, only eight centimetres (three inches) long, has brown and yellow plumage suggesting the uniform of an early-day British rifle corps. It is a tree-creeping species found mainly in beech forest. The bush wren is also an arboreal insect eater. The rock wren feeds chiefly in mountains on open slopes. Both wrens bob up and down vigorously on alighting, and the rifleman is a constant wing quiverer.

Xenocrates (d. 314 BC, Athens), Greek philosopher, pupil of Plato, and successor of Speusippus as the head of the Greek Academy, which Plato founded about 387 BC. In the company of Aristotle he left Athens after Plato's death in 348/347, returning in 339 on his election as head of the Academy, where he remained until his death.

Xenocrates' writings are lost except for fragments, but his doctrines appear to resemble Plato's as reported by Aristotle. Among them is the "derivation" of all reality from the interaction of two opposite principles, "the One" and "the indeterminate dyad." It is the dyad that is responsible for multiplicity, or diversity, evil, and motion, whereas the One is responsible for unity, good, and rest. Numbers and geometrical magnitudes are seen as the first products of this derivation. In addition Xenocrates divided all of reality into three realms: (1) the sensibles, or objects of sensation; (2) the intelligibles, or objects of true knowledge, such as Plato's "Ideas"; and (3) the bodies of the heavens, which mediate between the sensibles and the intelligibles and are therefore objects of "opinion." This tripartite division typifies the Academy's tendency to bridge the gap between the two traditional modes of cognition, the mode of sense experience and the mode of intellection.

A second threefold division in Xenocrates' thought separated gods, men, and "demons." The demons represented semihuman, semidivine beings, some good and others evil. To these beings Xenocrates attributed much of what popular religion attributed to gods, and ritual mysteries were instituted to propitiate them, especially the evil ones. Though it is uncertain how literally Xenocrates viewed the demons, his demonology was highly influential, particularly on those early Christian writers who identified pagan deities with evil demons.

The classical distinction differentiating mind, body, and soul has been attributed by some to Xenocrates and by others to the Stoic philosopher Poseidonius. The same is true of the related doctrine that men die twice, the second time occurring on the Moon and consisting in the mind's separation from the soul to make its ascent to the Sun. Sometimes considered an Atomist for his view that matter is composed of indivisible units, he held that Pythagoras, who stressed the importance of numbers in philosophy, was responsible for the Atomist view of acoustics, in which the sound perceived as a single entity actually consists of discrete sounds. The same Pythagorean influence on thinkers of the Academy can be seen in Xenocrates' devotion to tripartite divisions. Yet another such division is found in his general view of philosophy, which he divided into logic, physics, and ethics. The origin of philosophy, he maintained, lies in man's desire to resolve his anxieties. Happiness is defined as the acquisition of the perfection that is peculiar and proper to man; thus, enjoyment consists in being in contact with the things that are natural to him. This

doctrine, which suggests the primacy of ethics over speculation in philosophy, foreshadows the Stoic view that ethical norms are to be derived from observation of the natural world. Xenocrates admitted, however, that external items are important for happiness, a notion that the Stoics rejected.

xenolith, rock fragment within an intrusive igneous body that is unrelated to the igneous body itself. Xenoliths, which represent pieces of older rock incorporated into the magma while it was still fluid, may be located near their original positions of detachment or may have settled deep into the intrusion, if their density is greater. Xenoliths can be contrasted with autoliths, or cognate xenoliths, which are pieces of older rock within the intrusion that are genetically related to the intrusion itself. The general term for all such incorporated bodies is inclusions. Xenoliths are usually reconstituted through the processes of contact metamorphism, in which heat and fluids cause mineralogic and chemical changes in the parent rock of the xenolith; a study of these changes can give information on the temperature and composition of the magmatic body.

xenon (Xe), chemical element, heavy and extremely rare gas of Group 0 (noble gases) of the periodic table. It was the first noble gas found to form true chemical compounds. More than 4½ times heavier than air, xenon is colourless, odourless, and tasteless. Solid xenon belongs to the face-centred cubic crystal system, which implies that its molecules, which consist of single atoms, behave as spheres packed together as closely as possible.

Xenon occurs in slight traces in gases within the Earth and is present to an extent of about 0.000086 percent, or about one part in 10,000,000, by volume of dry air. Xenon is manufactured on a small scale by the fractional distillation of liquid air. The British chemists Sir William Ramsay and Morris W. Travers isolated the element (1898) by repeated fractional distillation of the noble gas krypton, which they had discovered six weeks previously.

The element xenon is used in lamps that produce intense, extremely short flashes of light, such as stroboscopes and lights for high-speed photography. When a charge of electricity is passed through the gas at low pressure, it emits a flash of bluish-white light; at higher pressures white light resembling daylight is emitted. Xenon flash lamps are used to activate ruby lasers.

Natural xenon is a mixture of nine stable isotopes in the following percentages; xenon-124 (0.096); xenon-126 (0.090); xenon-128 (1.92); xenon-129 (26.44); xenon-130 (4.08); xenon-131 (21.18); xenon-132 (26.89); xenon-134 (10.44); and xenon-136 (8.87). The xenon found in some stony meteorites shows a large proportion of xenon-129, believed to be a product of radioactive decay of iodine-129, whose half-life is 17,000,000 years. Study of the xenon-129 content of meteorites casts light on the history of the solar system. More than a dozen radioactive xenon isotopes produced by fission of uranium and other nuclear reactions are known. For example, xenon-135 (9.2-hour half-life) is produced by uranium fission in nuclear reactors, where it is troublesome because it absorbs fission-producing neutrons.

Noble gases were thought to be chemically inert until Neil Bartlett produced (1962) the first noble-gas compound, a red crystalline solid, xenon hexafluoroplatinate(V), that can

best be formulated as $Xe(PtF_6)_x$, in which x varies in value from one to two. Xenon was later observed to combine directly with fluorine to form a series of fluorides, XeF_2 , XeF_4 , and XeF_6 , of which the tetrafluoride (XeF_4) is the easiest to prepare. The oxides XeO_3 and XeO_4 , made indirectly in aqueous solution, are explosively unstable when dry. Stable, insoluble xenate(VIII) salts, such as that of sodium, Na_4XeO_6 *8H₂O, and several other stable compounds—for example, the yellow solid cesium octafluoroxenate(VI), Cs_2XeF_8 —have been prepared and studied.

Xenophanes (b. probably c. 560 BC, Colophon, Ionia—d. probably c. 478), Greek poet and rhapsode, religious thinker, and reputed precursor of the Eleatic school of philosophy, which stressed unity rather than diversity and viewed the separate existences of material things as apparent rather than real.

Xenophanes was probably exiled from Greece by the Persians who conquered Colophon about 546. After living in Sicily for a time and wandering elsewhere in the Mediterranean, he evidently settled at Elea in southern Italy. In one of his poems, which survive only in fragments, he declared that his travels began 67 years earlier, when he was 25; if this is so, he would have been at least 92 at his death.

Xenophanes' philosophy found expression primarily in the poetry that he recited in the course of his travels. Fragments of his epics reflect his contempt for contemporary anthropomorphism and for popular acceptance of Homeric mythology. Most celebrated are his trenchant attacks on the immorality of the Olympian gods and goddesses. In his elegiac fragments he ridicules the doctrine of the transmigration of souls, condemns the luxuries introduced from the nearby colony of Lydia into Colophon, and advocates wisdom and the reasonable enjoyment of social pleasure in the face of prevalent excess.

Some critics consider Parmenides (fl. c. 450 BC) as the founder of the Eleatic school, but Xenophanes' philosophy probably anticipated his views. The tradition that Xenophanes founded the school is based primarily on the testimony of Aristotle, whose views Xenophanes also anticipated. Among the few other Greek writers who subsequently mentioned Xenophanes are Plato, who said that "The Eleatic school, beginning with Xenophanes and even earlier, starts from the principle of the unity of all things," and Theophrastus, who summed up Xenophanes' teaching in the formula "The all is one and the one is God."

Xenophanes was less a philosopher of nature in the manner of Parmenides, who looked for abstract principles underlying natural change, than a poet and religious reformer who applied generally philosophical and scientific notions to popular conceptions. His system and critiques of the works of other thinkers appear primitive in comparison with later Eleaticism, which developed its philosophy of appearance and reality into a sophisticated system.

Xenophon (b. 431 BC, Attica, Greece—d. shortly before 350, Attica), Greek historian, author of the *Anabasis*. Its prose was highly regarded by literary critics in antiquity and had strong influence on Latin literature.

Life. Born of a well-to-do Athenian family, Xenophon grew up during the great war between Athens and Sparta (431–404 BC) and served in the elite force of Athenian cavalry. He and his well-to-do contemporaries sat at the feet of Socrates, were critical of the extreme form of democracy under which they lived, and sympathized with the right-wing revolutionaries who seized power for short spells in 411 BC and 404 BC. When democracy was reestablished in Athens in 401, Xenophon chose to go abroad. His dislike of extreme democracy was deepened by the condemnation and execution of Socrates in 399; a few years later he was himself exiled as a traitor.

The great experience of his life was his service with the Greek mercenaries of the Persian prince Cyrus, first as a soldier of fortune and then, after Cyrus' death, as an elected commander of the Greek force, the "Ten Thousand," composed of men who found themselves 1.000 miles (about 1.500 kilometres) from home and who fought their way through the unknown territories of Kurdistan and Armenia until they reached the Greek city of Trapezus (now Trabzon) on the Black Sea early in 400. This exploit, on which he based his work Anabasis, made his name and his fortune at a young age. Service followed under a Thracian prince in Bulgaria and then under Spartan command in Asia Minor, where he met the man whom he was to admire most, the Spartan king Agesilaus II, who commanded large forces against Persia from 396 to 394. Xenophon served on his staff and was present at the Battle of Coronea, when Agesilaus defeated a coalition of Greek states including Athens. After the battle he accompanied Agesilaus to Delphi and placed an offering to Apollo in the treasury of the Athenians. It was probably at this time that he was banished by Athens.

Xenophon was now deeply involved with Sparta and Agesilaus, whom he continued to serve. He was rewarded first with a residence at Sparta and then with an estate at Scillus near Olympia. Happily married and father of two sons, he had ample means and leisure to hunt, entertain the local gentry, and build a chapel to the hunter goddess, Artemis. But the star of Sparta was setting. In 371 Xenophon found a new refuge at Corinth. When Athens and Sparta became allies against Thebes, his banishment was revoked, and he went home c. 365. He resumed his old life in Athenian society, remained somewhat critical of democracy, and saw his sons join his old cavalry regiment. Xenophon wrote what was probably his last work, Ways and Means, in 355 BC, advocating a policy of peace for Athens and the Greek states. He was reputedly very handsome, and two copies of an original head, sculptured in marble, have survived.

Writings. The most personal of his writings is Anabasis (or Anabasis Kyrou, "The Expedition of Cyrus"), published probably under a nom de guerre. The narrative excels in graphic details, but the fictitious speeches with which it is adorned have a contrived and artificial air. It is an account by a young man, somewhat romantic, excited by danger and discovery, receptive of impressions, and prompt in action. There are memorable moments. When he rode forward, expecting an enemy, and found the men at the top of the pass shouting "the sea, the sea," and then those behind

all started running...and coming to the top, they embraced one another and their generals and captains, with tears in their eyes, and bringing together a great many stones—by whose order is not known—made a great cairn.

His experience as a horseman prompted two works: On Horsemanship (Peri hippikës), which contains all the knowledge of the professional horseman in hunting and war and reveals his own love of horses; and Cavalry Officer (Hipparchikos), the main interest of which derives from the chapters on the conditions of service in the Athenian cavalry. A short treatise, On Hunting (Kynēgetikos), regarded by some as spurious, contains a wealth of technical information and seeks to justify hunting as a training for war and for all that requires quick thinking and quick action.

His admiration for Socrates and his dislike for the Sophists led him to write his own justification of Socrates in three works (Apology, Symposium, and Memorabilia), in which he presented a view of Socrates very different from that of his contemporary Plato; for Xenophon was interested less in philosophical disputation than in personal anecdotes, dinner-party talk, and the more practical aspects of education. Although much of what he had to say was trivial, he appreciated Socrates' concern with goodness. The name of Socrates was used also in a treatise on estate management, Oeconomicus, which was cast in the form of a dialogue; but the ideas are entirely Xenophon's, and it is full of horticultural and other details. Of particular charm is the portrayal of the estate owner's wife, who was delightful and dutiful, accepting her husband's rebuke for using makeup and wearing high heels. Xenophon expressed his own ideas about the training of a statesman and the importance of the family in the Cyropaedia, a historical novel in which Cyrus, founder of the Persian Empire, undergoes an ideal form of education. In the field of ideas this was his most original and stylish work. A pendant to it is Hieron, a fictitious dialogue on kingship

between a king and a poet.

Personal admiration led Xenophon to complete the unfinished work of Thucvdides, who came from the same social background. His history of the period 411-403 BC, a patchwork based on personal experience and lacking critical analysis, bears no comparison with the work of Thucydides. Later it formed books I and II of the Hellenica, a history of Greek affairs from 411 to 362. For events after 403 Xenophon drew again upon his own experiences and also upon those of his acquaintances, mainly Peloponnesians. He revealed his and their prejudices, sometimes in a disingenuous manner, and left large gaps in his narrative; objectivity, thoroughness, and research were not for him. The speeches that he inserted in imitation of Thucydides were vehicles for anecdotes, aphorisms, and oratorical display rather than for the evaluation of fundamental principles of policy, and divine providence played an increasing part in later events he chronicled. The city and the hero of his prime, Sparta and Agesilaus, received special accolades in two treatises, The Constitution of Sparta (Lakedaimonion politeia) and Agesilaus, which are informative as well as laudatory. Late in life, when he was living at Athens, he wrote Ways and Means, which provides a most interesting picture of the economic structure of Athens as it was in 355 BC. The Constitution of Athens, although transmitted among his works, was not by Xenophon, who died in Attica a year or two before 350. Assessment. As a writer of prose, Xenophon ranked with his fellow historians Herodotus and Thucydides in the opinion of literary critics of antiquity and had a stronger influence on Latin literature than either. His works were translated into many European languages in the 16th century, and, until comparatively recently, his reputation stood high. He was the first journalist in the sense that he recorded his personal experiences for their own sake and expressed his personal views on leading personalities and popular topics of his time. He wrote fluently in an exceptionally lucid and gracious style, avoided mannerisms or bombast, and gave pleasing expression to a considerable range of ideas, which were all completely undemanding. His life and times were interesting, and he wrote about them with prejudice, enthusiasm, and some insight.

He was not an intellectual force or an educational reformer, but his practicality and orthodoxy made him a popular writer.

Breitenbach, "Xenophon von Athen," in Pauly-Wissowa Realencyclopādie, vol. 19, col. 1569–2051 (1967), each with full bibliography. For a picture of Xenophon, see G.M. Richter, The Portraits of the Greeks, vol. 2 (1965).

xenotime, widely distributed phosphate mineral, yttrium phosphate (YPO₄, though large proportions of erbium commonly replace yttrium), that occurs as brown, glassy crystals, crystal aggregates, or rosettes in igneous rocks and associated pegmatites, in quartzose and micaceous gneiss, and commonly in detrital material. Occurrences include Norway, Sweden, Madagascar, Brazil, and North Carolina. The name is from the Greek word meaning "vain honour," because the yttrium in xenotime was mistakenly thought to be a new element. For detailed physical properties, *see* phosphate mineral (table).

Xerente (people): see Sherenté.

xeroderma (skin disease): see ichthyosis.

xeroderma pigmentosum, rare, recessively inherited skin condition in which resistance to sunlight and other radiation beyond the violet end of the spectrum is lacking. On exposure to such radiation the skin erupts into numerous pigmented spots, resembling freckles, which tend to develop into multiple carcinomas. The condition may occur in mild or severe forms. Protection from direct sunlight and surgical destruction of precancerous or established malignant lesions are the prescribed treatment.

xerophyte, any plant adapted to life in a dry or physiologically dry habitat (salt marsh, saline soil, or acid bog) by means of mechanisms to prevent water loss or to store available water. Succulents (plants that store water) such as cacti and agaves have thick, fleshy stems or leaves. Other xerophytic adaptations include waxy leaf coatings, the ability to drop leaves during dry periods, the ability to reposition or fold leaves to reduce sunlight absorption, and the development of a dense, hairy leaf covering.

Xerox Corporation, major U.S. corporation and first manufacturer of xerographic, plain-paper copiers. Headquarters are in Stamford, Conn.

The company was founded in 1906 as Haloid Company, changed its name to Haloid Xerox Company in 1958, and to Xerox Corporation in 1961. In 1960 Xerox first marketed the 914 xerographic copier; the process, which made photographic copies onto plain, uncoated paper, had been known for some time, but this was its first commercial application. The product had such success that the company has had to wage a continuing campaign to prevent the trademark Xerox from becoming a generic term.

Since that first copier, the company has expanded into other information products and

publishing, while remaining a major reprographics manufacturer. Its primary products are related to the information-processing business, including xerographic copiers and related services, and other business products and supplies. It introduced word-processing machines in 1974, and in 1979 introduced Ethernet, an office communications network. The company also manufactures computer terminals, memory disk drives, and other computer software and offers seminars and management consulting. It manufactures office supplies and optical equipment for the defense and aerospace industries and conducts research in advanced military and aerospace technology. Xerox owns R.R. Bowker, which publishes Publishers' Weekly, Library Journal, and Books in Print. It also owns several publishers of textbooks and educational materials. Its University Microfilms International stores and rents microfilms of leading periodicals and books. In 1983 the company purchased Crum and Forster, Inc., an insurance holding company. The following year it completed the purchase of Van Kampen Merritt, Inc., an investment banking firm.

Xerxes I, Old Persian Khshayarsha, byname Xerxes the Great (b. c. 519 bc—d. 465, Persepolis), Persian king (486–465 bc), the son and successor of Darius I. He is best known for his massive invasion of Greece

Xerxes I, detail of a bas-relief of the north courtyard in the treasury at Persepolis, late 6th-early 5th century BC; in the Archaeological Museum, Tehrān

By courtesy of the Oriental Institute, the University of Chicago

from across the Hellespont (480 BC), a campaign marked by the battles of Thermopylae, Salamis, and Plataea. His ultimate defeat spelled the beginning of the decline of the Achaemenid Empire.

Accession to the throne. Xerxes was the son of Darius I and Atossa, daughter of Cyrus; he was the first son born to Darius after his accession to the throne. Xerxes was designated heir apparent by his father in preference to his elder brother Artabazanes. A bas-relief on the southern portico of a courtyard in the treasury of Persepolis, as well as the bas-reliefs on the east door of the tripylon (an ornamental stairway) depict him as the heir apparent, standing behind his father, who is seated on the throne. When his father died, in 486 BC, Xerxes was about 35 years old and had already governed Babylonia for a dozen years.

One of his first concerns upon his accession was to pacify Egypt, where a usurper had been governing for two years. But he was forced to use much stronger methods than had Darius: in 484 BC he ravaged the Delta and chastised the Egyptians. Xerxes then learned of the revolt of Babylon, where two nationalist pretenders had appeared in swift succession.

The second, Shamash-eriba, was conquered by Xerxes' son-in-law, and violent repression ensued: Babylon's fortresses were torn down, its temples pillaged, and the statue of Marduk destroyed; this latter act had great political significance: Xerxes was no longer able to "take the hand of" (receive the patronage of) the Babylonian god. Whereas Darius had treated Egypt and Babylonia as kingdoms personally united to the Persian Empire (though administered as satrapies), Xerxes acted with a new intransigence. Having rejected the fiction of personal union, he then abandoned the titles of king of Babylonia and king of Egypt, making himself simply "king of the Persians and the Medes.

It was probably the revolt of Babylon, although some authors say it was troubles in Bactria, to which Xerxes alluded in an inscription that proclaimed:

And among these countries (in rebellion) there was one where, previously, daevas had been worshipped. Afterward, through Ahura Mazda's favour, I destroyed this sanctuary of daevas and proclaimed, "Let daevas not be worshipped!" There, where daevas had been worshipped before, I worshipped Ahura Mazda.

Xerxes thus declared himself the adversary of the daevas, the ancient pre-Zoroastrian gods, and doubtlessly identified the Babylonian gods with these fallen gods of the Aryan religion. The questions arise of whether the destruction of Marduk's statue should be linked with this text proclaiming the destruction of the daeva sanctuaries, of whether Xerxes was a more zealous supporter of Zoroastrianism than was his father, and, indeed, of whether he himself was a Zoroastrian. The problem of the relationship between the Achaemenid religion and Zoroastrianism is a difficult one, and some scholars, such as M. Molé, have even thought that this is an improper posing of the question, that there were, rather, three different states of religion: a religion of strict observance, a royal religion as attested by the Achaemenid inscriptions, and the popular religion as described by the Greek historian Herodotus.

War against the Greeks. With the tranquillity of the empire reestablished, Xerxes would willingly have devoted himself to peaceful activities. But many of those around him were pressing for the renewal of hostilities. His cousin and brother-in-law Mardonius, supported by a strong party of exiled Greeks, incited him to take revenge for the affront that Darius had suffered at the hands of the Greeks at Marathon (490 BC). The impressionable Xerxes gave way to pressure from his entourage and threw himself into patient diplomatic and military preparations for war, which required three years to complete (484-481 BC). Herodotus notes that never before had such an effort been undertaken. Troops were levied in all the satrapies, and a navy, intended to be the army's supply line, was gathered. The care lavished on this enterprise shows that the King did not regard it as a minor operation.

There has been much later speculation on the real causes for the expedition. They could not have been economic, because Greece was not important then. Perhaps it was only the manifestation of a royal absolutism: Xerxes, whose character was later distorted in Greek legend, was neither foolish nor overly optimistic; although sensible and intelligent, he was nevertheless, according to G. Glotz,

a sovereign by divine right, to whom opposition was as annoying as sacrilege... nervous in temperament, fallen from youthful fire into indolence, incited to make a war he didn't like...

At the head of his armies, he left Sardis for the Hellespont and had two boat bridges placed across the strait. A storm destroyed them, and Xerxes had the sea whipped as punishment. With the bridges remade, for seven days he oversaw the crossing of the army-5,000,000 men according to Herodotus and 360.000 by modern estimate, supported by 700 to 800 ships. Their passage was facilitated by a massive engineering works: a channel was dug across the Isthmus of Actium so that the peaks of Mount Athos might be avoided. Nevertheless, the army's size was of no help, partly because of misinformation about the enemy terrain and partly because of the appearance of a national feeling in Greece. After a few successes (e.g., Thermopylae, mid-August 480 BC), Xerxes occupied Attica and pillaged Athens on September 21, but on September 29, at Salamis, a naval battle, which he had initiated, turned into a defeat. Without a fleet to bring supplies to the army, he had to retreat; he crossed over into Asia, leaving Mardonius in Thessaly. During an indecisive battle near Plataea, on Aug. 27, 479, Mardonius was killed, and his death obliged the army of occupation to withdraw. Hostilities continued for 13 years, but thenceforth Xerxes involved himself only slightly

Withdrawal to Persia. Soured by this failure, which modern historians consider the beginning of Achaemenid decline but which was undoubtedly noticed much less by contemporaries, Xerxes retired to Susa and Persepolis. He then furthered the depletion of the once-enormous resources he had gathered, through multiple taxation, by launching a vast construction program. At the capital city of Persepolis, Darius' architects, working from a unified plan of great scope, had already begun construction on a gigantic terrace of the Apadana (an audience hall), the Tripylon, a palace, and a treasury. When Xerxes became king, he had laid the enameled-brick facing on the exterior of the Apadana and finished his father's palace. Then he erected other monuments: his own palace, southeast of Darius' and very similar to it in plan, and a mysterious building called the Harem by archaeologists—a line of small, identical rooms that may have been Xerxes' treasury. He also undertook construction of the Hall of a Hundred Columns, or Throne Room, but he was able to finish only the paving and the base of the walls (the walls themselves and the decoration of this gigantic hypostyle hall were the work of Artaxerxes I). These buildings marked an evolution toward the colossal and toward a style that was perhaps more pretentious than that typical of Darius' reign.

Little is known about the last years of Xerxes' life. After his reversal in Greece, he withdrew into himself and allowed himself to be drawn into harem intrigues in which he was, in fact, only a pawn: thus, he disposed of his brother's entire family at the demand of the queen. But in 465 he himself fell, together with his eldest son, under the blows of murderous members of his court, among them his minister Artabanus. Another son, Artaxerxes I, succeeded in retaining power.

[J.-L.Hu.]

BIBLIOGRAPHY. There is no biography devoted solely to Xerxes. The basic work is still A.T. Olmstead, *History of the Persian Empire* (1948), a heavy, involved work, but one that contains the essentials. See also Charles Hignett, *Xerxes' Invasion of Greece* (1963), which deals only with the relationships between Xerxes and Greece.

Xhosa, also spelled XOSA, formerly KAFFIR, or KAFIR (Arabic: "Infidel"), a cluster of related tribes living primarily in Transkei (q.v.), southern Africa, and forming part of the southern Nguni (q.v.) group of Bantu-speaking peoples. (The Transkei is a non-internationally recognized republic lying along the Indian Ocean in southeastern South Africa; it is the designated national territory for the Xhosa population of

South Africa.) The main Xhosa groups are the Gcaleka, Ngika, Ndlamba, Dushane, Qayi, Ntinde, and the Gqunkhwebe (the latter being partly of Khoikhoin origin).

In the late 18th and the 19th centuries, a series of conflicts popularly called the Kaffir Wars (see Cape Frontier Wars) engaged the Xhosa against the European settlers in the eastern frontier region of Cape Colony. The expanding Xhosa, driven southward by overpopulation and land shortage, encountered Cape colonists moving northward in search of good farmland. The struggle lasted for a century, but eventually the Xhosa were defeated by the European settlers.

Today the Xhosa are mainly agriculturists but keep some cattle. They are organized into patrilineal clans, each of which is associated Xia Gui (Chinese painter): see Hsia Kuei.

with a tribe or chiefdom, the clan head being the tribal chief, ruling with the aid of a council of the heads of the small subclans and lineages. Beginning in the 1960s, a high proportion of workers left the Transkei as labour migrants, going to Johannesburg and other parts of the country. This migration of workers (for the most part men) seriously disrupted Xhosa family and community life. The Xhosa numbered about 5,000,000 in the late 20th century, with about 40 percent of them residing in the Transkei and most of the rest in various (other) parts of South Africa.

Xhosa-Ciskei (South Africa): see Ciskei.

Xhosa language, also spelled xosa, formerly KAFFIR, or KAFIR, a Bantu language spoken in the Republic of South Africa, especially in the eastern part of the Cape of Good Hope. Xhosa is a member of the Southeastern, or Nguni, subgroup of the Bantu group of the Benue-Congo branch of the Niger-Congo language family. Other languages of the subgroup are Zulu, Swazi, Basuto (or Sotho), Tswana (or Bechuana), Venda, and Ndebele. Although Xhosa and Zulu are similar enough to be considered dialects of one language, Xhosa and Zulu speakers consider them to be separate languages.

The sound system of Xhosa contains three types of click sounds borrowed from the neighbouring Khoisan languages. Xhosa uses a system of tones to distinguish words that would otherwise sound the same.

khoang. The town was formerly an international opium market. Corn (maize) and rice are raised by valley Lao in the valleys north of Xiangkhoang and by Khmu (Lao-Theng, or Lao-Theung; Mountain Mon-Khmer) and Tai Neua groups in scattered upland areas to the north and east of it, while the Meo (Miao, or Hmong), a highland minority, grew opium poppies, at least until the mid-1970s.

The area in which Xiangkhoang is situated also has perhaps the greatest variety of unexploited minerals in Laos, including coal, iron ore, antimony, lead, zinc, silver, and copper. Xiangkhoang is linked to Louangphrabang and Muang Vangviang by highway. Pop. (latest est.) town, 4,000.

Xiangkhoang, Plateau de, formerly PLA-TEAU DU TRANNINH, English TRAN NINH PLATEAU, dissected upland of complex geologic structure in north-central Laos. The plateau is a western extension of the northern Chaîne Annamitique (Annamite Chain); it is drained principally by the Ngum and Ngiap (Nhiệp) rivers to the south and the Khan River to the north, all Mekong River tributaries. Once the upland's limestone and sandstone hills were covered with tropical monsoon rain forest, but shifting cultivation practiced by mountain Meo (Miao, or Hmong) and Khmu (Lao Theng; Mountain Mon-Khmer) peoples have left only scattered remnants of oak and pine, principally along the stream courses. Around liangkhoang town are workable deposits of alluvial gold, antimony, copper, lead, zinc, and silver.

Xingu River, Portuguese RIO XINGU, river in Mato Grosso and Pará states, Brazil. The river rises on the Planalto (plateau) do Mato Grosso, in the drainage basin framed by the Serra do Roncador and the Serra Formosa mountain ranges. Formed by several headstreams, principally the Curiseu, Batovi, and Romuro rivers, the Xingu meanders generally northward for approximately 1,300 mi (2,100 km), emptying into the Amazon River just south of the Ilha (island) Grande de Gurupá. South of Altamira it receives its main tributary, the Iriri (800 mi long).

Although the Xingu's lower course is wide (2½ mi) at its mouth and the channel is deep, the river is navigable only from its mouth to Sousel and Vitória, 125 mi south. Its upper course is marked by innumerable rapids. The Xingu-Araguaia Hydroelectric Project was built along the river during the late 1970s. The Xingu was first explored in 1884–87 by the German ethnologist and explorer Karl von den Steinen. In the 1950s Xingu National Park was designated as a preserve for Brazil's Indians, including the Tchikao, who were threatened by extinction.

Xiong Foxi, Foxi also spelled FUXI, Wade-Giles romanization HSIUNG FO-HSI (b. 1900, Feng-ch'eng, Kiangsi Province, China—d. Oct. 26, 1965, Shanghai), Chinese playwright who helped to create popular drama intended to entertain and educate the peasantry.

Xiong Foxi began writing, directing, and acting in plays as a youth and, while at Yenching University, helped to establish the Minchung Hsi-chü She (People's Dramatic Society). After graduate work at Columbia University, New York City, he returned to China as a professor of dramatic arts and as the editor of a drama magazine. The high point of Xiong Foxi's career came in 1932, when he was appointed director of experimental rural theatre in Ting-hsien, Hopeh Province. Xiong Foxi lived among the peasants so that he could write plays that they could understand and learn from. His productions, which often used Western dramatic techniques and emphasized the importance of staging, won him wide renown; he described his experiences in the book An Experiment in Popularizing Drama (1937).

During the Sino-Japanese War (1937–45), Xiong Foxi served the Nationalist government as a theatre director, president of a dramatic arts college, and founder of two literary magazines. He also continued to write during this time, producing two novels and numerous short stories. After the Communist government was established in 1949, he was a leading member of many of its cultural and educational committees.

Xiongnu (people): see Hsiung-nu.

Xipe Totec (Nahuatl: "Our Lord the Flayed One"), pre-Columbian Mexican god of spring (the beginning of the rainy season) and of new vegetation; he was also the patron of goldsmiths.

As a symbol of the new vegetation, Xipe Totec wore the skin of a human victim—the "new skin" that covered the Earth in the

spring. His statues and stone masks always show him wearing a freshly flayed skin. Described as anauatl iteouh ("god of the coast"), Xipe Totec was originally a deity of the Zapotec and Yopi Indians in the present states

Xipe Totec, pottery figure from Monte Albán, Zapotec culture, 8th-11th century AD Hamlyn Group Picture Library

of Oaxaca and Guerrero, an area believed to be particularly rich in gold. Among the Zapotecs he was considered a vegetation god and was associated with the Feathered Serpent (Quetzalcóatl). Xipe Totec was considered a foreign god, and his temple bore the name Yopico, or the "Yopi Place." Representations of Xipe Totec first appeared at Xolalpan, near Teotihuacán, and at Texcoco, in connection with the Mazapan culture—that is, during the post-Classic Toltec phase (9th-12th century AD). The Aztecs later adopted his cult under the reign of Axayacatl (1469-81). During the second ritual month of the Aztec year, Tlacaxipehualiztli ("Flaying of Men"), the priests killed human victims by removing their hearts. They flayed the bodies and put on the skins, which were dyed yellow and called teocuitlaquemitl ("golden clothes"). Other victims were fastened to a frame and put to death with arrows; their blood dripping down was believed to symbolize the fertile spring rains. A hymn sung in honour of Xipe Totec called him Yoalli Tlauana ("Night Drinker") because beneficent rains fell during the night; it thanked him for bringing the Feathered Serpent, symbol of plenty, and for averting drought.

Xipibo (Andean Indians): see Shipibo.

Xirgu, Margarita, in full MARGARITA XIRGU I SUBIRÀ (b. June 18, 1888, Molíns de Rey, Spain—d. April 25, 1969, Montevideo), Catalan actress and producer whose greatest contribution was her advancement of the plays of Federico García Lorca.

Xirgu made her professional debut in Barcelona in 1906 and five years later joined the Teatro Principal. She made her first appearance in Madrid in 1914, performing exclusively in the Catalan language. Over the next 20 years she applied her depth of feeling and brilliant technique with equal success to comedy and tragedy, including triumphs as Salome, Saint Joan, and Medea. Xirgu became director of the Teatro Español in Barcelona, where she produced and starred in the premiere performances of many of García Lorca's plays, notably Mariana Pineda (1927) and Yerma (1934). She was on tour in Latin America when the Spanish Civil War broke out in 1936, and she spent the remainder of

her life in voluntary exile in Argentina (where she staged the world premiere of García Lorca's *La casa de Bernarda Alba* in 1945) and in Uruguay (where she headed the Montevideo drama school). Her motion pictures include *Violante* (1910) and García Lorca's *Bodas de sangre* (1939; "Blood Wedding").

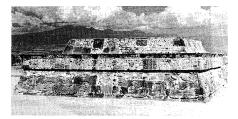

Xiuhtecuhtli (Nahuatl: "Turquoise [Year] Lord"), also called HUEHUETEOTL ("Old God"), Aztec god of fire, thought to be the creator of all life. "Old God" is a reflection of his relative age in the Aztec pantheon. In association with Chantico, his feminine counterpart, Xiuhtecuhtli was believed to be a representation of the divine creator, Ometecuhtli.

One of the important duties of an Aztec priest centred on the maintenance of the sacred fire, making sure that it should burn perpetually. A new fire was ritually kindled during the dedication of new buildings. The two festivals of Xiuhtecuhtli coincide with the two extremes in the climatological cycle, the heat of August and the cold of January. Once every 52 years, at the end of a complete cycle in the calendar of the Aztecs, fire was also ceremonially transferred, first from temple to temple, and then from temples to homes.

The god of fire appears in various representations and guises, one of which depicts him as a toothless old man with a stooped back, carrying an enormous brazier on his head. His insignia was the Xiuhcóatl, or serpent of fire, characterized by a nose of horn, decorated with seven stars.

Xochicalco, ancient Toltec city known for its impressive ruins; it is located on the top of a large hill and parts of surrounding hills near Cuernavaca, in Morelos state, Mexico.

Xochicalco was built primarily during the 8th and 9th centuries AD and soon became an important trading centre. Although it also served for many years as a prominent religious centre, it was apparently turned into a defensive stronghold before the Spanish conquest (c. 1520).

Main temple pyramid at Xochicalco Lawrence Cherney—FPG/EB Inc.

Excavations have revealed two separate building complexes, one centring on the so-called La Malinche temple pyramid and ball court, the other built around the main temple pyramid, the principal monument at Xochicalco. Built on a four-sided base, the main pyramid is especially famous for its lower facing of perfectly fitted and intricately carved stones. The reliefs, which show strong Mayan influence, portray plumed serpents, priests with elaborate headdresses, squatting warriors, glyphs, and fire symbols.

Xochimilco, delegation (administrative subdivision), central Federal District, central Mexico. It lies at 7,461 ft (2,274 m) above sea level in the Valley of Mexico, on Lake Xochimilco. Built on the site of a pre-Columbian town, Xochimilco is famous for its *chinampas*, or floating gardens. Indians constructed rafts on the lake, covered them with soil, and cultivated fruits, vegetables, and flowers, which they shipped to Mexico City via canal. In time the rafts took root and became islands. Tourism is a major source of income. Down-

town Mexico City, 14 mi (23 km) to the north-northwest, can be reached via a link to the peripheral expressway or by several major avenues. A campus of the Autonomous Metropolitan University of Mexico City is located in Xochimilco. Pop. (1980) 217,481.

Xochiquetzal (Nahuatl: "Precious Feather Flower"), Aztec goddess of beauty, sexual love, and household arts. She is also associated with flowers and plants and, in myth, came from Tamoanchán, the verdant paradise of the west.

Xochiquetzal, illustration from the Codex Fejérváry-Mayer

By courtesy of the Liverpool City Museum

Originally wife of Tlaloc, the rain god, she was abducted for her beauty by Tezcatlipoca, the malevolent god of night, who enthroned her as goddess of love. In some areas she was identified with Chalchiuhtlicue, goddess of freshwater.

xylem, in botany, part of the vascular system that conveys water and dissolved minerals from the roots to the rest of the plant and may also furnish mechanical support. Xylem consists of specialized water-conducting tissues made up mostly of narrow, elongated, hollow cells. These cells may be of several types, including tracheids (the basic cell type), vessel members, fibres, and parenchyma. Xylem constitutes the major part of a mature woody stem or root; the wood of a tree is composed of xylem. Xylem formation begins when the actively dividing cells of growing root and shoot tips (apical meristems) give rise to primary xylem. As the growing part of the plant

Cross section of oak xylem

builds past the xylem thus formed, the vascular cambium produces secondary xylem tissues that cover the primary xylem. When this happens the primary xylem cells become dead and empty, losing their conducting function and forming a hard skeleton that serves only to support the plant. Thus, in the trunk and older branches of a large tree only the outer part of the wood (secondary xylem) serves in water conduction, while the inner part (heartwood) is composed of dead but structurally strong primary xylem. See also parenchyma; tracheid; vessel.

xylene, any of three isomeric dimethylbenzenes [which have the same chemical formula, $C_6H_4(CH_3)_2$, but different molecular structure], used as solvents, as components of aviation fuel, and as raw materials for the manufacture of dyes, fibres, and films. The three isomers, designated ortho (o), meta (m), and para (p), differ structurally only in the location of the methyl groups. All three are obtained from coal-tar distillate and petroleum as a mixture containing 50-60 percent by volume of m-xylene and 20-25 percent of each of the other isomers. Fractional distillation of the mixture removes the meta and para isomers, which have very similar boiling points, from the less volatile ortho isomer. Upon cooling the mixture of meta and para isomers, much of the p-xylene crystallizes in nearly pure form. The meta isomer, the principal component of the remaining liquid, then can be purified by taking advantage of its solubility in a mixture of hydrofluoric acid and boron trifluoride. Meta- and para-xylene undergo nitration and reduction to give xylidines, used in making dyes. The meta isomer also is converted to trinitro-t-butyl-m-xylene, or xylene musk, a component of perfumes. Oxidation of the xylenes gives monocarboxylic acids (toluic acids), and then dicarboxylic acids (phthalic acids).

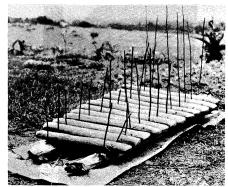

The commercial xylene mixture is a colourless, nonviscous, flammable, toxic liquid that is insoluble in water but miscible with many organic liquids. Xylene is commonly used as a solvent for lacquers and rubber cements.

xylophone (from Greek xylon and phonē: 'wood" and "sound"), percussion instrument consisting of a set of graduated, tuned wooden bars supported at nodal (nonvibrating) points and struck with padded mallets. The xylophone possibly originated in Southeast Asia or Oceania and presently exists in forms as simple as two or three logs laid across a player's legs or as wooden slabs set across two supports such as logs; a pit dug in the earth may act as a resonating chamber. In more complex forms the wooden bars are affixed to a frame and often supplied with resonators integral to the instrument. Among the most highly developed types is the Indonesian gambang, in which the bars are pinned on the edges of a wooden trough that serves as a resonator. Possessing a range of about 3½ or 4 octaves, the gambang is used in the gamelan (Indonesian percussion orchestra). It was known as early as the 8th century and gave rise to similar instruments with metal keys (metallophones) also prominent in Indonesian music. Xylophones were introduced into China from Burma in the late

The xylophone is also one of the principal instruments of African music, being found in many forms. The amadinda is made of logs. Gourd resonators are often provided for each key, sometimes with a mirliton (vibrating membrane) set in the resonator wall, giving a buzzing edge to the tone. Many African xylophones show similarities to Southeast Asian ones in tuning and construction, and they may have come to Africa through trade or migrating peoples. It is known in Latin America as a marimba (q.v.; one of its African names) and was probably taken there by African slaves.

The xylophone is first mentioned in Europe in 1511. Known as hölzernes Gelächter ("wooden percussion") or Strohfiedel ("straw hiddle," because the bars were supported on straw), it was long a Central European folk

African log amadinda xylophone; property of the Uganda Museum, Kampala
Hilleoeist/Kubik

instrument, in which the bars extended away from the player instead of in a line across him. Carillonneurs in Flanders and the Netherlands often used a keyboard version as a practice instrument. About 1830 it became immensely popular through the concerts of the touring Polish virtuoso Michal Jozef Guzikov, who used the then common "four-street" instrument (having four staggered rows, tuned chromatically—i.e., to a 12-note scale). It became a fashionable solo and garden concert instrument.

In its 20th-century form the xylophone's keys are usually arranged in two rows, somewhat like piano keys, on a stand; to improve the tone, a hollow groove is cut along the underside of each plate. Tube resonators are often provided. The compass is normally four octaves upward from middle C. Works using it include Le Marteau sans maître (The Hammer Without a Master, 1954), by Pierre Boulez, and The Golden Age (1930), by Dmitry Shostakovich. Western metallophones related to the xylophone include the glockenspiel and vibraphone.

Xystus (name of popes): see under Sixtus.

XYY-trisomy, relatively common human sex chromosome anomaly in which a male has two Y chromosomes rather than one. It occurs in 1 in 500-1,000 live male births, and individuals with the anamoly are often characterized by tallness and severe acne and sometimes by skeletal malformations and mental deficiency. It has been suggested that the presence of an extra Y chromosome in an individual may cause him to be more aggressive and prone to criminal behaviour, a condition called the "supermale" syndrome. Studies of prison populations have tended to confirm this hypothesis; but subsequent studies of the general population, especially those in which affected individuals were observed from early childhood over a long period of time, have cast serious doubt on the validity of linking the chromosomal anomaly directly to behavioral abnormalities.

XYZ Affair, diplomatic incident that, when made public in 1798, nearly involved the United States and France in war. Pres. John Adams dispatched three ministers to France in 1797 to negotiate a commercial agreement to protect U.S. shipping. In Paris the ministers were approached by three French agents who suggested a bribe of \$250,000 to Talleyrand, the French foreign minister, and a loan of \$10,000,000 to France as a prelude to negotiations. In April 1798 the machinations of the three French agents (called X, Y, and Z in the diplomatic correspondence) were made public in the United States. There was a great outcry over the bribe solicitation, followed by preparations for war. Although a period of undeclared naval warfare ensued between France and the United States formal war was avoided, and the incident was settled by the Convention of 1800.

Ya-an, Pinyin Ya'AN, town in west-central Szechwan sheng (province), China. Ya-an is situated in the mountainous western border of the Szechwan Basin. It is a communications centre near the crossing of two main routes—one running west to K'ang-ting and to Tibet and another running north-south from Ch'eng-tu to the southwest.

Established as the seat of a county under the Ch'in (221–206 BC) and Han (206 BC-AD 220) dynasties, it was later abandoned to the Mongols. Retaken by the Chinese in the late 5th century, it became in 604 the seat of Ya Prefecture, whence it derived its modern name. It was, however, little more than a frontier garrison protecting the western approaches to Szechwan from Tibet. Known as Ya-chou, or Ya-chou Prefecture, throughout Ming (1368-1644) and Ch'ing (1644-1911) times, it became the county of Ya-an in 1912. In 1939 it was placed in the new province of Hsi-k'ang. Under Communist rule it replaced K'ang-ting in 1950 as capital of Hsi-k'ang, but, when the latter province was abolished in 1955, it again became part of Szechwan.

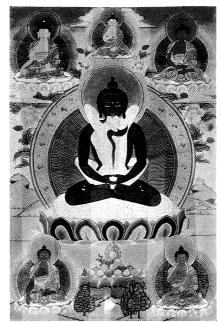

The city is a traditional market for the tea grown in quantity in the surrounding agricultural area; the tea is cured and prepared in the city. It is also a market for trade in medicinal herbs and animal products. From nearby Tao-fu, iron ore of high quality is shipped to the industrial city of Chungking. Ya-an has small-scale iron manufacture, using local anthracite for fuel. The town also has tanneries, mica and asbestos plants, and small engineering works producing farm tools and repairing and maintaining automobiles and machinery. Pop. (1985 est.) 86,000.

Ya-lu-tsang-pu Chiang (Asia): see Brahma-putra River.

Ya-lung River, Wade-Giles romanization YA-LUNG CHIANG, Pinyin YALONG JIANG, long secondary tributary of the Yangtze River in central and southern China. The Ya-lung rises in the Pa-yen-k'a-la Mountains in Tsinghai Province at an elevation of nearly 16,-500 feet (5,000 m). The upper stream flows southeastward to the south of the Pa-yenk'a-la Mountains into northwestern Szechwan Province. Below Kan-tzu it swings southward to flow along the western side of the Ta-hsüeh Mountains. After making some wide loops in its course at the southern end of this range, the river flows into the Chin-sha River near Tuk'ou on the border of Yunnan Province. The Ya-lung is torrential for most of its course and carries a very large volume of water, but it is useless for navigation. Until comparatively recently, its lower course, south of the Tahsüeh Mountains, was the limit of effective Chinese penetration to the West; its valley provided the major trade route from Ch'engtu in Szechwan to Ta-li in Yunnan and to Southwest China and Upper Burma.

Yaabetz: see Emden, Jacob Israel.

yab-yum (Tibetan: "father-mother"), in Buddhist art of India, Nepal, and Tibet, the representation of the male deity in sexual embrace with his female consort. The pose is generally understood to represent the mystical union of the active force, or method (*upāya*, conceived of as masculine), with wisdom (prajna, conceived of as feminine)—a fusion necessary to overcome the false duality of the world of appearances in the striving toward spiritual Enlightenment. The use of sexual union as a symbol of mystical union evolved from Indian Tantric thought. It was never fully accepted by the Buddhists of China and Japan. Even in Tibet the *yab-yum* images are not intended for general use but are meant to be viewed only by those who have received proper instruction concerning their esoteric significance. In Tibet, entreaties are considered more efficacious when made to a deity in the company of his consort, and the tutelary deities (yi-dam)

Dhyāni-bodhisattva Samantabhadra in the yab-yum attitude with his consort, painting on a Tibetan temple banner, c. 19th century; in the collection of Fosco Maraini, Florence

By courteey of Ecoco Moreini

adopted by monks and priests are invariably represented in the *yab-yum* attitude.

Yablochkov, Pavel Nikolayevich also called PAUL JABLOCHKOV (b. Sept. 14 [Sept. 2, Old Style], 1847, Zhadovka, Russia—d. March 31 [March 19], 1894, Saratov), Russian electrical engineer and inventor who developed the Yablochkov candle, the first arc lamp that was put to wide practical use and that greatly accelerated the development of electric lighting.

Yablochkov, lithograph by Lemercier, c 1880

l. Roger-Violle

In 1871 Yablochkov was appointed director of the telegraph lines between Moscow and Kursk, a position he resigned in 1875 to devote himself to research on arc lamps. In 1876 he settled in Paris, and late in that year he completed work on his candles, which consisted of two parallel carbon rods separated by a nonconducting clay partition that gradually vaporized as the carbons burned away. For a few years his system was widely used for street lighting in European cities, but it was gradually superseded by incandescent lighting. Yablochkov contributed various other electrical developments but died in poverty.

Yablonitsky Pass, Russian PEREVAL YABLONITSKY, also spelled PEREVAL JABLONICKII, pass in the outer eastern Carpathians of the Ukrainian Soviet Socialist Republic, an important route connecting the rest of the republic with the isolated Zakarpatskaya oblast (administrative region) and with northeastern Romania. The southern portion of the pass is

formed by the valley of the Tisa River, and the northern section contains the headwaters of the Prut. The head of the pass is 3,054 feet (931 m) above sea level and is crossed by a road and a railway line. The nearby mountains rise to more than 6,600 feet (2,000 m).

Yablonovy Range, Russian Yablonovy Khrebet, mountain range in the Transbaikalia region of Chita oblast (administrative region) and the Buryat Autonomous Soviet Socialist Republic, far eastern Russian Soviet Federated Socialist Republic. The range is some 500 miles (800 km) long northeast—southwest and reaches a maximum height of 5,512 feet (1,680 m) in Mount Kusotuy. Formed principally of granites and gneisses, it has been uplifted and much-fractured. The highest peaks are bare, but most of the range is densely forested with larch, spruce, and pine. The Trans-Siberian Railroad crosses the range by a low pass at Yablonovaya.

yacht, a sail- or power-driven vessel, usually light and comparatively small, used for racing or for recreation. In recreation the term applies to very large craft, originally powered by sail and later by steam or internal-combustion engines. It is in this sense that the generality of nonyachting (nonsailing) people usually think of the term. Technically, the word yacht excludes boats propelled by paddles, oars, or outboard motors. Also, recreational powered craft below the largest size are usually called cabin cruisers (see motorboating).

The English word yacht and the equivalent word in many European languages comes from the Dutch use in the 16th and 17th centuries of the word jaght, later jacht, which, with the word schip added, meant "ship for

chasing.

Yachting and yacht clubs. As the Dutch rose to preeminence in sea power during the 17th century, the early yacht became a pleasure craft used first by royalty and later by the burghers on the canals and the protected and unprotected waters of the Low Countries. Racing was incidental, arising as private matches. English yachting began with King Charles II of England during his exile in the Low Countries. On his restoration to the English throne in 1660, the city of Amsterdam presented him with a 20-metre (66-foot) pleasure boat with a beam (maximum width) of 5.6 m (18 feet), which he named Mary. Charles and his brother James, the duke of York (James II, reigned 1685-88), built other yachts and in 1662 raced two of them for a £100 wager on the Thames from Greenwich to Gravesend and back. Yachting became fashionable among the wealthy and nobility, but at that time the fashion did not last.

The first yacht club in the British Isles, the Water Club, was formed about 1720 at Cork, Ire., as a cruising and unofficial coast guard organization, with much naval panoply and formality. The closest thing to a race was the "chase," when the "fleet" pursued an imaginary enemy. The club persisted, largely as a social club, until 1765 and in 1828 became, after merging with other groups, the Cork Yacht Club (later the Royal Cork Yacht Club).

Yacht racing began in some organized fashion on the Thames about the mid-18th century. The duke of Cumberland founded the Cumberland Fleet for Thames racing in 1775. When George IV came to the throne in 1820, it came to be called the Fleet to His Majesty's Coronation Sailing Society. The Thames Yacht Club seceded after a racing dispute to become the Royal Thames Yacht Club in 1830. The first English yacht club had been formed at Cowes on the Isle of Wight in 1815, and royal patronage made the Solent, the strait between the mainland and the Isle of Wight, the continuing site of British yachting.

The club at Cowes became the Royal Yachting Club, again at the accession of George IV. All members were required to own boats of at least 20,321 kilograms (20 tons). Sailing matches for large stakes were held, and the social life was splendid. Ultimately Royal Yachting Club boats increased in size to more than 355,617 kg.

In North America yachting began with the Dutch in New York in the 17th century and continued when the English gained control. Sailing was mostly for pleasure and reached its apogee in George Crowinshield's Cleopatra's Barge (1815), which cruised on the Mediterranean and set a standard of luxury and elegance for the later yachts in those waters from the late 19th century on. In the first quarter of the 19th century, the brothers John C. and James Stevens of Hoboken, N.J., built notable yachts, aboard one of which, Gimcrack (1813), in the year of its launching, was founded the New York Yacht Club (NYYC), the first continuing American yacht club.

Kinds of sailboats. Early sailing yachts followed the lines of such naval craft as brigantines, schooners, and cutters from the 17th century until the second half of the 19th century. The design of large vachts was first greatly affected by the success of America, which was designed by George Steers for a syndicate headed by John C. Stevens and was the boat for which the America's Cup (q.v.)was named after its victory at Cowes in 1851. Early yachts were not designed and built in the modern sense, only a model being used. Not until the second half of the 19th century did what was called naval architecture come into being. Not until the 1920s did the application of the science of aerodynamics do for the design of sails and rigging what science had earlier done for hulls.

Because nearly all sailboats were individually custom-built, there arose a need for handicapping boats before the one-design class boats were built. Thus, a rating rule (q.v.) came into being, which resulted in the International Rule, adopted in 1906 and revised in 1919. (Today, one of the fastest growing areas in the field of sailing is that of one-design class boats. All boats in a one-design class are built to the same specifications in length, beam, sail area, and other elements. Racing between such boats can be held on an even basis with no handicapping necessary.)

So long as yachting belonged primarily to the royal and the rich, cost was no object, and the size of boats increased, in both length and weight. The promotion and popularity of smaller craft came in the second half of the 19th century from the sailing of the Englishmen R.T. McMullen, a stockbroker, and E.F. Knight, a barrister and journalist. A voyage around the world (1895–98) sailed single-handedly by the naturalized U.S. captain Joshua Slocum in the 11.3 m Spray demonstrated the seaworthiness of small craft. Thereafter in the 20th century, notably after World War II, smaller racing and recreational craft became more common, down to the dinghy, a favorite training boat, of 3.7 m. In the late 20th century boats of less than 3 m were sailed single-handedly across the Atlantic.

Kinds of power yachts. After the decade 1840-50, when steam began to replace sail in commercial vessels, the steam engine and, later, the internal-combustion engine were increasingly used in pleasure vessels. Large power yachts were developed to a high degree, and long-distance cruising became a favourite pastime of the rich. The earliest power yachts were paddle-wheel boats; these then gave way to the completely submerged screw or propeller type of propulsion. As in the case of naval and merchant vessels, auxiliaries carrying both sail and power were the yacht fashion for many years. By the second half of the 20th century many vachts were still auxiliaries, but the majority were exclusively power yachts containing gasoline or diesel engines

During the last decade of the 19th century there was a boom in the construction of large steam yachts. Conspicuous among these was the *Mayflower* (1897) of 2,690 tons, containing triple-expansion engines, twin screws, and a compartmented iron hull and manned by a crew of more than 150. The *Mayflower*, purchased by the United States Navy in 1898, was the official yacht of the president of the United States until 1929 and saw active service during World War II.

As larger and more reliable internal-combustion engines were produced, many large yachts began using them for power. The development of the diesel engine, using heavy oil for fuel, advanced during World War I; and, in the decade that followed, large power-yacht building flourished, reaching a climax in the Orion (1930), 3,097 tons. During that period the largest auxiliary yacht built was the fourmasted steel barque-rigged Sea Cloud (1931),

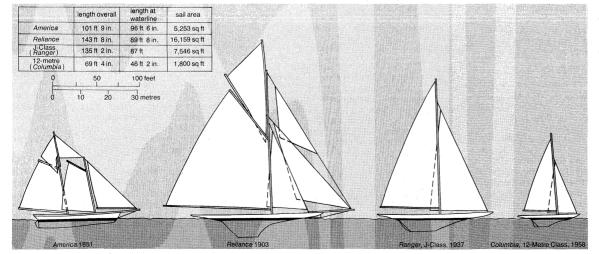

2,323 tons.

The building of large power yachts declined after 1932; and the trend thereafter was toward smaller, less expensive craft. After World War II, many small naval vessels were sold to

private owners for conversion to yachts. By the late 20th century yachting had become a widespread popular sport enjoyed by thousands of yachtsmen personally manning and maintaining their own small pleasure craft. The number of yachts and yachtsmen increased steadily, not only in the traditional areas along the seacoasts but also on inland waterways and lakes.

Racing clubs. In England by 1881 most of the important yacht clubs had become members of the Yacht Racing Association (founded 1875; from 1952 the Royal Yachting Association). It made rules governing regatta sailing and later took on duties as a representative body for all British yachting, including dealing with port, harbour, and other governmental authorities. In the United States, where there is much freshwater sailing, yacht clubs were founded between 1849 and 1880 at New Orleans; Detroit; Boston; San Francisco; Marblehead, Mass.; Oyster Bay, N.Y.; Chicago; and Larchmont, N.Y. By the late 20th century there were about 1,500 active yacht clubs in the United States. The Royal Canadian Yacht Club was founded in 1852, and the Australian Yacht Squadron (later the Royal Sydney Yacht Squadron) in 1862. Yacht clubs were founded in many countries throughout the world. The North American Racing Union was formed in 1925. A need for a body to set international racing rules and classes resulted in the founding of the International Yacht Racing Union (IYRU) in 1907. Yachting organizations with specialized interests also arose, such as the Cruising Club of America (founded 1922) and the Royal Ocean Racing Club (founded 1925), both active in offshore and ocean racing. Many other specialized organizations were formed for preparing charts and offering challenge cups for small sailing craft. In the second half of the 20th century, many organizations were formed for boats of one class and design.

Olympic Games. The yacht races held in every Olympic meet since 1900 except for 1904 illustrate the general tendency in the period toward smaller boats and, after midentury, the increasing popularity of one-class racing. Earlier Olympics included races for boats ranging in length from 40 to 5.5 m, and in weight from 508 to 20 kg, as well as an open class with no weight restriction. In the 1920 games, races were for 14 classes, that number being required to accommodate boats fitting both the old rating rule of 1906 and the new one of 1919. The difficulty and expense of freighting boats and the increasing difficulty of recruiting large amateur crews often led to

Evolution of America's Cup racing yacht design (from left): America, original winner of the cup; Reliance, largest defender; Ranger, typical J-Class defender; and Columbia, typical 12-Metre Class yacht, the first 12-Metre defender

host countries winning the most races, sometimes by default. After World War II, the number of classes stabilized and the size of boats shrank. There were usually five classes, with 5.5-metre boats predominating, which included a monotype (one-person crew), a two-person centreboard boat, a two-person keeled boat, a three-person one-design boat, and a development boat. Certain models might not appear in Olympic competition one year but again be used in later games. Classes are named by the International Olympic Committee based on recommendations made by the IYRU.

Courses. Sailboat races are held over two kinds of courses: point-to-point and closed. Most ocean racing is point-to-point, as in transoceanic races, global circumnavigation, the Bermuda Race (q.v.; first raced in 1906 from Newport to Bermuda), and the Transpacific Race (q.v.; first raced in 1906 from California to Hawaii). Such offshore races as the America's Cup and the Fastnet Cup (qq.v.) are closed course and point-to-point, respectively. The One Ton Cup (q.v.), first raced in 1907, came to include both closed course and pointto-point races. Small boat races, on both inland water and inshore oceanic waters, are usually sailed on closed courses, most commonly triangular.

Transatlantic racing and global circumnavi-Ocean racing began in 1866 with a match race held under NYYC rules from Sandy Hook, Conn., to Cowes, Isle of Wight, Eng., by three schooners of 32- to 32.6-metre length: Fleetwing, Vesta, and Henrietta. Henrietta, owned by the American newspaper publisher James Gordon Bennett, won in 13 days of sailing. The first single-sailor transatlantic voyage was made in a 6-metre boat by Alfred Johnson in 1876 to commemorate the centenary of U.S. independence. The first singlehanded race in 1891 was won by the American sailor Si Lawlor. A series of single-handed races, sponsored by the London Observer, began in 1960 and was held quadrennially thereafter. It was in these races that Francis Chichester (later Sir Francis Chichester, q.v.) attracted attention. Interest in sailing around the world was greatly stimulated by his lone voyage around the world in 1966-67. Circumnavigation races included the Golden Globe Race, sponsored by the Sunday Times of London in 1968, and races later organized by the Royal Naval Racing Association and held quadrennially from 1973. The introduction of self-steering gear did much to facilitate such racing.

cal services to indicate the place that is being read on a Torah (biblical) scroll, thus eliminating the necessity of touching the sacred manuscript with the hand. Many yadayim are prized as works of art. Yādava DYNASTY, rulers of a 12th-14thcentury Hindu kingdom of central India in what is the modern Indian state of Mahārāshtra. Originally a feudatory of the Eastern Cālukyas of Kalyāni, the dynasty became paramount in the Deccan under Bhillama (c. 1187-91), who founded Devagiri (later Daulatābād) as his capital. Under Bhillama's grandson Singhana (c. 1210-47) the dynasty reached its height at the expense of the Hoysalas in the south, the Kākatīyas in the east, and the Paramāras and Cālukyas in the north. Later rulers continued expansionist wars with varying success. During the reign of the last Yādava king, Rāmacandra (reigned 1271-c. 1309), a Muslim army commanded by the Delhi sultan 'Alā'-ud-Dīn Khaljī invaded the kingdom in 1294 and imposed tributary status. A later attempt to throw off the vassalage brought another Delhi army; Rāmacandra was imprisoned but was later released and remained loyal to Delhi until his death. In a further attempt, his son and successor died in battle, and the kingdom was annexed by the Khaljī empire in 1317.

Yaddo, formally THE CORPORATION OF YADDO, a working community of writers, composers, and visual artists, located on the outskirts of Saratoga Springs, New York, U.S. Yaddo is a nonprofit organization founded in 1900 by New York financier Spencer Trask (1844–1909), his wife, the writer Kate, or Katrina, Nichols Trask (1853–1922), and philanthropist George Foster Peabody (1852–1938) for the purpose of providing a place for artists to reside and work in a quiet, secluded atmosphere conducive to creative endeavours. During their lifetimes the Trasks frequently entertained artists as houseguests at their Yaddo

The Yaddo mansion at Saratoga Springs, New York © Tim Moran

estate, which included a mansion situated among more than 400 acres (160 hectares) of woodland, lakes, and gardens. In 1926, four years after Katrina Trask Peabody's death (she married Peabody in 1920), the plan was put into operation, and Yaddo opened its doors to the first guest-artists.

Typically, guests remain for stays of two to eight weeks, and over the years as many as 177 have been received annually. Applications are reviewed by an advisory committee of artists, and invitations are issued without respect to sex, race, age, or religious persuasion. The quality of one's work is the sole citerion for admission. Among the many notables who have experienced Yaddo's program are Truman Capote, John Cheever, Hermann Broch, James Baldwin, Sylvia Plath, Bernard Malamud, Carson McCullers, Katherine Anne Porter, Clyfford Still, Milton Avery, Raymond Carver, James T. Farrell, William Carlos Williams, Theodore Roethke, Robert Lowell, Langston Hughes, Otto Luening, and Henri Cartier-Bresson

Yaddo is supported by grants from the New York State Council on the Arts and from the National Endowment for the Arts, as well as by private and corporate funding.

Yadin, Yigael, original name YIGAEL SUKENIK (b. March 21, 1917, Jerusalem—d. June 28, 1984, Hadera, Israel), Israeli archaeologist and military leader noted for his work on the Dead Sea Scrolls.

Yadin, the son of an archaeologist, was educated at Hebrew University (M.A., 1945; Ph.D., 1955). He was a member of the Haganah military organization from 1932 to 1948 and served as chief of the general staff of the Israel Defense Forces from 1949 to 1952. He was also deputy prime minister, 1977–81. Yadin, who was a leader of major archaeological expeditions in Israel, including those at Hazor (1955–58; 1968), the Dead Sea Caves (1960–61), and Masada (1963–65), became professor of archaeology at Hebrew University in 1959. He received the laureate of Israel prize (1956) and the Rothschild humanities prize (1964).

Yadin's writings centre upon his archaeological endeavours. They include *The Message* of the Scrolls (1957; new ed. 1962), Hazor, 3 vol. (1958-62), and *The Art of Warfare in Biblical Lands in the Light of Archaeological Discovery*, 2 vol. (1963). He is also the author of Masada: Herod's Fortress and the Zealots' Last Stand (1966).

Yafo (Israel): see Tel Aviv-Yafo.

Yagoda, Genrikh Grigoryevich, Yagoda also spelled JAGODA (b. 1891, Łodz, Pol., Russian Empire—d. March 15, 1938, Moscow), head of the Soviet secret police under Stalin from 1934 to 1936 and a central figure in the purge trials.

Yagoda joined the Bolsheviks in 1907 and became a member of the presidium of the Cheka (Soviet secret police) in 1920. He was a deputy chairman of the Cheka's successor organization, OGPU, from 1924 to 1934 and from 1930 was in charge of the system of forced-labour camps in the Soviet Union. A close, longtime associate of Stalin, Yagoda became in 1934 a member of the Central Committee of the Communist Party and was put in charge of the newly organized Commissariat of Internal Affairs, or NKVD, into which the secret police had been absorbed. There is evidence that Yagoda was instrumental in engineering in 1934 the assassination of Sergey Mironovich Kirov, Leningrad party secretary and a member of the Politburo, whom Stalin perceived as a potential rival. As head of the NKVD, Yagoda prepared the first of the public purge trials (August 1936), in which Zinovyev, L.B. Kamenev, and a number of their associates confessed to a series of astonishing charges and were immediately executed.

One year later Yagoda himself became a victim of the widespread purges that he had helped to carry out on Stalin's orders. He was removed from office in September 1936 and replaced as People's Commissar by N.I. Yezhov, under whose direction the purge trials proceeded. Yagoda was arrested in 1937 and became a defendant at the third public purge trial (March 1938). He was accused of being a member of a "Trotskyite" conspiracy intent on destroying the Soviet Union through sabotage. He was convicted, sentenced to death on March 13, and shot soon afterward.

Yahgan (people): see Yámana.

yahrzeit (Yiddish: "year time"), also spelled YORTZEIT, or JAHRZEIT, in Judaism, the anniversary of the death of a parent or close relative, most commonly observed by burning candle for an entire day. On the anniversary, a male (or female, in Reform and Conservative congregations) usually recites the Qaddish (doxology) in the synagogue at all three services, and males may be called up (aliyah) for the public reading of the Torah. If the anniversary falls on a day on which the Torah is

not read, the calling up takes place before the anniversary, as near as possible to the actual date of death. Sephardic (Spanish-rite) Jews attach great importance to the privilege of being called up on the sabbath that precedes the anniversary, for on that day they are allowed to recite the Haftarah (a passage from the prophets).

More learned or more pious Jews may mark the anniversary by studying portions of the Mishna, choosing sections from the sixth division (laws of purity) that begin with letters from the name of the deceased. While some Jews observe a strict fast on *yahrzeit*, others will abstain only from meat and drink. Visiting the grave is no longer quite so common.

Yahrzeit apparently developed from an early Jewish custom of fasting on the anniversaries of the deaths of certain important leaders. During the last centuries of the Second Temple period (c. 520 BC-AD 70), Jews are known to have made solemn vows never to partake of meat or wine on the anniversaries of their parents' deaths. As observed today, yahrzeit probably began in Germany about the 14th century and gradually spread to other regions.

Yahweh, the God of the Israelites, his name being revealed to Moses as four Hebrew consonants (YHWH) called the tetragrammaton. After the Exile (6th century BC), and especially from the 3rd century BC on, Jews ceased to use the name Yahweh for two reasons. As Judaism became a universal religion through its proselytizing in the Greco-Roman world, the more common noun elohim, meaning "god," tended to replace Yahweh to demonstrate the universal sovereignty of Israel's God over all others. At the same time, the divine name was increasingly regarded as too sacred to be uttered; it was thus replaced vocally in the synagogue ritual by the Hebrew word Adonai "My Lord"), which was translated as Kyrios "Lord") in the Septuagint, the Greek version of the Old Testament.

The Masoretes, who from about the 6th to the 10th century worked to reproduce the original text of the Hebrew Bible, replaced the vowels of the name YHWH with the vowel signs of the Hebrew words Adonai or Elohim. Thus, the artificial name Jehovah (YeHoWaH) came into being. Although Christian scholars after the Renaissance and Reformation periods used the term Jehovah for YHWH, in the 19th and 20th centuries biblical scholars again began to use the form Yahweh. Early Christian writers, such as Clement of Alexandria in the 2nd century, had used a form like Yahweh, and this pronunciation of the tetragrammaton was never really lost. Other Greek transcriptions also indicated that YHWH should be pronounced Yahweh.

The meaning of the personal name of the Israelite God has been variously interpreted. Many scholars believe that the most proper meaning may be "He Brings Into Existence Whatever Exists" (Yahweh-Asher-Yahweh). In I Samuel, God is known by the name Yahweh Teva-ot, or "He Brings the Hosts Into Existence," the hosts possibly referring to the heavenly court or to Israel.

The personal name of God probably was known long before the time of Moses. The name of Moses' mother was Jochebed (Yokheved), a word based on the name Yahweh. Thus, the tribe of Levi, to which Moses belonged, probably knew the name Yahweh, which originally may have been (in its short form Yo, Yah, or Yahu) a religious invocation of no precise meaning evoked by the mysterious and awesome splendour of the manifestation of the holy.

Yaḥyā (Maḥmūd al-Mutawakkil) (b. 1867, Yemen—d. Jan. 17, 1948, Ṣanʿā', Yemen), Zaydī imām of Yemen from 1904 to 1948. When Yaḥyā was a child, Yemen was a province of the Ottoman Empire. His youth was spent in the service of his father's administration, and, when his father died in 1904, Yaḥyā succeeded him as *imām*. The Yemenis had always resented Turkish rule, and Yaḥyā was soon able to assemble a potent military force. Sporadic warfare lasted until 1911, when he was able to force the Turks to recognize the autonomy of his personal rule over the Yemen. He remained loyal to the Turks when World War I broke out but did not take an active part in the hostilities. At the close of the war he was recognized as the independent ruler of the Yemen, but there was no agreement on just which territories composed the country.

Yaḥyā clashed with the British, who had a military base in Aden and who considered many of the neighbouring tribes to be under their protection. He also clashed with his Arab neighbours along the Red Sea coast in the province of Asir. War with the Saudis broke out in 1934, just after the conclusion of the treaty with Great Britain, and Yaḥyā suffered a decisive defeat. Ibn Saʿūd was generous, forced the *imām* to make no territorial concessions, and permitted a reversion to the prewar status quo. Thereafter foreign affairs ceased to be a dominant concern, and Yaḥyā directed his attention mostly to stabilization at home.

The hallmark of his rule was isolation from the outside world. His military power was based on the support of the Zaydi tribesmen of the interior highlands, while he administered the country through a small class of nobles known as sayyids. Yaḥyā himself secured what amounted to a monopoly of Yemen's foreign trade. He was most concerned that no foreign influences disrupt this delicate equilibrium. He received some economic and military aid from the Italians in the 1920s and '30s but firmly refused close contacts, such as an exchange of diplomatic missions. During World War II he remained neutral, but trouble began afterward, when the British strengthened their position in Aden and Yemenis who were discontented with Yaḥyā's isolationist autocracy looked to them for support. Yemenis abroad also supported the domestic dissidents, but opposition did not become active until 1946. Two years later, the aged imam was machine-gunned to death.

Yaḥyā ibn Maḥmūd al-Wāsiṭī (fl. 13th century, Iraq), Muslim painter and illustrator who produced work of originality and excel-

Leaf from the *Maqāmāt* of al-Ḥarīrī showing camels with their driver, by Yahyā ibn Maḥmūd al-Wāsiṭī, Baghdad School, 1237; in the Bibliothèque Nationale, Paris (Ms. Arabe 5847)

By courtesy of the Bibliotheque Nationale, Paris

lence. He was the outstanding painter of the Baghdad school of illustration, which blended Turkish art and native Christian (probably Jacobite or Syriac Monophysite) painting in a lively Islāmic syncretism.

Yanyā was not the first to paint in this style, but he was the best artist whose work has survived. His work shows a synthesis of realism and stylization, and his composition is more elaborate than in earlier Islāmic painting

He was a native of the town of Wāsiṭ in what is now southern Iraq. Nothing is known of his life, and knowledge of him rests solely on his work.

About 1237 he illustrated the *Maqāmāt* ("Assemblies") of al-Ḥarīrī, a series of anecdotes concerning the picaresque adventures of an eloquent 12th-century Arab rogue, a work that was highly popular at this period. The 96 illustrations are of outstanding quality with fine composition, expressive figures, and vivid but controlled colours. They provide a fascinating series of glimpses into and commentaries on 13th-century Islāmic life and are remarkably satisfying as storybook illustrations.

Yahya Khan, Agha Mohammad (b. Feb. 4, 1917, near Peshāwar, India—d. Aug. 10, 1980, Rāwalpindi, Pak.), president of Pakistan (1969–71), a professional soldier who became commander in chief of the Pakistani armed forces in 1966.

Yahya was born to a family that was descended from the elite soldier class of Nāder Shāh, the Persian ruler who conquered Delhi in the 18th century. He was educated at Punjab University and later graduated first in his class from the Indian Military Academy at Dehra Dūn. He served in Italy and the Middle East during World War II and, after the partition of India, organized the Pakistani Staff College in 1947.

After serving in the war with India over Kashmir, he became Pakistan's youngest brigadier general at 34, its youngest general at 40, and commander in chief in 1966. A protégé of Pres. Ayub Khan, Yahya was in command of the military when street riots erupted. Ayub called on him to take over the direction of the government and preserve the integrity of Pakistan. He was appointed chief administrator of martial law, which he declared with the words "I will not tolerate disorder. Let everyone return to his post."

Yahya Khan succeeded Pres. Ayub Khan when the latter resigned his office in March 1969. In 1971 a serious conflict erupted between the central government and the Awami Party of East Pakistan, led by Sheikh Mujibur Rahman. The East Pakistani leader demanded autonomy for his half of the geographically divided nation, and Yahya Khan responded by ordering the Army to suppress the Awami Party. The brutality with which his orders were carried out and the resulting influx of millions of East Pakistani refugees into India led to the Indian invasion of East Pakistan and the rout of its West Pakistani occupiers. East Pakistan became the independent state of Bangladesh, and with its loss Yahya Khan resigned (Dec. 20, 1971).

He was replaced by his foreign minister, Zulfikar Ali Bhutto, who put him under house arrest. Shortly afterward he was paralyzed by a stroke and, after his release, played no further important political role.

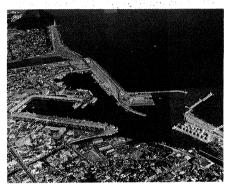

Yaḥyā Şobḥ-e Azal, Mīrzā (b. 1831, Tehrān—d. April 29, 1912, Famagusta, Cyprus), half brother of Bahā' Ullāh (the founder of the Bahā'ī faith) and leader of his own Bābist movement in the mid-19th century Ottoman Empire.

Yaḥyā was the designated successor of Sayyid Alī Muḥammad, a Shīʿī sectarian leader known as the Bāb (Arabic: "gate," referring to one who has access to the hidden imām). The Bāb was executed in 1850, and by the following year his followers regarded Yaḥyā Mīrzā as

the Bāb, in spite of his youth. To avoid persecution by orthodox Shī'ī authorities, he fled Iran in 1853 to Turkish Baghdad where he remained for a decade along with his followers, called Azalis or Bābis. In 1866, in Edirne, a schism erupted between Yahyā and Bahā' Úllāh, who now claimed to be divine. In order to stop the sectarian strife which erupted among the followers of each, the Ottoman authorities exiled both, sending Yahyā to Cyprus in 1868. When Cyprus came under British rule in 1878 he became a pensioner of the crown and lived out his days in obscurity.

Although reviled by the followers of Bahā' Ullāh, some, particularly in Iran, still regard Yahyā as the true spiritual leader.

Yaizu, city, Shizuoka Prefecture (ken), Honshu, Japan, on the west coast of Suruga-wan (Suruga Bay). Since the Tokugawa era (1603– 1867) it has been one of the important coastal fishing ports for tuna, bonito, skipjack, and mackerel. Canning and freezing plants operate there. Deep-sea fishing developed in the early 20th century. Yaizu contains the summer home of the 19th-century U.S. writer

Yaizu, Japan

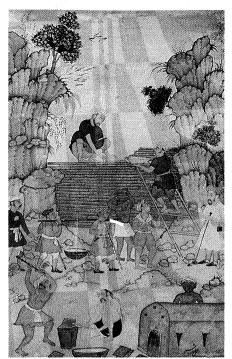

and educator Lafcadio Hearn. Pop. (1983 est.) 106,641.

yajña (Sanskrit: "sacrifice, offering"), in Hinduism, worship based on rites prescribed in the earliest scriptures of ancient India, the Vedas, in contrast to $p\bar{u}j\bar{a}$ (q.v.), which may include image worship and devotional practices non-Vedic in origin.

A yajña is always purposeful, even though the aim may be as general as sustaining the natural order of the universe. Correct performance of the ritual and recitation of the necessary mantras, or sacred formulas, is considered essential; and the performer and the objects employed must all be in a high state of purity. Such ritual requirements gave rise to the professional class of priests, the modern Brahmans, who are still required to officiate at all important public *vaiñas*. Many orthodox Hindu householders continue to perform the mahāyajñas, the five daily domestic offerings.

Yājūj and Mājūj, in Islāmic eschatology, two hostile forces who will ravage the Earth before the end of the world. The Qur'an relates that a certain people terrorized by Yājūj and Mājūj induced Alexander the Great to construct a great wall between them. Yājūj and Mājūj, thus trapped between two mountains until the last days of the world, dig under the wall every night trying to escape, only to find each morning that the wall has been restored by God (Allāh).

Tradition provides several descriptions of Yājūj and Mājūj, who are Muslim counterparts of the biblical Gog and Magog. Some are tall as cedars, and others wide as they are tall; one variety is completely covered with ears. They will appear in large numbers in the northeast of the ancient world as portents of the end, then proceed south toward Israel, drinking up the waters of the Tigris and Euphrates rivers or

the Sea of Galilee and killing everyone along the way. When there are no more human targets left for their arrows, Yājūj and Mājūj will shoot at the sky, but God will either fill their ears and noses and throats with worms and destroy them in a single night or send a flock of birds to drown them in the sea.

Yajurveda, collection of mantras (sacred formulas) and verses that forms part of the ancient sacred literature of India known as the Vedas. *See* Veda.

yak (Bos grunniens), large, massively built ox, family Bovidae (order Artiodactyla), of the Tibetan plateaus 4,300–6,100 metres (14,000– 20,000 feet) above sea level.

Some large yak bulls attain heights of about 1.8 metres (6 feet) at the shoulder hump; cows and domesticated varieties are much smaller. The hair of wild yak is black and short, except on the flanks and tail where it forms a long, shaggy fringe. The horns spread outward and upward, and the head is held low like that of the bison.

Wild yaks (Bos grunniens mutus) live in large herds of females, young bulls, and calves,

Yak (Bos grunniens) Russ Kinne-Photo Researchers

the mature bulls staying together in smaller groups. Mating takes place in winter, and the calves are born in the following autumn. Yaks graze on grass and require much water (they are said to eat snow in winter).

Wild yaks, now reduced in numbers and

listed as endangered in the Red Data Book, are found mainly in northern Tibet. Domestic vaks, which breed freely with domestic cattle, are often piebald black and white; they are used as pack, draft, and saddle animals in the plateaus and mountains. The hides of both wild and tame yaks provide leather, and the tails are valued as fly whisks in India. Domesticated yaks are also kept for milk and beef. The hair from the long fringes of the flanks is used in making cords and ropes. The dried dung of the yak is the only obtainable fuel on the treeless Tibetan plateaus.

Yaka, a people inhabiting the wooded plateau and savanna areas between the Kwango and Wamba rivers in southwestern Zaire directly bordering Angola on the west. One theory says that the Yaka migrated northward to their present lands from the periphery of the Lunda Empire, while another associates the Yaka with Jaga warriors from the source of the Kwango (now in Angola) who, beginning in the 16th century, moved into the old Kongo Kingdom. Yaka is now a tribal name given to the people of several heritages, including those

related to the neighbouring Suku.

Yaka have a system that combines patrilineal filiation (inheritance of the name, responsibilities, and prerogatives that determine social position) with matrilineal descent. Residence is with the husband's family. Those with a common patrilineal ancestry are split into collateral lines that live in distinct hamlets or villages. A lineage headmanship is not inherited "vertically" but is passed "horizontally" from one collateral line to another, thus reinforcing bonds among lineage members who do not live together. Vertical political hierarchy was a structure imposed or adopted from Lunda conquerors; contemporary Yaka chiefs are functionaries in the government of Zaire. Yaka believe that life and life-promoting skills or influences are inherited through matrilineal descent, and divination to determine causes of misfortune and strategies for redress are within the realm of matrilineal relations.

Rural Yaka are subsistence farmers of cassava and corn (maize) as staple crops. Their diet is supplemented when possible by hunting or fishing. Most Yaka men seek work in Kinshasa or other urban centres, and many engage in trade in the greater Kongo area. Yaka material culture (carving, basketry, metal work, and weaving) is well known. Yaka masks and figures have distinctive bulky forms, globular eyes, and turned up noses; some are poly-chrome, and many have raffia cloth or fringes attached. Yaka style dominates the expressive forms of neighbouring groups.

Yakima, Sahaptian-speaking Indian tribe that lived along the Columbia, Yakima, and Wenatchee rivers in south central Washington. They were members of the Plateau culture area and were primarily salmon fishers.

Although culturally much like other Sahaptin (q.v.) Indians of the Plateau, the Yakima acquired historical distinction in the Yakima Indian Wars (1855–58), a failed attempt by the Indians to resist U.S. forces intent upon clearing the Washington Territory for white prospectors and settlers.

The conflict stemmed from a treaty that had been negotiated in 1855, according to which the Yakima and 13 other tribes were to be placed on a reservation and confederated as the Yakima Nation. Before the treaty could be ratified, however, a number of tribes united under the Yakima chief Kamaiakan, who declared his intention to drive all whites from the region. After initial Indian successes, the uprising spread to other tribes in Washington and Oregon. Three years of raids, ambushes, and engagements followed, until September 1858, when the Indians were decisively defeated at the Battle of Four Lakes (on a tributary of the Spokane River).

In 1859, the treaty of 1855 was effected, with the Yakima and most of the other tribes confined to reservations and their fertile ancestral lands opened to white appropriation. Since that time, all of the residents of the Yakima Reservation have been termed Yakima, and the descendants of the original tribe cannot be distinguished.

Yakima, city, seat (1886) of Yakima county, south-central Washington, U.S., on the Yakima River. In 1884 the Northern Pacific Railway selected the site of Yakima City (now Union Gap) as a construction headquarters. This was abandoned and a new settlement (4 miles [6 km] north), known as North Yakima, became a railroad depot and cattleshipping point. Irrigation, introduced in 1891, turned the Yakima Valley into a highly productive area supporting apples, pears, cherries, sugar beets, mint, hops, livestock, and dairying. Food processing became important. The city, named for the Yakima Indians (whose reservation lies southwest), was incorporated in 1883 as North Yakima (the prefix was dropped in 1918). It is the site of Yakima Valley College (1928) and is a tourist centre and the eastern gateway to Mount Rainier National Park. Pop. (1987 est.) city, 50,205; metropolitan area (MSA), 182,800.

Consult the INDEX first

Yakima River, river, rising in the Cascade Range, near Snoqualmie Pass in south-central Washington, U.S., and flowing south-east about 200 miles (320 km) past Ellensburg and Yakima to join the Columbia River near Kennewick in Benton county. The Yakima and its tributaries irrigate about 460,000 acres (190,000 hectares) in the river valley. The Keechelus Dam, near the river's source, is a major unit of the U.S. Bureau of Reclamation's Yakima project. The Yakima Indian name probably means "runaway," referring to the rushing waters of the river.

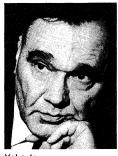

Yako, also spelled YAKÖ, or YAKURR, people of the Cross River region of eastern Nigeria; they speak Luko, a language of the Benue-Congo branch of the Niger-Congo family.

The Yako are mainly yam farmers; subsidiary crops include cocoyams (taro), corn (maize), okra, and pumpkin. The main cash crop is palm oil. The Yako occupy compact villages divided into wards, each containing several patrilineal clans. Patrilineal descent governs rights to farm land, house sites, and cooperative labour. Men of the same patrilineal clan live together and cooperate in farming activities. The head of the clan arbitrates disputes, performs clan rituals, and represents the clan in external relations. The Yako also recognize matrilineal descent, which governs the inheritance of transferable wealth, such as livestock and currency. Matrilineal kin are responsible for debts incurred by individuals, have rights and obligations in payment of compensation for injuries, and participate in certain rituals associated with a fertility spirit.

Secular and ritual authority within the village wards is vested in a group of ward leaders, led by a ward head. Secular and ritual authority for the entire village is concentrated in a council of village priests (the *yabot*); the village head is the priest of the paramount fertility spirit.

Traditional Yako ritual is concerned with sacrifice, invocation or control of spiritual beings, and divination. Supernatural beings include a creator god, protective tutelary spirits, malevolent spirits, and the ghosts of the dead. Many Yako are now Christians.

Yakovlev, Aleksandr Sergeyevich (b. April 1 [March 19, Old Style], 1906, Moscow—d. Aug. 22, 1989), aircraft designer noted for his series of Yak aircraft, most of which were fighters widely used by the Soviet Union in World War II.

Yakovlev Novosti Press Agency

After graduation from the Air Force Engineering Academy in 1931, Yakovlev immediately began to design aircraft, both pistonand jet-engined. Just before World War II he designed the Yak-1 fighter. His first jet fighter, the Yak-15, was designed in 1945, followed by the Yak-17 and Yak-23. His successful twinengined "flying wagon" helicopter (the Yak-24) set several world records. In the years after World War II, as the MiG design increased in popularity, Yakolev began to design civilian aircraft, especially sport planes.

A member of the Communist Party of the Soviet Union from 1938, Yakovlev served from 1940 to 1956 as a deputy minister of the aircraft industry and as chief designer thereafter. He was awarded the Stalin Prize seven times and the Order of Lenin eight times and became a member of the U.S.S.R. Academy of Sciences in 1976.

yaksha, also spelled YAKSA, Sanskrit masculine singular YAKŞA, feminine singular YAKŞĀ,

Yaksha, stone figure from Vidisha, Madhya Pradesh, India, c. 1st century BC; in the Vidisha Museum, India Pramod Chandra

or YAKṣinī, in the mythology of India, a class of generally benevolent nature spirits who are the custodians of treasures that are hidden in the earth and in the roots of trees. Principal among the yakshas is Kubera (q.v.), who rules

in the mythical Himalayan kingdom called

Yakshas were often given homage as tutelary deities of a city, district, lake, or well. Their worship, together with popular belief in nagas (serpent deities), feminine fertility deities, and mother goddesses, probably had its origin among the early Dravidian peoples of India. The yaksha cult coexisted with the priest-conducted sacrifices of the Vedic period, and continued to flourish during the Kuṣāna period.

In art, sculptures of yakshas were among the earliest of deities, apparently preceding images of the bodhisattvas and of Brahmanical deities, whose representation they influenced. Their images are the prototypes also for the attendants of later Hindu, Buddhist, and Jaina art. The female yakshas often appeared on early Buddhist and Jaina railings and gateways as nude, or seminude, heavily jeweled fertility figures.

Yakub Beg (b. 1820, Pskente, Kokand [now in Uzbek S.S.R.]—d. May 16, 1877, Kashgaria [now in Sinkiang province, China]), Tadzhik adventurer who entered northwest China in 1864 and through a series of military and political maneuvers took advantage of the anti-Chinese uprisings of its Muslim inhabitants to establish himself as head of the kingdom of Kashgaria. Expanding northward in the area of modern Sinkiang province, he attracted the attention of the Ottoman sultan, who made Yakub the emir of Kashgaria.

During the turmoil, the Russians occupied parts of Chinese Turkistan and Sinkiang and then encouraged Yakub to sign a commercial treaty in 1872. The following year, the British—to ensure a buffer zone between India and the southward-expanding Russian Empire—signed a similar treaty with Kashgaria. Those two treaties, in effect, gave Kashgaria international recognition.

But the Chinese, who had been occupied with rebellions and invasions in other parts of their empire, then decided to take decisive action against Yakub. An army under the noted Chinese scholar-general Tso Tsungt'ang (1812–85) advanced rapidly westward toward Kashgaria. On May 16, 1877, with the fall of Yakub's capital city of Turfan, the kingdom of Kashgaria came to an end, and Yakub committed suicide.

Yakushi-ji, temple complex dedicated to Yakushi, the Healing Buddha, in Nara, Japan. It was established about 690 outside

The three-storied eastern pagoda of Yakushi-ji, Nara period, Nara, Japan

Milt and Joan Mann—CAMERAMANN INTERNATIONAL

Nara, and in 718 it was refounded within the city. The only one of the original buildings to have survived is the three-storied eastern pagoda, which is one of the finest examples of religious architecture of the Nara period (AD 710-784). Yakushi-ji has many treasures of Japanese art, the most famous being the Nara-period sculpture group known as the Yakushi triad (statues of Buddha, Nikko, and Gakko).

Yakut, also spelled YAKUTS, also called SAKHA, major people of Siberia, now completely Russianized culturally. In the 17th century they inhabited a limited area on the

Yakut musicians playing the khomus, a native mouth harp

middle Lena River; they have expanded (numbering about 328,000 in the 1979 census) and today form the main population of the Yakut Autonomous Soviet Socialist Republic. They speak a Turkic language and, in their own language, are known as Sakha. The Yakut are apparently a fusion of migrants from the Lake Baikal region with the aborigines of the Lena-probably mostly Evenk, who have contributed much to their culture. Other evidence, however, points to a southern ancestry related to the Turkish tribes of the steppe and Altai Mountains.

Despite the Arctic climate, the Yakut have clung to a cattle economy, though the livestock must be sheltered and fed a large part of the year. Fishing in rivers and lakes ranks next in importance. They were formerly seminomadic, with winter settlements of earth-covered log huts and summer camps of conical tents (near pasturage and sources of hay for winter fodder). The southern Yakut have turned to farming under Soviet influence; the most northerly adopted reindeer breeding from the Evenk. The Yakut were the only potters among the historic Siberian tribes; they were also ironworkers.

In the 17th century the Yakut consisted of 80 independent tribes, subdivided into clans. The family (husband, wife, and children) was the primary Yakut social unit. The position of women in family and public life was inferior. Great supernatural power was attributed to blacksmiths since their art was considered a divine gift. The old Yakut religion had many supernatural spirits, good and evil. Black shamans dealt with evil spirits and white shamans with benevolent beings. Religious attitudes toward horses were expressed in the well-known koumiss (fermented mare's milk) festivals: one in spring for good deities, and one in fall accompanied by blood sacrifices of livestock for evil deities.

Yakut Autonomous Soviet Socialist Republic, also called YAKUTIYA, administrative division of the Russian Soviet Federated Socialist Republic, in northeastern Siberia. Lying in the basins of the great rivers flowing to the Arctic Ocean—the Lena, Yana, Indigirka, and Kolyma—it covers 1,198,150 sq mi (3,103,200 sq km), including the New Siberian Islands between the Laptev and East Siberian seas, and is the largest administrative unit in the Soviet Union except for the Russian S.F.S.R. itself. It was formed in 1922.

A mountainous area interspersed with broad plateaus and broken by river and coastal lowlands, Yakutiya extends from the Central Siberian Plateau on the west to the Moma Mountains on the east and from the Arctic lowlands and islands on the north to the Stanovoy Mountains on the south. The climate of Yakutiya, the most severe of the inhabited world, is extremely continental, with an average January temperature of -46° F (-43.5° C) and an average July temperature of 66° F. The entire region is underlain by permafrost, with only isolated unfrozen patches in the south. At Yakutsk (q.v.), the capital, it is 450 ft (140 m) deep, while on the coast where there are extensive areas of fossil ice, it reaches 1,000 ft or more in depth. Soils are most poorly developed over the permafrost. Tundra vegetation, consisting of mosses, lichens, and dwarf shrubs, occurs in a broad strip along the coast and gives way in a southward progression to stunted forests of Dahurian larch and dwarf birch and the swampy forests, or taiga, of birch, pine, and spruce.

The Yakuts, a Mongoloid people who formed from the merger of local tribes with Turkic groups that came from the south in the 6th-10th centuries AD, joined the Russian state in the first half of the 17th century. Yakutsk, the largest city, was founded in 1632. In 1638 the Yakutsk voyevodstvo (province) was established and the area was opened to the Russians, who settled in the towns along the middle Lena. By the 19th century the Yakuts, formerly nomadic herdsmen (deer and horses), hunters, and fishermen, adopted a sedentary life. In 1979 Yakuts constituted 37 percent of the republic's population, while Russians

comprised 50 percent.

Economic conditions reflect the remoteness and harsh physical conditions of Yakutiya. Agriculture is possible only in the south along the Lena and its tributaries, where potatoes, oats, rye, and vegetables are grown and cattle are raised. The Yakuts, Evenks, and Evens peoples live chiefly by reindeer herding, fishing, and hunting squirrel, fox, arctic fox, and ermine. Mineral resources include deposits of gold near Aldan and Tommot in the south and in the Indigirka Valley, diamonds and salt in the Vilyuy Basin, tin in the Yana Valley, and coal along the lower Lena. Mining and timber working are the main industries. Huge deposits of natural gas in the Vilyuy Basin have been discovered, and exploration was still under way in the early 1980s. The area around Yakutsk, which has food-processing plants, sawmills, and light manufacturing plants, is the most industrially developed part of the republic. A hydroelectric station on the Vilyuy at Chernyshevsky is in operation.

Apart from the roads linking Yakutsk to Aldan, to the port of Magadan on the Sea of Okhotsk, and to the Vilyuy Valley, the only communications over this great area are by the rivers (open only for three to four months a year), by winter sled trails, and by air to Moscow and other towns of the republic and its neighbouring regions. Pop. (1983 est.) 944,-

Yakut language, member of the Turkic language group (a subfamily of the Altaic languages), spoken in northeastern Siberia (Yakut A.S.S.R.), in the U.S.S.R. Yakut is classified as a distinct branch of the Turkic languages, because its speakers have been geographically isolated from the Central Asian Turkic communities since the 14th century; it shows closest affinity to the northeastern Turkic languages. At present the shortest distance separating the Yakut people from other Turkic peoples is some 1,200 kilometres (750 miles). See also Turkic languages.

Yakutsk, city and capital of the Yakut Autonomous Soviet Socialist Republic, far northeastern Russian Soviet Federated Socialist Republic, on the Lena River. A fort was founded on the low right bank in 1632 and transferred to the present site of Yakutsk in 1642. Long a small provincial centre of wooden houses, Yakutsk has grown in size and acquired light industries, up-to-date housing, and paved streets, but its functions remain primarily those of administration and of a river port. It has a university (founded 1956) and the Yakut branch of the Academy of Sciences of the U.S.S.R. Pop. (1983 est.) 170,000.

yakuza (Japanese: "good-for-nothing"), also called GYANGU, gangster or mobster, member of a boryokudan (q.v.) or gang of racketeers.

Yala, town and *changwat* (province) in the Southern region of Thailand. Yala town, the provincial capital, is a commercial centre on the Mae Nam (river) Pattani, the Bangkok-Singapore railway, and the Pattani-Penang highway. The landlocked province borders on Malaysia and includes the southernmost point in Thailand. It has an area of 1,746 sq mi (4,521 sq km) and is drained by the Mae Nam Pattani, which flows north into the Gulf of Thailand. The population includes Thai Muslim, Malay Muslim, and Chinese. The province is heavily planted in rubber. Bannang Sata and Betong are provincial tin-mining centres. Pop. (1980) town, 47,174; province, 265,276.

Yale, Caroline Ardelia (b. Sept. 1848, Charlotte, Vt., U.S.—d. July 2, 1933, Northampton, Mass.), U.S. educator of the deaf and long-time principal of the Clarke School for the Deaf.

Caroline Yale, 1927 By courtesy of the Clarke School for the Deaf. Northampton, Mass.

After studying for two years at Mount Holyoke College, South Hadley, Mass., and teaching briefly in academies at Williston and Brandon, Vt., Yale joined the teaching staff of the Clarke Institution for Deaf Mutes (which in 1896 became the Clarke School for the Deaf) at Northampton. Its principal, Harriet Burbank Rogers, rejecting the finger alphabet, introduced the German oral method to teach deaf children to speak and to read lips. After a visit for a trial month on the staff in 1870, Yale remained for 63 years. She became associate principal in 1873 and principal in 1886. Under her direction the school added athletic and manual training and, in 1889, classes to train teachers for the deaf. She was director of the American Association to Promote Teaching of Speech to the Deaf and author of Years of Building, Memories of a Pioneer in a Special Field of Education (1931).

Yale, Elihu (b. April 5, 1649, Boston—d. July 8, 1721, London), wealthy English merchant, official of the East India Company, and benefactor of Yale University. Although born in Massachusetts, Yale was taken to England by his family at the age of three, and he never returned to America. He was educated at a private school in London.

In 1671 Yale began working for the East India Company and was sent the following year to Madras. From a fairly low-ranking position he worked his way up by 1687 to become governor of the East India Company's installation at Madras, Fort Saint George. Five years later the company removed him from office, charging him with self-aggrandizement at company expense. He was kept in Madras until 1699 and forced to pay a fine, but Yale was still able to take a sizable fortune with him when he finally sailed for England. In London he entered the diamond trade, but he devoted a good deal of his time and money to philanthropy.

Connecticut's London agent, Jeremiah Dummer, approached Yale with the suggestion that the Collegiate School at Saybrook in the colony would welcome a contribution. Yale responded with a gift of books. Later, in 1718, Cotton Mather wrote to Yale, hinting broadly that the Saybrook school—which had recently moved to New Haven-could be renamed in Yale's honour in gratitude for another sizable gift. Thereupon, Yale sent more books, a portrait of George I, and a variety of goods from the East Indies. The gifts were sold in Boston for some £800, and the money was used to construct a building called Yale College in New Haven. By its charter of 1745, the entire institution was named Yale University. Yale was buried at Wrexham in North Wales.

Yale, Frankie, byname of Frank UALE (b. 1885, Brooklyn, N.Y., U.S.—d. July 1, 1927, Brooklyn), American gangster and national president, during its heyday (1918–28), of the Unione Siciliane, a Sicilian fraternal organization that by World War I had become a crime cartel operating in several U.S. cities and active in robbery, prostitution, labourunion extortion, and other rackets.

Yale graduated from youth gangs to bootlegging and rum-running during Prohibition and took on murder contracts as a sideline; he was reputedly the imported gunman who held Dion O'Bannion's hand while cohorts shot the Chicago mobster. Yale himself was finally killed driving his car on a Brooklyn street as another car drew alongside, machine guns firing. Al Capone allegedly ordered the execution, suspecting Yale of a liquor hijacking. Yale's funeral was grandly enacted, with a \$12,000 casket and 28 trucks of flowers.

Yale, Linus (b. April 4, 1821, Salisbury, N.Y., U.S.—d. Dec. 25, 1868, New York, N.Y.), American inventor and designer of the compact cylinder pin-tumbler lock that bears his name.

At first Yale tried portrait painting, but he became interested in locks after his father began to manufacture bank locks in Newport, N.Y., about 1840. His first achievement was the Yale Infallible Bank Lock in 1851. Later he opened his own shop in Shelburne Falls, Mass., where he produced the Yale Magic Bank Lock and the Yale Double Treasury Bank Lock. By about 1862 he had introduced the combination lock.

His most important invention was the cylinder lock, based on the pin-tumbler mechanism of the ancient Egyptians. The serrations on the edge of the key raise pin tumblers to exactly the correct height, allowing the cylinder of the lock to revolve and withdraw the bolt. In 1868 Yale, in partnership with John Henry Towne and his son, Henry Robinson Towne, founded the Yale Lock Manufacturing Company at Stamford, Conn.

Yale University, private university in New Haven, Conn., that was founded in 1701 and is the third oldest university in the United States. It was originally chartered by the colonial legislature of Connecticut as the Colle-

giate School and was held at Killingworth and other locations. In 1717 the school was moved to New Haven, and the following year it was renamed Yale College in honour of a wealthy British trader and philanthropist, Elihu Yale, who had made a series of donations to the school. Yale's initial curriculum emphasized classical studies and strict adherence to orthodox Puritanism.

Yale's medical school was organized in 1810. The divinity school arose from a department of theology created in 1822, while a law department became affiliated with the college in 1824. The geologist Benjamin Silliman, who taught at Yale between 1802 and 1853, did much to make the experimental and applied sciences a respectable field of study in the United States. While at Yale he founded the American Journal of Science and Arts, which was one of the great scientific journals of the world in the 19th century. Yale's Sheffield Scientific School, begun in the 1850s, was one of the leading scientific and engineering centres in the nation until the 20th century.

Graduate instruction was begun at Yale in 1846, and a graduate school was organized the following year. A school of art was created in 1865, and schools of music, forestry, nursing, drama, management, and architecture were subsequently established. The college was renamed Yale University in 1886. Women were first admitted to the graduate school in 1892, but the university did not become fully coeducational until 1969. Yale is highly selective in its admissions, and is among the nation's most highly rated schools in terms of academic and social prestige.

The Yale University Library, with nearly 6,000,000 volumes, is one of the largest in the United States. Yale's extensive art galleries, the first in a U.S. college, were established in 1832 when Colonel John Trumbull donated a gallery to house his paintings of the American Revolution. Yale's Peabody Museum of Natural History houses important collections of paleontology, archaeology, and ethnology.

Yale's graduates have included the U.S. presidents William Howard Taft, Gerald Ford, and George Bush, the politician John C. Calhoun, the theologian Jonathan Edwards, the inventors Eli Whitney and Samuel F.B. Morse, and the lexicographer Noah Webster.

Yalow, Rosalyn S(ussman) (b. July 19, 1921, New York, N.Y., U.S.), American medical physicist who was awarded a share (with Andrew V. Schally and Roger Guillemin) of the 1977 Nobel Prize for Physiology or Medicine for her development of the technique of radioimmunoassay (RIA).

Yalow graduated from Hunter College in New York City in 1941 and four years later received her Ph.D. in physics from the University of Illinois. From 1946 to 1950 she lectured on physics at Hunter. In 1947 she became a consultant in nuclear physics to the Bronx Veterans Administration Hospital, where in 1950 she was appointed physicist and assistant chief of the radioisotope service. With a colleague, Solomon A. Berson, she began investigating various medical applications of radioactive isotopes. By combining techniques from radioisotope tracing and immunology, Yalow developed RIA, which proved to be a very sensitive and simple means for measuring minute concentrations of biological and pharmacological substances in blood or other fluid samples. RIA was first applied by Yalow and Berson in 1959 in studying insulin concentration in the blood of diabetics, but the method soon found hundreds of other applications. In 1976 Yalow became the first woman to be awarded the Albert Lasker Prize for basic medical research. From 1973 she was director of the Solomon A. Berson Research Labora-

Yalta, also spelled JALTA, city, Crimea *oblast* (province), Ukrainian Soviet Socialist Repub-

Garden facade of Livadiya Palace, Yalta, Ukrainian S.S.R.

John Massey Stewart

lic, on the southern shore of the Crimean Peninsula. Settlement on the site dates from prehistoric times, but modern Yalta developed only in the early 19th century, becoming a town in 1838. Its favourable climate with mild winters and its scenic location between sea and mountains make Yalta one of the most popular holiday and health resorts of the Soviet Union, with many hotels and sanatoriums, including one established in 1900 at the instigation of the writer-physician Anton Chekhov. There are wine-making, fruit-canning, and tobacco-processing industries. Yalta is a regular port of call for passenger ships from Soviet Black Sea ports. The city has a road link to Simferopol. In February 1945, during World War II, Allied leaders met at Yalta in the Livadiva Palace in what became known as the Yalta Conference. Pop. (1987 est.) 89,000.

Yalta Conference (Feb. 4–11, 1945), major World War II conference of the three chief Allied leaders, President Franklin D. Roosevelt of the United States, Prime Minister Winston Churchill of Great Britain, and Premier Joseph Stalin of the Soviet Union, which met at Yalta in the Crimea to plan the final defeat and occupation of Nazi Germany.

It had already been decided that Germany would be divided into occupied zones administered by U.S., British, French, and Soviet forces. The conferees accepted the principle that the Allies had no duty toward the Germans except to provide minimum subsistence, declared that the German military industry would be abolished or confiscated, and agreed that major war criminals would be tried before an international court, which subsequently presided at Nuremberg. The determination of reparations was assigned to a commission.

How to deal with the defeated or liberated countries of eastern Europe was the main problem discussed at the conference. The agreements reached, which were accepted by Stalin, called for "interim governmental authorities broadly representative of all democratic elements in the population . . . and the earliest possible establishment through free elections of governments responsive to the will of the people." Britain and the United States supported a Polish government-in-exile in London while the Soviets supported a communist-dominated Polish committee of national liberation in Lublin. Neither the Western Allies nor the U.S.S.R. would give up its Polish group, so they could only agree that the Lublin committee would be broadened to include representatives of other Polish political groups, upon which the Allies would recognize it as a provisional government of national unity that would hold free elections to choose a successor government. Poland's future frontiers were also discussed, but no decisions were reached.

Regarding the Far East, a secret protocol stip-

ulated that, in return for the Soviet Union's entering the war against Japan within "two or three months" after Germany's surrender, the U.S.S.R. would regain the territory lost to Japan in the Russo-Japanese War of 1904–05, and the status quo in pro-Soviet Outer Mongolia would be maintained. Stalin agreed to sign a pact of alliance and friendship with China.

The United Nations organization charter had already been drafted, and the conferees worked out a compromise formula for voting in the Security Council. The Soviets withdrew their claim that all 16 Soviet republics should have membership in the General Assembly.

After the agreements reached at Yalta were made public in 1946, they were harshly criticized in the United States. This was because, as events turned out, Stalin failed to keep his promise that free elections would be held in Poland, Czechoslovakia, Hungary, Romania, and Bulgaria. Instead, communist governments were established in all those countries, noncommunist political parties were suppressed, and genuinely democratic elections were never held. At the time of the Yalta Conference, both Roosevelt and Churchill had trusted Stalin and believed that he would keep his word. Neither leader had suspected that Stalin intended that all the Popular Front governments in Europe would be taken over by communists. Roosevelt and Churchill were further inclined to assent to the Yalta agreements because they assumed, mistakenly as it turned out, that Soviet assistance would be sorely needed to defeat the Japanese in the Pacific and Manchuria. In any case, the Soviet Union was the military occupier of eastern Europe at the war's end, and so there was little the Western democracies could do to enforce the promises made by Stalin at Yalta.

Yalu River, Wade-Giles romanization YA-LÜ CHIANG, Pinyin YALU JIANG, Korean AM-NOK-KANG, river that forms the northwestern boundary between North Korea and the Northeast Region (Manchuria) of China. The Chinese provinces of Kirin and Liaoning are bordered by the river. Its length is estimated to be 491 miles (790 km), and it drains an area of some 12,259 square miles (31,751 square km). From a mountainous source in the Ch'angpai Mountains, the river flows southwestward to drain into the Yellow Sea. The river is an important source of hydroelectric power, is used for transportation (especially of lumber from the rich forests on its banks), and provides fish for the riverine populations.

In addition to serving as a political boundary, the Yalu River constitutes a dividing line between Chinese and Korean cultures. It is generally known abroad by its Chinese name, Ya-Iŭ (Pinyin Ya-Iu), instead of by its Korean name, Amnok. According to ancient writing, the Chinese name, which is derived from the words ya ("duck") and lü ("greenish blue"), is a comparison of the blueness of the river's waters and the greenish blue of a particular species of domestic duck that inhabits it. The Yalu did not become a political boundary until the Korean-Chinese border was established toward the end of the Korean Koryŏ dynasty in the 14th century. The river played an important political role in the Korean War of 1950-53.

The Yalu rises in T'ien Lake (known in Korean as Ch'ŏn Lake), a body of water of indeterminate depth on top of Pai-t'ou Mountain on the Chinese–North Korean border, at a height of 9,000 feet (2,700 m) above sea level. Winding southward as far as Hyesan, North Korea, and then meandering northwestward for 80 miles (130 km), the river reaches Linchiang, Kirin province, from which it flows southwestward for 200 miles (320 km) before emptying into Korea Bay.

Except for small areas of basaltic lava along the easternmost part of the river's course, the

Yalu flows over Precambrian rock (more than 570 million years old) before its alluvium begins to spread out as it approaches its estuary. Throughout much of its course it flows through deep, gorgelike valleys, with mountains ranging in height from 1,900 to 3,800 feet (600 to 1,200 m) above sea level rising on either bank. The principal tributaries are the Herchun, Changjin, and Tokro rivers.

The upper part of the Yalu as far as Linchiang has very rapid currents, many waterfalls, and sunken rocks. The middle part, which extends as far as Ch'osan, contains considerable deposits of alluvium that make the riverbed so shallow in places that it prevents even timber rafts from passing downstream during the dry season. The lower part of the river's course has a very slow current in which deposits of alluvium are even greater and form a vast delta containing many islands. The silting of the river has increased so much in the past several decades that, whereas in 1910 ships of 1,000 tons could easily sail upstream to the port of Sinŭiju, today 500-ton ships can hardly manage to do so.

The climate along the river's course is typically continental and characterized by cold winters and warm summers. The river is frozen and thus closed to navigation during the four winter months (November through February). Because it is situated in mountain ranges and is not far from oceans, the river's basin receives fairly heavy rainfall, much of which occurs during the months of June, July, August, and September. The abundant rainfall waters rich forests of conifers as well as deciduous trees. The forests provide a sanctuary for wildlife, which includes wild boars, wolves, tigers, jaguars, bears, foxes, and such birds as ptarmigan and pheasant. The river

It is notable that fish in two of the tributaries of the Yalu—the Herchun and Changjin—are like those in the upper stream of the Amur River in China and not like those in the Yalu. It is supposed that these tributaries once were connected with the Sungari River, a tributary to the Amur, only to be separated from it and connected with the Yalu when an eruption of Pai-t'ou Mountain produced a flow of basaltic lava during the Quaternary Period (within the last 1.6 million years).

abounds in carp and eels.

Ever since a tribe called the Yojin was driven into Manchuria in the 16th century, the Korean side of the river has been inhabited only by Koreans. The northwestern (Chinese) bank is inhabited by Manchurians and Chinese. The arable land along the river amounts to no more than 220,000 acres (89,000 hectares). Rice is the main crop grown along the river's lower course; corn (maize), millet, soybeans, barley, and sweet potatoes are raised further upstream in the mountainous middle and upper reaches of the river.

The river measures about 460 feet (140 m) in width and 3 feet (one metre) in depth at Hyesan and is 640 to 800 feet (200 to 250 m) wide and 4.5 feet (1.4 m) deep at Chunggang. It reaches 1,280 feet (390 m) in width at Sindojang, the location of an immense reservoir of the Sup'ung Lake hydroelectric station. In its estuary the river is 3 miles (5 km) wide and 8 feet (2.5 m) deep.

The river is primarily important as a source for hydroelectricity. The largest dam on the river is located at Sup'ung-nodongjagu, North Korea, situated 35 miles (56 km) upstream from Sinüiju. The height of the dam is 320 feet (100 m) and its length 2,880 feet (880 m); the surface area of the reservoir is 133 square miles (345 square km), and its potential generating capacity amounts to about 7,000,000 kilowatts. One of the largest hydroelectric plants in eastern Asia, it supplies electricity for a large area of the northern part of North Korea as well as the southern part of the Manchurian region, both for industrial development and for electric railroads. Its im-

portance to the Chinese economy was a major reason for the entry of the People's Republic of China into the Korean War in 1950, when United Nations troops were advancing northward toward the Yalu.

Yam (god): see Yamm.

yam, any of several plant species of the genus Dioscorea (family Dioscoreaceae), native to warmer regions of both hemispheres. A number of species are cultivated for food in the tropics; in certain tropical cultures, notably of West Africa and New Guinea, the yam is the primary agricultural commodity and the focal point of elaborate ritual.

True yams are botanically distinct from the sweet potato (q.v.), but moist-fleshed varieties of sweet potato are often called yams in the United States. D. bulbifera, the airpotato yam, is one of the few true yams cultivated for food in the United States. Yams have thick tubers (generally a development of the base of the stem), from which protrude long, slender, annual, climbing stems bearing leaves, which are either alternate or opposite and either entire or lobed and unisexual flowers in long clusters. The flowers are generally small and individually inconspicuous, though collectively showy. Each consists of a greenish, bell-shaped or flat perianth of six pieces, enclosing six or fewer stamens in the male flowers and surmounting a three-celled, threewinged ovary in the female flowers. The ovary ripens into a membranous capsule, bursting by three valves to liberate numerous flattish or globose seeds.

Most yams contain an acrid principle that is dissipated in cooking. D. trifida and D. alata are the edible species most widely diffused in tropical and subtropical countries. The tubers of D. alata sometimes weigh 45 kg (100 pounds). D rotundata and D. cayenensis are the main yam species grown in West Africa. D. esculenta, grown on the subcontinent of India, in southern Vietnam, and in the South Pacific islands, is one of the tastiest yams. D. batatas, the Chinese yam, or cinnamon vine, is widely cultivated in East Asia.

Hundreds of species of yams are known, and they vary widely in taste and appearance. Yams' flesh ranges in colour from white to yellow, pink, or purple. They vary in taste from sweet to bitter to tasteless. Yams are consumed as cooked starchy vegetables. They are often boiled and then mashed into a sticky paste or dough, but they may also be fried, roasted, or baked in the manner of potatoes.

yam bean: see jícama.

Yama, in Tibetan Buddhism, one of the eight fierce protective deities. See dharmapāla.

Yama, in the mythology of India, the lord of death. The Vedas describe him as the first man who died, blazing the path of mortality down which all men have since followed. He is the guardian of the south (the region of death) and presides over the resting place of the dead, which is located in the south under the earth. In the Vedas Yama was represented as a cheerful king of the departed ancestors, not as a punisher of sins, but in later mythology he became known as the just judge (Dharmarāja) who weighs the good and evil deeds of the dead and determines their retribution. He is described as majestic in appearance, green, with red eyes and red garments. He carries a mace, which may be ornamented with a skull, and a noose and rides a buffalo. His two four-eyed dogs guard the entrance to his kingdom, and the crow and the pigeon act as his messengers. Yama has also passed over into Buddhist mythology in Tibet, China, and Japan, where he occupies a similar but minor role as the guardian of the abode of the dead.

yama (Sanskrit: "restraint"), in the Yoga system of Indian philosophy, first of the eight stages intended to lead the aspirant to samādhi, or state of perfect concentration. An ethical preparation, meant to purify the individual, yama involves the abstinence from injury to others and from lying, stealing, sex, and avarice.

The second stage, nivama (Sanskrit: "discipline"), in its ethical intent similar to yama, comprises five categories of observance: cleanliness, contentment with one's material condition, asceticism, study of the metaphysics relating to salvation, and devotion to God.

Neither vama nor niyama is a specifically Yogic state; they are preliminaries necessary for any type of asceticism. They prepare the yogic practitioner for the more difficult stages.

Yama-no-kami, in Japanese popular religion, any of numerous gods of the mountains. These kami are of two kinds: (1) gods who rule over mountains and are venerated by hunters, woodcutters, and charcoal burners and (2) gods who rule over

Yama-no-kami, print Giraudon-Art Resource/EB Inc

agriculture and are venerated by farmers. Chief among them is O-yama-tsumi-no-mikoto, born from the fire god who was cut into pieces by his angry father Izanagi (see Ho-musubi). Another prominent mountain deity is Ko-no-hana-saku-va-hime-wife of the divine grandchild Ninigi and mother of two mythological princes, Fireshade and Fireshine—who resides on Fuji-yama. A widespread tradition connected with the worship of Yama-no-kami is the offering of a salt-sea fish called okoze.

yamabushi (Japanese religion): see Shugen-

Yamaga Sokō, original name YAMAGA TA-KASUKE, also called JINGOZAEMON (b. Sept. 21, 1622, Aizu, Iwashiro Province, Japand. Oct. 23, 1685, Edo), military strategist and Confucian philosopher who set forth the first systematic exposition of the missions and obligations of the samurai (warrior) class and who made major contributions to Japanese military science. Yamaga's thought became the central core of what later came to be known as Bushido (Code of Warriors), which was the guiding ethos of Japan's military throughout the Tokugawa period (1603-1867) and down to the end of World War II.

A rōnin, or masterless samurai, Yamaga early showed great promise, and he journeyed to Edo (now Tokyo), the capital, where he soon

became the favourite student of the Neo-Confucian scholar Hayashi Razan. Yamaga soon moved beyond his teacher, however, studying Buddhism, Shinto, and military science as well as Confucianism. Within a short time he became one of the most popular teachers of his time, attracting thousands of disciples. As a result of his fame, in 1652 he was appointed military instructor to the lord of the great han (fief) of Ako.

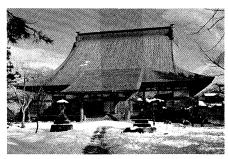

Yamaga made important innovations in the study of strategy and tactics, weapons, and military intelligence. His work as a military teacher became one of his most important legacies; 19th-century students of Yamaga, though fiercely nationalistic and antiforeign, were among the first to advocate learning more about Western nations so that Japan would be better able to oppose them.

Meanwhile, Yamaga began his attempts to develop a suitable ethic for the samurai class and turned to the Chinese "Ancient Learning" school of Confucianism, which advocated a return to the original 7th/6th-century-BC teachings of Confucius. Yamaga felt that those teachings were more appropriate to the samurai class than the watered-down Neo-Confucianist philosophy of Tokugawa Japan. Accordingly, Yamaga equated the samurai with the Confucian "superior man" and taught that his essential function was not only to keep himself fit for possible military service, but to justify the stipend his lord provided him with by becoming an exemplar of virtue for the lower classes. Without disregarding the basic Confucian virtue, benevolence, Yamaga emphasized the second virtue, righteousness, which he interpreted as obligation or duty.

Yamaga's critique of Neo-Confucianism first appeared in 1665 in his Yamaga gorui ("Yamaga's Sayings"), the summary of which was also published in three volumes under the title Seiyōyōroku ("Summary of Holy Teachings"). His views were seen as a potential challenge to Tokugawa authority, and he was banished from the capital in the custody of the Lord of Akō and exiled to one of the remote corners of Japan.

Yamaga became the teacher and chief inspiration for the future leader of the "47 ronin." Following Yamaga's code, that group of samurai in 1702 defied shogunate law and risked their own lives to avenge the death of their lord. That incident still is one of the most famous in Japanese history and brought increased (if posthumous) fame to Yamaga and his ideas. Another of his ideas was that Japanese civilization was superior even to that of China. In his Chūchō jijitsu ("The True Facts Concerning the Middle Kingdom"), Yamaga maintained that since its founding Japan had remained loyal to its divine Imperial line, whereas China's dynasties had come and gone. Furthermore, he argued, Confucian philosophy had been corrupted by metaphysical speculation, but Japan had remained true to the Confucian conception of duty. In the 19th century these thoughts helped inspire the militant Japanese nationalists, who in 1868 overthrew the Tokugawa shogunate and restored direct Imperial rule to Japan.

Yamagata, prefecture (ken), northern Honshu, Japan, on the Sea of Japan. Much of its 3,601 sq mi (9,327 sq km) is mountainous. Bandai-Asahi National Park, stretching from north to south, includes the Dewa Sangan (Three Mountains of Dewa [Gassan, Yudono-san, Haguro-san]), which are sacred to the Shugen-do sect of Buddhism; the granite mountains associated with Asahi-dake (6,135 ft [1,870 m]); and Iide-san (6,906 ft). In the northwest, Chōkai Quasi-national Park is crowned by Chōkai-zan, which rises to 7,316 ft on the border with Akita Prefecture. The extinct volcano of Zaō-san (6,040 ft) is the central feature of Zaō Quasi-national Park in the southeast.

Kokubun-ji (Kokubun Temple), Yamagata city, Japan

The prefecture is drained by the Mogamigawa (Mogami River). Its valley is followed by a main highway and railway and contains the major interior towns. The short coastal plain is largely composed of the Mogami-gawa delta.

Yamagata's agriculture is based on rice production, sericulture, and fruit orchards. Forestry and fishing are locally important, and deposits of petroleum, zinc, natural gas, and feldspar are worked. Industries produce electrical machinery, precision instruments, and paper.

The prefectural capital, Yamagata, is the largest city. Located in an interior mountain basin, it developed as the castle town of the Mizuno daimyo family. A commercial centre and seat of Yamagata University (1949), its industry produces various consumer goods and cast metal.

Yonezawa is another important interior town. The coastal district is dominated by the industrial centres of Tsuruoka and Sakata, the main port. Pop. (1983 est.) city, 242,015; prefecture, 1,256,000.

Yamagata Aritomo, Kōshaku (Duke, or Prince) (b. Aug. 3, 1838, Hagi, Japan—d. Feb. 1, 1922, Tokyo), Japanese soldier and states-

Yamagata Aritomo By courtesy of the International Society for Educational Information, Tokyo, Inc.

man who exerted a strong influence in Japan's emergence as a formidable military power at the beginning of the 20th century. He was the first prime minister under the parliamentary regime, serving 1889-91 and 1898-1900.

Early career. Yamagata was from a family of the lowest samurai rank in Chōshū, a feudal domain strongly opposed to the military dictatorship that ruled Japan from the 17th century until the restoration of Imperial rule under the emperor Meiji in 1868. He began his career as an errand boy of the treasury office and an informer in the police administration. Educated from c. 1858 at Shōka-Sonjuku, a private school, he became a promising member of revolutionary loyalists who were incensed by the growth of foreign influence under the shogunate and raised the cry "Sonnō jōi" ("Revere the emperor! Drive out the barbarians!"). In 1863 Yamagata was chosen

commanding officer of the Kiheitai, the most famous of the irregular troop units formed by the revolutionaries in Chōshū. Serving in the Shimonoseki Incident in 1864—the bombardment of Chōshū by an allied fleet of Western powers that resulted in the defeat of the rebels—he was wounded. The defeat opened Yamagata's eyes to the superiority of the Western military system and convinced the leaders of the Sonnō Jōi Movement that their "antiforeign" policy was doomed to failure unless Japan acquired efficient modern armament equal to that of the Western powers.

In 1867 the Tokugawa shogunate was overthrown and in 1868 the Meiji government established. When adherents of the shogunate in the north rose against the Meiji emperor, Yamagata headed a military expedition to suppress the revolt. The incident convinced him that the popular troops he led were superior to the regular army of the northern domains and that the nation's security would best be safeguarded by a system of universal obligatory military service.

After studying military institutions as a step toward the modernization of the Japanese Army, Yamagata returned to Japan in 1870. Soon after that, he became secretary to the vice minister of military affairs. Intending to abolish the system of the feudal domains and to centralize political power, he proposed the formation of an Imperial Force (Goshimpei). In early 1871, when a force of about 10,000 men drawn from the feudal armies was organized, Yamagata was promoted to vice minister of military affairs. This Imperial Force was later renamed Imperial Guard (Konoe), and Yamagata became its commander.

With the help of the restoration hero Saigō Takamori, who wielded great influence in the army, Yamagata succeeded in introducing conscription. When the government reorganized the military system into an army and a navy, he became minister of the army. After Saigō's resignation from the government in protest against its restrained policy toward Korea, Yamagata assumed greater influence over the government.

Yet the right to determine government policies lay largely in the hands of the councillor (sangi) to the Executive Council. Thus, in 1874 when a punitive expedition to Formosa was discussed, Yamagata, though minister of the army, had no voice in the decision. This fact determined him to work to separate military policies from civilian control. Because the Japanese Army was not yet ready for war against China, he had opposed the Formosa expedition; and, in order to allay his opposition, the government reluctantly promoted him to sangi in August 1874.

In 1877 Saigō Takamori and his adherents in Satsuma rose against the government, and Yamagata headed the expeditionary forces that put down the revolt. His victory proved once again the superiority of the conscript army over the former samurai troops. It also helped to establish his leadership in the army.

In 1878 Yamagata issued the "Admonition to the Military," emphasizing the old virtues of bravery, loyalty, and obedience to the emperor, to counteract democratic and liberal trends. After separating the Operations Department from the Army Ministry and reorganizing the General Staff Office, he resigned as army minister and assumed the position of chief of the general staff. He also took the important step of refashioning the Japanese military system according to the Prussian example.

In 1882 Yamagata induced the Emperor to promulgate the "Imperial Precept for the Military"—in essence a recapitulation of Yamagata's "Admonition to the Military"—which was to become the spiritual guidepost of the Imperial army until the surrender of Japan in World War II. In anticipation of the

Sino-Japanese War, he reorganized the army to adapt it for field operations. While still chief of the general staff he entered politics in 1882 and became president of the Legislative Board (Sangiin), a group of elders who advised the government concerning the establishment of the basic principles of the Meiji constitution. As home minister from 1883 to 1889, he established local government bodies, modernized the police system, and perfected controls over both institutions. As always, he was intent on creating a strong executive in anticipation of a future challenge from the parties. He was created a count in 1884 and resigned as chief of the general staff.

Rise to political power. In 1889, after surveying systems of local government in Europe for a year, he returned to Japan to become the first prime minister under the newly established parliamentary system. More conservative than Ito Hirobumi, who drafted the Japanese constitution, Yamagata proposed to the first Diet that Japan should expand its dominion over part of the Asian continent. When he was promoted to full general, he became the virtual head of the army. He induced the Emperor to proclaim the Imperial Rescript on Education, the guideline under the Meiji regime. In 1891 Yamagata, exhausted by party strife, resigned as prime minister. He served, however, as minister of justice (1892-93) and president of the Privy Council (1893-94) and remained a *genrō* (elder statesman) of an informal body of confidential advisers to the Emperor.

When the Sino-Japanese War broke out in 1894, Yamagata became commander of the 1st Army, in Korea, but sickness forced him to return home in the middle of the war. Confronted with the Russian-German-French diplomatic intervention in May 1895 after Japan's victory over China, he urged a compromise with Russia by dividing the Korean peninsula, which he effected as special ambassador to Moscow in 1896. His promotion to field marshal in 1898 affirmed his preeminent position in Japan's military and political life.

His second Cabinet was organized in November 1898. Half of its members were generals and admirals, and with their help Yamagata succeeded in accelerating his expansionist policy in Asia. When the Boxer Rebellion broke out in China in response to foreign encroachment, Yamagata, at Great Britain's request, dispatched the largest of the foreign contingents that were sent to put down the rebellion. This force played a major role in suppressing the Chinese nationalist movement and boosted Japan's international position. Domestically, Yamagata did his best to suppress the social-labour movement in its incipient stage, while strengthening the autonomy of the armed service and the bureaucracy. He also issued a governmental regulation which permitted only officers on active service to be appointed army and navy ministers, thus virtually freeing the military from civilian con-

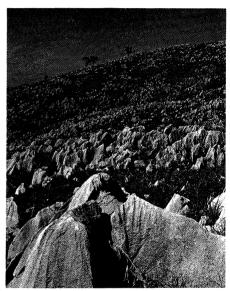

In October 1900, when it found that it could deal neither with the nation's financial crisis brought on by military expansion nor with the problem of the division of China by the powers after the Boxer Rebellion, the Yamagata Cabinet resigned. From 1903 until 1909 he and Itō Hirobumi alternately occupied the office of president of the Privy Council. During the Russo-Japanese War of 1904–05 he was chief of the general staff. For his distinguished service he was awarded the title of prince. In anticipation of a recurrence of war between Japan and Russia, he prepared a contingency plan for war with the United States and Russia. Called the plan of national defense for the empire, it played a substantial part in the entry of Japan into World War II.

Without a rival after Itō Hirobumi's assassination in 1909, Yamagata led Japan as a vir-

tual dictator, backed by the military and the bureaucracy under his influence. He consistently opposed the creation of a genuine Cabinet. When the Chinese revolution broke out in 1911, he endeavoured to help sustain the Ch'ing dynasty, and soon after the outbreak of World War I he succeeded in transforming the agreement with tsarist Russia into the military pact. In 1921, however, he meddled in the Crown Prince's marriage and was publicly censured. Yamagata died in disgrace the following year. (Fu.M.)

BIBLIOGRAPHY. The three biographies of Yamagata, in Japanese—by Fujimura Michio (1961), by Oka Yoshitake (1958), and by Tokutomi Iichiro (1933, reprinted 1969)—are all excellent. A publication in English, Roger F. Hackett, Yamagata Aritomo in the Rise of Modern Japan, 1838–1922 (1971), gives a full account of his life.

Yamaguchi, prefecture (ken), extreme western Honshu, Japan, bordered by the Sea of Japan (north), the Shimonoseki-kaikyō (Shimonoseki Strait; southwest), and the Inland Sea (south). Most of its 2,355-sq-mi (6,100-sq-km) area is composed of plateaus and hills, and

Akiyoshi-dai (Akiyoshi Plateau) with limestone outcroppings, Yamaguchi Prefecture, Japan Orion Press—FPG/EB Inc.

there are no extensive plains. The limestone caves and outcroppings of the Akiyoshi-dai (plateau) in the west present a typical karst formation and are widely known tourist attractions. Rice and mandarin oranges are grown, and there is a large deep-sea fishery catch. Coal is mined at Omine and limestone and marble at Akiyoshi. Industries produce iron and steel, chemicals, and lumber.

Yamaguchi, the prefectural capital, dates from the 14th century. The castle town was planned to resemble Kyōto; it prospered as a cultural and commercial centre under the Ouchi feudal lords. Yamaguchi was the home of the 15th-century landscape painter Sesshū. Following the traditions of the Chinese school, Sesshū is noted for his strong personal style.

Shimonoseki is the largest city in the prefecture and a leading industrial and educational centre and port. Iwakuni, on the Inland Sea, is known for its castle and arched Kintai-kyō (Kintai Bridge). On the Sea of Japan, Hagi is an ancient pottery centre that retains the charm of the feudal period. Pop. (1983 est.) city, 120,605; prefecture, 1,600,000.

Yamal Peninsula, Russian POLUOSTROV YAMAL, lowland region in northwestern Siberia, Russian Soviet Federated Socialist Republic,

bounded on the west by the Kara Sea and Baydarata Bay, on the east and southeast by the Gulf of Ob, and on the north by the Malygina Strait. The peninsula has a total length of 435 miles (700 km), a maximum width of 150 miles (240 km), and an area of 47,100 square miles (122,000 square km). The coasts of Yamal are mainly low-lying and sandy, whereas the inland region, rising in the south to a maximum height of 300 feet (90 m), has an irregular surface much affected by marine and glacial deposition. Drainage is exceedingly poor. Large natural-gas deposits have been discovered on the west coast of the peninsula and exploited at Kharasavey. Yamal in the Nenets language means "land's end."

Yamalo-Nenets, autonomous okrug (district), Tyumen oblast (province), far-northern Russian S.F.S.R. It was established in 1930 for the Nenets, or Samoyed, people, although by 1979 they constituted only 11 percent of the population. The *okrug* covers 289,700 square miles (750,300 square km) in the northern West Siberian Plain. Apart from the narrow chain of the northern Urals in the west, the okrug is a huge, level plain, covered by extensive swamps and barren tundra; in the south is stunted forest. The climate is extremely severe. Reindeer herding and fishing were the only occupations until the early 1970s, when exploitation of natural-gas deposits was begun. The natural-gas fields in the okrug are some of the largest in the world. Among the many deposits, the Urengoy and Medveshye fields are the largest producers. Pop. (1989 prelim.)

Yamamoto Eizō: see Ryōkan.

Yamamoto Gonnohyōe, HAKUSHAKU (Count), Gonnohyōe also spelled GOMBEE (b. Nov. 26, 1852, Kagoshima, Satsuma province, Japan—d. Dec. 8, 1933, Tokyo), Japanese naval officer who served two terms as prime minister of his country (1913–14; 1923–24).

Yamamoto's well-placed political contacts aided his rapid rise in the navy. During the Sino-Japanese War he served as aide-de-camp to general headquarters and in 1898 was appointed minister of the navy in the Japanese Cabinet with the rank of vice admiral. Promoted to admiral in 1904, he became a member of the government's high-ranking Military Council.

In 1913 popular discontent with the oligarchic nature of Japanese politics caused the fall of the newly formed Cabinet of the former army general Katsura Tarō. The old oligarchs who still controlled the government refused to allow Hara Kei, head of the dominant political party, to assume the prime ministership, and Yamamoto was chosen as a compromise candidate. Under Yamamoto, legislation to further the influence of the political parties was passed and reform of the civil service appointment system carried out. Yamamoto's government also began Japanese involvement on the Chinese mainland, demanding and receiving new railway rights in Manchuria.

In 1914, however, Yamamoto was forced to retire after Japanese naval officers were found to have received bribes to ensure that the German firm of Siemens and the British firm of Vickers, Ltd., received naval armament contracts. In 1923 he again assumed the prime ministership, following the great Tokyo earthquake of that year in which 132,807 people died. In the wake of the widespread anarchy and destruction resulting from the earthquake, Yamamoto attempted to restore law and order and continue government services. Four months later, however, he resigned when his Cabinet assumed "responsibility" for an attempt to assassinate the Prince Regent (later the emperor Hirohito).

Yamamoto Isoroku (b. April 4, 1884, Nagaoka, Japan—d. April 18, 1943, Solomon Islands), Japanese naval officer who conceived of the surprise attack on the U.S. naval base at Pearl Harbor on Dec. 7, 1941.

Yamamoto graduated from the naval academy in 1904 and fought as an ensign in the Russo-Japanese War. He was naval attaché at the Japanese embassy in Washington, D.C., during 1926–27. He became vice minister of the Japanese navy in 1936, commander of the First Fleet in 1938, and commander in chief of Japan's Combined Fleet in August 1941.

Yamamoto opposed war with the United States because he feared Japan would lose a protracted struggle with such a powerful opponent. Once the decision to go to war was made, however, Yamamoto asserted that Japan's only chance for victory lay in a surprise attack that would cripple the American naval forces in the Pacific, after which Japan could seize the rich lands of Southeast Asia and move eastward across the Pacific unopposed. Yamamoto's plan for a carrier-based air strike on Pearl Harbor was adopted by the naval general staff, but meanwhile he was predicting that if the war with the United States lasted more than one year, Japan would eventually be defeated.

After the success of the attack on Pearl Harbor, Yamamoto sought a decisive battle with what remained of the United States' Pacific forces, namely, its aircraft carriers. But the resulting battle, at Midway Island (June 1942), was won by the Americans. Yamamoto's ensuing campaign in the Solomon Islands was also less than successful. His death resulted when U.S. forces, having broken the Japanese communication codes, knew his whereabouts and ambushed and shot down his plane over Bougainville Island in the Solomons.

Yamamoto was Japan's greatest naval strategist during World War II. His contribution to naval strategy lies in his early recognition of the effectiveness of carrier-based aircraft in long-range naval attacks.

Yámana, also called YAHGAN, South American Indian people, very few in number, who were the traditional occupants of the south coast of Tierra del Fuego and the neighbouring islands south to Cape Horn. In the 19th century they numbered between 2,500 and 3,000. The Yámana language forms a distinct linguistic group made up of five mutually intelligible dialects that correspond to five regionally defined subdivisions.

Archaeologists have found extensive remains of Yámana camping places. Like their neighbours the Alacaluf and the Chono (*q.v.*), the Yámana hunted and gathered shellfish, seals, whales, and birds; a few berries and several kinds of fungi rounded out their diet. Despite the cold, rainy climate they had only a single garment of animal skin, worn like a cape over the shoulders. Their canoes had distinctive raised, pointed ends and a fireplace amidships.

The Yámana had no organized tribal life or recognized leaders. The family, usually monogamous, formed the basic social, political, and economic unit. They followed no clear pattern of migration and rarely camped in one place for more than a few days.

Their aesthetic activities were simple and few. They believed in a benevolent deity who was the giver of life and who punished wrongdoers. There were lesser spirits also, who could be approached through a shaman.

Yamana Mochitoyo, also called Yamana sōzen (b. June 26, 1404, Japan—d. April 15, 1473, Kyōto), head of the most powerful warrior clan in western Japan in the 15th century.

Yamana's attempts to increase his family's rank and influence brought him into conflict with a rival clan in eastern Japan and resulted in the Ōnin War (1467-77), which was followed by a century of internecine strife. As a Buddhist monk, he took the name Sōzen,

and, because of his quick temper and scarlet complexion, he was sometimes called Akanyūdō, the Red Monk,

Yamana's rival for power within the central government, or shogunate, was Hosokawa Katsumoto, head of an important coalition of warriors from eastern Japan, and the kanrei, or shogunal prime minister. The conflict between the two contenders for power erupted into warfare in 1467, when the shogun, Ashikaga Yoshimasa (ruled 1449–73), attempted to name his infant son, rather than his younger brother, as his heir.

Although both Yamana and Hosokawa died in 1473, the fighting dragged on for four more years, when it ended in a stalemate. By that time the last vestiges of the central government's control over the outlying regions of Japan had been eliminated, and local warrior families had begun to quarrel among themselves. Within the central government the Yamana family lost out to the Hosokawas.

Yamanashi, landlocked ken (prefecture), central Honshu, Japan. Much of its area of 1,723 square miles (4,463 square km) is mountainous, including the peaks of Mount Shirane (10,472 feet [3,192 m]) in the northwest and Mount Fuji (12,388 feet) on the southern border. The prefecture is drained by the Fuji River and its tributaries. The five lakes associated with Mount Fuji—Yamanaka, Kawaguchi, Sai, Shōji, and Motosu—are located in the south.

Yamanashi is basically agricultural, with extensive mulberry fields and orchards of

Waterfall in the Nishizawa valley near Nanatsugama, Yamanashi prefecture, Japan

peaches, apples, and cherries. Kōshū grapes are also grown. Small-scale factories manufacture textiles and processed foods. The prefectural capital, Kōfu (q.v.), is a major industrial and educational centre. Pop. (1988 est.) 846,000.

Yamanouchi FAMILY, Yamanouchi also spelled YAMAUCHI, family of Japanese feudal lords who from 1600 to 1868 dominated the important fief of Tosa on the island of Shikoku.

The rise in the Yamanouchi family's fortunes began with Yamanouchi Kazutoyo (1545/46–1605). For his successes on the battlefield in the service of Toyotomi Hideyoshi, then the most powerful general in Japan, Kazutoyo was rewarded with a small fief. After Hideyoshi's death, Kazutoyo switched his loyalty to Tokugawa Ieyasu (1543–1616), whom he aided at the Battle of Sekigahara (1600) by benevolent neutrality. Ieyasu became the dominant power in Japan, and he rewarded Kazutoyo with the large fief of Tosa.

Throughout the Tokugawa shogunate (1603-1867), the Yamanouchi, unlike many of the other great lords, remained loyal to the Tokugawa. When agitation against the Tokugawa family began in the mid-19th century, the head of the Yamanouchi family, Yamanouchi Toyoshige (1827-72), tried to negotiate a favourable settlement for the Tokugawas with the dissident lords. But, when his efforts failed, he joined the rebels in overthrowing the Tokugawa rule in order to prevent warriors of rival fiefs from obtaining too much influence in the new imperial government. Under this imperial government, formed in 1868, Tosa was made into Köchi prefecture, and Toyoshige was given the hereditary title of prince, though his feudal prerogatives were eliminated.

Yamanoue Okura (b. c. 660—d. c. 733), one of the most individualistic, even eccentric, of Japan's classical poets, who lived and wrote in an age of bold experimentation when native Japanese poetry was developing rapidly under the stimulus of Chinese literature. His poems are characterized by a Confucianinspired moral emphasis unique in Japanese poetry. The stern logic of Confucian morality, however, is often tempered with a Buddhist resignation more in keeping with the typical

Japanese view of the world.

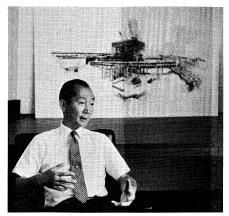

Relatively little is known of Okura's early life. From 726 to 732 he was governor of the province of Chikuzen, in Kyushu. There he was responsible to the governor-general of the island, Ōtomo Tabito, himself a major poet and patron of letters, and the two formed a close literary relationship that both influenced and encouraged Okura. All of Okura's extant work is contained in the 8th-century anthology Man'yō-shū. The most famous of his poems is the "Hinkyū mondo" ("Dialogue on Poverty"), which treats the sufferings of poverty in the form of an exchange between a poor man and a destitute man. Also outstanding are poems expressing love for his children and laments on the death of his son, on the instability of human life, and on his own sickness and old age.

Yamāntaka, in northern Buddhism, one of the eight fierce protective deities. See dharma-

Yamasaki, Minoru (b. Dec. 1, 1912, Seattle, Wash., U.S.—d. Feb. 6, 1986, Detroit, Mich.), American architect whose buildings, notable for their appeal to the senses, departed from the austerity often associated with post-World War II modern architecture.

Following his graduation from the University of Washington, Seattle, Yamasaki went in 1934 to New York City, where he held a number of design positions and from 1943 to 1945 was an instructor in architectural design at Columbia University. In 1945 he moved to Detroit, becoming chief designer for the large architectural firm of Smith, Hinchman and Grylls; one of his projects was a modern addition for the Neoclassic Federal Reserve Bank. He resigned in 1949 to become a partner with George Hellmuth and Joseph Leinweber. He designed the Lambert-St. Louis Municipal Airport terminal, notable for its impressive use of concrete vaults and a strong influence on subsequent American air-terminal design. In 1955, the year in which Hellmuth left the partnership, Yamasaki was commissioned to design the American consulate in Kobe, Japan.

The McGregor Memorial Conference Community Center, Wayne State University, Detroit, completed in 1958, is a widely admired example of his interior and exterior design used to convey serenity and delight. Another outstanding structure, the Reynolds Metals Company Building, also in Detroit, made use of skylights, plants, and pools. His design of the U.S. science pavilion for the Seattle World's Fair of 1962 was impressive, but some

Minoru Yamasaki, 1972

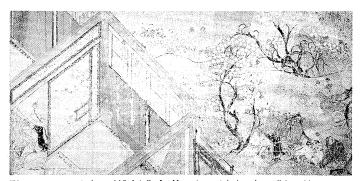

critics found its use of tall Gothic arches lacking in architectural logic. Similar criticisms were aroused by his unconventional design for North Shore Congregation Israel (1964), a Jewish temple in Glencoe, Ill. Yamasaki's World Trade Center (1972) in New York City, one of the world's tallest structures, is notable for its twin 110-story towers and for its 5-acre (2-hectare) plaza. He is the author of A Life in Architecture (1979).

Yamasee War (1715-16), in British-American colonial history, conflict between Indians, mainly Yamasee, and British colonists in the southeastern area of South Carolina, resulting in the collapse of Indian power in that area. Embittered by settlers' encroachment upon their land and by unresolved grievances arising from the fur trade, a group of Yamasees rose and killed 90 white traders and their families (April 15, 1715). All the surrounding Indian tribes except the Cherokee and the Lower Creek eventually allied themselves with Yamasee bands that continued to raid trad-

An able strategist, he trained Japanese soldiers in the technique of jungle warfare and helped conceive the military plan for the Japanese invasion of the Thai and Malay peninsulas in 1941-42. In the course of a 10week campaign, Yamashita's 25th Army overran all of Malaya and obtained the surrender of the huge British naval base at Singapore on Feb. 15, 1942. Soon afterward Yamashita was retired by Prime Minister Tojo Hideki to an army training command in Manchuria. and he did not see active service again until after Tojo's fall in 1944, when he was sent to command the defense of the Philippines. His forces were badly defeated in both the Leyte and the Luzon campaigns, but he held out until after the general surrender was announced from Tokyo in August 1945. More than a year later he was tried for war crimes, and, though he denied knowing of atrocities committed under his command, he was convicted and eventually hanged.

Yamato, city, Kanagawa ken (prefecture), Honshu, Japan, in the eastern part of the Sagamihara Plateau. During the Tokugawa period (1603-1867) it was a local trade centre for the surrounding sericultural region. An air base of the Imperial Japanese Army, established in the city in 1942, was taken over by U.S. occupation forces after World War II. The city has rapidly industrialized since 1955, producing vehicles, machinery, and records. It is connected by rail to the Tokyo-Yokohama metropolitan area. Pop. (1988 est.) 188,351.

Yamato-e (Japanese: "Japanese painting"), style of painting important in Japan during the 12th and early 13th centuries. It is a Late Heian style, secular and decorative with a tradition of strong colour. The Yamato-e style was partly native in inspiration and partly derived from one of the styles of decorative wall and scroll painting of T'ang dynasty China.

"Nozame monogatari emaki," detail of a Yamato-e style hand scroll (emakimono), colour on paper, second half of the 12th century, Late Heian period, in the Yamato Bunka Museum, Nara, Japan

ing posts and plantations. The conspiracy disintegrated, however, when South Carolinian military resistance was strengthened by additional troops from neighbouring colonies and war supplies from New England. Many of the defeated Indians escaped to Florida, joining runaway black slaves and other Indians to form what later were called the Seminole.

Yamashita Tomoyuki, also called YA-MASHITA HŌBUN, byname TIGER OF MALAYA (b. Nov. 8, 1885, Kōchi, Japan-d. Feb. 23, 1946, Manila, Phil.), Japanese general known for his successful attacks on Malaya and Singapore during World War II.

After graduating from the Army Academy (1905) and the Army War College (1916), Yamashita was an officer for the Army General Staff Office. He rose rapidly through the ranks of the Imperial Army, eventually becoming the highest-ranking general of its air force.

Yamato-e is a calculated decorative style and is essentially an art of illustration, at its best unequaled in its vigorous, flowing compositions. Placement is the overriding consideration. Scroll paintings of the 12th and 13th centuries show a close relation between painting and prose. The Genji scrolls, probably the oldest examples of the style, achieve an intimate quality through the use of an aerial perspective over roofless Japanese architecture. They are notable for the variety, harmony, and richness of their colour schemes, a characteristic typical of painting of the Late Heian period.

Yamato-Kōriyama, also called kōriyama-KINGYO (Kōriyama-Goldfish), city, Nara ken (prefecture), western Honshu, Japan. It is located 3 miles (5 km) southwest of Nara city. A prehistoric settlement, it became a castle town during the last decade of the 15th century.

With the opening of a trunk line of the National Railway, a modern textile factory was established there in 1893. The most important industry of the city has been goldfish breeding, which produces about 60 percent of the goldfish in Japan and has established overseas markets. The city also attracts many tourists to Jiko Temple, which has a ceremonial teahouse and garden. Pop. (1985) 89,624.

yamato koto (musical instrument): see wagon.

Yamato Takeru, in full YAMATO TAKERU NO MIKOTO (Japanese: "Prince Brave of Yamato"), Japanese folk hero, noted for his courage and ingenuity, who may have lived in the 2nd century AD. His tomb at Ise is known as the Mausoleum of the White Plover.

The legendary son of the legendary 12th emperor Keikō, Yamato Takeru was supposedly responsible for expanding the territory of the Yamato court. His story appears in the chronicles Kojiki (completed in 712) and Nihon Shoki ("Japanese Chronicles"; completed in 720). In the stories, he subdued two uncouth Kumaso warriors by cleverly disguising himself as a woman and, at a banquet in his honour, killing them while they were drunk. He cut away the burning grass of a fire set by the Ainu tribesmen with the miraculous sword Kusanagi and escaped. His adventures ended on the plains of Tagi, where he was stricken with illness and, according to legend, changed into a white plover and disappeared from the world.

Yamazaki Ansai (b. Jan. 24, 1619, Kyōto, Japan—d. Oct. 16, 1682, Kyōto), propagator in Japan of the philosophy of the Chinese Neo-Confucian philosopher Chu Hsi (1130–1200). Yamazaki reduced Neo-Confucianism to a simple moral code, which he then blended with the native Shintō religious doctrines. This amalgamation was known as Suika Shintō.

A Buddhist monk early in life, Yamazaki began to study Confucianism and gradually

Yamazaki Ansai, ink drawing by an unknown artist

By courtesy of the International Society for Educational Information Tokyo, Inc.

turned against Buddhism. By the time he was 29, he had become a Confucian teacher, gathering thousands of students, among whom were some of the greatest scholars of the day. From the complex philosophic system of Chul Hsi, Yamazaki extracted the simple formula "Dayotion within rightenussess without" By

Hsi, Yamazaki extracted the simple formula "Devotion within, righteousness without." By the former he meant the Neo-Confucian emphasis on sincerity and seriousness. But in Yamazaki's hands, these concepts took on religious connotations. Indeed, as Yamazaki

grew older, he began to combine the ethical doctrines of Confucianism with the religious values of Shintō. He equated the Chinese speculations on the universe with Shintō creation legends and identified the various elements of the Neo-Confucian metaphysical principles with the Shintō gods. The Supreme Ultimate (T'ai Chi) of the Neo-Confucianists (i.e., the normative principle underlying the various objects and affairs of the world) became identified in Yamazaki's system with the first two divinities mentioned in the Shintō religious chronicles.

His amalgamation of Confucian morality with the Shintō tradition of the divine origin of the imperial line was one of the philosophical roots of the later extreme Japanese nationalism and emperor worship. Yamazaki was himself intensely nationalistic: he instructed his disciples that if Confucius and his great disciple Mencius were to come to Japan at the head of an invading army, the students would be obliged to don their armour and attempt to capture both sages.

Yamazaki Sōkan (b. c. 1465, Ōmi province, Japan—d. c. 1552, Shikoku?), Japanese renga ("linked-verse") poet of the late Muromachi period (1338–1573) who is best known as the compiler of *Inu tsukuba shū* (c. 1615; "Mongrel Renga Collection"), the first published anthology of haikai (comic renga).

Little is known of Sōkan's life. According to tradition he served as a retainer to the shogun Ashikaga Yoshihisa and became a monk after Yoshihisa's death in 1489. Many other legendary tales exist about his unconventional life-style, which usually characterize him as being destitute and mad, but historical evidence indicates that he earned a comfortable income from teaching poetry and from his calligraphy.

The *Inu tsukuba shū*, containing haikai by Sōkan and others, was probably written over a period of several years but was not published until some 100 years after its completion. The delay in publication may have been because Sōkan compiled the book for the use of his students and did not intend for it to be published. A more likely reason, however, is the coarse and profane nature of many of its poems. Despite their earthiness, the poems contained a wit and freshness that appealed to the aspiring haikai poets of the 17th century, especially those of the Danrin school, who often tried to imitate their style.

Yambol, also spelled JAMBOL, town, eastcentral Bulgaria, on the Tundzha (Tundja) River. North of the present town are the ruins of Kabyle (or Cabyle), which originated as a Bronze Age settlement in the 2nd millennium BC and was conquered by the Macedonians under Philip II in 342-341 BC. Taken by Rome in 72 BC, Kabyle became a city in the Roman province of Thrace, governing the middle reaches of the Tundzha (ancient Tonsus), and serving as a rest stop on the road to Adrianople (now Edirne). It was the seat of a bishopric in the 4th century AD and disappeared in the 6th century. Finds from excavations at Kabyle are in the Regional Museum of Yambol.

Between the 11th and the 14th century, the present site was called Diampolis; from the 15th to the 19th century under the Turks, it was referred to as Yamboli. The town has ruins of a notable stone mosque. Yambol's industries produce textiles, machinery for footwear manufacture, ceramics, furniture, processed foods, wines, and beverages. Pop. (1988 est.) 94 951

Yamethin, town, central-northern Myanmar (Burma), occupying a high point on the central plain. For centuries it was an important junction on the caravan trade route between the Shan region to the east and Myingyan, 90 miles (145 km) northwest, on the Irrawaddy

River. Modern Yamethin, a municipality since 1888, has railway workshops and is irrigated by the Kyeni Tank (reservoir), built in the 11th century, to the southeast. It is linked by road and railway to Yangôn (Rangoon) and Mandalay. The surrounding area produces rice, sugarcane, corn (maize), and millet. Pop. (latest est.) 13,992.

yamim nora'im (Hebrew: "days of awe"), English HIGH HOLY DAYS, in Judaism, the High Holy Days of Rosh Hashana (on Tishri 1 and 2) and Yom Kippur (on Tishri 10), in September or October. Though the Bible does not link these two major festivals, the Talmud does. Consequently, yamim nora'im is sometimes used to designate the first 10 days of the religious year: the three High Holy Days, properly so-called, and also the days between. The entire 10-day period is more accurately called Aseret Yeme Teshuva ("Ten Days of Penitence").

Yamm, also spelled YAM (Hebrew: "Sea"), ancient West Semitic deity who ruled the oceans, rivers, lakes, and underground springs. He also played an important role in the Baal myths recorded on tablets uncovered at Ugarit, which say that at the beginning of time Yamm was awarded the divine kingship by the god El, the president of the pantheon. One day, Yamm's messengers requested that the gods surrender Baal to be a bond servant to Yamm. El finally agreed, but Baal refused to go and instead engaged Yamm in battle. After a furious fight, in which the craftsman Kothar supplied Baal with two special weapons, Yamm was finally slain and the kingship given to Baal. According to some scholars, Yamm was the same deity as Lotan (Hebrew: Leviathan), who was represented as a hydralike dragon or serpent.

Yamoussoukro, town and capital designate. south-central Côte d'Ivoire (Ivory Coast), located about 170 miles (274 km) northwest of the national capital, Abidjan. Yamoussoukro is Côte d'Ivoire's "second capital," as it is the birthplace, home, and unofficial headquarters of President Félix Houphouët-Boigny, Côte d'Ivoire's only head of state since independence was achieved in 1960. The town houses the assembly hall of the nation's only political party, the Democratic Party of Côte d'Ivoire (Parti Démocratique de la Côte d'Ivoire). Yamoussoukro has become a major urban centre largely because of the president's influence, with a dense infrastructure of roads and public utilities. The fishing, forestry, and perfume industries play important roles in the town's economy. Sites of cultural importance in Yamoussoukro include the Yamoussoukro Basilica, a large mosque, other churches, and secondary schools. Pop. (1984 est.) 120,000.

Yamoussoukro Basilica, in full OUR LADY OF PEACE OF YAMOUSSOUKRO BASILICA, Roman Catholic basilica in Yamoussoukro, Côte d'Ivoire, that is the largest Christian church in the world. The basilica's rapid construction in 1986-89 was paid for by Côte d'Ivoire's president since independence, Félix Houphouët-Boigny, and the building is situated in his birthplace, the city of Yamoussoukro. The basilica's form is roughly based on that of Saint Peter's in Rome, with a dome surmounting a colonnade that is in the form of a Latin cross. The basilica is fronted by a large plaza encircled by two more colonnades. The 272 Doric columns that support the colonnades are made of cement and rise as high as 101 feet (31 m). The basilica's gigantic dome dwarfs that of Saint Peter's and rises to a height of 489 feet (149 m). The basilica has the capacity to hold 18,000 worshipers, while the esplanade can accommodate a crowd of 300,000.

Yampa River, river, in the western United States, rising in the White River National Forest of northwestern Colorado, in the Rocky

Mountains. It flows north past Steamboat Springs, then turns west to flow through Yampa Canyon (about 1,600 feet [490 m] deep) in Dinosaur National Monument and joins the Green River near the Utah border after a course of about 250 miles (400 km). Its chief tributary, the Little Snake, joins it from the north immediately east of the monument. The river's name probably derives from an Indian tribe.

Yampi Sound, portion of the Indian Ocean off the north coast of Western Australia, between King Sound and Collier Bay. It con-

Yampi Sound, Western Australia

tains the four island clusters of the Buccaneer Archipelago, named for the buccaneer William Dampier. High-grade iron-ore deposits occur on the islands, the largest of which are Koolan, Irvine (with extensive underwater iron deposits), and Cockatoo. On Cockatoo, named after the white birds that abound there, hematite (an iron ore) has been mined since 1951; mining on Koolan began in 1965. Most of the ore, extracted by the Broken Hill Proprietary Company, Ltd., is shipped to the company's steelworks at Whyalla, S.Aus., and at Port Kembla, N.S.W. Extreme tides on Yampi Sound make navigation difficult. The sound was named in 1838 by Lieutenant John Lort Stokes (who surveyed the coast aboard HMS Beagle) and derives from an Aboriginal word meaning "freshwater."

> Consult the INDEX first

Yamuna River, also called JUMNA, river in Uttar Pradesh state, northern India, rising in the Himalayas near Jamnotri. It flows in a southerly direction through the Himalayan foothills and onto the northern Indian plain, along the Uttar Pradesh-Haryāna state border. The Eastern and Western Yamuna canals are fed from the river at that point.

The Yamuna then passes Delhi, where it feeds the Āgra Canal. Near Mathura it turns southeastward and passes Āgra, Fīrozābād, and Etāwah. Below Etāwah it receives a number of southern tributaries, the largest of which are the Chambal, the Sindh, the Betwa, and the Ken. Near Allahābād, after a course of about 855 miles (1,376 km), the Yamuna joins the Ganges River; their confluence is a sacred place to Hindus.

Traffic on the Yamuna is light. Above Agra it shrinks to a small stream in summer, partly because of the amount of water removed by the canals.

Yan Fu (Chinese scholar): see Yen Fu.

Yan Liben: see Yen Li-pen.

Yan Ruoju (Chinese scholar): see Yen Jochü. Yan Yuan (Confucianist philosopher): see Yen Yüan.

Yana, Hokan-speaking California Indians formerly living along the eastern tributaries of the upper Sacramento River, from the Pit River to southwest of Lassen Peak. Yana territory comprised a myriad of foothills and narrow, rugged canyons, partly wooded but mostly brush-covered and rocky.

There were four Yana divisions—Northern, Central, and Southern Yana, as well as Yahi—speaking mutually intelligible dialects. A significant characteristic of Yana speech was its use of separate forms for men and women. The differences were small; but females used their word forms exclusively, whereas men used the male forms among themselves and the female forms when addressing women.

Life generally was very poor in the harsh, barren environment. The Yana lived in earth-covered winter lodges and thatch-covered summer dwellings, hunted various game, and fished for salmon. Little is known of their social organization, except that it probably comprised small bands and contained classes or rankings. The Yana were relatively warlike, a common trait among northern hill dwellers of California.

In the 1860s the Yahi group were the victims of particularly brutal attacks by nearby white settlers. The settlers launched an extermination campaign, killing most of them and driving off a few survivors, who hid themselves in solated canyons for more than 40 years. The last known Yahi survivor (Ishi), discovered in 1911, died in 1916. Other Yana, if they survive, are intermixed with other Indians.

Yanam, town, Pondicherry union territory, an enclave within northeastern Andhra Pradesh state, southern India, on the main mouth of the Godāvari River.

Formerly part of the Cōla empire, the area came under Muslim occupation in the 16th century. In the 17th and 18th centuries it was the scene of constant warfare between Muslim, British, and French troops. When much of the coastal plain was incorporated into the Madras Presidency in 1765, Yanam remained a French enclave. It joined the union territory in 1954. Pop. (1981) 11,631.

Yan'an (China): see Yen-an.

Yanbu', also spelled YENBO, town, western Saudi Arabia, on the Red Sea north of Jidda. It serves as the country's second Red Sea port, after Jidda, and is the main port for Medina, 100 miles (160 km) to the east. The economy of Yanbu' was traditionally based on the pilgrim trade and the export of agricultural products, especially dates. Its harbour is being enlarged and improved to ease the pressure on Jidda, and the city is one terminus of three pipelines built in the 1980s for the delivery of petroleum and petroleum products to a major petrochemical complex at Yanbu'. The town has a small airfield and roads extending along the coast and eastward to Medina. Pop. (latest est.) 30,000.

Yancey, Jimmy, byname of James Edward Yancey (b. Feb. 20, 1898, Chicago—d. Sept. 17, 1951, Chicago), American blues pianist who established the boogie-woogie style with slow, steady, simple left-hand bass patterns. These became more rapid in the work of his students Albert Ammons and Meade "Lux" Lewis, who popularized the "Yancey Special."

Yancey was largely a self-taught pianist, with some instruction from his brother Alonzo. He had a childhood career as a singer and dancer, touring American vaudeville circuits and European music halls, giving a command performance for King George V of England in 1913. Returning to Chicago, Yancey performed at small taverns and informal gatherings. He played baseball in the Negro leagues until 1919, the year he married Estella Harris

(Mama Yancey), who sang with him at house parties throughout the 1920s, '30s, and '40s. They had three recording sessions together and performed on network radio in 1939 and at Carnegie Hall in New York City in 1948. From 1925 until his death, Yancey worked as a groundskeeper at the Chicago White Sox baseball stadium.

Yancey's influence on other musicians was profound, but his music was known to only a small coterie during his lifetime. Mama Yancey continued to perform and record, working with pianists Little Brother Montgomery and Erwin Helfer. She sang at Carnegie Hall again in 1981.

Yancey, William Lowndes (b. Aug. 10, 1814, Warren County, Ga., U.S.—d. July 27, 1863, Montgomery, Ala.), American southern political leader and "fire-eater" who, in his later years, consistently urged the South to secede in response to Northern antislavery agitation.

Though born in Georgia, Yancey in 1822 moved with his mother and stepfather, an antislavery Presbyterian minister, to Troy, N.Y. Yancey attended Williams College from 1830 to 1833 and then studied law in Greenville, S.C. In 1834 he was admitted to the bar. As editor of the *Greenville Mountaineer* during the nullification crisis, he took a firm Unionist stand.

In 1836 Yancey moved to Alabama, where he rented a plantation and purchased two local newspapers. It was as a lawyer, however, that he became prominent, and in 1841 he was elected to the Alabama legislature; he became a state senator in 1843. He urged many progressive reforms as an Alabama legislator, and there is no evidence that he was a proponent of secession prior to the Mexican War. In 1844 Yancey was elected to the U.S. Congress. He was reelected the following year but resigned in September 1846 to devote himself to fostering a grassroots movement in the South to counter Northern antislavery agitation. In 1848 he drafted the Alabama Platform, the foundation of his political creed until the outbreak of the American Civil War. Drawn up in response to the Wilmot Proviso—a proposed ban on slavery in the territories newly acquired from Mexico-the Alabama Platform insisted that slaveowners had the right to take their chattel property with them into the territories, that Congress had the duty to protect the rights of slaveholders everywhere, that a territorial legislature could not ban slavery, and that the Democratic Party should endorse only proslavery candidates for national office.

Although it was endorsed by the Alabama legislature, Yancey's Alabama Platform was overwhelmingly rejected when he presented it at the 1848 Democratic National Convention. Yancey, however, was resolute, and, after the Compromise of 1850, he added secession to his creed. For the next decade he sought to arouse Southerners to the peril of remaining in the Union. He organized Southern-rights associations and in 1858 assisted in the creation of the League of United Southerners. He delivered hundreds of speeches, trying to draw Southerners of all parties and persuasions into a movement backing his uncompromising proslavery states' rights position.

By 1860 the Alabama Platform had won substantial support throughout the South. At the Democratic National Convention in Charleston, a slightly revised version won only qualified acceptance, prompting the Southern delegates to withdraw and nominate a rival ticket. In essence, therefore, Yancey was responsible for the dissolution of the last national institution of the antebellum era.

Yancey then campaigned for John C. Breck-

nridge, nominee of the Southern wing of the party, the Constitutional Democrats. Following Lincoln's election, it was Yancey who trafted Alabama's secession ordinance. Early in 1861, he went to England and France in juest of official recognition of the new Concederate government, but his mission proved insuccessful. He returned in 1862 and was elected to the Confederate Senate, where he served until his death.

Yancheng (China): see Yen-ch'eng.

Yáñez, Agustín (b. May 4, 1904, Guadalara, Mex.—d. Jan. 17, 1980, Mexico City), Mexican novelist and short-story writer and active political figure who held several government posts.

Yáñez was a member of the Generation of 1924 group of writers and was active in the Banderas de Provincias group, which trans-lated Kafka and Joyce. A lawyer by profession, he began to publish novels in the 1940s. The novel Al filo del agua (1947; "To the Edge of the Water"; The Edge of the Storm), his masterpiece, presents life in a typical Mexican village just before the Mexican Revolution. Its use of stream of consciousness, interior monologue, and complex structure anticipates many traits of the Latin-American new novel of the 1950s and 1960s. La creación (1959; "The Creation"), a novel that has some of the same characters as Al filo del agua, is an attempt to define the new cultural climate that resulted from the revolution. La tierra pródiga ("The Lavish Land") appeared in 1960.

Las tierras flacas (1962; The Lean Lands) shows the effect of industrialization on a peasant society. Tres cuentos (1964; "Three Stories") and Los sentidos del aire (1964; "The Ways the Wind Blows"), short-story collections, deal with man's attempt to come to grips with time and space. His Obras escogidas ("Selected Works") were published in 1968

Yáñez was governor of the state of Jalisco (1953–59), subsecretary to the president of Mexico (1962–64), and secretary of education (1964–70). Most of his works are set in his native state, Jalisco. *Genio y figuras de Guadalaiara* (1941; "The Character and Personages of Guadalajara") recalls the men who developed the city. The essay collections *Mitos indígenas* (1942; "Native Myths"), *El clima espiritual de Jalisco* (1945; "The Spiritual Climate of Jalisco"), and *Don Justo Sierra* (1950) reveal a critical and sensitive mind.

Yáñez Pinzón, Vicente: see Pinzón, Martín Alonso and Vicente Yáñez.

Yang, Chen Ning, byname FRANK YANG (b. Sept. 22, 1922, Hofei, Anhwei, China), Chinese-born American theoretical physicist whose research with Tsung-Dao Lee showed

Chen Ning Yang

By courtesy of the State University of New York at Stony Brook

that parity—the symmetry between physical phenomena occurring in right-handed and left-handed coordinate systems—is violated when elementary particles decay. Until this discovery it had been assumed by physicists that parity symmetry is as universal a law as the conservation of energy or electric charge. This and other studies in particle physics earned Yang and Lee the Nobel Prize for Physics for 1957.

Life. Yang's father, Yang Ko-chuen (also known as Yang Wu-chih), was a professor of mathematics at Tsinghua University, near Peking. While still young, Yang read the auto-biography of Benjamin Franklin and adopted "Franklin" as his first name. After graduation from the Southwest Associated University, in K'unming, he took his B.Sc. in 1942 and his M.S. in 1944. On a fellowship, he studied in the United States, enrolling at the University of Chicago in 1946. He took his Ph.D. in nuclear physics with Edward Teller and then remained in Chicago for a year as an assistant to Enrico Fermi, the physicist who was probably the most influential in Yang's scientific development. Lee had also come to Chicago on a fellowship, and the two men began the collaboration that led eventually to their Nobel Prize work on parity. In 1949 Yang went to the Institute for Advanced Study in Princeton, N.J., and became a professor there in 1955. He became a U.S. citizen in 1964.

Work. Almost from his earliest days as a physicist, Yang had made significant contributions to the theory of the weak interactionsthe forces long thought to cause elementary particles to disintegrate. (The strong forces that hold nuclei together and the electromagnetic forces that are responsible for chemical reactions are parity conserving. Since these are the dominant forces in most physical processes, parity conservation appeared to be a valid physical law, and few physicists before 1955 questioned it.) By 1953 it was recognized that there was a fundamental paradox in this field since one of the newly discovered mesonsthe so-called K-meson-seemed to exhibit decay modes into configurations of differing parity. Since it was believed that parity had to be conserved, this led to a severe paradox. After exploring every conceivable alternative, Lee and Yang were forced to examine the experimental foundations of parity conservation itself. They discovered, in early 1956, that, contrary to what had been assumed, there was no experimental evidence against parity nonconservation in the weak interactions. The experiments that had been done, it turned out, simply had no bearing on the question. They suggested a set of experiments that would settle the matter, and when these were carried out by several groups over the next year, large parity-violating effects were discovered. In addition, the experiments also showed that the symmetry between particle and antiparticle, known as charge conjugation symmetry, is also broken by the weak decays.

In addition to his work on weak interactions, Yang, in collaboration with Lee and others, carried out important work in statistical mechanics—the study of systems with large numbers of particles—and later investigated the nature of elementary particle reactions at extremely high energies. From 1965 Yang was Albert Einstein professor at the Institute of Science, State University of New York at Stony Brook, Long Island. During the 1970s he was a member of the board of Rockefeller University and the American Association for the Advancement of Science and, from 1978, of the Salk Institute for Biological Studies, San Diego. He was also on the board of Ben-Gurion University, Beersheba, Israel. He received the Einstein Award in 1957 and the Rumford Prize in 1980.

BIBLIOGRAPHY. Jeremy Bernstein, A Comprehensible World (1967), a collection of essays on modern science containing a profile of Lee and Yang first published in *The New Yorker* magazine; H.A. Boorse and L. Motz (eds.), *The World of the Atom*, vol. 2 (1966), a collection of popular and semipopular papers on modern physics containing both biographical sketches of Lee and Yang and some of their popular essays. Yang's *Selected Papers 1945–80 with Commentary* (1983) includes personal memories, letters, and recollections of developments in theoretical physics since World War II.

Yang Chien (Chinese emperor): see Wen Ti (541-604).

yang-ch'in, Pinyin YANGQIN, Chinese dulcimer in which tone is produced by striking the strings with bamboo beaters covered with rubber or leather. The vibration of the strings is transmitted to a trapezoidal wooden soundboard by bridges, over which the strings are stretched.

The yang-ch'in has four or five bridges with sets of strings on each bridge pitched whole steps apart and neighbouring sets of strings on adjacent bridges pitched a fifth apart, thus allowing a chromatic scale to be played in all keys. The range of this instrument covers one octave below middle C and two and a half octaves above it. The yang-ch'in was introduced to the Far East from the West c. 1800 and is now an important feature in Chinese orchestras and ballad-singing accompaniments.

Yang-chou, Pinyin YANGZHOU, city in Kiangsu Province (sheng), China. It is a county-level municipality (shih) and the administrative centre of Yang-chou Prefecture (ti-ch'ū). Yang-chou is situated to the north of the Yangtze River at the southern terminus of the section of the Grand Canal joining the Huai Ho (river) to the Yangtze.

In the 4th and 3rd centuries BC Yang-chou was a fief known as Kuang-ling in the state of Ch'u. After the Ch'in unification of the empire in 221 BC, it became the seat of a county. Under the Han dynasty (206 BC-AD 220) it was the seat of a feudal principality. In the 5th and 6th centuries it was the seat of a commandery, or chün (district controlled by a commander), called either Kuang-ling or Nan-yen. During this early period, Yang-chou was the traditional name for Southeast China—one of the nine traditional divisions of China.

The identification of the old city of Kuangling with Yang-chou began in 590. Yang-chou became the southern capital of the Sui dynasty (581–618) in 605. In 606–607 it became the southern terminus of the canal system built to link the Yangtze and Huai valleys with the capital cities of Lo-yang and Ch'ang-an. Yang-chou became a major port and transshipment point, as well as the chief commercial city of the Yangtze Valley. After 763, under the T'ang dynasty (618–907), Yang-chou became the administrative centre for the state's financial apparatus in southern China and the headquarters of the salt administration. It was also an important seaport.

Yang-chou continued to be a flourishing trading centre through the Sung (960–1279) and Yüan (1206–1368) periods. According to some scholars, Marco Polo, the 13th-century Venetian traveler (who knew the city as Yonju), was employed as an official there; he speaks of its flourishing trade and large garrison forces.

During the Ming dynasty (1368–1644), its importance as a port diminished with the decline of Chinese sea-borne trade. The city, previously located near modern Chiang-tu some distance to the east, had been moved to its present site during the Southern Sung dynasty (1127–1279). Under the Ming the present city was constructed on a part of the Sung site, and the whole surrounded by 5.5 mi (9 km) of walls.

Yang-chou remained a regional administrative centre from Ming to Ch'ing times (1368–1911/12), forming a superior prefecture (fu)

of the same name. During this period it was of national importance as the base for the Liang-huai Salt Administration. The salt merchants of Yang-chou grew immensely wealthy, and from the 16th to the 18th centuries were patrons of the arts and letters, making Yang-chou an important centre of culture. Its decline dates from the Taiping Rebellion (1850-64). The city was taken by the rebels in 1853, and in 1855 it was the site of a major battle in which the Imperial (Manchu) forces were disastrously defeated. During these years Yang-chou was seriously damaged, its temples and public buildings being destroyed. Its recovery was hampered by the fact that from 1855 onward the Grand Canal was flooded and its northern reaches damaged, so that grain shipments to Peking and Tientsin were increasingly sent north by sea from Shanghai. At the same time the changes in the salt administration also struck at the other base of Yang-chou's traditional prosperity. In 1913 it ceased to be a superior prefecture and reverted to a county municipality.

In the early part of the 20th century, it remained relatively prosperous, and was still a centre of the salt administration, although no longer the home of its merchant princes. It also remained a centre of such traditional handicrafts as silk textiles, lacquer ware, carving, and embroidery. It was a regional market, especially for rice, and a centre of food pro-

Since 1949 Yang-chou has experienced a revival, especially since the restoration of the southern reaches of the Grand Canal and improvements made in the canal system to the north. It is primarily a transportation and market city and is the focus of an extensive road network. Industry, chiefly cotton spinning and textiles, is less important. In the 1970s a pumping station was constructed to pump Yangtze River water to the northern part of the country. The city has many ancient buildings and sites of historic interest. Pop. (1980 est.) 280,000.

Yang Chu, Pinyin yang zhu (b. 440 bc, China—d. 360? BC, China), one of the early Taoist philosophers. Yang has been infamous in Chinese history for what was thought to be his extreme hedonism. This characterization of Yang was fostered by the great Confucian philosopher Mencius (c. 371-289 BC), the second Sage (after Confucius) of China, who condemned Yang Chu for upholding the principle of "each for himself." According to Mencius, "Though he [Yang] might have benefitted the world by plucking out a single hair, he would not have done it." The few fragments of Yang's writing that have survived, however, make it doubtful that this is an accurate interpretation of his ideas.

Yang Chu was an advocate not of license and debauchery but of naturalism. He said, "The only way to treat life is to let it have its own way, neither hindering it nor obstructing ' He felt that man owes it to himself to live pleasurably and that to live pleasurably means to live naturally. Overindulgence is as much against nature as rigid self-restraint. Interference with others, whether in the form of assistance or encroachment, is out of the

Yang-ch'üan, Pinyin YANGQUAN, city, eastern Shansi Province (sheng), China. It is a prefecture-level municipality (shih) entirely surrounded by Chin-chung Prefecture (ti-ch'ü). Yang-ch'üan is located in the mountains of Shansi, west of the main range of the T'aihang Shan (mountains), at the eastern end of the route through the mountains via Niang-tzu Kuan (pass). Its site was of major strategic importance throughout history, commanding one of the main routes from the North China Plain to Shansi and the Northwest.

Yang-ch'üan itself, however, was only an insignificant mountain village, subordinate to the nearby town of P'ing-ting until the 20th century. It was first opened up by the construction of the railway from Shih-chia-chuang in Hopeh Province to T'ai-yüan in Shansi. Yang-ch'üan then became a railway centre, as well as a key road junction on the east-west highway via the Niang-tzu Kuan, being also linked to the north-south route to the valleys of southeastern Shansi.

With the coming of the railway, Yangch'uan, located in the heart of the rich Shansi coalfield, also became an important mining centre, producing both coking coal and anthracite. Much of the coal is used for generating power, both locally and in T'ai-yuan. It also supplied the Lung-yen steelworks at Hsüan-hua, northwest of Peking in Hopeh. Yen Hsi-shan, provincial warlord of Shansi in the first half of the 20th century, established an ironworks at Yang-ch'üan. This formed the base of a local munitions industry and was one of the few ironworks that continued in production through the depressed years of the late 1920s and 1930s.

Since 1949, prospecting has revealed rich deposits of anthracite, iron ore, iron pyrites, and refractory clays in the vicinity. Yang-ch'üan has grown into an important iron smelting centre, mainly producing pig iron for steel-works in T'ai-yüan and in Tientsin. Pop. (1980 UN est.) 376,000.

Yang Di (Chinese emperor): see Yang Ti.

Yang Guifei (Chinese concubine): see Yang Kuei-fei

Yang Hsiu-ch'ing, Pinyin YANG XIUQING (d. Sept. 2/3, 1856, Nanking), organizer and commander in chief of the Taiping Rebellion, the political-religious uprising that occupied most of South China between 1850 and 1864.

A dealer in firewood, Yang joined the Taiping band shortly before the rebellion broke out and quickly rose to a high position. In 1851, when the supreme Taiping leader, Hung Hsiu-ch'üan (1814-64), proclaimed his own dynasty and gave himself the title of T'ienwang, or Heavenly King, he made Yang commander in chief of the armed forces with the title of Tung-wang, or Eastern King. Yang organized the Taiping army and also developed a massive system to spy on the Taiping followers. Hung Hsiu-ch'üan had formed the Taipings after a series of visions in which it was revealed to him that he was the younger son of God, sent down to earth to save China. Yang proceeded to buttress his own position by imitating Hung. He went into a series of trances, in which he claimed to speak as the mouthpiece of the Lord, an accomplishment confirmed by his seeming ability to reveal traitors to the Taiping cause and confront them with the details of their treason.

Under Yang's direction, the Taipings advanced northward until in 1853 they took the large east central city of Nanking and made it their capital. Taiping armies continued north in an effort to take the Imperial capital at Peking. Meanwhile, Hung turned his attention increasingly to his harem and to religious affairs. He made Yang his prime minister, with authority to organize the Taiping administra-

Gradually, Yang also usurped Hung's prerogatives as Heavenly King, and the resentful Hung ordered Yang's execution. Not only was Yang put to death, but his entire family and thousands of his adherents were destroyed. After this coup d'etat Taiping leaders grew increasingly suspicious of one another, and the Taiping cause began to collapse.

Yang Hsiung, Pinyin YANG XIONG (b. c. 53 BC, near Ch'eng-tu, Szechwan Province, China—d. AD 18, Ch'ang-an, now Sian, Shensi Province), Chinese poet and philosopher best known for his poetry written in the form known as fu(q,v)

As a quiet and studious young man he came

to admire and practice the fu form. When he was over 40 years of age he went to live in the Imperial capital, Ch'ang-an (Sian), where his reputation as a poet won him a position at court. In AD 9 when Wang Mang usurped

Yang Hsiung, portrait by an unknown artist; in the National Palace Museum, Taipei

the Imperial throne and executed or imprisoned many prominent persons, Yang Hsiung, about to be arrested and fearful that he could not clear himself, threw himself from the high window of a pavilion and was badly injured. The Emperor, finding that Yang had no interest in politics, ordered that his case be dropped.

In later life Yang Hsiung turned from poetry to philosophy, in which he was influenced by both Confucianism and Taoism. The doctrine for which he is remembered reflects the perennial Chinese interest in human nature, which Yang regarded as a mixture of good and evil, avoiding the extreme positions taken by Mencius (original goodness) and Hsün-tzu (original evil). His chief works in philosophy were the Fa-yen, in 13 chapters, devoted to ethics, history, etc., and the T'ai-hsüan ching, 15 essays imitating the Confucian Classic I Ching in form.

Yang Kuei-fei, Pinyin yang guifei (d. 756, Ma-wei, China), notorious beauty and concubine of the great T'ang emperor Hsüan Tsung (reigned 712–756). Because of her the Emperor is said to have neglected his duties, and the T'ang dynasty (618-907) was greatly weakened by a rebellion that ensued. Her story has been the subject of many outstanding Chinese poems and dramas. The daughter of a high official, she was one of the few obese women in Chinese history to have been considered beautiful. She became a concubine to Hsüan Tsung's son, but the 60-year-old emperor found the girl so desirable that he forced his son to divorce her. Soon her two sisters were admitted into the Imperial harem, and her brother Yang Kuo-chung became the first minister of the empire.

Through Yang's influence, An Lu-shan, a cunning young general of Turkish origin, rose to great prominence. Yang adopted him as her legal son and is said to have made him her lover. With such powerful patronage, An Lu-shan came to control an army of 200,000. Jealous of the power of Yang's brother, An Lu-shan soon turned against the Emperor and led a great rebellion against him. When the capital was captured in 756, Hsüan Tsung and his court were forced to flee to the south. On the road the Imperial soldiers became enraged with members of the Yang family, whom they thought responsible for the debacle, and executed both Yang and her brother.

Yang Ti, Pinyin YANG DI (posthumous name, or shih), personal name (Wade-Giles romanization) YANG KUANG, or YANG YING, temple name (SUI) KAO TSU (b. 569, China—d. 618, China), the second and penultimate emperor of the Sui dynasty (581–618). Under Yang Ti canals were built and great palaces erected.

He acceded to the throne in 604, and it is generally agreed that he did so after assassinating his father and his elder brother. Embarking on a costly program of construction and conquest, in 608 he built a great canal between the rice-producing areas in the south and the Peking area in the north. Yang Ti extended this transportation system in 610, beginning the Grand Canal network that was later used to supply the capital and northern border armies with food from the south. He strengthened China's northern border by rebuilding, at great expense, the Great Wall separating China from Inner Asia. Yang Ti further strained his dwindling resources by spending lavish sums on palace construction and ornamentation, stocking his private park with mature trees carried on specially constructed carts from distant forests. Finally, he embarked on a series of foreign adventures, extending the Chinese empire south to present-day Vietnam and north into Inner Asia. But his three expeditions against the Koreans between 612 and 614 ended so disastrously that the Chinese people became disheartened and broke out in revolt. Yang Ti was forced to flee to South China, where he was eventually assassinated. One of his former officials (Li Yüan) reunited the empire and founded the T'ang dynasty (618–907).

Yang Xiong (Chinese poet): see Yang Hsiung. Yang Xiuqing (Chinese rebel leader): see Yang Hsiu-ch'ing.

Yang Yen, Pinyin Yang Yan (b. 727, China—d. 781, China), minister to the T'ang emperor Te Tsung (reigned 779/780–805).

Yang introduced a new system of taxation into China that helped reduce the power of the aristocratic classes and eliminate their large tax-free estates. Yang abolished the various land, labour, produce, and other taxes to which the Chinese peasantry had been subject and the upper classes immune. In their place he created the double tax. Levied twice a year on land in the 6th and 11th months, regardless of ownership, it persisted in its basic form until the Communist revolution in 1949. Yang himself committed suicide when a jealous co-minister accused him of bribery and corruption.

Yang Zhu (Chinese philosopher): see Yang Chu.

yangban (Korean: "two groups"), the highest social class of the Yi dynasty (1392–1910) of Korea. It consisted of both munban, or civilian officials, and muban, or military officials. The term yangban originated in the Koryö dynasty (935–1392), when civil service examinations were held under the two categories of munkwa (civilian) and mukwa (military). By the Yi dynasty, the term came to designate the entire landholding class. The Yi dynasty had a rigidly hierarchical class system composed broadly of four classes: yangban, chungin (intermediate class), sangmin (common people), and ch'önmin (lowborn people).

The yangban were granted many privileges by the state, including land and stipends, according to their official grade and status. They alone were entitled to take civil service examinations and were exempt from military duty and corvée labour. They were even permitted to have their slaves serve their own terms of punishment.

The rules to which the *yangban* were subjected were severe. Unless at least one of their

family members within three successive generations was admitted to the officialdom, they were deprived of their *yangban* status. They were expected always to exhibit courtesy and righteousness and to be prepared to sacrifice their lives for a greater cause. No matter how poor, they were not supposed to show a shred of meanness in their behaviour.

The *yangban* system, corrupted and deemed pernicious to social development, was discarded in 1894, when a series of modern reforms were effected.

Yangiyul, also spelled IANGIIUL, or JANGIJUL', city, Tashkent oblast (province), Uzbek S.S.R. The city lies in the middle of the Tashkent oasis. Formerly a village on the site of the ancient settlement of Kaunchi-Tepe, it developed between World Wars I and II because of its proximity to Tashkent and its situation on the Tashkent-Samarkand railway and Great Uzbek Highway. It is now a thriving centre of food and other light industries. Pop. (1987 est.) 71,000.

Yangôn, also called RANGOON, city and capital of Myanmar (Burma). It is located in the southern part of the country on the eastern (left) bank of the Yangôn, or Hlaing, River (eastern mouth of the Irrawaddy River), 25 miles (40 km) north of the Gulf of Martaban of the Andaman Sea. Yangôn is the largest city in Myanmar and is the country's industrial and commercial centre. It was known abroad as Rangoon until 1989, when the government of Myanmar requested that Yangôn, a transliteration reflecting the Burmese pronunciation of the city's name, be used by other countries.

The site of the city is a low ridge surrounded by delta alluvium. The original settlements were located on the ridge, but the modern town was built on alluvium. Subsequent expansion has taken place both on the ridge and on delta land. The local climate is warm and humid, with much rainfall.

The centre of the city, called the Cantonment, was planned by the British in 1852 and is laid out on a system of blocks, each 800 by 860 feet (245 by 262 m), intersected regularly by streets running north-south and east-west. As Yangôn's population increased in the 20th century, new settlements were built in the north, east, and west that greatly expanded the city's area.

The most notable building in Yangôn is the Shwe Dagon Pagoda, a great Buddhist temple complex that crowns a hill about one mile north of the Cantonment. The pagoda itself is a solid brick stupa (Buddhist reliquary) that is completely covered with gold. It rises 326 feet (99 m) on a hill 168 feet (51 m) above the city. Yangôn is the site of several other major religious edifices, including the World Peace Pagoda (1952) and the Sule and Botataung pagodas.

Most of the city's centre is made up of brick buildings, which are generally three to four stories high, while traditional wooden structures are common in the outlying areas. Among the old colonial structures of red brick are the Office of Ministers (formerly the Old Secretariat), the Law Courts, Yangôn General Hospital, and the customhouse. Modern architecture includes the Secretariat Building, the department stores in the Cantonment, the Polytechnic School, the Institute of Medicine I, and the Yangôn Institute of Technology at Insein.

Yangôn's rice mills and sawmills located along the river are the largest in the country. The city's major industries—which produce textiles, soap, rubber, aluminum, and iron and steel sheet—are state-owned, while most of its small industries (food-processing and clothing-manufacturing establishments) are owned privately or cooperatively. The central area of the city contains the commercial district of banks, trading corporations, and offices, as well as shops, brokerage houses, and bazaars.

North of the city's centre is Royal Lake (Kandawgyi), surrounded by a wooded park; nearby are the city's zoological and botanical gardens. Yangôn's several museums include the Bogyoke Aung San Museum and the National Museum of Art and Archaeology. There are several stadiums for sports and athletic events. The University of Rangoon, established in 1920, was reconstituted into the Arts and Science University in 1964.

Yangôn is Myanmar's main centre for trade and handles more than 80 percent of the country's foreign commerce. Rice, teak, and metal ores are the principal exports. The city is also the centre of national rail, river, road, and air transportation; an international airport is located at Mingaladon, north of Yangôn.

The Shwe Dagon Pagoda had been a place of pilgrimage for many centuries, and Yangôn grew out of a settlement around the temple that eventually became known as Dagon. Its status was raised to that of a town by the Mon kings in the early 15th century. When King Alaungpaya (who founded the last dynasty of Myanmar kings) conquered southern Myanmar in the mid-1750s, he developed Dagon as a port and renamed it Yangôn ("The End of Strife"), a name that was later transliterated as Rangoon by Arakanese interpreters accompanying the British. By the early 19th century the town had a thriving shipbuilding industry, as well as a British trading station. Rangoon was taken by the British at the outbreak of the First Anglo-Burmese War in 1824 but was restored to Burmese control two years later. The city was taken again in 1852 by the British, who made it the administrative capital of Lower Burma (i.e., the southern part of the country). After the British annexation of all of Burma in 1886, Rangoon became the capital city and grew in importance.

In 1930 Rangoon was struck by a massive earthquake and tidal wave, and during World War II it was the scene of major fighting between the Allies and the Japanese. The city was subsequently rebuilt, though as the capital of independent Myanmar (since 1948) it never regained the commercial importance it had under the British as one of the great ports of southern Asia. By the late 20th century, the city's economic vitality had declined, largely owing to the isolationist policies of the Myanmar government. Area city, 77 square miles (199 square km). Pop. (1983 prelim.) 2,458,712.

Yangôn River, also called RANGOON RIVER, marine estuary in southern Myanmar (Burma), formed at the city of Yangôn (Rangoon) by the confluence of the Pegu and Myitmaka rivers. It empties into the Gulf of Martaban of the Andaman Sea, 25 miles (40 km) southeast. Linked west to the Irrawaddy River by the Twante Canal (first dug in 1883), it is the main access channel to Yangôn and can accommodate oceangoing vessels.

yangqin (musical instrument): see yang-ch'in. Yangquan (China): see Yang-ch'üan.

Yangtze Plain, Wade-Giles romanization CH'ANG CHIANG P'ING-YÜAN, Pinyin CHANG JIANG PINGYUAN, series of alluvial plains of uneven width along the Yangtze River and its major tributaries, beginning east of I-ch'ang (Hupeh province), China. The Middle Yangtze Plain comprises parts of northeastern Hunan, southeastern Hupeh, and north-central Kiangsi provinces, including Tung-t'ing, P'oyang, and Hung lakes. The Lower Yangtze Plain includes the Yangtze River delta and T'ai Lake and the area along the Yangtze in south-central Anhwei province. There are a few isolated hills, but mostly the plains are level and lie below 150 feet (45 m) above sea level. The slopes of the valleys bordering the plains have been converted into a system of flat terraces. The rivers, canals, and lakes form a network of navigable waterways. Flood diversion projects built after 1949 have helped control flooding. Rice, cotton, wheat, rape-seed, mulberries, bamboo, hemp, and fish are raised; the major cities are Shanghai, Nanking, Hang-chou, and Wu-han.

Yangtze River, Wade-Giles romanization CH'ANG CHIANG, Pinyin CHANG JIANG, longest river of both the People's Republic of China and Asia and the third longest river in the world, having a length of 3,915 miles (6,300 km)

A brief treatment of the Yangtze River follows. For full treatment, see MACROPAEDIA: Asia.

The Yangtze rises on the Plateau of Tibet in western China and flows in a generally north-easterly direction across 12 Chinese provinces and regions to its delta on the East China Sea. More than three-quarters of the river's course runs through mountains; the lower course, however, is situated at the southern edge of the extensive North China Plain in the low-lands of eastern China.

The drainage basin of the Yangtze covers an area of 756,300 square miles (1,959,000 square km), encompassing eight principal tributaries; the Ya-lung, Min, Chia-ling, and Han rivers join the Yangtze on its left bank, and the Wu, Yüan, Hsiang, and Kan rivers on its right bank. The Yangtze carries a tremendous volume of water and is ranked fourth in volume among the rivers of the world. During the period of monsoon rains in the summer months, the Yangtze and its tributaries spill over, creating extensive floods. If the floods in the main channel coincide with flooding in one or more of the major tributaries, powerful, destructive flood waves can result—an occurrence that has struck repeatedly in the history of China.

Population distribution in the Yangtze River basin is uneven; it is greatest in the plains that adjoin the banks of the river and its tributaries in central and eastern China and is most sparse in the highlands to the west. Such large cities as Shanghai, Nanking, Wu-han, Chungking, and Ch'eng-tu, all of which have urban area populations of more than 2,000,-000, are located in the basin. The Yangtze River basin is considered the granary of China and contributes nearly half of the country's agricultural output, including nearly threefourths of its total volume of rice. Other chief crops include wheat, barley, corn (maize), beans, and hemp. The rivers and large lakes of the basin, most notably the Tung-t'ing, P'o-yang, and T'ai lakes, abound with fish of commercial value. The fishing trade is widely developed and is a major livelihood for much of the population of the region. The Yangtze River is China's principal inland waterway and binds the country's inland and sea ports together with other major cities into a transportation network in which Nanking, Wuhan, and Chungking play leading roles. Intensive cargo and passenger traffic travels along 1,700 miles (2,700 km) of the river's course, with large ships reaching as far as Wu-han, 700 miles (1,100 km) upriver from the coast.

Yangzhou (China): see Yang-chou.

Yanji (China): see Yen-chi.

Yankari, game reserve, Bauchi state, east-central Nigeria, south of Bauchi town. It was established in 1956 and covers more than 800 square miles (2,000 square km). The park, at an elevation of about 1,600 feet (500 m), has characteristic savanna vegetation, including swamps in river floodplains, grasslands, and thick bush. Yankari is rich in animal life, with antelopes (roan, waterbuck, bushbuck, and hartebeest), elephants, hippopotamuses, giraffes, baboons, hyenas, lions, leopards, and crocodiles. Special features of the reserve include ancient sandstone cisterns, carved by former inhabitants for water storage, and the Wikki Warm Springs.

Yankee, a native or citizen of the United States or, more narrowly, of the New England states of the United States (Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut). The term Yankee is often associated with such characteristics as shrewdness, thrift, ingenuity, and conservatism. It was applied to Federal soldiers and other Northerners by Southerners during the American Civil War (1861–65) and afterward.

The origin of the term is unknown. The Oxford English Dictionary says that "perhaps the most plausible conjecture" is that it comes from the Dutch Janke, the diminutive of Jan (John). British soldiers are recorded using it as a term of derision in 1775. Mitford Mathews (A Dictionary of Americanism on Historical Principles [1951]) traced its rise from epithet to respectability, pointing out that no evidence of use of the word by New Englanders before the Battle of Lexington (1775) has been found.

Many fanciful derivations have been put forward. A mythical tribe of Massachusetts Indians, the Yankos ("Invincibles"), were said to have been defeated by brave New Englanders who then somehow assumed the Indians' name. Virginians countered with the story that the word really means coward or slave and is derived from the Cherokee word eankle; no such word exists in the Cherokee language. These and many other theories about the origin of Yankee and of Yankee Doodle are reviewed and are all rejected in a comprehensive study conducted for the Librarian of Congress by Oscar G. Sonneck (1873–1928): Report on "The Star-Spangled Banner," "Hail Columbia," "America," "Yankee Doodle" (1909).

Yankton, a major division of the Sioux (q.v.), or Dakota, confederation of American Indians.

Yankton, city, seat (1862) of Yankton county, southeastern South Dakota, U.S. The city lies along the Missouri River near its confluence with the James River. Yankton is just east of Gavins Point Dam and National Fish Hatchery and Lewis and Clark Lake. Settled in 1858 and named for the Yankton Indians, it served as the first capital of Dakota Territory (1861-83). The old Territorial Legislative Building now houses a museum. After the arrival of the Dakota Southern Railway in 1872, it became a river port and an outfitting point for gold prospectors. It is the seat of Yankton (1881) and Mount Marty (1922) colleges. The city's primary industries are based on processing the agricultural products of the surrounding area. Inc. 1869. Pop. (1988 est.) 11,677.

Yannina (Greece): see Ioánnina.

Yanofsky, Charles (b. April 17, 1925, New York, N.Y., U.S.), American geneticist who demonstrated the colinearity of gene and protein structures.

Yanofsky was educated at the City College of New York and at Yale University (Ph.D., 1951), where he studied chemistry and microbiology. While at Yale he showed that a suppressor mutation (change in a gene that reverses the visible effects of mutation in a second gene) results in the reappearance of an enzyme that was missing in a mutant organism. He was also part of the research team that first demonstrated that certain mutant genes produce inactive proteins, detectable with the techniques of immunology.

From 1954 to 1958 Yanofsky was at Western Reserve University Medical School in Cleveland, Ohio, and he then moved to Stanford University, Palo Alto, Calif. There, working with the bacterium *Escherichia coli*, he showed that the sequence of the nitrogen-containing bases forming part of the structure of the genetic material has a linear correspondence to the amino acid sequence of proteins. In his investigations of the biochemical actions

of suppressor mutations, Yanofsky and his research group studied mutants of the mold Neurospora crassa and found that suppression resulted in the restoration of the ability to form an active enzyme in a mutant that had previously produced an inactive protein. He was elected president of the Genetics Society of America in 1969 and received the National Academy of Sciences Award in Microbiology for 1972.

Yanomamö, also spelled Yanoamö, South American Indians, speakers of a Xirianá language, who live in the remote forest of the Orinoco River basin in southern Venezuela and the northernmost reaches of the Amazon River basin in northern Brazil. In the late 20th century the Yanomamö probably numbered about 10,000 individuals throughout their range.

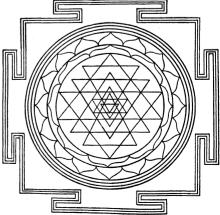

The Yanomamö practice slash-and-burn agriculture and live in small, scattered semipermanent villages. They supplement their crop of plantains, cassava, tubers, corn (maize), and other vegetables with gathered fruits, nuts, seeds, grubs, and honey. They hunt monkeys, deer, tapir, fowl, and armadillos. They grow tobacco, a great favourite of Yanomamö of all ages, and cotton, an important trade and domestic item used in the manufacture of string and cord for hammocks, nets, containers, and clothing. They keep dogs, both for village security and for hunting.

The Yanomamö live in vine-and-leafthatched houses in palisaded villages surrounded by garden plots. They relocate their villages when the soil wears out or when a village has become too susceptible to attack by other Yanomamö.

Traditional Yanomamö culture, such as is still practiced in remote parts of Venezuela, places a high premium on aggressive, fierce, and violent behaviour. Yanomamö are constantly at war with one another, and much of Yanomamö social life centres on forming alliances through trade and sharing food with other friendly groups, while waging war against hostile villages. The role of continuous, nonterritorial war in Yanomamö society has attracted the attention of anthropologists who have studied the Yanomamö in the second half of the 20th century. By the 1990s the way of life and even the continued survival of the Yanomamö were threatened by the incursions of Brazilian miners into their territory in the Roraima state of Brazil.

Yantai (China): see Yen-t'ai.

yantra (Sanskrit: "instrument"), in Tantric Hinduism and Vajrayāna, or Tantric Buddhism, a linear diagram used as a support for meditation. In its more elaborate and pictorial form it is called a mandala (q.v.). Yantras

Śrīyantra

range from those traced on the ground or on paper and disposed of after the rite, to those etched in stone and metal, such as are found in temples. When used along with yogic practices, the component parts of the *yantra* diagram take the believer along the different steps leading to Enlightenment.

One characteristic yantra employed in the ritual worship of the goddess Sakti is the śriyantra (also called śricakra, "wheel of Śri"). It is composed of nine triangles: five pointing downward, said to represent the yoni, or vulva, and four pointing upward, said to represent the lingam, or phallus. The dynamic interplay is understood to be an expression of all the cosmic manifestations, beginning and ending with union at the centre, visualized as a dot (bindu).

Yao, various Bantu-speaking peoples inhabiting southernmost Tanzania, the region between the Rovuma and Lugenda rivers in Mozambique, and the southern part of Malaŵi.

By 1800 the Yao had become known as traders plying between the inland tribes and the Arabs on the east coast. Much of this trade was in slaves, which led eventually to clashes with European powers who were establishing control over former Yao territory in the late 18th and 19th centuries. The Yao were never united but lived as small groups ruled by chiefs who were predominantly military and commercial leaders; by 1900 all Yao chiefdoms had come under German, Portuguese, or British rule.

The Yao are an agricultural people using slash-and-burn techniques to cultivate their staples, corn (maize) and sorghum. Fish provide protein in areas near lakes or larger rivers. In Malaŵi they cultivate tobacco as an important cash crop.

The Yao live in compact villages of 75 to 100 persons under traditional headmen. These headmen, like the chiefs, succeed matrilineally, the office usually going to the eldest sister's firstborn son. On marriage the man leaves his village to live in that of his wife, so that villages are composed basically of groups of women related through the female line, together with their spouses. Yao social life features annual initiation ceremonies involving circumcision for boys. Originally, these ceremonies were closely connected with the worship of ancestor spirits, but through Arab contact most Yao are Muslims, and the rites incorporate Islāmic elements.

Yao, mountain-dwelling peoples of southern China and Southeast Asia. In the late 20th century there were estimated to be 1,400,000 in China, 360,000 in Vietnam and Laos, and 30,000 in northern Thailand. Most Yao in China live in the Kwangsi Chuang autonomous region, with smaller numbers in Hunan, Yunnan, Kweichow, and Kwangtung provinces. Although they speak closely related Sino-Tibetan dialects, the widely dispersed groups of the Yao have developed in different directions, adjusting their ways to the environments in which they live. In the Chinese province of Kwangtung, some Yao are wetrice cultivators in the lowlands, but elsewhere they have kept to the mountains, where they engage in a migratory slash-and-burn agriculture.

The Yao groups are animists who believe in various classes of spirits. Those of the Ling-nan area of China (Kwangtung-Kiangsi Chuang) revere their ancestors in Chinese fashion and also believe in ghosts and spirits who must be placated. An important cult is that of the dog-god P'an Ku; according to legend he delivered the head of an enemy to a monarch and was awarded a princess for a wife, and the Yao descended from this union. The Yao

of Indochina, who are called Man by the Vietnamese, revere their ancestors, believe in spirits associated with natural elements (e.g., thunder, clouds, rivers, and mountains), and practice a form of witchcraft directed at their enemies.

The Yao are village peoples, and their indigenous political structure does not extend above the village chief. Some villages in Kwangtung have several clans, and the clan chiefs act jointly in matters that concern the entire village. The Yao carry on trade with the peoples of the lowland, obtaining manufactured goods and some food in exchange for the products of the hills.

Yao, formally (Wade-Giles romanization) T'ANG TI YAO, in Chinese mythology, a legendary emperor (c. 24th century BC) of the golden age of antiquity, exalted by Confucius as an inspiration and perennial model of virtue, righteousness, and unselfish devotion.

Yao, imaginative portrait by an artist of the Ch'ien-lung period (1735–96); in the Metropolitan Museum of Art, New York City

By courtesy of the Metropolitan Museum of Art, New York, gift of Mrs. Edward S. Harkness, 1947

His name is inseparable from that of Shun, his successor, to whom Yao gave his two daughters in marriage.

Legends recount that after 70 years of Yao's rule, the sun and moon were as resplendent as jewels, the five planets shone like strung pearls, phoenixes nested in the palace courtyards, crystal springs flowed from the hills, pearl grass covered the countryside, rice crops were plentiful, two unicorns (omens of prosperity) appeared in the capital at P'ing-yang, and the wondrous calendar bean made its appearance, producing one pod each day for half a month before the 15 pods withered one by one on successive days.

Two remarkable events marked Yao's reign: a rampaging flood was controlled by Ta Yü; and Hou I, the Lord Archer, saved the world from destruction by shooting down 9 of the 10 suns burning up the Earth.

Like Fu Hsi, Shen Nung, and Huang Ti before him, Yao had special temples dedicated in his honour. He is said to have offered sacrifices and to have practiced divination. In choosing a successor, Yao bypassed his own less worthy son in favour of Shun and served as counselor to the new emperor.

Yao, city, Ōsaka fu (urban prefecture), Honshu, Japan, on the Nagase River. The city is situated on mountain slopes and a plain in Kongō-Ikoma Quasi-national Park. The central part of the city was a commercial centre during the Tokugawa period (1603–1867). Yao is now an industrial and residential suburb of the Ōsaka-Kōbe Metropolitan Area, with large-scale machinery, chemical, and textile plants along the river. The railway to

Ōsaka was opened in 1925. Pop. (1988 est.) 276,591.

Yao-shih-fo (Buddha): see Bhaisajya-guru.

Yaounde (people): see Yaunde.

Yaoundé, also spelled YAUNDE, city and capital of the Republic of Cameroon. It is situated on a hilly, forested plateau between the Nyong and Sanaga rivers in the south-central part of the country. Founded in 1888 during the period of the German protectorate, Yaoundé was occupied by Belgian troops in 1915 and was declared the capital of French Cameroun in 1922. From 1940 to 1946 it was replaced as the capital by Douala, but after independence it became the seat of government of Cameroun in 1960, of the federal government in 1961, and of the united republic in 1972.

The city has grown as an administrative, service, and commercial centre and a communications hub for road, rail, and air transport. Yaoundé contains several small manufacturing and processing industries (a cigarette factory, a brewery, sawmills, and printing presses) and is also the market for one of the richest agricultural areas in the country.

The University of Yaounde was founded in 1962; the city also has schools of education, agriculture, health, engineering, journalism, administration, and international relations. The Pasteur Institute of Cameroun for biomedical research is among Yaounde's many research institutes, and the national library and archives are located in the city. Natural features in the vicinity include Nachtigal Falls and a chain of grottoes known as Akok-Bekoe (Grottoes of the Pygmies). Pop. (1987 est.) 712,089.

Yap, formerly GUAP, island and archipelago of the western Caroline Islands, part of the Federated States of Micronesia. The archipelago, with a total land area of 45.9 square miles (118.9 square km), comprises the islands of Gagal-Tomil, Map, Rumung, and Yap (also called Rull, Ruul, Uap, Yappu). Yap, the largest island (38.7 square miles [100.2 square km]), has a central range of hills rising to Mount Tabiwol, 568 feet (173 m), and is thickly wooded. Temperatures are fairly constant throughout the year. The mean monthly temperature is 82° F (28° C), and the average annual rainfall is 122 inches (3,100 mm).

In pre-European times Yap was the centre of a cultural area stretching from Palau in the west to near Truk in the east. Extensive ruins and the islanders' renowned use of stone-disk money date from this period. Probably sighted (1526) by the Portuguese, Yap was nominally controlled by Spain after being discovered anew by the Spanish galleon captain Francisco Lazeano in 1686. It passed to Germany in 1899. During this period, David O'Keefe, an American, founded a trading empire based upon his supplying the Yapese with traditional stone money in return for copra. The German authorities made Yap a centre for underwater cable communication and divided the archipelago into 10 administrative units that still function as such, each unit electing a magistrate who is a member of the district administrator's advisory council. Under Japanese control from 1919, Yap became a point of conflict until the United States and Japan reached agreement (1921) concerning the use of the cable facilities. Yap was a Japanese air and naval base during World War II. Yap became part of the United Nations Trust Territory of the Pacific Islands in 1947 and part of the newly established Federated States of Micronesia in 1986.

Copra is the chief export, and some surplus bananas, coconuts, and taros are sold to nearby atolls. Yams, sweet potatoes, pepper, cloves, and tobacco are also grown, and there is some fishing. Agricultural labour is divided between the sexes, each tending separate taro patches. A caste system with economic sig-

nificance ranks Gatchapar, Teeb, and Ngolog as the most important villages. By the 1970s there were more than 20 public and mission elementary schools in the state. The Yapese, physically and linguistically, are more closely related to Melanesians than to the other people of the Carolines. Pop. (1985 est.) island, 6,951; (1980) archipelago, 5,196.

Yap Ah Loy (b. March 14, 1837, Kwangtung Province, China—d. April 15, 1885, Kuala Lumpur, Malay Peninsula), leader of the Chinese community of Kuala Lumpur, who was largely responsible for the development of that city as a commercial and mining centre.

Yap Ah Loy arrived in the Malay state of Selangor in 1856 at the age of 19. He spent his first years in the peninsula as a miner and petty trader, but in 1862 his fortunes improved when his friend Liu Ngim Kong became Capitan China of Kuala Lumpur, a position not only of leadership within the Chinese community but also of liaison with the Malay political system and, after British intervention in 1874, with British officials as well. He served as Liu's trusted lieutenant and became the new Capitan China after Liu's death in 1869, upon which he began to put together a sound administration and a strong fighting force.

When civil war broke out in Selangor in 1870, Yap Ah Loy was faced with internecine fighting among dissident Chinese groups as well as attacks from Malay factions. His decisive victory at Kuala Lumpur in 1873 proved to be the turning point of the war and left him in a strong political position. Until 1879 he was almost supreme in the interior of the state. As the acknowledged leader of the Chinese community he had been given the powers of a Malay ruling chief by the British except for the right to tax, a restriction he easily evaded. He achieved a striking postwar recovery in the mining industry and established Kuala Lumpur as the economic centre of the peninsula. Through his control of the tin market. his ownership of local "farms" (monopolies on the sale of items such as opium and exclusive control of activities such as gambling), and his diverse business interests, he amassed a considerable personal fortune.

When in 1879 the first British resident (government adviser) was assigned to Kuala Lumpur, the power of the Capitan China began to be undermined. None of Yap Ah Loy's successors approached his power and independence of action. The city that he had largely developed retained its preeminent position and became the capital of Malaysia.

Yap Trench, also called WEST CAROLINE TRENCH, deep submarine trench in the western Pacific Ocean located east of the Yap Ridge and the Yap island group. The Yap Trench is about 400 miles (650 km) long from north to south and reaches a maximum depth of 27,976 feet (8,527 m) some 300 miles (480 km) northeast of the Palau Islands. It is a part of the chain of trenches that begins at the southwestern edge of the Bering Sea and runs southward toward the southern tip of the Philippine Trench (Mindanao Trench). Besides the Yap Trench, the chain includes the Kuril, Japan, Izu, and Mariana trenches. The greatest known depth of the Pacific Ocean, the Trieste Depth (36,201 feet [11,034 m]), occurs near the intersection of the Mariana and Yap trenches.

Yapen Island, Indonesian PULAU YAPEN, Dutch JAPPEN EILANDEN, island comprising most of Yapen Waropen kabupaten (regency), in Sarera Bay off the northern coast of Irian Jaya province, Indonesia. Its area of 936 square miles (2,424 square km) has an elevated central ridge that rises to 4,907 feet (1,496 m). The chief settlement is Serui on the central southern coast. Pop. (1980) regency, 59,982.

yapok, also spelled YAPOCK, marsupial mammal, a species of opossum (q.v.).

Yapurá River (South America): see Japurá River.

Ya'qūb ibn Laith aṣ-Ṣaffār (b. 840—d. 879), founder of the Ṣaffarid Empire, who rose from obscurity to rule much of present Iran as well as portions of Afghanistan and Pakisan; at one point he came close to capturing Baghdad, the seat of the caliph (the religious leader of all Islām).

After Laith's apprenticeship as a coppersmith (saffār, whence the name of the dynasty), he became a bandit and assembled an independent army. He won a measure of respect from the caliph by conquering non-Muslim areas in what is now Afghanistan. He then began to act as an independent ruler, minting his own coinage and driving out the Tāhirid dynasty from control of Khorāsān, in eastern Iran. Laith next seized control of the Iranian foodproducing provinces of Fars and Ahwaz. Finally in 878 he marched on Baghdad itself but was stopped when its defenders cut irrigation dikes.

Laith is a popular folk hero in Iranian history, and it was at his court that the revitalization of the Persian language began after two centuries of eclipse by Arabic.

Ya'qūbī, al-, in full aḥmad ibn abū ya'qūbī ibn Ja'far ibn wahb ibn wādiḥ al-ya'qūbī (d. 897, Egypt), Arab historian and geographer, author of a history of the world, Tā'rīkh ibn Wāḍiḥ ("Chronicle of Ibn Wāḍiḥ"), and a general geography, Kitāb al-buldān ("Book of the Countries").

Until 873 al-Ya'qūbī lived in Armenia and Khorāsān, under the patronage of the Iranian dynasty of the Ṭāḥirids, and wrote his history there. After the fall of the Ṭāḥirids he traveled to India and the Maghrib (North Africa) and died in Egypt.

The *Tā'rīkh ibn Wāḍiḥ* is divided into two parts. The first is a comprehensive account of pre-Islāmic and non-Islāmic peoples, especially of their religion and literature; it includes extracts from the Greek philosophers and accounts from stories and fables. The second part covers Islāmic history up to 872. The author's Shī'ite bias pervades the work.

In the *Kitāb al-buldān*, a large part of which is lost, al-Ya'qūbī analyzes statistics, topography, and taxation in describing the larger cities of Iraq, Iran, Arabia, Syria, Egypt, the Maghrib, India, China, and the Byzantine Empire.

Yaque del Norte River, river in central and northwestern Dominican Republic. The largest river in the nation, its headstreams rise on the northern slopes of the Cordillera Central, uniting to descend northward into the Cibao Valley, which lies between the Cordillera Central and the Cordillera Septentrional. The river then flows generally west-northwestward through the agricultural Cibao Valley before emptying into Manzanillo Bay, off the Atlantic Ocean, just downstream from Montecristi. The stream is 240 miles (386 km) long and, although generally shallow and therefore navigable only by small craft, it is subject to flooding during the rainy season. Its waters are used extensively for irrigating rice, sugarcane, plantain, and tobacco in the Cibao Valley; Tavera hydroelectric dam at Tavera, south of Santiago de los Caballeros, was completed in 1972.

Yaque del Sur River, river in southwestern Dominican Republic, one of the nation's three most important river systems. Its headstreams arise on the southern slopes of the Cordillera Central, uniting near Duarte Peak. The river is 80 miles (130 km) long and descends into the eastern San Juan valley, crosses into the Neiba valley, and then turns abruptly eastward to empty into Neiba Bay, off the Caribbean

Sea, just north of Barahona. Although the river is not navigable except by small craft, it is economically important because its waters are used extensively for irrigating rice, plantain, sugarcane, beans, bananas, and peanuts (groundnuts).

Yaqui, Indian people centred in southern Sonora state, on the west coast of Mexico. They speak the Yaqui dialect of the language called Cahita, which belongs to the Uto-Aztecan language family. (The only other surviving speakers of the Cahita language group are the related Mayo people.)

The Yaqui were, and in part remain, settled agriculturists, but they offered a stubborn resistance to the first Spanish invaders in the 16th and 17th centuries. They gradually came under mission influence and settled in church-centred communities, but in the 19th century Mexican encroachments on the fertile lands of their tribal territory led to a series of Yaqui uprisings that were finally quelled with difficulty by the Mexican Army in 1887. Thousands of Yaqui were deported, and the remainder were left greatly reduced in numbers by warfare and emigration. Much of the Yaqui's tribal lands were restored to them by the Mexican government in the 1930s, however. Since the 1940s, large irrigation projects using the waters of the Yaqui River have shifted the emphasis in Yaqui agriculture from subsistence crops of corn, beans, and squash to the growing of cash crops such as wheat and cotton, and the production of vegetable oils. The Yaqui are Roman Catholic, but the form of their worship is clearly influenced by aboriginal practices. The Yaqui numbered about 25,000 in the late 20th century, with several thousand also living in Arizona in the United States.

Yaqui River, Spanish Río YAQUI, river in Sonora state, northwestern Mexico. Formed in the Sierra Madre Occidental by the junction of the Bavispe and Papigochie rivers, the Yaqui flows generally southward and westward through Sonora for approximately 200 miles (320 km), crossing the coastal plain to empty into the Gulf of California 28 miles (45 km) southeast of Guaymas. The Yaqui is Sonora's largest river system. Retained by the Alvaro Obregón Dam above Ciudad Obregón and by the Novillo Dam above Soyopa, the river is used extensively for irrigation. Wheat, corn (maize), rice, and fruits are the principal crops cultivated along its lower course. The Yaqui is not navigable.

Yaracuy, state, northwestern Venezuela. It is bounded by the states of Falcon (north), Carabobo (east), Cojedes (south), and Lara (west). It lies within a tropical zone and has an area of 2,741 square miles (7,100 square km). The state embraces the fertile and economically important valley of the Yaracuy River, which separates the Segovia Highlands on the west and northwest from the central highlands on the east. Yaracuy is extremely productive agriculturally. The principal crops grown in the state include peanuts (groundnuts), sugarcane, bananas, citrus fruits, coffee, cotton, and tobacco. There are deposits of coal, copper, lead, and platinum. The state, which lies in the nation's most densely populated region, is part of the important commercial area centred at Barquisimeto. The Pan-American Highway traverses the heart of Yaracuy, linking San Felipe (q.v.), the state capital, with the neighbouring cities of Puerto Cabello to the northeast and Barquisimeto to the southwest. Pop. (1987 est.) 356,355.

Yarborough, Cale, byname of WILLIAM CALEB YARBOROUGH (b. March 27, 1939, Timmonsville, S.C., U.S.), U.S. stock-car racing driver who was the first to win the National

Association for Stock Car Auto Racing (NASCAR) championship three consecutive years.

Yarborough began driving stock cars in the early 1960s, and in 1968 he won four NASCAR six races, including the Daytona 500-mile race and the Atlanta 500, the former of which he also won in 1977 and 1983 and the latter of which he also won in 1967, 1974, and 1981. After unsuccessfully driving United States Automobile Club (USAC) championship cars (1971–72), he won his first NASCAR championship in 1976, repeating in 1977 and 1978. In 1977 he was the first NASCAR driver to start and finish 30 of 30 races.

yard-of-ale glass, drinking glass known in England from the 17th century, approximately one yard (90 centimetres) long and holding about one pint (0.5 litre). It has a trumpet-shaped opening at one end and either a foot

Yard-of-ale glass, English, 18th century; in the Victoria and Albert Museum, London

By courtesy of the Victoria and Albert Museum, London; photograph, A.C. Cooper Ltd.

at the other or a trick bulb, which makes drinking more difficult, for when air gets into it the ale is forced out in a rush. Impractical for ordinary use, it appears to have been reserved for demonstration of drinking feats or for special toasts and the like.

yardang, large area of soft, poorly consolidated rock and bedrock surfaces that have been extensively grooved, fluted, and pitted by wind erosion. The rock is eroded into alternating ridges and furrows essentially parallel to the dominant wind direction. The relief may range from one to several metres and there may be unconnected hollows and other irregular shapes. Yardangs occur in various deserts of the world including the Turkistan and the Mojave deserts.

Yarden, ha- (Israel-Jordan): see Jordan River.

Yardley, Herbert Osborne (b. April 13, 1889, Worthington, Ind., U.S.—d. Aug. 7, 1958, Washington, D.C.), U.S. cryptographer who organized and directed the U.S. government's first formal code-breaking efforts during and after World War I.

As a young man Yardley displayed a marked talent for mathematics and began a lifelong fascination with the game of poker. At 23 he entered the U.S. State Department as a coding clerk and, discovering a remarkable aptitude for cryptology, was soon making recommen-

dations to improve and protect government codes. In 1917 he was put in charge of MI8, the code-breaking section of the Military Intelligence Division (MID). After World War I he proposed that a permanent organization be created "for code and cipher investigation and attack." In 1919 a joint body, funded by the State Department and the military, was established in New York City with Yardley in charge. In 1921 this group broke the Japanese diplomatic code and provided information that the State Department used to advantage during the Washington Naval Disarmament Conference. Over the next several years the group suffered from the indifference and even hostility of public officials, culminating in Secretary of State Henry Stimson's dictum that Gentlemen do not read each other's mail.' The group was disbanded and Yardley, unable to find employment, published in 1931 a best-seller entitled The American Black Chamber, describing in detail the workings of the code group. As a result 19 nations changed their diplomatic codes. In 1938 Chinese Nationalist leader Gen. Chiang Kai-shek engaged Yardley to break the codes of the Japanese armies then invading China. He remained there until 1940, when he went to Canada to set up a cryptology service. Yardley also wrote The Education of a Poker Player (1957).

Yardley, Kathleen: see Lonsdale, Dame Kathleen.

Yare, River, stream in the county of Norfolk, England, which enters the North Sea 25 mi (40 km) east of Norwich. It flows sluggishly across Norfolk to Norwich, where it is joined by the Wensum from the north. In its lower course it traverses the flat, alluvial tract of the Broads to its estuary, Breydon Water. The Bure (from the north) and Waveney (from the south) also enter this estuary, the mouth of which is deflected south for 3 mi by the spit on which the resort of Great Yarmouth stands.

Yareaḥ, ha- (rabbi): see Astruc of Lunel.

Yarikh, also spelled Yareah, ancient West Semitic moon god whose marriage to the moon goddess Nikkal (Sumerian Ningal, Queen) was the subject of a poem from Ras Shamra (ancient Ugarit). The first part of the poem recorded the courtship and payment of the bride price, while the second half of the poem was concerned with the feminine aspects of the marriage. Fertility, symbolized by the birth of offspring, was believed to be the principal result of the marriage; thus, the Canaanites believed that fruitfulness in heaven would also result in terrestrial abundance for human beings.

Yarīm, town, Ibb liwā' (province), south central Yemen (Ṣan'ā'). In the heart of the Yemen Highlands, its site is on an upland plateau dominated by the massif of nearby Jabal (Mount) Sumārah, which rises to about 10,-000 ft (3,000 m) above sea level. In antiquity the Yarim area was the core of the state of Himyar, which ruled over much of southern Arabia from c. 115 BC to c. AD 575; the Himyarite capital of Zafar (q.v.) was about 9 mi (15 km) south of Yarīm. The town is now a way station on the all-weather highway from the capital city of San'ā' to the city of Ta'izz, in the south; it is also a local trade centre for the farmers and shepherds of the surrounding highland area. The ruins of ancient Zafar, off the highway in rugged, mountainous terrain, are still visible. Pop. (1977 est.) 8,038.

Yarkant, Wade-Giles romanization SHACH'E, Pinyin SHACHE, conventional YARKAND, oasis city in the Sinkiang Uighur Autonomous Region (tzu-chih-ch'ü), China. It is a county (hsien) seat in K'a-shih Prefecture (ti-ch'ü). The city comprises several separate walled units, one of which is named So-ch'e, and another Yarkant; both names have at times

been used as general terms for the city as a whole and for the oasis. Yarkant is situated in an oasis watered by the Yeh-erh-ch'iang Ho (river) at the western end of the Tarim Basin, southeast of Kashgar, at the junction of roads to A-k'u-su (Wen-su) to the northwest and to Ho-t'ien (Khotan) to the southeast. The roads form parts of the ancient northern and southern branches of the Silk Road through the Tarim Basin.

Yarkant first came to the notice of the Chinese in the latter part of the 2nd century BC, when it was known as the kingdom of Sahch'e, commanding the route over the Pamir Mountains. At the end of the 1st century AD, weakened by warfare with its neighbours, Yarkant was taken by Chinese armies under Pan Ch'ao. During the T'ang period (618-907) it again began to emerge as an important place, after having been overshadowed by Karghalik to the south and by Kashgar to the northwest. It became still more important in the 12th and 13th centuries, becoming the chief base of the khanate of Chagatai (part of the Mongol Empire). At the end of the 16th century it was riven by factional dissension and was eventually incorporated into the khanate of Kashgar. It was finally brought under Chinese control in the mid-18th century.

The oasis covers some 1,240 sq mi (3,210 sq km) and is very fertile. It produces a variety of grain crops, as well as cotton, hemp, beans, fruit, and mulberries for the local silk industry. Around the oasis there is extensive stock rearing, primarily of camels, horses, and sheep. The towns have many handicrafts, producing fine cotton and silk textiles, carpets, and leather goods. The population of the oasis area includes a wide variety of peoples, among them Chinese, Uighurs, Iranians, and some Indians. Pop. (mid-1970s est.) 10,000–50,000.

Yarkon River (Israel): see Yarqon River.

Yarmouth, town, seat of Yarmouth county, southwestern Nova Scotia, Canada, at the Atlantic entrance to the Bay of Fundy, 201 mi (323 km) west of Halifax. The site may well have been visited by Leif Ericsson and his Norsemen in 1007; the Runic Stone (found at nearby Overton in 1812), said to be carved by Ericsson, is in the Yarmouth County Historical Society Museum. The community was founded in 1761 by New England settlers. Some Acadians (banished about 1755) returned in 1767, and the population was increased in 1785 by the arrival of Loyalists. The town, once a noted shipbuilding centre, was probably named for Yarmouth, Mass. It is now a port and car-ferry terminal for services to Bar Harbor and Portland, Maine, U.S. Yarmouth Light, at the mouth of its harbour, is a familiar landmark. Economic activities focus on industrial fabrics, cotton duck, and dairy and fish products; pulpwood, fish, lumber, fruit, and cattle are exported. Inc. 1890. Pop. (1981) 7,475.

Yarmouth, Great (Norfolk, England): see Great Yarmouth.

Yarmouth Interglacial Stage, major division of Pleistocene deposits and time in North America (the Pleistocene Epoch began about 2,000,000 years ago and ended about 10,000 years ago). The Yarmouth Interglacial followed the Kansan and preceded the Illinoian stages of widespread continental glaciation. The Yarmouth Interglacial was named for deposits that were studied in the region of Yarmouth, Iowa, and is equivalent to the Mindel-Riss Interglacial Stage of Alpine Europe.

The Yarmouth Interglacial is represented by the remains of ancient soil horizons developed on Kansan glacial deposits as well as by deposits of peat. In some localities fossil vertebrates are especially well represented; the composition of these faunas indicates that Yarmouth climates were at least as warm as modern climates. In some regions, the development of distinctive deposits seems to indicate that Yarmouth climates may have been semiared

Yarmūk River, Hebrew Nahar Ha-yarmuk, Arabic Nahr Al-yarmūk, river, a tributary of the Jordan River, in southwest Asia. For most of its course, the Yarmūk forms the boundary between Syria to the north and Jordan to the south. Since the Six-Day War of June 1967, the lower 14 miles (23 km) of the river have been under Israeli control.

The Yarmūk rises on a lava plain in southwest Syria, near the Jordan frontier, and flows roughly southwestward until its confluence with the Jordan River. The Yarmūk is only 20 miles (32 km) long in a straight line, but because of the many convolutions in its course, the total length of the stream is about 50 miles (80 km). The river has cut through the resistant lava of the plateau to soft, chalky limestone beneath, creating a steep-walled gorge.

The Yarmūk was the site of the Battle of the Yarmūk River, one of the decisive battles in the history of Palestine. The Arabs, who under Khālid ibn al-Walīd had conquered Damascus in 635, were forced to leave the city when they were threatened by a large Byzantine army under Theodorus. Khālid concentrated his forces south of the Yarmūk River, and on Aug. 20, 636, he took advantage of a rebellion among the Byzantine forces to attack and destroy them. The battle marked the beginning of Muslim suzerainty in Palestine, which was broken only by the period of the Crusades (1099–1291) and lasted until World War I.

The Yarmuk River formerly provided hydroelectric power for Jordan, and its valley was the site of a branch railway, but successive Arab-Israeli wars and the accompanying territorial disputes in the area have largely erased these economic developments.

After the Six-Day War of 1967, the government of Israel opened the lower Yarmūk river valley, with its fine scenery, hot springs, and interesting ruins of Roman times, to tourist traffic. The Gawr irrigation canal, begun in 1958 and completed in 1966, diverts water from the Yarmūk to irrigate land in the northern Ghar region in Jordan.

yarn, continuous strand of fibres grouped or twisted together and used to construct textile fabrics.

A brief treatment of yarn follows. For full treatment, see MACROPAEDIA: Industries, Textile

Yarns are made from both natural and synthetic fibre, in filament or staple form. Filament is fibre of great length, including the natural fibre silk and the synthetic fibres. Most libres that occur in nature are of fairly short length, or staple, and synthetic fibres may be cut into short, uniform lengths to form staple.

Spinning is the process of drawing out and imparting twist to a mass of fibres. Filament yarns generally require less twist than staple. A fairly high degree of twist produces strong yarn; low twist produces softer, more lustrous yarn; and tight twist produces crepe yarns. Two or more single strands of yarn may be twisted together, forming ply yarn.

Novelty yarns, used to produce special effects, include bouclé, characterized by projecting loops; nub yarn, with enlarged places, or nubs, produced by twisting one end of a yarn around another many times at one point; and chenille, a soft, lofty yarn with pile protruding on all sides. Textured yarns are synthetic filament yarns that are made bulky or stretchy by heating or other techniques.

In yarns used for weaving, the warp, or lengthwise, yarns are usually made stronger, more tightly twisted, smoother, and more even than the filling, or crosswise, yarns. Knitting yarns have less twist than weaving yarns. Yarns used for machine knitting may be sin-

gle or ply types; ply yarns are generally used for hand knitting. Thread, used for sewing, is a tightly twisted ply yarn having a circular cross section.

Yaroslav I, byname YAROSLAV THE WISE, Russian YAROSLAV MUDRY (b. 980—d. Feb. 2, 1054), grand prince of Kiev from 1019 to 1054.

A son of the grand prince Vladimir, he was vice-regent of Novgorod at the time of his father's death in 1015. Then his eldest surviving brother, Svyatopolk the Accursed, killed three of his other brothers and seized power in Kiev. Yaroslav, with the active support of the Novgorodians and the help of Varangian (Viking) mercenaries, defeated Svyatopolk and became the grand prince of Kiev in 1019.

Yaroslav began consolidating the Kievan state through both cultural and administrative improvements and through military campaigns. He promoted the spread of Christianity in the Kievan state, gathered a large collection of books, and employed many scribes to translate Greek religious texts into the Slavic language. He founded churches and monasteries and issued statutes regulating the legal position of the Christian Church and the rights of the clergy. With the help of Byzantine architects and craftsmen, Yaroslav fortified and beautified Kiev along Byzantine lines. He built the majestic Cathedral of St. Sophia and the famous Golden Gate of the Kievan fortress. Under Yaroslav the codification of legal customs and princely enactments was begun, and this work served as the basis for a law code called the Russkaya Pravda ("Russian Justice").

Yaroslav pursued an active foreign policy, and his forces won several notable military victories. He regained Galicia from the Poles, decisively defeated the nomadic Pechenegs on the Kievan state's southern frontier, and expanded Kievan possessions in the Baltic region, suppressing the Lithuanians, Estonians, and Finnish tribes. His military campaign against Constantinople in 1043 was a failure, however.

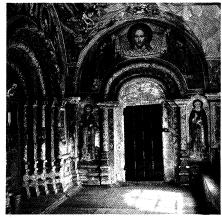

Trade with the East and West played an important role in Kievan Rus in the 11th century, and Yaroslav maintained diplomatic relations with the European states. His daughters Elizabeth, Anna, and Anastasia were married respectively to Harald III of Norway, Henry I of France, and Andrew I of Hungary.

In his testament, Yaroslav sought to prevent a power struggle among his five sons by dividing his empire among them and enjoining the younger four sons to obey the eldest, Izyaslav, who was to succeed his father as grand prince of Kiev. This advice had no lasting effect, and civil war ensued after Yaroslav's death.

Yaroslavl, oblast (province), western Russian Soviet Federated Socialist Republic. It has an area of 14,100 square miles (36,400 square km) and lies in the upper Volga River basin. Most of the oblast is a low plain traversed by the Volga River and broken only by the low, morainic Danilov and Uglich uplands, which run northeast-southwest across it. In the northwest is the 1,768-square-mile (4,579square-kilometre) Rybinsk Reservoir on the Volga; most of the reservoir lies within the oblast. The oblast's natural vegetation is forest of spruce, pine, oak, maple, and ash, with many patches of swamp and with floodplain meadows along the rivers. Agriculture is dominated by dairying, and the region is noted for its cheeses; flax, oats, fodder crops, and vegetables are also grown. Textile manufacture, timber working, and food processing are widespread in the towns, with engineering and chemical industries in the two main centres, Yaroslavl city (oblast headquarters) and Rybinsk. Power is supplied by the Rybinsk hydroelectric station. Pop. (1986 est.) 1,453,000.

Yaroslavl, city and administrative centre of Yaroslavl oblast (province), western Russian

Soviet Federated Socialist Republic. It lies on the right bank of the Volga River, 175 miles (282 km) northeast of Moscow. Yaroslavl is believed to have been founded in 1010 by Prince Yaroslav the Wise, and it served as the capital of an independent principality from 1218 until 1471, when it came under the rule of Moscow. Yaroslavl was sacked by the

Church of Nikola Nadein, Yaroslavl city, Russian S.F.S.R.
Shostal—FB Inc.

Tatars in 1238 and by Ivan I Kalita in 1332 and was captured by Novgorod in 1371, but on each occasion its recovery was swift. The opening of trade with the West during the 16th century brought prosperity to the town, which lay at the intersection of the great Volga River and Moscow-Archangel trade routes. The Yaroslavl Great Manufactory, one of the earliest and largest textile mills in Russia, was established in 1722, and by the late 18th century Yaroslavl had become an important industrial centre.

Yaroslavl's industries now produce heavy machinery (particularly diesel engines and electrical equipment), refined petroleum products, textiles, and synthetic rubber and tires. Power is produced by coal-burning electric plants and by the Rybinsk and Uglich hydroelectric stations, upstream on the Volga.

Many fine churches survive in Yaroslavl, including the Transfiguration Cathedral (1505–16) of the Saviour Monastery. The churches of Elijah the Prophet, Nikola Nadein, and St. John the Baptist all date from the 17th century. Yaroslavl has a university, several institutes of higher education, four theatres (including Russia's first public theatre, founded in 1750), an art gallery, several musuems, and a symphony orchestra. Pop. (1986 est.) 630,000.

Yarqon River, also spelled YARKON RIVER, Hebrew NAḤAL YARQON, river in west-central Israel, the principal perennial stream flowing almost entirely within the country. The name is derived from the Hebrew word yaroq ("green"); it was formerly called by the Arabs

Yarqon River above Tel Aviv-Yafo, Israel Maynard Williams—Shostal/EB Inc.

Nahr el-Auja (The Tortuous River). The Yarqon rises in springs near Rosh ha-'Ayin (Hebrew: "fountainhead"; literally, "head of the spring") and flows westward for about 16 mi (26 km) to the Mediterranean in northern Tel Aviv-Yafo. It marks the boundary between the Plain of Sharon (north) and the coastal lowlands (south). The seasonal water-courses west of Rosh ha-'Ayin, which form part of the drainage system, extend eastward into the Israeli-administered West Bank. They include the Naḥal Shillo (Wādī Dayr Ballūṭ) in the east, usually considered by geographers to mark the boundary between historic Judaea and Samaria, and the Naḥal Ayyalon (Aijalon) in the southeast. In the valley of the latter, according to the Bible, the moon stood still during Joshua's conquest of the Amorites (Josh. 10).

Until the 1950s the Yarqon was a pleasant stream frequented by boaters; since the construction and expansion of the Yarqon-Negev Project, part of the National Water Plan (1955 and following), the water level has gone down

and pollution has increased.

The Yarqon basin was the centre of several 19th-century settlements including Petah Tiqwa, Bene Beraq, Ramat Gan, and Tel Aviv. It was the site of several important British victories over the Turks in their conquest of Palestine during World War I. At the mouth of the river, in Tel Aviv, a shallow-draft port was built during the prolonged strike of the Arab port workers of Jaffa (1936); after World War II, however, it was abandoned.

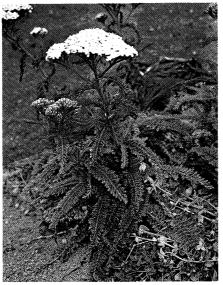

Near the river's mouth, adjacent to the campus of Tel Aviv University, are the important archaeological excavations of Tell Qasile.

Yarra River, river, south central Victoria, Australia, rising near Mt. Matlock in the Eastern Highlands and flowing westward for 153 mi (246 km) through the Upper Yarra Dam, past the towns of Warburton, Yarra Junction, and Warrandyte, to Melbourne. Its upper course traverses timber and dairy country; its mouth at Hobson's Bay (at the head of Port Phillip Bay), formerly a swamp, was dredged to create the Port of Melbourne. Development of the Upper Yarra basin is controlled by the New Yarra Valley Authority, created in 1977. The river was seen in 1803 by Charles Grimes during his survey of Port Phillip Bay, and its first settlement (1835) grew to become the city of Melbourne. Once called Great, or Freshwater, River, its present Aboriginal name means "running water."

Yarrawonga-Mulwala, twin towns on the Victoria-New South Wales border, Australia, on opposite sides of the Murray River. Located on the Murray Valley Highway and with rail connections southwest to Melbourne (135 mi [217 km] southwest), Yarrawonga-Mulwala lies near the Yarrawonga Weir, which impounds the Murray to form Lake Mulwala, a reservoir (15,000 ac [6,070 ha]) used for irrigation and recreation. Yarrawonga was founded in 1868 and made a shire in 1891; its name derives from an Aboriginal term meaning "where the cormorant builds." The town serves an area of livestock raising, dairy and fruit farming, and wheat and grape cultivation. Activities also include stock selling, flour milling, and shoe manufacture. Pop. (1981) Yarrawonga-Mulwala, 4,476.

yarrow, any of about 80 species of perennial herbs comprising the genus Achillea of the family Asteraceae, native primarily to the North Temperate Zone. They have toothed, often finely cut leaves that are sometimes aromatic. The many small white, yellow, or pink flowers often are grouped into flat-topped clusters.

Some species are cultivated as garden orna-

Yarrow (Achillea millefolium variety lanulosa)

mentals. The dried leaves of sneezewort (A. ptarmica) are used to make a sneezing powder, and parts of yarrow or milfoil (A. millefolium) have been used for snuff and tea.

Yaruro, South American Indian people inhabiting the tributaries of the Orinoco River. Only a few Yaruro remain on the Capanaparo and Cinaruco rivers in Venezuela. Their language, also called Yaruro, is a member of the Macro-Chibchan linguistic group.

The Yaruro differ from the typical agriculturists and hunters of the savannas of the region in that their life centres on the river. Crocodiles, manatees, turtles, and the eggs of these animals provide their basic foods. Fish are hunted in canoes and killed with bow and arrow. The Yaruro do not hunt the caiman, the tonina, or the howling monkey because they believe that these creatures are relatives of mankind. They make pottery, basketry, and netting.

The basic social unit of the Yaruro is the extended family consisting of the head man, his sons, their wives, and unmarried children. There are also two matrilineal groups or moieties; the members of each group take spouses from the other. Marriage is normally monogamous, although polygyny and polyandry are known.

They believe in a moon goddess, who created the world, and other gods and spirits. Communication with gods and ancestors is through shamans, who may be either male or female and whose main function is to treat sickness.

Yasawa Group, chain of about 20 volcanic islands in the Western Division of Fiji, in the South Pacific, northwest of Viti Levu, the principal Fijian island. They were sighted in 1789 by Capt. William Bligh of the British Navy and cover a total land area of 52 sq mi

Village on Yasawa, Fiji Photo Research International

(135 sq km). The principal islands are Naviti and Yasawa. By the 1970s the group, only a short cruising distance from the international airport at Nadi on Viti Levu, was beginning to develop a tourist business. The population is almost entirely Melanesian. Pop. (1976)

Yashin, Lev Ivanovich (b. Oct. 22, 1929, Moscow), Soviet association football (soccer) player renowned for his acrobatic skills as goalkeeper.

From 1949 to 1971 Yashin was a member of the Moscow Dynamo Club and in 1954 joined the Soviet national team. After helping win the Olympic gold medal (soccer) in 1956, Yashin played for the Soviet Union until retiring in 1970, including participation in the World Cup tournaments of 1958, 1962, and 1966. He became a coach after his retirement.

yashmak, also spelled YAŞMAK, long, narrow face screen or veil traditionally worn in public by Muslim women. The yashmak can consist of a piece of black horsehair attached near the temples and sloping down like an awning to cover the face, or it can be a veil covered with pieces of lace, with slits for the eyes, tied behind the head by strings and sometimes supported over the nose by a small piece of gold, ivory, or silver.

Muslim woman wearing a yashmak and chador, in "Femme du peuple," coloured engraving, Egypt, 1855-60

By courtesy of the Victoria and Albert Museum, London

The yashmak is usually worn with an enveloping garment most frequently called a chador. The custom of wearing the costume is centuries old, but in the 20th century it was slowly being abandoned except in the most traditional societies.

Yasnaya Polyana, village and former estate of the Russian novelist Leo Tolstoy, in Tula oblast (administrative region), central Russian Soviet Federated Socialist Republic, 100 mi (160 km) south of Moscow. Yasnaya Polyana (Sunlit Meadows) was acquired in 1763 by C.F. Volkonsky, Leo Tolstoy's great grandfather. Leo Tolstoy was born at Yasnaya Polyana in 1828 and after his marriage in 1862 returned and lived there for another 48 years. Following Tolstoy's conversion to Christian anarchism, Yasnaya Polyana became a pilgrimage centre for his followers. Upon his death in 1910, Tolstoy was buried in a grave marked only by

nine oaks on Stary Zakaz (Old Wood) Hill. a few hundred yards from his simply furnished home. Looted during the German occupation in 1941. Tolstov's home and the remaining portion of the original estate were preserved under the auspices of the Ministry of Culture of the U.S.S.R. The Tolstoy Memorial Museum complex includes the Volkonsky mansion built in the Neoclassical style, a servants' house, coach houses, a park extending to the Voronka River, and Tolstoy's home, with his library of some 22,000 books. The building where Tolstoy organized a school for peasants in the late 1850s has become a literary museum. An Order of Lenin (an award for special services, ratified by the Presidium of the Supreme Soviet of the U.S.S.R.) was bestowed upon the Yasnaya Polyana museum complex in 1978. Pop. (early 1980s) less than 10,000.

Yass, town, southeastern New South Wales, Australia. It lies along the Yass River, which is a tributary of the Murrumbidgee. The Yass Plains, on the Western Slopes of the Eastern Highlands, were explored in 1824 by Hamilton Hume and William Hovell. The town, established in 1837, serves a district producing merino wool, wheat, oats, orchard fruits, silver, lead, and bismuth. Yass lies on the Hume Highway near its junction with the Barton and has rail connections to Sydney (144 miles [232 km] northeast) and Melbourne. Burrinjuk River is 20 miles (32 km) to the northeast. Pop. (1981) 4.283.

Yass-Canberra (Australia): see Australian Capital Territory.

Yasuda Yukihiko, original name YASUDA SHINZABURŌ (b. Feb. 16, 1884, Nihonbashi, Tokyo—d. April 29, 1978, Ōiso, Kanagawa Prefecture), painter who excelled in depicting historical personages in the tradition of Japanese painting but augmented them with a psychological dimension.

Yasuda studied briefly under Kobori Tomone at the Tokyo Art Academy but left before graduation to establish a study group called Kōjikai in 1901, with the cooperation of several young artists. He contracted tuberculosis while still young, but this did not prevent him from continued involvement. In 1914 he joined the Japan Fine Arts Academy upon its revival and became one of its most important members. His technique was based on that of the *Yamato-e* (traditional Japanese painting), and he painted with graceful lines and warm and gentle colouring. His historical paintings were enriched by his erudition and profound knowledge of Japanese history. Among his best-known works are "The Hall of Dreams"

Oiso), entrepreneur who founded the Yasuda *zaibatsu* ("financial clique"), the fourth largest of the industrial and financial combines that dominated the Japanese economy until the end of World War II.

Of humble origin, Yasuda ran away from home to go to Tokyo, where he started work as a shop assistant and eventually began his own exchange brokerage. He prospered, becoming a major lender to the new Meiji government (1868–1912) and the founder of a giant banking empire. He soon branched out into industrial enterprises, buying up railways, shipping companies, and other businesses.

In his old age, he became one of Japan's major philanthropists, endowing many fine arts and educational projects. He was assassinated by a young rightist who saw Yasuda as a symbol of the corrupting influence of business on government.

Yasui Sōtarō (b. May 17, 1888, Kyōto—d. Dec. 10, 1959, Tokyo), Japanese painter who excelled in drawing in the Western style. He was particularly famous for his portraits.

The son of a wholesale cotton-goods merchant, Yasui began to study painting in 1904 at the Shogoin Institute of Western Art (which later became the Kansai Bijutsuin [Fine Arts Academy of Western Japan]) under its founder, Asai Chū. In 1907 he went to France, where he remained until 1914, except for occasional trips to Holland, Italy, Spain, and other European countries. In France he continued his study of painting, at first formally and later on his own. He was particularly influenced by the work of Gustave Courbet and Paul Cézanne. Upon his return to Japan he held a successful exhibition of 40-odd paintings and drawings. He gradually loosened himself from the overwhelming influence of the French masters and developed a more individual style based on painstaking sketches and with a frequently decorative composition, especially in portrait paintings. Among his representative works are "Nude Washing Her Feet" (1913), "Paulownia Blossoms" (1924), "Woman With a Fan" (1929), "Seoul" (1938), and "At the Studio" (1951).

Yāsūj (Iran): see Yesuj.

Yates, Edmund Hodgson (b. July 3, 1831, Edinburgh—d. May 20, 1894, London), English journalist and novelist who made respectable both the gossip column and the society paper.

The son of the actor Frederick Henry Yates and the actress Elizabeth Yates, Edmund Hodgson Yates began working at age 16 in the London general post office and rose to be-

"Yume-dono," painting by Yasuda Yukihiko; in the Tokyo National Museum By courtesy of the Tokyo National Museum

(1912), "Praying for Her Majesty's Safe Delivery" (1914), and "The Camp at Kise River" (1941). Yasuda also taught at the University of Tokyo from 1944 to 1951. He received the Order of Cultural Merit in 1948, becoming in that year a member of the Japan Art Academy.

Yasuda Zenjirō (b. Nov. 25, 1838, Toyama, Etchū Province, Japan—d. Sept. 28, 1921,

come head of the missing-letters department before retiring in 1872. In the early 1850s he began writing criticism and poetry for various popular journals and then began working as an editor while collaborating in the writing of theatrical farces. He also became a familiar figure in literary and artistic circles. It was as a columnist for the *Illustrated Times*, in 1855, that Yates first introduced a steadily appear-

ing column of gossip about public personalities. Entitled "The Lounger at the Clubs," it

proved a great success.
In the 1860s and '70s Yates edited various popular journals, including Temple Bar, Tinsley's Magazine, and Time. In 1874 he founded, with Grenville Murray, the first relatively respectable society paper, The World. This was a journal reporting the activities and associations of socially prominent persons. As editor, Yates strove to elevate The World above the level usual for this type of publication—i.e., that of a scurrilous and scandalous journal used by the editors for making libelous personal attacks in the course of satisfying their own and their friends' vendettas. The World proved to be quite successful, although Yates was briefly imprisoned at one point for a libel he made in it.

Yates also wrote a number of novels, many of which were published serially in popular journals. The best of these books are *Broken to Harness* (1864) and *Black Sheep* (1867). His most lasting work, however, is his autobiography, *Edmund Yates: His Recollections and Experiences* (1884).

Yathrib (Saudi Arabia): see Medina.

Yatsushiro, city, Kumamoto ken (prefecture), Kyushu, Japan. It is situated along the delta of the Kuma River, facing Yatsushiro Bay. The city developed around a Shintō shrine that was built during the Heian era (794–1185). It was a castle town and began the production of Yatsushiro pottery in the 16th century.

The city rapidly industrialized in the early 20th century. Factories producing cement, paper, rayon, and distilled beverages utilize the area's rich natural resources, which include water, timber, clay, and limestone. Yatsushiro has a fishing and commercial port that was enlarged in 1956 and is located at the junction of the Kagoshima and Hisatsu railway lines. Pop. (1985) 108,790.

Yaunde, also spelled YAOUNDE, or JAUNDE, also called ÉWONDO, a Bantu-speaking people of the hilly area of south-central Cameroon who live in and around the capital city of Yaoundé. The Yaunde and a closely related people, the Eton, comprise the two main subgroups of the Beti, which in turn constitute one of the three major subdivisions of the cluster of peoples in southern Cameroon, mainland Equatorial Guinea, and northern Gabon known as the Fang (q.v.). The other two main subdivisions are those of the Bulu and of the Fang proper, who live mostly in Gabon and in Equatorial Guinea.

Yaunde is a dialect of the Yaunde-Fang group of Bantu languages; people may speak a maternal dialect, such as Eton, but they learn to read and write in Yaunde. Yaunde is also used for commerce and politics in rural areas inhabited by other groups and is especially useful in Yaoundé city, where immigrants from throughout Cameroon and neighbouring countries employ it as a lingua franca. Vocabulary from these other dialects, other nearby languages, and English and French is assimilated into everyday speech.

The Yaunde share a common culture and history with other Beti, and it is often difficult to distinguish them from their neighbours. Beti are said to be the last of several great waves of Fang immigrants who came from somewhere to the northeast perhaps because of pressure from the jihad of the Fulani under Usman dan Fodio. While the Fang proper drove into what is now Gabon, and the Bulu subgroup swept toward the sea, the Beti followed these powerful precursors and occupied lands adjacent to theirs.

The Yaunde live in a region of equatorial

forest. They raise staple crops of cassava and corn (maize), which are supplemented with a wide variety of vegetable leaves, palm oil, wild mushrooms, insects, and other gathered products. Yams, plantains, and peanuts (groundnuts) are also important to the Yaunde economy, the latter so much so that the name Ewondo is derived from peanut. Goats and pigs are kept but are used more for ritual feasts than everyday eating. Cacao is an important cash crop, but its cultivation is not as profitable as it is in other areas, because poorer soil and higher population density reduce the land area available for plantations. Rural Yaunde. as a consequence, are less wealthy than some of their neighbours; in general, Yaunde are more often labourers in urban centres than are individuals from the richer, cacao-producing regions.

The Yaunde, like the Bulu and other Fang, had only a loose political organization prior to European conquest, and their society remains essentially egalitarian. The essential units of Yaunde society are genealogically related clans determined through patrilineal descent; lineage groups within those clans; and the larger entities of the tribes, which are loosely cohering clusters of clans. The age groups into which Yaunde society was also divided have decreased in importance in recent years. Most rural Yaunde continue to live in small clusters of adjacent homesteads (with populations rarely exceeding 300 or 400 people) rather than in real villages.

Yauri, historic kingdom, traditional emirate, and local government council, Sokoto State, northwestern Nigeria. The kingdom was probably founded by the Reshe (Gungawa) people. The date of its founding is unknown, but by the mid-14th century it was considered one of the most important of the banza bakwai (the "seven unsanctioned states" of the Hausa-speaking peoples). A political power struggle took place between Yauri and Zaria (emirate), both Hausa-speaking groups, over the governmental control of the Seven Hausa States. Yauri lost the struggle and Zaria was then recognized as comprising the Seven True Hausa States. Yauri, however, became known as the "seven illegitimate states" of the Hausa peoples. The walls of its first capital, Bin Yauri (Birnin Yawari, Ireshe Bino, Ireshe)traditionally said to date from the 10th century-have long been in ruins. Both Yauri's 5th and 11th kings (Yauri and Jerebana II, respectively) are credited with establishing Islām as the state religion.

Muhammadu Kanta, founder of the Kebbi kingdom to the north, conquered Yauri in the mid-16th century; and Yauri, although essentially independent after Kanta's death (c. 1561), paid tribute to Kebbi until the mid-18th century. In about 1810 King Albishir (Mohammadu dan Ayi), the Hausa ruler of Yauri, pledged allegiance to the emir of Gwandu, the Fulani Empire's overlord of the western emirates, and became the first emir of Yauri.

The expulsion in 1844 of Emir Jibrilu Gajere by the peoples of Yauri led to civil war. In 1850 Emir Suleimanu dan Addo moved the Yauri capital from Bin Yauri to the island of Ikum in the Niger River. Fears of conquest by Kontagora, the adjoining emirate to the south and east, led the Yauri rulers to retain the island capital until 1888, when agreement was reached with Kontagora's Amīr Ibrahim Nagwamatse and the Yauri capital was moved to Yelwa (q.v.).

Since that time—through British rule (1901–60) and Nigerian independence (since 1960)—Yelwa has remained the traditional seat of the emirate and the chief trade centre. Crops are grown for export on the fertile Niger flood plain. Most of the population of the emirate is composed of members of the Yauri, Dakarki (Dakarawa), Kamberi, Reshe, Dukawa, Hausa, and Fulani groups.

Yavana, in early Indian literature, either a Greek or another foreigner. The word appears in Achaemenian (Iranian) inscriptions in the forms Yauna and Ia-ma-nu, referring to the Ionians of Asia Minor, who were conquered by the Achaemenid king Cyrus the Great in 545 BC. It was probably adopted by the Indians of the northwestern provinces from this source, and its earliest attested use in India is by the grammarian Pāṇini (c. 5th century BC) in the form Yavanānī, which is taken by commentators to mean Greek script. At that date the name probably referred to communities of Greeks settled in the eastern Achaemenian provinces.

From the time of Alexander the Great (c. 334 BC) Yavana came to be applied more specifically to the Greek kingdom of Bactria, and, even more specifically, after c. 175 BC, to the Indo-Greek kingdom in the Punjab. Indian sources of that time regarded the Yavanas as a barbarian people of the northwest. From the beginning of the Christian Era the word was often used loosely to refer to any foreigner; and at a much later date it frequently applied to the Muslim invaders of India.

Yavarí River (South America): see Javari River.

Yavorov, Peyo, pseudonym of PEYO KRACHOLOV (b. May 6, 1877, Chirpan, Bulg.—d. Jan. 20, 1914, Sofia), Bulgarian poet and dramatist, the founder of the Symbolist movement in Bulgarian poetry.

Yavorov took part in the preparation of the ill-fated Macedonian uprising against Ottoman hegemony in August 1903, edited revolutionary papers, and crossed twice into Macedonia with partisan bands. He committed suicide at the age of 36.

Until 1900 Yavorov mainly wrote poetry of a social-political character, inspired by compassion for the peasantry, the struggles of the Macedonians, and the suffering of the Armenian exiles. Disillusionment with radicalism led him then to abandon realism for introspection and Symbolism. Besides several collections of poems—Stikhotvoreniya (1901); Bezsunitsi (1907); Podir Senkite na Oblatsite (1910)—his works include the plays V Polite na Vitosha (1911) and Kogato Gram Udari (1912); a biography of the Macedonian leader Gotse Delchev; and a book of reminscences of his fighting days, Haidushki Kopneniya (1908).

Yavuz: see Selim I.

yawara (martial art): see jujitsu.

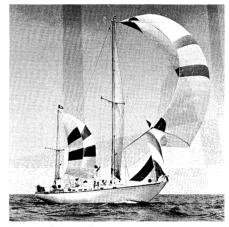

Yawatahama, city, Ehime ken (prefecture), Shikoku, Japan. It lies along the Uwa Sea. A castle town and fishing port during the Tokugawa era (1603–1867), it later developed as a trade centre for silk cocoons and raw silk. The city is now an important base for deepsea trawling and has fish-processing and cotton textile industries. Mandarin oranges are cultivated in the hinterland. A ferry operates across the Bungo Strait between Yawatahama and Usuki, on the eastern coast of Kyushu. Pop. (1980) 43,823.

Yawkey, Tom, byname of THOMAS AUSTIN YAWKEY, original name THOMAS AUSTIN (b. Feb. 21, 1903, Detroit—d. July 9, 1976, Boston), American professional baseball executive, sportsman, and owner of the American League Boston Red Sox (1933–76), who was the last of the patriarchal owners.

Yawkey was taken into the home of his maternal uncle William Yawkey and received a B.S. degree (in mining engineering and chemistry) from Yale University in 1925. After his mother's death he took his uncle's name and at the age of 16 became heir to his uncle's fortune. Yawkey had a lifelong passion for baseball, and he bought the Red Sox in 1933. He signed such stars as Jimmy Foxx, Lefty Grove, Joe Cronin, Ted Williams, and Carl Yastrzemski. The Red Sox won the American League pennant three times but lost the World Series to the National League St. Louis Cardinals (1946, 1967) and to the Cincinnati Reds (1975).

Yawkey was also an avid fisherman and hunter and played squash racquets and handball. His 40,000-acre (16,000-hectare) wildlife preserve at South Island, S.C., provided feeding and stopover sites for migrating birds and habitat for other wildlife. He willed 15,000 acres (6,070 hectares) of it to the state of South Carolina with a trust fund of \$10,000,000 for its maintenance.

yawl, two-masted sailboat, usually rigged with one or more jibsails, a mainsail, and a mizzen. In common with the ketch, the forward (main) mast is higher than the mizzenmast, but the

The yawl Girouette II
Frank Gordon and Son

mizzenmast of a yawl is placed astern of the rudder post, while that of the ketch is closer amidships. Like most modern pleasure boats, yawls are rigged with fore-and-aft sails (in line with the keel), the most effective rigging in utilizing manpower. The word yawl is sometimes applied to a dinghy and to a light fishing vessel rigged with lugsails.

vaws, also called FRAMBESIA, contagious disease occurring in moist tropical regions throughout the world. It is caused by a spirochete, Treponema pertenue, that is structurally indistinguishable from *T. pallidum*, which causes syphilis. Some syphilologists contend that yaws is merely a tropical rural form of syphilis, but yaws is nonvenereal, and later systemic complications from the disease are much rarer than in syphilis. The Wassermann and Kahn test for syphilis, however, often read positive with yaws, and there is some degree of cross-immunity. The spirochetes of yaws are present in the discharge from lesions and are transferred by direct contact to the abraded skin of an uninfected person; by contaminated clothing; and by flies that feed on the sores. The disease is most frequently contracted in early childhood, and considerable immunity to subsequent infection is acquired.

Yaws has three stages. The symptoms are an initial papule on the skin at the site of inoculation, followed by multiple cauliflower eruptions, and later, in some cases, by mutilating destruction of the skin, mucous membranes, and bones. The primary yaws sore is characterized by a wartlike thickening of the epi-

dermis, which becomes fibrous, cracks open, bleeds easily, and discharges a serous fluid.

A month or more later, when the first lesion may have disappeared except for a scar, multiple eruptions of the same type characteristically develop, often at junctions of the skin and mucous membranes, as around the mouth, nose, and anus, or on the skin of the crotch, neck, arms, legs, and buttocks. These lesions, whether initial or secondary, are yellowish-red and look somewhat like a raspberry (hence the name frambesia, latinized from the French framboise: "raspberry"). Later, the disease may subside, leaving only superficial scarring, but in some instances there may be deforming tertiary yaws involving the nose, long bones ("boomerang leg" of Australia), and, rarely, the spleen, brain, and great blood vessels.

Penicillin is rapidly effective in killing the spirochete and in curing yaws except in the tertiary stage, when oxophenarsine with bismuth subsalicylate is used. Prevention centres on isolating and promptly treating cases to reduce exposure and on maintaining personal and group hygiene. All abrasions and sores of the skin and mucous membranes should be treated with appropriate antiseptics and covered with clean dressings, and all clothing in contact with yaws lesions should be sterilized or destroyed.

Yayoi culture (c. 250 BC-c. AD 250), prehistoric culture of Japan, subsequent to the Jōmon culture. Named after the district in Tokyo where its artifacts were first found in 1884, the culture arose on the southern Japanese island of Kyushu and spread northeastward toward the Kantō Plain. The Yayoi people mastered bronze and iron casting. They wove hemp and lived in village communities of thatched-roofed, raised-floor houses. They employed a method of wet paddy rice cultivation, of Chinese origin, and continued the hunting and shell-gathering economy of the Jōmon culture.

Yayoi pottery, like earlier Jōmon ware, was unglazed. Pottery of the Early Yayoi period (250-100 BC) was characterized by knifeincised surface decoration. During the Middle Yayoi period (100 BC-AD 100), pottery objects with comb-mark decorations appeared. Forms of this warm, russet-coloured ware included tall footed vessels, large and small jars, bowls, and spouted vessels. Yayoi ware appears wheel-thrown but was made by the coiling method—that is, by preparing the clay in the shape of a rope and coiling it spirally upward. Surfaces were smoothed with a paddle or edging tool, then painted in red and polished to a high finish. Pieces produced in the last stage of the period were often undecorated.

Yayoi sites have yielded bronze mirrors and coins bearing similarities to Chinese Handynasty bronzes; ceremonial bronze weapons, swords, spears, and halberds; and bronze bells (dōtaku) decorated with incised geometric designs and matchstick drawings.

Yayoi pottery seems to be of two types, western and eastern, these being roughly geographically divided by the Inland Sea. Comparison of the bronzes, on the other hand, suggests the division of Yayoi culture into a western section around northern Kyushu, a central section around the Kinki area, and an eastern section around the Kantō Plain.

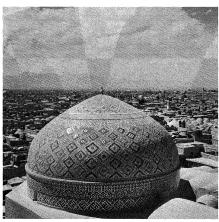

yazata, in Zoroastrianism, member of an order of angels created by Ahura Mazdā to help him maintain the flow of the world order and quell the forces of Ahriman and his demons. They gather the light of the Sun and pour it on the Earth. Their help is indispensable in aiding man to purify and elevate himself. They teach him to dispel demons and free himself of the future torments of hell. Persons who remember the yazata through ritual offerings receive their favour and prosper. Zoroaster

prayed to them to grant him strength for his mission.

The principal *yazata*s are mostly ancient Iranian deities reduced to auxiliary status: Ātar (Fire), Mithra, Anahita, Rashnu (The Righteous), Sraosha, and Verethraghna.

Yazd, also called YEZD, city, central Iran. The city dates from the 5th century AD and was described as the "noble city of Yazd" by Marco Polo. It stands on a mostly barren, sand-ridden plain about 4,000 feet (1,200 m) above sea level. The climate is completely desertic. A network of qanats (tunnels dug to carry water) links Yazd with the edge of the nearby mountain Shīr Khū. Historically, Yazd has been the link between Fars and Khorasan and between Persian Iraq and Kerman, and it was situated at the intersection of the trade routes from central Asia and India. It served as a provincial capital and earned the title of Dār al-ibada (Home of Piety), owing to its many religious buildings. Some of the city's inhabitants are Zoroastrians whose ancestors had fled toward Yazd and Kerman when the Muslim Arabs conquered Iran. Yazd is now the last centre of Zoroastrianism in Iran.

Since Sāsānian times Yazd has been famous for beautiful silk textiles that were rivaled in later periods only by those of Kāshān and Esfahān. The city is still a major centre of silk weaving. It has spinning and weaving mills, a plant for the manufacture of water purification and filtration equipment, and considerable mining and quarrying activity; copper deposits nearby are processed at the Sar Cheshmeh facilities. Almonds, fruit, and some grain are grown near the city.

The dome of the Masjed-e Jom'eh, Yazd, Iran By courtesy of the Iran National Tourist Organization

Besides a few remains of the imposing medieval city wall, the city has many important mosques and mausoleums dating from the 12th imam (head of Islām; 1035). The Masjed-e Jom'eh (Friday Mosque) is distinguished by the highest minarets in Iran, mosaic faience (earthenware ceramics), a superb mihrab (pulpit) dated 1375, and two oratories that are Gothic in appearance. Some of the other mosques and mausoleums in the city are decorated with delicate and rich stucco relief or are polychromed with tones of pale blue, rose, and yellow. The skyline is picturesque with minarets and many tall towers that were designed to bring cool air from underground into the buildings' chambers. Yazd city is linked with Kerman, Qom, Esfahan, and Tehran by road and railway; it also has an airport.

The economy of the area in which Yazd is situated is dominated by agriculture that was modernized through the establishment of farm corporations and processing centres for agricultural products. The chief crops grown include wheat, barley, cotton, oilseeds, indigo plants, fruits, and vegetables. Pop. (1985 est.) city, 223,300.

Yazdegerd, also spelled YEZDEGERD, or YEZDEGIRD, Middle Persian YZDKRT, name of Iranian rulers of the Sāsānian dynasty grouped below chronologically and indicated by the symbol •.

• Yazdegerd I (fl. 5th century), king of the Sāsānian Empire (reigned 399-420).

Yazdegerd was a highly intelligent ruler who tried to emancipate himself from the dominion of the magnates and of the Magi (a priestly caste serving a number of religions); thus, his reign is viewed differently by Christian and Magian sources. Because he stopped the persecution of the Christians, the Christian writers praise his clemency, but the sources dependent on Magian tradition refer to him as "Yazdegerd the Sinner." He also tried to limit the power of the nobles, but their resistance finally was answered with severity. He lived in peace and friendship with the Roman Empire and was therefore praised by Byzantine authors. He appears to have been murdered in Khorāsān and was succeeded by one of his sons. Bahrām V.

• Yazdegerd II (fl. 5th century), king of the Sāsānian dynasty (reigned 438-457), the son and successor of Bahrām V.

Although Yazdegerd was at first tolerant of the Christians, he remained a zealous Zoroastrian and later persecuted both Christians and Jews. He was engaged in a short war with Rome in 442 and also fought against the Kushans (Kuṣāṇas) and Kidarites in the east. Little else is known of Yazdegerd's reign; he was succeeded in turn by two of his sons, Hormizd III and Firūz.

• Yazdegerd III (d. 651, Merv, Sāsānian Empire), the last king of the Sāsānian dynasty (reigned 632–651), the son of Shahryār and a grandson of Khosrow II.

A mere child when he was placed on the throne, Yazdegerd never actually exercised power. In his first year the Arab invasion began, and in 636/637 the Battle of al-Qādisīyah on one of the Euphrates canals decided the fate of the empire. His capital, Ctesiphon, was occupied by the Arabs, and Yazdegerd fled into Media, where his generals unsuccessfully attempted to organize resistance. After the Battle of Nahāvand (642), in which Sāsānian forces were badly defeated, Yazdegerd sought refuge in one district after another, until at last he was slain at Merv. The Parsis-Zoroastrians who immigrated to western India on the advent of Islām—still use the old Persian calendar and continue to count the years from Yazdegerd's accession.

Yazīd I, in full Yazīd IBN MUʿĀWIYAH IBN ABĪ SUFYĀN (b. c. 645, Arabia—d. 683, Damascus), second Umayyad caliph (680–683), particularly noted for his suppression of a rebellion led by Ḥusayn, the son of 'Alī. The death of Ḥusayn at the Battle of Karbalā' (680) made him a martyr and made permanent a division in Islām between the party of 'Alī (the Shī'ites) and the majority Sunnites.

As a young man Yazīd commanded the Arab army that his father, Mu'āwiyah, sent to lay siege to Constantinople. Soon afterward he became caliph, but many of those whom his father had kept in check rebelled against him.

Although presented in many sources as a dissolute ruler, Yazīd energetically tried to continue the policies of Mu'āwiyah and kept many of the men who had been in his father's service. He strengthened the administrative structure of the empire and improved the military defenses of Syria. The financial system was reformed. He lightened the taxation of some Christian groups and abolished the tax concessions granted to the Samaritans as a reward for aid they had rendered in the days of the Arab conquests. He concerned himself

with agricultural matters and improved the irrigation system of the Damascus oasis.

Yazīd ibn al-Muhallab (b. 672—d. 720, Wāsit, Iraq), provincial governor in the service of several caliphs of the Umayyad dynasty.

In the first years of the 8th century Yazīd became governor of Khorāsān. He soon came into conflict with the powerful governor of Iraq, al-Hajjāj, at whose instigation the caliph, al-Walid, had Yazid jailed. In 708 Yazid managed to escape, fleeing to the protection of Sulayman, al-Walid's brother. When in 715 Sulaymān himself became caliph, Yazīd was named governor of Iraq and embarked on a persecution of the followers of al-Hajjāj, who had died in 714. Later he was also named governor of Khorāsān, while retaining supreme command in Iraq. Cruelty and extortion characterized his administration. In 717 he was again jailed when he was unable to transmit the appropriate tribute to Damascus. Once more he escaped, this time to lead a rebellion that resulted in his death.

Yazīdī, also spelled YEZĪDĪ, AZĪDĪ, ZEDĪ, or IZDI, religious sect, found primarily in the districts of Mosul, Iraq; Diyarbakır, Tur.; Aleppo, Syria; Soviet Armenia and the Caucasus; and in parts of Iran. The Yazīdī religion is a syncretic combination of Zoroastrian, Manichaean, Jewish, Nestorian Christian, and Islāmic elements. The Yazīdī themselves are thought to be descended from supporters of the Umayyad caliph Yazid I. They believe that they were created quite separately from the rest of mankind, not even being descended from Adam, and they have kept themselves strictly segregated from the people among whom they live. Although scattered and probably numbering fewer than 100,000, they have a well-organized society, with a chief sheikh as the supreme religious head and an emir, or prince, as the secular head.

The chief divine figure of the Yazīdī is Malak Tā'ūs ("Peacock Angel"), who is worshiped in the form of a peacock. He rules the universe with six other angels, but all seven are subordinate to the supreme God, who has had no direct interest in the universe since he created it. The seven angels are worshiped by the Yazīdī in the form of seven bronze or iron peacock figures called *sanjaq*, the largest of which weighs nearly 700 pounds (320 kg).

Yazīdī are antidualists; they deny the existence of evil and therefore also reject sin, the devil, and hell. The breaking of divine laws is expiated by way of metempsychosis, or transmigration of souls, which allows for the progressive purification of the spirit. The Yazīdī relate that, when the devil repented of his sin of pride before God, he was pardoned and replaced in his previous position as chief of the angels; this myth has earned the Yazīdī an undeserved reputation as devil worshipers. Shaykh 'Adī, the chief Yazīdī saint, was a 12th-century Muslim mystic whom the Yazīdī believe to have achieved divinity through metempsychosis.

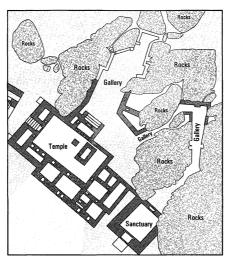

The Yazīdī religious centre and object of the annual pilgrimage is the tomb of Shaykh 'Adī, located at a former Christian monastery in the town of ash-Shaykh 'Adī, north of Mosul. Two short books written in Arabic, *Kitāb al-jilwah* ("Book of Revelation") and *Maṣḥaf rash* ("Black Writing"), form the sacred scriptures of the Yazīdī, and an Arabic hymn in praise of Shaykh 'Adī is held in great esteem.

Yāzijī, Nāṣīf (b. March 25, 1800, Kafr Shīmā, Lebanon—d. Feb. 8, 1871, Beirut), Lebanese scholar who played a significant role in the revitalization of Arabic literary traditions.

Until 1840 Yāzijī was employed in the service of Bashīr Shihāb II, the emir of Lebanon.

He then moved to Beirut, where he continued his literary work. He was a Christian, and for a while he helped some American missionaries prepare Arabic textbooks for use in local mission schools. He had a deep love for the Arabic language and a deep appreciation for the beauty of classical Arabic literature. He was also a purist in that he sought to eliminate "corruptions" that through the centuries had been absorbed into language and to return to the practices of the classical scholars. In previous centuries the classic literature had fallen into neglect, but the writings of Yāzijī and of other Christian Arabs helped to revive it as an active element in contemporary Arabic culture.

Yazılıkaya (Turkish: "Inscribed Rock"), Hittite monument about a mile northeast of Boğazköy; it was the site of the Hittite capital

Yazılıkaya From K. Bittel, R. Naumann, and H. Otto, Yazilikaya: Architektur Felsbilder, Inschriften, und Kleinfunde

Hattusa in eastern Turkey. Two recesses in the rock, one to the northeast and the other to the east, form natural open-air galleries. In a northeastern recess is carved a long procession of mostly male figures to the west and female to the east, meeting on the far northeastern wall. The east gallery contains a relief of a procession of warriors; on the opposite wall is a large relief showing a king in the embrace of his patron god, with a long dagger thrust into the rock before him.

Study has revealed that the sanctuary was completed by King Tudhaliyas IV during the 13th century BC, the last period of the Hittite empire, when Hurrian religious and cultural influence had become predominant. The shrine, therefore, canonized the official Hurrianized cult of the Hittite capital city.

Yazoo City, city, seat (1849) of Yazoo County, west-central Mississippi, U.S. It lies along the Yazoo River, 38 miles (61 km) northwest of Jackson. Founded as Hanan's Bluff in 1824, it was incorporated in 1830 and called Manchester; it was renamed for the Yazoo Indians in 1839. Its riverfront was the scene of several Civil War battles; the hull of the Baron DeKalb, sunk by Federal forces, is still visible at low water. Yazoo City was almost completely destroyed by fire in 1904 and was afterward rebuilt. An oil refinery was built in the city after the state's first oil well began production (1939) nearby. Yazoo City is an agricultural-trade centre (cattle, soybeans, corn [maize], cotton) and has some manufactures (nitrogen chemicals, fertilizer, machinery, textiles). Delta National Forest is a few miles west. Pop. (1986 est.) 11,957.

Yazoo River, river formed by the confluence of the Tallahatchie and Yalobusha rivers north of Greenwood, Mississippi, U.S. It me-

anders 189 miles (304 km) generally south and southwest, much of the way paralleling the Mississippi River, which it joins at Vicksburg. The Yazoo flows with a fall of only 7½ inches (19 cm) per mile. Prior to the completion of a system of levees in 1886, the Yazoo Basin was subject to headwater flooding by the larger streams; after that it became a major cottongrowing region. The basin, or floodplain, between the Mississippi on the west and the Yazoo on the east is now protected from the Mississippi's overflow by 270 miles (435 km) of levees extending from south of Memphis to the mouth of the Yazoo at Vicksburg. The basin is variously called the Delta, the Yazoo Delta, and the Yazoo Basin. Chief cities along the Yazoo River are Greenwood, Clarksdale, and Yazoo City.

The name Yazoo (that of an Indian tribe) is also applied to a tributary that flows parallel to the main stream for some distance before their confluence farther downstream.

Ye Jianying, Wade-Giles romanization YEH CHIEN-YING (b. May 14, 1897, Mei-hsien, Kwangtung Province, China—d. Oct. 22, 1986, Peking), Chinese Communist military officer, administrator, and statesman who held high posts in the Chinese government during the 1970s and '80s.

Born of a middle-class family, Ye graduated from the Yunnan Military Academy in 1919 and joined Sun Yat-sen's Nationalist movement shortly thereafter. He established a lifelong friendship with Zhou Enlai when the two were on the faculty of the Whampoa Military Academy during the mid-1920s. He joined the Chinese Communist Party (CCP) in 1927 and studied in Moscow from 1928 to 1931, subsequently joining Mao Zedong's Kiangsi Soviet. Ye helped to plan the Long March (1934–35), and by the late 1930s he had earned a reputation as an outstanding strategic planner. He was chief of staff of the (Communist) Eighth Route Army during much of World War II. He became a member of the Central Committee of the CCP in 1945. During the civil war between the Communists and Nationalists (1945-49), he was deputy chief of the general staff of the Communist armed forces.

Ye was the chief political commissar in Kwangtung Province in the early 1950s and was also mayor of Canton at this time. In 1955 he was made a marshal of the People's Liberation Army, and in 1966 he was made a member of the ruling Politburo of the CCP. He became a member of the powerful Standing Committee of the Politburo in 1973. After Mao's death in 1976, Ye opposed the Gang of Four and supported Hua Guofeng. Ye served as defense minister from 1975 to 1978 but, having grown feeble from old age, was in the latter year made chairman of the Standing Committee of the National People's Congress, thereby becoming nominal chief of state. He generally opposed Deng Xiaoping's reforms, and in 1985 he retired from his principal posts, including his membership in the Politburo.

Yeager, Charles E(Iwood), byname CHUCK YEAGER (b. Feb. 13, 1923, Myra, W.Va., U.S.), American test pilot and U.S. Air Force officer who was the first man to exceed the speed of sound in flight.

Yeager enlisted in the U.S. Army in September 1941, shortly after graduating from high school, and was assigned to the Army Air Corps. He was commissioned a reserve flight officer in 1943 and became a pilot in the fighter command of the Eighth Air Force stationed in England. He flew 64 missions over Europe during World War II, shot down 13 German aircraft, and was himself shot down over France (he escaped capture with the help of the French underground). After the war he became a flight instructor and then a test pilot, securing a regular commission as a captain in 1947.

Yeager was chosen from several volunteers to test-fly the secret experimental X-1 aircraft, built by the Bell Aircraft Company to test the capabilities of the human pilot and fixedwing aircraft against the severe aerodynamic stresses of sonic flight. On Oct. 14, 1947, over Rogers Dry Lake in southern California, he rode the X-1, attached to a B-29 mother ship, to an altitude of 25,000 feet (7,600 m). The X-1 then rocketed separately to 40,000 feet (12,000 m), and Yeager became the first man to break the sound barrier, which was approximately 662 miles per hour (1.066 kilometres per hour) at that altitude. The feat was not announced publicly until June 1948. Yeager continued to make test flights, and, on Dec. 12, 1953, he established a world speed record of 1,650 miles per hour (2,660 km/h) in an X-1A rocket plane.

In 1954 Yeager left his post as assistant chief of test-flight operations at Edwards Air Force Base in California to join the staff of the Twelfth Air Force in West Germany. Following other routine assignments, he returned to Edwards in 1962 as commandant of the Aerospace Research Pilot School with the rank of colonel. In 1968 he took command of the 4th Tactical Fighter Wing. He retired from the Air Force with the rank of brigadier general in 1975. His autobiography, Yeager, was published in 1985.

year, time required for the Earth to travel once around the Sun, about 365¹/4 days. This fractional number makes necessary the periodic intercalation of days in any calendar that is to be kept in step with the seasons. In the Gregorian calendar a common year contains 365 days, and every fourth year (with a few exceptions) is a leap year of 366 days.

In astronomy, several kinds of year are distinguished, having slightly different lengths. The solar year (365 days 5 hours 48 minutes 46 seconds), also called tropical year, or year of the seasons, is the time between two successive occurrences of the vernal equinox (the moment when the Sun apparently crosses the celestial equator moving north). Because of the precession of the equinoxes (an effect of a slow wobble in the Earth's rotation), the solar year is shorter than the sidereal year (365 days 6 hours 9 minutes 10 seconds), which is the time taken by the Sun to return to the same place in its annual apparent journey against the background of the stars. The anomalistic year (365 days 6 hours 13 minutes 53 seconds) is the time between two passages of the Earth through perihelion, the point in its orbit nearest the Sun. A lunar year (used in some calendars) of 12 synodic months (12 cycles of lunar phases) is about 354 days long. A cosmic year is the time (about 225,000,000 years) needed for the solar system to revolve once around the centre of the Milky Way Galaxy.

yeast, any of certain economically important single-celled fungi, most of which are in the class Ascomycetes, only a few being Basidiomycetes. The ascomycetan yeasts include the common bread-, beer-, and wine-producing varieties of Saccharomyces cereviseae.

Yeast reproduce asexually by budding: a small bump protrudes from a parent cell, enlarges, matures, and detaches. A few yeasts reproduce by fission, the parent cell dividing into two equal cells. Some yeasts are mild to dangerous pathogens of humans and other animals (e.g., Candida albicans, Histoplasma, Blastomyces). Torula is a genus of wild yeasts that are imperfect, never forming sexual spores.

In food manufacture, yeast is used to cause fermentation and leavening. The fungi feed on sugars, producing alcohol (ethanol) and carbon dioxide; in beer and wine manufacture the former is the desired product, in baking, the latter. In sparkling wines and beer some of the carbon dioxide is retained in the finished beverage. The alcohol produced in breadmak-

ing is driven off when the dough is baked. The fermentation of wine is initiated by naturally occurring yeasts present in the vineyards.

Yeast is 50 percent protein and is a rich source of vitamins B_1 , B_2 , niacin, and folic acid. Brewer's yeast is sometimes eaten as a vitamin supplement.

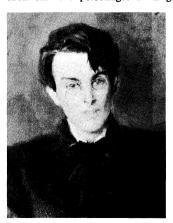

In commercial production, selected strains of yeast are fed a solution of molasses, mineral salts, and ammonia. When growth ceases, the yeast is separated from the nutrient solution, washed, and packaged. Yeast for baking is sold in compressed cakes containing starch or in a dry granular form mixed with cornmeal.

Yeats, Jack Butler (b. Aug. 23, 1871, London—d. March 28, 1957, Dublin), leading Irish painter of the 20th century, whose scenes of Irish daily life and Celtic mythology contributed to the surge of nationalism in the Irish arts after Irish independence was won.

The younger son of John Butler Yeats, a well-known portrait painter, and brother of William Butler Yeats, the poet, he was privately educated in Sligo. His early work was mainly confined to illustrations for books and broadsheets produced by his sisters at the Dun Emer, later the Cuala Press of Dundrum near Dublin. About 1915 he began to paint in oil, and it was during the years of the Irish struggle for independence that his style matured and he began to acquire fame. His approach to the Irish scene is romantic and emotional, vet never out of touch with reality. Yeats was also a writer, whose literary works are characterized by the same qualities of fantasy and of colourful and haphazard expression that are apparent in his paintings.

Yeats, William Butler (b. June 13, 1865, Sandymount, Dublin—d. Jan. 28, 1939, Roquebrune-Cap-Martin, Fr.), poet, dramatist, and Irish nationalist politician, winner of the Nobel Prize for Literature in 1923.

Heir to conflicting traditions. Yeats's father, John Butler Yeats, was a barrister, but eventually he became a portrait painter. His mother, formerly Susan Pollexfen, was the daughter of a prosperous merchant in Sligo, Ire. Normally, Yeats would have been expected to identify himself with the Protestant Anglo-Irish tradition—representing a powerful minority among Ireland's predominantly Roman Catholic population—but he did not. Although his mind was so filled with Irish images when he was at school in London that he felt himself a stranger there, he was separated from both historical traditions available to him in Ireland—from the Catholics, because he could not share their faith, and from the Protestants, because they "seemed to think of nothing but getting on in the world." He did revere the 18th-century splendour of the Protestant Anglo-Irish tradition manifested in such eminent personages in English litera-

ture and thought as Jonathan Swift, Edmund Burke, Oliver Goldsmith, and George Berkeley; but that tradition was now in sad decline. Historically, a new cycle appeared to be emerging, one favouring the Catholic tradition and perhaps expressed in Gaelic rather than in English. Yeats supported the movements that he could reconcile with his own severe artistic taste, but he was often equivocal in patriotic circles that advocated an Ireland entirely separated from British government. Before Yeats could find his place in either of the two Irish communities, he had to define himself in relation to his remarkably ambiguous country. Yeats's attempts to define his relationship to his country are found throughout his poetry; his best hope, he felt, was to cultivate a tradition more profound than either the Catholic or the Protestant—the tradition of a hidden Ireland that existed largely in the anthropological evidence of surviving customs, beliefs, and holy places, more pagan than Christian. Many of his early essays and reviews, beginning in 1886, are attempts to reveal Ireland, now that its hour had come.

In 1867, when Yeats was only two, his family moved to London, where John Butler Yeats hoped for more commissions than he received in Dublin. In 1880 the family moved back to Dublin, where William attended the high school. He spent the holidays with his uncle George Pollexfen in Sligo, the setting of many of his poems. In 1883 he attended the Metropolitan School of Art in Dublin, where the most important part of his education was in meeting other poets and artists.

Aesthete, mystic, and nationalist. while, Yeats was beginning to write: his first publication, two brief lyrics, appeared in the Dublin University Review in 1885. In the same year, he helped to form a group devoted to the occult, the Dublin Hermetic Society. When the family went back to London in 1887, Yeats joined the Theosophical Society, a growing international movement that sought wisdom and brotherhood through mysticism. Magic appealed to Yeats because it was a form of imaginative life far removed from the workaday world. The age of science was repellent to Yeats; he was far more interested in astrology than in astronomy. He was a visionary, and he insisted upon surrounding himself with poetic images. He began a study of the prophetic books of William Blake, and this enterprise brought him into contact with other visionary traditions, such as the Platonic, the Neoplatonic, the Swedenborgian, and the alchemical.

Yeats was already a proud young man, and his pride required him to rely on his own taste and his sense of artistic style. He was not boastful, but spiritual arrogance came easily to him. His early poems, collected in *The Wanderings of Oisin, and Other Poems* (1889), are the work of an aesthete, often beautiful but always rarefied, a soul's cry for release from circumstance.

In 1889 Yeats met Maud Gonne, an Irish beauty, ardent and brilliant. From that moment, as he wrote, "the troubling of my life began." He fell in love with her, but his love was hopeless. Maud Gonne liked and admired him, but she was not in love with him. Her passion was lavished upon Ireland; she was a rebel, a rhetorician, commanding in voice and in person. When Yeats joined in the Irish nationalist cause, he did so partly from conviction, but mostly for love of Maud. Much of what he wrote of Ireland during those years was as if whispered to Maud. When his play Catheen ni Houlihan was first performed in Dublin in 1902, she played the title role.

After the rapid decline and death of the con-

After the rapid decline and death of the controversial Irish leader Charles Stewart Parnell in 1891, Yeats felt that Irish political life lost

its significance. The vacuum left by politics might be filled, he felt, by literature, art, po-etry, drama, and legend. The Celtic Twilight (1893), a volume of essays, was Yeats's first effort toward this end, but progress was slow until 1896, when he met Augusta Lady Gregory, an aristocrat who was to become a playwright and his close friend. She was already collecting old stories, the lore of the west of Ireland. Yeats found that this lore chimed with his feeling for ancient ritual, for pagan beliefs never entirely destroyed by Christianity. He felt that this lore was intimately related to peasant life, and that by devoting himself to it he might yet establish a vivid relation to the people. If he could treat Irish folklore in a strict and high style, he would create a genuine poetry while, in personal terms, moving toward his own identity. The political equivalent of this ideal would be a liaison of peasant and aristocrat; the peasant element for its experience, the aristocratic for style. Such a liaison would rebuke the hated middle class, the product of town and money; it would have a moral effect, even if it did not take practical effect. From 1897, Yeats spent his summers at Lady Gregory's home, Coole Park, County Galway, and he associated Coole with a vanishing world of grace. That the park was surrounded by peasants made the vision complete.

In 1899 Yeats asked Maud Gonne to marry him, but she declined. Four years later she married Maj. John MacBride, an Irish soldier who shared her feeling for Ireland and her hatred of English oppression: he was one of the rebels later executed by the British government for their part in the Easter Rising of 1916. Meanwhile, Yeats devoted himself to literature and drama, believing that poems and plays would engender a national unity capable of transfiguring the entire Irish nation. Such stirrings culminated in the founding of the famous Abbey Theatre in Dublin, which gave its first performance in 1904. Yeats's On Baile's Strand, a play on the theme of father against son, was on the first program. For several years thereafter he occupied himself with the daily chores of running the Abbey

It was a controversial time. Yeats's own plays were often denounced as irreligious, anti-Catholic, and therefore anti-Irish. There were quarrels with actors, producers, and newspapers. The first performance of John Millington Synge's Playboy of the Western World in 1907 led to uproar in the theatre. Yeats, always a proud and somewhat lordly man, proved himself a formidable warrior in disputes; he was also slow to forget old wounds and was widely disliked. He despised the middle class, the shopkeeping people, and all those who-like most Dubliners-wanted conventional success. Yeats's appeal to pagan Ireland for its apparently heroic values was regarded as an insult by modern citizens, Catholic and Protestant alike. Gradually, he found himself moving away from the common interests of a middle-class people. The Abbey Theatre now seemed to be losing its soul; many of its plays struck Yeats as mean and vulgar, consolation prizes for a shoddy populace. He began to turn his mind toward a different kind of theatre, which would not depend upon the whim of a mob. In 1913 he spent some months at Stone Cottage, Sussex, with the American poet Ezra Pound acting as his secretary. Pound was then editing translations of the No plays of Japan, and Yeats was greatly excited by them, largely because they issued from an aristocratic culture, taking their standards from the court rather than the mob. Gradually, he devised what he considered an equivalent of the No drama, his Four Plays for Dancers (1921), a series of short, formal dramas that could be performed as well in a drawing room as in a theatre. He thought of these plays as a new kind of drama, a harmony of word, mask, and dance, the music and gesture symbolic rather than imitative. The plays would appeal to an audience of high-born people, those few who enjoyed the virtues of style. His play At the Hawk's Well (first performed 1916) embodied many of the values he espoused. The bourgeois theatre of money and mob was merely a place of "nervous tremors," rather than of the pity and terror stirred by ancient Greek drama. The arts that interested Yeats at this time were those that enable their audience to pass for a few moments into "a deep of the mind that had hitherto been too subtle for our habitation."

Inevitably, these values were difficult to sustain in the daily scene of Irish life. To Yeats, sinister forces seemed at work in the dispute that arose in 1913 over the disposition of Sir Hugh Lane's great collection of 39 French Impressionist paintings. Lane planned to give them to the Dublin Municipal Gallery of Modern Art on condition that a gallery be built to show them. When the gallery was not built, Lane, in anger, lent them to the National Gallery in London, and when he died in 1915 both institutions claimed them. Yeats entered the quarrel in 1913 because he thought that a splendid act, an aristocratic gesture, on Lane's part, had been spurned by a vulgar Dublin. Many of the poems in Yeat's Responsibilities (1914) were inspired by the Lane controversy, which became extraordinarily bitter. It marked a new phase in the relation between Yeats and Ireland.

With Lady Gregory in the spring of 1907 he had visited Florence, Milan, Urbino, Ferrara, and Ravenna, and he never forgot the evidence of aristocratic grace that the Italian towns and cities offered. From 1913 his yearning for Renaissance Italy, the whole lost kingdom of courtesy and civility, reverberated through his work.

The mature poet and senator. In 1917 Yeats asked Iseult Gonne, Maud Gonne's daughter, to marry him. She refused. Some weeks later he proposed to Miss George Hyde-Lees and was accepted; they were married in 1917. A daughter, Anne Butler Yeats, was born in 1919, and a son, William Michael Yeats, in 1921.

In 1922, on the foundation of the Irish Free State, Yeats accepted an invitation to become a member of the new Irish Senate: he served for six years. In 1923 he was awarded the Nobel Prize for Literature. Now a celebrated figure, he was indisputably one of the most significant modern poets. But he did not rest upon those laurels. His mind was engaged in meditation upon the relation between imagination, history, and the occult. He wanted to present his thoughts in one great book, a sacred book of the arts. The first version of it was published in 1925 as A Vision. But Yeats was not content with it, and he continued to work on it for several years, the definitive version appearing in 1937. Meanwhile, his poetry increased in authority. The Tower (1928), named after a ruined Norman castle he bought at Gort, is one of his most imperious books, the work of a fully accomplished artist; in it, the experience of a lifetime is brought to perfection of form. Still, some of Yeats's greatest work was written subsequently, appearing in The Winding Stair (1929).

Though now approaching his late 60s Yeats continued writing. The intensity of his feeling persisted, but much of the poetry is marred by a certain hysteria of the imagination, and the balance of reality and justice is insecure. The world seemed to be falling apart, and he hated it, but he was often fascinated by its fall. His reverence for aristocratic style sometimes served an authoritarian ideology, and it has been charged that he was a Fascist during his last years. Feeling that his revered values were being destroyed, Yeats fancied that they could

be saved by a great man, a strong leader. He admired the Italian Fascist dictator Benito Mussolini for his vigour, his authoritarian lucidity. In On the Boiler (1939), a prose pamphlet, Yeats vented his rage and frustration at a corrupt world. It has been charged that he longed for political power and that he would have used it violently if he had secured it. Yeats's rage, however, is a poet's rage, his vision of life a poet's vision. He wanted only moral force, the strength he ascribed to certain great symbols. The political power he did exercise as an Irish senator was directed to practical work; it was concerned with such matters as censorship, the Lane pictures, health insurance, divorce, the Irish language, education, copyright protection, and Ireland's membership in the League of Nations. He was also chairman of the Senate Committee on Coinage.

Yeats's last years were strained. His health was poor, and he travelled to avoid the damp Irish winters. But he did not retire from the world. Suspecting that the violence of the decade of the 1930s must end in war, he was horrified by the prospect and yet attracted to it. He assured himself that beneath the marching feet of Mussolini's Italy one might still hear the themes of love, art, beauty, and civility. Yeats's sense of life during those years was apocalyptic: sometimes he ran away from the apocalypse in terror; sometimes he conspired with it.

In 1936 his Oxford Book of Modern Verse, 1892–1935, a gathering of the poems he loved, many of them by his friends, was published. Still working on his last plays, he completed The Herne's Egg, his most raucous work, in 1938. Within a year he died abroad. Final arrangements for burial in Ireland could not be made, so he was buried at Roquebrune, Fr. The intention of having his body buried in Sligo was thwarted when World War II began in the autumn of 1939. In 1948 the body was finally taken back to Sligo and buried in a little Protestant churchyard at Drumcliffe, as he specified in "Under Ben Bulben," in his Last Poems (1939), under his own epitaph: "Cast a cold eye On life, on death. Horseman, pass

(D.Do./Ed.)

MAJOR WORKS. *Poetry* (lyrical). *Poems* (1895), containing revised versions of the two series, "Crossways" and "The Rose"; The Wind Among the Reeds (1899); In the Seven Woods (1903); The Green Helmet, and Other Poems (1910); Responsibilities (1914); The Wild Swans at Coole (1917); Michael Robartes and the Dancer (1921), includes Easter 1916; Later Poems (1922); The Tower (1928); The Winding Stair, and Other Poems (1929); A Full Moon in March (1935); Last Poems and Plays (1936-39; with Yeats's final revisions and corrections, 1940). (Narrative and dramatic): The Wanderings of Oisin, and Other Poems (1889); The Shadowy Waters (1900); "The Old Age of Queen Maeve" (1903); "Baile and Aillinn" (1903); "The Two Kings" (1913); "The Gift of Harun al-Rashid" (1923); Yeats's last revisions of his poems may be found in the Collected Poems (1960).

Drama (in verse). The Countess Kathleen (1892), revised as The Countess Cathleen (1912); The Land of Heart's Desire (1894); The King's Threshold (1904); On Baile's Strand (1905); Deirdre (1907); The Green Helmet (1910); At the Hawk's Well, published in Four Plays for Dancers (1921); The Cat and the Moon and Certain Poems (1924); Sophocles' King Oedipus (1928); Sophocles' Oedipus at Colonus, first published in The Collected Plays of W.B. Yeats (1934); A Full Moon in March (1935); The Herne's Egg (1938); Purgatory and The Death of Cuchulain, published in Last Poems and Two Plays (1939). (In prose): Cathleen in Houlihan (1902); The Hour-Glass: A Morality (1904); The Player Queen (1922); The Resurrection (1927); The Words upon the Window-Pane (1934). For Yeats's final versions of his plays, see the Collected Plays (1963).

Prose (folktales, stories, and sketches). Fairy and Folk Tales of the Irish Peasantry (1888); The

Celtic Twilight (1893); The Secret Rose (1897); The Tables of the Law: The Adoration of the Magi (1897); Stories of Michael Robartes and His Friends (1932). (Essays): Ideas of Good and Evil (1903); Discoveries: A Volume of Essays (1907); The Bounty of Sweden (1925), includes The Irish Dramatic Movement (1924), Yeats's Nobel Prize address; Essays, 1931-1936 (1937); If I Were Four-and-Twenty (1940). (Autobiographical writings): Reveries over Childhood and Youth (1915); The Trembling of the Veil (1922); Estrangement (1926); The Death of Synge, and Other Passages from an Old Diary (1928); Dramatis Personae (1935); Pages from a Diary Written in Nineteen Hundred and Thirty (posthumously 1940); Autobiographies (posthumously 1955). (Critical and philosophical writings): Synge and the Ireland of His Time (1911); Per Amica Silentia Lunae (1918); The Cutting of an Agate (1919); A Vision (1925); Explorations (1962), essays and introductions selected by Mrs. Yeats; Essays and Introductions (1961).

BIBLIOGRAPHY. Works of mainly biographical interest include: Joseph Hone, W.B. Yeats, 1865-1939, 2nd ed. (1962); A. Norman Jeffares, W.B. Yeats: Man and Poet, 2nd ed. (1962); Richard Ellmann, Yeats: The Man and the Masks (1949, reprinted 1978); and Edward Malins, A Preface to Yeats (1975). Works of critique and interpretation include Harold Bloom, Yeats (1970); Richard F. Peterson, William Butler Yeats (1982); Denis Donoghue and J.R. Mulryne (eds.), An Honoured Guest (1965); Richard Ellmann, The Identity of Yeats (1954); Frank Kermode, Romantic Image (1957); Thomas Parkinson, W.B. Yeats, Self-Critic (1951); G.B. Saul, Prolegomena to the Study of Yeats's Poems (1957), and Prolegomena to the Study of Yeats's Plays (1958); F.A.C. Wilson, W.B. Yeats and Tradition (1958), and Yeats's Iconography (1960); Denis Donoghue, Yeats (1971). Bibliographies include Allan Wade, A Bibliography of the Writings of W.B. Yeats, 3rd ed. rev. (1968); and K.P.S. Jochum, W.B. Yeats: A Classified Bibliography of Criticism: Including Additions to Allan Wade's Bibliography . . . (1978).

Articles are alphabetized word by word, not letter by letter

Yecla, city, Murcia province and autonomous community (region), southeastern Spain, north of the city of Murcia, on the Arroyo del Jua (a tributary of the Río Segura) at the slopes of the Cerro del Castillo. The Stone Age remains of Monte Arabí are to the northwest. The city received its coat of arms from Charles II in 1687. It has castle ruins and two prominent churches: the 17th-century Gothic Iglesia del Salvador (Church of the Saviour) and the Romanesque Basílica de la Purísima (Basilica of the Immaculate Conception), completed in 1868. The writer Azorin used the latter as a setting for his novel La voluntad (1902; "Volition"). Yecla is an agricultural trade centre dealing in wine, olives, cattle, and cereals. Light industries include furniture making and distilling. Pop. (1981) 25,146.
