The horny layer. The final product of the epidermis is the keratin that packs the cornified cells. The term keratin is applied generally to the hard keratins of hair, horn, and nails, and to the soft keratin of the epidermis. They are all insoluble filamentous proteins, composed of polypeptide chains that are stabilized by links using two atoms of sulfur. The source of the keratin of the stratum corneum has been a subject of controversy; but it is now generally accepted that about a third of its total mass is made up of proteins synthesized in the granular layer and the remainder from so-called intermediate filaments, which are present in keratinocytes from the basal layer outward.

The barrier that prevents water loss from the body is situated in the lower part of the horny layer. In this region the spaces between the compacted layers of keratin-filled cells contain lamellae of lipid (wax) that has been formed within the membrane-coating granules of the live epidermal cells below.

Pigmentation. The human skin is variously coloured and shows remarkable individual variations even within racial groups. The appearance of the skin is partly due to the reddish pigment in the blood of the superficial vessels. In the main, however, it is determined by melanin, a pigment manufactured by dendritic cells called melanocytes, found among the basal cells of the epidermis. Their numbers in any one region of the body, which range from about 1,000 to more than 2,000 per square millimetre, are roughly the same within and between races; the blondest whites have as many as the darkest blacks. Colour differences are due solely to the amount of melanin produced and the nature of the pigment granules. When the skin becomes tanned on exposure to sunlight, the melanocytes do not increase in number, only in activity.

All melanocytes, whether resident in the basal epidermis or in the matrix of the hair, have migrated there during embryonic life from a region known as the neural crest. Each epidermal melanocyte is associated with a group of neighbouring keratinocytes into which it transfers granules of pigment by way of long, branching dendrites. The whole has been termed an epidermal melanocyte unit. Once inside the epidermal cells, the melanin granules tend to move above the nucleus, forming a shroud over it. Such an orientation of melanin suggests that it is there to protect the cells from damaging ultraviolet rays, and experiments with tissue cultures support this view.

Protective function of melanin

Melanin is of two kinds: dark brown eumelanin and pale red or yellowish phaeomelanin. Both are formed within the melanocytes by the initial oxidation of the amino acid tyrosine with the aid of the enzyme tyrosinase; subsequently their synthetic pathways diverge. In addition to protecting the skin from ultraviolet radiation, epidermal pigmentation forms epigamic markings. The heavy pigmentation of the nipples and areolae of breasts, as well as that in the labia minora, penis, and scrotum, is related to sexual communication.

Immunoregulation and Langerhans cells. Although synthesis of protective keratin is clearly a major function of the epidermis, the discovery of an immunoregulatory role for the epidermis has revolutionized concepts of its importance in the immune defense systems of the host. In addition to melanocytes, human epidermis contains another system of dendritic cells, which do not manufacture pigment. Their distribution extends farther toward the skin surface than that of the pigment cells. After their discovery by the German physician Paul Langerhans in 1868, their function remained obscure until it was realized that they are a vital part of the immunologic mechanism.

Electron microscopic examination has revealed that the morphological hallmark of the Langerhans cell is a unique tennis-racket-shaped organelle, the Birbeck granule. Langerhans cells can be looked upon as "sentinel" cells of the immune system. By virtue of their situation, they are among the first cells to come into contact with foreign particulate substances encountering the skin. Their function is aided by the large surface area created by the dendritic processes of the cell. By means of specialized receptors on the cell membrane, the Langerhans cell recognizes invading as opposed to host molecules. By conveying this information to the lymphoid system, the body is able to mount a defensive immunologic response to the foreign material.

The concept that the role of keratinocytes themselves is confined to the synthesis of a horny protective outer covering for the skin has also become outmoded. Keratinocytes secrete a number of immunostimulatory high-molecular-weight peptides, collectively termed epidermal cytokines. One of these, the epidermal-cell-derived thymocyte-activating factor (ETAF), is also secreted by epidermal Langerhans cells. It has the function of enhancing the immune responsiveness of the lymphoid system as well as apparently being involved in the body's systemic reaction to infection and injury. Because the whole blood volume circulates through the skin every few minutes, immunoregulatory substances released by the cells of the epidermis may have a profound influence on the body's capacity to mount immune responses to viral or bacterial infections or to cancerous growths.

HAIR

Human hair has little protective value, even in hirsute persons. Eyelashes, eyebrows, and the hairs inside the external ears and nostrils have obviously useful functions, and scalp hair may be thick enough to provide some protection from the midday Sun. The beard and mustache, though, are embellishments, which establish maleness and are likely to be concerned with sexual or social communication; and axillary and pubic hair probably form part of scent-disseminating mechanisms.

An important role for hair, however, is its participation in the body's sensory apparatus. All hair follicles are surrounded by sensory nerves, and pressure on the hair shaft is transmitted to these nerves. Other mammals, including

subhuman primates, have highly specialized sensitive hair follicles around the eyes, lips, and muzzle. These produce "tactile" hairs, known as vibrissae or whiskers, which are particularly large in nocturnal mammals. The follicles from which these hairs emerge are rich in nerves and are surrounded by a sinus filled with blood. Humans are the only animals with no sinus hair follicles; but human hair follicles, particularly those of the face, are well supplied with nerves, and human skin is probably more sensitive than that of any other mammal.

Hair follicles

Hairs are manufactured by follicles. Essentially, these are tubelike pockets of the epidermis that extend through most or all of the depth of the skin and enclose a small papilla of dermis in their base. They lie at an angle to the skin surface. Two-thirds of the way up is a bulge, and attached to it are wisps of smooth muscle fibre that, on contracting, pull the follicle to a more or less perpendicular position. This action also puckers the skin into a mound on the surface—a so-called goose pimple.

Exactly as in other mammals, the human hair is formed by division of cells in the region known as the bulb, at the base of the follicle. Pigment is incorporated from melanocytes in this region. Human hair follicles also go through cycles of activity. After a period of growth, the hair becomes clubbed, rather than cylindrical, in shape. Fibrous rootlets anchor the club to the surrounding follicular tissue. While forming the club, the follicle shrivels up, the lower part becoming largely dissipated. A resting follicle can be recognized at once by the clubbed hair and by the follicle's short size and unique structure. Follicles remain dormant for variable periods of time. When they become active again, they reconstruct a bulb that manufactures a new hair. As the new hair works its way to the surface, the club hair is loosened from its moorings and shed.

The activity of the hair follicles in the scalp is not synchronized, so that there is a small but steady molt of about 50 to 100 hairs a day from a total of around 150,000 follicles. There is, nevertheless, evidence of seasonal fluctuation, with the greatest hair loss in late summer and fall. A follicle may continue its activity for a long time, and hairs sometimes grow for several years and attain considerable lengths. Even in the human scalp—where the hair follicles are dense and vigorously productive—baldness occurs in a large number of individuals. Baldness is not a disease but is a systematic involution of hair follicles, culminating in organs similar to the primitive embryonic follicles; the numbers of follicles do not necessarily diminish.

Until late in fetal life the forehead is indistinguishable from the scalp, with no line of demarcation between the two. After the fifth month of gestation the follicles in the rest of the scalp grow larger, but those of the forehead do not. After birth the hairs on the forehead become even smaller and nearly invisible. The hairline of newborn infants is usually indistinct; the familial hairline pattern is defined late in childhood through a process that is identical with that of baldness. When male pattern baldness sets in, in the late 20s or earlier, the follicles affected undergo exactly the same changes as do those that establish the hairline.

Male pattern baldness and its female equivalent, which is usually more diffuse, are hereditary conditions. Paradoxically, since male hormones (androgens) stimulate the growth of most other hair, this type of baldness occurs only if androgens are present.

Hairs vary in colour, diameter, and contour. The different colours result from variations in the amount, distribution, and type of melanin pigment in them, as well as from variations in surface structure that cause light to be reflected in different ways. Hairs may be coarse or so thin and colourless as to be nearly invisible. Straight hairs are round, while wavy hairs are alternately oval and round; very curly and kinky hairs are shaped like twisted ribbons.

Human hair grows at the rate of about one-third of a millimetre a day, and once keratinized it is inert. If the colour or shape of a hair is altered as it is formed, several days must elapse before the effect becomes visible. Hairs become white with aging because of the failure of the melanocytes to inject pigment into the cells as they are formed. Tales of hair becoming white overnight may perhaps arise from cases of rapid differential shedding of pigmented hairs from a mixed population of white and dark ones, but the suggestion that individual dark hairs can somehow rapidly turn white is not true.

Androgen-dependent hair

The beard and mustache are the most obvious examples of hair that requires male sex hormones, or androgens, for its growth. Facial hairs begin to develop at puberty, about two years after the start of pubic hair growth. The rate of growth of the beard initially increases with age, but levels out after 35. Hair on the chest—a traditional sign of masculinity—and that on the limbs are also androgen-dependent. Androgens cause longer hairs to be formed, partly by making them grow faster, but mainly by increasing the length of anagen, the growing phase. Fully formed hairs on the thigh are over three times longer in young men than in women; and the duration of anagen is around 54 days in males, compared with 22 days in females.

Pubic and axillary hair are also dependent on androgens, but they differ from other body hair in that they are luxuriant in females as well as in males. Their growth requires lower levels of hormone. The lower triangle of pubic hair is present in persons with a rare disease known as male pseudohermaphroditism. These individuals are genetic males who remain female in form until puberty because they lack an enzyme necessary to bind two atoms of hydrogen to the male hormone testosterone, which is responsible for male sex characteristics. Since persons with male pseudohermaphroditism lack facial hair, even when adults, it seems that beard growth requires the conversion of testosterone to dihydrotestosterone but that pubic hair growth does not.

SEBACEOUS GLANDS

The sebaceous glands are usually attached to hair follicles and pour their secretion, sebum, into the follicular canal. In a few areas of the body, disproportionately large sebaceous glands are associated with very small hair follicles; in other areas there are glands that are altogether free of follicles.

The outstanding feature of sebaceous glands is their holocrine mode of secretion, involving complete disintegration of the sebaceous cells. The glands consist of a series of lobes, or acini, each with a duct running toward the main sebaceous duct. The cells are generated by cell division around the periphery of each lobe. As they move toward the centre of the lobe and toward the duct, they synthesize and accumulate fat globules and become progressively larger and distorted. Ultimately they disintegrate to form the secretion.

Human sebum is a complex mixture of lipids—triglyceride fats (57.5 percent), wax esters (26 percent), squalene (12 percent), cholesterol esters (3 percent), and cholesterol (1.5 percent). The triglycerides are largely hydrolyzed by bacteria by the time the sebum reaches the skin surface, so that about a third of the surface fat consists of free fatty acids.

The activity of the sebaceous glands is mainly controlled by androgens. The glands are quite large at birth because of the influence of maternal hormones during development, but they regress soon afterward. They become active again at, or somewhat in advance of, the first signs of puberty. Their rate of secretion is a little higher in adult men than in women, and it falls off gradually with age in both sexes. It is very low in eunuchs but has been shown to increase when they are treated with androgens. That other factors—for example, pituitary hormones—may also influence secretion is suggested by the observation that sebum production is abnormally high in acromegaly, a disorder resulting from excessive secretion of growth hormone.

Problematic function of sebum

The function of sebum has been greatly debated. Some scientists have theorized that it is important as an emollient to prevent too rapid loss of water from the superficial layers of the stratum corneum; others have held that it is a functionless product of now useless, or vestigial, organs. Yet humans have more and larger glands than most mammals, and there is a specific plan in their distribution: they are largest and most numerous on the face and around the anogenital surfaces.

The skin around the nose, mouth, and forehead and over

the cheekbones has beds of gigantic glands, the secretion of which keeps these surfaces constantly oily. The sebaceous glands evenly spaced in rows at the border of the eyelids—the meibomian glands—are so large that they are easily seen with the naked eye when the eyelids are everted. The glands on the genitalia produce copious amounts of sebaceous matter called smegma. Only humans have rich populations of sebaceous glands on the hairless surfaces of the lips; these glands increase in number and size as persons mature. The inside of the cheeks also has many large sebaceous glands, and occasionally there are glands even on the gums and tongue.

It seems highly unlikely, in view of these facts, that sebum is functionless. While its significance is certainly not established, it is possible that it is concerned with subtle chemical communication by smell or taste. Such a function would bring human beings into line with other mammals.

SWEAT GLANDS

Sweat glands are coiled tubes of epidermal origin, though they lie in the dermis. Their secretory cells surround a central space, or lumen, into which the secretion is extruded. There are two distinct types: eccrine glands open by a duct directly onto the skin surface; apocrine glands usually develop in association with hair follicles and open into them.

Most other mammals have numerous apocrine glands in the hairy skin; eccrine glands are usually absent from the hairy skin and limited to friction surfaces. In nonhuman primates there is a tendency for the number of eccrine sweat glands over the body to increase in progressively advanced animals at the same time that the number of apocrine glands becomes reduced. Prosimians have only apocrine glands in the hairy skin; eccrine glands begin to appear in some of the higher forms. The great apes either have equal numbers or have more eccrine than apocrine glands. Humans have the most eccrine glands, with apocrine glands restricted to specific areas.

Strictly speaking, apocrine glands have nothing to do with sweating. They appear late in fetal development (five to 5½ months) nearly everywhere on the body. Most of these rudiments disappear within a few weeks except in the external ear canals, in the axillae, on the nipples of the breasts, around the navel, and on the anogenital surfaces; single glands may be found anywhere. From this, one might speculate that the ancestors of humans had apocrine glands widely distributed over the body, and the embryonic rudiments may be reminders of the history of a once widespread organ system.

Where they appear, the apocrine glands are large and numerous. In the axilla they are so large that the coils press upon each other, forming adhesions and cross-shunts of such complexity that the glands are more spongy than tubular. The complex of these large apocrine glands commingled with an equal number of eccrine sweat glands in the axilla composes what is known as the axillary organ, one of the most characteristic features of human skin. Other than humans, only chimpanzees and gorillas have axillary organs. In spite of their large size, apocrine glands secrete only small amounts of a milky, viscid fluid—pale gray, whitish, yellow, or reddish—which contributes very little to axillary sweat. If eccrine glands were not there, the axillae would be relatively dry.

Axillary secretion

The odour of axillary secretion becomes more intense as it is decomposed by bacteria. Although axillary odours frequently seem unpleasant, they are not invariably so. The odour of individual human beings comes mostly from apocrine secretion, with some contribution from sebum. Since the body odours of all other animals have a social or sexual significance, it can be assumed that this is the archetypal purpose of apocrine secretion, even in humans. The view that the axillary organs are scent glands is supported by the finding that androsterones—the compounds that are responsible for the odour of the boar to which the sow responds—also occur in human axillary secretions.

Humans have 2,000,000 to 5,000,000 eccrine sweat glands, with an average distribution of 150 to 340 per square centimetre. They are most numerous on the palms and soles and then, in decreasing order, on the head, trunk, and extremities. Some individuals have more glands than others, but there is no difference in number between men and women.

The specific function of sweat glands is to secrete water upon the surface so that it can cool the skin when it evaporates. The purpose of the glands on the palms and soles, however, is to keep these surfaces damp, to prevent flaking or hardening of the horny layer, and thus to maintain tactile sensibility. A dry hand does not grip well and is minimally sensitive.

The eccrine glands, then, can be divided into those that respond to thermal stimulation, the function of which is thermoregulation, and those that respond to psychological stimuli and keep friction surfaces moist. This makes a clear-cut distinction between the glands on the hairy surfaces and those on the palms and soles. In addition to thermal and psychological sweating, some individuals sweat on the face and forehead in response to certain chemical substances.

The glands on the palms and soles develop at about 3½ months of gestation, whereas those in the hairy skin are the last skin organs to take shape, appearing at five to 5½ months, when all the other structures are already formed. This separation of events over time may represent a fundamental difference in the evolutionary history of the two types of glands. Those on palms and soles, which appear first and are present in all but the hooved mammals, may be more ancient; those in the hairy skin, which respond to thermal stimuli, may be more recent organs.

The sweat glands in the hairy skin of subhuman primates possibly function subliminally, although they are structurally similar to those of humans. The skin of monkeys and apes remains dry even in a hot environment. Profuse thermal sweating in humans, then, seems to be a new function. Eccrine sweat glands respond to a variety of drugs with different properties. They often respond differently in different individuals under nearly identical conditions and sometimes even respond inconsistently in the same individual. Notwithstanding these apparent vagaries, the eccrine glands function continuously, although their secretion may be imperceptible. Sweating is essential for keeping the human body from becoming overheated.

Essential function of sweating

NAILS

A major characteristic of primates is that their fingers and toes terminate in nails rather than in claws. One can speculate that the development of nails into flattened plates reflects the discontinuation of their use for digging or for defending and attacking. In a broad sense, nails are analogous to hair, having similar composition (keratin) and some common structural features. Even their genesis and mode of growth are comparable, but not identical, to those of hair.

Although apparently simple structures, nails are formed by complex and still poorly understood structural entities referred to as nail organs. Unlike hair, nails grow continuously, with no normal periods of rest; if their free edges were protected from wear, they would extend to prodigious lengths, growing in a twisted fashion like a ram's horns. Nails grow about 0.1 millimetre per day, or roughly one-third as rapidly as hair. Growth is somewhat slower in winter than in summer and slower in infants and old people than in vigorous young adults. It requires about three months for a whole nail to replace itself.

A number of factors can alter normal nail growth, among them age, trauma, poisons, and organic disorders. Habitual nail biting speeds up growth, and certain occupational practices can cause an increase in thickness. The nail-forming organ is particularly sensitive to physiological changes. During stressful periods or prolonged fever, or in response to noxious drugs, nails may become cracked, thinner, thicker, furrowed, or otherwise deformed, or they may be shed. Such sensitivity of response should make nails relatively good indexes of the health of individuals. But because of their ready response to so many internal and external factors, and because changes in them often occur without a known reason, signs of abnormality can be misleading or difficult to interpret. Like hair, the visible part of the nail plate is a dead structure. Defects

inflicted upon it by mechanical means that do not disturb the underlying living tissue are eventually cast off at the free border.

Nails have a root, buried beneath the skin; a plate that is firmly attached to a nail bed underneath; and a free edge. Depending upon its thickness and the quality of its surface, the nail plate may be pink or whitish; the nail itself is translucent and colourless, allowing the colour of the blood in the superficial capillaries of the nail bed to show through. At its base the nail plate may have a whitish, arched marking called a lunule. Always present on thumbnails, lunules may be present or absent on the other fingers and are nearly always absent on the little finger. There are variations in different individuals and even between the two hands of the same person; such variations are probably controlled by genetic factors.

The nail itself consists of firmly cemented keratinized cells, flattened horizontally to the surface. Whereas the surface of nail plates may appear to be smooth, it is lined by parallel, longitudinal furrows, more strongly etched in some persons than in others and typically more prominent in the aged. These markings have some correspondence to the more pronounced grooves and ridges on the undersurface of the plate.

Nail growth

Nails grow from a matrix at the base of the nail root. During the early part of their journey, matrix cells multiply and move forward, synthesizing keratin, underneath the fold of skin (eponychium) at the base of the nail. Once exposed to the surface, the nail is fully formed. The nail plate seems to glide over the nail bed, but it is firmly attached to it; the entire tissue, nail bed and plate, most likely moves forward as a unit. The nail bed has often been called sterile matrix, since it adds little or nothing to the nail plate. Yet under certain pathologic conditions, it assumes keratinizing activities that result in a variably thickened or deformed nail plate.

Although it is less effective than claws for digging or gouging, the flattened nail is still an excellent adaptation that has added much to the development of manipulative skills. Nails not only protect the tips of fingers but also give them firmness and the ability to pick up or make contact with minute objects. Claws would be useless for such functions.

CUTANEOUS SENSE ORGANS

The skin has both free nerve endings and so-called corpuscular endings, which include nonnervous elements. The corpuscular endings are further differentiated as encapsulated or nonencapsulated receptors.

Free nerve endings occur in the epidermis, in the superficial dermis, where they are arranged in tufts, and in hair follicles. Merkel cells, which are found in the basal layer of the epidermis, are an example of nonencapsulated corpuscular receptors. The most striking example of an encapsulated receptor is the Pacinian corpuscle, an ovoid structure that is about one millimetre in length and lamellated in section, like an onion; these receptors can be found deep in the dermis. Various other dermal sense organs—for example, Golgi-Mazzoni corpuscles, Krause end bulbs, Meissner corpuscles, and Ruffini endings—have also been described.

It can easily be demonstrated that touch, cold, warmth, and pain are each perceived in separate points on the skin surface. The various end organs were at one time, therefore, somewhat arbitrarily assigned as monitors of one or another of these qualities. A difficulty was that many of the receptors are present only in glabrous skin, even though hairy skin in similarly perceptive. These earlier ideas were undoubtedly too simple, but electrophysiologists have confirmed the view that the various end organs respond to specific stimuli. The functional existence of mechanoreceptors, thermoreceptors, and pain receptors has been established, though only some of these can be identified with classical end organs. The Merkel cells and Ruffini endings, for example, are "slowly adapting" mechanoreceptors; while the Meissner, Pacinian, and Golgi-Mazzoni corpuscles and the hair follicle receptors are "rapidly adapting" mechanoreceptors.

(W.M./F.J.G.E.)

Skin diseases

GENERAL FEATURES

Although most diseases affecting the skin originate in the layers of the skin, such abnormalities are also important factors in the diagnosis of a variety of internal diseases. There is some truth in the belief that the skin mirrors a person's internal health. Often, the visibility and accessibility of skin make it the first organ of the body to show detectable signs of underlying disease. Abnormalities of the skin frequently suggest metabolic, malignant, and glandular diseases.

A mirror to health

Like other tissues, skin is afflicted by all types of pathological changes, including hereditary, inflammatory, benign and malignant (neoplastic), endocrine, hormonal, traumatic, and degenerative processes. Emotions affect the health of the skin as well. The reaction of the skin to these diseases and disorders differs from that of other tissues in many ways. For example, extensive inflammation of the skin may affect metabolism within other organs and systems of the body, causing anemia, circulatory collapse, disorders of body temperature, and disturbance of water and electrolyte balance in the blood. The skin has such vigorous healing properties, however, that widespread injury, as in thermal burns, may be followed by a marked degree of regrowth of the injured or diseased areas, with a disproportionally small degree of scarring.

Diagnosis. The skin has an inherent region-specific anatomical diversity that may profoundly modify the appearance of a rash. This is apparent when skin transplanted from one area of the body to another (other than a symmetrically opposite area) retains the morphological characteristics of the donor area. Thus the morphology of eczema or lichen planus on the palms and soles may bear little or no resemblance to the same disease in the same individual on the face or scalp. In these instances a biopsy shows the abnormalities of the cells of the skin and the pattern and distribution of any invading cells. The ability to identify immunoreactants (immunoglobulins, or antibodies, that react with specific invading agents, or antigens) in skin biopsies has greatly increased the accuracy of the diagnosis of inflammatory disorders and has clarified their immunologic basis, especially in the blistering disorders.

The classification of hereditary skin disorders generally has been based upon gross morphological, histological, and electron microscopic findings; however, because a skin disease may not always have a characteristic presentation, the specific diagnosis sometimes has been in doubt. Better understanding of the biochemical defects underlying hereditary skin disorders now allows these conditions to be diagnosed with more precision. One subset of the ichthyoses, a group of sometimes disabling genetic skin disorders, may thus be delineated from other members of the group, based on biochemical detection of a specific enzyme defect (reduced steroid sulfatase enzyme).

Distribution. The distribution of a rash depends on factors both intrinsic and extrinsic to the body. Mechanical factors (such as trauma, environmental agents, fungal or viral infections, and drugs) are among the most common extrinsic determinants of distribution. Environmental influences, such as sunburn and light-sensitive, drug-induced reactions, may also play a major role. Psoriasis and the rare hereditary blistering disorders collectively called epidermolysis bullosa owe their distributions to local trauma; lesions that show a predilection for the elbows, knees, and lower back are common in psoriasis, and those found in the hands, feet, knees, and mouth of children are indicative of epidermolysis bullosa. A lesion of an eruption that subsequently develops where a mechanical or other physical trauma was applied is termed an isomorphic reaction. Skin diseases in which isomorphic reactions are characteristic include lupus erythematosus (sunlight), psoriasis, lichen planus, and viral warts (mechanical trauma).

Factors

Intrinsic rather than extrinsic influences explain the characteristic systematic pattern of a number of rashes. Some rashes with a symmetrical and segmental distribution may owe their pattern to the segmental arrangement of the embryo. In other rashes, it is the distribution of the cutaneous nerve supply; for example, the pattern of the rash

of herpes zoster (shingles) is determined by the cutaneous distribution of the infected sensory nerve dorsal root ganglion. The blood supply to the skin has a characteristic anatomical distribution that influences the pattern of certain skin eruptions in which cutaneous vascular narrowing or blood stasis is a major feature.

Appearance. Skin diseases in which there is an overproduction of epidermal cells or a disorganization of their differentiation (development of their mature form and function) often show scaling. Simple benign hyperplasia (overgrowth) of the epidermis such as is commonly seen in infantile eczema often appears as lichenification, a term used to describe a thickening of the epidermis in which the normal surface markings of the skin are greatly exaggerated. Chronic benign or malignant proliferative dermatoses involving the epidermis often have a rough warty surface caused by overproduction by the epidermal cells of keratin.

Scaling

There are relatively few skin diseases in which inflammation, including responses to physical injury (such as sunburn), allergy, and infections (such as boils and cold sores), does not play a part. Even cancerous lesions of the skin frequently show some degree of inflammatory response. Inflammation is usually the result of the release of chemical mediators in the skin. These mediators include histamine, which is stored in a preformed state in the skin, and peptides (kinins) and fatty acids (prostaglandins and leukotrienes), which are formed enzymatically in response to injury. In some skin diseases inflammation is the major factor in the morphological appearance of the rash (for example, acute allergic contact dermatitis).

The most important features of inflammation include redness, caused by dilation of blood vessels; heat, caused by increased blood flow; swelling, caused by leakage of fluid from the small blood vessels; and pain or itching. In addition, the affected skin may feel indurated (hardened) because of the deposition of the coagulation protein fibrin and the infiltration by inflammatory blood cells (lymphocytes, histiocytes, and polymorphonuclear leukocytes). Medications designed to counteract inflammation in the skin may antagonize the effects of mediators (*e.g.*, antihistamines). Nonsteroidal anti-inflammatory drugs of the type effective in arthritis, including aspirin and indomethacin, have proved to be of little or no value in the treatment of inflammatory skin diseases.

Whealing reactions (hives, nettle rash, urticaria) constitute a special form of inflammation in which vascular changes predominate, with little or no inflammatory cellular reaction. Localized fluid accumulation (edema) causes the development of a short-lived wheal associated with intense itching. Its appearance frequently indicates an underlying allergic cause. Intense inflammation may occasionally lead to the formation of blisters, caused by the effects of enzymes released from inflammatory cells, from the resident cells of the skin, or from blood plasma components. These enzymes cause the breakdown of proteins responsible for the structural integrity of the skin. In some blistering (bullous) skin diseases (such as pemphigus), the development of large blisters is the predominant morphological feature.

Inflammatory diseases of the dermis often evoke a secondary proliferative and scaly response in the epidermis. Dermal inflammatory disorders may be acute, as in hemolytic (blood-cell destroying) streptococcal infections leading to cellulitis (diffuse inflammation of the connective tissues), or chronic and granulomatous, as in chronic cutaneous tuberculosis (lupus vulgaris). In the first instance the changes of acute inflammation discussed above are present but there is normally no epidermal change. In the second, the skin is hardened and thickened, and it has a brownish appearance under the microscope.

Pigmentation

The intrinsic colour of normal skin is pale yellow, but this colour is modified by pigments—both by melanin and by hemoglobin. The intensity of the brown hue conferred by melanin depends on the distribution of the melanin granules within the cells. All races have the same number of melanocytes, although melanin is produced and distributed through the epidermis more efficiently in blacks. Increased melanin pigmentation is a common reaction to prolonged inflammation of the skin. The intensity and shade of pink depend on the state of the cutaneous circulation. When blood vessels are dilated with increased blood flow, as in an inflammatory disorder, the skin is bright red. The vasodilation associated with stagnant blood flow, as in excessive cooling of the skin, gives the skin a purplish hue.

The predominant symptom of skin disease is itching. Although readily distinguishable from pain, itching appears to be transmitted along the same sensory neural pathways. There are no specialized sensory receptors for itching in the skin; both itching and pain are transduced by free nerve endings located at the dermo-epidermal junction. Although an itching sensation may result in healthy skin from a direct conversion of very light pressure (light stroking of the skin of the lips is a good example), in most skin diseases itching is caused by the release of pharmacological mediators, such as histamine. When itching occurs in normal-appearing skin, as is the case in liver or kidney disease, the itching is probably due to an abnormal accumulation of metabolic products in the skin.

HEREDITARY SKIN DISEASES

The formation of almost all components of the skin (for example, hair texture and colour and skin pigmentation and thickness) is under genetic control. A large number of common skin diseases also are directly or indirectly determined by a person's genotype (genetic constitution), but their expression may require an external influence or an altered hormonal milieu. The hereditary diseases psoriasis and atopic eczema are examples of skin disorders in which sunlight (as an extrinsic factor) or stress (as an intrinsic factor) activate the condition. Even when heredity has an immediate determining role, other factors may influence the expression of disease. The hereditary blood vessel diseases of the skin, for example, many of which are under direct genetic control, sometimes do not become evident until the hormonal changes of puberty create conditions optimal for disease expression.

Nevi

A common genetic abnormality is the nevus, often called a mole or birthmark. Nevi are due to primary abnormalities in the structure or number of skin cells. A local increase in the concentration of melanocytes is termed a melanocytic or pigmented nevus; an area of increased capillary concentration, a capillary nevus. In nevus anemicus, an area of skin is pale because of reduced blood flow, even though there is no evidence of a structural disorder. Although most nevi are benign, malignant transformation may cause melanocytic nevi.

If an abnormality is inherited as an autosomal dominant trait and one parent is affected, then, from the laws of Mendelian inheritance, each child has a 50 percent risk for the disease. Amniocentesis, often performed between the 12th and 20th weeks of pregnancy, entails little risk to the mother or fetus and makes it possible to diagnose prenatally severe disorders such as epidermolysis bullosa, a blistering and scarring disorder; albinism, or a generalized lack of pigment from the skin; and xeroderma pigmentosum, a precancerous condition in which sunlight-induced skin damage cannot be enzymatically corrected by the affected skin cells.

GENERALIZED SKIN DISEASES

Eczema and dermatitis. The terms eczema and dermatitis are often used interchangeably to denote an inflammatory process in the skin that involves the upper dermis and epidermis. The epidermis exhibits swelling of the keratinocytes and accumulation of fluid between them (spongiosis). In the severe form of spongiosis, blisters form within the epidermis. Childhood eczema in black children frequently is seen as a follicular eruption of pinhead-sized papules. In chronic forms of eczema or dermatitis the prominent changes are thickening of the epidermis and marked hyperkeratosis (thickening of the outer horny layer of the epidermis). These changes lead to lichenification (see above), roughening and scaling of the skin surface, and itching. The function of the horny layer as an impervious barrier may be seriously impaired, with two important consequences: loss of water from the skin leads

to desiccation of the horny layer, which in turn leads to cracking, increased scaling, and soreness; and loss of the barrier function causes increased absorption of medications applied to the surface of the skin. For example, the enhanced absorption of topically applied corticosteroids may cause toxic changes in the skin and in distant organs and tissues.

Types of dermatitis

Dermatitis is classified into several different types, including contact dermatitis, atopic dermatitis, and seborrheic dermatitis. Contact dermatitis may be further classified as allergic or nonallergic. Nonallergic contact dermatitis occurs in response to skin irritants, is common in industrial settings (occupational dermatitis), and usually affects the hands. Acids, alkalis, dirty oils, detergents, solvents, and even repeated exposure to water are among the numerous causes. Genetic predisposition undoubtedly plays a part, however, which explains why some workers, but not others, suffer from occupational dermatitis, despite equal exposure.

Allergic contact dermatitis is a less common cause of occupational skin disease but is frequently found among the general population. Like primary irritant contact dermatitis, it can be produced and studied under controlled conditions, and therefore more is known about the underlying pathogenic mechanisms. Allergic contact dermatitis occurs only in persons who have, after previous exposure, become sensitized to the offending antigen. Common antigens include nickel, chromium, rubber, and paraphenyline diamine. The dendritic Langerhans cells of the epidermis are responsible for recognizing the antigen, which is usually bound to a homologous protein or polypeptide. This information, conveyed to the local lymph glands via the lymphatic vessels, leads to the formation of specifically sensitized lymphocytes. On subsequent exposure to the offending antigen, these and other secondarily recruited cells release chemical mediators (lymphokines) that evoke dermatitis in the exposed skin. Sensitization usually persists, although it may decline with old age.

Allergic contact dermatitis is usually suspected from the distribution of the rash, which corresponds to the areas of skin exposed to the antigen. For example, red-tipped match contact allergic dermatitis is caused by phosphorous sesquisulfide released as a vapour following the striking of a match. In pipe and cigarette smokers who use this type of match, the area affected is the side of the face, explained by the smoker's habit of cupping the match and matchbox in the hands during the process of striking. The diagnosis of allergic contact dermatitis is confirmed by a patch test, in which minute concentrations of suspect antigens are placed on areas of the skin. An accurate diagnosis of allergic contact dermatitis is important because the condition can be cured by avoiding contact with the offending substance.

Atopic dermatitis, which affects a small number of infants, is one of several genetically linked disorders that include asthma, hay fever, and urticaria. This group of atopic diseases is characterized by sensitization of the skin to a wide range of common antigens. In addition to eczematous changes, persons with atopic dermatitis may also often have diminished, absent, or paradoxical cutaneous vascular reactions to vasodilating and vasoconstricting drugs; impaired immunity to fungal and viral infections; and cataracts in the lenses of the eyes. Although there is some controversy over the causes of atopic dermatitis, the role of genetics is undisputed. About 70 percent of patients have a family history of eczema, asthma, or hay fever. Most patients begin to suffer symptoms during the first six months of life, and there is evidence that ingestion of dairy products during this period may precipitate development of atopic dermatitis in a predisposed infant. There is no real evidence that food plays a significant role in the development of atopic dermatitis in older children and adults. The disease usually improves during the second decade of life, although it sometimes persists in adults and may even appear then for the first time.

Seborrheic dermatitis

Seborrheic dermatitis is a less common form of chronic dermatitis that characteristically affects the scalp and other hairy areas, the face, and flexural areas (groin, armpits, skin behind the ears, the cleft between the buttocks). It is frequently associated with infection of the skin by yeasts and bacteria, but a causal relationship with these organisms has not been established. There is no evidence of increased greasiness of the skin (seborrhea). Dandruff is a mild form of seborrheic dermatitis that affects most people at some time during their lives. The scaliness of the scalp associated with dandruff is caused by the intermittent shedding of dead stratum corneum cells, which in health are shed continuously.

Psoriasis. Although the mechanisms of inheritance are not clear, historically psoriasis, like atopic dermatitis, has been thought to be inherited as an autosomal dominant trait that pursues a chronically remitting and relapsing course. Psoriasis, however, is less common than atopic dermatitis, affecting about 2 percent of the population, and is both a proliferative and an inflammatory disorder. The most important feature of psoriasis is an accelerated proliferation of the keratinocytes, which results in the formation of raised scaly plaques in areas of injury, notably the knees, elbows, buttocks, and knuckles. Streptococcal tonsillitis frequently precedes relapses, especially in children, and the mechanism in these cases is probably immunologic. The isomorphic reaction (see above) is a feature of psoriasis. Persons with the disease may also have a characteristic form of arthritis that affects joints in the fingers and spine. Whether the increased rate of keratinocyte proliferation is due to increased activity of a growth-promoting factor or to lack of a growth inhibitor is unknown.

As an inflammatory disorder, psoriasis is characterized by nests of neutrophil leukocytes in the epidermis called microabscesses. Possible mediators that attract this cell type are leukotrienes and fragments derived from activated blood peptide components called complement. The skin blood vessels are also abnormal in psoriasis, with increased twisting. The relationship of this dermal change to the epidermal abnormalities is not clear. Although psoriasis is neither infectious nor contagious it is disfiguring.

Skin cancer. Skin cancer is one of the most common forms of cancer in humans and, although visible and therefore recognizable at an early stage, it results in significant mortality. The incidence and prevalence of skin cancer can be greatly reduced by simple preventive measures, such as avoidance of exposure to the Sun and to excessive ionizing radiation.

Primary skin cancers can be divided into two types: epidermal cancers, which originate in keratinocytes, melanocytes, or skin appendages (*e.g.*, sweat glands, the pilosebaceous apparatus); and dermal cancers, which originate in neural, vascular, mesenchymal, or lymphoreticular tissues. Malignant tumours arising from keratinocytes or melanocytes are the most frequent skin cancers.

Basal cell carcinoma

Basal cell carcinoma, rare in Negroes and Asians, is the most common malignant skin tumour in Caucasians. It arises from the undifferentiated basal keratinocytes of the epidermis. Although multiple basal cell carcinomas may develop early in life as an inherited trait (nevoid basal cell carcinoma syndrome, or as a complication of xeroderma pigmentosum), most arise in middle age and later. These cancers rarely metastasize but may be highly invasive locally; they are then known as rodent ulcers. The lesions occur in fair-skinned persons and on areas of skin that receive the greatest exposure to sunlight. Treatment with inorganic arsenical drugs and exposure to ionizing radiation (X rays, radium) may also contribute to some cases. Avoidance of unnecessary sunlight and careful control of ionizing radiation significantly lowers the incidence of basal cell carcinoma. Although metastases are rare, the cancer may spread locally and invade surrounding tissues. When this occurs, treatment may be difficult and lengthy.

Squamous cell carcinoma is less common than basal cell carcinoma but has a higher rate of metastasis. It is common in children with xeroderma pigmentosum, who are unable to repair DNA damage caused by ultraviolet irradiation. In most persons this inability is due to the deficiency of an endonuclease enzyme. Incomplete repair of damaged DNA causes mutations that appear as basal or squamous cell carcinomas, malignant melanomas, and keratoacanthomas.

In adults, squamous cell carcinoma rarely occurs in the absence of an external cause. Protracted exposure to sunlight is the usual cause, but chronic scarring from burns, as well as reactions to vaccinations, radiation dermatitis, and chronic ulceration, may contribute to some cases. Squamous cell carcinoma is also an occupational hazard, as was noted at the end of the 19th century in regard to chimney sweeps who contracted cancer after exposure to tars. Tar-induced squamous cell carcinoma occurs today in workers who distill tar vapour in the manufacture of coal gas and in machinery operators whose clothes and skin become soaked in mineral oil.

Because of the high rate of metastasis of squamous cell carcinomas, early diagnosis is important, especially in a middle-aged or elderly person with a skin ulcer that fails to heal. Skin lesions that precede the development of squamous cell carcinoma include white patches in the mucous membranes of the mouth, genitalia, or anus; warty lesions called keratoses (which are especially common after chronic exposure to the Sun, when they are called solar keratoses); and the lesions of Bowen's disease—persistent red scaly plaques that on microscopic examination are found to contain grossly abnormal keratinocytes. When squamous cell carcinoma follows Bowen's disease, there is often a history of treatment with an inorganic arsenical drug.

Malignant melanoma

In Western countries, the mortality from the skin cancer malignant melanoma is increasing by about 4 percent per year. This type of skin cancer arises from the melanocytes of the skin, and the tumour is therefore often, but not invariably, pigmented with melanin. In adults malignant melanoma arises either as a new lesion or as a change in a benign pigmented mole. Malignant melanoma metastasizes frequently, and excision of the tumour together with a collar of surrounding healthy skin is curative if done early.

Primary cancers arising in the dermis are much less common than epidermal malignant tumours. Mycosis fungoides is a malignant tumour of the T lymphocytes of the dermis. Despite the name, fungal infection does not cause the cancer. Mycosis fungoides (which is rare in children) is ultimately fatal, but the tumour grows slowly enough that many patients die of unrelated causes.

Extrinsic causes of dermal cancers are rare. An exception is the malignant cutaneous vascular tumour called Kaposi's sarcoma. Although there are many varieties of Kaposi's sarcoma, the development of one particular form is a common terminal event in patients with acquired immune deficiency syndrome, and the tumour may therefore result from infection by a retrovirus known as the human immunodeficiency virus (HIV).

Skin infections and infestations. Healthy skin harbours a resident, harmless bacterial population that includes Micrococcaceae, Propionibacteriaceae, and aerobic diphtheroids. In addition, pathogenic strains of staphylococci may inhabit the skin of healthy persons, who then act as carriers. These strains are often resistant to antibiotics, so that carriers pose a serious health hazard to those with diminished resistance to infection, such as newborn infants and elderly surgical patients. Most infections by resistant organisms occur nosocomially, or in hospitals. Although local measures, such as cleansing of the involved skin, are often effective for minor skin infections, serious infections require antibiotics.

Bacterial infections

Signs of bacterial infection appear after the organisms have been introduced into the dermis. Some organisms, such as staphylococci and streptococci, produce a pustular infection (impetigo, boils) in which the main features are acute inflammation and the accumulation of large numbers of white blood cells as pus. Other organisms, including *Mycobacterium tuberculosis* and *Treponema pallidum* (the spirochete that causes syphilis), may cause more chronic inflammatory changes without pus but involving a characteristic arrangement of mononuclear inflammatory cells called histiocytes. The term granulomatous is used to describe this kind of cutaneous reaction to infection. Leprosy is a cutaneous bacterial granulomatous disease in which the causative organism, *Mycobacterium leprae,* resides in the neural tissue in the skin, producing the characteristic features of nerve thickening and anesthesia. Despite its bacterial origin and popular reputation, leprosy is minimally infectious, and isolation of affected persons is rarely justifiable.

A number of different viral species are epidermotropic; that is, they invade the epidermis, either from the skin surface through a minor abrasion, as in viral warts, or from the bloodstream (viremia), as in varicella (chickenpox), or through the peripheral sensory nerves, as in herpes zoster (shingles). The human wart virus causes epidermal cellular proliferation and hyperkeratosis. When it invades the genital skin and mucous membranes it produces moist, exuberant, highly vascular warts called condylomata acuminata. These warts are transmitted through sexual contact and may become cancerous. By contrast, common viral warts of the hands, feet, and other non-mucosal surfaces are not sexually transmitted and rarely become cancerous. Viral warts on non-mucosal surfaces occur in almost all children, although most disappear spontaneously with the development of acquired immunity.

Viral infections

Herpes simplex (cold sores, fever blisters) and herpes zoster (shingles) are two epidermal viral infections that produce blisters within the epidermis. The severity of these infections is influenced by the state of the person's immune system; they are more severe in injured persons, in the elderly, and in debilitated patients, especially those with cancer of the lymphoid system. Herpes zoster (shingles) and varicella (chickenpox) are caused by the same virus, and patients with shingles have previously had chickenpox. The virus remains dormant in the sensory nerves and is later reactivated, either spontaneously or following the impairment of immune defense mechanisms. The virus, by translocating along the nerve branches, invades the epidermis; the distribution of the ensuing vesicular rash, which is painful, is confined to the cutaneous distribution of the same sensory nerve.

Fungal infection is a common cause of chronic skin eruption. Several species of dermatophyte fungi may live on the dead horny layer of the skin. The inflammatory changes they produce are partly due to irritant products of the fungus, which diffuse into the skin, and partly to an immunologic reaction by the host in an attempt to eliminate the fungus. Yeasts, of which *Candida albicans* is the most common, are also a cause of chronic skin or mucous membrane infection. In patients receiving immunosuppressive drugs for organ transplantation, yeast infections may become systemic, and both yeast and dermatophyte infections may be extensive, persistent, and unresponsive to drug treatment. The availability of systemic antifungal drugs, including griseofulvin and the broad-spectrum imidazole group, has revolutionized the treatment of these disorders, but many patients with both minor and serious fungal infections remain, for various reasons, resistant to drug treatment.

Skin infestations are frequent in persons living or working in overcrowded, unhygienic conditions. Pediculosis (crabs, lice, nits), which affects hairy areas, is diagnosed by identifying the egg capsules (nits) that are cemented to the hair shaft. Lice may also be visible near the base of the hair. Scalp, axillary, or pubic hair may be affected. Scabies, which is caused by the mite *Sarcoptes scabiei,* is usually acquired through close personal contact, especially sexual contact. It affects all areas of the body except the soles of the feet, head, and neck (in infants these areas are also involved) and causes an itchy eruption that is largely an allergic reaction to the products of the mites. Although most persons develop an immunologic reaction to scabies, acquired immunity is poor or nonexistent, and recurring attacks are common. The condition is treated with benzyl benzoate, and all persons who have had contact with the infected individual must be treated, whether symptomatic or not, because of the high rate of reinfestation.

Urticaria (hives). The skin blood vessels can also show acute, short-lived reactions. Urticaria features an area of central redness, on which is superimposed an irregular wheal, caused by local edema, and surrounded by a bright pink flare. The wheals are usually multiple and remain visible for 30 to 45 minutes. The reaction is due to release of histamine from cellular stores within the skin and is

Common causes of hives

usually accompanied by itching. Common causes include allergies to shellfish, strawberries, and nuts or to drugs such as penicillin; but physical factors such as cold, exercise, and sunlight may also produce the response. Since histamine is an important causative agent in urticaria, most cases respond to antihistamine treatment.

LOCALIZED SKIN DISEASES

Pigments. An increase in melanin pigmentation may be caused by an increased density of melanocytes, by abnormal packaging of melanin, or by increased melanin production. Pigmented birthmarks usually reflect local increases in melanocyte numbers, but in certain rare congenital pigmentary disorders, such as von Recklinghausen's neurofibromatosis, there is abnormal packaging of melanin within the melanocytes. Pigment production in the skin is regulated by a pituitary peptide hormone, melanocyte-stimulating hormone, and the increase in melanin pigmentation seen with pituitary tumours may reflect overproduction of this hormone by the pituitary.

Both suntans and postinflammatory pigmentation result from the overproduction of melanin by melanocytes. In suntans melanin overproduction occurs in response to ultraviolet light and protects the skin against sunburn and the carcinogenic actions of ultraviolet rays. Postinflammatory pigmentation follows a number of inflammatory skin disorders, including chronic dermatitis, acne vulgaris, lichen planus, and drug reactions. It is more common in dark-skinned than in fair-skinned persons. In suntans and postinflammatory pigmentation there is usually no increase in the number of melanocytes.

Loss of melanin pigmentation may be caused by the absence of melanocytes, as in vitiligo; reduced or absent synthesis of melanin by melanocytes, as in albinism and phenylketonuria; abnormal packaging of melanin in melanosomes, as in the Chediak-Higashi syndrome; or insufficient transfer of melanosomes to keratinocytes, as in hypopigmentation secondary to atopic dermatitis or psoriasis. Vitiligo is a common disorder of pigmentation that results in the widespread appearance of depigmented patches, notably around the mouth, anogenital area, eyelids, elbows, knees, and backs of the hands, due to an absence of melanocytes in these areas. Vitiligo is usually a slowly progressive disorder that is probably the result of abnormal immunologic reactions against constituents of the body's own cells (autoimmunity).

Certain chemicals found in plants, the psoralens, if taken orally or applied to the skin enhance the ability of ultraviolet light to induce pigmentation. Although rarely successful, treatment with psoralens and ultraviolet radiation has restored pigmentation. Persons with vitiligo should avoid sunlight, which accentuates the contrast between normal and depigmented skin.

Collagen

Connective tissues. Collagen is the major structural protein of skin and is responsible for its tensile strength, elasticity, and pliability. It is synthesized in the dermis by fibroblasts. Scarring is caused by excess production of collagen during healing. When the collagenous proliferation is extensive, a hypertrophic scar, called a keloid, results.

There are at least five types of collagen and numerous inherited disorders of collagen synthesis. The best known of the inherited disorders is the Ehlers-Danlos syndrome, which includes at least seven varieties of connective tissue defects. Most persons with Ehlers-Danlos syndrome have increased joint mobility and fragile skin, and they bruise easily. Depending on the nature of the defect in collagen synthesis, patients may also have spinal deformities, ocular defects, and ruptures of major blood vessels.

The connective tissue of the skin may rupture after stretching, even in healthy persons, forming purple linear discolorations. Because of the defect in the continuity of the dermal connective tissue, these striae are soft to the touch. Initially livid, after several months the striae become ivory white and firm because of the formation of scar tissue. Rapid growth during adolescence may cause striae to form on the thighs, buttocks, lower trunk, or shoulders. During pregnancy striae form on the abdomen as the elastic tissue stretches and weakens. Striae may also follow treatment with corticosteroid drugs.

The skin connective tissue is affected in a group of inflammatory disorders collectively termed the autoimmune connective tissue diseases. These diseases, which include systemic lupus erythematosus, dermatomyositis, polyarteritis nodosa, and systemic sclerosis, are characterized by the involvement of more than one organ or system, the presence in the serum of immunoglobulin autoantibodies that react with human tissue or organ components, and inflammatory damage to blood vessels of the skin and other organs. Systemic sclerosis causes hardening of the skin (scleroderma) due to an increase in the connective tissue of the dermis and marked tethering of the dermal connective tissue to subcutaneous tissues. The process is not confined to the skin, and the cause is not known, although an autoimmune basis is thought to be involved because of the associated immunologic abnormalities. There is evidence that the skin fibroblasts of patients with scleroderma produce more collagen than the fibroblasts of healthy persons. It has also been suggested that the connective tissue changes may be caused by vascular abnormalities. No satisfactory treatment is known, although improvement of the circulation with vasodilating drugs may produce temporary relief.

Blood vessels. Blood circulation in the skin serves both to supply nutrients and as a means of regulating temperature. The structural and functional organization of the skin's vascular system is complex, and there are major regional variations. Skin blood vessel disorders may arise from an increase in the viscosity of blood contents or from abnormalities of the vessels themselves. Increased viscosity may be due to an overabundance of red blood cells (polycythemia) or an increase in one or more fractions of the protein content of the plasma; hyperglobulinemia is an example of the latter. In functional disorders of the blood vessels, nervous control of the vessels may be disturbed, leading to vascular spasm or dilatation (flushing). In Raynaud's phenomenon, the vascular spasm is severe, affecting the extremities and leading to attacks of cold, white fingers. Milder degrees of spasm, as well as increases in blood viscosity, may cause a purple discoloration of the skin (cyanosis), which may assume a reticulate pattern (livedo reticularis).

Etiology

Damage to the vessel walls themselves may perturb skin circulation. Causes include atherosclerosis resulting from age-related degenerative changes, disturbance of lipid (fat) metabolism, and inflammation of the vessel wall. Inflammation is characteristic of the autoimmune connective tissue diseases (see above). When disease of the blood vessels is severe, lack of blood in the affected areas may cause skin ulcers. Chilblains (pernio) occur when the skin is persistently chilled, leading to protracted vessel spasm, cyanosis, coldness, and ultimately ulceration of the affected area.

Hair and pilosebaceous follicles. Hair is of little functional value in humans. Many systemic diseases, however, alter the appearance and growth patterns of hair. In diseases of malnutrition, such as kwashiorkor, the scalp hair becomes reddish brown, sparse, and brittle. Acute protein starvation may lead to the cessation of hair growth and constriction of the hair shafts. Chronic iron deficiency may cause diffuse hair loss (alopecia). Since the continuous hair growth of healthy persons involves the cells of the hair root in exuberant mitotic activity, hair is especially vulnerable to the cytotoxic action of drugs. Acute hair loss is an early side effect of the cytotoxic drugs used in cancer chemotherapy.

Kwashiorkor

Acute diffuse hair loss (telogen effluvium) may also occur after severe fevers and childbirth. It appears to be caused by an abrupt reduction in the proportion of actively growing hairs, and after a few months the hair regrows normally without treatment. The hair follicles may become inflamed, forming small pustules, which, in severe cases, result in bald, scarred areas with destroyed follicles.

Both pattern baldness in men and hirsutism in women are under the control of the steroid sex hormones. Male pattern baldness occurs to some extent in almost all men. It may start any time after puberty and is distinguished from other forms of alopecia by the pattern of frontal and temporal hair recession and thinning over the crown. On the affected areas of the scalp a downy hair called vellus

replaces the former long, sturdy, pigmented terminal hair. Almost as common is the reverse process, in which hair that was formerly vellus alters to the long pigmented terminal type and becomes more visible. When this occurs in the areas of the female body sensitive to male sex hormones, and especially when it follows the adult male pattern of hair distribution, it is known as hirsutism. Some affected women have endocrinologic abnormalities, including ovarian cystic disease or overactive adrenal glands, that elevate the levels of androgen (male sex hormones). These women may also have menstrual irregularities or be infertile. Hormonal treatment or, in less extensively hirsute women, electrolytic depilation may be helpful.

Among persons with curly hair, and especially among blacks, cut ends of hair may curve and bury themselves in the skin, causing acute pustular reactions. These ingrowing hairs, or pili incarnati, affect 70 percent of black men who are clean-shaven.

Acne. The hair follicle from which the hair shaft emerges serves as a duct for conducting sebum, the oily product of the sebaceous gland, to the skin surface. The hair follicle and sebaceous gland together form the pilosebaceous unit. Sebum secretion is under hormonal control and increases substantially at puberty, then continues at an increased rate into advanced adult life. An important disease of the pilosebaceous unit is acne vulgaris, which occurs on the face, shoulders, and upper torso of adolescents. The hallmark of acne vulgaris is the comedo, commonly known as the blackhead. The comedo consists of a mixture of keratinous debris and sebum that lodges in the mouth of the pilosebaceous duct. Affected areas of the skin also exhibit inflamed papules, pustules, and cysts. The inflammation is caused by leakage of sebum and keratin debris outside the distended pilosebaceous duct. The bacillus *Propionibacterium acnes,* which populates the lesions, may also contribute indirectly to the inflammation by metabolizing the sebum to produce irritant fatty acids.

Acne vulgaris

Eruptions can be brought on by contact with dirty oils or tars and halogenated hydrocarbons. Chloracne, caused by exposure to chlorine compounds, may develop in workers involved in the manufacture of cables, insecticides, fungicides, and herbicides. Industrial accidents involving the release of tetrachlorodibenzodioxin vapour have caused severe community outbreaks of chloracne. Acne rosacea, an acne of middle age that exhibits nodular swelling of tissues in the face, is a disease that occurs rarely among blacks.

Sweat glands. Most sweat glands in humans are eccrine (*i.e.,* they secrete outwardly) and are under the control of the autonomic nervous system. Eccrine sweat glands are distributed uniformly over the body and function mainly in controlling temperature, although on the hands and feet they assist grip. Inability to secrete adequate sweat (anhidrosis) is usually a congenital abnormality. Hyperhidrosis is the abnormal excessive secretion of sweat, usually on the palms and soles and in the axillae. Emotional stress normally stimulates sweating in these areas, but in hyperhidrosis excessive sweating may follow minor stimuli or no obvious stimulus at all. Hyperhidrosis may be an occupational problem for those who handle books, papers, or metallic objects that can rust.

Most serious disorders of the eccrine sweat glands result from the retention of sweat. Prickly heat (miliaria) occurs in persons living in a hot, humid environment and is due to sweat retention brought on by the combination of increased sweat production and blockage of the duct from hydration of the surrounding horny layer of skin. The gland continues to secrete, and the pressure may rupture the sweat duct at its junction with the epidermis. In heatstroke, another disorder of the eccrine sweat glands, the glands are exhausted and unable to secrete sweat. Hyperpyrexia, an excessive rise in body temperature, may ensue and is sometimes fatal. The most common disorder of the eccrine glands, however, is excessive sweating of the palms, soles, armpits, and face. Emotional stress normally stimulates sweating in these areas, but emotional hyperhidrosis (increased sweating) occurs when excessive sweating follows minor or no obvious stimuli.

Apocrine sweat glands, which are normally limited to the armpits, perineum, and genitalia, differ anatomically and physiologically from eccrine sweat glands. In the apocrine glands the secretions are concentrated at the free end of the cell, which is cast off along with the secretory products. Apocrine secretion is oily, opalescent, and odourless when secreted, but acquires an offensive smell when it mingles with the bacteria of the skin. The actions of deodorants and antiperspirants are based mainly on an antibacterial effect, on mechanical blockade of the apocrine gland pores, or both.

Nails. The most common causes of diseased nails are chronic paronychia—infection of the soft tissue of the fingers between the lateral edges of the nail plates and the lateral nail folds—fungus infections, trauma, psoriasis, impaired circulation, and dermatitis. Chronic paronychia is an occupational hazard of dishwashers, bar workers, hairdressers, and vegetable preparers. When the cuticle is lost, water, bacteria, and yeasts seep under the nail fold and cause inflammation. The lateral nail folds extrude beads of pus when they are squeezed. The infection is commonly caused by the yeast *Candida albicans,* and when this organism is identified, infection elsewhere in the body should be sought.

Like the hair, the nails may be useful indicators of skin diseases and of internal disorders. Psoriasis causes pitting on the surface of the nails and an increase in their growth rate. Lichen planus causes a characteristic scarring of the posterior nail fold, leading to fusion of the posterior nail fold with the nail plate. Club-shaped deformity of the nail plate is associated with chronic chest disease and cyanotic congenital heart disease. A reduction in the rate of nail growth, a yellow discoloration of the nail plate, and a smooth curvature to the nails are all features of the yellow nails syndrome, a rare hereditary condition in which the lymphatic drainage system of the body is defective. In chronic anemia the nail plate may become concave (koilonychia). Transverse depressions of the nail plates called Beau's lines result from temporary interruption of nail growth and are seen in a number of acute illnesses, including coronary thrombosis, pneumonia, and severe injuries. Various forms of interference with the blood supply may affect the nail matrix and produce irregular growth of the nails. Drug treatment may cause shedding of the nails. Photo-onycholysis—destruction of the nails from exposure to sunlight—occurs in patients taking photosensitizing drugs such as certain broad-spectrum antibiotics.

METABOLIC DISORDERS

Metabolic disorders may result in the deposition of excess materials in the dermis and thus cause disease. Uric-acid salts are deposited in gout, calcium salts in calcinosis, lipids in xanthomatosis, an abnormal protein in amyloidosis, mucin in myxedema, and porphyrins in porphyria. The appearances of the skin are usually sufficiently characteristic to be diagnostic.

A metabolic disorder that dramatically affects the skin is porphyria, an enzyme defect that causes hemoglobin precursors, or porphyrins, to accumulate in the skin. Porphyrins are abnormally sensitive to long wavelength ultraviolet light. The accumulation of porphyrins results in severe sun sensitivity, with blistering, increased skin fragility, and scarring on the areas exposed to light. The most common form, porphyria cutanea tarda, is usually caused by a combination of a hereditary enzyme defect and chronic alcoholism.

AGING AND THE SKIN

More than one-third of persons over 65 years of age have skin problems. Prevalent in the elderly are such common skin conditions as fungal infections, excessive dryness, various benign tumours, seborrheic dermatitis, seborrheic warts, solar keratoses, and hirsutism. Many age-related skin disorders previously viewed as inevitable accompaniments of advancing age are now known to be remediable.

Skin may age much faster than the rest of the body because of environmental effects, especially sunlight. A fair-skinned woman who habitually sunbathes, for example, may have a senile skin at age 40, whereas her coeval who spends most of her time indoors may not. The predominant features of the aging skin include skin laxity lead-

ing to wrinkles, dryness, itching, increased pigmentation, and telangiectasia (*i.e.,* visible dilation of the skin blood vessels). Moles, large seborrheic warts, and small hemangiomas (de Morgan's spots) are more common among whites, while small black warts (dermatosis papulosa nigra) of the upper chest and face and tiny white spots (idiopathic guttate hypomelanosis) are more common among blacks.

There is no evidence that the rate of reproduction of epidermal cells slows with age. There are, however, marked degenerative changes in the connective tissue, both elastic and collagenous, that cause wrinkling and loss of elasticity. So-called rejuvenating cosmetic skin preparations are ineffective, although simple emollients may provide temporary suppleness. Avoiding excessive exposure to sunlight and using sunblocks, if adopted early in life, should retard the aging process and reduce the incidence of skin cancers. None of these treatments, however, does more than slow the onset of senescence in the skin, and those who survive into the 10th decade of life have age-related changes that are largely independent of their earlier life-styles.

Human Intelligence

Much of the excitement among investigators in the field of intelligence derives from their trying to determine exactly what intelligence is. Different investigators have emphasized different aspects of intelligence in their definitions. For example, in a 1921 symposium on the definition of intelligence, the American psychologist Lewis M. Terman emphasized the ability to think abstractly, while another American psychologist, Edward L. Thorndike, emphasized learning and the ability to give good responses to questions. In a similar 1986 symposium, however, psychologists generally agreed on the importance of adaptation to the environment as the key to understanding both what intelligence is and what it does. Such adaptation may occur in a variety of environmental situations. For example, a student in school learns the material that is required to pass or do well in a course; a physician treating a patient with an unfamiliar disease adapts by learning about the disease; an artist reworks a painting in order to make it convey a more harmonious impression. For the most part, adapting involves making a change in oneself in order to cope more effectively, but sometimes effective adaptation involves either changing the environment or finding a new environment altogether.

Effective adaptation draws upon a number of cognitive processes, such as perception, learning, memory, reasoning, and problem solving. The main trend in defining intelligence, then, is that it is not itself a cognitive or mental process, but rather a selective combination of these processes purposively directed toward effective adaptation to the environment. For example, the physician noted above learning about a new disease adapts by perceiving material on the disease in medical literature, learning what the material contains, remembering crucial aspects of it that are needed to treat the patient, and then reasoning to solve the problem of how to apply the information to the needs of the patient. Intelligence, in sum, has come to be regarded as not a single ability but an effective drawing together of many abilities. This has not always been obvious to investigators of the subject, however, and, indeed, much of the history of the field revolves around arguments regarding the nature and abilities that constitute intelligence.

THEORIES OF INTELLIGENCE

Theories of intelligence, as is the case with most scientific theories, have evolved through a succession of paradigms that have been put forward to clarify our understanding of the idea. The major paradigms have been those of psychological measurement (often called psychometrics); cognitive psychology, which concerns itself with the mental processes by which the mind functions; the merger of cognitive psychology with contextualism (the interaction of the environment and processes of the mind); and biologic science, which considers the neural bases of intelligence.

Psychometric theories. Psychometric theories have gen-

erally sought to understand the structure of intelligence: What form does it take, and what are its parts, if any? Such theories have generally been based on and tested by the use of data obtained from paper-and-pencil tests of mental abilities that include analogies (*e.g., lawyer* : *client* :: *doctor* : ?), classifications (*e.g.,* Which word does not belong with the others? *robin, sparrow, chicken, bluejay*), and series completions (*e.g.,* What number comes next in the following series? 3, 6, 10, 15, 21, ?).

The psychological model for psychometric theories

Underlying the psychometric theories is a psychological model according to which intelligence is a composite of abilities measured by mental tests. This model is often quantified by assuming that each test score is a weighted linear composite of scores on the underlying abilities. For example, performance on a number-series test might be a weighted composite of number, reasoning, and possibly memory abilities for a complex series. Because the mathematical model is additive, it assumes that less of one ability can be compensated for by more of another ability in test performance. For instance, two people could gain equivalent scores on a number-series test if a deficiency in number ability in the one person relative to the other was compensated for by superiority in reasoning ability.

The first of the major psychometric theories was that of the British psychologist Charles E. Spearman, who published his first major article on intelligence in 1904. Spearman noticed what, at the turn of the century, seemed like a peculiar fact: People who did well on one mental ability test tended to do well on the others, and people who did not do well on one of them also tended not to do well on the others. Spearman devised a technique for statistical analysis, which he called factor analysis, that examines patterns of individual differences in test scores and is said to provide an analysis of the underlying sources of these individual differences. Spearman's factor analyses of test data suggested to him that just two kinds of factors underlie all individual differences in test scores. The first and more important factor Spearman labeled the "general factor," or *g*, which is said to pervade performance on all tasks requiring intelligence. In other words, regardless of the task, if it requires intelligence, it requires *g*. The second factor is specifically related to each particular test. But what, exactly, is *g*? After all, calling something a general factor is not the same as understanding what it is. Spearman did not know exactly what the general factor might be, but he proposed in 1927 that it might be something he labeled "mental energy."

The concept of *g*

The American psychologist L.L. Thurstone disagreed not only with Spearman's theory but also with his isolation of a single factor of general intelligence. Thurstone argued that the appearance of just a single factor was an artifact of the way Spearman did his factor analysis and that if the analysis were done in a different and more appropriate way, seven factors would appear, which Thurstone referred to as the "primary mental abilities." The seven primary mental abilities identified by Thurstone were verbal comprehension (as involved in the knowledge of vocabulary and in reading); verbal fluency (as involved in writing and in producing words); number (as involved in solving fairly simple numerical computation and arithmetical reasoning problems); spatial visualization (as involved in mentally visualizing and manipulating objects, as is required to fit a set of suitcases into an automobile trunk); inductive reasoning (as involved in completing a number series or in predicting the future based upon past experience); memory (as involved in remembering people's names or faces); and perceptual speed (as involved in rapidly proofreading to discover typographical errors in a typed text).

It is a possibility, of course, that Spearman was right and Thurstone was wrong, or vice versa. Other psychologists, however, such as the Canadian Philip E. Vernon and the American Raymond B. Cattell, suggested another possibility—that both were right in some sense. In the view of Vernon and Cattell, abilities are hierarchical. At the top of the hierarchy is g, or general ability. But below g in the hierarchy are successive levels of gradually narrowing abilities, ending with Spearman's specific abilities. Cattell, for example, suggested in a 1971 work that general ability can be subdivided into two further kinds of abilities, fluid and crystallized. Fluid abilities are the reasoning and problem-solving abilities measured by tests such as the analogies, classifications, and series completions described above. Crystallized abilities can be said to derive from fluid abilities and be viewed as their products, which would include vocabulary, general information, and knowledge about specific fields. John L. Horn, an American psychologist, suggested that crystallized ability more or less increases over the life span, whereas fluid ability increases in the earlier years and decreases in the later ones.

Fluid and crystallized abilities

Most psychologists agreed that a broader subdivision of abilities was needed than was provided by Spearman, but not all of these agreed that the subdivision should be hierarchical. J.P. Guilford, an American psychologist, proposed a structure-of-intellect theory, which in its earlier versions postulated 120 abilities. For example, in an influential 1967 work Guilford argued that abilities can be divided into five kinds of operations, four kinds of contents, and six kinds of products. These various facets of intelligence combine multiplicatively, for a total of $5 \times 4 \times 6$, or 120 separate abilities. An example of such an ability would be cognition (operation) of semantic (content) relations (product), which would be involved in recognizing the relation between *lawyer* and *client* in the analogy problem, *lawyer* : *client* :: *doctor* : ?. In 1984 Guilford increased the number of abilities proposed by his theory, raising the total to 150.

It had become apparent that there were serious problems with psychometric theories, not just individually but as a basic approach to the question. For one thing, the number of abilities seemed to be getting out of hand. A movement that had started by postulating one important ability had come, in one of its major manifestations, to postulating 150. Because parsimony is usually regarded as one of several desirable features of a scientific theory, this number caused some disturbance. For another thing, the psychometricians, as practitioners of factor analysis were called, didn't seem to have any strong scientific means of resolving their differences. Any method that could support so many theories seemed somewhat suspect, at least in the use to which it was being put. Most significant, however, was the seeming inability of psychometric theories to say anything substantial about the processes underlying intelligence. It is one thing to discuss "general ability" or "fluid ability," but quite another to describe just what is happening in people's minds when they are exercising the ability in question. The cognitive psychologists proposed a solution to these problems, which was to study directly the mental processes underlying intelligence and, perhaps, relate them to the factors of intelligence proposed by the psychometricians.

Cognitive theories. During the era of psychometric theories, the study of intelligence was dominated by those investigating individual differences in people's test scores. In an address to the American Psychological Association in 1957, the American psychologist Lee Cronbach, a leader in the testing field, decried the fact that some psychologists study individual differences and others study commonalities in human behaviour but never do the two meet. In Cronbach's address his plea to unite the "two disciplines of scientific psychology" led, in part, to the development of cognitive theories of intelligence and of the underlying processes posited by these theories.

Dangers in evaluating test scores

Without an understanding of the processes underlying intelligence it is possible to come to misleading, if not wrong, conclusions when evaluating overall test scores or other assessments of performance. Suppose, for example, that a student does poorly on the type of verbal analogies questions commonly found on psychometric tests. A possible conclusion is that the student does not reason well. An equally plausible interpretation, however, is that the student does not understand the words or is unable to read them in the first place. A student seeing the analogy, *audacious* : *pusillanimous* :: *mitigate* : ?, might be unable to solve it because of a lack of reasoning ability, but a more likely possibility is that the student does not know the meanings of the words. A cognitive analysis enables the interpreter of the test score to determine both the degree to which the poor score is due to low reasoning

ability and the degree to which it is a result of not understanding the words. It is important to distinguish between the two interpretations of the low score, because they have different implications for understanding the intelligence of the student. A student might be an excellent reasoner but have only a modest vocabulary, or vice versa.

Mental processes and representation

Underlying most cognitive approaches to intelligence is the assumption that intelligence comprises a set of mental representations (*e.g.,* propositions, images) of information and a set of processes that can operate on the mental representations. A more intelligent person is assumed to represent information better and, in general, to operate more quickly on these representations than does a less intelligent person. Researchers have sought to measure the speed of various types of thinking. Through mathematical modeling, they divide the overall time required to perform a task into the constituent times needed to execute each mental process. Usually, they assume that these processes are executed serially—one after another—and, hence, that the processing times are additive. But some investigators allow for partially or even completely parallel processing, in which case more than one process is assumed to be executed at the same time. Regardless of the type of model used, the fundamental unit of analysis is the same: a mental process acting upon a mental representation.

A number of cognitive theories of intelligence have evolved. Among them is that of the American psychologists Earl B. Hunt, Nancy Frost, and Clifford E. Lunneborg, who in 1973 showed one way in which psychometrics and cognitive modeling could be combined. Instead of starting with conventional psychometric tests, they began with tasks that experimental psychologists were using in their laboratories to study the basic phenomena of cognition, such as perception, learning, and memory. They showed that individual differences in these tasks, which had never before been taken seriously, were in fact related (although rather weakly) to patterns of individual differences in psychometric intelligence test scores. These results, they argued, showed that the basic cognitive processes might be the building blocks of intelligence.

Following is an example of the kind of task Hunt and his colleagues studied in their research. The experimental subject is shown a pair of letters, such as "A A," "A a," or "A b." The subject's task is to respond as quickly as possible to one of two questions: "Are the two letters the same physically?" or "Are the two letters the same only in name?" In the first pair the letters are the same physically, and in the second pair the letters are the same only in name.

The psychologists hypothesized that a critical ability underlying intelligence is that of rapidly retrieving lexical information, such as letter names, from memory. Hence,

Computation of reaction time to test questions

they were interested in the time needed to react to the question about letter names. They subtracted the reaction time to the question about physical match from the reaction time to the question about name match in order to isolate and set aside the time required for sheer speed of reading letters and pushing buttons on a computer. The critical finding was that the score differences seemed to predict psychometric test scores, especially those on tests of verbal ability, such as verbal analogies and reading comprehension. The testing group concluded that verbally facile people are those who have the underlying ability to absorb and then retrieve from memory large amounts of verbal information in short amounts of time. The time factor was the significant development here.

A few years later, the American psychologist Robert J. Sternberg suggested an alternative approach to studying the cognitive processes underlying human intelligence. He argued that Hunt and his colleagues had found only a weak relation between basic cognitive tasks and psychometric test scores because the tasks they were using were at too low a level. Although low-level cognitive processes may be involved in intelligence, according to Sternberg they are peripheral rather than central. He proposed that psychologists should study the tasks found on the intelligence tests and then determine the mental processes and strategies that people use to perform those tasks.

Sternberg began his study with the analogies tasks such as *lawyer* : *client* :: *doctor* : ?. He determined that the solution to such analogies requires a set of component cognitive processes: namely, encoding of the analogy terms (*e.g.,* retrieving from memory attributes of the terms *lawyer, client,* and so on), inferring the relation between the first two terms of the analogy (*e.g.,* figuring out that a lawyer provides professional services to a client), mapping this relation to the second half of the analogy (*e.g.,* figuring out that both a lawyer and a doctor provide professional services), applying this relation to generate a completion (*e.g.,* realizing that the person to whom a doctor provides professional services is a patient), and then responding. Using techniques of mathematical modeling applied to reaction-time data, Sternberg proceeded to isolate the components of information processing. He determined whether or not each experimental subject did, indeed, use these processes, how the processes were combined, how long each process took, and how susceptible each process was to error. Sternberg later showed that the same cognitive processes are involved in a wide variety of intellectual tasks, and he suggested that these and other related processes underlie scores on intelligence tests.

Sternberg's use of analogies

Other cognitive psychologists have pursued different paths in the study of human intelligence, including the building of computer models of human cognition. Two leaders in this field have been the American psychologists Allen Newell and Herbert A. Simon. In the late 1950s and early 1960s they worked with a computer expert, Clifford Shaw, to construct a computer model of human problem solving. Called the General Problem Solver, it could solve a wide range of fairly structured problems, such as logical proofs and mathematical word problems. Their program relied heavily on a heuristic procedure called "means-ends analysis," which, at each step of problem solving, determined how close the program was to a solution and then tried to find a way to bring the program closer to where it needed to be. In 1972, Newell and Simon proposed a general theory of problem solving, much of which was implemented on the computer.

The Newell–Simon theory of problem solving

Most of the problems studied by Newell and Simon were fairly well structured, in that it was possible to identify a discrete set of moves that would lead from the beginning to the end of a problem. For example, in logical-theorem proving the final result is known, and what is needed is a discrete set of steps that lead to that solution. Even in chess, another object of study, a discrete set of moves can be determined that will lead from the beginning of a game to checkmate. The biggest problem for a computer program (or a human player, for that matter) is in deciding which of myriad possible moves will most contribute toward winning a game. Other investigators have been concerned with less well-structured problems, such as how a text is comprehended, or how people are reminded of things they already know when reading a text.

All of the cognitive theories described so far have in common their primary reliance on what psychologists call the serial processing of information. Fundamentally, this means that cognitive processes are executed in series, one after another. In solving an algebra problem, for example, first the problem is studied, then an attempt is made to formulate some equations to define knowns and unknowns, then the equations may be used to solve for the unknowns, and so on. The assumption is that people process chunks of information one at a time, seeking to combine the processes used into an overall strategy for solving a problem.

For many years, various psychologists have challenged the idea that cognitive processing is primarily serial. They have suggested that cognitive processing is primarily parallel, meaning that humans actually process large amounts of information simultaneously. It has long been known that the brain works in such a way, and it seems reasonable that cognitive models should reflect this reality. It proved, however, to be difficult to distinguish between serial and parallel models of information processing, just as it had been difficult earlier to distinguish between different factor models of human intelligence. Subsequently advanced techniques of mathematical and computer modeling were brought to bear on this problem, and various researchers,

Computer modeling in intelligence research

including the American psychologists David E. Rumelhart and Jay L. McClelland, proposed what they call "parallel distributed processing" models of the mind. These models postulated that many types of information processing occur at once, rather than just one at a time.

Even with computer modeling, some major problems regarding the nature of intelligence remain. For example, a number of psychologists, such as the American Michael E. Cole, have argued that cognitive processing does not take into account that the description of intelligence may differ from one culture to another and may even differ from one group to another within a culture. Moreover, even within the mainstream cultures of North America and Europe, it had become well known that conventional tests, even though they may predict academic performance, do not reliably predict performance in jobs or other life situations beyond school. It seemed, therefore, that not only cognition but also the context in which cognition operates had to be taken into account.

Cognitive-contextual theories. Cognitive-contextual theories deal with the way that cognitive processes operate in various environmental contexts. Two of the major theories of this type are that of the American psychologist Howard Gardner and that of Sternberg. In 1983 Gardner proposed a theory of what he called "multiple intelligences." Earlier theorists had gone so far as to contend that intelligence comprises multiple abilities. But Gardner went a step further, arguing that there is no single intelligence. In his view, intelligences are multiple, including, at a minimum, linguistic, logical-mathematical, spatial, musical, bodily-kinesthetic, interpersonal, and intrapersonal intelligence. Some of these intelligences are quite similar to the abilities proposed by the psychometric theorists, but others are not. For example, the idea of a musical intelligence is relatively new, as is the idea of a bodily-kinesthetic intelligence, which encompasses the particular faculties of athletes and dancers. Gardner derived his listing of intelligences from a variety of sources, including studies of cognitive processing, of brain damage, of exceptional individuals, and of cognition across cultures. Gardner proposed that whereas most concepts of intelligence had been ethnocentric and culturally biased, his was universal, based upon biologic and cross-cultural data as well as upon data derived from the cognitive performance of a wide array of people.

Gardner's "multiple intelligences" theory

The "triarchic" theory

An alternative theory also taking into account both cognition and context is Sternberg's "triarchic" theory of human intelligence. Sternberg agreed with Gardner that conventional notions of intelligence were too narrow. But he disagreed as to how psychologists should go beyond traditional conceptions, suggesting that abilities such as musical and bodily-kinesthetic ones are talents rather than intelligences in that they are fairly specific and are not prerequisites for adaptation in most cultures.

According to Sternberg, intelligence has three aspects. These are not multiple intelligences, as in Gardner's scheme. Where Gardner viewed the various intelligences as separate and independent, Sternberg posited three integrated and interdependent aspects of intelligence. These aspects relate intelligence to what goes on internally within a person, to what goes on in the external world, and to experience, which mediates between the internal and external worlds.

The first aspect consists of the cognitive processes and representations that form the core of all thought. Sternberg distinguished three kinds of processes: those involved in deciding what to do and later in deciding how well it was done, those involved in doing what one had decided to do, and those involved in learning how to do it in the first place. For example, when deciding which of two brands of a product to buy, a shopper might first decide how to decide which is a better purchase (say, in terms of unit cost), then actually do the required calculation. Of course the shopper had first to have learned how to calculate unit prices.

The second aspect consists of the application of these processes to the external world. According to Sternberg, mental processes serve three functions in the everyday world: adaptation to existing environments, the shaping of existing environments into new ones, and the selection of new environments when old ones prove unsatisfactory. The theory holds that more intelligent persons are not just those who can execute many cognitive processes quickly or well; rather, their greater intelligence is reflected in knowing what their strengths and weaknesses are and capitalizing upon their strengths while remedying or compensating for their weaknesses. More intelligent persons, then, find a niche in which they can operate most efficiently.

The role of experience

The third aspect of Sternberg's triarchic theory is the integration of the internal and external worlds through experience. One measure of intelligence is the ability to cope with relatively novel situations. For example, intelligence might be measured by taking someone who is well adapted to one culture and placing him in an unfamiliar one, in order to assess his ability to cope with a new situation. Or in the case of a person for whom an automobile is of critical importance, intelligence may be gauged according to the way that person functions when the car is being repaired and unavailable for a short period. Sternberg also suggested that another facet of experience that is important in evaluating intelligence is the automatization of cognitive processing, which occurs when a once relatively novel task becomes familiar. For example, when children first learn to read, they are confronted with a relatively novel task. But one is interested not only in how well children deal with the novelty of reading but also in how well they render reading automatic and subconscious. The abilities to cope with relative novelty and to automatize cognitive processing are seen as interrelated: The more a person is able to automatize the tasks of daily life, the more mental resources there are left to cope with novelty.

Biologic theories. The theories discussed above seek to understand intelligence in terms of underlying hypothetical constructs, whether these constructs are factors (*e.g.,* verbal ability, spatial ability), as is the case with psychometric theories; cognitive processes (*e.g.,* retrieval of information from memory, inferring relations); or cognitive processes as they interact with context (*e.g.,* musical intelligence or the shaping of the environment). Some theorists, however, have taken a radically different approach, seeking to understand intelligence directly in terms of its biologic bases without intervening hypothetical constructs. These theorists, usually called reductionists, believe that a true understanding of intelligence can result only from the identification of its biologic substrates. Reductionism takes an appealing philosophical stance, and some would argue that there is no real alternative if the goal is to explain rather than merely to describe behaviour. But the case is not an open-and-shut one. In trying to discover why an automobile does not start in the morning, for example, the driver does not usually imagine that the basic problem is one involving molecules and atoms. The driver is probably better advised to analyze the performance of components, such as the starter or carburetor. Even if the automobile's molecular or atomic reactions could be analyzed, such an analysis would probably be unhelpful. The example suggests that the biologic approaches to intelligence should be looked at as complementary to, rather than as replacing, other approaches. Although relatively little is known about the biologic bases of intelligence, progress has been made on three different fronts, all involving studies of brain operation.

Hemispheric studies. One front has been the investigation of types of intellectual performance as related to the regions of the brain from which they originate. A researcher in this area, the American psychologist Jerre Levy, investigated the functioning of the two hemispheres of the brain. Levy and others found that the left hemisphere is superior in analytical functioning, of which the use of language, for instance, is a prime example. The right hemisphere, on the other hand, is superior in many forms of visual and spatial performance and tends to be more synthetic and holistic in its functioning than the left. Such patterns of hemispheric specialization are complex and cannot easily be generalized.

Functions of the brain's hemispheres

The specialization of the two hemispheres of the brain is exemplified in an early study by Levy and another American psychologist, Roger W. Sperry, who worked with split-brain patients, individuals who have had their

corpus callosum severed. Because the corpus callosum, in the normal brain, links the two hemispheres, in these patients the hemispheres function independently of each other. But, as in normal persons, the right side of the body connects with the left hemisphere of the brain, and the left side connects with the right hemisphere.

Levy and Sperry asked split-brain patients to match small wooden blocks held in either their left or their right hand (but not looked at) with corresponding two-dimensional pictures. They found that the left hand did better than the right at this task, but, of more interest, they found that the two hands appeared to use different strategies in solving the problem. Their analysis demonstrated that the right hand found it relatively easier to deal with patterns that are readily described in words but difficult to discriminate visually. In contrast, the left hand found it easier to deal with patterns requiring visual discrimination.

Brain-wave studies. A second front of research has involved the use of brain-wave recordings to study the relation between these waves and either performance on ability tests or in various kinds of cognitive tasks. Researchers in some of these studies found a relationship between certain aspects of electroencephalogram (EEG) waves and scores on a standard psychometric test of intelligence.

Blood-flow studies. A third and relatively new front of research has involved the measurement of blood flow in the brain, which is a fairly direct indicator of functional activity in brain tissue. In such studies the amount and location of blood flow in the brain is monitored while subjects perform cognitive tasks. John Horn, a prominent researcher in this area, found that older adults show decreased blood flow to the brain, that such decreases are greater in some areas of the brain than in others, and that the decreases are particularly notable in those areas responsible for close concentration, spontaneous alertness, and the encoding of new information. These findings highlight the importance not only of understanding intelligence in general but also of understanding it as a faculty that develops over time.

DEVELOPMENT OF INTELLIGENCE

There have been a number of approaches to the study of the development of intelligence. Psychometric theorists, for instance, have sought to understand how intelligence develops in terms of changes in the factors of intelligence over time and changes in the amounts of the various abilities that children have. For example, the concept of mental age was popular during the first half of the 20th century. A given mental age was held to represent an average child's level of mental functioning for a given chronological age. Thus, an average 12-year-old would have a mental age of 12, but an above-average 10-year-old or a below-average 14-year-old might also have a mental age of 12 years. The concept of mental age fell into disfavour, however, and has come to be used only rarely. Two main reasons appear to have caused this change. First, the concept does not seem to work after about the age of 16. The mental test performance of, say, a 25-year-old is generally no better than that of a 24- or 23-year-old. Furthermore, in later adulthood some test scores seem to start declining. Second, many psychologists believe that intellectual development does not exhibit the kind of smooth continuity that the concept of mental age appears to imply. Rather, development seems to come in intermittent bursts, whose timing can differ from one child to another.

The concept of mental age

Jean Piaget's work. The landmark work in intellectual development has not come out of psychometry but rather out of a tradition forged by the Swiss psychologist Jean Piaget. Over the course of a long career, Piaget formulated what became one of the monumental theories in the history of psychology. Two of its main aspects concern the mechanisms by which intellectual development takes place and the periods through which children develop. As modeled by Piaget, the child explores the world and observes regularities and makes generalizations, much as a scientist does. The first part of Piaget's theory recognizes two fundamental cognitive processes that work in somewhat reciprocal fashion. The first is what Piaget called assimilation, a process that involves incorporating new information into an already existing cognitive structure. Suppose, for example, that a child knows how to solve problems that require a percentage of a given number to be calculated. The child then learns how to solve problems that ask what percentage of a number another number is. The child already has a cognitive structure, or what Piaget called a "schema," for percentage problems and can incorporate the new knowledge into the existing structure. But suppose the child is to learn next how to solve time-rate-distance problems, never before having dealt with this type of problem. In this case, the child may need to call upon the second process, accommodation, to form a new cognitive structure that can incorporate the new information. Cognitive development, according to Piaget, represents a dynamic equilibrium between the two processes of assimilation and accommodation.

Piaget's "schema"

The second part of Piaget's theory postulates that there are four major periods in intellectual development. The first, the sensorimotor period, extends from birth through roughly two years of age. During this period, a child learns how to modify reflexes to make them more adaptive, to coordinate actions, to retrieve hidden objects, and, eventually, to begin representing information mentally. During the second, preoperational, period from about two to seven years of age, a child experiences the growth of language and mental imagery and learns to focus on single perceptual dimensions, such as colour and size. The third, concrete-operational, period from about seven to 12 years of age is the time during which a child develops an important set of skills referred to as conservation skills. For example, suppose that water is poured from a wide, short beaker into a tall and narrow one. A preoperational child, asked which beaker has more water, will say that the second beaker does (the tall, thin one); a concrete-operational child, however, will recognize that the amount of water in the beakers must be the same. Finally, children emerge into the fourth, formal-operational, period, which begins about age 12 and continues throughout life. The formal-operational child develops thinking skills in all logical combinations and learns to think with abstract concepts. For example, a concrete-operational child asked to determine all possible orderings, or permutations, of four digits, such as 3-7-5-8, will have great difficulty doing so. The formal-operational child, however, will adopt a strategy of systematically varying alternations of digits, starting perhaps with the last digit and working toward the first. This systematic way of thinking is not possible for the normal concrete-operational child.

De-emphasis on Piagetian concepts

Piaget's theory had a major impact on the views of intellectual development, but the theory no longer has the widespread acceptance it once had, particularly from the 1950s through the 1970s. One reason for this is that the theory deals primarily with scientific and logical modes of thought and much less with aesthetic, intuitive, and other modes of thought. Another reason is that Piaget tended to overestimate the ages at which children could first perform certain cognitive tasks. Despite its diminished influence, however, Piaget's theory continues to serve as a basis for other theories.

Post-Piaget theories. Later theories of intellectual development, influenced by Piaget, have taken several courses. One has been to expand on Piaget by suggesting a possible fifth, adult, period of development, such as problem finding. A second course has been to suggest quite different periods of development from those suggested by Piaget. A third course has been to accept that intellectual development occurs through the periods Piaget proposed, but to hold that the cognitive bases of development differ from those recognized by him. Some of these theories emphasize the importance of memory capacity. For example, it has been shown that children's difficulties in solving transitive inference problems (such as: If A is greater than B, B is greater than C, and D is less than C, which is the greatest?) result primarily from memory limitations rather than reasoning limitations, as argued by Piaget. A fourth course has been to focus on the role of knowledge in development. Some investigators argue that much of what has been attributed to reasoning and problem-solving ability in intellectual development is actually better attributed

to the increasing knowledge base of a child. Although the above approaches are diverse, they are all related as alternative responses to Piaget.

The environmental viewpoint. The views of intellectual development described above all emphasize the importance of the organism in intellectual development. But an alternative viewpoint emphasizes the importance of the environmental context and, particularly, the social environment. This view is related to the cognitive-contextual theories discussed above. Championed originally by L.S. Vygotsky, a Soviet psychologist, this viewpoint suggests that intellectual development may be largely influenced by a child's interactions with others: A child sees others thinking and acting in certain ways and then internalizes and models what is seen. An Israeli psychologist, Reuven Feuerstein, has elaborated upon this point of view, suggesting that the key to intellectual development is what he calls mediated learning experience. The parent mediates, or interprets, the environment for the child, and it is largely through this mediation that the child learns to understand and interpret the world.

MEASURING INTELLIGENCE

Almost all of the theories discussed above have in common the use of fairly complex tasks for gauging intelligence in both children and adults. Some of these tasks have been explicitly discussed—for example, those requiring recognition of analogies, classification of similar terms, extrapolation of number series, performance of transitive inferences, and the like. How did theorists of intelligence come to use these tasks in preference to the myriad other possibilities? That question is answered through the discussion of the measurement of intelligence.

Although the kinds of complex tasks that have been discussed above fall into a single tradition for the measurement of intelligence, the field actually has two major traditions. The tradition that has been discussed most prominently and has been most influential is that of the French psychologist Alfred Binet. But an earlier tradition, and one that still shows some influence upon the field, is that of the English scientist Sir Francis Galton.

The influence of Sir Francis Galton

The publication in 1859 of Charles Darwin's *The Origin of Species* had a profound effect on many lines of scientific endeavour. The book suggested that the capabilities of humans are, in some sense, continuous with those of lower animals and, hence, can be understood through scientific investigation. One person who was strongly influenced by Darwin's thinking was his cousin Sir Francis Galton. For seven years—from 1884 to 1890—Galton maintained a laboratory at the South Kensington Museum in London, where, for a small fee, visitors could have themselves measured on a variety of psychophysical tasks, such as weight discrimination and sensitivity to musical pitch. But Galton believed that these tests measured more than just psychophysical abilities. He believed that psychophysical abilities were the basis of intelligence and, hence, that his tasks were measures of intelligence. The earliest formal intelligence test, therefore, required a person to perform such simple tasks as deciding which of two weights was heavier or showing how forcefully he could squeeze his hand. The Galtonian tradition was taken to the United States by the psychologist James McKeen Cattell. One of Cattell's students, Clark Wissler, collected data showing that scores on Galtonian types of tasks were not good predictors of grades in college, or even of each other. Cattell continued his work in psychometric research, however, and with Edward L. Thorndike developed the principal facility in the United States for mental testing and measurement.

The IQ test. The more influential tradition of mental testing was developed by Binet and his collaborator, Theodore Simon, in France. In 1904 the minister of public instruction in Paris named a commission to study or create tests that would insure that mentally retarded children received an adequate education. The minister was also concerned that certain children were being placed in classes for the retarded not because they were retarded but because they had behaviour problems, and teachers did not want them in their classrooms. Even before Wissler's research, Binet, who was charged with developing the new test, had flatly rejected the Galtonian tradition, believing that Galton's tests measured fairly trivial abilities. He proposed instead that tests of intelligence should measure skills such as judgment, comprehension, and reasoning—the same kinds of skills measured on most intelligence tests today. Binet's early test was taken to the United States by a Stanford University psychologist, Lewis Terman, whose version came to be called the Stanford-Binet test. This test has been revised frequently and continues in use.

Stanford-Binet test

The Stanford-Binet test, and others like it, have traditionally yielded at the very least an overall score referred to as an intelligence quotient, or IQ. Some tests, such as the Wechsler Adult Intelligence Scale (Revised) and the Wechsler Intelligence Scale for Children (Revised) yield an overall IQ as well as separate IQs for verbal and performance subtests. An example of a verbal subtest would be vocabulary, whereas an example of a performance subtest would be picture arrangement, the latter requiring an examinee to arrange a set of pictures into a sequence so that they tell a comprehensible story.

IQ was originally computed as the ratio of mental age to chronological (physical) age, multiplied by 100. Thus, if a child of 10 had a mental age of 12 (that is, performed on the test at the level of an average 12-year-old), the child was assigned an IQ of $(12/10) \times 100$, or 120. If the 10-year-old had a mental age of eight, the child's IQ would be $(8/10) \times 100$, or 80. A score of 100, where the mental age equals the chronological age, is average.

As discussed above, the concept of mental age has fallen into disrepute, and few tests continue to involve the computation of mental ages. Many tests still yield an IQ, but they are most often computed on the basis of statistical distributions. The scores are assigned on the basis of what percentage of people of a given group would be expected to have a certain IQ. (See PSYCHOLOGICAL TESTS AND MEASUREMENT.)

The distribution of IQ scores. Intelligence test scores follow an approximately normal distribution, meaning that most people score near the middle of the distribution of scores and that scores drop off fairly rapidly in frequency as one moves in either direction from the centre. For example, on the IQ scale, about two out of three scores fall between IQs of 85 and 115, and about 19 out of 20 scores fall between 70 and 130. Put another way, only one out of 20 scores differs from the average IQ (100) by more than 30 points.

"Labeling" IQ scores

It has been common to associate certain levels of IQ with labels. For example, at the upper end, the label "gifted" is sometimes assigned to people with IQs over a certain point, such as 130. And at the lower end, mental retardation has been classified into different degrees depending upon IQ, so that, for example, IQs of 70–84 have been classified as borderline retarded, IQs of 55–69 as mildly retarded, IQs of 40–54 as moderately retarded, IQs of 25–39 as severely retarded, and IQs below 25 as profoundly retarded. Labeling schemes like these, however, have pitfalls and are in some ways dangerous.

First, the labels assume that conventional intelligence tests provide sufficient information to classify someone as either gifted, on the one hand, or mentally retarded, on the other. But most authorities would agree that this assumption is almost certainly false. Conventional intelligence tests are useful in providing information about some people some of the time, but the information they provide is about a fairly narrow range of abilities. To label someone as mentally retarded solely on the basis of a single test score is to risk doing a potentially great disservice and injustice to that person. Most psychologists and other authorities recognize that social as well as strictly intellectual skills are important in classifying a person as retarded. If a person adapts well to the environment, then it seems inappropriate to refer to that person as mentally retarded, a term with inescapably pejorative connotations.

Second, giftedness is generally recognized as more than just a degree of intelligence, even broadly defined. Most psychologists who have studied gifted persons agree that a variety of aspects make up giftedness. Howard E. Gruber, the Swiss psychologist, and the American psychologist Mihaly Csikszentmihalyi are among a number of researchers

Views on giftedness

who are skeptical that the giftedness observed in children has much to do with the giftedness observed in adults. Gruber believes that giftedness unfolds over the course of a lifetime and involves achievement at least as much as intelligence. Gifted people, he contends, have life plans that they seek to realize, and these plans develop over the course of many years. To measure giftedness merely in terms of a single test score would be, for Gruber, a trivialization of the concept.

Third, a given test score can mean different things to different people. An IQ score for a person who has grown up in a ghetto home and gone to an inadequate school does not have the same meaning as the same IQ score for someone who has grown up in an upper-middle-class suburban environment and gone to a well-endowed school. An IQ score also does not mean the same thing for a person whose first language is not English but who takes a test in English, as it does for a native English-speaker. Another factor is that some people are "test-anxious" and may do poorly on almost any standardized test. Based on these and similar drawbacks, it has come to be believed generally that scores have to be interpreted carefully on an individual basis.

Psychologists now believe that IQ represents only a part of intelligence, and intelligence is only one factor in both retardation and giftedness. Earlier rigid concepts in the field of intelligence measurement, which led to labeling, have had undesirable effects. The growth of a more recent concept, the malleability of intelligence, has also served to discredit labeling.

THE MALLEABILITY OF INTELLIGENCE

Intelligence has historically been conceptualized as a more or less fixed trait. This view perceives intelligence as something people are born with, and the function of development is to allow this genetic endowment to express itself. A number of investigators have taken the approach that intelligence is highly heritable, transmitted through the genes. Other investigators believe that intelligence is minimally heritable, if at all. Most authorities take an intermediate position.

Various methods are used to assess the heritability of intelligence. Notable among these is the study of identical twins reared apart. For a variety of reasons, identical twins are occasionally separated at or near birth. If the twins are raised apart, and if it is assumed that when twins are separated they are randomly distributed across environments (often a dubious assumption), then the twins would have in common all of their genes but none of their environment, except for chance environmental overlap. As a result, the correlation between their performance on tests of intelligence can provide an estimate of the proportion of variation in test scores due to heredity. Another method of computing the hereditary effect on intelligence involves comparing the relationship between intelligence test scores of identical twins and those of fraternal twins.

Studies of heritability of intelligence

Considering the large number of studies that have investigated the heritability of intelligence, it is surprising that so much disagreement exists among researchers. It has been estimated that roughly half the variation in intelligence test scores is caused by hereditary influences. But it is significant that estimates of heritability can differ among ethnic and racial groups, as well as across time within a single group. Moreover, the estimates are computed, for the most part, on the basis of intelligence test scores, so that the estimates are only for that part of intelligence measured by the tests.

Whatever the heritability factor of IQ, a separate issue is whether intelligence can be increased. Work by a New Zealand researcher, James Flynn, has shown that, in the late 20th century, scores on intelligence tests have been rising rather steadily throughout the world. Although the reason for the increase has not been satisfactorily explained, there is little doubt that this is a developing phenomenon requiring careful investigation.

Despite the general increase in scores, average IQs continue to vary both across countries and across different socioeconomic groups. For example, many researchers have found a positive correlation between socioeconomic status and IQ, although they disagree over the reason for the relationship. Most investigators agree that differences in educational opportunities play an important role, and some investigators believe that there is a hereditary basis for the difference as well. But there is simply no broad consensus on the issue of why the differences exist, and, again, it should be noted that the differences are based on IQ, not broadly defined intelligence.

It is important to understand that no matter how heritable intelligence is, some aspects of it are still malleable. Heritability of a trait is a separate issue from its malleability. A person's height, for example, is 90 percent heritable; the best predictor of height is the height of a person's parents. Yet, because of better nutrition and health care, average heights in the United States have climbed during the 20th century. Thus, with intervention, even a highly heritable trait can be modified. There is a growing body of evidence that aspects of intelligence, too, can be modified. Intelligence, in the view of many authorities, is not a fixed trait, with its level a foregone conclusion the day a person is born. To the contrary, a program of training in intellectual skills can increase some aspects of a person's level of intelligence. No training program—no environmental condition of any sort—can make a genius of a person with low measured intelligence. But some gains are possible, and a number of programs have been developed for increasing intellectual skills. A main trend for psychologists working in the intelligence field has been to combine testing and training functions in order to enable people to optimize their intelligence.

Modification of intelligence

BIBLIOGRAPHY

General works: Introductions that provide a frame of reference and the terminology necessary for understanding the study of intelligence are found in such comprehensive sources as ROM HARRÉ and ROGER LAMB (eds.), *The Encyclopedic Dictionary of Psychology* (1983); BENJAMIN B. WOLMAN (ed.), *Handbook of Intelligence: Theories, Measurements, and Applications* (1985); RICHARD L. GREGORY (ed.), *The Oxford Companion to the Mind* (1987); and RAYMOND J. CORSINI (ed.), *Encyclopedia of Psychology*, 4 vol. (1984). Applications and varieties of intelligence are discussed in ROBERT J. STERNBERG and RICHARD K. WAGNER (eds.), *Practical Intelligence: Nature and Origins of Competence in the Everyday World* (1986). A comprehensive but fairly elementary introduction to the field is ROBERT KAIL and JAMES W. PELLEGRINO, *Human Intelligence: Perspectives and Prospects* (1985). For current research in the field, articles in *Psychology Today* (monthly) provide coverage on a general level.

Theories of intelligence: For early theories, see ALFRED BINET and THÉODORE SIMON, *The Development of Intelligence in Children: The Binet-Simon Scale*, trans. from French (1916, reprinted 1983); JOAN W. REEVES, *Thinking About Thinking: Studies in the Background of Some Psychological Approaches* (1965), a summary of Binet's work; and CHARLES E. SPEARMAN, *The Nature of "Intelligence" and the Principles of Cognition* (1923, reprinted 1973), and *The Abilities of Man: Their Nature and Measurement* (1927, reissued 1970). Later theories are presented in HOWARD GARDNER, *Frames of Mind: The Theory of Multiple Intelligences* (1983); RAYMOND B. CATTELL, *Intelligence: Its Structure, Growth, and Action* (1987); ROBERT J. STERNBERG, *Beyond IQ: A Triarchic Theory of Human Intelligence* (1985), and *The Triarchic Mind: A New Theory of Human Intelligence* (1988); MICHAEL COLE and BARBARA MEANS, *Comparative Studies of How People Think* (1981); and ROGER SPERRY, *Science and Moral Priority: Merging Mind, Brain, and Human Values* (1983). Comprehensive reviews of the field are presented in ROBERT J. STERNBERG (ed.), *Handbook of Human Intelligence* (1982), and *Human Abilities: An Information-Processing Approach* (1985); and ROBERT J. STERNBERG and DOUGLAS K. DETTERMAN (eds.), *What Is Intelligence?: Contemporary Viewpoints on Its Nature and Definition* (1986).

Development of intelligence: A definitive summary of Piaget's earlier work is presented in JOHN H. FLAVELL, *The Developmental Psychology of Jean Piaget* (1963). Piaget's works on the mechanisms of intellectual development and fundamental cognitive processes are available in English translations: JEAN PIAGET, *The Psychology of Intelligence*, trans. by MALCOLM PIERCY and D.E. BERLYNE (1950, reprinted 1981; originally published in French, 1947); and *The Essential Piaget*, ed. by HOWARD E. GRUBER and J. JACQUES VONÈCHE (1977, reprinted 1982). For other influential views, see L.S. VYGOTSKY, *Mind in Society: The Development of Higher Psychological Processes*, trans. from Russian, ed. by MICHAEL COLE *et al.* (1978), the cognitive-contextual theory of intellectual development; and

REUVEN FEUERSTEIN, *The Dynamic Assessment of Retarded Performers: The Learning Potential Assessment Device, Theory, Instruments, and Techniques* (1979, reprinted 1985), an analysis of the role of learning experiences in intellectual development.

Measuring intelligence: Early traditional approaches to evaluating intelligence are presented in FRANCIS GALTON, *Hereditary Genius: An Inquiry into Its Laws and Consequences* (1869, reissued 1978), and *Inquiries into Human Faculty and Its Development* (1883, reissued 1973). For American investigations at the beginning of the 20th century and their results, see EDWARD L. THORNDIKE *et al.*, *The Measurement of Intelligence* (1927, reprinted 1973). Developments and applications of Binet's tradition of mental testing are described in LEWIS M. TERMAN, *The Measurement of Intelligence: An Explanation of and a Complete Guide for the Use of the Stanford Revision and Extension of the Binet-Simon Intelligence Scale* (1916, reprinted 1975). For later research in the field, see PHILIP E. VERNON, *The Measurement of Abilities,* 2nd ed. (1972); DAVID WECHSLER, *Wechsler's Measurement and Appraisal of Adult Intelligence,* 5th enl. ed., rev. by JOSEPH D. MATARAZZO (1972); and ANNE ANASTASI, *Psychological Testing,* 6th ed. (1988).

Malleability of intelligence: Arguments for and against heritability as an essential trait of intelligence are presented in the works of ARTHUR R. JENSEN, *Genetics and Education* (1972); JOHN C. LOEHLIN and ROBERT C. NICHOLS, *Heredity, Environment, & Personality: A Study of 850 Sets of Twins* (1976); PHILIP E. VERNON, *Intelligence, Heredity, and Environment* (1979); and H.J. EYSENCK and LEON J. KAMIN, *Intelligence, the Battle for the Mind* (1981).

Intelligence and Counterintelligence

In a world of sovereign nations, information is a prime element of national power. Intelligence, which is best defined as evaluated information, is the vital and often pivotal foundation for national decisions. The nature of intelligence is illustrated by a U.S. presidential order (Executive Order No. 12333) of December 4, 1981, which directed the national intelligence system to "Provide the President . . . with the necessary information on which to base decisions concerning the conduct and development of foreign, defense and economic policy, and the protection of United States national interests from foreign security threats." The order directed that "all means" consistent with the law and rights of individuals "be used to develop intelligence information for the President" and specified that "emphasis should be given to detecting and countering espionage and other threats . . . by foreign intelligence services against the United States government." These official words define the functions of intelligence and counterintelligence, but they omit a third and most controversial role of intelligence agencies, that of intervening secretly in the political or economic affairs of other nations, an activity commonly referred to as covert action.

Intelligence, counterintelligence, and covert action denote a wide variety of governmental activities related to national security and defense and foreign policy. A statesman's day often begins and ends with the reading of intelligence reports. Accurate information is essential to, but does not guarantee, optimal decisions, while inadequate information has demonstrably led to disaster. The need for information must be recognized, and it must be collected efficiently, interpreted with sophistication, communicated with speed to precisely where it is most needed, and acted on with skill and courage.

NATURE OF INTELLIGENCE

The various categories of intelligence are potentially endless. The armed services need military intelligence, a space or Earth satellite program needs scientific information, a foreign office needs political or biographical information, and a premier or president needs an amalgam of these and many more. Consequently, intelligence activity has become a vast international industry, most of which goes forward in secrecy. Total U.S. governmental expenditures on intelligence in the mid-1980s, for example, were estimated at around $12,000,000,000 (precise figures are secret). Employed in this work were perhaps 200,000 persons in the United States and many thousands more overseas. The intelligence activities of the Soviet Union were likely of greater dimensions, and all major nations maintain large intelligence bureaucracies.

Types of intelligence that are sought. Political intelligence is at once the most sought after and least reliable of the various types. Obviously, no one can predict what the outcome of political forces in a foreign country will be, and the analyst is reduced to making forecasts of alternatives based on what he knows about political trends and patterns. His most concrete data include such things as voting trends, the details of party organization and leadership, and sophisticated analyses of political documents. A prime source of political intelligence has long been the reports of diplomats, who normally gather data from open sources in the country where they are stationed. Their work is supplemented by that of the professional intelligence apparatus. Much military intelligence is gathered by military attachés, who have formal diplomatic status but are known to be chiefly concerned with intelligence. Ironically, military information is often more difficult to obtain in peacetime than during war, although space reconnaissance technology has greatly expanded collection capacity. In wartime much is learned from captured equipment, captured enemy forces, and information gained from patrols. The kinds of information considered to be of greatest value pertain to military organization and equipment, procedures and formations, and the number of units and total personnel.

Sources of information

Economic factors are crucial to a nation's military strength, its political development, and the conduct of its foreign policy. Unemployment in Japan, a food shortage in India, rice production in Southeast Asia, a balance of payments crisis in the United States or the United Kingdom—each has obvious relevance to the conduct of foreign policy. Intelligence organizations, therefore, give major importance to the collection of data on trade, finance, natural resources, and industrial capacity, and to complex analyses such as the estimation of gross national product.

Technological advance has produced an ongoing race between military capabilities and defensive measures, and between new methods of collecting intelligence and new techniques of protecting secret information. Consequently, intelligence systems must be on guard against scientific or technological breakthroughs that may give one country a decisive advantage over another. They must be kept abreast of foreign advances in nuclear energy, in the electronic, chemical, and computer sciences, and along all other frontiers of scientific knowledge.

If an intelligence system is to make predictions of a foreign nation's future behaviour, it obviously needs detailed information about the personal characteristics of national decision makers. The scope of biographical research has broadened with the growth of international organizations, since negotiators need to be briefed with information about their foreign counterparts.

Intelligence agencies constantly work at compiling data on foreign populations, topographies, climates, and an increasingly wide range of ecological factors. The questions asked of the intelligence analyst may range from "What is the nature of the water supply in Addis Ababa?" to "What are the prospects for economic growth next year in Outer Mongolia?"

Three categories of intelligence

Types of intelligence in terms of scope. Intelligence is often classified in three categories: strategic (sometimes called national), tactical, and counterintelligence. Of these, the broadest in scope is strategic intelligence, which covers information about the capabilities and intentions of foreign nations. Tactical intelligence, sometimes called operational or combat intelligence, is information required by field commanders. The distinction between strategic and tactical may be vanishing, because in an age of rockets, missiles, and jet aircraft a major field commander may require much the same kind of information as a president and his national security council, and vice versa.

Counterintelligence is information and activity related to protecting one's own information and the secrecy of one's own intelligence operations. Its purpose is to prevent spies or other agents of a foreign power from penetrating one's government, armed services, or intelligence agencies. Counterintelligence is also concerned with protecting a nation's high technology, deterring terrorism, and coping with international narcotics traffic. Counterintelligence operations sometimes produce positive intelligence. The adversary's efforts to penetrate one's own security may give clues as to what information the adversary needs, as well as information about his techniques, equipment, and operational procedures. Opportunities are sometimes offered by counterintelligence to manipulate the adversary's intelligence service. Moles and double agents are part of the real world of counterintelligence.

Sources of intelligence. While the public sees the intelligence operative as a cloak-and-dagger secret agent, in fact the largest amount of intelligence work is an undramatic search of public sources. This includes the monitoring of foreign radio broadcasts, the analysis of the contents of foreign publications of all kinds, and the sifting of reports from diplomats, businessmen, accredited military attachés, and other observers. Most intelligence work is performed by university-trained research analysts in quiet offices.

Covert sources of intelligence are more dramatic, falling into three major classifications: aerial and space reconnaissance, electronic eavesdropping and code breaking, and the secret agent working at the classic spy trade. Broadly speaking, the value of each as a source of crucial information is probably in descending order as listed. This is because a photograph constitutes hard (*i.e.*, reliable) intelligence, whereas the report of a secret agent may be speculative and difficult to prove and therefore soft.

A BRIEF HISTORY OF INTELLIGENCE ACTIVITIES

Intelligence in premodern periods. The earliest counterparts of the modern intelligence agency were perhaps the ancient soothsayers, such as the Delphic oracle, who claimed to be able to communicate with the gods and therefore often were said to have the power of predicting the future. As in modern times, their reports were often ambiguous and often ignored by the decision makers. The Bible reports God's advice to Moses (Num. 13) that he send agents to "spy out the land of Canaan." Twelve agents were sent who returned after 40 days to report that the people in the land flowing with milk and honey were more powerful than the Israelites—for which intelligence they were punished by God.

Another ancient commentator on intelligence and counterintelligence was Sun-tzu, whose *Ping-fa* (*The Art of War*), written about 400 BC, is said to be widely read by contemporary Chinese Communist strategists. Sun-tzu refers in his book to five kinds of secret agents, corresponding to modern concepts of agents in place, double agents, deception agents, expendable agents, and penetration agents. Sun-tzu stressed the importance of good intelligence organization, and he also wrote of counterintelligence and psychological warfare.

In the Middle Ages

In the Middle Ages intelligence began to be used systematically in western Europe, although it was crudely organized. On the one hand, it was usually impossible to conceal the massing of troops or ships, making strategic surprise difficult to achieve in military operations; on the other hand, communication was slow, and thus a fine balance often existed between the information available and the ability to communicate it in time.

In the 15th century the Italian city-states began to establish permanent embassies in foreign capitals. The Venetians used such outposts as intelligence sources and even developed codes and ciphers by which information could be secretly communicated. By the 16th century other European governments had followed suit.

From the Renaissance to the Franco-Prussian War

The growth of nationalism and intelligence systems. The rise of nationalism, punctuated by the Peace of Westphalia in 1648, saw the growth of standing armies and professional diplomats. These brought a need on the part of statesmen for evaluated foreign information, and so organizations and procedures for its procurement were developed. Queen Elizabeth I maintained a notable intelligence organization. Her principal state secretary, Sir Francis Walsingham, developed a network of several score intelligence agents in foreign lands. He recruited graduates of Oxford and Cambridge, developed the black arts of espionage and foreign political intrigue, and created tools and techniques for making and breaking codes. Later the cardinal de Richelieu and Oliver Cromwell, whose intelligence chief, John Thurloe, is often cited as an early master spy, developed notable intelligence systems.

Not until the late 18th century, however, did sharp organizational distinctions arise between internal security (a counterintelligence function) and external foreign intelligence. The populace began to give its allegiance to the state rather than to dynasties or religious leaders. As a result, national leaders concerned themselves increasingly with foreign public opinions, producing both a new diplomacy and new intelligence needs.

Major innovations in organization and doctrine have been credited to Frederick the Great. Under Frederick, and later under Bismarck's aide Wilhelm Stieber, the Prussians organized the intelligence function as an integral part of the general staff. This called for a single military intelligence agency to serve as the nation's eyes on the outside world. Under Stieber perhaps the first large-scale espionage system emerged.

Modern power politics and intelligence systems. European power politics, the pursuit of imperialist foreign policies, and advances in military and communications technology required an increasing amount of strategic intelligence. Intelligence bureaus spread throughout Europe, producing a corresponding growth in counterintelligence.

During World War I

Nevertheless, most European nations entered World War I with inadequate intelligence services. That war is now often cited as one that none of the combatant nations intended, suggesting in itself a tragic intelligence failure. The French intelligence service had been torn by internal intrigue, after having already been weakened by the Dreyfus affair, and other services had been shaken by scandals. Miscalculation of German military strength in 1914 was a prime example of intelligence failure.

German intelligence had also deteriorated. The German General Staff of 1914 evidently placed little faith in the in-

formation supplied to it. For the Germans, policy seemed to dominate intelligence.

The Russians had great initial success against the Austrians because of the treason of an Austrian general staff officer, but subsequently Russian intelligence performed no better than that of other nations in World War I. The British were successful in breaking German naval codes and in their Middle Eastern intelligence operations. The Germans carried on successful activities in Persia and scored limited espionage successes in the United States. The United States had no central intelligence. At the beginning of the war army intelligence was a small section within the general staff, comprising two officers and two clerks; by the war's end, this service had grown to 1,200 officers and civilians. Patently, most were amateurs. Navy intelligence was equally deficient.

The intelligence lessons of World War I, along with advances in technology, especially electronics and aircraft, resulted in a proliferation of intelligence agencies in the 1920s and 1930s. The growth of such agencies was further stimulated by the advent of regimes with expansionist foreign policies in the U.S.S.R., Italy, Germany, and Japan. These produced, in reaction, counterintelligence organizations in the democracies.

World War II

World War II led to the creation and expansion of intelligence services everywhere. The United States, which had virtually no peacetime intelligence services, created in the Office of Strategic Services (OSS) its first full-fledged organization for intelligence and secret operations. The war imposed intelligence requirements never before faced by the major warring powers. This was primarily the result of accelerating technology. Air warfare in particular required vast new offensive and defensive intelligence operations, and the growth of radio broadcasting produced a new art of psychological warfare that demanded intelligence services for the analysis of its effects. Even with all the new developments, intelligence forecasting remained a precarious trade. The Pearl Harbor attack in December 1941, the Battle of the Bulge in 1944, the unexpected German resilience under Allied bombing attacks—in these and other instances the decision makers failed to profit from their elaborate intelligence networks.

But there was one area of enormous profit. Perhaps the most significant intelligence exploit of all times was the Ultra secret—in which the British, with prior help from the Poles and the French, and possessing a German Enigma encoding machine, broke the German military code and read most of the signals between Hitler and his field commanders throughout the war. Put simply, the Ultra operation involved intercepting German signals that had been mechanically enciphered by an Enigma machine, decoding the messages that the German high command assumed were impenetrable, and distributing the information secretly to appropriate headquarters. In essence, throughout much of the war the Allied side was reading the mind of the Axis command. As the war progressed, Hitler's increasingly centralized control of operations on all fronts made German military operations especially vulnerable. On those occasions when the Allies were caught by surprise, such as the American defeat at Kasserine Pass, the Allied defeat at Arnhem, and the Battle of the Bulge, either the Germans had used land lines for communication, or Ultra intercepts had been misused.

World War II was followed by the Cold War, in which the intelligence organizations of opposing blocs became combatants. In every major nation huge new bureaucracies were created. Usually these consisted of interlocking and often competitive secret agencies, vying for new assignments and sometimes withholding information from each other. The world soon became familiar with the Central Intelligence Agency (CIA) of the United States. Somewhat less well known were Great Britain's MI-5 and MI-6, the KGB and the GRU of the Soviet Union, the SDECE of France, China's Social Affairs Department, and the Mossad of Israel. At the same time, the exploits of spies and counterspies became a subject for mass media fiction. Books, movies, and television moved the spy to centre stage, sometimes in a comic but often in a deadly serious role. All of this tended to glamorize what is most often a painstakingly tedious, or even at times a disgustingly immoral and distasteful, occupation.

NATIONAL INTELLIGENCE ORGANIZATIONS

In a world in revolutionary ferment, the authentic intelligence officer occupies the centre of great debates over national security policy. At issue in most of the debates are questions of power, probability, and time. A prime task of the modern professional intelligence officer, military or civilian, is to try to answer questions for the policymaker about power and about behaviour probabilities, within a time scale. For a chief of state trying to decide a question about nuclear armaments, for example, an ideal intelligence system would provide precise knowledge of a potential enemy's power, the probability of that enemy's behaviour or reaction in given contingencies, and a time schedule for the most likely sequence of events.

Policy questions

These are basic, even classic problems for all intelligence services. Information as to how these services address their problems is highly uneven. More is generally known about the U.S. system than any other, a good deal about that of the Soviet Union, and comparatively less about other systems. Intelligence systems fall into three general types: the U.S., which has been followed by nations such as West Germany, Japan, and South Korea since they came under U.S. influence after World War II; the Soviet, which is imitated in large measure by most Communist-governed nations; and the British, on which are patterned the systems of most nations with true parliamentary governments.

The United States. The Central Intelligence Agency (CIA) was created in September 1947. The CIA grew out of the nation's wartime experience with the Office of Strategic Services (OSS) and a postwar decision to create a central organization for defense. This included a partially unified Department of Defense and a National Security Council (NSC), chaired by the president. The CIA is under the jurisdiction of the NSC.

World War II had shown that there was a need for a central organization to coordinate for the president all information on foreign affairs and to perform certain functions best done centrally. There were heated debates at the war's end as to how much centralization was needed. Some wanted a central intelligence setup that would eliminate Army, Navy, State Department, and other separate units. Others wanted to turn over all but technical military intelligence functions to the State Department. The outcome was a compromise in which the Central Intelligence Agency was created by the National Security Act of 1947, but other departments and agencies continued to maintain their own intelligence sections. Since then the idea of a single entity has given way to the concept of an "intelligence community" comprising the CIA, the Defense Intelligence Agency (DIA), separate Army, Navy, and Air Force intelligence staffs, State Department intelligence, the National Security Agency (NSA), a Department of Energy nuclear intelligence unit, and the Federal Bureau of Investigation (FBI). The National Security Act of 1947, which has remained the basic charter for the organization, assigned to the CIA five specific functions: (1) advising the National Security Council on intelligence matters related to national security; (2) recommending to the NSC measures for efficient coordination of the intelligence activities of departments and agencies of government; (3) correlating and evaluating intelligence and seeing that it is properly communicated within the government; (4) carrying out for existing intelligence agencies any additional services the NSC determines can best be performed centrally; and (5) carrying out such other functions and duties related to national security intelligence as the NSC may direct.

The Central Intelligence Agency

Out of this assignment of basic functions grew a large new agency with assignments around the globe. By the 1980s the CIA was believed to employ about 18,000 full-time employees in the United States, mainly in Washington, D.C., and several thousands more in overseas posts. Its annual budgets do not include functions performed by military and paramilitary units under the CIA's direction and control. Policy and operational guidelines for the CIA are contained in periodically revised presidential executive orders and some two-score secret National Security

Council Intelligence Directives defining its functions and establishing jurisdictions in areas in which other intelligence agencies might have a functional claim.

Since 1947 the CIA has come to perform three major assignments: (1) foreign intelligence collection, evaluation, and communication; (2) counterintelligence operations overseas; and (3) secret political intervention, psychological warfare, and paramilitary operations in foreign areas. The first two functions are clearly stipulated in the congressional statute creating the CIA; the third was assumed as a Cold War necessity and on the basis of a very free interpretation of the original charter.

The CIA is managed by a director and a deputy director, both appointed by the president and subject to Senate confirmation. The director of Central Intelligence in fact wears two hats. He is head of the Central Intelligence Agency as well as being the president's principal intelligence adviser, and thus theoretically the number one man in the intelligence community—theoretically, because each of the other major units, such as the Federal Bureau of Investigation, the National Security Agency, or the Defense Intelligence Agency, operates somewhat autonomously. The head of the CIA is, in fact, "first among equals," and his authority has increased over the years.

The major divisions of the CIA are those for intelligence, operations, science and technology, and administration. The intelligence division, the largest, is responsible for the production of finished intelligence in its various forms—from instant news flashes to encyclopaedic surveys. Most of the thousands of workers in the intelligence division are technical specialists or research analysts. By contrast, the operations directorate, sometimes called the "Department of Dirty Tricks," has handled various clandestine operations, such as espionage missions, counterintelligence overseas, political intervention, recruitment of defectors, and a variety of covert actions in foreign areas. The science and technology division concerns itself both with new techniques of intelligence gathering and with the technological developments of other nations that may have impact upon U.S. security. The administration directorate is concerned with recruitment and training, library services, including information storage and retrieval, and various other housekeeping activities.

The CIA performs the difficult dual role of independent intelligence producer and coordinator of a vast intelligence system comprising many units. The CIA produces intelligence in a variety of forms, from bulletins of current information, such as the National Intelligence Daily for top policymakers, to long-range forecasts. Under the CIA's leadership, the National Foreign Intelligence Board (NFIB) has responsibility for the production of National Intelligence Estimates (NIE), supposedly representing the best information available throughout the government on such questions as "What is the current and future status of Soviet civil defense?" The NFIB, representing all the major units of the intelligence community, includes what was formerly called the Board of National Estimates, which has been replaced by national intelligence officers with geographical and functional jurisdictions. National Intelligence Estimates have drawn mixed reviews for objectivity, accuracy, length, style, and timeliness. A National Foreign Intelligence Council operates as a companion to NFIB to deal with priorities and budgets.

The FBI's principal role in the intelligence system is in counterintelligence, limited primarily to internal security within the United States. The CIA's counterintelligence role is applied primarily overseas, while the FBI's jurisdiction normally ends at the water's edge. The FBI director operates under the attorney general in the Department of Justice. An assistant director of the FBI heads an Intelligence Division, the budget, personnel, and organization of which are secret. Increasing concern with terrorist activity has involved the FBI's Criminal Division in counterintelligence, and the FBI and CIA are known to cooperate increasingly in some areas. The Defense Intelligence Agency and agencies of the armed services also perform counterintelligence functions within their limited jurisdictions.

The National Security Agency is the largest, most expensive, and perhaps least known of all American intelligence organizations. Its basic functions are signals intelligence—the making and breaking of codes and ciphers. Created by presidential directive in 1952, the NSA has remained, despite its enormous size and worldwide activities, the most secret of the acknowledged U.S. intelligence units. The directive creating the agency remains secret. Headed by a high-ranking military officer, the agency is under the secretary of defense but maintains a degree of autonomy. From its headquarters near Washington, D.C., the NSA conducts an immense variety of electronic espionage activities. Estimates of its size generally set its number of employees at around 20,000, but its activities also involve thousands of armed-service personnel, supervised by the NSA. Devices for electronic espionage of various sorts are placed in planes, on ships, or at ground installations overseas. This kind of intelligence work was brought to world attention when the USS "Pueblo" was seized by the North Koreans in 1968 and its crew detained for a year. The subsequent Navy and congressional inquiries revealed that the ship was on assignment for the National Security Agency, with a mission to collect data on North Korean and Soviet naval operations in the Sea of Japan.

The National Security Agency

The Defense Intelligence Agency is the newest major member of the U.S. intelligence community. It was established in 1961 as a culmination of the increasing centralization in the Department of Defense, which began with the unification measures of 1947. The DIA was set up by the secretary of defense to improve the intelligence product available to him and to the Joint Chiefs of Staff. Another purpose was to eliminate costly duplication and a tendency of the separate armed services to use their own intelligence data as ammunition in the annual competition for budget allocations.

The DIA is the foreign military intelligence arm of the secretary of defense, the Joint Chiefs of Staff, and the unified and specified military commands. It supplies military intelligence for national reports and estimates, coordinates Defense Department collection requirements, and manages the defense attaché system. Persons assigned to the DIA come from each of the armed services, and more than half of the DIA staff are civilians.

The Department of State, through its Bureau of Intelligence and Research, collects, analyzes, and disseminates large amounts of political, economic, and cultural information about those nations in which the United States has accredited representation. The bureau, referred to as INR in the intelligence community, operates under a director whose rank since 1963 has been that of assistant secretary of state. The bureau has the double function of meeting the requirements of the intelligence community as set by the National Security Council and the State Department's own intelligence needs. Area specialists constitute the bulk of the INR staff, which is small by comparison with those of other intelligence agencies.

The Department of Energy has representation in the intelligence community through an assistant secretary for defense programs, whose responsibilities include the nuclear intelligence role of the former Atomic Energy Commission. Intelligence functions are the responsibility of a deputy assistant secretary for security affairs and a director of the Office of International Security Affairs, who oversee the collection of foreign energy intelligence and its dissemination within the government.

Military intelligence services

The creation of the DIA sharply reduced the role of the separate armed forces in the high-level intelligence system. Yet each of the armed services maintains a major intelligence division for tactical and technical intelligence and for counterintelligence activities.

As organized in 1985, Army intelligence comprised six directorates: Intelligence Resources Management; Foreign Liaison; Counterintelligence (the Army's traditional "CIC" security service); Intelligence Systems, made up of departments for long-range planning, signals intelligence, human intelligence, imagery, and intelligence systems integration; Intelligence Automation Management; and Foreign Intelligence, which includes departments for requirements, scientific and technical, and intelligence, which is subdivided along geographical lines. Also attached to the Intelligence directorate are a "Red Team," a field operating agency

giving staff support in war games, and a Current Intelligence Division.

U.S. Naval intelligence has evolved into a complex Office of Naval Intelligence (ONI), with five major divisions: Military Information; Intelligence Research and Development; Intelligence Policy and Estimates; Special Projects; and Plans, Programs, and Systems Architecture. Each division reports to the ONI secretariat, which has staff assistants for such categories as Soviet strategy and doctrine, foreign intelligence agency liaison, intelligence community coordination, and routine management duties. The deputy director of ONI for plans, to whom this entire structure reports, serves also as commander of the Naval Security Group Command, which has code-making and code-breaking responsibilities. In addition, the Naval Intelligence Command, under the other deputy director of ONI, handles staff support for all other areas except codes and ciphers.

The Air Force, like the Navy, has been accorded by technology a front-line intelligence position. The assistant chief of staff, intelligence, is charged with the responsibility for planning, directing, and supervising Air Force policies and organizations covering a worldwide range of intelligence activities. A special responsibility is to be a sentinel against technological, strategic, or tactical surprise. These various functions are performed under two main directorates. One is the Division of Estimates, which supervises departments for weapons, space, and technology; strategic threat; regional estimates; and general-purpose threat. The other is the Directorate of Plans and Systems, which oversees a complex set of activities, including groups for management, planning, and collection. There is also an Electronic Combat Intelligence Group, which reports directly to the assistant chief of staff, intelligence. Also coming under Air Force operational control is the National Reconnaissance Office (NRO), one of several highly secret units for surveillance by satellite, including photographic, signal, and electronic intelligence. The existence of NRO is not officially acknowledged, but it has functioned since the early 1960s, and its importance and size grow with advancing surveillance technology. It is perhaps the most expensive, and one of the most useful, sources for intelligence.

The Soviet Union. The Committee of State Security (KGB [Komitet Gosudarstvennoy Bezopasnosti]) resembles the American CIA and FBI and Secret Intelligence Service rolled into one. This combination of foreign intelligence, counterintelligence, and internal security roles is unusual, although the Soviet system has set the pattern for intelligence services in other Communist countries.

From Cheka to KGB

The lineage of the KGB began with the Cheka, the secret police established by the Bolsheviks in 1917. In 1922 the Cheka was reorganized into the GPU (State Political Administration) and in 1934 was renamed the NKVD (People's Commissariat for Internal Affairs). During World War II several further reorganizations occurred, out of which grew the MGB (Ministry of State Security).

The current organization, the KGB, was created in 1954. It is commonly believed to dominate the entire Soviet intelligence system, and some analysts picture the KGB chief as a man of immense potential power in the political sphere. (Yury Andropov, who had headed the KGB for 15 years, served as Soviet party chief from 1982 to his death in 1984.) Other separate intelligence agencies do exist in the U.S.S.R., including that of the Foreign Ministry, but most particularly the Central Intelligence Office (GRU [Glavnoye Razvedyvatelnoye Upravleniye])—the chief intelligence directorate of the Army general staff. The GRU deals primarily with military intelligence, and, although at times there have been indications of competition and conflict with the KGB, the latter dominates.

The KGB is organized into a number of major directorates. The First Chief Directorate carries out primarily counterintelligence missions. This pervasive section of the KGB performs an internal security function similar in some ways to that of the American FBI but not limited to domestic jurisdictions.

The Second Chief Directorate is responsible for foreign intelligence and is believed to have a wide variety of subsections dealing with particular areas (such as an American section) and specific functions (such as psychological warfare in foreign areas).

The Third Chief Directorate is believed to encompass Smersh, popularized in the 1960s by the British novelist Ian Fleming. The real Smersh—derived from the Russian *smert shpionam*, meaning "death to spies"—has as its principal assignment maintaining security within the armed forces and watching for potential traitors within the military and intelligence services.

There are a number of other chief directorates, each with specialized intelligence functions and particular geographical jurisdictions. Many Soviet officials serving abroad have some direct connection with the KGB or the GRU, and it has been alleged that some Soviet ambassadors have held rank within the KGB. Soviet diplomats assigned to the United Nations occasionally have been discovered to be intelligence agents, but the same is assumed to hold true for the diplomats of most other major nations.

Estimates of the size and annual cost of Soviet intelligence are speculative. Since the KGB encompasses internal security, border guards, and foreign-intelligence personnel, the total cost probably runs into billions of dollars, with perhaps several hundred thousand employees, not counting paramilitary detachments; clearly most of these are involved with domestic intelligence. But there is no reliable information on these matters.

The United Kingdom. British intelligence was organized along modern lines as early as the days of Queen Elizabeth I, and the long British experience has influenced the structure of most other systems. Unlike those of the United States and the Soviet Union, British intelligence agencies have preserved through most of their history a high degree of secrecy concerning their organization and operations. Even so, Britain has suffered an unusually large number of native spies within the intelligence establishment.

The two principal British intelligence agencies are the Secret Intelligence Service (SIS; also known by its wartime designation, MI-6) and the Security Service (commonly called MI-5). The labels derive from the fact that the Secret Intelligence Service was once "section six" of military intelligence and the Security Service, "section five."

Today MI-6 is a civilian organization with functions resembling those of the American CIA. The British intelligence community, however, is even more of a confederation of separate agencies than is that of the United States. The Secret Intelligence Service is charged with gathering information overseas and with other strategic services ranging from foreign espionage to covert political intervention. The director of the SIS is commonly referred to as "C" and remains an anonymous figure in British governmental life. A high wall of secrecy likewise surrounds his organization; the government barely acknowledges its existence, although an annual lump-sum appropriation request must be presented publicly to Parliament. The British services are much smaller, perhaps by a factor of 20, than those of either the United States or the Soviet Union.

Security Service

Also included in the annual budget submitted to Parliament is the Security Service (MI-5). This is roughly equivalent to the American FBI, or the internal security section (counterintelligence) of the Soviet KGB. It differs from the FBI in performing certain counterintelligence functions overseas. Its main charge is to protect British secrets at home from foreign spies and to prevent domestic sabotage, subversion, and the theft of state secrets. The Security Service is headed by a director general, whose code name in years gone by was "K"—a designation derived from the name of Sir Vernon Kell, its head from 1909 to 1940. The Security Service makes no direct arrests but rather works secretly behind the more publicized "Special Branch" of Scotland Yard. The director of the Security Service reports to the prime minister through the home secretary.

The supervision of the Secret Service is the duty of the Joint Intelligence Committee, a Cabinet subcommittee under the permanent undersecretary of the foreign office. Another layer of control is exerted by the Cabinet secretary in the case of the Secret Service and by the permanent head of the Civil Service in the case of the Security Service.

Another principal member of the British intelligence community is the Defence Intelligence Service, resembling

the American Defense Intelligence Agency. This integrates intelligence specialists of the Royal Army, Navy, and Air Force within the Ministry of Defence. Still another service is Communications Intelligence, an organization for electronic surveillance and cryptology. Its operations are concentrated in what is called the Government Communications Headquarters (GCHQ) at Cheltenham.

The Joint Intelligence Committee combines all of the British intelligence agencies and performs functions of overall policy control and of approval of "national estimates" similar to those carried out by the U.S. National Intelligence Council. The British Cabinet and parliamentary government affords a system of accountability lacking in the United States.

France. Contemporary French intelligence and counterintelligence may be described as an amalgam of units dating from Napoleon Bonaparte and a system developed by Gen. Charles de Gaulle as leader of the Free French in World War II. From 1947 until 1981 the major French intelligence service was known as the Service de Documentation Extérieure et de Contre-Espionnage (SDECE). Colloquially it was termed "The Pool," referring to its mixture of military and civilian officers.

In 1981 SDECE was reorganized as the Direction Générale de la Sécurité Extérieure (DGSE). The structure also changed, but the agency's traditional functions remained: collection and analysis of foreign information, counterespionage outside of France, and overseas covert political actions. Because of France's former colonial ties to Africa, it is widely believed that the bulk of French intelligence operations and covert action have centred in West Africa.

Another major French intelligence agency is the Second Directorate of the National Defense Staff, combining, to some degree, formerly separate Army, Navy, and Air Force specialists. The traditions and doctrines of the old French Army's Deuxième Bureau (Military Intelligence) no doubt influence the general staff's Second Directorate. Its function is to gather foreign military intelligence. A third important member of the French intelligence system is the DST (Direction de la Sécurité du Territoire), charged with internal security. It is the French equivalent of the American FBI and operates under the administrative control of the Ministry of the Interior.

The SDECE was shaken in 1968 by the publication of the memoirs of Philippe Thyraud de Vosjoli, who had been an important officer in the French intelligence system for 20 years. De Vosjoli asserted that SDECE had been deeply penetrated by the Soviet KGB in the 1950s, an allegation that the government denied. He also indicated that there had been periods of intense rivalry between the French and American intelligence systems. There have been other indications that SDECE experienced a number of major intelligence failures, structural reorganizations, and changes of leadership in the period between 1950 and 1980.

China. The People's Republic of China has an intelligence system that resembles closely the system of the Soviet Union, although not much is known about it. Less distinct lines exist in China between the professional intelligence function and Communist Party administrative functions. The best information suggests that the intelligence organization consists of four major units: those of the Party, the State Council (the governmental bureaucracy), the military establishment (Defense Ministry), and the Ministry of Foreign Affairs.

Dominance of the party

Under the title Social Affairs Department, the intelligence unit of the Central Committee of the Communist Party attempted for some years to exert control over the entire intelligence system, much in the fashion of the Soviet KGB. This department, with perhaps 25,000 employees, is thought by some to have been abolished during the Cultural Revolution of the late 1960s. It is probable that only its name was changed. As in the U.S.S.R., the Army—through the Defense Ministry's large intelligence staff—is potentially a strong competitor of the civilian intelligence agencies. The Army chief of staff in China also runs the military secret police and heads the Political Department of the Defense Ministry. Clearly there are two main functions within the military: first, to assure the reliability and loyalty of the Chinese military establishment—in effect, an internal security function—and second, to secure positive intelligence about foreign military systems. The State Council operates a Ministry of Public Security that concerns itself mainly with internal security. Finally, there is the Foreign Intelligence Department in the Ministry of Foreign Affairs, responsible for intelligence gathering and other overseas activities, including covert political action. Its agents operate, like those of most other nations, through embassies, legations, the New China News Agency, the overseas Chinese, and other obvious channels.

Outside observers have speculated about the quality of Chinese foreign intelligence, and some have suggested that Peking's leaders are poorly informed about the outside world as a consequence of a party-dominated intelligence system reporting what its leaders want to hear. If this is true, it is but an exaggeration of a fault common to all intelligence systems. China's decreasing isolation from world politics, beginning in the early 1970s, will likely increase the sophistication of Chinese foreign intelligence.

Israel. The state of Israel, since its creation in 1948, has met its obvious need for intelligence and counterintelligence with services that have gained a first-class reputation. One mark of their professionalism is that less is known about them than about other systems. They constitute five major organizations.

The Central Institute for Intelligence and Security has a director who is chairman of a committee presiding over the entire Israeli intelligence system. The Central Institute operates primarily in foreign areas. Popularly known as Mossad, it carries out foreign espionage and covert political operations. The numerous Israeli secret agents living in Arab lands, for example, are under the supervision of Mossad. Its director is responsible to the prime minister.

Mossad and Shin Bet

A second agency is the Shin Bet, after the Hebrew initials for General Security Services. Its main function is internal counterintelligence. Shin Bet is an investigative agency concerned with potential sabotage, Arab terrorist activities, and security matters having a strong political flavour. A third major Israeli agency is the Intelligence Corps of the Defense Forces, commonly referred to as Military Intelligence. Some see it as a rival to Mossad, and conflicts between them have been reported. Its chief is the military intelligence adviser to the defense minister. The Research Department of the Foreign Ministry is a fourth agency. This relatively small unit focusses on political information, including policy-oriented studies and the evaluation of information supplied through diplomatic channels. The fifth member of the system—the Special Investigations Department of the Israel Police Force—is concerned with criminal investigations inside Israel's boundaries.

Israel's successes in wars with Arab countries may be attributed in some measure to the efficiency of its intelligence system. But it has not been without its scandals. The most dramatic was the "Lavon affair," which led to the resignation of Prime Minister David Ben-Gurion. This is said to have been an attempt in 1954 to blow up American and British information offices in Egypt in order to arouse Western public opinion against the Egyptians. But for the most part the secret services of Israel have operated without exposure and with frequent success.

Israeli intelligence has the advantage of a cosmopolitan population, providing persons whose language and experience enable them to pose as citizens of Chicago, Munich, London, Rome, or even Cairo. Recruitment is thought to be from three main sources: the Haganah, the one-time illegal Jewish army in Palestine, with its allied intelligence agency; ex-members of the Irgun and Stern groups that also operated in the prestate era; and the newer immigrants.

HOW INTELLIGENCE IS GATHERED

Good intelligence management must begin with the determination of what needs to be known. Unless precise requirements are set, data will be collected unsystematically and the decision maker left, in the end, without the required information. Once data are collected they must be evaluated and transformed into a usable form (and sometimes stored for future use). Evaluation is essential because of the wide variety of sources, many of them of doubtful reliability. A standardized system is used. Source

reliability may be rated A, B, C, etc., down a scale. Information accuracy may likewise be rated 1, 2, 3, etc., with 1 representing confirmed information and 3 denoting a "possibly true" degree of accuracy. Thus the classification of a bit of information as C-3 would mean it came from a fairly reliable source and was possibly true.

With organizational sophistication, refined procedures, and the most advanced technology, intelligence still falls into two categories—the knowable and the unknowable. It is possible to obtain hard intelligence on the number of Soviet intercontinental ballistic missiles. But it is not possible to predict, with precision, the political intentions of Soviet leaders.

Most valuable information comes from overt sources, that is to say, from sources accessible without resort to illegal methods. Open sources probably contribute more than 80 percent of the input to most intelligence systems. This varies according to the subject country, since clearly there are far fewer state secrets in some countries than in others. Foreign mass media, including press, radio, and television, are a standard source, and they require a massive effort in recording, translating, and storing information.

Covert sources and clandestine collection methods provide the basis for much of the drama and romance accorded intelligence work in fiction. The classic espionage agent is now obsolescent. Some have suggested that the place of the human agent on the ground is being taken by inanimate operators such as orbiting reconnaissance satellites, long-range cameras, and a variety of sensing, detecting, and acoustical instruments. It is now possible to see and hear at a distance in the night and to photograph from an altitude of hundreds of miles. A race has developed between the use of technology to uncover secrets and its use to make secrets more secure.

Techniques of reconnaissance have advanced dramatically since the 1940s, when the Soviets accused the United States, accurately, of drifting balloons carrying special cameras across Soviet territory to photograph military and industrial installations. The Peking Military Museum has had on display American drone aircraft, downed over China, that were used for photoreconnaissance missions. The American U-2 aircraft and its higher flying successors are capable of taking photographs of ground installations that experts can read with great accuracy. Orbiting satellites, continuing advances in photographic capabilities and sensing devices, and the growth of computer technology have radically changed intelligence and counterintelligence capabilities. The USS "Pueblo," captured by the North Korean government in January 1968, might accurately be described as an electronic scavenger sent to collect information about North Korean radio communications procedures, Soviet naval equipment and procedures, and other kinds of intelligence such as Soviet submarine signatures—telltale and unique signals permitting their later identification. Computers can be used to analyze complex data on industrial production, missile launchings, and economic growth rates. High-altitude photographs taken from aircraft or satellites yield information on crops, floods, drought areas, or even plant diseases, which in turn can be used to assess the economic prospects of a country.

Use of aircraft and satellites

So vast is the intake of information that intelligence systems have been threatened by inundation. In the years since World War II great efforts have gone into the development of efficient means for cataloging, storing, and retrieving on demand the gigantic volume of data being amassed. Intelligence agencies have led in developing new indexing and codifying techniques and machinery for the electronic analysis, storage, and location of specific information. Some believe that data collection has been overemphasized at the expense of analysis, but silicon chips and microcircuitry hold promise for coping with the tidal wave of information.

POLICY CONSIDERATIONS

Since World War II, intelligence has come to constitute one of the world's largest industries, employing hundreds of thousands of professionals. Annual expenditures for governmental and nongovernmental intelligence run into many billions of dollars. Under contemporary political and technological conditions, intelligence systems are likely to grow in size and scope. They have already taken on assignments that go beyond their informational and security functions, such as secret political and paramilitary operations. These activities will probably continue, since they are preferable to overt warfare between nuclear powers.

Among the superpowers, intelligence services have probably outgrown their optimal size. Secret bureaucracies tend to grow beyond the point of efficiency, especially when they can argue that the fate of the nation depends upon their budgetary health. There is also the problem of control. In some respects this is similar to the problem of civil–military relations, aggravated by the secrecy factor. To put the matter simply: knowledge is power, and secret knowledge is secret power. Historically, secret services have often been vehicles of conspiracy and political intrigue. Control is difficult to apply, in both democracies and authoritarian systems, since a secret service can logically demand secrecy for its operations. In an age of accelerating technology, it seems quite likely that the power of intelligence systems will grow vis-à-vis political authority. Presidents and prime ministers, to avoid becoming prisoners of their intelligence systems, will have to be alert to the need for effective policy controls.

BIBLIOGRAPHY

General works and bibliographies: GEORGE C. CONSTANTINIDES, *Intelligence and Espionage: An Analytical Bibliography* (1983), an authoritative bibliography with substantial annotations, covering works published to 1981; TYRUS G. FAIN (ed.), *The Intelligence Community: History, Organization and Issues* (1977), a reference work containing most of the important documentation, dealing primarily with the 1970s; ROY GODSON (ed.), *Intelligence Requirements for the 1980s,* 5 vol. (1979–82), symposium papers and comments on the whole range of questions, including intelligence, counterintelligence, and covert action; DAVID KAHN, *The Codebreakers: The Story of Secret Writing* (1967), a standard work on cryptanalysis, and *Hitler's Spies: German Military Intelligence in World War II* (1978); WILLIAM V. KENNEDY *et al., Intelligence Warfare* (1983), an authoritative catalog of modern intelligence technology; HARRY HOWE RANSOM, *The Intelligence Establishment,* rev. and enlarged ed. (1970), an analysis of the evolution, functions, and problems of U.S. intelligence, with a chapter on the British experience; MYRON J. SMITH, *The Secret Wars,* 3 vol. (1980–81), a comprehensive bibliography of secret operations, loosely defined, covering the period 1939–80.

United States: JAMES BAMFORD, *The Puzzle Palace: A Report on America's Most Secret Agency* (1982), a resourceful journalist's detailed description of the National Security Agency; RAY S. CLINE, *Secrets, Spies and Scholars: Blueprint of the Essential CIA* (1976), a former intelligence professional's description of the evolution of the intelligence system and of his role in its development; WILLIAM COLBY and PETER FORBATH, *Honorable Men: My Life in the CIA* (1978), a candid and sometimes critical account, by a former director of the Central Intelligence Agency, of Colby's intelligence experience; LAWRENCE FREEDMAN, *US Intelligence and the Soviet Strategic Threat* (1977), an analysis of the performance of U.S. intelligence in gauging Soviet military power in the 1960s and 1970s; MORTON H. HALPERIN *et al., The Lawless State: The Crimes of the U.S. Intelligence Agencies* (1976), a detailed summary of the findings of congressional and other investigations of intelligence agency abuses; WILLIAM LEARY (ed.), *The Central Intelligence Agency: History and Documents* (1984), containing a reprint of ANNE KARAKELAS' authoritative history of the CIA and important documents for the years 1947–81; RONALD LEWIN, *The American Magic: Codes, Ciphers and the Defeat of Japan* (1982), an account of the role of signals intelligence in the Pacific in World War II; MARK M. LEWENTHAL, *U.S. Intelligence: Evolution and Anatomy* (1984), a practical organizational description of the U.S. intelligence system; VICTOR MARCHETTI and JOHN D. MARKS, *The CIA and the Cult of Intelligence* (1974, reissued 1983), an expression of disillusionment with the American intelligence system by two former intelligence officers; DAVID C. MARTIN, *Wilderness of Mirrors* (1980), an insightful view of conflict between intelligence and counterintelligence within the U.S. system: THOMAS POWERS, *The Man Who Kept the Secrets: Richard Helms and the CIA* (1979), a journalist's astute analysis not only of Helms's intelligence career but also of many of the intelligence controversies in the United States from 1945 to 1979; HARRY ROSITZKE, *The CIA's Secret Operations: Espionage, Counterespionage and Covert Action* (1977), a former CIA official's account of secret actions; BRADLEY F. SMITH, *The Shadow Warriors* (1983), perhaps the best account to date of

the Office of Strategic Services in World War II; THOMAS F. TROY, *Donovan and the CIA: A History of the Establishment of the Central Intelligence Agency* (1981), a detailed account.

HINSLEY *et al., British Intelligence in the Second World War: Its Influence on Strategy and Operations,* 3 vol. (1979–84), an official history based on the authors' access to secret archives; R.V. JONES, *The Wizard War: British Scientific Intelligence 1939–1945* (1978), an account of the role and significance of technical intelligence in World War II, by a major participant; RONALD LEWIN, *Ultra Goes to War: The First Account of World War II's Greatest Secret Based on Official Documents* (1978, reissued 1980), a demonstration of how Allied access to Germany's secret communications aided victory in World War II; BRUCE PAGE, DAVID LEITCH, and PHILLIP KNIGHTLEY, *The Philby Conspiracy* (1968, reissued 1981), one of the most detailed accounts, by a team of journalists, of Soviet agent H.A.R. Philby's penetration of the British secret service.

Soviet Union: JOHN BARRON, *KGB: The Secret Work of Soviet Secret Agents* (1974), a standard history, and *KGB Today: The Hidden Hand* (1983); BRIAN FREEMANTLE, *KGB* (1982), a popular descriptive analysis; HARRY ROSITZKE, *KGB: The Eyes of Russia* (1981), a general description by a former CIA professional; VIKTOR SUVOROV (pseud.), *Inside Soviet Military Intelligence* (1984), an insider's view by a former Soviet intelligence professional.

(H.H.R.)

International Law

International law is the body of legal rules that apply between sovereign states and such other entities as have been granted international personality (status acknowledged by the international community). The term was coined by Jeremy Bentham and is synonymous with the term "law of nations" and its equivalents in other languages.

Like precepts of international morality, the rules of international law are of a normative character; that is, they prescribe standards of conduct. They distinguish themselves, however, from moral rules by being, at least potentially, designed for authoritative interpretation by an independent judicial authority and by being capable of enforcement by the application of external sanctions.

International law means public international law as distinct from private international law or the conflict of laws, which deals with the differences between the municipal laws of different countries.

International law forms a contrast to municipal law. While international law applies only between entities that can claim international personality, municipal law is the internal law of states that regulates the conduct of individuals and other legal entities within their jurisdiction.

International law should also be distinguished from quasi-international law, which is the law governing relations similar to those covered by international law but outside the pale of international law because at least one of the parties lacks international personality. Concession agreements between oil companies and sovereign states fall into this category. In case of doubt, they are subject to the municipal law of the state granting the concession.

Transnational law is a purely negative term. It is intended to convey that, in accordance with the intention of contracting parties, a transaction of a consensual character is not or should not be subject to municipal law.

Fundamentals of international law

VIEWS ON INTERNATIONAL LAW

A view of international law in three complementary perspectives assists in the better understanding of the subject. The sociological perspective offers an explanation of the social functions fulfilled by international law. The historical perspective provides insight into the growth potential of international law. The ethical perspective furnishes a normative measuring rod by which to test the moral adequacy of any particular system.

The sociological perspective. Law is primarily an outgrowth of a specific social environment. In particular, this applies to law in unorganized international society as well as in specific international societies organized on the confederate model, such as the League of Nations and the United Nations. The chief participants—the sovereign states, and especially the strongest among them—tend to view themselves as ultimate ends and are inclined to insist on control of the means indispensable for their survival in any crisis, especially their freedom to arm themselves. They form alliances and counteralliances for aggressive and defensive purposes, create precarious systems of balance of power, and pursue policies of involvement or isolation.

In such situations the primary function of law is to legitimate power; that is, the law assists in maintaining the supremacy of force and the hierarchies established on the basis of power and gives to such quasi-orders the respectability and sanctity of law. International law in unorganized international society serves these purposes in a variety of ways; for example, one of the cornerstones of international customary law is the independence of states, which provides for freedom of armament, access to raw materials and markets, and the admission of immigrants. Similarly, whether a state decides to participate in an international congress or conference depends on its own will. Moreover, in the absence of agreement to the contrary, unanimity is required for any decision reached in the assembly of any such international gathering. Fi-

nally, any binding third-party settlement of a dispute by reference to law or equity depends on the consent of the parties concerned.

By building international customary law on the foundation of state sovereignty, states make certain of reserving for themselves the choice between peace and war. Moreover, international customary law puts at the disposal of its subjects the right to apply measures short of war by way of reprisal against alleged breaches of international law.

In international confederations, such as the League of Nations and United Nations, the rights of sovereign states to threaten or resort to the use of force are limited by consensual undertakings. Yet, voting procedures providing for unanimity or reserving veto rights and wide escape clauses (such as those contained in articles 51 and 107 of the UN Charter) tend to reduce such peacekeeping systems to relative ineffectiveness, in particular in relation to the major world powers.

In fields less central to the systems of open power politics or power politics in disguise, international law may also fulfill the functions of a law of reciprocity and of a law of coordination. Thus, for example, on the basis of many treaties, an international customary law of diplomatic immunity, codified in the 1961 Vienna Convention on Diplomatic Relations, has developed.

Occasionally, the law of reciprocity—that is, a set of legal rules, compliance with which rests normally on the expectation of mutual advantages rather than on the fear of the application of external sanctions—intrudes even into spheres that are closer to actual power politics. This is always possible on a consensual basis, as in peace treaties, and occasionally has happened, as in the various conventions agreed upon at Lausanne in 1923 that terminated a war between Greece and Turkey. The laws of war are illustrations from international customary law. They include legal rules that apply to wars fought for limited purposes where both sides have exhausted the means of escalation available in systems of power politics but resist the temptation of total war with no legal restraints.

In an unorganized international society based on entities that tend to put their own interest before the commonweal, the scope of a law of coordination, or community law, in which the common interest overrides sectional interests, is limited. An example of this type of law is the gradual outlawry of the slave trade by bilateral and multilateral consensual undertakings, especially the Treaty of Paris (1815) and the Slavery Conventions of 1926 and 1956.

The historical perspective. Since the dawn of history inchoate systems of international law have come into existence in many parts of the world. Though of comparative interest, most have not had any influence on the evolution of contemporary international law. Leaving aside the borrowing of some Roman-law terminology and legal techniques, such continuity as exists in the practice of international law dates from early medieval international law.

Historical foundations

International law is the product of a threefold process initiated in the Western world: the disintegration of the medieval European community into a European society, the expansion of this European society, and concentration of power in a developing world society in the hands of a rapidly declining number of major world powers.

The premises of medieval international law were simple. (1) In the absence of an agreed state of truce or peace, war was the basic state of international relations even between independent Christian communities. (2) Unless exceptions were made by means of individual safe conduct or treaty, rulers saw themselves entitled to treat foreigners at their absolute discretion. (3) The high seas were no-man's-land, where anyone might do as he pleased.

Treaty law was the predominant feature of medieval international law. Sanctions varied from the exchange of hostages, the pledging of towns, castles, and territories, and the mortgaging of the personal property of kings, or their subjects, to the appointment of guardians or the addition of the signatures of powerful dignitaries representing the various estates of a prince's realm. Supernatural sanctions, such as solemn oaths or excommunications of a guilty party, were also employed. The observance of treaties and other engagements rested on the same basis as it did in subsequent phases of international law: self-interest, especially in relation to obligations of a reciprocal character, and the value attached by an obligated party to his moral credit and his respect for the principle of good faith.

International law and the expanded world of nation-states

With the expansion of European society the spiritual basis of inter-Christian international law was weakened but not eliminated. In particular, the universalist spirit that imbued the naturalist doctrine of international law gave to international law the elasticity needed to adapt itself to a constantly widening international environment. Even so, international law primarily served the purposes of assisting in the process of Western expansion.

In the process of the transformation of international law into a world law, international law exchanged its Christian foundation for that of a law among states that were civilized in a highly formal sense. Civilization was understood as compliance with the minimum requirements of the rule of law, as this term, or its continental equivalents, was used in pre-1914 days in the Western world, especially regarding the treatment of the persons and property of foreign nationals. It took merely a further step to make sovereignty the decisive test of full international personality. In the pre-1939 era of the coexistence of democratic communities with totalitarian states such as the Soviet Union, Fascist Italy, Nazi Germany, and militaristic Japan, international law had become a law among sovereign states.

While the coexistence of sovereign states in a legal system postulates equality, this equality in international law is of a purely formal character. For example, since the formation of the United Nations in 1945, membership has increased threefold. Even though the number of sovereign and equal states has sharply increased, real influence still rests with only a handful of nations. The veto power of the permanent members of the UN Security Council, the weighting of votes according to the financial interest taken in the International Monetary Fund, and the special position accorded to states of chief industrial importance (as in the International Labour Organisation) are indicative of this trend.

The development of the doctrine of international law followed only slowly in the wake of the practice of international law. In the early days of international law it sufficed to have lawyers trained in canon and civil law. They tended to apply to novel situations the concepts of municipal law with which they were familiar. This accounts for the long-continued overemphasis in the doctrine of international law on analogies from these familiar systems of internal community law to systems developed by societies with very different cultural traditions.

The beginnings of European international law and relations are to be found in the microscopic interstate system of the Italian city-states. Here may be seen the beginnings of the doctrine of international law, especially in the writings of two Italian lawyers, Bartolo da Sassoferrato (1314–57) and Baldo degli Ubaldi (1327–1400). When in the late 15th and 16th centuries Spain became the leading Western power, Francisco de Vitoria (*c.* 1486?–1546) founded the Spanish school of international law. In the 17th century it came to be rivaled by the Anglo-Dutch school, particularly in the persons of Alberico Gentili (1552–1608) and Hugo Grotius (1583–1645).

The early theorists

While neither Grotius nor any other exponent of international law was the "father" of international law, Grotius' *De Jure Belli ac Pacis* (1625; *On the Law of War and Peace*) acquired a fame far greater than that of the works of his predecessors. This was due to a combination of factors that appealed to his contemporaries and subsequent generations: he stressed the self-defeating character of war, accepted sovereign states as the basic unit of international law, and skillfully blended natural law, Roman law, and state practice in a manner that left in vital matters sufficient discretion to governments to do, without legal hindrance, what they thought opportune.

Samuel von Pufendorf (1632–94), the German publicist and jurist, espoused the priority of natural law over positive law. An extreme naturalist school following his lead attempted to identify international law with natural law.

In England, Richard Zouche (1590–1661) laid the foundations of positivism in international law, drawing a sharp distinction between the postulates of natural law and international law as actually supplied in state practice. An eclectic school, sometimes described as Grotian, tried to find a golden mean between the extremes of naturalism and positivism by relying on both natural and positive law. Christian Wolff (1679–1754) and Emerich de Vattel (1714–67) were two of its early exponents.

Contemporary approaches

The one-sidedness and subjectivity of these techniques led to new departures on inductive, interdisciplinary, and relativist lines. The essence of the inductive approach is in the ascertainment of the rules of international law exclusively by means of generally accepted and rationally verifiable evidence. In particular, this involves recognition that the principles, as distinct from the rules, of international law are normally merely abstractions from these rules but do not constitute legitimate law-creating processes. The interdisciplinary treatment of international law makes it possible to view international law from an outside perspective provided by sociology, history, and ethics. Finally, the exploration of the possible forms of the development of international law in a relativist way, that is making available, side by side, various patterns that exist for the solution of any social problem, provides a detached but constructive approach to problems of international law in the making.

The ethical perspective. In its own speculative framework, the naturalist doctrine of international law provided both sociological and ethical perspectives of the subject. Subsequently, during the reign of positivism, the consideration of these perspectives was neglected.

A less subjective ethical measuring rod than those applied by naturalist writers is that of civilization itself. Links between international law and civilization exist not only historically but also explicitly in one of the three law-creating processes that the International Court of Justice is charged to apply: the general principles of law recognized by civilized nations. Civilization in this sense is more than a mature and rational apparatus of thought and action. It is a continuous process toward, and away from, community relations; its aim is to develop relations ultimately based on free cooperation and fellowship rather than on fear.

The relations between international law and civilization have varied considerably throughout the history of international law. Ample evidence of this is furnished by state practice regarding the recognition of new governments, states, or nations; the large-scale disregard of the minimum standard regarding the treatment of foreigners; and the ambivalent attitude of states to the legality of weapons of mass destruction. Thus, the relation between international law and civilization is tenuous at the best of times, and it is advisable for any ethical evaluation of contemporary international law to err on the side of caution.

SOURCES OF INTERNATIONAL LAW

Basic issues

Certain basic issues call for discussion: the law-creating processes of international law; the law-determining agencies of international law; the relations between international law and municipal law; and the nature of and the relations between rules, principles, and standards of international law.

The law-creating processes of international law. These are the forms in which rules of international law come into existence; *i.e.,* treaties, rules of international customary law, and general principles of law recognized by civilized nations. It is the merit of article 38 of the Statute of the International Court of Justice that this exclusive list of primary law-creating processes has received almost universal consent. States that have assented to, or acquiesced in, resolutions adopted unanimously by the UN General Assembly and stated to be declaratory of existing international law may be thought to be prevented in good faith from contesting any longer the existence of a formerly controversial rule of international law. On a consensual basis and, thus, in accordance with one of the primary law-creating processes, this and other secondary law-creating processes can, and have, come into existence.

International customary law. This is essentially the international law of unorganized international society, and its rules can be summarized under the heads of seven fundamental principles. The two constitutive elements of international customary law are (1) a general practice of states on a universal, general, or regional basis and (2) the acceptance by the states concerned of this practice as law.

The origin of international customary law is frequently found in earlier treaty clauses, which subsequently were taken for granted, as with the rules regarding the minimum standard applicable to foreign nationals and their property. Occasionally, as in the law of the sea and the law of armed conflict, individual rules of international law have developed out of roughly parallel practices of the leading powers.

Treaties. Treaties and other consensual engagements are legally binding undertakings by which, without any requirements of form under international customary law, the subjects of international law may declare, modify, or develop existing international law as they see fit or agree on transactions; *e.g.,* of a territorial character. They are thus able to transform *jus strictum* into *jus aequum, jus dispositivum* into *jus cogens* (see below), and vice versa, and unorganized international society into global or regional international societies on confederate or supranational levels of integration.

The general principles of law recognized by civilized nations. Such principles must fulfill two requirements. To qualify under this heading, a legal principle must be a general principle of law, as distinct from a legal rule of a more limited functional scope. It must be recognized and shared by a fair number of civilized nations and probably include representation of at least the principal legal systems.

The general principles of law come into play only as a subsidiary law-creating agency, that is, in the absence of competing rules of international customary law or treaty law. Their existence in the background forestalls any argument that supposed gaps in international law prevent international judicial organs from deciding on the substance of any dispute submitted to their jurisdiction.

The law-determining agencies of international law. These agencies furnish the evidence for the existence of asserted rules of international law. The totality of the subjects of international law constitutes the relevant agency for any rules of universal customary international law. A convincing majority of subjects of international law provides the requisite evidence for the existence of an alleged rule of general customary international law. The ensemble of the parties to a treaty fulfills the same function in relation to any particular consensual engagement. The body of civilized nations forms the relevant law-determining agency regarding general principles of law recognized by civilized nations.

The decisions of international and national courts and tribunals plus the doctrine of international law (*i.e.,* the teachings of the most highly qualified publicists) constitute what are described in article 38 of the Statute of the International Court of Justice as "subsidiary" means for the determination of the rules of international law.

In practice, consensus scarcely ever exists in any of these law-determining agencies. Thus, it is necessary to determine the relative evidential value of any pronouncements made by the elements of law-determining agencies; *i.e.,* the views of individual parties to treaties, relevant diplomatic material, and pertinent decisions of international and national judicial organs. To obtain as objective as possible an evaluation, it is advisable to subject each case to a threefold scrutiny: the degree of generic and individual independence of the element of the law-determining agency concerned, its international outlook, and its professional attainments.

International law and municipal law. International law applies in the relations between the subjects of international law. The relations between subjects and objects, and between objects alone, of international law are governed by municipal law or quasi-international law.

While international law is a legal system that actually exists, the term municipal law is an abstraction from the

The relation between municipal and international law

multitude of legal systems that are internal to the individual subjects of international law. Thus, actual conflicts can only arise between international law and individual legal systems other than international law, such as United States law or Soviet law. How such conflicts are resolved depends on the level on which they arise. Ultimately, any municipal organ is governed by its own municipal law and must, if needs be, give priority to it. Similarly, international organs, such as the International Court of Justice, may have to give priority to international law and treat municipal law as inferior in an accepted hierarchy of interlocking legal systems. They may even view international law as being exclusive of all other law and treat municipal law as a mere set of facts, which, as the case may be, complies with or contravenes the international obligations of a subject of international law.

Other basic issues of international law. *Rules, principles, and standards.* The rules of international law are the legal norms that can be verified as the products of one or more of the three generally recognized law-creating processes. For purposes of systematic exposition and legal education, it is also valuable to abstract principles from legal rules. Such principles of international law provide the common denominator for a number of related legal rules. They must not be abused by reversing the procedure for the purpose of deriving from them additional legal rules that cannot be verified independently by reference to the primary or secondary law-creating processes of international law. The more fundamental the rules that underlie any particular principle, the more a justification exists for seeing the principle itself as fundamental. It is possible to summarize the whole of international customary law in a number of fundamental principles, and attempts even have been made to reduce all these rules to a single fundamental principle, or *Grundnorm,* such as consent, recognition, and good faith.

Underlying norms

By way of treaty, subjects of international law are free to create additional principles; *e.g.,* those of freedom of commerce or navigation, or a principle such as that of peaceful coexistence embodied in article 2 of the Charter of the United Nations. Unless parties desire to give unconditional effect to any such optional principle, they have at their disposal counterparts to compulsory rules in the form of optional standards, such as those postulated by most favoured nation and preferential treatment.

Jus dispositivum and jus cogens. In terminology derived from Roman law, a distinction is made in mature legal systems of municipal law between rules that may be altered by contracting parties (*jus dispositivum*) and others that may not (*jus cogens*). As distinct from legal systems with a centralized legal order, around which such *jus cogens* has grown, international customary law, as the law of unorganized international society, does not know of any such peremptory rules. Limitations on the freedom of states imposed by common sense, self-interest, and other pragmatic considerations must not be mistaken for *jus cogens.* Yet, nothing prevents sovereign states from creating peremptory international law by way of treaty; *e.g.,* the seven principles formulated in article 2 of the United Nations Charter.

Jus strictum and jus aequum. Also derived from Roman law, this distinction indicates differences between two other types of rule. Rules of *jus strictum* (*e.g.,* the rules of international customary law on the right of a state to request the recall of a foreign envoy as persona non grata) must be interpreted strictly and literally as embodying absolute rights. Others, such as those providing for freedom of communication, must be interpreted as rules of *jus aequum; i.e.,* in a reasonable and equitable manner.

Rules of international law

CUSTOMARY INTERNATIONAL LAW

The basic rules of international customary law can be summarized in the following fundamental principles: sovereignty, recognition, consent, good faith, freedom of the seas, international responsibility, and self-defense. In this survey are also included post-1945 codifications of the relevant rules of international customary law.

Sovereignty. Initially, a subject of international law is bound only by applicable rules of universal or general international customary law. Additional international obligations may be imposed on any subject of international law only with its consent. Unless the territorial jurisdiction of a state is excluded or limited by rules of international law, its exercise is exclusively the concern of the state in question. Subjects of international law may claim potential jurisdiction over persons or things outside their territorial jurisdiction. In the absence of permissive rules to the contrary (*e.g.,* the right of hot pursuit from the territorial sea to the high sea, or the right of reprisal) they may exercise such jurisdiction only inside their territories. It follows from the coexistence of sovereign states under international law that, in principle, they are all equal in status.

Territorial jurisdiction

Recognition. The rules governing recognition cover situations such as the co-option of new subjects of international law, the recognition of territorial claims of another state, the grant and withdrawal of nationality, and the recognition of the maritime flag of a landlocked state.

In principle, recognition is discretionary, but premature recognition of belligerents and insurgents runs counter to the exclusive domestic jurisdiction of the other state concerned and is illegal. The scope and effects of recognition must be ascertained according to the tenor of the act of recognition and its context. It may be unconditional or conditional and may be explicit or implied.

The devices of protest and reservation of rights may be used to prevent silence from being misinterpreted as an implied recognition of a situation or transaction. Notification is a means of bringing a situation or transaction to the attention of a third power with the intent to invite recognition or some other reaction.

The uses of recognition

In practice, the chief function of recognition is to acknowledge the existence of an entity as a subject of international law with whom another state can maintain diplomatic relations. The main forms of recognition are recognition of a state or government as exercising de facto or de jure authority in a territory or, as it is simply called, de facto and de jure recognition. De facto recognition implies acceptance of the claim of the recognized government to exercise jurisdiction within its own territory. De jure recognition, however, usually implies acceptance of the claim of the recognized government to exercise extraterritorial jurisdiction over, for example, nationalized companies that own ships entitled to sail under the flag of the recognized state.

Recognition, being a matter of intent, may fall short of full recognition and be limited to recognition of a group as belligerents or as insurgents, if such rebels are in de facto control of part of the territory of another state.

Sovereign states are the principal subjects of international law. Yet nothing prevents states from recognizing dependent states with limited international personality, such as international protectorates or the former mandates of the League of Nations. None of the trust territories of the United Nations has international personality. They are, however, under the control of the United Nations. Similarly, states are free to recognize, for all or limited purposes, nontypical subjects, such as the Holy See, international institutions, and even individual persons as subjects of international law. In each case, whether any entity has been so recognized is merely a question of evidence.

Consent. The rules on consent enable subjects of international law, when entering into agreement, to modify and to supplement as they see fit, but without prejudice to the rights of third parties, any of the rules of international customary law or the general principles of law recognized by civilized nations.

Sovereign states have full capacity to enter into any kind of consensual engagement. The capacity of other entities with international personality to undertake consensual commitments under international law is limited according to the scope of their international personality. In the absence of evidence to the contrary, consensual engagements between subjects of international law are governed by international law, but consensual engagements between subjects and objects, or between objects of international law, are outside the pale of international law.

The ambit of agreement

Barring prior obligations to the contrary, as contained, for example, in an undertaking to negotiate or conclude another agreement, the entry into consensual engagements is purely optional.

International customary law does not prescribe any particular form for consensual engagements, unless the parties desire not to create legal obligations. The effect of consent given in accordance with the requirements of international law is to create legal rights and duties between the contracting parties. In the absence of any contrary intention of the parties, the suspension, revision, and termination of consensual engagements depend on the consent or acquiescence of each of the contracting parties.

Excepting agreements entered into by international organizations, the subject of the law of treaties is now codified in the 1969 Vienna Convention on the Law of Treaties.

Good faith. In the early phases of the evolution of international law, good faith meant, primarily, the absence of bad faith. Gradually, however, good faith was identified with the requirements of reasonableness, common sense, and equity.

Thus, parties to consensual engagements and parties responsible for duly communicated unilateral acts, which they intend to have legal effect, must interpret and execute such engagements in good faith. If a consensual engagement that is subject to international ratification has been ratified, good faith regulates also the relations between the parties prior to final ratification. Barring more specialized provisions, acts committed contrary to good faith by any international institution, all of which derive their authority from consensual engagements, are void. Excess of jurisdiction by an international judicial organ or corruption of judges by one of the parties falls in this category. Rules of *jus aequum* must be interpreted as relative rights; that is, their arbitrary exercise is an abuse of right and a tortious act. In the case of rights derived from rules of *jus strictum,* a harsh exercise of such rights is not illegal but amounts to an unfriendly act; that is, it is open to retorsion, meaning lawful but unfriendly acts of retaliation. On the international judicial level the consensual nexus within which judges and parties operate tends to transform any absolute rights into relative rights, subject to judicial balancing processes in which considerations of good faith, common sense, and reasonableness play a prominent part.

Equitable principles

Freedom of the seas. The inclusion of the rules on the freedom of the high seas (*i.e.,* those parts of the interlinking chain of oceans that lie seaward of the territorial sea) among those of a fundamental character would be justifiable on the ground alone that they apply geographically to two-thirds of the globe. These rules preclude the appropriation by any individual subject of international law of any portion of the high seas as distinct from the subsoil and bed of the sea. The exercise of permitted jurisdiction varies according to the state of peace, intermediacy between peace and war (*status mixtus*), or war between the states concerned. Subject to a number of exceptions, in time of peace a state may exercise jurisdiction only over ships entitled to fly its own flag. In a state of intermediacy, states are free, under international customary law, to interfere with one another's shipping by way of reprisal. In time of war, permissible interference with enemy and neutral shipping is regulated by the rules of sea warfare and prize law. The use of the high seas, the airspace above the high seas, and the seabed must be exercised with reasonable regard for the interests of others. The Conventions of 1954, 1962, and 1969 for the Prevention of Pollution of the Sea by Oil provide a limited implementation of this rule. Piracy *jure gentium* (*i.e.,* illegal acts of violence, detention, or depredation for private ends committed on the high seas) and slave trading are illegal forms of the use of the high seas under international customary law.

The subject is now largely codified in the 1958 Geneva Conventions on the High Seas and on Fishing and Conservation of the Living Resources of the High Seas.

International responsibility. The rules governing the principle of international responsibility complement all other rules of international law. They transform merely admonitory precepts into legal forms and, in this sense, may also be described as sanctions of international law.

The rules on international responsibility can be reduced to two propositions: (1) the breach of any international obligation by the organ of a subject of international law constitutes an illegal act or international tort, and (2) the commission of an international tort involves the duty to make reparation. These are rules of international customary law. Thus, the obligations they create arise independently of the will of any particular subject of international law, and they may be modified by consent and acquiescence. In particular, they can be strengthened by consensual rules that provide for penalties corresponding to those in municipal criminal law (sometimes also described as international criminal law) but, actually, constituting merely internationally postulated rules of municipal law, which may be waived by acquiescence and nonprosecution of claims (also described as extinctive prescription).

Other rules, such as the powers exercised by states in relation to pirates, blockade runners, and war criminals, constitute extraordinary forms of the exercise of national jurisdiction. They are lawful because the home states of these three groups of individuals may not in good faith contest the exercise of such jurisdiction.

Self-defense. In unorganized international society the distinction between the lawful and unlawful use of force was accepted in state practice in situations of *status mixtus.* In a state of war any limitations of the right to wage war (*jus ad bellum*) remained a largely ignored postulate of naturalist doctrine on the distinction between just (and legal) and unjust (and illegal) war. The realization of this objective had to await later multilateral treaties, which, by reference to the test of self-defense, incorporated the distinction between legal and illegal wars and other use of force.

The use of force

Under international customary law measures of self-defense may be taken against illegal acts that are attributable to another subject of international law; against acts of individuals, ships, or aircraft that disentitle any other subject of international law from the grant of protection; and against acts of objects of international law that lack a subject of international law that is entitled to give them diplomatic protection.

The need for self-defense must be compelling and instant. Measures of self-defense comprise any action, including hot pursuit from the territorial sea into the high seas, that is necessary to repel an imminent or present invasion of the rights of a subject of international law.

In cases not covered by the conditions of lawful self-defense, the threat or use of force under international customary law may amount to a legitimate form of self-help. If a subject of international law has committed an international tort and refuses to make reparation, the other party may resort to acts of retorsion or reprisal.

The legal effects of resorting to war under international customary law are to bring into operation the laws of war and neutrality (*jus in bello*).

INTERNATIONAL RULES GOVERNED BY TREATIES AND OTHER AGREEMENTS

The sphere of freedom of action for subjects of international law—what, in relation to typical international persons, may also be termed unlimited state jurisdiction—is governed primarily by the rules on sovereignty. Limitations of this jurisdiction come about as the result of the interplay of the rules underlying some of the other fundamental principles with those on sovereignty.

This interaction of rules has brought about secondary rules and legally determined situations. Five of these are of especial significance: territory, diplomatic law, and immunity; the protection of nationals abroad; freedom of commerce and navigation; extradition and asylum; and succession to international rights and obligations.

Territorial control

Territory. Owing to the preponderance, in a world largely appropriated by sovereign states, of territorial over personal jurisdiction, the rules governing title to territory are of major importance. There are significant exceptions, however, such as the high seas; Antarctica, barred from further exclusive appropriation by the 1959 Antarctic Treaty; and outer space and celestial bodies, excluded under the 1967 Outer Space Treaty. The rules relating to territory

rest, first, on sovereignty: occupation, addition by natural causes of new land to riverbanks (accretion, accession, or alluvion), and assumption, under international customary law, of sovereignty over territories whose state apparatuses have been destroyed by conquest (debellatio); second, on recognition that stops third parties from contesting the validity of a recognized title; and, third, on consent—namely, consent of the cession of territory.

The legal function of frontiers is to settle the exact extent of contiguous territories by unilateral action, express consent, recognition, or acquiescence.

The airspace above, and the subsoil below, national territory, including the territorial sea, are treated as appurtenances of a state's territory.

Internal waters include ports, harbours, all waters on the landward side of the baseline of the territorial sea, and historic bays; *i.e.,* bays that, irrespective of their width, are treated, on grounds of acquiescence or recognition, as subject to the jurisdiction of the coastal state.

The normal baseline of the territorial sea is the low-water line along a state's seacoast. It is generally recognized that the minimum breadth of the territorial sea is three miles. The outer limit of the territorial sea, which constitutes also the frontier between national territory and the high sea, is drawn by reference to the baseline.

Most of the sea matters are not codified in the 1958 Convention on the Territorial Sea and Contiguous Zone. While it has proved impossible to reach agreement on the breadth of the territorial sea, it is laid down in the above convention that the contiguous zone—*i.e.,* a geographically limited zone of the high seas contiguous to the territorial sea in which coastal states exercise a limited jurisdiction over foreign ships—should not extend beyond 12 miles from the baseline of the territorial sea. (G.Sc.)

Outer space. The successful launching in 1957 of the first artificial Earth satellite marked the beginning of a new branch of international law, namely, international space law. This refers to those rules within the international legal system that regulate human activities in outer space, including the Moon and other celestial bodies, and in relation to outer space.

International space law embraces, in the first place, all existing and future rules of international customary or treaty law that contain no geographical limitations, expressed or implied, and are consequently applicable to any conduct of subjects of international law. Insofar as international customary law is concerned, these rules include virtually all those governing the principles of recognition, consent, good faith, self-defense, and international responsibility. That, in principle, international law was from the very beginning applicable to outer space has been reaffirmed by the United Nations on several occasions.

International space law includes, second, such new rules, whether of customary or treaty law, that have evolved since the beginning of the space age or that may be developed specifically to regulate the activities of states and their nationals in space or actions in relation to such activities. While a number of bilateral and multilateral agreements as well as international agencies already exist in this field, the United Nations has been particularly active in the development of general international space law. It has adopted a number of resolutions embodying recommended standards of conduct in relation to outer space and has prepared five multilateral treaties for adoption by states.

United Nations resolutions

These multilateral treaties are: (1) the 1967 Treaty on Principles Governing the Activities of States in the Exploration and Use of Outer Space, including the Moon and Other Celestial Bodies; (2) the 1968 Agreement on the Rescue of Astronauts, the Return of Astronauts and the Return of Objects Launched into Outer Space; (3) the 1972 Convention on International Liability for Damage Caused by Space Objects; (4) the 1975 Convention on Registration of Objects Launched into Outer Space; and (5) the 1979 Agreement Governing the Activities of States on the Moon and Other Celestial Bodies. The last one proclaims the Moon and other celestial bodies within the solar system, other than the Earth, together with their natural resources, the common heritage of mankind. All five treaties are in force among their respective contracting parties, but the most important of these are doubtless the treaties on principles and on liability. The latter lays down detailed rules governing the recovery of damages for losses caused by space objects.

Many of the provisions of the treaty on principles are not only binding on the contracting parties in terms of treaty law but also have gained wide acceptance from both parties and nonparties as expressing rules of general international law; consequently they are binding on all states. In fact, the technological advances in this sphere have been so fast and the need to adopt appropriate legal rules in response thereto has been so pressing that it has become increasingly apparent that much of the product of what has traditionally been called the law-creating process of international customary law need not rest on custom at all. Such practice as may be required as one of the two constitutive elements of a rule of international customary law needs to have existed only long enough to prove the existence of a general acceptance among states of the norm in question as a rule of international law. In fact, the law-creating process can be reduced to a single act or omission, and its role is reduced to that of merely establishing the acceptance of a given rule as law by the generality of states.

Among the norms of treaty law that appear to have acquired such general acceptance are primarily some of the basic principles found in the 1967 treaty. They include the principles that outer space, including the Moon and other celestial bodies, is not subject to national appropriation (Article II) and that the state of registry of a space object retains jurisdiction and control over such object and over any personnel thereof while in outer space or on a celestial body (Article VIII). If so, this means that under general international law there can be no territorial acquisition or exercise of territorial sovereignty in outer space and on celestial bodies. With regard to this issue, at least some of the rules underlying the principle of freedom of the high seas are capable of being applied by analogy. Two other principles from the 1967 treaty have probably also achieved the same status as rules of general international law: first, states bear international responsibility for national activities in space and must subject such activities, whether conducted by official bodies or private individuals, to authorizations and control (Article VI); and second, states that launch or procure the launching of a space object or from whose territory or facility a space object is launched are internationally liable for damage caused to another state or its nationals by such object (Article VII).

Neutrality of outer space

More problematic is Article IV of the 1967 treaty, a key provision from the standpoint of world disarmament. Article IV, in its first paragraph, prohibits the stationing of nuclear weapons or other weapons of mass destruction in outer space or on celestial bodies, while in its second paragraph it prescribes that the Moon and other celestial bodies (without mention of outer space as such) shall be "used . . . exclusively for peaceful purposes." The problem is twofold. First, it is difficult to determine, on the evidence available, whether this provision has been generally accepted as declaratory of general international law. Second, there is a wide division of opinion as to the interpretation of the word peaceful in the second paragraph. One school maintains that it means "nonmilitary," while the other argues that it means simply "nonaggressive." The latter interpretation appears to have gained currency, although it renders the stipulation supererogatory, inasmuch as aggressive activities as such are contrary to international law wherever they may occur.

The arrival of the space age has created many problems crying out for legal regulation. International agencies other than the United Nations have also contributed to the development of international space law. The International Telecommunication Union, for example, has done much to regulate, among other things, the use of radio frequencies for telecommunications and direct television broadcasting by artificial satellites. Many problems remain unresolved and others will no doubt arise. Among those being discussed are the definition of outer space and its delimitation from airspace, equitable use of the

geostationary orbit, the use of nuclear-powered satellites, international direct television broadcasting, remote sensing, and the military use of outer space. (Bi.C.)

Diplomatic law and immunity. States and international institutions can act only through individuals. Thus, relations between states—and international institutions—are based on the principle of necessary representation. The chief representative of a state is the head of state who, in principle, has plenary powers to commit his state. After a number of earlier attempts to settle continuous disputes over the precedence of diplomatic envoys, the classes of diplomatic envoys and their privileges and immunities are now codified in the 1961 Vienna Convention on Diplomatic Relations.

Protection and status of citizens and economic interests abroad

Similarly, the rights and immunities of consuls—resident officials stationed abroad with the consent of the receiving state for purposes of promoting trade and assisting nationals of the sending country—are codified in the 1963 Vienna Convention on Consular Relations.

The protection of nationals abroad. The relevant rules for such protection grew out of individual safe-conducts and innumerable bilateral treaties of commerce and navigation and, between civilized nations, were gradually taken for granted as rules of international customary law or general principles of law recognized by civilized nations.

These rules imply the application of a minimum standard that complies with the rule of law, as understood in liberal and democratic Western countries, regarding the protection of the life, liberty, dignity, and property of foreign nationals. Regarding property, the freedom of states to expropriate or nationalize private property in the public interest with full (or adequate), prompt, and effective compensation is generally accepted as a rule of international customary law. The rule has behind it the authority of the Permanent Court of International Justice and a considerable number of international tribunals. Doubts that have been raised against the continued validity of the rule (especially in Communist and capital-importing states) are related to the application of the rule in cases of doubtful titles to property rather than to the existence of the rule itself. There is also a widespread mixture of politics, trade, and aid that, on pragmatic grounds, frequently makes inadvisable an insistence by capital-exporting states on strict compliance with the rule.

Freedom of commerce and navigation. Under international customary law the right of foreign nations to trade in a country and use its means of communications, such as roads, rivers, and airspace, is within the exclusive jurisdiction of the territorial sovereign. By way of treaty such rights of commerce and navigation are granted normally on relative terms; *i.e.,* by reference to optional standards. The classical standards of international treaty law in these fields are those of most favoured nation treatment (treatment on the basis of foreign parity), national treatment (treatment on the basis of inland parity), identical treatment, equitable treatment, good-neighbourly treatment, open-door treatment (equal treatment of all concerned in a third sovereign state or a territory such as a United Nations trust territory), and preferential treatment. In state practice, some of these standards are employed cumulatively or alternatively in one and the same treaty.

Extradition and asylum. In accordance with a long-established practice, states have concluded extradition treaties enabling them to secure the return of fugitives from their own territorial jurisdiction. In states in which the rule of law in the Western sense applies, considerable care is taken to define precisely the offenses for which extradition may be granted, and extradition normally is limited to nonnationals of the country requested to grant extradition. While a number of states take a different view of political crimes, it is a liberal Western tradition to exclude political offenders from extradition unless they are charged with an attack on life.

Treatment of fugitives

In the absence of consensual undertaking to the contrary, any state may grant asylum in its own territory to any individual. This territorial asylum differs from diplomatic asylum; *i.e.,* asylum that is granted in diplomatic premises situated in another state's territory. In the absence of express treaty rights to this effect, diplomatic asylum may not be granted, but, on humanitarian grounds, the territorial sovereign often acquiesces in such action.

Succession to international rights and obligations. It is necessary to distinguish three typical situations: (1) revolution—this, in principle, is treated as a purely internal affair and does not affect the obligations of the subject of international law concerned; (2) territorial changes—if two states decide on the cession of an insignificant portion of territory, the matter is settled between the parties by the rules on consent and, in relation to third parties, by those on recognition; if a state agrees to its own truncation or if a composite state is dismembered, the legal consequences of such changes are settled by treaty, recognition, or acquiescence; (3) belligerent occupation—in the case of belligerent occupation falling short of debellatio, any territorial changes are treated as temporary while the war lasts. Furthermore, it is presumed that in the absence of any express settlement in a treaty of cession the public property of the ceding state becomes automatically the property of the cessionary state, and the public law of the ceding state is replaced by that of the cessionary state.

There is no general rule of international customary law imposing automatic succession by the cessionary state to the state debts of the ceding state. On equitable grounds, however, a rule to the opposite effect is frequently asserted regarding strictly localized debt. Cessionary states are under no obligation to assume any responsibility for tortious acts or omissions of the ceding state.

In principle, treaties are binding only between the contracting parties. Thus, if one of the parties cedes part of its territory, existing treaties are interpreted according to the rule of movable treaty frontiers; that is, the territorial scope of treaty obligations is presumed to be automatically adjusted to subsequent territorial changes. In cases in which the nonexistence of rules of international law on the automatic succession to international obligations would lead to harsh results, these are likely to be mitigated by the need of the new subject of international law concerned to be recognized and the freedom of existing subjects to make recognition dependent on compliance with justified expectations.

The role of international organizations

Global multipurpose institutions, such as the League of Nations and the United Nations, are best understood as organizational superstructures of international customary law on a consensual and confederate basis. Their impact on international law is threefold: modification by express consent of the rules underlying the fundamental principles of international law, indirect modification of these rules by acquiescence on the part of member states in the action of organs not actually authorized to exercise lawmaking functions, and initiation of the further codification and development of international law.

United Nations influence on international law

The chief modification introduced by the United Nations Charter is the limitation of the rights of subjects of international law under international customary law to threaten or resort to armed reprisals and war. This extends the duties of the former members of the League of Nations and parties to the Kellogg–Briand Pact of 1928. The prohibition covers the threat or use of force in circumstances falling short of war in the formal sense.

The principal means of indirect lawmaking in the United Nations are resolutions of the General Assembly that are adopted unanimously or with the two-thirds majority required for important questions. If such resolutions purport to be declaratory of international law, it is difficult for member states who voted for them to claim that, on the matters involved, the General Assembly is limited to the mere task of making recommendations. If the organs concerned of the United Nations act consistently on particular resolutions, eventually a time comes when even those states that have voted against them will be deemed to have acquiesced in such resolutions. Nonmember states that are admitted to membership in the United Nations after such resolutions have been adopted may find themselves in a similar situation. They have obtained their recognition on the assumption that they will abide by the

generally accepted rules of international law, and, increasingly, member states that grant recognition may equate the near-universal law and practice of the United Nations with general international customary law. Moreover, new members must expect that they join this global confederation as they find it.

A number of resolutions passed by the General Assembly fall into this in-between category of law-in-the-making—*e.g.,* those on the Nuremberg Principles that dealt with crimes against peace, war crimes, and crimes against humanity (Res. No. 95[II], 1946); genocide (Res. No. 96[I], 1946); the Universal Declaration of Human Rights (Res. No. 217[III], 1948); the right of peoples and nations to self-determination (Res. No. 637[VII], 1952); permanent sovereignty over natural resources (Res. No. 1803[XVII], 1962); denuclearization (Res. No. 1884[XVIII], 1963); and nonintervention (Res. No. 2131[XX], 1965).

In some instances, as before the adoption of the Universal Declaration of Human Rights, the almost unanimous protestations by speakers in the General Assembly regarding the purely moral character of the precepts enshrined in the declaration provide adequate evidence of the nonlegal character of the resolution in question. In others, such intention may become evident from the self-contradictions contained in the resolutions themselves. In still others, the intimation of the need for further study and the request for codification of the subject may suggest the political rather than legal character of a particular resolution. But if at any subsequent stage it can be shown that large and consistent majorities of the principal organs of the United Nations accept rules laid down in such resolutions as legally binding, the transition from law-in-the-making to new law tends to be made.

International Law Commission

The International Law Commission, an auxiliary but autonomous organ of the General Assembly of the United Nations, consists of 25 members of recognized competence in international law (Article 2[1] of the Commission's Statute). It has initiated codification and development in a number of fields of international law. In practice, the commission does not distinguish between its efforts on the codification (*i.e.,* the restatement of existing international law) and the development of international law by draft rules involving changes in existing international customary law. Thus, any of the rules proposed by the commission must be examined from this point of view.

In the field of humanitarian law (*i.e.,* the protection of the individual) the International Convention on the Elimination of All Forms of Racial Discrimination of 1965 and the International Covenants on Civil and Political and on Economic, Social, and Cultural Rights, opened for signature in 1966, were channeled from the United Nations Commission on Human Rights to the General Assembly of the United Nations through the Economic and Social Council. On a level of closer constitutional and ideological homogeneity, the Council of Europe adopted the Rome Convention for the Protection of Human Rights and Fundamental Freedoms of 1950, as subsequently amended, and in the European Commission of Human Rights and the European Court of Human Rights provided the most effective means yet put into operation for the implementation of the protection of human rights.

On specialized topics, such as the law of the sea, international labour law, and international private law, the Inter-Governmental Maritime Consultative Organization, the International Labour Organisation, and the Hague Conference of Private Law, respectively, fulfill drafting functions of a quasi-legislative character comparable to those of the International Law Commission. Yet it remains for the sovereign states concerned to decide if they want to limit their freedom of action by such further consensual commitments.

Future development

If this will exists, states are not limited to the development of international law on a confederate level. They are free to transform regional, continental, or global areas into federations of a territorial type such as the Commonwealth of Australia. They may also try functional federation on the model of such European supranational organizations as the European Economic Community. Under these conditions the wheel has come full circle, and international law turns again into municipal law, but, until such a development becomes universal, international law is likely to remain indispensable in the relations between such sectional groupings. 20th-Century International Relations

The purpose of diplomatic history is to explain the origins and the effects of foreign policies, and its focus is each country's policy-making elite. But this involves the historian at once in a complication. The statesman exists simultaneously in two realms: the domestic political system whence his authority derives, and the international system in which he represents his state to the world. Pressures and problems, temptations and opportunities arise constantly from both realms. Which one ought to command the historian's attention? The founders of modern diplomatic history, beginning with Leopold von Ranke, propounded a view known as "the primacy of foreign policy." Founded on German Idealist philosophy, Rankeanism asserted the primary influence of a state's geography and external threats in the shaping, not only of its foreign policy but of its internal military, political, and cultural institutions as well. An island kingdom like Britain, for instance, free of the constant threat of invasion, could militarily afford and commercially benefit from liberal institutions. Prussia, by contrast, relatively poor and surrounded by potential enemies, required for its survival as a state rigorous centralization and militarization.

The primacy of foreign policy was especially plausible to historians immersed in the diplomacy of medieval and early modern Europe, when foreign policy was a virtual monopoly of the prince and his advisers. The rationalist bias of the Enlightenment reinforced the notion of the international state-system as a kind of self-regulating Newtonian universe in which states revolved about each other in alliance or war according to natural laws of self-interest and balance of power. A wise ruler like Frederick II the Great of Prussia saw himself as "the first servant of the state" and made policy according to *raison d'état,* the prudent and rational dictate of dynastic interest. This model of the international system, while reductionist, was not determinist, since it made room for the wisdom and folly, courage and cowardice of individual rulers.

But the debate over the origins of World War I, and the failure of documentary reconstruction of the diplomatic narrative to resolve the question of responsibility for 1914, threw diplomatic history into a crisis. By the late 1920s historians like Sidney Fay and Pierre Renouvin were looking beyond the documents for the deeper or long-range causes of the war, such as militarism or imperialism. Historians influenced by sociology and economics, in turn, located the seeds of the fateful foreign policies preceding the war in the economic and social conflicts of prewar Europe. A young German, Eckhart Kehr, turned Ranke on his head by postulating a "primacy of domestic policy" and argued that a state's foreign policy derives from domestic social and political forces, not vice versa. In particular, imperialism and militarism were seen to be defensive strategies by which threatened elites attempted to rally their people against a foreign threat to distract them from social tensions at home. But if the old diplomatic history was simplistic and dangerous in its glamorization of the exercise of power, the primacy of domestic policy tended to the opposite extreme, ignoring the fact that governments are obliged to respond to real pressures from abroad regardless of their domestic situation. An empirical approach, therefore, is to examine the internal causes of foreign policy in all states and also the effects of those policies on all other states as they are transmitted through the international system.

Ultimately, the conduct and analysis of diplomacy and war rest on a calculus of the power of each state in the system and of its perception by others. National power is the product of all those assets, human and material, that contribute to a state's ability to influence the behaviour of other states by force, threat, or inducement. Human sources of power include population, educational level and work discipline, morale, motivation (through ideology, patriotism, or charismatic leadership), and skill in military and civil administration. Material resources include land area and climate, geographic location, raw materials, and agricultural resources. Last but not least is technology, which is a function of both human and material resources and which can alter the importance of population and geography and render once-effective administrative systems obsolete. Despite the best efforts of political scientists and military planners, these elements of national power (especially human resources) are difficult to quantify and compare. Hence misperception by one state of another's capabilities and intentions is almost the rule rather than the exception. This is why those elusive assets, prestige and intelligence, are sometimes decisive in diplomacy and war.

International relations are shaped primarily by those states perceived to be Great Powers, countries whose interests and capabilities transcend their own self-defense or region. For some 200 years after the treaties of Utrecht and Nystad (1713–14, 1721), the roster of the Great Powers included the same five states: Britain, France, Prussia (and, later, Germany), the Habsburg monarchy (Austria), and Russia. But a mere three decades after World War I only one of these venerable powers, Britain, had not undergone two or more radical changes of government, and only one, Russia, was still a Great Power. Between 1914 and 1945 the European system committed suicide, and two global superpowers rose to replace it. And four decades after 1945, the ability of the United States and the Union of Soviet Socialist Republics to control events around the world was in turn challenged from many sources, giving rise to speculation that the world might be in the early stages of a shift back into a multipolar balance-of-power system.

This article is intended to provide a single integrated narrative of world diplomacy and politics from the outbreak of World War I to the 1980s. Its twin themes are the rivalries of the Great Powers during the age of the world wars and the Cold War, and the replacement, largely through the agency of those wars, of the European state system by a world system with many centres of both power and discord. Because domestic affairs figure heavily in the analysis of each state's foreign policies, the reader should consult the histories of the individual countries for more detail.

For discussion of the military strategy, tactics, and conduct of World War I and World War II, see WORLD WARS, THE. For coverage of related topics in the *Macropædia* and *Micropædia,* see the *Propædia,* sections 963, 96/10, 96/11, and all of Part Nine, Division VII, especially sections 971, 972, 975, 976, and 978.

The roots of World War I, 1871–1914

Forty-three years of peace among the Great Powers of Europe came to an end in 1914, when an act of political terrorism provoked two great alliance systems into mortal combat. The South Slav campaign against Austrian rule in Bosnia, culminating in the assassination of the Habsburg heir-apparent at Sarajevo, was the immediate spark. But this local crisis rapidly engulfed all the powers of Europe through the mechanisms of the Triple Alliance and the Triple Entente, diplomatic arrangements meant precisely to enhance the security of their members and deter potential aggressors. The long-term causes of the war can therefore be traced back to the forces that impelled the formation of those alliances, increased tensions among the Great Powers, and made at least some European leaders desperate enough to seek their objectives by force, even at the risk of a general war. These long-range forces include militarism and mass mobilization, instability in domestic and international politics occasioned by rapid industrial growth, global imperialism, popular nationalism, and the rise of a social Darwinist worldview. But the question of why World War I broke out should be considered together with the questions of why peace ended, and why in 1914 rather than before or after.

THE BISMARCKIAN SYSTEM, 1871–90

The era of the Great Powers. The European map and world politics were less confused in the decades after 1871 than at any time before or since. The unifications of Italy and Germany removed the congeries of Central European principalities that dated back to the Holy Roman Empire, while the breakup of eastern and southeastern Europe into small and quarreling states (a process that would yield the term balkanization) was not far advanced. There the old empires, Russian, Austro-Hungarian, and Ottoman (Turkish), still prevailed. The lesser powers of Europe, including some that once had been great, like The Netherlands, Sweden, and Spain, played little or no role in the affairs of the Great Powers unless their own interests were directly involved. Both physical size and the economies of scale important in an industrial age rendered smaller and less developed countries impotent, while the residual habits of diplomacy dating from the Congress of Vienna of 1815, made the Great Powers the sole arbiters of European politics.

In the wider world, a diplomatic system of the European variety existed nowhere else. The outcome of the U.S. Civil War and Anglo-American settlement of the Canadian border ensured that North America would not develop a multilateral balance-of-power system. South and Central America had splintered into 17 independent republics following the final retreat of Spanish rule in 1820; but the new Latin-American states were inward-looking, their centres of population and resources isolated by mountains, jungle, and sheer distance, and disputes among them were of mostly local interest. The Monroe Doctrine, promulgated by the United States and enforced by the British Navy, sufficed to spare Latin America new European adventures, the only major exception—Napoleon's III's gambit in Mexico—occurring while the United States was preoccupied with civil war. When the United States purchased Alaska from the Russian tsar and Canada acquired dominion status, both in 1867, European possessions on the American mainland were reduced to three small Guianan colonies in South America. North Africa was still nominally under the aegis of the Ottoman sultan, while sub-Saharan Africa, apart from a few European ports on the coast, was terra incognita. The British had regularized their hold on the Indian subcontinent after the Indian Mutiny of 1857–58, while the Chinese and Japanese empires remained xenophobic and isolationist. Thus the cabinets of the European Great Powers were at the zenith of their influence.

Europe itself, by 1871, seemed to be entering an age of political and social progress. Britain's Second Reform Bill (1867), the French Third Republic (1875), the triumph of nationalism in Italy and Germany (1871), the establishment of universal manhood suffrage in Germany (1867), equality for the Hungarians in the Habsburg monarchy (1867), emancipation of the serfs in Russia (1861), and the adoption of free trade by the major European states all seemed to justify faith in the peaceful evolution of all Europe toward liberal institutions and prosperity.

International peace also seemed assured once Otto von Bismarck declared the new German Empire a satisfied power and placed his considerable talents at the service of stability. The chancellor knew Germany to be a military match for any rival but feared the possibility of a coalition. Since France would never be reconciled to her reduced status and the loss of Alsace-Lorraine imposed by the treaty ending the Franco-German War, Bismarck strove to keep France isolated. In 1873 he conjured up the ghost of monarchical solidarity and formed a Dreikaiserbund (Three Emperors' League) with Austria-Hungary and Russia. But such a combination was always vulnerable to Austro-Russian rivalry over the Eastern Question—the problem of how to organize the Balkan Peninsula as the feuding nationalities there gradually freed themselves from the decrepit Ottoman Empire.

The Three Emperors' League

After the Slavic provinces of Bosnia and Hercegovina rebelled against Ottoman rule in 1875, and Russia made war on the Ottoman Empire two years later, the Dreikaiserbund collapsed. Bismarck achieved a compro-

mise at the Congress of Berlin (1878), but Austro-Russian amity was not restored. In 1879, therefore, Bismarck concluded a permanent peacetime military alliance with Austria, whereupon the tsarist government, to court German favour, agreed to a renewal of the Dreikaiserbund in 1881. Italy, seeking aid for her Mediterranean ambitions, joined Germany and Austria-Hungary to form the Triple Alliance in 1882.

Balkan diplomacy

The next Balkan crisis, which erupted in Bulgaria in 1885, again tempted Russia to expand its influence to the gates of Constantinople. Bismarck dared not oppose the Russians lest he push them toward an alliance with vengeful France. So instead he played midwife to an Anglo-Austro-Italian combination called the Second Mediterranean Entente, which blocked Russian ambitions in Bulgaria while Bismarck himself concluded a Reinsurance Treaty with St. Petersburg in 1887. Once more the Eastern Question had been defused and Germany's alliances preserved.

The nature of the German state. The generation of peace after 1871 rested on Germany's irenic temper, served in turn by Bismarck's statesmanship. Should that temper change, or less adept leadership succeed Bismarck, Germany had the potential to become the major disrupter of European stability. For the constitution drafted by Bismarck for the Second Reich was a dysfunctional document designed to satisfy middle-class nationalism while preserving the power of the Prussian crown and the Junker class (the Prussian landed aristocracy). Apparently a federal empire, Germany was in fact dominated by Prussia, which was larger in area and population than all the other states combined. The king of Prussia was kaiser and chief warlord of the German armies; the prime minister of Prussia was the federal chancellor, responsible, not to a majority in the Reichstag, but only to the crown. Furthermore, Prussia retained a three-class voting system weighted in favour of the wealthy. The army remained, in Prussian tradition, virtually a state within the state, loyal to the kaiser alone. In sum, Germany remained a semi-autocratic military monarchy even as it blossomed into an industrial mass society. The lack of outlets for popular dissent and reform was especially damaging given the cleavages that continued to plague Germany after unification: Protestant North versus Catholic South; agriculture versus industry; Prussia versus the other states; Junkers versus middle-class liberals; industrialists versus the (increasingly Socialist) working class. Bismarck manipulated the parties and interests as he did foreign powers. But toward the end of his tenure, even he realized that German politics might someday reduce to a choice between surrender of privilege by the old elites or a coup d'état against the liberal and Socialist groups he labeled *Reichsfeinde* (enemies of the Reich).

Austria-Hungary and Russia, still overwhelmingly agrarian, faced different challenges by the end of the 19th century. Most acute for Austria-Hungary was the nationality question. An heir to the universalist vision of the Holy Roman Empire, Austria-Hungary was a multinational empire composed not only of Germans and Magyars but also of (in 1870) 4,500,000 Czechs, 3,100,000 Ruthenes, 2,400,000 Poles, 2,900,000 Romanians, 3,000,000 Serbo-Croats, and 600,000 Italians. In this age of nationalist ideology, the Habsburgs faced the challenge of accommodating the yearnings of their ethnic minorities without provoking the dissolution of their empire. In British, French, and, increasingly, Russian opinion, Austria-Hungary was simply out of step with the times, moribund, and, after Turkey, the most despised of states. Bismarck, however, saw Austria-Hungary as "a European necessity": the organizing principle in an otherwise chaotic corner of Europe, the bulwark against Russian expansion, and the keystone in the balance of power. But the progress of nationalism among the peoples of eastern Europe gradually undermined the legitimacy of the old empires. Ironically, Austria existed from 1815 to 1914 in a symbiotic relationship with her ancient enemy, the Ottoman Empire. For as the Balkan peoples gradually pulled free from Constantinople, they and their cousins across the Habsburg frontier inevitably agitated for liberation from Vienna as well.

Austria-Hungary's challenge

Russia was also a multinational empire, but with the exception of the Poles her subject peoples were too few compared to Great Russians to pose a threat. Rather, Russia's problem in the late 19th century was backwardness. Ever since the humiliating defeat in the Crimean War, tsars and their ministers had undertaken reforms to modernize agriculture, technology, and education. But the Russian autocracy, making no concession to popular sovereignty and nationality, was more threatened by social change even than the Germans. Hence the dilemma of the last tsars: They had to industrialize in order to maintain Russia as a Great Power, yet industrialization, by calling into being a large technical and managerial class and an urban proletariat, also undermined the social basis of the dynasty.

In sum, the decades after 1871 did not sustain the liberal progress of the 1860s. Resistance to political reform in the empires, a retreat from free trade after 1879, the growth of labour unions, revolutionary socialism, and social tensions attending demographic and industrial growth all affected the foreign policies of the Great Powers. It was as if, at its pinnacle of achievement, the very elements of liberal "progress"—technology, imperialism, nationalism, cultural modernism, and scientism—were inviting Europeans to steer their civilization toward calamity.

THE IMPACT OF INDUSTRIALISM AND IMPERIALISM

Patterns of population. European demographic and industrial growth in the 19th century was frantic and uneven, and both qualities contributed to growing misperceptions and paranoia in international affairs. European population grew at the rate of 1 percent per year in the century after 1815, an increase that would have been disastrous had it not been for the outlet of emigration and the new prospects of employment in the rapidly expanding cities. But the distribution of Europe's peoples changed radically, altering the military balance among the Great Powers. In the days of Louis XIV, France was the most populous—and also the wealthiest—kingdom in Europe, and as late as 1789 it numbered 25,000,000 to Britain's 14,500,000. When the French Revolution unleashed this national power through rationalized central administration, meritocracy, and a national draft based on patriotism, it achieved unprecedented organization of force in the form of armies of millions of men.

The French tide receded, at the cost of more than a million deaths from 1792 to 1815, never to crest again. Population growth in France, alone among the Great Powers, was almost stagnant thereafter; by 1870 her population of 36,000,000 was nearly equal to that of Austria-Hungary and already less than Germany's 41,000,000. By 1910 Germany's population exploded to a level two-thirds greater than France's, while vast Russia's population nearly doubled from 1850 to 1910 until it was more than 70 percent greater than Germany's, although Russia's administrative and technical backwardness offset to a degree her advantage in numbers. The demographic trends clearly traced the growing danger for France vis-à-vis Germany and the danger for Germany vis-à-vis Russia. Should Russia ever succeed in modernizing, she would become a colossus out of all proportion to the European continent.

The decline of France

Population pressure was a double-edged sword dangling out of reach above the heads of European governments in the 19th century. On the one hand, fertility meant a growing labour force and potentially a larger army. On the other hand, it threatened social discord if economic growth or external safety valves could not relieve the pressure. The United Kingdom adjusted through urban industrialization on the one hand and emigration to the United States and the British dominions on the other. France had no such pressure but was forced to draft a higher percentage of its manpower to fill the army ranks. Russia exported perhaps 10,000,000 excess people to its eastern and southern frontiers and several million more (mostly Poles and Jews) overseas. Germany, too, sent large numbers abroad, and no nation provided more new industrial employment from 1850 to 1910. Still, Germany's landmass was small relative to Russia's, her overseas possessions unsuitable to settlement, and her sense of beleaguerment acute in the face of the "Slavic threat." Demographic trends thus

Emigration as a safety valve

helped to implant in the German population a feeling of both momentary strength and looming danger.

Industry, technology, and trade. Industrial trends magnified the demographic, for here again Germany was far and away the fastest growing economic power on the Continent. This was so not only in the basic industries of coal and iron and steel but also in the advanced fields of electricity, chemicals, and internal combustion. Germany's swift development strained the traditional balance of power in her own society and politics. By the end of the century Germany had become a highly urbanized, industrial society, complete with large, differentiated middle and factory proletariat classes, but it was still governed largely by pre-capitalist aristocrats increasingly threatened by demands for political reform.

Industrialization also made possible the outfitting and supply of mass armies drawn from the growing populations. After 1815 the monarchies of Europe had shied away from arming the masses in the French revolutionary fashion, and the events of 1848 further justified their fear of an armed citizenry. But in the reserve system Prussia found a means of making possible a rapid mobilization of the citizenry without the risk to the regime or the elite officer corps posed by a large standing, and idle, army. (In Austria-Hungary the crown avoided disloyalty in the army by stationing soldiers of one ethnic group on the soil of another.) After Prussia's stunning victory over France in 1871, all the Great Powers came sooner or later to adopt the German model of a mass army, supplied by a national network of railways and arms industries coordinated in turn by a general staff. The industrialization of war meant that planning and bureaucracy, technology and finance were taking the place of bold generalship and esprit in the soldier's craft.

The final contribution to the revolution in warfare was planned research and development of weapons systems. Begun hesitantly in the French Navy in the 1850s and 1860s, command technology—the collaboration of state and industry in the invention of new armaments—was widely practiced by the turn of the century, adding to the insecurity that inevitably propelled the arms races. The demographic, technical, and managerial revolutions of the 19th century, in sum, made possible the mobilization of entire populations and economies for the waging of war.

The Pax Britannica

The home of the Industrial Revolution was Great Britain, whose priority in the techniques of the factory system and of steam power was the foundation for a period of calm confidence known (with some exaggeration) as the Pax Britannica. The pound sterling became the preferred reserve currency of the world and the Bank of England the hub of international finance. British textiles, machinery, and shipping dominated the markets of Asia, South America, and much of Europe. The British Isles (again with some hyperbole) were "the workshop of the world" and in consequence from 1846 led the world in promoting free trade. British diplomacy, proudly eschewing alliances in favour of "splendid isolation," sought to preserve a balance of power on the Continent and to protect the routes to India from Russian encroachment in the Middle East or Afghanistan.

The Pax Britannica could last only as long as Britain's industrial hegemony. But that hegemony very naturally impelled other nations somehow to catch up, in the short term by imposing protective tariffs to shield domestic industries and in the longer term by granting government subsidies (for railroads and other national development work) and the gradual replication of British techniques. First Belgium, France, and New England, then Germany and other states after 1850 began to challenge Britain's industrial dominance.

France (1860), Prussia (1862), and other countries then reversed earlier policies and followed the British into free trade. But in 1873 a financial panic, attributed by some to overextension in Germany after receipt of France's billion-franc indemnity, ended the period of rapid growth. In the depression of 1873–96 (actually years of slower, uneven growth) industrial and labour leaders formed cartels, unions, and lobbies to agitate for tariffs and other forms of state intervention to stabilize the economy. Bismarck resisted until European agriculture also suffered from falling prices and lost markets after 1876 owing to the arrival in European ports of North American cereals. In 1879 the so-called alliance of rye and steel voted a German tariff on foreign manufactured goods and foodstuffs. Free trade gave way to an era of neo-mercantilism. France, Austria, Italy, and Russia followed the new (or revived) trend toward tariff protection. After 1896 the volume of world trade rose sharply again, but the sense of heightened economic competition persisted in Europe.

The alliance of rye and steel

Social rifts also hardened during the period. Challenged by unrest and demands for reforms, Bismarck sponsored the first state social insurance plans, but he also used an attempt on the Kaiser's life in 1878 as a pretext to outlaw the Social Democratic Party. Conservative circles, farmers as well as the wealthier classes, came gradually to distrust the loyalty of the urban working class, but industrialists shared few other interests with farmers. Other countries faced similar divisions between town and country, but urbanization was not advanced enough in Russia or France for socialism to acquire a mass following, while in Britain agriculture had long since lost out to the commercial and industrial classes, and the working class participated fully in democratic politics. The social divisions attending industrialization were especially acute in Germany because of the rapidity of her development and the survival of powerful pre-capitalist elites. Moreover, the German working class, while increasingly unionized, had few legal means of affecting state policy. All this made for a series of deadlocks in German politics that would increasingly affect foreign policy after Bismarck's departure.

The New Imperialism. The 1870s and 1880s, therefore, witnessed a retreat from the free market and a return to state intervention in economic affairs. The foreign counterpart to this phenomenon was the New Imperialism. The Great Powers of Europe suddenly shook off almost a century of apathy toward overseas colonies and, in the space of 20 years, partitioned almost the entire uncolonized portion of the globe. Theories postulating Europe's need to export surplus capital do not fit the facts. Only Britain and France were capital-exporting countries in 1880, and in years to come their investors preferred to export capital to other European countries (especially Russia) or the Western Hemisphere rather than to their own colonies. The British remained free-trade throughout the era of the New Imperialism, a booming home economy absorbed most German capital, and Italy and Russia were large net importers of capital. Once the scramble for colonies was complete, pressure groups did form in the various countries to argue the economic promise of imperialism, but just as often governments had to foster colonial development. In most cases, trade did not lead but followed the flag.

Imperialism and capital

Why, then, was the flag planted in the first place? Sometimes it was to protect economic interests, as when the British occupied Egypt in 1882, but more often it was for strategic reasons or in pursuit of national prestige. One necessary condition for the New Imperialism, often overlooked, is technological. Prior to the 1870s Europeans could overawe native peoples along the coasts of Africa and Asia but lacked the firepower, mobility, and communications that would have been needed to pacify the interior. (India was the exception, where the British East India Company exploited an anarchic situation and allied itself with selected native rulers against others.) The tsetse fly and the *Anopheles* mosquito—bearers of sleeping sickness and malaria—were the ultimate defenders of African and Asian jungles. The correlation of forces between Europe and the colonizable world shifted, however, with the invention of shallow-draft riverboats, the steamship and telegraph, the repeater rifle and Maxim gun, and the discovery (in India) that quinine is an effective prophylactic against malaria. By 1880 small groups of European regulars, armed with modern weapons and exercising fire discipline, could overwhelm many times their number of native troops.

The scramble for Africa

The scramble for Africa should be dated, not from 1882, when the British occupied Egypt, but from the opening of the Suez Canal in 1869. The strategic importance of that

waterway cannot be overstated. It was the gateway to India and East Asia and hence a vital interest nonpareil for the British Empire. When the Khedive of Egypt defaulted on loans owed to France and Britain, and a nationalist uprising ensued—the first such Arab rebellion against the Western presence—the French backed away from military occupation, although with Bismarck's encouragement and moral support they occupied Tunis in 1881, expanding their North African presence from Algeria. Prime Minister William Ewart Gladstone, otherwise an adamant anticolonialist, then established a British protectorate in Egypt. When the French reacted bitterly, Bismarck further encouraged French colonial expansion in hopes of distracting them from Europe, and he then took his own country into the fray by claiming four large segments of Africa for Germany in 1884. In that year the King of the Belgians cast his eye on the entire Congo Basin. The Berlin West Africa Conference of 1884–85 was called to settle a variety of disputes involved in European colonial occupation, and over the next 10 years all the Great Powers of Europe save Austria-Hungary staked out colonies and protectorates on the African continent. But whatever the ambitions and rivalries of military adventurers, explorers, and private empire-builders on the scene, the cabinets of Europe came to agreements on colonial boundaries with surprising neighbourliness. Colonial wars did ensue after 1894, but never between two European colonial powers.

It has been suggested that imperial rivalries were a long-range cause of World War I. It has also been said that they were a safety valve, drawing off European energies that might otherwise have erupted in war much sooner. But the links between imperialism and the war are more subtle. The heyday of the New Imperialism, especially after 1894, created a tacit understanding in the European elites and the broad literate classes that the days of the old European balance of power were over, that a new world order was dawning, and that any nation left behind in the pursuit of world power would sink into obscurity. This intuition must surely have fed a growing sense of desperation among Germans, and one of paranoia among Britons, about trends in global politics. A second point, subtler still, is that the New Imperialism, while it did not directly provoke World War I, did occasion a transformation of alliances that proved dangerous beyond reckoning once the Great Powers turned their attention back to Europe.

The impact of social Darwinism

Charles Darwin published *The Origin of Species* in 1859, and within a decade popularizers had applied—or misapplied—his theories of natural selection and survival of the fittest to contemporary politics and economics. This pseudoscientific social Darwinism appealed to educated Europeans already demoralized by a century of higher criticism of religious scripture and conscious of the competitiveness of their own daily lives in that age of freewheeling industrial capitalism. By the 1870s books appeared explaining the outcome of the Franco-German War, for instance, with reference to the "vitality" of the Germanic peoples by comparison to the "exhausted" Latins. Pan-Slavic literature extolled the youthful vigour of that race, of whom Russia was seen as the natural leader. A belief in the natural affinity and superiority of Nordic peoples sustained Joseph Chamberlain's conviction that an Anglo-American–German alliance should govern the world in the 20th century. Vulgar anthropology explained the relative merits of human races on the basis of physiognomy and brain size, a "scientific" approach to world politics occasioned by the increasing contact of Europeans with Asians and Africans. Racialist rhetoric became common currency, as when the Kaiser referred to Asia's growing population as "the yellow peril" and spoke of the next war as a "death struggle between the Teutons and Slavs." Poets and philosophers idealized combat as the process by which nature weeds out the weak and improves the human race.

By 1914, therefore, the political and moral restraints on war that had arisen after 1789–1815 were significantly weakened. The old conservative notion that established governments had a heavy stake in peace lest revolution engulf them, and the old liberal notion that national unity, democracy, and free trade would spread harmony, were all but dead. The historian cannot judge how much social Darwinism influenced specific policy decisions, but a mood of fatalism and bellicosity surely eroded the collective will to peace.

COMPLETING THE ALLIANCE SYSTEMS, 1890–1907

Germany's new course. In 1890 the young Kaiser William II dismissed the aged Bismarck and proclaimed a new course for Germany. An intelligent but unstable man who compensated for a withered arm with military demeanour and intemperate remarks, William felt keenly his realm's lack of prestige in comparison with the British Empire. William rejected Bismarck's emphasis on security in Europe in favour of a flamboyant *Weltpolitik* (world policy) aimed at making Germany's presence abroad commensurate with her new industrial might. Where Bismarck considered colonies a dangerous luxury given Germany's geographic position, the Kaiser thought them indispensable for Germany's future. Where Bismarck sought alliances to avoid the risk of war on two fronts, the Kaiser (and his chief foreign policy official, Baron von Holstein) believed Germany should capitalize on the colonial quarrels among France, Britain, and Russia. Where Bismarck had outlawed the Socialists and feared for the old order in Germany, the Kaiser permitted the anti-Socialist laws to lapse and believed he could win over the working class through prosperity, social policy, and national glory.

The consequences of the new course were immediate and damaging. In 1890 Holstein gratuitously dropped Bismarck's Reinsurance Treaty with Russia, prompting St. Petersburg to overcome its antipathy to republican France and conclude a military alliance in 1894. The tie was sealed with a golden braid: Between 1894 and 1914 the Russians floated billions of francs in loans on the Paris market to finance factory building, arms programs, and military railroads to the German border. Russia hoped mainly for French support in its colonial disputes with the British Empire and even went so far as to agree with Austria-Hungary in 1897 to hold the question of the Balkans in abeyance for 10 years, thereby freeing resources for the construction of the Trans-Siberian Railroad and the penetration of northern China. The German foreign office thus did not take alarm at the alliance Bismarck had struggled so long to prevent.

The Dual Alliance

The Sino-Japanese War of 1894–95 signaled the arrival of Japan on the world stage. Having seen their nation forcibly opened to foreign influence by Commodore Matthew C. Perry in 1853, the Japanese determined not to suffer China's fate as a hapless object of Western incursion.Once the Meiji Restoration established strong central government beginning in 1868, Japan became the first non-Western state to launch a crash program of industrialization. By the 1890s its modern army and navy permitted Japan to take its place beside the Europeans as an imperial power. In the war with China, Japan won control of Korea, Taiwan, Port Arthur on the Manchurian mainland, and other advantages. European intervention scaled back these gains, but a scramble for concessions in China eventuated. Russia won concessions in Manchuria, the French in South China, the Germans at Chiao-chou Bay on the Shantung Peninsula. In 1898 the United States annexed the Philippine Islands after the Spanish–American War. The loser in the scramble, besides China, was Britain, which had previously enjoyed a near monopoly in the China trade.

The threats to Britain's empire. British fortunes suffered elsewhere during this high tide of imperialism from 1897 to 1907. The South African, or Boer, War (1899–1902) against the independent Boer republics of the South African interior proved longer and costlier than the British expected, and although they won the "dirty little war" the British saw their world position erode. Germany partitioned Samoa with the United States, and the latter annexed the Hawaiian Islands. Germany abandoned her long apathy toward the Middle East and won a concession for Turkish railroads. The Kaiser, influenced by his envy of Britain, his own fondness for seafaring, and the worldwide impact of *The Influence of Sea Power upon History* by the American naval scholar Captain Alfred Thayer Mahan, determined that *Weltpolitik* was impossible without

The Boer War

a great High Seas Fleet. The prospect of a large German navy—next to the growing fleets of France, Russia, Japan, and the United States—meant that Britain would no longer rule the waves alone.

The dawn of the 20th century was thus a time of anxiety for the British Empire as well. Challenged for the first time by the commercial, naval, and colonial might of many other industrializing nations, the British reconsidered the wisdom of splendid isolation. To be sure, in the Fashoda Incident of 1898 Britain succeeded in forcing France to retreat from the upper reaches of the Nile. But how much longer could Britain defend her empire alone? Colonial Secretary Joseph Chamberlain began at once to sound out Berlin on the prospect of global collaboration. A British demarche was precisely what the Germans had been expecting, but three attempts to reach an Anglo-German understanding, between 1898 and 1901, led to naught. In retrospect, it is hard to see how it could have been otherwise. The German foreign minister and, from 1900, chancellor, Bernhard, Fürst von Bülow, shared the Kaiser's and Holstein's ambitions for world power. If, as Germany's neo-Rankean historians proclaimed, the old European balance of power was giving way to a new world balance, then the future would surely belong to the Anglo-Saxons (British Empire and America) and Slavs (Russian Empire) unless Germany were able to achieve its own place in the sun. Bülow agreed that "our future lies on the water." German and British interests were simply irreconcilable. What Britain sought was German help in reducing Franco-Russian pressure on the British Empire and defending the balance of power. What Germany sought was British neutrality or cooperation while Germany expanded its own power in the world. Bülow still believed in Holstein's "free hand" policy of playing the other powers off against each other and accordingly placed a high price on German support and invited Britain to join the Triple Alliance as a full military partner. Understandably, the British declined to underwrite Germany's continental security.

Anglo-German naval competition

The failure of the Anglo-German talks condemned both powers to dangerous competition. The German navy could never hope to equal the British and would only ensure British hostility. But equality was not necessary, said Admiral Alfred von Tirpitz. All Germany needed was a "risk fleet" large enough to deter the British, who would not dare alienate Germany and thus lose their only potential ally in the continuing rivalry with France and Russia. In this way Germany could extract concessions from London without alliance or war. What the Germans failed to consider was that Britain might someday come to terms with its other antagonists.

This was precisely what Britain did. The Edwardian era (1901–10) was one of intense concern over the decline of Britain's naval and commercial dominance. German firms shouldered aside the British in numerous markets (even though they remained each other's best trading partners). The new German navy menaced Britain in her home waters. The French and Russian fleets, not to mention the Japanese, outnumbered the Royal Navy's Asian squadron. The French, Italian, and potential Russian presence in the Mediterranean threatened the British lifeline to India. Soon the Panama Canal would enable the United States to deploy a two-ocean navy. Accordingly, the foreign secretary, Lord Lansdowne, set about reducing the number of Britain's potential opponents. First, he cemented friendly relations with the United States in the Hay–Pauncefote Treaty (1901). He then shocked the world by concluding a military alliance with Japan, thereby securing British interests in East Asia and allowing the empire to concentrate its regional forces on India. But when growing tension between Russia and Japan over Manchuria appeared likely to erupt in war in 1904, France (Russia's ally) and Britain (now Japan's ally) faced a quandary. To prevent being dragged into the conflict, the French and British shucked off their ancient rivalry and concluded an Entente Cordiale whereby France gave up opposition to British rule in Egypt, and Britain recognized French rights in Morocco. Though strictly a colonial arrangement, it marked another step away from isolation for both Britain and France and another step toward it for the restless and frustrated Germans.

The Entente Cordiale

The Russo-Japanese War of 1904–05 was an ominous turning point. Contrary to all expectations, Japan triumphed on land and sea, and Russia stumbled into the Revolution of 1905. U.S. President Theodore Roosevelt mediated the Treaty of Portsmouth ending the war, and the Tsar quelled the revolutionary flames with promises of parliamentary government, but the war resonated in world diplomacy. Japan established itself as the leading Asian power. The example of an Oriental nation rising up to defeat a European Great Power emboldened Chinese, Indians, and Arabs to look forward to a day when they might expel the imperialists from their midst. And tsarist Russia, its Asian adventure a shambles, looked once again to the Balkans as a field for expansion, setting the stage for World War I.

The Triple Entente. In 1905 the Germans seized on Russia's temporary troubles to pressure France in Morocco. Bülow believed he had much to gain—at best he might force a breakup of the Anglo-French entente, at worst he might provoke a French retreat and secure German rights in Morocco. But at the Algeciras Conference in 1906, called to settle the Morocco dispute, only Austria-Hungary supported the German position. Far from breaking the Entente Cordiale, the affair prompted the British to begin secret staff talks with the French military. The United States, Russia, and even Italy, Germany's erstwhile partner in the Triple Alliance, took France's side. For some years Italian ambitions in the Mediterranean had been thwarted, and the attempt to conquer Abyssinia in 1896 had failed. The German alliance seemed to offer little, while Rome's other foreign objective, the Italian *irredenta* in the Tirol and Dalmatia, was aimed at Austria-Hungary. So in 1900 Italy concluded a secret agreement pledging support for France in Morocco in return for French support of Italy in Libya. The Russo-Japanese War also strengthened ties between France and Russia as French loans again rebuilt Russia's shattered armed forces. Finally, and most critically, the defeated Russians and worried British were now willing to put to rest their old rivalry in Central Asia. The Anglo-Russian Convention of 1907 made a neutral buffer of Tibet, recognized Britain's interest in Afghanistan, and partitioned Persia into spheres of influence. Foreign Secretary Sir Edward Grey also hinted at the possibility of British support for Russian policy in the Balkans, reversing a century-old tradition.

Anglo-Russian entente

The heyday of European imperialism thus called into existence a second alliance system, the Triple Entente of France, Britain, and Russia. It was not originally conceived as a balance to German power, but that was its effect, especially in light of the escalating naval race. In 1906 the Royal Navy under the reformer Sir John Fisher launched HMS *Dreadnought,* a battleship whose size, armour, speed, and gunnery rendered all existing warships obsolete. The German government responded in kind, even enlarging the Kiel Canal at great expense to accommodate the larger ships. What were the British, dependent on imports by sea for seven-eighths of their raw materials and over half their foodstuffs, to make of German behaviour? In a famous Foreign Office memo of January 1907, Senior Clerk Sir Eyre Crowe surmised that *Weltpolitik* was either a conscious bid for hegemony or a "vague, confused, and unpractical statesmanship not realizing its own drift." As Ambassador Sir Francis Bertie put it, "The Germans aim to push us into the water and steal our clothes."

For France the Triple Entente was primarily a continental security apparatus. For Russia it was a means of reducing points of conflict so that the antiquated tsarist system could buy time to catch up technologically with the West. For Britain the ententes, the Japanese alliance, and the "special relationship" with the United States were diplomatic props for an empire beyond Britain's capacity to defend alone. The three powers' interests by no means coincided—disputes over Persia alone might have smashed Anglo-Russian unity if the war had not intervened. But to the Germans, the Triple Entente looked suspiciously like encirclement designed to frustrate their rightful claims to world power and prestige. German attempts to break

the encirclement, however, would only alarm the entente powers and cause them to draw the loose strings into a knot. That in turn tempted German leaders, fearful that time was against them, to cut the Gordian knot with the sword. For after 1907 the focus of diplomacy shifted back to the Balkans, with European cabinets unaware, until it was too late, that alliances made with the wide world in mind had dangerously limited their freedom of action in Europe.

MILITARISM AND PACIFISM BEFORE 1914

Anxiety and the arms race. It is difficult to escape the conclusion that Europe before 1914 succumbed to hubris. The conventional images of "armed camps," "a powder-keg," or "saber rattling" almost trivialize a civilization that combined within itself immense pride in its newly expanding power and almost apocalyptic insecurity about the future. Europe bestrode the world, and yet Lord Curzon could remark, "We can hardly take up our morning newspaper without reading of the physical and moral decline of the race," and the German chief of staff, Helmuth von Moltke, could say that if Germany backed down again on Morocco, "I shall despair of the future of the German Empire." France's stagnant population and weak industry made her statesmen frantic for security, Austrian leaders were filled with foreboding about their increasingly disaffected nationalities, and the tsarist regime, with the most justification, sensed doom.

Whether from ambition or insecurity, the Great Powers armed as never before in peacetime, with military expenditures reaching 5 to 6 percent of national income. Military conscription and reserve systems made available a significant percentage of the adult male population, and the impulse to create large standing armies was strengthened by the widespread belief that firepower and financial limitations would make the next war short and violent. Simple reaction also played a large role. Fear of the "Russian steamroller" was sufficient to expand Germany's service law; a larger German army provoked the outmanned French into an extension of national service to three years. Only Britain did without a large conscripted army, but her naval needs were proportionally more expensive.

The peacetime armies

In an age of heavy, rapid-fire artillery, infantry rifles, and railroads, but not yet including motor transport, tanks, or airplanes, a premium was placed by military staffs on mass, supply, and prior planning. European commanders assumed that in a continental war the opening frontier battles would be decisive, hence the need to mobilize the maximum number of men and move them at maximum speed to the border. The meticulous and rigid advance planning that this strategy required placed inordinate pressure on the diplomats in a crisis. Politicians might hold back their army in hopes of saving the peace only at the risk of losing the war should diplomacy fail. What was more, all the continental powers embraced offensive strategies. The French general staff's "cult of attack" assumed that élan could carry the day against superior German numbers. Its Plan XVII called for an immediate assault on Lorraine. The Germans' Schlieffen Plan addressed the problem of war on two fronts by throwing almost the entire German army into a sweeping offensive through neutral Belgium to capture Paris and the French army in a gigantic envelope. Troops could then be transported east to meet the slower-moving Russian army. Worked out down to the last railroad switch and passenger car, the Schlieffen Plan was an apotheosis of the industrial age: a mechanical, almost mathematical perfection that wholly ignored political factors. None of the general staffs anticipated what the war would actually be like. Had they glimpsed the horrific stalemate in the trenches, surely neither they nor the politicians would have run the risks they did in 1914.

The Schlieffen Plan

Above the mass infantry armies of the early 20th century stood the officer corps, the general staffs, and at the pinnacle the supreme war lords: kaiser, emperor, tsar, and king, all of whom adopted military uniforms as their standard dress in these years. The army was a natural refuge for the central and eastern European aristocracies, the chivalric code of arms sustaining almost the only public service to which they could still reasonably lay claim. Even in republican France a nationalist revival after 1912 excited public morale, inspired the military buildup, and both fueled and cloaked a revanche aimed at recovery of the provinces lost 40 years before. Popular European literature poured forth best-sellers depicting the next war, and mass-circulation newspapers incited even the working classes with news of imperial adventures or the latest slight by the adversary.

The peace movements. Various peace movements sprang up to counter the spirit of militarism before 1914. Most numerous and disturbing to those responsible for national defense were the Socialists. The Second International took the Marxist view of imperialism and militarism as creatures of capitalist competition and loudly warned that if the bosses provoked a war, the working classes would refuse to take part. Jean Jaurès defined the proletariat as "masses of men who collectively love peace and hate war." The 1912 Basel Conference declared the proletariat "the herald of world peace" and proclaimed "war on war." Sober observers like George Bernard Shaw and Max Weber doubted that any putative sense of solidarity among workers would outweigh their nationalism, but the French government kept a blacklist of agitators who might try to subvert mobilization. Some of Germany's leaders imagined that war might provide the opportunity to crush socialism by appeals to patriotism or martial law.

A liberal peace movement with a middle-class constituency flourished around the turn of the century. As many as 425 peace organizations are estimated to have existed in 1900, fully half of them in Scandinavia and most others in Germany, Britain, and the United States. Their greatest achievements were the Hague conferences of 1899 and 1907, at which the powers agreed to ban certain inhumane weapons but made no progress toward general disarmament. The liberal peace movement also foundered on internal contradictions. To outlaw war was to endorse the international status quo, yet liberals always stood ready to excuse wars that could claim progressive ends. They had tolerated the wars of Italian and German unification, and they would tolerate the Balkan Wars against the Ottoman Empire in 1912–13 and the great war in 1914. Another solution for many peace advocates was to transcend the nation-state. Norman Angell's *The Great Illusion* (1910) argued that it already had been transcended: that interdependence among nations made war illogical and counterproductive. To Marxists this image of capitalism was ludicrous; to Weber or Joseph Schumpeter, it was correct, but beside the point. Blood was thicker than class, or money; politics dominated economics; and irrationality, reason.

The Hague conferences

The one European statesman most sympathetic to the peace movements was, not surprisingly, Britain's Liberal foreign secretary, Sir Edward Grey. Citing the waste, social discord, and international tension caused by the naval arms race, he made several overtures to Germany in hopes of ending it. When these failed, Britain had little choice but to race more quickly than the Germans. Even radical Liberals like David Lloyd George had to admit that however much they might deplore arms races in the abstract, all that was liberal and good in the world depended on the security of Britain and its control of its seas.

THE BALKAN CRISES AND THE OUTBREAK OF WAR, 1907–14

Growing tensions and German isolation. In the end, war did not come over the naval race, or commercial competition, or imperialism. Nor was it sparked by the institutional violence of the armed states, but by underground terrorism in the name of an oppressed people. Nor did it come over the ambitions of Great Powers to become greater, but over the fear of one Great Power that unless it took vigorous action it might cease to exist altogether. It began in the Balkans.

In 1897 Austria-Hungary and Russia had agreed to put their dispute over the Balkans on ice. When the agreement ran out in 1907, the Ottoman Empire still ruled Macedonia, ringed by Greece, Montenegro, Serbia, and Bulgaria. But everything else had changed. For now Austria-Hungary's only reliable ally was Germany, whose *Weltpolitik* had led it to join the competition for influence at

The thawing of the Balkans

Constantinople. Russia was looking again at the Balkans for foreign policy advantage and enjoying, for the first time, a measure of British tolerance. In Serbia, the state most threatening to Vienna because of its ethnic tie to the Serbs and Croats inside the Dual Monarchy, a fundamental political shift had occurred. In previous years Vienna had neutralized Serbia by bribing the ruling Obrenović dynasty, but in 1903 the rival Karageorgević clan seized control in Belgrade in a bloody coup d'état and shifted to a violently anti-Austrian policy. Finally, in 1908, a cabal of officers known as the Young Turks staged the first modernizing revolution in the Muslim world and tried to force the Sultan to adopt liberal reforms. In particular the Young Turks called for parliamentary elections, thereby placing in doubt the status of Bosnia and Hercegovina, provinces still under Ottoman sovereignty but administered by Austria-Hungary since 1878. Austro-Hungarian foreign minister Aloys Aehrenthal proposed to settle the Bosnian issue and to crush Serbian ambitions once and for all by annexing the provinces. To this purpose he teased the Russian foreign minister, Aleksandr Petrovich Izvolsky, with talk of a quid pro quo, Russia's acquiescence in annexation and in return Austria-Hungary's in the opening of the Dardanelles Strait to Russian warships. When instead Aehrenthal acted unilaterally, and Izvolsky's straits proposal was rejected, the Russians felt betrayed. Their response was to increase aid and comfort to their client Serbia and to determine never again to back down in the Balkans.

Annexation and the straits question

German politics were also approaching a breaking point. Chancellor von Bülow had governed, with the support of Tirpitz, the Kaiser, and the moderate and conservative parties in the Reichstag, on the basis of a grand compromise of which the navy was the linchpin. Agrarian interests continued to demand protection against foreign foodstuffs, but the tariffs imposed to that end harmed German industrial exports. A large armaments program, especially naval, compensated heavy industry for lost foreign markets. The losers in the tariffs-plus-navy-legislation arrangement were consumers, who were taxed for the defense program after they had paid higher prices for bread. Popular resentment tended to increase the Socialist vote, and the other parties could command a majority only by banding together.

Soon, however, the expensive dreadnought race provoked a fiscal crisis that cracked the Bülow bloc and, in 1909, elevated Theobald von Bethmann Hollweg to the chancellorship. He faced the choice of ending the naval race and moderating Germany's *Weltpolitik,* or making democratic concessions to the left, or somehow rebuilding the coalition of conservative agrarians and industrialists in the teeth of Socialist opposition. Bethmann showed signs of preferring the first course but was undercut by the pressure of industry, Tirpitz' naval propaganda, and the Kaiser's bravado, symbolized by his damaging *Daily Telegraph* interview (1908) in which he made inflammatory remarks about the British. When in 1912 Lord Haldane was dispatched to Berlin to discuss a suspension of the naval arms race, the Kaiser spoiled chances for an accord by introducing a new naval bill two days before Haldane's arrival. The British then accelerated their own dreadnought construction. By now the failure of German policy was apparent. Clearly the British would not permit Germany to challenge their sea power, while the Junker-dominated German army agreed in 1912 to tolerate further naval expansion only if the army were granted a sharp increase in funding as well. In the 1912 elections the Social Democrats won 110 seats and became the largest party in the Reichstag.

Domestic and foreign stalemate obsessed Germany's political and military leadership. Reform at home meant an end to the privileged positions of the various elites; retreat abroad meant the end of Germany's dreams of world power. A bold stroke, even at the risk of war, seemed the only way out of the double impasse. In 1911 Foreign Minister Alfred von Kiderlen-Wächter tried to force the issue in Morocco, where the French clearly aimed at a formal protectorate in defiance of the Algeciras accords. Germany sent the gunboat *Panther* to the Moroccan port of Agadir in defense of "German interests" there. But Britain again stood with France, and Kiderlen-Wächter acquiesced in a French Morocco in exchange for portions of French colonies in Central Africa. In France this accommodation of Germany brought down the government of Premier Joseph Caillaux, who was succeeded by Raymond Poincaré, a determined nationalist and advocate of military preparedness who quickly secured passage of an expansion of the standing army. In Britain, Winston Churchill, then first lord of the Admiralty, withdrew his fleet from the Mediterranean to home waters, making mandatory even closer military coordination with France.

The *Panther* incident

This Second Moroccan Crisis confirmed Germany's isolation, while the British, French, and Russian military buildups meant that time was on the side of the entente. Moltke had already raised the notion of preventive war, and in the Kaiser's war council of December 1912 he blustered, "War, the sooner the better." To be sure, jingoism of this sort could be found in every Great Power on the eve of the war, but only the leaders in Berlin—and soon Vienna—were seriously coming to view war as not simply a possibility but as a necessity.

The final prewar assault on the Ottoman Empire also began in 1911. Italy cashed in her bargain with France over Libya by declaring war on Turkey and sending a naval squadron as far as the Dardenelles. Simultaneously, Russian ministers in the Balkans brought about an alliance between the bitter rivals Serbia and Bulgaria in preparation for a final strike against Ottoman-controlled Europe. The First Balkan War erupted in October 1912, when Montenegro declared war on Turkey, followed quickly by Serbia, Bulgaria, and Greece. The Young Turks ended the conflict with Italy, ceding Libya, but failed to contain the Balkan armies. In May 1913 the Great Powers imposed a settlement; Macedonia was partitioned among the Balkan states, Crete was granted to Greece, and Albania was given its independence. Landlocked Serbia, however, bid for additional territory in Macedonia, and Bulgaria replied with an attack on Serbia and Greece, thus beginning the Second Balkan War in June 1913. In the peace that followed in August, Bulgaria lost all her stake in the former Turkish lands plus much of the southern Dobruja to Romania. Serbia, however, doubled its territory and, flushed with victory, turned its sights on the Austro-Hungarian provinces of Bosnia and Hercegovina.

The Balkan wars

The final crisis. How might the Habsburg Empire survive the rise of particularist nationalism in eastern Europe? Austrian statesmen had debated the question for 50 years, and the best answer seemed to be some form of federalism permitting political autonomy to the nationalities. Reforms of this nature had always been vetoed by the Hungarians, who stood to lose their own position vis-à-vis the German-Austrians and the minorities in their half of the empire. Conrad Franz, Graf von Hötzendorf, chief of the general staff, favoured preventive war against Serbia to stifle nationalist agitation for good and reinforce the old order. However, Archduke Francis Ferdinand wrote: "I live and shall die for federalism; it is the sole salvation for the monarchy, if anything can save it." Out of favour with the court for his morganatic marriage, resented by the Hungarians, and resented by conservatives, the heir-apparent was also feared by Slavic radicals as the one man who might really pacify the nationalities and so frustrate their dreams of a Greater Serbia. Hence the archduke was a marked man among the secret societies that sprang up to liberate Bosnia. Such is the logic of terrorism: Its greatest enemies are the peacemakers.

The National Defense (Narodna Odbrana) was formed in Serbia in 1908 to carry on pro-Serbian and anti-Austrian agitation across the border. Its nonviolent methods were deemed insufficient by others who formed in 1911 the secret society Union or Death (Ujedinjenje ili Smrt), also known as the Black Hand, led by the head of Serbian military intelligence, Colonel Dragutin Dimitrijević. The latter had been involved in the 1903 assassinations of the Obrenović family and favoured terrorist action over intellectual propaganda. With his support, if not on his direct orders, a band of youthful romantics conspired to assassinate Francis Ferdinand during his state visit to Sarajevo. On June 28, 1914, which happened to be the Serbian na-

The assassination of Francis Ferdinand

tional holiday, the Archduke and his wife rode in an open car through the streets of the Bosnian capital. A bomb was thrown but missed. The Archduke completed his official duties, whereupon the governor of Bosnia suggested they deviate from the planned route on the return trip for safety's sake. But the lead driver in the procession took a wrong turn, the cars stopped momentarily, and at that moment the 19-year-old Gavrilo Princip fired his revolver, killing both royal passengers.

Reaction in Vienna, and Europe generally, was surprisingly restrained. No one imagined that the outrage had more than local importance, much less that Bismarck's prophecy about "some damned fool thing in the Balkans" starting the next war was about to be fulfilled. Conrad von Hötzendorf saw the deed as pretext for his preventive war against Serbia, but the aged emperor Francis Joseph preferred to await an inquiry to determine the extent of Serbian complicity. Germany, on the other hand, pressed for a firm riposte and in the Kaiser's famous "blank check" memo promised to support whatever action Austria might take against Serbia. The Germans expected Russia to back down, since its military reforms would not be complete for several years, but even if Russia came to Serbia's aid, the German high command was confident of victory. Bethmann was less so. A move against Serbia could lead to a world war, he warned on July 7. Yet Bethmann went along in the vain hope of localizing the conflict.

Austrian Foreign Minister Leopold, Graf von Berchtold, now advocated a firm policy toward Serbia lest Austria's prestige deteriorate further and the Balkan states unite behind Russia. Gróf Tisza, the prime minister of Hungary, insisted, however, that diplomatic and legal justifications precede such a clash of arms: Austria must first present a list of demands for redress. Should Serbia accept, the empire would win a "brilliant diplomatic success"; should Serbia refuse, war could be waged with Austria-Hungary posing as the aggrieved party. In no case was Austria to annex any Serbian territory.

The Russian response to any Austrian initiative would be critical, and by chance the president and prime minister of France, Poincaré and René Viviani, were paying a state visit to St. Petersburg in July. Strangely, there is no record of the Franco-Russian conversations, but it is known that Poincaré assured the Russians that France would stand by her alliance commitments. On July 23, just after the French leaders left for home, Vienna presented its ultimatum to Belgrade, demanding dissolution of the secret societies, cessation of anti-Austrian propaganda, and Austrian participation in the investigation of the Sarajevo crime. Serbia was given 48 hours to respond.

The Austrian ultimatum

The Russian foreign minister, Sergey Dmitriyevich Sazonov, erupted at news of the ultimatum and insisted on military measures. The French ambassador, Maurice-Georges Paléologue, with or without instructions from his departed chiefs, encouraged Sazonov. For if Austria's prestige—and very future—were at stake in the Balkans, so too were tsarist Russia's, for which the Balkans was the only region left in which to demonstrate its vitality. But now Germany was competing for influence over the Young Turks, courting Bulgaria, and plotting to smash Serbia. The German slogan "From Berlin to Baghdad," referring originally only to railroads, took on ominous new political meaning. On July 25 the Russian Council of Ministers decided that if Austrian forces entered Serbia, Russia would mobilize its army. This precipitous, indeed anticipatory, decision reflected Russia's size and the inadequacy of its rail network. Sazonov seems to have considered mobilization a political threat, but given the mechanistic timetables that were integral to the planning of all the European general staffs, it could only provoke countermobilizations and an inexorable drift into war.

On July 25 Serbia accepted all the Austro-Hungarian conditions save those two that directly compromised its sovereignty. Two days later Berchtold persuaded Francis Joseph to initiate war. At the same moment the Kaiser, returning from a yachting expedition, tried belatedly to restrain Vienna. On July 28 Austria declared war and bombarded Belgrade; on the same day the Tsar approved the mobilization of the Russian army against Austria, and alarms went off all over Europe. Sir Edward Grey, Kaiser William, and the Italian government all proposed negotiations, with the Austrians to occupy Belgrade as a pledge of Serbian compliance. The German ambassador in St. Petersburg assured the Russians that Austria meant to annex no Serbian territory. But it was too little and far too late. In St. Petersburg the generals protested that partial mobilization would disrupt their contingency plans: How could Russia prepare to fight Austria-Hungary while leaving naked her border with Austria's ally Germany? The weak and vacillating Tsar Nicholas II was persuaded, and on the afternoon of July 30 he authorized general mobilization of the Russian army.

The previous day, Poincaré and Viviani had finally arrived back in Paris, where they were met with patriotic crowds and generals anxious for military precautions. In Berlin, anti-Russian demonstrations and equally anxious generals called for immediate action. On the 31st, when all the other powers had begun preparations of some sort, and even the British had put the fleet to sea (thanks to Winston Churchill's foresight), Germany delivered ultimatums to Russia, demanding an end to mobilization, and to France, demanding neutrality in case of war in the east. But Russia and France could scarcely accede without abandoning the Balkans, each other, and their own security. When the ultimatums expired, the Schlieffen Plan was put into effect. Germany declared war against Russia on August 1 and against France on August 3 and demanded safe passage for its troops through Belgium. Refused again, Germany invaded Belgium in force.

German entry into the war

On August 3, Italy took refuge in the fact that this was not a defensive war on Austria-Hungary's part and declared its neutrality. That left only Britain, faced with the choice of joining its entente partners in war or standing aloof and risking German domination of the Continent. Britain had little interest in the Serbian affair, and the kingdom was torn by the Irish question. The Cabinet was in doubt as late as August 2. But the prospect of the German fleet in the English Channel and German armies on the Belgian littoral settled the issue. On the 3rd Britain demanded that Germany evacuate Belgium, and Grey won over Parliament with appeals to British interests and international law. On August 4, Britain declared war on Germany.

THE WAR-GUILT QUESTION

The search for causes. Debate over the origins of World War I was from the start partisan and moral in tone. Each of the belligerents published documentary collections selected to shift the blame and prove that it was fighting in self-defense. Serbia was defending itself against Austrian aggression. Austria-Hungary was defending its very existence against terror plotted on foreign soil. Russia was defending Serbia and the Slavic cause against German imperialism. Germany was defending its lone reliable ally from attack and itself from entente encirclement. France, with most justification, was defending itself against unprovoked German attack. And Britain was fighting in defense of Belgium, international law, and the balance of power.

In the Treaty of Versailles (1919) the victorious coalition justified its peace terms by forcing Germany and its allies to acknowledge guilt for the war. This tactic was historically dubious and politically disastrous, but it stemmed from the liberal conviction, as old as the Enlightenment, that peace was normal and war an aberration or crime for which clear responsibility—guilt—could be established. Almost at once, revisionist historians examined the thousands of documents that governments made available after 1920 and challenged the Versailles verdict. Yes, the German government had issued the risky "blank check" and urged Vienna on an aggressive course. It had swept aside all proposals for mediation until events had gained irreversible momentum. It had, finally, surrendered its authority to a military plan that ensured the war could not be localized. Indeed, the whole course of German foreign policy since 1890 had been restless and counterproductive, calling into existence the very ring of enemies it then took extreme risks to break. But, on the other hand, Russia's hasty mobilization expanded the crisis beyond the Balkans, initiated a round of military moves, and

The "blank check"

contributed to German panic. Given the military realities of the age, Sazanov's notion of Russian mobilization as a mere "application of pressure" was either disingenuous or foolish. France could be faulted for not restraining Russia and for issuing its own "blank check." Even the British might have done more to preserve peace, either through more vigorous mediation or by making clear that they would not remain neutral in a continental war, thus deterring the Germans. Finally, what of the states at the heart of the crisis? Surely Belgrade's use of political terrorism in the name of Greater Serbia, and Austria-Hungary's determination to crush its tormentors, provoked the crisis in the first place. By the 1930s moderate historians had concluded, with Lloyd George, that no one country was to blame for the war: "We all stumbled into it."

The failure of documentary research to settle the war-guilt question led other historians to look behind the July 1914 crisis for long-range causes of the war. Surely, they reasoned, such profound events must have profound origins. As early as 1928 the American Sidney B. Fay concluded that none of the European leaders had wanted a great war and identified as its deeper causes the alliance systems, militarism, imperialism, nationalism, and the newspaper press. (Marxists, of course, from the publication of Lenin's *Imperialism, the Highest Stage of Capitalism* in 1916, held finance capitalism to be accountable for the war.) In this view the polarization of Europe into alliance systems had made "chain-reaction" escalation of a local imbroglio almost predictable. Militarism and imperialism had fed tensions and appetites among the Great Powers, while nationalism and sensational journalism had stoked popular resentments. How else could one explain the universal enthusiasm with which soldiers and civilians alike greeted the outbreak of war? Such even-handed sentiments, along with the abstraction of the terms of analysis that exculpated individuals while blaming the system, were both appealing and prescriptive. In the 1930s British statesmen in particular would strive to learn the lessons of 1914 and so prevent another war. As another generation's hindsight would reveal, the lessons did not apply to the new situation.

After World War II and the Cold War had left the issues of 1914 passé, a committee of French and German historians agreed that World War I was an unwilled disaster for which all countries shared blame. But only a few years later, in 1961, that consensus shattered. A German historian, Fritz Fischer, published a massive study of German war aims during 1914–18 and held that Germany's government, social elites, and even broad masses had consciously pursued a breakthrough to world power in the years before World War I and that the German government, fully aware of the risks of world war and of British belligerency, had deliberately provoked the 1914 crisis. Fischer's thesis sparked bitter debate and a rash of new interpretations of World War I. Leftist historians made connections between Fischer's evidence and that cited 30 years before by Eckhart Kehr, who had traced the social origins of the naval program to the cleavages in German society and the stalemate in the Reichstag. Other historians saw links to the Bismarckian technique of using foreign policy excursions to stifle domestic reform, a technique dubbed "social imperialism." Germany's rulers, it appeared, resolved before 1914 to overthrow the world order in hopes of preserving the domestic order.

The Fischer thesis

Traditionalist critics of Fischer pointed to the universality of imperialistic, social Darwinist, and militaristic behaviour on the eve of the war. The Kaiser, in his most Wagnerian moods, only spoke and acted like many others in all the Great Powers. Did not Sazonov and the Russian generals, in their unrecorded moments, yearn to erase the humiliation of 1905 and conquer the Dardanelles, or Poincaré and General J.-J.-C. Joffre wonder excitedly if the recovery of Alsace-Lorraine were finally at hand, or the Primrose and Navy leagues thrill to the prospect of a Nelsonian clash of dreadnoughts? Germans were not the only people who grew weary of peace or harboured grandiose visions of empire. To this universalist view leftist historians like the American A.J. Mayer then applied the "primacy of domestic policy" thesis and hypothesized that all the European powers had courted war as a means of cowing or distracting their working classes and national minorities.

Such "new left" interpretations triggered intense study of the connections between domestic and foreign policy, leading to the conclusion that a postulation of internal origins of the war, while obvious for Austria and plausible for Russia, failed in the cases of democratic Britain and France. If anything, internal discord made for reticence rather than assertion on the part of their foreign policy elites. The conservative historian Gerhard Ritter even challenged the Fischer thesis in the German case. The real problem, he argued, was not fear of the Social Democrats but the age-old tension between civilian and military influence in the Prussian-German government. Politicians, exemplified by Bethmann, did not share the eagerness or imprudence of the general staff but lost control of the ship of state in the atmosphere of deepening crisis leading up to 1914. Finally, a moderate German historian, Wolfgang J. Mommsen, dispensed with polemics altogether. Germany's rapid industrialization and the tardiness of modernization in Austria-Hungary and Russia, he concluded, created instabilities in central and eastern Europe that found expression in desperate self-assertion. Echoing Joseph Schumpeter, Mommsen blamed the war on the survival of pre-capitalist regimes that simply proved "no longer adequate in the face of rapid social change and the steady advance of mass politics." But this interpretation amounted to an updated and elaborated version of the unsophisticated consensus that "we all stumbled into it." Are world wars, then, beyond human control?

Backwardness as a cause of war

Thus, the search for long-range causes, while turning up a wealth of new information and insight, ran ultimately aground. After all, if "imperialism" or "capitalism" had caused the war, they had just as assuredly caused the unprecedented era of peace and growth that preceded it. Imperialist crises, though tense at times, had always been resolved, and even Germany's ambitions were on the verge of being served through a 1914 agreement with Britain on a planned partition of the Portuguese empire. Imperial politics were simply not a casus belli for anyone except Britain. Military preparedness was at a peak, but armaments are responses to tensions, not the cause of them, and they had, perhaps, served to deter war in the numerous crises preceding 1914. Capitalist activity tied the nations of Europe together as never before, and most leading businessmen were advocates of peace in 1914. The alliance systems themselves were defensive and deterrent by design and had served as such for decades. Nor were they inflexible. Italy opted out of her alliance, the Tsar was not bound to risk his dynasty on behalf of Serbia, or the Kaiser his on behalf of Austria-Hungary, while the French and British cabinets might never have persuaded their parliaments to take up arms had the Schlieffen Plan not forced the issue. Perhaps the 1914 crisis was, after all, a series of blunders, in which statesmen failed to perceive the effects their actions would have on the others.

The centrality of the Habsburg monarchy. Or perhaps a long-range view that is still serviceable is precisely the one derived from old-fashioned analysis of the balance of power system, forgotten amid the debates over national or class responsibility. This view, suggested by Paul Schroeder in 1972, asks not why war broke out in 1914 but why not before? What snapped in 1914? The answer, he argued, is that the keystone of the European balance, the element of stability that allowed the other powers to chase imperial moonbeams at will, was Austria-Hungary itself. But the heedless policies of the other powers gradually undermined the Habsburg monarchy until it was faced with a mortal choice. At that point, the most stable member of the system became the most disruptive, the girders of security—the alliances—generated destructive pressures of their own, and the European system collapsed. To be sure, Austria-Hungary was threatened with her own nationality problem, aggravated by Serbia. But it could better have met that threat if the Great Powers had worked to ameliorate pressures on it, just as they had carried the declining Ottoman Empire for a full century. Instead, the ambitions of Russia, France, and Britain, and the stifling friendship

The monarchy undermined

of Germany, only served to push Austria-Hungary to the brink. This was not their intention, but it was the effect.

The central fact of global politics from 1890 to 1914 was Britain's relative decline. This occurred naturally, as industrial power diffused, but was aggravated by the particular challenge of Germany. Overextended, the British sought partners to share the burdens of a world empire and were obliged in return to look kindly on those partners' ambitions. But the resulting Triple Entente was not the cause of Germany's frustrations in the conduct of *Weltpolitik*. Rather it was the inability of Germany to pursue an imperial policy *à outrance*. Situated in the middle of Europe, with hostile armies on two sides, and committed to the defense of Austria-Hungary, Germany was unable to make headway in the overseas world despite her strength. By contrast, relatively weak France or hopelessly ramshackle Russia could engage in adventures at will, suffer setbacks, and return to the fray in a few years. Schroeder concluded: "The contradiction between what Germany wanted to do and what she dared to do and was obliged to do accounts in turn for the erratic, uncoordinated character of German world policy, its inability to settle on clear goals and carry them through, the constant initiatives leading nowhere, the frequent changes in mid-course." All Germany could do was bluff and hope to be paid for doing nothing: for remaining neutral in the Russo-Japanese War, for not building more dreadnoughts, for letting the French into Morocco, for not penetrating Persia. Of course, Germany could have launched an imperialist war in 1905 or 1911 under more favourable circumstances. It chose not to do so, and German might was such that prior to 1914 the other powers never considered a passage of arms with Germany.

Contradictions in German policy

Instead, Triple Entente diplomacy served to undermine Austria-Hungary. Everyone recognized that it was the "sick man of Europe" and that its demise would be inconvenient at very best and would almost certainly expose the ethnic mare's nest of southeastern Europe to civil war or Russian or German domination. Yet no one did anything about it. France could scarcely afford to—its security was too tightly bound to Russia's—but France's policy of wooing Italy out of the Triple Alliance was a grave setback, not for Germany but for Austria-Hungary. Russia brazenly pushed the Slavic nationalities forward, thinking to make gains but never realizing that tsarism was as dependent on Habsburg survival as Austria-Hungary had been on Ottoman survival. Only Britain had the capacity to maneuver, to restrain the likes of Serbia and Russia and take some of the Austro-Hungarian burden off Germany's shoulders. And indeed it had done so before—in 1815–22, 1878, and 1888. But now the British chose vaguely to encourage Russia in the Balkans, letting Austria-Hungary, as it were, pay the price for distracting Russia from the frontiers of India. So by 1914 Austria was encircled and Germany was left with the choice of watching her only ally collapse or risking a war against all Europe. Having chosen the risk, and lost, it is no surprise that the Germans (as well as the other powers) gave vent to all their prewar bitterness and pursued a thorough revision of world politics in their own favour.

World War I, 1914–18

World War I has aptly been called a war of illusions that exposed in sharp relief all the follies of the prewar generation. The war plans of the generals had misfired at once, and expectations that the intensity of modern firepower would serve the offense, or that the war must be brief, proved horribly false. Germany expected to achieve hegemony in Europe as a step toward world power, and instead world powers were called into play to prevent hegemony in Europe. Socialists thought war would bring general strikes and revolution, and instead the war inspired patriotic national unity. Monarchists hoped war would bolster the old regimes, and instead it cast down the remaining dynasties of eastern Europe. Liberals hoped that war would promote the spread of freedom, and instead it forced even democratic governments to impose censorship, martial law, and command economies subordinated to the dictates of centralized bureaucracy. Each nation in its own way sacrificed one by one those values it claimed to be fighting for in the belief that final victory would make good all the terrible cost. And with terrible irony World War I also ended in various plans for peace as illusory as the plans for war had been. As the historian William McNeill wrote, "the irrationality of rational, professionalized planning could not have been made more patently manifest."

A war of illusions

World War I can be divided, without undue violence to reality, into three periods: the initial battles, struggles for new allies, and mobilization on the home fronts, occupying the period from 1914 to 1916; the onset of ideologized warfare in the Russian revolutions and American entry in 1917; and the final four-way struggle of 1918 among German imperialism, Allied war-aims diplomacy, Wilsonian liberal internationalism, and Leninist Bolshevism.

MILITARY STALEMATE AND NEW BELLIGERENTS

From grand plans to the trenches. The first months of war resounded with the collision of the war plans pored over for decades by the general staffs of Europe. The original German plan for a two-front war, drafted by Helmuth von Moltke the elder, had called for taking the offensive against Russia and standing on the defensive in the rugged Rhineland. The plan showed military prudence and complemented the stabilizing diplomacy of Bismarck. But Alfred, Graf von Schlieffen, presided over the German military in the era of Kaiser William's *Weltpolitik* and adopted a more ambitious and risky course. His plan, conceived in 1891 and completed by 1905, envisioned a massive offensive in the west to knock out the compact French forces in six weeks, whereupon the army could shift eastward to confront the plodding Russians. But a quick decision could be achieved in France only by a vast enveloping action. The powerful right wing of the German army must descend from the north and pass through the neutral Low Countries. This would virtually ensure British intervention. But Schlieffen expected British aid to be too little and too late. In sum, the Schlieffen Plan represented a pristine militarism: the belief that all factors could be accounted for in advance, that execution could be flawless, that pure force could resolve all political problems including those thrown up by the plan itself. In the event, the Germans realized all of the political costs of the Schlieffen Plan and few of the military benefits.

The German plan of war

Like the Germans, the French had discarded a more sensible plan in favour of the one implemented. French intelligence had learned of the grand lines of the Schlieffen Plan and its inclusion of reserve troops in the initial assault. General Victor Michel therefore called in 1911 for a blocking action in Belgium in addition to an offensive into Alsace-Lorraine. But this required twice the active troops currently available. France would either have to give up the Belgian screen or the offensive. The new chief of staff, J.-J.-C. Joffre, refused to believe that Germany would deploy reserve corps in immediate combat and gave up the screen.

The traditional British way of war had been maritime: destroy the enemy's fleet, impose a blockade, and use land forces only to secure key points or aid continental allies at decisive moments. In Sir John Fisher's phrase, the army "should be regarded as a projectile fired by the navy." The prewar conversations with France, however, led the War Office to consider how Britain's army might help in case of war with Germany. General Henry Wilson insisted that even Britain's six divisions of professionals could tilt the balance between France and Germany and won his case for a British Expeditionary Force. Privately, he conceded that six divisions were "fifty too few" and hoped for a mass conscript army on continental lines.

By October 1914 all the plans had unraveled. After the German defeat in the Battle of the Marne, the Western Front stabilized into an uninterrupted line for 466 miles from Nieuwpoort on the Belgian coast south to Bapaume, then southeast past Soissons, Verdun, Nancy, and so to the Swiss frontier. Both sides dug in, elaborated their trench systems over time, and condemned themselves to four years of hellish stalemate on the Western Front.

Creation of the Western Front

The situation was little better on the other front. A necessary assumption of the Schlieffen Plan was the inadequacy of the Russian rail network to support a rapid offensive. By 1914, however, railroads through Poland were much improved, and the Russian general staff agreed to take the offensive in case of war to relieve the pressure on France. Similarly, the Germans had asked the Austrian commander, Conrad von Hötzendorf, to attack Russia and ease the threat to Germany. But Austria also had a two-front war and an army too small to fight it. Due to penury and its nationality problems, the monarchy fielded fewer battalions in 1914 than it had in the war of 1866. As the saying went, Austria was always *"en retard d'une armée, d'une année et d'une idée"* ("one army, one year, and one idea behind"). Austria's solution was to send one army south against Serbia and one to Galicia against the Russians, and to deploy a third as need required. The reserves, a third of Austria's already outnumbered forces, spent the opening battles shuttling back and forth on the rails. Austria failed to penetrate Serbian defenses while the Germans smashed the Russian attack into East Prussia. In the east, too, stalemate set in.

Defense in depth

By mid-1915 the Germans had overcome supply problems and were better prepared for trench warfare than the Allies. They also pioneered the concept of "defense in depth," making a second trench line the main barrier to assault. Allied generals responded with longer and denser artillery bombardments but thereby relinquished the element of surprise. Such tactics turned western battlefields into seas of wreckage with a "storm of steel" raging above, and condemned hundreds of thousands of men for the sake of a few thousand yards of "no man's land." Allied attacks of 1915 cost the British more than 300,000 casualties and the French 1,500,000. The only German initiative, the Second Battle of Ypres, introduced poison gas to the Western Front. But no commander could see a means of breaking the deadlock, and all confessed their strategy to be one of attrition.

The war at sea and abroad. The stalemate on land was matched by stalemate at sea when the British decided to impose a distant rather than close blockade of the German coast. This reduced the danger to the Grand Fleet and, it was hoped, might entice the German navy to venture out for a decisive battle. Admiral von Tirpitz was prepared to run such a risk, believing that the technical superiority of his High Seas Fleet would balance out Britain's numerical edge. Only by risking all on a major fleet action might Germany break the blockade, but the Kaiser and civilian leadership wished to preserve their fleet as a bargaining chip in eventual peace talks, while the British dared not provoke an engagement since a major defeat would be disastrous. Admiral John Jellicoe, it was said, was "the only man who could lose the war in an afternoon."

German overseas losses

In the wide world, the Allies cleared the seas of German commerce raiders and seized the German colonial empire. In the Pacific, New Zealanders took German Samoa and Australians German New Guinea. On Aug. 23, 1914, the Japanese empire honoured its alliance with Britain by declaring war on Germany. Tokyo had no intention of aiding its ally's cause in Europe but was pleased to occupy the Marshall and Caroline archipelagos and lay siege to Germany's Chinese port of Tsingtao, which surrendered in November. Germany's African colonies were, on the outbreak of war, immediately cut off from communications and supply from home, but military operations were needed to eliminate the German presence. By early 1916, Togoland (Togo) and Kamerun (Cameroon) fell to Anglo-French colonial forces and German South West Africa (South West Africa/Namibia) to the South Africans. Only in German East Africa was a native force under Lieutenant Colonel Paul von Lettow-Vorbeck, numbering initially only 12,000 men, able to survive for the entire war, tying down 10 times that number of Allied troops.

Efforts to break the stalemate. Thus all the armies and navies of Europe faced each other across fortified front lines. The prewar plans had succumbed to the technological surprise of 1914–15: that the withering firepower of machine guns, cartridge rifles, and rapid-fire artillery favoured the defense. Infantry in deep trenches, fronted with mines and barbed wire and backed by artillery, could not be dislodged by frontal attack. Accordingly, military and political leaders spent the war groping for means of breaking the stalemate in the trenches. First, neutrals might be enticed to enter the war, perhaps throwing enough weight into the balance to provide victory. Second, new weapons, tactics, and theatres might be tried to break the deadlock or achieve strategic goals elsewhere. Third, more and more men and matériel might be squeezed out of the home economy to tip the balance of forces or wear down the enemy in a war of economic attrition. The first of these means determined much of the diplomatic history of the war. The second stimulated technological developments such as poison gas, tanks, and submarines, and the peripheral campaigns of southern Europe and the Middle East. The third determined the evolution of war economies and the character of what came to be called total war.

Turkey enters the war

The first of the European neutrals to join the fray was the Ottoman Empire. Having lost the Balkans before 1914 and fearing partition of their Arab possessions by the Triple Entente, the Young Turks under Enver Paşa looked to Germany, whose military efficiency they admired. Enver led in negotiating a secret German-Ottoman treaty, signed Aug. 2, 1914. But the Grand Vizier and others in the Sultan's court held back, even after extracting a German loan—tantamount to a bribe—of £5,000,000. The war party then resorted to more extreme measures. The Ottoman fleet, reinforced by two German cruisers, entered the Black Sea in October, bombarded Odessa and the Crimean ports, and sank two Russian ships. The commander then falsified his account to make it appear that the enemy had provoked the action. The outraged Russians declared war on November 1. The Ottoman Empire's alliance with the Central Powers was a serious blow to the Entente, for it effectively isolated Russia from its Western allies and weakened their hand in the Balkan capitals. But the Turks concluded that a Triple Entente victory in the war would lead to the partition of their empire even if they remained neutral (Allied negotiations had already begun to this effect), whereas joining forces with Germany gave them at least a fighting chance to survive and perhaps even win some spoils from Russia. Enver also declared a jihad, or holy war, inciting Muslims to rise up against British and Russian rule in India, Persia, and Central Asia.

Turkish forces deployed along the coasts of the Dardanelles and on the Caucasus frontier with Russia, where severe fighting began in the rugged mountains. Enver, with German encouragement, took the strategic offensive when he ordered 10,000 troops from Syria to attack the Suez Canal in late January 1915. After crossing the Sinai the tired soldiers found Indian and Australasian divisions in training, as well as gunboats and other equipment they could not match. The Turks fell back to Palestine and never menaced the canal again.

The Dardanelles campaign

The vulnerability and value of the Dardanelles in turn attracted the British. When Russia requested a Western assault on Turkey to relieve the pressure in the Caucasus, War Secretary Lord Herbert Kitchener and First Lord of the Admiralty Winston Churchill promoted an attack on the Dardanelles. By capturing Constantinople, the British could link up with the Russians, knock Turkey out of the war, and perhaps entice the Balkan states to rally to the Allied cause. The British War Council created an amphibious force of British, Australians, and New Zealanders to capture the heights of the Gallipoli peninsula. On April 25 the "Anzac" (Australian and New Zealand) forces went ashore, but their assaults on the heights of Sari Bair were turned back through the charismatic leadership of the young Turkish officer Mustafa Kemal. A sweltering, bloody deadlock dragged on into the summer. Five more divisions and another amphibious landing, at Suvla Bay in August, failed to take the rugged heights in the face of human wave counterattacks by the Turks. Cabinet opinion gradually turned against the campaign, and the Allied force of 83,000 was evacuated—a dangerous operation conducted with great skill—in January 1916. The Turks had lost some 300,000 men, the Allies about 250,000 to battle and disease. Gallipoli was, in Clement Attlee's

words, "the one strategic idea of the war." Its failure, through bad leadership, planning, and luck, condemned the Allies to seek a decision in bloody battles of attrition on the Western Front.

The other peripheral front that enticed Allied strategists was Austria's border with Italy. Though a member of the Triple Alliance, the Rome government maintained on Aug. 3, 1914, that it was not bound to fight since Austria had not been attacked nor had it consulted with Italy as the treaty required. Prime Minister Antonio Salandra, a nationalist dedicated to the Irredentists' goal of recovery of Trentino and Trieste from Austria, announced that Italy would be informed by *sacro egoismo.* This, he explained, was a mystical rather than cynical concept, but it set off seven months of haggling over what the Allies would offer Italy to enter the war, and what the Central Powers would offer for neutrality. Some considerations were objective: Italy's 4,160 miles of coastline made defense against the Anglo-French fleet virtually impossible; any gains extorted from the Central Powers for neutrality would hardly be secure should those powers win the war; and neutrality was incompatible with Italy's tenuous claim to be a Great Power. What was more, all the Central Powers could offer was Trentino, and even that promise had to be forced from Vienna by German pressure.

The competition for Italy

After a clumsy intervention by the Russian foreign minister, Sazonov, in which he tried to secure Italy's help and still protect Serbian interests on the Dalmatian coast, negotiations moved to London. Berlin dispatched ex-chancellor Bülow and Roman Catholic statesman Matthias Erzberger to Rome to plead for the Central Powers. On April 26, the day after the first Gallipoli landing, the Treaty of London committed Italy to enter the war against Austria-Hungary within a month. In return the Allies promised Italy Trentino, part of South Tirol, Trieste, a third of Dalmatia (at the expense of Serbian ambitions), a mandate over Albania, a portion of German East Africa, all of Libya, a part of Asia Minor, and a 1,250,000,000-lira war chest from Britain. Still, a month of crisis followed in Rome as journalists like Gabriele D'Annunzio and Benito Mussolini stoked war fever and parliamentary power-broker Giovanni Giolitti (backed by Bülow) maneuvered for peace and *parecchio*—the "much" that might be obtained from Austria without lifting a rifle. After a Cabinet crisis Salandra returned to power to declare war on Austria-Hungary on May 23, 1915 (though Italy did not declare war on Germany until August 1916).

General Luigi Cadorna's war plan called for a strategic defense in the mountainous Trentino while half the Italian army concentrated for attack along the Isonzo River to the south. In June 1915 he launched the first of 11 battles of the Isonzo, wasting some 250,000 men against the rocky parapets and spirited Austrian defenders. The southern front became another deadlock, while Italy's weak finances and industry would only make her a continuing drain on Anglo-French resources.

First battle of the Isonzo

After Turkey and Italy, attention turned to the neutral Balkan states. The entry of the Balkan states on the side of the Central Powers would doom Serbia and open direct communications between Germany and Turkey. Balkan participation on the Allied side would isolate Turkey and complete the encirclement of Austria-Hungary. The Central Powers had the upper hand in Bulgaria, still smarting from its defeat in the Second Balkan War and allied with Turkey as of Aug. 2, 1914. The Allies had little to offer Bulgaria except bribes, especially after their failure at Gallipoli. German offers proved irresistible: Macedonia (from Serbia) and parts of the Dobruja and Thrace should Romania and Greece intervene. Bulgaria joined the Central Powers on Sept. 6, 1915. In Romania the Allies had the upper hand despite a treaty, renewed in 1913, binding Bucharest and its Hohenzollern dynasty to the Triple Alliance. Romania's main ambition was to annex Transylvania, a Habsburg province populated largely by Romanians, but Prime Minister Ionel Brătianu determined to stay neutral and observe the fortunes of war.

In 1915 those fortunes appeared to favour the Central Powers on the Turkish, Italian, Serbian, and Russian fronts. The Russian front collapsed in the face of a German offensive in May, allowing the Central Powers to reoccupy Galicia, Lithuania, and Courland in the north. In July the Germans resumed the drive and threatened to pincer the entire Russian army in Poland. Warsaw fell on August 5 and Brest-Litovsk on the 26th, whereupon the German armies outran their supplies and halted the drive on a line stretching from Riga on the Baltic to Czernowitz on the Romanian border. Russian losses were apocalyptic: more than a million men captured and at least as many killed and wounded in 1915. Technical inferiority, shortage of munitions, and poor tactics led to terrible wastage of men in the attack and lack of mobility on the defense. The inadequacy of the Russian state and economy in modern war now stood revealed. Desertions increased and morale plummeted. On September 5, Tsar Nicholas himself took over supreme command, a chivalrous move but one that would identify the crown with future disasters.

German advance against Russia

In 1916 German strategists again turned west with the expressed intention of bleeding France white and breaking her army's spirit. The object of attack was to be the fortress of Verdun, and the plan called for the substitution of ordnance for manpower as much as possible, thereby using Germany's industrial might to kill Frenchmen in the most efficient way. The assault began on February 21, following an avalanche of shells and poison gas, and continued without interruption for five months. France's civilian and military leadership turned Verdun into a national symbol of resistance, symbolized by General Philippe Pétain's famous order of the day: "*Ils ne passeront pas!*" Verdun was the most intensive battle in history and cost France and Germany more than 300,000 men each.

In December 1915 an Allied conference at Chantilly had decided to coordinate simultaneous attacks on all fronts. Given Verdun, responsibility for the Western assault fell to the British. After elaborate preparation and a week of bombardment the cream of "Kitchener's New Army" went over the top on July 1, 1916, and strode in formation toward the German lines. By mid-November the Somme offensive had gained about six and a half miles across a 30-mile front at the cost of 420,000 Britons, 194,000 Frenchmen, and 440,000 Germans.

The First Battle of the Somme

On the Eastern Front in 1916 the Russian command dutifully took up the offensive to relieve the pressure on Verdun and in coordination with the push on the Somme. But failures in leadership and supply, poor intelligence and tactics again thwarted the courage of Russia's peasant-soldiers, 100,000 of whom were lost in a March attack that achieved nothing. The last gasp of the tsarist army followed in June. Russian attacks at Lutsk, Buchach, and Czernowitz beginning June 4 achieved total surprise, captured 200,000 men, and overran Bukovina by the end of the month. This apparent revival of Russia's fortunes prompted the Romanians, finally, to declare war on Austria-Hungary on Aug. 27, 1916. Half the Romanian army—12 divisions—joined the offensive and advanced into Transylvania, expecting to deal the final blow to staggering Austria-Hungary. Instead, Germany, Turkey, and Bulgaria promptly declared war on Romania. The Romanians held out for a month against a German-Austrian-Bulgarian attack at the Vulcan and Szurduk (Surduc) passes, but the Central Powers broke through and captured Bucharest on December 6. The Romanian gambit ended in disaster as the Germans acquired their oil and wheat and the Russians inherited an additional 300 miles of frontline. Meanwhile, the Russian offensive degenerated into frontal assaults and closed in August. Russia had lost 500,000 men—the last trained reserves of the tsarist army.

Fall of Bucharest

By the end of 1916 what may be called the traditional phase of the war had run its course. Despite ever greater expenditures of men and matériel and the accession of neutral powers to one side or the other, victory remained elusive. Henceforth the coalitions would rely all the more on breaking the internal cohesion of the enemy or on calling forth global forces to tip the balance. The resort to revolution, especially in Russia, and extra-European powers, especially the United States, would have profound consequences for Europe's future in the 20th century, while internal mobilization for total war had already gone far to reshape European societies.

WAR MOBILIZATION AT HOME AND ABROAD

The invention of total war. When the first campaigns failed and the belligerents steeled themselves to fight a long war of attrition, World War I became total—that is, a war fought without limitations, between entire societies and not just between armies, with total victory the only acceptable outcome. It became such a war because, for the first time, the industrial and bureaucratic resources existed to mobilize an entire nation's strength, because the stalemate required total mobilization, and because the tremendous cost and suffering of such a war seemed to preclude settling for a negotiated truce. Only victory might redeem the terrible sacrifices already made by both sides; and if final victory were the only acceptable end, then any means could be justified in pursuit of it.

The first violent battles of 1914 nearly expended prewar munitions reserves. By mid-war the artillerymen of the Western Front might fire more shells in a single day than were expended in the entire Franco-German War. Clearly the home front—the war economy—would be the most decisive of all. And yet the governments, expecting a short war, were unprepared for economic mobilization and had to adjust to emergencies and shortages as they arose. In Germany the process began in the first days of war when private manufacturers, especially Walther Rathenau, suggested a state bureau to distribute raw materials to industry. Over the years it became a model for new agencies, boards, and commissions controlling production, labour, rationing, travel, wages and prices. By late 1917, Germany came to dominate the economies of Austria-Hungary and the occupied regions by the same means. In all the belligerent nations, to a greater or lesser degree, civil and economic liberties, the free market, even national sovereignty, gave way to a kind of military socialism in the crucible of war. All the belligerents met their labour needs through employment of old men, children, and women (a fact that ensured the success of the suffragette movement in Europe after the war). The Allies also engaged in economic war through agreements with neutral countries on the Continent not to re-export goods to Germany and through preemptive purchase of everything from Chilean nitrates to Romanian wheat.

Germany's wartime command economy

An economic problem that could be postponed was the financial one. The belligerents immediately ended controvertibility of their currencies according to the gold standard and liquidated their holdings overseas. By late 1915 the British and French also began to float sizable loans on the American market, even as they themselves underwrote the war efforts of weaker economies like the Italian and Russian. British, Germans, and Americans covered a fraction of the war's expense through income and other taxes, but World War I was financed primarily through war bonds and secondarily through loans from abroad. This pattern would exacerbate the diplomatic and domestic political climates after the war, when the bills for the four years' wastage came due.

Financing the war

The weapon of morale. The mass conscripted army and labour force, the employment of women and children, and the mobilization of science, industry, and agriculture meant that virtually every citizen contributed to the war effort. Hence all governments tried to stoke morale on the home front, subvert that of the enemy, and sway the opinions of neutrals. A variety of techniques for manipulating information were used, including particularly censorship and vilification of the enemy. German propaganda depicted Russians as semi-Asiatic barbarians and the French as mere cannon fodder for the bloated, envious British Empire lusting to destroy Germany's power, prosperity, and *Kultur*. The French Maison de la Presse and British Ministry of Information took German war guilt for granted and made great play of the atrocities committed by the "Hun" in Belgium and on the high seas, where defenseless passenger ships were treacherously torpedoed. War hatred whipped up by such propaganda made it all the more difficult to justify negotiating a truce.

The Allies proved more adept than the Germans at psychological warfare. Propaganda was distributed across German lines by shells, planes, rockets, balloons, and radio. Such activities were given into the hands of an Inter-Allied Propaganda Commission in 1918. The Allies also, especially after 1917, identified themselves with such universal principles as democracy and national self-determination, while the German war effort had only a narrow national appeal. The most important target of propaganda was the United States. In the first weeks of war the British cut the German transatlantic cables and subsequently controlled the flow of news to America. German attempts to influence U.S. opinion were invariably clumsy, while the British, aided by the common language, reminded Americans of their common values for which German militarism had no respect. In political warfare, German attempts to arouse the Muslim world and incite India to rebellion were stillborn, while their exploitation of the situation in Ireland, culminating in the Easter Rising of 1916, backfired. The aristocratic and continental German officials seemed out of their element when either trying to appeal to the masses or looking beyond Europe. But their one success was nothing less than the Russian Revolution of 1917 (see below).

Allied propaganda and America

WAR AIMS AND PEACE FEELERS

War aims of the belligerents. For what were the nations of Europe making such total and mortal commitments? In public each government insisted it was fighting first in self-defense, then for victory and some hallowed national goal like naval security for Britain, Alsace-Lorraine for France, or Constantinople for Russia. But in private, now that peacetime constraints were torn off, each indulged greater ambitions. German war aims took shape at once in the September Program of Bethmann. While debate exists over how much this document reflected Bethmann's real views, it did come to represent the prevailing view of the military, which in turn came to speak increasingly for Germany as a whole. The dream of world power seemed within reach through the acquisition of Belgian and French colonies that, when joined to Germany's and perhaps Portugal's, would constitute a *Mittelafrika* of immense proportions. In Europe the Germans determined to assure that France and Russia would pose no threat in the future and to create an economic base suitable for a world power. This notion of a single economic bloc from Berlin to Baghdad, including Belgium, the Longwy-Briey mines of France, Poland, Courland, the Ukraine, and the Balkans, was popularized as *Mitteleuropa* in a 1915 best-seller by Friedrich Naumann. How committed Germany's civilian leadership was to this hegemonic plan is disputed: Bethmann favoured abandoning much of it in hopes of a negotiated peace. But a war-aims majority held the balance in the Reichstag until 1917 and in the military until the bitter end.

The idea of *Mitteleuropa*

On Sept. 5, 1914, the entente powers solemnly and severally renounced any separate peace, but throughout the war they felt constrained to bolster each other's will to fight with promises of spoils. Hence the purchase of Italy's belligerency and the shocking willingness of Britain and France to consign Constantinople to Russia in March 1915. In general, Allied ambitions added up to the partition of the German and Ottoman empires and security against Germany in Europe and on the seas. Partition of Austria-Hungary was not an initial Allied aim. In the spring of 1915 France and Russia exchanged letters promising that both could do as they wished on their borders with Germany, implying a free hand for Russia in Galicia and East Prussia and the same for France on the Rhine. French industry contemplated an advance into the Saar and Rhine regions to end France's inferiority in coal production (which would only be exacerbated by the return of Alsace-Lorraine with its rich iron deposits). For the French army and foreign ministry, however, the main motive for separating the Rhineland from Germany was security: what Poincaré called "breaking Prussian militarism" and Aristide Briand "guarantees of lasting peace." In 1917 Paris and St. Petersburg were close to a formal treaty on the German boundaries when the Russian Revolution intervened.

The Allies specified their colonial claims in an agreement of April 1916, by which Britain was granted influence in Mesopotamia and Syria; France the same in Lebanon,

Allied territorial agreements

Cilicia, and southern Kurdistan; and Russia in Armenia and northern Kurdistan; Palestine was placed under joint Anglo-French administration. The Sykes–Picot Agreement in May also divided much of the Ottoman Empire into British and French spheres. The Agreement of Saint-Jean-de-Maurienne of April 1917 promised Italy concessions on the Anatolian coast; one Allied motive in this was to persuade Rome to scale down its claims on Austria-Hungary in hopes of a separate peace with Vienna (see below). Finally, the French began in 1916 to formulate a second set of war aims directed, not at Germany, but at their own allies. British currency supports, loans, coal shipments at fixed prices, and other benefits helped sustain the French war effort, and the minister of commerce, Etienne Clémentel, lobbied for an extension of these supports beyond an armistice lest France win the military struggle only to lose the postwar economic struggle. The British agreed at the Allied Economic Conference of 1916, and the following year the French placed even greater hopes of economic solidarity in the newly associated power, the United States.

Attitude of the United States. Since 1783 the United States had acquired a number of foreign policy traditions. George Washington, in his Farewell Address, admonished his young and vulnerable country to avoid alliances that would drag it into disputes in which it had no interest. Thus was born a powerful isolationalist and exclusivist tradition. The Monroe Doctrine declared the Western Hemisphere off-limits to European adventurism, giving birth to a regionalist and paternalist tradition vis-à-vis Latin America. After the Civil War, belief in America's Manifest Destiny directed national attention to the West Coast and beyond. Then the war against Spain in 1898 yielded colonial possessions in the Caribbean and Pacific and inspired the building of a two-ocean navy and of a Panama Canal to serve it. By 1914, when the canal opened, the United States was already the greatest industrial power in the world, yet its tradition of exclusivity and its tiny standing army gave the Europeans excuse to ignore America's potential might.

Wilsonian neutrality

In August 1914 President Woodrow Wilson implored the American people to be "neutral in thought as well as deed" with respect to the European war. In so doing he was not only honouring tradition but also applying his own religious principles to foreign policy. His agenda upon entering the White House in 1913 had been domestic reform, and he had written that it would be an irony of fate should foreign policy come to dominate in his administration. Yet when fate so decreed, Wilson preferred to trust his own motives and methods rather than the advice of his secretaries of state or his other advisers. Wilson deplored the war and earnestly wished to bring about a just and lasting peace through U.S. mediation, for what greater mission could Providence assign to that "city on a hill," the United States of America?

American power began to figure in the balance of war almost from the start. Trading was suspended on the New York Stock Exchange when war broke out, but when it resumed in November 1914, Europeans sold most of the $4,000,000,000 worth of securities they held before the war. U.S. loans to belligerents were at first declared "inconsistent with the true spirit of neutrality," but the large Anglo-French orders for U.S. munitions, raw materials, and food created an economic boom, and by 1915 the Allies needed credit to continue their purchases. An initial £200,000,000 loan in September 1915 led eventually to billions being floated on the U.S. market and a complete reversal of the financial relationship between the Old World and the New. By 1917 the United States was no longer a debtor nation but the world's greatest creditor. U.S. firms also inherited many overseas markets, especially in Latin America, which the British and Germans could no longer serve.

To Americans neutrality seemed both moral and lucrative—the United States, said Wilson, was "too proud to fight." But the failure of his peace initiatives, the German assaults on neutrals' rights at sea, and the cumulative effect of Allied propaganda and German provocations conjoined to end U.S. neutrality by 1917. On Feb. 4, 1915, Germany declared the waters around the British Isles a war zone in which Allied ships would be sunk, without warning if necessary. While this procedure dispensed with traditional civilities like boarding, search and seizure, and care of civilians, effective submarine warfare required it. Underwater craft relied on stealth and surprise and exposed themselves to easy destruction once they made their presence known. Thus, even though the British blockade interfered with neutral shipping more than the German blockade, the latter appeared far more beastly. The sinking of the Cunard liner *Lusitania* on May 7, 1915, which killed over a thousand passengers, including 128 U.S. citizens, outraged U.S. public opinion despite the rightful German claim that she was carrying munitions (173 tons worth). Two more passenger ships, the *Arabic* and *Hesperia,* went down in August and September, respectively, whereupon American diplomatic protests caused civil officials in Berlin to overrule the military command and call off unrestricted submarine warfare, although the issue did not remain settled.

Sinking of the *Lusitania*

Wilson's own peace initiatives, including an offer of mediation by Secretary of State William Jennings Bryan in 1914 and a trip to Europe by Wilson's personal aide and adviser, Colonel Edward M. House, in 1915, were unsuccessful. Early in 1916 House returned to Europe and on February 22 in London agreed to a formula whereby the United States would summon a peace conference and—if Germany refused to attend or proved unreasonable—"would leave the conference as a belligerent on the side of the Allies." Wilson later drew back from the guarantee and added the word "probably" after "would." But the British themselves shied from promoting such a conference, while the other belligerents also ducked the suggestion lest they compromise the determination of their people or incur the distrust of allies.

By the end of 1916 Germany had 102 U-boats ready for service, many of the latest type, and the chief of the naval staff assured the Kaiser that unrestricted submarine warfare would sink 600,000 tons of Allied shipping per month and force Britain to make peace within five months. Bethmann fought to delay escalation of the submarine war in hopes of another Wilsonian peace move. But the President held off new initiatives during his reelection campaign. When he had still not acted by December 1916, Bethmann was forced to make a deal with his own military, which consented to tolerate a German peace offer in return for Bethmann's endorsement of unrestricted submarine warfare if the offer failed. But the army helped ensure that the German note (released December 12) would fail by insisting on implicit retention by Germany of Belgium and other battlefield conquests. Wilson followed on the 18th with an invitation to the two camps to define their war aims as a prelude to negotiation. The Allies demanded evacuation of occupied lands and guarantees against Germany in the future. The Germans stuck to their December note, and the military command decided to resume unrestricted submarine warfare on February 1.

German debate over submarine warfare

The United States broke diplomatic relations with Germany on February 3 and commenced the arming of merchant ships on March 9. Meanwhile, German Foreign Secretary Arthur Zimmermann, anticipating war with the United States over the U-boat issue, cabled an offer of alliance to Mexico on January 16, promising Mexico its own "lost provinces" of Texas, Arizona, and New Mexico in case of war with the United States. British intelligence intercepted the Zimmermann telegram and leaked it to Washington, further inflaming American opinion. When U-boats proceeded in mid-March to sink the *Algonquin, City of Memphis, Vigilancia,* and *Illinois* (the latter two without warning), Wilson went before Congress and in a lofty and moving address reviewed the reasons why America was forced to take up the sword—why, "God helping her, she can do no other." On April 6, 1917, Congress declared war on Germany, and the United States became an Associated (not an Allied) Power. Henceforth World War I hinged on whether the U-boats could force Britain to her knees and the German armies overwhelm the sagging Western Front before the men and matériel of the aroused Yankees could arrive in France.

THE CRISES OF 1917

War-weariness and diplomacy. For every belligerent, 1917 was a year of crisis at home and at the front, a year of wild swings and near disasters, and by the time it was over the very nature of the war had changed dramatically.

A French offensive in the spring soon ground to a standstill, sparking a wave of mutinies and indiscipline in the trenches that left the French army virtually useless as an offensive force. The British offensive of July–November, called variously Passchendaele or the Third Battle of Ypres, was a tactical disaster that ended in a viscous porridge of mud. That offensive action could be ordered under such conditions is a measure of how far Western Front generals had been seduced into a gothic unreality. Allied and German casualties "in Flanders Fields, where poppies grow" numbered between 500,000 and 800,000. The British Army, too, now neared the end of its offensive capacities.

The tragedy of Flanders Fields

For two years the Italian front had been left unchanged by the first nine battles of the Isonzo. But the underfinanced and underindustrialized Italian war effort gradually eroded. The Tenth Battle of the Isonzo (May–June 1917) cost Italy dearly, while the Eleventh (August–September) registered a "success" amounting to some five miles of advance at a cost of over 300,000 casualties, pushing the total for the war to more than a million. With peace propaganda, strikes, and Communist agitation spreading through Italy, and the Austrians in need of stiffening, the German high command reinforced the Austrians at Caporetto. Within days the Italian commander had to order a general retreat. The Germans broke the line of the Tagliamento as well, and not until the Italians regrouped at the Piave on November 7 did the front stabilize. Caporetto cost Italy 340,000 dead and wounded, 300,000 prisoners, and another 350,000 deserters: an incredible 1,000,000 in all, suggesting that the Italian army, like the French, was on strike against its own leadership.

Among the Central Powers also, 1917 intensified the yearning for peace. Polish, Czech, and Yugoslav leaders had formed committees in exile to agitate for the autonomy or independence of their peoples, while war-weariness among those at home grew with the food shortages, bad news from the front, and desertions among the troops. When Emperor Francis Joseph died in November 1916 after 68 years on the throne, there was a sense that the empire must die with him. Already Austro-Hungarian officials had begun to look for a way out of the war—which meant a way out of the German alliance. The new Habsburg foreign minister, the Polish Ottokar, Graf Czernin, raised the issue of war aims and peace at his first ministerial meeting with the new emperor, Charles. A negotiated peace could only be one without victors or vanquished, conquests or indemnities—so said Czernin 10 days before Wilson's own "Peace Without Victory" speech. The only means of achieving such a peace, however, was for Austria-Hungary's ally Germany to restore Belgium and, perhaps, Alsace-Lorraine.

The first Austrian demarches, made through Scandinavia, came to nothing, so Charles, Czernin, and the Empress Zita tried again in late January 1917 through the intermediary of her brother, Prince Sixtus of Bourbon-Parma, on leave from service in the Belgian army. In March, Charles drafted a letter in which he asked Sixtus to convey to the President of France his "lively sympathies" and support for the evacuation of Belgium and the lost provinces. The cautious French premier, Alexandre Ribot, shared the news in April with Lloyd George, who said simply, "That means peace." But Baron Sonnino, at the Conference of Saint Jean-de-Maurienne, refused to consider peace with Austria-Hungary (the only enemy Italy was interested in fighting) and warned Lloyd George against attempts to split their alliance. Charles second letter, in May, which inexplicably told the French and British of an "Italian peace offer" that was never made, only put the Allies on their guard.

Simultaneously the parliamentary forces of Germany rose in protest against the war, the erosion of civilian authority, and the war-aims stubbornness of the military command. A moderate annexationist deputy, Matthias Erzberger, met with Czernin and Emperor Charles in April 1917 and learned that Austria-Hungary's military strength was near its end. In May a Reichstag committee demanded that the army be placed under civilian control. The Kaiser and the military high command replied with scorn. In July Bethmann was forced to resign and the army assumed de facto control of Germany. When the Kaiser appointed a nonentity, Georg Michaelis, as chancellor, the Reichstag passed a peace resolution on July 19 by a vote of 212–126. But the resolution could have no bearing on the ruling circles, to whom compromise with the foreign enemy meant surrender to the domestic forces of reform.

Military supremacy in Germany

In mid-August, Pope Benedict XV tried to preserve momentum toward a truce by calling on all parties to evacuate occupied regions. But the German government again refused to surrender Belgium, while the American reply to the Vatican seemed to insist on the democratization of Germany. Emperor Charles and Czernin were likewise unable to make headway, for the Allies were not at this point seeking a general peace but only a separate peace with Austria-Hungary that would leave Germany stranded. That Vienna could not in honour do, nor Berlin permit. The United States declared war on Austria-Hungary on Dec. 7, 1917, and when the French government leaked news the following spring of the Austrian peace correspondence, Charles and Czernin were forced to humble themselves before the Kaiser and German high command at Spa. Austria-Hungary had become a virtual satellite of the German military empire.

The Ottoman Empire in 1917 began to give way before the relatively mild but incessant pressure on fronts the other powers considered sideshows. Baghdad fell to British forces in March. Sir Edmund Allenby, having promised Lloyd George that he would deliver Jerusalem to the British people "as a Christmas present," made good his promise on December 9. The political future of Palestine, however, was a source of confusion. In the war-aims treaties, the British had divided the Middle East into colonial spheres of influence. In their dealings with the Arabs the British spoke of independence for the region. Then on Nov. 2, 1917, the Balfour Declaration promised "the establishment in Palestine of a national home for the Jewish people," albeit without prejudice to "the civil and religious rights of existing non-Jewish communities." Foreign Secretary Arthur Balfour was persuaded that this action was in British interest by the energetic appeals of Chaim Weizmann, but in the long run it would cause no end of difficulty for British diplomacy.

The Balfour Declaration

The one flank on which Turkey had not been besieged was the Balkan, where an Allied force remained in place at Salonika pending resolution of the Greek political struggle. The Allies continued to back Prime Minister Venizélos, who, because King Constantine still favoured the Central Powers, had fled Athens in September 1916 and set up a provisional government under Allied protection at Salonika. Finally, the Anglo-French deposed Constantine in June 1917 and installed Venizélos in Athens, whereupon Greece declared war on the Central Powers. By the end of 1917, therefore, Turkey, like Austria, was exhausted, beleaguered on four fronts, and wholly dependent on German support.

The Russian Revolution. But while Britain, France, Italy, Germany, Austria-Hungary, and Turkey all survived their crises of 1917 and found the will and stamina for one last year of war, Russia succumbed to its crisis. In three years of war Russia had mobilized roughly 10 percent of its entire population and lost over half of that number in battle. The home economy was stretched to the limit, and even the arms and food it could produce were subject to vagaries of transport and corruption in the supply services. Inflation and food shortages panicked the towns, shortages of fuel isolated the countryside. Suddenly, on March 12, 1917, the parliament and Petrograd soviet (workers' and soldiers' council) joined forces to form a Provisional Government. Three days later the Tsar abdicated.

The Provisional Government

Two leading ministers in the new regime, Aleksandr Kerensky and Pavel Milyukov, hoped to streamline the state and invigorate the war effort. Political liberals, they valued Russia's ties to Britain and France and even looked

forward to capturing Constantinople as a means of legitimating the new regime. Kerensky assured the Allies on March 17 that Russia would fight "unswervingly and indefatigably" until victory. The local soviets and leftist parties, however, forced a declaration in April by which "free Russia" renounced domination over other nations and their territories. When Prince Gyorgy Lvov, the prime minister, promised to accept the revolutionary formula of "no annexations, no indemnities" on May 15, Milyukov stepped down as foreign minister. President Wilson was especially moved by the spectacle of Russia embracing democracy, and all the Allies could now truly depict their cause as moral and ideological: "to make the world safe for democracy," as Wilson said, in opposition to militarism and imperialism. But Russia's ability to fight steadily and rapidly deteriorated. The Petrograd soviet called for abolition of the officer corps, and the Provisional Government abolished courts-martial and issued a Declaration of Soldiers' Rights.

The Provisional Government's decision to continue the war was a grave disappointment to the Germans. Since 1914 they had dabbled in revolutionary intrigues in hopes of shattering Russia from within. The campaign took two forms: collaboration with nationalist agitators among the Finns, Baltic peoples, Poles, Ukrainians, and Georgians; and support for Russian social revolutionaries. Lenin, leader of the most virulent wing of Russian Marxists, the Bolsheviks, was living in Kraków when the war broke out and was promptly arrested. But an Austrian Social Democrat, Victor Adler, persuaded the Austrian minister of the interior that Lenin was an ally in the fight against Russia, whereupon he was released into Switzerland. Another Russian émigré and Socialist, Alexander Helphand, impressed the German ambassador in Constantinople with his revolutionary connections and was soon briefing the German foreign ministry in Berlin. In March 1915 the Germans set aside the first 2,000,000 of what would eventually total 41,000,000 marks spent on secret subversion in Russia.

After the first Eastern Front victories in 1915, Berlin had hoped to entice Russia into a separate peace, and efforts to that end continued up to March 1917. But behind the scenes, Helphand's organization, supported by the German foreign office, worked to spread revolutionary and pacifist ideas inside Russia. After Kerensky's declaration that Russia would stay in the war, the German command determined to facilitate Lenin's return to Russia. On April 9, 1917, he and his comrades were placed aboard a special security train in Zurich for the trip across Germany, continued by boat to Sweden and thence by rail to Petrograd.

Lenin's return

Bolshevik propaganda penetrated the army, which even the Russian high command confessed was "a huge, weary, shabby, and ill-fed mob of angry men." In an attempt to restore it to fighting trim, General Lavr Kornilov urged on Kerensky a number of reforms (August 16), but behind Kornilov were conspirators hoping for military dictatorship. Kerensky grasped the danger to himself, forbade troop movements to the capital lest they support a coup, and then had Kornilov arrested. This division between the centre and right gravely weakened the Provisional Government and strengthened the Bolsheviks, who took the lead in denouncing this "counterrevolutionary plot." The Provisional Government, bereft of authority and will, hoped to hold on until elections for a Constituent Assembly in December. Lenin, knowing he stood to lose by the fact and the result of free elections, struck in November, and the Provisional Government collapsed in the face of the Bolshevik coup d'état.

One of Lenin's first acts as revolutionary dictator of Russia was to attempt to transform the European war of nations into a war of classes. His ringing speech of November 8 appealed to workers and soldiers everywhere to force an immediate armistice, end secret diplomacy, and negotiate a peace of "no annexations, no indemnities." Lenin, Trotsky, and Karl Radek promptly organized to spread revolution abroad. The expected uprisings occurred nowhere, but peace was mandatory for Russia if the Bolshevik regime were to survive. On December 15, therefore, Lenin's regime signed an armistice with the Central Powers.

LAST BATTLES AND ARMISTICE

Russia's withdrawal from the war. The events of 1917 meant that World War I was no longer a two-sided contest. Rather, four visions of the future now competed for the allegiance of governments and peoples. Germany fought on in hope of victory and domination of the Continent. The Allies fought on to frustrate Germany and realize their own ambitious war aims. Wilson's America fought as an "associated power" for a liberal internationalist agenda opposed to German and Allied imperialism alike. Finally, Lenin's Russia raised a second challenge to the old diplomacy in the name of Socialist internationalism. German, Allied, Wilsonian, and Bolshevik images of the peace differed so radically that the war was now as much ideological as it was military.

Lloyd George and Wilson replied to Lenin's peace initiatives with speeches of their own to reassure their peoples, contrast their liberal goals with those of the Germans, and perhaps persuade Russia to remain in the field. Lloyd George insisted before the Trades Union Congress (Jan. 5, 1918) that "we are not fighting a war of aggression against the German people," and stressed autonomous development for all peoples, including those of Austria-Hungary. Wilson's Fourteen Points speech (Jan. 8, 1918) called for (1) open covenants, openly arrived at; (2) freedom of the seas; (3) lowering of economic barriers; (4) reduction of armaments; (5) colonial arrangements respecting the will of the peoples involved; (6) national self-determination for the peoples of Russia; (7) restoration of Belgium; (8) return of all invaded territory plus Alsace-Lorraine to France; (9) Italian recovery of her *irrendente;* (10) autonomy for the nationalities of Austria-Hungary; (11) restoration of the Balkan states and access to the sea for Serbia; (12) autonomy for the peoples of the Ottoman Empire and free navigation through the Dardanelles; (13) an independent Poland with access to the sea; and (14) a "general association of nations" offering "mutual guarantees of political independence and territorial integrity." In his Four Principles (February 11) and Five Particulars (September 27) speeches Wilson elaborated his views on national self-determination, a truly revolutionary idea with global, but unpredictable, implications.

Wilson's Fourteen Points

Allied assurances failed to dissuade the Bolsheviks from exiting the alliance. Lenin took power on the slogan "Peace, Bread, and Land," and he needed to be free of the war in order to consolidate Bolshevik power. A peace conference convened at Brest-Litovsk on Dec. 22, 1917, but proceeded slowly while the two sides—one imperialist, the other incipiently totalitarian—bickered about the definition of "national self-determination." On Jan. 7, 1918, Leon Trotsky asked for adjournment, still hoping for revolutionary outbreaks abroad. In fact, a mutiny in the Austrian fleet and a general strike movement in Berlin did occur but were easily suppressed. The Bolshevik leadership now faced three bad choices: to defy the Germans and risk conquest and overthrow; to relent and sign over half of European Russia to German control; or to pursue what Trotsky called "neither war nor peace" while awaiting the revolution in Germany. He also wished to avoid any sign of collusion with the German military, lest the Bolsheviks appear to be collaborationists. In the meantime the Germans and Austrians concluded the *Brotfrieden* ("bread peace") with representatives of the wheat-rich Ukraine. But when Bolshevik forces began to penetrate the Ukraine—and the German high command tired of Trotsky's rhetoric—the Germans broke off talks and ordered the army to resume its advance. The French ambassador immediately offered the Bolsheviks all aid if they would fight the Germans, but Lenin ordered an immediate capitulation. Germany now presented even harsher peace terms. On March 3 the Bolsheviks signed. The Romanians then made peace on the 5th, and newly independent Finland signed a treaty with Germany on the 7th.

Trotsky's "neither war nor peace"

In the Treaty of Brest-Litovsk the Bolshevik regime turned over to Germany 34 percent of Russia's population, 32 percent of Russia's farmland, 54 percent of Russia's industrial plant, 89 percent of Russia's coal mines, and virtually all of its cotton and oil. These economic gains in the east, plus the release of troops who could

Treaty of Brest-Litovsk

now be shifted to the Western Front, revived German hopes that victory was achievable before the Americans arrived in force.

Negative views of the Bolshevik Revolution predominated from the start in Western capitals, although some people on the left in London, Paris, and Washington sympathized with it or thought it would bring much needed "efficiency" to Russia. The French and British had talked of supporting this or that Russian faction with arms or cash and had agreed on a tentative division of southern Russia into areas of responsibility. The German advance of February then caused the Allied missions to flee Petrograd and reassemble in remote Vologda, where they waited to see what direction the Bolsheviks would take. The Treaty of Brest-Litovsk answered the question. It was an unparalleled disaster for the beleaguered Allies, who now had to consider intervention in Russia. First, if they could link up with nationalist Russians and reopen the Eastern Front, they might save their exhausted armies in France from facing the full might of the Central Powers. Second, it would be most helpful if they could save Allied war matériel that had stacked up in Russian ports (some 162,495 tons of supplies in Arkhangelsk alone) from seizure by the Germans or Bolsheviks and distribute it to Russians still willing to fight Germans.

Allied intervention in Russia

When the German onslaught on the Western Front opened in March, the French and British became desperate for a diversion in the East. In March 1918 an Anglo-French expedition docked at Murmansk, followed in June by an American cruiser and 150 marines. An Anglo-French force occupied Arkhangelsk in August, and 4,500 U.S. soldiers under British command joined them in September. These tiny contingents, totaling about 28,000 men, were never meant to overthrow the Bolshevik regime, although the British hoped they might serve as magnets for White Russian forces opposing the Bolsheviks.

The Japanese, seeking an imperial foothold on the Asian mainland, used Brest-Litovsk as pretext to occupy Vladivostok in April. Wilson then committed U.S. troops to Siberia in order to keep an eye on the Japanese and to make contact with 30,000 Czechoslovak legionnaires, mostly former prisoners of war from the Habsburg armies seeking to escape Russia to fight for an independent Czech state. The Czechoslovak Legion, released and armed by the Kerensky government, at first declared neutrality toward Russian politics, but when the Bolsheviks tried to disarm them, skirmishes ensued, and the legion became strung out along the 6,000-mile-long Trans-Siberian Railway. The Allied interventions also became entangled in the erupting Russian Civil War. Bolsheviks controlled Petrograd, Moscow, and the core regions of Russia, while White governments were established by Admiral Aleksandr Kolchak in Omsk and General Anton Denikin in Odessa.

The eastern minorities. The saga of the Czechoslovak Legion was symbolic of the growing vigour of the national movements inside the Habsburg Empire. Early in the war the subject peoples had remained loyal to beloved old Francis Joseph. But martial law, which fell especially hard on minorities, war weariness, hunger, and the example of the Russian Revolution converted moderates among the Czechs, Galician Poles, and South Slavs to the cause of independence. The Czechs and Slovaks were brilliantly served by Tomáš Masaryk and Edvard Beneš, who lobbied for Allied recognition of a Czech national council. The Polish movement, led by Józef Piłsudski, sought to establish similar national institutions and cooperated with the Central Powers after their Two Emperors' Manifesto (Nov. 5, 1916) promised autonomy to the Poles. The Polish National Committee in France, and famed pianist Ignacy Paderewski in the United States, also pleaded the Polish cause. Yugoslav (or South Slav) agitation was complicated by rivalries between the Serbs (Orthodox, Cyrillic alphabet, and politically stronger) and the Croats and Slovenes (Roman Catholic, Latin alphabet, politically disinherited), as well as Serbia's and Italy's conflicting claims to the Dalmatian coast. In July 1917 the factions united in the Corfu Declaration that envisioned a Kingdom of Serbs, Croats, and Slovenes. All the committees then gathered in Rome for a Congress of Oppressed Nationalities in April 1918.

The Corfu Declaration

The Allies stood aloof from the nationalities while hope persisted of detaching Austria-Hungary from Germany. But in 1918 the Allies took up the revolutionary weapon. In April 1918 Masaryk sailed to the United States, won personal recognition from Wilson and Secretary of State Robert Lansing, and concluded the Pittsburgh Convention by which Slovak-Americans, on behalf of their countrymen, agreed to join the Czechs in a united state. The Czechoslovak National Council won official recognition as a co-belligerent and de facto government-in-exile from France in June, Britain in August, and the United States in September. Only their quarrel with Italy kept the Yugoslavs from achieving the same. Thus, de facto governments were prepared to assume control of successor states as soon as Habsburg authority should collapse, internally or on the military fronts.

Germany's final battles. Ironically the Germans did not take maximum advantage of Brest-Litovsk after all, leaving about a million men—60 divisions—in the East in order to coerce the Ukrainians into relinquishing foodstuffs, to pursue political goals in the Baltic, and to ensure Bolshevik compliance. Facing virtual starvation as economic exhaustion deepened and the Allied blockade grew more effective, the German high command decided on a series of all-out attacks on the Western Front, beginning in March 1918. But tactical errors, together with the Allies' creation at last of a unified command and the arrival in strength of eager U.S. divisions, blunted and then turned back the offensives. By late July it was clear that Germany had lost the war. The 1918 offensives cost 1,100,000 men and drained the Reich of reserves. Morale plummeted on the Western Front and at home. Then on Aug. 8, 1918, British, Australian, and Canadian divisions struck on the Somme and overwhelmed German forces not adequately dug in. The 20,000 casualties, and an equal number of prisoners taken in one day, testified to the broken spirit of the German troops. Further Allied successes followed, and on Sept. 29, 1918, General Erich Ludendorff, the chief of staff, informed the Kaiser that the army was finished. The next day the new chancellor, the moderate Maximilian, Prince of Baden, was authorized to seek an armistice. On the night of October 3–4 he requested an armistice from President Wilson on the basis of the Fourteen Points.

Germany requests an armistice

While negotiations began for an armistice in the West, Germany's allies elsewhere collapsed. The collapse of the Bulgarian front before the Franco-Serbian offensive ended with the French cavalry capture of Skopje on September 29, whereupon the Allies accepted Bulgaria's petition for peace in the Armistice of Salonika. This opened Constantinople to attack and prompted the Turks as well to sue for peace. It also left Austria-Hungary, stymied on the Italian front, with little recourse. On October 4 Vienna appealed to President Wilson for an armistice on the basis of the Fourteen Points. But the U.S. note of the 18th indicated that autonomy for the nationalities no longer sufficed and thus amounted to the writ of execution for the Habsburg Empire. On October 28, in Prague and Kraków, Czech and Polish committees declared independence from Vienna. The Croats in Zagreb did the same on the 29th pending their union with the Serbs, and Germans in the Reichsrat proclaimed rump Austria an independent state on the 30th. The Armistice of Villa Giusti (November 4) required Austria-Hungary to evacuate all occupied territory, the South Tirol, Tarvisio, Gorizia, Trieste, Istria, western Carniola, and Dalmatia, and to surrender its navy. Emperor Charles, his empire gone, pledged to withdraw from Austria's politics on November 11 and from Hungary's on the 13th.

The first U.S. note responding to the German request for an armistice was sent on October 8 and called for evacuation by Germany of all occupied territory. The German reply sought to ensure that all the Allies would respect the Fourteen Points. The second U.S. note reflected high dudgeon about Germany's seeking assurances, given her own war policies. In any case, the British, French, and Italians (fearing Wilsonian leniency and angry about not being consulted after the first note) insisted that their military commands be consulted on the armistice terms. This in turn gave the Allies a chance to ensure that Germany

Allied solidarity on war aims

be rendered unable to take up resistance again in the future, whatever the eventual peace terms, and that their own war aims might be advanced through the armistice terms; *e.g.*, surrender of the German navy for the British, occupation of Alsace-Lorraine and the Rhineland for the French. Wilson's second note, therefore, shattered German illusions about using the armistice as a way of sowing discord among the Allies or winning a breathing space for themselves. The third German note (October 20) agreed to the Allies setting the terms and indicated, by way of appeasing Wilson, that Maximilian's civilian Cabinet had replaced any "arbitrary power" (Wilson's phrase) in Berlin. The third U.S. note (October 23) specified that the armistice would render Germany incapable of resuming hostilities. Ludendorff now wanted further resistance, but the Kaiser instead asked for his resignation on the 26th. The next day Germany acknowledged Wilson's note.

Some Allied leaders, most notably Poincaré and General John Pershing, bitterly disputed the wisdom of offering Germany an armistice when her armies were still on foreign soil. But Foch drafted military terms harsh enough for the skeptics, and Georges Clemenceau could not in good conscience permit the killing to go on if Germany were rendered defenseless. Meanwhile House, sent by Wilson to Paris to consult with the Allies, threatened a separate U.S.-German peace to win Allied approval of the Fourteen Points on November 4 (excepting a British reservation about "freedom of the seas," a French one about "removal of economic barriers and equality of trade conditions," and a clause enjoining Germany to repair war damage). House and Wilson jubilantly concluded that the foundations of a liberal peace were in place: substitution of the Fourteen Points for the Allies' "imperialist" war aims and the transition of Germany to democracy. The fourth U.S. note (November 5) informed the Germans of Allied agreement and the procedures for dealing with Marshal Foch.

Germany, however, seemed to be moving less toward democracy than anarchy. On October 29 the naval command ordered the High Seas Fleet to leave port for a last-ditch battle, prompting a mutiny, then full insurrection on November 3. Workers' and soldiers' councils formed in ports and industrial cities, and a socialist Republic of Bavaria was declared on the 8th. Two days later Maximilian announced the abdication of Kaiser William II and his own resignation, and Social Democratic leader Friedrich Ebert formed a provisional government. On the 10th the Kaiser went into Dutch exile. The armistice delegation led by Erzberger, meanwhile, met with Marshal Foch in a railway carriage at Rethondes on the 8th. Erzberger begged for amelioration of the Allies' terms and especially for the lifting of the blockade so that Germany might be fed. He raised the spectre of Bolshevism. Receiving only minor concessions, the Germans relented and signed the Armistice on Nov. 11, 1918. It called on Germany to evacuate and turn over to Allied armies all occupied regions, Alsace-Lorraine, the left (west) bank of the Rhine, and the bridgeheads of Mainz and Coblenz. A neutral zone of 10 kilometres on the right bank of the Rhine must also be evacuated, the entire German navy surrendered, and the treaties of Brest-Litovsk and Bucharest renounced. Germany was also to turn over a large number of locomotives, munitions, trucks, and other matériel—and to promise reparation for damage done.

Abdication and armistice

THE COLLAPSE OF THE OLD ORDER

The four years' carnage of World War I was the most intense physical, economic, and psychological assault on European society in its history. The war took directly some 8,500,000 lives and wounded another 21,000,000. The demographic damage done by the shortage of young, virile men over the next 20 years is incalculable. The cost of the war has been estimated at more than 200,000,000,000 1914 dollars, with some $36,800,000,000 more in damage. Much of northern France, Belgium, and Poland lay in ruin, while millions of tons of Allied shipping rested at the bottom of the sea. The foundation stone of prewar financial life, the gold standard, was shattered, and prewar trade patterns were hopelessly disrupted.

Economic recovery, vital to social stability and the containment of revolution, depended on political stability. But how could political stability be restored when four great empires—the Hohenzollern, Habsburg, Romanov, and Ottoman—had fallen, the boundaries of old and new states alike were yet to be fixed, vengeful passions ran high, and conflicting national aims and ideologies competed for the allegiance of the victors? In World War I, Europe lost its unity as a culture and polity, its sense of common destiny and inexorable progress. It lost much of its automatic reverence for the old values of country, church, family, duty, honour, discipline, glory, and tradition. The old was bankrupt. It remained only to decide which newness would take its place.

Spiritual cost of the war

The damage wrought by war would live on through the erosion of faith in 19th-century liberalism, international law, and Judeo-Christian values. For whatever the isolated acts of charity and chivalry by soldiers struggling in the trenches to remain human, governments and armies had thrown away, one by one, the standards of decency and fair play that had governed European warfare, more or less, in past centuries. Total war meant starving of civilians through naval blockade, torpedoing of civilian craft, bombing of open cities, poison gas in the trenches, and tactics of assault that took from the private soldier any dignity, control over his fate, or hope of survival. World War I subordinated the civilian to the military and the human to the machine. It remained only for such imperious cynicism to impose itself in peacetime as well, in totalitarian states modeled on war government, until the very distinction between war and peace broke down in the 1930s.

Peacemaking, 1919–22

The bells, flags, crowds, and tears of Armistice Day 1918 testified to the relief of exhausted Europeans that the killing had stopped and underscored their hopes that a just and lasting peace might repair the damage, right the wrongs, and revive prosperity in a broken world. Woodrow Wilson's call for a new and democratic diplomacy, backed by the suddenly commanding prestige and power of the United States, suggested that the dream of a new Jerusalem in world politics was not merely Armistice euphoria. A century before, Europe's aristocratic rulers had convened in the capital of dynasties, Vienna, to fashion a peace repudiating the nationalist and democratic principles of the French Revolution. Now, democratic statesmen would convene in the capital of liberty, Paris, to remake a Europe that had overthrown monarchical imperialism once and for all in this "war to end war."

In fact, the immense destruction done to the political and economic landmarks of the prewar world would have made the task of peacemaking daunting even if the victors had shared a united vision, which they did not. Central and Eastern Europe were in a turmoil in the wake of the German, Habsburg, Russian, and Ottoman collapses. Revolution sputtered in Berlin and elsewhere, and civil war in Russia. Trench warfare had left large swaths of northern France, Belgium, and Poland in ruin. The war had cost millions of dead and wounded and more than $200,000,000,000, not to mention the $30,000,000,000 more in damage to property and sunken ships. Ethnic hatreds and rivalries could not be expunged at a stroke, and their persistence hindered the effort to draw or redraw dozens of boundaries, including those of the successor states emerging from the Habsburg Empire. In the colonial world the war among the imperial powers gave a strong impetus to nationalist movements. India alone provided 943,000 soldiers and workers to the British war effort, and the French empire provided the home country with 928,000. These men brought home a familiarity with European life and the new anti-imperialist ideas of Wilson or Lenin. The war also weakened the European powers vis-à-vis the United States and Japan, destroyed the prewar monetary stability, and disrupted trade and manufactures. In sum, a return to 1914 "normalcy" was impossible. But what could, or should, replace it? As French foreign minister Stéphen Pichon observed, the war's end only meant that "the era of difficulties begins."

The legacy of war

The Paris Peace Conference ultimately produced five treaties, each named after the suburban locale in which it was signed: the Treaty of Versailles with Germany (June 28, 1919); the Treaty of Saint-Germain with Austria (Sept. 10, 1919); the Treaty of Neuilly with Bulgaria (Nov. 27, 1919); the Treaty of Trianon with Hungary (June 4, 1920); and the Treaty of Sèvres with Ottoman Turkey (Aug. 10, 1920). In addition, the Washington Conference treaties on naval armaments, China, and the Pacific (1921–22) established a postwar regime in those areas.

COMPETING VISIONS OF STABILITY

The idealist vision. According to the armistice agreement the peace was to be based on Wilson's Fourteen Points. But the French and British had already expressed reservations about them, and, in many cases, the vague Wilsonian principles lent themselves to varying interpretations when applied to complex realities. Nevertheless, Wilson anticipated the peace conference with high hopes that his principles would prevail, either because of their popularity with common people everywhere, or because U.S. financial leverage would oblige European statesmen to follow his lead. "Tell me what is right," he instructed his delegation on the *George Washington* en route to Paris, "and I will fight for it." Unique among the victor powers, the United States would not ask any territorial gains or reparations and would thereby be free to stand proudly as the conference's conscience and honest broker.

America as honest broker

Wilsonianism, as it came to be called, derived from the liberal internationalism that had captured large segments of the Anglo-American intellectual elite before and during the war. It interpreted war as essentially an atavism associated with authoritarian monarchy, aristocracy, imperialism, and economic nationalism. Such governments still practiced an old diplomacy of secret alliances, militarism, and balance of power politics that bred distrust, suspicion, and conflict. The antidotes were democratic control of diplomacy, self-determination for all nations, open negotiations, disarmament, free trade, and especially a system of international law and collective security to replace raw power as the arbiter of disputes among states. This last idea, developed by the American League to Enforce Peace (founded in 1915), found expression in the Fourteen Points as "a general association of nations" and was to be the cornerstone of Wilson's edifice. He expected a functioning League of Nations to correct whatever errors and injustices might creep in to the treaties themselves.

Liberal internationalism set the tone for the Paris Peace Conference. European statesmen learned quickly to couch their own demands in Wilsonian rhetoric and to argue their cases on grounds of "justice" rather than power politics. Yet Wilson's principles proved, one by one, to be inapplicable, irrelevant, or insufficient in the eyes of European governments, while the idealistic gloss they placed on the treaties undermined their legitimacy for anyone claiming that "justice" had not been served. Wilson's personality must bear some of the blame for this disillusionment. He was a proud man, confident of his objectivity and prestige, and he insisted on being the first U.S. president to sail to Europe and to conduct negotiations himself. He had visited Europe only twice before, as a tourist, and now delayed the peace conference in order to make a triumphant tour of European capitals. Moreover, the Democrats lost their Senate majority in the elections of November 1918, yet Wilson refused to include prominent Republicans in his delegation. This allowed Theodore Roosevelt to declare that Wilson had "absolutely no authority to speak for the American people." Wilson's flaws exacerbated the difficulty of promoting his ideals in Paris and at home. Still, he was a prophet in world politics, both as lawgiver and as seer. Only a peace between equals, he said, can last.

Woodrow Wilson's triumph

The realist vision. Georges Clemenceau also approached peacemaking as a personal quest, stacking the French delegation with loyal supporters and minimizing the influence of the foreign ministry, the army, and parliament. Even political enemies hailed Clemenceau (known as "the tiger") as "père la victoire," and he determined not to betray the soldiers' victory in the peace negotiations to come. But the French vision of a just peace contrasted sharply with Wilson's. France alone in 1914 had not chosen war, but had been summarily attacked. France had provided the major battleground, suffered the most physical damage, and sacrificed a generation of manhood. France faced the most massive task of reconstruction, the most direct threat of German revenge, and the most immediate responsibility for executing the armistice and peace treaties by dint of its contiguity with Germany. Clemenceau, therefore, sought material advantage from the peace according to a traditional balance-of-power viewpoint and did so with almost universal support in the government. The 77-year-old Clemenceau, who had begun his political career during the German siege of Paris in 1870–71, placed little faith in Germany's sudden conversion to democracy, nor in Wilson's lofty idealism, which he characterized with irony as "noble candour." The French government judged early on that Wilson's dream of a prosperous German republic taking its place in the council of nations was the primary obstacle to a peace serving France's real needs. Indeed, his decision to accept the armistice may have been influenced by the fact that a more thorough victory over Germany would also have meant another million American soldiers at the front and proportionally greater U.S. influence over the peace.

Postwar France faced a severe triple crisis. The first involved future security against German attack: Germany remained far more populous and industrial than France, and now France's erstwhile eastern ally, Russia, was hors de combat. The French would try to revive an anti-German alliance system with the new states in eastern Europe, but the only sure way to restore a balance of power in Europe was to weaken Germany permanently. The second crisis was financial. France had paid for the war largely by domestic and foreign borrowing and inflation. To ask the nation to sacrifice further to cover these costs was politically impossible. Indeed, any new taxes would spark bitter social conflict over which groups would bear the heaviest burdens. Yet France also faced the cost of rebuilding the devastated regions and supporting an army capable of forcing German respect for the eventual treaty. The French, therefore, hoped for inflows of capital from abroad to restore their national solvency. Third, France faced a crisis in her heavy industry. The "storm of steel" on the Western Front made obvious the strategic importance of metallurgy in modern war. Recovery of Alsace-Lorraine lessened France's inferiority to Germany in iron but by the same token worsened her shortage of coal, especially metallurgical coke. European coal production was down 30 percent from prewar figures by 1919, creating acute shortages everywhere. But France's position was especially desperate after the flooding of French mines by retreating German soldiers. To realize the industrial expansion made possible by the recovery of Alsace-Lorraine, France needed access to German coal and markets and preferably a cartel arrangement allowing French industry to survive German competition in the peacetime to come.

France's triple crisis

Wilson's program was not without promise for France if collective security and Allied solidarity meant permanent British and American help to deter future German attacks and restore the French economy. In particular, the French hoped that the wealthy United States would forgive the French war debts. On the other hand, if Britain and the United States pursued their own interests without regard to French needs, then France would be forced to find solutions to its triple crisis through harsher treatment of Germany.

In some respects, Britain stood between France and the United States. It would be more accurate, however, to view Britain as the third point of a triangle, attached to the interests of France in some cases, to the principles of the United States in others. Hence, Prime Minister David Lloyd George, second only to Wilson in liberal rhetoric, was accused by Americans of conspiring with Clemenceau to promote old-fashioned imperialism, and, second only to the French in pursuing balance of power, was accused by Clemenceau of favouring the Germans. But that was Britain's traditional policy: to prop up the defeated power in a European war and constrain the ambitions of the victor. To be sure, in the election campaign held after the

Lloyd George's third way

Armistice, Lloyd George's supporters brandished slogans like "Hang the Kaiser" and "Squeeze the German lemon til the pips squeak," but at the peace conference to come, Lloyd George equivocated. Britain would take the toughest stand of all on German reparations in hopes of ameliorating its own financial situation vis-à-vis the United States, but otherwise promoted a united, healthy Germany that would contribute to European recovery and balance the now ascendant power of France. Of course, Lloyd George also demanded a ban on German naval armaments and partition of Germany's colonies.

Exhausted Italy was even less able than France to absorb the costs of war. Labour unrest compounded the usual ministerial instability and enhanced the public appeal of anti-Communist nationalists like Benito Mussolini. But the hope that the war would prove somehow worthwhile put peace aims at the centre of Italian politics. In April 1918 the terms of the Treaty of London were proclaimed on the floor of Parliament, sparking months of debate between nationalists and Wilsonians over their propriety. By January 1919, however, Prime Minister Vittorio Emanuele Orlando and Foreign Minister Sidney Sonnino had won a mandate for a firm position at the peace conference in favour of all Italy's claims with the exception of that to the entire Dalmatian coast.

Japan's war gains

The other victorious Great Power, Japan, suffered the least human and material loss in the war and registered astounding growth. Between 1913 and 1918 Japanese production exploded, foreign trade rose from $315,000,000 to $831,000,000, and population grew 30 percent until 65,000,000 people were crowded into a mountainous archipelago smaller than California. Clearly Japan had the potential and the opportunity for rapid expansion in the Pacific and East Asia.

Finally, the defeated Germans also looked with hopes to the peace conference. Throughout the first half of 1919 the new Weimar Republic (so called after the site of its constitutional convention) was in gestation, and the Germans hoped that their embrace of democracy might win them a mild peace. At the very least they hoped to exploit differences among the victors to regain diplomatic equality, as Talleyrand had done for France at the Congress of Vienna. Instead, the Allies found compromise among themselves so arduous that they could brook no further negotiation with Germany. German delegates were not invited to Paris until May, and the "preliminaries of peace" became, with few exceptions, the final treaty. To Germans, Wilson's promise of "open covenants, openly arrived at" proved a sham, and the final treaty a *Diktat.*

THE VERSAILLES "DIKTAT"

Hammering out the treaty. The Paris Peace Conference opened on Jan. 18, 1919, in a politically charged atmosphere. The delegations of 27 nations harassed the Great Powers with their various and conflicting complaints and demands. The Great Powers, in turn, sent five delegates each, supported by sprawling staffs of geographers, historians, and economists. Clearly, peace could not be made in such a global assembly; hence the five leading victors created a Council of Ten—the heads of government and their foreign ministers. But even this proved unwieldy, and since Italy and Japan tended to focus on questions of local interest, major decisions were hammered out in private by an informally constituted Big Three: Wilson, Lloyd George, and Clemenceau. The French had tried to impose a schedule of priorities for the conference, but Wilson insisted on tackling the League of Nations first in order to prevent the others from rejecting the League or using it as a bargaining chip in later disputes. The French were skeptical of the idealistic basis of the League but hoped that it might be turned into an instrument of security committing the British and Americans to the defense of the new European order. In this they were disillusioned, for the British viewed the League less as a means for mobilizing force against an aggressor than as a means of preventing future conflicts in the first place.

The Covenant of the League

The Covenant of the proposed League provided for a plenary assembly of all members and a council of the Great Powers and outlined a system of sanctions against aggressor states. But the British chose to focus on moral sanctions (not unlike Wilson's belief in the "court of world opinion"), or at most economic sanctions, and participation in military sanctions was made voluntary. The Covenant also contained machinery for declaring boundary changes, implying that the League's primary function was to secure peace, not to secure the status quo. Upon final rejection in April of a Franco-Italian plan for tougher collective security and an international force adequate to enforce peace, French newspapers scorned the League as a toothless debating society. And since Clemenceau had succeeded in having Germany barred from the League pending good behaviour, the German press denounced it as a "League of Victors."

In mid-February Wilson returned to the United States to attend to presidential duties, and in his absence committees went to work on the details of the German treaty. Foremost in the minds of the French was security against future German attack. As early as November 1918 Marshal Ferdinand Foch drafted a memo identifying the Rhine as "the frontier of democracy" and arguing for the separation of the Rhineland from Germany and its occupation in perpetuity by Allied troops. This plan echoed earlier French war aims: The victory of 1871 had created a unified Germany; the defeat of 1918 should undo it. Foch's occupation forces tried also to locate and encourage the Rhenish autonomist tendencies that grew up for a brief time in 1919 out of the desire to escape the burden of defeat and fear of the Communist agitation in Berlin. But the primary French argument was strategic: Four times in a century German armies had invaded France from the Rhineland (1814, 1815, 1870, 1914), and a united Germany would remain potentially overwhelming. As General Fayolle put it, "One speaks of the League, but what can this hypothetical society do without a means of action? One promises alliances, but alliances are fragile, like all human things. There will always come a time when Germany will have a free hand. Take all the alliances you want, but the greatest need for France and Belgium is a material barrier."

The Rhineland question

André Tardieu, Clemenceau's chief aide, sought to give the Rhineland scheme a Wilsonian gloss in a lengthy memo distributed on February 25. The Rhenish people, he claimed, were largely Celtic, Catholic, and liberal and resented the rule of Germanic, Protestant, and authoritarian Prussia. They had been loyal citizens of the French Republic and Empire from 1792 to 1815. Thus an autonomous Rhineland would serve both self-determination and the defense of democracy. The British and Americans rejected Tardieu's brief in the strongest terms and warned that dismemberment of Germany would only create "a new Alsace-Lorraine" and the seeds of a new war. In April, after Wilson returned to Paris, he and Lloyd George countered with an unprecedented offer: an Anglo-American guarantee to fight on the side of France in case of future German aggression. The French were again skeptical. In a future war the United States and Britain would need months or years to raise and transport armies, by which time France might be lost. On the other hand, how could Clemenceau refuse an unlimited extension of the wartime coalition? On March 17 he proposed a mixed solution—the guarantee treaties, plus material safeguards including German disarmament, demilitarization, and Allied occupation of the Rhine.

This acrimonious debate over security overlapped with the negotiations over reparations. The latter was perhaps an even more emotional issue, since the financial settlement would affect every taxpayer in every country. The moral issues also seemed clearer: Surely Germany, and not her victims, should pay for reconstruction; surely the wealthy British and Americans should forgive France's war debt, a small sacrifice beside those made by France in the joint effort. The French government had borrowed 26,000,000,000 francs from its own people during the war and owed another $3,600,000,000 to Britain and the United States. The franc had lost 70 percent of its value. Yet French hopes for Allied economic unity were dashed when the U.S. Treasury refused to discuss abrogation of war debts, rejected French and Italian proposals for a

"financial League of Nations," and opposed economic favouritism of all kinds in accord with the Fourteen Points. The British, in turn, repudiated the resolutions of the 1916 Allied Economic Conference and refused to forgive France her debt so long as the United States insisted on repayment from London.

"If it is France or Germany that must be ruined," wrote a conservative French journal about the reparations debate, "let us be sure that it is Germany!" The French chamber refused to vote a tax on capital and relied on German payments to cover the cost of repairing the devastated regions. Wilson accepted German responsibility for war damage, but the British vastly inflated reparations by insisting on repayment for "invisible damage" like sunken ships and cargo, lost markets and production, and veterans' pensions. On the other hand, the British favoured setting a fixed indemnity in the treaty, while the French claimed that Germany should agree to pay whatever reparation ended up costing. When negotiations failed to fix either a total sum or the percentage shares to flow to France, Britain, Belgium, and the others, the U.S. delegation recommended on March 24 that the whole problem be postponed. On April 5 it was agreed that a Reparations Commission would determine, by May 1, 1921, the amount and timing of German payments and be empowered to declare defaults and sanctions in case of noncompliance. But in the meantime Germany would make immediate transfers totaling 20,000,000,000 gold marks. Thus the peace conference obliged the Germans to sign an open account and adjourned without plans to stabilize currencies or settle war debts.

The Reparations Commission

In economic matters the French delegation laboured to improve the imbalance in heavy industry between Germany and France. At first Clemenceau fought hard for annexation of the Saar—the French "frontier of 1814"—and then settled for French control of the Saar coal mines and a League of Nations administration for 15 years, at which time the Saarlanders would hold a plebiscite to decide their permanent status. Germany was also obliged to deliver 20,000,000 tons of coal per year to France and Belgium and to allow the products of Alsace-Lorraine into Germany duty-free for five years.

Such punitive clauses ensured German feebleness for some time to come. France, on the other hand, now possessed both the largest army in Europe and a set of natural allies among the new states in eastern Europe. Not surprisingly, many British observers came to consider France the primary threat to dominate the Continent. In late March Lloyd George's eloquent Fontainebleau Memorandum warned that vindictiveness in the hour of victory would serve not justice and reconciliation but German revanchism and Bolshevik propaganda. Nevertheless Clemenceau, under attack from President Poincaré, Marshal Foch, and the parliament for "giving up the Rhine," dared not compromise further. On April 22, Wilson and Lloyd George accepted his material guarantees of security in addition to the Anglo-American pacts. These included the limitation of the German army to 100,000 men with no offensive weapons; demilitarization of a zone extending 50 kilometers east of the Rhine; and an Allied occupation of the left bank of the Rhine, with bridgeheads at Cologne, Koblenz, Mainz, and Kehl. The occupation would be divided into three zones, to be evacuated serially at five-year intervals.

Reaction to the treaty. On May 7 the German delegation was finally summoned to receive the draft treaty. Additional important clauses called for the abolition of the German high seas fleet, the general staff, and conscription; partition of Germany's African colonies; cession of the Eupen-et-Malmédy district to Belgium, Alsace-Lorraine to France, most of Upper Silesia and West Prussia to Poland, including a corridor to the Baltic that cut Germany in two; plebiscites to determine whether Allenstein and Marienwerder should go to Poland and Schleswig to Denmark; a League of Nations administration for the free city of Danzig (to provide Poland a coastal port); prohibition of *Anschluss* (union) between Germany and Austria; and abrogation of the Treaty of Brest-Litovsk. Finally, Article 231 enjoined Germany to accept full responsibility for the war caused "by the aggression of Germany and her allies."

German territorial cessions

The draft treaty caused acute consternation in Germany (though it left Germany intact and was mild compared to Germany's terms to Russia at Brest-Litovsk), and the German delegation argued without success for substantial revisions. The Germans could not reject the treaty, however, without inviting a continuation of the Allied blockade, revolutionary outbreaks, an Allied military advance, or French intrigues against German unity. (On June 1, Foch's generals in the occupation implicated themselves in an abortive separatist putsch aimed at creating a "Rhineland Republic" and thereby magnified German—and British—suspicions.) Hence, the German delegation—frock-coated professionals bearing little resemblance to the spike-helmeted militarists the Allies meant to punish—affixed their signatures to the treaty in the Hall of Mirrors at Versailles on the fifth anniversary of the Sarajevo assassination (June 28, 1919). The Weimar coalition of Democrats, Social Democrats, and the Catholic Centre party ratified the treaty on July 9. German nationalists, however, denounced acceptance of the treaty as treason and immediately began propounding the myth that the German army had been "stabbed in the back" by Socialists and defeatists, the "November criminals" who signed the Armistice, and the liberal parties who signed the Versailles *Diktat*. The war-guilt clause was particularly damaging, since any historical evidence suggesting that Germany did not bear sole guilt for the war would tend to undermine the treaty's legitimacy.

Allied delegates and populations were scarcely happier with the treaty than the Germans. British diplomat Harold Nicolson echoed the views of disillusioned Wilsonians when he left the signing ceremony in disgust, "and thence to bed, sick of life." Economist John Maynard Keynes quit the peace conference in protest and returned to Britain to write a scathing critique of Wilson and the treaty, whose economic clauses, he said, stymied European recovery. Nor were the French satisfied. Marshal Foch despaired of containing the power of a united Germany and prophesied: "This is not peace, but a truce for 20 years." Poincaré predicted willful German default and Allied disputes over execution. Clemenceau had to exploit all his prestige to win parliamentary ratification, and still he lost the presidential election that followed.

As for Wilson, the treaty he had personally helped to fashion, and the global obligations it imposed on the United States, proved unpopular with various factions in American politics, including nationalists, isolationists, "Monroe Doctrine" regionalists, xenophobes, and tariff protectionists. The immediate postwar years also gave rise to the "red scare," the first legislation limiting immigration to the United States on an ethnic basis, and the belief that Wilson had been duped by the clever Europeans so that the war redounded only to the benefit of Anglo-French imperialism. But it is not true that the United States retreated at once into isolationism. The debate over Versailles was essentially a debate over the terms on which the United States would continue to play a role in world affairs. Most important was fear that Article 10 of the League Covenant might embroil the United States in foreign quarrels and even violate the Constitution. The Senate Committee on Foreign Relations, led by Henry Cabot Lodge, eventually proposed ratification of the Treaty of Versailles subject to 14 reservations, but Wilson insisted on an all-or-nothing strategy and embarked on a hectic national tour to mobilize public support. In October 1919 he suffered a debilitating stroke, and on November 19 the Senate voted down the treaty. Further compromise led to a final vote on March 19, 1920, but Wilson instructed his own loyalists to reject any reservations. The 49–35 vote fell short of the necessary two-thirds majority. By failing to ratify the Treaty of Versailles, the United States also rejected the League of Nations (which its own president had forced on the Europeans), the security guarantee by which Clemenceau had been persuaded to give up the Rhineland, and U.S. commitment to the economic and political reconstruction of Europe. All this gave those who clung to the belief that the French cause had been betrayed the opportunity to deal even more harshly with Germany.

U.S. reaction to the treaty

THE WEST AND THE RUSSIAN CIVIL WAR

Bolshevik diplomacy. France's deep fears about a future German threat sprang in large part from the elimination of Russia as a factor in the European balance. Indeed, the Russian question was at least as important as the German one and absorbed as much time and worry at the peace conference. After Brest-Litovsk, Anglo-French policy turned sharply anti-Bolshevik, and Clemenceau and Foch worked to build a *cordon sanitaire* in eastern Europe against German and Bolshevik expansion alike. The Lenin regime also repudiated the tsarist debts to Britain and France (the latter being more delicate since most of it dated from before the war and was owed to private bondholders). But Wilson still believed in the innate desire of the Russian people for democracy and searched desperately for ways to end the civil war and liberalize the Reds, the Whites, or both. As early as July 1918 he wrote Colonel Edward House: "I have been sweating blood over what is right and feasible to do in Russia. It goes to pieces like quicksilver under my touch."

France's *cordon sanitaire*

After Brest-Litovsk the Bolsheviks came quickly to a two-track policy toward the West. Their rhetoric still condemned Allied and German imperialists in vitriolic terms, but their deeds aimed at securing their own survival at all costs. These included attempts to open negotiations with Allied governments, to exploit differences among them, to persuade them to withdraw support for the Whites, and to encourage the opposition to intervention in Russia that already existed among French and British workers and soldiers. On the other hand, the Red Terror launched by the Bolsheviks in 1918, including the murder of the royal family, convinced many in the West that this new breed was beyond the pale. U.S. Secretary of State Robert Lansing called Bolshevism "the most hideous and monstrous thing that the human mind has ever conceived." When, in August 1918, the Cheka (secret police) arrested 200 British and French residents of Moscow, invaded their consulates, and murdered the British naval attaché, opinion spread in Paris and London that the Bolsheviks were thugs and bandits, if not German agents. In the autumn the Allies imposed a blockade on the Moscow regime and broke the last contacts (diplomatic missions and the Red Cross) that still existed.

The Bolsheviks' paramount need was a breathing spell in which to consolidate their power, mobilize the economy in the lands under their control, and subdue the White armies. By the end of 1918 these forces included the Cossacks of General Anton Denikin in the south, supported by the French from Odessa; the Ukrainian separatists; General Nikolay Yudenich's army of the Baltic; a puppet government in the north supported by the Anglo-French from Arkhangelsk; and the government of Admiral Aleksandr Kolchak at Omsk in Siberia. American and Japanese troops occupied Vladivostok on the Pacific. The Bolsheviks had also invaded Estonia only to be met by local troops, a British naval squadron, Yudenich's Russian nationalists, and even General Rüdiger von der Goltz's German veterans seeking to maintain German authority on the Baltic. Against these disparate and uncoordinated forces the Bolsheviks deployed the Red Army under the command of Leon Trotsky. In the opening stages of the Revolution they experimented with a "people's army" in which ranks were abolished and officers were elected by the troops. This quickly gave way to traditional military practice and even recruitment of ex-tsarist officers and technicians. By the turn of 1919 the Red Army numbered in the millions.

The opponents of the Bolsheviks

Lenin instructed the new commissar for foreign affairs, Georgy Chicherin, to try to separate the United States from the Allies. In October and November 1918 he addressed long notes to Wilson protesting Allied intervention and proposing a cease-fire in return for Allied evacuation. Then in December, Maksim Litvinov appealed to Wilson in terms drawn from the Fourteen Points, ending with the plea *auditur et altera pars* ("let the other side be heard"). Some historians have judged these demarches as a genuine opportunity for early reconciliation between the Bolsheviks and the West. Others consider them the equivalent of the Brest-Litovsk negotiations with the Germans, a "peace offensive" designed to serve the internal security of the regime. The Western powers, however, were confused about how to influence events in Russia. In January 1919, Lloyd George showed Wilson an intelligence report indicating that the Allied interventions, if not increased massively, would only strengthen the appeal of the Bolsheviks. He favoured negotiation; Clemenceau favoured a stronger intervention.

Given the Bolsheviks' single-minded dedication to power and ideology (which was, after all, their sole source of legitimacy), it is difficult to imagine how Allied–Soviet friendship, or a compromise settlement among the Russian factions, could have emerged. Nevertheless, the snarled diplomacy of the two sides during the peace conference widened the gap between them. Lenin had postponed his summons to European Socialists to form the Third (or Communist) International (Comintern) until January lest it spoil his efforts to open negotiations with the West. He finally issued the call on Jan. 25, 1919, just as the Paris Peace Conference finally decided to make an initiative. It appeared, therefore, as if Lenin was intent on remaining an international outlaw seeking to destroy the very governments with which he claimed to want normal relations. The Comintern was founded on March 2, and at its second congress (July 1920) Lenin insisted that member parties accede to 21 conditions imposing rigorous Communist discipline and subordinating local parties to the will of Moscow. It divided European Socialists, most of whom rejected the Communists' violent tactics, Lenin's dictatorship, or both. From its inception, therefore, the Comintern was an arm of Soviet foreign policy more than a vehicle of Socialist internationalism.

Founding of the Comintern

Allied approaches to the Bolsheviks. Meanwhile, Wilson and Lloyd George agreed on an appeal directed to the White forces (and radioed to the Bolsheviks) to declare a cease-fire and send representatives to the island of Prinkipo (Büyükada), in the Sea of Marmara. This was a fruitless gesture, since neither the Red nor the White regime could survive except by the other's total destruction. The Bolsheviks ignored the call for a truce but accepted the invitation; the Whites, with French encouragement, candidly declined both. The Big Three were informed of the failure on February 12, two days before Wilson's return to the United States. Winston Churchill then hurried to Paris to urge on Wilson a vigorous Allied military campaign on behalf of the Whites. But even if the Big Three had agreed to launch an anti-Bolshevik crusade, their war-weary populations, depleted treasuries, and aroused labour unions would not have permitted it.

Five days later Colonel House, who was given charge of Russian matters by Wilson, asked a young American liberal, William Bullitt, to journey to Russia for direct talks with Lenin. Bullitt reached Petrograd on March 8, spoke with Chicherin and Litvinov, then went on to Moscow. Lenin offered an immediate cease-fire and negotiations in return for the cessation of Allied occupation, aid to the Whites, and the blockade. The Bolsheviks, in turn, promised amnesty to all Russians who had collaborated with the Allies. Bullitt returned to Paris in great excitement at the end of March, only to be denied an audience with Wilson and to find the conference near collapse over the Rhineland question. Lloyd George was under pressure from parliamentary Tories to avoid conciliating Lenin, while the general level of Allied anxiety had been raised by declaration of a Soviet republic in Bavaria and Béla Kun's Communist coup d'état in Hungary on March 21. Kun immediately invaded Czechoslovakia and appealed to Lenin for help (which the Bolsheviks were in no condition to provide). On April 10 a Romanian army attacked Hungary, and successive Red and White terrors ensued. The episodes ended on May 1, when German federal troops deposed the Bavarian Communists, and August 1, when Kun fled the approaching Romanian army.

Communist revolts

Historians debate whether the Bullitt mission was a missed opportunity. Considering the Bolsheviks' final victory, the Allies would have done well to extricate themselves on Lenin's March 1919 terms. On the other hand, the document held out little hope for a Russia in line with Western principles or interests. Allied acceptance would

have obliged them to pull out their own forces, cut off aid to the Whites, and resume trade with the Bolsheviks. If hostilities had then resumed—on any pretext—the Reds would have been able to crush the divided Whites and solidify their control. On the other hand, Lenin was hard pressed in the spring of 1919—Kolchak was launching a major offensive—and was probably sincere in seeking relief. Bullitt himself was consumed with bitterness over his reception in Paris and rebuked Wilson for having "so little faith in the millions of men, like myself, in every nation who had faith in you." (Bullitt testified before the Senate against the Versailles treaty and retired to France until, in 1933, he was appointed the first U.S. ambassador to the Soviet Union. Disillusioned with Stalin, he soon resigned.)

The fourth approach by the peace conference to Russia grew out of letters from the director of European food relief, Herbert Hoover (March 28), and the Norwegian explorer and philanthropist Fridtjof Nansen (April 3) urging massive deliveries of food to Russia. The way to fight Communism, they argued, was with bread, not guns. Colonel House procured Allied consent to offer relief to Russia, but only if Russian transportation facilities were placed at the disposal of an Allied commission. The Bolsheviks replied in derisory terms on May 13, since the conditions would have meant de facto Allied control of Russia. (In 1921 the American relief commission nonetheless began distribution of food that saved countless Russians from starvation.)

Consolidation of the Revolution. The peace conference's inability to frame a common policy toward the Lenin regime meant that Russia's future was now solely a military matter. By May, Kolchak's offensive reached its greatest extent, approaching Moscow from the east, and the French and British resolved to recognize the Whites. Wilson also gave up on the Reds and began cajoling White leaders to pledge democratization of Russia in the event of their victory. But the Red Army turned back Kolchak in the summer, and the Allies gave up in the north, evacuating Arkhangelsk, after a number of clashes with Red forces, on Sept. 30, 1919, and Murmansk on October 12.

War Communism

The Russian Civil War was a vast, protean struggle fought out in five major theatres with rapid thrusts over hundreds of miles made possible by railroads and cavalry. The Reds took good advantage of their interior lines, while their control of Russia's industrial heartland and trunk rail lines and their ruthless requisitioning (known as "War Communism") procured enough food and supplies for them to outlast their enemies. The outcome was not inevitable, but the inability of the far-flung White forces to coordinate their actions exposed them to defeat in detail. Denikin took Kiev in September 1919, but a Soviet counteroffensive forced him steadily back until his last base fell in March 1920. Command in the south fell to General Pyotr Wrangel. Meanwhile, the Red Army drove out Kolchak and recaptured Omsk in November 1919. On April 25, 1920, war broke out between the Soviets and Poland as the Polish leader, Marshal Józef Piłsudski, pursued his ambition of a grand Polish-Lithuanian-Ukrainian empire. On May 7 the Poles captured Kiev, but a Soviet counterstroke drove them out (June 11), captured Vilnius (July 15), and soon threatened Warsaw itself. Alarms arose in western Europe over the possible sovietization of Poland and even a German–Bolshevik alliance to overthrow the Treaty of Versailles. But Piłsudski, with advice from French attaché General Maxime Weygand, hurled back the overextended Reds, took 66,000 prisoners, and recaptured extensive Belorussian territories. Distressed by the resistance of the Poles to the Revolution, Lenin counseled peace, as at Brest-Litovsk, even on humiliating terms. A preliminary treaty (October 12) and final Treaty of Riga (March 18, 1921) fixed the Soviet–Polish border just to the west of Minsk and far to the east of the Curzon Line proposed at Paris.

Peace with Poland freed the Red Army to turn south and eliminate the last resistance from Wrangel, who evacuated the Crimea on Nov. 14, 1921. Soviet forces invested the Caucasus as well, setting up an "autonomous" federation of Communist regimes in Georgia, Armenia, and Azerbaijan. The original anti-imperialism of the Bolsheviks thus gave way to a policy of domination of all the subject nationalities of the Russian Empire that the Bolsheviks could subdue. On Oct. 25, 1922, the Japanese withdrew from Vladivostok under U.S. pressure, bringing all foreign interventions in Russia to a close.

Formation of the U.S.S.R.

The Union of Soviet Socialist Republics came into existence on Dec. 30, 1922. In the World War and Civil War, Russia had lost Poland, Finland, the Baltic states, and Bessarabia. The Communist government had survived, but the Revolution had failed to spread. Hence, the Bolshevik leaders were left to construct a permanent relationship to an outer world which they defined as implacably hostile. The Western powers, in turn, faced the challenge of living with a Great Power that repudiated, at least publicly, all norms of international behaviour.

CENTRAL EUROPE AND THE MIDDLE EAST

The reorganization of central Europe. Although the Habsburg Empire had ceased to exist, the peace conference dealt with the new republics of Austria and Hungary as defeated powers and systematically favoured the interests of the successor states that had arisen from the ruins of the empire in the last weeks of the war. It was Wilson's hope that peace and self-rule might finally bless the troubled regions between Germany and Russia through strict application of the principle of nationality. But east-central Europe comprised a jumble of peoples with conflicting claims based on language, ethnicity, economics, geography, military considerations, and historic ties. What was more, the new states themselves were in no case homogeneous. The name Yugoslavia could not hide the rivalries within that kingdom of Serbs, Croats, and Slovenes. Czechoslovakia was born of an alliance of convenience among Czechs, Slovaks, and Ruthenes. Historic Poland embraced Ukrainians, Germans, Lithuanians, and Yiddish-speaking Jews. Romania, enlarged by the accession of Transylvania and Bessarabia, now numbered millions of Ukrainians, Hungarians, Jews, and other minorities. In short, the Balkanization of central Europe raised more political disputes than it solved and created many little multinational states in place of a few empires.

The Polish patchwork

Poland was a favourite of the Americans and the French by dint of historic sympathies, the votes of Polish-Americans, and Clemenceau's hope for a strong Polish ally in Germany's rear. The Fourteen Points promised Poland an outlet to the sea, but the resulting corridor on the mouth of the Vistula contained 1,500,000 Kashubians and Germans. In the north, the Baltic states of Lithuania, Latvia, and Estonia won their independence from Moscow and were sheltered by the British fleet. But in a perfect example of the vagaries of national self-determination, Lithuania and Poland quarreled over the disposition of Vilnius. The town of Vilnius (according to 1897 Russian statistics) was 40 percent Jewish, 31 percent Polish, 24 percent Russian, and 2 percent Lithuanian. Vilnius Province, however, was 61 percent Russian, 17 percent Lithuanian, 12 percent Jewish, and 8 percent Polish. In December 1919 the Supreme Allied Council provisionally awarded Vilnius to Lithuania. Poland and Czechoslovakia similarly quarreled over the coal-rich Teschen district. Poles predominated in the district, but historic claims lay with Bohemia. In the end the Great Powers merely ratified the de facto partition effected by occupying Polish and Czech troops—a solution that favoured Czechoslovakia and left a bitterness the two states could ill afford and never overcame. Finally, the Polish–German conflict over Upper Silesia, another coal-rich region of mixed nationality, proved that even the League of Nations could not make an objective judgment. The March 1921 plebiscite called for in the Treaty of Versailles (one of the few concessions awarded the German delegation) showed German preponderance in the region as a whole but Polish majorities in the vital mining districts. The British delegation in the League argued that Germany could hardly be expected to pay reparations if it lost yet another rich source of coal, while the French sought to weaken Germany further and bolster the Polish economy. Finally, in October 1922, Poland was granted the greater portion of the mines.

The Treaty of Saint-Germain disposed of the Austrian

half of the former Habsburg monarchy. Tomáš Masaryk and Edvard Beneš, sincere Wilsonians, exploited their personal goodwill to win two major concessions that otherwise violated the principle of national self-determination. First, they retained for Czechoslovakia the entire historic province of Bohemia. This afforded the vulnerable new state the military protection from Germany of the Sudeten mountains, but it also brought 3,500,000 Sudeten Germans under the rule of Prague. Second, Czechoslovakia received territory stretching south to Bratislava on the Danube, providing it with a riverine outlet but creating a minority of a million Magyars. The Austrian boundary with Yugoslavia at Klagenfurt was fixed by plebiscite in Austria's favour in October 1920, as was the division of the Burgenland district between Austria and Hungary in December 1921.

The Sudeten Germans

Italy's boundaries with Austria and Yugoslavia became one of the most volatile issues of the peace conference owing to Italian truculence and Wilsonian sanctimoniousness. Orlando clung to the Allied promises that had enticed Italy into the war in the first place. But Wilson, offended by the secret war-aims treaties, vented his frustration on Italy. He went so far as to plead his case publicly in the French press on April 24, 1919, a violation of diplomatic etiquette that provoked the Italians to bolt the conference. Upon their return, a compromise of sorts was achieved: Italy received Trieste, parts of Istria and Dalmatia, and the Upper Adige as far as the Brenner Pass with its 2,000,000 German-speaking Austrians. But Wilson refused to budge on Fiume, a province whose hinterland was Yugoslav but whose port city was Venetian. On June 19 Orlando's government fell over the issue. In August, Fiume was declared a free city, and in September a band of Italian freebooters led by the nationalist poet Gabriele D'Annunzio, declared Fiume a free state. Such passions among Italians over their "mutilated victory" helped prepare the way for the triumph in 1922 of Mussolini's Fascists.

The Treaty of Trianon, delayed until 1920 by the Communist coup in Hungary, partitioned that ancient kingdom among its neighbours. Transylvania, including its minority of 1,300,000 Magyars, passed to Romania. The Banat of Temesvár (Timişoara) was divided between Romania and Yugoslavia, Sub-Carpathian Ruthenia passed to Czechoslovakia, and Croatia to Yugoslavia. All told, Hungary's territory shrank from 109,000 to 36,000 square miles. The armies of rump Austria and Hungary were limited to 35,000 men.

Partition of Hungary

The Treaty of Neuilly with Bulgaria marked yet another stage in the old struggles over Macedonia dating back to the Balkan wars and beyond. Bulgaria lost its western territories back to the kingdom of Serbs, Croats, and Slovenes (now Yugoslavia) and nearly all of Western Thrace to Greece, cutting the Bulgarians off from the Aegean. Their armed forces were likewise limited to 20,000 men. Austria, Hungary, and Bulgaria also accepted war guilt and reparations obligations, but these were later remitted in light of their economic weakness.

The settlement in east-central Europe was a generally well-meaning attempt to apply the principle of nationality under the worst imaginable circumstances. The new governments all faced aggrieved minorities, not to mention the onerous tasks of state-building—drafting constitutions, supporting currencies, raising armies and police—with no democratic tradition or financial resources beyond what they could borrow from the already strapped British and French. Austria in particular was a head without a body—over a quarter of its population lived in Vienna—yet was forbidden union with Germany. Hungary suffered violations of self-determination to an even greater degree and was bound to become a centre of aggressive revanche. Disputed borders, ethnic tensions, and local ambitions hampered economic and diplomatic cooperation among the successor states and would make them easy prey to a resurgent Germany, or Russia, or both.

The reorganization of the Middle East. The Treaty of Sèvres likewise dismembered the Ottoman Empire. Here again secret war-aims treaties reflected Allied ambitions in the Middle East, but Wilson was less willing to challenge them given his belief that the Arab peoples were not ready for self-rule. To avoid the tinge of imperialism the victors took control of the former Ottoman (and German) territories under "mandates" from the League: Class A mandates for those lands to be prepared for independence (Iraq, Transjordan, and Palestine, entrusted to Britain, and Syria and Lebanon to France); Class B mandates for those judged not ready for self-rule in the foreseeable future (Tanganyika to Britain, Cameroons and Togoland divided between Britain and France, and Rwanda-Urundi to Belgium); and Class C trust territories (German South West Africa to South Africa, Kaiser Wilhelms Land [New Guinea] to Australia, German Samoa to New Zealand, and the Mariana, Marshall, and Caroline islands to Japan).

The League mandate system

The victors also agreed, informally, that southern Anatolia was to be a French sphere of influence, while Italy received the Dodecanese Islands and a sphere of influence in eastern Anatolia. The Greek government of Venizélos, still a British client, occupied Smyrna (İzmir) and its hinterland, to the consternation of the Italians, who considered this poaching on their zone. Armenia was a special consideration because of its Christian population and the wartime deaths of hundreds of thousands (some claimed millions) of Armenians—through battle, mass murder, or forced deportation—at the hands of the Young Turks, who considered them a seditious element. Talk of an American mandate for Armenia gave way to independence. The collapse of the tsarist regime spared the Allies from having to award Constantinople and the Straits to Russia. The British proposed a League of Nations regime under U.S. administration for these areas, but Wilson refused this responsibility, while Indian Muslims protested any weakening of the Islāmic caliphate. So the status of Constantinople remained in abeyance, although the Straits were demilitarized and an Anglo-French-Italian commission regulated free passage. In August 1920 the helpless sultan's delegation signed the Treaty of Sèvres.

It was a dead letter. For Mustafa Kemal, the Turkish war hero, rallied his army in the interior and rebelled against the foreign influence in Anatolia and Constantinople. Unwilling to dispatch British armies, Lloyd George encouraged the Greeks to enforce the treaty instead. Indeed, Venizélos harboured a dream, the *megali idea,* of conquering the entire Turkish littoral and making the Aegean Sea a "Greek lake" as in ancient times. The Treaty of Sèvres, therefore, was the signal for the start of a Greco-Turkish War. By the end of 1920 the Greeks had fanned out from İzmir, occupied the western third of Anatolia, and were threatening the Turkish Nationalists' capital of Ankara. In March 1921 the British and French proposed a compromise that was rejected by the Turks, who nonetheless kept open diplomatic links in an effort to split the Allies. But as Kemal, later called Atatürk, put it: "We could not flatter ourselves that there was any hope of diplomatic success until we had driven the enemy out of our territory by force of arms." The tide of battle turned in August 1921, and the Greeks were forced to retreat precipitously through a hostile countryside. The French then made a separate peace with Ankara, settled their Syrian boundary, and withdrew support for the Anglo-Greek adventure. In March 1921 Turkey also signed a treaty of friendship with the new U.S.S.R. regulating the border between them and dooming the briefly independent Armenian and Transcaucasian republics.

The Greco-Turkish War

Another Allied offer (March 1922) could not tempt Kemal, who now had the upper hand. His summer attack routed the Greeks, who engaged in a panicky naval evacuation from İzmir which the Turks reentered on September 9. Kemal then turned north toward the Allied zone of occupation at Çanak (now Çanakkale) on the Dardanelles Strait. The French and Italians pulled out, and the British commissioner was authorized to open hostilities. At the last moment the Turks relented, and the Armistice of Mudanya (October 11) ended the fighting. Eight days later Lloyd George's Cabinet was forced to resign. A new peace conference produced the Treaty of Lausanne (July 24, 1923), which returned eastern Thrace to Turkey and recognized the Nationalist government in return for demilitarization of the Straits. The Treaty of Lausanne was to prove a durable solution to the old "Eastern question."

The Young Turk and Kemalist rebellions were models for other Islāmic revolts against Western imperialism. Persian nationalists had challenged the shah and Anglo-Russian influence before 1914 and flirted with the Young Turks (hence with Germany) during the war. By August 1919, however, British forces had contained both domestic protest and an ephemeral Bolshevik incursion and won a treaty from Tehrān providing for British administration of the Persian army, treasury, and railroads in return for evacuation of British troops. The Anglo-Persian Oil Company already controlled the oil-rich Persian Gulf. In June 1920, however, nationalist agitation resumed, forcing the shah to suspend the treaty. In Egypt, under British occupation since 1882 and a protectorate since 1914, the nationalist Wafd Party under Sa'd Zaghlūl Pasha, agitated for full independence on Wilsonian principles. Their three weeks' revolt of March 1919, suppressed by Anglo-Indian troops, gave way to passive resistance and bitter negotiations between Zaghlūl and the British high commissioner, Edmund Allenby. On Feb. 28, 1922, the British ended the protectorate and granted legislative power to an Egyptian assembly, though they retained military control of the Suez Canal.

Britain in Egypt

In India, where Britain controlled the fate of some 320,000,000 people with a mere 60,000 soldiers, 25,000 civil servants, and 50,000 residents, the war also sparked the first mass movement for independence. Out of hostility to Britain's Turkish policies, Islāmic leaders joined forces with Hindus in protest against the British raj. Edwin Montagu promised constitutional reform in July 1918, but the Indian National Congress deemed it insufficient. In 1919 famine, the return of Indian war veterans, and the inspiration of Mohandas Gandhi provoked a series of ever larger demonstrations until, on April 13, a nervous British general at Amritsar ordered his troops to open fire, and 379 Indians were killed. The amīr of Afghanistan, Amānollāh Khān, then sought to exploit the unrest in India to throw off the informal protectorate Britain enjoyed over his country. Parliament hastily approved the Montagu reforms, vetoed a campaign through the Khyber Pass, and so staved off a general uprising. But the Indian independence movement became a British preoccupation.

Other challenges to the empire arose from white minorities. After the Armistice, Lloyd George finally bowed to Irish demands for independence. After much negotiation and a threatened revolt in the northern counties, the compromise of December 1921 established the Irish Free State as a British dominion in the south while predominantly Protestant Northern Ireland remained in the United Kingdom. (The Sinn Féin nationalists continued to protest the treaty until, in 1937, Éire achieved complete independence, Ulster remaining British.) In South Africa the war propelled General Jan Smuts to international prominence and an influential role at the peace conference. South African expansionists clung to their own version of manifest destiny and dreamed of absorbing German South West Africa, Bechuanaland, and Rhodesia to forge a vast empire on the southern third of the continent. The British Colonial Office sternly resisted such ambitions. Yet the white minority of 1,500,000, dwarfed by a population of 5,000,000 blacks, 200,000 Indians, and 600,000 Chinese labourers, was itself split among Boer nationalists, "reconciled Boers," and British. The nationalists cited Wilsonian principles in a symbolic claim to restore the independent Transvaal and Orange republics in 1919 and remained a disaffected nationality within the Union of South Africa.

Ireland and South Africa

The non-European revolts, however—in Turkey, Persia, Egypt, India, and China—were the first expressions of what would become a major theme of the 20th century. Native elites, often educated in Europe and citing the anti-imperialist ideas of Wilson or Lenin, formed the first cadre of mass movements for decolonization. Often alienated from Europeans by their colour and customs, but no longer able to fit comfortably into their pre-modern societies, they became deracinated agitators for independence and modernization. Their growing numbers demonstrated that European imperialism, even as it reached its greatest extent through the 1919 treaties, must inevitably be a passing phenomenon.

THE NEW BALANCE IN EAST ASIA

The three Pacific powers. World War I also overthrew the power structure in East Asia and the Pacific. Before 1914 six imperial rivals had struggled for concessions on the East Asian coast. But the war eliminated Germany and Russia from colonial competition and weakened Britain and France, leaving the United States, Japan, and China in an uncomfortable triangular relationship that would persist until 1941.

Americans, largely ignorant of Asian realities, harboured a mix of attitudes before 1914. Contemptuous of what seemed to some of them, at least, as a barbaric and frozen Chinese culture, they nevertheless saw China as an unequalled opportunity for both Christian proselytizing and commercial exploitation. American investment in China in 1914 was only a quarter that of Japan and a 10th that of Britain, but moralism and manifest destiny both seemed to endow the United States with a special mission in China. On the other hand, Americans admired Japan for its mastery of modern technology but by the same token feared it as the primary obstacle to U.S. hopes for China. In 1899, a year after American acquisition of the Philippines and a year before the Boxer Rebellion, Secretary of State John Hay circulated his two "Open Door" notes imploring the Great Powers to eschew the dismemberment of China and to preserve free commercial access for all. The growing Japanese fleet worried American naval planners, who drafted at the time of the Russo-Japanese War the "Plan Orange" contingency for war with Japan. (They also conceded the impossibility of defending the Philippines against Japanese attack.)

The "Open Door"

The Chinese Revolution of 1911–12, inspired by the democratic principles of Sun Yat-sen (educated in Hawaii and British Hong Kong), expelled the Manchu dynasty and elevated the Nationalist Party, or Kuomintang (KMT), to power. But Sun quickly gave way in 1913 to General Yüan Shih-k'ai, whose failure to unify the giant land of 400,000,000 condemned China to a struggle among rival warlords that kept it in turmoil until at least 1928. Even as the Chinese revolted against foreign influence and exploitation, they remained nonetheless vulnerable to imperial predations or, conversely, dependent on foreign protection. In 1913 the Wilson administration entered office with a decidedly pro-Chinese leaning, and at the same time many Americans on the West Coast had become alarmed about the growing presence and success of enterprising Japanese immigrants and had begun to seek, in Washington and California, to legalize various forms of discrimination against them.

Japanese expansion during World War I only magnified American concern. After seizing Germany's Pacific islands and Chiao-chou Bay on the strategic Shantung Peninsula, Japan imposed on China the "Twenty-one Demands" (January 1915), claiming greatly expanded economic privileges and rights in Manchuria and Inner Mongolia (Sept. 3, 1916). After U.S. entry into the war, the Peking regime (but not the Nationalists in Canton) declared war on the Central Powers (Aug. 14, 1917) in hopes of defending its interests at the peace conference. The United States moved to end the embarrassment stemming from its cobelligerency with both China and Japan through the Lansing–Ishii Agreement of Nov. 2, 1917, in which Japan paid lip service to the Open Door while the United States recognized Japan's "special interests" in China. Wilson also sent troops to Vladivostok to monitor the Japanese intervention in Siberia.

The Paris Peace Conference exposed the two branches of Japanese expansionism, rooted in a bursting population and a booming industry in need of raw materials and markets. Delegate Saionji Kimmochi demanded the inclusion of a clause in the League of Nations Covenant proscribing racial discrimination, a principle that would have obliged the United States, Canada, and Australia to admit immigrants from Japan on equal terms with those of other nations. This was politically impossible for Wilson and Lloyd George to accept. The Japanese also demanded the rights formerly held by Germany at Chiao-chou, which Peking resisted vehemently. Finally Saionji agreed to drop the racial-equality plank in return for the granting of Japan's

Japan and the treaty

Chinese demands and threatened to reject the League of Nations if they were denied. Against Lansing's advice, Wilson acquiesced. Announcement of the terms provoked the anti-Western May Fourth Movement in China and caused it to be the only state that refused even to sign the Treaty of Versailles. Japan's triumph was an inauspicious precedent for diplomatic extortion by imperialist states from liberal states at the expense of helpless third parties.

The organization of power in the Pacific. In the United States, liberal internationalists, balance-of-power realists, Protestant churches with Chinese missions, and xenophobes all decried the cynical expansionism of Japan and what they took to be Wilson's capitulation. The Republican administration of Warren G. Harding in 1921 therefore determined to continue an ambitious naval construction plan dating from before the war and to pressure London to terminate the Anglo-Japanese Alliance dating from 1902. War debts gave the United States financial leverage over the British, as did American influence (based in a large Irish-American segment of the electorate) in the Irish question then reaching its climax. In June 1921 the British Commonwealth Conference bowed to this pressure and decided not to renew the alliance. This in turn confronted the Japanese with the prospect of a Britain aligned with Washington, not Tokyo, as well as a costly arms race against the world's two leading naval powers. A postwar business slump and worker unrest also suggested to Tokyo the wisdom of a tactical retreat.

Secretary of State Charles Evans Hughes invited the Great Powers to Washington, D.C., to forge a new order for East Asia and the Pacific. A Four-Power Pact negotiated at the conference (November 1921–February 1922) enjoined the United States, Japan, Britain, and France to respect each other's Pacific island dependencies for 10 years. A Nine-Power Pact obliged all parties to respect "the sovereignty, the independence, and the territorial and administrative integrity of the state of China" and the commercial Open Door. A separate Sino-Japanese agreement provided for Japanese evacuation of Shantung. In a Five-Power Treaty on naval armaments, Britain, the United States, Japan, France, and Italy agreed severally to maintain the naval balance of capital ships in the ratios 5:5:3:1.67:1.67 and agreed not to fortify their Pacific possessions. The latter three powers protested, but the United States frankly threatened to use its superior resources to dwarf the Japanese fleet, while France and Italy could not afford to compete with the British. France was also hoping for British support at this time in the struggle over German reparations (see below). Still, domestic displeasure with the treaties forced both the French and Japanese cabinets to resign.

The Five-Power naval treaty

Hughes's balance-of-power diplomacy for the Pacific seemed to reflect a realist turn in American statecraft in reaction to Wilson's idealism insofar as the United States flexed its muscle to compel the British and Japanese to keep hands off China and limit armaments. But in so doing the United States assumed responsibility as the balancer and container of Japanese power, for the naval agreement still left the Japanese fleet dominant in Asian waters. Moreover, the Japanese had clearly bowed to *force majeure* and, while resigned for the time being, would shrug off these constraints as soon as the Great Depression began to sap American resolve. In the long run, East Asian stability could come only through a strong and united China, for a weak and divided China represented constant temptation to a Japan bursting with strength, anxious for outlets, and resentful of Anglo-American containment.

THE POSTWAR GUILT QUESTION

Looking back on 1919–21 from the perspective of World War II, historians easily concluded that the Paris peacemakers had failed. In fact, debate over a "postwar guilt question" began even before the Big Three had completed their work. Anglo-American liberals felt betrayed by Wilson's failure to fashion a new diplomacy, while exponents of traditional diplomacy ridiculed Wilson's self-righteous intrusions. As Harold Nicolson put it: "We had hoped to call a new world into existence; we ended only by fouling the old." In other words, the peace amounted to a self-defeating mixture of contradictory ends or of tough ends and gentle means. Many Britons said the Treaty of Versailles was too harsh, would destroy Germany's economy and fragile new democracy, and would drive the bitter Germans to embrace militaristic revanche or Bolshevism. Many Frenchmen replied that the treaty was too mild, that a united Germany would resume its drive for hegemony, and that German democracy was sheeps' clothing put on for Wilson's benefit. Historians persuaded by the former argument often cast the peace conference as a morality play, with the messianic Wilson frustrated in his lofty mission by the atavistic Clemenceau. Those persuaded by the second argument speculate that the French plan for a permanent weakening of Germany might have made for a stabler Europe but for Wilson's and Lloyd George's moralizing, which, incidentally, served American and British interests at every turn. Clemenceau said: "Wilson speaks like Jesus Christ, but he operates like Lloyd George." And Lloyd George, when asked how he had done at Paris, said, "Not badly, considering I was seated between Jesus Christ and Napoleon."

The peace conference as morality play

Such caricatures skirt the facts that the war was won by the greatest coalition in history, that the peace could only take the form of a grand compromise, and that ideas are weapons. Once taking them up to great effect in the war on Germany, the Big Three could not cynically shrug them off any more than they could their constituents' interests, hopes, and fears. A purely Wilsonian peace, therefore, was never a possibility, nor was a purely power-political one on the order of the Congress of Vienna. Perhaps the new diplomacy was revealed as a sham or a disaster, as many professional diplomats claimed. Perhaps Wilson's moral insinuations only gave all parties grounds to depict the peace as illegitimate, one man's justice being always another's abomination. But it was still the old diplomacy that had spawned the hideous war in the first place. The pursuit of power without regard to justice, and the pursuit of justice without regard to power, were both doomed and dangerous occupations—such seemed to be the lesson of Versailles. The democratic states would spend the next 20 years searching in vain for a synthesis.

In the 1960s this portrait of the peace conference as a Manichaean duel gave way to new interpretations. New left historians depicted peacemaking after World War I as a conflict between social classes and ideologies, hence as the first episode in the Cold War. Arno J. Mayer wrote of 1919 as an "international civil war" between the "forces of movement" (Bolsheviks, Socialists, labour, and left-Wilsonians) and the "forces of order" (the Russian Whites, Allied governments, capitalists, and conservative power-politicians). While this thesis attracted overdue attention to the domestic political concerns of the Big Three, it imposed an equally dualistic set of categories, derived from the "primacy of domestic policy" paradigm, on the convoluted events of 1919. Perhaps it is most accurate to describe the Paris Peace Conference as the birthplace of all the major tactics, confrontational and conciliatory, for dealing with the Bolshevik phenomenon that have reappeared time and again to the present day. Prinkipo was the first attempt to get Communists and their opponents to substitute negotiations for force. Bullitt made the first stab at détente: direct negotiation of a modus vivendi. Churchill was the first "hawk," declaring that the only thing Communists understand is force. And Hoover and Nansen first acted on the theory that Communism is a social disease for which aid, trade, and higher standards of living were the cure.

The new left view

Thus, to say that the democratic, free-market statesmen at Paris were anti-Bolshevik is to state the obvious; to make this the wheel around which all else turned is to ignore the subtle. As Marshal Foch observed in counseling against exaggeration of the Bolshevik threat: "Revolution never crossed the frontiers of victory." That is, Communism was a product not just of privation, but of defeat, as in Russia, Germany, and Hungary. Perhaps, as Churchill thought, the Western democracies were not obsessed enough with the Bolshevik threat. They also understood it poorly, differed as to tactics, and were continually absorbed in other issues. Yet the failure to reintegrate Russia into the Eu-

ropean order was as poisonous to future stability as the German peace.

Whatever one's interpretation and assessment of the personalities and policies that collided at Paris, the overall settlement was surely doomed, not only because it sowed seeds of discord in almost every clause, but because all the Great Powers scurried from it at once. Germans denounced Versailles as a hypocritical *Diktat* and determined to resist it as much they were able. Italians fulminated against the "mutilated victory" given them by Wilson and then succumbed to Fascism in 1922. The Russian Communists, not privy to the settlements, denounced them as the workings of rapacious rival imperialisms. From the start, the Japanese ignored the League in favour of their imperial designs, and they soon held the Washington treaties to be unfair, confining, and dangerous to their economic health. The United States, of course, rejected Versailles and the League. Only Britain and France remained to make a success of Versailles, the League, and the chronically unstable successor states. But by 1920 British opinion was already turning against the treaty, and even the French, bitter over their "betrayal" at the hands of the United States and Britain, began to lose faith in the 1919 system. It was a new order that many yearned to overthrow and few were willing to defend.

The Versailles discords

A fragile stability, 1922–29

The 1920s are usually depicted as a bridge between the turmoil of the war and the turmoil of the 1930s, a brief truce in the "Thirty Years' War" of the 20th century. The disputes over execution of the Treaty of Versailles suggest a continuation of the Great War by other means, while the economic and security arrangements of mid-decade, and the era of good feeling they engendered, were flawed from their inception and collapsed with the onset of the Great Depression. Still, the postwar decade was Shakespeare's "time for frighted peace to pant." The conflicts of the early 1920s notwithstanding, weary populations had no stomach for war and demanded, in President Harding's words, a "return to normalcy," however fragile it might prove.

A BROKEN WORLD

The failure of democratic consensus. But what was normal in a world broken by total war? The pillars of the antebellum system—the balance of power, the non-interventionist state, the gold standard, and the free-market economy—lay in ruins and in any case reflected a faith in the natural play of political and economic forces that many Europeans had ceased to share. Wilsonians and Leninists blamed balance-of-power diplomacy for the war and fled from such normalcy. Technocrats, impressed by the productivity of regulated war economies, hoped to extend them into peacetime to promote recovery and dampen competition. Some economists and politicians even applauded the demise of the gold standard ("a barbarous relic," said Keynes) since inflation seemed the only means of financing jobs and veterans' pensions, thus stabilizing domestic societies. Finally, the free-market economy that had made high growth rates and technological dynamism seem normal from 1896 to 1914 was itself challenged by Socialists on the left and corporate interest groups on the right. In every case governments found it easier to try to shift the burden of reconstruction on to foreign powers, through reparations, loans, or inflation, than to impose taxes and austerity on quarreling social groups at home. It soon became clear that the effects of the war would continue to politicize economic relations within and between countries; that the needs of internal stability conflicted with the needs of international stability; that old dreams clashed with new realities, and new dreams with old realities.

The politicization of economic life

The search for a new stability. The lack of consensus on democracy itself also hampered the quest for a new stability. Wilson expected victory to mean a heyday of democracy in which the will of the people would oblige states to value peace and compromise. Instead, Communists and Fascists alike challenged democratic assumptions and elevated social class, race, and the state to the role Wilson reserved for the individual. In terms of the distribution of world power, the 1920s gave rise to a false normalcy, an Indian summer of European Great Power politics thanks to the peripheral roles played by the United States and the Soviet Union. In diplomacy, affairs of state came to be conducted increasingly by politicians meeting in grand conferences or at the League of Nations rather than by experts communicating with precision through written notes. Inevitably, style replaced substance at such meetings as prime ministers worried as much about their political image at home as about the actual issues at hand. The prime ministers of France and Britain held no less than 23 meetings from 1919 to 1923. As French Ambassador Camille Barrère complained, "Politicians have replaced diplomats at these conferences and seem to believe that nations conduct business like deputies in the Palais-Bourbon." But the trend was irreversible, for the crises of war and peace impressed on voters how much foreign policy affected their pocketbooks and daily lives, and they were sure to hold their elected officials responsible. Technological developments—the telephone, the wireless, and soon the airplane—also tended to reduce the role of professional ambassadors to that of messengers.

Behind the contradictory mixture of old and new in politics lay a profound cultural confusion. For the cultural shock of the Great War had turned modernist iconoclasm from the conceit of bohemian cliques into a new conventional wisdom. Respect for elders, for established authority, for "bourgeois" decency and restraint, died in the trenches. Faith in God and faith in reason, the two abiding fonts of Western culture, withered under the war's barbarizing bombardment, as did the belief in human progress born of the Enlightenment and the Industrial Revolution. Science and technology, those engines of progress, had only perfected an economy of death, and turned soldiers and civilians into mere cogs in the war machine. In the 1920s Einsteinian relativity, or a debased and popularized notion of it, replaced the comfortable order of the Newtonian universe, offering skeptics a pseudo-scientific justification for their rejection of absolute moral values. Popular Freudianism, depicting man as the victim of irrational, subconscious drives, seemed to describe the behaviour of 1914–18 better than the old Aristotelian psychology of man as a rational, moral creature. Nietzsche's transvaluation of values, implying that in a social Darwinist world compassion and charity were suicidal and force and mastery progressive, became a fad. To vulgar minds on the right and the left, Nietzsche's critique of modern mass civilization was an anthem for a politics of the violent deed. And while some artists despaired of man's fate in the crucible of the machine age, there were others, like the German Bauhaus school, who extolled steely power or, like the Italian Futurists, even modern war.

The rise of relativism

Oswald Spengler's 1918–22 best-seller *The Decline of the West* mourned the engulfing of *Kultur* by the cosmopolitan anthill of *Zivilisation* and argued that only a dictatorship could arrest the decline. Sociologist Max Weber hoped for charismatic leadership to overcome bureaucracy. Much painting, music, and film of the 1920s illustrated the theme of decline: Paul Klee's Cubist depiction of literally broken people and societies; George Grosz's looks beneath the veneer of respectable society to the rot underneath; the broken musical scales of Arnold Schoenberg; and the political drama of Bertolt Brecht. The intelligentsia of the 1920s leveled a comprehensive assault on bourgeois values, forms, and traditions. Tradition won scarcely more respect in the salons of Paris and London. The decade that was to have spawned a democratic diplomacy prepared the way instead for the totalitarian diplomacy of the 1930s.

To be sure, these were the years when European statesmen, in historian Charles Maier's words, set themselves the task of "recasting bourgeois Europe" and pioneered corporatist compromise among organized interest groups and bureaucracies when the increasingly polarized parliaments were unable to distribute the costs and benefits of reconstruction. By 1925 they had made a good show of it, as currencies and world trade stabilized and food, coal, and industrial production again reached 1913 levels. But the American economy alone boomed following the

postwar slump of 1920–21. Between 1922 and 1929, U.S. steel production climbed 70 percent, oil 156 percent, and automobiles 255 percent. Overall, national income soared 54 percent in those years; by 1929 the U.S. economy accounted for 44.8 percent of global industrial output, compared to 11.6 percent for Germany, 9.3 for Britain, 7.0 for France, and 4.6 for the Soviet Union. Yet the demobilization of American armed forces and United States refusal to make political-military engagements abroad meant that this mighty power existed in semi-isolation from the rest of the world. France and Britain, though engaged, lacked the resources and the will to run the risks inherent in trying to reintegrate Germany and Russia into the European order. A world with such disparities in the distribution of power and responsibility could not be returned to normal. It could only be given the appearance of normalcy by pasting paper constitutions, paper money, and paper treaties over the absence of common values, common interests, or a true balance of power.

The rise of the U.S. economy

REPARATIONS, SECURITY, AND THE GERMAN QUESTION

The continuing problem of Germany. The Great War failed to solve the German question. To be sure, Germany was exhausted and in the shackles of Versailles, but its strategic position actually improved in the war. Britain and France were at least as exhausted, Russia was in chaos and her boundary driven far to the east, and Italy was disaffected from her former allies, so that Germany's eastern and southern approaches now consisted of a broad ring of weak states. If and when Germany escaped Versailles, therefore, it might pose a greater threat to Europe than in 1914.

This danger obsessed postwar French leaders, but they quarreled among themselves over the proper response: strict execution of the Versailles treaty and perhaps even the breaking of German unity, or a Wilsonian policy of "moral disarmament" and reconciliation? In late 1919 the French electorate returned a staunchly conservative decision. The peace conference had not solved France's triple crisis of security, finance, and industrial reconstruction. Postwar French governments undertook to replace the abortive Anglo-American guarantee with an alliance system of Germany's neighbours. Belgium shrugged off neutrality, which had failed spectacularly to shelter it in 1914, and concluded a military alliance with France in September 1920. The Franco-Polish alliance (February 1921) and a Franco-Czechoslovak entente (January 1924) created an eastern counterweight to Germany. But these states, while wedded to the Versailles system, needed more protection than they offered. France could come to their aid only by a vigorous offensive against Germany from the west, which in turn required access to the bridgeheads over the Rhine. Thus, not only French security but that of east-central Europe as well depended on German disarmament and Allied occupation of the Rhineland.

France's new alliances

French finances were strained by the costs of rebuilding the devastated regions, the army, imperial obligations, and the refusal of the French chamber to accept sizable new taxes until Germany had paid reparations or France's war debts were annulled. To the extent that Germany reneged, France would face deficits imperiling its currency. As to industrial reconstruction, France depended on Germany for the coal needed to revive iron and steel production and at the same time was forced to countenance a cartel arrangement to escape Germany's economic competition.

Far from sympathizing with France's plight, the United States and Britain quickly withdrew from the Versailles treaty. Britain found itself in the midst of a postwar economic slump magnified by its wartime losses in ships and markets. Lloyd George had promised the veterans a land "fit for heroes," yet unemployment reached 17 percent in 1921. The war had accelerated the decline of the aging British industrial plant and the economy more generally. Unemployment never dipped much below 10 percent during the decade before the onset of the Great Depression, and in the early 1920s the pressure was on the British government to boost employment by reviving trade. Keynes argued persuasively that while Europe could never recover until the German economy took its natural place at the centre, virtually every clause of the treaty seemed designed to prevent that particular return to normalcy. To be sure, the British needed the reparations debt from Germany on the books to balance against their own war debts to the United States. But soon after the war Lloyd George came to favour German recovery in the interest of trade. The entente with France became strained as early as 1920 over the issues of reparations, Turkey, and the coal shortage of that year, from which Britain garnered windfall profits at the expense of the French.

Britain's economic woes

German politics and reparations. Germany, meanwhile, weathered both the leftist agitation of 1919 and the right-wing Kapp Putsch of March 1920. But elections showed a swing to the centre-right in German politics away from the parties that had voted to ratify Versailles. The insecure coalition cabinets of the early 1920s, therefore, found themselves with little room to maneuver on the foreign stage. They dared not rebel openly against Versailles, but dared not endorse fulfillment too eagerly in the face of domestic opinion. Nor could the weak Berlin government take forceful measures to end inflation, impose taxes, or regulate big business. The industrial magnates of the Ruhr thus acquired a virtual veto power over national policy by dint of their importance to the economy, a fact the embittered French did not fail to notice. German leaders themselves differed over how to win relief from the treaty. Army chief Hans von Seeckt and the eastern division of the foreign office thought in Bismarckian terms and favoured close ties with Russia, despite its obnoxious regime. But other economic and foreign policymakers preferred to rely on Britain and the United States to restrain France and revise the treaty. German diplomats soon synthesized these approaches, threatening closer ties with Moscow in order to win concessions from the West.

The Reparations Commission bickered throughout 1920 over the total sum to be demanded of Germany and its distribution among the Allies. At the Spa Conference (July 1920), France won 52 percent of German payments, Britain 22 percent, Italy 10, and Belgium 8. At the conferences of Hythe, Boulogne, and Brussels, France presented a total bill of 230,000,000,000 gold marks, although the British warned that this was far beyond Germany's capacity to pay. But when German foreign minister Walter Simons offered a mere 30,000,000,000 (Paris Conference, February 1921), French Premier Aristide Briand and Lloyd George made a show of force, seizing in March the Ruhr river ports of Düsseldorf, Duisburg, and Ruhrort, taking over the Rhenish customs offices, and declaring a 50 percent levy on German exports. Finally, on May 5, 1921, the London conference presented Berlin with a bill for 132,000,000,000 gold marks, to be paid in annuities of 2,000,000,000 plus 26 percent ad valorem of German exports. The Germans protested adamantly that this was "an injustice without equal." Historians have differed sharply as to whether the obligations were within the capacity of the German economy. But the May 1921 schedule was less harsh than it seemed, for the bill was divided into three series—A bonds totaling 12,000,000,000 marks, B bonds for 38,000,000,000, and the unlikely C bonds in the amount of 82,000,000,000. The latter would not even be issued until the first two series were paid and existed as much to balance against the Allies' debts to the United States as actually to be paid by Germany. Nevertheless, Chancellor Konstantin Fehrenbach resigned rather than accept this new *Diktat,* and his successor, Joseph Wirth, acquiesced only under threat of occupation of the Ruhr.

The German reparations bill

The "fulfillment" tactic adopted by Wirth and his foreign minister, Walther Rathenau, was to make a show of good faith to demonstrate that the reparations bill was truly beyond Germany's capacity. They were aided in this by the continuing deterioration of the paper mark. The prewar value of the mark was about 4.2 to the dollar. By the end of 1919 it reached 63, and after the first payment of 1,000,000,000 marks under the London plan, the mark fell to 262 to the dollar. The French argued that the inflation was purposeful, designed to feign bankruptcy while allowing Berlin to liquidate its internal debt and German industrialists like Hugo Stinnes and Fritz Thyssen to borrow, expand, and dump exports on the world market.

Recent research suggests, however, that the government did not fully understand the causes of the inflation even though it recognized its social utility in stimulating employment and permitting social expenditures. Of course, the reparations bill, while not the cause of inflation, was a strong disincentive to stabilization for Berlin could hardly plead bankruptcy if it boasted a strong currency, a balanced budget, and a healthy balance of payments. And insofar as the German government was dependent on those who benefited most from inflation—the industrialists—it was incapable of implementing austerity measures. This financial tangle might have been avoided by a program of reparations-in-kind whereby German firms delivered raw and finished goods directly to the Allies. The Seydoux Plan of 1920 and the Wiesbaden Accords of 1921 embraced such a mechanism, but the Ruhr magnates, delighted that the French might "choke on their iron" in the absence of German coal, and the British, fearful of any continental cartel, together torpedoed reparations-in-kind. By December 1921, Berlin was granted a moratorium.

Allied politics and reparations. At the Cannes Conference (January 1922) the Allies searched for common ground on reparations, a security pact, and Lloyd George's scheme for a grand economic conference including Soviet Russia. But the French chamber rebelled, and Briand was replaced as prime minister by the wartime president, Poincaré. A hard-headed lawyer from Lorraine, Poincaré was determined to relieve France's triple crisis without sacrificing its treaty rights. He approached London for a security pact, only to learn that the British were not willing to guarantee the Rhenish demilitarized zone and demanded French concessions on reparations in return. In June a conference of international bankers in Paris recommended loans to stabilize the German mark, but only if Germany were granted a long moratorium on reparations. (Meanwhile, the U.S. Congress created the World War Foreign Debt Commission to pressure the Allies to fund their war debts.) The grand economic conference promoted by Lloyd George was held at Genoa in April and May 1922 and was the first to bring German and Russian delegations together with the Allies on a status of equality. But the Soviets refused to recognize the tsarist regime's prewar debts and then shocked the Allies by signing the Treaty of Rapallo (April 16) with Germany, an innocuous document (providing for annulment of past claims and restoration of diplomatic relations) that nonetheless appeared to signal an unholy alliance between the two European outcasts. (Innocuous or not, Rathenau was assassinated by German rightists on June 24; Erzberger, signer of the Armistice, had also been murdered in 1921.) French representatives also bargained directly with the Ruhr magnates late in 1922, hoping for a coal-for-iron exchange and market-sharing, but the German price was evacuation of the Rhineland and substantial revision of the Treaty of Versailles. Meanwhile, the German mark tumbled to 7,500 to the dollar in December. Poincaré concluded that only force would break the deadlock. As he told the Belgians in July, "I will propose a short moratorium subject to guarantees. If England refuses I will act alone. The German industrialists conspire to destroy the mark. They hope to ruin France."

The Treaty of Rapallo

The new German Cabinet of Wilhelm Cuno made a desperate appeal to the United States. Secretary of State Hughes responded on December 29 with an offer to convene a committee of experts to study means of stabilizing the mark, but he held out no hope that the United States might relent on war debts. When the Reparations Commission declared that Germany had defaulted on its 1922 timber deliveries (Britain dissenting), Poincaré had his mandate to take sanctions. On Jan. 11, 1923, French and Belgian troops began to occupy the Ruhr. If the Germans submitted peacefully, the Ruhr would constitute a "productive guarantee," generating coal and receipts for France and giving her a valuable bargaining chip. If the Germans resisted, the French might take whatever measures seemed fit, up to and including political change in the Rhineland.

Occupation of the Ruhr

German workers protested the occupation of the Ruhr with an immense sitdown strike that proprietors and the government quickly joined. Berlin supported this passive resistance with unemployment relief that, in seeking to prove that the hated French could not "mine coal with bayonets," completed the destruction of the German currency. The railroads, mines, factories, and public services in the Ruhr and Rhineland ground to a halt. Poincaré steeled his will and dispatched French engineers and workers to revive the Rhine-Ruhr complex through the Inter-Allied Control Commission for Factories and Mines (MICUM) and a Franco-Belgian directorate for the railroads. The Allied Rhineland Commission (Britain dissenting) seized all executive, legislative, and judicial power in the occupied territories, expelled 16,000 uncooperative German officials (and more than 100,000 persons in all), and sequestered all German government property, energy resources, and transportation. France began covertly subsidizing separatist agitation. The Ruhr adventure thus became an economic war of attrition with stakes potentially as high as in a shooting war. If France retreated, the Treaty of Versailles was as good as dead; if Germany collapsed, the Rhineland might be lost.

The paper mark reached 4,000,000 to the dollar in August, and the Reich treasury was at the end of its tether. Business in non-occupied Germany was choking, and social unrest was spreading. Bavarian rightists called for war or separatism, while the Communist Party made gains in the cities. Gustav Stresemann, the conservative, business-oriented politician who replaced Cuno, finally ended passive resistance in September 1923 "to preserve the life of the nation and the state." But Poincaré, instead of naming his terms to Germany, apparently threw away the victory and accepted, after nine months' delay, Hughes's invitation to form a committee of experts. Poincaré's inaction baffled contemporaries, but in fact he had little to gain from dealing with Berlin. Only Britain and the United States could cancel France's war debts, stabilize the mark with loans to fund reparations, and offer security pacts or legitimize an autonomous Rhenish state, while only the Ruhr magnates could satisfy French industrial needs. So Poincaré ordered his Ruhr army commander to negotiate directly with Thyssen, Stinnes, Krupp, and their colleagues for the MICUM Accords (November 23) under which German industry went back to work, while he himself saw to the mandate of the international committee of experts.

Poincaré's plans misfired, however, for by the time the committee of experts began its deliberations at the turn of 1924, France's dearly purchased leverage had eroded and Germany had begun to recover. Troops expelled Communists from the governments of Saxony and Thuringia, a Communist putsch in Hamburg misfired, and Bavarian police quashed the Nazi putsch led by Adolf Hitler and Ludendorff. Hjalmar Schacht, recently appointed president of the Reichsbank, halted the inflation with a temporary currency called the Rentenmark, and on New Year's Day 1924 the president of the Bank of England, Montagu Norman, extended a 500,000,000 gold mark credit to back a new German mark. In October 1923, meanwhile, rowdy bands supported by the French occupation began to seize public buildings from Aachen to Speyer and to proclaim a Rhineland Republic. These separatists had no support from the population or from genuine Rhenish notables like the mayor of Cologne, Konrad Adenauer, and their actions only further discredited French policy in the eyes of Britain. By January the separatists had been driven out or murdered by fellow Germans. Finally, the French franc also succumbed to the pressure it had been under since the war. Poincaré tried austerity measures, but a new collapse in March forced him to borrow $89,000,000 from J.P. Morgan, Jr., of New York to stabilize the exchange rate. All these blows to France's position told in the report of the committee of experts under American Charles G. Dawes, released in April 1924. It called for a grand loan to Germany and the resumption of reparations payments, but made the latter contingent on French withdrawal from the Ruhr and restoration of German economic unity. Jacques Seydoux, an economist in France's foreign ministry, had predicted this outcome as early as November 1923: "There is no use hiding the fact that we have entered on the path of the 'financial reconstruction of Europe.' We will not deal with Germany as conqueror to vanquished; rather

German fiscal measures

the Germans and Frenchmen will sit on the same bench before the United States and other lending countries." On May 11, 1924, the French electorate defeated Poincaré in favour of the Cartel des Gauches (leftist coalition) under Édouard Herriot, who favoured a policy of accommodation with Germany.

THE AGREEMENTS OF MID-DECADE

Reparations agreements. Out of the exhaustion of France and Germany after the Ruhr struggle and the desire of American bankers and British diplomats to promote their reconciliation, the period 1924–26 finally produced agreements on reparations, security, and industrial cooperation. An interim reparations plan, the Dawes Plan, emerged from the London conference of July–August 1924. Expecting to join Ramsay MacDonald, Britain's first Labour prime minister, in Socialist brotherhood, Herriot instead found himself a supplicant whose bargaining points were few and feeble. France was obliged to evacuate the Ruhr (by August 1925), to end sanctions on the Rhine, and to promise never again to impose sanctions on Germany without the unanimous agreement of the Reparations Commission. The United States would lend $200,000,000 to Germany to "prime the pump," and Germany would pay from 1,000,000,000 to 2,500,000,000 marks in reparations for five years. The French government, by contrast, issued bonds worth 44,000,000,000 francs from 1919 to 1925 to finance reconstruction of its devastated regions. In the end, Germany received more money in loans than it ever paid in reparations, so the cost of repairing war damage was borne ultimately by the taxpayers, investors, and consumers of the Allied nations and the United States.

Loans to Germany

The influx of American capital through the Dawes Plan nevertheless broke the postwar spiral of inflation, default, and hostility and made possible a return to the gold standard. Germany stabilized its currency in 1924, Britain followed in 1925, and France did so in 1926 (officially in 1928). The smaller countries of Europe and Latin America, in turn, pegged their currencies against either the dollar, the pound, or the franc. Finally, the French government agreed in the Mellon–Berenger Accords (April 20, 1926) to fund its war debts at the favourable rates offered by the United States. The new gold standard and the cycle of international transfers, however, depended on a continuous flow of American capital. Should that flow ever cease, the normalcy so painfully achieved would quickly be imperiled.

Security and the League of Nations. In the realm of security, France had still achieved nothing. Of course, the Versailles restrictions on German armaments were still in force, as well as France's rear alliance system, but in striving for collective security the French suffered a series of disappointments. League of Nations Assembly Resolution XIV of September 1922 endorsed the disarmament commission's recommendation for a treaty on collective security. The Czech delegation, led by Edvard Beneš, quickly rose to a position of leadership in security matters, with the support of French and British proponents of the League such as Lord Robert Cecil, whose Draft Treaty of Mutual Assistance came under discussion in 1923. Beneš rightly criticized the Draft Treaty for requiring unanimity on the League Council to declare sanctions against an aggressor. For only in rare cases was the accused party's guilt obvious to all, as the 1914 case itself illustrated. Beneš also wanted some mechanism for pacific settlement of disputes before resort to arms. But more telling was opposition to the concept of collective security in British opinion. Canada, Australia, and other dominions especially opposed an instrument that might involve them in war over some obscure conflict in eastern Europe. In July 1924 London rejected the Draft Treaty.

The Draft Treaty of Mutual Assistance

Beneš submitted an improved Geneva Protocol (or Protocol for the Pacific Settlement of International Disputes) in October. Under the protocol, states would agree to submit all disputes to the Permanent Court of International Justice, any state refusing arbitration was ipso facto the aggressor, and the League Council could impose binding sanctions by a two-thirds majority. France enthusiastically supported the Geneva Protocol, but British Foreign Secretary Austen Chamberlain rejected it in March 1925.

Herriot had made it known that France would not proceed with the first partial evacuation of the Rhineland, scheduled for January 1925, unless he could show the French people something in the way of security. Chamberlain suggested to Stresemann in February 1925 that the Germans themselves reassure France through a regional security pact. Stresemann took up the idea, seeing in it a way to head off a bilateral Anglo-French alliance. Herriot's government fell in April, but Aristide Briand stayed on as foreign minister to carry through negotiations. Stresemann and Briand met and embraced at Locarno, swore to put the war behind them once and for all, and signed five treaties (Oct. 16, 1925) designed to pacify postwar Europe. Locarno seemed truly a second peace conference and was greeted with cheers and relief in world capitals. The main treaty, the Rhineland Pact, enjoined France, Belgium, and Germany to recognize the boundaries established by the Treaty of Versailles as inviolate and never again to resort to force in an attempt to change them. Moreover, the pact was guaranteed by Britain and Italy, who pledged to resist whatever country violated the demilitarized Rhineland. Germany also signed arbitration agreements with France, Belgium, Poland, and Czechoslovakia, agreeing to submit future disputes to international authority.

The Locarno Pact

Locarno seemed a giant step forward. Rather than a *Diktat,* it was a voluntary recognition by Germany of the 1919 borders in the West. Britain had been brought in to guarantee, not only France, but demilitarization of the Rhineland. Italy's adherence was a bonus. Germany had negotiated as an equal and looked forward to further abridgement of Versailles restrictions. Above all, Briand hoped, Locarno was the start of the "moral disarmament" of Germany. But some contemporaries, and many historians, criticized Locarno for being an incomplete system, as dangerous as it was seductive. By way of granting German equality, Britain had guaranteed Germany against French attack as much as France against Germany. "England," said Poincaré, "becomes the arbiter of Franco-German relations." To be sure, France still promised to help Poland and Czechoslovakia in case of German attack, but after Locarno, Prague and Warsaw discounted the French commitment. What was more, Locarno all but invited German revisionism in the east by explicitly providing, not for recognition, but arbitration on Germany's eastern borders. Changes in French military policy also bode ill for eastern Europe. Since 1919, Foch and Pétain had quarreled over whether to adopt an offensive or defensive contingency plan for the French army. In the wake of Locarno the Pétain faction won, and France began to design an imposing system of concrete fortresses along the border with Germany. This Maginot Line (after Minister of War André Maginot) was not meant to preclude offensive action by the French army but was in effect (in Foch's words) a "Great Wall of China" that would breed a false sense of security and weaken France's will to take the offensive on behalf of her eastern allies.

Finally, the aftermath of the Ruhr episode provided French and German industry with a chance to normalize their relations. The evacuation of the Ruhr restored Germany's coal leverage, and Berlin recovered tariff sovereignty in 1925 under the Treaty of Versailles, but the French inflation of 1924–26 shifted the export price advantage from Germany to France. Long and complicated four-way negotiations (French and German public and private sectors) produced a Franco-German steel syndicate in 1926 providing for coal-for-iron exchanges and an international committee to fix production quotas quarterly. The latter awarded France a 31 percent share compared to 43 percent for Germany, a marked improvement over the 1 to 4 ratio France had suffered before 1914. Franco-German commercial treaties followed in 1926–27.

Franco-German coal and iron agreements

The agreements of mid-decade ended the bickering and uncertainty of the immediate postwar years and made Germany a partner in the new Europe. But in every case they replaced French rights under Versailles with voluntary agreements dependent both on Anglo-American support and German goodwill.

ITALY AND EAST-CENTRAL EUROPE

Fascism and Italian reality. The peoples of east-central Europe enjoyed a degree of freedom in the 1920s unique in their history. But the power vacuum in the region resulting from the temporary impotence of Germany and Russia pulled in other Great Powers—chiefly Mussolini's Italy and France—seeking respectively to revise or uphold the 1919 order.

Fascism was the most striking political novelty of the interwar years. Fascism defied precise definition. In practice it was an anti-Marxist, antiliberal, and antidemocratic mass movement that aped Communist methods, extolled the leadership principle and a "corporatist" organization of society, and showed both modern and anti-modern tendencies. But the three states universally acknowledged to be Fascist in the 1930s—Italy, Germany, and Japan—were most similar in their foreign, rather than their domestic, ideology and policy. All embraced extreme nationalism and a theory of competition among nations and races that justified their revolts—as "proletarian nations"—against the international order of 1919. In this sense, Fascism can be understood as the antithesis of Wilsonianism rather than of Leninism.

In the first decade of Mussolini's rule, changes in Italian diplomacy were more stylistic than substantive. But recent historiography argues that this decade of relatively good behaviour was a function of the continuing constraints on Italian ambitions rather than moderation in Fascist goals. Mussolini proclaimed upon taking power that "treaties are not eternal, are not irremediable," and declared loudly and often his determination to restore Italian grandeur. This would be accomplished by revision of the "mutilated victory," by the transformation of the Mediterranean into an Italian *mare nostrum,* and by the creation of "a new Roman Empire" through expansion and conquest in Africa and the Balkans. Such reveries reflected not only Mussolini's native grandiloquence but also Italy's relative poverty and surplus rural population and need for markets and raw materials secure from the competition of more developed powers. In this sense, Italy was a sort of weak Japan. And like the Japanese, Italians bristled at the tendency of the Great Powers to treat them, in Mussolini's words, "as another Portugal." Still, Fascist bluster seemed safely unmatched in actions, and London in particular was pleased with the tendency of the Fascist foreign minister Dino Grandi to "take refuge on rainy days under the ample and capacious mantle of England" in traditional Italian fashion. More than once Grandi dissuaded Il Duce from provocative actions, taking care not to offend his vanity. The Italian navy's inferiority to the British and French, and the army's need for reorganization, also suggested prudence.

The "new Roman Empire"

Fascist diplomacy. Italian diplomacy in the 1920s, therefore, was a mix of bombast and caution. At the Lausanne Conference, Mussolini dramatically stopped his train to oblige Poincaré and Curzon to come to him. He made Italy the first Western power to offer a trade agreement and recognition to the Bolsheviks and was proud of Italy's role in the League (though he considered it "an academic organization") and as a guarantor of the Locarno Pact. In the Mediterranean, Mussolini protested French rule in Tunis and asserted for Italy a moral claim to the province. But he satisfied his thirst for action against weaker opponents. He broke the Regina Agreement with the Sanūsī tribesmen of Libya, which had limited Italian occupation to the coast, and by 1928 completed Italy's conquest of that poor and weak country.

Italy's main sphere of activity was the Balkans. When an Italian general surveying the border of a Greek-speaking district of Albania was killed in August 1923, Mussolini ordered a naval squadron to bombard the Greek isle of Corfu. The League of Nations awarded Italy an indemnity, but not the island. In January 1924, Wilson's Free State of Fiume disappeared when Yugoslav Premier Nikola Pašić granted Italian annexation in the Treaty of Rome. Diplomatic attempts to regularize relations between Belgrade and Rome, however, could not overcome Yugoslavia's suspicion of Italian ambitions in Albania. In 1924 a coup d'état, ostensibly backed by Belgrade, elevated the Muslim Ahmed Bey Zogu in Tiranë. Once in power, however, Ahmed Zogu looked to Italy. The Tiranë Pact (Nov. 27, 1926) provided Italian economic aid and was followed by a military alliance in 1927 and finally a convention (July 1, 1928) declaring Albania a virtual protectorate of Italy. Ahmed Zogu then assumed the title of King Zog I.

Italy and Albania

To the north, Italian diplomacy aimed at countering French influence among the successor states. In 1920 the French even courted Hungary and toyed with the idea of resurrecting a Danubian Confederation, but when the deposed Habsburg King Charles appeared in Hungary in March 1921, Allied protests and a Czech ultimatum forced him back into exile. Hungarian revisionism, however, motivated Beneš to unite those states that owed their existence to the Treaty of Trianon. A Czech–Yugoslav alliance (Aug. 14, 1920), Czech–Romanian alliance (April 23, 1921), and Romanian–Yugoslav alliance (June 7, 1921) together formed what was known as the Little Entente. When Charles tried again in October to claim his throne in Budapest, the Little Entente threatened invasion. While France had not midwived the combination, it associated strongly with the successor states through Franco–Czech (Oct. 16, 1925), Franco–Romanian (June 10, 1926), and Franco–Yugoslav (Nov. 11, 1927) military alliances. The latter implied that France would side with Belgrade against Rome in case of war and exacerbated the strained relations between France and Italy.

Mussolini had more luck in the defeated states of central Europe, Austria and Hungary. But in the former case, Italy was not siding with the revisionists. In return for financial aid to end its own hyperinflation, Austria had promised the League of Nations in 1922 that it would not seek *Anschluss* with Germany. Mussolini proclaimed in May 1925 that he, too, would never tolerate the *Anschluss* but set out to curry favour with the Austrian government. An Italo-Hungarian commercial treaty (Sept. 5, 1925), a friendship treaty (April 5, 1927) moving Hungary "into the sphere of Italian interests," and a rapprochement with Bulgaria in 1930 completed Italy's alignments with the states defeated in the war. Hungary in particular attracted Mussolini's sympathy. But as long as the combined will of the Little Entente, backed by France, opposed revisionism, Italy alone could force no alterations. On the other hand, military or economic cooperation among the congeries of states in east-central Europe also proved impossible. Czech–Polish rivalry continued, however illogical, and after Piłsudski's coup d'état in Poland in 1926 even the internationalist Beneš sought to steer German revisionism against Poland rather than Austria and the Danubian basin. The Little Entente and French alliances, therefore, amounted to a fair-weather system that would collapse in the first storm.

THE INVENTION OF SOVIET FOREIGN POLICY

Lenin's diplomacy. In November 1920 Lenin surprised Western observers and his fellow Bolsheviks alike by declaring that "we have entered a new period in which we have . . . won the right to our international existence in the network of capitalist states." By 1921, the generally accepted turning point in Soviet policy, Bolshevism had made the transition from a revolutionary movement to a functioning state. The Civil War was won, the New Economic Policy ended the brutal "War Communism" and restored a measure of free market activity to peasants, and the Soviet government was organized along traditional ministerial lines (though subject to the dictates of the Communist Party). Russia was ready—needed—to pursue traditional relations with foreign powers in search of capital, trade, and technology for reconstruction. The emergence of what Stalin called "Socialism in one country" therefore obliged the Soviets to invent out of whole cloth a "Communist" foreign policy.

The New Economic Policy

That invention took shape as a two-track approach whereby Russia (from 1922 the U.S.S.R.) would on the one hand continue to operate as the centre of world revolution, dedicated to the overthrow of the capitalist powers, and yet conduct an apparently regular existence as a nation-state courting recognition and assistance from those same powers. The first track was the responsibility of the

Comintern (Third International) under Grigory Zinovyev and Karl Radek; the second, of the Narkomindel (foreign commissariat) directed from 1920 to 1930 by the timid and cultured prewar nobleman, Georgy Chicherin. The Comintern enjoyed direct access to the Politburo, whereas the Narkomindel had no voice even in the Central Committee until 1925. In practice, however, the foreign policy interests of the U.S.S.R. dominated even the Comintern to such an extent that other Communist parties were not factions in their own country's politics so much as Soviet fifth columns operating abroad. When subversive activity flagged, diplomacy came to the fore; when diplomacy was unfruitful, revolution was emphasized. The goal was not to encourage "peace" or "progressive reform" in the West, but solely to enhance Soviet power. Thus Lenin instructed Comintern parties "to unmask not only open social patriotism but also the falseness and hypocrisy of social pacifism"; in other words, to do all that was possible to undermine Moscow's rivals on the left as well as on the right through the infiltration and subversion of Western labour unions, armed forces, newspapers, and schools. Yet Moscow readily ignored or confounded the efforts of local Communists when diplomatic opportunities with foreign countries seemed promising. The scent of betrayal this caused made mandatory the secrecy, discipline, and purges demanded of Communist parties abroad.

At the third congress of the Comintern in 1921 even Trotsky, the impassioned advocate of world revolution, admitted that the struggle of the proletariat in other countries was slackening. At that time the mutiny of Russian sailors at Kronshtadt and widespread famine in Russia impelled the party to concentrate on consolidating its power at home and reviving the economy. The Soviets, therefore, turned to the capitalists who, Lenin jeered, would "sell the rope to their own hangmen" in search of profits. Indeed, Western leaders, especially Lloyd George, viewed the vast Russian market as a kind of panacea for Western industrial stagnation and unemployment. But he and others misunderstood the nature of the Soviet state. Private property, commercial law, and hard currency no longer existed in Russia; one did business, not in a market, but on terms laid down by a state monopoly. What was more, by 1928 the whole point of trade was to allow the Soviet economy to catch up to the West in the shortest possible time and thus achieve complete self-sufficiency. It was, in George Kennan's words, a "trade to end all trade."

Domestic imperatives

The Anglo-Russian commercial pact of March 1921 and secret contacts with German military and civilian agents were the first Soviet openings to the Great Powers. Both culminated the following year in the Genoa Conference, where the Soviet representatives appeared, to the relief of their counterparts, in striped pants and on good behaviour. Indeed, having seized power as the minority faction of a minority party, the Bolsheviks sought legitimacy abroad as the most adamant sticklers for etiquette and legalism. But the Western powers insisted on an end to Communist propaganda and recognition of the tsarist debts as prerequisites to trade. Chicherin countered with a fanciful claim for reparations stemming from the Allied interventions, at the same time denying that Moscow bore any responsibility for the doings of the Comintern. As Theodore von Laue has written, "To ask the Soviet regime . . . to refrain from making use of its revolutionary tools was as futile as to ask the British Empire to scrap its fleet." Instead, a German-Russian knot was tied in the Treaty of Rapallo, whereby the U.S.S.R. was able to take advantage of Germany's bitterness over Versailles to split the capitalist powers. Trade and recognition were not the only consequences of Rapallo; in its wake began a decade of clandestine German military research on Russian soil.

Upon the occupation of the Ruhr the Soviets declared solidarity with the Berlin government. By August 1923, however, with Stresemann seeking negotiations with France and German society disintegrating, revolutionary opportunism again took precedence. The Politburo went so far as to designate personnel for a German Communist government, and Zinovyev gave German Communists the signal to stage a putsch in Hamburg. When it proved a fiasco, the Soviets returned to their Rapallo diplomacy with Berlin. The political victories of the leftists MacDonald in Britain and Herriot in France then prompted recognition of the Soviet government by Britain (Feb. 1, 1924), Italy (February 7), France (October 28), and most other European states. Later in 1924, however, publication during the British electoral campaign of the infamous (and probably forged) "Zinovyev letter" ordering Communists to disrupt the British army created a sensation. British police also suspected Communists of subversive activities during the bitter General Strike of 1926 and launched the "Arcos raid" on the Soviet trade delegation in London in May 1927. Anglo-Soviet relations did not resume until 1930.

Recognition of the Soviet Union

Stalin's diplomacy. Lenin's incapacity and death (Jan. 21, 1924) triggered a protracted struggle for power between Trotsky and Joseph Stalin. In foreign policy their conflict seemed one of an emphasis on aiding the European peoples "in the struggle against their oppressors" (Trotsky) versus an emphasis on "building Socialism in one country" (Stalin). But that was largely a caricature meant to discredit Trotsky as an "adventurer." During the intraparty struggle, however, Soviet foreign policy drifted. The "partial stabilization of capitalism in the West" through the Dawes Plan and the Locarno treaties was a rude setback for Moscow. When Germany later joined the League of Nations, the Soviet press warned Germany against this "false step" into "this wasp's nest of international intrigue, where political sharpers and thieving diplomatists play with marked cards, strangle weak nations, and organize war against the U.S.S.R." But the Germans were not about to throw away their Russian card. Negotiations to expand the Rapallo accord produced the Treaty of Berlin (April 24, 1926) by which Germany pledged neutrality in any conflict between the U.S.S.R. and a third power, including the League of Nations. Germany also provided a 300,000,000-mark credit and in the late 1920s accounted for 29 percent of Soviet foreign trade.

From 1921 on, the Politburo judged Asia to be the region that offered the best hope for Socialist expansion, although this required collaboration with "bourgeois nationalists." The Bolsheviks suppressed their own subject nationalities at the first opportunity, yet declared their solidarity with all peoples resisting Western imperialism. In 1920 they paid homage to the "great and famous Amīr Amānollāh" in cementing relations with the new Afghan leader, and they were the first to sign treaties with Nationalist Turkey. In September 1920 the Comintern sponsored a conference of "the peoples of the East" at Baku. Zinovyev and Radek presided over a contentious lot of Central Asian delegates, whose own quarrels, of which the Armenian-Turkish was the most vitriolic, made a mockery of any notion of regional or political solidarity. Thereafter, Soviet Asian activity went underground, alternately aiding Communists against nationalists like Reza Khan and Mustafa Kemal, and aiding nationalists against the European powers.

Central Asian overtures

The centrepiece of Soviet designs in Asia could only be China, whose liberation Lenin viewed in 1923 as "an essential stage in the victory of socialism in the world." In 1919 and 1920 the Narkomindel made much of its revolutionary sympathy for China by renouncing the rights acquired by tsarist Russia in its concessionary treaties. But soon the Soviets were sending troops into Outer Mongolia, allegedly at the request of local Communists, and concluding their own treaty with Peking (May 31, 1924) that granted the U.S.S.R. a virtual protectorate over Outer Mongolia—its first satellite—and continued ownership of the Chinese Eastern Railway in Manchuria.

The political disintegration of China, and their own devious tactics, inevitably complicated Soviet policy. While pursuing superficially correct relations with Peking, the Politburo placed its future hopes on the Canton-based Nationalists (KMT), whose members were impressed by the Bolsheviks' example of how to seize and master a vast undeveloped country. In 1922 the Comintern directed Chinese Communists to enroll in the KMT even as Adolf Yoffe renounced all Soviet intentions of importing Marxism into China. The Communist presence in the KMT grew rapidly until, after Sun Yat-sen's death in March 1925, Comintern agent Mikhail Borodin became the main strategist for the KMT. Still, the Soviets

were uncertain how to proceed. In March 1926, Trotsky counseled caution lest precipitate attacks on foreign interests in China impel the imperialists—including Japan—into anti-Soviet action. Indeed, Stalin did his best to woo Tokyo, noting that Japanese nationalism had great anti-Western potential.

On March 20, 1926, Chiang Kai-shek turned the tables with a coup that elevated him within the KMT and landed many Communists in prison. Ignoring the outrage of the Chinese Communists, Borodin remained in Chiang's good graces, whereupon Chiang staged the northern expedition in which he greatly expanded KMT power with the help of Communist organizations in the countryside. But Borodin also advised leftist KMT members to leave the south for a new base in the Wu-han cities to escape Chiang's immediate control. This "Left KMT" or "Wu-han Body" was to steer the KMT in a Communist direction and eventually seize control. The Soviet Party Congress in January 1927 even declared China the "second home" of world revolution, and Stalin confided to a Moscow audience that Chiang's forces were "to be utilized to the end, squeezed out like a lemon, and then thrown away." But Chiang preempted again by ordering a bloody purge of Shanghai Communists on April 12–13, 1927. Trotsky blamed Stalin's lack of faith in revolutionary zeal for the debacle, declaring that he should have unleashed the Communists sooner. Instead, the Left KMT eroded, many of its former adherents going over to Chiang. With the party thus fractured, Stalin changed his mind and ordered an armed revolt by Communists against the KMT. This, too, ended in carnage, and by mid-1928 only scattered bands (one under Mao Zedong) remained to take to the hills.

Stalin and China's revolution

Stalin's triumph at home and failure in China ended the formative era of Soviet foreign policy. The Politburo had expelled Zinovyev, Radek, and Trotsky by October 1926; the Party Congress condemned all deviation from the Stalinist line in December 1927; and Trotsky went into exile in January 1929. Thenceforth Soviet foreign policy and the Comintern line reflected the will of one man. Communist parties abroad likewise purged all but Stalinists and reorganized in rigid imitation of the U.S.S.R.'s ruthless dictatorship. The Sixth Party Congress (summer 1928) anathematized social democracy in the strongest terms ever and strengthened its call for subversive activities against democratic institutions. Above all, Stalin declared after an ephemeral war scare of 1926 that the era of peaceful coexistence with capitalism was coming to an end and ordered vigorous measures to prepare the U.S.S.R. for war.

First Five-Year Plan

The New Economic Policy gave way to the First Five-Year Plan (Oct. 1, 1928) for collectivization of agriculture and rapid industrialization, which condemned millions of peasants to expropriation, starvation, or exile to Siberia, but enabled the regime to sell wheat abroad to pay for industrial goods. Stalin imported entire factories from the United States, France, Italy, and Germany as the basis for the Soviet steel, automotive, aviation, tire, oil, and gas industries. In 1927 he launched the first of the show trials of industrial "wreckers" who had allegedly conspired with reactionaries and foreign agents, and in 1929 he purged all those—the "Right Opposition"—who questioned the Five-Year Plan.

The Bolsheviks interpreted their survival and consolidation in the 1920s as confirmation of their reading of the objective forces of history. In fact, Soviet foreign policy could boast of few successes. It was the Allied defeat of Germany in 1918 and the Red Army's military prowess that permitted the revolution to survive; the Versailles restraints on Germany and *cordon sanitaire* in eastern Europe that sheltered Russia from the West as much as it sheltered Europe from Bolshevism; American pressure on Japan that restored Vladivostok to the U.S.S.R.; Anglo-French recognition that opened much of the world to Soviet trade; and Western technology that enabled Stalin to hope for rapid economic modernization. The link with Germany was a Soviet achievement, but even it had a double edge, for it helped Germany to prepare for its own remilitarization. Of course, Stalin was ultimately right that a crisis of capitalism and new round of imperialism and war were just around the corner, but in part it was Comintern assaults on Western liberals and Socialists that helped to undermine the fragile stability of the 1920s.

THE UNITED STATES, BRITAIN, AND WORLD MARKETS

U.S. leverage in world markets. The economic dislocations and technological advances of the war, the relative rise of American power, and territorial changes in the colonial world all made stabilization of world markets a pressing issue in the 1920s. The resolution of this issue was chiefly the responsibility of the two economies that bestrode the world: the United States and the British Empire. Their interests diverged in many regions. At the Allied Economic Conference of 1916 the British and French had projected a postwar Allied cartel to control raw materials, while in 1918 the British drafted plans for excluding American capital from the British Empire. At the peace conference Wilson and Lloyd George engaged in backstage debate over the allocation of United States and Allied shipping with an eye to expanding their respective countries' share of world trade. On the heels of the merchant shipping rivalry came naval competition that culminated in the breaking of the Anglo-Japanese Alliance and the Washington Treaty limitations. Finally, the war debts raised the issue of whether Britain would seek a "debtors' cartel" with the French to defy Wall Street, or join the United States in a "creditors' cartel." At stake in the U.S.–British disputes was their relative global power in coming decades.

Traditional American protectionism triumphed after the electoral victory of the Republicans. The Fordney–McCumber Tariff (September 1922) was the highest in U.S. history and angered the Europeans, whose efforts to acquire dollars through exports were hampered even as the United States demanded payment of war debts. In raw materials policy, however, the United States upheld the Open Door. Secretary of Commerce Herbert Hoover rejected both statist economic competition that bred war and laissez-faire competition that bred cycles of boom and bust. Instead, he advocated formal cooperation among firms of various nations to stabilize the price and supply of commodities, raise living standards, and yet avoid the waste and oppression of regulatory bureaucracies. This "third alternative" would create "a new economic system, based neither on the capitalism of Adam Smith nor upon the Socialism of Karl Marx." By dint of leverage and persuasion, the United States gradually brought Britain around to this model of informal entente. By late 1922 London bankers also took the American position on war debts, and the two nations also cooperated in such new areas as transoceanic cables and radio. Of surpassing importance for national power in the mechanized 20th century, however, was oil.

The Fordney–McCumber Tariff

After the Great War, known oil reserves outside the industrial powers themselves were concentrated in the British mandates of the Middle East, Persia, the Dutch East Indies, and Venezuela. The Royal Dutch/Shell Group and Anglo-Persian Oil Company dominated oil exploration and production in Asia, but increasingly they confronted revolutionary nationalism, Bolshevik agitation (in Persia), and U.S. opposition to imperialism. When the British and French agreed at San Remo (1920) to coordinate their oil policies in the Middle East, the American Petroleum Institute and the U.S. State Department protested any exclusion of U.S. firms. What was more, the United States invoked the Mineral Lands Leasing Act of 1920 against the Dutch, denying them access to American reserves in retaliation for Shell's monopoly in the East Indies. In 1921, Hoover and Secretary of State Hughes encouraged seven private firms to form an American Group, led by Standard Oil of New Jersey, to seek a share of Mesopotamian oil reserves, while State Department expert Arthur Millspaugh outlined a plan for worldwide Anglo-American reciprocity. The British, fearing American retaliation and anxious to have help against native rebellions, granted the American Group a 20 percent share of the rich Mesopotamian fields. In 1922 a similar arrangement spawned the Perso-American Petroleum Company. In 1925 the Iranian nationalist Reza Khan, inspired in part by the Kemalist revolt in Turkey, seized power and had

Sharing Middle Eastern oil

himself proclaimed Reza Shah Pahlavi, but he was unable to play the British and Americans off against each other. Oil politics and nationalism in the Middle East, therefore, presaged events of the post-1945 era. (Another anticipation occurred in Palestine, where the Balfour Declaration encouraged thousands of Jewish Zionists to immigrate, leading to bloody clashes with Palestinian Arabs in 1921 and 1929.) Reciprocity also triumphed in U.S.–Dutch oil diplomacy, and Standard Oil of New Jersey acquired a 28 percent share in the East Indies by 1939.

U.S. leverage in Latin-American affairs. In Venezuela and Central America the situation was the reverse. During the war the State Department endorsed all-American oil concessions, but, in accordance with the principle of reciprocity, Hughes instructed his Latin-American ambassadors in 1921 to respect foreign interests. Latin America in general became far more of an American sphere of influence during the war than ever before owing to the growth of American commerce at Britain's expense. Central American governments now relied on New York banks to manage their public finance rather than those of London and Paris, while the U.S. share of Latin-American trade totaled 32 percent, double Britain's share, though British capital still predominated in the economics of Argentina, Brazil, and Chile.

Ever since the 17 republics of mainland Latin America emerged from the wreck of the Spanish Empire in the early 19th century, North Americans had viewed them with a mixture of condescension and contempt that focused on their alien culture, racial mix, unstable politics, and moribund economies. The Western Hemisphere seemed a natural sphere of U.S. influence, and this view had been institutionalized in the Monroe Doctrine of 1823 warning European states that any attempt to "extend their system" to the Americas would be viewed as evidence of an unfriendly disposition toward the United States itself. On the one hand, the doctrine seemed to underscore republican familiarity, as suggested by references to "our sister republics," "our good neighbors," our "southern brethren." On the other hand, the United States later used the doctrine to justify paternalism and intervention. This posed a quandary for the Latin Americans, since a United States strong enough to protect them from Europe was also strong enough to pose a threat itself. When Secretary of State James G. Blaine hosted the first Pan-American Conference in 1889, Argentina proposed the Calvo Doctrine asking all parties to renounce special privileges in other states. The United States refused.

U.S. paternalism in Latin America

After the Spanish–American War in 1898 the United States strengthened its power in the Caribbean by annexing Puerto Rico, declaring Cuba a virtual protectorate in the Platt Amendment (1901), and manipulating Colombia into granting independence to Panama (1904), which in turn invited the United States to build and control the Panama Canal. In the Roosevelt Corollary (1904) to the Monroe Doctrine the United States assumed "an international police power" in cases where Latin-American insolvency might lead to European intervention. Such "dollar diplomacy" was used to justify—and probably made inevitable—the later "gunboat diplomacy" of U.S. military intervention in Santo Domingo, Nicaragua, and Haiti. In his first term President Wilson also became embroiled in the Mexican Revolution. An affront to U.S. sailors led to his bombardment of Veracruz (1914), and border raids by Pancho Villa prompted a U.S. expedition into northern Mexico (1916). The Mexican Constitution of 1917 then granted to the state all subsoil resources to prevent their exploitation by U.S. firms. Such revolutionary efforts to nationalize resources, however, only meant that they went undeveloped or were exploited at home by corrupt officials, while the United States retaliated by cutting off loans and trade. The Latin-American dilemma of weakness and disunity in proximity to a mighty and united power was thus insoluble through unilateral efforts or a Pan-American movement dominated by Washington.

Wilson's proposed League of Nations seemed to offer Latin America a means of circumventing U.S. influence. But the United States inserted Article 21 to the effect that "Nothing in this Covenant shall be deemed to affect the validity of international engagements, such as treaties of arbitration or regional understandings like the Monroe Doctrine." Secretary of State Hughes later defended U.S. behaviour by candidly questioning the ability of some Latin-American states to maintain public order, sound finance, and the rule of law. When the Chaco dispute between Bolivia and Paraguay erupted into war, League of Nations President Briand offered his personal good offices, but he refused to assert League authority for fear of irritating the United States. In the end, the Pan-American Commission of Inquiry assumed jurisdiction.

Latin America and the League of Nations

Latin-American protests grew in volume, especially in 1926, when a Mexican-supported leftist rebellion in Nicaragua prompted U.S. Secretary of State Frank B. Kellogg to report to the Senate Foreign Relations Committee on "Bolshevist Aims and Policies in Mexico and Latin America." But intervention by United States marines in Nicaragua only paved the way for the dictatorial regime of the Somozas. At the Pan-American Conference of 1928, rivalry between Argentina and Brazil and the Chaco contestants, and the caution of other states, precluded their presenting a united Latin-American front. But the U.S. administrations of the decade did labour to improve the American image. The Clark Amendment of 1928 repudiated the Roosevelt Corollary, while Hoover toured 10 Latin-American nations after his election as president and repudiated the "big brother" role. In the 1920s, therefore, the United States continued to squeeze out European influence in Latin America but was itself moving slowly toward the "Good Neighbor" policy of the 1930s.

THE LOCARNO ERA AND THE DREAM OF DISARMAMENT

The Locarno treaties promised a new era of reconciliation that seemed fulfilled in the mid-to-late 1920s as the European and world economies recovered and the German electorate turned its back on extremists of the right and left. Locarno had also anticipated Germany's entry into the League. But the prospect of expanding the League Council kicked off an indelicate scramble for Council seats as Britain supported Spain, France supported Poland, and Brazil insisted that it represent Latin America (angering the Argentines). Sweden and Czechoslovakia helped to break the deadlock by magnanimously sacrificing their seats, although Brazil in the end quit the League. Finally, on Sept. 8, 1927, Stresemann led a German delegation into the halls of Geneva, pledging that Germany's steadfast will was to labour for freedom, peace, and unity. Briand, by now the statesman most associated with "the spirit of Geneva," replied in like terms: "No more blood, no more cannon, no more machine-guns! . . . Let our countries sacrifice their amour-propre for the sake of the peace of the world." The same month, Stresemann tried to capitalize on the goodwill during an interview with Briand at Thoiry. He suggested a 1,500,000,000-mark advance on German reparations payments (to ease the French fiscal crisis then nearing its climax) in return for immediate evacuation of the last two Rhineland zones. The French chamber would likely have rejected such a concession, and in any case Poincaré, again in power, stabilized the franc soon after.

The very goodwill expressed at Geneva—and removal of the Interallied Military Control Commission from Germany in January 1927—prompted London and Washington to ask why the French (despite their pleas of penury when war debts were discussed) still maintained the largest army in Europe. France clung firm to its belief in military deterrence of Germany, even when isolated in the League of Nations Disarmament Preparatory Commission, but the German demand for equality of treatment under the League Charter impressed the Anglo-Americans. To avert U.S. suspicions, Briand enlisted Secretary Kellogg's participation in promoting a treaty by which all nations might "renounce the resort to war as an instrument of national policy." This Kellogg–Briand Pact, signed on Aug. 27, 1928, and eventually subscribed to by virtually the entire world, marked the high point of postwar faith in paper treaties and irenic promises.

The Kellogg–Briand Pact

On July 3, 1928, Chancellor Hermann Müller (a Social Democrat) and Stresemann decided to force the pace of Versailles revisionism by claiming Germany's moral right

to early evacuation of the Rhineland. In return they offered a definitive reparations settlement to replace the temporary Dawes Plan. The French were obliged to consider the offer—a revival of Thoiry—because the French chamber had refused to ratify the 1926 agreement with the United States on war debts on the ground that it did not yet know what could be expected of Germany in reparations. So another committee of experts under another American, Owen D. Young, drafted a plan that was approved at the Hague Conference of August 1929. The Young Plan projected German annuities lasting until 1989. In return, the Allies abolished the Reparations Commission, restored German financial independence, and promised evacuation of the Rhineland by 1930, five years ahead of the Versailles schedule.

The Young Plan

Why did Briand and even Poincaré make so many concessions between 1925 and 1929? Briand, of course, had sincerely hoped for Germany's "moral disarmament," and both concluded that France's treaty rights had become a wasting asset. Better to sacrifice them now in return for concessions and goodwill, since they would expire sooner or later anyway. But Stresemann was far from accepting the status quo. His policy of accommodation was designed to achieve the gradual abolition of the Versailles strictures until Germany recovered its prewar freedom of action, at which time he could set out to restore its prewar boundaries as well. For instance, he showed no interest in an "Eastern Locarno" ensuring the boundaries of the successor states. That is not to say, however, that Stresemann anticipated the use of force or the revival of Germany's extreme war aims.

As the decade of the 1920s came to a close, most Europeans expected prosperity and harmony to continue. Briand even went so far as to propose in 1929 that France and Germany explore virtual political integration in a European union, asking only that Germany confirm her 1919 boundaries as immutable. But Stresemann died suddenly on Oct. 3, 1929, and three weeks later the New York stock market crashed. In the storms to come, the need for firm, material guarantees of security would be greater than ever. But on June 30, 1930, in accordance with the Young Plan, the last Allied troops departed the German Rhineland for home.

The origins of World War II, 1929–39

The 1930s were a decade of unmitigated crisis culminating in the outbreak of a second total war. The treaties and settlements of the first postwar era collapsed with shocking suddenness under the impact of the Great Depression and the aggressive revisionism of Japan, Italy, and Germany. By 1933 hardly one stone stood on another of the economic structures raised in the 1920s. By 1935 Adolf Hitler's Nazi regime had torn up the Treaty of Versailles and by 1936 the Locarno treaties as well. Armed conflict began in Manchuria in 1931 and spread to Abyssinia in 1935, Spain in 1936, China in 1937, Europe in 1939, and the United States and U.S.S.R. in 1941.

The context in which this collapse occurred was an "economic blizzard" that enervated the democracies and energized the dictatorial regimes. Western intellectuals and many common citizens lost faith in democracy and free-market economics, while widespread pacifism, isolationism, and the earnest desire to avoid the mistakes of 1914 left Western leaders without the will or the means to defend the 1919 order. This combination of demoralized publics, stricken institutions, and uninspired leadership led historian Pierre Renouvin to describe the 1930s simply as "*la décadence.*"

The militant authoritarian states on the other hand—Italy, Japan, and (after 1933) Germany—seemed only to wax stronger and more dynamic. The Depression did not cause the rise of the Third Reich or the bellicose ideologies of the German, Italian, and Japanese governments (all of which pre-dated the 1930s), but it did create the conditions for the Nazi seizure of power and provide the opportunity and excuse for Fascist empire-building. Hitler and Mussolini aspired to total control of their domestic societies, in part for the purpose of girding their nations for wars of conquest which they saw, in turn, as necessary for revolutionary transformation at home. This ideological meshing of foreign and domestic policy rendered the Fascist leaders wholly enigmatic to the democratic statesmen of Britain and France, whose attempts to accommodate rather than resist the Fascist states only made inevitable the war they longed to avoid.

The authoritarian states

THE ECONOMIC BLIZZARD

Political consequences of the Depression. The debate over the origins of the Great Depression and the reasons for its severity and length is highly political, given the implications for the validity of theories of free market, regulated, and planned economies, and of monetary and fiscal policy. It is usually dated from the New York stock-market crash of October 1929, which choked the domestic and international flow of credit and severely damaged global trade and production. Wall Street prices fell from an index of 216 to 145 in a month, stabilized in early 1930, then continued downward to a bottom of 34 in 1932. Industrial production fell nearly 20 percent in 1930. Unlike previous swings in the business cycle, this financial panic did not eventuate in the expected period of readjustment, but rather defied all governmental and private efforts to restore prosperity for years until it seemed to a great many that the system itself was breaking down.

Mutual recriminations flew across the Atlantic. Americans blamed the Europeans for the reparations tangle, for pegging their currencies too high upon the return to gold, and for misuse of the American loans of the 1920s. Europeans blamed the United States for its insistence on repayment of war debts, high tariffs, and the unfettered speculation leading to the stock-market crash. Certainly all of these factors contributed. More tangibly, however, a sudden contraction of international credit in June 1928 made an international emergency likely. Since the Dawes Plan of 1924, Europe had depended for capital and liquidity on the availability of American loans, but increasingly American investors were flocking to the stock market with their savings, and new capital issues for foreign account in the United States dropped 78 percent, from $530,000,000 to $119,000,000. Loans to Germany collapsed from $200,000,000 in the first half of 1928 to $77,000,000 in the second half and to $29,500,000 for the entire year of 1929. A world crisis was also brewing in basic commodities, a market in which prices had been depressed throughout the decade. Mechanization of agriculture stimulated overproduction, and Soviet dumping of wheat on the world market to earn foreign exchange for the First Five-Year Plan compounded the problem.

The Smoot–Hawley Tariff, the highest in U.S. history, became law on June 17, 1930. Conceived and passed by the House of Representatives in 1929, it may well have contributed to the loss of confidence on Wall Street and signaled American unwillingness to play the role of leader in the world economy. Other countries retaliated with similarly protective tariffs, with the result that the total volume of world trade spiraled downward from a monthly average of $2,900,000,000 in 1929 to less than $1,000,000,000 by 1933. The credit squeeze, bank failures, deflation, and loss of exports forced production down and unemployment up in all industrial nations. In January 1930 the United States had 3,000,000 idle workers, and by 1932 there were more than 13,000,000. In Britain 22 percent of the adult male work force lacked jobs, while in Germany unemployment peaked in 1932 at 6,000,000. All told, some 30,000,000 people were out of work in the industrial countries in 1932.

The Smoot–Hawley Tariff

The Depression naturally magnified European bitterness over the continuing international obligations, but the weakest link in the financial chain was Austria, whose central bank, the Creditanstalt, was on the verge of bankruptcy. In March 1931, Stresemann's successor as German foreign minister, Julius Curtius, signed an agreement with Vienna for a German–Austrian customs union, but French objections to what they saw as a first step toward the dreaded *Anschluss* provoked a run on the Creditanstalt and forced Berlin and Vienna to renounce the union on September 3. The panic then spread to Germany, rendering the Reichs-

he
loover
lorato-
um

bank unable to meet its obligations under the Young Plan. President Hoover responded on June 20, 1931, with a proposal for a one-year moratorium on all intergovernmental debts. Short of a general recovery or global agreement on the restoration of trade, however, the moratorium could only be a stopgap. Instead, every country fled toward policies of protection, self-sufficiency, and the creation of regional economic blocs in hopes of isolating itself from the world collapse. On Sept. 21, 1931, the Bank of England left the gold standard, and the pound sterling promptly lost 28 percent of its value, undermining the solvency of countries in eastern Europe and South America. In October a national coalition government formed to take emergency measures. The Ottawa Imperial Economic Conference of 1932 gave birth to the British Commonwealth of Nations and a system of imperial preferences, signaling the end of Britain's 86-year-old policy of free trade.

The Lausanne Conference of June–July 1932 took up the question of what should be done after the Hoover Moratorium. Even the French granted the impossibility of further German payments and agreed to make an end of reparations in return for a final German transfer of 3,000,000,000 marks (which was never made). The United States, however, still insisted that the war debts be honoured, whereupon the French parliament willfully defaulted, damaging Franco-American relations.

Failures of the League. Panicky retrenchment and disunity also rendered the Western powers incapable of responding to the first violation of the postwar territorial settlements. On Sept. 10, 1931, Viscount Cecil assured the League of Nations that "there has scarcely ever been a period in the world's history when war seemed less likely than it does at the present." Just eight days later officers of Japan's Kwantung Army staged an explosion on the South Manchurian Railway to serve as pretext for military adventure. Since 1928, China had seemed to be achieving an elusive unity under Chiang Kai-shek's Nationalists (KMT), now based in Nanking. While the KMT's consolidation of power seemed likely to keep Soviet and Japanese ambitions in check, resurgent Chinese nationalism also posed a threat to British and other foreign interests on the mainland. By the end of 1928, Chiang was demanding the return of leased territories and an end to extraterritoriality in the foreign concessions. On the other hand, the KMT was still split by factions, banditry continued widespread, the Communists were increasingly well-organized in remote Kiangsi, and in the spring of 1931 a rival government sprang up in Canton. To these problems were added economic depression and disastrous floods that took hundreds of thousands of lives.

Japan, meanwhile, suffered rudely from the Depression because of her dependence on trade, her ill-timed return to the gold standard in 1930, and a Chinese boycott of Japanese goods. But social turmoil only increased the appeal of those who saw in foreign expansion a solution to Japan's economic problems. This interweaving of foreign and domestic policy, propelled by a rabid nationalism, a powerful military-industrial complex, hatred of the prevailing distribution of world power, and the raising of a racialist banner (in this case, anti-white) to justify expansion, all bear comparison to European Fascism. When the parliamentary government in Tokyo divided as to how to confront this complex of crises, the Kwantung Army acted on its own. Manchuria, rich in raw materials, was a prospective sponge for Japanese emigration (250,000 Japanese already resided there) and the gateway to China proper. The Japanese public greeted the conquest with wild enthusiasm.

Japan's
nvasion of
Manchuria

China appealed at once to the League of Nations, which called for Japanese withdrawal in a resolution of October 24. But neither the British nor U.S. Asiatic fleets (the latter comprising no battleships and just one cruiser) afforded their governments (obsessed in any case with domestic economic problems) the option of intervention. The tide of Japanese nationalism would have prevented Tokyo from bowing to Western pressure in any case. In December the League Council appointed an investigatory commission under Lord Lytton, while the United States contented itself with propounding the Stimson Doctrine, by which Washington merely refused to recognize changes born of aggression. Unperturbed, the Japanese prompted local collaborationists to proclaim, on Feb. 18, 1932, an independent state of Manchukuo, in effect a Japanese protectorate. The Lytton Commission reported in October, scolding the Chinese for provocations but condemning Japan for using excessive force. Lytton recommended evacuation of Manchuria but privately believed that Japan had "bitten off more than she can chew" and would ultimately withdraw of its own accord. In March 1933, Japan announced its withdrawal instead from the League of Nations, which had been tested and found impotent, at least in East Asia.

The League also failed to advance the cause of disarmament in the first years of the Depression. The London Naval Conference of 1930 proposed an extension of the 1922 Washington ratios for naval tonnage, but this time France and Italy refused to accept the inferior status assigned to them. In land armaments, the policies of the powers were by now fixed and predictable. Britain and the United States deplored "wasteful" military spending, especially by France, while reparations and war debts went unpaid. But even Herriot and Briand refused to disband the French army without additional security guarantees that the British were unwilling to tender. Fascist Italy, despite its financial distress, was unlikely to take disarmament seriously, while Germany, looking for foreign-policy triumphs to bolster the struggling Republic, demanded equality of treatment: Either France must disarm, or Germany must be allowed to expand its army. The League Council nonetheless summoned delegates from 60 nations to a grand Disarmament Conference at Geneva beginning in February 1932. When Germany failed to achieve satisfaction by the July adjournment it withdrew from the negotiations. France, Britain, and the United States devised various formulas to break the deadlock, including a No Force Declaration (Dec. 11, 1932), abjuring the use of force to resolve disputes, and a five-power (including Italy) promise to grant German equality "in a system providing security for all nations." On the strength of these the Disarmament Conference resumed in February 1933. By then, however, Adolf Hitler was chancellor of the German Reich.

Geneva
Disar-
mament
Conference
of 1932

A common impression of Herbert Hoover is that he was passive in the face of the Depression and isolationist in foreign policy. The truth was almost the reverse, and in the 1932 campaign his Democratic opponent, Franklin Roosevelt, was the more traditional in economic policy and isolationist in foreign policy. Indeed, Hoover bequeathed to his successor two bold initiatives meant to restore international cooperation in matters of trade, currency, and security: the London Economic Conference and the Geneva Disarmament Conference. The former convened in June 1933 in hopes of restoring the gold standard but was undermined by President Roosevelt's suspension of the gold convertibility of the dollar and his acerbic message rejecting the conference's labours on July 3. At home, Roosevelt proposed the series of government actions known as the New Deal in an effort to restore U.S. productivity, in isolation, if need be, from the rest of the world. The Disarmament Conference came to a similar end. In March, Ramsay MacDonald proposed the gradual reduction of the French army from half a million to 200,000 men and the doubling of Germany's Versailles army to the same figure, accompanied by international verification. But a secret German decree of April 4 created a National Defense Council to coordinate rearmament on a massive scale. Clearly the German demand for equality was a ploy to wreck the conference and serve as pretext for unilateral rearmament.

Germany
moves to
rearm

Negotiations were delayed by a sudden initiative from Mussolini in March calling for a pact among Germany, Italy, France, and Britain to grant Germany equality, revise the peace treaties, and establish a four-power directorate to resolve international disputes. Mussolini appears to have wanted to downgrade the League in favour of a Concert of Europe, enhancing Italian prestige and perhaps gaining colonial concessions in return for reassuring the Western powers. The French watered down the plan until

the Four-Power Pact signed in Rome on June 7 was a mass of anodyne generalities. Any prospect that the new Nazi regime might be drawn to collective security disappeared on Oct. 14, 1933, when Hitler denounced the unfair treatment accorded Germany at Geneva and announced its withdrawal from the League of Nations.

THE RISE OF HITLER AND FALL OF VERSAILLES

Failure of the German Republic. The origins of the Nazi Third Reich must be sought not only in the appeal of Hitler and his party but also in the weakness of the Weimar Republic. Under the republic, Germany boasted the most democratic constitution in the world, yet the fragmentation of German politics made government by majority a difficult proposition. Many Germans identified the republic with the despised Treaty of Versailles and, like the Japanese, concluded that the 1920s policy of peaceful cooperation with the West had failed. What was more, the republic seemed incapable of curing the Depression or dampening the appeal of the Communists. In the end, it self-destructed. The first Depression-era elections, in September 1930, reflected the electorate's flight from the moderate centrist parties: Communists won 77 seats in the Reichstag, while the Nazi delegation rose from 12 to 107. Chancellor Heinrich Brüning, unable to command a majority, governed by emergency decree of the aged president, Paul von Hindenburg.

The National Socialist German Workers' Party (Nazis) exploited the resentment and fear stemming from Versailles and the Depression. Its platform was a clever, if contradictory, mixture of socialism, corporatism, and virulent assertion in foreign policy. The Nazis outdid the Communists in forming paramilitary street gangs to intimidate opponents and create an image of irresistible strength, but unlike the Communists, who implied that war veterans had been dupes of capitalist imperialism, the Nazis honoured the Great War as a time when the German *Volk* had been united as never before. The army had been "stabbed in the back" by defeatists, they claimed, and those who signed the Armistice and Versailles had been criminals; worse, international capitalists, Socialists, and Jews continued to conspire against the German people. Under Nazism alone, they insisted, could Germans again unify under *ein Reich, ein Volk, ein Führer* and get on with the task of combating Germany's real enemies. This amalgam of fervent nationalism and rhetorical socialism, not to mention the charismatic spell of Hitler's oratory and the hypnotic pomp of Nazi rallies, was psychologically more appealing than flaccid liberalism or divisive class struggle. In any case, the Communists (on orders from Moscow) turned to help the Nazis paralyze democratic procedure in Germany in the expectation of seizing power themselves.

The "stab in the back"

Brüning resigned in May 1932, and the July elections returned 230 Nazi delegates. After two short-lived rightist cabinets foundered, Hindenburg appointed Hitler chancellor on Jan. 30, 1933. The president, parliamentary conservatives, and the army all apparently expected that the inexperienced, lower-class demagogue would submit to their guidance. Instead, Hitler secured dictatorial powers from the Reichstag and proceeded to establish, by marginally legal means, a totalitarian state. Within two years the regime had outlawed all other political parties and coopted or intimidated all institutions that competed with it for popular loyalty, including the German states, labour unions, press and radio, universities, bureaucracies, courts, and churches. Only the army and foreign office remained in the hands of traditional elites. But this fact, and Hitler's own caution at the start, allowed Western observers fatally to misperceive Nazi foreign policy as simply a continuation of Weimar revisionism.

Adolf Hitler recounted in *Mein Kampf,* the autobiographical harangue written in prison after his abortive putsch of 1923, that he saw himself as that rare individual, the "programmatic thinker and the politician become one." Hitler distilled his *Weltanschauung* from the social Darwinism, anti-Semitism, and racialist anthropology current in prewar Vienna. Where Marx had reduced all of history to struggles among social classes, in which revolution was the engine of progress and the dictatorship of the proletariat the culmination, Hitler reduced history to struggle among biologic races, in which war was the engine of progress and Aryan hegemony the culmination. The enemies of the Germans, indeed of history itself, were internationalists who warred against the purity and race-consciousness of peoples—they were the capitalists, the Socialists, the pacifists, the liberals, all of whom Hitler identified with the Jews. This condemnation of Jews as a racial group made Nazism more dangerous than earlier forms of religious or economic anti-Semitism that had long been prevalent throughout Europe. For if the Jews, as Hitler thought, were like bacteria poisoning the bloodstream of the Aryan race, the only solution was their extermination. Nazism, in short, was the twisted product of a secular, scientific age of history.

Nazi anti-Semitism

Hitler's worldview dictated a unity of foreign and domestic policies based on total control and militarization at home, war and conquest abroad. In *Mein Kampf* he ridiculed the Weimar politicians and their "bourgeois" dreams of restoring the Germany of 1914. Rather, the German *Volk* could never achieve their destiny without Lebensraum ("living space") to support a vastly increased German population and form the basis for world power. Lebensraum, wrote Hitler in *Mein Kampf,* was to be found in the Ukraine and intermediate lands of eastern Europe. This "heartland" of the Eurasian continent (so named by the geopoliticians Sir Halford Mackinder and Karl Haushofer) was especially suited for conquest since it was occupied, in Hitler's mind, by Slavic *Untermenschen* (subhumans) and ruled from the centre of the Jewish-Bolshevik conspiracy in Moscow. By 1933 Hitler had apparently imagined a step-by-step plan for the realization of his goals. The first step was to rearm, thereby restoring complete freedom of maneuver to Germany. The next step was to achieve Lebensraum in alliance with Italy and with the sufferance of Britain. This greater Reich could then serve, in the distant third step, as a base for world dominion and the purification of a "master race." In practice, Hitler proved willing to adapt to circumstances, seize opportunities, or follow the wanderings of intuition. Sooner or later politics must give way to war, but because Hitler did not articulate his ultimate fantasies to the German voters or establishment, his actions and rhetoric seemed to imply only restoration, if not of the Germany of 1914, then the Germany of 1918, after Brest-Litovsk. In fact, his program was potentially without limits.

European responses to Nazism. European reaction to the rise of Nazism was cautious, but not at first overtly hostile. The Four-Power Pact and a concordat with the Vatican (July 20, 1933), negotiated by the Catholic Franz von Papen, conferred a certain legitimacy on the Nazi regime. (Hitler sought to end Vatican support for the Catholic Centre Party while he proceeded to subordinate the churches and to corrupt Christianity into a state-centred form of neo-paganism. Pope Pius XI, like every other European statesmen after him, thought that he could appease and moderate the Nazis.) On Jan. 26, 1934, Hitler shocked all parties by signing a nonaggression pact with Poland. This bit of duplicity neutralized France's primary ally in the east while helping to secure Germany over the dangerous years of rearmament. The new Polish foreign minister, Józef Beck, was in turn responding to the dilemma of Poland's central position between Germany and the U.S.S.R. He hoped to preserve a balance in his relations with the two giant neighbours (Poland signed a three-year pact with Moscow in July 1932) but feared the Soviets (from whom Poland had grabbed so much territory in 1921) more than the still-weak Germans. The pact with Germany was meant to run for 10 years.

The German-Polish pact

France was the nation most concerned by the Nazi threat and most able to take vigorous action. But fear of another war, the defeatist mood dating from the failure of the Ruhr occupation, the passivity engendered by the Maginot Line (due for completion in just five years), and domestic strife exacerbated by the Depression and the Stavisky scandal of 1933 all served to hamstring French foreign policy. As in the Weimar Republic, Communists and monarchists or Fascist groups like the Croix de Feu and Action Fran-

çaise battled in the streets. In February 1934 a crowd of war veterans and rightists stormed the parliament, and the Édouard Daladier Cabinet was forced to resign to head off a coup d'état. The new foreign minister, Louis Barthou, had been a friend of Poincaré and made a final effort to shore up France's security system in Europe: "All these League of Nations fancies—I'd soon put an end to them if I were in power. . . . It's alliances that count." But alliances with whom? The French Left was adamantly opposed to cooperation with Fascist Italy, the Right despised cooperation with the Communist Soviet Union. Britain as always eschewed commitments, while Poland had come to terms with Germany. Nevertheless, the moment seemed opportune; both Italy and the U.S.S.R. now made clear their opposition to Hitler and desire to embrace collective security.

To be sure, Mussolini was gratified by the triumph of the man he liked to consider his younger protégé, Hitler, but he also understood that Italy fared best while playing off France and Germany, and he feared German expansion into the Danubian basin. In September 1933 he made Italian support for Austrian Chancellor Engelbert Dollfuss conditional on the latter's establishment of an Italian-style Fascist regime. In June 1934 Mussolini and Hitler met for the first time, and in their confused conversation (there was no interpreter present) Mussolini understood the Führer to say that he had no desire for *Anschluss*. Yet, a month later, Austrian Nazis arranged a putsch in which Dollfuss was murdered. Mussolini responded with a threat of force (quite likely a bluff) on the Brenner Pass and thereby saved Austrian independence. Kurt von Schuschnigg, a pro-Italian Fascist, took over in Vienna. In Paris and London it seemed that Mussolini was one leader with the will and might to stand up to Hitler.

The first Hitler-Mussolini meeting

Stalin, meanwhile, had repented of the equanimity with which he had witnessed the Nazi seizure of power. Before 1933, Germany and the U.S.S.R. had collaborated, and Soviet trade had been a rare boon to the German economy in the last years of the Weimar Republic. Still, the behaviour of German Communists contributed to the collapse of parliamentarism, and now Hitler had shown that he, too, knew how to crush dissent and master a nation. The Communist line shifted in 1934–35 from condemnation of social democracy, collective security, and Western militarism to collaboration with other anti-Fascist forces in "Popular Fronts," alliance systems, and rearmament. The United States and the U.S.S.R. established diplomatic relations for the first time in November 1933, and in September 1934 the Soviets joined the League of Nations, where Maksim Litvinov became a loud proponent of collective security against Fascist revisionism.

Thus, Barthou's plan for reviving the wartime alliance and arranging an "Eastern Locarno" began to seem plausible—even after Oct. 9, 1934, when Barthou and King Alexander of Yugoslavia were shot dead in Marseille by an agent of Croatian terrorists. The new French foreign minister, the rightist Pierre Laval, was especially friendly to Rome. The Laval–Mussolini agreements of Jan. 7, 1935, declared France's disinterest in the fate of Abyssinia in implicit exchange for Italian support of Austria. Mussolini took this to mean that he had French support for his plan to conquer that independent African country. Just six days later the strength of German nationalism was resoundingly displayed in the Saar plebiscite. The small, coal-rich Saarland, detached from Germany for 15 years under the Treaty of Versailles, was populated by miners of Catholic or social democratic loyalty. They knew what fate awaited their churches and labour unions in the Third Reich, and yet 90 percent voted for union with Germany. Then, on March 16, Hitler used the extension of French military service to two years and the Franco-Soviet negotiations as pretexts for tearing up the disarmament clauses of Versailles, restoring the military draft, and beginning an open buildup of Germany's land, air, and sea forces.

The Saar plebiscite

In the wake of this series of shocks Britain, France, and Italy joined on April 11, 1935, at a conference at Stresa to reaffirm their opposition to German expansion. Laval and Litvinov also initialed a five-year Franco-Soviet alliance on May 2, each pledging assistance in case of unprovoked aggression. Two weeks later a Czech-Soviet pact complemented it. Laval's system, however, was flawed; mutual suspicion between Paris and Moscow, the failure to add a military convention, and the lack of Polish adherence meant that genuine Franco-Soviet military action was unlikely. The U.S.S.R. was in a state of trauma brought on by the Five-Year Plans, the slaughter and starvation of millions of farmers, especially in the Ukraine, in the name of collectivization, and the beginnings of Stalin's mass purges of the government, army, and Communist party. It was clear that Russian industrialization was bound to overthrow the balance of power in Eurasia, hence Stalin was fearful of the possibility of a preemptive attack before his own militarization was complete. But he was even more obsessed with the prospect of wholesale rebellion against his regime in case of invasion. Stalin's primary goal, therefore, was to keep the capitalist powers divided and the U.S.S.R. at peace. Urging the liberal Western states to combine against the Fascists was one method; exploring bilateral relations with Germany, as in the 1936 conversations between Hjalmar Schacht and Soviet trade representative David Kandelaki, was another.

Italy and Britain looked askance at the Franco-Soviet combination, while Hitler in any case sugar-coated the pill of German rearmament by making a pacific speech on May 21, 1935, in which he offered bilateral pacts to all Germany's neighbours (except Lithuania) and assured the British that he, unlike the Kaiser, did not intend to challenge them on the seas. The Anglo-German Naval Agreement of June 18, which countenanced a new German navy though limiting it to not larger than 35 percent the size of the British, angered the French and drove a wedge between them and the British.

The Anglo-German naval pact

Italian aggression. The Stresa Front collapsed as soon as Paris and London learned the price Mussolini meant to exact for it. By 1935 Mussolini had ruled for 13 years but had made little progress toward his "new Roman Empire" that was to free Italy from the "prison of the Mediterranean." What was more, Il Duce concluded that only the crucible of war could fully undermine the monarchy and the church and consummate the Fascist revolution at home. Having failed to pry the French out of their North African possessions, Mussolini fixed on the independent African empire of Abyssinia (Ethiopia). Italy had failed in 1896 to conquer Abyssinia, thus to do so now would erase a national humiliation. This spacious land astride Italy's existing coastal colonies on the Horn of Africa boasted fertile uplands suitable for Italy's excess rural population, and Mussolini promised abundant raw materials as well. The conquest of Abyssinia would also appear to open the path to the Sudan and Suez. Finally, this landlocked, semifeudal kingdom seemed an easy target. In fact, Emperor Haile Selassie had begun a modernization program of sorts, but this only suggested that the sooner Italy struck, the better.

The Italian army was scarcely prepared for such an undertaking, and Mussolini made matters worse by ordering ill-trained blackshirt brigades to Africa and entrusting the campaign to a Fascist loyalist, Emilio De Bono, rather than to a senior army officer. The military buildup at Mitsiwa left little doubt as to Italian intentions, and Britain tried in June to forestall the invasion by arranging the cession of some Abyssinian territories. But Mussolini knew that the British Mediterranean fleet was as unready as his own and expected no interference.

De Bono's absurdly large army invaded Ethiopia from Eritrea on Oct. 3, 1935. Adwa, the site of the 1896 debacle, fell in three days, after which the advance bogged down and Mussolini replaced De Bono with Marshal Pietro Badoglio. The League Council promptly declared Italy the aggressor (October 7), whereupon France and Britain were caught on the horns of a dilemma. To wink at Italy's conquest would be to condone aggression and admit the bankruptcy of the League; to resist would be to smash the Stresa Front and lose Italian help against the greater threat, Germany. The League finally settled on economic sanctions but shied away from an embargo on oil, which would have grounded the Italian army and air force, or closure of the Suez Canal, which would have cut the

Invasion of Ethiopia

Italian supply line. The remaining sanctions only vexed Italy without helping Abyssinia. Germany, no longer a League member, ignored the sanctions and so healed its rift with Rome.

In December, Laval and Sir Samuel Hoare, the British foreign secretary, contrived a secret plan to offer Mussolini most of Abyssinia in return for a truce. This Hoare–Laval Plan was a realistic effort to end the crisis and repair the Stresa Front, but it also made a mockery of the League. When it leaked to the press, public indignation forced Hoare's resignation. On the battlefield, the Italians finally took the fortress of Mekele on November 8, but their slow advance led Mussolini to order a major offensive in December. He instructed Badoglio to use whatever means necessary, including terror bombing and poison gas, to end the war.

The first German move. Hitler observed the Abyssinian War with controlled glee, for dissolution of the Stresa Front—composed of the guarantors of Locarno—gave him the chance to reoccupy the Rhineland with minimal risk. A caretaker government under Albert Sarraut was in charge of France during a divisive electoral campaign dominated by the leftist Popular Front, and Britain was convulsed by a constitutional crisis stemming from King Edward VIII's insistence on marrying an American divorcée. On March 7, 1936, Hitler ordered a token force of 22,000 soldiers back across the bridges of the Rhine. Characteristically, he chose a weekend for his sudden move and then softened the blow with offers of nonaggression pacts and a new demilitarized zone on both sides of the frontier. Even so, Hitler assured his generals he would retreat if the French intervened.

Occupation of the Rhineland

German reoccupation and fortification of the Rhineland was the most significant turning point of the interwar years. After March 1936 the British and French could no longer take forceful action against Hitler except by provoking the total war they feared. Why did the French, especially, not act to prevent this calamity to their defensive posture? They were not taken by surprise—Hitler's preparations had been noted—and Sarraut himself told French radio listeners that "Strasbourg would not be left under German guns." Moreover, the French army still outnumbered the German and could expect support from Czechoslovakia and possibly Poland. On the other hand, the French army commander, General Maurice Gamelin, vastly overestimated German strength and insisted that a move into the Rhineland be preceded by general mobilization. The French Cabinet also concluded that it should do nothing without the full agreement of the British. But London was not the place to look for backbone. Prime Minister Stanley Baldwin shrugged: "They might succeed in smashing Germany with the aid of Russia, but it would probably only result in Germany going Bolshevik," while the editor of *The Times* asked, "It's none of our business, is it? It's their own back-garden they're walking into." But by failing to respond to the violation, Britain, France, and Italy had broken the Locarno Treaties just as gravely as Germany.

The strategic situation in Europe now shifted in favour of the Fascist powers. In June, Mussolini appointed as foreign minister his son-in-law Galeazzo Ciano, who concluded an agreement with Germany on July 11 in which Italy acquiesced in Austria behaving henceforth as "a German state." The Rome–Berlin Axis followed on November 1, and the German–Japanese Anti-Comintern Pact, another vague agreement ostensibly directed at Moscow, on November 25. Finally, Belgium unilaterally renounced its alliance with France on October 14 and returned to its traditional neutrality in hopes of escaping the coming storm. As a direct result of the Abyssinian imbroglio, the militant revisionists had come together, and the status quo powers had splintered.

The Rome–Berlin Axis

Meanwhile, on May 5, 1936, Italian troops entered Addis Ababa and completed the conquest of Abyssinia. The country was never entirely pacified despite costly and brutal repression. But the Abyssinian war had been a disaster for the democracies, smashing both the Stresa Front and the credibility of the League. As historian A.J.P. Taylor wrote: "One day [the League] was a powerful body imposing sanctions, seemingly more effective than ever before; the next day it was an empty sham, everyone scuttling from it as quickly as possible." In December 1937, Italy, too, quit the League of Nations.

The blow to the League

BRITISH APPEASEMENT AND AMERICAN ISOLATIONISM

The rationale of appeasement. It is time to explore the roots of democratic lethargy in the face of Fascist expansionism in the 1930s. British policy, in particular, which Prime Minister Neville Chamberlain would proudly term "appeasement," conjures up images of naive, even craven surrender to Nazi demands. In the minds of British statesmen, however, appeasement was a moral and realistic expression of all that was liberal and Christian in British culture. First, 1914 cast a dark shadow on the opinion leaders of the 1930s, who determined this time to shun arms races and balance-of-power and commercial competition, and so spare the world another horrible war. Second, the overextended British Empire lacked the resources to confront threats from Japan in Asia, Italy in the Mediterranean, and Germany in Europe all at once. Wisdom dictated that Britain come to terms with the greatest and closest to home of its potential adversaries, Germany. Third, the British public was understandably provincial about central Europe and had no desire (in the popular French phrase) "to die for Danzig." This sentiment was even more pronounced in the British Dominions. Fourth, many Tory and Labour leaders, while put off by Hitler's ideology and brutality, shared his antipathy to Versailles and urged "fair play" in cases where German nationals were separated from the fatherland. Thus Wilsonian national self-determination perversely made the Nazis appear to be on the side of principle. Fifth, the appeasers also presumed that the Nazis would become less rambunctious once their grievances were removed. Sixth, some demoralized Englishmen believed the propagandistic claim that Fascism was the only bulwark against the spread of Bolshevism. Seventh, domestic opinion in Britain favoured a passive reliance on the League of Nations somehow to prevent another catastrophe—Baldwin's policy of sanctions without war in Abyssinia, as the chief case in point, earned his party a huge electoral victory in November 1935. Nor had pacifism flagged since 1933, when the Oxford Union "Resolved that this house refuses to fight for King and Country."

Voices of dissent existed. Some Left-Labourites warned that Fascism must be stopped sooner or later, while a few Tory backbenchers led by Winston Churchill demanded rearmament. In the mid-1930s a source in the Air Ministry leaked data to Churchill suggesting that Germany's air force was rapidly overtaking Britain's. But fear of the Luftwaffe only provided another excuse for appeasement, for aviation had developed to the point that theorists like the Italian Giulio Douhet could argue that air bombardment would win the next war in 48 hours by leveling enemy cities. In an air age, the English Channel no longer sheltered Britain from destruction.

Fear of war from the air

Many of these same considerations afflicted French policy: fear of another total war and destruction from the air, apathy toward eastern Europe, and ideological confusion. The election of May 3, 1936, brought victory for the Popular Front, which formed a Cabinet under the Socialist Léon Blum. But his economic policies threw France into a turmoil of strikes, capital flight, and recrimination. "Better Hitler than Blum," said some on the Right.

The civil war in Spain. The Spanish Civil War highlighted the contrast between democratic bankruptcy and totalitarian dynamism. In 1931 the Spanish monarchy gave way to a republic whose unstable government moved steadily to the left, outraging the army and church. After repeated provocations on both sides, army and air force officers proclaimed a Nationalist revolt on July 17, 1936, that survived its critical early weeks with logistical help from Portugal's arch-conservative premier António Salazar. The Nationalists, rallying behind General Francisco Franco, quickly seized most of Old Castile in the north and a beachhead in the south extending from Córdoba to Cádiz opposite Spanish Morocco, where the insurrection had begun. But the Loyalists, a Popular Front

composed of liberals, Socialists, Trotskyites, Stalinists, and anarchists took up arms to defend the Republic elsewhere and sought outside aid against what they styled as the latest Fascist threat. Spain became a battleground for the ideologies wrestling for mastery of Europe.

The civil war posed a dilemma for France and Britain, pitting the principle of defending democracy against the principle of noninterference in the domestic affairs of other states. The ineffectual Blum at first fraternally promised aid to the Popular Front in Madrid, but he reneged within a month for fear that such involvement might provoke a European war or a civil war in France. The British government counseled nonintervention and seemingly won Germany and Italy to that position. But Hitler, on well-rehearsed anti-Bolshevik grounds, hurriedly dispatched 20 transport planes that allowed Franco to move reinforcements from Morocco. Not to be outdone, Mussolini sent matériel, Fascist "volunteers," and, ultimately, regular army formations. The Italians performed miserably (especially at Guadalajara, March 1937), but German aid, including the feared Condor Legion, was effective. Hitler expected to be paid for his support, however, with economic concessions, and he also saw Spain as a testing-ground for Germany's newest weapons and tactics. These included terror bombing such as that over Guernica in April 1937, which caused far fewer deaths than legend has it but became an icon of anti-Fascism through the painting of Pablo Picasso. International aid to the Loyalists ran from the heroic to the sinister. Thousands of leftists and idealistic volunteers from all over Europe and America flocked to International Brigades to defend the Republic. Material support, however, came only from Stalin, who demanded gold payment in return and ordered Comintern agents and commissars to accompany the Soviet supplies. These Stalinists systematically murdered Trotskyites and other "enemies on the left," undermined the radical government of Barcelona, and exacerbated the intramural confusion in Loyalist ranks. The upshot of Soviet intervention was to discredit the Republic and thereby strengthen Western resolve to stay out.

The International Brigades

The war dragged on through 1937 and 1938 and claimed some 500,000 lives before the Nationalists finally captured Barcelona in January 1939 and Madrid in March. During the final push to victory, France and Britain recognized Franco's government. By then the fulcrum of diplomacy had long since shifted to central Europe. But the Nationalist victory did not, in the end, redound to the detriment of France, for Franco politely sent the Germans and Italians home and observed neutrality in the coming war, whereas a pro-Communist Spain might have posed a genuine threat to France during the era of the Nazi–Soviet pact.

The return of U.S. isolationism. The extreme isolationism that gripped the United States in the 1930s reinforced British appeasement and French paralysis. To Americans absorbed with their own distress, Hitler and Mussolini appeared as slightly ridiculous rabble-rousers on movie-house newsreels and certainly no concern of theirs. Moreover, the revisionist theory that the United States had been sucked into war in 1917 through the machinations of arms merchants or Wall Street bankers gained credence from the Senate's Nye Committee inquiries of 1934–36. But U.S. isolationism, like British appeasement, had many roots: liberal abhorrence of arms and war, the evident failure of Wilsonianism, the Depression, the revisionism of American historians, who were among the leaders in arguing that Germany was not solely responsible for 1914. Nor were isolationists restricted only to the Great Plains states or to one political party. Some members of Congress favoured punctilious defense of U.S. interests in the world but rejected involvement in the quarrels of others. Some were full-fledged pacifists even if it meant surrendering some U.S. rights abroad. Left-wing isolationists warned that another great war would push the United States in the direction of Fascism. Conservative isolationists warned that another great war would usher in socialism.

These factions disputed among themselves over the wording of legislation, but their collective strength was enough to carry a number of bills designed to prevent a recurrence of the events of 1914–17. The Johnson Act of 1934 forbade American citizens to lend money to foreign countries that had not paid their past war debts. The Neutrality acts of 1935 and 1936 prohibited sale of war matériel to belligerents and forbade any exports to belligerents not paid for with cash and carried in their own ships. Thus, the United States was not to acquire a stake in the victory of any side or expose its merchant ships to submarines. The effect of these acts, however, was to preclude American aid to Abyssinia, Spain, and China, and thus hurt the victims of aggression more than the aggressors.

The Neutrality acts

The United States did take steps in the 1930s, however, to mobilize the Western Hemisphere for the purposes of fighting the Depression and resisting European, especially German, encroachments. Roosevelt gave this initiative a name in his first inaugural address: the Good Neighbor Policy. Building on steps taken by Hoover, Roosevelt pledged nonintervention in Latin domestic affairs at the Montevideo Pan-American Conference of 1933, signed a treaty with the new Cuban government (May 29, 1934) abrogating the Platt Amendment, mediated a truce in the Chaco War between Bolivia and Paraguay in 1934 (a peace treaty following in July 1938), and negotiated commercial treaties with Latin-American states. As war approached overseas, Washington also promoted pan-American unity on the basis of nonintervention, condemnation of aggression, no forcible collection of debts, equality of states, respect for treaties, and continental solidarity. The Declaration of Lima (1938) provided for pan-American consultation in case of a threat to the "peace, security, or territorial integrity" of any state.

Japan's aggression in China. The first major challenge to American isolationism, however, occurred in Asia. After pacifying Manchukuo, the Japanese turned their sights toward North China and Inner Mongolia. But over the intervening years the KMT had made progress in unifying China. The Communists were still in the field, having survived their Long March (1934–35) to Yen-an in the north, but Chiang's government, with German and American help, had introduced modern roads and communications, stable paper currency, banking, and educational systems. How might Tokyo best round out its continental interests: by preemptive war or by cooperating with this resurgent China to expel Western influence from East Asia? The chief of the operations section of the Japanese general staff favoured collaboration and feared that an invasion of China proper would bring war with the Soviets or the Americans, whose economic potential he understood. But supreme headquarters preferred to take military advantage of apparent friction between Chiang and a North China warlord. In September 1936 Japan issued seven secret demands that would have made North China a virtual Japanese protectorate, but Chiang rejected them. In December Chiang was even kidnapped by one of his own generals, the commander of Nationalist forces from Manchuria, who tried to force him to suspend fighting the Communists and to declare war on Japan. This Sian Incident demonstrated the unlikelihood of Chinese collaboration with the Japanese program and strengthened the war party in Tokyo. As in 1931, hostilities began almost spontaneously and soon took on a life of their own.

The Sian Incident

An incident at the Marco Polo Bridge near Peking (then known as Pei-p'ing) on July 7, 1937, escalated into an undeclared Sino-Japanese war. Contrary to the Japanese analysis, both Chiang and Mao Zedong vowed to come to the aid of North China, while Japanese moderates failed to negotiate a truce or localize the conflict and lost all influence. By the end of July the Japanese had occupied Peking and Tientsin. The following month they blockaded the South China coast and captured Shanghai after brutal fighting and the slaughter of countless civilians. Similar atrocities accompanied the fall of Nanking on December 13. The Japanese now expected the Chinese to sue for peace, but Chiang moved his government to Han-k'ou and continued to resist the "dwarf bandits" with hit-and-run tactics that sucked the invaders in more deeply. The Japanese could occupy cities and fan out along roads and rails almost at will, but the countryside remained hostile.

World opinion condemned Japan in the harshest terms. The U.S.S.R. concluded a nonaggression pact with China

(Aug. 21, 1937), and Soviet-Mongolian forces skirmished with Japanese on the border. Britain vilified Japan in the League, while Roosevelt invoked the Stimson Doctrine in his "quarantine speech" of October 5. But Roosevelt was prevented by the Neutrality acts from aiding China even after the sinking of U.S. and British gunboats on the Yangtze.

Responses to Japan

On March 28, 1938, the Japanese established a Manchukuo-type puppet regime at Nanking, and spring and summer offensives brought them to the Wu-han cities (chiefly Han-k'ou) on the Yangtze. Chiang stubbornly moved his government again, this time to Chungking, which the Japanese bombed mercilessly in May 1939, as they did Canton for weeks before its occupation in October. Such incidents, combined with the Nazi and Fascist air attacks in Spain and Abyssinia, were omens of the total war to come. The United States finally took a first step in opposition to Japanese aggression on July 29, 1939, announcing that it would terminate its 1911 commercial treaty with Japan in six months and thereby cut off vital raw materials to the Japanese war machine. It was all Roosevelt could do under existing law, but it set in train the events that would lead to Pearl Harbor.

ANSCHLUSS AND THE MUNICH PACT

The German-Austrian union. Heightened assertiveness also characterized foreign policies in Europe in 1937. But while Hitler's involved explicit preparations for war, Britain's consisted of explicit attempts to satisfy him with concessions. The conjuncture of these policies doomed the independence of Austria, Czechoslovakia, and Poland, and set Europe on a slippery slope to war.

By the end of 1936, Hitler and the Nazis were total masters of Germany with the exceptions of the army and the foreign office, and even the latter had to tolerate the activities of a special party apparatus under the Nazi "expert" on foreign policy, Joachim von Ribbentrop. Nazi prestige, bolstered by such theatrics as the Berlin Olympics, the German pavilion at the Paris Exhibition, and the enormous Nürnberg party rallies, was reaching its zenith. In September 1936, Hitler imitated Stalin again in his proclamation of a Four-Year Plan to prepare the German economy for war under the leadership of Hermann Göring. With the Rhineland secured, Hitler grew anxious to begin his "drive to the east," if possible with British acquiescence. To this end he appointed Ribbentrop ambassador to London in October 1936 with the plea, "Bring me back the British alliance." Intermittent talks lasted a year, their main topic being the return of the German colonies lost at Versailles. But agreement was impossible, since Hitler's real goal was a free hand on the Continent, while the British hoped, in return for specific concessions, to secure arms control and respect for the status quo.

Germany's Four-Year Plan

Meanwhile, Stanley Baldwin, having seen the abdication crisis through to a finish, retired in May 1937 in favour of Neville Chamberlain. The latter now had the chance to pursue what he termed "active appeasement": find out what Hitler really wants, give it to him, and thereby save the peace and husband British resources for defense of the empire against Italy and Japan. By the time of Lord Halifax's celebrated visit to Berchtesgaden in November 1937, Hitler had already lost interest in the talks and begun to prepare for the absorption of Austria, a country in which, said Halifax, Britain took little interest. Hitler had also taken measures to complete the Nazification of foreign and defense policy.

On November 5, Hitler made a secret speech in the presence of the commanders of the three armed services, War Minister Werner von Blomberg, Foreign Minister Konstantin von Neurath, and Göring. The Führer made clear his belief that Germany must begin to expand in the immediate future, with Austria and Czechoslovakia as the first targets, and that the German economy must be ready for full-scale war by 1943–45. On November 19, Hitler replaced Schacht as minister of economics. Two months later he fired generals Blomberg and Werner von Fritsch in favour of the loyal Walther von Brauchitsch and Wilhelm Keitel and replaced Neurath with Ribbentrop. Historians have debated whether the November 5 speech was a blueprint for aggression, a plea for continued rearmament, or preparation for the purges that followed. But there is no denying that the overheated Nazi economy had reached a critical turn with labour and resources fully employed and capital running short. Hitler would soon have to introduce austerity measures, slow down the arms program, or make good the shortages of labour and capital through plunder. Since these material needs pushed in the same direction as Hitler's dynamic quest for Lebensraum, 1937 merely marked the transition into concrete timetables of what Hitler had always desired. Nazification of the economy, the military, and the foreign service only removed the last vestige of potential opposition to a risky program of ruthless conquest.

German intrigues in Austria had continued since 1936 through the agency of Arthur Seyss-Inquart's Nazi movement. When Papen, now ambassador to Vienna, reported on Feb. 5, 1938, that the Schuschnigg regime showed signs of weakness, Hitler invited the Austrian dictator to a meeting on the 12th. In the course of an intimidating tirade Hitler demanded that Nazis be included in the Vienna government. Schuschnigg, however, insisted that Austria remain "free and German, independent and social, Christian and united," and scheduled a plebiscite for March 13 through which Austrians might express their will. Hitler hurriedly issued directives to the military, and when Schuschnigg was induced to resign, Seyss-Inquart simply appointed himself chancellor and invited German troops to intervene. A last-minute Italian demarche inviting Britain to make colonial concessions in return for Italian support of Austria met only "indignant resignation" and Anthony Eden's irrelevant complaints about Italy's troops in Spain. A French plea for Italian firmness, in turn, provoked Ciano to ask: "Do they expect to rebuild Stresa in an hour with Hannibal at the gates?" Still, Hitler waited nervously on the evening of March 11 until he was informed that Mussolini would take no action in support of Austria. Hitler replied with effusive thanks and promises of eternal amity. In the nighttime invasion, 70 percent of the vehicles sent into Austria by the unprepared Wehrmacht broke down on the road to Vienna, but they met no resistance. Austrians cheered deliriously on the 13th, when Hitler declared Austria a province of the Reich.

The end of Austrian resistance

The taking of Czechoslovakia. The *Anschluss* outflanked the next state on Hitler's list, Czechoslovakia. Once again Hitler could make use of national self-determination to confuse the issue, as 3,500,000 German-speakers organized by another Nazi henchman, Konrad Henlein, inhabited the Czech borderlands in the Sudeten Mountains. Already on February 20, before the *Anschluss,* Hitler had denounced the Czechs for alleged persecution of this German minority, and on April 21 he ordered Keitel to prepare for the invasion of Czechoslovakia by October even if the French should intervene. Chamberlain was intent on appeasing Hitler, but this meant "educating" him to seek redress of grievances through negotiation, not force. He issued a stern warning to Germany during the spring war scare while pressuring Beneš to compromise with Henlein. Germany, however, had instructed Henlein to display obstinacy so as to prevent agreement. In August a worried British Cabinet dispatched the elderly Lord Walter Runciman to mediate, but Henlein rejected the program of concessions he finally arranged with Beneš. As the prospect of war increased, the British appeasers grew more frantic. In the spring the editor of the leftist *New Statesman* thought "armed resistance to the dictators was now useless. If there was a war we should lose it." General Edmund Ironside, ruing the prime minister's reluctance to rearm, sneered that "Chamberlain is of course right. . . . We cannot expose ourselves now to a German attack. We simply commit suicide if we do." And a shocking *Times* editorial called for the partition of Czechoslovakia, a view shared by Hitler at the Nürnberg party rally, where he condemned "Czechia" as an "artificial state." Chamberlain then journeyed to Berchtesgaden and proposed to give the Germans all they demanded. Hitler, nonplussed, spoke of the cession of all Sudeten areas at least 80 percent German and agreed not to invade while Chamberlain won over Paris and Prague.

The abandonment of the Czechs

The French Cabinet of Édouard Daladier and Georges-Etienne Bonnet agreed, after the latter's frantic pleas to Roosevelt failed to shake American isolation. But the Czechs resisted handing over their border fortifications to Hitler until September 21, when the British and French made clear they would not fight for the Sudetenland. Chamberlain flew to Bad Godesberg the next day only to be met with a new demand that the entire Sudetenland be ceded to Germany within a week. The Czechs, fully mobilized as of the 23rd, refused, and Chamberlain returned home in a funk: "How horrible, fantastic, incredible it is that we should be digging trenches and trying on gas masks here because of a quarrel in a far-away country between people of whom we know nothing." But his sorrowful address to Parliament was interrupted by the news that Mussolini had proposed a conference to settle the crisis peacefully. Hitler agreed, having seen how little enthusiasm there was in Germany for war and on the advice of Göring, Goebbels, and the generals. Chamberlain and Daladier, elated, flew to Munich on September 29.

The awkward and pitiful Munich Conference ended on the 30th in a compromise prearranged between the two dictators. The Czechs were to evacuate all regions indicated by an international commission (subsequently dominated by the Germans) by October 10 and were given no recourse—the agreement was final. Poland took the opportunity to grab the Teschen district disputed since 1919. Czechoslovakia was no longer a viable state, and Beneš resigned the presidency in despair. In return, Hitler promised no more territorial demands in Europe and consultations with Britain in case of any future threat to peace. Chamberlain was ecstatic.

Why did the Western powers abandon Czechoslovakia, which, by dint of its geography, democracy, military potential (more than 30 divisions and the Škoda arms works), and commitment to collective security, could rightly be called "the keystone of interwar Europe"? No completely persuasive answer is possible, but this height of appeasement can be accounted for by politics, principles, and pragmatism. There is no question that the Munich settlement was extremely popular. Chamberlain returned to London claiming "peace in our time" and was greeted by applauding throngs. So was Daladier. The relief was so evident even in Germany that Hitler swore he would allow no more meddling by "English governesses" to cheat him of his war. Of course, the euphoria was not universal: Aside from the Czechs, who wept in the streets, Churchill spoke for a growing minority when he observed that the British Empire had just suffered its worst military defeat and had not fired a shot.

Could Czechoslovakia have been defended? Or was Munich a necessary evil to buy time for Britain to rearm? Certainly British air defenses were unready, while France's scarcely existed, and the strength of the Luftwaffe, so recently discounted by the British Cabinet, was now exaggerated. The French and Czech armies still outnumbered the German, but French intelligence also magnified German strength, while the army had no plans for invading Germany in support of the Czechs. The Munich powers were criticized for ignoring the U.S.S.R., which had claimed readiness to honour its alliance with Prague. But the U.S.S.R. would hardly confront Germany unless the Western powers were already engaged, and the ways open to them were few without transit rights across Poland. The West discounted Soviet military effectiveness in light of Stalin's 1937 purge of his entire officer corps down to battalion level. The Soviets were also distracted by divisional-scale fighting that broke out with Japanese forces on the Manchurian border in July–August 1938. At best, a few squadrons of Soviet planes might have been sent to Prague.

Of course, the moral cause of liberating the Sudeten-Germans was ludicrous in view of the nature of the Nazi regime and was far outweighed by the moral lapse of deserting the doughty Czechs (French ambassador André François-Poncet, upon reading the Munich accord, choked, "Thus does France treat her only allies who had remained faithful to her.") That betrayal, in turn, seemed more than outweighed by the moral cause of preventing another war. In the end, the war was only delayed a year, and whatever the military realities of 1938 versus 1939, the appeasement policy was an exercise in self-delusion. Chamberlain and his ilk did not begin their reasoning with an analysis of Hitlerism and then work forward to a policy. Rather, they began with a policy based on abstract analysis of the causes of war, then worked backward to an image of Hitler that suited the needs of that policy. As a result, they gave Hitler far more than they ever gave the democratic statesmen of Weimar and, in the end, the freedom to launch the very war they slaved to prevent.

Hitler had no intention of honouring Munich. In October the Nazis encouraged the Slovak and Ruthene minorities in Czechoslovakia to set up autonomous governments and then in November awarded Hungary the 4,600 square miles north of the Danube taken from it in 1919. On March 13, 1939, Gestapo officers carried the Slovak leader Monsignor Jozef Tiso off to Berlin and deposited him in the presence of the Führer, who demanded that the Slovaks declare their independence at once. Tiso returned to Bratislava to inform the Slovak Diet that the only alternative to becoming a Nazi protectorate was invasion. They complied. All that remained to the new president in Prague, Emil Hácha, was the core region of Bohemia and Moravia. It was time, said Hácha with heavy sarcasm, "to consult our friends in Germany." There Hitler subjected the elderly, broken-spirited man to a tirade that brought tears, a fainting spell, and finally a signature on a "request" that Bohemia and Moravia be incorporated into the Reich. The next day, March 16, German units occupied Prague, and Czechoslovakia ceased to exist.

Nazi incitement of minorities

TECHNOLOGY, STRATEGY, AND THE OUTBREAK OF WAR

Rearmament and tactical planning. The Anglo-French defection from east-central Europe doomed the balance of power of interwar Europe. That the Western powers were unwilling and unable to defend the balance was in part the product of inadequate military spending and planning over the course of the decade. Still, decisions were taken in the last 24 months of peace that would shape the course of World War II.

The central problem posed for all defense establishments was how to respond to the lessons of the 1914–18 stalemate. The British simply determined not to send an army to the Continent again, the French to turn their border into an impregnable fortress, and the Germans to perfect and synthesize the tactics and technologies of the last war into a dynamic new style of warfare: the Blitzkrieg ("lightning war"). Blitzkrieg was especially suited to a country whose geostrategic position made likely a war on two fronts and dictated an offensive posture: a Schlieffen solution made plausible by the internal-combustion engine. Whether or not Hitler actually planned for the type of war with which the general staff was experimenting is debatable. Perhaps he only made a virtue of necessity, for the Nazis by no means created a full war economy in the 1930s. Since Blitzkrieg attacks by tank columns, motorized infantry, and aircraft permitted the defeat of enemies one by one with lightning speed, it required only "armament in width," not "armament in depth." This in turn allowed Hitler to mollify the German people with a "guns and butter" economy, with each new conquest providing the resources for the next. Blitzkrieg also allowed Hitler to conclude that he might successfully defy other Great Powers whose combined resources dwarfed those of Germany. After Munich, German rearmament accelerated, but not nearly to the degree of likely enemies. Hitler may have been right to launch his war as soon as possible, on the calculation that only by seizing the resources of the entire continent could the Reich prevail against the British Empire or the Soviet Union.

Invention of Blitzkrieg

After Versailles the British government had established the Ten-Year Rule as a rationale for holding down military spending: Each year it was determined that virtually no chance existed of war breaking out over the next decade. In 1931 expenditures were cut to the bone in response to the worldwide financial crisis. The following year, in response to Japanese expansion, the Ten-Year Rule was abolished, but Britain did not make even a gesture toward

rearmament until 1935. These were "the years the locust hath eaten," said Churchill. Understandably, British strategy fixed on the imperial threats from Japan and Italy and envisioned the dispatch of the Mediterranean fleet to Singapore. But Britain's defensive posture, budgetary limits, and underestimation of Japan's capabilities, especially in the air, made for a desultory buildup in battleships and cruisers rather than aircraft carriers. The British army in turn was tied up in garrisoning the empire; only two divisions were available for the Continent.

Britain's home air defense

After March 1936 the Defence Requirements Committee recognized that home air defense must become Britain's top priority and commanded development of a high-speed, single-wing fighter plane. But two years passed before Sir Warren Fisher finally persuaded the Air Ministry to concentrate on fighter defense in its Scheme M, adopted in November 1938. At the time of Munich, therefore, the Royal Air Force possessed only two squadrons of Spitfires and Hurricanes, lacked oxygen masks sufficient to allow pursuit above 15,000 feet, and had barely begun deployment of that new wonder, radar. Only after Hitler's occupation of Prague was conscription reinstated (April 27, 1939) and a continental army of 32 divisions planned. Throughout the era of appeasement the British expected to resist Japan and come to terms with Germany. Instead, by dint of the mistaken choices in naval technology and the eleventh-hour attention to air defense, Britain would be humiliated by Japan and withstand Germany.

The Maginot Line

Of all the Great Powers, France most expected the next war to resemble the last and so came to rely on the doctrine of the continuous front, the Maginot Line, and the primacy of infantry and artillery. The Maginot Line was also a function of French demographic weakness vis-à-vis Germany, especially after military service was cut to one year in 1928. This siege mentality was the polar opposite of the French "cult of the attack" in 1914 and ensured that Colonel Charles de Gaulle's 1934 book depicting an all-mechanized army of the future would be ignored. As late as 1939 the French war council insisted that "no new method of warfare has been evolved since the termination of the Great War." Even though French military spending held steady through the Depression, France's army and air force were ill-designed and not deployed for offense or mobile defense, even if their aged and hidebound commanders had had the will to conduct them.

Soviet preparations and technical choices also presaged the defeats to come in the early years of the war. Communist doctrine decreed that matériel, not generalship, was decisive in war, and Stalin's Five-Year plans concentrated on steel, technology, and weapons. Soviet planners also benefited from the work of some outstanding aviation designers, whose experimental planes broke world records and whose fighters performed well in the early days of the Spanish war. But Stalin's obsession with domestic security outweighed rational planning for national security. In 1937 Marshal Mikhail Tukhachevsky and his weapons research teams were liquidated or consigned to the *gulag*. Then Stalin ordered the 1936-vintage fighter planes into mass production at the very time the Germans were upgrading their Messerschmidts. The Soviets were sufficiently impressed by Douhet's theories to invest in heavy bombers that would be of marginal use against a Blitzkrieg and defenseless without fighter cover. Stalin's advisers also misunderstood the use of tanks, placing them in the front line rather than in mobile reserves. These mistakes almost spelled the death of Bolshevism in 1941.

Italian unreadiness

Little need be said of Italian preparations. Italy's industrial base was so small, and its leaders so inept, that Mussolini had to order local Fascists to make a visual count of airplanes on fields around the country to contrive an estimate of his air strength. In August 1939, Ciano appealed to Mussolini not to join Hitler in unleashing war, given the deplorable state of Italian armed forces. This apprehensiveness was shared by the Italian generals and indeed by most military leaders of the 1930s. The Great War had revealed the vanity of planning, the vagaries of technical change, and the terrible cost of industrial war. In 1914 the generals had pushed for war while civilian leaders hung back; in the 1930s the roles were reversed. Only in Japan, which had won easy victories at little cost in 1914, did the military push for action.

Poland and Soviet anxiety. Hitler's cynical occupation of Prague, giving the final lie to all his peaceful protestations after Munich, prompted much speculation about the identity of his next victim: Romania with its oil reserves, the Ukraine, Poland, or even the "Germanic" Netherlands, which suffered an invasion scare in January? Chamberlain himself, offended in conscience and ego, attacked Hitler's mendacity and evident intention of dominating the continent by force. In a speech on March 17, 1939, he gave voice to the new conviction of "the man on the street" that Hitler could not be trusted and must be stopped. Three days later Hitler renewed his demand for a "corridor across the [Polish] Corridor" to East Prussia and restoration of Danzig to the Reich. On the 22nd he underscored his seriousness by forcing Lithuania to cede Memel (Klaipėda).

After 10 days of hand wringing, during which Colonel Beck repeated Poland's opposition to seeking help from Moscow, the British Cabinet declared a unilateral military guarantee of Polish security on March 31, solemnized in a bilateral treaty on April 6. It seemed an extraordinary turnaround in British policy: the apparent end of appeasement. In fact, it was a last desperate effort by Chamberlain to preserve appeasement and teach Hitler to settle foreign disputes by diplomacy, as at Munich, and not by force, as at Prague. But the pace of Fascist expansion was irreversible and even contagious. Mussolini had grown irritable over Hitler's succession of coups and his own junior-partner status, so Italy occupied Albania on April 7 and expelled its erstwhile client King Zog. Hitler, who reacted to the British guarantee with the oath, "I'll cook them a stew they'll choke on!" renounced his 1934 pact with Poland and the Anglo-German Naval Treaty on the 28th. Germany and Italy then turned their Axis into a military alliance known as the Pact of Steel on May 22.

The Pact of Steel

How could Britain and France ever make good on their pledges to defend Poland? British planning called only for a naval blockade in the early stages of war, while the French (despite a promise to attack) contemplated no action beyond French soil. The answer was that the Polish guarantee was a military bluff unless the Red Army could somehow be enlisted. So finally, in the late spring of 1939, the Western allies went in search of collaboration with Moscow.

Stalin had witnessed events during the era of appeasement with growing suspicion and moved his pieces on the chessboard with deftness and cynicism. His overriding purpose was to deflect the thrusts of Germany and Japan elsewhere or—if the U.S.S.R. were forced to fight—make certain that the Western powers were likewise engaged. German reoccupation of the Rhineland had been a military setback, since it freed Germany for adventures to the east, but a diplomatic boon, since it enhanced the value of the Soviet alliance for France. The Anti-Comintern Pact had opened the terrible possibility for the Soviet Union of a war on two fronts, but it soon developed that Berlin and Tokyo were both expecting the other to stand guard over Russia while they pursued booty in central Europe and China respectively. Now Britain and France were promising to fight Hitler over Poland, thereby handing Stalin the choice of joining the Western powers in war or dealing separately with Germany to avoid conflict entirely. Fearing that war might unleash rebellion at home, Stalin chose to become the greatest appeaser of all.

Stalin's choice

It is often said that Munich forced Stalin to conclude that the Western powers were pushing Nazi Germany to the east and thus reluctantly to consider rapprochement with Hitler. But one might just as well interpret Litvinov's passionate pleas for collective security as a ploy to provoke conflict between Germany and the West while the U.S.S.R. huddled in safety behind its Polish buffer. The incident that made possible the union of the two dictators, as historian Adam Ulam has shown, was not Munich but the British guarantee of Poland. Before that act Stalin faced the prospect of an unopposed German march into Poland, whereupon the U.S.S.R. would be in mortal danger. After that act, Hitler could seize Poland only at the

cost of war with the West, whereupon Hitler would need the U.S.S.R. as an ally. The British guarantee thus made Stalin the arbiter of Europe.

In a contest for Soviet friendship, however, the Allies were at a distinct disadvantage. All they could offer Stalin was the likelihood of war, albeit in alliance with them. On May 3, Stalin replaced Foreign Minister Litvinov, pro-Western and a Jew, with Vyacheslav Molotov—a clear signal of his willingness to improve relations with the Nazis. The Western powers accordingly stepped up their appeals to Moscow for an alliance, but they faced two lofty hurdles. First, Stalin demanded the right to occupy the Baltic states and portions of Romania. While Westerners could scarcely expect to enlist the Red Army in their cause without giving something in return, they could scarcely justify turning free peoples over to Stalinist tyranny. Second, the Poles, as always, refused to invite the Red Army onto lands they had wrested from that same army just 18 years before. By July, Stalin was also demanding that a military convention precede the political one to ensure that he was not left in the lurch. Ironically, the only ploy likely to persuade Stalin of Western sincerity was a blunt threat that the West would *not* fight for Poland *unless* the U.S.S.R. participated.

Since the spring of 1939 the U.S.S.R. had been sending signals to Berlin that Hitler alternately acknowledged and ignored. His hatred for the Moscow regime was overcome, however, by the urgings of Ribbentrop and the unease of his generals. The Soviets, for their part, were again fighting heavy battles along the Manchurian border and in need of security in Europe. Soviet bargaining power was enhanced by the fact that Hitler had a timetable: He had ordered the invasion of Poland by August 26. Negotiations dragged on from July 18 to August 21, when Hitler insisted that Stalin receive Ribbentrop and conclude their business two days hence. On Aug. 23, 1939, therefore, Ribbentrop and Molotov signed the German–Soviet Nonaggression Pact in Moscow, then raised their glasses as Stalin, the leader of world Communism, toasted the German people and their beloved Führer and vowed never to betray them. This nonagression pact was in fact a pact of aggression against Poland, which was to be partitioned, roughly along the old Curzon Line. Hitler also granted the U.S.S.R. a free hand in Finland, the Baltic states, and Bessarabia.

The German–Soviet Nonaggression Pact

Hitler expected that his successful wooing of Russia would oblige Britain and France to withdraw their pledge to Poland. The free peoples were indeed shocked by the news from Moscow, but far from succumbing, they steeled their will to resist. The world situation, so cloudy since 1933, suddenly seemed clear, and scales fell from many eyes. The abstract and often effete ideological debate over democratic decadence and the relative merits of Fascism and Communism came suddenly to an end. Both vaunted ideologies now seemed so much lying propaganda, and their patrons so many gangsters. The day after the pact Chamberlain wrote to Hitler to warn that British resolve was as firm as ever, and on the 25th he signed a full alliance with Poland. British determination and the news that Italy was not ready for war prompted Hitler to delay his invasion a week in hopes of detaching Britain with promises of treaties and guarantees of the British Empire. When Chamberlain refused, Hitler demanded a Polish plenipotentiary be sent to Berlin on August 30 to settle the matter of Danzig and the Corridor. Should the Poles refuse, their obstinancy might give London an excuse to leave them to their fate. But Colonel Beck had seen the fate of Schuschnigg and Hácha; he would not submit to a Hitlerian kidnapping nor another Munich. When Hitler's ultimatum expired, the German army staged a border incident and invaded Poland in force on the morning of Sept. 1, 1939.

Invasion of Poland

The British and French parliaments, confident that their governments had turned every stone in search of peace, declared war on Germany on September 3.

HITLER'S WAR OR CHAMBERLAIN'S?

For two decades after 1939, German guilt for the outbreak of World War II seemed incontestable. The Nürnberg war-crimes trials in 1946 brought to light damning evidence of Nazi ambitions, preparations for war, and deliberate provocation of the crises over Austria, the Sudetenland, and Poland. Revelation of Nazi tyranny, torture, and genocide was a powerful deterrent to anyone in the West inclined to dilute German guilt. To be sure, there were bitter recriminations in France and Britain against those who had failed to stand up to Hitler, and the United States and the U.S.S.R. alike were later to invoke the lessons of the 1930s to justify Cold War policies: Appeasement only feeds the appetite of aggressors; there must be "no more Munichs." But World War II was undeniably Hitler's war, as the ongoing publication of captured German documents seemed to prove.

The British historian A.J.P. Taylor challenged the thesis of sole Nazi guilt in 1961, coincidently the same year Fritz Fischer revived the notion of German guilt for World War I. Taylor boldly suggested that Hitler's "ideology" was nothing more than the sort of nationalist ravings "which echo the conversation of any Austrian cafe or German beer-house"; that Hitler's ends and means resembled those of any "traditional German statesman"; and that the war came because Britain and France dithered between appeasement and resistance, leading Hitler to miscalculate and bring on the accident of September 1939. Needless to say, revisionism on a figure so odious as Hitler sparked vigorous rebuttal and debate. If Hitler had been a traditional statesman, then appeasement would have worked, said some. If the British had been consistent in appeasement—or resisted earlier—the war would not have happened, said others.

Fischer's theses on World War I were also significant, for if Germany at that time was bent on European hegemony and world power, then one could argue a continuity in German foreign policy from at least 1890 to 1945. Devotees of the "primacy of domestic policy" even made comparisons between Hitler's use of foreign policy to crush domestic dissent and similar practices under the Kaiser and Bismarck. But how, critics retorted, could one argue for continuity between the traditional imperialism of Wilhelmine Germany and the fanatical racial extermination of Nazi Germany after 1941? At bottom, Hitler was not trying to preserve traditional elites, but to destroy the domestic and international order alike.

Soviet writers tried, without success, to draw a convincing causal chain between capitalist development and Fascism, but the researches of British Marxist T.W. Mason did expose the German economic crisis of 1937, suggesting that the timing of World War II was partly a function of economic pressures. Finally, Alan Bullock suggested a synthesis: Hitler knew where he wanted to go—his will was unbending—but as to how to get there he was flexible, an opportunist. Gerhard Weinberg's exhaustive study of the German documents then confirmed a neo-traditional interpretation to the effect that Hitler was bent on war and Lebensraum and that appeasement only delayed his gratification.

Hitler's will to war

Publication of British and French documents, in turn, enabled historians to sketch a subtler portrait of appeasement. Chamberlain's reputation improved during the 1970s as American historians, conscious of U.S. overextension in the world and sympathetic to detente with the Soviets, came to appreciate the plight of Britain in the 1930s. But financial, military, and strategic rationalizations could not erase the gross misunderstanding of the nature of the enemy that underlay appeasement. The British historian Anthony Adamthwaite concluded in 1984 that despite the accumulation of sources the fact remains that the appeasers' determination to reach agreement with Hitler blinded them to reality. If to understand is not to forgive, neither is it to give the past the odour of inevitability. Hitler wanted war, and Western and Soviet policies throughout the 1930s helped him to achieve it.

World War II, 1939–45

War once again broke out over nationality conflicts in east-central Europe, provoked in part by a German drive for continental hegemony, and it expanded, once again, into a global conflict whose battle zones touched the waters or

heartlands of almost every continent. The total nature of World War II surpassed that of 1914–18 in that civilian populations not only contributed to the war effort but also became direct targets of aerial attack. Moreover, in 1941 the Nazi regime unleashed a war of extermination against Slavs, Jews, and other elements deemed inferior by Hitler's ideology, while Stalinist Russia extended its campaign of terror against the Ukrainians to the conquered Poles. The Japanese–American war in the Pacific also assumed at times the brutal aspect of a war between races. This ultimate democratization of warfare eliminated the age-old distinction between combatants and non-combatants and ensured that total casualties in World War II would greatly exceed those of World War I and that civilian casualties would exceed the military.

The broadening of war

Once again the European war devolved into a contest between a German-occupied *Mitteleuropa* and a peripheral Allied coalition. But this time Italy abandoned neutrality for the German side, and the Soviet Union held out in the east, while France collapsed in the west. Hence Soviet dictator Joseph Stalin took France's place in meetings of the "Big Three," together with Franklin Roosevelt and Winston Churchill. The Japanese chose to remain neutral vis-à-vis the U.S.S.R., while the Grand Alliance of anti-Fascist states simmered with conflicts over strategy and war aims. World War II, therefore, comprised several parallel or overlapping wars, while the war in Europe became a kind of three-way struggle among the forces of democracy, Nazism, and Communism. As soon as German and Japanese power were effaced, the conflicts among the victors burst into the open and gave birth to the Cold War. World War II completed the destruction of the old Great Power system, prepared the disintegration of Europe's overseas empires, and submerged Europe itself into a world arena dominated by the Soviet Union and the United States.

THE LAST EUROPEAN WAR, 1939–41

Poland and the northern war. At first glance Germany might have seemed the underdog in the war launched by Hitler. The Wehrmacht numbered 54 active divisions, compared to 55 French, 30 Polish, and two British divisions available for the Continent. But the combination of German Blitzkrieg tactics, French inactivity, and Russian perfidy doomed Poland to swift defeat. The German army command deployed 40 of its divisions, including all six panzer (armoured) divisions and two-thirds of its 3,500 aircraft in the east. The so-called Siegfried Line in the west, manned by 11 active divisions and reserve units as they became available, sufficed to block a French advance. Beginning on September 1, General Fedor von Bock's northern army corps pinched off the Polish Corridor from East and West Prussia, while General Gerd von Rundstedt's more powerful southern army corps drove across the border from Silesia and Slovakia. Polish Marshal Edward Śmigły-Rydz tried vainly to defend Poland's industrial regions along the frontier, increasing his army's vulnerability to Blitzkrieg. German tanks quickly burst into the rear, while dive-bombing Stukas disrupted Polish supply and reinforcements. The Polish air force was destroyed in 48 hours. Within a week two panzer corps advanced 140 miles to the outskirts of Warsaw and the Bug River line to the south. Śmigły-Rydz's order for a general retreat on the 10th came too late; most Polish forces were already outflanked on the north by General Heinz Guderian's rapid thrust to Brest-Litovsk and on the south by Paul von Kleist's panzers advancing from Lvov. On September 17 the pincers closed, the Soviet army invaded from the east, and the Polish government fled to Romania, whence it made its way to London as the first of many European governments-in-exile. The Warsaw garrison surrendered on the 27th.

The fall of Warsaw

In a protocol of May 15, 1939, the French had promised to take the offensive two weeks after mobilization. Instead, General Maurice Gamelin contented himself with a brief sortie into the Saar, after which the French withdrew to the Maginot Line. The regime most upset by the German walkover in Poland was Hitler's new ally, the Soviets. On September 10, Stalin ordered partial mobilization and loudly boasted of the Red Army's "three million men." Since a callup of reserve troops was scarcely needed merely to occupy Moscow's share of Poland under the German–Soviet pact, this maneuver must have reflected Stalin's fear that the Germans might not stop at the prearranged line. Stalin told the German ambassador on September 25: "In the final settlement of the Polish question anything that in the future might create friction between Germany and the Soviet Union must be avoided." Three days later Molotov signed a new agreement granting Germany a somewhat larger share of Poland as well as extensive Soviet trade in return for a free hand in Lithuania. Only after this second German–Soviet pact did Communist parties in the West fully embrace their new Nazi ally and oppose Western military resistance to Hitler. Henceforth, Stalin was a fearful and solicitous neighbour of the Nazi empire, and he moved quickly to absorb the regions accorded him. By October 10, Latvia, Lithuania, and Estonia had been forced to accept Soviet occupation. When Finland resisted Soviet demands for border rectifications and bases, Stalin ordered the Red Army to attack on November 30. He expected a lightning victory of his own that would impress Hitler and increase Soviet security in the Baltic. Instead, the Finns resisted fiercely in this "Winter War," holding the fortified Mannerheim Line in the south and cutting off the road-bound Soviet columns in the north with their mobile ski troops. The disorganized Red Army, by contrast, showed the effect of the recent military purges. In some cases only the machine guns of NKVD (political police) units kept the soldiers at the front. Soviet military prestige suffered a devastating blow.

No major fighting broke out in the West during this period, sardonically dubbed the "Sitzkrieg," or Phony War. After the fall of Poland, while hope still existed that a repetition of World War I might be avoided, Hitler sought to persuade Britain to renege on its commitment to Poland's defense. In secret contacts and in his "Peace Address" to the Reichstag of October 6 he even hinted at the possibility of restoring a rump Polish state. The Chamberlain Cabinet, betrayed so often by Hitler, refused to acknowledge the demarches, however, and Hitler ordered preparations for an attack in the west by November 12. The army high command protested vigorously against a winter campaign, and bad weather did force a postponement first to January 1940 and then to the spring. Since the French and British were loath to take initiative, the Phony War dragged on. Gamelin's lame proposal of an advance through the Low Countries was moot given the Dutch and Belgian commitments to neutrality. Combat occurred only at sea. In 1939 alone U-boats sank 110 merchant vessels as well as the aircraft carriers *Ark Royal* and *Courageous* (September 14 and 17) and the battleship *Royal Oak* (October 14). The battle cruisers *Scharnhorst* and *Gneisenau* and pocket battleship *Deutschland* eluded British pursuit and returned safely to port. The *Graf Spee,* however, caught in the South Atlantic, sank nine merchantmen before sustaining damage from British cruisers. It then put in at Montevideo, causing a diplomatic crisis for the South American states. The naval situation, therefore, came quickly to resemble that of World War I, with the British fleet maintaining a distant blockade in the North Sea and the Germans waging a submarine war against British shipping.

The "Phony War"

The Russo-Finnish War, however, suggested that Scandinavia might provide a theatre in which to strike a blow at the German–Russian alliance. Beyond the feckless expulsion of the Soviet Union from the League of Nations on December 14, Britain and France contemplated helping the brave Finns—even at the risk of war with Russia—and perhaps cutting the flow of Swedish iron to Germany. The French wanted to send several divisions to Narvik in Norway and thence by land to Finland. The British demurred at such a violation of neutral rights, but Churchill, now first lord of the Admiralty, insisted that "humanity, rather than legality, must be our guide." In the event, the Allies dithered (as did the United States, which debated granting a loan to Finland, the only nation to pay interest on its World War I debt) until a massive Soviet offensive broke the Mannerheim Line in February. Stalin had given

The Russo-Finnish War

a hint of the future by setting up a Finnish Democratic Republic during the war, under the Comintern agent Otto Kuusinen, but he settled for a treaty with Helsinki on March 12, 1940, in which Finland ceded the Karelian isthmus and leased a naval base to the U.S.S.R. on the Hangö peninsula.

The Finnish fiasco toppled Daladier's government in favour of a Cabinet under Paul Reynaud. He and Neville Chamberlain hoped at least to deny the Germans possible U-boat bases by mining or occupying Norwegian ports. But the German navy, too, had persuaded Hitler of the strategic importance of Norway, and on April 9, the day after British minelaying began, the Germans suddenly seized the ports from Oslo to Narvik in a brilliant sea and air operation, and occupied Denmark by Blitzkrieg. British troops contested Norway and managed to capture Narvik on May 27, but by then greater events were unfolding on the Continent. The British evacuated Narvik on June 6, and Vidkun Quisling's collaborationists assumed control of Norway.

The Western front. The Allies' bungling in Scandinavia lost Chamberlain the confidence of Parliament, and King George VI selected Winston Churchill to head the War Cabinet. In the first of many ringing speeches that would sustain the British spirit, Churchill told his nation: "I have nothing to offer but blood, toil, tears, and sweat."

In eight months of warfare all the belligerents had vastly expanded their frontline strength. In May 1940 the German army concentrated 134 divisions on the Western front, including 12 panzer divisions, 3,500 tanks and 5,200 warplanes. The French army totalled 94 divisions, the British 10, and the neutral Belgians and Dutch 22 and eight respectively. The French army possessed some 2,800 tanks, but less than a third were concentrated in armoured units. The French air force, disrupted during the Popular Front, was in any case antiquated, and 90 percent of the artillery dated from World War I. More important, French morale was low, sapped by the memory of the first war's carnage, by political decadence, and by over-reliance on the Maginot Line. Britain's Royal Air Force had become a prodigious force thanks to 1,700 new planes, but commanders were loath to deflect them from home defense to the Continent. The German plan of attack in the west, meanwhile, had evolved since the previous autumn. Originally favouring a Schlieffen-type attack with the mass concentrated on the right wing in Belgium, the Führer had been won to General Erich von Manstein's scheme for a panzer attack through the rugged Ardennes Forest of southern Belgium and Luxembourg. Either route bypassed the Maginot Line, but the latter plan took advantage of the panzer army's ability to pierce French defenses, disrupt the enemy rear, and split Allied forces in two. The concomitant risk was that Allied counterattacks might pinch off and destroy the armoured spearheads at a blow.

French unreadiness for war

The German offensive struck with devastating effect on May 10. Within days the Dutch surrendered. Göring's Luftwaffe did not get the message and proceeded to devastate the central city of Rotterdam, killing numerous civilians and sending a signal to the city of London. Meanwhile, General Gerd von Rundstedt's panzer army picked its way through the Ardennes and emerged in force at Sedan. By May 20, German tanks reached the coast at Abbeville and cut the Allied armies in two. On the 28th, King Leopold III instructed the Belgian army to surrender, while the British government ordered Lord Gort, commanding the British Expeditionary Force, to make for Dunkirk and prepare for evacuation by sea.

As the Blitzkrieg in Poland had shocked Stalin, so the German victory in France shocked Mussolini. For 17 years he had preached the necessity and beauty of war, believing that a neutral Italy would cease to be regarded as a Great Power and that he needed war in order to fulfill his expansionist fantasies and permit the full triumph of Fascism at home. Yet in August 1939 he demanded from Germany 6,000,000 tons of coal, 2,000,000 tons of steel, and 7,000,000 tons of oil before he could honour the Pact of Steel. In fact, war preparations under the corrupt and incompetent Fascists remained feeble, and during these months of nonbelligerence, Mussolini himself took sick and at times even considered joining the Allies. On March 18 he met Hitler at the Brenner Pass and was told that the Germans did not need him to win the war but that he would be allowed to participate and thus escape second-rate status in the Mediterranean. Still Mussolini tried to have it both ways, telling his military chiefs that Italy would not fight Hitler's war, but a "parallel war" to forge "a new Roman Empire." In reality, he would enter the war only when it seemed clear the Allies were finished and his regime would not be put to the test.

That moment seemed to arrive in June 1940. With French defeat assured, Mussolini declared war on France and Britain on the 10th. "The hand that held the dagger," said President Roosevelt, "has struck it into the back of its neighbor." As Mussolini put it to Marshal Pietro Badoglio, "All we need is a few thousand dead" to win a place at the peace conference. The Italian offensive on the Alpine front met contemptuous resistance from the French—Italy's gains were measured literally in yards—but Mussolini was right about the proximity of victory. With German forces streaming east and south, the French government fled on the 11th to Bordeaux and debated three courses of action: request an armistice; transfer the government to North Africa and fight on from the colonies; ask Germany for its terms and temporize. The choice was complicated by a French promise to Britain not to exit the war without London's consent. Churchill, concerned that the French fleet not fall into German hands, went so far as to offer Anglo-French political union on June 16. Reynaud wanted to continue the war but was outvoted. He resigned on the 16th, whereupon the ancient Marshal Pétain asked for an armistice. From London, General Charles de Gaulle broadcast a plea to the French people to fight on and set about organizing Free French forces in France's sub-Saharan colonies. But the armistice was signed at Compiègne, in the same railway car used for the German armistice of 1918, on June 22. The Germans occupied all of northern France and the west coast—60 percent of the country—and the rest was administered by Pétain's quasi-Fascist collaborationist regime at Vichy. The French navy and air force were neutralized. In another meeting of dictators on the 18th, Hitler disappointed Mussolini with his talk of a mild peace lest French forces be driven to defect to Britain. Instead, Pétain broke relations with London on July 4, following a British attack on the French fleet moored at Mers el-Kebir in Algeria. Hitler at once toyed with the notion of winning the Vichy French to an active alliance, thrusting Mussolini farther into the background.

Italy enters the war

The French armistice

Britain's refusal to give up frustrated Hitler, especially since his ultimate goal—Lebensraum—lay in the east. The chief of the army general staff quoted Hitler on May 21 as saying that "we are seeking contact with Britain on the basis of partitioning the world." But when the carrot failed, Hitler tried the stick, authorizing plans on July 2 for Operation Sea Lion, the cross-Channel invasion. Such an operation required complete air superiority, and Göring promised that the Luftwaffe could smash British air defenses in four days. The Battle of Britain that followed in August 1940 was a massive air duel between Germany's 1,200 bombers and a thousand fighter escorts and the RAF's 900 interceptors. But the British Hurricanes and Spitfires were technically superior to all the German fighters except the Me-109, which was restricted in its range to the zone south of London. The British radar screen and ground control network permitted British fighters to concentrate on each German attack. On September 7 Göring made the fatal error of shifting the attack from airfields to London itself (in retaliation for a September 4 raid on Berlin). For 10 days the blitz continued night and day over London, the climax coming on the 15th when nearly 60 German planes were shot down. Two days later Hitler granted that air superiority was not to be had and postponed Operation Sea Lion.

The Battle of Britain

For a full year—June 1940 to June 1941—the British Empire fought on alone (though with growing U.S. aid) against Germany, Italy, and the threat of Japanese action in Asia. Frustrated on sea and in the air, Hitler pondered how his overwhelming land power might be used

to persuade Britain to call it quits. A Mediterranean strategy based on the capture of Gibraltar, Malta, and the Suez Canal, did not seem likely to be decisive, nor did it satisfy the Nazis' *Blut und Boden* ("blood and earth") lust for Lebensraum. To be sure, the Germans raised the prospect of an occupation of Gibraltar numerous times with Franco, but the latter always found an excuse to remain neutral. In fact, Franco knew that the Spanish were exhausted after their civil war and that Spain's Atlantic islands would be lost to the British if it joined the Axis. A Catholic authoritarian, he was also contemptuous of the neo-pagan Fascists. After their last meeting, Hitler confessed that he would rather have his teeth pulled than go through another bout with Franco. Hitler also negotiated with Pétain in July and October 1940 and May 1941, in hopes of enticing France into alliance. But Pétain, too, played a double game, pledging "genuine collaboration" with Germany but reassuring the British that he sought a "cautious balance" between the belligerents.

Spanish neutrality

Hitler's troublesome ally Italy, however, ensured that Germany would be involved in complications to the south. On July 7, 1940, Ciano visited Hitler seeking approval for an expansion of the war to Yugoslavia and Greece. The Führer instead encouraged the occupation of Crete and Cyprus, which would further the war against Britain. But three days later Italy's inability to chase the British out of the Mediterranean became apparent when a British convoy off Calabria bumped into an Italian force that included two battleships and 16 cruisers. The Italian commander broke off the action after one hit on one of his battleships, whereupon the Fascist air force arrived to bomb indiscriminately friend and foe alike, doing little damage to either. Frustrated in the Balkans and at sea, Mussolini ordered his Libyan army to cross the Western desert and conquer Egypt. This adventure soon turned to disaster.

The Eastern front. The end of hostilities in western Europe also provoked a jockeying for position in eastern Europe, where Stalin's fear of the all-conquering Nazis had grown apace. In 1940 Germany signed a pact with Romania for oil and arms transfers. Stalin then forced the Romanian government to hand over Bessarabia and northern Bukovina (June 26, 1940), and annexed Estonia, Latvia (July 12), and Lithuania (August 3) to the U.S.S.R. Hungary and Bulgaria now demanded Romanian territories for themselves, but Hitler intervened to prevent hostilities, lest Stalin see the chance to occupy the Romanian oil fields around Ploieşti. The Treaty of Craiova (August 21) awarded the Southern Dobruja to Bulgaria, and the so-called Vienna Award by Hitler and Mussolini ceded northern Transylvania to Hungary. Romania's King Carol II abdicated in protest, General Ion Antonescu took power, and a German military mission arrived in Bucharest on October 12.

The fall of Romania

The Romanian coup provoked Mussolini's next rash act. "Hitler always faces me with *faits accomplis,*" he raged. "This time I will pay him back in his own coin." On October 13, Mussolini ordered Marshal Badoglio to prepare the long-desired attack on Greece for two weeks hence. He would declare his independence from Hitler and consummate his "parallel war." On Oct. 28, 1940, seven Italian divisions crossed the Albanian border into Greece, provoking Hitler's adjutant to record: "Führer enraged . . . this is revenge for Norway and France." In fact, Mussolini's impetuous attack, combined with the reversals in Africa, would only ensure his humiliation and utter dependence on his northern ally. For the Greek campaign was predictably disastrous, given Italy's bare numerical superiority and lack of planning and equipment, the rough terrain, and the determination of the Greeks. On November 8, General Alexandros Papagos counterattacked, and within a month the Greeks had turned the tables, occupying one-third of Albania. Prime Minister Ioannis Metaxas refused to let the British into Greece for fear of provoking the Germans; indeed, he hoped to drive Italy out of the Balkans before German help might arrive, and to induce Yugoslavia and Turkey to make common cause with Greece against the Fascists.

The Balkan situation seriously interfered with Hitler's evolving continental strategy. Ribbentrop still hoped to persuade him that Britain could be induced to relent through diplomacy, and his last achievement was the Tripartite (or Axis) Pact between Germany, Italy, and Japan on Sept. 27, 1940. Presumably, this alliance would deflect U.S. attention from Europe, threaten the U.S.S.R. with a war on two fronts, and thus drive the British to despair over the prospect of facing Germany alone. But London stood firm, and Hitler grew impatient to get on with his real chore of seizing a Ukrainian empire for the German master race. Upon his return from unsuccessful conferences with Franco at Hendaye (October 23) and Pétain at Montoire (24th), Hitler played host to Soviet Foreign Minister Molotov in Berlin (November 12–14). Though Stalin had meticulously observed his pact with Hitler, their rivalry in the Balkans strained relations. Hitler and Ribbentrop tried to persuade the Soviets to pursue their "natural tendency" to expand in the direction of the Indian Ocean, but Molotov repeatedly interrupted to ask the Germans why they were sending troops to Finland and Romania. These conversations confirmed Hitler's intention to turn his idle military machine to the east. Conquest of the U.S.S.R. might serve now as both means and end, convincing the British of the hopelessness of their situation, allowing Hitler to realize Nazi racist fantasies, and forging a territorial basis for global empire. On December 18 he ordered the army to prepare Operation Barbarossa by May 15, 1941.

The Tripartite Pact

This latest timetable, however, fell victim to Mussolini's folly and the need to secure Germany's flank in the Balkans. German troops entered Romania on Jan. 7, 1941, and Bulgaria on February 27. But Italy's disasters brought into question the very survival of the Fascist regime. Mussolini made Badoglio a scapegoat and in November 1940 issued the first of his pitiful appeals to Hitler to bail him out. At their Berghof meeting on Jan. 20, 1941, Hitler informed Mussolini of his plans to invade Greece. The death of Metaxas in the following days, in turn, led the Greeks to accept a British expeditionary force. Accordingly, Hitler pressured Yugoslavia to permit the passage of German troops, but air force officers in Belgrade staged a coup on March 27 and signed a treaty with Moscow. Furious over such defiance, Hitler ordered a Blitzkrieg for April 6 that broke Yugoslav resistance in five days and overran Greece by the 22nd. Crete then succumbed to a spectacular German airborne assault (May 20–31). Hitler set up puppet regimes in Serbia and "Greater Croatia" and partitioned the rest of Yugoslavia among his client states.

Greece and Yugoslavia

The Balkan campaign postponed "Barbarossa" for six weeks. This did not overly perturb Hitler, who promised his generals victory within a month and denied the need to prepare for cold-weather warfare in Russia. But some generals were skeptical of Blitzkrieg in the vastness of Russia, while others debated whether to force narrow spearheads deep into Russia, emulating the campaign in France, or fight classic battles of envelopment close to the frontier. Hitler's "infallible intuition" dictated the latter, lest his armies, like Napoleon's, be sucked too deep into Russia before enemy forces were destroyed. In the spring of 1941 the Wehrmacht assembled 4,000,000 men—the greatest invasion force in history—including 50 Finnish and Romanian and 207 German divisions armed with 3,300 tanks. They faced a Red Army of some 4,500,000 men and perhaps 15,000 tanks. German success depended heavily on surprise, but preparations of such magnitude could scarcely be hidden. Stalin seemed alive to the danger when he signed a neutrality pact with Japan on April 13 (knowing of Japan's preference for a southern strategy from the espionage of Richard Sorge in Tokyo), then pleaded with Foreign Minister Matsuoka Yosuke: "We must remain friends and you must now do everything to that end." Yet Stalin also redoubled his efforts to assure Hitler of his good intentions and discounted British warnings of a German attack (they had been making such predictions since June 1940, and even the British thought a German strike against Turkey or England more likely). Stalin may also have dismissed the warnings as attempts to poison his relations with Germany. In any case, the Germans achieved complete tactical surprise, while the

Soviets' forward deployments exposed them to the full force of Blitzkrieg.

Invasion of the Soviet Union

The Germans struck on June 22, 1941, along a 2,000-mile-front. Three army groups drove deep into the Soviet Union, occupying vast territories and capturing huge numbers of Soviet troops. But gradually the momentum deserted the invaders. Many myths surround the 1941 campaign. It is said that the Germans were wrong in making for Moscow like Napoleon. But Moscow was of far more military value in 1941 than in 1812; it was the hub of Soviet railroads, communications, and government, and its capture might have crippled the Soviet effort to reinforce the front from the Asian hinterland or have undermined the Communist regime. It is also said that winter defeated the Germans. But they would have had ample time to reach Moscow before winter had they not wasted almost two months in diversions and debate. It is also said that the size of the Soviet Union made swift German victory impossible. But the endless Russian plain actually aided the panzer armies by giving them limitless room to maneuver and form the huge pockets that cost the Red Army 2,500,000 men in the first six months. What did stop the Germans was their own dilatoriness, the mud and unpaved roads, their underestimation of Soviet reserves and resilience, and the Nazis' own brutality, which alienated a population otherwise hostile to Stalinism.

By December 1941 the German invasion of the U.S.S.R. and the latter's survival had confirmed precisely that British hope which Hitler had meant to quash. The entry into the war of the United States that same month made German defeat virtually certain—and also brought to a close the last purely European war.

ORIGINS OF AMERICAN BELLIGERENCE

From neutrality to active aid. The outbreak of war brought a swift change of mood to the United States. While isolationism was still widespread, the vast majority of Americans were sympathetic to Britain, and Roosevelt did not follow Wilson in asking Americans to be neutral in thought as well as deed. Instead he set out to lead public opinion and gradually expand his ability to aid the Allies. On Sept. 21, 1939, his brilliant speech to Congress laid the groundwork for passage of the Pittman Bill, which became law on November 4 and repealed the arms embargo on belligerent nations. Henceforth, the United States might trade with Britain and France, but only on a "cash and carry" basis. Senator Arthur Vandenberg rightly noted that the United States could not "become the arsenal for one belligerent without becoming the target for another." Still, the President made clear to Churchill (with whom he struck up close relations by correspondence) his desire to aid Britain in every way consonant with the American mood. Only once did Roosevelt make a feint at mediation: In March 1940 he sent Undersecretary of State Sumner Welles to Europe on a fact-finding mission that revealed "scant immediate prospect" of peace. When Hitler's Western offensive followed, even that dubious prospect disappeared, and Churchill assured his House of Commons that Britain would fight on "until, in God's good time, the New World, with all its power and might, steps forth to the rescue and liberation of the Old."

Cash and carry

In January 1940, Roosevelt asked for a mere $2,000,000,000 in defense spending, a slight increase over the year before. But the fall of France pushed the pace of U.S. rearmament up to $10,500,000,000 by September. Opinion polls showed the American public heavily favouring a policy of "all aid short of war" to Britain. On May 15, Churchill sought to capitalize on the shifting sentiment with an emergency request for 40 or 50 overage destroyers with which to counter German U-boats. Roosevelt hesitated because of the legal complications, while continuing his efforts to shape opinion by encouraging William Allen White's Committee to Defend America to foster the idea that "Between Us and Hitler Stands the *British* Fleet!" On September 2 the United States transferred 50 warships to Britain in return for long-term leases on British naval bases in the Western Hemisphere. Despite Roosevelt's public relations, isolationist sentiment remained strong. On September 4 the America First Committee arose to challenge Roosevelt's deceptive campaign for intervention, and Wendell Willkie charged during the presidential campaign that Roosevelt's reelection would surely mean war. The president responded that "your boys are not going to be sent into any foreign wars," gliding over the fact that if the United States were attacked, it would no longer be a foreign war.

Lend-lease

The next step in U.S. involvement stemmed from Churchill's warning of Dec. 9, 1940, that Britain was near bankruptcy. Roosevelt responded with lend-lease, a plan to "eliminate the dollar sign" by lending, not selling, arms. If your neighbour's house is on fire, he argued, you do not sell him a hose, you lend it to him until the fire is out. "If Great Britain goes down," he warned, "all of us in the Americas would be living at the point of a gun. . . . We must be the great arsenal of democracy." Churchill added his own ringing appeal on Feb. 9, 1941: "Give us the tools and we will finish the job." Willkie asked Republicans to back lend-lease, which became law on March 11.

Unknown to the public, Roosevelt authorized joint U.S.–British staff talks. The two countries also collaborated on how to meet the U-boat menace. Admiral Karl Dönitz's wolfpack technique, by which eight to 10 U-boats would strike a convoy from the surface at night (thereby avoiding the British Anti-Submarine Detection Investigation Committee device [ASDIC sonar]), cost the British and Americans 320,048 tons of shipping in January 1941 and 653,960 tons in April. American Admiral Harold R. Stark considered the situation "hopeless except as [the United States] take strong measures to save it." In Hemispheric Defense Plan No. 1 (April 2) Roosevelt authorized the navy to attack German submarines west of 25° longitude and by executive agreement with the Danish government-in-exile placed Greenland under American protection (April 9). U.S. marines also occupied Iceland in July.

The German invasion of the Soviet Union posed the problem of whether to extend lend-lease to the U.S.S.R. Only 35 percent of Americans polled favoured underwriting the Communist regime, but Roosevelt, supporting his acting secretary of state, Sumner Welles, said "Of course we are going to give all aid we possibly can to Russia," on the theory that anything that contributed to the defeat of Germany enhanced the security of the United States. Aid to the Soviet Union began in July, and a formal agreement followed on August 2. But the initial supplies were too meagre to affect the battles of 1941. Roosevelt meanwhile pressed for amendments to the Selective Service Act to remove the ceiling of 900,000 men on U.S. armed forces and the ban on use of troops beyond the Western Hemisphere and to permit the president to retain draftees in service. This provoked the last great Congressional debate on isolationism versus interventionism; the House passed the bill by a single vote on August 12.

The Atlantic Charter

It was during this debate that Roosevelt and Churchill met secretly off the coast of Newfoundland and drafted a manifesto of the common principles that bound their two countries and all free peoples. In this eight-point Atlantic Charter (announced on August 14), reminiscent of Wilson's Fourteen Points, the signatories renounced territorial aggrandizement and endorsed the restoration of self-government to all captured nations and equal access to trade and raw materials for all. According to Churchill, Roosevelt also promised to "wage war but not declare it" and to look for an incident that would justify open hostilities. When the Congress voted on November 7 to arm merchant ships and allow them into the war zone, it seemed that submarine warfare would again be casus belli for the United States. U-boats had already torpedoed the destroyers *Kearney* and *Reuben James* (the latter was attacking the submarine, but sank with 115 hands on October 31). But in fact it took dramatic events in another theatre altogether to make Roosevelt's undeclared war official.

Japan's challenge. When war broke out in Europe, the Japanese occupation of China was nearing its greatest extent, and there was no sign of Chinese capitulation. Japan was understandably incensed when its ally in the Anti-Comintern Pact, Germany, joined with Moscow at a time when the Japanese were fighting the Soviets in

Manchuria and Mongolia. On the other hand, the German victories of 1940 made orphans of the French and Dutch colonies in Southeast Asia, including mineral-rich Indochina and oil-rich Indonesia. These sources of vital raw materials were all the more tempting after the United States protested Japan's invasion of China by allowing its 1911 commercial treaty with Japan to expire in January 1940. Thereafter trade continued on a day-to-day basis while U.S. diplomacy sought peaceful ways to contain or roll back Japanese power. But the territorial and trade hegemony that Japan would come to term the "Greater East Asia Co-Prosperity Sphere" in 1941 increasingly appeared to be a cover for brutal imperialism and exclusionist trade policies. In June 1940, as France was crumbling, Japan insisted that the new Vichy regime cut off the flow of supplies to China over Indochinese railways. The beleaguered British, fearful of simultaneous war in Asia and Europe, also agreed to close down the Burma Road to China for three months, isolating Chiang Kai-shek.

Toward Asian hegemony

Japanese militarists then arranged a new government in Tokyo under the weak Konoe Fumimaro, expecting that Foreign Minister Matsuoka and War Minister Tōjō Hideki would dominate. On July 27 the Cabinet decided to ally with the Axis and strike into Southeast Asia even as it sought to resume normal trade with the United States.

Japanese assertion posed a dilemma for Washington. Secretary of War Henry Stimson and Treasury Secretary Henry Morgenthau, Jr., believed an embargo on oil and scrap iron would cripple the Japanese war machine, but Secretary of State Cordell Hull feared an embargo would provoke Japan into seizing Southeast Asia. On July 26, 1940, after lengthy debate, the United States banned export of high-grade scrap iron and aviation fuel to Japan. On August 1, Japan forced Vichy to permit a limited occupation of northern Indochina, and the following month it signed the Tripartite (Axis) Pact in which Germany, Italy, and Japan pledged aid to each other should any be attacked by a power not at present involved in the Pacific War (*i.e.,* the United States). But this act of defiance only stoked American indignation. In November, Roosevelt approved a loan of $100,000,000 to the Nationalist Chinese and began to allow American pilots to volunteer for Chinese service in Claire Chennault's Flying Tigers. In December and January all forms of iron, copper, and brass were added to the embargo.

Civilian government had eroded in Japan until censorship, propaganda, and intimidation overwhelmed moderates and placed policy in the hands of militarists devoted to traditional Japanese exclusivism, xenophobia, and the Bushidō code of combat. Of the latter mentality Americans had barely a clue, just as the Japanese looked upon Western notions of self-determination and the Open Door as so much hypocrisy. But although reciprocal misunderstanding and racialist thinking inhibited the quest for peace in the Pacific, Japan's determination to carve out an Asian empire was clearly the source of the crisis, while American policy was essentially reactive.

The latest U.S. trade restrictions sparked the final peace initiative of the moderate faction composed of Konoe and leading Japanese industrialists. Two American Catholic missionaries served as intermediaries for an alleged Japanese offer to evacuate China and break the Tripartite Pact in return for normal trade with the United States. This was exactly what Roosevelt wanted, and he urged that the offer be placed in writing. A new Japanese ambassador, Nomura Kichisaburo, then arrived in Washington and met privately with Hull 40 times after March 1941. On April 9 the Catholic missionaries delivered a written offer, but it contained no promise of troop withdrawals and instead asked the United States to cut off aid to China. Hull clearly informed Nomura that any accord must be founded on four principles: respect for territorial integrity, noninterference in the internal affairs of other countries, commercial equality, and respect for the status quo in the Pacific. Nomura unfortunately failed to understand and reported that the United States had accepted the April 9 proposal. The Tokyo Cabinet then drafted an even tougher note as a basis for negotiation, prompting Hull to conclude that the Japanese were incorrigible.

Japanese-U.S. diplomacy

Meanwhile, the Japanese military debated the merits of a northern advance against the Soviet Union's maritime provinces or a southern advance against the French, Dutch, and British colonies. The Russo-Japanese neutrality pact of April 1941 indicated a southern advance, but the German invasion of the Soviet Union indicated a northern one. The course of the war—and the survival of the U.S.S.R.—hung in the balance. Heretofore, Hitler had been at pains to keep Japan out of his Soviet sphere of influence, but at the height of German success in the Soviet Union, Hitler suggested to Ambassador Oshima Hiroshi that the two join forces to liquidate the Soviet empire, a plan endorsed by Matsuoka. If Hitler meant it, he was too late, for the Cabinet in Tokyo decided again after the invasion of the Soviet Union (June 22) to exploit German victories rather than take part in them. The Japanese army and navy would move south and establish the Greater East Asia Co-Prosperity Sphere. The Emperor endorsed the plan on July 2, and the Americans, having broken the Japanese code with the MAGIC process, knew of the decision at once. On July 26, Japan occupied all of French Indochina, and the United States impounded Japanese assets. On September 5, Hull sanctioned a complete embargo on petroleum.

Japan now faced a choice of abandoning all the conquests made since 1931 or seizing the necessary war matériel to defend its empire. Konoe tried desperately to reverse the tide and requested a summit meeting with Roosevelt. But Roosevelt, on Hull's advice, insisted on prior Japanese acceptance of the four principles. Konoe was obliged on September 7 to make a deal with his militarists: He could try once more for an agreement, but if the United States did not relent by early October, Konoe would then support the military solution. When the deadlock was confirmed Konoe in fact resigned on October 16, and Tōjō became prime minister. The veteran diplomat Kurusu Saburo then flew to Washington with two final options, Plan A and Plan B. The latter held out some hope, since in it Japan at least promised to make no military moves to the south. But MAGIC deciphered a cable revealing the secret deadline of November 29, while the British, Dutch, and Chinese vetoed any modus vivendi that left Japan a free hand in China. On November 27, American warnings of war were dispatched to the Pacific, and on December 1 a Japanese Imperial conference ratified Tōjō's conclusion that "Japan has no other way than to wage war . . . to secure its existence and self-defense."

Plan A and Plan B

The final diplomatic exchanges were superfluous, but they included a 10-part American note of November 26 and Roosevelt's personal appeal to the Emperor on December 6. That same day a 13-part Japanese reply arrived in Washington, which MAGIC deciphered even before the Japanese embassy did. That war was imminent was clear; where the first blow would fall was not. On Sunday, December 7, a 14th part arrived, which the Japanese embassy was slow in translating and typing. By the time the diplomats arrived at Hull's office at 2:00 PM, news of the treacherous attack on Pearl Harbor, Hawaii, had already arrived. Hull delivered his opinion of Japanese diplomacy in vitriolic terms and told the ambassadors to get out. The following day Roosevelt named it "a day which will live in infamy" and asked Congress for a declaration of war.

Revisionist historians have argued that Roosevelt should have known of the danger of Japanese attack from the secret intercepts and reports of Japanese fleet movements, or that he did know and purposely suppressed the information so that the United States might enter the European war, unified and irate, "through the back door." To be sure, American blunders marked the final years of neutrality, and a cover-up of those blunders may have occurred. But certainly no one forced the Japanese to make a direct attack on U.S. territory, nor did anyone expect an attack so bold as that on Hawaii. Nor did the Congress even take that opportunity to enter the European war. That was accomplished on December 11, when Hitler and Mussolini, honouring the Tripartite Pact, declared war on the United States. Hitler considered the "half-Judaized and half-negrified" Americans to be of little military account, especially since, he believed, the Japanese war would prevent U.S.

The Axis declares war

intervention in Europe. His gratuitous declaration of war was in fact a folly surpassing Ludendorff's provocations of the United States in 1917.

Japan's war plan was marked by operational brilliance but strategic folly. The notion that Japan could take on the British Empire and the United States at the same time, and win, was the equivalent (in the Japanese simile for courage) of "jumping with eyes closed off the veranda of Kiyomizu Temple." Still, Admiral Yamamoto devised a bold campaign to destroy Allied striking power for the foreseeable future, whereupon the Americans would presumably sue for peace. He assigned all six of his aircraft carriers to a surprise attack on the U.S. Navy base at Pearl Harbor. The rest of the navy—eight battleships, four auxiliary carriers, 20 cruisers, and 112 destroyers—was earmarked for the south, together with 11 infantry divisions and 795 planes. The first force struck at dawn, its dive-bombers penetrating Pearl Harbor's defenses through the mountain passes of Oahu. They sank four of eight U.S. battleships, damaged four others, sank or disabled 10 other ships and 140 planes, and killed 2,330 troops. By chance, the three U.S. aircraft carriers were at sea and escaped destruction. A second Japanese force destroyed 50 percent of the U.S. aircraft in the Philippines, landed on Luzon on December 10, took Manila on Jan. 2, 1942, and drove the remaining U.S. and Filipino forces into redoubts on the Bataan Peninsula and Corregidor Island. The Japanese also bombed Hong Kong on December 8, took the British outpost from the mainland on the 25th and occupied Bangkok on December 9 and southern Burma on the 16th. Most damaging to the British were the Japanese landings in Malaya after December 8 and the advance through the jungle to Singapore. This mighty fortress, considered impregnable, was the keystone of British strategy in Asia, and Churchill had ordered out the battleship *Prince of Wales* and battle cruiser *Repulse* in the expectation of intimidating the Japanese. Instead, Japanese aircraft sank the two ships on December 10. On Feb. 9, 1942, three Japanese divisions overran Singapore, whose defenses were directed seaward, and captured the 90,000-man force. The fall of Singapore crippled British communications and naval power in Asia.

Pearl Harbor

The fall of Singapore

Supporting the assault on the Philippines, the Japanese bombed Wake Island on December 8 and overcame fierce resistance from the tiny U.S. garrison on December 23. By February 10, Guam and Tarawa in the Gilberts and Rabaul and Gasmata on New Britain were occupied. Japan was now master of a vast empire stretching from Manchuria to the East Indies and the border of India deep into the western Pacific.

THE TURNING POINT, 1942

Within a year after American entry into the war Axis power crested and began to ebb, for critical battles were fought in 1942 in every major theatre. The year also saw the forging of a Grand Alliance among the United States, Britain, and the U.S.S.R. and the first sign of disagreement on strategy and war aims.

After Pearl Harbor, Churchill requested an immediate conference with Roosevelt. The two met for three weeks at the Arcadia Conference in Washington after Dec. 22, 1941. They reaffirmed the "Europe first" strategy and conceived "Gymnast," a plan for Anglo-American landings in North Africa. They also created a Combined Chiefs of Staff Committee and issued, on Jan. 1, 1942, the United Nations Declaration in the spirit of the Atlantic Charter. But Sir Anthony Eden had traveled to Moscow in late December and returned with troubling news: Stalin demanded retention of all the territory gained under the German–Soviet Nonaggression Pact and grumbled that the Atlantic Charter was apparently directed against him, not Hitler. The Soviets also first made what was to become their incessant demand that the Allies open a second front in France to take the pressure off the Red Army. Roosevelt sent Army Chief of Staff George C. Marshall to London to argue for a cross-Channel invasion by April 1943, but the British deemed it impossible. London reassured Molotov by concluding an Anglo-Soviet alliance (May 26, 1942) to last for 20 years. In late June, Churchill and Roosevelt met again in Washington, D.C., and confirmed plans for a joint operation in Africa despite the misgivings of American generals, who suspected the British of being more concerned for the defense of their empire than the rapid defeat of Hitler. In the end the British won, and on July 25 the Allies approved the renamed operation "Torch"—a combined invasion of North Africa planned for the autumn. Churchill then traveled to Moscow in August 1942, where Stalin berated him for postponing the second front and suspending Arctic convoys because of German naval action. Despite his suspicions and fears, Stalin could take grim satisfaction from the events of 1942, for by December of that year the German advance into the Soviet Union had been stopped, though at enormous cost.

The Allied landings in North Africa, where British forces had finally turned back General Erwin Rommel's Afrika Korps at el-Alamein, were targeted for Casablanca, Oran, and Algiers. (Hence, the first American initiative in the war was to be an unprovoked and undeclared attack against neutral territory.) Vichy France promptly severed diplomatic relations with Washington and ordered French forces in North Africa to resist. Brief but serious fighting resulted at Oran and Casablanca. The allies had been seeking a French leader with the prestige and willingness to rally French Africa against the Axis, but the nominal commander was Admiral François Darlan, an ardent collaborationist in the Vichy Cabinet. The Allies preferred General Henri Giraud, a heroic escapee from a prison camp, but he insisted on being given command of the whole Allied invasion force. When Darlan surprisingly turned up in Algiers, U.S. Ambassador Robert Murphy negotiated a deal whereby Eisenhower recognized Darlan as political chief of North Africa in return for Darlan's ordering French forces to cease resistance. The Americans soon escaped the embarrassment of having bargained with a leading Fascist when a French royalist shot Darlan on December 24. De Gaulle was able to outmaneuver the vain but inept Giraud to become de facto leader of Free French forces.

Invasion of North Africa

In the Pacific, the naval Battle of Midway in June, the landing of U.S. forces on Guadalcanal in August, and the creation of an "island-hopping" strategy against Japan's sudden and far-flung empire similarly blunted the string of the Axis' early victories. Meanwhile, General Douglas MacArthur rallied Allied forces in Australia in anticipation of fulfilling his departing promise to the Filipinos: "I shall return." A Japanese invasion force landed near Gona at the southeastern end of New Guinea in July 1942 and drove Australian troops back to within 32 miles of Port Moresby. But MacArthur executed a series of landings behind the Japanese and secured the entire Papuan coast by late January 1943. Thenceforth Japan, too, went on the strategic defensive.

THE ECONOMIC AND SCIENTIFIC WARS

How could the Axis powers have imagined that they might win the war, given their narrow base of land area, population, and production, and the size and strength of the enemies they themselves forced into the war? The answer was Blitzkrieg, which involved more than simply a set of tactics for mobile combat but was rather an encompassing theory of total war. The theory posited a strategically mobilized and organized economy meant to avoid a repetition of the war of attrition that wore Germany down in 1914–18. By overrunning their neighbours one by one in swift assaults, the Germans constantly added to their own manpower and resource base while shrinking that available to the enemy. In addition, armament in breadth rather than depth provided the flexibility necessary to shift production from one set of weapons to another depending on the needs of the next campaign, and it permitted constant innovation of weapons systems. Most tellingly, Blitzkrieg shifted the burdens of war from Germany to the conquered peoples. By June 1940 the British were unable to budge a Nazi empire that drew on the resources of the entire continent. But Hitler also realized by late 1940 that all the resources of America would eventually be made available to Britain; hence his decision to break the stalemate by unleashing Blitzkrieg against the Soviet

Union. Soviet survival, however, turned the Blitzkrieg into a gigantic war of attrition after all, one in which Germany could never prevail.

The German economy and the Jews. Cut off from foreign sources of capital, Germany paid for World War II through taxes and ruthless exploitation of occupied regions. Levies on conquered peoples amounted to 40 percent of the income raised by internal taxation, and 42 percent of that tribute came from France. The number of slave labourers deployed by various arms of the regime peaked at 7,100,000 in 1944; this figure included prisoners of war and "racial enemies" condemned to slavery until death in SS camps.

Seen only in cold economic terms, Nazi genocide against Jews and other groups, racially or ideologically or otherwise defined, was the height of irrationality. As early as January 1939 Hitler gave vent to his pathological hatred and fear of the Jews before the Reichstag: "If the international Jewish financiers . . . succeed in plunging the nations once more into a world war the result will be the obliteration of the Jewish race in Europe." The war gave Hitler the opportunity to seek a "final solution." In 1939–40 the Nazis considered using Poland or Madagascar as dumping grounds for Jews. But the invasion of the U.S.S.R. emboldened Hitler, Göring, and SS leaders Heinrich Himmler and Reinhard Heydrich to decide instead on mass extermination in camps at Belzec, Majdanek, Sobibor, Treblinka, and Auschwitz. Large numbers of SS troops, as well as railroads and rolling stock, were absorbed in capturing, transporting, and putting to death as many as 12,000 Jews per day. The total by war's end would reach 6,000,000, almost half from Poland, and some 2,000,000 others including Gypsies, clergy, Communists, and other resisters. SS troops accompanied the regular army into the Soviet Union in 1941 and made racial war on the Slavs as well in order to prepare the farmlands of the Ukraine for German settlement.

The death camps

News of the Holocaust reached the West slowly but surely, although Auschwitz was able to keep its monstrous secret for more than two years after the first gassings in May 1942. Richard Lichtheim of the Jewish Agency in Geneva served as a conduit for information about what was occurring in Nazi Europe, but his and others' efforts to promote action on the part of the Allies broke against political and practical barriers. The British, worried by the prospect of Arab revolt, limited Jewish emigration to Palestine, while quotas elsewhere in the world meant that even those Jews who managed to escape Europe sometimes had nowhere to go. Reports appearing in Western newspapers inspired the Allies to make a declaration on Dec. 17, 1942, condemning "this bestial policy of cold-blooded extermination," and on Jan. 22, 1944, Roosevelt established a War Refugee Board "to forestall the plan of the Nazis to exterminate all Jews and other minorities." But the Allies were unable to take direct action of any sort until the capture of Italy brought Allied bombers within range of the camps. Jewish leaders were then misled by hints that the Germans might negotiate about the Jews. Finally, after June 1944, when escapees confirmed the existence and nature of Auschwitz, the World Jewish Congress requested bombing of the gas chambers. But the Allied Bomber Command judged that its efforts should be directed only at military targets and that the best way of helping the Jews was to hasten the defeat of Nazi Germany.

Strategic bombing. Allied strategic bombing was the most deadly form of economic warfare ever devised and showed another side of the indiscriminateness of industrial war. But in mid-1941 the British Chiefs of Staff soberly concluded that morale, not industry, was Germany's most vulnerable point and ordered Sir Arthur Harris of the RAF Bomber Command to concentrate on "area bombing" of cities. Churchill's scientific adviser Professor L.A. Lindemann of Oxford (later Lord Cherwell) concurred in April 1942 that one-third of all Germans could be rendered homeless in 15 months by strategic bombing of cities. The Royal Air Force accordingly assigned its new Lancaster four-engine bombers to a total war on German civilians. After attacks on Lübeck and the Ruhr, Harris sent a thousand planes against Cologne on May 30–31 in an attack that battered one-third of the city. In 1943, after an interlude of bombing German submarine pens, the Lancasters launched the Battle of the Ruhr totaling 18,506 sorties and the Battle of Hamburg numbering 17,021. The fire raids in Hamburg killed 40,000 people and left a million homeless. The Royal Air Force then hit Berlin (November 1943 to March 1944) with 20,224 sorties, avenging many times over all the damage done by the Luftwaffe to London.

Area bombing of Germany

By early 1943 the U.S. 8th Air Force joined in the air campaign but eschewed terror bombing. Its B-17 Flying Fortresses and B-24 Liberators conducted daylight precision bombing of industrial targets. As a result, they suffered heavy losses that climaxed in October 1943 over the Schweinfurt ball-bearing plants, when the United States lost 148 bombers in a week. The Army Air Forces suspended daylight sorties for months until the arrival of a long-range fighter, the P-51 Mustang. Bombing then resumed and concentrated on the German oil industry, creating a serious shortage that virtually grounded the Luftwaffe by the time of the D-Day invasion. The effectiveness of strategic bombing is a subject of great debate, since German war production actually increased over the years 1942–44. German engineers became masters at shielding equipment, restoring it to operation in a matter of days, or even moving plants underground. Nor did the German people crack under British devastation of their towns and homes. But the air offensive did force the Germans to divert as many as 1,500,000 workers to the constant task of rebuilding and established the Allied mastery of the air that permitted the success of the Normandy landings.

Allied economic management. Britain was only in the early stages of rearmament when the war broke out, but after the fall of France the transition to a World-War-I-type command economy was precipitous. Churchill replaced some 60 interdepartment committees for war economics with the single Lord President's Committee under Sir John Anderson. Within 18 months Anderson organized the most centralized and complete war mobilization of any nation. It included controls on trade, foreign exchange, wages and prices, and raw materials. The National Service Act of December 1941 outdid even the U.S.S.R. by making every man under 50 and every woman under 30 liable to government assignment. Of the 2,800,000 new war workers, 79 percent were female. The state also cut consumer production to a minimum: 67 percent of the work force was employed in war-related jobs. Once again, the British exercised financial responsibility by raising taxes, deferring wages, and compelling savings.

The Lord President's Committee

Even before the war, and despite the Depression, the American gross national product (GNP) of $88,600,000,000 dwarfed that of any other country. Under the impulse of war it increased by 1944 to $135,000,000,000, of which 40 percent was directed to military purposes. About 60 percent of all the munitions used by the Allies in 1944 was made in the United States. In addition to arming its own immense air and sea forces, the United States provided $32,500,000,000 in lend-lease support, including $13,500,000,000 to Britain and $9,000,000,000 to the U.S.S.R. Total U.S. production included 300,000 aircraft, 51,400,000 tons of shipping, 8,500,000 tons of warships, and 86,700 tanks. The government financed this phenomenal buildup largely through war bonds in the early years and later through taxation.

The American war effort was also achieved without the rigid centralized control of Britain. In January 1942 the War Production Board emerged, staffed with "dollar-a-year" volunteers from business, while the Office of War Mobilization (May 1943) under James F. Byrnes served less as a dictator than an umpire in matters involving labour, business, and the military.

The War Production Board

The Soviet Union also made a stupendous economic effort in the war despite conditions as difficult as the American ones were favourable. Within a few months in 1941 the U.S.S.R. lost to the enemy over half its industrial capacity and richest farmland and countless skilled workers. Yet the Soviets rebounded quickly, relocating over 1,300 factories to the Urals region in an effort that

involved perhaps 10,000,000 people. Coal, oil, electricity, and food never regained prewar levels, but arms production boomed. The Soviets managed to turn out 136,800 aircraft and 102,500 tanks by 1945, surpassing the Germans in both. The centrally directed Gosplan and party apparatus, of course, had initiated a ruthless command economy as early as 1928, and Soviet appeals to patriotism (as opposed to Marxism), the network of forced-labour camps, and severe austerity made the effort possible. Despite punishing taxation and subsistence wages (40 percent of the 1940 level) state income covered only half the budget over 1941–45, laying the basis for the inflation that would lead to postwar devaluation. But the Soviet war economy, like that of the United States, prepared the country for postwar superpower status.

Japan's strategy was similar to Germany's Blitzkrieg in that the swift conquest of isolated territories was designed to create a self-sufficient empire capable of withstanding any blow from without. Once again, precise operational planning permitted Japan to increase weapons production steadily from the inception of a full war economy in 1942 to early 1945, when U.S. bombing intensified. By 1944 naval ordnance production was over five times that of 1941, and aviation more than four and a half times. The Japanese, like the Nazis, exploited their conquered peoples and even more than the Nazis subjected prisoners of war to slavery or death. But the fact that attacking Pearl Harbor would "awaken a sleeping giant" was lost on Japanese planners. By 1944 military expenditures absorbed 50 percent of the Japanese GNP, a degree of concentration second only to that of the Soviet Union. Yet the United States, with half its effort diverted to Europe, still overwhelmed the Co-Prosperity Sphere.

Science and technology in wartime. Of the many wartime innovations, those in macroeconomics and management techniques were among the most important, for the rapid increase achieved in labour productivity would make possible the economic miracles of many nations after the war as well. U.S. merchant vessels that took 35 weeks to build before the war were being launched in 50 days by 1943. The Soviet Ilyushin II-4 airplane absorbed 20,000 man-hours before the war and 12,500 in 1943. By the end of the war the British government was choosing contractors on the basis of management, rather than technical, experience. The industrial world was reaching a new plateau of efficiency.

Planned research and development

World War II was unprecedented in the fillip it delivered to science and technology and the maturation of planned research and development (R and D). What Churchill called "the wizard war" between scientists to devise new weapons and electronic countermeasures for air and sea combat began before 1939 in the R and D laboratories of German and British firms and institutes. The Soviet Union had since 1919 made the "scientific pursuit of science" a pillar of the regime, and the 1,650,000,000 rubles budgeted for R and D in 1941 was far and away the largest effort in the world. The Fascist regimes also made a fetish of technological progress. Mussolini established a National Council of Research in 1936 under the famed radio pioneer Guglielmo Marconi. Hitler took for granted the preeminence of German science, and showed a lively interest in new weapons technology. But the totalitarian regimes' insistence on "communist science" or "Fascist science," their secrecy, persecutions, and suppression of intellectual freedom meant that their R and D investment yielded less than that of the liberal states. Stalin's fear that technical experts might turn to political opposition led him to consign thousands of scientists and engineers to the *gulag,* where they worked under the eye of the secret police. Nazi persecution chased dozens of brilliant Jews and others (especially nuclear physicists) out of Europe, thereby enriching the brainpool of Britain and the United States. The dictators' personal interventions in matters of weapons research and deployment, while sometimes breaking bottlenecks and ending jurisdictional feuding, more often skewed the work of scientists in less productive or dead-end directions. In short, World War II made planned R and D a permanent and mighty tool of state power while demonstrating that too much state control or ideological content in research inevitably brought diminishing returns.

The liberal states, by contrast, responded quickly and effectively to the scientific challenge. Nowhere was this more evident than in cryptanalysis and espionage, in which the Allies repeatedly bested the otherwise secretive and devious Axis. As early as 1931, Captain Gustave Bertrand of French intelligence procured documents from a German traitor concerning the cryptographic rotor device Enigma. A brilliant Polish mathematician, Marian Rejewski, cracked Enigma by 1938, only to have the unsuspecting Germans add two rotors to the machine. Britain's scientists in the ULTRA project then worked on methods to generate keys for Enigma until they devised the cumbersome Colossus machines that some consider the first electronic computers. ULTRA not only compromised every German spy in Britain but also provided the British with decryptions of German directives and deployments for the whole of occupied Europe for the entire war.

The ULTRA project

Following the Battle of Britain, to which radar made such a vital contribution, Churchill established a Scientific Advisory Committee under L.A. Lindemann. He and his rival Sir Henry Tizard helped to direct the research programs that discovered various means of jamming the German bombers' radio navigation system. By autumn 1940 the Germans countered with their X-Gerät that broadcast its signal on several frequencies, but this was overcome in turn by British airborne radar that allowed fighters to home in on bombers individually. A similar contretemps occurred in the air battles over Germany and inspired the development of devices that guided night bombers to their targets despite jamming, the H_2S system that permitted crews to "see" through cloud cover, and the use of billows of aluminum strips dropped from bombers to confuse German radar. Microwave radar helped search planes locate submerged U-boats after March 1943.

Roosevelt entrusted the American effort to Vannevar Bush's Office of Scientific Research and Development (OSRD), which channeled contracts of $1,000,000 or more to over 50 universities during the war. The OSRD, the Naval Research Laboratory, and army arsenals produced such innovations as the antitank "bazooka" rocket, the proximity fuse, the DUKW amphibious vehicle, the first use of DDT to combat malaria, and mass production of the antibiotic penicillin for war wounds (1943). Soviet researchers, despite the handicaps imposed by invasion and their own regime, developed the devastating Katyusha rocket-cluster (called "Stalin organs"), the sturdy T-34 tank, and, by war's end, a prototype jet fighter. The Germans eased their shortages of vital materials through processes for coal gasification (5,700,000 tons worth in 1943) and for producing synthetic rubber. They were also first with an operational combat jet aircraft, the Me-262, but the Nazi regime instead chose to allocate steel and fuel to submarines, ending any chance that Germany might regain control of the skies.

New weapons

The four technological developments that would come to define the postwar strategic environment were radio-electronics, the electronic computer, the ballistic missile, and the atomic bomb. The medium-range ballistic missile A4 (called the Vengeance weapon, V2 by Goebbels) was the brainchild of German rocket engineers who had first come together as amateur spaceflight enthusiasts in the 1920s. The German army began funding their research in 1932 and built a large test range at Peenemünde after 1937. There, Commander Walter Dornberger and Chief Engineer Wernher von Braun developed and tested the A4 by 1942. But the program did not receive top priority until 1943, at which time a British air raid on Peenemünde forced construction of an underground factory in the Harz Mountains to construct the rockets. The V2s, of which 4,300 were fired (half of them at Antwerp) after September 1944, did considerable damage until the Allies captured the launch sites in The Netherlands.

The V2 rocket

Nuclear physics had advanced to the point by 1938 that the German physicists Otto Hahn and Fritz Strassmann were able to demonstrate nuclear fission. Scientists in Britain, France, Germany, the U.S.S.R., and the United States all speculated on the possibility of building an

atomic explosive device, and in 1939 Albert Einstein wrote to President Roosevelt personally, urging a crash program to perfect such a bomb before the Nazis. The resulting Manhattan Project absorbed $2,000,000,000 of the $3,850,000,000 spent by the United States on R and D in World War II. Churchill, too, approved a nuclear program, code-named the Directorate of Tube Alloys, in Britain's dark days of 1941. But by 1943 the Americans had built up a sizeable lead and agreed at the Quebec Conference to share results with the British. German atomic research depended on heavy water from Norway, but British commandos and the Norwegian underground sabotaged the plant in 1943. The scientists also failed to press for top priority, which went instead to the missile program. Soviet atomic research kept abreast of the West until the invasion, and in June 1942, Stalin authorized a crash program that by war's end had begun to produce fissionable uranium in quantity. In no country was much official thought apparently given to the moral and long-range consequences of this potentially devastating invention.

The Manhattan Project

A final, though lesser known, scientific breakthrough of World War II was the application of methods from the physical and social sciences to problems of production, logistics, and combat. Known as "operational research," this application of science to practical problems was a major step in the process by which military men in the 20th century lost primacy in their profession to civilian specialists. Whether in the scientific study of various antisubmarine tactics, the selection of targets for strategic bombing, or the optimal size and pattern for naval convoys, operational research completed the mobilization by governments of the world's intellectual community.

STRATEGY AND DIPLOMACY OF THE GRAND ALLIANCE

Allied strategy to the fall of Italy. In the wake of Operation "Torch," Roosevelt and Churchill met at Casablanca (January 1943) to determine strategy for the coming year. Once again Roosevelt conciliated Churchill, agreeing to put off opening a second front in France in favour of more modest operations against Sicily, Italy, and the "soft underbelly" of Europe after the liberation of North Africa. General George Marshall and Admiral Ernest King succeeded in winning approval for offensives in Burma and the southwest Pacific. The French rivals, de Gaulle and Giraud, were persuaded at least to feign unity and later to create a French Committee of National Liberation under their joint chairmanship (May 1943). But the main event was Roosevelt's parting announcement that "peace can come to the world only by the total elimination of German and Japanese military power . . . (which) means unconditional surrender." This surprise declaration was not spontaneous, as Roosevelt claimed; it was a considered signal to Stalin of Allied resolve, especially necessary after General Eisenhower's ignominious "Darlan deal." But it also rashly committed the United States to a power vacuum, rather than a balance of power, in postwar Europe, and may have discouraged Germans from attempting to oust Hitler in hopes of escaping utter defeat.

Stalin's reaction to Casablanca was predictably sour. In March he expressed great anxiety about repeated postponement of the second front in France. On the other hand, the Battle of Stalingrad had more or less assured eventual Soviet victory. Would it not have served Soviet interests more to delay the Allied presence in Europe as long as possible? It is likely that Stalin's continued pressure for a second front was a function of his perennial fears for internal Soviet security. Stalin may have wanted to recapture his lost ground, especially the Ukraine, as quickly as possible lest anti-Soviet movements take hold there or in neighbouring countries. At this time Stalin also began to denounce the London Poles as reactionaries and sponsored a new Union of Polish Patriots in Moscow as a rival government-in-exile. The final breach between the London Poles and Stalin followed in April 1943, when the Germans uncovered a mass grave in the Katyn forest containing the corpses of over 4,000 Polish officers captured by the Russians in 1939. (Another 10,000 Polish officers were killed in Soviet secret police concentration camps.) Churchill advised Władysław Sikorski, prime minister in the London government-in-exile, not to pursue the issue out of deference to Stalin, who blamed the massacre on the Germans. But the Poles invited an International Red Cross investigation that strongly suggested the Soviets had committed the crime in the spring of 1940, presumably to exterminate Poland's non-Communist leadership class. Stalin's seemingly benign dissolution of the Comintern in May 1943 was likewise inspired by postwar planning. The party purges and the assassination of Trotsky in Mexico (August 1940) placed foreign Communists so securely under Moscow's thumb that the formal apparatus of control was no longer needed, while the appearance of independence on the part of Communist parties would ease their participation in coalition governments after the war.

The rival Poles

At the Trident Conference in Washington (May 1943) Churchill and Roosevelt finally projected a 29-division invasion of France for May 1944. The long delay was the consequence of the need to build up troop strength, landing craft, and supplies, and to ensure complete command of air and sea. But Stalin again castigated Allied bad faith and initiated a series of vitriolic communications with Churchill.

Plan for the invasion of France

The final defeat of Rommel's Afrika Korps opened the way for the invasion of Sicily in July 1943. The Allies' rapid success there gradually undermined Mussolini's eroding Fascist regime. Badoglio, Ciano, and Grandi had all denounced Mussolini's leadership and had been sacked by February 1943. Other Fascist leaders insisted on convening the Grand Council in July and after violent debate voted 19 to 8 in favour of restoring "the prerogatives of the King and parliament." Mussolini resigned the next day, and Badoglio took power in the face of a complex dilemma. Italy wanted peace, but to break the alliance with Hitler might provoke a German attack and condemn Italy to prolonged fighting. Thus, while feigning continued loyalty to Germany, Badoglio made secret contact with Eisenhower in the hope of synchronizing an armistice and an Allied occupation. But the Americans insisted on August 11 that Italy give an unconditional surrender and would not promise to land as far north as Rome. With tension and German suspicions mounting—and two British corps crossing the Straits of Messina—Badoglio agreed secretly to invite Allied occupation on September 3. The armistice was announced on the 8th, and Allied landings followed that night in the Bay of Salerno south of Naples. Four days later Hitler sent a crack team of commandos under Otto Skorzeny to rescue Mussolini and set him up as a puppet dictator in the north of Italy.

The new Italian government, far from exiting the war, was obliged to do a volte-face and declare war on Germany on October 13. The Allies did not take Naples until October 1 and made no dent in the Germans' reinforced Gustav Line until 1944.

Italy's volte-face

Early war-aims agreement. The Quebec Conference (Aug. 14–24, 1943) was the first in which Roosevelt and Churchill spent more time discussing the Pacific War than the European. They gave green lights to General MacArthur to fight northward toward the Philippines and to the U.S. Navy to drive straight across the Pacific to the Ryukyu Islands. The British even reluctantly accorded the U.S. Navy program top priority. The Allies also confirmed the invasion of France for May 1944, and thenceforth the American strategy of concentration would take precedence over British peripheral strategy. Eden and Hull then journeyed to Moscow (October 19–30), where they assured Stalin of the date for a second front. They also won his approval of the arrangements made for Italy, according to which the interallied commission requested by Stalin would merely advise the Anglo-American commanders on the spot rather than govern on its own. When Soviet armies later entered eastern European states, Stalin would point to the Italian precedent to justify unilateral Soviet military control.

At the Cairo Conference (November 22–26), Roosevelt, Churchill, and Chiang discussed the Burma theatre and made the Cairo Declaration, which prescribed as terms for ending the Pacific War the Japanese surrender of Manchuria, Formosa, Korea, the Pescadores, and Pacific

The Cairo Declaration

islands acquired since 1914. It also established Chiang as one of the Great Power allies, a point that did not please Churchill.

The first Big Three summit meeting followed in Tehrān from Nov. 28 to Dec. 1, 1943. From the Soviet point of view, the results could only have been satisfactory, for Stalin saw with his own eyes the conflicts that Communist theory predicted must erupt between the "imperialist" powers. In fact, Roosevelt and Churchill displayed the inevitable divergences between a moralizing democracy recently forced out of isolation and a world empire committed for 250 years to preserving the balance of power. What was more, Churchill had no illusions about the Soviet dictator, whereas Roosevelt preferred to believe that he could reason with "Uncle Joe" if only he could allay Soviet suspicions. Roosevelt made a point of chiding Churchill in Stalin's presence and advocating an end to European colonialism after the war. For his part, Stalin again demanded his 1941 frontiers, and the Baltic coast of East Prussia as well, and the others acquiesced in the restoration of the Curzon Line frontier, provided Poland was compensated with territories taken from Germany in the west. As to Germany itself, the Western powers had discussed breaking up the country and turning the Danubian regions of Austria, Hungary, and Bavaria into a "peaceful, cowlike confederation," while Churchill spoke of similar federations for eastern Europe. Stalin viewed such notions with suspicion, since they were reminiscent of the *cordon sanitaire* idea of 1918 and in any case would interfere with the piecemeal communization of the small states. His plan was to Balkanize eastern Europe, punish France for her surrender and strip her of her colonies, and keep Poland and Italy weak. As U.S. diplomat Charles E. Bohlen recorded at Tehrān: "The result would be that the Soviet Union would be the only important military power and political force on the continent of Europe." Roosevelt did win an agreement in principle on formation of a postwar international organization to be led by the United States, the Soviet Union, Britain, and China. Whether unity among them would survive victory was a question Churchill and others brooded on in silence.

Soviet plans for eastern Europe

THE DEFEAT OF NAZI GERMANY

In 1944 the German forces in Soviet territory shrank from attrition and transfers to the west, while geography and Hitler's reluctance to authorize retreats gave his generals no prospect of shortening the front. Soviet advances were limited only by their own supply capacity. A three-pronged offensive in March squeezed the Germans out of the southern Ukraine. Only the Carpathian Mountains kept the Red Army from the Hungarian Plain, and on March 20 Hitler ordered German occupation of Hungary to prevent the regent Admiral Miklós Horthy from defecting to the Allies. The Red Army entered Bessarabia and northern Romania in April. In the south, Odessa fell on April 10, and Sevastopol on May 9. In the far north, German forces withdrew from Leningrad to Lake Peipus, relieving that city after more than two years of siege and combat that killed 632,000 civilians, mostly from starvation. A two-month pause followed in the Soviet Union, during which the western Allies finally opened the second front in France.

The Allied invasion of Europe. While preparations for D-Day reached their final stages the Allies made a fateful decision to campaign vigorously on the Italian front in hopes of drawing off German reserves from France. But German resistance was fierce, and by October autumn rains curtailed Allied attacks, ending their dream of bursting into Austria from the south.

By spring 1944 the Germans had mustered 59 divisions in France and the Low Countries, but only 10 were motorized and almost 30 were in static defense positions. As the Allied buildup in England reached huge proportions, the Germans tried to divine where the blow would come. Hitler and Rommel thought Normandy; the theatre commander, Rundstedt, believed Calais. Their deployments reflected a compromise. Meanwhile, Roosevelt and Marshall chose Eisenhower to command Supreme Headquarters Allied Expeditionary Force (SHAEF), and he managed the preparation of "Overlord," the cross-Channel invasion, with tact and skill. More than 3,000,000 men crowded into southern English bases and ports, anxiously awaiting a D-Day on which 176,475 soldiers, 20,111 vehicles, 1,500 tanks, and 12,000 planes would move by air and sea across the Channel. Eisenhower described them as being "as tense as a coiled spring." Elaborate deceptions kept the Germans guessing about the point of attack, and Normandy was chosen in part because it was not the easiest or nearest French beachhead. On June 6, American, British, and Canadian forces went ashore, but seven tense and bloody weeks passed before the Allies broke out of the Norman peninsula. The initial campaign, thanks to Allied courage and matériel and German blunders, removed more divisions from the Wehrmacht's order of battle than even the great Soviet offensive of June 1944.

Operation "Overlord"

As Allied armies raced westward and northward to liberate France, Eisenhower faced the problem of what to do with Paris. He had no desire to interrupt the drive for a difficult urban battle, nor to undertake the chore of feeding 4,000,000 inhabitants. But the Parisian police went on strike on August 19, and de Gaulle secretly ordered French forces to seize the capital. Meanwhile, Hitler had ordered that the landmarks of Paris be blown up before the Germans retreated. But garrison commander Dietrich von Choltitz refused to carry out the order and negotiated a surrender that opened the city to Allied forces on the 25th. Eisenhower gave the honour of leading the parade to de Gaulle and General Jacques-Philippe Leclerc.

Soviet advances in the east. In five months from D-Day the Western Allies liberated France and Belgium and advanced 350 miles. In the midst of the Normandy campaign, on June 22, the Red Army launched its summer offensive. Armoured spearheads chased German remnants to the East Prussian border and the banks of the Vistula by July 31, an advance of 450 miles in five weeks. By October the Baltic coast was cleared of Germans. These massive victories carried the Red Army to the borders of nine states that had been independent before 1939, making possible the sovietization of eastern Europe. The first episode in that process stemmed from an uprising by the Polish Home Army in Warsaw, underground allies of the London Poles. Expecting momentary liberation from across the Vistula, the Home Army rebelled against the German occupation and seized control of the city. But Stalin called it a "reckless venture," and the Soviets sat idly by while Hitler ordered in SS divisions to crush the resistance and flatten the ancient city. To be sure, the Red Army had just finished a huge advance that stretched its supply lines to the limit. But Stalin shed no tears over the slaughter of the non-Communist Warsaw Poles, who held out bravely for eight weeks, and even hindered U.S. and British planes from supplying Warsaw by denying them landing rights in Soviet territory. On August 22, Stalin simply dismissed the Warsaw Poles as "criminals" and set up his Moscow Poles in Lublin as the acting government of "liberated Poland." In the north, the Finns sued for peace in early September, accepting their 1940 losses and giving up in addition the Arctic port of Petsamo (Pechenga), and a $300,000,000 indemnity, terms confirmed in the treaty of peace concluded in 1947. The U.S.S.R. allowed the Finns self-rule so long as Helsinki coordinated its foreign policy with that of the U.S.S.R. Latvia, Lithuania, and Estonia, however, were reannexed.

The rape of Warsaw

The Soviets unleashed another major offensive in August through Bessarabia, even though the Balkan front was irrelevant to the quick defeat of Germany. King Michael concluded an armistice with Moscow on September 12. Citing the Italian precedent, Molotov brushed aside the Western Allies' attempts to win a share of influence over Romanian affairs. Bulgaria, which was not at war with the U.S.S.R., tried to establish its neutrality, but the Red Army occupied it anyway and set up a "Fatherland Front" in which Communists were predominant. When Soviet and Romanian troops invaded Hungary in October, Horthy tried to extract his country from the war. But the SS arranged his overthrow, and fighting continued until the fall of Budapest on Feb. 13, 1945. A foolish waste of troops for the Nazis, the battle of Budapest was equally irrational

The fall of Budapest

for Stalin unless his true goal was political. Meanwhile, Yugoslav partisans under a local Communist, Josip Broz Tito, captured Belgrade on Oct. 20, 1944, and evicted the Germans.

One by one the states of eastern Europe were falling to Communist forces in circumstances prejudicing their future independence. When Churchill arrived in Moscow on Oct. 9, 1944, he tried to contain the march of Communism into central Europe by making a deal with Stalin on spheres of influence: Romania to be 90 percent Soviet; Greece 90 percent British; Yugoslavia and Hungary 50–50; Bulgaria 75 percent Soviet, 25 British. While apparently a realistic response to Soviet ambitions—and presence—in contrast to Roosevelt's reliance on vague principles, Churchill's proposal was in fact rather silly. Stalin was unlikely to grant Western influence in countries under Soviet occupation (like Hungary), while the meaning of such numbers as "75–25" was unfathomable. Poland was not mentioned at all. On the other hand, Churchill did forestall Soviet aid to the Communist partisans in Greece and may have helped to shield the crucial Mediterranean from Soviet influence for years after the war.

The final Allied agreements. In February 1945 the Big Three held their last summit conference, at Yalta on the Crimean Peninsula. It was a last chance to forestall the disintegration of the alliance upon victory or, conversely, for the British and Americans to take firm measures against Soviet control in eastern Europe. Roosevelt was now mortally ill and exhausted by the strenuous journey. Controversy later raged over his decision to attend the conference at all, his eagerness to conciliate Stalin, and the sinister presence in his entourage of Communist agent Alger Hiss. Postwar critics would charge that Roosevelt had been duped at Yalta and had "sold out" eastern Europe to the Communists. Doubtless if Churchill's advice had been followed, the policy of trust might have given way to one of hard bargaining and clear haggling over boundaries and governments in Europe and Asia. But in fact there was little the Western powers could have done to frustrate Stalin other than threatening a new world war. Nor could Churchill and Roosevelt have openly relinquished any liberated states to Stalin without abrogating the principles on which the war had been fought and alienating the millions of U.S. voters of eastern European descent. As for Asia, the United States was yet facing a campaign that might cost hundreds of thousands of American lives. Purchasing Soviet help against Japan seemed both realistic and humane. Roosevelt could not predict that the atomic bomb would render Soviet aid superfluous.

The controversy over Yalta

Of the three great allies Britain was the weakest and most interested in restoring a balance of power in Europe. Churchill, a keen critic of Bolshevism since 1919, had lobbied all throughout the summer of 1944 for an Italian campaign in hopes that the Allies might reach the Danube before the Red Army, and in October he had made the "spheres of influence" deal with Stalin. But the war map—and Roosevelt's unwillingness to strain the alliance—defeated all these tactics. On the eve of Yalta, Churchill wondered whether "the end of this war may well prove to be more disappointing than was the last." American war aims, by contrast, were nebulous to nonexistent, except for a reprise of Wilsonian internationalism. There is little evidence of economic motives in U.S. policy and, incredibly, no contingency plans for a breakdown in relations with the U.S.S.R. While Roosevelt feared another American retreat into isolationism, he also believed in the possibility of a postwar Great Power condominium. He was prepared to show Stalin that the Anglo-Saxons were not ganging up on him and wanted Soviet participation in a United Nations Organization. But Stalin pursued the old-fashioned way of postwar security: military and political control of eastern Europe to create a buffer for the U.S.S.R. and to ensure Soviet domination over its own repressed nationalities.

At the Yalta Conference, Big Three unity seemed intact, but only because the participants resorted to vagueness or postponements on the most explosive issues. A joint European Advisory Commission, it was decided, would divide Germany into occupation zones, with the Soviet zone extending to the Elbe and a French zone carved out of the Anglo-American spheres. Berlin would likewise be placed under four-power control. The Western Allies repudiated the extreme plans broached at Quebec for the pastoralization of Germany and favoured German industrial recovery under international control. But the Soviets insisted on the right to strip Germany of $20,000,000,000 worth of machinery and raw materials. The issue was assigned to a reparations commission. As for the political future of Germany, Stalin revived earlier Big Three talk of breaking Germany into several states, but the Western Allies now perceived the danger of further Balkanization in central Europe in light of Soviet power. This matter, too, was left for study.

Soviet reparations demands

Poland was, as always, a most difficult problem. The Western Allies reiterated their Tehrān approval of the Curzon Line, now modified slightly in Poland's favour, as the Soviet–Polish border. But the assignment of 2,700,000 Germans to Poland in the West worried Churchill: "It would be a pity to stuff the Polish goose so full of German food that it died of indigestion." Hence Poland's western frontier would be left to a peace conference. As for the Polish government, the most the Western Allies achieved was a vague promise from Stalin that he would reorganize the Lublin Committee and permit free elections among "non-Fascist elements" within a month after peace. But Stalin reserved the right to decide who was "Fascist" and rejected international supervision of the elections. Roosevelt proposed a Declaration on Liberated Europe, by which the Big Three promised to help all liberated peoples "to solve by democratic means their pressing political and economic problems" through "free elections of Governments responsive to the will of the people." Stalin signed, probably considering this more high-flown American rhetoric meant for domestic consumption. In the Communist lexicon words like democratic and free implied conditions virtually the opposite of what Roosevelt intended. Since Roosevelt also announced (to Churchill's despair) that the United States would evacuate its troops from Europe within two years, Stalin may have felt that he could safely ignore the Declaration on Liberated Europe.

Stalin did prove conciliatory on the United Nations, which had already been discussed at the Dumbarton Oaks Conference between Aug. 21 and Oct. 7, 1944. The Soviets had demanded that all 16 constituent republics of the U.S.S.R. be represented (ostensibly to balance the British Empire nations that would vote with London) and that permanent members of the Security Council retain a veto on all issues, not just those involving sanctions or threats to peace. At Yalta, Stalin settled for three seats in the General Assembly and a limited veto. Like Wilson at Versailles, Roosevelt put great stock in international organization and was prompted to remark, "The Russians have given in so much at the conference that I don't think we should let them down." Finally, Stalin promised to declare war on Japan within 90 days of the German surrender in return for southern Sakhalin and the Kuril Islands, retention of Outer Mongolia, and a promise of U.S. support for Soviet rights at Dairen (Lü-ta) and Port Arthur (Lüshun)—all the old objects of Russian imperialism in east Asia. Within a month news from the various commissions established at Yalta indicated that the Soviets did not intend to meet Western expectations. When Molotov announced on March 23 that most of the London Poles were disqualified from Polish elections, Roosevelt reportedly banged his fist on his wheelchair: "Averell [Harriman, ambassador in Moscow] is right. We can't do business with Stalin. He has broken every one of the promises he made at Yalta." Roosevelt then retreated, disillusioned, to Warm Springs, Ga., where he died on April 12.

The United Nations compromises

The Allied advance from the west was stalled for six weeks by the Battle of the Bulge, Hitler's last offensive, but by February 1945 German resistance was near its end. Some Soviet and Western leaders were openly describing the last campaigns as a "land-grab" directed as much against their distrustful allies as against the Germans. But the commanders in the West still took steps to prove that they were supporting the Soviet advance. The worst product of this policy was the Allied bombing of Dresden on

Feb. 13–14, 1945, allegedly to destroy a key communications centre for Germans facing the Red Army. But the two-day incendiary raid by almost 2,400 bombers created a fire storm that consumed the medieval city and killed perhaps 135,000 civilians, to virtually no military purpose.

Another product of Western efforts to reassure Stalin was the refusal to order British and American armies to race the Soviets to Berlin. On March 7, 1945, General George Patton's tanks broke through weak German lines and the 1st Army infantry captured intact a Rhine bridge at Remagen. Churchill pleaded for a rapid thrust in order to secure Berlin and Prague: "Highly important that we shake hands with the Russians as far to the east as possible." Stalin, in turn, tried to lull his allies by saying that "Berlin has lost its former strategic importance," while in fact ordering his generals to make for it as soon as possible. But Eisenhower, backed by Marshall, confined himself to military considerations alone. The Allied armies would close the Ruhr pocket, then advance in breadth in case the rumours were true of a Nazi "Alpine redoubt" in the south. When the Western armies exceeded the limits of their occupation zones in April, Eisenhower even called them back. Soviet forces, meanwhile, captured Vienna and Königsberg on April 9 and encircled Berlin by the 25th. Five days later a despairing Hitler declared that Germany had proved unworthy of him and committed suicide in his Berlin bunker. Hitler's successor, Admiral Dönitz, opened negotiations with the Western powers, hoping to save as many troops and refugees as possible from Soviet reprisals. But the U.S.S.R. refused to recognize the surrender ceremony at Eisenhower's headquarters on May 7, necessitating a second surrender, and a separate Soviet V-E Day, in Berlin on May 8. The war in Europe was over.

Allied occupation

THE DEFEAT OF JAPAN

The encirclement of Japan. By January 1944 the American buildup in the Pacific permitted both the army and navy commands to accelerate the rollback of Japanese power. Indeed, the United States had by then deployed as many men and planes and more ships in the Pacific theatre as in the European. The army under General MacArthur aimed at the liberation of the Philippines, thereby cutting Japanese communications with the East Indies and the sea route to Southeast Asia. The navy under Admiral Chester Nimitz moved up the Marshall and Mariana chains to bring U.S. bombers within range of the Japanese home islands. In both cases the Americans employed the tactic of island-hopping and relied on superior firepower to inflict appalling casualties on fanatical Japanese defenders who preferred death to the shame of surrender.

In the central Pacific, the navy's material superiority allowed Nimitz to pierce Japan's "absolute national defense sphere" almost at will. By 1943 the United States was producing 100,000 planes per year, compared to Japan's total of 63,000 for the entire war. By the summer of 1944 the United States had nearly 100 carriers of all types in the Pacific, compared to Japan's total of 20 for the war. The Japanese also lost more than 80 percent of the 6,000,000 tons of shipping with which they began the war (half to U.S. submarines) and were forced to expose their proud navy to destruction in a vain effort to supply their far-flung garrisons. The U.S. advance was limited only by its own supply lines, which stretched 5,000 miles from Pearl Harbor and 8,000 from the continental bases of California.

Japan's shipping losses

The bombing of the Japanese home islands achieved a new plateau of horror when the U.S. Army Air Forces adopted Britain's European tactics of low-level nighttime raiding on urban areas. On the night of March 9–10, 1945, napalm area bombing of largely wooden Tokyo stoked firestorms that destroyed a quarter of the city, killed 80,000 civilians, and left 1,000,000 homeless. Similar devastating fire raids were launched against Ōsaka, Kōbe, Yokohama, and other cities.

The atomic decision. By April, Japan lay open to direct assault by land as well as air and sea. How could the United States bring Tokyo to surrender? Three means suggested themselves: invasion, inducement, and shock. The first would involve a lengthy, brutal campaign in which, it was estimated, hundreds of thousands of American and perhaps 2,000,000 Japanese lives would be lost. Yet the Joint Chiefs had no choice but to prepare for this eventuality, and by May 25 they had instructed MacArthur to plan Operation "Olympic," an invasion of Kyushu, for November 1. The second means, inducement, was clearly preferable, and on May 8, the day after the German surrender, President Harry S. Truman tried it. Unconditional surrender, he said, would mean "the termination of the influence of the military leaders who have brought Japan to the present brink of disaster," but did not mean "the extermination or enslavement of the Japanese people," who would be free to "return to their families, their farms, their jobs." Unfortunately, Truman did not include (as the State Department advised) a promise that the Japanese might retain their emperor, the god-king of their Shintō state religion. On the other hand, the Japanese government foolishly dismissed Truman's appeal as propaganda and began to mobilize the home front to resist an invasion.

The third means of achieving a surrender—by shock—had become a possibility on Dec. 30, 1944, when General Leslie Groves, head of the Manhattan Project, reported that it was "reasonably certain" that a gun-type atomic bomb equivalent to 10,000 tons of TNT and an implosion-type bomb would be ready for testing by the summer of 1945. On April 25, soon after Truman's accession to the presidency, Secretary of War Stimson impressed on him the significance of this development: "Within four months we shall in all probability have completed the most terrible weapon ever known in human history, one bomb of which could destroy a whole city." He then formed an Interim Committee of statesmen and scientists to debate how the bomb should be employed. On May 31 and June 1 the committee received scientific briefings and held discussions on whether to share the secret with the Soviets, how long it would take other nations to develop their own atomic bomb, how international control might be achieved, whether the U.S. monopoly might help Washington in its relations with Moscow, and whether the bomb would be a universal blessing or a Frankenstein's monster.

The Interim Committee

In the matter at hand, however, the committee concluded that the bomb should be used to end the war as soon as possible; that it should be dropped on a military-urban target so as to demonstrate its full force; and that a demonstration or warning should not be made beforehand, lest the bomb lose its shock value. The scientific panel under J. Robert Oppenheimer concurred on June 16. As he later said: "We didn't know beans about the military situation in Japan. . . . We did say that we did not think exploding one of these things as a firecracker over a desert was likely to be very impressive."

The first atomic test at Alamogordo, N.M., on July 16, 1945, yielded an explosion equivalent to that of 15,000 tons of TNT and stunned Oppenheimer and his colleagues with its elemental power. At that moment Truman was attending the final Big Three meeting at Potsdam, Ger., and casually mentioned to Stalin that the United States had "a new weapon of unusual destructive force." Stalin said he was glad to hear of it and hoped the United States would make good use of it against the Japanese. Though little else was agreed upon at Potsdam, the Big Three did jointly invite Japan on July 26 to surrender unconditionally or face "prompt and utter destruction." When no surrender was forthcoming, Truman gave the Army Air Forces on Tinian Island the green light. He wrote later that he never lost a moment's sleep over his decision.

A specially equipped B-29, the *Enola Gay,* dropped an atomic bomb on the military port of Hiroshima on Aug. 6, 1945. The heat and blast effaced everything in the vicinity, burned 4.4 square miles, killed upwards of 66,000 people, and injured 70,000 more. Two days later the U.S.S.R. declared war on Japan and invaded Manchuria. On August 9 the second atomic bomb fell on Nagasaki, killing 39,000 people. On that day the Voice of the Sacred Crane—the emperor's command—summoned the Cabinet to an audience. Hirohito expressed his wish that Japan accept the terms of the Potsdam Declaration on the sole condition that the emperor remain sovereign. To continue the war, he said, would be suicidal. And then,

Hiroshima and Nagasaki

perhaps realizing the irony of that remark, he turned to the military men and noted that their performance had fallen rather short of their promises. Even at that late date some fanatical officers attempted a coup on the palace grounds rather than submit. But on Sept. 2, 1945, General MacArthur received the Japanese surrender on the battleship *Missouri* in Tokyo Bay, and the greatest war in history came to a close.

The coming of the Cold War, 1945–57

The symbolic first meeting of American and Soviet soldiers occurred at Torgau, Ger., on April 25, 1945. Their handshakes and toasts in beer and vodka celebrated their common victory over Nazi Germany and marked the collapse of old Europe altogether; but their inarticulate grunts and exaggerated smiles presaged the lack of communication in their relationship to come. Grand wartime coalitions invariably break up once the common fight gives way to bickering over division of the spoils, but feuding victors after the wars of Louis XIV and Napoleon or World War I at least negotiated treaties of peace, while the rancour among them was moderated by time or the danger that the common enemy might rise again. But after 1945 no grand peace conference convened, no common fear of Germany or Japan survived, and the quarrels among the victors only grew year by year into what U.S. presidential adviser Bernard Baruch and pundit Walter Lippmann termed a Cold War.

The U.S.–Soviet conflict began in 1945 over treatment of occupied Germany and the composition of the Polish government. It grew during 1946 as the Soviets communized the lands under their occupation and the victors failed to agree on a plan for the control of atomic energy. From 1947 to 1950 the reactions of Washington and Moscow to the perceived threats of the other solidified the division of Europe and much of the world into two blocs led by what are now called the superpowers, and the Cold War became universalized, institutionalized, and militarized.

Emergence of superpowers

The settlement after World War II, therefore, was a peace without treaties, and the Cold War magnified, distorted, or otherwise played upon the other historical trends given impetus by the world wars of the 20th century: Asian nationalism, decolonization, the seeming culmination of the 37-year-old Chinese Revolution, the evolution of independent Communist parties in Yugoslavia and Asia, and western Europe's drive to end four centuries of conflict through economic integration. The early Cold War was not a decade of fear and failure alone but also a creative time that gave birth to the closest thing to a world order that had existed since 1914. For with the sole major exception of the later Sino-Soviet split, the boundaries, institutions, and relationships fashioned in the late 1940s were very nearly the same ones that shaped world politics in the 1980s.

THE COLD WAR GUILT QUESTION

Historian Charles S. Maier has said that the debate over the origins of the Cold War is an extension of the Cold War itself. Indeed, as early as 1948 American left-liberals blamed the Truman administration for the icy tone of its relations with Moscow; rightists blamed the Communists but accused Roosevelt and Truman of appeasement; while moderates of both parties shared a consensus that Truman's containment policy was, as the historian Arthur Schlesinger, Jr., wrote, "the brave and essential response of free men to communist aggression." After all, Stalin's tyranny was undeniable and his seizure of countries in eastern Europe one by one was reminiscent of Hitler's "salami tactics." To be sure, Roosevelt may have helped to foster mistrust by refusing to discuss war aims earlier and then relying on vague principles, and Truman may have blundered or initiated steps that solidified the Cold War. But those steps were taken only after substantial Soviet violation of wartime agreements and in fearful confusion over the motivations for Soviet policy. Was the U.S.S.R. implacably expansionist, or were its aims limited? Was it executing a plan based on Communist faith in world revolution, or reflecting the need of the regime for foreign enemies to justify domestic terror, or merely pursuing the traditional aims of Russian imperialism? Or was Stalin's own paranoia or ambition responsible for Soviet aggression, in which case different leaders might prove more accommodating? Since Soviet sources remain inaccessible these questions have continued to bedevil Western historians and statesmen.

Soviet motives

The fact that Western societies tend to parade their disagreements and failures in public, in contrast to the Soviet fetish for secrecy, guaranteed that historical attention would fix on American motivations and mistakes. In the late 1950s and 1960s traditional left-liberal scholars smarting from the excesses of McCarthyism and new leftists of the Vietnam era began publishing revisionist interpretations of the origins of the Cold War. The "hard revisionism" of William Appleman Williams in 1959 depicted the Cold War in Marxist fashion as an episode in American economic expansion in which the U.S. government resorted to military threats to prevent Communists from closing off eastern European markets and raw materials to U.S. corporations. Less rigidly ideological "soft revisionists" blamed the Cold War on the irascible Truman administration, which, they charged, had jettisoned the cooperative framework built up by Roosevelt at Tehrān and Yalta and had dropped the atomic bombs on Japan as a means of frightening the Russians and forcing an "American peace." These revisionist interpretations were not based so much on new evidence as on new assumptions about U.S. and Soviet motives, influenced in turn by the protest movements against the Vietnam War, nuclear weapons, and alleged domination of American society by the "military-industrial complex." Looking back to the years after 1945, they argued that Stalin was not a fanatical aggressor but a traditional Soviet statesman. After all, the Soviet Union had been brutally invaded and had lost 20,000,000 lives in the war. Stalin could thus be excused for insisting on friendly governments on his borders. But he was betrayed, said revisionists, by American militancy and Red-baiting after the death of Roosevelt.

Traditional historians countered that little evidence existed for most of the revisionist positions. To be sure, American hostility to Communism dated from 1917, but the record proved Roosevelt's commitment to good relations with Stalin, while no proof at all was forthcoming that American policymakers were anxious to penetrate eastern European markets, which were, in any case, of minor importance to the U.S. economy. Williams rebutted that policymakers so internalized their economic imperialism that they did not bother to put their thoughts on paper. But this "argument from no evidence" made a mockery of scholarship. The preponderance of evidence also indicated that the atomic decision was made for military considerations, although isolated advisers did hope that it would ease negotiations with Moscow. These and other examples led most historians to conclude that, while the revisionists brought to light new issues and exposed American aimlessness, inconsistency, and possible overreaction at the end of World War II, they failed to establish their primary theories of American guilt.

Historians with a longer perspective on the Cold War transcended the passions of Vietnam-era polarization and observed that deeper forces must have been at work for the Cold War to have persisted for so long after 1945. Indeed, it is difficult to imagine how leaders of the two countries could have sat down agreeably and settled the affairs of the world. For the new superpowers were wrenched out of isolationism and thrust into roles of world leadership, they nurtured contrary universalist ideologies, and they mounted asymmetrical military threats (one based on conventional weapons, sheer numbers, and land power; the other on nuclear might, technological superiority, and air and sea power). To these liabilities could be added the fact that both countries had been forced into World War II by sneak attacks and had resolved never again to be seduced into appeasement or to be taken by surprise.

Roots of the Cold War

Even such a balanced long-range view should not be taken uncritically. It remains the case that the Cold War grew out of specific diplomatic disputes, among them Germany, eastern Europe, and atomic weapons. Could

those disputes have been avoided or amicably resolved? Certainly some prior agreement on war aims might have softened the discord after 1945, but Roosevelt's policy of avoiding divisive issues during the war, while wise in the short run, enhanced the potential for conflict. It might, without undue exaggeration, be said that the United States entered the postwar period with only a vision of a postwar economic world and few political war aims at all, and thus had little excuse for indignation once Stalin set out methodically to realize his own aims. But this does not justify a Soviet policy bent on denying self-rule to neighbouring peoples and imposing police states as cruel as those of Hitler. For although the Soviets had lost 20,000,000 in the war, Stalin had killed at least an equal number of his own citizens through deliberate famine and purge. American hegemony, if it can be called that, was by contrast liberal, pluralistic, and generous.

The question has been posed, is it not an expression of American exclusivism, self-righteousness, or cultural imperialism to insist that the rest of the world conform to Anglo-Saxon standards of political legitimacy? Even if so, critics must take care not to indulge in a double standard: excusing the U.S.S.R. for being "realistic" and damning the United States for being insufficiently "idealistic."

WASTELAND: THE WORLD AFTER 1945

The ruin of Europe and Japan. Harry Truman had been an artilleryman in World War I and remembered well the lunar landscape of the Western Front. Yet while driving from Potsdam to Berlin in July 1945 he exclaimed: "I never saw such destruction!" Almost all the great cities of central and eastern Europe were jagged with ruined buildings, pitted roads, wrecked bridges, and choked waterways. Amid it all were the gaunt survivors, perhaps 45,000,000 of them homeless, including 25,000,000 in those lands—Poland, the Ukraine, and Russia—that had been overrun and scorched two or three times. European communications and transportation reverted to 19th-century levels: 90 percent of French trucks and 82 percent of French locomotives were out of commission, as were over half the rolling stock in Germany and two-thirds of the Balkan railroads. European coal production was at 40 percent of prewar levels, and more than half the continent's merchant marine no longer existed. Some 23 percent of Europe's farmland was out of production by war's end. Of course, people could be fed with American aid while the rubble was cleared away and utilities restored. But World War II cost Europe more in monetary terms than all its previous wars put together. The war also set in train the greatest *Völkerwanderung*—movement of peoples—since the barbarian incursions of the late Roman Empire. During the Nazi onslaught some 27,000,000 people fled or were forced out by war and persecution, and 4,500,000 more were seized for slave labour. When the Red Army advanced westward millions more fled before it to escape reprisals or Communism. All told, about 60,000,000 people of 55 ethnic groups from 27 countries were uprooted. Finally, 7,000,000 Axis prisoners of war were in Allied hands, along with 8,000,000 Allied prisoners of war liberated from the Axis and 670,000 survivors of Nazi death camps.

The survivors

The landscape in much of Japan was just as barren, its cities flattened by bombing, its industry and shipping destroyed. Large parts of China had been under foreign occupation for up to 14 years and—like Russia after World War I—still faced several years of destructive civil war. Indeed, the war had laid waste every major industrial region of the globe except North America. The result was that in 1945–46 the United States accounted for almost half the gross world product of goods and services and enjoyed a technological lead symbolized by, but by no means limited to, its atomic monopoly. On the other hand, Americans as always wanted to demobilize rapidly and return to the private lives and careers interrupted by Pearl Harbor. The Soviet Union, by contrast, was in ruin, but its mighty armies occupied half a dozen states in the heart of Europe, while local Communist parties agitated in Italy and France. The United States and the Soviet Union thus appeared to pose asymmetrical threats to each other.

U.S. economic dominance

As British ambassador Sir Archibald Clark-Kerr reported from Moscow: "There was great exultation. Russia could be made safe at last. . . . Then plump came the Atomic Bomb. At a blow the balance which had now seemed set was rudely shaken. Russia was balked by the West when everything seemed to be within her grasp. The three hundred divisions were shorn of much of their value."

U.S. vision of reconstruction. American planners envisioned postwar reconstruction in terms of Wilsonian internationalism but were determined to avoid the mistakes that resulted after 1918 in inflation, tariffs, debts, and reparations. In 1943 the United States sponsored the United Nations Relief and Rehabilitation Administration to distribute food and medicine to the stricken peoples in the war zones. At the Bretton Woods Conference (summer 1944) the United States presided over the creation of the International Monetary Fund and the World Bank. The dollar was returned to gold convertibility at $35 per ounce and would serve as the world's reserve currency, while the pound, the franc, and other currencies were pegged to the dollar. Such stability would permit the recovery of world trade, while a General Agreement on Tariffs and Trade (ratified in 1948) would ensure low tariffs and prevent a return to policies of economic nationalism. Treasury Secretary Henry Morgenthau tried to entice the Soviets to join the Bretton Woods system, but the U.S.S.R. opted out of the new economic order.

The American universalist program seemingly had more luck in the political realm. Roosevelt was convinced that the League of Nations had been doomed by the absence of the United States and the Soviet Union and thus was anxious to win Soviet participation in the compromises at Yalta. The Big Four powers accordingly drafted the Charter of the United Nations at the San Francisco Conference in April 1945. Roosevelt wisely appointed several leading Republicans to the U.S. delegation, avoiding Wilson's fatal error and securing the Senate ratification of the Charter on July 28, 1945, by a vote of 89–2. Like Wilson, Roosevelt and Truman hoped that future quarrels could be settled peacefully in the international body.

The UN charter

The end of East–West cooperation. By the time of the Potsdam Conference, Truman was already aware of Soviet unwillingness to permit representative governments and free elections in the countries under their control. The U.S.S.R. compelled the king of Romania to appoint a Communist-dominated government, Tito's Communists assumed control of a coalition with royalists in Yugoslavia, Communists dominated in Hungary and Bulgaria (where a reported 20,000 people were liquidated), and the Red Army extended an invitation to "consult" with 16 underground Polish leaders only to arrest them when they surfaced. As Stalin said to the Yugoslav Communist Milovan Djilas: "In this war each side imposes its system as far as its armies can reach. It cannot be otherwise." On April 23, 1945, Truman scolded Molotov for these violations of the Yalta Accords and, when Molotov protested such undiplomatic conduct, replied: "Carry out your agreements and you won't get talked to like that." On May 11, three days after the German surrender, Truman abruptly ordered the termination of Lend-Lease aid to the U.S.S.R. Two weeks later Stalin replied in like terms to envoy Harry Hopkins by way of protesting the suspension of Lend-Lease, Churchill's alleged plan to revive a *cordon sanitaire* on Russia's borders, and other matters. But Hopkins assured him of American good will and acquiesced in the imprisonment of the Polish leaders and the inclusion of only a few London Poles in the new government. The United States and Britain then recognized the Warsaw regime, assuring Soviet domination of Poland.

The short-lived détente was to be consummated at Potsdam, the last meeting among the Big Three. In the midst of the conference, however, the British electorate rejected Churchill at the polls, and Labour Party leader Clement Attlee replaced him in the councils of the great. Aside from the Soviet promise to enter the war against Japan and Truman's hint that the United States had developed the atomic bomb, the Potsdam Conference dealt with postwar Europe. The U.S.S.R. was authorized to seize one-third of the German fleet, extract reparations-in-kind

The Potsdam Conference

from its east German occupation zone, and benefit from a complicated formula for delivery of industrial goods from the western zones, 15 percent to be counted as payment for foodstuffs and other products sent from the Soviet zone. The conference provided for peace treaties with the defeated countries once they had "recognized democratic governments" and left their drafting to the Council of Foreign Ministers. Finally, the Potsdam nations agreed to prosecute Germans for war crimes in trials that were conducted at Nürnberg for a year after November 1945.

While Potsdam seemed to promise continued cooperation, it left the most divisive issues—the administration of Germany and the configuration of east European governments—to future discussion. At the first such meeting, in September, the new U.S. secretary of state, James F. Byrnes, asked why Western newsmen were not allowed in eastern Europe and why governments could not be formed there that were democratic yet still friendly to Russia. Molotov asked on his own account why the U.S.S.R. was excluded from the administration of Japan.

Truman enumerated the principles of American foreign policy in his Navy Day speech of October 27. Its 12 points echoed the Fourteen Points of Woodrow Wilson, including national self-determination, non-recognition of governments imposed by foreign powers, freedom of the seas, commerce, expression and religion, and support for the United Nations. But confusion reigned in Washington as to how to implement these principles in league with Moscow. As political commentator James Reston observed, two schools of thought seemed to compete for the ear of the President. According to the first, Stalin was committed to limitless expansion and would only be encouraged by concessions. According to the second, Stalin was amenable to a structure of peace but could not be expected to loosen his hold on eastern Europe so long as the United States excluded him from, for instance, Japan. Truman and the State Department drifted between these two poles, searching for a key to unlock the secrets of the Kremlin and hence the appropriate U.S. policy.

The Byrnes mission

Truman's last attempt to win the Soviets to his universalist vision was the Byrnes mission to Moscow of December 1945. There the Soviets promptly accepted an Anglo-American plan for a UN Atomic Energy Agency meant to control the development and use of nuclear power. Stalin also conceded that it might prove possible to make some changes in the Romanian and Bulgarian parliaments, though conceding nothing that might weaken his hold on the satellites. George F. Kennan of the Moscow embassy called the concessions "fig leaves of democratic procedure to hide the nakedness of Stalinist dictatorship," while Truman's own dissatisfaction with the results at Moscow, and growing domestic criticism of his "coddling" of the Russians, were pushing him toward a drastic reformulation of policy.

Why, in fact, did Stalin engage in such a hurried takeover of eastern Europe when it was bound to provoke the United States (magnifying Soviet insecurity) and waste the opportunity for access to U.S. loans and perhaps even atomic secrets? Was not Stalin's policy, in retrospect, simply unwise? Such questions cannot be answered with assurance, since less is known about the postwar Stalinist era (1945–53) than any other in Soviet history. But the most tempting clue is again to be found in Stalin's domestic calculations. If the Soviet Union were to recover from the war, not to mention compete with the mighty United States, the population would have to be spurred to even greater efforts, which meant intensifying the campaign against alleged foreign threats. What was more, the Soviets had only recently regained control of populations that had had contact with foreigners and, in some cases, collaborated with the invaders. Ukrainians in particular had tried to establish an autonomous status under the Nazis, and they persisted in guerrilla activity against the Soviets until 1947. If Soviet citizens were allowed widespread contact with foreigners through economic cooperation, international institutions, and cultural exchanges, loyalty to the Communist regime might be weakened. Firm control of his eastern European neighbours helped assure Stalin of firm control at home. Indeed, he now ordered the utter isolation of Soviet life to the point that returning prisoners of war were interned lest they "infect" their neighbours with notions of the outside world. Perhaps Stalin did not really fear an attack from the "imperialists" or consider a Soviet invasion of western Europe. But neither could he welcome the Americans and British as genuine comrades in peace without undermining the ideology and the emergency that justified his own iron rule.

Soviet isolationism

A swift return to Communist orthodoxy accompanied the clampdown on foreign contacts. During the war the U.S.S.R.'s leading economist, Evgeny Varga of the Institute of World Economy and World Politics, argued that government controls in the United States had moderated the influence of monopolies, permitting both dynamic growth and a mellower foreign policy. The U.S.S.R. might therefore benefit from East–West cooperation and prevent the division of the world into economic blocs. Stalin appeared to tolerate this nontraditionalist view as long as large loans from the United States and World Bank were a possibility. But the suspension of lend-lease, opposition to a Soviet loan in the State Department, and Stalin's renewed rejection of consumerism doomed these moderate views on the world economy. The new Five-Year Plan, announced at the start of 1946, called for continued concentration on heavy industry and military technology. The war and victory, said Stalin, had justified his harsh policies of the 1930s, and he called on Soviet scientists to overtake and surpass Western science. Varga perforce recanted and embraced the traditional view that Western economies were about to enter a new period of inflation and unemployment that would increase the imperialist pressure for war. Andrey Zhdanov, the Communist leader of Leningrad, was a bellwether. In 1945 he wanted to reward the Soviet people with consumer goods for their wartime sacrifices; in early 1947 he espoused the theory of the "two camps," the peace-loving, progressive camp led by the Soviet Union and the militaristic reactionary camp led by the United States.

American confusion came to an end after Feb. 9, 1946, when Stalin's great speech inaugurating the Five-Year Plan reiterated clearly his implacable hostility to the West. Kennan responded with his famous "Long Telegram" from Moscow (February 22), which for years to come served as a primer on Soviet behaviour for many in Washington. The Kremlin's "neurotic view of world affairs," he wrote, was the product of centuries of Russian isolation and insecurity vis-à-vis the more advanced West. The Soviets, like the tsars, viewed the influx of Western ideas as the greatest threat to their continued power, and they clung to Marxist ideology as a cover for their disregard for "every single ethical value in their methods and tactics." The U.S.S.R. was not Nazi Germany—it would not seek war and was averse to risk taking—but it would employ every means of subverting, dividing, and undermining the West through the actions of Communists and fellow travelers. Kennan's advice was to expect nothing from negotiations but to remain confident and healthy, lest the United States become like those with whom it was contending.

The Kennan analysis

Kennan's analysis implied several important conclusions: that the Wilsonian vision inherited from Roosevelt was fruitless; that the United States must take the lead in organizing the Western world; that the Truman administration must prevent a renewal of isolationism and persuade the American people to shoulder their new responsibilities. Churchill, though out of office, aided this agenda when he warned the American people (with Truman's confidential endorsement) from Fulton, Mo., on March 5, 1946, that an "iron curtain" had descended across the European continent.

THE COLD WAR IN EUROPE

Peace treaties and territorial agreements. The early spring of 1946 was a turning point when the United States gave up its hopes of cooperation in favour of what would soon be called "containment." The first manifestation occurred in March 1946, when the U.S.S.R. failed to evacuate Iran on schedule and Secretary of State Byrnes was obliged to go to the UN Security Council and even hint at hostilities to get Moscow to retreat. This incident,

together with Soviet pressure on Turkey and Yugoslav involvement in the Greek civil war, seemed to indicate that Communists were prepared to use force to expand.

The year 1946 saw many meetings of the Council of Foreign Ministers, including the peace conference envisioned at Potsdam. The council convened in Paris on July 29, 1946, and ultimately produced treaties of peace with Italy, Hungary, Romania, Finland, and Bulgaria, signed on Feb. 10, 1947. Border questions after World War II were comparatively minor—a somewhat ironic fact, given the interwar attacks on Versailles by all parties. Romania ceded northern Bukovina and Bessarabia back to the U.S.S.R., which also claimed Petsamo and the Karelian isthmus from Finland and the Carpatho-Ukraine from Czechoslovakia. Hungary returned northern Transylvania to Romania. Italy ceded the Dodecanese islands to Greece and surrendered its overseas colonies, although a Soviet demand for a trusteeship over Libya was denied. Trieste was contested by Italy and Yugoslavia and remained under Western occupation until 1954. The major change affected Poland, which was figuratively picked up and moved some 150 miles to the west. This meant that east and west Prussia and Silesia came under Polish administration, while the U.S.S.R. absorbed the entire Baltic coast as far as the venerable German port of Königsberg (Kaliningrad). The U.S.S.R. was the only power to make significant territorial gains from the war.

The new Poland

Four-power cooperation in Germany continued to deteriorate. The Americans had agreed at Potsdam to reparations-in-kind but opposed extreme efforts by the Soviets and the French to pauperize the Germans lest the burden of feeding them fall entirely on the American taxpayer. What was more, the Soviets would be unwilling (in Kennan's view) to countenance centralized German institutions unless they were in a position to use them to communize the entire country. In early May 1946, General Lucius Clay, commanding the U.S. zone, refused to authorize shipments out of western Germany until agreement was reached on treating Germany as a unit under four-power control. On September 6, Byrnes then announced a new policy: if unification of all Germany proved impossible, the United States would instead promote "maximum possible unification," (*i.e.,* in the western zones only). This ensured a permanently divided Germany.

Atomic energy. The superpowers also failed to join hands on atomic energy. Despite resistance from powerful circles in the press, Congress, and the military against any giveaway of atomic secrets, Byrnes appointed a committee in January 1946 to draft proposals for international control of atomic energy. The resulting (Dean) Acheson–(David) Lilienthal Report called for a UN authority to survey and control all uranium deposits and ensure that atomic research was conducted for peaceful purposes only. Once controls were in place, the United States would relinquish its arsenal and scientific information to the world community. Truman entrusted the diplomatic task to Baruch, who insisted that nations not be allowed to employ their Security Council veto in atomic matters. He then appealed to the UN on June 14, 1946: "We are here to make a choice between the quick and the dead." The Soviet plan, presented by Andrey Gromyko, called instead for immediate prohibition of all manufacture and use of atomic weapons. Measures to ensure compliance would follow, but there could be no tampering with the Security Council veto. Western delegates pointed out that the Soviets were asking the United States to give up its monopoly and make public all its data in return for a paper promise of compliance. Gromyko countered that the United States was asking all other countries to reveal the state of their own research before it gave up its own arsenal. At the final vote in December, the U.S.S.R. and Poland vetoed the Baruch Plan, and international control of atomic energy ceased to be a possibility. While the United States was not as forthcoming as it might have been, the Soviet refusal to allow on-site inspection would frustrate disarmament for the next 40 years.

The Baruch Plan

The economic battle with Communism. By the turn of 1947 it appeared that Truman's foreign policy was foundering. His secretary of agriculture, Henry A. Wallace, had been outspoken in criticism of the Baruch Plan and of the policy of "getting tough" with Russia. Upon resigning he became a leader of those whom Truman privately described as the "Reds, phonies and the parlour pinks" he feared were "a sabotage front for Uncle Joe Stalin." The 1946 elections then returned a Republican Congress bent on cutting costs and "bringing the boys home." Yet the United States was on the verge of the greatest reversal of its foreign policy traditions since 1917. For on Feb. 21, 1947, the British government announced that its economic difficulties would force it to suspend economic and military aid to Greece and Turkey by March 31. Greece was embroiled in civil war provoked by Communists. Turkey was under Soviet pressure for bases and naval passage through the Dardanelles. If those countries succumbed to Communist influence, the Mediterranean and the entire Middle East might follow. Truman, his new secretary of state, George C. Marshall, and Marshall's deputy, Dean Acheson, resolved at once that the United States must step in. On February 27 Acheson impressed congressional leaders with a vivid account of the Soviet strategy of expansion and its implications for American security. After a tense silence, Republican Senator Arthur Vandenberg vowed to support the new policy if Truman would explain it with equal clarity to the American people. On March 12, Truman accordingly told Congress that "at the present moment in world history nearly every nation must choose between alternative ways of life. The choice is too often not a free one. . . . It must be the policy of the United States to support free people who are resisting attempted subjugation by armed minorities or by outside pressure." He asked for $400,000,000 in aid specifically for Greece and Turkey, but the Truman Doctrine thus propounded universalized the American commitment to contain the spread of Communism.

The Truman Doctrine

The mobilization of American might for this task followed swiftly. On June 5, 1947, at Harvard University, Marshall called for a massive program of foreign aid to help the European states recover. In July, Kennan, signing himself "X," educated the public on "The Sources of Soviet Conduct" and outlined the strategy of containment in the journal *Foreign Affairs.* The National Military Establishment Act of 1947 (in the works since the war) created a permanent Joint Chiefs of Staff, a single secretary of defense, the U.S. Air Force as a separate service with its nuclear-armed Strategic Air Command, and the Central Intelligence Agency (CIA). Kennan himself soon criticized the Truman Doctrine as indiscriminate and excessively military. Drawing on classical geopolitics, he narrowed U.S. interests to the protection of those industrial regions not yet in the hands of the U.S.S.R. (North America, Britain, Germany, and Japan). In practice, however, defense of those regions seemed to require defense of contiguous areas as well. Japanese security, for instance, depended on the fate of Korea, and European security on not being outflanked in the Middle East. American responsibilities, therefore, could easily appear to be global.

The Marshall Plan was born in the State Department in response to the fact that western Europe was making little progress toward prosperity and stability. Britain was exhausted and committed to the Labour government's extensive welfare programs. In France, Charles de Gaulle's postwar government quickly gave way to a Fourth Republic paralyzed by quarreling factions that included a large, disciplined Communist party. In Italy, too, Communists threatened to gain power by parliamentary means. All suffered from underproduction, a shortage of capital, and energy shortages exacerbated by the severe winter of 1946–47. Marshall therefore put forward a plan for cash grants to a joint European economic council "to assist in the return of normal economic health, without which there can be no political stability and no assured peace."

The Marshall Plan

The British foreign secretary, Ernest Bevin, spoke for western Europe when he told Parliament, "When the Marshall proposals were announced, I grabbed them with both hands." At Kennan's insistence, Marshall aid was offered to all of Europe, including the Soviet bloc, but Stalin denounced the plan as a capitalist plot. The one eastern European state not yet communized, Czechoslo-

vakia, attempted to join the Marshall Plan, but Communist pressure forced it to back out. In February 1948, less than 10 years after Munich, the Czech Communist party subverted the republic and Czech democracy again fell to totalitarian rule, a tragedy punctuated by the suicide—or murder—of Foreign Minister Jan Masaryk. Stalin reinforced his attack on the Marshall Plan by reviving the Communist International, now called the Communist Information Bureau (Cominform), in October 1947, and by escalating ideological warfare against the West.

Communist Czechoslovakia

The new hope kindled in western Europe by the Marshall Plan helped secure the defeat of the Communists in the 1948 Italian election (the $1,000,000 of CIA funds for the Christian Democrats was hardly decisive) and stabilize politics elsewhere in western Europe. Under the Marshall Plan, the United States then transferred $13,600,000,000 to the stricken economies of western Europe in addition to $9,500,000,000 in earlier loans and $500,000,000 in private charity.

The division of Europe. The Marshall Plan's manifold effects included the hardening of the division of Europe, the movement for integration within western Europe, and the creation of the two Germanies. "Bizonia," the product of an economic merger between the U.S. and British occupation zones, was announced on May 29, 1947, and a new U.S. policy followed on July 11 that ended Germany's punitive period and aimed at making its economy self-sufficient. When in March 1948 some of the western European states responded to the coup in Czechoslovakia by signing the Brussels Treaty and pressing ahead with the establishment of a West German currency and government, the Russians walked out of the Allied Control Council. On June 24 Soviet occupation forces in the eastern zone blocked Allied road and rail access to the western zones of Berlin. This first Berlin crisis, made possible by the anomaly of a U.S.-British-French interest 100 miles inside the Soviet zone, forced Truman to define the limits of his "get tough" policy. Clay and Acheson advocated sending an armed convoy along the access routes to assert Allied rights, but neither the Joint Chiefs, nor the British and French, were prepared to risk war. Instead, the United States responded with an enormous airlift, totaling 277,264 sorties, to keep western Berlin supplied with food, fuel, and medicine. Perhaps Stalin hoped to drive the Allies from Berlin, or to prevent the setting up and possible rearmament of a West German state, or to induce the American electorate in 1948 to return to isolationism. In the event, the blockade only frightened the Western powers into stronger new measures. On April 4, 1949, the foreign ministers of the United States, Britain, France, Belgium, The Netherlands, Luxembourg, Italy, Portugal, Denmark, Iceland, Norway, and Canada founded the North Atlantic Treaty Organization (NATO) in Washington, providing for mutual aid in case of attack against any member. On May 8, the West German parliamentary council adopted a constitution, and on May 23 the Federal Republic of Germany came into being. Stalin acknowledged defeat in Berlin and lifted the blockade on May 12, but the Soviets countered by creating mirror institutions—the German Democratic Republic (Oct. 7, 1949) and the Council for Mutual Economic Assistance (Comecon) in the Soviet bloc.

The Berlin airlift and NATO

The parallel and hostile German states and regional alliances institutionalized and militarized the Cold War even as the Communist ideological offensive and the Truman Doctrine had universalized it. But before this first phase of the Cold War closed, two events called into question some root assumptions of the two sides. The first was the West's assumption that Communism was a monolithic movement controlled from the Kremlin. For in June 1948 the world became aware of a rift between Stalin and Tito that threatened to shake the Soviet empire of "people's democracies." This rift could be traced to the war, in which Tito's Communist partisans expelled the Nazis from Yugoslavia without large-scale aid from the Soviet Union. As a national hero, Tito had strong domestic support and thus was not personally dependent on Stalin. He even persevered in support for the Greek Communists while Stalin was adhering to his 1944 agreement with Churchill to keep hands off Greece. When Stalin and Molotov vetoed his plans for a Balkan confederation, Tito purged Yugoslav Communists known to be in the pay of Moscow. Stalin countered with brutal threats and a purge of Communists in the satellites accused of Titoist tendencies. But Tito held firm: Yugoslavia would "choose its own path to socialism," seek economic ties with the West, and indirectly place itself under Western protection. Tito also ceased to support the Greek Communists, and the civil war there soon ended in a victory for the royal government (October 1949).

Tito's rebellion

The second assumption of the early Cold War was shattered in August 1949 when the Soviet Union exploded its first atomic bomb. Its development might have been hastened by espionage, but Soviets had been among the leaders in nuclear physics before the war, and knowledgeable observers had known that a Soviet atomic bomb was only a matter of time.

THE COLD WAR IN THE MIDDLE EAST AND ASIA

The creation of Israel. Islāmic and south Asian nationalism, first awakened in the era of the first World War, triumphed in the wake of the second, bringing on in the years 1946–50 the first great wave of decolonization. The British and French fulfilled their wartime promises by evacuating and recognizing the sovereignty of Egypt, Jordan, Lebanon, and Syria in 1946 and Iraq in 1947. (Oman and Yemen remained under British administration until the 1960s, Kuwait and the Trucial States until 1971.) The strategic importance of the Middle East derived from its vast oil reserves, the Suez Canal, and its position on the southern rim of the U.S.S.R. While the Islāmic kingdoms and republics were not drawn to Communist ideology, the Soviets hoped to expand their influence by pressuring Turkey and Iran and involving themselves in the intramural quarrels of the region. Chief among these was the Arab-Israeli dispute.

The Zionist movement of the late 19th century had led by 1917 to the Balfour Declaration by which Britain promised an eventual homeland for Jews in Palestine. When that former Ottoman province became a British mandate under the League of Nations in 1922, it contained about 700,000 people, of whom only 58,000 were Jews. By the end of the 1920s, however, the Jewish community had tripled, and Arab resentment exploded in bloody riots in 1929 and again in 1936–39 with the encouragement of Amīn al-Ḥusaynī, grand mufti of Jerusalem and admirer of the Nazis. For self-protection the Jews formed Haganah (Defense), an underground militia that by 1939 had grown into a semiprofessional army. The Zionist cause then began to benefit from the worldwide sympathy caused by the Nazi holocaust and by Haganah co-belligerency in the British war against Germany. But the Irgun Zvai Leumi (National Military Organization), a Zionist terror organization under Menachem Begin, and the Abraham Stern Group, which found even the Irgun too mild, turned against the British occupation in 1944 despite vehement opposition from Chaim Weizmann and others promoting the Jewish cause overseas. The newly formed Arab League, in turn, pledged in March 1945 to prevent the formation of any Jewish state in Palestine.

Zionist terror campaigns

Meanwhile, Zionists concentrated on the United States, whose large Jewish voting bloc was believed likely to influence policy. In the 1944 campaign Roosevelt endorsed the founding of a "free and democratic Jewish Commonwealth," and U.S. policy subsequently clashed with Britain's, which aimed at maintaining paramountcy in the region through good relations with the Arabs. Foreign Secretary Bevin opposed and Truman endorsed a proposal in April 1946 by an Anglo-American Committee of Inquiry to allow another 100,000 Jews into Palestine, an idea dwarfed by David Ben-Gurion's demand for 1,200,000. Jewish terrorism exacerbated British hostility through such incidents as the flogging and murder of British soldiers, culminating in the bombing of the King David Hotel on July 22, 1946, in which 41 Arabs, 28 British, and 22 others died. All told, Jewish terrorists killed 127 British soldiers and wounded 331 from 1944 to 1948, as well as thousands of Arabs. On the other hand, heartrending tales of Jewish

survivors of Nazi Europe being turned back from their "promised land" also tugged at Western consciences.

On April 2, 1947, Bevin washed his hands of Palestine and placed it on the docket of the UN, which recommended partition into Jewish and Arab states. The United States and Britain feared that the Arabs would turn to the Soviets for aid, but the U.S.S.R. mystified all parties in October by agreeing with the American plan for partition. The Soviets apparently hoped to hasten British withdrawal, insinuate themselves into Middle Eastern diplomacy, and profit from the discord following partition. The General Assembly approved partition on November 29, granting to Jews some 5,500 square miles, mostly in the arid Negev. When the Arab League proclaimed a jihad (holy war) against the Jews, Truman's advisers began to reconsider partition, for the loss of Arab oil might cripple the Marshall Plan and the U.S. military in case of war. But when the British pulled out and Ben-Gurion declared the state of Israel on May 14, 1948, Stalin and Truman (whether out of sympathy or domestic politics) immediately advanced recognition.

Partition of Palestine

At the moment of partition the number of Jews had risen to some 35 percent of the total population of Palestine, and they were faced with Arab League forces totaling 40,000 men. The Haganah fielded about 30,000 volunteers armed with Czech weapons sent at the behest of the U.S.S.R. On the day after partition the Arab League launched its attack, but the desperate Jewish defense prevailed on all five fronts. The UN called for a cease-fire on May 20 and appointed Count Folke Bernadotte as mediator, but his new partition plan was unacceptable to both sides. A 10-day Israeli offensive in July destroyed the Arab armies as an offensive force, at the cost of 838 Israeli lives. Members of the Stern Group assassinated Bernadotte on September 17. A final offensive in October carried the Israelis to the Lebanese border and the edge of the Golan Heights in the north, to the Gulf of Aqaba and into the Sinai in the south. Armistice talks resumed on Rhodes on Jan. 13, 1949, with the American Ralph Bunche mediating, and a truce followed in March. But no Arab state recognized Israel's legitimacy. Over a half-million Palestinian refugees were scattered around the Arab world. Between 1948 and 1957 some 567,000 Jews were expelled from Arab states, nearly all of whom resettled in Israel. The 1948 war thus marked only the beginning of trouble in the region.

South Asia. The British faced a similar problem on a much larger scale in India, whose population included 250,000,000 Hindus, 90,000,000 Muslims, and 60,000,000 distributed among various ethnic and religious minorities. Between the wars Mohandas Gandhi's passive-resistance campaigns had crystallized Indian nationalism, which was nurtured in part by the relative leniency of British rule. Parliament set in motion the process leading to home rule in 1935, and the Attlee Cabinet rewarded India for its wartime loyalty by instructing Lord Louis Mountbatten on Feb. 20, 1947, to prepare India for independence by June 1948. He did so, too hastily, in only six months, and the partition of the subcontinent into a mainly Hindu India and a mainly Muslim but divided Pakistan (including part of Bengal in the east) on Aug. 15, 1947, was accompanied by panicky flight and riots between Hindus and Muslims that claimed between 200,000 and 600,000 lives. Perhaps a bloodbath was inevitable whatever Mountbatten did or however long he took to do it. But nothing tarnished Britain's colonial record in India so much as its termination. The Congress Party of Jawaharlal Nehru then took firm control and governed the Dominion (after 1950 the Republic) of India in parliamentary style and made India one of the first decolonized states to adopt a posture of nonalignment among the great powers. Disputes with Pakistan, especially over the contested province of Jammu and Kashmir, however, ensured continued strife on the subcontinent.

Partition of India and Pakistan

Elsewhere in South Asia the colonial powers expelled the Japanese only to confront indigenous nationalist forces. The British fought a successful counterinsurgency against Communist guerrillas in Malaya, but the French waged a protracted and ultimately unsuccessful war with Communist Viet Minh in Indochina, while the Dutch failed to subdue nationalists in Indonesia and granted independence in 1949. The United States transferred power peacefully in the Philippines in 1946.

In Japan, the American occupation under General Douglas MacArthur effected a peaceful revolution, restoring civil rights, universal suffrage, and parliamentary government, reforming education, encouraging labour unions, and emancipating women. In the 1947 constitution drafted by MacArthur's staff Japan renounced war and limited its military to a token force. During the Korean War a majority of the Allies signed a separate peace treaty and the United States entered into a mutual security pact with Japan (Sept. 8, 1951). These policies laid the foundation for a peaceful and prosperous Japan, but the United States took upon itself the burden of defending the western Pacific for the foreseeable future.

The Chinese civil war. The Asian future would be determined above all by the outcome of the civil war in China, a war that had never totally ceased even during the Japanese invasion and occupation. In 1945, Truman reaffirmed America's commitment to a "strong, united, and democratic China" and dispatched Marshall to seek a truce and a coalition government between Chiang Kai-shek's Nationalists at Chungking and Mao Zedong's Communists in Yen-an. But neither side had any intention of compromising with the other, and fighting resumed in October 1946. At first the United States imposed an arms embargo, but after May 1947 it extended aid to Chiang—a policy aptly described as "neutrality against the Communists."

Stalin, having blundered badly in China in the 1920s, kept up correct relations with the Nationalists on the assumption that Chiang was too strong to defeat but not strong enough to defy Soviet interests in Manchuria, Mongolia, and Sinkiang. The U.S.S.R. concluded a treaty of friendship with the Nationalist government on Aug. 14, 1945. Soviet policy at that time was to depict Mao as a mere agrarian reformer and to call for a coalition government. Having won Chiang's blessing, the Soviets systematically looted Manchuria of industrial equipment and reassumed their old rights on the Chinese Eastern railway. At the same time, Molotov insisted that the United States withdraw its advisers.

Chiang's forces advanced on all fronts until they captured Yen-an itself in March 1947. But the rapid occupation of north China and Manchuria, with American aid but against American advice, overextended the Nationalist army and tied it to cities and railroad lines. Corrupt officers also sold vast numbers of U.S. weapons to the enemy and siphoned off much of the $2,000,000,000 in U.S. aid into personal fortunes. When the Communists counterattacked at the end of 1947, Nationalist units were left isolated in the cities or simply melted away. The Communists took Tientsin and Peking in January 1949 and opened a southward offensive in April. By June their army had grown to 1,500,000 men and Chiang's had shrunk to 2,100,000. On August 5 a State Department White Paper announced the cessation of all aid to the Nationalists and concluded that "the ominous result of the civil war in China is beyond the control of the government of the United States." The remaining Nationalists fled to the island of Formosa (Taiwan), and the Communists officially proclaimed the People's Republic of China at Peking on Oct. 1, 1949. Only then did Stalin recognize the Maoist regime and negotiate to return Port Arthur and the Manchurian railway to Chinese control.

Isolation of the Nationalists

The fall of China to Communism, following hard on the Berlin Blockade and the first Soviet A-bomb test, was a terrific blow to the United States. The disaster gave Republicans a stick with which to beat the Truman administration, while the perjury of Alger Hiss (a high-ranking State Department officer, president of the Carnegie Endowment for World Peace, and erstwhile Communist agent) lent credence to charges that Communist sympathizers were at work in Washington. On Feb. 9, 1950, Senator Joseph R. McCarthy claimed to know the identities of 205 State Department officials tainted by Communism. Over the course of four years of congressional hearings McCarthy used innuendo and intimidation to propound charges that,

in virtually every case, proved groundless. But the tide of suspicion he incited—or exploited—ironically made him, as Truman said, "the greatest asset that the Kremlin has." For not only did his behaviour besmirch the image of the United States, but it bequeathed the charge of "McCarthyism" as an impregnable defense to be used by all manner of leftists.

"Who lost China?"

The original question—Who lost China?—had been answered by the White Paper: America was not omnipotent and China was not America's to lose. But misperception of Asian realities and the "Europe-first" bias of the East Coast establishment, most Democrats, and the Army certainly contributed to the debacle. "Asia-firsters," including the much less influential West Coast establishment, most Republicans, and the Navy, rued the equanimity with which the administration witnessed the collapse of the Nationalists. For his part, Stalin must have found it equally mysterious that the United States would go to the brink of war over Berlin and spend billions to aid western Europe, then stand aside while the world's most populous nation went Communist and shrug that it would "wait for the dust to settle" (Acheson's phrase).

The Korean War. Events in neighbouring Korea determined that the dust would not settle for another 20 years. In 1945, Soviet and American troops had occupied the peninsula, ruled by Japan since 1895, on either side of the 38th parallel. In North Korea indigenous Marxists under Kim Il-sung took control with Soviet assistance and began to organize a totalitarian state. In South Korea, General John R. Hodge, lacking firm instructions from Washington, began as early as the autumn of 1945 to establish defense forces and police and to move toward a separate administration. He also permitted the return of nationalist leader Syngman Rhee. By the time Washington and Moscow noticed Korea, the Cold War had already set in and the de-facto partition, as in Germany, became permanent. South and North Korean governments formally arose in 1948, each claiming legitimacy for the whole country and threatening to unify Korea by force. Between October 1949 and June 1950 several thousand soldiers were killed in border incidents along the parallel. The war that followed, therefore, was not so much a new departure as a denouement.

On Jan. 12, 1950, Acheson outlined his Asian policy in a speech before the Press Club in Washington, D.C. He included Japan, Okinawa, and the Philippines within the American line of defense but excluded Taiwan and Korea.

North Korean invasion

Five months later, on June 25, 1950, the North Koreans invaded across the 38th parallel. Conventional wisdom had it that Kim Il-sung was acting on Stalin's orders and that Acheson's omission had "invited" the attack. But the declassification of documents of the period has led to a reconsideration of the question of the origins of the Korean War. The United States had not ignored Korea; rather, the State Department considered South Korea vital to the defense of Japan. It is more likely that Acheson's failure to mention Korea meant that the United States did not intend to station its own forces in Korea, unlike the countries mentioned, and that the United States was purposely withholding unequivocal support from Rhee lest he take it as encouragement to invade the north. Thus, Acheson was trying to prevent a war, but probably trying also to ensure that if hostilities did occur, the Communists would be to blame. Perhaps that is why he later referred to North Korea's attack, not as an act of perfidy or aggression, but as one of stupidity.

Stalin always behaved toward his client states with similar caution and strove to keep them under control. Why then should he "unleash" Kim and expose North Korea to a U.S. counterattack that might become a precedent for pushing Communism back elsewhere? The possibility exists that Kim (like Ho Chi Minh) acted on his own in pursuit of a united national Communist state. On the other hand, Stalin may indeed have encouraged North Korea to attack in order to keep Kim—and Mao—dependent on the U.S.S.R. or to create a costly diversion for the Americans. According to Khrushchev's memoirs, Kim initiated the idea of invading and Stalin, almost casually and certainly foolishly, approved it.

The Truman administration responded with alacrity, viewing Korea as a test case for the policy of containment. The United States appealed to the Security Council (which the Soviets were boycotting for its continued seating of Nationalist China) and obtained a condemnation of North Korea and an affirmation of collective security. Once the South Korean rout was evident, Truman ordered MacArthur to transfer forces from Japan to Korea, where they barely established a perimeter around the port of Pusan. Against Senator Robert A. Taft's protest of Truman's actions as a usurpation of Congress' right to declare war, most Americans accepted Truman's analogy with the 1930s and his determination not to appease the aggressor. Ultimately 16 United Nations member states provided troops for this "police action," but U.S. and South Korean troops bore the brunt of the fighting.

In September 1950, following MacArthur's brilliant amphibious landing at Inch'ŏn, Truman approved operations north of the 38th parallel, and soon UN forces were driving through North Korea toward the Yalu river border with China. When the UN General Assembly adopted a U.S. resolution (October 7) to establish a unified, democratic Korea, it appeared that the Western alliance was going beyond containment to a "rollback" strategy: Communists who attacked others ran the risk of being attacked themselves. But in November, contrary to MacArthur's confident predictions, Chinese forces attacked across the Yalu. By the new year UN armies had retreated south of the 38th parallel and MacArthur demanded the right to expand the war. If American boys were dying, he asked, how could the government in good conscience fail to attack the enemy's home base or use every weapon at its disposal? But Prime Minister Attlee, speaking for the allies, strongly opposed a wider war or the use of nuclear weapons. By April 1951 the UN forces had recaptured Seoul and regained the 38th parallel.

UN invasion of North Korea

The effects of the Korean War reverberated around the world. Europeans feared that Korea was a diversion and that Stalin's real aim was to attack in Europe. Accordingly, Acheson agreed in September 1950 to contribute U.S. divisions to a NATO army under the command of General Eisenhower. "Asia-firsters" objected strenuously to this and kicked off what was known as "the great debate." Herbert Hoover even called for the United States to write off western Europe and make the Western Hemisphere the "Gibraltar of Western Civilization." But the Truman administration, backed by eastern Republicans and Eisenhower himself, persuaded Congress to commit four additional divisions to Europe. The Korean War also hastened implementation of NSC-68, a document drafted by Paul Nitze that called for a vigorous program of atomic and conventional rearmament to meet America's global commitments.

As American and allied publics grew increasingly impatient with the bloody deadlock in Korea, Truman determined to seek a negotiated peace. MacArthur tried to undermine this policy, issuing his own ultimatum to Peking and writing Congress that "there is no substitute for victory," whereupon Truman fired him for insubordination in April 1951. The popular warrior and proconsul went home to a hero's welcome, and the Senate held hearings on the propriety of the "limited war" strategy. Marshall defended the President, arguing that a wider war in Asia would expose Europe to attack, while General Omar Bradley insisted that MacArthur's plans would "involve us in the wrong war, at the wrong place, at the wrong time and with the wrong enemy." MacArthur retorted that limited war was a form of appeasement.

Truman and MacArthur

Truce negotiations opened at Kaesŏng on July 10 after the Chinese dropped their demands for withdrawal of all foreign troops from Korea and admission of the People's Republic to the UN in place of Nationalist China. The talks broke off in August, then resumed at P'anmunjŏm in October. Bitter fighting continued for two more years as each side sought to improve its tactical position. The talks centred on two issues: the demarcation line between North and South Korea and the repatriation of more than 150,000 Chinese and North Korean prisoners of war, many of whom did not want to return home. After hinting that

the United States might resort to use of the atomic bomb, newly elected president Dwight Eisenhower achieved an armistice signed at P'anmunjŏm on July 27, 1953, that separated the armies with a demilitarized zone and otherwise restored the *status quo ante bellum.* But Chinese torture of U.S. prisoners and anti-American propaganda, combined with U.S. refusal to recognize the Peking regime and the conclusion of a defense treaty with Nationalist China (Taiwan), ensured continued hostility between Washington and Peking. Indeed, documents declassified in the late 1980s showed that Truman and Eisenhower saw early on the potential for a Sino-Soviet split and that maximum pressure on Peking, not conciliation, was the way to bring it on.

Asian wars and the deterrence strategy. While war raged in Korea, the French were battling the nationalist and Communist Viet Minh in Indochina. When a French army became surrounded at Dien Bien Phu in 1954, Paris appealed to the United States for air support. American leaders viewed the insurgency as part of the worldwide Communist campaign and first propounded the theory that if Indochina went Communist, other Southeast Asian countries would also fall "like dominoes." But Eisenhower was reluctant to send U.S. troops to Asian jungles, to arrogate war-making powers to the executive, or to sully the anti-imperialist reputation of the United States, which he considered an asset in the Cold War. In any case both he and the American people wanted "no more Koreas." Hence the United States supported partition of Indochina as the best means of containing the Viet Minh, and after French Premier Pierre Mendès-France came to power promising peace, partition was effected at the Geneva Conference of 1954. Laos and Cambodia won independence, while two Vietnams emerged on either side of the 17th parallel: a tough Communist regime under Ho Chi Minh in the north, an unstable republic in the south. National elections intended to reunite Vietnam under a single government were scheduled for 1956 but never took place, and when the United States assumed France's former role as South Vietnam's sponsor, another potential "Korea" was created.

The two Vietnams

The Korean War and the new administration brought significant changes in U.S. strategy. Eisenhower believed that the Cold War would be a protracted struggle and that the greatest danger for the United States would be the temptation to spend itself to death. If the United States were obliged to respond to endless Communist-instigated "brushfire wars" it would soon lose the capacity and will to defend the free world. Hence Eisenhower and Secretary of State John Foster Dulles determined to solve "the great equation," balancing a healthy economy with only what was essential by way of military force. Their answer was a defense policy whereby the United States would deter future aggression with its airborne nuclear threat. As Dulles put it, the United States reserved the right to reply to aggression with "massive retaliatory power" at places of its own choosing. In implementing this policy, Eisenhower cut overall defense spending by 30 percent over four years but beefed up the Strategic Air Command. The diplomatic side of this new policy was a series of regional pacts that linked the United States to countries ringing the entire Soviet bloc. Truman had already founded the NATO alliance, the ANZUS pact with Australia and New Zealand (1951), the Pact of Rio with Latin-American nations (1947), and the defense treaty with Japan (1951). Now Dulles completed an alliance system linking the 1954 Southeast Asia Treaty Organization (SEATO), stretching from Australia to Pakistan, to the 1955 Baghdad Pact Organization (later the Central Treaty Organization [CENTO]), stretching from Pakistan to Turkey, to NATO, stretching from Turkey (after 1952) to Iceland.

Regional alliances

Dulles viewed the postwar world in the same bipolar terms as had Truman and, for that matter, Stalin. But Asian independence not only expanded the arena of Cold War but also spawned the third path of nonalignment. In April 1955 delegates from 29 nations attended the Bandung (Indonesia) Afro-Asian Conference, which was dominated by Nehru of India, Gamal Abdel Nasser of Egypt, and Sukarno of Indonesia. In theory the delegates met to celebrate neutrality and an end to "the old age of the white man"; in fact they castigated the imperialist West and praised, or tolerated, the U.S.S.R. Although most of the Bandung leaders were sloganeering despots in their own countries, the movement captivated the imagination of many guilt-ridden Western intellectuals.

The nonaligned nations

THE PACE OF EUROPEAN INTEGRATION

The nature and role of Germany. The shared horror of World War II and the decline of Europe from the seat of world powers into an arena of U.S.-Soviet competition revived the ancient dream of European unity. In modern times, Roman Catholics, liberals, and Socialists had all conceived of one means or another to transcend nationalism, and after 1945 a combination of factors made the dream plausible. First, the Soviet threat gave western Europeans an incentive to unite for defense and economic recovery. Second, the very scale of the superpowers suggested that Europeans must pool their resources if they hoped to play a major role in world affairs. Third, two world wars and the Fascist interlude had discredited nationalism and propelled moderate Christian Democrats and Social Democrats to prominence in postwar Europe. Fourth, integration was a means by which German economic and military power might be safely revived. Fifth, centralized planning, which had evolved naturally with the war economies, made economic integration seem possible and attractive. Finally, the United States used its leverage through the Marshall Plan to encourage multinational institutions, cooperation, and free trade.

In early disputes over the occupation of Germany, France often sided with the U.S.S.R. in order to keep Germany weak and obtain reparations. But the Berlin crisis of 1948 convinced the French that a way must be found to reconcile German recovery with their own security. The architects of an integrationist solution were the French technocrat Jean Monnet and Foreign Minister Robert Schuman. The Schuman Plan of May 1950 called for a merger of west European coal and steel industries to hasten recovery, forestall competition, and make future wars between France and Germany impossible. The patriarchal chancellor of the new West German republic, Konrad Adenauer, embraced the offer at once, for the primary foreign policy goal of his new state was economic and political rehabilitation. The founding of the West German state was his first success; the drafting of a sturdy democratic constitution was the second; his adoption, with Ludwig Erhard, of a dynamic free-market economic policy was the third. Once Marshall Plan aid arrived, West Germany was well on its way to the *Wirtschaftswunder,* the economic miracle of the 1950s. But it still remained for Adenauer to achieve security and full sovereign rights for West Germany. The Cold War permitted him to do both at once. By moving West Germany into the democratic free-market camp he earned protection and trust from the West. Of course, Adenauer could not ignore the emotional issue of German reunification, and thus he refused to recognize the East German regime or Polish control of the lands east of the Oder-Neisse rivers. The Hallstein Doctrine extended this non-recognition to all countries that did recognize East Germany. But Adenauer knew that to base policy on the prospect of reunification was unrealistic. The Soviets' Prague Proposals of October 1950 had envisioned a united, demilitarized German state—Kennan now endorsed such a neutral zone in central Europe to separate the Cold War rivals—but the Soviets insisted on a Constituent Council with equal representation for East and West Germany, even though the West had twice the population. At best, the East German delegation could block progress indefinitely while preventing West Germany from joining the Western bloc. At worst, the Soviets might subvert or coerce a disarmed Germany into aligning with Moscow. In the atmosphere of the Korean War, the Prague Proposals could not be taken up with confidence.

The Schuman Plan

The Prague Proposals

Instead, Adenauer endorsed the Schuman Plan and helped to found the European Coal and Steel Community among "the Six": France, West Germany, Italy, and the Benelux countries. The Korean War sparked the next initiative toward integration when the United States, bogged

down in Asia, requested a sizable increase in the European contribution to NATO. In 1951 the French and British cabinets both fell over the costly issue of rearmament before a committee managed to work out an acceptable distribution of burdens in October. But the obvious solution was German rearmament, something the nervous French refused to countenance unless the German army were merged into an international force, a European Defense Community (EDC). The implications were profound, for a common western European army would require a common defense ministry, coordinated foreign policy, joint defense budget, even a common parliament to approve spending and policy. In sum, the EDC would go far toward creating a United States of Europe. The West German parliament was first to ratify the EDC, in March 1953, but Britain, still clinging to the vestiges of empire and its "special relationship" with the United States, opted out. As Anthony Eden put it, joining a European federation "is something which we know, in our bones, we cannot do." The French, in turn, debated the issue until Stalin's death and the Korean armistice eroded the sense of emergency. French Communists, of course, opposed the EDC, while Gaullists blanched at merging France's proud services into a European potpourri. Despite Dulles' threat of an "agonizing reappraisal" of U.S. policy should the EDC fail, the French parliament voted it down on Aug. 30, 1954. An alternate solution quickly followed: West Germany was simply admitted to NATO and its *Bundeswehr* (armed forces) placed under Allied command. The Soviets responded in 1955 by creating the Warsaw Pact, a military alliance of the U.S.S.R. and its eastern European satellites.

NATO and the Warsaw Pact

Postwar European recovery. The first postwar decade was one of anxiety and crisis for Europe but one also of astounding economic recovery. Thanks to rational planning, labour–management cooperation, emphasis on production, the Marshall Plan, and the very destructiveness of the war, which made new plant construction necessary and thorough, the members of the Organisation for European Economic Co-operation all exceeded their prewar production levels by 1950 and achieved an annual average growth rate of 5 to 6 percent through 1955. The political stability wrought by the Cold War and the Western alliance and by the American military umbrella, which permitted Europeans to devote more resources to building the welfare state, made for unprecedented prosperity.

Eastern Europe also recovered from the war, but more slowly and not always to its own benefit. In the late 1940s the U.S.S.R. forced one-sided trade treaties on its satellites so that Polish and Romanian foodstuffs and Czech and East German technology flowed to the U.S.S.R. rather than to world markets. Stalin's death on March 5, 1953, sparked hopes for a thaw in the eastern bloc and in the Cold War. The ephemeral collective leadership that succeeded him executed the hated secret-police chief, Lavrenty Beria, and released thousands from prison camps. Riots in East Germany and Poland also induced Moscow to scale back its exploitation of the satellites and reduce reparations from East Germany. A Soviet delegation even visited Belgrade in 1955 to attempt a reconciliation with Tito. That same year the Austrian State Treaty provided for the first Soviet military withdrawal since the war and brought into being a neutral Austrian state.

In 1956 Nikita Khrushchev emerged as the new Soviet premier and shocked the 20th Party Congress with his midnight speech denouncing Stalin's "cult of personality" and manifold crimes against the party. But de-Stalinization, however carefully undertaken, created a crisis of legitimacy for the Soviet empire. In the summer of 1956 Władisław Gomułka rose to leadership of the Polish Communist Party on a wave of strikes and riots. When Moscow received his reassurances and allowed him to stay in power, other eastern Europeans were tempted to test the limits of de-Stalinization. The Hungarians reached them in October 1956 after the reformist premier Imre Nagy was deposed and protests spread that Soviet troops already on the scene were unable to quell. Nagy returned to power to announce the end of the one-party state and to release the Roman Catholic primate, József Cardinal Mindszenty, from his long imprisonment. Nagy also promised freedom of speech and the withdrawal of Hungary from the Warsaw Pact. While Hungary's fate hung in the balance, the Western powers had their attention diverted by a second Middle Eastern war.

The Hungarian uprising

The Suez Crisis. The Arab states, after their defeat in 1948, passed through a period of political unrest. The most critical change occurred in Egypt, where in 1952 a cabal of young army officers backed by the Muslim Brotherhood forced the dissolute King Farouk into exile. In 1954 Nasser emerged to assume control. Nasser envisioned a pan-Arab movement led by Egypt that would expel the British from the Middle East, efface Israel, and restore Islāmic grandeur. Egypt began sponsoring acts of violence against Israel from the Gaza Strip and cut off shipping through the Strait of Tiran. The British were understandably hostile to Nasser, as were the French, who were battling Islāmic nationalists in Morocco, Algeria, and Tunisia.

Israel had used the years since 1948 to good effect, developing the arid country and training a reserve force of 200,000 men and women armed primarily with French weapons. David Ben-Gurion believed that the Arabs would never accept the existence of Israel except by force. U.S. policy was to play down the Arab–Israeli dispute and alert all parties to the danger of Communist penetration. To this end, Eisenhower dispatched a futile mission in January 1956 in hopes of reconciling Cairo and Tel Aviv. In addition, the United States agreed to contribute $56,000,000, and $200,000,000 through the World Bank, to Egypt's project for an Aswān Dam on the Nile. But Nasser's flirtations with Moscow alienated Dulles. Then, on July 26, 1956, Nasser nationalized the Suez Canal.

The conservative Cabinet in London, the French, and the Israelis resolved to thwart Nasser. They could cite as precedent a CIA-backed coup d'état in Iran (August 1953) that overthrew the ascetic nationalist Mohammad Mosaddeq, who had expropriated foreign oil interests and also looked for support to the U.S.S.R. In any case, British, French, and Israeli planners met to work out a joint strike at the Sinai and Suez that might permit a far-reaching realignment in the Middle East. Eisenhower got wind of Israeli military preparations but believed that the blow would fall on Syria. He especially opposed hostilities before the U.S. election lest he lose Jewish votes by having to scold Israel. But Moshe Dayan quietly mobilized all of Israel's mobile brigades, which struck on October 29 and took the Egyptians—and the Americans—by surprise. Israeli war aims included the elimination of the Egyptian army as an offensive threat, neutralization of Palestinian bases in Gaza, and capture of the Strait of Tiran. The Anglo-French goals were to secure the Suez Canal and possibly to topple Nasser and thus strike a blow at Arab radicalism.

The CIA in Iran

An Israeli airborne assault secured the Mitla Pass in the Sinai while armoured columns penetrated the peninsula. The Anglo-French then issued an ultimatum to Cairo and proceeded to bomb Egyptian bases. The Egyptian army evacuated the Sinai. Eisenhower, preoccupied with Hungary and the election, was furious at this act of insubordination on the part of his allies and sponsored a UN resolution for a cease-fire on November 1. Egypt frustrated the Anglo-French plan by the simple expedient of scuttling ships in the canal, but the Anglo-French went ahead with a landing at Port Said. The superpowers then forced an evacuation and the insertion of UN peacekeeping forces in the Sinai and Gaza Strip. There matters stood for 10 years.

The only one who gained in the Suez muddle was the U.S.S.R. With the West in disarray and involved in a campaign that looked very much like old-fashioned imperialism, Soviet tanks returned to Budapest on November 4, crushed the Hungarians fighting with their homemade weapons, and liquidated their leaders. In 1957 the Soviets declared a new policy of "centralism" for the satellites and denounced both "dogmatism" (a code word for Stalinism) and "revisionism" (a code word for liberty).

The events of October 1956 nevertheless helped to renew momentum for European integration. Hungary reminded western Europeans of the nature and proximity of the

Soviet regime; Suez made them resentful of American tutelage. Inspired by Monnet and Belgian economist Paul-Henri Spaak, "the Six" drafted the Euratom Treaty for a joint nuclear energy agency and the Treaty of Rome to expand the coal and steel community into a full-fledged Common Market. The treaties were signed on March 25, 1957, and went into effect on Jan. 1, 1958. The European Economic Community provided for internal and external tariff coordination, free movement of labour and capital, and a common agricultural pricing policy. Integration theorists hoped that international economic institutions would sustain a momentum leading to political unity as well.

The Treaty of Rome

NUCLEAR WEAPONS AND THE BALANCE OF TERROR

The race for nuclear arms. The postwar arms race began as early as 1943, when the Soviet Union began its atomic program and placed agents in the West to steal U.S. atomic secrets. When the U.S.S.R. rejected the Baruch Plan in 1946 and U.S.–Soviet relations deteriorated, a technological race became inevitable. The years of the U.S. monopoly, however, were a time of disillusionment for American leaders, who discovered that the atomic bomb was not the absolute weapon they had first envisioned. First, the atomic monopoly was something of a bluff. As late as 1948 the U.S. arsenal consisted of a mere handful of warheads and only 32 long-range bombers converted for their delivery. Second, the military was at a loss as to how to use the bomb. Not until war plan "Half Moon" (May 1948) did the Joint Chiefs envision an air offensive "designed to exploit the destructive and psychological power of atomic weapons." Truman searched for an alternative, but balancing Soviet might in conventional forces with a buildup in kind would have meant turning the United States into a garrison state, an option far more expensive and damaging to civic values than nuclear weapons. A few critics, notably in the navy, asked how a democratic society could morally justify a strategy based on annihilation of civilian populations. The answer, which had been evolving since 1944, was that U.S. strategy aimed at deterring enemy attacks in the first place. "The only war you really win," said General Hoyt Vandenberg, "is the war that never starts."

Nuclear deterrence, however, was subject to at least three major problems. First, even a nuclear attack could not prevent the Soviet army from overrunning western Europe. Second, the nuclear threat was of no use in cases of civil war, insurgency, and other small-scale conflicts, a fact Stalin evidently relied on in several instances. Third, the U.S. monopoly was inevitably short-lived. By 1949 the Soviets had the atomic bomb, and the British joined the club in October 1952. The United States would be obliged to race indefinitely to maintain its technological superiority.

The first contest in that race was for the "superbomb," a hydrogen, or fusion, bomb a thousand times more destructive than the atomic fission variety. Many scientists opposed this escalation. The dispute polarized the political and scientific communities. On the one hand it seemed as if the Cold War had created a climate of fear that no longer permitted principled dissent even on an issue involving human survival; on the other hand, it seemed as if the dissenters, inadvertently or not, were promoting the interests of the U.S.S.R. In January 1950, Truman gave his approval to the H-bomb project, and the first fusion bomb was tested successfully at Enewetak Atoll in November 1952. No debate occurred in the Soviet Union, where scientists moved directly to fusion research and exploded their first bomb in August 1953.

The hydrogen bomb

In the meantime, Soviet agitprop agencies laboured abroad to weaken Western resolve. A prime target was NATO, which the Kremlin evidently viewed as a political threat (since its inferior order of battle was scarcely an offensive military threat). After 1950 the Soviets alternately wooed the western Europeans with assurances of goodwill and frightened them with assurances of their destruction if they continued to host American bases. Cominform parties and front organizations (such as the World Peace Council) denounced the Pentagon and U.S. "arms monopolies" and exploited fear and frustration to win over intellectuals and idealists. The Stockholm Appeal of 1950, initiated by the French Communist physicist Frédéric Joliot-Curie, gathered petitions allegedly signed by 273,470,566 persons (including the entire adult population of the U.S.S.R.). Similar movements organized marches and protests in Western countries against nuclear arms (no such manifestations occurred in the Soviet bloc).

Eisenhower's defense policy brought a sharp increase in research and development of warheads and long-range bombers and the construction of air bases on the territory of allies circling the U.S.S.R. But the H-bomb breakthrough also triggered a race to develop intercontinental ballistic missiles (ICBMs). The United States entered the postwar era with an advantage in long-range rocketry, thanks to the suspension of the Soviet program during the war and the decision by the Germans' V-2 rocket team, led by Wernher von Braun, to surrender to the U.S. Army. But in the budget-cutting of the late 1940s, the Truman administration surmised that the United States, possessed of superior air power and foreign bases, did not need long-range guided missiles. The first atomic weapons, bulky and of limited yield, also suggested that no rocket large and accurate enough to destroy a target 6,000 miles distant was then possible. But the vastly greater yield of fusion bombs and the expectation of smaller warheads changed that calculation. The U.S. ICBM project received top priority in June 1954. The Soviets, by contrast, needed to find a means of threatening the United States from Soviet soil. As early as 1947, therefore, Stalin gave priority to ICBM development.

The missile race

Arms control and defense. How could the arms race be headed off before the world became locked into what Churchill called "the balance of terror"? The UN Disarmament Commission became a tedious platform for the posturings of the superpowers, the Americans insisting on on-site inspection, the Soviets demanding "general and complete disarmament" and the elimination of foreign bases. Eisenhower hoped that Stalin's death might help to break this deadlock. Churchill had been urging a summit conference ever since 1945, and once de-Stalinization and the Austrian State Treaty gave hints of Soviet flexibility, even Dulles acquiesced in a summit, which convened at Geneva in July 1955. The Soviets again called for a unified, neutral Germany, while the West insisted that it could come about only through free elections. On arms control, Eisenhower stunned the Soviets with his "open skies" proposal. The United States and the Soviet Union, he said, should exchange blueprints of all military installations and each allow the other side to conduct unhindered aerial reconnaissance. After some hesitation, Khrushchev denounced the plan as a capitalist espionage device. The Geneva summit marginally reduced tensions but led to no substantive agreements.

The "open skies" proposal

"Open skies" reflected the American fear of surprise attack. In 1954 a high-level "Surprise Attack Study" chaired by the scientist James Killian assured the president of a growing American superiority in nuclear weapons that would hold until the 1958–60 period but warned that the U.S.S.R. was ahead in long-range rocketry and would soon achieve its own secure nuclear deterrent. The panel recommended rapid development of ICBMs, construction of a distant early warning (DEW) radar line in the Canadian Arctic, strengthened air defense, and measures to increase intelligence-gathering capabilities, both to verify arms control treaties and to avoid overreaction to Soviet advances. The Killian report gave birth to the U-2 spy plane, which began crisscrossing the U.S.S.R. above the range of Soviet air defense in 1956, and to a research program to develop reconnaissance satellites to observe the U.S.S.R. from outer space.

In 1955 both the United States and the Soviet Union announced programs to launch artificial Earth satellites during the upcoming International Geophysical Year (IGY). The Eisenhower administration, concerned that the satellite program not interfere with military missile programs or prejudice the legality of spy satellites to come, entrusted its IGY proposal to the small, nonmilitary Vanguard rocket. While Vanguard development crept ahead, the Soviet program won the first space race with Sputnik

1 on Oct. 4, 1957. The Soviet achievement shocked the Western world, challenged the strategic assumptions of every power, and thus inaugurated a new phase in the continuing Cold War.

Total Cold War and the diffusion of power, 1957–72

The concomitant arrival of the missile age and of an independent and restive Third World multiplied the senses in which politics had become global. Intercontinental rockets not only meant that the most destructive weapons known could now be propelled halfway around the world in minutes, but also, because of the imminent nuclear standoff they heralded, that a Cold War competition would now extend into other realms—science and technology, economic growth, social welfare, race relations, image making—in which the Soviets or Americans could try to prove that their system was the best. At the same time, the decolonization of dozens of underdeveloped states in Asia and Africa induced the superpowers to look beyond the original front lines of the Cold War in Europe and East Asia.

These technological and political revolutions would seem to have raised the United States and the Soviet Union to unequaled heights of power. The Soviets and Americans advanced rapidly in the high technology required for spaceflight and ballistic missiles, while techniques for the mobilization and management of intellectual and material resources reached a new level of sophistication, especially in the United States, through the application of systems analysis, computers, bureaucratic partnership with corporations and universities, and Keynesian "fine-tuning" of the economy. By the mid-1960s the vigorous response of the Kennedy and Johnson administrations to the Cold War challenge seemed to ensure American technological, economic, and military primacy for the forseeable future. A mere five to seven years later, however, it became clear that the 1960s, far from establishing an American hegemony, had in fact wrought a diffusion of world power and an erosion of the formerly rigid Cold War blocs. Western Europe and Japan, now recovered from the war, also achieved dynamic economic growth in the 1960s, reducing their relative inferiority to the United States and prompting their governments to exercise a greater independence. The Sino-Soviet split, perhaps the most important event in postwar diplomacy, shattered the unity of the Communist bloc, and Third World countries often showed themselves resistant to superpower coercion or cajoling. By 1972 the U.S.S.R., despite its achievement of relative parity in nuclear weapons, was obsessed with the prospect of a hostile China, while the United States, having squandered its wealth, prestige, and domestic tranquillity in the Vietnam War, was trying to scale back its global commitments. The Nixon Doctrine, détente with Moscow, the opening to China, and uncoupling of the dollar from gold were the symptoms of this American retreat.

The American watershed

THE WORLD AFTER SPUTNIK

Soviet progress and American reaction. Premier Khrushchev anticipated the new correlation of forces in his foreign policy address to the 20th Party Congress in 1956. Soviet H-bombs and missiles, he said, had rendered the imperialists' nuclear threat ineffective, the U.S.S.R. an equal, the socialist camp invincible, and war no longer inevitable, and thus "peaceful coexistence" inescapable. In Leninist doctrine this last phrase implied a state of continued competition and socialist advance without war. The immediate opportunities for socialism, according to Khrushchev, derived from the struggle of the colonial peoples, which the U.S.S.R. would assist through foreign aid, propaganda, subversion, and support for "wars of national liberation."

The Soviet successes in outer space just 40 years after the Bolshevik Revolution were powerful evidence for Khrushchev's claims that the U.S.S.R. had achieved strategic equality and that Communism was the best system for overcoming backwardness. Sputnik restored Soviet prestige after the 1956 embarrassment in Hungary, shook European confidence in the U.S. nuclear deterrent, magnified the militancy of Maoist China, and provoked an orgy of self-doubt in the United States itself. The two Sputnik satellites of 1957 were themselves of little military significance, and the test missile that launched them was too primitive for military deployment, but Khrushchev claimed that long-range missiles were rolling off the assembly line "like sausages," a bluff that allowed President Eisenhower's opponents—and nervous Europeans—to perceive a "missile gap." Khrushchev in turn tried to capitalize on the apparent gap in a series of crises. But his adventurous policy only provoked perverse reactions in China, the United States, and Europe that undermined his own political support at home.

Soviet missile bluff

Eisenhower was apprised in advance of Soviet missile progress thanks in part to overflights of the U-2 spyplane. By the time of Sputnik the Pentagon already had several parallel programs for ballistic missiles of various types, including the advanced, solid-fueled Polaris and Minuteman. The great fleet of B-47 and B-52 intercontinental bombers already deployed also assured continued American strategic superiority through the early 1960s. The frugal Eisenhower thus tried to play down the importance of Sputnik and to discourage a race for arms or prestige, but he was frustrated by a coalition of Democrats, journalists, academics, and hawks of both parties who insisted that the United States not only leapfrog the Soviets in space and missiles but also increase federal support to education, extend more military and economic aid to the Third World, and expand social programs at home intended in part to polish the American image abroad—in short, pursue the Cold War more vigorously. Eisenhower conceded to this mood in 1958 by sponsoring creation of the National Aeronautics and Space Administration and passage of the National Defense Education Act, accelerating weapons programs, and deploying intermediate-range missiles in England, Italy, and Turkey. He also acknowledged the expanded Soviet threat in his State of the Union Address in 1958: "Trade, economic development, military power, arts, science, education, the whole world of ideas—all are harnessed to this same chariot of expansion. The Soviets are, in short, waging total cold war." But a similarly total American response to this challenge, requiring virtually wartime levels of national mobilization to outdo a totalitarian system in whatever field of endeavour it chose to emphasize would, in Eisenhower's mind, have undermined the free market and fiscal soundness that were the foundation of American strength in the first place. Liberal economists argued in response that a sharply expanded role for the federal government was a matter of survival in the "space age" and would even stimulate economic growth, military prowess, and social progress.

Creation of NASA

The Sino-Soviet split. A still more energetic U.S. riposte would await the end of Eisenhower's term, but "Mr. Khrushchev's boomerang" (as John Foster Dulles termed Sputnik) had an immediate and disastrous impact on Soviet relations with the other Communist giant, China. Under their 1950 treaty of friendship, solidarity, and mutual assistance, Soviet technical aid flowed to Peking during the Korean War and helped support China's successful Five-Year Plan after 1953. Western observers looked in vain for ways to split the Communist bloc. But as early as 1956 Chinese leaders showed displeasure over Khrushchev's denunciation of Stalin, the Kremlin's tendency to treat the Chinese party as it did those of the lesser satellites, and the new Soviet leaders themselves, whom Mao evidently considered mediocrities. Mao also denounced "peaceful coexistence" as decadent and revisionist, a position shared by the tiny Stalinist dictatorship of Albania. Russian leadership in the world Communist movement was thus challenged for the first time.

Mao was a romantic revolutionary with an unquestionable bent for cruel or irrational theatrics on a gigantic scale. In the mid-1950s he paraded the slogan "Let a Hundred Flowers Bloom," ostensibly to encourage the voicing of new ideas on national development but perhaps rather to entice potential dissenters into revealing themselves. In 1958 this campaign was suddenly replaced by the "Great Leap Forward," by which all 700,000,000 Chinese were to form self-sufficient communes devoted to local industrial-

The Great Leap Forward

ization. Large-scale industries and infrastructure collapsed, much to the disgust of Soviet guest engineers. By 1960–61 the economic chaos had become so severe that famine claimed 6,000,000–7,000,000 lives. Nevertheless, the Chinese leadership seized upon Sputnik as proof that the "East wind" was prevailing over the "West wind" and insisted that the Soviets use their new superiority to press the revolution worldwide and, to the same end, provide China with atomic bombs and rockets. If the imperialists insisted on unleashing nuclear war, lectured Mao, and "half of mankind died, the other half would remain, while imperialism would be razed to the ground and the whole world become socialist." The Soviets were appalled, especially since their superiority was, for the time being, a sham. At a November 1958 summit Mao learned that the Soviets would insist on retaining control over any warheads sent to China and would not share missile technology. When the Soviets also failed to back the Chinese in their 1958–59 conflicts with Taiwan and India, Sino-Soviet tensions increased. In the end Khrushchev refused to deliver a prototype nuclear warhead, whereupon the Chinese angrily repudiated "slavish dependence" on others and pledged to create their own nuclear arsenal. On July 16, 1960, the U.S.S.R. recalled all its specialists from China.

The Sino-Soviet split shattered the strict bipolarity of the Cold War world (though the United States would not take advantage of that fact for more than a decade) and turned the U.S.S.R. and China into bitter rivals for leadership in the Communist and Third worlds. The fundamental causes of the split must be traced to contradictions in the Soviet role as both the leader of the Communist movement and as a great power with its own national interests. Before 1949 the U.S.S.R. had been able to subordinate the interests of foreign Communists to its own, but the Communist triumph in China, paradoxically, was a potential disaster for the U.S.S.R., for Mao and the Chinese would inevitably refuse to play the role of pupil. Once the Korean War was over and Stalin dead, the Chinese asserted themselves, learned the limits of "socialist internationalism," and angrily began to plot their own course. While the ideological rift served, in the short run, to invigorate both Communist rivals as they competed for prestige and influence among the world's revolutionaries, it destroyed the myth that Communism transcended nationalism and power politics. It also meant that the U.S.S.R. was delicately situated between the nuclear-armed NATO powers and the fanatical (and numerous) Chinese, and to appease either meant to alienate the other. Accordingly, Khrushchev played a risky double game from 1958 to 1962, alternately holding out hope for arms control to the NATO powers and leveling demands backed by rocket-rattling. The historian Adam Ulam has seen in this a "grand design" by which Khrushchev hoped to ingratiate himself with the West (for instance, through a nuclear test-ban treaty) in return for the evacuation of West Berlin, recognition of the East German government, and permanent denial of nuclear weapons to West Germany—all of which might demonstrate Soviet commitment to the Communist cause while providing a pretext for denial of nuclear weapons to China. But whether a grand design or an improvisation, Soviet diplomacy had to reckon at every turn with Peking's reactions and their likely effect on the rest of the Communist bloc.

Soviet diplomatic offensive. The Polish foreign minister, Adam Rapacki, was chosen to open Moscow's post-Sputnik campaign with a proposal to the UN General Assembly in October 1957 for a ban on nuclear weapons in Poland, Czechoslovakia, and the two Germanies. This initiative, like others of the sort before and after, was a no-lose strategem for the U.S.S.R. Given the Warsaw Pact's superiority in conventional weapons, any reduction of the West's nuclear deterrent in Europe stood to weaken NATO, even as the burden of seeming to oppose arms control would fall on the West if it refused. At the same time, the U.S.S.R. combined open and covert support for Western antinuclear movements with loud reminders of its ability to destroy any nation that foolishly hosted American bases. NATO leaders resisted the Rapacki Plan but had immediately to deal with a March 1958 Soviet offer to suspend all nuclear testing provided the West did the same. Throughout the 1950s growing data on the harmful effects of nuclear fallout had been increasing pressure on the nuclear powers to take such a step. The United States and Britain were caught in the midst of testing warheads for the many new missiles under development, but a one-year test ban did go into effect in November 1958. With the Chinese making noises about a Soviet sellout to the West, however, Khrushchev immediately provoked a new crisis in Berlin, demanding that the Allies withdraw from West Berlin within six months. Khrushchev also indicated that the best way to solve the Berlin question would be to neutralize and disarm the two German states. In January 1959 the Soviets expanded their proposed nuclear-free zone to include the Far East and the whole Pacific Ocean area—a clear hint of their desire to prevent China from going nuclear.

The Rapacki Plan

The Berlin deadline passed without incident as Khrushchev accepted an invitation to become the first Soviet premier to visit the United States. The increased recognition by the United States and the U.S.S.R. that each had interests in coexistence which outweighed their ideological loyalties was made manifest in August 1958, when Chinese artillery began an intense bombardment of the Nationalist-held offshore islets of Quemoy and Matsu. Peking may have hoped to force Moscow to support its claim to sovereignty over Taiwan, while Chiang may have hoped to drag the United States into supporting an invasion of the mainland. But neither superpower was willing to risk war. The U.S. 7th Fleet resupplied Chiang's forces, while the Soviets pledged to defend mainland China, but both discouraged offensive action.

Quemoy and Matsu

By September 1959, when Khrushchev arrived in the United States, Dulles had died, and Eisenhower was intent to use personal diplomacy in an attempt to put a cap on the arms race. The tour itself—from New York City to Iowa to Hollywood—was a sensation, though Khrushchev professed distaste for American consumerism and predicted "your grandchildren will live under Communism." His talks with Eisenhower produced an ephemeral "spirit of Camp David" and the scheduling of a followup summit conference for May 1960 in Paris. Meanwhile, Khrushchev's last-ditch efforts to mend relations with Peking exploded in the spring of 1960. Mao himself reportedly authored an article cryptically condemning Khrushchev's détente policy as vile revisionism and reiterating Chinese willingness to confront nuclear war. The Chinese observer at a Warsaw Pact meeting in February 1960 declared in advance that any arms agreements reached at the U.S.–Soviet summit would not be binding on Peking. On the eve of the Paris summit an American U-2 spy plane was shot down over the U.S.S.R. When Eisenhower refused to apologize for the incident and assumed personal responsibility, Khrushchev had little choice but to walk out.

Decolonization and development. Events in the other new arena of the post-Sputnik era—the Third World—likewise antagonized relations among the U.S.S.R., the United States, and China. All three assumed that the new nations would naturally opt for the democratic institutions of their mother countries, or on the other hand would naturally gravitate toward the "anti-imperialist" Soviet or Maoist camps. The United States had urged Britain and France to dismantle their empires in the aftermath of World War II, but once those countries became Washington's most potent allies in the Cold War, the United States offered grudging support for Anglo-French resistance to nationalist and Communist forces in their colonies. President Truman's Point Four Program mandated U.S. foreign aid and loans to new nations lest they "drift toward poverty, despair, fear, and the other miseries of mankind which breed unending wars." When the Eisenhower administration cut back on foreign aid, a great debate about its efficacy ensued among American experts. Critics insisted that the Marshall Plan was not a valid analogy for Third World aid since the former had been a case of helping industrial populations rebuild their societies, while the latter was a case of sparking industrial or even merely agricultural development in primitive economies. Foreign

The Point Four Program

aid did not necessarily serve U.S. interests, since many Third World rulers chose neutralism or socialism, nor did it promote economic growth, since most new nations lacked the necessary social and physical infrastructure for a modern economy. Proponents of aid replied that U.S. capital and technology were needed precisely to build infrastructure, to assist "nation building," and to fortify recipients against Communists and others who might subvert the development process in its early stages. In the late 1950s, U.S. economic aid averaged about $1,600,000,000 per year, compared to about $2,100,000,000 in military aid to friendly regimes. The Soviet line, by contrast, held that new nations would not be truly independent until they freed themselves from economic dependence on their former masters. But the Soviets invariably expected a political return for their own assistance. The claim of the People's Republic of China to be the natural leader of Third World revolt also obliged Khrushchev to make bolder endorsements of wars of national liberation. By 1960 it was already clear, however, that local politics and culture made every Third World situation unique.

The Middle East had reached an unstable deadlock based precariously on the UN-administered cease-fire of 1956. But the eclipse of British and French influence after the Suez debacle made the United States fearful of growing Soviet influence in the region, symbolized by the Soviet offer to take over construction of the Aswān Dam in Egypt. In January 1957 the U.S. Congress authorized the president to deploy U.S. troops in the region if necessary and to dispense $500,000,000 in aid to friendly states. This Eisenhower Doctrine appeared to polarize the region, with Middle East Treaty Organization members in support and Egypt, Syria, and Yemen (which formed a short-lived United Arab Republic in 1958) in opposition. When, in July 1958, nationalist generals backed by a variety of factions, prominent among which were Communists, overthrew the pro-Western Hāshimite monarchy in Iraq, and unrest spread to Jordan and Lebanon, Eisenhower responded at once. The 14,000 U.S. troops that landed in Beirut allowed the Lebanese president to restore order on the basis of a delicate compromise among radical, Muslim, and Christian factions. Khrushchev denounced the intervention, demanded that the U.S.S.R. be consulted, and tried without success to convene an international conference on the Middle East. His extension of an invitation to India, and not China, needlessly alienated Peking and signaled a new Soviet interest in relations with New Delhi.

The climactic year of African decolonization was 1960, and the first Cold War crisis on that continent occurred when, in that year, Belgium hastily pulled out of the vast Congo. Tribal antagonisms and rival personalities made even the independence ceremonies a catastrophe, as the Congolese nationalist leader and first prime minister, Patrice Lumumba, supported an insurrection by Congolese army units that involved the murder of whites and blacks alike. No sooner had Belgian troops returned to restore order than Moise Tshombe declared the secession of the iron-rich Katanga province. UN Secretary General Dag Hammarskjöld intervened against the Belgians and Katangese (thereby setting an ominous precedent of UN toleration for black violence against blacks or other races), while the Soviets accused Tshombe of being a dupe for imperialist mining interests and threatened to send arms and Soviet "volunteers" to the leftist Lumumba. Hammarskjöld then organized a UN armed force to subdue Katanga and save the Congo—and Africa—from Cold War involvement. The clumsy UN efforts did not prevent, and may have incited, the spread of civil war. Lumumba tried to establish his own secessionist state, but he then fell into the hands of the Congolese army headed by Joseph Mobutu, a former sergeant, and was murdered by the Katangans in January 1961. Hammarskjöld himself died in a plane crash in the Congo in September 1961. UN troops remained until 1964, but as soon as they were withdrawn rebellion returned and Mobutu seized control in a military coup d'état in 1965. The Katangan revolt was not quelled until 1967.

The Congo crisis

In Southeast Asia the Geneva Accords disintegrated rapidly after 1954. The planned elections to reunify Vietnam were never held, since South Vietnam's leader, Ngo Dinh Diem, both feared the results and denied the possibility of free elections in the Communist north. Ho Chi Minh's regime in Hanoi then trained 100,000 native southerners for guerrilla war and launched a campaign of assassination and kidnapping of South Vietnamese officials. In December 1960 the Viet Cong (as Diem dubbed them) proclaimed the formation of a National Liberation Front (NLF), with the avowed aim of reuniting the two Vietnams under a Hanoi regime. American advisers tried vainly to arrest the disintegration of South Vietnam with advice on counterinsurgency and state-building techniques.

Guerrilla war in Vietnam

In neighbouring Laos the Communist Pathet Lao took control of the two northernmost provinces of the country in defiance of the neutral government under Prince Souvanna Phouma agreed upon after Geneva. Those provinces sheltered the Ho Chi Minh Trail supply route bypassing the demilitarized zone between the two Vietnams. When a new, assertive Laotian government sent troops to enforce its authority over the provinces in 1958–59, civil war appeared inevitable. A military coup d'état led by Kong Le briefly returned Souvanna Phouma to power, but when Kong Le was in turn driven out in December 1960, he joined forces with the Pathet Lao in their strategic stronghold in the Plain of Jars. Having secured the Laotian territory needed for infiltration and assault on South Vietnam, North Vietnam persuaded China and the U.S.S.R. in December 1960 to approve Ho's plan for a "nonpeaceful transition to socialism" in Vietnam.

Latin-American problems. Finally, Cold War rivalry and Third World problems intersected devastatingly in the Americans' own backyard. Before the era of Roosevelt's Good Neighbor Policy, the United States had frequently been accused of meddling too much in the affairs of other states in the hemisphere. By the 1950s the contradictory charge was leveled that the United States was not involving itself enough, as evidenced by the fact that the United States spent $12,600,000,000 on aid to Asia and the Middle East in the period 1953–57 compared with $1,900,000,000 on Latin America. But resentment over the CIA's role in thwarting a Communist-backed coup in Guatemala in 1954 and violent protests against Vice President Richard M. Nixon during his trip to Caracas and Lima in 1958 alerted Washington to the dangers inherent in neglecting the genuine needs of the region. The United States agreed to fund an Inter-American Development Bank, while the State Department sought to avoid too close an association with unpopular, authoritarian regimes. Whatever the overall merits of such a policy, it had immediate and disastrous effects in Cuba.

In 1952 Fulgencio Batista established a corrupt dictatorship in Cuba, and four years later a young revolutionary named Fidel Castro took to the Sierra Maestra with 150 comrades and made pretensions of fighting a guerrilla war. In fact, Castro's campaign was largely propaganda (the insurgents lost only 40 men in the largest engagement), and the real struggle for Cuba was fought out in the arenas of Cuban and American public opinion. After Nixon's tour, liberal opinion and the State Department deserted Batista, and the new ambassador to Havana was ordered to preside over his fall. In March 1958 the United States suspended arms sales to Cuba, and on Jan. 1, 1959, a triumphant Castro entered Havana without the necessity of fighting a battle. Contrary to his image as populist and a democrat, Castro made himself the new dictator, nationalized hundreds of millions of dollars worth of American property, and declared that he was and had always been a Marxist. His actions gradually alienated whatever sympathy he had in the United States. Castro invited Soviet aid and came to rely on it heavily after the United States curtailed Cuba's sugar import quota in July 1960. Eisenhower instructed the CIA to explore means of removing Castro, who made Cuba into an immensely valuable Soviet satellite 90 miles from the United States.

Castro's victory

By 1960, therefore, the post-Sputnik world posed new challenges for the Western alliance stretching from outer space to Third World jungles. Polls showed that a majority of western Europeans believed Khrushchev's propaganda about Soviet superiority and that a majority of Americans

no longer believed in Eisenhower's low-key approach to Cold War issues.

SUPERPOWER RELATIONS IN THE 1960S

Policies of the Kennedy administration. The inauguration of John F. Kennedy as president of the United States infused American foreign policy with new style and vigour. He had promised to "get America moving again," and he appointed a Cabinet and staff who shared his belief that the United States could be doing far more to prove its technological and moral superiority over the U.S.S.R., win the "hearts and minds" of Third World peoples, and accelerate social progress at home. His administration also overturned Eisenhower's policy on economy and defense and held that Keynesian fiscal policy and large programs for research, education, and human resources would foster the rapid growth needed to pay for the new federal activism. Kennedy's inaugural address was thus an exhortation and warning: "Let every nation know, whether it wishes us well or ill, that we shall pay any price, bear any burden, meet any hardship, support any friend, oppose any foe to assure the survival and the success of liberty." He and Secretary of Defense Robert McNamara accordingly increased the U.S. defense budget by 30 percent in their first year in office and approved deployment of a strategic triad of weapons—the land-based Minuteman ICBMs, submarine-launched Polaris missiles, and B-52 bombers. The Kennedy advisers had also been highly critical of the policy of reliance on massive retaliation and determined to make the United States capable of flexible response by expanding conventional armed forces as well. Kennedy paid special attention to the training of counterinsurgency "special forces."

U.S. strategic triad

On May 25, 1961, Kennedy told a joint session of Congress that "the great battlefield for the defense and expansion of freedom today is the whole southern half of the globe—Asia, Latin America, Africa, and the Middle East." The enemies of freedom were seeking to capture these rising peoples "in a battle of minds and souls as well as lives and territories." Expanded aid programs, the Peace Corps, active promotion of democracy through the U.S. Information Agency, and military support against guerrilla warfare would, he declared, all help in cases "where the local population is too caught up in its own misery to be concerned about the advance of Communism." Kennedy also underscored the impact of the Soviet space program on world opinion (Yuri Gagarin had become the first man to orbit the Earth on April 12) and asked that Congress commit the United States to a program to land a man on the Moon by 1970. Kennedy's call for the creation of an International Telecommunications Satellite Consortium bespoke his desire to associate the United States with the peaceful uses of outer space.

The new attitude toward the Third World was perhaps the clearest break in American diplomacy. Basing its policy on W.W. Rostow's "non-Communist manifesto" describing stages of economic development, the Kennedy administration increased foreign aid for Third World nations whether or not they were politically aligned with the United States. The Alliance for Progress, created in March 1961, especially targeted Latin America. By 1965 U.S. foreign aid reached $4,100,000,000 as compared with $2,300,000,000 contributed by all other developed countries. The validity of Rostow's investment model for economic "takeoff" was debated for two decades, but perhaps the greatest weakness in U.S. aid programs was the assumption that local rulers could be persuaded to put their own people's welfare first. Instead, aid money often fed corruption, bolstered power-hungry leaders or socialist bureaucracies, or helped to finance local conflicts. What was more, the Soviets had some natural advantages in dealing with such leaders, since they offered no moralistic advice about democracy and human rights, while their own police-state methods served the needs of local despots. On the other hand, sustained world economic growth and measures to stabilize commodity prices helped the developing countries to achieve an average annual growth rate of 5 percent during the 1960s (compared with 5.1 percent for industrial countries). But the crushing rate of Third World population growth (2.6 percent annually) meant that even in the best of times foreign aid only just offset the effects of Third World fertility.

The development models debate

Kennedy's first crisis stemmed from his endorsement of the CIA plan to unseat Castro. The CIA had trained Cuban exiles in Guatemala and flown them to Florida, whence they were to stage an invasion of Cuba in expectation of a popular revolt there. Instead, the landing at the Bay of Pigs on April 17, 1961, was a fiasco. No coordination had been achieved with dissidents inside Cuba, while the failure to provide U.S. air cover (pehaps for fear of retaliation in Berlin) doomed the invasion. Castro's army killed or captured most of the 1,500-man force in two days. The U.S.S.R. reaped a propaganda harvest and pledged to defend Cuba in the future. Kennedy had to content himself with a promise to resist any efforts by Castro and guerrilla leader Che Guevara to export revolution elsewhere in Latin America.

The Bay of Pigs

Kennedy and Khrushchev held a summit meeting in Vienna in June 1961. With Berlin and the Third World uppermost in his mind, Kennedy proposed that neither superpower attempt to upset the existing balance of power in any region where the other was already involved. Khrushchev evidently considered the young president to be weak and on the defensive and tried to intimidate him with a new ultimatum, threatening to turn over control of western access to West Berlin to the East German government. (Khrushchev was being pressured by East German leader Walter Ulbricht to stem the tide of thousands of skilled workers who were fleeing across the zonal boundary into West Berlin.) Kennedy responded by pledging to defend West Berlin and calling up 250,000 reservists. On Aug. 13, 1961, Soviet and East German troops closed down interallied checkpoints and proceeded to build the Berlin Wall, sealing off the western city. Just as in 1948, the U.S. leadership debated whether to respond with force to this violation of the Potsdam Accords, but the hesitancy of the NATO allies and the timidity—or prudence—of Kennedy limited the West to a reassertion of access rights to West Berlin.

The Cuban missile crisis. In the midst of this crisis the Soviets unilaterally broke the moratorium on nuclear testing, staging a series of explosions yielding up to 50 megatons. Soviet technology had also perfected a smaller warhead for the new Soviet missiles now ready to be deployed, like the Minuteman, in hardened silos. Khrushchev, his nation still behind in strategic nuclear firepower, tried to redress the balance by insinuating 42 medium-range missiles into Cuba, whence they could reach most of the continental United States. He apparently hoped that these missiles, once in place, could then serve as a bargaining chip in negotiations leading to a neutralized Germany, which in turn might help Moscow persuade the Chinese to cease their own nuclear program. Instead, the ploy brought the world to the brink of war. U-2 spy planes photographed the missile sites under construction in Cuba on Oct. 14, 1962. Two days later Kennedy convened a secret crisis-management committee that leaned at first toward a surgical air strike to destroy the sites. But the President opted for a less risky response: a naval quarantine to prevent Soviet freighters from reaching Cuba and an ultimatum demanding that the bases be dismantled and the missiles removed. On October 18, Soviet Ambassador Andrey Gromyko met with Kennedy and denied that the U.S.S.R. had any offensive intentions with respect to Cuba. On October 22 the President informed the nation of the crisis and called on Khrushchev to pull back from "this clandestine, reckless, and provocative threat to world peace." For two days the world waited anxiously, and on the 24th Soviet ships in transit abruptly changed course away from Cuba. On the 26th Khrushchev sent Kennedy a message offering to withdraw the missiles in exchange for a U.S. pledge never to invade Cuba. The next day a harsher message arrived with a new demand that the United States withdraw its own missiles from Turkey. Those antiquated Jupiters, deployed in the early post-Sputnik scare, were already due for removal, but Kennedy would not do so under Soviet threat. Hence Attorney General Robert Kennedy suggested a ploy: simply reply to Khrushchev's

U.S. blockade of Cuba

first note as if the second had never been sent. On the 28th the Soviets agreed to dismantle the Cuban bases in return for a no-invasion pledge. Several months later the United States quietly removed its missiles from Turkey.

The Cuban missile crisis seemed at the time a clear victory for Kennedy and the United States and was widely attributed to American superiority in nuclear weapons. In fact, neither side showed the slightest willingness even to bluff a nuclear strike, and it was probably the overwhelming U.S. superiority in conventional naval and air power in its home waters that left the U.S.S.R. no option but retreat. Nor was the crisis an unmitigated American victory. Kennedy's pledge never to overthrow Castro by force meant that the United States would have to tolerate whatever mischief he, backed by $300,000,000 a year in Soviet aid, might contrive in the future. To be sure, Kennedy warned that the United States would never tolerate any expansion of Communism in the hemisphere. (This pledge was underwritten by Lyndon Johnson in 1965 when he sent U.S. troops into the Dominican Republic to prevent a leftist takeover, but such interventionism only reminded Latin Americans of past "Yankee imperialism" and gave credence to Castro's anti-American propaganda.) The existence of a Communist base in the Caribbean, therefore, was to be a source of unending vexation for future American presidents. What is more, the Cuban missile crisis hardened Soviet determination never again to be humiliated by military inferiority. Khrushchev and his successors accordingly began the largest peacetime military buildup in history, which, by the 1970s, accorded the Soviet Union parity with the United States in nuclear forces and the ability to project naval power into every ocean of the world.

On the other hand, the Cuban missile crisis marked the final frustration of Khrushchev's efforts to force a German peace treaty and prevent the deployment of nuclear weapons on German or Chinese soil. Peking, of course, had supported the Soviets' bid to place missiles in Cuba and had taken the opportunity to attack India (see below). But the precipitous Soviet retreat prompted Chinese charges of "capitulationism." The Chinese nuclear program proceeded apace, with the People's Republic exploding its first atomic device in 1964. Never again would the Soviet leadership hope to control the foreign policy of the other Communist giant.

Renewed U.S.–Soviet cooperation. U.S.–Soviet relations, by contrast, markedly improved after the sobering visit to the brink of war. Hopes for a comprehensive nuclear test-ban treaty ran afoul of the U.S.S.R.'s customary refusal to permit on-site inspection to monitor underground tests, but a partial Test-Ban Treaty was signed by the United States, Britain, and the U.S.S.R. on Aug. 5, 1963, prohibiting nuclear explosions in the air, under the sea, and in outer space. The superpowers also established a direct communication link between Washington and Moscow for use in crisis situations. But other powers anxious to join the nuclear club, notably China and France, refused to adhere to the Test-Ban Treaty. Instead, the Chinese denounced Soviet collaboration with "the leader of world imperialism." Mao resurrected all of China's territorial claims against the Soviet Union dating from tsarist Russian imperialism and advocated partition of the Soviet empire. The Soviets, in turn, branded Mao with their most hateful current epithet: he was "another Stalin."

Nuclear Test-Ban Treaty

President Kennedy was assassinated on Nov. 22, 1963, and Khrushchev was removed from power by the Politburo in October 1964, a victim of his own failures in foreign policy and agriculture, and of the Communist Party's resistance to his attempted reforms. But the bilateral effort to pursue arms control survived under President Johnson and under Leonid Brezhnev and Alexey Kosygin. The Outer Space Treaty ratified in 1967 banned nuclear weapons and other weapons of mass destruction in Earth's orbit and on the Moon. A U.S.–Soviet draft Non-Proliferation Treaty was also adopted by the UN in June 1968. (Once again, France, China, India, Pakistan, and Israel refused to sign.) But none of the arms-control instruments of the 1960s put a cap on the arms race or restrained the signatories from doing anything in the strategic field that they had a desire to do anyway. The superpowers were able to modernize their arsenals through underground nuclear testing; outer space was an awkward and vulnerable place to deploy warheads in any case; and neither superpower had an interest in seeing nuclear weapons spread to more countries. Rather, American nuclear policy aimed, at least in the short run, at ensuring the continued stability of U.S.–Soviet deterrence, lately dubbed "mutual assured destruction." Adopting the views of strategist Bernard Brodie, McNamara concluded early on that the Soviets must eventually catch up and that a state of parity was the best that could be achieved in the nuclear age. Soon each side would be capable of obliterating the other in a retaliatory strike, even after a sneak attack. At that point, any attempt by either side to achieve an illusory superiority would only destabilize the balance and tempt one or the other into launching a first strike. Whether the Soviets ever shared this doctrine of deterrence is dubious. Marshal Sokolovsky's volumes on military strategy in the 1960s, while granting that nuclear war would be an unprecedented disaster for all, still committed the U.S.S.R. to a war-winning capability.

Nuclear Non-Proliferation Treaty

China, meanwhile, succumbed to another series of Maoist actions that completed that country's drift into chaos and isolation. In February 1966, Mao gave the nod to the young and fanatical Red Guards to make, by force, a Cultural Revolution. Violence swallowed up schools, factories, bureaucracies, cultural institutions, and everything that smacked of foreign or traditional Chinese influence. Countless victims suffered internal exile, public humiliation, forced "self-criticism," or death, while attacks on foreign embassies and denunciations of the superpower "condominium" persuaded Americans and Soviets alike that the Chinese were, for the moment at least, the major threat to world peace.

By the late 1960s, therefore, relations between the United States and the Soviet Union underwent a marked thawing. But at the same time, the Soviets and Americans alike had to acknowledge a growing lack of control over their once coherent Cold War camps.

THE EUROPE OF THE FATHERLANDS

Great Britain and decolonization. The Suez crisis of 1956, followed by Soviet space successes and rocket-rattling after 1957, was a serious blow to the morale of western Europe. Given the potential of the war scares over Berlin to fracture NATO, the United States had to reassure its allies and try to satisfy their demands for greater influence in alliance policy. American efforts largely succeeded in the case of Britain, an ally much depleted in power and will. American policy largely failed in the case of France, an ally stronger and more stable than at any time since 1940.

Since World War II, Britain had tried to maintain the appearance of a global power, developing its own nuclear weapons, deploying conventional forces around the world, and keeping hold of its African colonies. Churchill, returned to office in the early 1950s, had vowed never to "preside over the liquidation of the British Empire." Likewise, the British held aloof from the continental experiments with integration and saw their role rather as the vertex of three great world systems: the English-speaking peoples, the British Commonwealth, and the old European Great Powers. All this came to a sudden end when a combination of factors—sluggish economic performance by the world's oldest industrial power, growing pressure to decolonize, demands for greater social expenditures at home, and the superpowers' leap into the missile age—convinced London that it could no longer afford to keep up appearances in foreign policy. A defense White Paper of 1957 signaled a shift away from conventional armed forces toward reliance on a cheap, national nuclear deterrent. Then Sputnik convinced the British government to cancel its own ballistic-missile program and rely on its special relationship with the United States to procure modern weapons. Eisenhower agreed to sell the Skybolt air-launched missile to Britain by way of healing the wounds inflicted by Suez and shoring up NATO after Sputnik. But when McNamara subsequently cut the Sky-

Britain's retreat

bolt program in his campaign to streamline the Pentagon, the British government was acutely embarrassed. Kennedy met with Prime Minister Harold Macmillan at Nassau in December 1962 and offered Polaris submarines instead. It was hoped at the time that the British deterrent would be subsumed in a multilateral NATO force. The Conservative government also made the hard decision in 1963 to seek admission to the Common Market, only to be vetoed by the French. Not until 1971 was Britain's application, together with those of Ireland and Denmark, approved and the European community broadened.

The period 1957–62 was also the climax of decolonization. As early as 1946–47, when Britain was granting independence to India and states of the Middle East, the Attlee government sponsored the Cohen–Caine plan for a new approach to West Africa as well. It aimed at preparing tropical Africa for self-rule by gradually transferring local authority from tribal chiefs to members of the Western-educated elite. Accordingly, the Colonial Office drafted elaborate constitutions, most of which had little relevance to real conditions in primitive countries that had no natural boundaries, no ethnic unity or sense of nationalism, and no civic tradition. But when the Gold Coast (Ghana) elected radical leader Kwame Nkrumah, who then demanded immediate independence and got it in 1957, the British felt unable to deny similar grants to neighbouring colonies. Britain had, in fact, when the matter was faced squarely, little desire to hang on, given the exorbitant financial and political costs of late imperialism. In 1959 the Cabinet quietly decided to withdraw from Africa as soon as it won reelection. Macmillan then announced the new policy in Cape Town on Feb. 3, 1960, when he spoke of "the winds of change" sweeping across the continent. Nigeria, Togo, and Dahomey (Benin) became sovereign states in 1960, Tanganyika (Tanzania), Uganda, and Kenya in East Africa between 1961 and 1963, and Malawi and Northern Rhodesia (Zambia) in the south in 1964. White residents of Southern Rhodesia, however, declared their own independence in defiance of London and the UN. The Republic of South Africa and the surviving Portuguese colonies of Angola and Mozambique made those portions of southern Africa the last refuges of white rule on the continent.

African decolonization

Most new African states had little more to support their pretensions to nationhood than a paper constitution, a flag, and a London-backed currency. The leaderships blamed African underdevelopment on past exploitation rather than on objective conditions, thus rejecting the American and European development theories that saw political stability as possible only within the context of economic growth. Nkrumah lectured to his Pan-African Congress in 1963 that "the social and economic development of Africa will come only within the political kingdom, not the other way around." Indeed, Africa's politicians invariably styled themselves as charismatic leaders whose political and even spiritual guidance was the prerequisite for progress. Nkrumah himself seized all power in Ghana and made himself a quasi-divine figure until the army overthrew him in 1966. Togo's government fell to a military coup in 1963, and mutinies broke out in Kenya, Uganda, and Tanganyika. In the latter country, Julius Nyerere, much admired in Europe and the United States, declared a one-party dictatorship based on his ideology of *ujamaa* (familyhood), and courted aid from Communist China. Other leaders contrived similar ideologies to justify personal rule. By 1967 black Africa had suffered 64 attempted coups d'état, many born of tribal hatreds, and most Africans had fewer political rights than under colonial rule.

With the exception of the Congo, Cold War rivalries were absent from Africa in the 1960s, while the African regimes themselves wisely declared the inviolability of their boundaries lest the artificial lines drawn by the colonial powers provoke endless warfare. When Igbo tribesmen seceded from Nigeria in 1967 and formed the rebel state of Biafra, only four African nations supported their cause. Nigeria suppressed the secession in a bloody civil war. Decolonization nonetheless had a profound effect on international relations through the medium of the UN. The three dozen or so new African states combined with those of Asia and the Soviet bloc to form a permanent majority made up mostly of one-party dictatorships nevertheless claiming moral superiority over the Western "imperialists." Thus the founders' dreams that the UN might become a "parliament of the world" and bulwark of democracy and human rights were undermined by the very process of what, with one or another degree of irony, was called liberation. Instead, the UN degenerated into a forum for polemics and a playground for intrigue.

The Biafra revolt

France's independent course. Where Britain was enervated by the advent of the missile age and the Third World, France was invigorated. The weak Fourth Republic had suffered defeat in Indochina and was embroiled in a civil war between French settlers and native Muslims in Algeria. But Charles de Gaulle was called back to power 8 months after Sputnik 1, and he set about to forestall a threatened coup d'état by the French army, stabilize French politics, end the Algerian debacle (independence was granted in 1962 in the Treaty of Évian), and restore French power and prestige in the world. His constitution for a Fifth Republic established presidential leadership and ended France's chronic political instability, itself an achievement of great value to the West. But de Gaulle's vision of France involved neither *la plus grande France* of the colonial empire nor the Atlanticist France of NATO, nor the European France of the Common Market (EEC). Rather, de Gaulle proclaimed that a France without grandeur was not France at all and set out to reestablish French military, technological, and diplomatic independence.

France's decolonization proceeded as rapidly as Britain's, culminating in 1960 with the partition and independence of French West Africa. But de Gaulle refused to exhibit any guilt or doubt about France's *mission civilisatrice* and offered the populations a choice between going it alone or joining a linguistic, monetary, and development community with the former metropole. Only Guinea elected to follow a Marxist leader who sought ties with the U.S.S.R.

In defense matters, de Gaulle bristled at NATO's reliance on the United States and publicly doubted whether the U.S. nuclear umbrella over Europe was still reliable after Sputnik. Would the Americans really risk a nuclear attack on New York City or Washington, D.C., to defend Berlin or Paris? Therefore de Gaulle accelerated the quiet development of a nuclear capacity begun under the Fourth Republic, and France exploded its first atomic bomb in 1960. He also quintupled French spending on research and development, built independent bomber, missile, and submarine forces—the nuclear *force de frappe*—and made France the third space power with the launch of an Earth satellite in 1965. Gaullist France's rebellion against the tutelage of a superpower unwilling to accord it diplomatic equality or help it develop nuclear weapons bore genuine comparison to Maoist China. And the United States, like the U.S.S.R., tried various means to rein in its obstreperous ally, first trying to dissuade France from developing nuclear weapons, then inviting it to join a multilateral nuclear force (MLF) under NATO command. First suggested in December 1960, the MLF was pushed by Kennedy and Johnson, but de Gaulle responded with contempt, while Adenauer feared to join lest he damage West German relations with France. The idea of an MLF died in 1965, and in July 1966 de Gaulle took the final step of withdrawing French armed forces from NATO (though France remained a political member of the alliance). NATO headquarters were then moved from Paris to Brussels.

The *force de frappe*

De Gaulle similarly distrusted the movement for European integration, preferring what he termed "the Europe of the fatherlands" stretching "from the Atlantic to the Urals"—the latter phrase provocatively including the European portion of the Soviet Union. He tolerated European institutions such as the EEC, but only on terms of strict French leadership in partnership with West Germany, hence his veto of Britain's application in 1963. Moreover, de Gaulle viewed European cooperative programs in atomic and space research as ways to tap foreign contributions for the improvement of French national competitiveness, not as ways for France to contribute to European unity. Adenauer eagerly accepted de Gaulle's

leadership in order to complete Germany's postwar rehabilitation and retain the EEC market for Germany's booming industry. But de Gaulle crushed any lingering hopes for European political integration by boycotting the EEC in 1965–66 rather than allow the federalist commissioner Walter Hallstein to enhance the decision-making power of the EEC parliament. Finally, de Gaulle delighted in open criticisms of American foreign policy and courted closer relations with Moscow (which in return seized upon what appeared to be an opportunity to split the alliance), culminating in the pomp of a state visit in 1966. In all these ways Gaullist policy was a constant vexation to Washington, but in the long run it was probably a boon to the Western alliance for the technological dynamism, political stability, and military might it restored to France.

De Gaulle's diplomacy

ASIA BENEATH THE SUPERPOWERS

The first rebellions against the European imperial system had occurred on the rimlands of Asia at the start of the 20th century: the Russo-Japanese War, the Indian home-rule movement, and the Chinese and Young Turk revolutions. By the 1960s the southern tier of Asian states had given birth to local systems of power and rivalry beyond the control of the Great Powers. Several factors set these nations and their conflicts apart. First, the Middle East, the Indian subcontinent, and Indochina all seethed with ethnic conflicts that had little to do with the Cold War. Second, eastern and southern Asia continued to undergo a demographic explosion that made China and India by far the most populous states in the world and non-Soviet Asia the home of 55 percent of the human race. Third, the politics of these societies, involved as they were in the awakening of vast peasant masses, the breakdown of traditional village agriculture, religious and dynastic structures, and programs for rapid modernization, did not easily fall into categories familiar to Soviet and American planners of the 1950s. Fourth, most of the Asian rim was remote from the European Soviet Union and North America, making direct intervention there expensive and risky. Nevertheless, continued Soviet efforts to win influence in the Middle East, Chinese claims to natural leadership of the poor southern half of the globe, and American attempts to preserve a structure of containment of the Communist world necessarily involved the Great Powers in Asian diplomacy. The fate of half of mankind could not, it seemed, be a matter of indifference to countries that claimed universal missions.

The Six-Day War. In the Middle East, Nasser's star began to decline in the 1960s from its post-Suez peak. The Syrian Ba'th party, though socialist, resented Nasser's assumption of Arab leadership and took the country out of the United Arab Republic in 1961. Likewise, the presence of 50,000 Egyptian troops in Yemen failed to overcome the forces supporting the Yemeni imam, who was backed in turn by Saudi Arabia. On the other hand, the Cairo Conference of 1964 succeeded in rallying pan-Arab unity around resistance to Israel's plans to divert the waters of the Jordan. Also with both eyes on Israel, the conference restored an Arab High Command and elevated the Palestinian refugees (scattered among several Arab states since 1948) to a status approaching sovereignty, with their own army and headquarters in the Gaza Strip. Syria likewise sponsored a terrorist organization, al-Fatah, whose raids against Jewish settlements provoked Israeli military reprisals inside Jordan and Lebanon. Syria was divided principally between the socialist Ba'th, led by the minority 'Alawite community that dominated the army, and pro-Nasser pan-Arabists. In 1966 a military coup established a radical Ba'thist regime, but the army itself then split into rival factions. Nasser took the initiative to prevent a rightist reversal in Syria and reassert his leadership of the Arab cause.

Armed with Soviet tanks and planes, Nasser claimed his option under the 1956 accord to demand withdrawal of UN peace-keeping forces from the Sinai. Secretary-General U Thant complied on May 19, 1967. Four days later Nasser closed the Gulf of Aqaba to Israeli shipping. The Soviets apparently urged Nasser to show moderation, while President Johnson told Israeli Foreign Minister Abba Eban to remain calm: "Israel will not be alone unless it decides to go alone." But neither superpower was able to restrain its client. When Egyptian and Iraqi troops arrived in Jordan, giving every sign of an imminent pan-Arab attack, the Israeli Cabinet decided on a preemptive strike. The Israeli air force destroyed Nasser's planes on the ground, and in six days of fighting (June 5–10) the Israeli army overran the Sinai, the West Bank of the Jordan including the Old City of Jerusalem, and the strategic Golan Heights in Syria. The UN Security Council arranged a cease-fire and passed Resolution 242, calling for a withdrawal from all occupied regions. The Israelis were willing to view their conquests (except Jerusalem) as bargaining chips but insisted on Arab recognition of the right of Israel to exist and firm guarantees against future attack. The so-called frontline Arab states were neither able (for domestic reasons) nor willing to give such guarantees and instead courted Soviet and Third World support against "U.S.–Israeli imperialism." Hence Israel remained both greatly enlarged and possessed of shorter, more defensible borders, although it did acquire the problem of administering more than a million Arabs in Gaza and the West Bank.

Israel's first strike

China, India, and Pakistan. The Indian subcontinent comprised another system of conflict focused on border disputes among India, Pakistan, and China. Nehru's Congress Party had stabilized the political life of the teeming and disparate peoples of India. The United States looked to India as a laboratory of democracy and development in the Third World and a critical foil to Communist China, and in consequence had contributed substantial amounts of aid. But the U.S.S.R. also began an effective aid program in 1955, and Nehru looked to the U.S.S.R. for support against China once the Sino-Soviet split became evident. The Peking regime had brutally suppressed the buffer state of Tibet in 1950 and disputed the border with India at several points between the tiny Himalayan states of Nepal, Bhutan, and Sikkim. American military aid to Pakistan (a member of CENTO) also gave the Indians and Soviets reason to cooperate. In 1961, when President Ayub Khan of Pakistan earnestly sought Kennedy's mediation in the dispute over Kashmir, U.S. pressure proved inadequate to bring Nehru to the bargaining table.

Nehru was humbled, however, when the Chinese suddenly attacked in force across the disputed boundaries, choosing as their moment the height of the Cuban missile crisis. Indian forces were soundly defeated, 7,000 men having been killed or captured, and the lowlands of Assam lay open to the invaders. Apparently the Chinese leadership expected a Soviet triumph in Cuba or at least a drawn-out crisis that would prevent superpower intervention in India. But the swift resolution in Cuba in favour of the United States permitted Washington to respond to Nehru's request for help. The Chinese then halted the offensive and soon afterward withdrew.

The Kennedy administration used its newly won leverage to urge Nehru to settle his quarrel with Pakistan, but the negotiations failed to overcome Hindu–Muslim antipathy and the fact that the conflict was a unifying element in the domestic politics of both countries. Pakistani troops crossed the cease-fire line in Kashmir in August 1965, and India responded by invading Pakistan proper. Both superpowers backed U Thant's personal quest for a cease-fire, and the Indians withdrew. But the U.S.S.R. was able to regain influence with New Delhi, especially after the accession to power of Nehru's daughter, Indira Gandhi. In 1971 India and the U.S.S.R. concluded a 20-year Treaty of Peace and Friendship and Cooperation, an indication of how much the United States (not to mention Britain) had lost touch with the once model Third World democracy. Pakistan, meanwhile, was in ferment. President Ayub Khan was forced to step down in 1969 in favour of Yahya Khan, while elections in 1970 polarized the geographically divided country. West Pakistan chose Zulfikar Ali Bhutto as prime minister, but densely populated East Pakistan (Bengal) voted almost unanimously for a separatist party under Mujibur Rahman. When talks between the two leaders broke down, Bhutto gambled on sending in troops and jailing the secessionists. Vicious fighting broke out in Bengal, flooding India with some 10,000,000 refugees

India–Pakistan war

and provoking Indian intervention. The Soviets cautioned restraint but clearly favoured India, while U.S. President Nixon sent a carrier task force into the Bay of Bengal and openly favoured Pakistan, influenced by Pakistan's role as intermediary between Washington and Peking. In two weeks of fighting (Dec. 3–16, 1971) the Indians defeated the Pakistanis on all fronts, and East Pakistan became the new state of Bangladesh, comprising the delta of the Indus river. Pakistan thus lost well over half its population. Once Nixon's opening to China bore fruit, the subcontinent seemed to be polarized around a U.S.S.R.–India axis and a U.S.–Pakistan–China axis, though the United States resumed aid and food shipments during the Indian famine of 1972.

Creation of Bangladesh

To the south and east of the Asian mainland lay the vast, populous archipelago of Indonesia, where another romantic revolutionary, Sukarno, had played host to the Bandung Conference of 1955. Like Nasser, Nehru, and Mao, he ruled his 100,000,000 people by vague, hortatory slogans that added up to a personal ideology with nationalist and Communist overtones. The Kennedy administration had tried to appease Sukarno with development aid and even obliged the Dutch to cede Irian Barat (Irian Jaya) in the face of Sukarno's threats in 1963. Sukarno still turned to Moscow for support and gave himself over to profligate personal behaviour and foreign adventures, most notably an attempted attack on Malaysia in 1963. By 1965 Indonesia was $2,400,000,000 in debt and suffering widespread famine. In January of that year Sukarno withdrew his country from the UN over a dispute with Malaysia. The Soviets were clearly disgusted with Sukarno's regime, while the rival Chinese persuaded (perhaps blackmailed) him into approving a savage pro-Communist putsch in October 1965. General Suharto, however, put down the uprising and exacted a violent revenge in which as many as 300,000 Communists and their supporters were killed. Indonesia subsequently concerned itself with its internal problems, frustrating Soviet, Chinese, and American hopes for a strong ally.

Revolt and repression in Indonesia

The destruction of Indonesian Communism, achieved without the slightest American effort, was a source of great comfort for the United States, for a diametrically opposite course of events had, by 1965, begun to unfold in the last theatre of Asian conflict, Vietnam.

THE WAR IN SOUTHEAST ASIA

Cold War assumptions and the quagmire. As the Vietnam war began to recede into the past, the entire episode, from a neutral perspective, increasingly came to seem incredible. That the most powerful and wealthy nation on Earth should undertake 15 years of wasting conflict against a tiny state 10,000 miles from its shores—and lose—almost justifies historian Paul Johnson's phrase, "America's suicide attempt." Yet the destructive and futile U.S. engagement in Southeast Asia was a product of a series of trends that had been maturing since World War II. The early Cold War gave rise to U.S. leadership in the containment of Communism. Decolonization then thrust the United States into a role described by advocate and critic alike as "the world's policeman"—protector and benefactor of the weak new governments of the Third World. The potential of guerrilla insurgency, demonstrated in Tito's resistance to the Nazis and especially in the postwar victories of Mao, the Viet Minh, and Castro, made it the preferred mode for revolutionary action around the world. The emerging nuclear stalemate alerted Washington to the need to prepare for fighting limited (sometimes called "brushfire") wars sponsored by the Soviet Union or China through proxies in the Third World. In this era of Khrushchevian and Maoist assertiveness the United States could not allow any of its client states to fall to a Communist "war of national liberation" lest it lose prestige and credibility to Moscow and Peking. Finally, the "domino theory," to the effect that the fall of one country would inexorably lead to the communization of its neighbours, magnified the importance of even the smallest state and guaranteed that sooner or later the United States would become entangled under the worst possible conditions. One or even all of the assumptions under which the United States became involved in Vietnam may have been faulty, but very few in the government and the public questioned them until long after the country was committed.

The domino theory

By 1961, Diem's fledgling government in South Vietnam was receiving more U.S. aid per capita than any other country except Laos and South Korea. Authoritative reports detailed both the Viet Cong's campaign of terror against government officials in the south and widespread discontent over Diem's corrupt and imperious rule. In the face of both Khrushchev's renewed vow to support wars of national liberation and de Gaulle's warning ("I predict you will sink step by step into a bottomless military and political quagmire"), Kennedy chose Vietnam as a test case for American theories of state building and counterinsurgency. He approved a proposal by W.W. Rostow and General Maxwell Taylor to assign advisers to every level of Saigon's government and military, and the number of Americans in Vietnam grew from 800 to 11,000 by the end of 1962.

Ho Chi Minh's North Vietnamese considered the struggle against Diem and his American sponsors merely the next phase of a war that had begun against the Japanese and had continued against the French. Their determination to unify Vietnam and conquer all of Indochina was the principal dynamic behind the conflict. The total number of Communist troops in the South grew by recruitment and infiltration from some 7,000 in 1960 to more than 100,000 by 1964. Most were guerrilla militiamen who served also as local party cadres. Above them were the Viet Cong (formally the National Liberation Front, or NLF), deployed in regional military units, and units of the People's Army of North Vietnam (PAVN) entering the south along the Ho Chi Minh Trail. U.S. Special Forces tried to counter Communist control of the countryside with a "strategic hamlet" program, a tactic used with success by the British in Malaya. Diem instituted a policy of relocating the rural population of South Vietnam in order to isolate the Communists. The program caused widespread resentment, while Diem's persecution of local Buddhist sects provided a rallying point for protests. When Buddhist monks resorted to dramatic self-immolation in front of Western news cameras, Kennedy secretly instructed Ambassador Henry Cabot Lodge to approve a military coup. On Nov. 1, 1963, Diem was overthrown and murdered.

South Vietnam then underwent a succession of coups d'état that undermined all pretense that the United States was defending democracy. The struggle was thenceforth viewed in Washington as a military effort to buy time for state building and the training of the South Vietnamese army (Army of the Republic of Vietnam; ARVN). When two American destroyers exchanged fire with a North Vietnamese torpedo boat eight miles off the North's coast in August 1964 (an event whose occurrence was later disputed), Congress passed the Gulf of Tonkin Resolution authorizing the president to take whatever measures he deemed necessary to protect American lives in Southeast Asia. Johnson held off escalating the war during the 1964 electoral campaign but in February 1965 ordered sustained bombing of North Vietnam and sent the first U.S. combat units to the South. By June, U.S. troops in Vietnam numbered 74,000.

Gulf of Tonkin incident

The Soviet Union reacted to American escalation by trying to reconvene the Geneva Conference and bring pressure to bear on the United States to submit to the peaceful reunification of Vietnam. But China bluntly refused to encourage a negotiated settlement and insisted that the U.S.S.R. help North Vietnam by pressuring the United States elsewhere. The Soviets, in turn, resented Peking's assertion of leadership in the Communist world and had no desire to provoke new crises with Washington. The North Vietnamese were caught in the middle; Ho's ties were to Moscow, but geography obliged him to favour Peking. Hence North Vietnam joined in boycotting the March 1965 Communist conference in Moscow. The Soviets, however, dared not ignore the Vietnam War lest they confirm Chinese accusations of Soviet "revisionism."

The conduct and cost of the war. Meanwhile, the United States slid ineluctably into the quagmire predicted by de Gaulle. U.S. forces reached a peak of 543,000 men in 1969.

(Australia, New Zealand, Thailand, and the Philippines also sent small contingents, and South Korea contributed 50,000 men). The U.S. strategy was to employ mobility, based on helicopters, and firepower to wear down the enemy by attrition at minimal cost in U.S. lives.

The war of attrition on the ground, like the bombing in the North, was designed less to destroy the enemy's ability to wage war than to demonstrate to the enemy that he could not win and bring him to the bargaining table. But stalemate suited Hanoi, which could afford to wait, while it was anathema to the Americans. Johnson's popularity fell steadily. Most Americans favoured more vigorous prosecution to end the war, but a growing number advocated withdrawal. Antiwar dissent grew and spread and overlapped with sweeping and violent demands for social change. The American foreign policy consensus that had sustained containment since the 1940s was shattered by Vietnam.

In retrospect, Johnson's attempt to prevent the war from disturbing his own domestic program was vain, and his strategic conception was grounded in folly and hubris. For he and his advisers had no clear notion of what the application of American force was supposed to achieve. It was merely assumed to be invincible.

Hanoi understood that the classic Maoist strategy of isolating cities by revolutionizing the countryside was inapplicable to Vietnam because the cities could still hold out with foreign support. Accordingly, the North Vietnamese Politburo approved in mid-1967 a plan for urban attacks throughout South Vietnam. General Vo Nguyen Giap insisted, however, that NLF guerrillas, not PAVN units, be risked. The expectation was that direct attacks on cities would undercut American claims of pacification and magnify domestic American dissent. On Jan. 31, 1968 (the Tet holiday, during which many ARVN troops were home on leave), an estimated 84,000 Communist troops infiltrated South Vietnamese cities, attacked government installations, and even penetrated the American embassy in Saigon. The Tet offensive was carried out at terrible cost to Communist strength, but American press reports turned the offensive into a psychological defeat for the United States. Instead of ordering a counterattack, Johnson removed himself from the 1968 presidential campaign, ordered a bombing halt, and pledged to devote the rest of his administration to the quest for peace. Negotiations began in Paris, but the rest of the year was spent bickering over procedural issues.

The Tet offensive

For more than 25 years after 1941 the United States maintained an unprecedented depth of involvement in world affairs. In 1968 Vietnam finally forced Americans to face the limits of their resources and will. Whoever succeeded Johnson would have little choice but to find a way to escape from Vietnam and reduce American global responsibilities.

NIXON, KISSINGER, AND THE DÉTENTE EXPERIMENT

Détente as realism. After eight years in the shadow of Eisenhower and eight more years out of office, Richard Nixon brought to the presidency in 1969 rich experience as an observer of foreign affairs and shrewd notions about how to prevent the American retreat from global commitments from turning into a rout. In broad outlines, the Nixon strategy included a phased withdrawal of ground forces from Vietnam, a negotiated settlement saving the Saigon regime, détente with the U.S.S.R., resumption of relations with mainland China, and military support for selected regional powers permitting them to take over as local "policemen" in lieu of direct American involvement. In a period of just four years, 1969–72, the United States abandoned once-unshakable Cold War attitudes toward the Communist nations, while scaling back its own exposure in response to the Sino-Soviet split, imminent Soviet strategic parity, and the economic and psychological constraints on U.S. action stemming from the new American imperative of "no more Vietnams." Nixon believed that his own record as an anti-Communist and tough negotiator would quiet conservative opposition to détente, while liberals would find themselves outflanked on their own peace issue. In both ends and means American foreign policy evinced a new realism in stark contrast to the "pay any price, bear any burden" mentality of the Kennedy-Johnson years. In his inaugural address Nixon spoke instead of an "era of negotiation."

Détente, however, was not meant to replace the abiding postwar American strategy of containment. Rather, it was meant to be a less confrontational method of containing Communist power through diplomatic accords and a flexible system of rewards and punishments by which Washington might moderate Soviet behaviour. Journalists dubbed this tactic "linkage" insofar as the United States would link positive inducements (*e.g.*, arms control, technology transfers, grain sales) to expected Soviet reciprocity in other areas (*e.g.*, restraint in promoting revolutionary movements). Nixon had no illusions that U.S.–Soviet competition would disappear, but he expected that this carrot-and-stick approach would establish rules of the game and recognized spheres of influence. Pulling the Soviets into a network of agreements, and thus giving them a stake in the status quo, would create a stable structure of peace. Finally, expanding economic and cultural ties might even serve to open up Soviet society.

By 1971, Leonid Brezhnev, now established as the new Soviet leader, was ready to welcome American overtures for a variety of reasons. In 1968 relations with the eastern European satellites had flared up again when leaders of the Czech Communist party under Alexander Dubček initiated reforms promoting democratization and free speech. A wave of popular demonstrations added momentum to liberalization during this "Prague Spring" until, on August 20, the U.S.S.R. led neighbouring Warsaw Pact armies in a military invasion of Czechoslovakia. Dubček was ousted and the reforms undone. The ostensible justification for this latest Soviet repression of freedom in its empire came to be known as the Brezhnev Doctrine: "Each of our parties is responsible not only to its working class and its people, but also to the international working class, the world Communist movement." The U.S.S.R. asserted its right to intervene in any Communist state to prevent the success of "counterrevolutionary" elements. Needless to say, the Chinese were fearful that the Brezhnev Doctrine might be applied to them. In 1969 they accused the U.S.S.R. of "social imperialism" and provoked hundreds of armed clashes on the borders of Sinkiang and Manchuria. Soviet forces arrayed against China, already raised from 12 weak divisions in 1961 to 25 full ones, now grew to 55 divisions backed by 120 SS-11 nuclear missiles. In August 1969 a Soviet diplomat had carefully inquired about the likely American reaction to a Soviet nuclear strike against China. In sum, the need to repair the Soviet image in the wake of the Prague Spring, the fear of dangerous relations with Peking and Washington at the same time, as well as the chronic Soviet need for agricultural imports and access to superior Western technology, were all powerful incentives for seeking détente.

The Brezhnev Doctrine

From a longer perspective, however, détente had been the strategy of the U.S.S.R. ever since 1956 under the rubric "peaceful coexistence." Brezhnev repeated Khrushchev's assertion that Soviet nuclear parity took the military leverage from the hands of the bourgeois world, forcing it to accept the legitimate interests of other states, to treat the U.S.S.R. as an equal, and to acquiesce in the success of "progressive" and revolutionary struggle. Détente was thus for the Soviets a natural expression of the new correlation of forces, a means of guiding the weakened Americans through the transition to a new phase of history—and was certainly not meant to preserve the status quo or liberalize the U.S.S.R. One Western proponent of détente described the Soviet conception of it as a way "to make the world safe for historical change," and pointed out the implicit double standard—*i.e.*, that it was admissible for the U.S.S.R. to continue the struggle against the capitalist world during détente, but a contradiction for the Western powers to struggle against Communism. From the Marxist point of view, however, this was merely another reflection of objective reality: Now that nuclear balance was a fact, greater weight accrued to conventional military strength and popular political action, each of which strongly favoured the socialist bloc.

Soviet concept of détente

The contrasting U.S. and Soviet conceptions of détente would eventually scotch the hopes placed in it on both sides. But from 1969 to 1972 those differences were not yet apparent, while the immediate incentives for a relaxation of tensions were irresistible.

Scaling back U.S. commitments. The first indications of a new American sense of limits in foreign policy were in the economic sphere. Since World War II the global market economy had rested on the Bretton Woods monetary system, based on a strong American dollar tied to gold. Beginning in 1958 the United States began to run annual foreign-exchange deficits, resulting partly from the costs of maintaining U.S. forces overseas. For this reason, and because their own exports benefited from an artificially strong dollar, the Europeans and Japanese tolerated the U.S. gold drain and used their growing fund of "Eurodollars" to back loans and commerce. By the mid-1960s de Gaulle began to criticize the United States for exploiting its leadership role to "export its inflation" to foreign holders of dollars. The Johnson administration's Vietnam deficits then added the prospect of internal American inflation. By 1971 the American economic situation warranted emergency measures. Nixon imposed wage and price controls to stem inflation, and Secretary of the Treasury John Connally abruptly suspended the convertibility of dollars to gold. The dollar was allowed to float against undervalued currencies like the deutsche mark and yen, in consequence of which foreign holders of dollars took sharp losses and foreign exporters faced stiffer competition from American goods. New agreements in December 1971 stabilized the dollar at a rate 12 percent below Bretton Woods, but the United States had sorely tried allied loyalty.

The American retreat from an overextended financial position and insistence that its allies share the burden of stabilizing the U.S. balance of payments was the economic analog to the Nixon Doctrine in military affairs. The new president enunciated this doctrine in an impromptu news conference on Guam during his July 1969 trip to welcome home the Apollo 11 astronauts from the Moon. Nixon announced that the United States would no longer send Americans to fight for Asian nations but would confine itself to logistical and economic support: "Asian hands must shape the Asian future." In accord with this effort to shift more of the burden of containment to threatened peoples themselves, Nixon planned to assist regional pro-Western powers like Iran in becoming bulwarks of stability by providing them with sophisticated American weapons.

The Nixon Doctrine

Before the Nixon Doctrine could be credible, however, the President had to extricate the United States from Vietnam. In March 1969 he outlined a policy of Vietnamization, comprising a phased withdrawal of American ground troops and additional material and advisory support to make the ARVN self-sufficient. Nixon also hoped to enlist the Soviets in the cause of peace, but Moscow had less influence over Hanoi than he imagined and could not afford to be seen as appeasing the United States. Nixon then shifted to a subtler approach—long-term pressure on Hanoi combined with better relations with both Communist giants. Late in 1969 secret talks began in Paris between Henry Kissinger, Nixon's adviser for national security, and North Vietnamese Politburo member Le Duc Tho. At the same time, however, Nixon stepped up pressure on the North. When the anti-Communist general Lon Nol overthrew Prince Sihanouk in Cambodia in March 1970, Nixon acceded to the U.S. army's long-standing desire to destroy Communist sanctuaries inside that country. The U.S.-ARVN operation fell short of its promise and provoked protests at home and abroad. Despite public disfavour and congressional attempts to limit such actions, Nixon ordered continued secret American bombing inside Cambodia and also supported an ARVN operation into Laos to cut the Ho Chi Minh Trail.

The opening to China and "Ostpolitik." The linchpin of Nixon's strategy for a settlement in Vietnam was détente with Moscow and Peking. He was known as a firm supporter of the Nationalist regime on Taiwan, but he had softened his stance against mainland China before taking office. In 1969 he moved to signal Peking through the good offices of de Gaulle and Yahya Khan of Pakistan. Direct contacts, conducted through the Chinese embassy in Warsaw, were broken off after the 1970 U.S.-ARVN attacks on Cambodia, but Nixon and Kissinger remained hopeful. The Cultural Revolution ended in a serious power struggle in the Chinese leadership. Army commander Lin Biao opposed relations with the United States but died when his plane crashed in unclear circumstances. Zhou Enlai and Mao (presumably) contemplated the value of an American counterweight to the Soviets, concessions on the status of Taiwan, and technology transfers. The Nixon Doctrine also promised to remove the obnoxious U.S. military presence in Asia.

The Pakistani channel bore fruit in December 1970, when Yahya Khan returned from Peking with an invitation for an American envoy to discuss Taiwan. The following April the Chinese made the surprising public gesture of inviting an American table tennis team to the championship tournament in Peking. This episode of "ping-pong diplomacy" was followed by a secret trip to Peking by Kissinger. Kissinger's talks with Zhou and Mao yielded an American promise to remove U.S. forces from Taiwan in return for Chinese support of a negotiated settlement in Vietnam. The Chinese also agreed to a presidential visit in February 1972. The American people's long-latent fascination with China immediately revived, and Nixon's trip was a sensation.

Ping-pong diplomacy

The Soviets watched with palpable discomfort as Richard Nixon and Mao Zedong embraced and saluted each other's flags, and they quickly raised the premium on improving relations with Washington. Efforts to this end had been frustrated by a series of crises: a buildup of Soviet jets in Egypt and Jordan, the discovery of a Soviet submarine base under construction in Cuba in 1970, and Nixon's escalations of the war in Southeast Asia. But substantial moves toward East–West détente had already been made in Europe. Following de Gaulle's lead, West German foreign minister Willy Brandt, a Socialist and former mayor of West Berlin, had made overtures toward Moscow. After becoming chancellor in 1969 he pursued a thorough *Ostpolitik* (eastern policy), culminating in treaties with the U.S.S.R. (August 1970), renouncing the use of force in their relations, and with Poland (December 1970), recognizing Germany's 1945 losses east of the Oder–Neisse Line. Brandt also recognized the East German government (December 1972) and expanded commercial relations with other eastern European regimes. Both German states were admitted to the UN in 1973. Support for *Ostpolitik* among West Germans reflected the growing belief that German reunification would more likely be achieved through détente, rather than confrontation, with the Soviet bloc.

The United States, Britain, and France seconded Brandt's efforts by concluding a new Four Power accord with the U.S.S.R. on Berlin in September 1971. The Soviets made what they considered a major concession by agreeing to retain their responsibility under the Potsdam Accords for access to West Berlin and achieved in return Western recognition of the status quo in eastern Europe and access to West German technology and credits.

Arms-limitation negotiations. The centrepiece of a bilateral U.S.–Soviet détente, however, had to be the Strategic Arms Limitation Talks (SALT), which began in 1969. After a decade of determined research and deployment the Soviet Union had pulled ahead of the United States in long-range missiles and was catching up in submarine-launched missiles and in long-range bombers. Indeed, it had been American policy since the mid-1960s to permit the Soviets to achieve parity in order to stabilize the regime of mutual deterrence. But stability was threatened from the technological quarter with the development of multiple independently targeted reentry vehicles (MIRVs), by which several warheads, each aimed at a different target, could be carried on one missile, and antiballistic missiles (ABMs), which might allow one side to strike first while shielding itself from retaliation. In the arcane province of strategic theory, therefore, offense (long-range missiles) became defense, and defense (ABM) offense. Johnson had favoured a thin ABM system to protect the United States from a Chinese attack, and in 1969 Nixon won Senate approval of ABM deployment by a single vote. He intended,

SALT, MIRVs, and ABMs

however, to use the program as a bargaining chip. The Soviets had actually deployed a rudimentary ABM system but were anxious to halt the U.S. program before superior American technology left theirs behind. The public SALT talks stalled, but back-channel negotiations between Kissinger and Ambassador Anatoly Dobrynin produced agreement in principle in May 1971 to limit long-range missiles and ABM deployment. The American opening to China made the Soviets increasingly eager for a prompt agreement and summit meeting, while the Americans hoped that Moscow would encourage North Vietnam to be forthcoming in the peace talks.

Since 1968 North Vietnamese negotiators had demanded satisfaction of Premier Pham Van Dong's "four points" of 1965, including cessation of all U.S. military activity in Indochina, termination of foreign military alliances with Saigon, a coalition government in the South including the NLF, and reunification of Vietnam. The United States demanded withdrawal of all foreign troops from the South, including the PAVN. This deadlock, plus Hanoi's anxiety over the possible effects of détente, prompted another North Vietnamese bid for victory on the battlefield. In March 1972 they committed 10 of their 13 divisions to a massive offensive. Nixon responded by ordering the resumption of bombing of the North for the first time since 1969 and the mining of the harbour at Haiphong, North Vietnam's major port. The offensive stalled.

Nixon's retaliation against North Vietnam prompted speculation that the U.S.S.R. would cancel the planned summit meeting, but Soviet desire for détente prevailed. Kissinger visited Moscow in April 1972 to work out details on SALT and draft a charter for détente. Nixon instructed him "to emphasize the need for a single standard; we could not accept the proposition that the Soviet Union had the right to support liberation movements throughout the world while insisting on the Brezhnev Doctrine inside the satellite orbit." The Soviets, however, refused to make explicit concessions and defined détente as a means of preventing the inevitable struggle between "progressive" and "reactionary" forces from escalating into war. The result was a vague statement of 12 "basic principles of mutual relations" committing the two parties to peaceful coexistence and normal relations based on "sovereignty, equality, non-interference in internal affairs, and mutual advantage." Nixon then proceeded to Moscow in May 1972 and signed 10 documents providing for cooperation in economics, science and technology, outer space, medicine, health, and the environment. Most important were the SALT accords: an Interim Agreement limiting ballistic-missile deployment for five years and the ABM Treaty limiting each side to two ABM sites, one protecting the national capital, the other a long-range missile site. The treaty also enjoined the signatories not to interfere with each other's "national technical means of verification," a de facto recognition of each side's space-based reconnaissance satellites.

The SALT accords

The preliminary SALT agreement appeared to be a significant achievement, but there was in some ways less to it than met the eye. The treaty mandated controlled increases, not decreases, in the Soviet arsenal, while failing to ban development of cruise missiles, space-based weapons, or the MIRVing of existing launchers by the United States or the U.S.S.R. Thus the superpowers sacrificed the right to defend their attack missiles with ABMs while failing to ensure the stability of mutual deterrence. In sum, the limitation of one sort of nuclear launcher (long-range missiles) did not preclude a continuing arms race in other sorts of launchers or in technological upgrades. To be sure, the mere fact of a U.S.–Soviet agreement seemed of psychological value, but only if both sides were genuinely seeking to reduce arsenals and not simply to maneuver diplomatically for a future advantage. Hence the practical value, or danger, of SALT would only be revealed by superpower behaviour in years to come.

End of the Vietnam War. The American achievement of détente with both Moscow and Peking and the failure of North Vietnam's spring 1972 offensive moved both protagonists in that conflict to bargain as well. In October the secret talks in Paris between Kissinger and Le Duc Tho finally produced an agreement on a cease-fire, the release of prisoners of war, evacuation of remaining U.S. forces within 60 days, and political negotiations among all Vietnamese parties. But South Vietnam's president, Nguyen Van Thieu, balked: The plan might indeed allow the Americans to claim "peace with honour" and go home, but it would leave Thieu to deal with the Communists while 100,000 PAVN troops remained in his country. When North Vietnam sought to prevent any last-minute changes by releasing in public the Paris terms, Kissinger was obliged to announce on October 26 that "peace is at hand." After his landslide reelection a week later—a victory aided by the prospect of peace—Nixon determined to force compliance with the terms on both Vietnamese states. Nixon ordered 11 days of intensive bombing over Hanoi itself (December 18–28) while sending Thieu an ultimatum threatening a separate peace and cessation of U.S. aid if Saigon did not accept the peace terms. The United States was castigated worldwide for the "Christmas bombing," but when talks resumed in January, Hanoi and Saigon quickly came to terms. A Vietnam cease-fire went into effect on Jan. 27, 1973, and the last American soldiers departed on March 29.

The Christmas bombing

Vietnam had been America's longest and most divisive war, and public and congressional opinion flatly opposed any resumption of the agony. The 1973 accords, therefore, were a fig leaf hiding the fact that the United States had just lost its first war despite an estimated expenditure of $155,000,000,000, 7,800,000 tons of bombs (more than all countries dropped in all of World War II), and 58,718 American lives. Estimates of Vietnamese dead (North and South) totaled 950,000. In its proportional impact on Vietnamese society, the Vietnam War, 1965–75, was the fourth most severe in the world since 1816.

The end of U.S. involvement in Southeast Asia also brought to a close 15 years of astounding change in world politics featuring the arrival of the space and missile age, the climax of decolonization, the assertions of Maoist China and Gaullist France, the shattering of the myth (fostered by Washington and Moscow alike) of a monolithic Communist world, and the relative decline of American power. In 1969, the very moment when astronauts were setting foot on the Moon to fulfill Kennedy's pledge to prove American superiority, Nixon and Kissinger were struggling to adjust to the new realities and manage a limited American retreat. They succeeded brilliantly in establishing a triangular relationship with Moscow and Peking and appeared to have replaced Cold War with détente. Likewise, they appeared to have escaped from Vietnam and implemented the Nixon Doctrine. But new crises and reversals were in the offing that would prove the American decline had not yet been arrested. Given these reversals, détente might be judged as much an exercise in American presumption as the Vietnam War. For the U.S.S.R. could not be expected to cease its quest for real values in world competition just because the United States was prepared to acknowledge it as a military equal. Rather, that very equality opened up new opportunities for Soviet expansion with which the United States would be less able to cope than before. Khrushchev's boast about the new correlation of forces in the world may have brought the Soviets a series of embarrassments from 1957 to 1962, but a decade later it seemed perversely justified.

Dependence and disintegration in the global village

Events after the 1960s seemed to suggest that the world was entering an era both of complex interdependence among states and of disintegration of the normative values and institutions by which international behaviour had to a reliable extent been made predictable. Perhaps this was not an anomaly, for if modern weapons, communications satellites, and global finance and commerce really had created a "global village" in which the security and well-being of all peoples were interdependent, then by the same token the opportunities had never been greater for ethnic, religious, ideological, or economic differences to spark resentment and conflict among the villagers.

In a world so seemingly out of control, it is perhaps a wonder that politics have not been even more violent and anarchic. But the liberal dreams of progress nurtured in the 19th century had surely proved false. For the spread of modern technology and economic growth around the world had not necessarily increased the number of societies based on human rights and the rule of law, nor had multilateral institutions like the United Nations or financial and economic interdependence created a higher unity and common purpose among nations, except within the durable and democratic North Atlantic alliance.

Instead, the world after the 1960s saw a proliferation of violence at every level except war among developed nations, a world financial structure under tremendous strain, the worst economic downturn since the 1930s and reduced growth rates thereafter, recurrent fears of an energy crisis, the depletion of resources and concurrent global pollution, famine and genocidal dictators in parts of Africa and Asia, the rise of an aggressive religious fundamentalism in the Muslim world, and widespread political terrorism in the Middle East and Europe. The superpowers never ceased to compete in the realms of strategic weapons and influence in the Third World and thus failed to sustain their brief experiment with détente. As President Jimmy Carter's national security adviser, Zbigniew Brzezinski, concluded: "The factors that make for international instability are gaining the historical upper hand over the forces that work for more organized cooperation. The unavoidable conclusion of any detached analysis of global trends is that social turmoil, political unrest, economic crisis, and international friction are likely to become more widespread during the remainder of this century."

Global concerns after the 1960s

THE DECLINE OF DÉTENTE

General Secretary Brezhnev and President Nixon were understandably optimistic in the wake of the endorsement by the 24th Party Congress of the Soviet peace program in 1971 and Nixon's landslide reelection in 1972. Both expected their new relationship to mature over the course of Nixon's second term. But détente had fragile foundations in foreign as well as domestic policy. The Soviets viewed it as a form of mere peaceful coexistence in which revolutionary forces could be expected to take advantage of the new American restraint, while the U.S. administration implicitly sold détente as a means of restraining Communist activity around the world. American conservatives were bound to lose faith in détente with each new incident of Soviet assertiveness, while liberals remained hostile to Nixon himself, his *Realpolitik,* and his predilection for the use of force. Between 1973 and 1976 Soviet advances in the Third World, the destruction of Nixon's presidency in the Watergate scandal, and congressional actions to limit the foreign policy prerogatives of the White House undermined the domestic foundations of détente. After 1977 the U.S.S.R. seemed to take advantage of the Carter administration's vacillations in Third World conflicts and in arms-control talks until the Democrats themselves reluctantly announced the demise of détente following the Soviet invasion of Afghanistan in 1979.

The distraction of Watergate. Analysts with a sufficiently historical point of view tended to see in the Watergate affair and Nixon's 1974 resignation the culmination of a 30-year trend by which war and Cold War had greatly expanded, and ultimately corrupted, executive power. Liberals who, in Eisenhower's time, had called for strong presidential leadership now bemoaned "the imperial presidency." With what were widely understood to be the lessons of Vietnam fresh in the nation's mind, and a majority in Congress and the press hostile to the sitting president, the moment arrived for a legislative counterattack on the executive. This interpretation is borne out by the subsequent congressional acts designed to limit executive freedom in foreign policy. The War Powers Act of 1973 restrained the president's ability to commit U.S. forces overseas. The Stevenson and Jackson–Vanik amendments imposed conditions (regarding Soviet policy on Jewish emigration) on administration plans to expand trade with the U.S.S.R. In 1974–75 Congress prevented the president from involving the United States in a crisis on Cyprus or aiding anti-Communist forces in Angola and passed the Arms Export Control Act, removing the president's discretion in supplying arms overseas. New financial controls limited the president's ability to conclude executive agreements with foreign powers, a form of which 6,300 had been signed between 1946 and 1974 as compared with only 411 treaties requiring the Senate's advice and consent. Finally, revelations of past CIA covert operations, including schemes to assassinate Fidel Castro, inspired complicated congressional oversight procedures for U.S. intelligence agencies. These assaults on executive prerogative were meant to prevent future Vietnams, prevent unelected presidential aides from engaging in secret diplomacy, and restore to Congress an "appropriate" role in foreign policy. Critics of the limitations held that no great power could conduct a coherent or effective foreign policy under such a combination of openness and restrictions, especially in a world populated increasingly by totalitarian regimes, guerrilla movements, and terrorists.

The War Powers Act

The Nixon–Brezhnev summits of 1973–74 produced only minor follow-ons in the area of arms control—the uncontroversial Agreement on the Prevention of Nuclear War and an agreement to reduce the number of ABM sites from the two permitted in 1972 to one. Gerald Ford, president from August 1974, and Kissinger, who remained as secretary of state, attempted to restore the momentum of détente through a new SALT agreement regulating the dangerous race in MIRVed missiles, which SALT I had not prevented. The United States proposed strict equality in nuclear delivery systems and total "throw-weight." This meant that the United States would be allowed to MIRV more of its missiles to offset the greater size of Soviet missiles. But since the United States had no plans for a unilateral buildup in any case, the Soviets had no incentive to make such a concession. Instead, Ford and Brezhnev signed an Interim Agreement at Vladivostok in November 1974 that limited each side to 2,400 delivery vehicles, of which 1,320 could be MIRVed. While the Soviets claimed this was a concession, since they declined to count the 90 British and French missiles aimed at them, the Soviets' giant SS-18s, able to deliver up to 10 MIRVs, ensured the U.S.S.R. an advantage in ICBM warheads. The repeated failure to restrain the growth of Soviet offensive systems soon sparked fears that the United States might become vulnerable to preemptive attack.

The Vladivostok Agreement

Meanwhile, the mid-1970s brought to a logical conclusion the process of détente in Europe. Nixon and Kissinger, aware that the United States had seemed to ignore its European allies during the 10 years of Vietnam, declared 1973 "the year of Europe" and hoped to forestall NATO governments from bargaining with Moscow on their own. But Watergate and the Arab–Israeli War of that year turned this initiative into a public-relations failure. Instead the United States was obliged to follow the European lead in the ongoing Conference on Security and Cooperation in Europe and negotiations toward a "mutual and balanced force reduction" treaty covering NATO and Warsaw Pact forces in central Europe. The climax of the security talks was the Helsinki summit of 35 nations in the summer of 1975 and an agglomeration of proposals divided into three "baskets." (A fourth basket dealt with the question of a follow-up conference.) In Basket I the signatories accepted the inviolability of Europe's existing borders and the principle of noninterference in the internal affairs of other states—thereby recognizing formally the Soviet gains in World War II and the Soviet-bloc states. Basket II promoted exchanges in science, technology, and commerce, expanding Soviet access to Western technology and opening the Soviet market to western European industry. Basket III, the apparent Soviet concession, aimed at expanding cultural and humanitarian cooperation among all states on the basis of respect for human rights. Not surprisingly, Western opinion of the Helsinki Accords, and of détente in general, came to rest heavily on whether the U.S.S.R. would voluntarily comply with Basket III. American leaders of both parties considered Helsinki misguided and empty, especially after Moscow stepped up persecution of dissidents and jailed those of their citizens engaged in a "Helsinki watch" on

The Helsinki Accords

Soviet compliance. In sum, Helsinki (and U.S. demands on behalf of Soviet Jews) pointed up another contradiction in détente, this time between American insistence on Soviet liberalization and Soviet insistence on noninterference in domestic politics of other states.

During final negotiations at Helsinki, events in Southeast Asia compounded the American sense of humiliation and growing discontent with détente. The North Vietnamese had never viewed the 1973 peace accords as anything other than an interlude permitting the final withdrawal of American forces. In the year following they built up their strength in South Vietnam to more than 150,000 regulars armed with Soviet tanks, artillery, and anti-aircraft weapons. The ARVN was poorly trained, suffered from low morale after the Americans were gone, and faced an enemy able to attack at times and places of its own choosing. The American withdrawal also removed at a blow some 300,000 jobs from the local economy, and President Thieu made matters worse by trying to establish one-party bureaucratic rule without the charisma or prestige to sustain it. By October 1974 the Politburo in Hanoi concluded that the Saigon regime was ripe for collapse. Large-scale probes of ARVN defenses in January 1975 confirmed their optimism. By the end of the month 12 provinces and 8,000,000 people had fallen to the Communists. On April 10, unable to obtain congressional approval of $422,000,000 in further military aid, President Ford declared that the Vietnam War was over "as far as America is concerned." The final North Vietnamese offensive reached Saigon on April 30, 1975, as the last remaining Americans fled to helicopters atop the U.S. embassy. Hanoi triumphantly reunified Vietnam politically in July 1976 and confined thousands of South Vietnamese to "re-education camps," while thousands of "boat people" risked death in the South China Sea to escape reprisals and Communism.

The fall of Saigon

The end in Cambodia had already occurred. The Communist Khmer Rouge cut off the capital, Phnom Penh, in January 1975. When the U.S. Congress denied further aid to Cambodia, Lon Nol fled, and in mid-April the Khmer Rouge took control. Its leader, Pol Pot, was a French-educated disciple of Maoist "total revolution" to whom everything traditional was anathema. The Khmer Rouge reign of terror became one of the worst holocausts of the 20th century. All urban dwellers, including hospital patients, were forced into the countryside in order to build a new society of rural communes. Sexual intercourse was forbidden and the family abolished. More than 100,000 Cambodians, including all "bourgeois," or educated people, were killed outright, 400,000 succumbed in the death marches, and 1,200,000 people (a fifth of the Cambodian nation) perished in all. The Khmer Rouge, however, were not allied with Hanoi, and in 1979 PAVN forces invaded Cambodia to oust the Khmer Rouge and install a puppet regime. This completed the conquest of Indochina by North Vietnam, for Laos, too, became Communist after the fall of Saigon. Thus the domino theory was at last put to the test and to a large extent borne out.

Events in Africa as well seemed to bear out the Soviet expectation that "progressive forces" would gain ground rapidly during the new era of superpower parity. Angola and Mozambique, coastal states facing the oil-tanker routes around the Cape of Good Hope, were finally slated to achieve independence from Portugal following a leftist military coup in Lisbon in April 1974. Three indigenous groups, each linked to tribal factions, vied for predominance in Angola. The MPLA (Popular Movement for the Liberation of Angola) of Agostinho Neto was Marxist and received aid from the U.S.S.R. and Cuba. The FNLA (National Front for the Liberation of Angola) in northern Angola was backed by Zaire's Mobutu and initially by a token contribution from the CIA. In the south the UNITA (National Union for the Total Independence of Angola) of Jonas Savimbi had ties to China but came to rely increasingly on white South Africa. In the Alvor agreement of January 1975 all three agreed to form a coalition, but civil war resumed in July. By the end of the year the MPLA had been reinforced by 10,000 Cuban soldiers airlifted to Luanda by the U.S.S.R. But in the United States the imperative of "no more Vietnams" and congressional ire over CIA covert operations frustrated Ford's desire to help non-Communist Angolans. Neto accordingly proclaimed a People's Republic of Angola in November 1975 and signed a Treaty of Friendship with the U.S.S.R. the following October. The rebel factions, however, remained in control of much of the country, and Cuban troop levels eventually reached 19,000. A Marxist government also assumed power in Mozambique.

The war in Angola

American uncertainty. In winning the presidential election of 1976, Jimmy Carter capitalized on the American people's disgust with Vietnam and Watergate by promising little more than an open and honest administration. Though intelligent and earnest, he lacked the experience and acumen necessary to provide strong leadership in foreign policy. This was especially unfortunate since his major advisers had sharply divergent views on the proper American posture toward the Soviet Union.

Carter's inaugural address showed how much he diverged from the *Realpolitik* of Nixon and Kissinger. Such a sentiment as "Because we are free we can never be indifferent to the fate of freedom elsewhere," recalled Kennedy's 1961 call to arms. But Carter made clear that his emphasis on human rights applied at least as much to authoritarian governments friendly to the United States as to Communist states, and that idealism was in fact, as he put it on another occasion, the most "practical and realistic approach" to foreign policy. He hoped to divert American energies away from preoccupation with relations with the U.S.S.R. toward global problems such as energy, population control, hunger, curbing of arms sales, and nuclear proliferation. Carter's first initiative in the perilous field of arms control was an embarrassing failure. Rejecting his own secretary of state's advice to take a gradual approach, he startled the Soviets with a deep-cut proposal for immediate elimination of as much as 25 percent of the U.S. and Soviet strategic missiles and a freeze on new long-range missile deployment. Brezhnev rejected it out of hand, and Foreign Minister Andrey Gromyko called this attempt to scrap the Vladivostok formula a "cheap and shady maneuver."

Carter was to gain one stunning success during his term, a peace treaty between Egypt and Israel (see below), but he was unable to stem the growth of Soviet influence in Africa. Somalia, on the strategic Horn of Africa astride the Red Sea and Indian Ocean shipping lanes, had been friendly to Moscow since 1969. In September 1974 a pro-Marxist military junta overthrew the government of neighbouring Ethiopia, had Emperor Haile Selassie confined in his palace (where he was later suffocated in his bed), and invited Soviet and Cuban advisers into the country. The Somalis then took advantage of the turmoil—perversely, from Moscow's point of view—to reassert old claims to the Ogaden region of Ethiopia and invade, while Eritrean rebels also took up arms against Addis Ababa. The Soviets and Cubans stepped up support for Ethiopia, while Castro vainly urged all parties to form a "Marxist federation." Carter at first cut off aid to Ethiopia on the ground of human-rights abuses and promised weapons for the Somalis. By August he realized the arms would only be used in the Ogaden campaign and reversed himself, making the United States appear ignorant and indecisive. Somalia broke with the U.S.S.R. anyway, but 17,000 Cuban troops and $1,000,000,000 in Soviet aid allowed Ethiopia to clear the Ogaden of invaders and to suppress the Eritrean revolt in 1978. Ethiopia signed its own treaty of friendship and cooperation with the U.S.S.R. in November. The failure of the Carter administration either to consult with the Soviets or to resist Soviet-Cuban military intervention set a bad precedent and weakened both détente and U.S. prestige in the Third World.

Revolt in Ethiopia

The events in the Horn of Africa, which Brzezinski interpreted as part of a Soviet strategy to outflank the oil-rich Persian Gulf so vital to Western economies, encouraged the United States to seek help in balancing Soviet power in the world. The obvious means of doing so was to complete the rapprochement with China begun under Nixon. Some advisers opposed "playing the China card" for fear that the Soviets would retaliate by calling off the continuing SALT negotiations, but Brzezinski persuaded the President that

closer ties between the United States and China would oblige the U.S.S.R. to court the United States, as had occurred in 1972. Brzezinski went to Peking in May 1978 to initiate discussions leading toward full diplomatic recognition. His cause was aided by important changes in the Chinese leadership. Zhou Enlai and Mao Zedong had died in 1976. Hua Guofeng won the initial power struggle and ordered the arrest and trial of the radical Gang of Four led by Mao's wife, Jiang Qing. Both superpowers hoped that the suppression of radicals in favour of pragmatists in the Chinese government might portend better relations with Peking. But the rehabilitation of the formerly condemned "capitalist roader" Deng Xiaoping led to a resumption of Soviet–Chinese border clashes, and the clear shift of Vietnam into the Soviet camp strengthened Washington's hand in Peking. Hua and Carter announced in December 1978 that full diplomatic relations would be established on Jan. 1, 1979. The United States downgraded its representation on Taiwan and renounced its 1954 mutual defense treaty with the Nationalist Chinese.

The "China card"

The spectre of a possible Sino-American alliance may have alarmed the Soviets (Brezhnev warned Carter not to sell arms to China) but was never a real possibility. The Chinese remained Communist and distrustful of the United States. They made clear that China was no card to be played at will by one or the other of the superpowers. Nor could China's underdeveloped economy sustain a large conventional war or the projection of force overseas (which the United States would not want in any case), while in nuclear systems China was as weak vis-à-vis the Soviet Union as the Soviet Union had been vis-à-vis the United States in the 1950s. Ties to the United States might provide China with high technology, but the United States was no more willing to place nuclear or missile systems in Chinese hands than Khrushchev had been. To be sure, the United States had an interest in preventing a Sino-Soviet rapprochement (an estimated 11 percent of the Soviet military effort was devoted to the Chinese front), but any pause given the U.S.S.R. by Sino-American cooperation was probably more useful to China than to the United States. Indeed, Peking was quite capable of playing its U.S. card to carry out adventures of its own.

After their 1975 victory the North Vietnamese showed a natural strategic preference for the distant U.S.S.R. and fell out with their historic enemy, neighbouring China. In quick succession Vietnam expelled Chinese merchants, opened Cam Ranh Bay to the Soviet Navy, and signed a treaty of friendship with Moscow. Vietnamese troops had also invaded Kampuchea (Cambodia) to oust the pro-Peking Khmer Rouge. Soon after Deng Xiaoping's celebrated visit to the United States, Peking announced its intention to punish the Vietnamese, and, in February 1979, its forces invaded Vietnam in strength. The Carter administration felt obliged to favour China (especially given residual American hostility to North Vietnam) and supported Peking's offer to evacuate Vietnam only when Vietnam evacuated Cambodia. The Soviets reacted with threats against China, but Chinese forces performed abysmally even against Vietnam's frontier militia, and after three weeks of hard fighting, in which Vietnam claimed to have inflicted 45,000 casualties, the Chinese withdrew. The results for United States policy were all negative: Chinese military prestige was shattered, Cambodia remained in the Soviet-Vietnamese camp, and the tactic of playing the China card was rendered ridiculous.

The SALT II treaty

To the chagrin of Peking, the Sino-Vietnamese War failed to forestall a planned U.S.–Soviet summit meeting and the signing of a second arms agreement, SALT II. After Carter's first deep-cut proposal, negotiations had resumed on the basis of the Vladivostok Agreement and had finally produced a draft treaty. The summit was held in Vienna in June 1979, and Carter returned to seek congressional approval for SALT II as well as most-favoured-nation trade status for both the U.S.S.R. and China. The treaty inspired widespread suspicion in the United States Senate on its own merits. The modest limits on nuclear forces and allowances for upgrading existing missiles did not seem sufficient to prevent the Soviets' superior long-range missile forces from threatening the survival of United States land-based missiles. The American will to upgrade its own deterrent, meanwhile, seemed to be sapped by the SALT process itself. Confusion reigned over how the MX missile might be deployed so as to survive a Soviet first strike, and Carter canceled programs to deploy the B-1 strategic bomber and an antitank neutron bomb designed for Europe. There was widespread doubt whether Soviet compliance with SALT II could be adequately monitored. The treaty foundered as well on growing American impatience with Communist expansion in the Third World.

Soviet invasion of Afghanistan

Any chance of Senate ratification of SALT II disappeared on Dec. 25, 1979, when the U.S.S.R. launched an invasion of Afghanistan to prop up a friendly regime. Even after a decade of détente the American public still thought viscerally in terms of containment, and this latest and most brazen Soviet advance pushed the President over the fence. "This action of the Soviets," said Carter, "has made a more dramatic change in my own opinion of what the Soviets' ultimate goals are than anything they've done." Calling the Afghan invasion "a clear threat to peace," Carter ordered an embargo on sales of grain and high-technology equipment to the U.S.S.R., canceled U.S. participation in the 1980 Moscow Olympic Games, reinstated registration for the draft, withdrew the SALT II treaty from the Senate, and proclaimed the Carter Doctrine, pledging the United States to the defense of the Persian Gulf. It was clear to all that détente was dead.

Postmortem. Was détente a failure because the Soviets refused to play by the rules, because the United States was unwilling to accord the U.S.S.R. genuine equality, or because détente was never really tried at all? Or did the differing U.S. and Soviet conceptions of détente ensure that, sooner or later, American patience would wear thin? The last explanation is, in foreshortened perspective, at least, the most convincing. From the Soviet point of view the United States had been a hegemonic power from 1945 to 1972, secure in its nuclear dominance and free to undertake military and political intervention around the world. But the correlation of forces had gradually shifted to the point where the U.S.S.R. could rightly claim global equality and respect for "peaceful coexistence." Under détente, therefore, the United States was obliged to recognize Soviet interests in all regions of the world and to understand that the U.S.S.R. was now as free as the United States to defend those interests with diplomacy and arms. And those interests included, above all, fraternal aid for "progressive" movements in the Third World. Détente certainly could never mean the freezing of the status quo or the trends of history as understood in Marxist theory. Instead, in the Soviet view, the United States continued to resent Soviet equality in armaments, to shut the U.S.S.R. out of regional diplomacy (as in the Middle East), to interfere in Soviet domestic policy, to support counterrevolutionary movements, and, in violation of the spirit of détente, to attempt to organize the encirclement of the U.S.S.R. in league with NATO and China.

Divergent views of détente

From the American perspective, Soviet policy from 1945 to 1972 was characterized by a Marxist-Leninist drive to export revolution and achieve world dominion by dividing and bullying the West and exploiting the struggles of Third World nations. But given the growing maturity of the U.S.S.R. itself, the split in world Communism, and the realization that the Western world was not about to collapse (either from "the contradictions of capitalism" or Soviet subversion), had made Cold War obsolete. Under détente, therefore, the U.S.S.R. was obliged to accept the responsibilities as well as the benefits of membership in the comity of civilized states, to reduce its exorbitant military spending and subversive activity, and to cease trying to turn the domestic problems of other countries to unilateral benefit. Instead, in the American view, the U.S.S.R. continued to exploit Western restraint, to build up its nuclear and conventional forces far beyond the needs of deterrence, and to exploit Communist proxy forces to take over developing nations.

Each view had a basis in reality, and, given the differing assumptions of the two governments, each was persuasive. But the burden of compromise or dissolution of the relationship fell inevitably on the democratic, status quo

power. In time American opinion would cease to tolerate Soviet advances made under the guise of détente. The notion of détente was flawed from the start in two crucial points. First, with the exception of preventing nuclear war, the United States and the U.S.S.R. still shared no major interests in the world; and second, the specific agreements on respect for spheres of influence included Europe and isolated regions elsewhere but not the bulk of the Third World. The Americans inevitably viewed any Soviet assertiveness in such undefined regions as evidence of the same old Soviet drive for world domination, while the Soviets inevitably viewed any American protestations as evidence of the same old American strategy of containment. Within a decade, the hopes raised by Nixon and Brezhnev stood exposed as illusory.

THE "ARC OF CRISIS"

Among the manifestations of the diffusion of political power in the world after 1957 was the rise of regional powers and conflicts with only distant or secondary connections to the rivalries of the Cold War blocs, of multilateral political and economic pressure groups, and of revolutionary, terrorist, or religious movements operating across national boundaries ("nonstate actors"). The politics of the Middle East after 1972 comprised all three and so frustrated attempts by the industrial states to control events in the region that by 1978 Brzezinski was describing the old southern tier of states reaching beneath the U.S.S.R. from Egypt to Pakistan as the "arc of crisis."

Palestinian terrorism and diplomacy. The sweeping Israeli victory in the Six-Day War of 1967 had forced every Arab state to rethink its own foreign policy and the extent of its commitment to the cause of Arab unity. Egypt, having lost the Sinai, faced Israelis entrenched in the Bar-Lev line directly across the Suez Canal. Jordan, having lost the West Bank, faced Israeli troops directly across the Jordan River. Syria, having lost the Golan Heights, faced Israeli forces within easy striking distance of Damascus itself. The notion of united Arab armies sweeping the Jews into the sea had clearly proved to be romantic, while political unity among the Arabs suffered from the abiding division between nationalist and socialist states like Egypt, Syria, and Iraq, and traditional Arab monarchies like Saudi Arabia and Jordan.

The Palestine Liberation Organization (PLO), organized in 1964 to represent some 2,000,000 refugees from the Palestine mandate who were scattered around the Arab world and from 1969 led by Yasir Arafat, was also divided between old families of notables, whose authority dated back to Ottoman times, and young middle-class or fedayeen factions anxious to exert pressure on Israel and the West through terrorism. The latter included the Popular Front for the Liberation of Palestine (PFLP), formed three months after the 1967 war. Over the next year the PFLP hijacked 14 foreign airliners, culminating in its spectacular destruction of four planes at once in Jordan. In 1970–71 the moderate King Hussein of Jordan lost patience with the autonomous PLO formations in his territory and expelled them, provoking a sharp military exchange with Syria. But the PLO moved its central offices to Lebanon, whence terrorists could cross the frontier to commit atrocities against civilians inside Israel. The PFLP and other Palestinian groups also linked up with extreme leftist and rightist (because anti-Semitic) conspiracies in Italy, Austria, and Germany to form a terrorist network that left no European or Mediterranean state free from the fear of random violence. In September 1972 terrorists from an organization calling itself Black September took nine Israeli athletes hostage at the Munich Olympic Games; all of the hostages and five terrorists died in the ensuing gun battle with police.

The PLO and the PFLP

The terrorist network benefited mightily from the financial support, training, or refuge provided by established pro-Soviet states like Cuba, East Germany, Bulgaria, Algeria, Syria, Yemen (Aden), and especially Libya. In 1969 the Libyan monarchy was overthrown in a military coup led by Colonel Muammar al-Qaddafi, a fanatical adherent of Nasser's pan-Arabism. Following Nasser's death in 1970 and the development of rich oil deposits in Libya, Qaddafi styled himself as the new leader and financier of the radical Arab cause. In imitation of Mao, he issued a little *Green Book* describing his "new gospel. . . . One of its words can destroy the world." The ideology was a mixture of Third World-ism, Socialism, and Muslim fundamentalism, and it called forth a "heroic politics." In the eyes of the West, the rhetoric masked a crazed cruelty, and even in Arab eyes it seemed at best antiquated in the wake of the 1967 war.

Another new feature of Middle Eastern politics was the assertiveness of the Organization of Petroleum Exporting Countries (OPEC), composed of oil-producing countries in the Persian Gulf and Arabian Peninsula as well as Libya, Nigeria, and Venezuela. The members of this producers' cartel accounted for a large percentage of the world's oil reserves and wielded tremendous potential power over the Europeans and Japanese, who relied on imports for more than 80 percent of their energy needs. In the past, oil prices had been kept artificially low by the Western oil companies through bilateral agreements with producer states. By 1970, however, most host governments had taken over ownership of the production facilities, and they saw in a drastic rise of oil prices a means of accumulating capital for development and purchases of arms, as well as a way to pressure the Western states into respecting their grievances against Israel.

The OPEC cartel

The most populous frontline (*i.e.*, bordering Israel) Arab state, but one without oil revenues, was Egypt. Since 1955 Egypt had undergone a demographic explosion. Population was growing at a rate of 1,000,000 per year, and 35,000,000 people were crowded into the Nile Valley and Delta. The numbers and youth of the Egyptians (over half were under 25 in 1980), and the country's economic weakness, meant that frustrated and unemployed youth posed the constant threat of political instability. Certainly Egypt could no longer afford an endless crusade against Israel. These considerations dominated the thinking of Nasser's successor as president, Anwar el-Sādāt. But neither could he abandon Nasser's legacy, especially with the Sinai under Israeli occupation, without losing his legitimacy at home. Accordingly, Sādāt laid a risky and courageous plan to extricate his country from its foreign and domestic stalemates. Husbanding the arms provided by the U.S.S.R. after 1967, he abruptly expelled his 20,000 Soviet advisers in July 1972 and opened a secret channel to Washington, hinting that Egypt and the United States together could eliminate Soviet involvement in the Middle East. For only the Americans, he reasoned, might influence the Israelis to return the occupied regions. Then, on Oct. 6, 1973, during the Jewish holiday of Yom Kippur, he launched the fourth Arab–Israeli war.

The Yom Kippur War

The Egyptian army moved across the Suez Canal in force and engaged the Bar-Lev line. For the first time it made substantial progress and inflicted a level of casualties especially damaging for the outmanned Israelis. Syrian forces also stormed the Golan Heights. The United States and the Soviet Union reacted with subtle attempts to fine-tune the outcome by alternately withholding or providing arms to the belligerents and by urging or discouraging a UN cease-fire. Nixon denied Israel an airlift of arms until October 13, preventing Israel from launching a prompt counterattack and thereby signaling Sādāt of American sympathy. But once assured of United States aid, the Israelis struck on both fronts, regained the Golan Heights, and crossed the Suez Canal. Henry Kissinger, alarmed that the Israeli victory might be so complete as to hinder a lasting settlement, quickly agreed to call, with the Soviet Union, for a UN cease-fire. It broke down at once, and Israeli forces encircled a 20,000-man Egyptian army corps. Brezhnev curtly warned Nixon of possible Soviet military intervention, which the United States moved to deter, perhaps recklessly, with a worldwide alert of its military forces. Finally, Kissinger threatened a cutoff of arms deliveries unless Israel halted its offensive, and peace was restored.

The 1973 war saved Egyptian honour and solidified Sādāt's prestige to the point where he could afford to be conciliatory. The United States emerged as the "honest broker" between Egypt and Israel. As Kissinger put it,

"The Arabs can get guns from the Russians, but they can get their territory back only from us." Kissinger's "shuttle diplomacy" between Tel Aviv and Cairo secured an Israeli withdrawal beyond the Suez in January 1974, the reopening of the canal, the insertion of a UN force between the antagonists, and, in September 1975, an Israeli retreat from the crucial Mitla and Gidi passes in the Sinai. The United States flooded both countries with economic and military aid, and Sādāt repudiated Nasser's socialism in favour of policies stimulating domestic private enterprise.

The limited rapprochement that emerged from the 1973 war was purchased at great economic cost, for the Arab OPEC nations, led by Saudi Arabia, seized the opportunity to enact an embargo of oil exports to all nations aiding Israel, which lasted for five months. More telling still was the price revolution that preceded and followed. OPEC had already engineered a doubling of the posted price of oil to $3.07 per barrel by the eve of the war. In January 1974 it nearly quadrupled the price again, to $11.56 per barrel. The importance of this sudden rise cannot be exaggerated. The resulting shortages and exorbitant costs accelerated the growing inflation in the Western world, exposed the energy-dependency of the industrial nations, created a vast balance-of-payments deficit in many industrial nations, wiped out the hard-won economic progress of many developing nations, and placed massive sums of petrodollars in the hands of a few underpopulated Middle Eastern states. The political upshot was that the United States and Europe would have to pay close attention to the desires of those Arab states in foreign policy as long as OPEC unity survived.

The oil embargo

In November 1977, Sādāt shocked the Arab world by announcing his willingness to go to Jerusalem personally to seek peace. When his talks with the new Israeli prime minister, Menachem Begin, broke down, President Carter invited them both to Camp David in September 1978. During 11 days of intensive discussion, Carter succeeded in bringing the rivals together. The Camp David Accords provided for complete Israeli evacuation of the Sinai, gradual progress toward self-rule for West Bank Palestinians over a five-year period, and a peace treaty signed by Begin and Sādāt at the White House in March 1979. This historic settlement dismayed other Arab states and split the PLO asunder, the so-called rejectionists refusing to recognize the settlement. Qaddafi purchased huge amounts of Soviet arms and expanded Libya's training and supply of terrorists. In December 1979, 300 Muslim fundamentalists trained in Yemen seized the holiest of all Islāmic shrines in Mecca. Sādāt himself was assassinated by Arab extremists in 1981.

Camp David Accords

The Iranian revolution. Carter's success in Middle Eastern diplomacy was likewise undercut by the collapse of the strongest and staunchest American ally in the Muslim world, the Shah of Iran. Since the monarchy had been restored by a CIA-aided coup in 1953, Reza Shah Pahlavi had used Iran's oil revenues to finance rapid modernization of his country and the purchase of American arms. Nixon had chosen Iran to be a United States surrogate in the vital Persian Gulf, and as late as 1977 Carter praised the Shah for making Iran "an island of stability." Clearly, American intelligence services failed to detect the widespread Iranian resentment of modernization (meaning, in this context, materialism, emancipation of women, and secularization), middle-class opposition to the autocracy, and the rising tide of Shīʿite fundamentalism that were undermining the Shah's legitimacy. Fundamentalist movements and conflicts between Sunnite and Shīʿite Muslims have arisen periodically in the course of Islāmic history, but the outbreaks of the late 20th century were especially notable in light of the Western assumption that less developed countries would naturally secularize their politics and culture as they modernized their society and economy. Instead, rapidly developing Iran succumbed to a religious revolution led by Ayatollah Ruhollah Khomeini. By November 1978 the beleaguered Shah saw his options reduced to democratization, military repression, or abdication. Despite the importance of Iran for U.S. interests, including the presence there of critical electronic listening posts used to monitor missile tests inside the U.S.S.R., Carter was unable to choose between personal loyalty toward an old ally and the moral argument on behalf of reform or abdication. In January 1979 the Shah left Iran; the next month, when he requested asylum in the United States, Carter refused lest he give offense to the new Iranian regime. But the gesture did not help the United States. An interim government in Tehrān quickly gave way to a theocracy under Khomeini, who denounced the United States as a "great Satan" and approved the seizure in November 1979 of the American embassy in Tehrān and the holding of 52 hostages there. The hostage drama dragged on for nearly 15 months, and most Americans were infuriated by the unfathomable Khomeini and frustrated by Carter's apparent ineffectiveness.

The hostage crisis

Carter reacted to the crisis by adopting Brzezinski's formula that the Middle East and South Asia constituted an arc of crisis susceptible to Soviet adventurism. In his State of the Union Address of January 1980 he enunciated the Carter Doctrine, declaring that any attempt by an outside force to gain control of the Persian Gulf would be viewed as an attack on the vital interests of the United States, and he pledged to form a Rapid Deployment Force to defend the region. Whether the U.S. military was truly capable of sustained combat in that remote region was doubtful. When diplomacy failed to free the hostages in Tehrān, Carter resorted in April 1980 to a military rescue mission, hoping to repeat the success of a brilliant Israeli commando raid that had freed 103 airline passengers at Entebbe, Uganda, in 1976. But the operation was a humiliating failure. Only in January 1981, after the overwhelming defeat of his reelection bid, did Carter achieve the release of the hostages.

The Soviets in Afghanistan. Brzezinski's fears that the U.S.S.R. would take advantage of the arc of crisis seemed justified when the Soviet army invaded Afghanistan in 1979. It is likely, however, that the Soviets were responding to a crisis of their own, rather than trying to exploit another's. Remote and rugged Afghanistan had been an object of imperialist intrigue throughout the 19th and 20th centuries because of its vulnerable location between the Russian and British Indian empires. After 1955, with India and Pakistan independent, the Afghan government of Mohammad Daud Khan forged economic and military ties to the U.S.S.R. The monarchy was overthrown by Daud Khan in 1973 and was succeeded by a one-party state. The small Afghan Communist party, meanwhile, broke into factions, while a fundamentalist Muslim group began an armed insurrection in 1975. Daud Khan worked to lessen Afghanistan's dependence on Soviet and U.S. aid, and he reportedly had a heated disagreement with Brezhnev himself during a visit to Moscow in April 1977. Leftists in the Afghan officer corps, perhaps fearing a blow against themselves, murdered Daud Khan in April 1978 and pledged to pursue friendly relations with the U.S.S.R. Thus Afghanistan, under the rule of Nur Mohammad Taraki, was virtually in the Soviet camp. But when Taraki objected to a purge of the Afghan Cabinet, the leader of a rival faction, Hafizullah Amin, had him arrested and killed. These intramural Communist quarrels both embarrassed the Soviets and threatened to destabilize the Afghan regime in the face of growing Muslim resistance. In the fall of 1979 the Soviets built up their military strength across the border and hinted to American diplomats that they might feel obliged to intervene. On Dec. 25, 1979, the Soviet army began its occupation, and two days later a coup d'état led to the murder of Amin and the installation of Babrak Karmal, a creature of the KGB, who had been brought into the country by Soviet paratroops.

The Soviets would probably have preferred to work through a pliant native regime rather than invade Afghanistan, but Amin's behaviour and Moscow's unwillingness to risk a domestic overthrow of a Communist regime forced their hand. The invasion, therefore, appeared to be an application of the Brezhnev Doctrine and was all the more pressing given that the Central Asian provinces of the Soviet Union were also vulnerable to the rise of Islāmic fundamentalism. The United States was tardy in responding to the 1978 coup despite Carter's concern over the arc of crisis and the murder of the United

States ambassador in Kabul in February 1979. But the Soviet invasion aroused American suspicions of a Russian grand strategy aimed at seizing a warm-water port on the Indian Ocean and the oil of the Persian Gulf. Over the course of the next decade the puppet Afghan regime lost all authority with the people, Afghan soldiers defected in large numbers, and the Muslim and largely tribal resistance, armed with U.S. and Chinese weapons, held out in the mountains against more than 100,000 Soviet troops and Soviet terror bombing of their villages. More than 2,000,000 Afghans became refugees in Pakistan and Iran. Soon Western observers began to speak of Afghanistan as the Soviets' Vietnam.

The Shī'ite revolution in Iran, meanwhile, provoked and tempted neighbouring Iraq into starting yet another war in the arc of crisis. The secular, leftist Iraqi regime was nervous about the impact Iranian events might have on its own large Shī'ite population, while its Kurdish minority had resorted to terrorism in pursuit of its goal of a Kurdish state to be carved out of Turkey, Iraq, and Iran. Finally, the Iraqi government of Saddam at-Takrītī Hussein hoped to use the opportunity of Iran's apparent near-anarchy to seize the long-disputed Shatt al-Arab waterway at the mouth of the Tigris-Euphrates river system.

The Iranian–Iraqi War

Bolstered by arms purchased with oil revenues, Hussein unilaterally abrogated a 1975 accord on the waterway and launched a full-scale invasion of Iran in September 1980. After initial victories the Iraqis were surprisingly thrown back, and a war of attrition commenced. The Iraqis employed poison gas and were building a nuclear reactor capable of producing weapons-grade plutonium until the Israeli air force destroyed the reactor in a surprise raid in June 1981. The Iranians relied on human-wave assaults by revolutionary youths assured of a place in paradise for dying in battle. Both sides employed imported planes and missiles to attack each other's oil facilities, tanker ships, and, occasionally, cities. Attacks then spread to neutral shipping as well, and oil production in the entire Gulf region was placed in jeopardy. Neither superpower had any direct interest in the war except a common opposition to any overthrow of the local balance of power, but the Soviets tended to benefit from a prolongation of the conflict. In 1987 the United States sharply increased its presence in the Gulf by permitting Kuwaiti oil tankers to fly the U.S. flag and by deploying a naval task force to protect them in passage through the Gulf. Compared to the situation of the 1950s, when John Foster Dulles' CENTO seemed to ensure a ring of stable, pro-Western governments in the South Asian region, that of the 1980s was almost totally unpredictable.

RHETORICAL COLD WAR REVIVED

Rudderless diplomacy. After the collapse in 1979 of any pretense of détente, relations between the superpowers drifted. The 1980 U.S. election brought to the White House a new president, Ronald Reagan, seemingly the most conservative president on domestic policy since the 1920s and a Cold Warrior reminiscent of the 1950s. He bemoaned an arms-control process that, he said, always favoured the U.S.S.R. and sapped the will of the Western alliance, and a détente that only duped gullible Americans into acquiescing in Soviet gains. Reagan sounded like John Foster Dulles when he denounced the U.S.S.R. as "an evil empire" and held it accountable for the unrest in the world, and he echoed John Kennedy in calling for America to "stand tall in the world" again. But such rhetoric did not necessarily imply confrontational policies. Instead, Reagan's deeds recalled the prudent containment policies of the Eisenhower era. In part this may have been because the Reagan administration had to acknowledge the constraints on American overseas involvement that had arisen over the previous 20 years, including Soviet military parity or superiority, declining American economic leverage over its own allies, the "lessons of Vietnam" as they pertained to Third World conflicts, American moral doubts about supporting anti-Communist authoritarian governments, and congressional limits placed on executive action.

With a change in State Department leadership in June 1982, the pragmatic attitude of the administration became even more pronounced. American foreign policy in the 1980s, therefore, reflected the country's widespread disaffection with the results of détente but failed to establish a clear alternative. The one means the administration found for standing against growing Soviet power and influence was to extend aid and comfort to irregular forces resisting pro-Soviet governments in the Third World. Such "freedom fighters," as Reagan termed them, in Afghanistan, Angola, and Nicaragua, seemed to offer hope that the United States could pressure, and perhaps overthrow, totalitarian regimes without risking involvement in more Vietnams. Hence this Reagan Doctrine was a natural corollary of the Nixon Doctrine.

The Reagan Doctrine

Soviet foreign policy in the early 1980s also drifted, if only because of the advanced age of Brezhnev and the frequent changes in leadership after his death in November 1982. Early in the decade a recurrence of serious unrest in eastern Europe, this time in Poland, also kept the attention of the Kremlin close to home. During détente the Polish government expanded an ambitious development plan financed largely by western European credits. But economic performance foundered, foreign debt mounted to $28,000,000,000, and the state imposed successive price hikes on staples. By 1979–80 a popular protest movement grew up around the officially unsanctioned Solidarity labour union and its charismatic leader, Lech Wałęsa. The strong Catholic roots of Polish popular nationalism were evident in the movement, especially in light of the accession in 1978 of Karol Cardinal Wojtyła as Pope John Paul II, the first non-Italian pope in 456 years, who in 1981 survived an assassination plot probably hatched in Bulgaria, a Soviet satellite. As unrest mounted in Poland, NATO countries warned against a Soviet military intervention, holding in reserve the threat of declaring Warsaw in default on its debts. In December 1981, General Wojciech Jaruzelski declared martial law, sparing Poland a Soviet invasion at the price of military rule and the suppression of Solidarity. The United States responded by suspending Poland's most-favoured-nation trade status and blocking further loans from the International Monetary Fund. Reagan held the Soviet Union responsible for martial law; his attempts to extend the sanctions to an embargo on high-technology exports to the U.S.S.R., however, angered western Europeans, who feared losing access to eastern European markets and who were in the process of completing a huge pipeline from Siberia that would make western Europe dependent on the U.S.S.R. for 25 percent of its natural gas. In both the debt and pipeline issues, it seemed that the web of interdependence woven during détente served to constrain Western countries more than it did the U.S.S.R.

Martial law in Poland

Brezhnev's successor as General Secretary of the Communist Party, the former KGB chief Yury Andropov, declared that there was no alternative to détente as the Soviets understood it. He denounced Reagan's "militaristic course" as a new bid for U.S. hegemony. But it was Reagan's image of the U.S.S.R. that seemed confirmed when a Soviet jet fighter plane shot down a civilian South Korean airliner in Soviet air space in September 1983, killing 269 people. Some in the West supported the Soviet claim that the plane was on a spy mission but produced no persuasive evidence to that effect. Andropov's demise after a year and a half elevated Konstantin Chernenko, another member of the older generation of the Politburo who would himself survive only until March 1985. Given these frequent changes in leadership and the drain on Soviet resources caused by the ongoing war in Afghanistan, the Kremlin was even less able than the White House to mount new initiatives in foreign policy until late in the 1980s.

Renewal of arms control. The most serious consequence of the collapse of détente and the failure of the SALT II Treaty (judged by Reagan as "seriously flawed") appeared to be an acceleration of the arms race between the superpowers. Liberal critics feared that Reagan would unleash a new arms race; his supporters asserted that the Soviets had never stopped racing even during the era of SALT. But Reagan waffled on arms policy because of stiff domestic and European opposition to the abandonment

of arms control. Programs to upgrade the three elements of strategic deterrence were approved only after being cut back; yet they drew complaints from the Soviet Union that the highly accurate MX missile, the new Poseidon nuclear submarines, and air-launched cruise missiles for the B-52 force were first-strike weapons. A serious NATO worry stemmed from Soviet deployment of the new SS-20 theatre ballistic missile in Europe. In 1979 the Carter administration had acceded to the request by NATO governments that the United States introduce 572 Pershing II and cruise missiles into Europe to balance the 900 SS-20s. But the European antinuclear movement, now officially patronized by the British Labour Party, the Green Party in West Germany, and the Dutch and Belgian Social Democrats, forced Reagan to link Pershing deployment with intermediate nuclear forces (INF) talks with the U.S.S.R. Reagan tried to seize the moral high ground with his "zero-option" proposal for complete elimination of all such missiles from Europe and a call for new Strategic Arms Reduction Talks (START) to negotiate real reductions in the superpower arsenals. But the Soviets refused to scrap any of their long-range missiles or to trade existing SS-20s for Pershings yet to be deployed.

'Star Wars"

In March 1983, Reagan announced a major new research program to develop antiballistic missile defenses based in outer space. This Strategic Defense Initiative (SDI, dubbed "Star Wars" by opponents) was inspired by the emergence of new laser and particle-beam technology that seemed to have the potential to devise an accurate, instantaneous, and nonnuclear means of shooting down long-range missiles in their boost phase, before their multiple reentry vehicles had a chance to separate. The President thus challenged his country to exploit its technological edge to counter the threat of Soviet offensive missiles and perhaps liberate the world from fear of a nuclear holocaust. Scientific and political critics ridiculed SDI as naive (because it would not work or could be easily countered), expensive beyond reckoning, counter-productive (since it implied repudiation of the 1972 ABM Treaty), and dangerous (since the Soviets might stage a preemptive attack to prevent its deployment). But the alarmed Soviets weakened the case of American critics by launching their own propaganda campaign against SDI, implying that they took seriously its prospects for success. Evidence also mounted that the U.S.S.R. had been engaged in similar research since the mid-1970s. A $26,000,000,000, five-year American program was approved, although Congress limited future funding and arms-control advocates pressured the President to use SDI as a bargaining chip in the START talks. The Soviets broke off the INF and START talks at the end of 1983 but resumed talks two years later, apparently with hopes of stalling SDI research.

Regional crises. U.S.–Soviet competition in the Third World also continued through the 1980s, although Reagan's assertion that the Soviets were to blame for all unrest was less convincing than the less feverish, if cynical, view that the Soviets simply sought to benefit from indigenous sources of unrest. The campaign of the Communist-led African National Congress against apartheid in southern Africa, for instance, might serve Soviet strategic aims, but the black rebellion against white rule was surely indigenous. White-supremacist governments in southern Africa might argue, correctly, that the standard of living and everyday security of blacks were better in their countries than in most black-ruled African states, but the fact remained that African blacks, like all human beings, preferred to be ruled by their own tyrant rather than one of some other nationality or race. What was more, the respect shown by African governments for international boundaries began to break down after 1970. Spain's departure from the Spanish Sahara was the signal for a guerrilla struggle among Moroccan and Mauritanian claimants and the Polisario movement backed by Algeria. The Somali invasion of the Ogaden, Libyan intrusions into Chad and The Sudan, and Uganda's 1978 invasion of Tanzania exemplified a new volatility. Uganda had fallen under a brutal regime headed by Idi Amin, whom most African leaders tolerated (even electing him president of the Organization of African Unity) until Julius Nyerere spoke out, following Uganda's invasion of his country, about the African tendency to reserve condemnation for white regimes only.

Libya and Uganda

The black revolt against white rule in southern Africa was a timely consequence of the decolonization of Angola and Mozambique and of the Lancaster House accord under which white Southern Rhodesians accepted majority rule, resulting in 1980 in the full independence of Zimbabwe under Robert Mugabe, who in 1984 declared his intention to create a one-party Marxist state. South Africa tried to deflect global disgust with its apartheid system by setting up autonomous "tribal homelands" for blacks, but no other government recognized them. United States diplomacy sought quietly to promote a comprehensive settlement of southern Africa's problems by pressuring Pretoria to release South West Africa/Namibia and gradually dismantle apartheid in return for a Cuban evacuation of Angola and Mozambique. This policy of "constructive engagement," by which the U.S. State Department hoped to retain leverage over Pretoria, came under criticism every time a new black riot or act of white repression occurred. Critics demanded economic divestment from, and stringent sanctions against, South Africa, but supporters of the policy argued that sanctions would inflict disproportionate economic harm on South African blacks, drive the whites to desperation, and encourage violence that would strengthen the hand of Communist factions. Congressional pressure finally forced the administration to compromise on a package of sanctions in 1986, and U.S. firms began to pull out of South Africa.

The Middle East remained crisis-prone despite the Egyptian–Israeli peace. In 1978 an Arab summit in Baghdad pledged $400,000,000 to the PLO over the next 10 years. A comprehensive Middle East peace was stymied by the unwillingness of rejectionist Arab states to negotiate without the PLO, and the U.S.-Israeli refusal to negotiate with the PLO. In June 1982 the Begin government determined to put an end to terrorist raids by forcibly clearing out PLO strongholds inside Lebanon. In fact the Israeli army advanced all the way to Beirut in a bitter campaign that entrenched Syrian occupation of the strategic al-Biqāʿ Valley and intensified what already amounted to a Lebanese civil war among Palestinians, Muslims of various sects and allegiances, and Christian militiamen. The United States sent marines to Beirut to facilitate the evacuation of the PLO, while it tried without success to piece together a coalition Lebanese government and induce the Israelis and Syrians to withdraw. But in October 1983, terrorists blew up the marine barracks, killing more than 200 Americans. The Middle East peace process begun by Kissinger and continued by Carter seemed to have unraveled by the late 1980s. Western governments tried to coordinate policies on terrorism, including a firm refusal to bargain with kidnappers, but concern for the lives of hostages and fear of future retaliation insidiously weakened their resolve. In October 1985, however, the Israeli air force dispatched planes to bomb the PLO headquarters in Tunis. When Libyan-supported terrorists planted bombs in airports in Rome and Vienna in December 1985 and in a discotheque in Berlin in April 1986, Reagan ordered U.S. jets to attack terrorist training camps and air-defense sites in Libya. The raid was applauded by the American public, and terrorist incidents did seem to decline in number over the following year. Qaddafi suffered another reverse in the spring of 1987 when French-supported Chadian troops drove Libyan invaders from their country.

Israeli invasion of Lebanon

In the Persian Gulf the Reagan administration held publicly aloof from the war between Iraq and Iran. But intelligence that Shīʿite terrorists were behind the kidnapping of Americans in Beirut prompted the administration secretly to supply arms to Iran in return for help, never forthcoming, in securing the release of hostages. There was also a notion that such a deal might forge links to moderate Iranians in hopes of better relations in the event of the aged Khomeini's death. While the motives were humanitarian and strategic, this action directly contradicted the policy of shunning negotiations with terrorists that the United States had been urging on its allies. When the operation was exposed, the Reagan administration lost credibility with Congress and foreign governments alike.

Iran arms deal

LATIN-AMERICAN UPHEAVALS

Marxism and the Cuban role. After a tour of Latin America in 1950, American diplomat George Kennan wrote a memo despairing that the region would ever achieve a modest degree of economic dynamism, social mobility, or liberal politics. The culture itself was, in his view, inhospitable to middle-class values. As late as 1945 almost all the Latin-American republics were governed by landowning oligarchies allied with the church and army, while illiterate, apolitical masses produced the mineral and agricultural goods to be exported in exchange for manufactures from Europe and North America. But to Fidel Castro and other radical intellectuals, a stagnant Latin America without strong middle classes was precisely suited for a Marxist, not a democratic, revolution. Before 1958 the United States—the "colossus to the north"—had used its influence to quell revolutionary disturbances, whether out of fear of Communism, to preserve economic interests, or to shelter strategic assets such as the Panama Canal. But after Castro's triumph of 1959, the United States undertook to improve its own image through the Alliance for Progress and to distance itself from especially obnoxious authoritarian regimes. But Latin-American development programs largely failed to keep pace with population growth and inflation, and frequently they were brought to naught by overly ambitious schemes or official corruption. By the 1980s the wealthiest and largest states like Brazil and Mexico faced a crushing burden of foreign debt. Neo-Marxist economists of the 1960s and 1970s argued that even the more enlightened policies of the Kennedy and Johnson administrations kept Latin America in a condition of stifling dependence on American capital and markets and world commodity prices. Some endorsed the demands of the Third World bloc in the UN for a "New World economic order," involving a massive shift of resources from the rich countries to the poor or the "empowerment" of the developing countries to control the terms of trade along the lines of OPEC. Others advocated social revolution to transform Latin states from within. But the example of Cuba's slide into the status of a Communist satellite fully dependent on the U.S.S.R. revived the fear and suspicion with which Americans habitually regarded Third World revolutions.

Even after the Bay of Pigs invasion and the 1962 missile crisis, Cuba retained a certain autonomy in foreign policy, while the Soviets exhibited caution about employing their Cuban clients. Castro preferred to place himself among the ranks of Third World revolutionaries like Nasser, Nyerere, or Ghana's Kwame Nkrumah rather than follow slavishly the Moscow party line. He also elevated himself to leadership of the nonaligned nations. When relations between Havana and Moscow cooled temporarily in 1967–68, Brezhnev applied pressure, holding back on oil shipments and delaying a new trade agreement. Castro tried to resist the pressure by exhorting and mobilizing his countrymen to produce a record 10,000,000-ton sugar harvest in 1970. When the effort failed, Castro moved Cuba fully into the Soviet camp. The U.S.S.R. agreed to purchase 3,000,000 to 4,000,000 tons of sugar per year at four times the world price, provide cheap oil, and otherwise subsidize the island's economy at a rate of some $3,000,000,000 per year; thenceforward, 60 percent of Cuba's trade was with countries in the Soviet-bloc. Brezhnev himself visited Cuba in 1974 and declared the country "a strong constituent part of the world system of socialism." Castro, in turn, voiced the Soviet line on world issues, played host to Latin-American Communist party conventions, used the forum of the nonaligned nations movement to promote his distinctly aligned program, and made tens of thousands of Cuban troops available to support pro-Soviet regimes in Africa.

Cuba becomes a satellite

Soviet domination of Cuba, however, may have harmed their chances elsewhere in Latin America, since it alerted other leftists to the dangers of seeking Soviet support. Moreover, the Soviets simply could not afford such massive aid to other clients. This limitation appeared to be crucial even when Communists had a chance of prevailing in one of the largest, most-developed South American states, Chile. The Communist party there was a charter member of the 1921 Comintern and had strong ties to the Chilean labour movement. The party was outlawed until 1956, whereupon it formed an electoral popular front with the Socialists, and it narrowly missed electing Socialist Salvador Allende Gosseus to the presidency in 1964. The Christian Democratic opponent, Eduardo Frei Montalva, had warned that an Allende victory would make Chile "another Cuba." From 1964 to 1970, when Cuba was plying an autonomous course, the Chilean Castroites staged violent strikes, bombings, and bank robberies in defiance of the regular Communist party directed from Moscow. The latter's strategy was subtler. Hinting that it might support the Christian Democratic candidate rather than their rival leftists, the Communist party provoked the extreme right to run its own candidate in protest, thus splitting the conservative vote. The Nixon administration tried clumsily to influence the nominating process or foment a military coup, but Allende won an electoral victory in 1970. Once in office, he seized U.S. property and forged close ties to Cuba at the very time when Castro was being reined in by Brezhnev. The U.S.S.R., however, held back from extending large-scale aid, even after a fall in copper prices, radical union activity, and Allende's radical policies plunged Chile into economic chaos. In September 1973, General Augusto Pinochet Ugarte and the army overthrew Allende and established an authoritarian state. The Soviets and Allende sympathizers in North and South America depicted the denouement in Chile as the work of fascists in league with U.S. imperialists.

The United States' poor image in Latin America was of special concern to Jimmy Carter because of his dedication to the promotion of human rights. During his first year in office Carter sought to counter the traditional notion of "Yankee imperialism" by meeting the demands of the Panamanian leader, General Omar Torrijos Herrera, for a transfer of sovereignty over the Panama Canal. The U.S. Senate ratified the treaty (which called for a staged transfer, to be completed in 1999) by a bare majority, but most Americans opposed transfer of the canal. Conservatives also held Carter's human rights concerns to be naive, since the linking of U.S. government loans, for instance, to a regime's performance on human rights damaged American relations with otherwise friendly states while exercising no influence on human rights practices in Communist states. Supporters of Carter retorted that the pattern of U.S. support for cruel oligarchies on the excuse of anti-Communism was what drove oppressed Latins toward Communism in the first place.

The Panama Canal Treaty

The first hemispheric explosion in the 1980s, however, occurred in the southern cone of South America when the Argentine military ruler, Lieutenant General Leopoldo Galtieri—apparently to distract attention from the abuses of his dictatorship and an ailing economy at home—broke off talks concerning sovereignty over the Falkland Islands (Islas Malvinas) and invaded the remote archipelago in April 1982. The conservative British government of Margaret Thatcher was taken by surprise but began at once to mobilize supplies, ships, and men to reconquer the islands some 8,000 miles from home. The United States was torn between loyalty to its NATO ally (and political friend of President Reagan) and the fear of antagonizing South Americans by siding with the "imperialists." But when U.S. diplomacy failed to resolve the dispute, the United States supplied Britain with intelligence data from American reconnaissance satellites. The Royal Navy and ground forces began operations in May, and the last Argentine defenders surrendered on June 14. In the wake of the defeat, the military junta in Buenos Aires gave way to democratization.

The Falklands War

Nicaragua and El Salvador. Problems in Central America, however, commanded the attention of the United States throughout the 1980s. In Nicaragua the broadly based Sandinista revolutionary movement challenged the oppressive regime of Anastasio Somoza Debayle, whose family had ruled the country since the 1930s. In accordance with its human rights policies, the Carter administration cut off aid to Somoza, permitting the Sandinistas to take power in 1979. They appeared to Americans as democratic patriots and received large sums of United

States aid. But a radical faction soon took control of the revolution, and moderates either departed or were forced out of the government in Managua. The Sandinistas then socialized the economy, suppressed freedom of the press and religion, and established close ties to Cuba and other Soviet-bloc countries. By the time Reagan took office, neighbouring El Salvador had also succumbed to violence among leftist insurgents, authoritarian landowners supporting right-wing "death squads," and a struggling reformist government. Reagan vigorously affirmed a last-minute decision by Carter to grant military aid to the Salvadoran government. Nicaragua and Cuba were identified as the sources of the insurgency. Americans became increasingly confused by evidence of atrocities on all sides and were again torn between their desire to promote human rights and their determination to halt the spread of Communism. Opponents of U.S. involvement warned of another Vietnam in Central America, while supporters warned of another Cuba.

Nicaragua, meanwhile, built up one of the largest armies in the world in proportion to population, expanded its port facilities, and received heavy shipments of arms from the U.S.S.R. The CIA used this military buildup to justify the secret mining of Nicaraguan harbours in February 1984, which was, when revealed, universally condemned. The CIA also secretly organized and supplied a force of up to 15,000 anti-Sandinista "freedom fighters," known as the Contras, across the border in Honduras and Costa Rica, while U.S. armed forces conducted joint maneuvers with those states along the Nicaraguan border. The ostensible purpose of such exercises was to interdict the suspected flow of arms from Nicaragua to the Salvadoran rebels. In fact, American policy aimed at provoking a popular revolt in hopes of overthrowing the Sandinistas altogether.

Cuban and Soviet influence with leftist governments on the Caribbean islands of Jamaica, Trinidad, and Grenada also appeared to be on the increase, a trend that the Reagan administration tried to counter with its 1982 Caribbean Basin Initiative, an Alliance for Progress confined to the islands. Grenada, a tiny island that won independence from Britain in 1974, had initially come under the control of Sir Eric Gairy, whose policies and conduct verged on the bizarre. In March 1979, Gairy was overthrown by the leftist New Jewel Movement led by the charismatic Maurice Bishop. Over the next several years the regime socialized the country, signed mutual-assistance agreements with Soviet-bloc states, and hastened construction of a large airstrip that the United States feared would be used by Soviet aircraft. But the evident incompetence of the New Jewel leadership prompted a split in 1982 between Bishop's supporters and hard-line Leninists. In October 1983 the revolution came apart when Bishop was arrested and, when protest demonstrations broke out, was shot. The Organization of East Caribbean States invited American intervention, and U.S. forces, together with small contingents from neighbouring islands, landed on Grenada to restore order and protect American medical students. Free elections returned a moderate government to Grenada in 1984, but the self-destruction and overthrow of the New Jewel Movement, while a setback for Castroism in the region, also lent credence to Nicaragua's often and loudly voiced fear of an American invasion.

The invasion of Grenada

The U.S. public emphatically supported the Grenadian intervention but was split almost evenly on the question of support for the Nicaraguan Contras. While the Reagan Doctrine of supporting indigenous rebels, such as Jonas Savimbi's UNITA in Angola or the *mujāhidīn* in Afghanistan, appeared to be a low-risk means of countering Soviet influence, Americans remained nervous about the possibility of deeper United States involvement. Congress reflected this public ambivalence by first approving funds for the Contras, then restricting the ability of federal agencies to raise or spend funds for the Contras, then reversing itself again. In 1986 investigations of the secret U.S. arms sales to Iran revealed that National Security Council officials had kept supplies flowing to the Contras while the congressional restrictions were in effect by soliciting funds from private contributors and friendly Arab states and by diverting the profits from the Iranian arms sales. In 1987 Congress launched elaborate investigations into this "Iran-Contra Affair" that virtually paralyzed U.S. foreign policy in two regions of the world for more than a year.

THE GORBACHEV ERA

In the early 1980s the Reagan administration's rebuilding of U.S. defenses, restoration of steady economic growth, and self-confident assertion of American principles seemed to have regained the initiative in superpower relations for the United States. The Soviet Union, by contrast, suffered a prolonged leadership crisis and chronically poor economic performance. In 1985 the momentum shifted when the comparatively young and reform-minded Mikhail Gorbachev was elevated to the post of Communist Party general secretary. Unlike previous Soviet leaders, Gorbachev frankly admitted the damage done to the Soviet economy by bureaucratic rigidity, corruption, secrecy, and the lack of market incentives. Though his power was far from consolidated, Gorbachev launched an aggressive campaign on behalf of *perestroika* (economic restructuring) and *glasnost* (publicity, or openness), and his frankness and skill in dealing with the Western press persuaded many Europeans and Americans that real change had become possible in the Soviet Union.

Gorbachev also made surprising forays in foreign policy, including a concerted push for new arms control accords and negotiations with the United States, Pakistan, and the *mujāhidīn* in Afghanistan. In October 1986 Gorbachev met Reagan at an impromptu summit at Reykjavík and proposed dramatic cuts in long-range missile forces. He withdrew the offer when Reagan refused to renounce his SDI program. The following year Gorbachev caught the United States off balance again by suddenly agreeing to an earlier U.S. zero option proposal on intermediate-range nuclear forces (INF) in Europe. This time, negotiations at Geneva eventuated in an INF treaty signed at a Washington summit meeting in 1987. The U.S. Senate ratified the accord on the strength of its having eliminated an entire category of nuclear weapons and having allowed, for the first time, extensive on-site inspection in the Soviet bloc. But critics feared that stripping Europe of nuclear weapons would only enhance the value of the Warsaw Pact's superiority in conventional forces and require the United States to respond to an attack on western Europe either by using its strategic nuclear missiles or by abandoning Europe altogether. NATO governments cheered the arms pact but were reminded of why they had come to rely on nuclear defenses in the first place. Reagan and Gorbachev met again in Moscow in June 1988 to discuss an even bolder proposal: the reduction of superpower strategic nuclear weapons by 50 percent.

Gorbachev also carried through the Afghan negotiations to a May 1988 agreement providing for the withdrawal of Soviet troops and a cut-off of foreign military aid to the warring Afghan parties, leaving open the question of whether the U.S.S.R. would permit its client government in Kabul to fall. Meanwhile, the Reagan administration, weakened by the Iran-Contra scandal, also trimmed its sails with regard to Third World competition. The corrupt Filipino dictator Ferdinand Marcos, a long-standing ally of the United States, lost his grip on power in 1986 when crowds backed by leading elements in the church, press, labour unions, and part of the army rose up to demand his resignation. Rather than try to prop up Marcos, Reagan sent a personal envoy to Manila to engineer his departure and a transfer of power to Corazon Aquino, the wife of a popular opposition leader who had been murdered. In Central America, however, Reagan appeared to lose control of events. The U.S. Congress refused to renew military aid to the Contra rebels in Nicaragua, while Costa Rican president Oscar Arias preempted Reagan by negotiating a comprehensive Central American peace plan with all neighbouring countries. The success of the plan depended in large part on whether the Nicaraguan government carried out its promises regarding freedom of the press and religion and free elections.

As the 1980s ended it appeared that the renewed Cold War was again giving way to détente. Western leaders were left to meditate on several fundamental questions:

Was Gorbachev sincere in his effort to liberalize the Soviet bloc and scale back its foreign involvement? If so, would he survive his opposition at home? If he were both sincere and successful, would a more dynamic, efficient Soviet Union be good or bad for the West in the long run?

FORCES THAT SHAPE WORLD POLITICS

World politics since 1900 is a chronicle of the impact on war and diplomacy of the explosion of technological and organizational power. But it is also the story of the transformation of a Eurocentric great-power system dominated by states with similar Christian cultures into a global congeries of sovereignties, great and small, whose cultures are not merely dissimilar but often seem mutually incomprehensible. What began to disappear in 1914, and was largely gone by 1970, was a common structure of values and norms of behaviour among governments that shape world events. The transition was accompanied by unprecedented spasms of violence and sudden shifts in the fortunes of states. The 30 years' civil war among the European powers (1914–45) turned the old kaleidoscopic balance of six or seven great powers into an ellipse focused on the two superpowers. The 40 years afterward (1945–85) brought a rediffusion of power to second- and third-rank states and revealed new limits in the ability of states wielding traditional military or economic power (or even nuclear power) to control events beyond their borders even as they learned to mobilize their resources ever more effectively at home.

Failure of shared values

Hence all myths of progress, or even the simple belief in a linear logic to the course of history, went into remission. The 19th-century liberal myth of history as the progress of freedom broke on the experience of World War I, the Fascist and Communist episodes, and the failure of democracy and human rights to find many havens in the decolonized world. Freedom, in the Euro-American constitutional sense, has not fared well in the 20th century. But the 20th-century Marxist-Leninist myth that history is the product of inexorable laws tending toward proletarian socialism has broken on the failure of the U.S.S.R. and other Communist states to outperform freer societies even by material standards, to say nothing of qualitative standards of human fulfillment. But to go to the other extreme—to assert that the present age is one of irreversible decay and the future one of apocalypse—would be just as presumptuous. It cannot be said that nuclear war, or the triumph of a given form of society, or world government, or the perfection of freedom through technology, or the extirpation of freedom through biologic and psychological conditioning, is somehow inevitable. Whether or not human beings enjoy free will, they cannot know, much less make, their own future.

What at least are the parameters of world events in the near future? What trends will future historians deem most important? Those following, because of the range of possibilities to which they give rise, are likely candidates.

Demography and food. On the most fundamental level the 20th century has been the age in which the very ability of the Earth's resources to continue to support the human race was called into question. World population nearly doubled from 1,300,000,000 in 1900 to 2,500,000,000 in 1950, and doubled again to 5,000,000,000 by 1987. Estimates were that the 6,000,000,000 mark would be reached by 2000, the 10,000,000,000 mark by 2050. By the 1960s these numbers revived the fears of global famine attended by widespread violence that were first raised by Thomas Malthus early in the 19th century. But economic history suggests that the cause of Europe's "vital revolution" of the 18th to 20th centuries—the Industrial Revolution—was also the cure. Nations appear to pass through a demographic cycle in which falling death rates due to advances in medicine, public health, urbanization, and industrial production all stimulate rapid expansion of population until a level of per capita affluence is reached at which societies cease to reproduce themselves in great numbers and come to prefer the personal freedom and quality of life inherent in smaller families. Indeed, by the 1980s the birth rate of Caucasian populations of North America and Europe had declined to the point of zero population growth or, in the case of West Germany, Sweden, and others, below it. Similar drops in birth rate have occurred in Japan and the prosperous states of the Asian rim (Korea, Hong Kong, Singapore). By the 1980s the population explosion was occurring exclusively in the underdeveloped regions of South Asia, Africa, and Latin America and among racial minorities in more developed countries. The result is that the percentage of mankind residing in the industrial world, and of Caucasians in particular, has dropped steadily. The potential political consequences of this trend range from the upheavals attending massive famine and violence in the underdeveloped world to subtler changes in "First World" political cultures caused by the increase of Third World immigrants, guest workers, and refugees. In places where the industrial and underdeveloped countries directly abut, as along the U.S.–Mexico border or in Soviet Central Asia, tensions have already become evident.

The Malthusian question

While each country presents a unique combination of climate, arable land, fertility, cultural traditions, and available technology, one general reason the global population explosion threatens famine is the dismal performance of collectivized or planned agriculture. The United States, Canada, Australia, and the European Community produce record surpluses almost at will, and populous India, although prone to climatic disasters, is self-sufficient in food, while agriculture in Soviet and Third World socialist countries shows regular annual shortfalls. Unfortunately, landowning or bureaucratic elites in those countries have a vested interest in inefficient forms of land tillage. In many African states tribal hatreds and local wars only magnify the effects of drought, collectivist policies, and primitive technology. The prospect of famine or disease causing catastrophic mortality is a growing possibility, especially in Africa, where the demographic cycle is still in its first stage. Elsewhere, the prospects for the poor and populous nations of the Third World depend on how soon they can reach the stage in the demographic cycle when birthrates decrease. It could occur benignly, as a concomitant of higher per capita incomes, or forcibly, through state-enforced birth control or infanticide. It is likely, however, that by natural or artificial check the rate of increase in global population will be arrested over the course of the next century.

Failure of collective agriculture

Technology and technocracy. A second explosion characteristic of the 20th century is technological. It, too, began early in the Industrial Revolution of the 18th century. But unlike population in the advanced countries, the pace of technological advance did not ultimately slow down but continues to produce successive industrial revolutions including, most recently, those based on atomic power, the jet engine, electronics, computers, spaceflight, lasers, and bioengineering. But the political consequences of each new increment in human power over the material world are unfathomable. Have nuclear weapons rendered obsolete the accumulated lessons of strategy, diplomacy, and war? Or does human conflict continue according to its ancient patterns despite the risk of nuclear holocaust? Do computers magnify the ability of governments to control their populations, perhaps in totalitarian fashion, or will they decentralize the control of information and liberate the individual? To the extent that knowledge is power, the quest for new knowledge and technique is ipso facto a political activity. And the trend appears to be one toward ever greater government stimulation and regulation of new technology for the purposes of military and economic security.

The phenomenon of planned research and development, the "invention of invention," began in the late 19th century and received a powerful impetus from the World Wars and Cold War. The Soviets were the first to institute large-scale state mobilization of research in peacetime, and the scientific and engineering achievements of World War II impressed many in the market-oriented West with the social utility of state-supported research and development. Cold War competition, the high cost of research facilities in such fields as spaceflight and high-energy physics, and the role of technological prowess as a primary indicator of national power (especially after Sputnik) led governments

Technological competition

to expand their mobilization of science and technology. By the 1960s, France, Britain, West Germany, Japan, China, and India, as well as the superpowers, faced the choice of finding ways of keeping up with the pace of technology, at least in targeted specialties, or else falling behind in the ever-quickening global competition. This process meant a sharp increase in state power, since such mobilization required the coordination of government, private corporations, and universities, as well as state planning, budgeting, management, and regulation.

By the late 1960s, when the United States was racing to the Moon and was still the apparent leader of the world economy, Europeans feared that economies of scale would prevent their countries from effectively competing in high technology. Jean-Jacques Servan-Schreiber wrote a best-seller entitled *The American Challenge,* and many European leaders feared a widening technology gap. In fact, events of the next few years proved that technocratic force-feeding of progress did not guarantee meaningful results. By the late 1970s other factors, including a commercial failure to exploit new technologies, declining labour productivity, loss of will, and determined foreign challenges to American primacy in specific technological sectors, combined to reduce overall U.S. leadership. American automobile, steel, and electronics industries were no longer able to compete against German, Japanese, and other imports even in their own market. By the 1980s mismanagement of the U.S. space program destroyed competitiveness in the pursuit that once symbolized American superiority. The United States was also hampered in world commerce by aggressive (some said unfair) foreign trade practices and in military competition by an aggressive Soviet campaign to acquire advanced Western technology by purchase or espionage.

The condition of permanent and planned technological revolution in the late 20th century has therefore created an anomalous situation in which all states are, or feel themselves to be, functionally "backward" all the time and racing against the projected innovations of others. Neither the American liberal model of high technology tying the world together with bonds of interdependence, nor the Soviet model of high technology tending to the triumph of socialism and the dissolution of the nation-state, has come to pass. Instead, what may with justice be called the Gaullist model of international affairs has triumphed in an age of technological revolution, in which national technocracies mobilize for competition against rival national technocracies.

Whether this pace of change can or should continue is a question of value judgments. Critics of the materialism that drives high technology, or the centralized power complexes it creates, may protest the continuing diversion of resources into research and development. By the late 1980s a series of spectacular failures in high technology—the explosion of the space shuttle *Challenger,* the toxic chemical leak in Bhopāl, India, and the accident in the Chernobyl nuclear reactor in the U.S.S.R.—seemed to hint that faith in the saving grace of ever more complex technology was a form of hubris. But so long as the well-being of the developed and developing societies seems to depend on technological progress, it is difficult to see how the engine of change can be shut down.

Failures of technology

The military balances. In one respect nuclear weapons and the rush to high technology changed the strategic picture forever, in that two states, if they chose to do so, could obliterate any other nation or group of nations in the world. Compared to the likely results of nuclear war, even the "total" wars of 1914 and 1939 were decidedly limited. But nuclear weapons, by their very destructiveness, also proved to be disproportionate to all real-world conflicts that arose after 1945. Their diplomatic use as the ultimate threat behind a state's policies also declined with the advent of bipolar parity. Perhaps this helps to explain why far fewer countries actually acquired nuclear weapons than was feared in the 1960s. Only the United States, the Soviet Union, Britain, France, China, and India openly, and perhaps Pakistan, South Africa, and Israel secretly, possess nuclear capabilities, and those nations presumably would contemplate using them only to ward off a threat to national survival (which the very possession of nuclear weapons is designed to deter). The possibility remains, however, of nuclear war occurring by accident, by unplanned escalation of a crisis situation, or by a fanatical government in Iran, Libya, or elsewhere acquiring and using an atomic bomb regardless of the consequences.

A significant trend in nuclear weapons since the early 1960s has been toward reliance on warheads of smaller and smaller yield, made possible by more accurate missile-guidance systems. While the number of warheads deployed has been multiplied by the MIRVing of long-range missiles and the proliferation of medium-range and cruise missiles in the European theatre, the United States and the U.S.S.R. came to rely chiefly on bombs in the 200- to 500-kiloton range, rather than the megaton weapons of the 1950s and 1960s. The total megatonnage in the U.S. stockpile in 1980 was less than one-fourth what it had been in 1960. But the fact that this trend could reduce collateral damage and civilian deaths in a limited exchange of weapons aimed at military targets could be viewed as damaging to world security, since it could conceivably make nuclear war less "unthinkable."

After 1945, perhaps because of nuclear deterrence, the great powers remained at peace with each other for a longer time than ever before in modern history. But at the same time the nuclear age has been unusually violent at lower technological levels of conflict. A reasonable estimate of the number of wars after 1945 would approach 150, with total casualties in the range of 20,000,000. Virtually all of these wars occurred in the less developed continents, where more than 100 new sovereignties came into existence after World War II. The great powers were involved directly in several of the wars as they struggled with each other through proxy states. But beyond those conflicts, the freedom of Third World countries to engage in warfare with each other or even (as in Vietnam) against major powers was a product of the international trade in modern weapons. In the decade after 1975 alone, 116 nations of the Third World spent almost $250,000,000,000 on imported arms, roughly a third from the United States, a third from the U.S.S.R., and the rest mostly from Britain and France. This proclivity of Third World governments to spend their precious revenue or loans on armaments (albeit with the encouragement of the Great Powers) not only slowed their economic progress but also created little balances of power, with dynamics of their own, in every corner of the world. Finally, small nations and political movements chose increasingly to assert their wills by the irregular exercise of force through guerrilla war and terrorism. Global strategy and tactics, therefore, became probably more complicated and less predictable than at any time in modern history, raising fears that the Middle East or Southeast Asia might someday serve, as the Balkans did in 1914, to spark a superpower conflict. The analogy with 1914 is also tempting insofar as state-supported terrorism, which triggered World War I, again became prevalent in the world. Incidents of terrorism increased from about 180 in 1968 to more than 750 in 1980, and deaths due to terrorist action from less than 100 to more than 600. The targets were almost exclusively Western, not Soviet-bloc, lives and property.

Proliferation of war

The universal reliance on deterring, rather than repelling, enemy attack in the nuclear age and the continuing technological revolution in nuclear and conventional weapons also placed an unprecedented premium on the size and quality of forces in being, rather than on a state's ability to gear up for war once it had begun. Hence peacetime military spending throughout the world was at an all-time high. U.S. and Soviet military budgets in the mid-1980s were both on the order of $150,000,000,000 per year, or over 6 percent of gross national product in the case of the United States, over 12 percent for the U.S.S.R. The total for the world as a whole was around $550,000,000,000, one-fifth of which was accounted for by the Third World. The trends in the superpower balance, however, clearly favoured the U.S.S.R. Not only had the Soviets' buildup since the 1960s provided them with numerical superiority in many categories of nuclear weapons, but they also remained predominant in conventional military

Armaments spending

strength while the Soviet fleet grew into the largest in the world. A Soviet Mediterranean squadron made its appearance in 1964, an Indian Ocean squadron in 1968, and a large Pacific fleet in the 1980s. The U.S.S.R. defended its enormous military budget by reference to the fact that all the other nuclear powers and industrial giants in the world (North America, western Europe, China, and Japan) were hostile to it. Whatever the cause and effect, Western observers viewed the combination of endemic Soviet economic weakness and cresting Soviet military might as potentially volatile.

Economic growth. Military and political power ultimately rests on an economic foundation. That of the Western alliance was still clearly superior. While the Soviet bloc's share of world manufacturing production rose from 16 percent in 1953 to 21.1 percent in 1980, it still lagged far behind that of the market economies (77.5 percent in 1953; 66.9 percent in 1980). The purely American share continued to decline, however, from its artificial post-World War II high (44.7 percent in 1953) to 31.5 percent in 1980, signaling a shift of relative power toward Japan and the industrializing Third World states. In 1959, 71 percent of the world's 150 largest firms were American; in 1976, only 44 percent were United States-based. In 1970 the world's 10 biggest banks were American; only two still were in 1980. Real growth rates in the developed world also leveled off after the booming 1960s. The average annual United States rate of 3.9 percent fell to 2.9 percent during the inflationary 1970s; Japanese annual real growth fell by more than half to 4.5 percent; French growth from 5.6 to 3.3 percent; West German from 4.7 to 2.6 percent; and British from 2.9 to 1.7 percent. American growth reached moderately healthy levels again in the 1980s, but at the cost of stupendous budget deficits in excess of $200,000,000,000 per year. Britain in that period also showed signs of escaping the malaise dating to World War I. Still, the shifts in world economic power, a function of the inevitable diffusion of technology combined with the ability of mobile capital to seek lower labour costs in less developed countries, were shrinking the command of world resources once exercised by the United States and western Europe. The U.S.S.R. similarly suffered a declining growth rate in the 1970s (3.3 percent) and 1980s and fell so far behind in computer technology and other critical new fields that the Japanese GNP had almost surpassed that of the U.S.S.R. by the late 1980s.

Decline of growth rates

What these numbers signified was that the Soviet promise of overtaking the West would not be fufilled. In fact, if the trends of the 1980s were to continue, the Soviet share of world economic power would soon begin to decline. But the U.S. economy had been losing ground relative to the world as a whole since the 1950s and could not sustain its mid-1980s level of military and domestic spending. This trend accounted for growing protectionist sentiment in the United States as well as for demands that the allies (especially Japan) who benefited from American protection share more of the burden of the common defense. To the extent this occurred, however, Washington would lose still more leverage over the policies of its allies.

The decline in economic performance among the developed countries, combined with the relative failure of many Third World development programs and the punitive effects of the 1970s price revolution in oil, also created a severe world financial crisis. The United States and Britain relied on Arab, Japanese, and other foreign investors to buy their government bonds and banknotes, while developing countries amassed an outstanding debt of $600,000,000,000 by 1983 (despite having received another $200,000,000,000 in foreign aid over the previous 20 years). Argentina, Brazil, Chile, Mexico, and the Philippines alone accounted for almost half the Third World debt. This sea of liabilities was fed by the largesse of international charities such as the International Monetary Fund and World Bank, poor judgment on the part of private bankers, political underwriting of loans by the U.S. government, and the need to recycle Arab petrodollars to Third World countries injured by oil price hikes.

Third World debt

Another economic worry that first attracted attention in the 1970s was the possible depletion of the world's raw materials, a fear aptly dramatized by the 1973 Arab oil boycott and given formal expression in the Club of Rome's apocalyptic warnings against unbridled industrial growth. In 1974 the U.S. Bureau of Mines estimated that at then-current rates of increase in usage, the world would run out of oil in 74 years—even if known reserves increased five times over that period. Similar calculations left the world less than 100 years of aluminum, copper, lead, natural gas, nickel, and tin.

The spread of modern industry around the world also caused a degree of pollution of the air, sea, and land environments that by 1970 some scientists considered critical. In the Western world, unilateral and cooperative efforts achieved a great deal in reducing pollution levels, but the environmental movement had far less influence in the Soviet bloc and Third World, where demand for productivity far outweighed concern over pollution. The long-range consequences of testing the global ecosystem's resiliency were only beginning to be understood.

International organization. The kind of multilateral cooperation required for global planning in such matters as resource allocation and pollution control seemed unlikely to develop short of a planetwide crisis. Organizations with purely administrative or humanitarian duties, like the International Telecommunication Union or the World Health Organization, were able to function well in spite of political rivalries, but others involved in more sensitive pursuits were paralyzed by continuing East–West conflicts between the Soviet bloc and the Western alliance, combined with growing North–South conflicts between the rich and poor nations. When the UN was founded, democracies comprised a majority of the 51 member states, and their hope was that the organization would foster free trade, human rights, pluralistic regimes, and compromise solutions to global problems. By 1980 the UN had expanded to more than 150 members, three-quarters of which were one-party states. Such regimes enjoyed centralized political control of their domestic societies and economies and demanded similar control of international regimes.

East–West, North–South conflicts

Neo-Marxist economists and "dependency" theorists defended the impatience of the developing countries, arguing that the gap between rich and poor nations could only be narrowed by a transfer of power over decision making rather than by the action of trade and investment. The hypocrisy of oppressive Third World regimes that criticized the Western democracies while patronizing the U.S.S.R. was nonetheless palpable.

Arguments over how to manage the global problems in every sphere touched on the great debate over the comparative wisdom of reliance on natural processes (the market, the balance of power, the patterns of demography) versus reliance on institutional controls. It was, at bottom, a debate over the primacy of means or ends and over the definition of freedom.

TOUR D'HORIZON

Within the context shaped by these forces of world politics, the governments of the world struggled to identify their choices. The U.S.S.R. remained a military giant dominating the Eurasian landmass and able to project force into all regions of the world. But short of an extremely risky war of expansion, the Soviets could make use of their military might only to intimidate the weaker links in their chain of potential enemies. Moreover, the Soviets were reaching the limit of what they could afford to spend on the military, in light of the poor performance of their planned economy. The Soviet regime also faced discontent among its subject nationalities, especially the rapidly expanding Muslim peoples of Central Asia. The accession of the relatively youthful Gorbachev, and his apparent commitment to *perestroika* and *glasnost* held out hope of genuine change in the U.S.S.R. But to repudiate Leninism too obviously would also undermine the ideological legitimacy of the Communist Party and the Soviet ruling class.

The Soviet Union

The Chinese seemed to have chosen pragmatism over ideology in their Four Modernizations program and commitment to détente with the United States. But the slogan itself suggested the limits the Chinese Communist Party hoped to place on modernization: Reform was to be con-

fined to the agricultural, industrial, technical, and military spheres and not be allowed to spill over into the political. Hence the course laid out by Deng Xiaoping bore a certain comparison with that of Stalin. China's challenges in the area of population control and development were so formidable that talk of China becoming a third superpower was premature.

An added worry for both Communist giants was the rising economic power of Japan. Japan had become a powerhouse of such proportions that Japanese capital alone would have a serious impact on the development of East Asia and international finance. Japan was heavily dependent on open international markets to sustain its prosperity and, despite its tradition of single-minded competitiveness, had to take care not to provoke its customers into restrictive trade measures. The United States could at any time increase pressure on Japan to assume a larger role in the defense of Pacific sea lanes. The Japanese would then face the decision of whether to retire their memories of World War II and take their place as a major power. To do so without provoking threatening responses from China and the U.S.S.R. would be a major challenge for Tokyo and Washington alike.

The future of South Asia depended heavily on the outcome of the Soviet–Afghan war and the course taken by Iran upon the death of Khomeini. A continuing fundamentalist upsurge in the Muslim world could pose a serious threat to European and Japanese sources of oil. The Israelis, meanwhile, could not rely forever on the division of their enemies, their own military prowess, the quiescence of the million hostile Palestinians in the occupied West Bank and Gaza, and financial aid from the United States. Indeed, violent Palestinian protests on the West Bank in 1988 seriously damaged the Israeli cause in the United States and in world opinion. But neither could Israel afford to relinquish its territorial buffers without firm guarantees of security.

The western European governments remained in a quandary, caught between their dependence on the United States for defense and their desire for relaxation of tensions with the Soviet bloc, between their desire for denuclearization of Europe and their unwillingness to expand their own conventional forces. As long as this situation obtained, the Europeans would be perceived by Americans as free riders. The Common Market countries together had a GNP larger than that of the U.S.S.R. and two-thirds the size of the American, and had since 1950 enjoyed an age of peace and prosperity unprecedented in their history. An American pullout from Europe carried the risk that the Europeans would gradually submit to Soviet pressure rather than unite and defend themselves. But NATO had proved itself an unusually, perhaps uniquely, resilient alliance system, and a crisis in Western solidarity seemed likely only in the case of a decisive leftist-pacifist victory in the domestic politics of Britain or West Germany.

Latin America seemed to be a new storm centre in world politics. The population explosion and awakening of the peasant masses in this heretofore stagnant and quiescent continent presented opportunities for the Soviets, challenges to the United States, and grave dangers for the Latin-American peoples themselves. They faced terrific problems of development that, however they were met or not met, would tend to destabilize domestic politics. The United States was especially concerned with the region, not only because of its proximity but also because of the complex created in the American mind by Communist Cuba, which sat like a West Berlin inside the American sphere of influence. Thus, Central American and Caribbean states had only restricted room to maneuver in their domestic politics and little chance of working out their destinies wholly on their own. What Latin America appeared to need was the kind of regional leadership and inspiration it had not seen since the days of Simón Bolívar. But the largest states, like Brazil, Argentina, and Mexico, had failed to produce such leaders, while regional organizations were either dominated by the United States or lacked sufficient prestige and force to act effectively.

The United States faced problems of adjustment greater than that of any power except perhaps the U.S.S.R. American economic power would continue to shrink, partly because of the diffusion of manufacturing industries and technology around the world and partly because of the high percentage of U.S. brainpower and resources devoted to military-related research. The U.S. position in world affairs was not unlike that of the British Empire around the turn of the century, when Britain was still the overall naval, financial, commercial, and technological leader but was challenged by numerous industrializing powers anxious to build navies, markets, and colonial empires of their own. No longer able to defend the world order alone, Britain concluded a series of alliances to contain its rivals, especially Germany, and in the process lost some of its control over its own diplomacy. The United States had now to choose between maintaining its level of involvement in world affairs and deferring increasingly to allied opinion, or reverting to its other and older tradition of isolationism. But to the extent that isolationism was no longer an option, future American presidents would face the challenge of building a domestic base of support for foreign policies that neither fled from the realities of the world—including Soviet espionage and military power, global terrorism, and Third World poverty—nor undermined the values—including personal liberty, free enterprise, and limited government—that make the United States and its Western allies worth defending in the first place.

BIBLIOGRAPHY

General works: Important international histories of the 20th century are WILLIAM R. KEYLOR, *The Twentieth-Century World: An International History* (1984); and FELIX GILBERT, *The End of the European Era, 1890 to the Present,* 3rd ed. (1984). See also PAUL JOHNSON, *Modern Times: The World from the Twenties to the Eighties* (1983), episodic but insightful; and RENÉ ALBRECHT-CARRIÉ, *A Diplomatic History of Europe Since the Congress of Vienna,* rev. ed. (1973), a standard survey. The interpretive essays by LUDWIG DEHIO, *The Precarious Balance: Four Centuries of the European Power Struggle* (1962; originally published in German, 1948); and HAJO HOLBORN, *The Political Collapse of Europe* (1951, reprinted 1982), put the 20th century in a longer perspective. On war and intelligence, see MICHAEL HOWARD, *War in European History* (1976), and *War and the Liberal Conscience* (1978); THEODORE ROPP, *War in the Modern World* (1959, reprinted 1981); and ERNEST R. MAY (ed.), *Knowing One's Enemies: Intelligence Assessment Before the Two World Wars* (1984). Theoretical works on the nature of international relations include HANS J. MORGENTHAU and KENNETH W. THOMPSON, *Politics Among Nations: The Struggle for Power and Peace,* 6th ed. (1985); KENNETH N. WALTZ, *Man, the State, and War: A Theoretical Analysis* (1959, reprinted 1965); and F.H. HINSLEY, *Power and the Pursuit of Peace: Theory and Practice in the History of Relations Between States* (1963). JULIUS STONE, *Visions of World Order: Between State Power and Human Justice* (1984), explores the laws governing international relations in the modern world. Key terms and concepts of international politics are analyzed in DAVID WEIGALL, *Britain & the World, 1815–1986: A Dictionary of International Relations* (1987); and, in a larger work, EDMUND JAN OSMÁNCZYK, *The Encyclopedia of the United Nations and International Agreements* (1985).

World War I: Works on the origins of World War I include LUIGI ALBERTINI, *The Origins of the War of 1914,* 3 vol. (1952–57, reprinted 1980; originally published in Italian, 1942–43); LAURENCE LAFORE, *The Long Fuse: An Interpretation of the Origins of World War I* (1965, reprinted 1981); DWIGHT E. LEE, *The Outbreak of the First World War: Causes and Responsibilities,* 4th ed. (1975); V.R. BERGHAHN, *Germany and the Approach of War in 1914* (1973); ZARA S. STEINER, *Britain and the Origins of the First World War* (1977); and JAMES JOLL, *The Origins of the First World War* (1984). Diplomacy of the war years is explored in GERD HARDACH, *The First World War, 1914–1918* (1977; originally published in German, 1973); BERNADOTTE E. SCHMITT and HAROLD C. VEDELER, *The World in the Crucible, 1914–1919* (1984); Z.A.B. ZEMAN, *The Gentlemen Negotiators* (1971; U.K. title, *A Diplomatic History of the First World War*); and ARNO J. MAYER, *Political Origins of the New Diplomacy, 1917–1918* (1959, reissued 1967 as *Wilson vs. Lenin*). (*Peacemaking 1919*): The history of the Paris Peace Conference is found in the reminiscences of the principal participants, which are regrettably dated and tendentious, except for HAROLD NICOLSON, *Peacemaking, 1919* (1933, reprinted 1984), a memoir of lasting value. On Wilsonianism, see N. GORDON LEVIN, JR., *Woodrow Wilson and World Politics: America's Response to War and Revolution* (1968). On the Peace Conference and the Russian problem, see ARNO J. MAYER, *Politics and Diplo-*

macy of Peacemaking: Containment and Counterrevolution at Versailles, 1918–1919 (1967); GEORGE F. KENNAN, *Russia and the West Under Lenin and Stalin* (1961); and STEPHEN WHITE, *The Origins of Detente: The Genoa Conference and Soviet-Western Relations, 1921–1922* (1985). On French security during and after 1919, see WALTER A. MCDOUGALL, *France's Rhineland Diplomacy, 1914–1924: The Last Bid for a Balance of Power in Europe* (1978); and MELVYN P. LEFFLER, *The Elusive Quest: America's Pursuit of European Stability and French Security, 1919–1933* (1979). On reparations at the Peace Conference, see MARC TRACHTENBERG, *Reparation in World Politics: France and European Economic Diplomacy, 1916–1923* (1980). On war debts, see DENISE ARTAUD, *La Question des dettes interalliées et la reconstruction de l'Europe (1917–1929),* 2 vol. (1978, thesis). See also JOHN MAYNARD KEYNES, *The Economic Consequences of the Peace* (1919, reissued 1971); and ÉTIENNE MANTOUX, *The Carthaginian Peace: or, The Economic Consequences of Mr. Keynes* (1946, reprinted 1979).

(*The fragile 1920s*): PIERRE RENOUVIN, *War and Aftermath, 1914–1929* (1968; originally published in French, 1957); and RAYMOND J. SONTAG, *A Broken World, 1919–1939* (1971), provide excellent historical summaries. On economic history, see DEREK H. ALDCROFT, *From Versailles to Wall Street, 1919–1929* (1977). A keen portrayal of the statesmen of the period is offered in GORDON A. CRAIG and FELIX GILBERT (eds.), *The Diplomats: 1919–1939* (1953; reissued in 2 vol., 1971–72). On the settlement in East Asia and U.S.–Japanese–Chinese relations, see AKIRA IRIYE, *After Imperialism: The Search for a New Order in the Far East, 1921–1931* (1965), and *Across the Pacific: An Inner History of American-East Asian Relations* (1967). On U.S. policy in Latin America, see GORDON CONNELL-SMITH, *The United States and Latin America: An Historical Analysis of Inter-American Relations* (1974). For the broadest overview of European diplomacy in the 1920s, reinterpreted in light of new documentation, see CHARLES S. MAIER, *Recasting Bourgeois Europe: Stabilization in France, Germany, and Italy in the Decade After World War I* (1975). On Franco-German relations, see JACQUES BARIÉTY, *Les Relations franco-allemandes après la première guerre mondiale* (1977). On the settlements of the mid-1920s, see STEPHEN A. SCHUKER, *The End of French Predominance in Europe: The Financial Crisis of 1924 and the Adoption of the Dawes Plan* (1976); DAN P. SILVERMAN, *Reconstructing Europe After the Great War* (1982); and JON JACOBSON, *Locarno Diplomacy: Germany and the West, 1925–1929* (1972). The U.S.S.R. is covered exhaustively and insightfully in ADAM B. ULAM, *Expansion and Coexistence: Soviet Foreign Policy, 1917–73,* 2nd ed. (1974). The U.S.-Soviet contacts of the 1920s are explored in JOAN HOFF-WILSON, *Ideology and Economics: U.S. Relations with the Soviet Union, 1918–1933* (1974). On Geneva, see F.P. WALTERS, *A History of the League of Nations,* 2 vol. (1952, reprinted 1986); and GEORGE SCOTT, *The Rise and Fall of the League of Nations* (1973). Eastern European diplomacy is expertly covered by PIOTR S. WANDYCZ, *France and Her Eastern Allies, 1919–1925: French-Czechoslovak-Polish Relations from the Paris Peace Conference to Locarno* (1962, reprinted 1974); and F. GREGORY CAMPBELL, *Confrontation in Central Europe: Weimar Germany and Czechoslovakia* (1975).

(*Origins of World War II*): E.M. ROBERTSON (ed.), *The Origins of the Second World War: Historical Interpretations* (1971), compiles articles on the debate over A.J.P. TAYLOR, *The Origins of the Second World War* (1961; reissued with a new introduction, 1983), which is still good on British and French policy, but idiosyncratic and controversial on Hitler. ANTHONY P. ADAMTHWAITE, *The Making of the Second World War,* 2nd ed. (1979), offers an informative historical summary. See also the standard PIERRE RENOUVIN, *World War II and Its Origins: International Relations, 1929–1945* (1968; originally published in French, 1958); and the classic memoir by WINSTON CHURCHILL, *The Gathering Storm* (1948, reissued 1985). Nazi diplomacy is covered in detail in GERHARD L. WEINBERG, *The Foreign Policy of Hitler's Germany: Diplomatic Revolution in Europe, 1933–36* (1970), and *The Foreign Policy of Hitler's Germany: Starting World War II, 1937–1939* (1980). Other good interpretations include ALAN BULLOCK, *Hitler, a Study in Tyranny,* rev. ed. (1962); KLAUS HILDEBRAND, *The Foreign Policy of the Third Reich* (1973; originally published in German, 1971); and EBERHARD JÄCKEL, *Hitler's Weltanschauung: A Blueprint for Power* (1972; reissued as *Hitler's World View,* 1981; originally published in German, 1969). On Fascist Italy, see ELIZABETH WISKEMANN, *The Rome-Berlin Axis: A Study of the Relations Between Hitler and Mussolini,* new rev. ed. (1966); and DENIS MACK SMITH, *Mussolini's Roman Empire* (1976). On France, see ANTHONY P. ADAMTHWAITE, *France and the Coming of the Second World War, 1936–1939* (1977). On British appeasement, see MARTIN GILBERT, *The Roots of Appeasement* (1966); A.L. ROWSE, *Appeasement: A Study in Political Decline, 1933–1939* (1961); and TELFORD TAYLOR, *Munich: The Price of Peace* (1979). On the United States, see MANFRED JONAS, *Isolationism in America, 1935–1941* (1966); ROBERT A. DIVINE, *The Illusion of Neutrality* (1962); and ARNOLD A. OFFNER, *American Appeasement: United States Foreign Policy and Germany, 1933–1938* (1969, reissued 1976). The economic collapse of the 1930s is covered in CHARLES P. KINDLEBERGER, *The World in Depression, 1929–1939,* rev. ed. (1986); and its diplomatic effects in DAVID E. KAISER, *Economic Diplomacy and the Origins of the Second World War: Germany, Britain, France, and Eastern Europe, 1930–1939* (1980). On military preparations, see DONALD CAMERON WATT, *Too Serious a Business: European Armed Forces and the Approach to the Second World War* (1975); and ROBERT J. YOUNG, *In Command of France: French Foreign Policy and Military Planning, 1933–1940* (1978). On the origins of the Pacific war, see ARNOLD A. OFFNER, *The Origins of the Second World War: American Foreign Policy and World Politics, 1917–1941* (1975, reprinted 1986).

World War II and after: A monumental survey of European politics during World War II is presented in SIR LLEWELLYN WOODWARD, *British Foreign Policy in the Second World War,* 5 vol. (1962–70). Other works on diplomatic developments include ROBERT A. DIVINE, *The Reluctant Belligerent: American Entry into World War II,* 2nd ed. (1979), and *Roosevelt and World War II* (1969); HERBERT FEIS, *Churchill, Roosevelt, and Stalin: The War They Waged and the Peace They Sought,* 2nd ed. (1967); ANDREAS HILLGRUBER, *Hitlers Strategie: Politik und Kriegführung, 1940–1941,* 2nd ed. (1982); MACGREGOR KNOX, *Mussolini Unleashed, 1939–1941: Politics and Strategy in Fascist Italy's Last War* (1982); WILLIAM H. MCNEILL, *America, Britain, and Russia: Their Co-operation and Conflict, 1941–1946* (1953, reprinted 1970); ALAN S. MILWARD, *War, Economy, and Society, 1939–1945* (1977); and GORDON WRIGHT, *The Ordeal of Total War, 1939–1945* (1968). (*General histories*): For summaries of global relations since 1945, see PETER CALVOCORESSI, *World Politics Since 1945,* 5th ed. (1987); PETER LANE, *Europe Since 1945* (1985); ROBERT A. DIVINE, *Since 1945: Politics and Diplomacy in Recent American History,* 3rd ed. (1985); RAYMOND ARON, *The Imperial Republic: The United States and the World, 1945–1973* (1974, reprinted 1982; originally published in French, 1973); PAUL Y. HAMMOND, *Cold War and Détente: The American Foreign Policy Process Since 1945* (1975); JOHN LEWIS GADDIS, *Strategies of Containment: A Critical Appraisal of Postwar American National Security Policy* (1982); LAWRENCE FREEDMAN, *The Evolution of Nuclear Strategy* (1981); and a revisionist work by WALTER LAFEBER, *America, Russia, and the Cold War, 1945–1984,* 5th ed. (1985). On the Middle East, see TREVOR N. DUPUY, *Elusive Victory: The Arab-Israeli Wars, 1947–1974* (1978, reissued 1984); RITCHIE OVENDALE, *The Origins of the Arab-Israeli Wars* (1984); and GIDEON RAFAEL, *Destination Peace: Three Decades of Israeli Foreign Policy* (1981). On European recovery, see WALTER LAQUEUR, *The Rebirth of Europe* (1970); and RICHARD MAYNE, *The Recovery of Europe: From Devastation to Unity* (1970).

(*Origins of the Cold War*): On the Stalin-Truman years, see HARRY S. TRUMAN, *Memoirs,* 2 vol. (1955–56, reprinted 1986–87); DEAN ACHESON, *Present at the Creation: My Years in the State Department* (1969, reprinted 1987); GEORGE F. KENNAN, *Memoirs,* 2 vol. (1967–72); and DWIGHT D. EISENHOWER, *The White House Years,* 2 vol. (1963–65). Insightful histories include JOHN LEWIS GADDIS, *The United States and the Origins of the Cold War, 1941–1947* (1972), and *The Long Peace: Inquiries into the History of the Cold War* (1987); PAUL SEABURY, *The Rise and Decline of the Cold War* (1967); LOUIS J. HALLE, *The Cold War as History* (1967, reprinted 1971); DANIEL YERGIN, *Shattered Peace: The Origins of the Cold War and the National Security State* (1977); and HUGH THOMAS, *Armed Truce: The Beginnings of the Cold War, 1945–46* (1986).

The following are works of scholarship on the Cold War by authors who clearly regarded themselves as left-revisionist: WILLIAM APPLEMAN WILLIAMS, *The Tragedy of American Diplomacy,* 2nd rev. ed. (1972); GABRIEL KOLKO, *The Roots of American Foreign Policy: An Analysis of Power and Purpose* (1969); GAR ALPEROVITZ, *Atomic Diplomacy: Hiroshima and Potsdam: The Use of the Atomic Bomb and the American Confrontation with Soviet Power,* rev. ed. (1985); DENNA F. FLEMING, *The Cold War and Its Origins, 1917–1960,* 2 vol. (1961); and DAVID HOROWITZ, *The Free World Colossus: A Critique of American Foreign Policy in the Cold War,* rev. ed. (1971). ROBERT J. MADDOX, *The New Left and the Origins of the Cold War* (1973), provides a critique of their logic and use of evidence.

The Soviet side is discussed in VOJTECH MASTNY, *Russia's Road to the Cold War: Diplomacy, Warfare, and the Politics of Communism, 1941–1945* (1979); ADAM B. ULAM, *The Rivals: America and Russia Since World War II* (1971, reprinted 1983); DAVID HOLLOWAY, *The Soviet Union and the Arms Race* (1983); and THOMAS W. WOLFE, *Soviet Power and Europe, 1945–1970* (1970). MARSHALL D. SHULMAN, *Stalin's Foreign Policy Reappraised* (1963, reissued 1985); and WILLIAM TAUBMAN, *Stalin's American Policy: From Entente to Detente to Cold War* (1982),

are sympathetic accounts. On the "wise men" surrounding Truman during the late 1940s, see the critique by LLOYD C. GARDNER, *Architects of Illusion: Men and Ideas in American Foreign Policy, 1941–1949* (1970); and a later, more sympathetic work WALTER ISAACSON and EVAN THOMAS, *The Wise Men: Six Friends and the World They Made: Acheson, Bohlen, Harriman, Kennan, Lovett, McCloy* (1986). The standard earlier work on atomic policy is *A History of the United States Atomic Energy Commission,* vol. 1 by RICHARD G. HEWLETT and OSCAR E. ANDERSON, *The New World, 1939/46* (1962), and vol. 2 by RICHARD G. HEWLETT and FRANCIS DUNCAN, *Atomic Shield, 1947/1952* (1969). Making use of declassified material is a later work by GREGG HERKEN, *The Winning Weapon: The Atomic Bomb in the Cold War, 1945–1950* (1980). See also HERBERT F. YORK, *The Advisors: Oppenheimer, Teller, and the Superbomb* (1976); and ROBERT A. DIVINE, *Blowing on the Wind: The Nuclear Test Ban Debate, 1954–1960* (1978). On the origins of the Korean war, see BRUCE CUMINGS (ed.), *Child of Conflict: The Korean-American Relationship, 1943–1953* (1983); and on the war itself, DAVID REES, *Korea: The Limited War* (1964).

(*"Total" Cold War, 1957–72*): The concept of "total Cold War" is described in WALTER A. MCDOUGALL, *The Heavens and the Earth: A Political History of the Space Age* (1985). World trends after Sputnik are also the subject of W.W. ROSTOW, *The Diffusion of Power: An Essay in Recent History* (1972). See also the extremely interesting memoirs by NIKITA KHRUSHCHEV, *Khrushchev Remembers,* trans. from Russian (1970), and *Khrushchev Remembers: The Last Testament,* trans. from Russian (1974); RICHARD M. NIXON, *RN: The Memoirs of Richard Nixon* (1978); and HENRY KISSINGER, *White House Years* (1979). Also see ARTHUR M. SCHLESINGER, JR., *A Thousand Days: John F. Kennedy in the White House* (1965, reprinted 1983); ROGER HILSMAN, *To Move a Nation: The Politics of Foreign Policy in the Administration of John F. Kennedy* (1967); GRAHAM T. ALLISON, *Essence of Decision: Explaining the Cuban Missile Crisis* (1971); GLENN T. SEABORG, *Kennedy, Khrushchev, and the Test Ban* (1981); and DESMOND BALL, *Politics and Force Levels: The Strategic Missile Program of the Kennedy Administration* (1980). On the Sino-Soviet split, see ALFRED D. LOW, *The Sino-Soviet Dispute: An Analysis of the Polemics* (1976), continued in his *Sino-Soviet Confrontation Since Mao Zedong: Dispute, Detente, or Conflict?* (1987); DONALD S. ZAGORIA, *The Sino-Soviet Conflict, 1956–1961* (1962, reissued 1969); and WILLIAM E. GRIFFITH, *The Sino-Soviet Rift, Analyzed and Documented* (1964; reissued as *Sino-Soviet Relations, 1964–1965,* 1967). On the phenomenon of Gaullism, see CHARLES DE GAULLE, *Memoirs of Hope: Renewal and Endeavor* (1971; originally published in French, 1970); W.W. KULSKI, *De Gaulle and the World: The Foreign Policy of the Fifth French Republic* (1966); and WILFRID L. KOHL, *French Nuclear Diplomacy* (1971). On postwar German policies, see WILLIAM E. GRIFFITH, *The Ostpolitik of the Federal Republic of Germany* (1978); GERHARD WETTIG, *Community and Conflict in the Socialist Camp: The Soviet Union, East Germany, and the German Problem, 1965–1972* (1975; originally published in German, 1972–73); and PETER H. MERKL, *German Foreign Policies, West & East: On the Threshold of a New European Era* (1974).

(*Third World countries*): General works on European decolonization include JOHN D. HARGREAVES, *The End of Colonial Rule in West Africa: Essays in Contemporary History* (1979); PROSSER GIFFORD and W. ROGER LEWIS (eds.), *The Transfer of Power in Africa: Decolonization, 1940–1960* (1982); and ANN WILLIAMS, *Britain and France in the Middle East and North Africa, 1914–1967* (1968); HUGH THOMAS, *Suez* (1967; U.K. title, *Suez Affair*). On Soviet penetration of the Third World, see ROBERT C. HORN, *Soviet-Indian Relations: Issues and Influence* (1982); CHRISTOPHER STEVENS, *The Soviet Union and Black Africa* (1976); and ROBERT H. DONALDSON (ed.), *The Soviet Union in the Third World: Successes and Failures* (1981). The Vietnam War is treated in WILLIAM S. TURLEY, *The Second Indochina War: A Short Political and Military History, 1954–1975* (1986); STANLEY KARNOW, *Vietnam: A History* (1983); and GEORGE C. HERRING, *America's Longest War: The United States and Vietnam, 1950–1975,* 2nd ed. (1986). On U.S. involvement, see DAVID HALBERSTAM, *The Best and the Brightest* (1972, reprinted 1983); on the Tet Offensive, PETER BRAESTRUP, *Big Story: How the American Press and Television Reported and Interpreted the Crisis of Tet 1968 in Vietnam and Washington,* 2 vol. (1977); on U.S. bombing strategy, WALLACE J. THIES, *When Governments Collide: Coercion and Diplomacy in the Vietnam Conflict, 1964–1968* (1980); and on American military mistakes, HARRY G. SUMMERS, JR., *On Strategy: A Critical Analysis of the Vietnam War* (1982).

(*The Global Village since 1972*): For the contemporary period, memoirs become increasingly important. All the principals in the Carter administration produced lengthy accounts: JIMMY CARTER, *Keeping Faith: Memoirs of a President* (1982); CYRUS VANCE, *Hard Choices: Critical Years in America's Foreign Policy* (1983); and ZBIGNIEW BRZEZINSKI, *Power and Principle: Memoirs of the National Security Adviser, 1977–1981* (1983). A fine summary of the administration is GADDIS SMITH, *Morality, Reason, and Power: American Diplomacy in the Carter Years* (1986). China since 1970 is the subject of ROY MEDVEDEV, *China and the Superpowers,* trans. from Russian (1986); and C.G. JACOBSEN, *Sino-Soviet Relations Since Mao: The Chairman's Legacy* (1981). Middle Eastern diplomacy is expertly analyzed in BAHGAT KORANY and ALI E. HILLAL DESSOUKI, *The Foreign Policies of Arab States* (1984); and general Third World problems in STEPHEN D. KRASNER, *Structural Conflict: The Third World Against Global Liberalism* (1985). Soviet policy is the subject of ADAM B. ULAM, *Dangerous Relations: The Soviet Union in World Politics, 1970–1982* (1983); RICHARD F. STAAR, *USSR Foreign Policies After Detente,* rev. ed. (1987); and ROBERTA GOREN, *The Soviet Union and Terrorism* (1984). A thorough account of the decline of detente between the United States and U.S.S.R. is given in RAYMOND L. GARTHOFF, *Détente and Confrontation: American–Soviet Relations from Nixon to Reagan* (1985).

(*Arms race and disarmament*): Specific issues of armament and disarmament are discussed in NATIONAL ACADEMY OF SCIENCES (U.S.), *Nuclear Arms Control: Background and Issues* (1985); CURT GASTEYGER, *Searching for World Security: Understanding Global Armament and Disarmament* (1985); and WILLIAM T. LEE and RICHARD F. STAAR, *Soviet Military Policy Since World War II* (1986). For divergent views on the future of nuclear weapons, see KEITH B. PAYNE, *Strategic Defense: "Star Wars" in Perspective* (1986); CRAIG SNYDER (ed.), *The Strategic Defense Debate: Can "Star Wars" Make Us Safe?* (1986); JAMES H. WYLLIE, *European Security in the Nuclear Age* (1986); DONALD M. SNOW, *The Necessary Peace: Nuclear Weapons and Superpower Relations* (1987); ANGELO CODERILLA, *While Others Build: A Commonsense Approach to the Strategic Defense Initiative* (1988); and especially FREEMAN DYSON, *Weapons and Hope* (1984); and ROBERT M. LAWRENCE, *Strategic Defense Initiative: Bibliography and Research Guide* (1987).

International Trade

International trade includes all economic transactions that are made between countries. Among the items commonly traded are consumer goods, such as television sets and clothing; capital goods, such as machinery; and raw materials and food. Other transactions involve services, such as travel services and payments for foreign patents. International trade transactions are facilitated by international financial payments, in which the private banking system and the central banks of the trading nations play important roles.

International trade and the accompanying financial transactions are conducted generally toward the purpose of providing a nation with commodities it lacks in exchange for those that it produces in abundance; such transactions, functioning with other economic policies, generally improve the standard of living of a nation. This article provides a historical and contemporary overview of the structure of international trade, of the classic controversy over free versus controlled trade, and of the problems that arise in transactions between nations. (Ed.)

For statistical information on international trade, see the BRITANNICA WORLD DATA ANNUAL.

The theory of international trade

HISTORY

Accounts of barter of goods or of services among different peoples can be traced back almost as far as the record of human history. International trade, however, is specifically an exchange between members of different nations, and accounts and explanations of such trade begin (despite fragmentary earlier discussion) only with the rise of the modern nation-state at the close of the European Middle Ages. As political thinkers and philosophers began to examine the nature and function of the nation, trade with other nations became a particular topic of their inquiry. It is, accordingly, no surprise to find one of the earliest attempts to describe the function of international trade within that highly nationalistic body of thought now known as "mercantilism." Mercantilist analysis, which reached the peak of its influence upon European thought in the 16th and 17th centuries, focused directly upon the welfare of the nation. It insisted that the acquisition of wealth, particularly wealth in the form of gold, was of paramount importance for national policy. Mercantilists took the virtues of gold almost as an article of faith; consequently, they never undertook to explain adequately why gold deserved such a high priority in their economic plans.

Mercantilism

The trade policy dictated by mercantilist philosophy was accordingly simple: encourage exports, discourage imports, and take the proceeds of the resulting export surplus in gold. Because of their nationalistic bent, mercantilist theorists either brushed aside or else did not realize that, from an international viewpoint, this policy would necessarily prove self-defeating. The nation that successfully gains an export surplus must ordinarily do so at the expense of one or more other nations that record a matching import surplus. Mercantilists' ideas often were intellectually shallow, and indeed their trade policy may have been little more than a rationalization of the interests of a rising merchant class that wanted wider markets—hence the emphasis on expanding exports—coupled with protection against competition in the form of imported goods. Yet mercantilist policies, as will be noted later, are by no means completely dead today.

COMPARATIVE-ADVANTAGE ANALYSIS

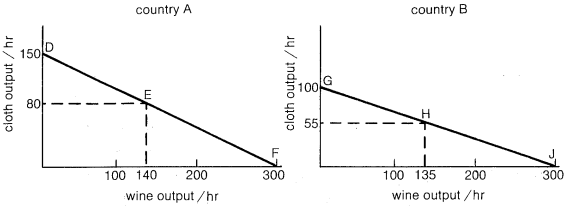
Adam Smith and David Ricardo

The British school of "classical economics" began in no small measure as a reaction against the inconsistencies of mercantilist thought. Adam Smith was the 18th-century founder of this school; his famous work, *The Wealth of Nations,* is in part an antimercantilist tract. In *The Wealth of Nations,* Smith emphasized the importance of specialization as a source of increased output, and he treated international trade as a particular instance of specialization: in a world where productive resources are scarce and human wants cannot be completely satisfied, each nation should specialize in the production of goods it is particularly well equipped to produce; it should export part of this production, taking in exchange other goods that it cannot so readily turn out. Smith did not expand these ideas at much length; but David Ricardo, the second great classical economist, developed them into the "principle of comparative advantage," a principle still to be found, much as Ricardo spelled it out, in every international trade text.

Simplified theory of comparative advantage. For clarity of exposition, the theory of comparative advantage is usually first outlined as though only two countries and only two commodities were involved, although it is by no means limited to such cases. Again for clarity, the cost of production is usually measured only in terms of labour time and effort; the cost of a unit of cloth, for example, might be given as two hours of work. The two countries will here be A and B, and the two commodities wine and cloth. The labour time required to produce a unit of either commodity in either country is as follows:

Cost of Production (labour time)

	country A	country B
wine (1 unit)	1 hour	2 hours
cloth (1 unit)	2 hours	6 hours



As compared with country A, country B is productively inefficient. Its workers need more time to turn out a unit of wine or a unit of cloth. This relative inefficiency may result from differences in climate, in worker training or skill, or in the amount of available tools and equipment, or from numerous other possible reasons. Ricardo took it for granted that such differences do exist, and he was not concerned with their origins.

Country A is said to have an absolute advantage in the production of both wine and cloth because it is more efficient in the production of both goods. Accordingly, A's absolute advantage seemingly invites the conclusion that country B could not possibly compete with country A, and indeed that if trade were to be opened up between them, country B would be competitively overwhelmed. Ricardo insisted that this conclusion is false. The critical factor is that country B's disadvantage is less pronounced in wine production, in which its workers require only twice as much time for a single unit as do the workers in A, than it is in cloth production, in which the required time is three times as great. This means, Ricardo pointed out, that country B will have a comparative advantage in wine production. Both countries will profit, in terms of the real income they enjoy, if country B specializes in wine production, exporting part of its output to country A, and if country A specializes in cloth production, exporting part of its output to country B. Paradoxical though it may seem, it is preferable for country A to leave wine production to country B, despite the fact that A's workers can produce wine of equal quality in half the time that B's workers can do so.

Ricardo's conclusion

To illustrate this conclusion, it can be considered that country A's total labour force consists of 300 workers. Disregarding the possibility of trade with B, A then has a choice of various outputs of cloth and of wine, depending on the number of workers engaged in each of the two occupations. This range of choices is illustrated by the line DEF in the accompanying diagram. If all 300 labourers work on cloth production, total hourly cloth output will be 150 units (point D in the diagram), since each such unit requires two hours' labour. At the other extreme, if

all labour works on wine production, wine output will be 300 units per hour (point F). Any intermediate point on the line DEF is possible. Point E, for example, indicates 80 units of cloth produced each hour (160 workers so employed) and 140 units of wine (employing the other 140 workers). DEF is country A's "production possibility" line. If it does not trade with country B and so can consume only what it produces itself, DEF will also be country A's "consumption possibility" line; it will choose some point thereon, depending on the preferences of its citizens for wine and cloth. DEF represents the limit of production and consumption possibilities; points above and to the right of DEF are unattainable.

Production possibilities for cloth and wine (see text).

In the right-hand diagram, the line GHJ has exactly the same production and consumption significance for country B—assuming its total force to be 600 workers (so as to make it roughly equal to A in total output capacity). The position of the line GHJ reflects the fact that labour in country B requires two hours to produce a unit of wine, and six hours for a unit of cloth.

One may consider that A and B are initially isolated from one another. Country A has chosen point E (80 cloth, 140 wine) as its production–consumption point. Country B has chosen point H (55 cloth, 135 wine). The opportunity of free trade between the two countries is now opened up. If both countries want to attain the higher levels of production and consumption available to them through specializing on and trading of the product for which they have a comparative advantage, Country A will shift its entire labour force to cloth production, and Country B will shift its entire labour force to wine production. A possible barter rate (setting aside the detail of how this would be worked out) might be one cloth for two and one-half wine. Country A might then choose to export 60 units of its hourly cloth output of 150, keeping the other 90 for domestic consumption. In exchange for this 60 cloth (at the 1-for-2½ exchange rate) it would receive 150 wine. A's real income position is thus improved in comparison with pretrade point E: cloth for domestic consumption has risen from 80 to 90, and wine consumption has risen from 140 to 150. Country B enjoys a similar gain. In comparison with pre-trade point H, its cloth consumption has risen from 55 to 60, and wine consumption has risen from 135 to 150.

› trade

The incentive to export and to import can be explained in price terms. In country A (before international trade), the price of cloth ought to be twice that of wine, since a unit of cloth requires twice as much labour effort. If this price ratio is not satisfied, one of the two commodities will be overpriced and the other underpriced. Labour will then move out of the underpriced occupation and into the other, until the resulting shortage of the underpriced commodity drives up its price. In country B (again, before trade), a cloth unit should cost three times as much as a wine unit, since a unit of cloth requires three times as much labour effort. Hence, a typical before-trade price relationship, matching the underlying real cost ratio in each country, might be as follows:

	country A	country B
Price of wine per unit	$5	£1
Price of cloth per unit	$10	£3

The absolute levels of price do not matter. All that is necessary is that in each country the ratio of the two prices should match the labour–cost ratio.

As soon as the opportunity of exchange between the two countries is opened up, the difference between the wine–cloth price ratio in country A (namely, 5:10, or 1:2) and that in country B (which is 1:3) provides the opportunity of a trading profit. Cloth will begin to move from A to B, and wine from B to A. A trader in A, starting with a capital of $10 for example, would buy a unit of cloth, sell it in B for £3, buy 3 units of B's wine with the proceeds, and sell this in A for $15. (This example assumes, for simplicity, that costs of transporting goods are negligible or zero. The introduction of transport costs complicates the analysis somewhat, but it does not change the conclusions, unless these costs are so high as to make trade impossible.)

So long as the ratio of prices in country A differs from that in country B, the flow of goods between the two countries will steadily increase as traders become increasingly aware of the profit to be obtained by moving goods between the two countries. Prices, however, will be affected by these changing flows of goods. The wine price in country A, for example, can be expected to fall as larger and larger supplies of imported wine become available. Thus A's wine–cloth price ratio of 1:2 will fall. For comparable reasons, B's price ratio of 1:3 will rise. When the two ratios meet, at some intermediate level (in the example earlier, at 1:2½), the flow of goods will stabilize.

John Stuart Mill's view

Amplification of the theory. At a later stage in the history of comparative-advantage theory, the English philosopher and political economist John Stuart Mill showed that the determination of the exact after-trade price ratio was a supply-and-demand problem. At each possible intermediate ratio (within the range of 1:2 and 1:3), country A would want to import a particular quantity of wine and export a particular quantity of cloth. At that same possible ratio, country B would wish to import and export particular amounts of cloth and of wine. For any intermediate ratio taken at random, however, A's export-import quantities probably will not match those of B. Ordinarily, there will be just one intermediate ratio at which the quantities correspond; that is the final trading ratio at which quantities exchanged will stabilize. (Once they have stabilized, there is no longer any profit in exchanging goods. Even with such profits eliminated, however, there is no reason why A producers should want to stop selling part of their cloth in B, since the return there is as good as that obtained from domestic sales. Any falloff in the amounts exported and imported would reintroduce profit opportunities.)

Variations of the labour-cost model

In the elementary labour-cost example used above, there will be complete specialization: country A's entire labour force will move to cloth production and country B's to wine production. More elaborate comparative-advantage models recognize production costs other than labour (that is, the costs of land and of capital). In such models, part of country A's wine industry may survive and compete effectively against imports, as may also part of B's cloth industry. The models can be expanded in other ways: to take account of more than two countries, or more than two commodities, and of transport costs. The essential conclusions, however, come from the elementary model used above, so that this model, despite its simplicity, still provides a workable outline of the theory. (It should be noted that even the most elaborate comparative-advantage models continue to rely on certain simplifying assumptions without which the basic conclusions do not necessarily hold. These assumptions are discussed below.)

As noted earlier, the effect of this analysis is to correct any false first impression that low-productivity countries are at a hopeless disadvantage in trading with high-productivity ones. The impression is false, that is, if one assumes, as comparative advantage theory does, that international trade is an exchange of goods between countries. It is pointless for country A to sell goods to country B, whatever its labour-cost advantages, if there is nothing that it can profitably take back in exchange for its sales. With one exception, there will always be at least one commodity that a low-productivity country such as B can successfully export. Country B must of course pay a price for its low productivity, as compared with A; but that price is a lower per capita domestic income and not a disadvantage in international trading. For trading purposes, absolute productivity levels are unimportant; country B will always

find one or more commodities in which it enjoys a comparative advantage; that is, a commodity in the production of which its absolute disadvantage is least. The one exception is that case in which productivity ratios, and consequently pre-trade price ratios, happen to match one another in two countries. Such would have been the case had country B required four labour hours (instead of six) to produce a unit of cloth. In this particular circumstance, there would be no incentive for either country to engage in trade, and no gain from trading. In a two-commodity example such as that employed, it might not be unusual to find matching productivity and price ratios. But as soon as one moves on to cases of three and more commodities, the statistical probability of encountering precisely equal ratios becomes very small indeed.

Value of the theory of comparative advantage

The major purpose of the theory of comparative advantage is to illustrate the gains from international trade. Each country can gain by specializing in those occupations in which it is relatively efficient; it should export part of that production and take in exchange those goods in whose production it is, for whatever reason, at a comparative disadvantage. The theory of comparative advantage thus provides a strong argument for free trade—and indeed for a laissez-faire attitude with respect to trade. The supporting argument is simple: specialization and free exchange among nations yield higher real income for the participants.

The fact that a country will enjoy higher real income as a consequence of the opening up of trade does not mean, of course, that every family or individual within the country must share in that benefit. Producer groups affected by import competition obviously will suffer, to at least some degree. Comparative-advantage theorists concede that free trade would affect the relative income position of such groups, and perhaps even their absolute income level. But they insist that the special interest of these groups clashes with the total national interest, and the most that they are usually willing to concede is the possible need for temporary protection against import competition, in order that the persons affected may have sufficient time to move to another occupation.

Nations do, of course, maintain tariffs and other barriers to imports. For discussion of the reasons for this seeming clash between actual policies and the lessons of the theory of comparative advantage, see below *State interference in international trade.*

SOURCES OF COMPARATIVE ADVANTAGE

Theories of productivity variation

As already noted, British classical economists simply accepted the fact that productivity differences exist between countries; they made no concerted attempt to explain which commodities a country would export or import. During the 20th century, international economists have offered a number of theories in an effort to explain why countries have differences in productivity, the factor that determines comparative advantage and the pattern of international trade.

Natural resources. First, countries can have an advantage because they are richly endowed with a particular natural resource. For example, countries with plentiful oil resources can generally produce oil inexpensively. Thus, Saudi Arabia produces oil very cheaply, giving it a comparative advantage in oil, and it exports oil in order to finance its purchases of imports. Similarly, countries with large forests generally are the major exporters of wood, paper, and paper products. The supply available for export also depends on domestic demand. Canada, for example, has large quantities of lumber available for export to the United States, not only because of its large areas of forest but also because its small population consumes little of the supply, leaving much of the lumber available for export. Climate is another natural resource that provides an export advantage. Thus, for example, bananas are exported by Central American countries, not Iceland or Finland.

Factor endowments: the Heckscher-Ohlin theory. The proposition that countries with plentiful natural resources generally have a comparative advantage in products using those resources is obvious and straightforward. A related, but much more subtle, explanation was put forward by two Swedish economists, Eli Heckscher and Bertil Ohlin. Ohlin's work was built upon that of Heckscher. In recognition of his ideas as described in his path-breaking book, *Interregional and International Trade* (1933), Ohlin shared the Nobel Prize for Economics in 1977.

The work of Heckscher and Ohlin

The Heckscher-Ohlin theory focuses on the two most important factors of production, labour and capital. Some countries are relatively well-endowed with capital; the typical worker has plenty of machinery and equipment at his disposal. In such countries, wage rates generally are high. Products requiring much labour—such as textiles, sporting goods, and simple consumer electronics—tend as a result to be more expensive than in countries with plentiful labour and low wage rates. On the other hand, goods requiring much capital and only a little labour (automobiles and chemicals, for example) tend to be relatively inexpensive in countries with plentiful and cheap capital. Thus, countries with abundant capital should generally be able to produce capital-intensive goods relatively inexpensively, exporting them in order to pay for imports of labour-intensive goods.

In the Heckscher-Ohlin theory it is not the absolute amount of capital that is important; rather, it is the amount of capital per worker. A small country like Luxembourg has much less capital in total than India, but Luxembourg has more capital per worker. Accordingly, the Heckscher-Ohlin theory predicts that Luxembourg will export capital-intensive products to India and import labour-intensive products in return.

Despite its plausibility the Heckscher-Ohlin theory is frequently at variance with the actual patterns of international trade. As an explanation of what countries actually export and import, it is much less accurate than the more obvious and straightforward natural resource theory.

One early study of the Heckscher-Ohlin theory was carried out by Wassily Leontief, a Russian-born U.S. economist. Leontief observed that the United States was relatively well-endowed with capital. According to the theory, therefore, the United States should export capital-intensive goods and import labour-intensive ones. He found that the opposite was in fact the case: U.S. exports are generally more labour intensive than the type of products that the United States imports. Because his findings were the opposite of those predicted by the theory, they are known as the Leontief Paradox.

The Leontief Paradox

Economies of large-scale production. Even if countries have quite similar climates and factor endowments, they may still find it advantageous to trade. Indeed, economically similar countries often carry on a large and thriving trade. The prosperous industrialized countries have become one another's best customers. A main reason for this situation lies in what is called the economies of large-scale production.

For many products, there are advantages in producing on a large scale; costs become lower as more is produced. Thus, for example, automobiles can be made more cheaply in a factory producing 100,000 units than in a small factory producing only 1,000 units. This means that countries have an incentive to specialize in order to reduce costs. To sell a large volume of output, they may have to look to export markets.

The smaller the country, and the more limited its domestic market, the more incentive it has to look to international trade as a way of gaining the advantages of large-scale production. Thus, Luxembourg or Belgium has much more to gain relatively than does the United States. Indeed, the advantages of large-scale production have been one of the major sources of gain from the establishment of the European Economic Community (EEC), which was formed for the purpose of providing free trade between most western European countries.

Even a large country such as the United States, however, can gain in some cases by exporting in order to lengthen production lines. For example, the Boeing Company has been able to produce airplanes more cheaply because it is able to sell large numbers of aircraft to other countries. The importing countries also gain because they can buy aircraft abroad more cheaply than they could produce them at home.

Technology. Technological development can also provide a distinctive trade advantage. The relatively advanced countries—particularly the United States, Japan, and those of western Europe—are the principal exporters of high-technology products such as computers and precision machinery.

One important aspect of technology is that it can change rapidly. This is perhaps most obvious in the computer field, where productivity has increased, and costs have fallen sharply since the early 1960s. Such rapid changes present several challenges. For the countries that are not in the front rank, it raises the question of whether they should import high-technology products or attempt to enter the circle of the most advanced nations. For the countries that have held the technological lead in the past, there is always the possibility that they will be successfully overtaken by newcomers. This occurred in the second half of the 20th century when Japan advanced technologically in its automobile production to the point where it could challenge the automobile leadership of North America and Europe. Japan quickly became the world's foremost producer of automobiles.

Technological lead changes

The product cycle. The spread of technology across national boundaries means that comparative advantage can change. The most technologically advanced countries generally have the advantage in making new products, but as time passes other countries may gain the advantage. For example, many television sets were produced in the United States during the 1950s. As time passed, however, and technological change in the television industry became less rapid, there was less advantage in producing sets in the United States. Producers of television sets had an incentive to look to other locations, with lower wage rates. In time, the manufacturers established overseas operations in Taiwan, Hong Kong, and elsewhere. Concurrently, the United States turned to new activities, such as the manufacture of large mainframe computers and the development of computer software. (R.R./P.Wo.)

State interference in international trade

METHODS OF INTERFERENCE

Regardless of what comparative-advantage theory may say about the virtues of unrestricted trade, all nations interfere with international transactions to at least some degree. Tariffs may be imposed on imports—in some instances making them so costly as to bar completely the entry of the good involved. Quotas may limit the permissible volume of imports. State subsidies may be offered to encourage exports. Money-capital exports may be restricted or prohibited. Investment by foreigners in domestic plant and equipment may be similarly restrained.

These interferences may be simply the result of special-interest pleading, because particular groups suffer as a consequence of import competition. Or a government may impose restrictions because it feels impelled to take account of factors that comparative advantage sets aside. It is of interest to note that insofar as goods and services are concerned, the general pattern of interference follows the old mercantilist dictum of discouraging imports and encouraging exports.

A company that finds itself barred from an attractive foreign market by tariffs or quotas may be able to leapfrog the barrier simply by establishing a manufacturing plant within that foreign country. This policy of foreign plant investment has expanded enormously since the end of World War II. U.S. companies have taken the lead, investing particularly in western Europe, Canada, and South America. Industry in other developed countries has followed a similar pattern—some foreign companies establishing plants within the United States as well as in other areas of the world.

Foreign ownership of domestic industry

The governments of countries subject to this new investment find themselves in an ambivalent position. The establishment of new foreign-owned plants may mean more than simply the creation of new employment opportunities and new productive capacity; it may also mean the introduction of new technologies and superior business-control methods. But the government that welcomes such benefits must also expect complaints of "foreign control," an argument that will inevitably be pressed by domestic owners of older plants who fear a new competition that cannot be blocked by tariffs. This has been a pressing problem for many governments, particularly insofar as investment by U.S. firms is involved. Countries such as the United Kingdom and Canada have been liberal in their admissions policy; others, notably Japan, impose tight restrictions on foreign-owned plants. (R.R.)

Tariffs. A tariff, or duty, is a tax levied on a commodity when it crosses the boundary of a customs area. The boundary may be that of a nation or a group of nations that have agreed to impose a common tax on goods entering their territory. Tariffs are often classified as either protective or revenue. Protective tariffs are designed to shield domestic production from foreign competition by raising the price of the imported commodity. Revenue tariffs are designed to obtain revenue rather than to restrict imports. The two sets of objectives are, of course, not mutually exclusive. Protective tariffs, unless they are so high as to keep out imports, yield revenue. Revenue tariffs give some protection to any domestic producer of the duty-bearing goods. A transit duty, or transit tax, is a tax levied on commodities passing through a customs area en route to another country. Similarly, an export duty, or export tax, is a tax imposed on commodities leaving a customs area. Finally, some countries provide export subsidies; import subsidies are rarely used.

Protective and revenue tariffs

How tariffs work. Tariffs on imports may be applied in several ways. If they are imposed according to the physical quantity of an import (so much per ton, per yard, per item, etc.), they are called specific tariffs. If they are levied according to the value of the import, they are known as ad valorem tariffs.

Tariffs may differentiate among the countries from which the imports are obtained. They may, for instance, be lower between countries that have previously entered into special arrangements, such as the trade preferences accorded to each other by members of the Commonwealth.

Tariffs may affect the economy of the country imposing them in a number of ways. By raising the prices of imported goods, tariffs may encourage domestic production. As expenditures on domestic products rise, domestic employment tends to do likewise. This is why tariffs are favoured by industries that find themselves pressed by foreign competitors. The tariff may also encourage tendencies toward a monopolistic market structure to the extent that it lessens foreign competition, with a resulting decrease in the incentive to modernize or innovate. By increasing the price of an imported commodity a tariff may also reduce its consumption, depending on how consumers react to the higher price. The decrease in demand could be large enough in relation to the world market to force the price of the import down.

Economic effects of tariffs

Measuring the effects of tariffs. It is difficult to gauge the effect of tariff barriers among countries. First of all, how import demand responds to changes in tariffs depends on a variety of factors—the reaction of producers and consumers to price changes, the share of imports in domestic production and consumption, the substitutability of imports for domestic products, and so on. And the responsiveness to tariff levels will differ from country to country as well as from commodity to commodity. Thus, the amount of a tariff does not necessarily determine its restrictive effect. For another thing, such comparisons also must be restricted to commodities for which tariffs are the major protective device. This is generally true for nonagricultural commodities in developed countries, but other devices are often employed to protect agricultural production. In the third place, a tariff levied upon imports of raw materials will protect domestic raw material producers but will increase the costs of manufacturers using those raw materials. It is necessary, therefore, to distinguish between nominal and effective rates of protection.

The nominal rate of protection is the percentage tariff imposed on a product as it enters the country. For example, if a tariff of 20 percent of value is collected on clothing as it enters the country, then the nominal rate of protection is that same 20 percent.

Figuring the effective rate of protection

The effective rate of protection is a more complex concept: consider that the same product—clothing—costs $100 on international markets. The material that is imported to make the clothing (material inputs) sells for $60. In a free trade situation, a firm can charge no more than $100 for a similar piece of clothing (ignoring transportation costs). Importing the fabric for $60, the clothing manufacturer can add a maximum of $40 for labour, profit markup, rents, and the like. This $40 difference between the $60 cost of material inputs and the price of the product is called the value added.

The same situation may be considered with tariffs—say, 20 percent on clothing and 10 percent on fabric. The 20 percent tariff on clothing would raise the domestic price by $20 to $120, while a 10 percent tariff on fabrics would increase material costs to the domestic producer by $6 to $66. Protection would thus enable the firm to operate with a value-added margin of $54—the difference between the domestic price of $120 and the material cost of $66. The difference between the value added of $40 without tariff protection and that of $54 with it provides a margin of $14. This means that the effective rate of protection of the domestic processing activity—the ratio of $14 to $40—would be 35 percent. The effective rate of protection derived—35 percent—is greater than the nominal rate of only 20 percent. This will be the case whenever the tariff rate on the final product is greater than the tariff on inputs. Because countries generally do levy higher tariffs on final products than on inputs, effective rates of protection are generally higher than nominal rates—often much higher.

The effective rate of protection also depends on the share of value added in the product price. Effective rates can be very high if value added to the imported commodity is a small percentage or very low if value added is a large percentage of the total price. Thus, effective protection in one country may be much higher than that in another even though its nominal tariffs are lower, if it tends to import commodities of a high level of fabrication with correspondingly low ratios of value added to product price.

Nontariff barriers. Other government regulations and practices may also act as barriers to trade. Quotas or quantitative restrictions may prohibit the importation of certain commodities or limit the amounts imported. Such quotas are usually administered by requiring importers to have licenses to bring in particular commodities. Quotas raise prices just as tariffs do, but, being set in physical terms, their impact on imports is direct, with an absolute ceiling set on supply. Increased prices will not bring more goods in. There is also a difference between tariffs and quotas in their effect on revenues. With tariffs, the government receives the revenue: under quotas, the import license holders obtain a windfall in the form of the difference between the high domestic price and the low international price of the import.

"Voluntary" export restraints

Another barrier, which has become increasingly common during the past several decades, is the "voluntary" export restraint (VER). For example, in the 1980s the Japanese (under pressure from the United States) "voluntarily" limited their exports of automobiles to the U.S. market. Like quotas, VERs limit the quantity of trade and therefore tend to raise the prices of imported goods. In this case the VER made Japanese automobiles less available in the United States and raised the prices that U.S. consumers had to pay for such automobiles. VERs are usually not voluntary in any meaningful sense. In this example, the Japanese agreement to a VER on automobiles was an attempt to avoid a U.S. import quota. For the Japanese, a VER was preferable to a U.S. import quota because Japanese exporters could charge higher prices. The Japanese exporters, rather than U.S. importers, reaped much of the windfall from the VER. A VER is also easier to get rid of. In addition, a VER has a less damaging effect on the political relations between countries.

Still other barriers include state trading organizations and government procurement practices that may be used preferentially. In the United States, "buy American" legislation requires government procurement agencies to favour domestic goods. Customs classification and valuation procedures, health regulations, and marking requirements may also have a restrictive effect on trade. Finally, excise taxes may act as a barrier to trade if they are levied at higher rates on imports than on domestic goods.

Protectionism in the less-developed countries. The industrialization that has taken place in the late decades of the 20th century in some developing countries has been characterized by the expansion of import-competing industries behind high tariff walls. In many of those countries tariffs and various quantitative restrictions on manufactured goods are great. The effective rates of protection may be even greater, because the goods tend to be highly fabricated and the proportion of value added in production after importation is low. While some places such as Hong Kong, Taiwan, and Korea have oriented their manufacturing industries mainly toward export trade, those are exceptional cases in the developing world. More commonly the new industries seek to compete with foreign-made goods for the domestic market. High protection in these countries has often contributed to a slowdown in the production and export of primary commodities and has discouraged expansion of exports of manufactured goods. Furthermore, while domestic production of nondurable consumer goods has permitted rapid economic growth at an early stage, developing countries have encountered considerable difficulties in producing more sophisticated commodities. They suffer all of the disadvantages of small domestic markets, in addition to a lack of incentives for technological improvement.

(B.B./T.J.B./P.Wo.)

ARGUMENTS FOR AND AGAINST INTERFERENCE

Revenue. Developing nations in particular often lack the institutional machinery needed for effective imposition of income or corporation taxes. The governments of such nations may then finance their activity by resort to tariffs on imported goods, since such levies are relatively easy to administer. The amount of tax revenue obtainable through tariffs, however, is always limited. If the government tries to increase its tariff income by imposing higher duty rates, this may choke off the flow of imports and so reduce tariff revenue instead of increasing it.

Arguments on the protection of industry

Economic development. *Protection of domestic industry.* Probably the most common argument for tariff imposition is that particular domestic industries need tariff protection for survival. Comparative-advantage theorists will of course argue that the industry in need of such protection ought not to survive and that the resources so employed ought to be transferred to occupations having greater comparative efficiency. The welfare gain of citizens taken as a whole would more than offset the welfare loss of those groups affected by import competition; that is, total real national income would increase. An opposing argument would be, however, that this welfare gain would be widely diffused, so that the individual beneficiaries might not be conscious of any great improvement. The welfare loss, in contrast, would be narrowly and acutely felt. Although resources can be transferred to other occupations, just as comparative-advantage theory says, the transfer process is sometimes slow and painful for those being transferred. For such reasons, comparative-advantage theorists rarely advocate the immediate removal of all existing tariffs. They argue instead against further tariff increases—since increases, if effective, attract still more resources into the wrong occupation—and they press for gradual reduction of import barriers. (R.R.)

The infant-industry argument. Advocates of protection often argue that new and growing industries, particularly in less-developed countries, need to be shielded from foreign competition. They contend that costs decline with growth and that some industries must reach a minimum size before they are able to compete with well-established industries abroad. Tariffs can protect the domestic market until the industry becomes internationally competitive and, it is often argued, the costs of protection can be recouped after the industry has reached maturity. In short, the infant-industry argument is based principally on the idea that there are economies of large-scale production in many industries and that developing countries have difficulty in establishing such industries.

Weaknesses of the infant-industry theory

Advocates of such protection, however, can have their arguments turned against them. While an individual country can, in some circumstances, gain from protecting its infant industries, this protection is particularly costly for the international community as a whole. Where there are major advantages in large-scale production, there are also large advantages in relatively free international trade. By closing off markets, protection reduces the ability of firms to gain economies of large-scale by exporting. If a group of countries imposes infant-industry protection, it will split up the market; each country may end up with small-scale, localized, inefficient production, thus reducing the prosperity of all of the countries. One way in which developing nations have tried to deal with this problem has been through the establishment of customs unions or other regional groupings (see below *International trade arrangements*).

Infant-industry tariffs have been disappointing in other ways; the infant-industry argument is often abused in practice. In many developing countries, industries have failed to attain international competitiveness even after 15 or 20 years of operation and might not survive if protective tariffs were removed. The infant industry is probably better aided by production subsidies than by tariffs. Production subsidies do not raise prices and therefore do not curtail domestic demand; and the cost of the protection is not concealed in higher prices to consumers. Production subsidies, however, have the disadvantage of drawing upon government revenue rather than adding to it, which may be a serious consideration in countries at lower levels of development. (B.B./T.J.B./P.Wo.)

Unemployment. Tariffs or quotas are also sometimes proposed as a way to maintain domestic employment—particularly in times of recession. There is, however, near-unanimity among modern-day economists that proposals to remedy unemployment by means of tariff increases are misguided. Insofar as a higher tariff is effective for this purpose, it simply "exports unemployment"; the rise in domestic employment is matched by a drop in production in some foreign country. That other country, moreover, is likely to impose a retaliatory tariff increase. Finally, the tariff remedy for unemployment is a poor one because it is usually ineffective and because more suitable remedies are now available. It has come to be generally recognized that unemployment is far more efficiently dealt with by the implementation of proper fiscal and monetary policies.

National defense. A common appeal made by an industry seeking tariff or quota protection is that its survival is essential in the national interest: its product would be needed in wartime, when the supply of imports might well be cut off. The verdict of economists on this argument is fairly clear: the national-defense argument is frequently a red herring, an attempt to "wrap oneself in the flag," and insofar as an industry is essential, the tariff is a dubious means of ensuring its survival. Essential industries ought instead to be given a direct subsidy to enable them to meet foreign competition, with explicit recognition of the fact that the subsidy is a price paid by the nation in order to maintain the industry for defense purposes.

Autarky, or self-sufficiency. Many demands for protection, whatever their surface argument may be, are really appeals to the autarkic feelings that prompted mercantilist reasoning. (Autarky is defined as the state of being self-sufficient at the level of the nation.) A proposal for the restriction of free international trade can be described as autarkic if it appeals to those half-submerged feelings that the citizens of the nation share a common welfare and common interests, whereas foreigners have no regard for such welfare and interests and might even be actively opposed to them. And it is quite true that a country that has become heavily involved in international trade has given hostages to fortune: a part of its industry has become dependent upon export markets for income and for employment. Any cutoff of these foreign markets (brought about by recession abroad, by the imposition of new tariffs by some foreign country, or by numerous other possible changes) would be acutely serious; and yet it would be a situation largely beyond the power of the domestic government involved to alter. Similarly, another part of domestic industry may rely on an inflow of imported raw materials, such as oil for fuel and power. Any restriction of these imports could have the most serious consequences. The vague threat implicit in such possibilities often results in a yearning for autarky, for national self-sufficiency, for a life free of dependence on the hazards of the outside world.

Self-sufficiency as a basis for national welfare

There is general agreement that no modern nation, regardless of how rich and varied its resources, could really practice self-sufficiency, and attempts in that direction could produce sharp drops in real income. Nevertheless, protectionist arguments—particularly those made "in the interests of national defense"—often draw heavily on the strength of such autarkic sentiments.

The terms-of-trade argument. When a country imposes a tariff, foreign exporters have greater difficulty in selling their products. As their exports decline, they may cut prices in order to keep their sales from falling drastically. Thus, for example, when a tariff of $10.00 is imposed, foreign exporters may cut their price by, say, $6.00. The foreign exporter is being "taxed" when the tariff is imposed; the other $4.00 is reflected in a higher price to the consumer. The use of tariffs to tax foreign exporters in this way is known as the terms-of-trade argument for protection. The terms of trade represent the relative price of what a nation is exporting, compared with the price paid to foreigners for imported goods. When the price of what is being exported rises, or when the price paid to foreigners for imported goods falls (as it may when a nation imposes a tariff), terms of trade improve. (Terms of trade is discussed below under *International commodity trade.*)

Balance-of-payments difficulties. Governments may interfere with the processes of foreign trade for a reason quite different from those thus far discussed: shortage of foreign exchange. Under the international monetary system established after World War II and in effect until the 1970s, most governments tried to maintain fixed exchange rates between their own currencies and those of other countries. Even if not absolutely fixed, the exchange rate was ordinarily allowed to fluctuate only within a narrow range of values.

If balance-of-payments difficulties arise and persist, a nation's foreign exchange reserve runs low. In a crisis, the government may be forced to devalue the nation's currency. But before being driven to this, it may try to redress the balance by restricting imports or encouraging exports, in much the old mercantilist fashion.

The problem of reserve shortages became acute for many countries during the 1960s. Although the total volume of international transactions had risen steadily, there was not a corresponding increase in the supply of international reserves. By 1973 payment imbalances led to an end of the system of fixed, or pegged, exchange rates and to a "floating" of most currencies. (Balance of payments is discussed in detail below under *International payments and exchange.*) (R.R./P.Wo.)

Floating currencies

International trade arrangements

Many efforts have been made in modern times to promote trade among nations. The ways in which this may be attempted range from agreements among governments to reduce or eliminate trade barriers to more ambitious attempts to harmonize economic policies, as in the European Economic Community (EEC) established by the nations of western Europe.

HISTORY OF MODERN TRADE POLICIES

Mercantilism. Much of the modern history of international relations concerns efforts to promote freer trade among nations. The 17th century saw the growth of restrictive policies that later came to be known as mercantilism. The mercantilists held that economic policy should be nationalistic and aim to secure the wealth and power of the state. The concept was based on the conviction that national interests are inevitably in conflict—that one nation can increase its trade only at the expense of other nations. Thus, governments were led to impose price and wage controls, foster national industries, promote exports of finished goods and imports of raw materials, and pro-

hibit the exports of raw materials and the import of finished goods. The state endeavoured to provide its citizens with a monopoly of the resources and trade outlets of its colonies.

A typical illustration of the mercantilist spirit is the famous English Navigation Act of 1651, which reserved for the home country the right to trade with the colonies and prohibited the import of goods of non-European origin unless transported in ships flying the English flag. This law lingered on until 1849. A similar policy was followed in France.

The growth of free trade

Liberalism. A strong reaction against mercantilist attitudes began to take shape toward the middle of the 18th century. In France, the economists known as Physiocrats demanded liberty of production and trade. In England, as discussed above, Adam Smith demonstrated in his *The Wealth of Nations* (1776) the advantages of removing trade restrictions. Economists and businessmen voiced their opposition to excessively high and often prohibitive customs duties and urged the negotiation of trade agreements with foreign powers. This change in attitudes led to the signing of a number of agreements embodying the new liberal ideas, among them the Anglo-French Treaty of 1786, which ended what had been an economic war between the two countries.

After Adam Smith, the basic tenets of mercantilism were no longer considered defensible. This did not, however, mean that nations abandoned all mercantilist policies. Restrictive economic policies were now justified by the claim that, up to a certain point, the government should keep foreign merchandise off the domestic market in order to shelter national production from outside competition. To this end, customs levies were introduced in increasing number, replacing outright bans on imports, which became less and less frequent.

In the middle of the 19th century, customs walls effectively sheltered many national economies from outside competition. The French tariff of 1860, for example, charged extremely high rates on British products: 60 percent on pig iron; 40 to 50 percent on machinery; and 600 to 800 percent on woolen blankets. Transport costs between the two countries provided further protection.

A triumph for liberal ideas was the Anglo-French trade agreement of 1860, which provided that French protective duties were to be reduced to a maximum of 25 percent within five years, with free entry of all French products except wines into Britain. This agreement was followed by other European trade pacts.

Resurgence of protectionism. A reaction in favour of protection spread throughout the Western world in the latter part of the 19th century. Germany adopted a systematically protectionist policy and was soon followed by most other nations. Shortly after 1860, during the Civil War, the United States raised its duties sharply; the McKinley Tariff Act of 1890 was ultraprotectionist. England was the only country to remain faithful to the principles of free trade.

The decline of free trade

But the protectionism of the last quarter of the 19th century was mild by comparison with the mercantilist policies that had been common in the 17th century and were to be revived between the two world wars. Extensive economic liberty prevailed by 1913. Quantitative restrictions were unheard of, and customs duties were low and stable. Currencies were freely convertible into gold, which in effect was a common international money. Balance-of-payments problems were few. People who wished to settle and work in a country could go where they wished with few restrictions; they could open businesses, enter trade, or export capital freely. Equal opportunity to compete was the general rule, the sole exception being the existence of limited customs preferences between certain countries, most usually between a home country and its colonies. Trade was freer throughout the Western world in 1913 than it was in Europe in 1970.

Post-World War I trends

The "new" mercantilism. World War I wrought havoc with these orderly trading conditions. By the end of hostilities, world trade was in a straitjacket that made recovery very difficult. The first five years of the postwar period were marked by the dismantling of wartime controls proper. The 1920 crisis and the commercial advantages accruing to countries whose currencies had depreciated, as had Germany's, rapidly led to fresh measures in restraint of trade. The protectionist tide engulfed the world economy, not because policymakers consciously adhered to any specific theory but because of nationalist ideologies and the pressure of economic conditions. In an attempt to end the continual raising of customs barriers, the League of Nations organized the first World Economic Conference in May 1927. Twenty-nine states, including the main industrial countries, subscribed to an international convention that was the most minutely detailed and balanced multilateral trade agreement ever approved until that time. It was a precursor of the arrangements made under the General Agreement on Tariffs and Trade of 1947.

The 1927 agreement remained practically without effect. During the Great Depression of the 1930s, unemployment in major countries reached unprecedented levels and engendered an epidemic of protectionist measures. Countries attempted to shore up their balance of payments by raising their customs duties and introducing a range of import quotas or even import prohibitions, accompanied by exchange controls.

From 1933 onward, the recommendations of all the postwar economic conferences based on the fundamental postulates of economic liberalism were ignored. The planning of foreign trade came to be considered a normal function of the state. Mercantilist policies dominated the world scene until after World War II.

TRADE AGREEMENTS

The term trade agreement or commercial agreement can be used to describe any contractual arrangement between states concerning their trade relationships. Trade agreements may be bilateral or multilateral—that is, between two states or between more than two states.

Provisions of bilateral agreements

Bilateral trade agreements. A bilateral trade agreement usually includes a broad range of provisions regulating the conditions of trade between the contracting parties. These include stipulations governing customs duties and other levies on imports and exports, commercial and fiscal regulations, transit arrangements for merchandise, customs valuation bases, administrative formalities, quotas, and various legal provisions. Most bilateral trade agreements, either explicitly or implicitly, provide for (1) reciprocity, (2) most-favoured-nation treatment, and (3) "national treatment" of nontariff restrictions on trade.

Reciprocity. In a trade agreement, the parties make reciprocal concessions to put their trade relationships on a basis deemed equitable by each. The principle of reciprocity is extremely old, and in one form or another it is to be found, implicitly at least, in all trade agreements. The concessions may, however, be in different areas. In the Anglo-French Agreement of 1860, for example, France pledged itself to reduce its duties to 20 percent by 1864. In return, Britain granted duty-free imports of all French products except wines and spirits. The principle of reciprocity implies only that the gains arising out of foreign trade are distributed fairly.

The most-favoured-nation clause. The most-favoured-nation clause binds a country to apply to its partner country any lower rate of import duties that it may later grant to imports from some other country. The clause may cover a list of specified products only, or specific concessions yielded to certain foreign countries. Alternatively, it may cover all advantages, privileges, immunities, or other favourable treatment granted to any third country whatever. The clause is intended to provide each signatory with the assurance that the advantages obtained will not be attenuated or wiped out by a subsequent agreement concluded between one of the partners and a third country. It guarantees the parties against discriminatory treatment in favour of a competitor.

Protection against discriminating tariffs

The effect of the most-favoured-nation clause on customs duties is to amalgamate the successive trade agreements concluded by a state. If the rates in different agreements are fixed at varying levels, the clause reduces them to the lowest rate specified in any agreement. Thus, goods imported from a country benefiting from most-favoured-

nation treatment are charged the rate of duty applicable to imports from another country which, in a subsequent trade agreement, has negotiated a lower rate of duty.

The coverage of the most-favoured-nation clause can be considerably reduced by a minute definition of a particular item so that a concession, while general in form, applies in practice only to one country. The best-known illustration of this technique is to be found in the German Tariff of 1902, which admitted at a special rate

> large dappled mountain cattle, reared at a spot at least 300 metres above sea level, and which have at least one month's grazing each year at a spot at least 800 metres above sea level.

The advantages granted under the most-favoured-nation clause may be conditional or unconditional. If unconditional, the clause operates automatically whenever appropriate circumstances arise. The country drawing benefit from it is not called on to make any fresh concession. By contrast, the partner invoking a conditional most-favoured-nation clause must make concessions equivalent to those extended by the third country. A typical wording was that of the 1911 treaty between the United States and Japan, which stated that

> in all that concerns commerce and navigation, any privilege, favour or immunity . . . to the citizens or subjects of any other State shall be extended to the citizens or subjects of the other Contracting Party gratuitously, if the concession in favour of that other State shall have been gratuitous, and on the same or equivalent conditions, if the concession shall have been conditional.

The conditional form of the clause may at first sight seem more equitable. But it has the major drawback of being liable to raise dispute each time it is invoked, for it is by no means easy for a country to evaluate the compensation it is being offered as in fact being equivalent to the concession made by the third country.

The effect of the unconditional form of the most-favoured-nation clause is, finally, to wipe out any relevance the principle of reciprocity may have had to the purely bilateral preoccupations of the negotiating parties, since the results of the bargaining process, instead of being limited to the participants, influence their relationships with other states. In practice, therefore, a country negotiating a trade agreement must measure the advantages it is willing to concede in terms of the benefits these concessions will provide collaterally to that third country which is the most competitive. In other words, the concessions that may be granted are determined by the minimum protection that the negotiating state deems indispensable to protect its home producers. This sets a major limitation on the scope of bilateral negotiations.

Determining the advantage of trade agreements

Protagonists of free trade consider that the unconditional most-favoured-nation clause is the only practical way by which to obtain the progressive reduction of customs duties. Apologists for protectionism are resolutely against it, preferring the conditional form of the clause or some equivalent mechanism.

The conditional most-favoured-nation clause was generally in use in Europe until 1860, when the so-called Cobden–Chevalier Treaty between Great Britain and France established the unconditional form as the pattern for most European treaties. The United States used the conditional most-favoured-nation clause from its first trade agreement, signed with France in 1778, until the passage of the Tariff Act of 1922, which terminated the practice. (The Trade Reform Bill of 1974, however, in effect restored to the U.S. president the authority to designate preferential tariff treatment, subject to approval by Congress.)

The Genoa conference in May 1922 and the World Economic Conference in May 1927 both recommended that trade agreements should include the most-favoured-nation clause whenever possible. But the Depression of the 1930s led instead to a rise of restrictions in world trade. Imperial or regional systems of preference came into being: the Ottawa Agreement of 1932 for the British Commonwealth; similar arrangements for the French empire; and a series of tariff and preference agreements negotiated in eastern and central Europe from 1931 on.

The "national treatment" clause. The "national treatment" clause in trade agreements is designed to ensure that internal fiscal or administrative regulations are not used to introduce discrimination of a nontariff nature. It forbids discriminatory use of the following: taxes or other internal levies; laws, regulations, and decrees affecting the sale, offer for sale, purchase, transport, distribution, or use of products on the domestic market; valuation of products for purposes of assessment of duty; legislation on prices of imported goods; warehousing and transit regulations; and the organization and operation of state trading corporations.

Multilateral agreements since World War II. When World War II ended, the lessons learned from the growth of protectionism since 1871, and most of all from the resurgence of trade restrictions in the interwar years, spurred the development of multilateral trade agreements and other forms of international economic cooperation. These developments culminated in the General Agreement on Tariffs and Trade (GATT).

Attempts at trade liberalization

The General Agreement on Tariffs and Trade. The General Agreement on Tariffs and Trade was signed at Geneva on Oct. 30, 1947, by 23 countries, which among them accounted for four-fifths of world trade. On the same day 10 of them, including the United States, the United Kingdom, France, Belgium, and The Netherlands, signed a protocol bringing the agreement into force on Jan. 1, 1948.

GATT takes the form of a multilateral trade agreement setting forth the principles under which the signatories, on a basis of "reciprocity and mutual advantage," shall negotiate "a substantial reduction in customs tariffs and other impediments to trade, and the elimination of discriminatory practices in international trade." With the adherence of additional countries GATT has become a charter governing almost all world trade except for that of the Communist countries.

Principles of GATT

The main principles underlying GATT are as follows: (1) There shall be no trade discrimination. The unconditional most-favoured-nation clause is regarded as fundamental. (2) As a rule, there is to be no protection other than that provided by the customs tariff (the "national treatment" principle). (3) Customs unions and free trade groupings are considered legitimate means of trade liberalization, provided that, taken as a whole, such arrangements do not discriminate against third countries. (4) Members of GATT are entitled to levy the following charges on imports: (*a*) an import tax equal in amount to internal taxes on the product concerned, subject only to the general principle embodied in (2) above; (*b*) "antidumping" duties in the case of imported products that are being sold at less than the price in the home market, or at less than cost; (*c*) countervailing duties to offset the effects of export subsidies; (*d*) fees and other proper charges for services rendered.

These, however, are only the basic principles. The agreement also contains a variety of clauses providing exceptions from the rules in special situations. These include balance-of-payments disequilibrium; serious and unexpected damage to domestic production; the requirements of economic development or, subject to very broad reservations, of agricultural policy; the need to protect domestic raw material production; and the interests of national security. In addition the GATT rules permit countries entering a customs union to depart from the most-favoured-nation principle. For example, within the European Economic Community, France can permit duty-free entry of goods from its fellow members—such as West Germany and Italy—without extending such duty-free treatment to the products of outside nations.

Periodically, major multilateral trade conferences, called rounds, are held by GATT countries to work out trade problems. Most of these have been held at Geneva, site of GATT headquarters. The formula for multilateral tariff bargaining applied in negotiations held under GATT auspices is a major innovation in intergovernmental cooperation. In appraising the concessions that they could afford to make, governments have been able to take account of the indirect advantages that they could expect to accrue to them from the full set of bilateral negotiations. Over the years since GATT's inception, it has been successful far

beyond its creators' expectations; its contribution to the growth of world trade has been major. Two GATT sessions of particular historic importance were the Kennedy Round and the Tokyo Round.

The Kennedy Round

As the economic integration of western Europe progressed, opinion in the United States became concerned at the prospect of remaining outside. Pres. John F. Kennedy pursued the goal of an Atlantic partnership and secured special negotiating powers under the Trade Expansion Act of 1962. The act authorized tariff reductions of up to 50 percent, subject to reciprocal concessions from the European partners. This marked a fundamental shift away from the traditional protectionist posture of the United States and led to the so-called Kennedy Round negotiations in the GATT, held in Geneva from May 1964 to June 1967.

The Kennedy Round negotiations concerned four types of problems: (1) progressive reduction, to amount finally to 50 percent, in the duties on all but a few products, in place of the item-by-item bargaining that had prevailed in earlier GATT conferences; (2) inclusion of agricultural as well as industrial products in the scope of the negotiations; (3) discussion of nontariff obstacles as well as of customs duties; and (4) nonreciprocity for economically less-developed countries. Fifty-four countries participated in the negotiations, which covered 400,000 tariff headings.

The final result was an average reduction of 35 percent in the duties levied on industrial products, to be implemented over a five-year period. This was less than the 50 percent originally envisaged. Further, the reductions were not geographically uniform: U.S., European, and Japanese duties were to fall by an average of 35 percent, British duties by 38 percent, and Canadian by 24 percent. Little change was made in steel and textile tariffs, since the participants felt that reductions in those industries would create intolerable political and social tensions in most of the industrial countries. Problems arose with regard to chemicals because of a so-called American Selling Price that was used for appraising the dutiable value of some products, based on prices ruling in the U.S. market; in return for a reduction of 50 percent in the rates of duty charged by the United States, Great Britain and the European countries agreed to lower their duties by 22 percent, with a further 24 percent reduction to become effective upon abrogation of the American Selling Price. Rather less spectacular results were achieved for agricultural commodities. These included the setting of a minimum price for wheat and a weighted reduction of between 15 and 18 percent in the duties charged on other agricultural and food products. In the area of nontariff barriers to trade the most significant result was the adoption of a uniform antidumping code.

The American Selling Price

The Kennedy Round continued the process of tariff reduction begun two decades earlier by the industrial countries. While developing countries drew little immediate advantage from the Kennedy Round negotiations, they were able to obtain the addition of a new part titled "Trade and Development" to the GATT charter, calling for stabilization, as far as possible, of raw material prices; reduction or abolition of customs duties or other restrictions that differentiate unreasonably between products in their primary state and the same products in finished form; and renunciation by the advanced countries of the principle of reciprocity in their relations with less-developed countries. (Ma.A./P.Wo.)

The next ministerial meeting of GATT opened in Tokyo on Sept. 12, 1973, and was attended by representatives of ministerial or comparable level from 102 countries. On September 14 the meeting closed with the adoption of what came to be called the Tokyo Declaration.

The declaration differed markedly from previous GATT documents in the inordinately large portion of its language devoted to strengthening the negotiating position of the less-developed countries. One of the general aims of the negotiations was said to be the securing of additional trade benefits for less-developed countries. Specifically, the trade negotiations would aim at improving the conditions of access for products of interest to such countries and ensuring stable, equitable, and remunerative prices for primary products. Tropical products would be given special and priority treatment. The principle of nonreciprocity in negotiations between developed and less-developed countries, an established principle in GATT, was reaffirmed: the importance of maintaining and improving the Generalized System of Preferences granted by developed countries to less-developed countries, as well as the need for special measures and the importance of providing special, differential, and more favourable treatment for less-developed countries, were recognized. Special attention was to be given to the trade interests of the least-developed countries.

Trade benefits for less-developed countries

The Tokyo Round

The Tokyo Declaration was followed by several years of multinational trade negotiations that came to be called the Tokyo Round, concluding in 1979 with the adoption of a series of tariff reductions to be implemented generally over an eight-year period beginning in 1980. Further progress was also made in dealing with nontariff issues. Most notably, a Code on Subsidies and Countervailing Duties was negotiated. This code had two main features: it listed a number of unacceptable subsidy practices, and it introduced a requirement that formal procedures be followed before the imposition of countervailing duties on imports subsidized by foreign nations. Specifically, before the imposition of a countervailing duty, an investigation had to establish that competing domestic firms were being injured. The code was not signed by all of the members, however, and the signing nations agreed only to follow the prescribed rules before applying countervailing duties to the exports of other signatories. Thus, while the code represented progress in dealing with a new topic, it also represented a departure from the most-favoured-nation principle: signatories were not required to extend the benefits of the code to GATT members who did not sign the code.

A new set of negotiations was initiated at a conference in Uruguay in 1986. Because traditional tariffs were becoming much less important, most of the attention was focused on other impediments to international transactions. The United States was particularly eager that the new negotiations include international transactions in services and an attack on the problems of international agricultural trade, which had been severely distorted by domestic price support programs and subsidized exports of surplus production. (P.Wo./Ed.)

The stimulus of the European Recovery Program

The Organisation for Economic Co-operation and Development. On April 16, 1948, 16 European countries responded to a U.S. offer of economic aid under the European Recovery Program by setting up the Organisation for European Economic Co-operation (OEEC). Although the immediate aim was to coordinate the distribution of U.S. credits, the OEEC convention was also designed to foster free trade between the members and allow their participation in customs unions or similar institutions. The members by 1955 consisted of Britain, France, West Germany, Italy, Spain, the Benelux countries, Austria, Denmark, Sweden, Norway, Switzerland, Portugal, Greece, Ireland, Turkey, and Iceland.

The Organisation for European Economic Co-operation did much to facilitate the recovery of intra-European trade and particularly to abolish most of the quantitative restrictions on imports within the area. On Sept. 30, 1961, it was converted into a new institution, the Organisation for Economic Co-operation and Development (OECD), and its membership expanded to include the United States and Canada. Japan became a member in 1964, Finland joined in 1969, Australia in 1971, and New Zealand in 1973.

The three fundamental aims of the OECD are to promote the economic growth of member countries in conditions of financial stability, to contribute to the economic growth of less-developed countries, and to foster the growth of world trade on a multilateral, nondiscriminatory basis. Having little power to enforce its decisions, the OECD has served mostly as a consultative body, influencing trade through its studies and communications.

ECONOMIC INTEGRATION

The economic integration of several countries or states may take a variety of forms. The term covers preferential tariffs, free-trade associations, customs unions, common

Forms of economic integration

markets, economic unions, and full economic integration. The parties to a system of preferential tariffs levy lower rates of duty on imports from one another than they do on imports from third countries. For example, Great Britain and its Commonwealth countries operated a system of reciprocal tariff preferences after 1919. In free-trade associations no duty is levied on imports from other member states, but different rates of duty may be charged by each member on its imports from the rest of the world. The European Free Trade Association is an example. A further stage is the customs union, in which free trade among the members is sheltered behind a unified schedule of customs duties charged on imports from the rest of the world. The 19th-century German Zollverein (see below) was a customs union. A common market is an extension of the customs union concept, the additional feature being that it provides for the free movement of labour and capital among the members; an example was the Benelux common market until it was converted into an economic union in 1959. The term economic union denotes a common market in which the members agree to harmonize their economic policies generally, as is the case with the European Economic Community (often referred to as the Common Market). Finally, total economic integration implies the pursuit of a common economic policy by the political units involved; examples are the states of the United States or the cantons of the Swiss confederation.

Economic integration may be brought about by the political will of a state powerful enough to impose it, as under the Roman Empire or the European colonial systems of the 19th century, or it may result from freely negotiated agreement between sovereign states, as has been more common in the 20th century.

The attempts at economic integration made after World War II can be appraised only by reviewing them against the background of the long process through which, over the centuries, the nations of the world have progressively achieved economic integration. Thus, for instance, the world's greatest power in the 17th century, France, was divided into a number of provinces separated from one another by various customs barriers involving a multitude of duties, tolls, and prohibitions. Trade regulations and fiscal charges differed from one region to the next; there was not even a single system of weights and measures. Not until after the Revolution did the economic integration of France really get under way.

Integration between the states of federations. *The United States.* The economic integration of the United States was not achieved all at once, but as the result of a long process during which the powers of the federal authorities were constantly reinforced. The Constitution empowered the federal government to regulate the conditions of trade with other countries and to set up a single system of duties. It also abolished the right of individual states to maintain separate customs legislation and to issue their own currencies. It authorized the federal government alone to issue currency and established the principle of free movement of persons, merchandise, and capital between the federated states. But the conflict of interest between North and South was settled only by the American Civil War. Almost 200 years were to elapse before the economies of the states could be considered as integrated for practical purposes, and even today many economic and fiscal disparities still exist among them.

Constitutional basis for trade regulation

The difficulties faced by the 13 original states should not be underestimated. During the years prior to the adoption of the Constitution there were bitter trade disputes among the states, which imposed tariffs against each other and refused to accept each other's currencies. Everything seemed to justify the words of a contemporary liberal philosopher, Josiah Tucker, Dean of Gloucester (England):

> As to the future grandeur of America, and its being a rising empire under one head, whether republican or monarchical, it is one of the idlest and most visionary notions that ever was conceived even by writers of romance. The mutual antipathies and clashing interests of the Americans, their differences of governments, habitudes, and manners, indicate that they will have no centre of union and no common interest. They never can be united into one compact empire under any species of government whatever; a disunited people till the end of time, suspicious and distrustful of each other, they will be divided and sub-divided into little commonwealths or principalities, according to natural boundaries, by great bays of the sea, and by vast rivers, lakes, and ridges of mountains.

Switzerland. The Swiss example is no less instructive. Although the Helvetic Confederation emerged as a political entity in the 14th century, its economic integration was achieved, only after many vicissitudes, with the constitution of 1848. The terms of this document established a common currency, set forth the principle of a common protective system for the cantons, and provided for free movement of goods and Swiss citizens throughout the national territory. Swiss economic integration is all the more remarkable in that it comprises peoples who speak four different languages.

The economic integration of colonial empires. When the great colonial powers of Europe founded their empires from the 16th century onward, they attempted to monopolize trade with the colonies and to turn it to their own profit. This policy involved four main restrictions: (1) The colonies were to trade exclusively with the mother country. (2) They were not to undertake manufacturing; transformation of raw materials into finished goods remained a monopoly right of the mother country. (3) Imports and exports of the colonies were to be carried only in ships flying the mother country's flag. (4) The mother country exempted colonial products from duty, or imposed lower rates.

This system, although progressively attenuated, applied in various forms from the 16th to the 19th century. Based on force, it was to the benefit of the home countries and detrimental to the economic growth of their colonies.

The German customs union

The Zollverein. The best known of the early customs unions is the German Zollverein (literally, "customs union"). Even though Napoleon had reduced the number of German states from 300 to 40 at the beginning of the 19th century, those that remained were isolated from each other by their own customs systems. In addition, numerous internal customs barriers hampered trade within each state. At the same time there was no single external tariff, and the German industries that had sprung up during the Napoleonic Wars were being crushed by English competition. These difficulties were at the root of the creation of the Zollverein.

The starting point was Prussia's abolition of all internal duties and its adoption of an external tariff in 1818. In the next few years a number of other German states followed the Prussian example. Bavaria and Württemberg set up a customs union in 1828, and by 1830 four separate customs unions were in existence. Prussia then sought to break up the local customs unions and attach them to a general customs union, the Zollverein. The coverage of the Zollverein increased until, by 1871, it included all the German states.

In its first phase, from 1834 to 1867, the Zollverein was administered by a central authority, the Customs Congress, in which each state had a single vote. A common tariff, the Prussian Tariff of 1818, shielded the member states from foreign competition, but free trade was the rule internally.

During a second phase, from 1867 to 1871 (following Prussia's victory over Austria at Sadowa), executive power was wielded by a federal council (Bundesrat) composed of governmental delegates, in which decisions were taken by an absolute majority. Prussia was entitled to 17 of the 58 votes and held the chair of the council. Legislative power lay with a "customs parliament" (*Zollparlament*) composed of deputies directly elected by popular vote, and, like the council, taking decisions by a majority vote. This arrangement transformed what had been a confederation into a federal state.

After the victory over France and the proclamation of the German empire in 1871, the customs parliament and the federal council were replaced by the parliament and the executive council of the empire. The federal state had become a nation.

The progressive destruction of a tangled maze of regulations, prohibitions, and controls set the stage for the

subsequent rapid development of the German economy. Although economic integration occurred before political unification, it would not have been possible had not many difficulties been swept away by irresistible pressure from Prussia with its military victories.

Belgium–Luxembourg Economic Union

The Benelux Economic Union. In 1921 Luxembourg, a former member of the Zollverein, signed the Convention of Brussels with Belgium, creating the Belgium–Luxembourg Economic Union. Since 1921 Belgium and Luxembourg have, then, had the same customs tariff and a single balance of payments.

The union was expanded after World War II to include The Netherlands. At the beginning of 1948 most import duties within the Benelux area were abolished, and a common external tariff was put into operation. Exceptions were made, nevertheless, for a few agricultural products, and it was also felt necessary to introduce a system of quotas.

It was rapidly perceived that a simple customs union was inadequate, and a treaty on Oct. 15, 1949, set as its target the progressive and complete liberalization of trade between the partners, systematic coordination of their international commercial and monetary policies, and the adoption of a joint bargaining position in negotiations with other countries. Though the experiment was optimistically viewed everywhere as the precursor of a wider European economic integration, it faced difficulties arising from the very different postwar situations of Belgium and The Netherlands. The two economies were competitive rather than complementary. Other problems arose in connection with the free access of Dutch agricultural products to the Belgian market. Moreover, the Belgian economic system was more liberal than the Dutch, where rigorous price control had long been a standard practice.

The development of Benelux received strong impetus from the formation of the European Economic Community in the 1950s. The Treaty of Rome in 1957 creating the EEC, or Common Market, spurred the members of Benelux to confirm and strengthen their own integration in the Benelux Treaty of Economic Union signed at The Hague on Feb. 3, 1958. The Hague treaty, however, contained little that was new, and in outline it was no more than the codification of results already achieved.

The Benelux Economic Union makes all of its decisions unanimously. The union has executive organs (the Committee of Ministers, the Council of the Economic Union, a number of commissions, and a Secretariat General); consultative organs (the Inter-Parliamentary Council and the Economic and Social Advisory Council); and legal organs (the Court of Justice).

Efforts toward further integration in Europe

The European Coal and Steel Community. An important step in European integration was taken in May 1950 when the French foreign minister, Robert Schuman, proposed that a common market for coal and steel be set up by countries willing to delegate powers over these sectors of their economies to an independent authority. The motive behind the plan was the belief that a new economic and political framework was needed if European unity was to be achieved and if the threat of a future Franco-German conflict was to be avoided. In April 1951 France, West Germany, Italy, and the three Benelux countries signed a treaty in Paris setting up the European Coal and Steel Community (ECSC).

The signatories bound themselves to abolish all customs barriers and other restrictions on the movement of coal and steel between their countries; to renounce all discriminatory practices among producers, purchasers, or users (with respect to price and delivery conditions, transport charges, selection of suppliers, etc.); to end government subsidies or grants-in-aid; and to eliminate all practices interfering with the operation of markets.

The constitution of the community. When first promulgated, the constitution of the Coal and Steel Community allowed that it be governed by a High Authority, assisted by a Consultative Committee, a Common Assembly, a Special Council of Ministers, and a Court of Justice.

The High Authority was the permanent executive organ of the community. Its decisions, taken by a majority vote, were fully binding on all member countries, each of which was pledged to respect the "supranational character" of the High Authority. The authority was to refer important substantive matters to the Consultative Committee before taking a decision. The latter was composed of coal and steel industry representatives, including producers, workers, users, and traders.

The assembly was empowered to exercise only parliamentary control but could overrule the High Authority by a two-thirds majority. Its delegates were composed of deputies of national parliaments.

The ECSC Council of Ministers

The function of the Council of Ministers was to "harmonise the actions of the High Authority and the governments responsible for the economic policy of respective countries." It was composed of representatives of member countries, each of which delegated a member of its government. Most decisions of the council were valid if voted by a majority of representatives. Unanimous agreement was required only on decisions concerning production questions and shortages. Taken as a whole, the treaty was similar to a federal constitution, embodied in a long and complex document.

There is, however, a basic incompatibility between the community's provenance, limited to the coal and steel industries, and the sovereignty of the member countries, each of which is responsible for its own general economic policy. As a practical matter, during the first 17 years of the community's existence, authority on all substantive issues remained vested in the national governments. The High Authority was autonomous only in matters of secondary importance. Thus, the coal crisis of 1958—when West German, Belgian, and French stocks of unsold coal rose to unmanageable proportions—was resolved at the national level. All the High Authority could do was to confirm the measures taken, even when they were contrary to the provision of the treaty. Similarly, the reduction of the labour force in coal mining from 650,000 persons at the end of 1957 to 300,000 10 years later was effected by individual countries; there was no community-wide action.

The treaty reserved for member countries responsibility for their own trade policies toward third countries. This hindered the establishment of an effective common market since a common market requires a unified system of protection from foreign competition. At the height of the coal crisis, for example, when stocks of coal rose in Belgium, West Germany, and France, Italy nonetheless continued to buy cheap supplies from the United States.

Later developments. Despite such difficulties much has been accomplished by the community. The markets for steel and coal have been liberalized to a considerable degree; the community has been a useful forum in which questions of common interest could be examined; and it has fostered the growth of an international spirit, which did much to facilitate the negotiation of the Treaty of Rome, establishing the European Economic Community and the European Atomic Energy Community (Euratom).

In 1957 the Coal and Steel Community's assembly and Court of Justice were replaced by parallel institutions established by the European Economic Community. In 1967 its executive organs were merged with those of the European Economic Community and Euratom in what is now called the European Communities. The other provisions of the treaty remained unchanged.

The Common Market

The European Economic Community. The European Coal and Steel Community was only the initial step in the movement for European integration. On March 25, 1957, its six member governments signed the Treaty of Rome, under which they agreed to establish the European Economic Community, or Common Market, which came into being on Jan. 18, 1958. In 1973 it was enlarged with the entry of Great Britain, Ireland, and Denmark. Since that time, Greece (1981), Spain (1986), and Portugal (1986) have become members. The EEC is the most far-reaching attempt at economic integration among sovereign countries. Its founding treaty has been the model, in whole or part, for all subsequent attempts at economic integration.

The Treaty of Rome aimed to "establish a common market" and "progressively bring the economic policies of members into alignment" so as to

promote the harmonious growth of economic activity in the Community as a whole, regular and balanced expansion, augmented stability, a more rapidly rising standard of living, and closer relations between the participating states.

The treaty pledged the signatories to

abolish customs duties and quantitative restrictions on the entry and outflow of merchandise, to abrogate all other measures having an equivalent effect, and to fix a common customs tariff for imports from non-member states.

They also agreed to "abolish, as between members, all barriers to the free movement of persons, services and capital." This was to be accomplished during a transition period of 12 years. The transition period ended on Jan. 1, 1970, and the community then entered into its definitive phase.

Formation of a customs union. The treaty set a timetable for the abolition of customs duties between member states. On balance, this timetable was met and in some areas exceeded so that, by the middle of 1968, tariff barriers had been abolished for agricultural as well as industrial products. By that date also, most quota restrictions had been lifted. The customs posts had not disappeared, however; they were still needed for such tasks as assessing and collecting the compensatory taxes that equalized the differences in taxes between member countries.

Tariffs on imports from outside the community were gradually brought closer, and on July 1, 1970, a common community tariff was put into effect.

Development of a common agricultural policy. When the treaty took effect at the beginning of 1958, agriculture was subsidized in all six member countries. The various price-support mechanisms differed substantially, as did foreign-trade policies and tariff levels. The cumulative impact of governmental intervention of various kinds over the years had led to major differences among the members in agricultural price levels. With the average price of wheat in the six countries in 1959 indexed at 100, the relative price levels in individual countries were as follows: Germany, 108; France, 78; Italy, 108; Belgium, 101; Luxembourg, 119; and The Netherlands, 86. The achievement of common policies in agriculture appeared to be so difficult that the treaty limited itself to setting forth a number of general provisions on which agreement seemed feasible. Despite this, a common agricultural policy was achieved: all tariff and quota restrictions on trade in farm products among member countries were abolished; a common set of tariffs on agricultural imports from non-EEC countries was established; and a common system of price supports took the place of the former national systems.

'he need
o stabilize
gricultural
rices

The price supports required difficult compromises among the member governments because of the differences in their domestic price levels for farm products. The EEC wheat price, for example, was set roughly halfway between the prices of the lowest-cost suppliers in the community, France and The Netherlands, and those of West Germany, which was the highest. France exerted considerable political pressure to persuade West Germany to accept a substantial lowering of the returns to its wheat producers. The community prices are supported by purchases from a common fund. The fund begins buying in any area where the price of a crop drops to a fixed intervention level. The cost of the price support program is financed by contributions from the members.

Since its inception, the common agricultural policy has experienced several fundamental problems, especially recurrent surpluses and conflicts of interest between large- and small-scale producers. Surpluses have originated as a result of the price support system, which helps marginal farmers stay in business, but often encourages more productive farmers to overproduce, creating surpluses that must be purchased with EEC funds. Recurrent surpluses of butter and sugar have become a particular problem. Conflicts of interest have arisen between countries that are net food importers (*e.g.*, the United Kingdom and West Germany), which make large contributions to the common policy but receive little return in export subsidies and price supports, and those that are net food-exporting countries (like France and Italy), which receive greater relative support.

Toward a harmonization of policies. Another fundamental aim of the Treaty of Rome was to achieve a general harmonization of national economic policies. The treaty envisaged the working out of common rules covering such matters as competition, taxation, and other economic legislation. It also called for the development of common policies in such areas as foreign trade and transportation. Members were asked to concert their economic policies in the fields of fiscal and monetary policy, balance-of-payments policy, and social welfare.

Relations with other countries. The treaty provides that overseas countries and territories having a special relationship with Belgium, France, The Netherlands, and Italy may be granted associate membership. The purpose of this was to eliminate preferential tariff arrangements by any member with outside countries by extending the same preferential terms to all of the members. The treaty also provides for a European Development Fund to assist the economic development of these countries.

EEC associate membership

New members. Any European state may request membership in the EEC. Acceptance requires a unanimous decision by the present members after "the conditions for entry and the modifications to be made to the Treaty as a result" have been agreed upon by the member states and the would-be entrant.

Associates. The EEC may also conclude an agreement of association with a nonmember country, a union of states, or an international organization. The associate is entitled to special terms in its trade with the EEC and can send representatives to its meetings. Associate status providing for a custom union after a 12-year transitional period was granted to Greece in 1962, prior to its accession as a full member, and to Turkey in 1964. Partial association agreements have been signed with other countries.

Constitution of the EEC. As mentioned above, since 1967 the governing bodies for the EEC, the ECSC, and Euratom have been integrated. These bodies include the Council of Ministers, the Commission, the European Parliament, and the Court of Justice. The Council of Ministers and Commission are assisted by the Economic and Social Committee with advisory functions. Headquarters are in Brussels, Luxembourg, and Strasbourg.

The council has decision-making power in all matters falling within the sphere of competence of the communities. Each member sends one delegate. During the transition period before 1970, all important decisions had to be taken unanimously; they may now be taken by either absolute majority or "qualified" majority (*i.e.*, with weighted voting rights) or unanimously. Either a qualified majority or unanimity are required on certain matters by the treaty. Decisions must be taken unanimously on a very large number of issues.

The Commission members are "selected by reason of their general competence and offering the utmost guarantees of independence." They are appointed by agreement among the member countries, not more than two being of the same nationality. Members serve a four-year term and may be reappointed. They are expected to act in the general interest of the communities, without deference to any government or other organization.

The EEC Commission

The Commission's basic function is to watch over the application of the Treaty of Rome and other treaties and to assist the council with recommendations or advice. Its powers for the most part are delegated to it by the council.

The European Parliament is formed of delegates selected from the parliaments of the members. In principle the parliament meets once a year. It passes recommendations and resolutions and discusses the Commission's annual report. It may pass a resolution of no confidence in the Commission by a two-thirds majority, resulting in immediate dismissal of the Commission members.

The Court of Justice is charged with the interpretation and application of the treaties. It is composed of 11 judges appointed by mutual agreement of the governments of the member states for six-year terms. Actions may be brought in the court by any member state or by any physical or legal person. The court's powers are considerable since community law takes precedence over the national laws of each member country.

The Economic and Social Committee is a consultative body composed of representatives of various economic and social strata, including manufacturing, agriculture, transportation, trade, handicrafts, the liberal professions, wage earners, and the public. Its members are appointed for a four-year term by unanimous decision of the council and may be reappointed.

Britain's reaction to the Common Market

The European Free Trade Association. When the European Economic Community was being organized, Great Britain sought to organize a free-trade area that would include 17 member countries of the Organization for European Economic Co-operation. This would have given Britain access to the benefits of the industrial common market on the Continent while avoiding possible infringements of British sovereignty. The effort failed, mainly because of French opposition. Britain then undertook the formation of a free-trade area in association with Austria, Denmark, Norway, Portugal, Sweden, and Switzerland.

The convention setting up the European Free Trade Association (EFTA) was signed at Stockholm on Jan. 4, 1960. The preamble stated that one of the main purposes of the organization was to "facilitate the future establishment of a wider multilateral association for abolition of customs barriers." More specifically, it was intended as a mechanism for freeing trade with the six Common Market countries without subscribing to the commitments of political character embodied in the Treaty of Rome. In the meantime, EFTA gave its seven members a stronger bargaining position vis-à-vis the other six, as well as the means of creating a large market of their own.

Operation of the EFTA. The European Free Trade Association is governed by a council composed of one member from each participating state. The council found it useful to set up a joint consultative committee composed of representatives of industry, business, and labour; a set of six permanent technical committees (on customs, trade, economic development, agriculture, economics, and budget); and working parties dealing with special topics.

The EFTA treaty, like that of the EEC, provided for a transitional period, set forth rules governing competition, and called for the abolition of all indirect protection and trade discrimination.

EFTA's special problem

The EFTA had one special problem arising from its nature as a free-trade area. Since the duties charged on imports from outside countries might differ from one member to another, traders could take advantage of the differences by channeling imports through the country levying the lowest rates and delivering them to customers in another member country. Rules were established to prevent this by classifying merchandise according to whether it was produced or fabricated in one of the member countries. In the case of goods made from imported raw materials, the rules required that the import content not exceed 50 percent of the export price of the finished product.

The EFTA's record. Although a 10-year transitional period was originally envisaged, internal customs barriers on industrial goods were eliminated on Jan. 1, 1967, three years ahead of schedule. Bilateral trade agreements have also been negotiated to increase trade in agricultural products.

The EFTA passed through two grave crises in the 1960s. The first was in 1961 when Britain, acting unilaterally, informed its partners that it had applied for membership in the EEC. The upshot was a joint declaration in which the EFTA members committed themselves to "coordinate their action and remain united throughout the negotiations." The second crisis occurred in October 1964, when, to shore up the pound sterling, Britain suddenly introduced a surcharge of 15 percent on all its industrial imports—an act that was in violation of the treaty.

Finland became an associate member of EFTA in July 1961, and Iceland was admitted to full membership in March 1970. In 1973 Britain and Denmark left the association when they were accepted as members in the European Economic Community—Britain, after two previous unsuccessful tries. Since that time agreements have been reached between EFTA and EEC promoting trade between the two groups.

Economic integration in Latin America. Progress toward economic integration in Europe encouraged the Latin-American republics to make similar attempts. By the late 20th century several organizations had been established to work toward such integration; they include the Central American Common Market; the Latin American Free Trade Association; the Andean Group; and the Caribbean Community and Common Market. (Ma.A./Ed.)

The Central American Common Market. On June 10, 1958, El Salvador, Guatemala, Honduras, Nicaragua, and Costa Rica signed a multilateral treaty aiming at free trade and economic integration. It provided for the establishment of a free-trade area within 10 years. The participating countries also agreed to the industrial integration of the region. These arrangements were completed by the signature on Dec. 13, 1960, of the Treaty of Managua. Its aims were similar to those of the EEC in Europe, namely, the establishment of a common market within five years and the organization of integrated industrial development. Most barriers on the region's internal trade have since been removed or reduced, and a single customs tariff has been introduced for most products imported from outside the area.

The Treaty of Managua

Economic integration in Central America has been hampered by disagreements and military conflicts in the area. Following a dispute with El Salvador in 1970, Honduras in effect withdrew from common market membership by implementing tariffs on imports from other member countries. In 1980, however, Honduras signed a treaty with El Salvador, settling their dispute and restoring Honduran participation in the common market trade agreements. During the 1980s, tensions between the revolutionary government of Nicaragua and its neighbours, as well as other disorders, have disrupted trade among the nations of Central America.

The Latin American Integration Association. On Feb. 18, 1960, Argentina, Brazil, Chile, Mexico, Paraguay, Peru, and Uruguay signed a treaty setting up the Latin American Free Trade Association (LAFTA), predecessor to the Latin American Integration Association. By 1970 the seven signatories had been joined by Ecuador, Colombia, Venezuela, and Bolivia. The treaty provided for a 12-year transition period during which all obstacles to trade were to be eliminated. It was based on the principle of reciprocity and most-favoured-nation treatment. Member states also committed themselves to progressive coordination of their industrialization policies. Special treatment was provided for agriculture and for the relatively least-developed member countries.

Liberalization of trade between the member countries was carried out initially through negotiation of product-by-product concessions. In 1967, however, the negotiations failed; they were postponed to 1968, when agreement was reached on a system of across-the-board automatic tariff reductions similar to those of the European Economic Community. The eventual aim was that LAFTA be the first step in a process that would to lead to a common Latin-American market; but during the 1970s it became apparent that the geographic diversity and varying levels of economic development exhibited by the member countries were handicapping the formation of a true common market within the association's existing framework. In the late 1970s negotiations were begun to establish a new framework for economic integration, and in 1980, 20 years after the creation of LAFTA, the Latin American Integration Association (LAIA; Asociación Latino-Americana de Integración) was formed. Unlike its predecessor, LAIA adopted an alternative to the concept of a free-trade area in that it opted for the establishment of bilateral preference agreements that would take into account the varying stages of economic development of the member countries. In order to best negotiate bilateral preference agreements the member nations were divided into three categories: most developed countries (Argentina, Brazil, and Mexico); intermediate developed countries (Chile, Colombia, Peru, Uruguay, and Venezuela); and least-developed countries (Bolivia, Ecuador, and Paraguay). Cuba was admitted to LAIA in 1986 with observer status.

The goal of LAFTA

The Andean Group. In 1966 Bolivia, Chile, Colombia, Ecuador, Peru, and Venezuela, all members of the Latin

American Free Trade Association, agreed to form a regional subgroup. The Andean Group finally began its official existence in June 1969 without Venezuela, which had withdrawn. By 1973, Venezuela had decided to join, but Chile withdrew in 1976. (The Andean Judicial Tribunal was established in 1980 to monitor, interpret, and resolve problems resulting from Andean Group decisions. The tribunal is composed of one judge from each country, serving a six-year term.) Among the group's aims are the acceleration of economic integration between member countries, the coordination of regional industrial development, the regulation of foreign investment in member countries, and the maintenance of a common external tariff.

The Caribbean Community and Common Market. Established in 1973 by 12 Caribbean countries, the Caribbean Community and Common Market (Caricom) is the successor to the Caribbean Free Trade Association, which was founded in 1968 by five former British colonies (Antigua, Barbados, Guyana, Jamaica, and Trinidad and Tobago), all of whom joined the new organization. The organization attempts to encourage economic integration in the Caribbean region and achieved partial agreement to a common external tariff and protective policy for the community in 1978.

Aims of Caricom

Caribbean economic integration was curtailed between 1976 and 1978, in part because of import restrictions imposed by Jamaica and Guyana, and in part because of dissatisfaction among the less-developed countries, who claimed that they were not receiving their fair share of trading revenues. By 1980 Jamaica and Guyana had removed their import restrictions and the Caricom Council had endorsed several measures to improve the status of the less-developed countries within Caricom. The less-developed countries, however, remained dissatisfied, and in 1981 the seven former members of the West Indies Associated States (Antigua and Barbuda, Dominica, Grenada, Montserrat, Saint Kitts-Nevis, Saint Lucia, and Saint Vincent) formed a subregional economic integration organization, the Organization of Eastern Caribbean States. They retained their Caricom membership. (Ed.)

The Council for Mutual Economic Assistance. A Soviet-sponsored effort to integrate the economies of eastern Europe began as early as Jan. 25, 1949, in response to the Marshall Plan. The founding states were Bulgaria, Hungary, Poland, Romania, Czechoslovakia, and the Soviet Union. Albania joined in 1949, the German Democratic Republic in 1950, and the Mongolian People's Republic in 1962. Albania ceased to participate after 1961. In its early years the activities of the Council for Mutual Economic Assistance (or Comecon) were limited mainly to the registration of bilateral trade and credit agreements among the member countries. After Stalin's death in 1953 it made efforts to promote industrial specialization and to reduce "parallelism" in the economies of its members. In 1956 and 1957, when most of its standing commissions began to operate, attempts were made to harmonize the long-term plans of the members.

Integration in eastern Europe

The establishment of the European Economic Community in 1958, together with pressures from the eastern European countries for a greater degree of independence, induced the Soviet leadership to rethink the organization. A new charter was signed by the members in Sofia on Dec. 14, 1959.

Economic objectives. The economic aims of the Council for Mutual Economic Assistance are

> through unification and coordination of the efforts of its member countries to contribute to the balanced growth of their economies, more rapid economic and technical progress, increased industrialization of those countries which are least advanced in this area, the continued growth of labour productivity, and the regular improvement of the welfare of the peoples of member countries.

Its pursuit of these objectives has been hindered by certain political and economic constraints. One of the most serious is the absence of flexible and realistic price systems in the member countries. This has made it impossible to base trade on relative prices; instead it has been conducted mainly on a barter basis through bilateral agreements between governments. In negotiating such agreements, the parties have been led to use "world prices"; *i.e.,* prices prevailing in the trade of countries outside the Council for Mutual Economic Assistance. Another hindrance to economic integration is the highly centralized economic planning in the member countries, which so far have had only limited success in coordinating their plans.

There have also been serious nationalistic tensions within the council. The Romanian government, for example, announced its intention to pursue all-around industrialization, including the development of its heavy industries, in opposition to the policy of specialization in raw materials and agricultural products that was said to have been the Council for Mutual Economic Assistance's policy for Romania.

Among the practical achievements of the Council for Mutual Economic Assistance, however, have been: the organization of railroad coordination (1956); construction of a high-voltage electricity grid (1962); creation of the International Bank for Economic Cooperation (1963); the pooling of 93,000 railway freight cars (1964); and construction of the "Friendship" oil pipeline from the Soviet Union's Volga region to the eastern European countries. Comecon initially was composed of the Soviet Union's eastern Europe satellites, but in 1972 Cuba became a member and in 1978 Vietnam joined.

Achievements of Comecon

The constitution of the Council for Mutual Economic Assistance. The highest authority of the organization is the council-in-session. It is composed of delegations from all member countries, the composition of each delegation being fixed by the government concerned. The conference of representatives of member countries, composed of one representative of each country, may issue recommendations and decisions. It may also submit proposals for examination by the council-in-session.

Various permanent commissions are composed of experts and official representatives of member countries. Some are general economic commissions; others deal with issues affecting specific industries. The headquarters of the various commissions are located in the capital cities of member countries. The central secretariat is in Moscow.

The Council for Mutual Economic Assistance is often called the eastern European counterpart of western Europe's EEC. Although the general aims are indeed the same, the two organizations differ radically in their approach to the problems involved. The EEC aims to achieve integration on a decentralized basis by means of an economic market in which goods, services, capital, and persons have full freedom of movement—a market regulated by uniform economic legislation. The Council for Mutual Economic Assistance seeks to achieve cooperation among national economies each of which is centrally planned and administered. (Ma.A.)

GATT rules regarding regional arrangements. When countries join regional trading groups such as the European Economic Community, they provide preferences to one another. For example, German producers can export duty-free to France, whereas U.S. or Japanese exporters still have to pay duties on products shipped to France. Thus, German producers are preferred over U.S. or Japanese suppliers; a customs union represents a departure from most-favoured-nation treatment. Nevertheless, countries entering a customs union or free-trade association are not in violation of their commitments under the General Agreement on Tariffs and Trade; customs unions and free-trade associations are permitted under GATT article XXIV.

GATT article XXIV

Specifically, this article allows countries to grant special treatment to one another by establishing a customs union or free-trade association, provided that (1) duties and other trade restrictions are "eliminated on substantially all the trade" among the participants; (2) the elimination of internal barriers occurs "within a reasonable length of time" (commonly interpreted as permitting a phase-in period of not more than 10 years); and (3) duties and other barriers to imports from nonmember countries "shall not on the whole be higher or more restrictive" than those preceding the establishment of the customs union or free-trade association. The third condition was explicitly aimed at protecting the rights of outside countries.

The first condition disapproves partial preferential arrangements covering only some products, while accepting broad arrangements covering (substantially) all products. It was supported on the ground that large, unrestricted markets provide substantial benefits—most notably, the large internal market within the United States. Such benefits should also be available to others. For example, when the GATT articles were being drafted, consideration was being given to an integration of the nations of western Europe.

Jacob Viner's reaction to article XXIV

Shortly after article XXIV was written, it received substantial support in the classic study of Jacob Viner, *The Customs Union Issue* (1950). Viner, a Canadian-born U.S. economist, saw efficiency as the main gain from international trade, since trade encourages production in a less costly location. He contended that a customs union works to increase efficiency in one way, but to decrease it in another. To explain why, Viner drew a distinction between two forces at work when a customs union is established. As two (or more) countries cut tariffs on each other's products, new trade is created. Some goods previously bought from domestic producers are now bought from lower-cost producers in the trading partner, whose goods now come in duty-free. Such trade creation improves efficiency.

When, however, a country removes tariffs on its partner's goods but not on the goods of outside countries, the partner has preferred access. As a result, some purchases are switched—goods are bought from the partner nation, rather than from the outside world. Such trade diversion reduces efficiency; purchases are switched from the efficient outside country to the less efficient partner nation. A customs union (or free-trade area) may be predominantly trade-creating, which is desirable, or it may be predominantly trade-diverting, which is not.

Viner's book thus introduced a skeptical note into the discussion of customs unions, which had previously been given broad approval. Viner's work also supported the distinctions made in article XXIV of the General Agreement on Tariffs and Trade. Clearly, if barriers on imports from nonmember countries are kept down, then trade diversion is less likely. Furthermore, the provision to disapprove partial preferential arrangements covering only some products, while accepting broad arrangements covering virtually all products found support within Viner's framework. Because of the political dynamics of trade negotiations, partial preferential arrangements generally cause more trade diversion than trade creation.

This can be illustrated in a hypothetical situation where countries (say, France and West Germany) are permitted to get together to make whatever preferential agreements they wish. A natural way for France to open negotiations would be to say to West Germany: "We'll cut tariffs on your automobiles and buy from you rather than Japan, if you will cut tariffs on our sugar and buy from us rather than from the Caribbean nations." In other words, negotiators tend to pick and choose those items previously imported from outside countries; they tend to cut tariffs where trade diversion is greatest. By requiring a comprehensive approach, article XXIV ensures that trade-creating tariff cuts will be made, too. (P.Wo.)

Patterns of trade

DEGREES OF NATIONAL PARTICIPATION

Nations vary considerably in the extent of their foreign trade. As a very rough generalization, it may be said that the larger a country is in physical size and population, the less its involvement in foreign trade, mainly because of the greater diversity of raw materials available within its borders and the greater size of its internal market. Thus, the participation of the United States is relatively low, as measured by percentage of gross national product, and that of the Soviet Union even lower. The U.S. gross national product, however, is so immense by world standards that the United States still ranks as one of the world's most important trading countries. Some of the smaller countries of western Europe (such as The Netherlands) have export and import totals that approximate half of their gross national products.

TRADE AMONG DEVELOPED COUNTRIES

The greatest volume of trade occurs among the developed, capital-rich countries of the world, especially among industrial leaders such as Australia, Belgium, Canada, France, Italy, Japan, The Netherlands, Spain, Sweden, the United Kingdom, the United States, and West Germany. Generally, as a country matures economically its participation in foreign trade grows more rapidly than its gross national product.

Trade within the EEC

The European Economic Community (EEC) affords an impressive instance of the gains to be derived from freer trade. A major part of the increases in real income in EEC countries is almost certainly attributable to the removal of trade barriers. The EEC's formation cannot, however, be interpreted as reflecting an unqualified dedication to the free-trade principle, since EEC countries maintain tariffs against goods from outside the Community.

TRADE BETWEEN DEVELOPED AND DEVELOPING COUNTRIES

Difficult problems frequently arise out of trade between developed and developing countries. Many less-developed countries are tropical, frequently relying heavily for income upon the proceeds from export of one or two crops, such as coffee, cacao, or sugar. Markets for such goods are highly competitive (in the sense in which economists use the term competitive)—that is, prices are extremely sensitive to every change in demand or in supply. Prices of manufactured goods, the typical exports of developed countries, are commonly much more stable. Hence, as the price of its export commodity fluctuates, the tropical country experiences large fluctuations in its "terms of trade," the ratio of export prices to import prices, often with painful effects on the domestic economy. With respect to almost all important primary commodities, efforts have been made at price stabilization and output control. These efforts have met with varied success.

Comparable problems arise when the developing country exports a mineral such as petroleum or copper. The initiative in developing such a resource has often been taken by a foreign company from a developed country that owns (in part if not in full) the extracting capital facilities. Particularly since the mineral resource is exhaustible, charges of exploitation are common. The matter is a continuing source of political strife and may on occasion lead to expropriation of the mineral properties.

Developing country trade organizations

Several groups of developing countries have joined in creating organizations for the promotion of trade between themselves. Notable examples include the Central American Common Market (1961), the Organisation Commune Africaine et Mauricienne (1965), the Association of Southeast Asian Nations (1967), the Caribbean Community and Common Market (1973), and the Latin American Integration Association (1980).

SOVIET FOREIGN TRADE

The Soviet Union's involvement in foreign trade, measured as before by comparing exports or imports against gross national product, is even lower than that of the United States. The U.S.S.R. is not in general an important trader in world markets, but it has made occasional large-scale entries, such as its grain purchases during years of domestic crop shortage in the 1960s and 1970s.

Soviet trend toward expanded trade

Since the 1917 Revolution, Soviet policy has clearly been influenced by the desire for self-sufficiency, further reinforced by its suspicions of the capitalist world and by its strong desire for centrally directed planning. Today, the U.S.S.R. appears to be showing a greater interest in expanded trade connections, doubtless because of growing industrial maturity.

The attitude of the U.S.S.R. toward foreign trade was forced to undergo some change when that country acquired influence over the eastern European countries after World War II. It established the Council for Mutual Economic Assistance (Comecon) to direct trade with and among its satellite neighbours. Comecon, however, appears to be primarily a device for implementing and integrating central development plans among member countries—unlike the EEC, which was planned to facilitate the unrestricted movement of goods and productive inputs. The patterns

of Comecon trade, however, are often difficult for an outsider to interpret. (R.R./Ed.)

International commodity trade

Goods that are traded internationally fall into two broad categories—primary goods and manufactured products. Manufactured products, such as machinery and clothing, comprise products whose value reflects largely the cost of manufacturing processes. Such manufacturing processes contribute relatively little to the value of primary goods, such as crude petroleum and cotton, which undergo but little processing before they are traded. Commodities and commodity markets are terms used as synonyms for primary goods and the markets in such goods.

PRIMARY COMMODITY MARKETS

Actual and futures markets

Trade in primary goods may take the form of a normal exchange of goods for money as in any everyday transaction (referred to technically as trade in "actuals"), or it may be conducted by means of futures contracts. A futures contract is an agreement to deliver or receive a certain quantity of a commodity at an agreed price at some stated time in the future. Trade in actuals has declined considerably and in many cases (such as the Liverpool markets in cotton and grain) has even come to a halt.

Operation of the market. The great bulk of commodity trading is now in contracts for future delivery. The purpose of trading in futures is either to insure against the risk of price changes (hedging) or to make a profit by speculating on the price trend. If a speculator believes, for example, that prices will rise, he buys a futures contract and sells it when he wishes (*e.g.*, at a more distant delivery date). The speculator either gains (if prices have risen) or loses (if they have fallen), the difference being due to the change in price.

"Hedging" means the offsetting of commitments in the market in actuals by futures contracts. A producer who buys a commodity at spot (current) prices but does not normally resell until three months later can insure himself against a decline in prices by selling futures: if prices fall he loses on his inventories but can purchase at a lower price; if prices rise he gains on his inventories but loses on his futures sales. Since price movements in the actuals market and the futures market are closely related, the loss (or gain) in actual transactions will normally be offset by a comparable gain (or loss) in the futures market.

The operation of futures markets requires commodities of uniform quality grades in order that transactions may take place without the buyer having to inspect the commodities themselves. This explains why there is no futures market, for example, in tobacco, which varies too much in quality. A steady, unfluctuating supply also is needed; this is referred to technically as "low elasticity of supply," meaning that the amount of a commodity that producers supply to the market is not much affected by the price at which they are able to sell the commodity. If supply could be adjusted relatively quickly to changes in demand, speculation would become too difficult and risky because exceptionally high or low prices, from which speculators are able to profit, are eliminated as soon as supply is adjusted. Monopolistic control of demand and supply is also unfavourable to the operation of a futures market because price is subject to a large extent to the control of the monopolist and is thus unlikely to fluctuate sufficiently to provide the speculator with an opportunity for making profits. There is, for example, no market in diamonds, since there is only one marketing cooperative. In 1966 the London market in shellac ceased to function after the Indian government applied control of exporters' prices at the source.

Major commodity markets

Before World War II London was the centre of international trade in primary goods, but New York City has become at least as important. It is in these two cities that the international prices of many primary products are determined. Although New York often has the bigger market, many producers prefer the London market because of the large fluctuations in local demand in the United States that influence New York market prices. In some cases international commodity agreements have reduced the significance of certain commodity markets.

There are markets in both New York and London for numerous primary goods, including cotton, copper, cocoa, sugar, rubber, coffee, wool and wooltops, tin, silver, and wheat. Tea, wool, and furs are auctioned in London, but in the case of many other commodities, auctions have been superseded by private sales. In London the metal market is much more a "spot" or delivery market than other futures markets. Many countries have their own markets: Australia for wool, Sri Lanka (Ceylon) and India for tea, and Malaysia for rubber and tin.

The terms of trade. The relation between the price of primary goods and that of manufactures has long intrigued economists. The relationship is known as the "terms of trade" and may be defined as the ratio of the average price of a country's or a group of countries' exports to the average price of its imports. The long-range trend of the terms of trade between primary products and manufactures has been the subject of diametrically opposed conclusions: some theorists hold that the trend is favourable to the less-developed countries, others that it is unfavourable. Faulty statistical material and methods in various countries are responsible for this lack of agreement.

Any comparison of the terms of trade over a long period of time is very difficult and may be misleading because the structure of trade changes, as does the quality of the groups of goods studied. Many economists believe that the terms of trade were adverse for less-developed countries from 1870 to 1938. They point to the fact that as developed countries become more technologically advanced there is a tendency for them to require relatively less in the way of primary products. A downward influence is thus exercised on primary product prices. Another factor is that in the industrial countries the benefits of progress find expression not in lower prices but in higher wages. This, together with inflationary pressures, means that prices of manufactured goods produced by the developed countries tend to rise steadily. There is thus a tendency, it is argued, for the less-developed countries to receive relatively less for what they have to sell and to have to pay more for what they need to buy. But the statistical problems posed by any attempt to verify this hypothesis are considerable. The countries selected, the relative weight assigned to the various goods, changes in transport costs, and the fact that the quality of manufactured goods has improved much more than that of primary goods make the statistics unreliable. There is also the problem that the terms of trade between primary commodities and manufactures do not necessarily coincide with the terms of trade between less-developed and industrial areas.

Effects of changes in the terms of trade

Even if it were established that the terms of trade have moved against the less-developed, largely primary-producing countries, this would not necessarily mean that their balance-of-payments situation has been adversely affected. A decline in the terms of trade may in fact improve a country's balance-of-payments, because, although the prices of that country's exports have fallen, it may, as a consequence of this fall in price, be able to sell a far larger quantity. Total revenue from exports may thus increase. Similarly, although imports may become more expensive, the result may be that the country's demand for imports drops very steeply, so that less is spent on them than when they were cheaper.

These problems make it extremely difficult to generalize about the effects of commodity price changes on the economic situation of one or a group of countries.

PRICE MOVEMENTS

Prices usually vary widely in commodity markets, not only in the short run but also in the long run. In the short run there are frequent changes in supply because of varying climatic conditions (for agricultural products) and because of political and other events on the international scene (such as the closure of the Suez Canal) and in individual countries (such as strikes). As a rule, price changes do not give rise in the short run to substantial changes in the supply of or demand for primary goods (low elasticity of supply and demand). Business cycles in the importing

countries, however, have an influence on demand. Market conditions differ, of course, from product to product. In the case of sugar and wheat, demand is fairly stable, but supply is not; as regards tin, and, indeed, the majority of metals, the converse is true. In the case of industrial commodities, such as cotton, there are fluctuations in both supply and demand.

Long-run effect of price change

In the long run the extent of changes in demand and supply is usually greater. A considerable and sustained price increase, for example, may result in a fall in demand and the appearance of substitute products. After a number of years, supply may increase in response to a higher level of demand reflected by higher prices. The length of time required to adjust supply to demand varies from commodity to commodity. Tree crops, for example, need a long growth period, and mineral reserves are tapped only if expectations about the price trend are favourable.

Effect on economic development. Through their repercussion on export earnings, price fluctuations are often held responsible for the variations in the growth rate of countries producing primary goods, especially since exports of a single primary good account for a large part of the total exports of many countries. But apart from the fact that, as described above, quantities exported influence export earnings as much as prices, there are many other factors that determine export earnings. Such factors include the type and destination of exports and, above all, the economic policies of the countries concerned.

It is thus difficult to generalize about the relation of foreign trade to economic growth. Many countries with very unstable exports have relatively stable national incomes; others whose exports are stable have highly unstable national incomes. The stimulus from exports will usually be stronger, for example, if the rate of demand for these exports is growing rapidly. Often, however, the transmission of growth to the nonexporting sector of the economy is impeded in less-developed countries by the economic, social, and political organization of the economy. It is important, for example, for some countries to try to decrease exports of goods that have a slowly growing demand and at the same time to try to increase exports of goods, such as minerals, for which world demand is growing more rapidly.

Efforts to stabilize prices. The uncertainty both for private producers and for governments resulting from sharp and sudden commodity price changes has resulted in many efforts to achieve greater stability on the market in primary goods.

Action in individual countries. In theory a country could insulate domestic producers against international price fluctuations through variable charges and subsidies, but politically it is difficult to tax away producers' profits during a period of rising prices and to hold the resulting revenue in order to redistribute it should prices and profits fall.

Price fluctuation in Africa

In Nigeria, Ghana, Sierra Leone, and The Gambia, for instance, national marketing boards that attempted to even out price fluctuations of cocoa, cotton, and peanuts (groundnuts) were in operation before those countries became independent. In the former French territories in Africa, stabilization funds fixed producer prices and controlled margins and profits. The main dangers inherent in national stabilization schemes are inconsistent government policies and the excessive operating costs of the public bodies concerned. These factors explain the unsatisfactory results of many national price agencies.

International cooperation. In the 1920s international cartels were created for rubber, sugar, tin, and tea, but they yielded no lasting results. Nor did cooperation between the governments of exporting and importing countries (such as in the International Wheat Agreement of 1933 and the International Sugar Agreement of 1937) serve to attain the desired goals during the Great Depression. Of special significance among more recent attempts to raise and stabilize a commodity price has been the one made by the Organization of Petroleum Exporting Countries (OPEC). (The special features of the oil market are considered below.) Other attempts to stabilize commodity prices since World War II have mainly assumed three forms—the multilateral contract agreement, the quota agreement, and the buffer-stock agreement. Transactions are effected at world market prices. When a minimum or a maximum price is reached or approached, efforts are made to ensure that prices remain within the two limits. Each of the three systems achieves this in a different way.

Three approaches to price stabilization

In the multilateral contract system, consumers and producers undertake to buy or sell a specified quantity of the commodity at agreed minimum and maximum prices, or at a price within the agreed range.

In the quota method, the quantity negotiated is determined by a previously fixed quota when a minimum or maximum price is exceeded. When there is a surplus, the producers restrict their exports or production; when there is a shortage, quotas are allotted to the consumer countries. With the buffer-stock method, stability is ensured by a combination of an export control arrangement and a buffer-stock arrangement. In certain circumstances exports are restricted by the controlling body. The buffer-stock agency buys when the market price is in the lower sector or at the floor price set out in the agreement; the buffer-stock agency sells when the market price is in the upper sector or at the ceiling price.

Results. The utility of commodity agreements in general can hardly be judged on past experience. Experience with wheat, sugar, and tin agreements, which cover a comparatively long period, is not conducive to generalization. Some degree of stability, though at a high price level, was achieved in the case of wheat, but this was due to the dominant influence of U.S. and Canadian policies. In the case of tin, too, transactions for the U.S. strategic stockpile exerted an influence. Political factors (including the Cuban revolution) underlay the de facto suspension from 1962 to 1969 of the sugar agreement, which had covered, and still covers, only a limited share of the world market.

The value of world transactions in tin, wheat, coffee, and sugar amounts to only a small part of the value of the world's entire commodity trade. Furthermore, the agreements in question do not cover all transactions. It is, in a way, understandable that only a few such agreements have been concluded; during a boom the producer countries are not inclined to conclude them, and during a depression there is little incentive for consumer countries to enter into them.

Conditions for success. A prerequisite for the success of commodity agreements is that they should embrace the vast majority of producers and especially the largest of them. No transactions should be excluded, and substitute commodities should be covered by the agreements.

Fixing the price range

The most intractable of the difficulties in concluding commodity agreements lies in the fixing of the price range. Neither unduly high nor unduly low price scales are tenable. Future market conditions are not easily foreseeable, so the possibility of errors cannot be ruled out; regular adjustment of the price ranges is necessary.

When it comes to determining the price range, the importing and exporting countries, respectively, do not systematically advocate low and high prices. Certain importing countries are not opposed to a relatively high price because the difference between the international price and the tariff-protected price of domestic producers is thereby reduced; exporting countries in a favourable competitive position are often in favour of lower prices so they will be able to increase their share of the market at the expense of less-competitive countries.

In concluding an agreement, the parties have to bear in mind that complete price stabilization is impossible. It would in fact be undesirable, because in the long run supply and demand need to remain in equilibrium, and the necessary adjustments in the economies concerned must not be precluded. Price fluctuations do not necessarily imply failure, because the fluctuations might well have been larger had the agreement not been concluded.

The method of stabilization needs to be chosen carefully, with due regard for the characteristics of the commodities concerned. The multilateral purchase contract and buffer-stock systems offer the advantage of not requiring any restrictions on production; new producers with improved technical equipment may participate.

A buffer stock needs to be sufficiently large if it is to achieve its purpose. Wider financing facilities are necessary; this is something to which the importing countries could contribute. Even then the buffer stock is better used together with other methods of stabilization. Because of the perishable nature of certain commodities or their bulk and high storage costs, however, a buffer stock is not always feasible. Buffer stocks alone often are not sufficient for the control of prices, and it is sometimes necessary for producers to restrict exports in order to reduce supply, thus pushing prices up.

INTERESTS OF THE LESS-DEVELOPED COUNTRIES

So far as the producer countries are concerned, stabilization of incomes, rather than of prices, is the most important factor. Although commodity agreements may contribute to this, their relatively limited success has caused other proposals to be advanced.

Compensatory financing refers to international financial assistance to a country whose export earnings have suffered as a result of a decline in primary commodity prices. Such a system was instituted in 1963 by the International Monetary Fund (IMF). In 1969 the IMF also began making loans available to countries having a balance-of-payments need in relation to the financing of buffer stocks under international commodity agreements.

EEC stabilization fund

The European Economic Community has established a stabilization fund for its associated overseas countries; prices must fall by a specified percentage before the mechanism of the fund goes into effect, and the richer beneficiary countries must repay the aid received.

Other proposals involve the introduction of simultaneous negotiations for a whole range of commodities. These discussions, however, and more particularly the administration of the resulting multicommodity agreement, would be highly complex. It may also be argued that the significance of export instability has been exaggerated and that most of the economies involved have suffered no serious damage. Thus, the resources devoted to countering price fluctuations and compensatory financing might be better employed in investments or technical assistance.

As to the possibility of the less-developed countries themselves influencing prices, circumstances vary from commodity to commodity. In the case of primary goods, such as coffee, that are produced only in the less-developed countries and for which practically no substitutes exist, action to increase prices can easily be taken if demand is not too much affected by price increases. A simple way to raise prices would be for the governments of producing countries to levy a duty on exports. Attempts by some developing countries to raise prices, however, can induce other developing countries to increase their output. For example, African coffee production was stimulated when Latin-American countries took steps to raise the price of their coffee.

Limitations on pricing

The fact that there are substitutes for a few primary goods (such as cotton, wool, and rubber) limits the extent to which primary-goods producers can raise their prices. Also, most commodities produced by less-developed countries face competition from the developed countries, which may produce the same commodities (such as petroleum, sugar, rice, and tobacco) or goods substitutable in varying degrees (such as soybean oil for peanut oil).

Many agricultural commodities are protected in the developed countries by tariffs, which means that the latter's requirements are often met entirely from domestic production. Some developed countries produce surpluses that are sold abroad at low, subsidized prices. Such commodities are therefore traded to a relatively small extent on world markets. The sales of the less-developed countries are thus influenced by the developed countries' national policies and by the price at which these countries sell their surpluses on the residual markets. The less-developed countries that produce minerals and metals seemingly have the most favourable export prospects because demand for these commodities is expanding among the developed countries, many of which are concerned over the depletion of their domestic resources.

(M.A.v.M./Ed.)

OPEC AND OIL

Of the multinational organizations aimed at affecting the price of a commodity, one of the most significant is the Organization of Petroleum Exporting Countries (OPEC). It was founded in 1960 by Middle Eastern countries and Venezuela, although its membership has come to include developing nations in other parts of the world. Some major oil-exporting nations have remained outside the organization, notably Mexico and the Soviet Union.

OPEC's effect on oil prices

The principal objective of OPEC has been to raise the price received by the oil-exporting countries. During its early years, it was notably unsuccessful: plentiful supplies of oil kept the price low throughout the 1960s. In the early 1970s, however, major changes took place. The rapid economic expansion, which was simultaneously occurring in many countries, put upward pressure on the demand for oil. At the same time, the production of oil was leveling out and beginning to decline in the United States, with the result that U.S. demand for imported oil was rising rapidly.

In 1973, OPEC seized the opportunities offered by the changing market conditions—and by the political and economic disruptions associated with the war between Israel and its Arab neighbours—to raise prices sharply, from about $3 to more than $12 per barrel. Between 1974 and 1979 the international price of oil remained quite stable, but then OPEC was once again successful in pushing the price up sharply—to more than $30 per barrel in 1980. These price increases caused a huge transfer in revenues from the oil-importing nations to the oil-exporting countries. They also contributed to a major increase in inflation in the importing countries.

World economic reaction to higher oil prices

The large increase in revenues in the OPEC nations allowed many of them to embark on major development programs. On the other side, the loss of revenues, combined with the inflationary impact, precipitated major recessions in many of the oil-importing countries in 1974–75 and 1980–82. The higher oil price has also been suggested as a cause of a decline in productivity in many countries after 1973, although the causes of the decline are not well understood.

OPEC has often been called an international cartel, but it lacked the standard enforcement mechanism of a cartel during the two periods (1973 and 1979–80) when prices rose spectacularly. That is, it did not have a mechanism for sharing the market among the oil-exporting nations. Saudi Arabia played a key role in enforcing the organization's price increases.

In the 1970s Saudi Arabia had proven reserves in excess of 150 billion barrels, more than twice as much as any other nation, and five or six times the proven reserves of such major non-OPEC producers as the United States and Mexico. Because of its huge reserves and productive capacity, Saudi Arabia was able to act as the residual supplier, cutting back on production when demand slackened, thus reducing downward pressures on prices. Saudi Arabia's willingness to act as the residual supplier was partly the result of its limited population; even when producing at much less than capacity, it had a very large oil income per capita.

Oil glut of the 1980s

During the early and middle 1980s, the oil market softened markedly. Oil consumption grew much more slowly, partly as a result of the major U.S. recession of 1982 and sluggish growth in western Europe, and partly as a result of increased conservation measures, a reaction to the upward spiral of fuel prices in the 1970s. At the same time, oil output increased in a number of non-OPEC areas such as the North Sea.

The result was downward pressure on prices through the mid-1980s. In order to maintain sales and revenues, OPEC members had an incentive to undercut the posted price. As its oil production fell sharply and the bills from its ambitious development projects continued to increase, Saudi Arabia became less willing to act as the residual supplier. In order to relieve the downward pressure on prices, OPEC members attempted to transform the organization into a more formal cartel, with production quotas for each member. But these efforts faced the classic problem of cartels: each member had an incentive to cheat on the

organization by producing more than its quota and by offering secret price concessions to buyers. (P.Wo.)

International payments and exchange

Economic life does not stop at national boundaries but flows back and forth across them. The money of one country, however, cannot as a rule be used in another country; the flow of payments must be interrupted at national boundaries by exchange transactions in which one national money is converted into another. These transactions serve to cover payments so long as there is a balance between them: local money can be exchanged against foreign money only insofar as there is a counterbalancing offer of foreign money in exchange.

In the Soviet Union and other countries with the Soviet kind of economic planning, there are no legal private markets for foreign exchange; in those countries the state has a monopoly of the business of foreign trade, which is generally conducted through formal agreements on a country-by-country basis. While the currencies of the Communist countries have official par values, these bear no particular relationship to their purchasing power or to the prices at which goods are exchanged. The international economic relationships of those countries therefore fall outside the scope of this discussion.

BALANCE-OF-PAYMENTS ACCOUNTING

The balance-of-payments accounts provide a record of transactions between the residents of one country and the residents of foreign nations. The two types of accounts used are the current account and the capital account.

The current account. When using balance of payments statistics it is important to understand their basic concepts. The balance of payments includes, among other things, payments for goods and services; these are often referred to as the balance of trade, but the expression has been used in a variety of ways. In order to be more specific, some authorities have taken to using the expression "merchandise balance," which unmistakably refers to trade in goods and excludes services and other occasions of international payment.

The various kinds of payments

Figures for the merchandise balance often quote exports valued on an FOB basis (free on board) and imports valued on a CIF basis (including cost, insurance, and freight to the point of destination). This swells the import figures relative to the export figures by the amount of the insurance and freight included. The reason for this practice has been that in many countries the trade statistics have been based on customs house data, which naturally include insurance and freight costs for imports but not for exports. The authorities have more recently made a point of providing estimates of imports valued on an FOB basis.

Another expression, "balance of goods and services," is often used. The British, however, continue to use the term invisibles for current services entering into international transactions. For many years the "visible" balance was taken to be equivalent to exports quoted FOB and imports CIF as explained above. The British authorities have more recently instituted another linguistic usage by which the "visible" balance is equivalent to the true merchandise balance. The old usage still lingers on in the less-expert literature.

And so the total current account is the balance of goods (merchandise) and services. The United Kingdom includes unilateral transfers among "invisibles" and in the current account. The United States statistics, more correctly, show them under a separate heading.

Services include such items as payments for shipping and civil aviation, travel, expenditures (including military) by the home government abroad and expenditures by foreign governments at home, interest and profits and dividends on investments, payments in respect of insurance, earnings of banking, merchanting, brokerage, telecommunications and postal services, films and television, royalties payable by branches, subsidiaries and associated companies, agency expenses in regard to advertising and other commercial services, expenditures by journalists and students, construction work abroad for which local payment is made and, conversely, earnings of temporary workers such as entertainers and domestic workers, and professional consultants' fees. This list contains the more important items but is not comprehensive.

Among unilateral transfers the more important are outright aid by governments, subscriptions to international agencies, grants by charitable foundations, and remittances by immigrants to their former home countries.

The capital account. There is also the capital account, which includes both long-term and short-term capital movements.

Long-term flows. Long-term capital movement divides into direct investments (in plant and equipment) and portfolio investments (in securities). In the 19th century direct investment in plant and equipment was preponderant. The United Kingdom was much the most important contributor to direct investment overseas. In the early part of the century it even contributed to the industrial development of the United States; later its attention shifted to South America, Russia, other European countries, and India. Investment in what came to be called the "Commonwealth" and "Empire," not prominent at that time, became very important in the 20th century. The other countries of western Europe also made important contributions to direct investment overseas.

British leadership in direct investments

The most important items of direct investment were railways and other basic installations. In early stages direct investment may help developing countries to balance their payments, but in later stages there will have to be a flow of interest and profit in the opposite direction back to the investing country. The United Kingdom is frequently cited as the country whose overseas investments were most helpful for developing countries because her rapidly growing population and small cultivable land area permitted her to develop large net imports of food and to run corresponding deficits on her merchandise account. The complementary surplus this generated in the developing countries from which the imports came enabled them to pay the interest and profit on British capital without straining their balances of payments.

Between World War I and World War II the United States began to take a more active interest in overseas investment, but this was not always well-advised. After the great world slump, which started in 1929, international investment almost ceased for lack of profit opportunities.

The international capital market

After World War II the United States began to build up a leading position as overseas investor. The process accelerated in 1956 and afterward, both on direct investment and on portfolio investment accounts. This may have been partly due to the desire of U.S. firms to have plants inside the European Economic Community. Other countries also found more opportunities for capital export than there had been in the interwar period. The United Kingdom gave special attention to the Commonwealth. During the 1970s and 1980s Japan became a major overseas investor, financing its foreign investments with the funds accumulated with its large current account surpluses. The U.S. international position changed sharply in the 1980s. As a result of its large current account deficits, the United States accumulated large overseas debts. Its position changed from that of major net creditor (it had larger investments abroad than foreign nations had in the United States) to that of the largest debtor nation. Its liabilities to foreign nations came to exceed its foreign assets by hundreds of billions of dollars.

Short-term flows. A very important distinction must be drawn between the short-term capital that flows in the normal course of industrial and commercial development and that which flows because of exchange-rate movements. The first class of short-term capital may be thought of as going in the train of direct long-term investment. A parent company may desire from time to time to supply its branch or affiliate with working capital. There may also be repayments from time to time. The second type of short-term capital flow occurs because of expectations of changes in exchange rates. For example, if people expect that the price of the dollar will fall in terms of the Japanese yen, they have an incentive to sell dollars and buy yen.

An international capital market developed in the 1960s

The Eurodollar

dealing in what are known as Eurocurrencies, of which much the most important was the Eurodollar. The prefix Euro is used because initially the market largely centred on the countries of Europe, but it has by no means been confined to them. Japan and the Middle Eastern oil states have been important dealers. While these short-term lendings normally move across national frontiers, they do not directly involve foreign exchange transactions. They may, however, indirectly cause such transactions to take place.

The nature of the market is as follows: In the ordinary course of affairs, an Italian, for example, acquiring dollars—say from exports or from a legacy—would sell these dollars for his own currency. But he may decide to deposit the dollars at his bank instead, with an instruction not to sell them for cash but to repay him in dollars at a later date. Thus the bank has dollars in hand and a commitment to pay them out in, say, three months. It may then proceed to lend these dollars to another bank, anywhere in the world. Since the lending and borrowing is done in dollars, no foreign exchange transaction is directly involved. The sum total of all operations of this sort is the Eurodollar market. It is not centred on any particular place and has no formal rules of procedure or constitution. It consists of a network of deals conducted by telephone and telex around the world. U.S. residents themselves lend to and borrow from this market.

One may ask why lenders and borrowers use this market in preference to more conventional methods of lending and borrowing. Ordinarily the answer is because they can get more favourable terms, since the market works on very narrow margins between lending and borrowing rates. This involves expertise; London has played the most important part in the creation of the market. The lender hopes to get a better rate of interest than he would on a time deposit in the United States (restrictions limiting interest payable on U.S. time deposits are said to have been a contributing cause of the growth of the market during the 1960s). At the same time, normally, the borrower will find that he has to pay a lower rate than he would on a loan from a commercial bank in the United States.

Rise in Eurodollar interest rates

This has not always been the case. In 1969 Eurodollar interest rates went to very high levels. One reason for this was the set of restrictions imposed by the United States on its commercial banks lending abroad. The second was that although the prime lending rates of the principal U.S. banks might be below Eurodollar rates, many individuals, including U.S. citizens, found that they could not get loans from their banks because of the "credit squeeze."

Because this form of international lending does not involve the sale of one currency for another, it does not enter into balance-of-payments accounts. Nonetheless it may have a causal effect on the course of the exchanges. For instance, the Italian cited above might have chosen to sell his dollars had he not been tempted by the more attractive Eurodollar rate of interest. In this case, the market causes dollars not to be sold that otherwise would have been. Others who have liquid cash at their disposal for a time may even buy dollars in order to invest them in the market at short term. That would be helpful to the dollar. There are countercases. An individual who has to make a payment in dollars but lacks cash may borrow the dollars in the Eurodollar market, when otherwise he would have got credit in his own country and used that to buy dollars; in this case the market is damaging to the dollar because its existence prevents someone from buying dollars in the regular way.

Assessing the balance. To summarize, the overall balance of payments comprises the current account (merchandise and services), unilateral transfers (gifts, grants, remittances, and so on), and the capital account (long-term and short-term capital movements). If payments due in exceed those due out, a country is said to be in overall surplus; and when payments due out exceed payments due in, it is in overall deficit. The surplus or deficit must be balanced by a monetary movement in the opposite direction, and consequently the overall balance including monetary movements must always be equal.

Deficit or surplus

In practice, great difficulties have been found in assessing whether a country is in deficit or in surplus. It is often important to establish this with a view to possible corrective measures. The United Kingdom stresses the combined balance of current and long-term capital account—*i.e.*, excluding short-term capital. Such a balance, however, omits short-term movements that occur in the ordinary course of business, which may be called "normal" and which ought in principle to be included. On the other hand it is not desirable to include equilibrating or disequilibrating capital movements. These occur in consequence of a deficit (or surplus), actual or anticipated. But there may be great statistical difficulty in distinguishing between the normal short-term capital flows and those that are consequential on a surplus or deficit.

It has been noted that the overall balance, including monetary movements, must be equal, but it usually happens that the figures do not in fact balance. U.S. statisticians call the residual figure that has to be inserted to square the account "errors and omissions." If the average value of this figure over a substantial period, such as 10 years—an even longer period may have to be taken if a country is in persistent surplus or deficit—has a positive or negative value of substantial amount, then it may be taken to constitute genuine items that have escaped the statistical net. These may legitimately be included in assessing whether a country is in genuine surplus or deficit and whether corrective measures are needed.

"Errors and omissions"

The "errors and omissions" item is extremely volatile from year to year and often very large. Such movements up and down are probably caused by precautionary short-term capital movements. There have been periods when a minus item in the U.S. account was rather strikingly associated with a plus item in the U.K. account, and conversely. Accordingly, in the short term, the "errors and omissions" item should not be included in assessing whether a country is in surplus or deficit.

It has been noted that the United Kingdom stresses the balance of current and long-term capital accounts (which include unilateral transfers). The U.S. position is less clear. It traditionally published two overall balance-of-payments measures: the "Liquidity Balance" and the "Official Settlements Balance."

In distinguishing between monetary and nonmonetary items, the Liquidity Balance included any increase in the holding of short-term dollar securities abroad as part of the U.S. deficit during the period; but it did not include as counterweight any increase in short-term foreign claims held by U.S. resident banks or others (apart from official holdings). Thus, in this respect the treatment was asymmetrical. The rationale for this was precautionary. The argument was that short-term dollar assets held abroad outside the central banks might at any time be sold in the market or turned in to the central banks of the respective countries and thus constitute a drain, or the threat of a drain, on U.S. reserves. On the other hand the corresponding foreign short-term assets held by U.S. resident banks or others were not readily mobilizable by U.S. authorities for making payments. Thus by this reckoning, if during a period non-central-bank foreign holdings of short-term dollar securities and resident non-central-bank U.S. holdings of short-term foreign securities went up by an equal amount, the situation would be shown as having deteriorated, since the former class (liabilities) were a threat to U.S. reserves, while the latter class (assets) could not be mobilized by U.S. authorities to meet such a threat. Thus, though the motive for this asymmetrical treatment may have been understandable, it was statistically unsatisfactory and also unsatisfactory as a guide to corrective action. This balance is thus mainly of historical interest, and it has not been commonly used since 1971.

The U.S. Official Settlements Balance

The U.S. Official Settlements Balance reckoned an increase in non-central-bank foreign holdings of short-term dollar assets as an inflow of short-term capital into the United States; similarly an increase in U.S. resident holdings of short-term foreign assets was an outflow of short-term capital. This was a logical treatment. But the balance thus defined proved in the 1960s to be extremely volatile. This was due to large movements of funds between foreign central banks and non-central-bank foreign holders, associated with the rise of the Eurodollar market. Oscillations

of this kind do not represent changes in the fundamental balance that are needed in order to determine whether corrective measures are required. It may well be that the British method of omitting short-term capital movements altogether in the assessment of surplus or deficit is, although imperfect, the most practical available. Since exchange rates began to float in the early 1970s, the major industrial countries have paid much less attention to overall balance-of-payments measures. The current account and the trade account are the two measures that are now most commonly used in developing countries.

(R.F.H./P.Wo.)

ADJUSTING FOR FUNDAMENTAL DISEQUILIBRIUM

A "fundamental disequilibrium" exists when outward payments have a continuing tendency not to balance inward payments. A disequilibrium may occur for various reasons. Some may be grouped under the head of structural change (resulting from changes in tastes, habits, institutions, technology, etc.). A fundamental imbalance may occur if wages and other costs rise faster in relation to productivity in one country than they do in others. Imbalance may also result when aggregate demand runs above the supply potential of a country, forcing prices up or raising imports. A war may have a profoundly disturbing effect on a country's economy.

The classical view. In the traditional "classical" view no intervention by the authorities was necessary to maintain external equilibrium, except for their readiness to convert currency into gold (or silver) upon demand. The system was supposed to work automatically. If a country had a deficit, gold would flow out, and the consequent reduction in the domestic money supply would cause prices to move downward. This would stimulate exports and tend to reduce imports. The process would continue until the deficit was eliminated. Classical doctrine did not embody a clear-cut theory about international capital movements. It was usually assumed that the trade balance (more strictly, balance on goods and services) would be tailored to accommodate any capital movement that occurred. Thus, if the country was exporting capital, gold flows would cause prices to move to such a level that exports minus imports would be equal to the capital flow; equilibrium in the overall balance was automatically secured.

From laissez-faire to intervention

In due course the classical scheme of thought came under criticism. Some critics asked if an outflow or inflow of specie would necessarily have a sufficient effect on the price level to ensure an equal balance of payments. More important, a reduction in the money supply, it was pointed out, might have a side effect on the level of economic activity. Some critics went further and argued that this side effect would be stronger than the effect on prices to such a degree as to cause unemployment to rise to an undesirable level.

Contemporary views. *Monetary and fiscal measures.* The belief grew that positive action by governments might be required as well. The doctrine was first related to monetary policy in particular. The idea was that interest-rate adjustments should be combined with open-market operations by a central bank to ensure that the domestic money supply and borrowing facilities were conducive to external long-period equilibrium. After World War II the idea came to be widely held that government budget policy (usually called fiscal policy) should be brought in to assist monetary policy. For instance, if aggregate domestic demand was running so high as to cause rising prices, this should be reduced both by having a tight monetary policy and by increasing taxation more than expenditure or reducing expenditure without reducing taxation. The correct apportionment of this task between the monetary and fiscal arms is still a subject of discussion.

The question of reducing demand-deflationary policy

Nor is there yet agreement about the scope of these policies or their ability to secure fundamental equilibrium in all cases. There is probably agreement that when overall demand is running in excess of the supply potential of the economy, it should be reduced by monetary and fiscal policies. There is difference of opinion, however, as to whether the reduction of aggregate demand will bring external payments into balance in all cases. For instance, a country may have a deficit owing to some underlying economic change (such as a shift in the pattern of world trade), even if domestic demand is not above the supply potential and prices are not rising. In this case, policies designed to reduce domestic demand (commonly called deflationary policies) would cause unemployment. Some hold that, if there is an external deficit, deflationary policies should be pursued to whatever extent may be needed to eliminate the deficit. Others hold that such a policy is socially unacceptable.

Opinions differ also about how deflationary measures work to improve the external balance. Some hold that they work mainly by reducing domestic activity and thereby the amount of imported materials that a country needs and the amount of income that people can afford to spend on imported goods. If this were the whole effect of a deflationary policy, it would improve the external balance only in proportion to the amount by which it increases unemployment. Those who hold that this is the only manner in which deflation affects the external balance are especially opposed to relying on deflationary policies alone to eliminate a deficit in conditions in which aggregate domestic demand is not running above the supply potential. Some hold that a reduction of home demand also helps because it makes producers look around more eagerly for export markets (and increase their selling efforts in the home market). This appears to be doubtful, however. There is further disagreement on the extent to which deflationary policies influence the course of prices. If aggregate demand is running above the supply potential of the economy, it is highly probable that deflationary policies will slow the increase of prices and thus make a country more competitive with foreign suppliers. There is not the same agreement about the effects when demand is initially running below the supply potential of the economy. Some hold that a deflationary policy, if pushed hard enough, will infallibly slow up price increases and so help the country's external balance. Others hold that it will not, and some even argue that higher interest rates and higher taxes (weapons of deflation) can cause prices to rise. Thus, it is not absolutely clear that monetary and fiscal policies will in all cases suffice to cure an external deficit, at least without socially unacceptable results.

There is also the opposite case of countries with a trade surplus. It is clear that these countries will be unwilling to encourage policies that cause domestic prices to rise. Price inflation is a social evil and politically unpopular.

Supply and demand in surplus countries

In the case of surplus countries, the same distinction must be made between the situation in which aggregate demand is fully up to or above the supply potential of the economy and that in which it is not. In the former case a further increase in demand would almost certainly have an inflationary effect; accordingly, surplus countries in this condition will be unwilling to use monetary and fiscal policies to eliminate their external surpluses. On the other hand, if aggregate demand is running below supply potential, then a surplus country might reasonably be asked to increase aggregate demand by monetary and fiscal policies on the view that the increase will not cause inflation but will tend to remove the external surplus by inducing more imports and possibly causing producers to be less active in their selling efforts abroad.

Incomes policy. Prices may rise even when aggregate demand is not in excess of the supply potential. This may be due to wage increases and other factors. Some hold that this can be dealt with through efforts to discourage excessive wage increases by a direct approach, which may consist of a propaganda campaign on the evil effects of wage-price inflation, together with guidelines governing rates of wage increases. This direct attempt to deal with the problem is generally known as "incomes policy."

Changes in exchange rates. Exchange-rate movements work by making the products of a deficit country more price competitive or those of a surplus country less price competitive. Any program that seeks to rectify an imbalance by changing the level of prices will be effective only if demand is "price elastic." In other words, if the offer of an article at a lower price does not cause an increase in demand for it more than in proportion to the fall in price,

the proceeds from its export will fall rather than increase. Economists believe that price elasticities are sufficiently great for most goods so that price reductions will increase revenues in the long run. The outcome is not quite so certain in the short run.

Devaluation

A fast means of changing relative price levels is devaluation, which is likely to have a quick effect on the prices of imported goods. This will raise the cost of living and may thereby accelerate demands for higher wages. If granted, these will probably cause rises in the prices of domestically produced goods. A "wage–price spiral" may follow. If this spiral moves too quickly it may frustrate the intended effect of the devaluation, namely that of enabling the country to offer its goods at lower prices in terms of foreign currency. This means that if the beneficial effects of a devaluation are not gathered in quickly, there may be no beneficial effect at all.

The authorities of a country that has just devalued must therefore be especially active in preventing or moderating domestic price increases. They will need to use the other policy measures discussed above. Devaluation (or the downward movement of a flexible rate) is thus not a remedy that makes other forms of official policy unnecessary. Some have argued that, if exchange rates were allowed to float, nothing further would have to be done officially to bring the external balance into equilibrium, but this is a minority view.

Resistance to upward valuation

One further point must be made regarding exchange-rate movements. It has been found in practice that governments resist upward valuation more than they do devaluation. Under the IMF system prior to 1973, devaluations in fact were larger and more frequent than upward valuations. This had an unfortunate consequence. It meant that the aggregate amount of price inflation in deficit countries resorting to devaluation as a remedy was not offset by equivalent price decreases in the surplus countries. Therefore this system had a bias toward worldwide inflation.

Trade restrictions. Since World War II the major industrial countries have attempted to reduce interferences with international trade. This policy, by extending the international division of labour, should increase world economic welfare. An exception has had to be allowed in favour of the less-developed countries. In the early stages of the development of a country, the effectiveness and feasibility of the three types of adjustment mechanism discussed above, particularly monetary and fiscal policies, may be much less than in the more advanced countries. The less-developed countries may therefore be driven to protection or the control of imports, for lack of any other weapon, if they are to stay solvent. It has already been noted that, even in the case of a more advanced country, the effectiveness and appropriateness of the above-mentioned adjustment mechanisms are not always certain. Thus, there is no certainty that some limitation on foreign trade and on the international division of labour may not be a lesser evil than the consequences that might follow from a vigorous use of the other adjustment mechanisms, such as unemployment.

Predisposition to the free flow of trade

Restrictions on capital exports. Interference with capital movements is generally considered a lesser evil than interference with the free flow of trade. The theory of the optimum international movement of capital has not yet been thoroughly developed, but there may be a presumption in favour of absolutely free movement. The matter is not quite certain; for instance, it might be desirable from the point of view of the world optimum to channel the outflow of capital from a high-saving country into the less-developed countries, although the level of profit obtainable in other high-saving countries might be greater. Or it might be expedient to restrain wealthy individuals in less-developed countries, where domestic saving was in notably short supply, from sending their funds to high-saving countries.

While there may be good reasons for interfering with the free international flow of capital in certain cases, it is not obvious that the outflow of capital from, or inflow of capital into, a country should be tailored to surpluses or deficits in current external accounts. It may be that in some cases the sound remedy for a deficit (or surplus) is to adopt adjustment measures such as those discussed above, bearing upon current items, rather than taking the easier way of adjusting capital movements to the de facto balance on current account.

FOREIGN EXCHANGE MARKETS

The buying and selling of currencies

A foreign exchange market is one in which those who want to buy a certain currency in exchange for another currency and those who want to move in the opposite direction are able to do business with each other. The motives of those desiring to make such exchanges are various. Some are concerned with the import or export of goods between one country and another, some with the purchase and sale of services. Some wish to move capital from one area to the other, and some wish to make gifts (the latter including government aid and gifts by charitable foundations).

In any organized market there must be intermediaries who are prepared to "quote a price," in this case a rate of exchange between two currencies. These intermediaries must move the price quoted in such a way to permit them to make the supply of each currency equal to the demand for it and thus to balance their books. In an important foreign exchange market the price quoted is constantly on the move.

An exchange rate is the price of one currency in terms of another. For example, in the market for the British pound sterling (£) in exchange for U.S. dollars ($), the exchange rate might be £1 = $2. This price may also be quoted the other way around; that is, $1 = £0.50.

In a foreign exchange market, there may be a standard, government-determined price, or par value. This par value may be quoted in terms of another currency; for example, the par value of the pound was £1 = $2.80 between 1949 and 1967. In 1973 many governments abandoned their par values and let their exchange rates be determined by the forces of demand and supply. An exchange rate determined in this way, without being tied to an official par, is called a flexible or floating exchange rate; in contrast, an exchange rate is said to be pegged if the government ties it to par value.

Historically, countries often tied their currencies to gold, setting their official parities in terms of that metal. Under this historical gold standard, the gold equivalence of currencies determined exchange rates. For example, the British pound was worth 4.86 times as much gold as the U.S. dollar during the period prior to World War I. The exchange rate remained at or quite close to the mint parity of £1 = $4.86. Nobody would pay much more than $4.86 for a British pound, nor take much less.

Bimetallism

Historically, there were also periods of bimetallism, when the gold standard was combined with a silver standard, and currencies were fixed in terms of both gold and silver. The bimetallic standard was given up by most of its adherents (the United States, France, Italy, Switzerland, The Netherlands, and Belgium) in the 1870s.

THE GOLD STANDARD

If the demand by those holding a particular currency, say sterling, for another currency, say the dollar, exceeds the demand of dollar holders for sterling, the dollar will tend to rise in the foreign exchange market. Under the gold standard system there was a limit to the amount by which it could rise or fall. If a sterling holder wanted to make a payment in dollars, the most convenient way for him to procure the dollars would be in the foreign exchange market. But under the gold standard he had another option; *i.e.,* he had a legal right to obtain gold from the authorities in exchange for paper currency at the established par value of that currency and remit the gold to the other country, where he would have a legal right to obtain its currency in exchange for bars of gold at the official valuation. Thus, it would not be advantageous for a sterling holder to obtain dollars in the foreign exchange market if the quotation for a dollar there exceeded parity by more than the cost of remitting gold. The exchange rate at which it became cheaper to remit gold rather than use the foreign exchange market was known as the "gold-export point." There was also a "gold-import point" determined on similar lines.

Most of those seeking dollars, however, did not under-

take to remit gold even if the dollar quotation was at the gold-export point. The remission of gold was handled by arbitrageurs. These are people who buy and sell currencies simultaneously on different exchanges in order to profit by small differences in the quoted rates. Their action would reduce the supply of sterling, since they would be selling sterling for gold to the British authorities, and increase the supply of dollars, since they would acquire dollars in exchange for gold from the U.S. authorities. The arbitrageurs would carry out these operations to the extent needed to prevent the scarcity of the dollar from raising its sterling price above the gold-export point for the United Kingdom, and conversely. At the same time, the gold reserve of the British authorities would be diminished, and the gold reserve of the U.S. authorities increased.

The arbitrageurs

The international gold standard provided an automatic adjustment mechanism, that is, a mechanism that prevented any country from running large and persistent deficits or surpluses. It worked in the following manner. A country running a deficit would see its currency depreciate to the gold-export point. Arbitrage would then result in a gold flow from the deficit to the surplus country. In other words, the deficit would be settled in gold.

The gold flow had an effect on the money system. When gold flowed into the banking system of the surplus country, its money stock rose as a consequence. On the other side, when a deficit country lost gold, its money stock fell. The falling money stock caused deflation in the deficit country; the rising money stock caused inflation in the surplus country. Thus, the goods of the deficit country became more competitive on world markets. Its exports rose, and its imports declined, correcting the balance-of-payments deficit.

Although this adjustment process worked automatically, it was not problem-free. The adjustment process could be very painful, particularly for the deficit country. As its money stock automatically fell, aggregate demand fell. The result was not just deflation (a fall in prices) but also high unemployment. In other words, the deficit country could be pushed into a recession or depression by the gold standard. A related problem was one of instability. Under the gold standard, gold was the ultimate bank reserve. A withdrawal of gold from the banking system could not only have severe restrictive effects on the economy but could also lead to a run on banks by those who wanted their gold before the bank ran out.

The gold standard during the Great Depression

These twin problems materialized during the Great Depression of the 1930s; the gold standard contributed to the instability and unemployment of that decade. Because of the strains caused by the gold standard, it was gradually abandoned. In 1931, faced with a run on its gold, Britain abandoned the gold standard; the British authorities were no longer committed to redeem their currency with gold. In early 1933 the United States followed suit. Although the tie of the dollar to gold was partially restored at a later date, one very important feature of the old gold standard was omitted. The public was not permitted to exchange dollars for gold; only foreign central banks were allowed to do so. In this way the U.S. authorities avoided the risk of a run on their gold stocks by a panicky public.

THE INTERNATIONAL MONETARY FUND

The International Monetary Fund (IMF), founded at the Bretton Woods Conference in 1944, is the official organization for securing international monetary cooperation. It has done useful work in various fields, such as research and the publication of statistics and the tendering of monetary advice to less-developed countries. It has also conducted valuable consultations with the more developed countries.

Drawing Rights

Of particular interest to this discussion is the Fund's system of Drawing Rights, which permits countries in temporary deficit to draw supplies of foreign currency according to predetermined quotas. These extra supplies of currency give a country more time in which to adjust its balance of payments and so avoid taking unsound or unneighbourly measures like import restrictions for lack of enough reserves to tide it over a difficulty. The mechanism is as follows: members of the Fund are required to make initial deposits according to their quotas, which are based on the country's national income, monetary reserves, trade balance, and other economic factors. Quotas are payable partially in Special Drawing Rights (see below *Special Drawing Rights*) and partially in a country's own currency. A country's quota closely approximates its voting power, the amount of foreign exchange it may purchase (Drawing Rights), and its allotment of Special Drawing Rights. The Fund makes its stock of members' currencies available to member countries that wish to draw upon their quotas. When creditor countries are presented with their own currencies previously deposited by them with the Fund, they are obliged to take them in final discharge of debts owed by other member countries. Since they previously deposited these currencies themselves they are in effect getting nothing from the debtor countries in respect of the debts owed to them, and their willingness to accept payment in this way is their contribution to the overall liquidity of the world system. Later the creditor countries may themselves become debtors and partake of the benefits. The debtors have to repay the Fund usually in three to five years. A country with more serious financial problems may draw as much as 140 percent of its quota during a three-year period, and repayment must be made between four to 10 years afterward.

The exercise of Drawing Rights is subject to discussion and sometimes to conditions, except for drawings on what are called the reserve tranches (sums equal to the member's original deposits in its own currency and Special Drawing Rights), which are given "the overwhelming benefit of the doubt." Countries are also free to draw without discussion up to the net amount to which they have previously been drawn upon by other countries.

IMF country quotas

The quotas paid by members of the IMF are the primary source of income for the organization. Quotas for member countries are periodically reviewed and reevaluated according to the country's financial situation. General increases in quotas normally occur following the periodic reviews, although special reviews and increases sometimes occur for specific countries, such as Saudi Arabia in 1981. The IMF also borrows to supplement its quota resources. In 1981, for example, Saudi Arabia agreed to loan the Fund more than $8,000,000,000 over a two-year period, and an additional $1,300,000,000 was loaned by a group of countries. Between 1976 and 1980 about one-third of the Fund's gold holdings were sold at public auction to benefit the member developing countries. More than $4,600,000,000 was received from the gold sale; part of the revenue was made available to members according to their quotas, and part of the revenue was placed in a trust fund to dispense low-interest loans to developing countries. (R.F.H./Ed.)

The International Monetary Fund as it finally emerged from the wartime discussions was a much more modest undertaking than had originally been conceived by the British. An early British proposal would have required creditor countries to receive payment in paper money up to the total amount of all the quotas of all the debtor countries. This seemed to many to be more than it was fair to ask creditors to do. The United States claimed that for a number of years after the war it was likely to be in credit against the whole of the rest of the world, and so it was. Under the British plan they would have had to give an unconscionably large amount of credit, with no certainty of repayment. At that time it did not seem at all likely that the United States would ever go into deficit, which, of course, it eventually did.

THE IMF SYSTEM OF PARITY (PEGGED) EXCHANGE RATES

The modified gold standard

When the IMF was established toward the end of World War II, it was based on a modified form of the gold standard. The system resembled the gold standard in that each country established a legal gold valuation for its currency. This valuation was registered with the International Monetary Fund. The gold valuations served to determine parities of exchange between the different currencies. As stated above, such fixed currencies are said to be pegged to one another. It was also possible, as under the old gold standard, for the actual exchange quotation to deviate somewhat on either side of the official parity. There was

agreement with the International Monetary Fund about the range, on either side of parity, within which a currency was allowed to fluctuate.

But there was a difference in the technical mode of operation. The service of the arbitrageurs in remitting physical gold from country to country as needed was dispensed with. Instead the authorities were placed under an obligation to ensure that the actual exchange rates quoted within their own territories did not go outside the limits agreed upon with the International Monetary Fund. This they did by intervening in the foreign exchange market. If, for instance, the dollar was in short supply in London, the British authorities were bound to supply dollars to the market to whatever extent was needed to keep the sterling price of the dollar from rising above the agreed-upon limit. The same was true with the other currencies of the members of the International Monetary Fund. Thus, the obligation of the monetary authorities to supply the currency of any Fund member at a rate of exchange that was not above the agreed-upon limit took the place of the obligation under the old gold standard to give actual gold in exchange for currency.

It would be inconvenient for the monetary authorities of a country to be continually watching the exchange rates in its market of all the different currencies. Most authorities confined themselves to watching the rate of their own currency against the dollar and supplying from time to time whatever quantity of dollars might be required. At this point the arbitrageurs came into service again. They could be relied upon to operate in such a way that the exchange rates between the various currencies in the various foreign exchange markets could be kept mutually consistent. This use of the dollar by many monetary authorities caused it to be called a currency of "intervention."

The official fixing of exchange rates as limits on either side of parity, outside of which exchange-rate quotations were not allowed to fluctuate, bears a family resemblance to the gold points of the old gold standard system. The question naturally arose why, in devising a somewhat different system, it was considered desirable to keep this range of fluctuation. In the old system it arose necessarily out of the cost of remitting gold. Since there was no corresponding cost in the new system, why did the authorities decide not to have a fixed parity of exchange from which no deviation would be allowed? The answer was that there was convenience in having a range within which fluctuation was allowed. Supply and demand between each pair of currencies would not be precisely equal every day. There would always be fluctuations, and if there were one rigidly fixed rate of exchange the authorities would have to supply from their reserves various currencies to meet them. In addition to being inconvenient, this would require each country to maintain much larger reserves than would otherwise be necessary.

Under a system of pegged exchange rates, short-term capital movements are likely to be equilibrating if people are confident that parities will be maintained. That is, short-term capital flows are likely to reduce the size of overall balance-of-payments deficits or surpluses. On the other hand, if people expect a parity to be changed, short-term capital flows are likely to be disequilibrating, adding to underlying balance-of-payments deficits or surpluses.

Methods of currency dealing

Equilibrating short-term capital movements. Commercial banks and other corporations involved in dealings across currency frontiers are usually able to see some (but not necessarily all) of their needs in advance. Their foreign exchange experts will watch the course of the exchanges closely and, if a currency is weak (*i.e.,* below parity), advise their firms to take the opportunity of buying it, even if somewhat in advance of need. Conversely, if the currency is above parity but not expected to remain so indefinitely, they may recommend postponing purchases until a more favourable opportunity arises. These adjustments under the influence of common sense and self-interest have an equilibrating influence in foreign exchange markets. If a currency is temporarily weak, it is presumably because of seasonal, cyclical, or other temporary factors. If on such an occasion private enterprise takes the opportunity to buy the currency while it is cheap, that tends to bring demand up to equality with supply and relieves the authorities from the need to intervene in order to prevent their currency from falling below the lower point whenever there is a temporary deficit in the balance of payments. As previously noted, when confidence in the fixed parity exchange rate drops and market participants expect a change in parity, short-term capital movements may be disequilibrating. (See below *Disequilibrating capital movements.*)

Equilibrating by short-term rate movements

Another equilibrating influence arises from the movements of short-term interest rates. When the authorities have to supply foreign currencies in exchange for the domestic currency, this causes a decline in the money supply in domestic circulation—unless the authorities deliberately take offsetting action. This decline in the money supply, which is similar to that occurring under the gold standard, tends to raise short-term interest rates in the domestic money market. This will bring an inflow of money from abroad to take advantage of the higher rates or, what amounts to the same thing, will discourage foreigners from borrowing in that country's money market since borrowing will have become more expensive. Thus, the interest-rate differential will cause a net movement of short-term funds in the direction required to offset the temporary deficit or, in the opposite case, to reduce a temporary surplus that is embarrassing to others. It must be stressed again that this equilibrating interest-rate mechanism implies confidence that the parity will not be altered in the near future.

The helpful movement of interest rates may be reinforced by action of the monetary authorities, who by appropriate open-market operations may cause short-term interest rates to rise above the level that they would have attained under market forces and thus increase the equilibrating movement of short-term funds. The Bank of England provided the most notable example of the smooth and successful operation of this policy under the old gold standard during many decades before World War I.

Forward exchange. The transactions in which one currency is exchanged directly for another are known as spot transactions. There can also be forward transactions, consisting of contracts to exchange one currency for another at a future date, perhaps three months ahead, but at a rate determined now. For instance, a German firm may have a commitment to pay a U.S. firm in dollars in three-months' time. It may not want to take the risk that the dollar will rise relative to the mark during the three months, so that it would have to surrender more marks in order to honour its commitment. It could of course buy the dollars right away and thus obviate this risk, but it may not have any spare cash and borrowing may be inconvenient. The firm has the alternative of buying dollars at a rate agreed upon now for which it does not have to surrender marks until three months have passed. Some firms have a regular routine procedure for covering all future commitments to be paid for in a foreign currency as soon as these are entered into. Of course, even a firm that does this may combine its routine procedure with a little judgment, for instance, if there are good reasons for believing that the foreign currency will become cheaper during the relevant period. And firms with multinational commitments will vary the distribution of their assets among different currencies in accordance with changing conditions. The forward-exchange rate will, like the spot rate, be continually varying. It is not usually identical with the spot rate but in normal times has a regular relation to it. This relation is determined as follows:

Forward rates

Dealers in forward exchange usually balance their commitments; for instance, a contract to deliver forward marks can be offset against one to deliver forward dollars, and nothing more has to be done about it. If a particular dealer cannot manage this he will be in communication with another who may be in the opposite position. It may not, however, always be possible to offset every transaction. If this is not done, the dealer must make a spot purchase of the currency—say marks—in excess demand in the forward market. If he did not do this he would risk an exchange loss on some of his forward transactions. For the purpose of evaluating the forward-exchange rate to be asked in a particular deal, it is always correct to suppose that the deal is one that cannot be offset. If the dealer

has to purchase marks on the spot, he can earn the rate of interest prevailing in Frankfurt until the time comes when he has to deliver the marks. Whether this is advantageous or not depends on whether the rate of interest in Frankfurt is higher or lower than that in New York City. If it is higher in Frankfurt, the dealer will normally quote a rate per forward mark that is lower than the spot rate; but if the rate of interest in Frankfurt is lower, then the forward mark will normally stand above the spot mark to compensate the dealer for having to employ his liquid funds in a less remunerative market. When the relation of the forward rate to the spot rate is determined by a comparison of the short-term interest rates in the two centres in the manner just described, the forward rate is said to be at "interest parity."

The question arises as to what particular interest rates are used to calculate the interest parity. There is a variety of practice. In previous times the rate of interest on U.S. Treasury bills and the rate of interest on British Treasury bills were used to determine the interest parity of the sterling price for forward dollars. More recently the interest rates on Eurodollars and Eurosterling have been used—that is, the interest on dollar and sterling accounts held by European banks.

In normal times arbitrage may be expected to hold forward rates to their interest parities. There have been times, and even rather prolonged periods, in which the forward rate for a currency has fallen below (or risen above) its interest parity. This may happen when there is a large one-way movement of funds (such as when there is a lack of confidence in a particular currency). In some cases, such as a simultaneous multiple swapping of currencies, the arbitrager does not have to commit any funds, but in forward arbitrage funds have to be committed for a period of three months. It is true that an arbitrageur who had bought three-months' sterling could resell the sterling before the three months had elapsed, but if he did so he might have to accept a loss. If the one-way movement is very heavy there may be a shortage of funds available for forward arbitrage. Nonetheless the demand for forward sterling has to be kept equal to the supply of it, and if there is insufficient arbitrage for this purpose then a positive profit has to appear on the purchase of forward sterling; in other words, its price has to fall below the interest parity.

Dealer problems in balancing contracts

If dealers in a forward currency cannot offset contracts for sale with contracts for purchase and find an excess of customers wishing to sell, the excess supply causes immediate pressure on the spot market, since arbitrageurs and others who supplement the forward demand for the weak currency must cover their positions by selling an equivalent amount spot. The only way in which the authorities can prevent an excess offer of their currency forward from causing an immediate drain on their reserves is by offering to buy it forward themselves, without simultaneously selling it spot. British authorities engaged in such operations during periods when sterling was weak, and similar operations have been conducted by other central banks in connection with swap agreements for mutual accommodation.

The foregoing descriptions of the equilibrating movements of short-term funds have not applied when there has been a serious lack of confidence that a given parity will be maintained. Occasions of lack of confidence occurred much more frequently under the modified gold standard (International Monetary Fund) than they did under the old gold standard. The reason for this is simple. Under the old gold standard it was not expected that a country of good standing would alter the gold valuation of its currency (although in much earlier days "debasement" was common enough). A devaluation of the official gold content was regarded as not far removed from a declaration of bankruptcy, and it was assumed that a country would avoid it at all costs and in all times short of a major war or revolution.

The IMF solution to disequilibrium

Under the International Monetary Fund this position was altered quite deliberately to allow a country whose payments were in "fundamental disequilibrium," to propose a change of parity. This remedy was proposed at the Bretton Woods Conference (1944), which set up the International Monetary Fund, because it was thought to be better than alternative remedies, such as domestic deflation.

Disequilibrating capital movements. Whatever its merits from a long-term point of view, the idea that it is quite respectable for a country to alter the par value of its currency in certain circumstances had disturbing effects on the movements of short-term funds—effects that may not have been clearly foreseen at the time of Bretton Woods. Such movements of funds were sometimes very large indeed. These movements were not equilibrating, like those described in relation to a parity in which there is confidence; on the contrary, they were disequilibrating. If a currency became weak—if the demand for it fell below the supply—this could give rise to the idea that the authorities having the weak currency might in due course decide to devalue it, as they were perfectly entitled, under International Monetary Fund principles, to do.

Covering. Foreign exchange advisers to corporations had to watch for such possibilities and propose a readjustment of assets entailing a movement out of the weak currency. It was not necessary that there be, on an objective assessment, a probability (more than a 50 percent chance) that the currency in question had to be devalued. To provoke a disequilibrating movement of funds it was enough that there should be a small chance (much less than 50 percent) that it would be devalued. In strict theory, funds should be moved out of a given currency whenever the probability that it will be devalued outweighs the cost of moving the funds.

Forms of covering

If a firm or its affiliate has foreseeable commitments to make payments in a currency other than that of the area in which it operates, it may think it wise to "cover" its position by buying the currency at once, in either the spot or the forward market. Covering may take other forms also. If a contract to pay abroad is in the currency of the home, or paying, country, then the prospective foreign receiver of these funds will have to consider whether he should not cover his own position by selling the currency of the paying country forward. Payments in the opposite direction have also to be considered. If these are in the currency of the home country, the foreigner due to make the payment will consider whether he should cover his position by buying the currency of the home country forward. If the payment is in the foreign currency, then the firm in the home country due to receive it will consider whether to cover itself by selling the foreign currency forward. Thus, there are four main classes of covering. In normal times it is probable that not all positions are covered in these four ways, although it is not impossible that they should be.

Effect of possible devaluation

If a suspicion arises that a particular currency, say that of the home country, may be devalued, then the position is radically changed. The following arguments apply in reverse to the case when it is believed that a particular currency may be valued upward. It is necessary to go through the four classes of cases. Members of the home country who normally cover their commitments to make payments in a foreign currency would clearly continue to do so. And those, if any, who do not habitually do so would be strongly advised to do so when there is a possibility that the home currency may be devalued. To take the second case—that of outward payments to be made in the home currency—the same applies: foreigners who normally sell it forward should continue to do so, and those who do not normally sell it forward would be strongly advised to do so lest the currency be devalued before the payment is made. Coming to the payments due to the home country, in the case of those to be made in the home currency, the foreigners who normally cover themselves by buying forward or spot should be advised to cease doing so immediately, since they may get the currency cheaper before the payment has to be made. Thus, in this case the fear of devaluation causes those concerned to stop covering their positions. The same applies to inward payments to be made in foreign currencies; residents of the home country would be advised to cease from such covering, since in the interval their currency may be devalued, and therefore it would be foolish to sell the foreign currency due to come, in advance of payment.

Thus, the prospect of devaluation may cause both addi-

tional covering and uncovering. Both types of change are adverse to the currency under suspicion. It is notable that the total value of the appropriate covering plus that of the uncovering when a currency becomes suspect is independent of the proportion of positions that are normally covered. If all positions are normally covered then the adverse effect will consist of an uncovering of about half of all positions. If all positions are not normally covered, then the adverse effect will be equal to the sum of the amount of extra covering and the amount of uncovering. The movement of funds under these heads can be very large in relation to a country's normal balance of incoming and outgoing payments. It makes no difference whether the changed action by the firms relates to the spot or to the forward markets. This is because, when there is a big one-way movement in the forward market, the whole of it is thrown, through the actions of the dealers, arbitrageurs, and the like, onto the spot market.

Hedging. Whereas the word "covering" relates to payments foreseen or possible, the term hedging is used for operations related not to prospective payments but to existing assets. Thus, a non-British firm may need to have a sterling balance for an indefinite period ahead. It may think it desirable in this case to protect its position against the possibility of sterling being devalued in the near future by selling sterling forward at the existing quoted rate. If sterling is devalued before the forward contract matures, the operator will get a foreign currency—say the franc—at the old rate and can rebuy sterling at a cheaper rate. The profit that he makes recoups him for the loss in the franc value of his sterling due to the devaluation. If there is no devaluation he can renew his hedge at the date due, if sterling is still suspect, or he can terminate it without loss except for the actual cost, or service charge, of the hedging transaction.

Hedging as protection of real assets

An even more important use of hedging is to protect the international value of real assets such as securities, real estate, and industrial buildings and plants. If a non-British person conducts business and has assets in Britain, he may think it wise to protect the international value of these assets by selling a certain amount of sterling forward. A devaluation, if it occurs, will reduce the foreign exchange value of the sterling assets; but the profit that the owner makes from selling sterling forward and buying it back at a cheaper rate will be an offset to this loss.

Speculation. The movements so far considered are of a precautionary nature. It is sometimes suggested, when there is a big movement of funds out of a currency, that those prompting it are actuated by some motive hostile to the suspect currency. This is usually quite wrong. Such large movements of funds are often referred to incorrectly as "speculative." This gives a false impression of what is happening. Speculation can, and often does, occur when a currency becomes suspect; but the word speculative should be confined to movements of funds made not to protect positions but purely in the hope of gain. A person may believe that the Deutsche Mark is likely to be valued upward and decide to buy Deutsche Marks, not because he has any commitments denominated in Deutsche Marks but because he wants to resell them afterward at a profit. He will probably buy the Deutsche Marks forward. Such speculation plays only a minor role in the early movements of funds in anticipation of a change of parity. It may, however, mount up very strongly in the last stages when an upward or downward revaluation has become almost certain.

A big outward movement of funds may precipitate a change of parity, desirable or undesirable in itself, simply because there are not enough reserves to finance the withdrawals. Even if the country in trouble is assisted by international credits, in certain cases these may not be large enough to avert the need for devaluation. A great movement of funds from a particular country may occur because it is thought likely that it will have to devalue. There may also be a great movement into a country thought likely to value upward. The latter kind of movement will cause difficulties for other countries, since the funds must come from somewhere. This adverse effect may be concentrated on one other currency, as in the classic crisis centred on a possible upward valuation of the Deutsche Mark in November 1968, where the drain was mainly from the French franc; or it may be more widely diffused, as in the crisis of the mark in September 1969.

Stresses in the IMF system. The International Monetary Fund system of pegged-but-adjustable exchange rates came under increasing pressures during the 1960s. The system suffered from three major, interrelated problems: inadequate adjustment, confidence, and liquidity. Changes actually made in exchange rates were inadequate to deal with the major disturbances occurring in international payments. Because the adjustment mechanisms in the system were inadequate, a number of countries ran large and persistent imbalances in their international payments. This led to a lack of confidence that existing par values could be maintained and to periodic speculative rushes into strong currencies and away from weak ones. Deficit countries were not in a position to meet large speculative attacks because of their limited quantities of liquid reserves.

Creating international reserves

Traditionally, there had been two major methods of international reserve creation: the mining of gold and the acquisition of reserves in the form of key currencies (mainly dollars). Gold mining did not keep up with the rapid increase in international trade; gold reserves became less and less adequate as a means for covering balance-of-payments deficits. The alternative method for acquiring reserves—the accumulation of U.S. dollars by central banks—had one major disadvantage. For countries such as the United Kingdom, West Germany, or Brazil to accumulate dollars, the United States had to run a balance-of-payments deficit. But when the United States ran large deficits, doubts arose regarding the ability of the United States to maintain the convertibility of the dollar into gold. In other words, there was a fundamental inconsistency in the design of the IMF system, which created something of a paradox: if the United States did run large deficits, the dollar would sooner or later be subject to a crisis of confidence; if it did not run large deficits, the rest of the world would be starved for dollar reserves.

Special Drawing Rights. To deal with the inability of the existing system to create an adequate quantity of reserves without requiring the United States to run large deficits, a new kind of reserve called Special Drawing Rights (SDRs) was devised by the International Monetary Fund. Members of the Fund were to be allocated SDRs, year by year, in prearranged quantities to be used for the discharge of international indebtedness. At the IMF meeting in 1969, agreement was reached for an issue extending over three years. These Special Drawing Rights differed from ordinary Drawing Rights in three important respects: (1) The use of Special Drawing Rights was not to be subject to negotiations or conditions. (2) There was to be only a very much modified form of repayment obligation. A member who used more than 70 percent of all the Special Drawing Rights allotted in a given period had to repay to the extent needed to reduce its average use of the rights during that period to 70 percent of the total. Thus, 70 percent of all Special Drawing Rights issued could be thought of as reserves in the fullest sense, since a member who limited its use to this amount would have no repayment obligation. (3) In the case of Drawing Rights, the Fund uses currencies as subscribed by members to provide the medium of payment. By contrast, the Special Drawing Rights were to be accepted in final discharge of debt without being translated into any particular currency. Though currencies would still have to be subscribed by members receiving Special Drawing Rights, these would be in the background and would not be used, except in the case of a member in net credit on Special Drawing Rights account who wished to withdraw from the scheme.

SDRs versus Drawing Rights

Initially, the total amount of Special Drawing Rights allocated was equivalent to more than U.S. $9,000,000,000, but additional allocations to IMF members during the 1970s more than doubled the total. The value of the Special Drawing Rights is based on the currencies of the largest exporting IMF members. The use of SDRs was altered and expanded in 1978, allowing agencies other than the IMF to use SDRs in monetary exchange. Subsequently SDRs have been used by the Andes Reserve Fund, the

Arab Monetary Fund, the Bank for International Settlements, and others.

Other efforts at financial cooperation. *The Group of Ten.* As early as 1961 there were signs of a crisis in the IMF system. The United States had been running a heavy deficit since 1958, and the United Kingdom plunged into one in 1960. It looked as if these two countries might need to draw upon continental European currencies in excess of the amounts available. Per Jacobssen, then managing director of the IMF, persuaded a group of countries to provide standby credits amounting to $6,000,000,000 in all, so that supplementary supplies of their currencies would be available. The plan was not confined to the countries that happened to be in credit at that time but was extended to other important countries, the currencies of which might run short at some future time. This plan was known as the "General Arrangements to Borrow." The adhering countries were 10 in number: the United States, the United Kingdom, Canada, France, West Germany, Italy, The Netherlands, Belgium, Sweden, and Japan. They became known as the "Group of Ten."

Problems of the 1960s

The arrangement was subject to the agreement that countries actually supplying additional currency would have the right to take cognizance of how the Fund used it. This put them in a power position as against the International Monetary Fund itself. Since then the Group of Ten has worked together in deliberating on international monetary problems.

The dominant position gained by the Group of Ten has been due not only to their provision of standby credit but also to the manner in which they do their business. The ultimate authority of the Group resides in the finance ministers of the countries concerned, who meet from time to time. Their deputies meet more frequently for detailed work on particular problems. These deputies consist of high-ranking persons in their respective treasuries and central banks; they are resident in their own countries and have day-to-day knowledge of their problems and of what is politically feasible. In this respect they are in a much more advantageous position than the executive directors of the International Monetary Fund, who live in Washington, D.C., and have less contact with their home governments; they also tend to be persons of higher standing and authority.

The Basel Group. In 1930 a Bank for International Settlements was established at Basel, Switz.; its main duty was to supervise and organize the transfer of German reparations to the recipient countries. This "transfer problem" had caused much trouble during the 1920s. There may also have been a hope in the minds of some that this institution might one day develop into something like a world central bank.

Not long after it was set up the Germans gained a moratorium on their reparations payments. By then, however, the Bank for International Settlements had become a convenient place for the heads of the European central banks to meet together and discuss current problems. This practice was resumed after the war, and the United States, although not a member, was invited to join in the deliberations.

The European Payments Union

When Marshall Plan aid was furnished by the United States to help European countries in their postwar reconstruction, a European Payments Union was established to facilitate multilateral trade and settlements in advance of the time when it might be possible to reestablish full multilateralism on a world scale. The war had left a jumble of trade restrictions that could not be quickly abolished. The European Payments Union also contained a plan for the provision of credit to European debtors. The United Kingdom was a member, and with it was associated the whole sterling area. Responsibility for working the machinery of the European Payments Union was assigned to the Bank for International Settlements. The European Payments Union was ultimately wound up after the countries of Europe were able to eliminate the last restrictions and make their currencies fully convertible in 1958.

In January and February 1961 there was a serious sterling crisis, due partly to the British deficit of 1960 and partly to a large movement of funds in anticipation of an upward valuation of the West German mark, which happened, and thereafter in anticipation of a second upward valuation, which did not happen at that time. To help the British, the Basel Group of central banks provided substantial credits. These were liquidated when the United Kingdom transferred its indebtedness to the International Monetary Fund the following July. The Basel Group has provided further credits from time to time. The problems involved have continued to be discussed at the monthly meetings.

Sterling devaluation of 1967

The arrangement made for the support of the sterling area in 1968 is noteworthy. After the devaluation of sterling in 1967 it was feared that the monetary authorities of the countries composing the sterling area might wish to reduce their holdings of sterling. Because there was a continuing problem of world liquidity and sterling played an important part as a reserve currency, the international consensus was that any substantial reduction in the holding of sterling as a reserve currency would be damaging to the international monetary system. Under the arrangement made in 1968 the United Kingdom on its side agreed to give a dollar guarantee to the value of the greater part of the sterling-area reserves; there were slightly different arrangements with each monetary authority. On its side the Bank for International Settlement agreed to organize credits to finance payments deficits for some countries of the sterling area, should these occur at times when the United Kingdom might find it difficult to handle them.

The OECD. The Organisation for European Economic Co-operation (OEEC) was set up in 1948 to make arrangements for the distribution of Marshall Aid among the countries of Europe. When its tasks in this connection were accomplished, it remained in existence, was broadened to include the United States, Canada, and Japan, and it was renamed the Organisation for Economic Co-operation and Development (OECD). It has a permanent staff and headquarters in Paris. It undertakes research on a substantial scale and affords a forum for the discussion of international economic problems. The Working Party No. 3 of the organization's Economic Committee, which is concerned with problems of money and exchange, has made significant contributions; it issued a very important report on balance-of-payments adjustment problems in 1966. At times the personnel of the Working Party has been much the same as that of the deputies of the Group of Ten. The Organisation for Economic Co-operation and Development has also set up an organization called the Development Assistance Committee, concerned with problems of assistance to the developing countries.

Working Party No. 3

Swap agreements. The informal system of swap agreements provides a mutual arrangement between central banks for standby credits designed to see countries through difficulties on the occasions of large movements of funds. These are intended only to offset private international flows of capital on precautionary or speculative account, not to finance even temporary deficits in countries' balance of payments. Arranged ad hoc and informally, they depend on the mutual goodwill and trust of the central banks involved. The system of credits, although informal, must be reckoned as important, because they are of large amount. (R.F.H./P.Wo.)

The end of pegged exchange rates. *The crisis of the dollar.* The monetary system established by the IMF in 1944 underwent profound changes in the 1970s. This system had assumed that the dollar was the strongest currency in the world because the United States was the strongest economic power. Other countries were expected to have difficulty from time to time in stabilizing their exchange rates and would need assistance in the form of credits from the International Monetary Fund, but the dollar was expected to remain stable enough to function as a substitute for gold in international transactions. In the second half of the 1960s these assumptions came into question. The war in Vietnam led to inflation. The flood of dollars into other countries caused difficulty for the European central banks, which were forced to increase their dollar holdings in order to maintain their currencies at the established exchange rates. As the flood continued in 1971, the West German and Dutch governments decided to let their currencies float—that is, to let their exchange

End of Bretton Woods system

rates fluctuate beyond their assigned parities. Austria and Switzerland revalued their currencies upward in relation to the dollar. These measures helped for a time, but in August the outflow of dollars resumed, and on August 15 Pres. Richard M. Nixon formally suspended the U.S. commitment made in 1934 to convert dollars into gold, effectively ending the postwar monetary system established by the IMF. Most of the major trading countries decided to abandon fixed exchange rates temporarily and temporarily let their currencies find their own values in relation to the dollar.

The Smithsonian Agreement and after. On Dec. 17 and 18, 1971, representatives of the Group of Ten met at the Smithsonian Institution in Washington, D.C., and agreed on a realignment of currencies and a new set of pegged exchange rates. The dollar was devalued in terms of gold, while other currencies were appreciated in terms of the dollar. On the whole, the dollar was devalued by nearly 10 percent in relation to the other Group of Ten currencies (those of the United Kingdom, Canada, France, West Germany, Italy, The Netherlands, Belgium, Sweden, and Japan). Several months after the Smithsonian Agreement, the six members of the European Economic Community (EEC) agreed to maintain their exchange rates within a range of 2.25 percent of parity with each other.

The Smithsonian Agreement proved to be only a temporary solution to the international currency crisis. A second devaluation of the dollar (by 10 percent) was announced in February 1973, and not long afterward Japan and the EEC countries decided to let their currencies float. At the time, these were thought of as temporary measures to cope with speculation and capital shifts; it was, however, the end of the system of established par values.

(R.F.H./F.S.P./Ed.)

FLOATING EXCHANGE RATES

Inadequacy of the adjustable pegs system

The floating exchange-rate system emerged when the old IMF system of pegged exchange rates collapsed. The case for the pegged exchange rate is based partly on the deficiencies of alternative systems. The IMF system of adjustable pegs proved unworkable in a world in which there were huge volumes of internationally mobile financial capital that could be shifted out of countries in balance-of-payments difficulties and into the stronger nations. The earlier gold standard system had likewise contained substantial defects. Under some circumstances, it required countries to go through a painful deflation. The gold standard, it is widely held, made the Great Depression of the 1930s even deeper than it might otherwise have been.

Three major, interrelated hopes were expressed when flexible exchange rates replaced the collapsing IMF system of pegged exchange rates in the early 1970s. First, flexible exchange rates would allow currencies to hold at or near their fundamental equilibrium values; national authorities would not feel obliged to defend exchange rates that were severely out of line. Second, deficit countries would be able to reestablish their international competitiveness without going through the painful deflationary process required by the old gold standard and without facing the political embarrassment of abandoning an established par value. Finally, the national monetary authorities would have a substantial degree of independence to pursue the most appropriate domestic monetary and fiscal policies, without being severely constrained by balance-of-payments pressures. In practice, exchange-rate flexibility turned out to be more complicated than its proponents had anticipated.

Exchange-rate fluctuations. The pegged exchange-rate system collapsed in two speculative flurries against the U.S. dollar in 1971 and 1973. In each case, the dollar depreciated about 10 percent in terms of an average of other currencies. (In calculating an average exchange rate for the dollar, the currencies of each other nation is weighted according to the volume of trade of that nation with the United States.) After these initial adjustments, exchange rates of the major trading nations were generally quite stable for the next four years (late 1973–77), although there were some fluctuations. The dollar strengthened following the first oil shock, which occurred in 1973–74; because the United States still produced most of the oil it consumed, it was expected to be less severely shaken by high oil prices than would its major trading partners, especially West Germany and Japan. In the 1973–77 period, the major exchange-rate change was a fall in the British pound sterling by about 30 percent when measured in terms of dollars.

Period of dollar decline

In late 1977 the dollar entered a period of instability. As the U.S. economy expanded and inflation increased, U.S. goods became less competitive on world markets. In response, the dollar began to slide downward. This raised the price of imported goods in the United States, adding to inflationary pressures. The United States seemed in danger of entering a wage–price–exchange rate spiral. Anticipating worse to come, speculators began to unload dollars, moving the exchange value of the dollar even lower and adding to the inflationary spiral. During the 1977–79 period, the average exchange value of the dollar declined by about 15 percent.

Faced with a rapidly deteriorating situation, the United States tightened its domestic policies sharply. In particular, monetary policy was tightened in order to combat the rapid inflation. This experience provided one early, important lesson about flexible exchange rates. Even though flexible exchange rates provide some independence for domestic monetary policies, domestic policies cannot be made without concern for international complications. This is true even for a large, prosperous economy, such as that of the United States.

Dollar surge in the 1980s

During the late 1970s, the U.S. dollar was threatened with a collapse. By the mid-1980s the opposite had occurred: the dollar had soared—rising about 80 percent. A number of forces contributed to this rise. One was U.S. fiscal policy: tax rates were cut sharply, and budgetary deficits ballooned. Large-scale government borrowing added to the demands on financial markets, leading to high interest rates. This encouraged foreign asset holders to buy U.S. bonds. To do so, they bought dollars, creating upward pressure on the exchange value of the dollar. In turn, the high dollar made it difficult for U.S. producers to compete on world markets. U.S. imports rose briskly; exports were relatively sluggish, and the U.S. trade deficit soared.

Because of strong competition from imports, U.S. producers of automobiles, textiles, and a number of other products lobbied for protection. Under the threat of unilateral U.S. actions, the government of Japan was persuaded to impose "voluntary" limits on exports of cars to the United States. There were concerns—both in the United States and in its trading partners—that the United States might adopt a much more protectionist policy because the high exchange value of the dollar was making it so difficult for U.S. producers to compete.

The "Plaza Agreement"

Faced with this unwelcome prospect, senior officials of the "Group of Five" (France, West Germany, Japan, the United Kingdom, and the United States) met at the Plaza Hotel in New York City in 1985. In the "Plaza Agreement," they declared their intention to bring the dollar down to a more competitive level, if necessary by official sales of dollars on exchange markets.

This episode raised fundamental questions about flexible exchange rates, leading some financial experts to suggest an intermediate system between freely flexible exchange rates and the old IMF system of adjustable pegs. With sizable exchange-market interventions by governments and central banks, exchange rates were not freely flexible. They were being managed by the authorities. (Such a managed floating rate is sometimes called a "dirty" float.)

Some experts supported more active exchange-rate management in order to prevent currencies from becoming severely misaligned. Governments were advised to declare "target zones" for exchange rates and to buy or sell currencies whenever needed to keep exchange rates within these zones—moving the target zones as fundamental economic conditions changed. The concept was to avoid large exchange-rate swings.

The European Monetary System. In the early 1970s, when the IMF system of adjustable pegs broke down, the currencies of the western European countries began to float, as did most other currencies.

However, the members of the European Economic Community wanted an exchange-rate agreement to comple-

ment their customs union. An early step was taken in this direction when the nations instituted the so-called "snake in a tunnel." Exchange-rate fluctuations between EEC members were limited, and the currencies moved in a narrow, undulating, snakelike pattern against the U.S. dollar and other outside currencies.

In 1979 most of the members of the EEC (with the important exception of the United Kingdom) entered a more formal agreement, the European Monetary System (EMS), which had some characteristics of the old IMF system.

The European Currency Unit

Exchange rates were to be pegged to a European Currency Unit (ECU), made up of a basket of European currencies. However, there were three important differences from the old IMF system: (1) the flexibility around the official rate was as much as 6 percent, substantially wider than the 1 percent under the IMF system; (2) official rates were to be adjusted more quickly and frequently than the IMF par rates; and (3) the U.S. dollar was not included in the EMS system; thus, the EMS currencies fluctuated as a group against the U.S. dollar.

THE INTERNATIONAL DEBT CRISIS

Developing nations have traditionally borrowed from the developed nations to support their economies. In the 1970s such borrowing became quite heavy among certain developing countries, and their external debt expanded at a very rapid, unsustainable rate. The result was an international financial crisis. Countries such as Mexico and Brazil declared that they could not keep up with the schedule of interest and principal payments, causing severe reactions in the financial world. Cooperating with creditor nations and the IMF, these countries were able to reschedule their debts—that is, delay payments to remove financial pressure. But the underlying problem remained—developing countries were saddled with staggering debts that totaled more than $800,000,000,000 by the mid-1980s. For the less-developed countries as a whole (excluding the major oil exporters), debt service payments were claiming more than 20 percent of their total export earnings.

Rescheduling of debts

The large debts created huge problems for the developing countries and for the banks that faced the risk of substantial losses on their loan portfolios. Such debts increased the difficulty of finding funds to finance development. In addition, the need to acquire foreign currencies to service the debt contributed to a rapid depreciation of the currencies and to rapid inflation in Mexico, Brazil, and a number of other developing nations.

The wide fluctuations in the price of oil were one of the factors contributing to the debt problem. When the price of oil rose rapidly in the 1970s, most countries felt unable to reduce their oil consumption quickly. In order to pay for expensive oil imports, many went deeply into debt. They borrowed to finance current consumption—something that could not go on indefinitely. As a major oil importer, Brazil was one of the nations adversely affected by rising oil prices.

Paradoxically, however, the oil-importing countries were not the only ones to borrow more when the price of oil rose rapidly. Some of the oil exporters—such as Mexico—also contracted large new debts. They thought that the price of oil would move continually upward, at least for the foreseeable future. They therefore felt safe in borrowing large amounts, expecting that rapidly increasing oil revenues would provide the funds to service their debts. The price of oil drifted downward, however, making payments much more difficult.

The debt reschedulings, and the accompanying policies of demand restraint, were built on the premise that a few years of tough adjustment would be sufficient to get out of such crises and to provide the basis for renewed, vigorous growth. To the contrary, however, some authorities believed that huge foreign debts would act as a continuing drag on growth and could have catastrophic results.

BIBLIOGRAPHY

General texts: The classic works in the field of international trade are ADAM SMITH, *An Inquiry into the Nature and Causes of the Wealth of Nations,* 2 vol. (1776), available also in many later editions, both complete and in selections; DAVID RICARDO, *On the Principles of Political Economy and Taxation* (1817), available also in modern editions; JOHN STUART MILL, *Principles of Political Economy,* 2 vol. (1848, reissued in 1 vol., 1909; reprinted 1987); GOTTFRIED VON HABERLER, *The Theory of International Trade with Its Applications to Commercial Policy* (1936, reprinted 1968; originally published in German, 1933); and JACOB VINER, *Studies in the Theory of International Trade* (1937, reprinted 1975). Useful textbooks include RICHARD E. CAVES and RONALD W. JONES, *World Trade and Payments: An Introduction,* 4th ed. (1985); WILFRED J. ETHIER, *Modern International Economics* (1983); PETER B. KENEN, *The International Economy* (1985); and PETER H. LINDERT, *International Economics,* 8th ed. (1986). Surveys of recent international financial developments may be found in the annual compiled by the INTERNATIONAL MONETARY FUND, *World Economic Outlook.* For surveys of recent advanced work in international economics, see RONALD W. JONES and PETER B. KENEN (eds.), *Handbook of International Economics,* vol. 1 (1984); and DAVID GREENAWAY (ed.), *Current Issues in International Trade: Theory and Policy* (1985).

Theories of international trade: The Heckscher-Ohlin theory has been the most scrutinized explanation of trade patterns. The classic work is BERTIL OHLIN, *Interregional and International Trade,* rev. ed. (1967). Other surveys are NICHOLAS OWEN, *Economies of Scale, Competitiveness, and Trade Patterns Within the European Community* (1983); and EDWARD E. LEAMER, *Sources of International Comparative Advantage: Theory and Evidence* (1984).

State interference: Elementary treatments of the theory and practice of tariffs may be found in standard texts, such as those listed above. Institutional and historical studies of tariffs include ASHER ISAACS, *International Trade, Tariff, and Commercial Policies* (1948); and F.W. TAUSSIG, *The Tariff History of the United States,* 8th ed. (1931, reprinted 1967). An analysis of the economic and political issues in trade policy may be found in BELA BALASSA, *Trade Liberalization Among Industrial Countries: Objectives and Alternatives* (1967); ROBERT E. BALDWIN and ANNE O. KRUEGER (eds.), *The Structure and Evolution of Recent U.S. Trade Policy* (1984); JAGDISH N. BHAGWATI (ed.), *Import Competition and Response* (1982); WILLIAM R. CLINE *et al., Trade Negotiations in the Tokyo Round: A Quantitative Assessment* (1978); WILLIAM R. CLINE (ed.), *Trade Policy in the 1980s* (1983); I.M. DESTLER, *American Trade Politics: System Under Stress* (1986); GARY CLYDE HUFBAUER and HOWARD F. ROSEN, *Trade Policy for Troubled Industries* (1986); and ROBERT Z. LAWRENCE and ROBERT E. LITAN, *Saving Free Trade: A Pragmatic Approach* (1986). Accounts of the General Agreement on Tariffs and Trade (GATT) may be found in GERARD CURZON, *Multilateral Commercial Diplomacy* (1965); GARDNER PATTERSON, *Discrimination in International Trade: The Policy Issues, 1945–1965* (1966); and GILBERT R. WINHAM, *International Trade and the Tokyo Round Negotiations* (1986). The effects of trade policies on the developing countries are studied in HARRY G. JOHNSON, *Economic Policies Toward Less Developed Countries* (1967).

International trade arrangements: General analyses include F.W. TAUSSIG, *Free Trade, the Tariff, and Reciprocity* (1920); LEAGUE OF NATIONS, *Commercial Policy in the Interwar Period: International Proposals and National Policies* (1942); JACQUES LACOUR-GAYET, *Histoire du commerce,* 6 vol. (1950–55); and ROBERT SCHNERB, *Libre-échange et protectionnisme,* 4th rev. ed., edited by MADELEINE SCHNERB (1977). Economic integration is treated in MAURICE ALLAIS, *L'Europe unie: route de la prospérité* (1960); BELA BALASSA, *The Theory of Economic Integration* (1961, reprinted 1982); BELA BALASSA *et al.* (eds.), *European Economic Integration* (1975); EUROPEAN FREE TRADE ASSOCIATION, *The Effects of EFTA on the Economies of Member States* (1969); JOSEPH GRUNWALD, MIGUEL S. WIONCZEK, and MARTIN CARNOY, *Latin American Economic Integration and U.S. Policy* (1972); MICHAEL HODGES and WILLIAM WALLACE (eds.), *Economic Divergence in the European Community* (1981); JAMES E. MEADE, *The Theory of Customs Unions* (1955, reprinted 1980); SCOTT R. PEARSON and WILLIAM D. INGRAM, "Economies of Scale, Domestic Divergences, and Potential Gains from Economic Integration in Ghana and the Ivory Coast," *The Journal of Political Economy,* 88:994–1009 (October 1980); DENNIS SWANN, *The Economics of the Common Market,* 5th ed. (1984); JACOB VINER, *The Customs Union Issue* (1950, reprinted 1983); WILLIAM WALLACE (ed.), *Britain in Europe* (1980); PAUL WONNACOTT, *The United States and Canada: The Quest for Free Trade* (1987); and BRUCE PARROTT (ed.), *Trade, Technology, and Soviet-American Relations* (1985).

International commodity markets: BELA BALASSA, *Trade Prospects for Developing Countries* (1964); L. BARANYAI and J.C. MILLS, *International Commodity Agreements* (1963; originally published in Spanish, 1962); C.P. BROWN, *Primary Commodity Control* (1975); JOSEPH D. COPPOCK, *International Economic Instability: The Experience After World War II* (1962), and

International Trade Instability (1977); SIMON KUZNETS, *Modern Economic Growth: Rate, Structure, and Spread* (1966); M.A.G. VAN MEERHAEGHE, *International Economic Institutions,* 4th ed. (1985; originally published in Dutch, 1964); J.W.F. ROWE, *Primary Commodities in International Trade* (1965); and UNITED NATIONS CONFERENCE ON TRADE AND DEVELOPMENT, *Proceedings* (irregular).

International exchange and payments: BENJAMIN J. COHEN, *Organizing the World's Money: The Political Economy of International Monetary Relations* (1977); RICHARD N. COOPER *et al.* (eds.), *The International Monetary System Under Flexible Exchange Rates: Global, Regional, and National* (1982); RICHARD N. COOPER, *Macroeconomic Policy Adjustment in Interdependent Economies* (1969); PAUL EINZIG and BRIAN SCOTT QUINN, *The Euro-Dollar System: Practice and Theory of International Interest Rates,* 6th ed. (1977); J. MARCUS FLEMING, *Guidelines for Balance-of-Payments Adjustment Under the Par-Value System* (1968); ANNE O. KRUEGER, *Exchange-Rate Determination* (1983); GERALD M. MEIER, *Problems of Trade Policy* (1973), *Problems of a World Monetary Order,* 2nd ed. (1982), and *Problems of Cooperation for Development* (1974); ROBERT A. MUNDELL, *International Economics* (1968); ROBERT SOLOMON, *The International Monetary System, 1945–1981,* new ed. (1982); and ROBERT TRIFFIN, *Gold and the Dollar Crisis: The Future of Convertibility* (1960, reprinted 1983), in which the author points out the contradictions in the IMF system. A suggestion for target zones for exchange rates is presented in JOHN WILLIAMSON, *The Exchange Rate System,* 2nd ed. (1985). International debt is specifically discussed in BELA BALASSA *et al., Toward Renewed Economic Growth in Latin America* (1986); WILLIAM R. CLINE, *International Debt: Systemic Risk and Policy Response,* new ed. (1984); THOMAS O. ENDERS and RICHARD P. MATTIONE, *Latin America: The Crisis of Debt and Growth* (1984); and CAROL LANCASTER and JOHN WILLIAMSON (eds.), *African Debt and Financing* (1986).

Iran

The Islāmic republic of Iran (Jomhūrī-ye Eslāmī-ye Īrān) covers 636,300 square miles (1,648,000 square kilometres) in southwestern Asia. It is bounded on the north by the Soviet Union and the Caspian Sea, on the east by Pakistan and Afghanistan, on the south by the Persian Gulf and the Gulf of Oman, and on the west by Turkey and Iraq. Iran also controls about a dozen islands in the Persian Gulf. More than 30 percent of its 4,770-mile (7,680-kilometre) boundary is seacoast. The capital is Tehrān (Teheran).

Among Middle Eastern countries, Iran is unique in many ways. Its official language, Fārsī (Persian), is Indo-European. While Iran adopted a modified version of the Arabic alphabet, it refused to lose its separate identity after the establishment of the Arab Empire in the 7th century. From the beginning of the Islāmic era there was strong support for the house of ʿAlī, Muḥammad's son-in-law. ʿAlī's claim of succession to the Prophet was disputed by the Sunnite majority, but his supporters proclaimed him first *imām* of their party. The party came to be called Shīʿah (Shīʿism), from *shīʿat ʿAlī,* "party of ʿAlī." When conversion to Islām began, Shīʿism was adopted by many, even though it was considered to be a heresy at the time. Despite persecution the Shīʿite branch continued to grow, and in the 16th century it became the official religion of Iran. The concept of divine or sacred kingship, which originated in the Mesopotamian Valley, was an integral part of pre-Islāmic Persian political culture, and the concept persists in the religious beliefs of the Shīʿites, who hold that sovereignty evolves from God and is expressed through his spokesmen on earth.

Iran is the only country in the Middle East that uses the Islāmic solar calendar, which originated before the beginning of the Persian Empire (550 BC). After the conversion of the vast majority of Iranians to Islām, the ancient Iranian calendar was adjusted to begin with the year of the Prophet Muḥammad's immigration to Medina (the *hijrah*), equivalent to AD 622 in the Gregorian calendar. To convert from the Islāmic solar calendar to the Gregorian, 621 or 622 years, depending on the time of year, are added to the Iranian year. (For example, the Iranian year 1361 began on March 21, 1982, and ended on March 20, 1983.) Nō-rūz (New Year's Day) falls on March 21, the vernal equinox. The Arabic lunar calendar is used for religious observances.

Iran has played an important role in the Middle East, as an imperial power and as a factor in rivalries between East and West. Its strategic position and its vast resources, including petroleum and natural gas, make it a nation to be reckoned with in the modern world.

Physical and human geography

THE LAND

Relief. A series of massive, heavily eroded mountain ranges surrounds Iran's high interior basin. Most of the country is above 1,500 feet (460 metres), with one-sixth of it over 6,500 feet. In sharp contrast are the coastal regions outside the mountain ring. In the north, the 400-mile strip along the Caspian Sea, never more than 70 miles wide and frequently narrowing to 10, falls sharply from the 10,000-foot summits to the marshy lake's edge, 90 feet below sea level. Along the southern coast, the land drops away from a 2,000-foot plateau, backed by a rugged escarpment three times as high, to meet the Persian Gulf and the Gulf of Oman.

The Zagros Mountains

The Zagros range stretches from the border with the Armenian Soviet Socialist Republic in the northwest to the Persian Gulf, and thence eastward into Baluchistan (Balūchestān). As it moves southward, it broadens into a 125-mile-wide band of parallel ridges lying between the plains of Mesopotamia and the great central plateau of Iran. It is drained on the west by streams that cut deep, narrow gorges and water fertile valleys. The land is extremely rugged and difficult of access and is populated largely by pastoral nomads.

The Elburz Mountains (Reshteh-ye Kūhhā-ye Alborz) run along the south shore of the Caspian Sea to meet the border ranges of Khorāsān (Khurasan) to the east. The highest of the chain's many volcanic peaks, some of which are still active, is snow-clad Qolleh-ye Damāvand (Mt. Demavend); estimates of its height range from about 18,400 feet (5,612 metres) to more than 19,000 feet.

Volcanic activity. Other volcanic peaks include Kūh-e Taftān (Mt. Taftān), a massive cone more than 13,000 feet high in southeastern Iran, which emits gas and mud at sporadic intervals. In the northwest Mt. Sabalān (more than 15,700 feet) and Mt. Sahand (more than 12,000 feet) have been inactive in historical times. Earthquake activity is frequent and violent. The 1,200-mile-long volcanic belt extends from the Soviet border in the northwest to Baluchistan in the southeast. In addition, in the northwestern section of the country lava and ashes cover a 200-mile stretch of land from Jolfā on the Soviet border eastward to the Caspian Sea. A third volcanic region, 250 miles long and 40 miles wide, runs between Lake Urmia (Daryācheh-ye Orūmīyeh) and the city of Qazvīn (Kazvin).

The interior plateau. The arid interior plateau, which extends into Central Asia, is cut by two smaller mountain ranges. In the flatlands lie the plateau's most remarkable features, the Dasht-e Kavīr (Kavīr Desert) and the Dasht-e Lūt (Lūt Desert), also called Kavīr-e Lūt. At the lowest elevations, series of basins in the poorly drained soil remain dry for months at a time; the evaporation of any accumulated water produces the salt wastes known as *kavīrs*. As elevation rises, surfaces of sand and gravelly soil gradually merge into fertile soil on the hillsides and mountain slopes.

Dasht-e Kavīr and Dasht-e Lūt

Drainage. The few streams emptying into the desiccated central plateau dissipate in saline marshes. The general drainage pattern is down the outward slopes of the mountains, terminating in the sea. There are three large rivers, but only one—the Rūd-e Kārūn (Kārūn River)—is navigable. It originates in the Zagros Mountains and flows south to the Shatt al-Arab (Arvand Rūd), which empties into the Persian Gulf. The Sefīd Rūd (Safid River) originates in the Elburz Mountains in the north. It runs as a mountain stream for most of its length but flows rapidly into the Gīlān plain and then to the Caspian Sea. The Safid River Dam, completed in the early 1960s at Manjīl, generates hydroelectric power and provides water for irrigation.

The Zāyandeh Rūd, the lifeline of Eṣfahān (Isfahan), also originates in the Zagros Mountains, flowing southeastward to Bāṭlāq-e Gāv Khūnī (Gāvkhāneh Marsh), a swamp northwest of the city of Yazd. The completion of the Kūhrang Dam in 1971 diverted water from the upper Kārūn through a two-mile-long tunnel into the Zāyandeh Rūd for irrigation purposes.

Other streams are seasonal and variable: spring floods do enormous damage, while in summer many streams disappear. Water is, however, stored naturally underground, finding its outlet in springs and in tap wells.

The largest inland body of water, Lake Urmia, in northwestern Iran, covers an area that varies from 2,000 to 2,300 square miles. Other lakes are principally seasonal, and all have a high salt content.

Soils. Soil patterns vary widely. The abundant subtropical vegetation of the Caspian coastal region is supported by rich brown forest soils. Mountain soils are shallow layers over bedrock, with a high proportion of unweathered fragments. Natural erosion moves the finer textured soils into the valleys. The alluvial deposits are mostly chalky, and many are used for pottery.

The semiarid plateaus lying above 3,000 feet are covered by brown or chestnut-coloured soil that supports grassy vegetation. The soil is slightly alkaline and contains 3 to 4 percent of organic material. The saline and alkaline soils in the arid regions are light in colour and infertile. The sand dunes are composed of loose quartz and fragments of other minerals. Except where anchored by vegetation, they are in almost constant motion, driven by high winds.

Climate. Iran's complex climate ranges from subtropical to subpolar. In winter a high-pressure belt, centred in Siberia, slashes west and south to the interior of the Iranian Plateau, while low pressures develop over the warm waters of the Caspian Sea, the Persian Gulf, and the Mediterranean Sea. In summer one of the lowest pressure centres in the world prevails in the south. Low pressures in Pakistan generate two regular wind patterns: the *shamāl,* which blows from February to October northwesterly through the Tigris–Euphrates Valley, and the "120-day" summer wind, which sometimes reaches velocities of 70 miles per hour in the Sīstān (Seistan) region near the Pakistan frontier. Warm Arabian winds bring heavy moisture from the Persian Gulf.

Altitude, latitude, maritime influences, seasonal winds, and proximity to mountain ranges or deserts play a significant role in the fluctuation of temperature, which varies from a high of 131° F (55° C) in Khūzestān (Khuzistan) at the head of the Persian Gulf to a low of −35° F (−37° C) in Azerbaijan (Āẕarbāyjān) in the northwest. Precipitation also varies widely, from less than two inches (50 millimetres) in the southeast to about 78 inches in the Caspian region. The annual average is about 16 inches. Winter is normally the rainy season for the country as a whole: more than 50 percent of the annual precipitation occurs in the three-month period. The northern coastal region presents a sharp contrast. The high Elburz Mountains, which seal off the narrow Caspian plain, wring moisture from the clouds, trap humidity from the air, and create a fertile semitropical region with luxuriant forests, swamps, and rice paddies. Temperatures may soar to 100° F (38° C) and the humidity to 98 percent. Frost is extremely rare. Except for this region, summer is a dry season. The northern and western parts of Iran have four distinct seasons. Moving south and east, spring and autumn become shorter and ultimately merge in an area of mild winters and hot summers.

Temperature and rainfall

Plant and animal life. Topography, altitude, water supply, and soil determine the character of the vegetation. Approximately one-tenth of Iran is forested, most extensively in the Caspian region. In the area are found broad-leafed, deciduous trees—oak, beech, linden, elm, walnut, ash, and hornbeam—and a few broad-leafed evergreens. Thorny shrubs and ferns also abound.

The Zagros Mountains are covered by semihumid oak forests, together with elm, maple, hackberry, walnut, pear, and pistachio trees. Willow, poplar, and plane trees grow in the ravines, as do many species of creepers. Thin stands of juniper, almond, berberis, cotoneaster, and wild fruit trees grow on the intermediate dry plateau. Thorny shrubs form the ground cover of the steppes, while artemisia (a kind of wormwood) grows at medium elevations of the desert plains and the rolling country. There are acacia, dwarf palm, kunar trees (Jerusalem thorn), and scattered shrubs below 3,000 feet. Desert sand dunes, which hold water, support thickets of brush. Forests follow the courses of surface or subterranean waters. Oases support vines

and tamarisk, poplar, date palm, myrtle, oleander, acacia, willow, elm, plum, and mulberry trees. In swamp areas reeds and grass provide good pasture.

Wildlife includes leopards, bears, hyenas, wild boars, ibex, gazelles, and mouflon, which live in the wooded mountains. Jackals and rabbits roam the interior. Wild asses live in the *kavīr*. Cheetahs and pheasants are found in the Caspian region, and partridges live in most parts of the country. Other birds, such as seagulls, ducks, and geese, live on the shores of the Caspian Sea and the Persian Gulf, while buzzards nest in the desert. Deer, hedgehogs, foxes, and 22 species of rodents live in semidesert, high-altitude regions. Palm squirrels, Asiatic black bears, and tigers live in Baluchistan. Tigers also inhabit the forests of the Caspian region.

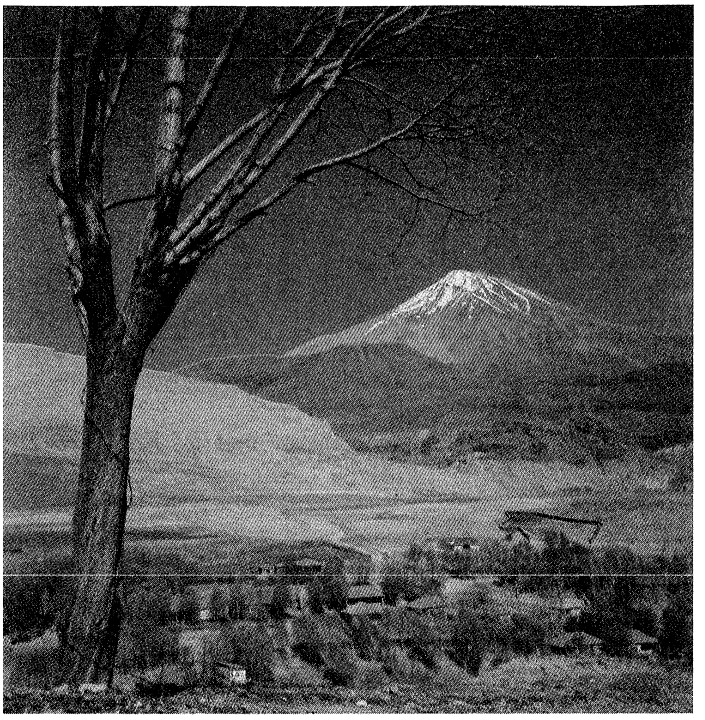
Studies made in Khūzestān, Baluchistan, and along the slopes of the Elburz and Zagros mountains have revealed the presence of a remarkably wide variety of amphibia and reptiles. Examples are toads, frogs, tortoises, lizards, salamanders, boas, racers, rat snakes, cat snakes, and vipers.

Some 200 varieties of fish live in the Persian Gulf, as do shrimps, lobsters, and turtles. Sturgeon, the most important commercial fish, is one of 30 species found in the Caspian Sea. It constitutes a major source of export income for the government, in the production of caviar. Mountain trout abound in small streams at high elevations and in rivers that are not seasonal.

Wildlife sanctuaries have been established in Iran, and the hunting of swans, pheasants, deer, tigers, and a number of other animals and birds is prohibited. Domestic animals include horses, donkeys, cattle, water buffalo, sheep, goats, both species of camels, dogs, and cats.

Regional characteristics

Settlement patterns. Traditionally, the country has been sharply divided along cultural, ethnic, and linguistic lines. In the popular mind, the people of each region, frequently associated with a particular city, have specific attributes. The Isfahani, for example, is known as a shrewd businessman, witty and industrious; the Yazdi as a hard-working agriculturalist. Azerbaijan produces soldiers and merchants. A Kurd is religiously independent, a fanatical fighter, while the Shīrāzī is a poet by nature and temperament.



The topography and the water supply determine the regions fit for human habitation, the character of the people, and their types of dwellings. The deep gorges and defiles, the unnavigable rivers, the empty deserts, and the impenetrable *kavīr*s all result in insularity and tribalism and in a concentration of population around the periphery and in the oases. The felt yurts (circular dwellings) of the Turkmen, the black tents of the Bakhtyārī, and the osier (willow) huts of the Baluchi are typical, as the tribesmen roam from summer to winter pasture. In the vast central and southern plains there are a number of oasis settlements with scattered rudimentary hemispherical or conical huts. Since the mid-20th century the migrations have shortened and the nomads have settled in more permanent villages.

The villages on the plains follow an ancient rectangular pattern. High mud walls with corner towers form the outer face of the houses, which have flat roofs of mud and straw supported by wooden rafters. In the open centre of the village is a mosque serving also as a school.

Mountain villages are situated on the rocky slopes above the valley floor, surrounded by terraced fields, usually irrigated, of grain and lucerne (alfalfa). The houses are square, mud-brick, windowless buildings with flat or domed roofs; a roof hole provides ventilation and light. The stable is usually under the house.

Caspian villages are completely different. The scattered hamlets have two-storied wooden houses. Separate outbuildings (barns, henhouses, silkworm houses) surround an open courtyard.

Tehrān, the capital and largest city, is separated from

Mt. Demavend, the highest volcanic peak in the Elburz Mountains.

the Caspian by the Elburz Mountains. Eṣfahān, about 250 miles south of Tehrān, is the second most important city and is famed for its architecture. There are few cities in central and eastern Iran, where water is scarce, although lines of oases penetrate the desert. Most towns are supplied with water by *qanāt*, an irrigation system by which an underground mountain water source is tapped and the water channelled down through a series of tunnels, sometimes 50 miles in length, to the town level. Towns are, therefore, often located a short distance from the foot of a mountain. The essential feature of a traditional Iranian street is a small canal.

Islāmic influence has determined city layout. There is still strict division into separate quarters—the governmental, the residential, and the business sector, or bazaar. The latter, fronting on a central square, is a maze of narrow arcades lined with small individual shops, grouped according to the type of product sold. Modern business centres, however, have grown up outside the bazaars. Dwellings in the traditional style are built around closed courtyards, with a garden and a pool. Public baths are found in all sections of the cities.

Construction of broad avenues and ring roads to accommodate modern traffic has changed the appearance of the large cities. Their basic plan, however, is still that of a labyrinth of narrow, crooked streets and culs-de-sac.

THE PEOPLE

Iran is a multilingual and diverse cultural society, and the majority of the population is extremely young. Nearly one-half of the people speak Fārsī, and another one-fourth speak some other Indo-European language or dialect. These are descendants of the Aryan tribes, whose origins are lost in antiquity. The Kurds, whose language has seen scant modification over the centuries, are a fierce nomadic people dwelling in the western mountains of Iran and in Iraq and Turkey. They constitute a small percentage of Iran's population. They have resisted the Iranian government's efforts, both before and after the revolution of 1979, to assimilate them into the mainstream of national life. Also inhabiting the western mountains are seminomadic Lurs, thought to be the descendants of the aboriginal inhabitants of the country. Closely related are the Bakhtyārī tribes, who live in the Zagros Mountains west of Eṣfahān. Both speak Lurī, a language distinct from, but related to, Fārsī. The Baluchi are a smaller minority who inhabit Iranian Baluchistan, which borders on Pakistan.

The Kurds

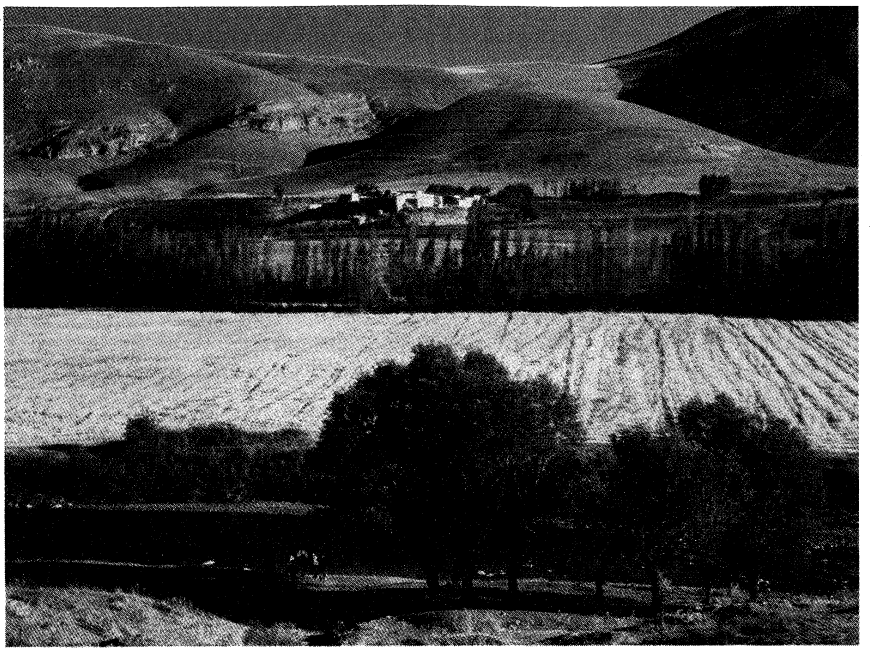
About one-fifth of Iranians speak a variety of Turkic languages. The largest Turkic-speaking group is the Azerbaijani, a farming and herding people who inhabit two northwestern provinces bordering on Turkey and the Soviet Union. Two other Turkic ethnic groups are the Qashqā'īs in the Shīrāz area to the north of the Persian Gulf and the Turkmen of Khorāsān in the northeast.

The Armenians, with a different ethnic heritage, have maintained their Indo-European linguistic identity. They are concentrated in Tehrān, Eṣfahān, and Azerbaijan and are engaged primarily in commercial pursuits. A few isolated remnants of Dravidians are found in the Sīstān region to the southeast.

Semites—Jews, Assyrians, and Arabs—constitute only a small percentage of the population. The Jews, like the Armenians, have retained their ethnic, linguistic, and religious identity and traditionally have clustered in the largest cities. The Assyrians are concentrated in the northwest, and the Arabs live primarily in the Persian Gulf islands and in Khūzestān. The Arabs' demand for autonomy was among the factors that led to the Iran–Iraq war of the 1980s.

Wars, intermarriage, and commerce have resulted in the intermingling of both blood and vocabulary. Before the revolution of 1979, English and French, and to a lesser degree German and Russian, were widely used by the educated class. Since 1979 Arabic has received priority because of its religious significance (it is the language of the Qur'ān).

The vast majority of Iranians are Muslims, mostly of the Shī'ite branch, which is the official state religion. The Kurds and Turkmen are Sunnite Muslims, and among Iran's Arabs the Sunnites and other sects are represented. (For a discussion of Islāmic sects, see ISLĀM, MUḤAMMAD AND THE RELIGION OF: *Theology and sectarianism.*)



Major religious minorities are Christians, Jews, and Zoroastrians. Christians comprise the largest minority group, of whom Orthodox Armenians constitute the bulk. The Assyrians are Nestorians, Protestants, and Roman Catholics, as are a few converts from other ethnic groups. The Zoroastrians are largely concentrated in Yazd in central Iran, Kermān to the southeast, and Tehrān.

Religious toleration, one of the characteristics of Iran as a monarchy, came to an end with the Islāmic revolution in 1979. While Christians, Jews, and Zoroastrians are recognized in the constitution of 1979 as official minorities, the revolutionary atmosphere in Iran is not conducive to equal treatment of non-Muslims. Among these, Iran's Bahā'īs were the greatest victims of persecution. Emigration greatly reduced the Jewish population, which had been a significant minority before 1979.

THE ECONOMY

Planned economic development, initiated in 1949, was terminated in 1978 and revived in 1982, but Iran's involvement in war with Iraq impeded progress. The management of the economy under the republic is subject to Islāmic criteria as determined by the Council of Guardians and approved by the legislature. The constitution of 1979 establishes specific guidelines for the administration of the nation's economic and financial affairs. The ultimate objectives are economic independence, full employment, and a comfortable standard of living. The economy is divided into three sectors: public, which includes major industries, banks, insurance companies, utilities, communications, foreign trade, and mass transportation; cooperative, which includes production and distribution of goods and services; and private, which consists of all activities that supplement the first two sectors.

In general terms, all former laws or any sections of them that violated the principles of Islāmic law were declared null and void. The nationalization of private banks and insurance companies and the increased state control of foreign trade have given the government a monopoly of most income-producing activities. As to the rest of the economy, most of the items listed for nationalization were already under state control at the time that the monarchy

The rich agricultural region of northwestern Iran.
© Abbas—Magnum

was overthrown. The various departments of the central government in Tehrān, as well as their provincial and local offices, either are headed by mullahs (religious teachers who are conversant with Islāmic law) or are advised by local religious leaders in the communities concerned.

In addition to the government's mandatory taxes, Islāmic taxes are collected on a voluntary basis. These include an income tax (*khums:* "one-fifth"); a tax for charitable causes (*zakāt*), which has a variable rate and is frequently in kind; and a land tax (*kharāj*), the rate of which has also been based on the principle of *ūshr,* 10 percent of the value of the crops, unless the land is tax-exempt.

Resources. Iran's most important natural resources are oil and natural gas. Production and exploration are concentrated in the southwest, but oil has also been discovered in Qom and the Kavīr-e Lūt, as well as under the offshore waters of the Persian Gulf.

Oil is produced for export and for domestic consumption. It is moved by pipelines to the terminal at Jazīreh-ye Khārk (Khārg Island) in the Persian Gulf and from there is shipped by tankers to western Europe, Asia, Japan, and other countries. Oil was refined primarily in Ābādān until the city was destroyed in the war with Iraq. Smaller refineries in Eṣfahān, Shīrāz, Lāvān, Tehrān, and Tabrīz produce a variety of refined products.

Natural gas, found in the south as well as in the Elburz Mountains and in Khorāsān, is also a valuable asset. Gathering and distributing spur lines run to Tehrān, Kāshān, Eṣfahān, Shīrāz, Mashhad, Ahvāz, and the industrial city of Alborz, near Qazvīn. This state-owned system, known as IGAT, is one of the largest gas lines in the Middle East.

The petrochemical industry

The petrochemical industry, concentrated in the south, expanded rapidly before the revolution. The Rāzī (formerly Shāhpūr) Chemical Company at Bandar-e Khomeynī (formerly Bandar-e Shāhpūr) produces ammonia, phosphates, sulfur, and other products. The plants of Khārg Island turned out sulfur, liquid gas, and light oil. The war with Iraq led to massive destruction of the petroleum and petrochemical industries.

Iran's other mineral resources are largely undeveloped. Major coal mines are in Khorāsān, Kermān, Semnān, Māzandarān, and Gilān. Smaller mines operate north of Tehrān, in Azerbaijan, and in Eṣfahān. Lead, in combination with zinc and other minerals, is widely scattered. Copper is found in a belt extending from the Pakistani border to the Soviet border. Kermān is the centre of copper production. Cement production is centred in the provinces of Tehrān, Fārs, and Khūzestān and in the region of Qazvīn, northwest of Tehrān. Fireclay, chalk, lime, gypsum, ochre, and kaolin (china clay) are also produced in commercial quantities. Other mineral resources include magnesite, uranium, chromium, antimony, manganese, tin, mica, alum, marble, turquoise, and emeralds.

Agriculture, forestry, and fishing. Because of poor soil and lack of adequate water distribution in many areas, less than 10 percent of the agricultural land in rural areas is under cultivation. Less than one-third of the cultivated area is irrigated; the rest is devoted to dry farming. The western and northwestern portions of the country are the most fertile.

Although the economy is primarily agrarian, agricultural activities provide a relatively small part of the gross domestic product. The farms are small; most are less than 25 acres. Soil is poor, seed is of low quality, water is scarce, and farming techniques are archaic. All of these factors contribute to low crop yield and to poverty in the rural areas.

The wide range of temperature fluctuation in different parts of the country makes it possible to cultivate diverse crops. These include cereals (wheat, barley, rice, corn [maize]), fruits (dates, figs, pomegranates, melons, grapes) and vegetables, cotton, sugar beets and sugarcane, nuts, olives, spices, tea, tobacco, and medicinal herbs.

Forests cover approximately the same amount of land as agricultural crops. The largest and most valuable forested areas are in the Caspian region, where many of the forests are commercially exploitable and include both hard and soft woods. Forest products include plywood, fibreboard, and lumber for the construction and furniture industries.

Forest crops and products

Fishing is important, and fish are caught both for domestic consumption and for export. They are marketed fresh, salted, smoked, or canned. Sturgeon (yielding its roe for caviar), bream, whitefish, salmon, mullet, carp, catfish, perch, and roach are caught in the Caspian Sea. More than 200 species of fish are found in the Persian Gulf, 150 of them edible. The catch includes shrimps and prawns.

Of the country's livestock, sheep are by far the most numerous, followed by goats, cattle, asses, horses, water buffalo, and mules. Camels and poultry are also found in large numbers.

Industry. Tehrān is the largest market for domestic products. Agricultural products are shipped to the nearest local town and thence transported to Tehrān or to provincial capitals by air, truck, rail, camels, mules, and donkeys. Since crafts are localized, each city has created a market for its products in the capital and other major

cities. Major industries are scattered, and their products are distributed nationwide.

Since 1954 industrial development has transformed parts of the country. Iran produces a wide range of products, such as automobiles, electrical appliances, telecommunications equipment, industrial machinery, paper, rubber products, steel, food products, wood and leather products, textiles, and pharmaceuticals.

Textile mills are centred in Eṣfahān and the Caspian region. Carpet weaving, a traditional Iranian industry, remains important; it contributes substantially to incomes in rural areas and is one of Iran's most important export industries.

Mining industry. Mining was primarily by hand until the early 1960s, and the ore was moved to refining centres by truck, rail, donkey, or camel. Mechanized methods were introduced as new mines and quarries were opened up. The mineral industries encompass both refining and manufacturing.

Construction. Until the early 1950s the construction industry was limited for the most part to small indigenous companies. When large government contracts were involved, however, foreign bidders were attracted. Increased income from oil and gas and the availability of easy credit triggered a building boom that took major international construction firms to Iran. This continued until 1975, when, because of a sharp rise in inflation, credit was tightened and the boom collapsed.

Energy. Until the 20th century Iran's sources of energy were almost entirely limited to wood and charcoal. Oil, natural gas, and coal are now used to supply heat and energy. A system of dams supplies hydroelectric power (and also irrigates cropland).

The establishment of the Atomic Energy Organization (AEO) of Iran in 1973 was intended to implement the government's plan to construct more than 20 nuclear plants. By 1978 two 1,200-megawatt reactors near Būshehr on the Persian Gulf were near completion, and they were scheduled to begin operation early in 1980. The revolutionary government cancelled the program in 1979. The AEO has been revived, but its activities are limited to the search for uranium inside Iran.

Tourism. Until the early 1960s little attention was paid to tourism. Lack of facilities made travel in Iran a rugged experience. Provisions for paved highways and hotel construction were then included in each successive development plan. The number of tourists increased steadily in the years 1964–78, but the political turmoil of 1978, which led to the overthrow of the monarchy, practically destroyed the tourist industry as well. The Islāmic regime discourages tourism from non-Muslim countries in an effort to exclude Western influences. Service industries have been decimated by the sharp decline in the tourist industry.

Finance. Government loans and credits have been made available to industrial and agricultural projects, primarily through banks. All private banks and insurance companies were nationalized in 1979. The Islāmic Bank of Iran (later reorganized as the Islāmic Economy Organization) was established in Tehrān, with branches throughout the country. Banks are divided into categories—such as commercial, industrial, and agricultural—but all are subject to the same regulations. In lieu of interest, considered to be usury and forbidden by Islām, banks impose a service charge, a commission, or both on loans.

In 1984 the value of trade in Tehrān's stock exchange was less than $1,000,000. Foreign investment came to a halt in 1979.

Trade. Despite the government's attempts to achieve self-sufficiency, the value of Iran's imports continues to be high, with machinery and transport equipment accounting for a considerable proportion, followed by basic manufactures and foodstuffs. The huge income derived from the export of petroleum products created a favourable balance of trade in the past, but this has been reversed. Other exports include caviar, carpets, cotton, fruits, textiles, minerals, chemicals, nuts, and motor vehicles.

Transportation. Iran's large centres of population are widely scattered, and transportation is made difficult by mountainous and desert terrain. Low funding and poor maintenance have reduced the efficiency of the all-weather roads, of which less than a third are paved. Nevertheless, motor vehicles, and buses and trucks in particular, are the most important means of transportation for both passengers and goods.

The principal line of the state-owned railway system spans the distance between the Caspian Sea and the Persian Gulf, with spur lines to some of the provincial capitals. In 1971 the railway was linked through Turkey with the European system; the link stimulated trade and tourism appreciably, undercutting air fares and materially reducing sea-transportation time. The Iranian portion of a line eastward to Singapore was completed as far as Mashhad by 1971. There is also a connection with the Soviet rail system via Jolfā in the northwest.

The Kārūn is the only navigable river and is used to transport passengers and cargo. On Lake Urmia there is regular passenger and cargo ferry service between the port of Sharafkhāneh in the northeast and Golmānkhāneh in the southwest. Before the outbreak of war with Iraq, Iran was served by five major ports on the Persian Gulf. Oil terminals at Ābādān and Khārg Island were destroyed or damaged in the fighting, as were port facilities at Khorramshahr and Bandar-e Khomeynī. Although facilities at the port of Būshehr have been expanded, neither it nor Bandar-e ʿAbbās, the largest port on the Gulf, can accommodate foreign trade. Consequently, a new port was readied at Bandar Beheshtī (formerly Chāh Bahār), on the Gulf of Oman.

Persian Gulf ports

Caspian seaports are primarily used for trade with the Soviet Union. Notable among them are Bandar-e Anzalī (formerly Bandar-e Pahlavī) and Bandar-e Torkeman (formerly Bandar-e Shāh).

Major cities and provincial capitals are served by the state-owned Iran Air, and all have airports capable of handling jets. Some major European, Asian, and African airlines serve Iran; Tehrān, Eṣfahān, Shīrāz, and Bandar-e ʿAbbās have international airports.

GOVERNMENT AND SOCIAL CONDITIONS

Government. As provided in the constitution of 1979, Iran is an Islāmic republic, with a president (officially the head of state), a Cabinet, a unicameral legislature (Majles), and a separate judicial branch. The *valiy-e faqih,* the supreme spiritual leader, chosen for his knowledge of Islāmic theology, is considered to be the representative of the Twelfth Imām and as such has final authority in all executive, legislative, and judicial matters. After the *valiy-e faqih*'s death, experts (jurists) elected by the people consult and select his successor, to be designated as the new "leader." If no single individual is available to fill the position, a Council of Leadership of three to five theologians is established, subject to popular approval.

The *valiy-e faqih*

The president, elected for four years, is largely a figurehead. He appoints the prime minister, who in turn selects his Cabinet with the advice and consent of the Majles. None of these can be chosen without the prior approval of the *valiy-e faqih;* any can be dismissed upon the recommendation of either the Supreme Court or the Majles.

The 270-member Majles is elected by secret ballot for four years; recognized minorities have token representation. A 12-member Council of Guardians with staggered terms determines the constitutionality of all laws passed by the Majles, as well as their conformity to Islāmic principles; six theologians are appointed by the *valiy-e faqih,* and six other Islāmic jurists are nominated by the High Council of the Judiciary and approved by the Majles. No legislation may be enacted unless the council is in session.

The judiciary consists of a Supreme Court, a Supreme Judicial Council, and lower courts. The chief justice and the prosecutor general must be Shīʿite jurists (*mujtahids*). Individual rights—such as freedom of press, assembly, and expression—are guaranteed within the framework of the Sharīʿah (Islāmic law). Under the constitution all Islāmic judges rely on the Sharīʿah. In 1982 any portion of the law codes of the monarchy that in the opinion of the Supreme Court did not conform with Islām were declared null and void. In 1983 the Majles revised the penal code and instituted a system of *qiṣāṣ* ("retribution"). Punish-

ments, including amputation of limbs and execution, may be carried out by a member of the injured party's family or by the state.

The *ostāns* (provinces) are subdivided into *shahrestāns* (counties), *bakhshs* (districts), and *dehestāns* (villages). Governors general (for provinces) and governors (for counties) are nominated by the minister of interior and appointed by the president. At each level there is a council, and the Supreme Council of Provinces is formed from representatives of the provincial councils. The Ministry of the Interior appoints each city's mayor, and city councilmen are locally elected. Villages are administered by a village master advised by elders.

Under the constitution elections are to be held at least every four years, supervised by the Ministry of Interior. Suffrage is universal and the minimum voting age is 16. All important matters are subject to referenda. Candidates for the presidency and the legislature are nominated by political parties. The most important among these is the Islāmic Republican Party, which controls the Majles. The Muslim People's Party, which once claimed more than 3,000,000 members, became inactive after 1981. Several parties—including the Tudeh (Communist) Party, the Mujāhedīn-e Khalq (Fighters for the People) Party, and the Democratic Party of Iranian Kurdistan—have been outlawed.

Political parties

In the absence of an organized ecclesiastical hierarchy, the religious scholars (*'ulemā*, or mullahs) have always been respected throughout the Islāmic world in general and in Iran in particular. In Iran their position is symbolized by the turban, a black one signifying direct descent from the Prophet Muḥammad. At all levels of government the mullahs exercise a great deal of influence either through direct participation in the political process or because of their ability to sway popular opinion.

Early in its existence the Islāmic regime declared its neutrality between East and West and expressed its intention to strengthen its ties with the Third World, particularly with other Islāmic countries. While the value of foreign trade with this latter group has increased, Iran remains heavily dependent upon the industrial countries of the world. It has retained membership in the United Nations and its affiliated agencies.

Revolutionary Guards

Armed forces. The Revolutionary Guards (Pāsdārān-e Inqilāb), organized in the early days of the republic, are the country's most effective military force. The Ministry of Revolutionary Guards operates separately from the Ministry of Defense. Security forces involved in war or in armed internal conflicts are either accompanied by Revolutionary Guards or led by them. Law enforcement in the cities is the responsibility of the national police force, and the gendarmerie oversees rural areas. Both are under the direction of the Ministry of Interior.

Education. Compulsory education through the fifth grade was established in 1943. All schools and universities reflect the Islāmic system of beliefs, except for a small number of private and parochial schools that are maintained by minority groups. The University of Tehrān and 25 training colleges were opened in 1934. Several more universities, teachers' colleges, and technical schools have been established since then.

The public school system is controlled by the Ministry of Education and Training. Each university is either controlled by the state or has a board of regents appointed by the president of the republic.

Advances in public health

Health and welfare. Health conditions appreciably improved after World War II through the combined efforts of the government, international agencies, and philanthropic endeavour. By 1964 smallpox had been eradicated, plague had disappeared, and malaria had been practically wiped out. Cholera, believed to have been controlled, broke out in 1970 and again in 1981 but was speedily checked. Health facilities, nevertheless, are far from adequate. There is a severe shortage, especially in rural areas, of doctors, nurses, and medical supplies.

Public hospitals provide free treatment for the poor. These are supplemented by private institutions, but all are inadequate. All health services are supervised by the Ministry of Health, the branch offices of which are headed by certified physicians.

The flow of population to the cities has created housing shortages. In major cities purified water is piped into the houses, while small towns and villages rely on wells, *qanāt*s, springs, or rivers. Central heating is not common except for modern buildings in major cities. Portable kerosene heaters, iron stoves using wood and coal, and charcoal braziers are common sources of heat. Welfare is administered by the Ministry of State for Welfare and the Mostaz'afān ("Downtrodden") and Shahid ("Martyr") foundations, the latter being particularly concerned with families of war casualties.

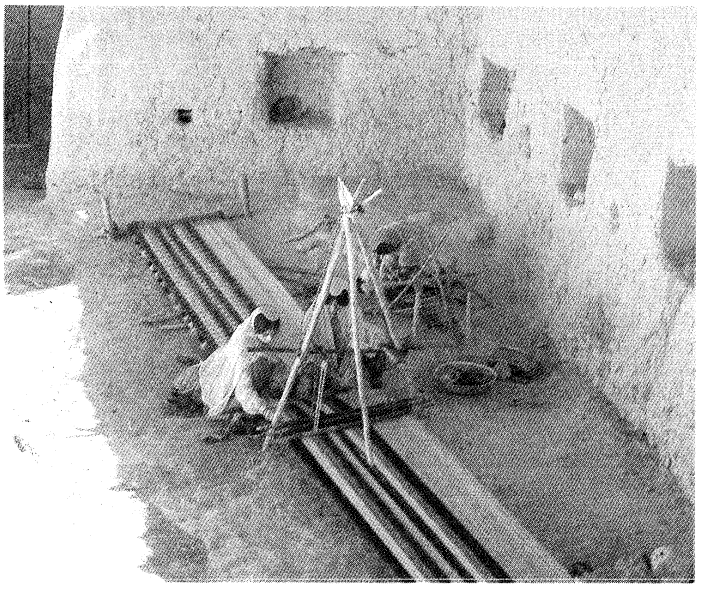
CULTURAL LIFE

Suffering, tears, self-flagellation, and martyrdom are the essential elements of the Shī'ite culture. As members of a minority religion and a protest movement in the early years of Islām, the Shī'ites were persecuted by the Sunnite majority. The martyrdom of al-Ḥusayn ibn 'Alī in AD 680 at Karbalā', Iraq, at the hands of the Umayyads, the sufferings of al-Ḥusayn's household, and the massacre of his followers became the rallying point for a national revival after the establishment of the Ṣafavid Empire in 1501. The Shī'ite Persians were then pitted against the Sunnite Ottomans. At the beginning of each lunar Islāmic year the Karbalā' tragedy is commemorated by *ta'ziya* (passion plays) and self-flagellation with chains, scimitars, and bare hands. The participants are often clothed in bloody shrouds signifying the blood-stained soil of Karbalā' and their willingness to join the ranks of the martyrs.

The martyrdom of al-Ḥusayn

The commemoration of Karbalā' has permeated all of Persian culture and finds expression in poetry, music, and the pessimistic Shī'ite view of the world. No religious ceremony is complete without a reference to Karbalā', and no month passes without at least one day of mourning. None of the efforts of the monarchy, such as the annual festivals of art and the encouragement of musicians and native craftsmen, succeeded in changing this basic attitude, which finds laughter and joy undesirable and, in some circles, even sinful.

There are, however, several festive occasions, the most important being *Nō-rūz*, the Persian New Year, and the birthday of the Twelfth Imām, whose second return the Shī'ites expect. The New Year celebration begins on the last Wednesday of the old year, is followed by a week-long holiday and continues until the 13th day of the new year, which is a day for picnicking in the countryside. On the Twelfth Imām's birthday cities sparkle with lights, and the bazaars are decorated and teem with shoppers.



Carpet looms dot the country. Each locality prides itself on a special design and quality of carpet that bears its name, such as Kāshān (Kashan), Kermān, Eṣfahān, Shīrāz, Tabrīz, and Qom. Carpets are used locally and are exported. The handwoven-cloth industry has survived stiff competition from the country's modern textile mills. Weavers produce velvets, printed cottons, wool brocades, shawls, and cloth shoes. Felt is made in the south and sheepskin is embroidered in the northeast.

Carpet weaving and cloth manufacture

A wide range of articles, both utilitarian and decorative, are made of various metals. The most famous centres are Tehrān (gold); Shīrāz, Eṣfahān, and Zanjān (silver); and Kāshān and Eṣfahān (copper). Khorāsān is known for its turquoise industry, as is the Persian Gulf region for natural pearls. The craft techniques are as divergent as the products themselves. Articles may be cast, beaten, wrought, pierced, or drawn (stretched out). The most widespread techniques for ornamentation are engraving, embossing, chiselling, damascening, encrustation, or gilding.

Numerous decorative articles in wood are produced for both the domestic and export markets in Eṣfahān, Shīrāz, and Tehrān (inlay) and in Rasht, Orūmīyeh (formerly called Reẓā'īyeh), and Sanandaj (carved and pierced wood). Machine-made ceramic tiles are produced in Tehrān, but handmade tiles and mosaics, known for their rich designs and beautiful colours, continue to be produced.

Stone and clay are also used for the production of a wide range of household utensils, trays, dishes, and vases. Mashhad is the centre of the stone industry. Potteries are widely scattered throughout the country, Hamadān being the largest centre.

Cloth being woven by Qashqā'ī women of the Shīrāz area.

Architecture

Under the monarchy two architectural trends developed—an imitation of Western styles that had little relevance to the country's climate and landscape, and an attempt to revive indigenous designs. The National Council for Iranian Architecture, founded in 1967, discouraged blind imitation of the West and promoted the use of more traditional Iranian styles that were modified to serve modern needs.

The strict Islāmic interpretation of the Bible's Second Commandment, which the Qur'ān reiterates, actually discouraged painting and sculpture. This, however, did not prevent Iranian artists from working in other media, such as calligraphy, illumination, weaving, ceramics, and metalwork. Western classical painting and sculpture were introduced in the late 19th century and were adapted to Iranian themes.

Music

For centuries musical development was inhibited because of Islāmic injunctions. Folk songs and ancient Persian classical music were preserved only through oral transmission from generation to generation. It was not until the 20th century that a music conservatory was founded in Tehrān and that Western techniques were used to record traditional melodies and encourage new compositions. This trend was reversed, however, in 1979, when the former restrictions on music were restored.

A motion-picture industry had developed before the revolution, with strong support from the Ministry of Higher Education and Culture. Production by the private sector has been discontinued, and the industry now concentrates on documentaries and on historical and religioethical themes. It operates under the supervision of the Ministry of Islāmic Guidance.

Museums are not numerous and are relatively recent, with two exceptions: the Golestān Palace Museum in Tehrān, which was opened in 1894, and the All Saviour's Cathedral Museum of Jolfā (Eṣfahān), which was built by the Armenian community in 1905. The only gallery devoted solely to art is the Tehrān Museum of Modern Art, opened in 1977. Other well-known museums include Iran Bāstān (1946) and Negarestān (1975) in Tehrān and Pārs in Shīrāz (1938). Among the learned societies, all of which are located in Tehrān, the most important are the Ancient Iran Cultural Society, the Iranian Mathematical Society, and the Iranian Society of Microbiology. There are also a number of research institutes, such as those for cultural, scientific, archaeological, anthropological, and historical research. In addition to the libraries of the various universities, there are public and private libraries in Tehrān, Mashhad, Eṣfahān, and Shīrāz.

Wrestling, horse racing, and ritualistic bodybuilding are the traditional sports of the country. Team sports were introduced from the West in the 20th century, the most popular being rugby and volleyball.

The development of municipal and amusement parks gained some momentum after World War II. Playgrounds in major cities are few, however, nor are there many public campgrounds. Several major cities have large sports stadiums.

The country's daily newspapers and periodicals are published primarily in Tehrān and must be licensed under the press law of 1979. The publication of any non-Muslim or anti-Muslim sentiments is strictly forbidden. Iran operates the Islāmic Republic News Agency (IRNA). Foreign correspondents are allowed into the country on special occasions. Despite constitutional guarantees of freedom of the press, censorship is ubiquitous.

Radio and television

Radio and television broadcasting stations serve Iran, and some radio broadcasts have international reception. In addition to Fārsī and foreign languages, transmitters broadcast in local languages and dialects. Because of widespread illiteracy, audiovisual media are much more effective than the press in the dissemination of information.

For statistical data on the land and people of Iran, see the *Britannica World Data* section in the BRITANNICA WORLD DATA ANNUAL. (Kh.Mo.)

History

This section covers the history of the Iranian Plateau from the beginning of recorded time until the present. It covers as well the succession of ancient empires centred there, the borders of which extended beyond those of the present country.

The early history of Iran may be divided into three phases: (1) the prehistoric period beginning with the earliest evidence of man on the Iranian Plateau (*c.* 100,000 BC) and ending roughly at the start of the 1st millennium BC; (2) the protohistoric period covering approximately the first half of the 1st millennium BC; and (3) the period of the Achaemenid dynasty (6th to 4th century BC), when Iran entered the full light of written history. The civilization of Elam, centred off the plateau in lowland Khūzestān, is an exception, for written history began there as early as it did in neighbouring Mesopotamia (*c.* 3000 BC).

Archaeological sources

The sources for the prehistoric period are entirely archaeological. Early excavation in Iran was limited to a few sites. In the 1930s archaeological exploration increased rapidly, but work was abruptly halted by the outbreak of World War II. After the war ended, interest in Iranian archaeology revived quickly, and since 1950 numerous excavations have revolutionized the study of prehistoric Iran.

For the protohistoric period the historian is still forced to rely primarily on archaeological evidence, but much information comes from written sources as well. None of these sources, however, is both local to and contemporary with the events described. Some sources are contemporary but belong to neighbouring civilizations that are only tangentially involved in events in the Iranian Plateau; for example, the Assyrian and Babylonian cuneiform records from lowland Mesopotamia. Some are local but not contemporary, such as the traditional Iranian legends and tales that supposedly speak of events in the early 1st millennium BC. And some are neither contemporary nor local but are nevertheless valuable in reconstructing events in the protohistoric period (*e.g.*, the 5th-century-BC Greek historian Herodotus).

For the study of centuries of the Achaemenid dynasty there is sufficient documentary material, so that this period is the earliest for which archaeology is not the primary source of data. Economic texts from Mesopotamia, Elam, and Iran; historical inscriptions such as that of Darius the Great at Bīsitūn; contemporary and later classical authors; and later Iranian legends and literature contribute, among other sources, to the understanding of the Achaemenid period.

THE ELAMITES, MEDIANS, AND ACHAEMENIDS

The prehistoric period. *The Paleolithic.* Enigmatic evidence of man's presence on the Iranian Plateau as early as Lower Paleolithic times comes from a surface find in the

Kermanshah Valley. The first well-documented evidence of human habitation is in deposits from several excavated cave and rock-shelter sites, mainly located in the Zagros Mountains of western Iran, dated to Middle Paleolithic or Mousterian times (*c.* 100,000 BC). There is every reason to assume, however, that future excavations will reveal Lower Paleolithic man in Iran. The Mousterian flint-tool industry found there is generally characterized by an absence of the Levallois technique of chipping flint and thus differs from the well-defined Middle Paleolithic industries known elsewhere in the Near East. The economic and social level associated with this industry is that of fairly small, peripatetic hunting and gathering groups spread out over a thinly settled landscape.

The Mousterian culture

Locally, the Mousterian is followed by an Upper Paleolithic flint industry called the Baradostian. Radiocarbon dates suggest that this is one of the earliest Upper Paleolithic complexes; it may have begun as early as 36,000 BC. Its relationship to neighbouring industries, however, remains unclear. Possibly, after some cultural and typological discontinuity, perhaps caused by the maximum cold of the last phase of the Würm glaciation, the Baradostian was replaced by a local Upper Paleolithic industry called the Zarzian. This tool tradition, probably dating to the period 12,000 to 10,000 BC, marks the end of the Iranian Paleolithic sequence.

The Neolithic. Evidence indicates that the Near East in general was one of the earliest areas in the Old World to experience what the Australian archaeologist V. Gordon Childe called the Neolithic revolution. That revolution witnessed the development of settled village agricultural life based firmly on the domestication of plants and animals. Iran has yielded much evidence on the history of these important developments. In the early Neolithic (sometimes called the Mesolithic), evidence of significant shifts in tool manufacture, settlement patterns, and subsistence methods, including the fumbling beginnings of domestication of both plants and animals, comes from such important western Iranian sites as Āsīāb, Gūrān, Ganj-e Dareh, and Ali Kosh. Similar developments in the Zagros, on the Iraqi side of the modern border, are also traceable at sites such as Karīm Shahīr and Zawi Chemi–Shanidar. This phase of early experimentation with sedentary life and domestication was soon followed by a period of fully developed village farming as defined at important Zagros sites such as Jarmo, Sarāb, upper Ali Kosh, and upper Gūrān. All of these sites date wholly or in part to the 8th and 7th millennia.

By approximately 6000 BC these patterns of village farming were widely spread over much of the Iranian Plateau and in lowland Khuzistan. Tepe Sabz in Khuzistan, Hajji Firuz in Azerbaijan, Godin Tepe VII in northeastern Luristan, Tepe Sialk I on the rim of the central salt desert, and Tepe Yahya VI C–E in the southeast have all yielded evidence of fairly sophisticated patterns of agricultural life (Roman numerals identify the level of excavation). Though distinctly different, all show general cultural connections with the beginnings of settled village life in neighbouring areas such as Afghanistan, Baluchistan, Soviet Central Asia, and Mesopotamia.

The 5th to mid-3rd millennia. Rather less is known of the cultures in this time range in Iran than of contemporary cultures elsewhere in the ancient Near East. Research has tended to concentrate on the Neolithic and protohistoric periods, and the scattered evidence for important cultural and artistic developments in the Chalcolithic and Early Bronze ages resists coherent summary. It is clear that trends that began in the late Neolithic period continued in the millennia that followed and that the rugged, broken landscape of the Iranian Plateau forced man into a variety of relatively isolated cultures. In no instance, with the important exception of Elam (see *The Elamites* below), did Iran participate in the developments that led to fully urban civilization in lowland Mesopotamia to the west or in the Indus Valley to the east. Throughout prehistory the Iranian Plateau remained at the economic and cultural level of village life achieved in the Neolithic. The separate cultural areas on the plateau are as yet barely understood by the modern archaeologist in any terms other than through the painted pottery assemblages found at several sites throughout Iran. Though developing in comparative isolation, each of these areas does yield some evidence for cultural contact with its immediate neighbours and, in some striking cases, with developments in the centres of higher civilization in Mesopotamia. Trade would appear to be the principal mechanism by which such contacts were maintained, and often Elam appears to have acted as an intermediary between Sumer and Babylon on the one hand and the plateau cultures on the other. Trade across the northern part of the plateau, through the sites of Hissar and Sialk, most probably involved the transshipment from Afghanistan to Mesopotamia of semiprecious stones such as lapis lazuli. The appearance of proto-Elamite tablets in Sialk IV may bear witness to such trade. So also may the appearance of similar proto-Elamite tablets at Tepe Yahya south of Kermān and in the great central desert provide evidence of trade connections between Mesopotamia and the east—in this case a trade that may have centred on specific items such as steatite and copper. The province of Fārs (Parsa) perhaps also participated in such trade networks, as is suggested by the appearance there, alongside strictly local ceramics, of wares that have clear Mesopotamian affinities. In the west central Zagros, outside influences from both the north and the west can be traced in the ceramic record; such is also the case for local cultures in Azerbaijan, to the northwest. In general, however, these millennia represent a major dark age in Iranian prehistory and warrant considerably more attention than they have recently received.

Trading contacts

The late 3rd and 2nd millennia. The beginning of this period is generally characterized by an even more marked isolation of the plateau than earlier, while the latter half of the period is one of major new disruptions, heretofore unique in Iranian history, that laid the groundwork for developments in the protohistoric period. In northwestern and central western Iran, local cultures, as yet barely defined beyond their ceramic parameters, developed in relative isolation from events elsewhere. All occupation had ceased at Tepe Sialk, but the painted pottery cultures characteristic of earlier Hissar and of the sites on the Gurgan Plain in the northeast continued. Little Mesopotamian influence is evident, though some contacts between Elam and the plateau remain. Perhaps beginning as early as 2400 BC but more probably somewhat later, a radical transformation occurred in the culture of the northeast: earlier painted potteries are entirely replaced by a distinctive gray or gray-black ceramic that is associated with a variety of other artifacts, primarily weapons and ornaments in copper or bronze, also unique. Whether this cultural change represents a strictly local development or testifies to an important intrusion of new peoples into the area is still under debate. In any case, none of these developments can be traced to Mesopotamia or to other areas to the west, regions which had previously been the source of outside influences on the Iranian Plateau. Somewhat later, the local cultures of central and northwestern Iran were apparently influenced by developments in northern Mesopotamia and Assyria along patterns of contact that were well established in earlier periods. Yet this contact, as it is observed at Godin III, Hasanlu VI, and Dinka Tepe, did not cause any major dislocation of local cultural patterns. In the second half of the 2nd millennium, however, western Iran—at first perhaps gradually, and then with striking suddenness—came under the influence of the gray and gray-black ware cultures that had developed earlier in the northeast. There the impact of these influences was such as definitely to suggest a major cultural dislocation and the introduction of a whole new culture and probably a new people into the Zagros. It was this development that marked the end of the Bronze Age in western Iran and ushered in the early protohistoric period.

The Elamites. Whereas the Iranian Plateau did not experience the rise of urban, literate civilization in the late 4th and early 3rd millennia on the Mesopotamian pattern, lowland Khuzistan did. There was centred Elamite civilization.

Geographically, Elam included more than Khuzistan; it was a combination of the lowlands and the immediate highland areas to the north and east. Elamite strength was based on an ability to hold these various areas together under a coordinated government that permitted the maximum interchange of the natural resources unique to each region. Traditionally this was done through a federated governmental structure.

Law of succession

Closely related to that form of government was the Elamite system of inheritance and power distribution. The normal pattern of government was that of an overlord ruling over vassal princes. In earliest times the overlord lived in Susa, which functioned as a federal capital. With him ruled his brother closest in age, the viceroy, who usually had his seat of government in the native city of the currently ruling dynasty. This viceroy was heir presumptive to the overlord. Yet a third official, the regent or prince of Susa (the district), shared power with the overlord and the viceroy. He was usually the overlord's son or, if no son was available, his nephew. On the death of the overlord, the viceroy became overlord. The prince of Susa remained in office, and the brother of the old viceroy nearest to him in age became the new viceroy. Only if all brothers were dead was the prince of Susa promoted to viceroy, thus enabling the overlord to name his own son (or nephew) as the new prince of Susa. Such a complicated system of governmental checks, balances, and power inheritance often broke down despite bilateral descent and levirate marriage (*i.e.*, the compulsory marriage of a widow to her deceased husband's brother). What is remarkable is how often the system did work; it was only in the Middle and Neo-Elamite periods that sons more often succeeded fathers to power.

Elamite history can be divided into three main phases: the Old, Middle, and Late, or Neo-Elamite, periods. In all periods Elam was closely involved with Sumer, Babylonia, and Assyria, sometimes through peaceful trade, more often through war. In like manner, Elam was often a participant in events on the Iranian Plateau. Both involvements were related to the combined need of all the lowland civilizations to control the warlike peoples to the east and to exploit the economic resources of the plateau.

The Old Elamite period. The earliest kings in the Old Elamite period may date to approximately 2700 BC. Already conflict with Mesopotamia, in this case apparently with the city of Ur, was characteristic of Elamite history. These early rulers were succeeded by the Awan (Shustar) dynasty. The 11th king of this line entered into treaty relations with the great Naram-Sin of Akkad (*c.* 2254–*c.* 2218 BC). Yet there soon appeared a new ruling house, the Simash dynasty (Simash may have been in the mountains of southern Luristan). The outstanding event of this period was the virtual conquest of Elam by Shulgi of the 3rd dynasty of Ur (2094–2047 BC). Eventually the Elamites rose in rebellion and overthrew the 3rd Ur dynasty, an event long remembered in Mesopotamian dirges and omen texts. About the middle of the 19th century BC, power in Elam passed to a new dynasty, that of Eparti. The third king of this line, Shirukdukh, was active in various military coalitions against the rising power of Babylon, but Hammurabi (more correctly, Hammurapi, *c.* 1792–1750 BC) was not to be denied, and Elam was crushed in 1764 BC. The Old Babylon kingdom, however, fell into rapid decline following the death of Hammurabi, and it was not long before the Elamites were able to gain revenge. Kutir-Nahhunte I attacked Samsuiluna (1749–1712 BC), Hammurabi's son, and dealt so serious a defeat to the Babylonians that the event was remembered more than 1,000 years later in an inscription of the Assyrian king Ashurbanipal. It may be assumed that with this stroke Elam once again gained independence. The end of the Eparti dynasty, which may have come in the late 16th century BC, is buried in silence.

Conquest by Ur

The Middle Elamite period. After two centuries for which sources reveal nothing, the Middle Elamite period opened with the rise to power of the Anzanite dynasty, whose homeland probably lay in the mountains northeast of Khuzistan. Political expansion under Khumban-numena (*c.* 1285–*c.* 1266 BC), the fourth king of this line, proceeded apace, and his successes were commemorated by his assumption of the title "Expander of the Empire." He was succeeded by his son, Untash-Gal (Untash (d) Gal, or Untash-Huban), a contemporary of Shalmaneser I of Assyria (*c.* 1274–*c.* 1245 BC) and the founder of the city of Dur Untashi (modern Choga Zanbil). In the years immediately following Untash-Gal, Elam increasingly found itself in real or potential conflict with the rising power of Assyria. Tukulti-Ninurta I of Assyria (*c.* 1244–*c.* 1208 BC) campaigned in the mountains north of Elam. The Elamites under Kidin-Khutran, second king after Untash-Gal, countered with a successful and devastating raid on Babylonia. In the end, however, Assyrian power seems to have been too great. Tukulti-Ninurta managed to expand, for a brief time, Assyrian control well to the south in Mesopotamia, Kidin-Khutran faded into obscurity, and the Anzanite dynasty came to an end.

After a short period of dynastic troubles, the second half of the Middle Elamite period opened with the reign of Shutruk-Nahhunte (*c.* 1160 BC). Two equally powerful and two rather less impressive kings followed this founder of a new dynasty, whose home was probably Susa, and in this period Elam became one of the great military powers of the Near East. Tukulti-Ninurta died in *c.* 1208 BC, and Assyria fell into a period of internal weakness and dynastic conflict. Elam was quick to take advantage of this situation by campaigning extensively in the Diyālā River area and into the very heart of Mesopotamia. Shutruk-Nahhunte captured Babylon and carried off to Susa the stele on which was inscribed the famous law code of Hammurabi. Shilkhak-In-Shushinak, brother and successor of Shutruk-Nahhunte's eldest son, Kutir-Nahhunte, still anxious to take advantage of Assyrian weakness, campaigned as far north as the area of modern Kirkūk. In Babylonia, however, the 2nd dynasty of Isin led a native revolt against such control as the Elamites had been able to exercise there, and Elamite power in central Mesopotamia was eventually broken. The Elamite military empire began to shrink rapidly. Nebuchadrezzar I of Babylon (*c.* 1124–*c.* 1103 BC) attacked Elam and was just barely beaten off. A second Babylonian attack succeeded, however, and the whole of Elam was apparently overrun, ending the Middle Elamite period.

Period of military greatness

It is noteworthy that during the Middle Elamite period the old system of succession to, and distribution of, power appears to have broken down. Increasingly, son succeeded father, and less is heard of divided authority within a federated system. This probably reflects an effort to increase the central authority at Susa in order to conduct effective military campaigns abroad and to hold Elamite foreign conquests. The old system of regionalism balanced with federalism must have suffered, and the fraternal, sectional strife that so weakened Elam in the Neo-Elamite period may have had its roots in the centrifugal developments of the 13th and 12th centuries.

The Neo-Elamite period. A long period of darkness separates the Middle and Neo-Elamite periods. In 742 BC, a certain Huban-nugash is mentioned as king in Elam. The land appears to have been divided into separate principalities, with the central power fairly weak. The next 100 years witnessed the constant attempts of the Elamites to interfere in Mesopotamian affairs, usually in alliance with Babylon, against the constant pressure of Neo-Assyrian expansion. At times they were successful with this policy, both militarily and diplomatically. But on the whole they were forced to give way to increasing Assyrian power. Local Elamite dynastic troubles were from time to time compounded by both Assyrian and Babylonian interference. Meanwhile, the Assyrian army whittled away at Elamite power and influence in Luristan. In time these internal and external pressures resulted in the near total collapse of any meaningful central authority in Elam. In a series of campaigns between 692 and 639 BC, in an effort to clean up a political and diplomatic mess that had become a chronic headache for the Assyrians, Ashurbanipal's armies utterly destroyed Susa, pulling down buildings, looting, and sowing the land of Elam with salt. of Iran is derived from Susiana. The stylized shapes of animals and birds are used, their curves and contrasting angularities skillfully adapted to the sensitive shapes of the clay vessels in a manner that implies a long history of evolutionary experiment. The simplified silhouettes, which once must have appeared as individual figures, are linked together in a repetitive frieze to form a band of enrichment or to articulate some plastic feature. Nothing of this sort is to be seen in the contemporary Ubaid pottery of southern Mesopotamia, although the two cultures show a parallel progression.

In the succeeding Protoliterate period each produced an independent form of pictographic writing. In Iran, this development took place in Elam, a region bordering on southern and central Mesopotamia. The Elamite use of pictographs was short-lived, however, and for a long time no further attempt was made to develop a written language. Modern knowledge of Elamite history during the centuries that followed thus depends exclusively on references in Mesopotamian literature, occasioned by the perpetual contacts between the two countries. Trade was on a large scale, and even the wars that so frequently interrupted it supplied the Elamites with Mesopotamian goods, including works of art that could serve as a pattern for Iranian artists. The stelae of Naram-Sin and Hammurabi were among major works brought as loot to the Elamite capital at Susa, where they have since been found. It is thus understandable that the native products of Elamite artists in the 3rd millennium BC—

Mesopotamian influence

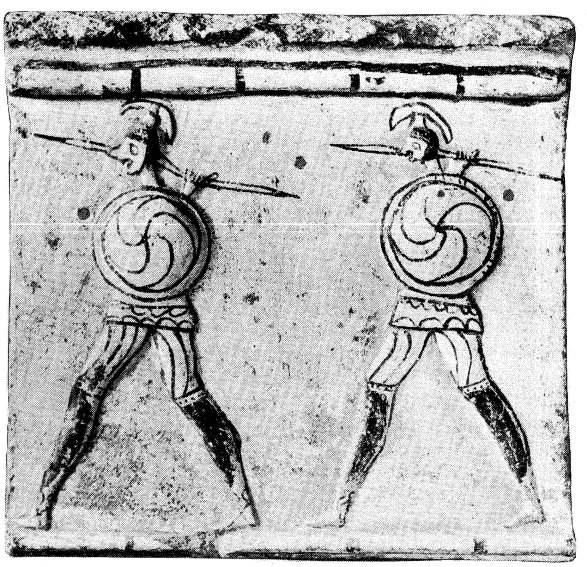
statues, reliefs, and smaller objects, such as cylinder seals—followed the conventions current in Mesopotamia. One interesting exception is a type of carved steatite bowl, at first thought to be an Elamite product but since found at sites as far apart as Mari on the Euphrates and Mohenjo-daro in the Indus Valley, where it originated, thus emphasizing the part played by Susa in transcontinental trade.

During the late 2nd millennium BC, Elam experienced a period of great prosperity and political stability under a line of powerful rulers. The character of Elamite architecture at this time was revealed by the discovery and excavation of a vast temple complex at Choga-Zambil (Dur Untash) in the Susa area. It was built by King Untash-Gal (*c.* 1265–45 BC) to fulfill the functions, first, of a holy shrine and centre of pilgrimage and, second, of a mausoleum for his family. Its central feature is a remarkably well-preserved ziggurat, 345 feet (105 metres) square and originally 144 feet (44 metres) high, built for the most part of baked bricks each weighing 18 kilograms. Apart from the fact that it has been reconstructed with four receding stages and a summit temple, the structure of the ziggurat has little in common with those in Mesopotamia. As described by one scholar,

> gates in the centre of each face led to diverging staircases up to the first stage, except on the southwest face, where a triple diverging staircase also led up to the second and higher stages.

Gates to the main stairways were flanked by glazed terracotta guardian animals—bulls or griffins. The paved area adjoining the ziggurat had a surrounding wall with im-

posing gateways. A similar outer wall enclosed a number of subsidiary temples, their dedication indicated by cuneiform inscriptions in the Elamite language. The ornamental sculptures from this complex were predominantly of glazed terra-cotta. A more striking example of contemporary Elamite sculpture is the life-size bronze statue of Queen Napirasu from Susa (now in the Louvre).



(S.H.F.L.)

The protohistoric period and the kingdom of the Medes. The beginning of the Iron Age is marked by major dislocations of cultural and historical patterns in western Iran (almost nothing is known of the eastern half of the plateau in the Iron Age). The Iron Age itself is divided into three periods: Iron Age I (*c.* 1300–*c.* 1000 BC), Iron Age II (*c.* 1000–*c.* 800/750 BC), and Iron Age III (*c.* 750–*c.* 550 BC). The latter is the archaeological equivalent of what historically can be called the Median period.

The coming of the Iranians. Though isolated groups of speakers of Indo-European languages had appeared and disappeared in western Iran in the 2nd millennium BC, it was during the Iron Age that the Indo-European Iranians rose to be the dominant force on the plateau. By the mid-9th century BC two major groups of Iranians appear in cuneiform sources: the Medes and the Persians. Of the two, the Medes were the more widespread and, from an Assyrian point of view, the more important group. When Assyrian armies raided as far east as modern Hamadān they found only Medes. In the more western Zagros they encountered Medes mixed with indigenous, non-Iranian peoples. Early in the 1st millennium, Iranian Medes already controlled almost all of the eastern Zagros and were infiltrating, if not actually pushing steadily, into the western Zagros, in some areas right up to the edge of the plateau and to the borders of lowland Mesopotamia. Persians (Parsua, Parsuash, Parsumash) also appear in roughly the same areas, though their exact location remains controversial. At times they seem to have settled in the north near Lake Urmia, at times in the central western Zagros near Bakhtaran (formerly Kermānshāh), later certainly in the southwestern Zagros somewhere near the borders of Elam, and eventually, of course, in the province of Fārs. It has been argued that these various locations represent a nomadic tribe on the move; more likely they represent more than one group of Persians. What is reasonably clear from the cuneiform sources is that these Medes and Persians (and no doubt other Iranian peoples not identified by name) were moving into western Iran from the east. They probably followed routes along the southern face of the Elburz Mountains and, as they entered the Zagros, spread out to the northwest and southeast following the natural topography of the mountains. Where they could, as, for example, along the major pass across the mountains from Hamadān to Bakhtaran, they infiltrated farther west. In doing so they met resistance from the local settled populations, who often appealed to Urartu, Assyria, and Elam for assistance in holding back the newcomers. Such appeals were, of course, most welcome to the great powers, who were willing to take advantage of the situation both to advance their interests vis-à-vis each other and to control the Iranian threat to themselves.

Penetration into the Zagros

It has been suggested that the introduction of gray and gray-black pottery into western Iran from the northeast, which signals the start of the Iron Age, is the archaeological manifestation of this pattern of a gradual movement of Iranians from east to west. The case is by no means proved but is a reasonable reading of the combined evidence. If it is so, then the earliest Iranians in the Zagros can be dated to Iron Age I times, *c.* 1300 BC. Archaeologically, the culture of Iron Age II times can be seen as having evolved out of that of the Iron Age I period, and, though the development is less clear, the same can be said of the relationship between the cultures of Iron Age II and III. The spread of the Iron Age I and II cultures in the Zagros is restricted and would appear to correspond fairly well with the distribution of Iranians known from the written documents. The distribution of the Iron Age III culture on the other hand is, at least by the 7th century, much more widespread and covers almost the whole of the Zagros. Thus, the argument that links these archaeological patterns with the Iranian migration into the area associates the Iron Age I and II cultures with the early penetration of the Iranians into the more eastern Zagros and with their infiltration westward along the major routes crosscutting the main mountain alignments. Those areas where traces of the Iron Age I and II cultures do not appear were the regions still under the control of non-Iranian indigenous groups supported by Urartu, Assyria, and Elam. The widespread Iron Age III culture is then associated with the rise to power of the Median kingdom in the 7th and early 6th

Phrygian ornament and architecture.

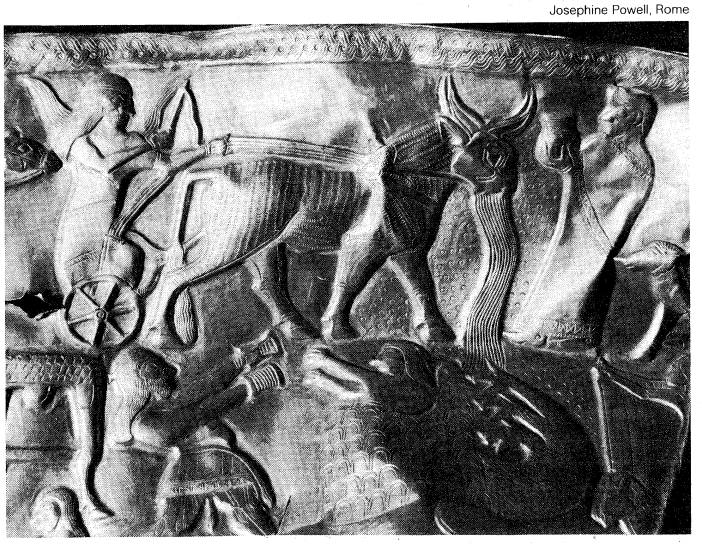
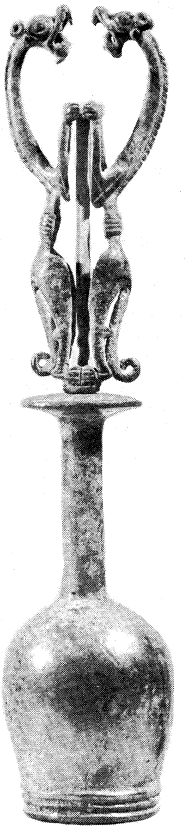
centuries BC and the Iranianization of the whole of the Zagros. (T.C.Y., Jr.)

Architecture and art. Much less is known about the northwestern part of modern Iran during the 2nd millennium BC, but, from about 1000 BC onward, it acquired a new importance. The southward migration of Indo-European peoples, many centuries earlier, that had brought the Hittites to Anatolia and the Kassites to Babylon was now followed by a new wave of peoples. Referred to as "Iranian," these peoples included both the Persians and the Medes. At first they were not more than a loose confederation of tribes, occupying a wide area of Iran south of the Caspian sea. In settling there they had bypassed the eastern provinces of Urartu and the prosperous country called Mannai, south of Lake Urmia, also avoiding contact with mountain tribes of Luristan. In the 8th and 7th centuries BC, however, the weakening of Urartu and Mannai by Assyrian conquests, followed by a Scythian invasion and the final collapse of Elam, made all of western Iran accessible, and the foundations of Median Empire were laid by Cyaxares.



With this complicated infusion of new elements and influences, it is hardly surprising that Iranian art of this period shows a rich synthesis of novel characteristics. Its most conspicuous surviving products are derived from four principal sources: an excavation at Hasanlu, probably the capital of the Mannaeans; a chance-found treasure from Ziwiye (Ziwiyeh) in Iranian Kurdistan; tomb finds at Marlik, near Kazvin; and excavated graves in Luristan.

The Mannaean capital had a powerfully walled citadel, built between 1000 and 800 BC, and within it an enormous palace or temple, consisting of two-story buildings around a partially roofed courtyard. It had been destroyed by fire, and interest in its architecture, which should be considerable, has been eclipsed by the beauty of some objects recovered from the burnt debris. One was a silver cup decorated with electrum figures in two registers; there are chariots and soldiers above and, below, a lion and a horse opposed heraldically between archers. Even more remarkable was a bowl of solid gold (Archaeological Museum, Tehrān), elaborately figured with repoussé ornament, the religious or heroic imagery of which is largely incomprehensible. Though it shows no Assyrian influence, the associations of its linear style are with the West, and some links with Hurrian mythology have been detected in the design.



Ziwiye treasure

The hilltop fortress at Ziwiye falls within the territory of the Mannaean state, but the famous treasure found there dates from its later history (7th century BC). The marvellously designed objects making up the treasure include an elaborate pectoral (breast) ornament, a bracelet with lions' heads, a similarly adorned torque (rigid necklace), a ram's

head rhyton, daggers, and enrichment for furniture—all of gold. As would be expected at this period, they show a variety of styles, sometimes combined in a single design, and carry suggestions of influence from Assyria, Syria, and even Egypt. The collection is thought by some to have been the property of a Scythian chief who temporarily ruled Mannai.

Dated to a period contemporary with the foundation of the Hasanlu citadel, though removed from it geographically, are the royal tombs found at Marlik. The tombs contained gold and silver vessels, comparable in design to those found at Hasanlu, and ingeniously grotesque animal figures in terra-cotta.

The Luristan Bronzes include objects basically homogeneous in style but varying considerably in date and excavated from burial grounds in the eastern Zagros Mountains. There appear to have been more than 400 of these burial grounds, each comprising about 200 graves, so that the number of ornamental bronze objects reaching museums and private collections must have been very great. The burials appear to cover a long period of time; but two main groups have been distinguished, belonging, respectively, to the latter half of the 2nd millennium BC and to the Iron Age from 1000 BC onward. In the second period, particularly, there was a continual movement of Indo-European horsemen migrating from the north—a fact that helps to explain the character of the bronzes themselves, for they are nomads' gear. These portable goods and chattels of wandering tribes must have been produced by the settled craftsmen in the towns and villages of Iran for the nomads who passed through. Chariot or harness fittings are predominant: they include rein rings, bits, and ornaments, as well as weapons and various types of talisman. All suggest an indigenous school of craftsmanship catering to a changing clientele whose tastes and requirements varied with their origin. In the earlier group some very ancient Mesopotamian motifs are seen—rein rings, for instance, resembling those from the Ur tombs—but these have been explained as the belated

use, in the 2nd millennium, of devices long superseded within Sumer itself.

There can be little doubt that, during the first half of the 8th century, when the Medes ruled northwestern Iran from their capital at Ecbatana (Hamadan), they developed some characteristic forms of architecture; this has been confirmed, for instance, by the discovery of a magnificent brick fortress at Nush-e Jan in that area. But the evolution of a style capable of expressing the full genius of Iranian invention fell to the lot of their Persian successors and, fortunately, is better documented by material remains.

(S.H.F.L.)

The kingdom of the Medes. Traditionally, the creator of the Median kingdom was one Deioces who, according to Herodotus, reigned from 728 to 675 BC and founded the Median capital Ecbatana (modern Hamadan). Attempts have been made to associate Daiaukku, a local Zagros king mentioned in a cuneiform text as one of the captives deported to Assyria by Sargon II in 714 BC, with the Deioces of Herodotus, but such an association is highly unlikely. To judge from the Assyrian sources, no Median kingdom such as Herodotus describes for the reign of Deioces existed in the early 7th century BC; at best, he is reporting a Median legend of the founding of their kingdom.

Foundation of the capital

According to Herodotus, Deioces was succeeded by his son Phraortes (675–653 BC), who subjugated the Persians and lost his life in a premature attack against the Assyrians. Some of this tale may be true. Assyrian texts speak of a Kashtariti as the leader of a conglomerate group of Medes, Scythians, Mannaeans, and miscellaneous other local Zagros peoples that seriously threatened the peace of Assyria's eastern borderlands during the reign of Esarhaddon (680–669 BC). It is possible that Phraortes is this Kashtariti, though the suggestion cannot be proven either historically or linguistically. That a Median king in this period exerted political and military control over the Persians is entirely reasonable, though it cannot be proven.

Beginning as early as the 9th century, and with increasing impact in the late 8th and early 7th centuries, groups of nomadic warriors entered western Iran, probably from across the Caucasus. Dominant among these groups were the Scythians, and their entrance into the affairs of the western plateau during the 7th century may perhaps mark one of the important turning points in Iron Age history. Herodotus speaks in some detail of a period of Scythian domination, the so-called Scythian interregnum in Median dynasty history. His dating of this event remains uncertain, but traditionally it is seen as falling between the reigns of Phraortes and Cyaxares and as covering the years 653 to 625 BC. Whether such an interregnum ever actually occurred, and, if it did, whether it should not be dated later than this, are open questions. What is clear is that, by the mid-7th century BC, there were a great many Scythians in western Iran; that they, along with the Medes and other groups, posed a serious threat to Assyria; and that their appearance threw previous power alignments quite out of balance.

Herodotus reports how, under Cyaxares of Media (625–585 BC), the Scythians were overthrown when their kings were induced at a supper party to get so drunk that they were then easily slain. It is more likely that about this time either the Scythians withdrew voluntarily from western Iran, and went off to plunder elsewhere, or that they were simply absorbed into a rapidly developing confederation under Median hegemony. Cyaxares is a fully historical figure, who appears in the cuneiform sources as Uvakhshatra. Herodotus speaks of how Cyaxares reorganized the Median army into units built around specialized armaments: spearmen, bowmen, and cavalry. The unified and reorganized Medes were a match for the Assyrians. They attacked one of the important Assyrian border cities, Arrapkha, in 615 BC, surrounded Ninevah in 614 BC but were unable to capture it, and instead successfully stormed the Assyrian religious capital, Ashur. An alliance between Babylon and the Medes was sealed by the betrothal of Cyaxares' granddaughter to Nabopollassar's son, Nebuchadrezzar II (605–562 BC). In 612 BC the attack on Ninevah was renewed and the city fell in late August (the Babylonians arrived rather too late to participate fully in the battle). The Babylonians and the Medes together pursued the fleeing Assyrians westward into Syria. Assyrian appeals to Egypt for help came to nought, and the last Assyrian ruler, Ashur-uballit II, disappeared from history in 609 BC.

Defeat of the Assyrians

The problem, of course, was how to divide the spoils among the victors. The cuneiform sources are comparatively silent, but it would seem that the Babylonians fell heir to all of the Assyrian holdings within the fertile crescent, while their allies took over all of the highland areas. The Medes gained control over the lands in eastern Anatolia that had once been part of Urartu and eventually became embroiled in war with the Lydians, the dominant political power in western Asia Minor. In 585 BC, probably through the mediation of the Babylonians, peace was established between Media and Lydia, and the Halys (Kızıl) River was fixed as the boundary between the two kingdoms. Thus a new balance of power was established in the Near East among Medes, Lydians, Babylonians, and, far to the south, Egyptians. At his death, Cyaxares controlled vast territories: all of Anatolia to the Halys, the whole of western Iran eastward, perhaps as far as the area of modern Tehrān (Teheran), and all of southwestern Iran, including Fārs. Whether it is appropriate to call these holdings a kingdom is debatable; one suspects that authority over the various peoples, Iranian and non-Iranian, who occupied these territories was exerted in the form of a confederation such as is implied by the ancient Iranian royal title, king of kings.

Astyages followed his father, Cyaxares, on the Median throne (585–550 BC). Comparatively little is known of his reign. All was not well with the alliance with Babylon, and there is some evidence to suggest that Babylonia may have feared Median power. The latter, however, was soon in no position to threaten others, for Astyages was himself under attack. Indeed, Astyages and the Medians were soon overthrown by the rise to power in the Iranian world of Cyrus II the Great of Persia.

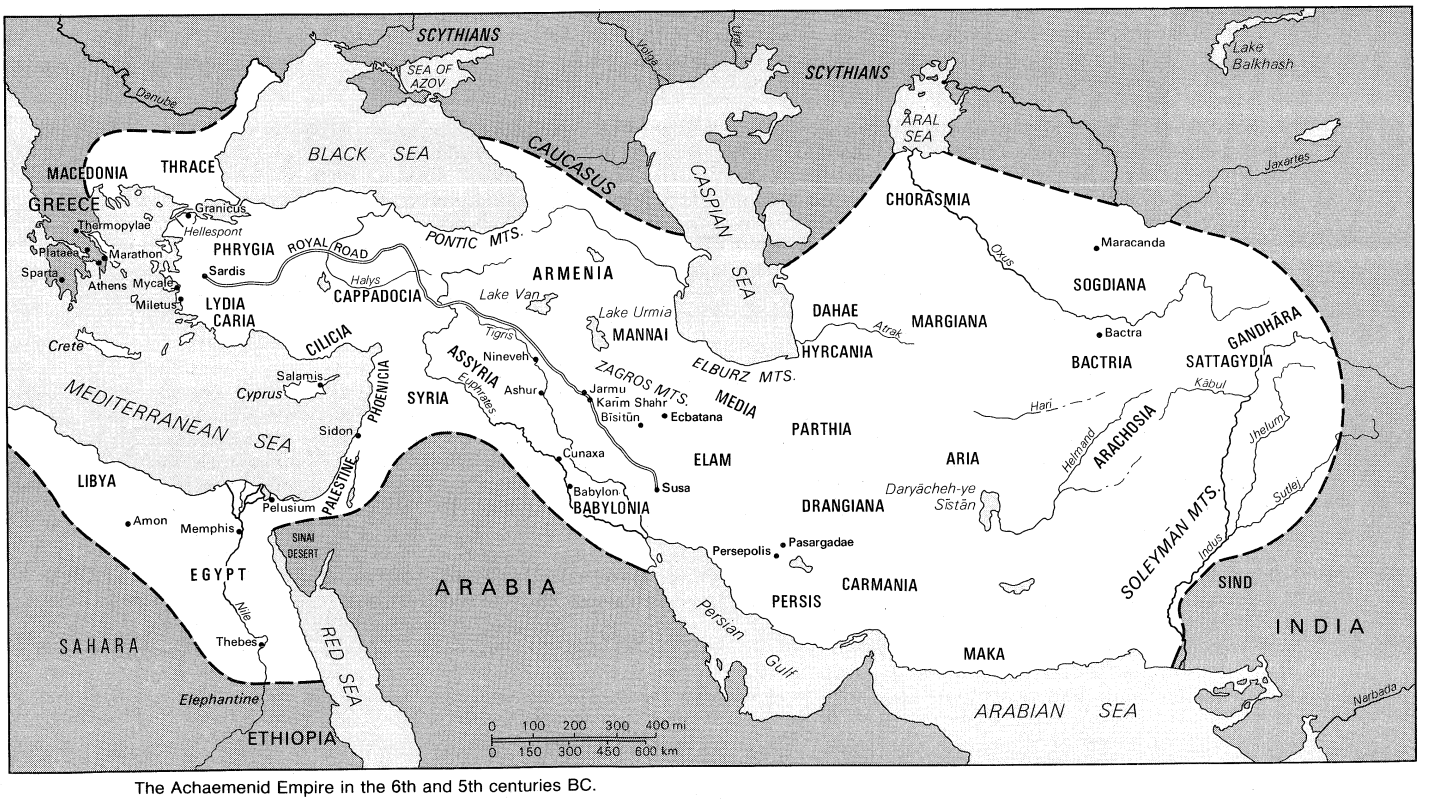
The rise of the Persians under Cyrus II. The ruling dynasty of the Persians settled in Fārs in southwestern Iran (possibly the Parsumash of the later Assyrian records) traced its ancestry back to an eponymous ancestor, Hāxamanish, or Achaemenes. There is no historical evidence of such a king's existence. Traditionally, three rulers fall between Achaemenes and Cyrus II: Teispes, Cyrus I, and Cambyses I. Teispes, freed of Median domination during the so-called Scythian interregnum, is thought to have expanded his kingdom and to have divided it on his death between his two sons, Cyrus I and Ariaramnes. Cyrus I may have been the king of Persia who appears in the records of Ashurbanipal swearing allegiance to Assyria after the devastation of Elam in the campaigns of 642–639 BC, though there are chronological problems involved with this equation. When Median control over the Persians was supposedly reasserted under Cyaxares, Cambyses I is thought to have been given a reunited Persia to administer as a Median vassal. His son, Cyrus II, married the daughter of Astyages and in 559 BC inherited his father's position within the Median confederation. Cyrus II certainly warranted his later title, Cyrus the Great. He must have been a remarkable personality, and certainly he was a remarkable king. He united under his authority several Persian and Iranian groups who apparently had not been under his father's control. He then initiated diplomatic exchanges with Nabonidus of Babylon (556–539 BC), which justifiably worried Astyages. Eventually, he openly rebelled against the Medes, who were beaten in battle when considerable numbers of Median troops deserted to the Persian standard. Thus, in 550 BC, the Median Empire became the first Persian Empire, and the Achaemenid kings appeared on the international scene with a suddenness that must have frightened many.

Rise of Cyrus the Great

Cyrus immediately set out to expand his conquests. After apparently convincing the Babylonians that they had nothing to fear from Persia, he turned against the Lydians under the rule of the fabulously wealthy Croesus. Lydian appeals to Babylon were to no avail. He then took Cilicia, thus cutting the routes over which any help might have reached the Lydians.

Croesus attacked and an indecisive battle was fought in 547 BC on the Halys River. Since it was late in the campaigning season, the Lydians thought the war was over for that year, returned to their capital at Sardis, and dispersed the national levy. Cyrus, however, kept coming. He caught and besieged the Lydians in the citadel at Sardis and captured Croesus in 546 BC. Of the Greek city-states along the western coast of Asia Minor, heretofore under Lydian control, only Miletus surrendered without a fight. The others were systematically reduced by the Persian armies led by subordinate generals. Cyrus himself was apparently busy elsewhere, possibly in the east, for little is known of his activities between the capture of Sardis and the beginning of the Babylonian campaign in 540 BC.

Nowhere did Cyrus display his political and military genius better than in the conquest of Babylon. The campaign actually began when he lulled the Babylonians into inactivity during his war with Lydia, which, since it was carried to a successful conclusion, deprived the Babylonians of a potential ally when their turn came. Then he took maximum advantage of internal disaffection and discontent within Babylon. Nabonidus was not a popular king. He had paid too little attention to home affairs and had alienated the native Babylonian priesthood. Second Isaiah, speaking for many of the captive Jews in Babylon, was undoubtedly not the only one of Nabonidus' subjects who looked to Cyrus as a potential deliverer. With the stage thus set, the military campaign against Babylon came almost as an anticlimax. The fall of the greatest city in the Near East was swift; Cyrus marched into town in the late summer of 539 BC, seized the hands of the statue of the city god Marduk as a signal of his willingness to rule as a Babylonian not as a foreign conquerer, and was hailed by many as the legitimate successor to the throne. In one stride Cyrus carried Persian power to the borders of Egypt, for with Babylon came all that it had seized from the Assyrians and had gained in the sequel.



The fall of Babylon

Little is known of the remainder of Cyrus' reign. The rapidity with which his son and successor, Cambyses II, initiated a successful campaign against Egypt suggests that preparations for such an attack were well advanced under Cyrus. But the founder of Persian power was forced to turn east late in his reign to protect that frontier against warlike tribes who were themselves in part Iranians and who threatened the plateau in the same manner as had the Medes and the Persians more than a millennium earlier. One of the recurrent themes of Iranian history is the threat of peoples from the east. How much Cyrus conquered in the east is uncertain. What is clear is that he lost his life in 529 BC, fighting somewhere in the region of the Oxus and Jaxartes rivers.

The Achaemenid dynasty. *Cambyses.* On the death of Cyrus the Great the empire passed to his son, Cambyses II (529–522 BC). There may have been some degree of unrest throughout the empire at the time of Cyrus' death, for Cambyses apparently felt it necessary secretly to kill his brother, Bardiya (Smerdis), in order to protect his rear while leading the campaign against Egypt in 525 BC. The pharaoh Ahmose II of the 26th dynasty sought to shore up his defenses by hiring Greek mercenaries, but was betrayed by the Greeks. Cambyses successfully managed the crossing of the hostile Sinai Desert, traditionally Egypt's first and strongest line of defense, and brought the Egyptians under Psamtik III, son and successor of Ahmose, to battle at Pelusium. The Egyptians lost and retired to Memphis; the city fell to the Persians and the Pharaoh was carried off in captivity to Susa. Three subsidiary campaigns were then mounted, all of which are reported as failures: one against Carthage, but the Phoenician sailors, who were the backbone of the Persian navy, declined to sail against their own colony; one against the oasis of Amon (in the Egyptian desert west of the Nile), which, according to Herodotus, was defeated by a massive sandstorm; and one led by Cambyses himself to Nubia. This latter effort was partly successful, but the army suffered badly from a lack of proper provisions on the return march. Egypt was then garrisoned at three major points: Daphnae in the east delta, Memphis, and Elephantine, where Jewish mercenaries formed the main body of troops.

Cambyses' campaign against Egypt

In 522 BC news reached Cambyses of a revolt in Iran led by an impostor claiming to be Bardiya, Cambyses' brother. Several provinces of the empire accepted the new ruler, who bribed his subjects with a remission of taxes for three years. Hastening home to regain control, Cambyses died—possibly by his own hand, more probably from infection following an accidental sword wound. Darius, a leading general in Cambyses' army and one of the princes of the Achaemenid family, raced homeward with

The Achaemenid Empire in the 6th and 5th centuries BC.

the troops in order to crush the rebellion in a manner profitable to himself.

Cambyses has been rather mistreated in the sources, thanks partly to the prejudices of Herodotus' Egyptian informers and partly to the propaganda motives of Darius I. He is reported to have ruled the Egyptians harshly and to have desecrated their religious ceremonies and shrines. His campaigns out of Egypt were all reported as failures. He was accused of suicide in the face of revolt at home. It was even suggested that he was mad. There is, however, little solid contemporary evidence to support these charges.

Darius I. Darius I, later called the Great, tells the story of the overthrow of Bardiya and of the first year of his own rule in detail in his famous royal inscription cut on a rock face at the base of Bīsitūn mountain, a few miles east of modern Bakhtaran. Six leading Achaemenid nobles assisted in slaying the false Bardiya and together proclaimed Darius the rightful heir of Cambyses. Darius was a member of the Achaemenid royal house. His great-grandfather had been Ariaramnes, son of Teispes, who had shared power in Persia with his brother Cyrus I. Ariaramnes' son, Arsames, and his grandson, Hystaspes (Darius' father), had not been kings in Persia, as unified royal power had been placed in the hands of Cambyses I by Cyaxares. Neither is named a king in Darius' own inscriptions. Hystaspes was, however, an important prince of the blood, who, at the time of revolt of the false Bardiya had apparently been the governor of Parthia. Darius himself was in the mold of Cyrus the Great—a powerful personality and a dynamic ruler.

It took more than a year (522–521 BC) of hard fighting to put down revolts associated with Bardiya's claim to the throne and Darius' succession to power. Almost every province of the empire was involved, including Persia and, most particularly, Media. A balanced policy of clemency backed by the swift and thorough punishment of any captured rebel leader, combined with a well-coordinated and carefully timed distribution of loyal forces, eventually brought peace to the empire and undisputed power to Darius. He then turned his attention to the organization and consolidation of his inheritance, and it was for this role—that of lawgiver and organizer—that he himself, to judge from his inscriptions, most wished to be remembered.

Darius' campaign of expansion

Such activities, however, did not prevent Darius from following an active expansionist policy. Campaigns to the east confirmed gains probably made by Cyrus the Great and added large sections of the northern Indian subcontinent to the list of Persian-controlled provinces. Expansion in the west began about 516 BC when Darius moved against the Hellespont as a first step toward an attack on the Scythians along the western and northern shores of the Black Sea. The real strategic purpose behind this move probably was to disrupt and if possible to interrupt Greek trade with the Black Sea area, which supplied much grain to Greece. Crossing into Europe for the first time, Darius campaigned with comparatively little success to the north of the Danube. He retreated in good order, however, with only limited losses, and a bridgehead across the Hellespont was established.

Perhaps in part in response to these developments, perhaps for more purely internal reasons, the Ionian Greek cities on the west coast of Asia Minor revolted against Persian rule in 500 BC. The Persians were apparently taken by surprise, and at first the rebellion prospered. The Ionians received some limited assistance from the Athenians and in 498 BC felt strong enough to take the offensive. With one hand Darius negotiated; with the other he assembled a counterattack. The first Persian military efforts proved only partially successful, however and the Ionians enjoyed another respite in the years 496–495 BC. A renewed Persian offensive in 494 BC was successful. The Greek fleet was badly beaten off Miletus, and the Persian land army began a systematic reduction of the rebel cities. In *c.* 492 BC Mardonius, a son-in-law of Darius, was made special commissioner to Ionia. He suppressed local tyrants and returned democratic government to many cities. In time the wounds caused by the revolt and its suppression healed, and by 481 BC Xerxes was able to levy troops in this region with little trouble.

By 492 BC Mardonius had also recovered Persian Thrace and Macedonia, first gained in the campaign against the Scythians and lost during the Ionian Revolt. There followed the Persian invasion of Greece that led to Darius' defeat at the Battle of Marathon on August 12, 490 BC. The "Great King" was forced to retreat and to face the fact that the Greek problem, which had probably seemed to the Persians a minor issue on the western extremity of the empire, would require a more concerted and massive effort. Thus began preparations for an invasion of Greece on a grand, coordinated scale. These plans were interrupted in 486 BC by two events: a serious revolt in Egypt, and the death of Darius.

Xerxes I. Xerxes (486–465 BC), Darius' eldest son by Queen Atossa, was born after his father had come to the throne; he had been designated official heir perhaps as early as 498 BC, and while crown prince he had ruled as the King's governor in Babylon. The new King quickly suppressed the revolt in Egypt in a single campaign in 485 BC. Xerxes then broke with the policy followed by Cyrus and Darius of ruling foreign lands with a fairly light hand and, in a manner compatible with local traditions, ruthlessly ignored Egyptian forms of rule and imposed his will on the rebellious province in a thoroughly Persian style. Plans for the invasion of Greece begun under Darius were then still further delayed by a major revolt in Babylonia about 482 BC, which also was suppressed with a heavy hand.

Invasion of Greece

Xerxes then turned his attention westward to Greece. He wintered in Sardis in 481–480 BC and thence led a combined land and sea invasion of Greece. Northern Greece fell to the invaders in the summer of 480, the Greek stand at Thermopylae in August of 480 came to nought, and the Persian land forces marched on Athens, taking and burning the Acropolis. But the Persian fleet lost the Battle of Salamis and the impetus of the invasion was blunted. Xerxes, who had by then been away from Asia rather long for a king with such widespread responsibilities, returned home and left Mardonius in charge of further operations. The real end of the invasion came with the Battle of Plataea, the fall of Thebes (a stronghold of pro-Persian forces), and the Persian naval loss at Mycale in 479 BC. Of the three, the Persian loss at Plataea was perhaps the most decisive. Up until Mardonius was killed, the issue of the battle was probably still in doubt, but once leaderless, the less organized and less disciplined Persian forces collapsed. Time and again in later years this was to be the pattern in such encounters, for the Persians never solved the military problem posed by the disciplined Greek hoplites.

The formation of the Delian League, the rise of Athenian imperialism, troubles on the west coast of Asia Minor, and the end of Persian military ambitions in the Aegean followed rapidly in the decade after Plataea. Xerxes probably lost interest in the proceedings and sank deeper and deeper into the comforts of life in his capital cities of Susa, Ecbatana, and Persepolis. Harem intrigues, which were steadily to sap the strength and vitality of the Achaemenid Empire, led to the assassination of the Great King in 465 BC.

Artaxerxes I to Darius III. The death of Xerxes was a major turning point in Achaemenid history. Occasional flashes of vigour and intelligence by some of Xerxes' successors were too infrequent to prevent eventual collapse but did allow the empire to die gradually. It is a tribute to Cyrus, Cambyses, and Darius that the empire they constructed was as resilient as it proved to be after Xerxes.

The three kings that followed Xerxes on the throne—Artaxerxes I (464–425 BC), Xerxes II (425–424 BC), and Darius II (423–404 BC)—were all comparatively weak individuals and kings, and such successes as the empire enjoyed during their reigns were mainly the result of the efforts of subordinates or of the troubles faced by their adversaries. Artaxerxes I faced several rebellions, the most important of which was that of Egypt in 459 BC, not fully suppressed until 454 BC. An advantageous peace (the Peace of Callias) with Athens was signed in 448 BC, whereby the Persians agreed to stay out of the Aegean and the Athenians agreed to leave Asia Minor to the Achaemenids. Athens broke the peace in 439

BC in an attack on Samos, and in its aftermath the Persians made some military gains in the west. Xerxes II ruled only about 45 days and was killed in a drunken stupor by the son of one of his father's concubines. The assassin was himself killed by Darius II, who rose to the throne through palace intrigue. Several revolts marred his reign, including one in Media, which was rather close to home.

The Peloponnesian War

The major event of these three reigns was the Peloponnesian War between Sparta and Athens that lasted, with occasional pauses, from 460 to 404 BC. The situation was ripe for exploitation by the famous "Persian archers," the gold coins of the Achaemenids that depicted an archer on their obverse and that were used with considerable skill by the Persians in bribing first one Greek state and then another. Initially, the Persians encouraged Athens against Sparta, and from this gained the treaty of Callias. Then, after the disastrous Athenian campaign against Sicily in 413 BC, the Persians intervened on Sparta's side. By the treaty of Miletus in 412 BC, Iran recovered complete freedom in western Asia Minor in return for agreeing to pay for seamen to man the Peloponnesian fleet. Persian gold and Spartan soldiers brought about Athens' fall in 404 BC. Despite the fact that the Persians played the two sides against each other to much advantage, they should have done better. One observes a certain lack of control from Susa by the king in these proceedings, and the two principal governors in Asia Minor who were involved, Tissaphernes of Sardis and Pharnabazus of Hellespontine Phrygia, seemed to have permitted a personal power rivalry to stand in the way of a really coordinated Persian intervention in the Greek war.

Artaxerxes II came to the throne in 404 BC and reigned until 359 BC. The main events of his long rule were the war with Sparta that ended with a peace favourable to the Persians; the revolt and loss to the empire of Egypt; the rebellion of Cyrus the Younger, brother of the king; and the uprising known as the revolt of the satraps.

Sparta, triumphant over Athens, built a small empire of its own and was soon involved in a war against the Persians, the principal issue again being the Greek cities of Asia Minor. While Sparta played one Persian governor in Anatolia against the other, the Persians spent gold in Greece to raise rebellion on Sparta's home ground. The Persians rebuilt their fleet and placed a competent Athenian admiral, Conon, in command. The contest continued from 400 to 387, with Sparta forced to act on an ever-shrinking front. A revitalized Athens, supported by Persia, created a balance of power in Greece, and eventually Artaxerxes was able to step in, at Greek request, and dictate the so-called King's Peace of 387–6 BC. Once again the Greeks gave up any claim to Asia Minor and further agreed to maintain the status quo in Greece itself. When Egypt revolted in 405 BC, Persia was unable to do much about it, and from this point forward Egypt remained essentially an independent state.

Cyrus the Younger, though caught in an assassination attempt at the time of Artaxerxes' coronation, was, nevertheless, forgiven, thanks to the pleadings of the Queen Mother, and was returned to the command of a province in Asia Minor. But he revolted again in 401 BC and, supported by 10,000 Greek mercenaries, marched eastward to contest the throne. He was defeated and killed at the Battle of Cunaxa in Mesopotamia in the summer of 401. The Greek mercenaries, however, were not broken and, though harried, left the field in good order and began their famous march, recorded in the *Anabasis* of Xenophon, north to the Black Sea and home. Probably no other event in late Achaemenid history revealed more clearly to the Greeks the essential internal weakness of the Achaemenid Empire than the escape of so large a body of men from the very heart of the Great King's domain.

Revolt of the satraps

Since 379 BC Greek mercenaries had been gathered together in order to mount a campaign against Egypt. An attack in 373 failed against the native 30th dynasty. On the heels of this failure came the revolt of the satraps. Several satraps, or provincial governors, rose against the central power, and one, Aroandas, a late satrap of Armenia, went so far as to stamp his own gold coinage as a direct challenge to Artaxerxes. The general plan of the rebels appears to have been for a combined attack. The rebel satraps were to coordinate their march eastward through Syria with an Egyptian attack, under the pharaoh Tachos (Zedhor), supported by Greek mercenaries. The Egyptian attack was called off because of a revolt in Egypt by Tachos' brother, and Artaxerxes managed to defeat the satraps who were left alone to face the Great King's wrath. How different would have been the wrath of Darius! Several of the satraps, including Aroandas, were actually forgiven and returned to their governorships. In general the impression is that, in the end, rather than fight the central authority, the satraps were willing to return to their own provinces and plunder there in the name of the Great King. Perhaps they saw that they actually had more authority and more control over real events in their own provincial territories than Artaxerxes had in his empire.

Reign of Artaxerxes III

Plot and counterplot, harem intrigue, and murder brought Artaxerxes III to the throne in 359 BC. He promptly exterminated many of his relatives who might have challenged his rule—all to no avail, for revolts continued to rock the empire. A fresh attempt to win back Egypt was thrown back in 351–350. This setback encouraged revolt in Sidon and eventually in all of Palestine and Phoenicia. Parts of Cilicia joined the rebellion but the revolt was crushed the same year it had begun, 345 BC. Peace was achieved only temporarily; mercenaries from Thebes and the Argives, as well as from the Greek cities of Asia Minor, gathered for a new attempt on Egypt, which, led by Artaxerxes III himself, succeeded in 343 BC. But the local dynasty fled south to Nubia, where it maintained an independent kingdom that kept alive the hopes of a national revival. Persia then misplayed its hand in Greece by refusing aid to Athens against the rising power of Philip II of Macedon. In 339 BC Persian troops were fighting alone in Thrace against the Macedonians, and in the following year, at the Battle of Chaeronea, Philip extended his hegemony over all of Greece—a united Greece that was to prove impervious to Persian gold.

Artaxerxes was poisoned by his physician at the order of the eunuch Bagoas. The latter made Arses king (338–336 BC) in hopes of being the power behind the throne, but Arses did not bend easily to Bagoas' will. He attempted to poison the kingmaker but was himself killed in retaliation. Bagoas then engineered the accession of Darius III, a 45-year-old former satrap of Armenia. So many members of the royal house had been murdered in the court intrigue that Darius probably held the closest blood claim to the throne by virtue of being the grandnephew of Artaxerxes II. Darius was able to put down yet another rebellion in Egypt under Khababash in 337–336 BC, but the beginning of the end came soon afterward, in May 334, with the loss of the Battle of Granicus to Alexander the Great. Persepolis fell to the invader in April 330, and Darius, the last Achaemenid, was murdered in the summer of the same year while fleeing the conqueror. His unfinished tomb at Persepolis bears witness to his lack of preparation.

The invasion of Alexander the Great

Alexander did not win his victories easily, however, and the catalog of troubles that marked the latter part of the Achaemenid Empire—rebellions, murders, weak kings trapped in the harem, missed chances, and foolish policies—cannot be the whole story. The sources, mostly Greek, are often prejudiced against the Persians and tend to view events from but a single point of view. No government could have lasted so long, found its way somehow through so many difficulties, and in the end actually have fought so hard against the conqueror without having much virtue with which to balance its vices.

Achaemenid society and culture. Achaemenid society and culture was in reality the collective societies and cultures of the many subject peoples of the empire. From this mosaic it is sometimes difficult to sort out that which is distinctively Persian or distinctively a development of the Achaemenid period, and therefore perhaps an early Iranian contribution to general Near Eastern society and culture.

Language. The languages of the empire were as varied as its peoples. The Persians, at least originally, spoke Old Persian, a southwestern dialect of Iranian (Median was

a northwestern Iranian dialect), but they were illiterate. Their language was first written when Darius commanded that a script suitable for this purpose be invented so that he might inscribe the record of his rise to power at Bīsitūn (the inscriptions in Old Persian are attributed to earlier kings as either late historical forgeries or as probably written during the reign of Darius). That few could read Old Persian might be the reason why Darius at Bīsitūn established the tradition that royal inscription should be trilingual in Old Persian, Babylonian, and Elamite. Old Persian was never a working written language of the empire. Elamite, written on clay tablets, appears to have been the language of many of the administrators in Fārs and, it may be assumed, in Elam. Archives of administrative documents in Elamite have been found at Persepolis. Aramaic, however, was the language of much of the empire and was probably the language most used in the imperial bureaucracy. The beginnings of the strong influence of Aramaic on Persian, which is so evident in the Middle Persian of Sāsānian times, can already be seen in the Old Persian royal inscriptions of late Achaemenid times.

Social organization. Little is known of Iranian social organization in the period. In general, it was based on feudal lines that were in part drawn by economic and social function. Traditional Indo-Iranian society consisted of three classes, the warriors or aristocracy, the priests, and the farmers or herdsmen. Crosscutting these divisions was a tribal structure based on patrilineal descent. The

Kingship

title king of kings, used even in the 20th century by the shahs of Iran, implies that the central authority exercised power through a pyramidal structure that was controlled at levels below the supreme authority by individuals who were themselves, in a certain sense, kings. Traditionally the king was elected from a particular family by the warrior class; he was sacred, and a certain royal charisma attached to his person.

Such a method of organizing and controlling society undoubtedly changed under the influences and demands of imperial power and underwent much modification as Iranians increasingly borrowed social and political ideas from the peoples they ruled. Even in later times, nevertheless, there is evidence that the original Iranian concepts of kingship and social organization were still honoured and remained the ideals of Persian culture.

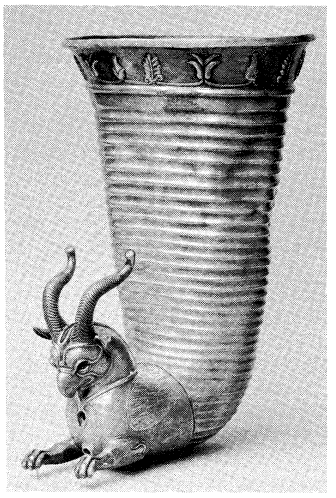
Religion. Iranian religion in the pre-Achaemenid and Achaemenid periods is a subject on which there is little scholarly agreement. When the Iranians first entered the semilight of the protohistoric period, they were certainly polytheists whose religious beliefs and practices closely paralleled other Indo-Iranian and Indo-European groups at the same stage in history. Their gods were associated with natural phenomena; with social, military, and economic functions; and with abstract concepts such as justice and truth. Their religious practices included, among others, animal sacrifice, a reverence for fire, and the drinking of the juice of the haoma plant, a natural intoxicant.

Probably around 600 BC there arose in the northeast of the plateau the great Iranian religious prophet and teacher,

Zoroastrianism

Zoroaster. The history of the religion that he founded is even more complicated and controversial than the history of pre-Zoroastrian Iranian religion. Yet certain features of his religious reform stand out. He was an ethical prophet of the highest rank, stressing constantly the need for man to act righteously and to speak the truth and abhor the lie. In his teaching the lie was almost personified as the Druj, chief in the kingdom of the demons, to which he relegated many of the earlier Indo-Iranian deities. His god was Ahura Mazdā, who, it seems likely, was a creation in name and attributes of Zoroaster. Though in a certain sense technically monotheism, early Zoroastrianism viewed the world in strongly dualistic terms, for Ahura Mazdā and the "Lie" were deeply involved in a struggle for the soul of man. Zoroaster, as might be expected, attempted to reform earlier Iranian religious practices as well as beliefs. He first rejected and then perhaps allowed the practice of the haoma cult in a modified form; he clearly condemned the practice of animal sacrifice; and he elevated to central importance in the ritual a reverence for fire. Fire worship, however, is a misnomer since the Zoroastrians have never worshipped fire but rather have revered it as the symbol *par excellence* of truth.

The crucial question is: were the Achaemenids Zoroastrians or at least followers of the prophet in the terms in which they understood his message? Possibly Cyrus the Great was, probably Darius I was, and almost certainly Xerxes and his successors were. Such a simple answer to the question is possible, however, only if we understand that Zoroastrianism as a religion had already undergone considerable development and modification since Zoroaster's lifetime, influenced by beliefs and practices and by the religions of those people of the Near East with whom the expanding Iranians had intimate contact.



The god of the Achaemenid kings was the great Ahura Mazdā, from whom they understood they had received their empire and with whose aid they accomplished all deeds. Xerxes and his successors mention other deities by name, but Ahura Mazdā remains supreme. Darius I names only Ahura Mazdā in his inscriptions. More significant, however, is Darius' tone, which is entirely compatible with the moral tone of Zoroaster and, in some instances, even compatible with details of Zoroaster's theology. During the reigns of Darius and Xerxes the archaeological record reveals that religious rituals were in force that were also compatible with an evolved and evolving Zoroastrianism. The haoma cult was practiced at Persepolis, but animal sacrifice is not attested. More important, fire clearly played a central role in Achaemenid religion.

There may have been religious overtones in the quarrel between Cambyses and Darius on the one hand and the false Bardiya, a Magian or Median priest, on the other. Certainly there were religious as well as political motivations behind Xerxes' suppression of the Daeva worshippers and the destruction of their temple. It is possible that there was some conflict among the royal Achaemenids, who were followers of one form of Zoroastrianism, the supporters of a different version of Zoroastrianism as practiced by other Iranians, believers in older forms of Iranian religion, and foreign religions, which in the light of the Prophet's teachings were reprehensible. Compromises and syncretism, however, probably could not be prevented. Though the Zoroastrian calendar was adopted as the official calendar of the empire in the reign of Artaxerxes I, by the time of Artaxerxes II, the ancient Iranian god Mithra and the goddess Anahita had been accepted in the royal religion alongside Ahura Mazdā.

Thus, in a sense, the Achaemenid kings were Zoroastrians, but Zoroastrianism itself was probably no longer exactly the religion Zoroaster had attempted to establish. What the religion of the people beyond court circles may have been is almost impossible to say. One suspects that a variety of ancient Iranian cults and beliefs were prevalent. The Magi, the traditional priests of the Medes, may have wielded more influence in the countryside than they did at court, and popular beliefs and practices may have been more deeply influenced by contact with other peoples and other religions. Later classical Zoroastrianism, as known in the Sāsānian period, was an amalgam of such popular cults, of the religion of the Achaemenid court, and of the teachings of the Prophet in their purer form (see also ZOROASTRIANISM AND PARSIISM). (T.C.Y., Jr.)

Art. Achaemenid art, like Achaemenid religion, was a blend of many elements. For Cyrus and his successors the access of temporal power and authority called for expression in the embellishment of their cities and the creation of an appropriately magnificent setting for their everyday lives. For an unsophisticated and hitherto nomadic people, this was an unprecedented requirement. Inspiration was at first sought in the existing formulas of Mesopotamia, Elam, Urartu, and Media, but from the beginning the matrix of the new style was the deep-seated artistic aptitude of the Iranians themselves. The marvels of Achaemenian art were conceived with native—and extraordinary—ingenuity. This continued to be the case even after the large-scale importation of Greek craftsmen in the time of Darius the Great (reigned 522–486 BC).

Architecture. The earliest stages in the evolution of Achaemenian architecture are to be seen in the rather scanty remains of Cyrus' capital city at Pasargadae, north of

Griffon rhyton (drinking vessel), silver, from the Oxus Treasure, Achaemenid period (559–330 BC). In the British Museum.

Persepolis. The layout retained the character of an nomadic encampment: widely separated buildings—including gatehouse, residential palace, and audience hall—standing in a vast park, surrounded by a wall 13 feet (four metres) thick. The audience hall provides the earliest example of a formula in design that was to become a criterion of the Achaemenian architecture: a columned hall with corner towers and external colonnades, called by the Persians an *apadana.* Other features are the Tomb of Cyrus, a gabled stone building on a stepped plinth, and a Zoroastrian fire temple (Zendan), a tower-like structure the plan of which recalls the standard Urartian temple. Replicas of the Zendan were built later at Naqsh-e Rostam and elsewhere. Also at Pasargadae, the workmanship of Greek stonemasons was already recognizable, but their full contribution to the new Achaemenian style of architecture is better seen at Persepolis, to which Darius transferred the state capital in 518 BC.

Achaemenian palaces

Achaemenian palaces are built on rock terraces levelled to receive them. The terrace at Persepolis measures approximately 1,600 × 1,000 feet (500 × 300 metres) and is over 43 feet (13 metres) high, with traces of a high enclosure wall of mud brick and around its outer edge and a magnificent stairway approach at its northeast corner. The palace buildings themselves, started by Darius in 518 BC and completed during the following half century by Xerxes and Artaxerxes I, are rather closely grouped together, with little consideration for the overall composition. They are decorated, for the most part externally, with portal sculptures and long ranges of relief carving. Apart from the ornamental facades of the stairways by which the buildings are approached, sculpture is confined to the decoration of doors or windows. These stone-built features together with a few internal columns are all that have survived.

In the absence of the mud-brick walls themselves, it is difficult to gain a true impression of the terrace's original appearance. Most characteristic of these Persian palaces is the proliferation of columns and the tendency to plan them around a square central chamber. In the main gatehouse, with its guardian bulls and bull-men, the square appears as an independent unit. Facing it at a higher level is the largest building of all, the great Apadana (hall) of Darius. It is 272 feet (83 metres) square and said to have accommodated 10,000 people. The four corner towers presumably contained guardrooms and stairs. The sculptured stairway by which it was reached bears the famous relief of the tribute bearers. Next comes the Throne Hall or Hall of a Hundred Columns. It has a portico on the north side with 16 pillars and guardian bulls built into the tower walls at either end. Seven sculptured windows in the north wall are balanced by corresponding niches elsewhere, and the reveals, or jambs, of the doors are also decorated with reliefs. Again approached by an ornamental stairway, a "tripylon" unit between these main buildings leads to others only tentatively identified. The plan of the building, called the Harlem by archaeologists, is to some extent self-explanatory. The character of the Treasury is indicated by security precautions in its planning. In this building the columns were of wood, heavily plastered and painted in bright colours. Elsewhere, columns are fluted in the Greek manner, while the more elaborate capitals and bases have a floral treatment that, like much other Achaemenian ornament, is half Greek and half Egyptian. The most notable form of capital and one peculiar to Achaemenian design is the "double-figure" impost (an upper addition to the capital), taking the form of paired bulls, bull-men, or dragons. Some of these features reappear in the contemporary palace at Susa. Also from this source are figured panels of molded and glazed brick (now in the Louvre), reminiscent of Nebuchadrezzar's Babylon.

(S.H.F.L.)

The palace at Susa

In describing, with justifiable pride, the construction of his palace at Susa, Darius says,

> The cedar timber—a mountain by name Lebanon—from there it was brought . . . the *yakā*-timber was brought from Gandara and from Carmania. The gold was brought from Sardis and from Bactria . . . the precious stone lapis-lazuli and carnelian . . . was brought from Sogdiana. The . . . turquois from Chorasmia . . . The silver and ebony . . . from Egypt . . . the ornamentation from Ionia . . . the ivory . . . from Ethiopia and from Sind and from Arachosia . . . The stone-cutters who wrought the stone, those were Ionians and Sardians. The goldsmiths . . . were Medes and Egyptians. The men who wrought the wood, those were Sardians and Egyptians. The men who wrought the baked brick, those were Babylonians. The men who adorned the wall, those were Medes and Egyptians.

This was an imperial art on a scale the world had not seen before. Materials and artists were drawn from all the lands ruled by the Great King, and thus tastes, styles, and motifs became mixed together in an eclectic art and architecture that in itself mirrored the empire and the Persians' understanding, of how that empire ought to function. Yet the whole was entirely Persian. Just as the Achaemenids were tolerant in matters of local government and custom, as long as Persians controlled the general policy and administration of the empire, so also were they tolerant in art so long as the finished and total effect was Persian. At Pasargadae, the capital of Cyrus the Great and Cambyses in Fārs, the Persian homeland, and at Persepolis, the neighbouring city founded by Darius the Great and used by all of his successors, one can trace to a foreign origin almost all of the several details in the construction and embellishment of the architecture and the sculptured reliefs, but the conception, planning, and overall finished product are distinctly Persian and could not have been created by any of the foreign groups who supplied the king of kings with artistic talent. So also with the small arts, at which the Persians excelled: fine metal tableware, jewelry, seal cutting, weaponry and its decoration, and pottery. It has been suggested that the Persians called on the subject peoples for artists because they were themselves crude barbarians with little taste and needed quickly to create an imperial art to match their sudden rise to political power. Yet excavations at sites from the protohistoric period show this not to have been the case. Cyrus may have been the leader of Persian tribes not yet so sophisticated nor so civilized as the Babylonians or Egyptians, but when he chose to build Pasargadae, he had a long artistic tradition behind him that was probably already distinctly Iranian and that was in many ways the equal of any. Two examples suffice: the tradition of the columned hall in architecture and fine gold work. The former can now be seen as belonging to an architectural tradition on the Iranian Plateau that extended back through the Median period to at least the beginning of the 1st millennium BC. The rich Achaemenid gold work, which inscriptions suggest may have been a specialty of the Medes, was in the tradition of the delicate metalwork found in Iron Age II times at Hasanlu and still earlier at Marlik. In its carefully proportioned and well-organized ground plan, rich architectural ornament, and magnifi-

cent decorative reliefs, Persepolis, primarily the creation of Darius and Xerxes, is one of the great artistic legacies of the ancient world.

The organization and achievement of the empire. At the centre of the empire sat the king of kings. Around him was gathered a court composed of powerful hereditary landholders, the upper echelons of the army, the harem, religious functionaries, and the bureaucracy that administered the whole. This court lived mainly in Susa but in the hot summer months went to Ecbatana (Hamadān), probably in the spring to Persepolis in Fārs, and perhaps sometimes to Babylon. In a smaller version it travelled with the king when he was away in the provinces.

The satraps

The provinces, or satrapies, were ruled by governors (satraps), technically appointed by the central authority but who often became hereditary subkings, particularly in the later years of the empire. They were surrounded and assisted in their functions by a court modelled on that of the central government and were powerful officials. The great king was nevertheless theoretically able to maintain considerable control in local affairs. He was the last court of appeal in judicial matters. He controlled directly the standing military forces stationed in the provinces, though as time went on, the military and civil authority in the provinces tended to become combined under the satrap. The king was also aided in keeping control in the provinces by the so-called king's eyes, or better, the king's ears, officials from the central government who traveled throughout the empire and who reported directly back to the king on what they learned. The number of satrapies and their boundaries varied greatly from time to time; at the beginning of Darius' reign there were 20 provinces. In general, as time went on, the number of satrapies increased, partly because of the need to reassert control over the satraps by decreasing their power base, partly because the feudal structure that underlay Persian society required rewarding more and more people with a role in government, and partly because the original 20 satrapies were undoubtedly simply too large to permit efficient administration.

The army

The army was a particularly important element within the empire. It, too, developed and changed with time. After Cyrus the Persian tribal levy, based on the responsibility of all male Persians to fight for the king, was replaced by a professional army supplemented by a troop levy from the subject peoples in time of intensive military activity. The elite of the standing army were the 10,000 "immortals" composed of Persians and Medes, 1,000 of whom were the personal guard of the king. The person who controlled this elite, as did Darius on the death of Cambyses, usually controlled all. The troops of the imperial levy fought with the regular army in national units, were armed according to their individual customs, but were usually officered by Persians. Permanent bodies of troops were stationed at strategic points throughout the empire, and, to judge from the garrison at Elephantine in Egypt, these were actually military colonies, firmly settled into the local countryside. Greek mercenaries were used with increasing frequency in later years and many Greeks fought faithfully for Persian silver.

Both the civil and the military administration, as well as public and private trade, were greatly facilitated by the famous royal Achaemenid road system. Communications throughout the empire were better than any previous Near Eastern power had maintained. The famous road from Susa to Sardis in western Asia Minor is the best known of these imperial highways. It was an all-weather road, maintained by the state. Over it ran a governmental postal system based on relay stations with remounts and fresh riders located a day's ride apart. The speed with which a message could travel from the provinces to the king at Susa was remarkable.

On the whole, Persian rule sat lightly on the subject peoples, at least under the early Achaemenids. It was a conscious policy of Cyrus and Darius to permit conquered nations to retain their own religion, customs, their methods of doing business, and even to some extent their forms of government. Cyrus' attitude toward the Babylonians, which led to his being accepted as the rightful successor of Nabonidus, his willingness to permit the Jews to return to Palestine and to their own way of life, and his successors' concern that this promise be honoured; Cambyses' behaviour in Egypt and his acceptance by the Egyptians as founder of a legitimate new Egyptian dynasty; and the policy adopted under Mardonius toward the Ionian cities following their rebellion are all examples of such a policy. Perhaps even too often in the later empire, rebellious peoples, governments, and leaders were forgiven and not suppressed with the thoroughness sometimes characteristic of other regimes. Lapses from this policy, such as Xerxes' violent reaction to rebellion in Babylon, stand out in the record.

Law

Law played an important role in the administration of the empire, and stories of Persian justice abound in the Greek sources. Darius particularly wished to be remembered as the great lawgiver, and law reform was one of the cornerstones in his program for reorganizing the empire. To judge from the Babylonian evidence, two sets of law, possibly administered by two sets of courts, were in force in the provinces. One was the local law undoubtedly based on custom and previous local codifications; the other was the Persian, or imperial, law, based ultimately on the authority of the great king. A new word for law appeared in the Near East in Achaemenid times, the Iranian *dāta,* and was borrowed by the Semitic languages used in the empire. In Babylonian and Aramaic, sources give evidence for Persian judges called by the Iranian word *dāta-bar.* These were probably the judges of the imperial courts. With legal reform came reform and unification of tax structures. The tax structure of the empire was apparently based on the principle that all the conquered lands were the actual property of the king. Thus taxes were rather rents, and the Persians and their land, Fārs, by virtue of not being a conquered people, were always tax-free. Each satrapy was required to pay a fixed yearly amount in gold or silver and each vassal state paid a fixed tribute in kind. Again going on the Babylonian evidence, where in previous times agricultural taxes were levied in fixed amounts regardless of the fluctuating quality of the harvest, under Darius all land was surveyed, an estimate of its yield based on an average of the harvests over several years was from time to time established, and taxes were levied in fixed amounts based on a percentage of that average yield. This was not quite an income tax, since it was not based on a percentage of each year's production, but it was at least a reasonable figure based on a reasonable average production.

Breakdowns often occurred in the Achaemenids' effort to maintain a productive balance between local social structures, customs, laws, and government and the demand of the empire. The failure of the Persians to find such a balance when dealing with what was, for them, that extremely strange system of social and political organization, the Greek polis, or city-state, probably lay at the heart of their never-ending troubles in Ionia as much as did the power and ambitions of mainland Greeks. Yet even the Ionians, at the best of times, often realized the mutual advantages and benefits of the king's peace and a unified western Asia under a tolerant central administration.

The economy

The economy of the empire was very much founded on that king's peace; it was when the peace broke down with ever-increasing frequency during the last century of Achaemenid rule that the economy of the empire went into a decline that undoubtedly contributed significantly to eventual political and military collapse. Wealth in the Achaemenid world was very much founded on land and on agriculture. Land was the principal reward that the king had available for those who gave service or who were in positions of great political or military power in the empire. Under Darius there was a measure of land called a "bow" that was originally a unit considered sufficient to support one bowman, who then paid his duty for the land in military service. At the other end of the scale were enormous family estates, which often increased in size over the years and which were or became hereditary holdings. They were often administered by absentee landlords. Such major landholdings were, as one would expect, usually in the hands of Iranians, but non-Iranians were also able to

amass similar wealth and power, thereby testifying once again to the inherent tolerance with which the empire was administered. The Achaemenids themselves took a positive role in the encouragement of agriculture by investing state funds and effort in irrigation and the improvement of horticulture.

They also invested in and endeavoured to encourage trade, a major source of imperial wealth. The effect of the state-maintained road system on the encouragement of trade has already been mentioned. Equal attention was paid to the development of sea borne trade. State-sponsored voyages of exploration were undertaken in order to search for new markets and new resources. Darius completed a project, begun by the Egyptians, of linking the Nile with the Red Sea by a canal, so that routes across the Arabian Sea and into the Persian Gulf could be used to link the eastern and western ends of his empire. As part of the same program, port development on the Persian Gulf coast was encouraged. An imperial standardization of weights and measures, efforts to encourage the development and use of coinage, and the standardization in the king's name of that coinage were all policies intended to encourage commerce and economic activity within the realm. Banking played a role in the economy. Documents have survived from a family banking business in Babylonia—the house of Murashu and Sons of Nippur—covering the years *c.* 455–403 BC; the firm evidently prospered greatly by lending money and by acting as a middleman in the system of tax collection. Interest rates were high, but borrowers were numerous.

As time went on, there were more and more such borrowers, for the later empire is marked by a general economic decline. The principal cause for this decline was the unsettled political conditions, but other, more indirect causes were unwise government interference in the economy, overtaxation, and the removal of too much hard money from the economy. Gold and silver tended to drain into the treasury of the central government from the provinces, and too little found its way back into the economy. Disastrous inflation was the result. The large sums of money paid to foreign mercenaries and as bribes to foreign governments must have also contributed to an unfavourable balance of payments that in turn stimulated inflation. Such conditions hardly strengthened the empire and must have contributed, in ways that cannot be documented with certainty, to the political unrest that was their own main cause.

The significance of the Achaemenids

Ultimately, the achievement of the Achaemenid Persians was that they ruled with much creative tolerance over an area and a time that, for both the Near East and for Europe, saw the end of the ancient and the beginning of the modern world. In one sense, the ancient Near East died when Cyrus marched into Babylon. Others would argue that its death came when Alexander burned Persepolis. The question remains open. What is clear is that the Achaemenid Empire, the largest anyone had ever yet tried to hold together and one that was not to be surpassed until Rome reached its height, was a profound force in western Asia and in Europe during an important period of ferment and transition in human history. That period witnessed major developments in art, philosophy, literature, historiography, religion, exploration, economics, and science, and those developments provided the direct background for the further changes, along similar lines, that made the Hellenistic period so important in history. Hellenism probably would not have been possible, at least not in the form we know it, if it had had to build directly on the rather more narrow and less ambitious base of the individual civilizations of Bablyon, Egypt, or Greece. In a sense the Achaemenid Persians passed on a concept of empire that, much modified by others, has remained something of a model throughout history of how it is possible for diverse peoples with variant customs, languages, religions, laws, and economic systems to flourish with mutual profit under a central government. In narrower terms, but for the Iranians themselves no less important, the Achaemenid Empire was the beginning of the Iranian nation, one of the pivotal peoples in the modern Near East. (T.C.Y., Jr.)

THE HELLENISTIC AND PARTHIAN PERIODS

Alexander and his successors. Between 336 and 330 BC Alexander completed the conquest of the whole Achaemenid Empire. (For the story of the conquest see ALEXANDER.) Alexander's burning of the royal palace at Persepolis in 330 symbolized the passing of the old order and the introduction of Greek civilization into western Asia. Greek and Macedonian soldiers settled in large numbers in Mesopotamia and Iran. Alexander encouraged intermarriage and fostered Greek culture, but he also retained a large part of the Achaemenid administrative structure and introduced Oriental elements and Greek political institutions.

Alexander left no heir. His death in 323 BC signalled the beginning of a period of prolonged internecine warfare among the Macedonian generals for control of his enormous empire. By the end of the 4th century BC Seleucus I Nicator had consolidated his control over that part of Alexander's territory that had corresponded to the Achaemenid Empire.

Seleucus, who, with his son Antiochus I, assumed supreme power, established a government with two capitals: Antioch on the Orontes River in Syria and Seleucia on the Tigris River in Babylonia. The greatest part of Asia—from the Aegean to the Punjab—belonged to this vast kingdom, and to its diverse and varied populace must be added several allied Greek cities, both in Greece and in Asia Minor.

The nobles and the nomads. As he was finishing the conquest of eastern Iran—and at a moment when his attention was being drawn toward the conquest of India—Alexander was confronted by two human factors that were of the greatest importance for the future of his empire. The first of these was the powerful local aristocracy of this part of the Achaemenid Empire, an aristocracy that held enormous properties and dominated the indigenous population; the second was the nomad population that for centuries had wandered along the northern and northeastern frontiers of Iran.

Alexander and the Iranian nobility

Alexander seems to have admired greatly the barons of eastern Iran; he had taken note of their ardour during the two years of hard and constant fighting in his conquest of northeastern Iran. Realizing how such a force could benefit the future of his empire, Alexander convoked an assembly of Bactrian nobles. He ordered 30,000 young men to be chosen for training in the Macedonian military disciplines. He understood the importance and effectiveness of the Iranian light cavalry armed with the bow, and his army would make use of this training in its march toward the plains of India. And finally, Alexander married Roxana of Sogdiana, daughter of a chief of one of the conquered countries, thereby symbolizing the union of the two races.

But Alexander was not unaware that other measures were needed to ensure his control of these vast territories. He founded many new cities, or refounded some that were already in existence. Many of these were placed strategically along the northern frontiers as protection. Almost half of these new cities were located in the "high (eastern) satrapies." This policy of Alexander was soon abandoned by the Seleucids, whose efforts at city planning were mostly confined to their western possessions.

In contrast with Alexander, the Seleucids were unable to maintain the good rapport with the eastern Iranian nobility that Alexander had believed essential. And this deficiency, a result of the Seleucids' "pro-Macedonian" policies, was one of the principal causes for the progressive decline of the Seleucid Empire.

The second of the human factors was the nomads who inhabited the immense territories beyond the northern frontiers. They fought constantly with the settled populations, but could nevertheless occasionally ally with them in the face of necessity. When Alexander arrived on the banks of the Jaxartes River, it marked the limit of the "civilized" world; beyond stretched the Eurasian wilderness. The Roman historian Quintus Curtius recounts Alexander's meeting with a delegation of Scythians who gave him a warning. They told him,

> Just cross the Tanais [properly the Jaxartes] and you will see how far Scythia stretches. You will never conquer the Scythians. Our poverty makes us quicker than your army, which bears plunder from so many nations. Just when you think we are far away, then will you see us in your camp. We know how to pursue and how to flee with the same swiftness. [One recalls here the famous "Parthian shot."] We seek out those deserts totally devoid of human culture rather than the cities and the rich countryside.

These words sum up what the nomad world represented to an empire that stretched several thousand miles from east to west. The non-nomad population knew the threat only too well. Alexander was not the first to cross swords with the nomads. Cyrus, founder of the Achaemenid Empire, had paid with his life while fighting them; and Darius, believing he could take them from behind through southern Russia, suffered a crushing defeat in his campaign against the Scythians along the shores of the Black Sea.

If the nomads and the eastern Iranian nobility were the two dominant factors in the decline of the Seleucid kingdom, and if the events they provoked were some of the principal causes for the exhaustion and eventual fall of that state, these same causes played a not inconsiderable role in the collapse of Parthian power. This power was undermined by an aristocracy that retained its military power and refused to bend before the royal will or to give up its meddling in the country's politics.

In the meantime, the kingdom's unruly neighbours to the north and the northeast, at the cost of the lives of several Parthian sovereigns, weakened the kingdom and sometimes added a complementary element to the often numerous intrigues of the pretenders to supreme power during the course of the almost half a millennium of the existence of the Parthian kingdom.

The Seleucids. In the struggle for power after Alexander's death, Seleucus I brought under his control the whole eastern part of Alexander's empire. But even before he had consolidated his control over this territory, the eastern provinces on the Indian frontier had begun to revolt.

Loss of eastern provinces

By about 304 BC Seleucus was forced to abandon these to Candragupta Maurya, the founder of the great Indian Maurya Empire. This was a serious loss to the Seleucids, for they lost not only the Indian territory conquered by Alexander but also frontier districts west of the Indus. As recompense for his losses, Seleucus received 500 elephants, which he took back with him to Syria. From this time on, the west was dominant in the Seleucids' politics to the detriment of their eastern possessions. This near disinterest of the Seleucids in these far-off eastern regions must have alienated the Greeks of these communities who had settled far from their homeland; and the thought of taking back their full independence could not have been far from their minds.

Soon afterward, toward 290–280 BC, the two eastern provinces of Margiana and Aria suffered an invasion by nomads. But the invasion was repelled and the nomads pushed back beyond the Jaxartes. Demodamas, general to the first two Seleucid kings, crossed the river and even put up altars to Apollo, ancestor of the dynasty. Alexandria of Margiana and Heraclea of Aria, founded by Alexander, were rebuilt by Antiochus I under the names of Antioch and Achaea, and a wall nearly 100 miles (160 kilometres) long was put up to protect the oasis of Merv against future invasions, the menace of which was never far. Patrocles received a commission to explore the Caspian Sea.

Seleucus I and his successors hoped to Hellenize Asia and held the conviction that the Greeks and Macedonians were a superior race and the bearers of a superior civilization. A network of cities and military colonies was built to assure the stability of a state whose inhabitants would be Asians. The Greek language made deep inroads, especially among the families of those numerous Greeks who married the local women and among those engaged in commerce. But after the 2nd century BC and the slowing of the Greco-Macedonian immigration, the Greek language lost ground and the local element became dominant.

Superficial Hellenization

The people of Iran, particularly those in the upper stratum of society, borrowed nothing from Hellenism but its exterior forms. Even the Iranians who lived in such cities as Seleucia or Susa do not seem to have been deeply affected by Greek ideas.

The movement of Iranian peoples. The victories of Alexander had brought the Greeks to the limits of the known world. But less than a century after Alexander's death there began a great movement back, propelled by stirring of peoples in the Iranian world. In a movement westward, and from the 3rd century BC, the Sarmatians occupied the northern shore of the Black Sea. While driving back their close relatives, the Scythians, they succeeded in "sarmatizing" the Greek cities along its shores. At the end of the 3rd century, there began in Chinese Turkistan a long migration of the Yüeh-chih, an Iranian people who about 130 BC invaded Bactria, putting an end to the Greco-Bactrian kingdom there. (In the 1st century AD they created the Kushan (Kuṣāṇa) Empire, which extended from Afghanistan to the Ganges and from Russian Turkistan to the estuary of the Indus.) Finally, in the mid-3rd century BC, taking a median direction between the other two movements described, the Parni, a nomadic or seminomadic people from Iran, took over the Seleucid satrapy of Parthia and created the Parthian kingdom. Restoring Achaemenid power for nearly half a millennium, the arrival of the Parthian state coincided with the expansion of Rome and played a significant role in the destinies of the world during the three centuries before and two centuries after Christ.

Revolt of the high satrapies. The empire of the Seleucids, like that of the Achaemenids before them, was shaken by revolts of the satraps. The difficult situation in the west and the grave reverses suffered by the royal house accelerated the weakening of the Macedonian kingdom. The loss of its eastern possessions in the 3rd century BC proved fatal to the Seleucid cause. Diodotus, a Greek who found himself at the head of the satrapy of Bactria, led a revolt that brought independence in about 250 BC; at about the same time Arsaces led the Scythian Parni into Parthia and defeated Andragoras, establishing an independent native dynasty.

Parthian independence

Parthia was the first province to detach itself from the Seleucid Empire, just as it had been the first to rise up on the occasion of the accession of Darius the Great. Andragoras, although he did not declare himself king, showed his independence by minting his own coins. At this time Parthia was one of the poorer of the high satrapies. Caught between the mountains and the great central desert, without large agricultural resources, this satrapal independence might seem surprising if it were not for the fact that the main route for the silk trade crossed right through Parthia over a distance more than 100 miles. The tolls the caravans paid must have produced a sizable income.

The defection of Diodotus is still easier to understand. Bactria, a vast country of a "thousand cities," was located at the junction of the routes to China and India, and it was rich in cultivable land. The Greco-Bactrian kingdom founded by Diodotus expanded rapidly, embracing Sogdiana and Aria, and extending southward and southeastward.

Being at some distance from the west, Diodotus and his successors adopted little by little the customs and lifestyles of their subjects. The closer these ties were drawn, the stronger became the loyalty of the Bactrians. It is believed that the separation of Diodotus from the Seleucids might, over the long term, have seemed to the Bactrians and Sogdians as the realization of their national destiny, and they might have looked on these satraps as men acting in their interest. For more than a century (230–130 BC) this kingdom held the frontiers and barred the route to the nomads.

The rise of the Parthians. *Invasion of the Parni.* Arsaces, who was chief of the Parni, a member tribe of the Dahae confederation, must have begun his struggle against the Seleucids from 247 BC, the year from which the Parthians dated their history. This does not necessarily mean that Arsaces was crowned king in 247. Other Iranian dynasties (*e.g.*, the Sāsānids; see below) dated the beginning of their eras from the time when they began to establish their power rather than from the time of coronation of the first monarch of their line.

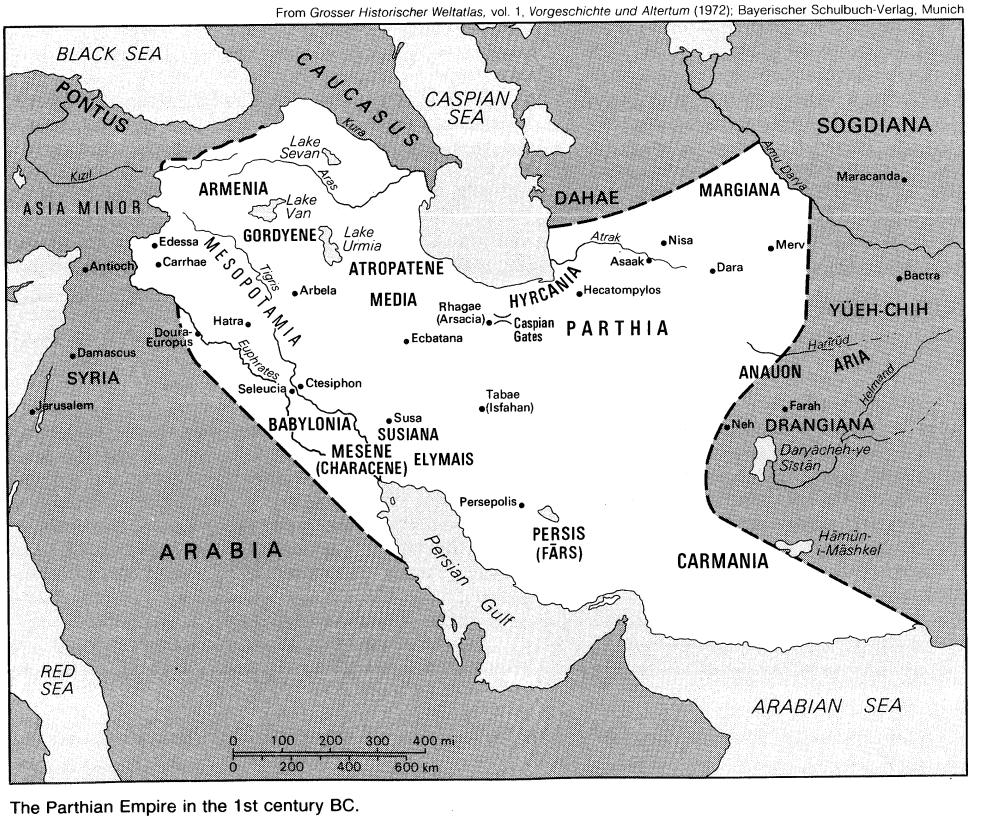
Daho-Parno-Parthian tribes "chose chiefs for war and princes for peace" from among the closest circle of the princely family. They were famous for their breeding of horses, for their combat cavalry, and for their fine archers. Alexander encountered them during his Bactrian campaign, and the Greek writers who recorded his reign remarked on their agility and effectiveness as horsemen. They were a people who kept the traditions of patriarchal tribal organization. The Parni, with Arsaces at their head, took the province of Parthia after having beaten Andragoras; soon, neighbouring Hyrcania was annexed and the Caspian reached. Arsaces had himself crowned in the city of Asaak, and the tribe took the name of the Parthians, their close relatives, a name that meant "exiled." Their language was closely related to Scythian and Median. The dynasty these people produced never broke its links with the people, and rare was the Arsacid dynastic sovereign who did not turn to his people in time of danger.

Formation of the Parthian state. The two new kingdoms, that of Arsaces I's Parthians and the Greco-Bactrian kingdom of Diodotus, sprang up almost simultaneously and very near each other; there were, however, notable differences between them. The motivating force behind the rebellion in Bactria was an association—or perhaps even a collaboration—between the local nobility (large landholders who dominated the whole indigenous population) and the local Greek community. Both groups were opposed to the Macedonian domination represented by the Seleucid dynasty.

Relations with the nomads

The makeup of the Parthian kingdom seems to have been different. It was essentially built on the relationship of the inhabitants of Parthia to the neighbouring tribes outside the static frontiers, an ethnic mass, half nomad, half settled, that inhabited the north of Iran. The success of Arsaces and his men was based on their strength, their spirit, and the weakness of their enemies. The Greek element present in Parthia does not seem to have played a role similar to that played by their counterparts in Bactria. In fact the Parthians, at least initially, may have been hostile to the local Greek populations. During their war with the Seleucid king Antiochus III (see below), they massacred all the Greek inhabitants of the city of Syrinx in Hyrcania.

Arsaces. Arsaces seems to have enjoyed great fame among the tribes. His name remained linked with the names of the sovereigns of this dynasty, who succeeded each other for the four and a half centuries of the Parthian state. His image regularly appeared on the obverse of Parthian coins right down to the end of the period.



The rupture of the communications link between the Seleucid capitals and the east caused by Arsaces' success placed Diodotus in a difficult situation. He seems to have wanted to collaborate with Seleucus II in a campaign he was preparing against the Parthians. The death of Diodotus (*c.* 234 BC) and the succession of his son, Diodotus II, reversed matters, for the young successor changed his father's policy and joined with Arsaces. It was not until 232 or 231 BC that Seleucus arrived in the east to put down the rebellion. Arsaces, who had remained closely allied with the nomads to the north, sensing his own weakness in the face of Seleucus' army, fled to the home of the Apasiacae, or "Scythians of the Waters." Seleucus II tried to cross the Jaxartes but, having suffered losses at the hands of the nomads, decided to return to Syria after receiving alarming news from the west. He made peace with Arsaces, who recognized his suzerainty.

Founding of new cities

From this time on, Arsaces changed his policy: he no longer acted as a nomad but rather as a chief of state, a worthy successor to the Seleucids, whose example he followed. He had himself crowned; besides Asaak and Dara (an impregnable fortress), he founded such cities as Nisa, where he would be buried. These new cities were usually named after the king or the dynasty. Arsaces seems not to have infringed upon the rights of the Greeks and Macedonians living in these cities, perhaps hoping to win their support. From the beginning, while maintaining the autonomy of the cities, he made use of propaganda to ensure their continuing obedience. He installed his capital at Hecatompylos, on the silk route. His death is dated between 217 and 211 BC.

Artabanus. His successor, Artabanus I (sometimes known as Arsaces II, reigned *c.* 211–191), continued the work of consolidation. Being already solidly established in Parthia and Hyrcania, Artabanus tried to extend his possessions toward Media. But events in the neighbouring Greco-Bactrian kingdom worked against him: Diodotus II lost his throne, accused, it is thought, of treason to Hel-

The Parthian Empire in the 1st century BC.

lenism through his alliance with the nomads. His throne had passed to Euthydemus when the Syrian army of Antiochus III arrived in Hyrcania.

The wave of revolts by the eastern satraps, which began a movement away from unity in the state, also affected western Iran. The beginning of the reign of the young Antiochus III the Great (223–187 BC) was marked by the dissidence of Molon and his brother Alexander, satraps of Media and Persis. Antiochus III did not undertake his campaign for recovery of the high satrapies—a project his father had planned and never carried out—until 212 BC.

It is admitted that at this time his kingdom in the east did not stretch farther than Media, Persis, Susiana, and Carmania. His operations against Artabanus I were successful; he took Hecatompylos and crossed the mountains separating that province from Parthia, which he occupied. Artabanus fled and took refuge with the friendly Apasiacae, as had his father, Arsaces I. The conflict between the Seleucids and Parthia, however, was ended by a compromise, just as it had been at the time of the invasion of Seleucus II. A much more important struggle against the Bactrian kingdom of Euthydemus awaited Antiochus III. He preferred to make peace with Artabanus, to whom he accorded the title of king in exchange for recognition of his fealty, and obliged the Parthian to send troops to reinforce the Syrian army. The rear of the Seleucid king was safeguarded, but the two provinces held by Artabanus were definitively lost by the Macedonians.

The period following Antiochus' campaign was marked by a strong resistance by the Bactrian cavalry at the frontier and by the siege of Bactra, for two years the capital (208–207 BC). There, too, the Seleucid king made peace with Euthydemus, who, like Artabanus, kept his title of king. Demetrius, son of Euthydemus, married a daughter of Antiochus the Great, thus preserving his political prestige.

Having acquired war elephants and provisions for his army in Bactria, Antiochus crossed the Hindu Kush into the Kabul Valley, where he concluded a pact with the Indian king Sophagasenos, secured still more elephants, and returned by way of southern Iran. The results of this long campaign were meagre. Antiochus recognized the independence of two kingdoms, that of the Parthians and that of Euthydemus, which had been no more than satrapies. The struggle must have weakened these two, but after receiving legalization of their status, the two states proceeded to the reestablishment of their material and military resources.

Phraates I. Precise information is not available concerning the reign of Priapatius (*c.* 191–176 BC), who succeeded Artabanus and whose name appears in documents found in excavations at Nisa. Under his son Phraates I (*c.* 176–171 BC), the young Parthian kingdom seems to have recuperated sufficiently to have taken up once again its expansionist activities. It attacked Media and was successful in the conquest of the Mardi tribe near the Caspian and set up a defense of the "Caspian Gates," an important strategic point of penetration in Phraates' possessions. Overturning tribal tradition, which reserved the succession to the throne to the eldest son, he designated as a successor—even though he had several sons—his brother Mithradates. His choice was no mistake.

Parthian expansion

The "phil-Hellenistic" period (c. 171 BC–AD 10). The accession of Mithradates I opened a new period in the destinies of the kingdom, which historians call "phil-Hellenistic" and which lasted from the accession of this prince (*c.* 171 BC) until *c.* AD 10. This period was characterized by a strong Hellenistic cultural influence, manifested in the use of the Greek language and in particular in the arts, where, however, national traditions were not completely abandoned.

Mithradates I. From the accession of Mithradates I an expansion of Parthian power in the military, political, and economic domains was manifest. The king began with an attack on the Greco-Bactrian kingdom, which was going through a period of weakness; then he turned against the west and declared himself independent of the Seleucids. To show his complete independence—the first of the Parthian sovereigns to do so—he began issuing coins bearing his likeness, wearing a royal diadem like the Seleucid kings. On the reverse side was a representation of Arsaces, ancestor of the dynasty, seated on an omphalos (hemispheric altar) and holding a bow, in imitation of Seleucid coins that showed Apollo in the same way, as the ancestor of the Seleucids.

The action Antiochus IV Epiphanes undertook against Mithradates ended with the death of Antiochus at Tabae (or Gabae, probably present Isfahan). His death brought a widespread dislocation of the Macedonian kingdom, which crumbled into several smaller states. Toward 160 BC most of the "high satrapies" and the eastern satrapies were apparently lost to the Seleucids. The power that could unite them into one could only be that of the Parthians, who, under Mithradates I, began the assault. In 155 BC Media was occupied, which opened the route to Mesopotamia. In 148–147 BC Mithradates reached Ecbatana, where he moved his capital. Rhagae was "refounded" and given the dynastic name of Arsacia. In 141 BC Mithradates took Seleucia on the Tigris and was recognized king of Babylonia. His forces conquered Susiana and Elymais, either at this time or after 139. In the same year (141), he was obliged to leave Hyrcania for his eastern possessions, which were evidently being menaced by hostile movements of the nomads. There he spent the remainder of his reign.

Demetrius II, probably acquainted with Mithradates' difficulties in the east, undertook an effort to retrieve the situation and recover Mesopotamia, but after a few successes he suffered defeat and was taken prisoner (139 BC). Sent to Hyrcania, he was married there to a daughter of Mithradates, who, by this union, became related to the house of Seleucus. The army of Demetrius included Greco-Bactrian and Elymaian troops—which is understandable—as well as men from Persis, or Persians, who by their cooperation with the Macedonians seem to indicate their opposition to the expansionism of the Parthians, whom they considered foreigners and conquerors. Persia under the Parthians was an empire, but not yet a nation.

Persian resistance to Parthia

Phraates II. Like his father, Mithradates I, Phraates was to remain for some time in the eastern provinces. He was also to endure a last Macedonian attempt to break the Parthian advance. Antiochus VII Sidetes, brother of Demetrius II, who had been taken prisoner, assembled a powerful army, which once more included men of Persis and Elymais. The strength in numbers and the wealth of this army made an impression on contemporaries, who reported that even the simple soldiers wore shoes cobbled with gold. Phraates was beaten in several battles, but time worked on his side. With the arrival of winter, Antiochus quartered his troops in several localities in Media. The local population, exasperated by the undisciplined Syrian soldiery, rose up in revolt. Antiochus was killed and his son taken prisoner (129 BC). Thanks to the loyalty of the Medians, whose sentiments contrasted with those of the Persians, Phraates was victorious. The year 129 BC was a turning point in the history of the eastern Mediterranean: Greco-Macedonian domination received a decisive blow, which it would survive for only 46 years.

The route to great acquisitions in the west seemed to open before Phraates, if the nomads did not stop him. Weakened in his struggle against Antiochus VII, he called upon the Śaka nomads to the north of his frontiers for aid, promising them payment. The reinforcements arrived too late to be of use; he sent them back, which provoked them to revolt and pillage the countryside. The Greek prisoners drafted by Phraates into his army participated in the pillage, and Phraates lost his life fighting them. The same fate was reserved for his successor and uncle, Artabanus II (*c.* 128–124/123). The Śakas were pushed back with some difficulty toward Drangiana, to which they gave their name Seistan (Sakastan). Another branch of the vast nomad movement crossed the Oxus and put an end to the Greco-Bactrian kingdom, on the ruins of which the powerful kingdom of the Kushāns was to be built.

The second stage of the phil-Hellenistic period extends from the first quarter of the 2nd century until about 30 BC and embraces a period when Parthia reached the apogee of its power and worldwide territorial expansion.

Mithradates II. The reign of this prince constitutes the most glorious chapter of Parthian history. It put an end to the ambitions of Artabanus' son Himerus, left by his father as governor of Mesopotamia, and brought back Hyspaosines, king of Characene, who had extended his possessions too far toward the north, into submission. In the east, the Śakas were on the move—soon an independent state would be formed there that would push toward eastern Iran and India; in the 1st century BC, two dynasties, the Indo-Scythian and the Indo-Parthian, whose members would remain closely linked to the Arsacid dynasty, were to reign in this region. They would disappear after having been absorbed by the kingdom of the Kushāns.

The eastern frontiers of Mithradates II incorporated Margiana and Aria. Once order was restored in the east, the King turned toward the west: he placed Tigranes I the Great on the throne of Armenia, and, extending his hegemony over this kingdom and over eastern Asia Minor, he organized pressure on the last Seleucids; among them, a pretender, Demetrius III, was taken prisoner. A meeting with Rome, which had already formed a "Province of Asia" in Asia Minor, became inevitable and took place in 92 BC on the Euphrates between the Roman general Sulla and the Parthian ambassador Orobaze. Mithradates II wisely refused to agree to follow in the Roman path and preferred to retain his neutrality in the struggle between Rome and Mithradates VI of Pontus. Rome in the west and Parthia in the east met as Alexander's successors and, with a common accord, settled the inheritance. The two parties recognized the Euphrates as a common frontier. It seems there was no longer a question either of an alliance or of a signed convention. Upon his return, Orobaze paid with his head for the *lèse majesté* he had committed by accepting a seat lower than Sulla's at their meeting.

Relations with China

For the first time, Parthian power entered into direct contact with the Chinese empire and received an embassy from the Han emperor Wu Ti (140–87 BC), who dispatched to meet them an escort of 20,000 men. The Chinese were particularly interested in the horses raised in Fergana, which they needed to create a cavalry to fight the nomadic Hsiung-nu, or Huns, on their northern border.

At the zenith of his power, Mithradates II took the title of "king of kings"; in the East, as well as in the West, his empire achieved a position of a power and stability previously unknown. He maintained diplomatic relations with the two greatest world powers, Rome and China. Mithradates I, Phraates II, and Mithradates II were the true creators of the Parthian state, winning for it military and economic victories and raising it to a level comparable to that of the Achaemenid Empire. After the death of Mithradates II, a short period of intrigue and rivalry saw the succession, in turn, of Gotarzes, Orodes I, and Sanatruces. The latter came to power late in life and was replaced in 70 BC by his son, Phraates III (70–58/57 BC), under whom took place sustained contacts with Rome.

Wars with Rome. The Roman general Lucullus, in charge of looking after Roman interests in the East (69 BC), hoped to lure Phraates III into an alliance that would help Rome in its struggle against Pontus and Armenia, but the Parthian king, while still maintaining "friendly" relations with Rome, retained his neutrality. An agreement with the Romans renewed the Euphrates line as a frontier. Three years later, in 66 BC, the Roman general Pompey replaced Lucullus and succeeded in concluding a real alliance with Phraates III. This proved, however, to be of short duration, for affairs in Armenia, aggravated by Roman operations on Parthian territory, had brought the two empires to a parting of the ways. To Phraates' protestations Pompey replied with the occupation of Gordyene, a vassal state of the Parthians, and treated with Phraates using the simple title "king." Pompey did not trouble himself over entering into direct relations with the sovereigns of Media and Elymais, vassals of Phraates. The position taken by the Romans toward the king of kings was rather more like that of conquerors than of allies. Pompey's policy became clear: from the Caucasus to the Persian Gulf he hoped to create a wall of states friendly to Rome that would encircle Parthia, in preparation for Roman conquest.

That action fell within the jurisdiction of the Roman triumvir Crassus. As early as 57 BC a conflict with Rome broke out over the case of Mithradates III (58/57–55 BC), who, opposing Orodes II (*c.* 57–37/36 BC), his brother, a parricide like himself of their father, Phraates III, fled to Syria and asked the legate Gabinius for aid and asylum. The Roman Senate forbade Gabinius to involve himself in the dispute over the succession to the Parthian throne. Three years later the tension between the two powers was settled in bloody fashion, and the rupture consummated in 53 BC. Without provocation, the army of Crassus—the only one of the triumvirs with Caesar without military glory (Caeser was conqueror of Gaul, and Pompey conqueror of the Near East)—crossed the Euphrates. Orodes II protested and invoked the treaty of friendship in vain. Crassus refused to reply until he arrived at Seleucia on the Tigris. It was a brutal breaking of all the agreements concluded in 69 and 66 BC.

The Battle of Carrhae

The battle near Carrhae (53 BC), led by Surenas with his light and heavy cavalry, cost Rome seven legions and the lives of Crassus and his son. Through Surenas' brilliant victory the routes to Iran and India were closed to Rome, and its ambitions in the Orient were so weakened that the Euphrates became not only a political but also a spiritual frontier; no effort at latinization was possible any longer. A united Greco-Iranian Asia front protected against the Romanization of Iranianized Hellenism and destroyed the myth of Roman invincibility.

The insignia of the Roman legions fell into Parthian hands, and 10,000 Roman prisoners were sent into captivity in Margiana. The victory over Crassus had great repercussions among the peoples of the East. It shook the Roman position in Asia Minor, Syria, and Palestine, while it restored the Parthians' confidence in their power and in their ability to resist Rome, promising them a dominant position among the peoples of the East. According to the Greek writer Plutarch, the severed head of Crassus was brought to Orodes like a hunting trophy while he was attending a presentation of Euripides' play *The Bacchae.*

The Parthian counterthrust in 52–50 BC under the command of Prince Pacorus (Pakores) was not crowned with success. The Arsacid army did not know how to organize long campaigns or how to lay siege to fortified cities. But soon, civil war in Rome reinforced the position of the Parthians, and Pompey, after being defeated by Caesar, thought of taking refuge among them. It is thought that Orodes, taking advantage of this lull, succeeded in resolving difficulties in the east with the Yüeh-chih, or even perhaps the Kushāns. In 48 BC, with Pompey dead, Caesar was absolute master of the Roman world and was preparing to revenge Crassus' defeat when he was assassinated in 44 BC. The duty of following through on Caesar's project fell to Mark Antony. Pacorus, anticipating Antony, crossed into Syria after having concluded an agreement with Quintus Labienus, a Roman commander on the side of Caesar's assassins who had gone over to the Parthians. The successes of the two armies were startling: Labienus took all of Asia Minor, Pacorus all of Syria and Palestine. For nearly two years all the western provinces of the Achaemenids remained in Parthian hands. In Rome it was rumoured that the Parthians were planning to invade Italy itself. But the successes of the Arsacid armies were as ephemeral as they were remarkable. Disagreement between the two generals weakened their effect. In 39 BC Labienus was conquered and slain. Asia Minor was recovered by the Romans, and the following year the same fate struck Pacorus and his conquests.

The defeat of Pacorus and Labienus

Under Orodes II the Parthians had reached the zenith of their power: in the west, the Arsacids had for a short time reestablished the empire of the Achaemenids almost in its entirety. Their successes in the east seem to have been equally important. Their capital was moved to Ctesiphon, where the military camp was transformed into a great metropolis, facing Seleucia across the Tigris. At Nisa the city was expanded, the royal palaces made larger, and the royal hypogea were enriched with precious pieces of fine Greco-Iranian art.

In 37 BC Orodes was assassinated by his son Phraates IV, who also did away with his brothers and his eldest son. In

36 BC Mark Antony began to carry out the revenge Caesar had planned. He brought his army to Armenia, through which he planned to enter Media and attack Parthia from the north. But cold weather and Phraates' cavalry combined to force Antony to abandon the fight and return to Syria. In 34 BC he launched another campaign and again suffered heavy losses, and his power struggle with Octavian forced him to abandon his plans for war against the Parthians.

Toward 30 BC Tiridates II, a pretender to the throne of Parthia supported by Rome, obliged Phraates IV to leave Mesopotamia and take refuge with his eastern neighbours, the Scythians, who restored him to power. Driven out, Tiridates took refuge at Rome. He returned again in 28–27 BC, after which Phraates was able to definitively reestablish his power at the same time Octavian was inaugurating the imperial period of Roman history.

Settlement with Rome. The new stage in the phil-Hellenistic period began toward 31 BC, when, after his victory over Antony, Octavian (now Augustus) was sole master in Rome. Before that, however, he had already proposed to Phraates an alliance and a treaty ending the war. The Battle of Carrhae and Antony's defeat raised Parthia to a major power in the eyes of Rome. A renewed "friendship" would permit the return of Roman prisoners and insignia. Augustus put pressure on Phraates through the pretender Tiridates and even tried military intervention. In the end a pact was signed in 20 BC that allowed the return of Roman prisoners and the insignia of the conquered legions.

Recognition of the Euphrates frontier

A new stage began in relations between the two states, marked by the conclusion of a real peace that recognized the Euphrates as a frontier between them. Phraates IV was dealt with as the sovereign of a great nation. Rome renounced its ambitions in the east, and Augustus inaugurated a policy of respect. The two states could do nothing but profit from the agreement, for a defeat would have been fatal to either power, and a victory hazardous. The caravan route to India and China was opened. Augustus received ambassadors from the many eastern peoples, including the Indo-Scythians and the Sarmatians. The only country in the east where Rome remained active was Armenia.

All obstacles, however, were not necessarily eliminated. There remained the question of Armenia, which, if controlled by Rome, would be a channel for penetration into Parthia from the north, but if controlled by Parthia would offer an outlet on the Black Sea, over which Rome asserted its authority. The rivalry of the two powers over this country would remain for centuries a stumbling block to peace.

Toward 10 or 9 BC Phraates sent his four sons and grandsons to Rome, a gesture that must be understood as one of confidence in a "friendly" power but also as a guarantee that his throne would pass to his son by Musa, an Italian slave girl given him by Augustus. This son, Phraates V, would assassinate his father with his mother's help and occupy the throne from 2 BC to AD 4 after having married his mother.

The end of this "phil-Hellenistic" period is marked by the clash of the ruling class with foreign influences that had penetrated life in Parthian society. These influences came from Rome and were often introduced by princes of the Arsacid house returning from stays abroad. The short reign of Orodes III (AD 4–6/7) was followed by that of Vonones (7/8–11), son of Phraates IV, who because of his Roman habits was driven out by the Parthian nobility, whose role at this time became dominant in internal politics and dynastic questions. Vonones' fall brought a change in the destinies of the country.

The "anti-Hellenistic" period (AD 12–162). The new and very important period in Parthian history, often called "anti-Hellenistic," embraces a century and a half, from AD 12 to 162. It is characterized by an expansion of the Parthian national culture and an opposition to all things foreign. The weakness of the reigning dynasty opened wide avenues to the nobility to involve themselves in the official existence of the state. They chose the sovereign whose reign opened the first stage in this new period.

Artabanus III. The king chosen by the barons to replace Vonones was Artabanus III (12–38). They were certainly mistaken in believing they would find in him an easy instrument to manipulate. Artabanus was the son of a viceroy of Hyrcania and was only Arsacid on his mother's side. Under his rule Parthia entered a brilliant but troubled era, one completely dominated by the personality of this violently anti-Roman sovereign, who was eager to drive Rome out of Asia. After an abortive attempt to place his son on the throne of Armenia, Artabanus avoided precipitating matters with Rome and dedicated himself to internal reforms, among which centralization occupied the place of first importance.

Rise of the nobles

The humbling of the great nobles, an enterprise in which he was sustained by the lesser nobles, became necessary. He had to reduce the hereditary privileges the barons had carved out for themselves. It was also necessary to reorganize the states that made up the kingdom. He put princes of his family on the various thrones of these states: Mesene, Persis, Elymais, Atropatene, all little states that were governed by men loyal to the throne. But it proved impossible for him to put down a revolt in the eastern possessions, where the Indo-Parthian king Gondophares declared himself independent (*c.* 19) and took the title "king of kings."

It is thought that the position taken toward the city-states, about which precise information is lacking, was the reason for the seven-year-long revolt of Seleucia on the Tigris. The fighting took place there between the Greek and Hellenized elements and the Semites, who demanded their right to participate in the autonomy of the city and who supported pretenders against Artabanus III.

A new attempt to place a son on the throne in Armenia angered Rome, which, with the aid of the nobility, sent for Tiridates III, a pretender the barons had crowned at Ctesiphon, obliging Artabanus III to take refuge with the Dahae, who helped him win back his throne. In 37 a meeting with a representative of Rome on a bridge in the middle of the Euphrates allowed an agreement to be reached that maintained the status quo in Armenia and recognized the Parthian sovereignty with the river as the frontier.

The strong personality of Artabanus III did not seek to impose his kingdom as a world power, but he did not hesitate to make plans to regain the western province, the former Achaemenid possessions.

Dissolution of the Parthian state. The period from 51 to 122 shows a slow dissolution of the Parthian state and its decomposition into several small countries. This was an inevitable result of the weakness of the central power.

Pliny's description of Parthia

In the 1st century AD the Parthian Empire, according to the Roman historian Pliny, was composed of 18 kingdoms, 11 in the north and seven in the south, some governed by Arsacid princes and others by local dynasties. In 58 Hyrcania became independent. In the realm of external affairs an effort was made to maintain good relations with Rome, especially because of the new kingdom of the Kushāns, which was causing concern on the eastern frontiers. It might be for this reason that in 87 Parthia sent an embassy to neighbouring China to the east of the Kushāns. Internally, the nationalistic upsurge became more accentuated.

After the short reign of Vonones II (51), the throne passed to Vologases I (51–77/78), an ardent anti-Roman. One of his brothers, Vonones, was made king of Media. Vologases I wanted his second brother, Tiridates, to be king of Armenia, which put him in the position of a break with Rome, which opposed him militarily. Upon orders from Nero, Corbulo undertook operations broken off by the exchange of ambassadors. An agreement was finally reached: in 66 Tiridates left for Rome with his whole family surrounded by a retinue of princes and 3,000 Parthian nobles. He received from Nero the crown of Armenia, and an end to hostilities was announced by the closing of the doors to the Temple of Janus.

Nationalist sentiment, which under Artabanus III had found expression in the invention of a genealogical table proving the Achaemenid descent of the Arsacid house, manifested itself under Vologases I by the compilation of the Avesta, the holy book of the Iranians, and by the

issuance of coins on which, for the first time, Pahlavi characters were added to the Greek legend.

In 78 Pacorus II came to the throne, to be replaced in 79 by the ephemeral Artabanus IV (80/81), who was then replaced permanently by Pacorus II. During his reign the country showed signs of a profound decomposition. The barons refused to obey the crown. In the provinces the army and finances were in the hands of the nobility. Aristocrats occupied the highest positions, and these positions became hereditary. Plots with Rome were hatched, and the nobility felt itself the equal of the dynasty, ready to revolt in defense of their privileges. Externally, the dynasty was unable to count on Rome, which constantly plotted in support of new pretenders. In 109/110 Pacorus II was replaced by Osroes, his brother or brother-in-law.

Invasion of Trajan

In 114 the emperor Trajan invaded Armenia. In vain did the King put his crown at Trajan's feet—he was defeated by the Roman soldiery. With Armenia occupied, the Emperor descended with his army into Mesopotamia. All Babylonia was taken and Ctesiphon, the capital, fell into the hands of the Romans, who carried off a daughter of Osroes and the golden throne of the Parthian kings. Victorious, Trajan went as far as the Persian Gulf. Iranian reaction was not late in coming. Faced with the gravity of the Roman offensive, all the princes of the royal house, formerly divided by internal strife, united against the invader. At Ctesiphon Trajan crowned a new vassal king, but revolt was in the wind and attempts to disunite the Parthian chiefs failed. The Romans suffered losses, and, after a reverse on the walls of Hatra, Trajan abandoned the campaign and died on his way home. Trajan's successor, Hadrian (117–138), abandoned all pretensions to Armenia, Mesopotamia, and Assyria.

Hadrian's desire for peace seems to have been sincere. He sent back Osroes' daughter, promised to return the golden throne, and did not try to profit from the long power struggle between Osroes and Vologases II. He even invited Osroes to come to Rome.

Peace with Rome. This was a time of 40 years of peace with Rome. The status quo it maintained with its western neighbour seems even to have been a necessity for the Parthian kingdom, the expansion of the kingdom of the Kushāns on the eastern frontiers having reached the peak of its power under King Kaniṣka (Kanishka). Accurate information about the relations between the Kushāns and the Parthians is not available, but this long peace sought with Rome suggests that certain precautions were necessary for the kingdom of Iran.

The end of the Parthian Empire (AD 162–226). The 40 years' peace was succeeded by almost uninterrupted hostilities with Rome, with varied success, Iran remaining more vulnerable because of the exposed position of its capital.

Apparent stability in the 2nd century

The reign of Vologases II (105/106–?147) and especially that of Vologases III (148–192), the latter not having to dispute the throne with a pretender, could by their length be a sign of a certain stability the country might have experienced. But underneath the apparent calm the intrigues continued, with Rome receiving embassies from the Hyrcanians, the Bactrians, and doubtless from the Kushāns.

A new clash with Rome came in 161, this time upon the initiative of Vologases III, who considered himself strong enough to attack. He occupied Armenia, crossed the Euphrates, and invaded Syria, which for two centuries had not seen Parthian cavalry. And although the country had been Roman since the time of Pompey, the Syrian population, which included Jews driven from Palestine by the Romans, received the Iranians as liberators. The situation became so serious that Lucius Verus, co-emperor with Marcus Aurelius, was dispatched to the east with strong reinforcements taken from the fronts on the Danube and Rhine. The Romans retook Armenia (163) and succeeded in a campaign similar to Trajan's: Doura-Europus was taken and remained Roman until its destruction by the Sāsānids; Seleucia on the Tigris, despite the welcome it reserved for the Romans, was sacked; and in 164 or 165 for the second time Ctesiphon fell into the hands of Romans, who razed the royal palace.

But once more success was not continuous. The Roman army had come from Armenia and had crossed through Azerbaijan, known even today as a country where plague is endemic. Contaminated, the Roman army was sorely tried by disease and obliged to retreat, but not definitively. Lucius Verus, repeating his campaigns in Armenia and northern Mesopotamia, inflicted heavy losses on the Parthians.

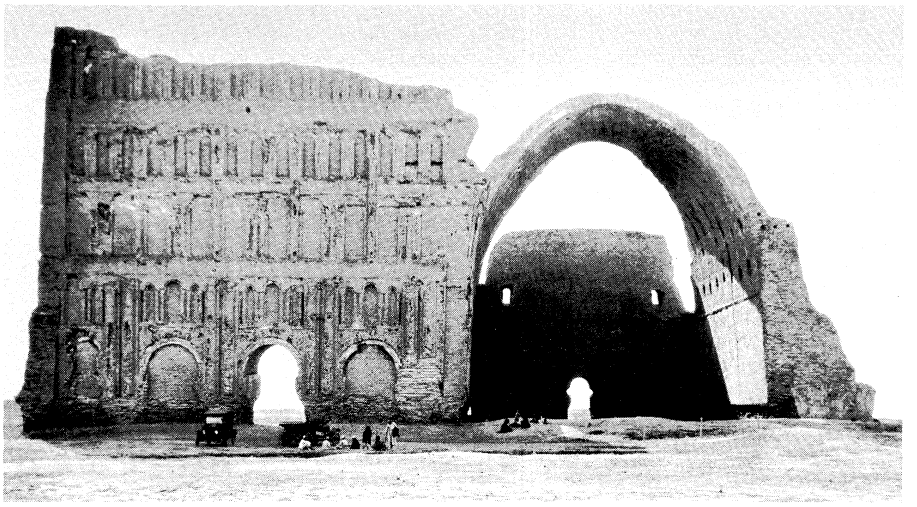
The tensions between the two states did not diminish when Vologases IV (191–207) supported a pretender (Niger) against the emperor Septimius Severus. The latter became emperor in 193 and began operations that permitted him to occupy first northern and then southern Mesopotamia and, for the third time in a century, Ctesiphon.

The Parthians in their retreat adopted a scorched-earth policy. As under Trajan, the starving Roman army went back up the Tigris, failed in its attempt to take Hatra, and left the country.

Vologases V, son of the previous king, succeeded him (207–222), and his throne was contested from 213 by another prince, Artabanus V (213–224), who was able to maintain himself thanks to the support of the kingdom of Media. A new invasion of Mesopotamia took place under Caracalla, the *casus belli* being the refusal of Artabanus V to give Caracalla his daughter in marriage. The young Roman emperor dreamed of rebuilding Alexander's empire but succeeded only in the pillage of Media and the destruction at Arbela of the hypogea of the Arsacid kings, whose bones he scattered.

Invasion of Caracalla

The Parthian reply was harsh. Artabanus V avenged himself by invading the Roman provinces and destroying several cities. Rome sued for peace. Artabanus' conditions were too hard and were refused. Hostilities were taken up again and turned in favour of the Parthians, who obtained such a success that the emperor Macrinus paid 200,000,000 sesterces to make peace.



Since 208 Pāpak (Bābak), a lesser prince of Persis, had been preparing a revolt, which his son Ardashir finally declared openly. A battle took place between him and Artabanus V in 224; the Parthian was killed, and the throne of Iran passed into the hands of the Sāsānids, a new national dynasty, originally from Fārs, cradle of the Achaemenids.

The Iran of the Parthians, a region strategically crucial for international commerce, maintained open roads, created cities, and encouraged exchanges that were the lifeblood of this great nation stretching from the portals of China and India to the Roman Empire. Tolerant in religion, it was Parthia that contributed to the dissemination of Buddhism to China, where a Parthian prince spread the word of Buddha near the middle of the 2nd century AD. For nearly half a millennium Parthia pursued its great ambition to recover the western provinces of the Achaemenids. An empire of the middle, between Rome on the west and the Kushāns on the east, undermined by internal weaknesses, Parthia finally succumbed, leaving its great dreams to its successors, the Sāsānids. (R.Gh.)

Architecture and art. In Iran and Mesopotamia, this long era of Parthian occupation is poorly represented by newly built towns, but there are a few notable examples. One was Ctesiphon, originally a Parthian military camp facing Seleucia, the older capital city on the other side of the Tigris River. Another was Hatra, a fortress city in the Jazīrah Desert between the Tigris and Euphrates rivers; and a third was Gūr-Fīrūzābād, south of Shiraz. All of these show the approximately circular plan of military tradition. The palaces, sometimes built of good ashlar masonry, and even the private houses are distinguished by a feature later characteristic of Islāmic architecture: the *īwān,* or three-sided hall, the fourth side of which is replaced by an open archway. At Hatra and in a Parthian palace at Ashur, the *īwān*s multiplied in number, and the adjoining facades are decorated with engaged columns, singly or in tiers, corresponding approximately to the orders of classical architecture.

Parthian palaces

Hatra is by far the best preserved and the most informative example of a Parthian city. It has an inner and an outer city wall, the former built of ashlar masonry, and a temenos (temple enclosure) enclosing the principal sacred buildings. The great central group, built during the

2nd and 1st centuries BC and still standing with many of its vaulted chambers intact, includes the Shamash temple, a characteristic Iranian sanctuary with a square central chamber, ambulatory, and outer wall incorporating a staircase to the roof. Comparable buildings have been found as far afield as Taxila in the Indus Valley. Excavations by Iraqi archaeologists have revealed temples dedicated to Al-Lāt and Shahiro, who, with Shamash, comprise a Hatran trinity.

In the 1st and 2nd centuries AD, Hatra was ruled by a dynasty of Arab princes whose written language was Aramaic. Excavations have yielded a great wealth of sculptures dating from this period, including portrait statues of the princes and their families. All of this material, when published, will throw new light on the whole subject of Parthian art, which depended hitherto on such isolated survivals as the magnificent bronze statue from Shami, in the old Elamite homeland. Rock reliefs at Tang-e Sarwak, Bīsitūn, and elsewhere reveal one salient characteristic of Parthian design—that is, the preference for "frontality" or, as one scholar describes it, "the tendency for the figures to ignore one another and to the face the spectator with an unblinking stare." Frontality is also characteristic of the Romano-Syrian sculptures of Palmyra and later passed into the fabric of Byzantine art.

Petra and Palmyra. Two cities, strategically placed in Jordan and eastern Syria, respectively, were at times associated with Parthian history and have left monuments suggesting a compromise between Roman and Near Eastern art. Both were caravan cities and each in turn acquired wealth and importance from its position at the junction of arterial trade routes. Petra, in biblical Edom, was ruled by Nabataean kings from late in the 2nd century BC until 106 AD, when it became a Roman colony. Its subsequent decline was due in part to the temporary ascendancy of Palmyra, on the western fringe of the Syrian desert, whose remarkable queen Zenobia ruled a miniature empire until defeated by the Romans in AD 272.

The significance of Petra in the history of ancient Near Eastern art is difficult to assess, since its art is in large part restriced to the design of rock-cut tombs or temples. Imitation building facades carved on cliff faces surround the tomb and temple entrances. Their most distinctively oriental characteristic is the baroque effect obtained by ingenious contortions of classical Roman formulas. The dramatic beauty of their natural setting and the chromatic peculiarity of the stone from which they were hewn are assets that have enhanced their reputation. Stripped of these, their interest is primarily academic.

Architecture of Palmyra

The architecture of Palmyra is more conventionally Roman, but it is freely associated with sculpture; and many bas-relief carvings decorate the tombs of rich merchants and other notables. Parthian influence is to be seen in their style, particularly in the frontality of the human figures.

(S.H.F.L.)

THE SĀSĀNIAN PERIOD

Foundation of the empire. *Rise of Ardashīr I.* At the beginning of the 3rd century AD, the Arsacid Empire had been in existence for some 400 years. Its strength had been undermined, however, by repeated Roman invasions, and the empire became once more divided, this time between Vologases V (207–222), who seems to have ruled at Ctesiphon, on the left bank of the middle Tigris in what is now Iraq, and Artabanus V (*c.* AD 213–224), who was in control of Iran and whose authority at Susa, in southwestern Iran, is attested by an inscription of AD 215.

It was against Artabanus V that a challenger arose in Persis. Ardashīr I, son of Pāpak and a descendant of Sāsān, was the ruler of one of the several small states into which Persia had gradually been divided. His father had taken possession of the city and district of Istakhr (Estakhr), which had replaced the old residence city of Persepolis, a mass of ruins after its destruction by Alexander the Great in 330 BC. Pāpak was succeeded by his eldest son, who was soon killed in an accident, and in AD 208 Ardashīr replaced his brother. He first built for himself a stronghold at Gūr, called after its founder Ardashīr-Khwarrah (Ardashīr's Glory), now Fīrūzābād, southeast of Shīrāz in Fārs. He subdued the neighbouring rulers and disposed, in the process, of his own remaining brothers. His seizure of such areas as Kermān, Isfahan, Elymais, and Characene (Mesene), to the east, north, and west of Fārs, respectively, led to war with Artabanus, his suzerain. The conflict between the two rivals lasted several years, during which time the Parthian forces were defeated in three battles. In the last of these, the battle in the plain of Hormizdagān (AD 224), Artabanus was killed.

Numismatic evidence concerning Ardashīr

There is evidence to support the assumption that Ardashīr's rise to power suffered several setbacks. Thus, Vologases V struck coins at Seleucia, on the Tigris, as late as AD 228/229 (the Seleucid year 539). Another Parthian prince, Artavasdes, a son of Artabanus V, known from coins on which he is portrayed with the distinguishing feature of a forked beard, seems to have exercised practical independence even after AD 228. Numismatic evidence further reflects the stages of Ardashīr's struggle for undisputed leadership. He appears on his coins with four different types of crown: as king of Fārs, as claimant to the throne before the battle at Hormizdagān (AD 224), and as emperor with two distinctly different crowns. It has been suggested that this evidence points to two separate coronation ceremonies of Ardashīr as sovereign ruler, the second, perhaps, indicating that he may have lost the throne temporarily.

According to aṭ-Ṭabarī, the Arabic historian (9th–10th centuries), Ardashīr, after having secured his position as a ruler in western Iran, embarked on an extensive military campaign in the east (AD 227) and conquered Seistan (Sakastan), Gorgān (Hyrcania), Merv

Table 1: Sāsānian Dates Established on Direct Ancient Evidence

*Syrian reckoning.

(Margiana), Balkh (Bactria), and Khwārezm (Chorasmia). The inference that this campaign resulted in the defeat of the powerful Kushān Empire is supported by the further statement of aṭ-Ṭabarī that the king of the Kushāns was among the eastern sovereigns, such as the rulers of Tūrān (Quzdar, south of modern Quetta) and of Mokrān (Makran), whose surrender was received by Ardashīr. These military and political successes were further extended by Ardashīr by his taking possession of the palace at Ctesiphon, by his assuming the title "king of kings of the Iranians," and by his refounding and rebuilding of the city of Seleucia, located on the Tigris River, under the new name of Weh-Ardashīr, the Good Deed of Ardashīr.

Sāsānian chronology

The chronology of events in the early Sāsānian period was calculated by the German orientalist T. Nöldeke in 1879, and his system of dating is still generally accepted. The discovery of fresh evidence in manuscript materials dealing with the life of Mani, a religious leader whose activities fall in the early Sāsānian period, led to a reassessment of Nöldeke's calculations by W.B. Henning, by which the principal events are dated about two years earlier. Another alternative was proposed by S.H. Taqizadeh, who preferred a sequence by which the same events are placed about six months later than the dates established by Nöldeke. Since the dating systems employed by the Sāsānians themselves were based on the regnal years of the individual kings, whose exact coronation dates are often subject to dispute, several details remain uncertain, and their definite solution has not been possible. A firmer basis of calculation is obtained when the ancient sources quote dates in terms of the Seleucid era, either according to the computation that prevailed in Babylonia, which started from 311 BC, or after the Syrian reckoning, beginning in 312 BC. Tables 2 and 3 give the dates as they can be established on direct numismatic or literary evidence in the differing chronological systems of Nöldeke, Henning, and Taqizadeh.

Wars of Shāpūr I. Shortly before his death, probably because of failing health, Ardashīr abdicated the throne in favour of his chosen heir, his son Shāpūr I. The latter assumed the responsibilities of government but delayed his coronation until after his father's death. Coins thus exist showing Ardashīr together with his son as heir apparent and Shāpūr alone wearing the eagle cap, indicating the exercise of royal rule before his coronation—besides the normal series of Shāpūr crowned as king.

Table 2: Chronological Systems of Nöldeke, Henning, and Taqizadeh

event	Nöldeke	Henning	Taqizadeh
Ardashīr's first year begins		Sept. 27, 223	Sept. 26, 226
Ardashīr's actual accession	Sept. 26, 266	April 28, 244	April 6, 227
Shāpūr's first year begins		Sept. 23, 239	Sept. 22, 241
Shāpūr's actual accession	Sept. 22, 241		
Shāpūr's coronation		April 12, 240	April 9, 243
Shāpūr's death		May 270	April 273
Accession of Hormizd I	Sept. 14, 272		
Hormizd I's death		June 271	April 274
Accession of Bahrām I	Sept. 14, 273		
Death of Mani (about age 60)		March 2, 274	Feb. 26, 277
Death of Bahrām I		Sept. 274	July 277
Accession of Bahrām II	Sept. 13, 276		

Shāpūr's defeat of the Romans

Shortly after his accession, Shāpūr was faced with an invasion of Persia by the emperor Gordian III (238–244):

> . . . the emperor Gordian levied in all of the Roman empire an army of Goths and Germans and marched against Asūristān [Iraq], the empire of Iran and us. On the border of Asūristān, at Massice [Misikhe on the Euphrates], a great battle took place. The emperor Gordian was killed and we destroyed the Roman army. The Romans proclaimed Philip [the Arab; 244–249] emperor. The emperor Philip came to terms, and as ransom for their lives he gave us 500,000 dinars and became our tributary. For that reason, we renamed Massice Fīrūz-Shāpūr ["victorious (is) Shāpūr"].

Several years later, in AD 256 (or AD 252), another confrontation between the Persians and Romans occurred:

> We attacked the Roman empire and we destroyed an army of 60,000 men at Barbalissus [in Syria]. Syria and its surrounding areas we burned, devastated and plundered. In this one campaign we captured of the Roman empire 37 cities. . . ,

including Antioch, the capital of Syria, itself. A third encounter took place when the emperor Valerian (253–260) came to the rescue of the city of Edessa, in Syria, which was besieged by the Persian army:

> He (Valerian) had with him (troops from) Germania, Rhaetia . . . [follow the names of some 29 Roman provinces], a force of 70,000 men. Beyond Carrhae and Edessa there was a great battle between the emperor Valerian and us. We made the emperor Valerian prisoner with our own hands; and the commanders of that army, the praefectus praetorii, senators and officers, we made them all prisoner, and we transported them to Persia. We burned, devastated and plundered Cilicia and Cappadocia . . . [follow the names of 36 cities].

The source for these quotations is Shāpūr's own account of the events. It was unknown until 1938, when expeditions of the Oriental Institute in Chicago discovered a long inscription on the walls of an Achaemenid building known as the Kaʿbe-ye Zardusht (Kaʿba of Zarathushtra). The text is in three languages, Sāsānian Pahlavi (Middle Persian), Parthian, and Greek. Besides the narrative of the military operations, the inscription provides a description of the Persian Empire of the time and an inventory of Zoroastrian religious foundations established by Shāpūr I to commemorate his victorious wars. These foundations were fire temples dedicated to the "soul" (memory) of the founder himself, of members of the royal family, and of prominent officials who had served under Shāpūr and his predecessor. The list of the officials who are specified by the positions they held throw light on the administrative organization of the empire.

Organization of the empire. In contrast to his father, who claimed to be "king of kings of Iran" (*shāhanshāh ērān*), Shāpūr I assumed the title "king of kings of Iran and non-Iran" (*shāhanshāh ērān ud anērān*). This formula was retained by his successors as the regular designation of the Sāsānian emperors. The hereditary local dynasties, which under the Arsacids had ruled many of the most important provinces, were to a large extent abolished. Instead, such areas as Maishān (Mesene), in western Iran, and Sakastan (Sīstān), in eastern Iran, were now ruled by members of the Sāsānian family, who were appointed by the sovereign with the title of *shāh* (king). Among such provincial governors, precedence was often given to the heir to the throne, who was placed in control of large territories, such as the former Kushān Empire (Kūshānshahr) and Armenia, with the title "great king" (*wuzurg shāh*). This arrangement lasted until the early 4th century AD, and such emperors as Shāpūr I and Hormizd II are known to have first held the title *kūshānshāh* as governors of the areas of Bactria, Sogdiana, and Gandhāra. Next in the hierarchy came a few remaining hereditary vassals, such as the kings of Iberia (now Georgia) in the Caucasus, and the chief nobles of the empire, among whom the Warāz, Sūrēn, and Karēn families retained their prominent position from Parthian times. Next in line were the satraps, whose importance had diminished and who were no more than the administrators of larger cities or court officials.

The list of provinces given in the inscription of Kaʿbe-yi Zardusht defines the extent of the empire under Shāp-

The Sāsānian Empire at the time of Shāpūr I.

ūr I, in clockwise geographical enumeration: (1) Persis (Fārs); (2) Parthia; (3) Susiana (Khūzestān); (4) Maishān (Mesene); (5) Asūristān (Iraq); (6) Adiabene; (7) Arabistān (northern Mesopotamia); (8) Atropatene (Āzārbāījān); (9) Armenia; (10) Iberia (Georgia); (11) Machelonia; (12) Albania (eastern Caucasus); (13) Balāsagān up to the Caucasus Mountains and the Gate of Albania (also known as Gate of the Alans, now the Darreh Āhū Pass in the central Caucasus); (14) Patishkhwagar (all of the Elburz Mountains); (15) Media; (16) Hyrcania (Gorgān); (17) Margiana (Merv); (18) Aria; (19) Abarshahr; (20) Carmania (Kermān); (21) Sakastan (Sīstān); (22) Tūrān; (23) Mokrān (Makran); (24) Paratān (Paradene); (25) India (probably restricted to the Indus Delta area); (26) Kūshānshahr, until as far as Peshāwar and until Kashgar and (borders of) Sogdiana and Tashkent; and (27), on the further side of the sea, Mazun (Oman). This empire, considerably more extensive than that controlled by the Arsacid dynasty, was governed by members of the royal family and by appointed officials directly responsible to the throne. The greater degree of centralization thus attained by the Sāsānian government partly explains its increased military effectiveness in comparison with the Arsacid administration. Tight organization of the numerous central and provincial officials, whose ranks in the bureaucratic structure on different levels were strictly defined, also contributed toward general administrative efficiency.

The extent of Shāpūr I's empire

Another trend that developed in the Sāsānian period, although it had already made itself felt under the Arsacids, was a strict principle of dynastic legitimacy. For a usurper not of the royal blood to come to the throne was an extremely rare occurrence, though it was in fact accomplished by Bahrām VI Chūbīn. Loyalty was given, however, to the whole royal house, rather as it was in the later Ottoman Empire. The person of the individual ruler was a matter of comparatively lesser importance, and one member of the dynasty could readily be removed and replaced by another. In accordance with this principle of legitimacy, Persian tradition carried the Sāsānian line back to the Achaemenids and, ultimately, to the kings of the legendary period.

Religious developments. *Zoroastrianism.* The ancestors of Ardashīr had played a leading role in the rites of the fire temple at Istakhr, known as Ādur-Anāhīd, the Anāhīd Fire. With the new dynasty having these priestly antecedents, it seems only natural that there would have been important developments in the Zoroastrian religion during the Sāsānian period. In fact, the evolution of Zoroastrianism as an organized religion into something resembling its modern form can be regarded as having begun in this period. Under the Parthians, local Magi had no doubt continued to perform the traditional ceremonies associated with the old Iranian deities, the fire cult, the creed preached by Zoroaster, with its emphasis on the worship of Ahura Mazdā, and even the cults of cosmopolitan deities that were introduced in the Hellenistic period and later.

Under the Sāsānians, stress came to be placed on the fire cult and the worship of Ahura Mazdā. Strong mutual relationships, furthermore, were developed between religion and the state, and an ecclesiastical organization was set up in which every local district of any importance had its own *mobed* ("priest"; originally *magupat,* "chief priest"). At their head stood the *mobedān mobed* ("priest of priests"), who, in addition to his purely religious jurisdiction, appears, especially in later times, to have had a more or less decisive voice in the choice of a successor to the throne and in other matters of state. There is also some evidence that the *mobeds*, by virtue of their proficiency in reading and writing in general and in the interpretation of the sacred scriptures in particular, performed the offices of registrars and scribes in semireligious or nonreligious matters, after the fashion of the Christian clergy in medieval Europe. This situation in turn makes it likely that the priestly library buildings not only contained the sacred texts, charters, and other church records but also served as repositories of local archives, title deeds, and other documents of a legal nature. The

Religion and the state

Table 3: Sāsānian Kings*

name	reign years	name	reign years
Defeat of Artabanus V (Ardavan)	226	Kavadh (Qobād) I (first reign)	488–496
Ardashīr I	224–241	Jāmāsb	496–499
Shāpūr I	241–272	Kavadh (second reign)	499–531
Hormizd I	272–273	Khosrow I	531–579
Bahrām I	273–276	Hormizd IV	579–590
Bahrām II	276–293	Khosrow II Parvīz (first reign)	590
Bahrām III	293	Bahrām VI	590–591
Narses	293–302	Khosrow II Parvīz (second reign)	591–628
Hormizd II	302–309	Bestām (rebel in Media)	591–596
Shāpūr II	309–379	Kavadh (Qobād) II Shīrūye (Siroes)	627–628
Ardashīr II	379–383	Ardashīr III	628–630
Shāpūr III	383–388	Shāhrbarāz	630
Bahrām IV	388–399	Pūrāndokht	629–631

*Based mainly on T. Nöldeke's chronology.

building known as Kaʿbe-ye Zardusht and referred to as a *bun-khānag* ("foundation house") may well have served this very purpose.

In the matter of religious practice, the theology of the Sāsānians appears to have developed from that previously current in their home province of Persis. There, extraneous religious influences were limited. The opposition between the good spirit of light and the demons—between Ormizd (Ahura Mazdā) and Ahriman (Angra Mainyu)—remained the essential dogma. All the other gods and angels were restricted to the role of subordinate servants of Ormizd, whose highest manifestation on earth was not so much the sun or the sun god Mihr (Mithra) but rather the holy fire guarded and attended by his priests. At the same time the names of such deities as Wahrām (Verethraghna), Mihr, and Anāhīd (Anahita) were still associated with the names of fire temples or classes of fires. Divine names were also used to designate the 30 days of each month and of the 12 30-day months of the year, plus five epact days called *gahānīg,* to align the lunar with the solar year.

Ritual practice

All the prescriptions of purity were scrupulously observed. The elaborate ritual still maintained in modern times by the Parsi for the purification and custody of the sacred fire was no doubt observed under the Sāsānians. The officiating priest was girt with a sword and carried in his hand the *barsman* (*barsom*), or bundle of sacred grass. His mouth was covered to prevent the sacred fire from being polluted by his breath. The practice of animal sacrifice, abhorred by the modern followers of Zoroaster, is attested for the Sāsānian period at least as late as the reign of Yazdegerd I (399–420). On the days of the important festivals, such as *Nōgrūz* (*Nowrūz*), the first day of the vernal equinox, and on the day of *Mihragan* (the 16th day of the seventh month), the sacred fire was displayed to the faithful (*wehden*) at nightfall from some vantage point. Under the Sāsānians, the injunction not to pollute the earth by contact with corpses but to expose the dead on mountain tops to vultures and dogs was strictly observed. Ahura Mazdā preserved his character as a national god, who bestowed victory and world dominion on his worshippers. In rock-relief sculptures he appears on horseback as a god of war.

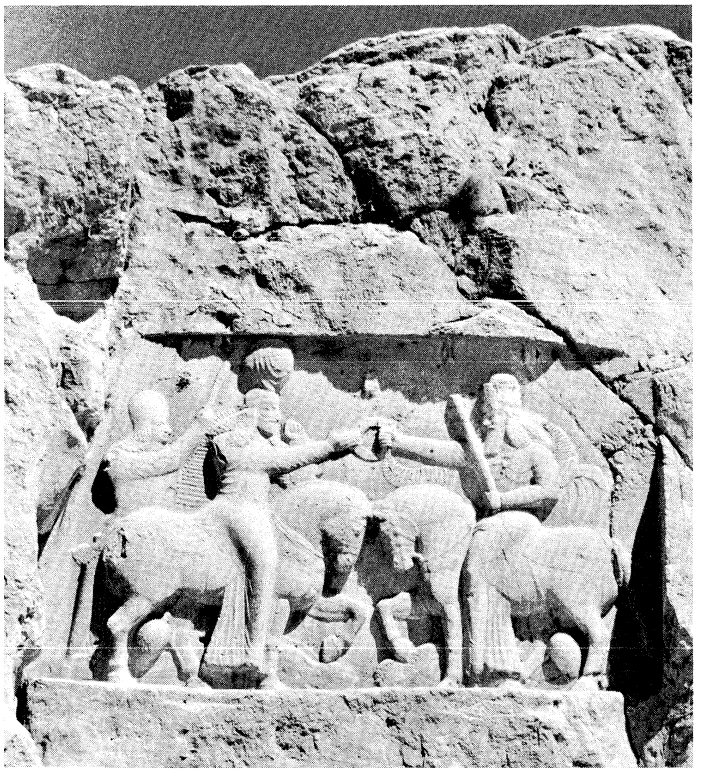
Theology was further developed, and an attempt was made to modify the old dualistic concept by considering both Ormizd and Ahriman as emanations of an original principle of infinite time (Zurvān). This doctrine enjoyed a certain degree of official recognition in early Sāsānian times. In the reign of Khosrow I (531–579), however, the "sect of the Zurvanites" was declared to be heretical. The chief trend of Sāsānian religion, apart from the process of institutionalization, was toward the elaboration of ritual and of the doctrine of purity. A complete and detailed system of casuistry was developed, which dealt with all things allowed and forbidden and with the forms of pollution and the expiation of each. One of the consequences of this development was the increasing emphasis placed on orthodoxy and rigorous obedience to priestly injunctions. Nonorthodox and heretical cults and forbidden manners and customs came to be regarded as a pollution of the land and a serious offense to the true God. It was the duty of the believer to combat and destroy the unbelievers and the heretics. In short, the tolerance of the Achaemenids and the indifference of the Arsacids were gradually replaced by religious intolerance and persecution.

Despite his priestly family origin, Ardashīr himself seems not to have been the person responsible for initiating these new directions in religious affairs. It was once believed that the institutionalization of the Zoroastrian church and the codification of its scriptures and beliefs was the work of a high priest named Tansar, a contemporary of Ardashīr I, of whose activities an account is preserved in the *Letter of Tansar,* contained in the history of Ṭabaristān by the Persian writer Ibn Isfandiyār (12th–13th centuries). New inscriptional evidence, however, rather suggests that, if Tansar was, in fact, a historical personage, his role in religious matters was overshadowed by Kartēr (Karder).

Role of the priest Kartēr

The latter, a *herbed* ("teacher priest") and *mobed* ("priest") already prominent under Shāpūr I, appears during the reigns of Bahrām I (273–276) and Bahrām II (276–293) as the dominant figure in the Zoroastrian church. As stated in the Kaʿbe-ye Zardusht inscription of Kartēr, he claims credit for the suppression of non-Zoroastrian religious communities in Iran ("and Jews, Buddhists, Brahmins, 'Nazoreans,' Christians . . . were struck upon"), for the imposition of orthodoxy and discipline on the priesthood ("the heretics [*ahlomog*] . . . who in the Magus estate did not attend to the Mazdean religion and the services to the gods with discrimination, I struck them with punishment and I castigated them"), and for the establishment of royal foundations for the maintenance of priests and of sacred fires.

Christianity. The reference in the Kartēr inscription to two sects of Christians continues the indications from Syriac sources that Christianity had by this time, the second half of the 3rd century, gained a firm footing in the lands of the Tigris and the Euphrates, where it was strongest among the Aramaic-speaking communities. Ultimately, Christian missionary effort came to expand over the whole of Iran and even beyond. As long as the Roman Empire remained pagan, the Christian communities of Iran lived undisturbed by persecution, while the Christians themselves showed outspoken hostility toward such heterodox sects as the Manichaeans and the Gnostic followers of Marcion and Bardesanes, who existed side by side with them. Once the emperor Constantine the Great (306–337) made Christianity the official religion of the Roman world, the Iranian Christians were, on the one hand, drawn to feel a certain sympathy for their foreign coreligionists, while, on the other, political significance came to be attached by the Sāsānian rulers to these religious connections with an often hostile foreign power. After 339 the Christians of Iran were subjected to severe persecutions at the hands of Shāpūr II and his successors. Substantial Christian communities survived, nonetheless, in parts of Iran long after the end of the Sāsānian dynasty.



Manichaeism. During the reign of Shāpūr I a new religious leader and movement made their appearance. Mani (between 216? and 274?) was the offspring of a Parthian family resident in Babylonia ("a thankful disciple I am, risen from Babel's land") but himself a speaker of Aramaic. In the early 20th century, knowledge of his teachings was greatly increased by the discovery of many fragments of Manichaean literature in eastern Turkistan. Subsequently, a large part of the *Kephalaia,* a collection of the religious injunctions of Mani, was recovered in a Coptic version, found in Egypt. These texts can now be collated with the versions of Manichaean doctrines as reported by the Church Fathers, including St. Augustine. From this cumulative documentation, to which other sources can be added, it appears, among other things, that Mani's teachings were formulated under the strong influence of Gnostic ideas and philosophy. Mani proclaimed himself to be the last and greatest Apostle of Jesus as well as the paraclete announced in the Gospel of St. John. With the Gnostic interpretation of the Gospel, Mani tried to combine the doctrines of Zoroaster and Jesus in order to create a new religion of a universal character. There is a tradition that he made his first appearance as a teacher on the coronation day of Shāpūr I (April 12, 240, or April 9, 243), but other evidence suggests that Mani was not necessarily in Iran at the time and may have been on a sea journey to India when he started preaching. He later returned and found many followers, among whom were Fīrūz (Pērōz) and Mihrshāh, governor of Maishān (Mesene), both brothers of Shāpūr I. Even the King himself is said to have been impressed and to have granted the prophet several personal interviews. On the last such occasion, Mani presented the King with his first book, the *Shāpuragān* (*Shabuhragan*), a summary of his teachings ("dedicated to Shāpūr") written in the Middle Persian language, further evidence of a degree of royal favour. During Shāpūr's reign the religion of Mani was thus propagated in and beyond Iran. The heir to the throne, Hormizd I, was also favourably disposed toward him. Shāpūr's younger son, Bahrām I, however, yielded to pressure from the priestly establishment, and Mani was executed. After that, Manichaeism was persecuted and destroyed in Iran. Yet it

Suppression of Manichaeism

maintained itself not only in the West, penetrating far into the Roman Empire, but also in the East, in Khorāsān and beyond the boundaries of the Sāsānian Empire. There the seat of its pontiff was at Samarkand, whence it penetrated into Central Asia.

Art and literature. Perhaps the most characteristic and certainly among the most impressive relics of Sāsānian art are the great rock sculptures carved on the limestone cliffs that are found in many parts of the country. The best known groups are at Naqsh-e Rostam and Naqsh-e Rajab, both near Persepolis, and at Bishāpūr, an ancient city a few miles north of Kāzerūn in Fārs. At Fīrūzābād, the ancient Gūr, also in Fārs, are two reliefs of Ardashīr I, one depicting the overthrow of Artabanus V, the other an investiture scene. Not far away, in the valley at Sar Mashhad, a representation of Bahrām II shows that king in the process of slaying two lions. At Dārābgerd, about 180 miles southwest of Shīrāz, Shāpūr I is shown triumphing over three Roman emperors, Gordian III, Philip the Arabian, and Valerian. At Naqsh-e Bahrām, north of Kāzerūn, Bahrām III is depicted enthroned. The same ruler appears at Qaṣr-e Abū Nasr, near Shīrāz, and at Gūyom, not far from there. Sāsānian sculptured reliefs are less numerous outside Fārs, but a Sāsānian equestrian that once existed at Rayy (ancient Rhagae), southeast of Tehrān, was replaced in the 19th century by a representation of Fatḥ

Paul Popper

Sāsānian rock relief showing the investiture in AD 226 of Ardashīr I at Naqsh-e Rostam, Persia (Iran).

ʿAlī Shāh, a member of the then-ruling Qajar dynasty. At Salmās, near Lake Urmia, Ardashīr I is shown on horseback while receiving the surrender of a Parthian personage. There are also later Sāsānian sculptures at Ṭāq-e Bostān, near Bakhtaran, showing Ardashīr II, Shāpūr III, and Khosrow II. In many of these representations the Sāsānian kings can often be identified by their individual crowns.

Architecture

The most ambitious and celebrated architectural achievement of the dynasty is the vast palace at Ctesiphon, built by Khosrow II (590; 591–628), of which a part is still standing. It is known as the Ṭāq Kisrā and is notable for its great barrel vault in baked brick, a typically Sāsānian architectonic device. Many Sāsānian buildings can also be seen in Fārs, where the characteristic construction is of limestone blocks embedded in strong mortar. The most important of these are the palace of Ardashīr I at Fīrūzābād, south of Shīrāz, and a small, well-preserved palace at Sarvestān, southeast of Shīrāz, in which the rooms are roofed with domes and squinches, features often found in Sāsānian architecture. Excavations at Bishāpūr, or Shāhpūr, near Kāzerūn, have revealed some mosaic floors and other features of this important Sāsānian town. Numerous fire temples of the period survive, especially in Fārs; these are square buildings roofed by a dome over four arches. Sāsānian remains of considerable extent also exist at Qaṣr-e Shīrīn, on the road from Baghdad to Tehrān, and at Gondēshāpūr, modern Shāhābād, south of Dezfūl.

Metalwork and coinage

Generally speaking, the Sāsānian era was one of a renascence in Iranian art, which, if not quite on the same level as the Achaemenid achievement, was of no small importance. Metalwork reached a high level of artistry and craftmanship; its most characteristic decorative themes are hunting scenes portraying the Sāsānian kings in action. A gold and enamel drinking vessel (now in the Bibliothèque Nationale in Paris) from the time of Khosrow I (531–579)—known as the "Cup of Solomon" and, according to one tradition, a gift of the caliph Hārūn ar-Rashīd to Charlemagne—is perhaps the most sumptuous specimen of Sāsānian metalworking. The art of gem engraving produced many fine intaglio stamp seals and cameos. The coins invariably bear a Pahlavi (Middle Persian) inscription; on the obverse is the head of the king, wearing his characteristic crown, accompanied by his name and title, on the reverse the fire altar with its guardians and the legend "Fire of Ardashīr, Shāpūr, etc." or, in the later period, an abbreviated mint name and the regnal date.

The acquaintance with Greek language and literature maintained by the Arsacid court had begun to decline during the last century of that dynasty. Greek versions nonetheless accompany the Parthian and Middle Persian texts of the inscriptions of Ardashīr I and Shāpūr I, as in the case of the Kaʿbe-yi Zardusht inscription. Later inscriptions, however, are only in Parthian and Middle Persian, as in the case of the inscription of Narses at Paikuli.

Literature

Most of the comparatively few remains of literature in (Book) Pahlavi—a form of Middle Persian somewhat different from that used in the Sāsānian inscriptions—is of late or post-Sāsānian date in its actual form, if not in content. This is partly due to the fact that the transition from an oral to a written literary tradition took place in the later part of the Sāsānian era. This is true of both religious and secular compositions. A passage in a religious text states that "it is proper to consider the living spoken word more weighty than the written." It should be added that most Sāsānian literary remains are primarily of religious and historical rather than of literary interest. Just as foreign learning appears in religious works, likewise foreign prose works of entertainment came to Persia, where they were translated; among them, in the time of Khosrow I, were Hellenistic romance literature and Indian books of tales, such as *Kalīlag and Dimnag,* based on the Indian *Pañcatantra* or the legends of *Barlaam and Josaphat* (*Balauhar and Budasaf*).

Foreign policy. In foreign policy the problems under the Sāsānian kings remained, as of old, the defense and, when possible, the expansion of the eastern and western frontiers. The successful military campaigns in the eastern areas by Ardashīr I and Shāpūr I, which resulted in the annexation of the western part of the Kushān Empire, have already been mentioned.

Conflicts with Rome. In the west, the old contest for northern Mesopotamia with the fortified cities of Carrhae, Nisibis, and Edessa continued. The Sāsānians were all the more eager to regain and retain control of Armenia because there the Arsacid dynasty still survived and turned for protection to Rome, with which, in consequence, new wars continually broke out. In the reign of Bahrām II (276–293), the emperor Carus (282–283) invaded Mesopotamia without meeting opposition and reached Ctesiphon. His sudden death, however, caused the Roman army to withdraw. Bahrām II had been prevented from meeting the Roman challenge by the rebellion of his brother, the *kūshānshāh* Hormizd, who tried to establish an independent eastern empire. This attempt ended in

failure, however, and Bahrām II appointed his younger son, the future Bahrām III, as viceroy of Sakastan (Sīstān). After Bahrām II had died (293), Narses, the youngest son of Shāpūr II, contested the succession of Bahrām III and won the crown. In memory of his victory, Narses erected a tower at Paikuli, in the mountains west of the upper Diyālā River, which was discovered in 1843 by the English Orientalist Sir Henry Rawlinson. Decorated with busts of Narses, the monument has a long inscription in Parthian and Middle Persian that tells the story of the events. In 296, Narses was forced to conclude a peace treaty with the Romans by which Armenia remained under Roman suzerainty and certain areas in northern Mesopotamia were ceded to Rome. By this treaty, which lasted for 40 years, the Sāsānians withdrew completely from the disputed districts. The Roman Empire had meanwhile become Christian, and the Syro-Christian populations of Mesopotamia and Babylonia began to feel sympathy with Roman policies for religious reasons. Christianity also became predominant in Armenia after King Tiridates adopted the Christian faith in 294. The Sāsānian emperors consequently felt the need to consolidate their Zoroastrianism, and efforts were made to perfect and enforce state orthodoxy. All heresy was proscribed by the state, defection from the official faith was made a capital crime, and persecution of the heterodox, the Christians in particular, began. Competition between Iran and Rome–Byzantium thus took on a religious dimension.

Religious factors in foreign policy

A new war was inevitable. It was begun by Shāpūr II in 337, the year of the death of Constantine the Great. Shāpūr besieged the fortress city of Nisibis three times without success. The emperor Constantius (337–361) conducted the war weakly, but Shāpūr was distracted by the appearance of a new enemy, the nomadic Chionites (Huns), on his eastern frontier. After a long campaign against them (353–358), he returned to Mesopotamia and, with the help of Chionite auxiliaries, captured the city of Amida (modern Diyarbakır) on the upper Tigris, an episode vividly narrated by the Roman historian Ammianus Marcellinus (*c.* 330–400). The emperor Julian the Apostate (361–363) reopened hostilities after the death of Constantius (361) but died after having reached the vicinity of Ctesiphon. His successor, Jovian (363–364), was forced to give up the Roman possessions on the Tigris, including Nisibis, and to abandon Armenia and his Arsacid protégé, Arsaces III, to the Persians. The greater part of Armenia then became a Persian province.

Intermittent conflicts from Yazdegerd I to Khosrow I. After about two decades of disturbed reigns (Ardashīr II, Shāpūr III, Bahrām IV), Yazdegerd I came to the throne. His reign is viewed differently by Christian and Zoroastrian sources. The former praise his clemency; the latter refer to him as "Yazdegerd the Sinful." His initial inclination toward tolerance of the Christian and Jewish religions was met by resistance on the part of the nobility. Because of their attitude and because of the growing fanaticism of the Christians, Yazdegerd was forced to turn to repression. After his death (420), the nobles refused to admit any of Yazdegerd's sons to the throne. But one of them, Bahrām V, had the support of al-Mundhir, Arab prince of al-Ḥīrah (east of the lower Euphrates) and a Sāsānian vassal, and also, apparently, of Mihr-Narseh, chief minister of Yazdegerd's last years, who was retained in office, and Bahrām eventually won the throne. As King Bahrām V, surnamed Gūr (Wild Ass), he became the favourite of Persian popular tradition, which exuberantly celebrates his prowess in hunting and in love. Unsuccessful in war with Byzantium (421–422), Bahrām V made a 100-year peace and granted freedom of worship to the Christians. In the east he did succeed in repelling an invasion by a new wave of Hephthalites. In the following decades, however (second half of the 5th century), Hephthalite attacks continued to harass and weaken the Sāsānians. Fīrūz (457–484) fell in battle against them; his treasures and family were captured, and the country was devastated. His brother Balāsh (484–488), unable to cope with continuing incursions, was deposed and blinded. The crown fell to Kavadh (Qobād) I, son of Fīrūz. While the empire continued to suffer distress, he was dethroned and imprisoned (496), but he escaped to the Hephthalites and was restored (499) with their assistance. The Nestorian doctrine (claiming that divine and human persons remained separate in the incarnate Christ) had by then become dominant among the Christians in Iran and was definitely established as the accepted form of Christianity in the Sāsānian Empire.

Reign of Kavadh I

Kavadh I proved himself a vigorous ruler. He restored peace and order in the land. A campaign against the Romans (502) resulted in the destruction of Amida, but another inroad by the Hephthalites in the east compelled him to ratify a peace treaty with the Byzantines. Toward the close of his reign, in 527, he resumed the war and defeated the Byzantine general Belisarius at Callinicum (531) with the support of al-Mundhir II of al-Ḥīrah. Earlier in his reign he had moved away from the Zoroastrian church and favoured Mazdak, the founder of a new socio-religious movement that had found support among the people. The crown prince, Khosrow, however, was an orthodox Zoroastrian; toward the end of his father's reign, in collaboration with the chief *mobed,* he contrived the condemnation of the Mazdakites, who were destroyed in a great massacre (528). On his father's death, after acceding as Khosrow I (531–579), he concluded peace with the Byzantine emperor Justinian (532). He reestablished Zoroastrian orthodoxy, and, although some persecution of Christian communities occurred during periods of tension with Byzantium, the restoration of peace brought about a considerable amount of religious tolerance.

Khosrow I was one of the most illustrious Sāsānian monarchs. From his time dates a new and more equitable adjustment of the imperial tax system. The levying of land revenue in kind was replaced by a fixed assessment in cash, and these assessments continued in force later under the Arab administration. His reputation as an enlightened and just ruler was high during his lifetime and later became legendary. When Justinian, in 529, closed the philosophy school in Athens, the last Neoplatonists turned to Khosrow in hopes of finding in him the true philosopher-king. Though they were disillusioned by conditions at his court, their gratitude was great when Khosrow obtained for them the right to return. From 540 onward Khosrow had been conducting a long war against Justinian, which, although interrupted by several armistices, lasted until the 50 years' peace of 561. Khosrow also extended his power to the Black Sea and inflicted heavy defeats on the Hephthalites. These military successes were in part the result of several reorganizations of the armed forces and the chain of command that were achieved during Khosrow's long reign.

Conflicts with the Turks and Byzantium. About 560 a new nation, that of the Turks, had emerged in the east. By concluding an alliance with a Turkish leader called Sinjibu (Silzibul), Khosrow was able to inflict a decisive defeat on the Hephthalites, after which event a common frontier between the Turkish and Sāsānian empires was established. Inevitably, this alliance became a source of possible friction, and the Turks sometimes acted as an ally of Byzantium against Iran in a second war (572–579).

Revolts of Bahrām Chūbīn and Bestām

Khosrow bequeathed this war to his son Hormizd IV (579–590), who in spite of repeated negotiations failed to reestablish peace between Byzantium and Iran. Hormizd was unable to display the same authority as his father, and he antagonized the Zoroastrian clergy by failing to take action against the Christians. He finally fell victim to a conspiracy headed by the general Bahrām Chūbīn. Hormizd's son, Khosrow II, was set up against his father and forced to acquiesce in Hormizd's execution. New unrest broke out, in which Bahrām Chūbīn—though not of royal lineage—attempted to secure the throne. Simultaneously another pretender, Prince Bestām, decided to try his luck. Khosrow fled to Byzantium, and the emperor Maurice (582–602) undertook his restoration by military force. Bahrām Chūbīn was routed (591) and fled to and was killed by the Turks, and Khosrow again ascended the throne in Ctesiphon. Bestām held out in Media until 596.

Khosrow II (590; 591–628), surnamed Parvīz (the Victorious), achieved unprecedented splendour and material wealth. The assassination of Maurice (602) impelled him to a war against Byzantium, in the course of which his armies penetrated as far as Chalcedon (opposite Con-

stantinople), ravaged Syria, and captured Antioch (611), Damascus (613), and Jerusalem (614); in 619 Egypt was occupied. The Byzantine Empire was, indeed, at its lowest ebb.

It took the great emperor Heraclius, who was crowned in 610, many years to rebuild the nucleus of a new army. This done, however, he set out in 622 and retaliated vigorously against the Persians. Their armies were defeated everywhere. In 624 Heraclius invaded Atropatene (Azerbaijan) and destroyed the great Zoroastrian fire temple; in 627 he entered the Tigris provinces. Khosrow II attempted no resistance; a revolution followed in which he was defeated and slain by his son Kavadh (Qobād) II (628). When Kavadh died a few months later, anarchy resulted. After a succession of short-time rulers, Yazdegerd III, grandson of Khosrow II, came to the throne in 633.

Triumph of the Arabs. All of these prolonged and exhausting hostilities had drastically reduced the powers of both Byzantium and Iran. The door was open to a newly emerging force that challenged both states and religions—the Arabs. After several encounters, the fate of the Sāsānian Empire was decided in the battle of al-Qādisīyah (636/637), on one of the Euphrates canals, not far from al-Ḥīrah, during which the Sāsānian commander in chief, Rustam, was killed. Ctesiphon with its treasures was at the mercy of the victors. Yazdegerd fled to Media, where his generals tried to organize new resistance. The battle fought at Nehāvand (642), south of Hamadān, put an end to their hopes. Yazdegerd sought refuge in one province after another, until at last, in 651, he was assassinated near Merv.

End of the Sāsānian Empire

With the fall of the empire, the fate of its religion was also sealed. The Muslims officially tolerated the Zoroastrian faith, though persecutions were not unknown. Little by little it vanished from Iran, except for a few surviving adherents who remain to the present day in Yazd and a few other places. Other Zoroastrians emigrated to western India, where they are now chiefly concentrated in Bombay. These Parsis (Persians) have preserved only a relatively small portion of their sacred writings. They still number their years by the era of Yazdegerd III, the last king of their faith and the last Sāsānian sovereign of Iran.

(A.D.H.B./M.J.Dr.)

IRAN FROM 640 TO THE PRESENT

The advent of Islām (640–829). The Arab invasion of Iran made a break with the past that affected not only Iran but all of western Asia and resulted in the assimilation of peoples who shaped and vitalized Muslim culture. The Prophet Muḥammad had made Medina, his adopted city, and Mecca, his birthplace, centres of an Arabian movement that Muslim Arabs developed into a world movement by the conquest of Iranian and Byzantine territories. Neither the Iranian nor Byzantine empires had been unfamiliar to those Arabs who were the former's Lakhmid and the latter's Ghassānid vassals, the two empires' frontier guardians against fellow Arabs who roamed deeper in the Arabian Desert. Also, Meccan and Medinese Arabs had established commercial connection with the Byzantines and Sāsānids. The immunity of Mecca's ancient sanctuary against outlawry and outrage had promoted this city's commercial importance. The Kaʿbah, as the sanctuary was called, was cleansed of idols by Muḥammad, who had himself once been engaged in commerce. He made it the sanctuary of a monotheistic faith whose sacred writings were impregnated with the injunctions and prohibitions needed by a business community for secure and stable trading.

Arab tribalism beyond urban fringes was less easily broken than idols. It was embedded in the desert sparsity that led to warfare and careful counting of a tribe's male offspring. After Mecca and Medina had become Muslim, to secure the routes they depended upon necessitated winning the desert Arabs' allegiance. In the process of doing this, wars over water holes, scanty pastures, men-at-arms, and camels were enlarged into international campaigns of expansion.

The vulnerability of Sāsānid Iran assisted the expansionist process. In AD 623 the Byzantine emperor Heraclius reversed Persian successes over Roman arms, namely, the capture of Jerusalem in 614 and a victory at Chalcedon in 617. His victim, Khosrow Parvīz, died in 628 and left Iran a prey to a succession of puppet rulers who were frequently deposed by a combination of nobles and Zoroastrian clergy. Thus, when Yazdegerd III, Iran's last Sāsānid and Zoroastrian sovereign, came to the throne in 632, the year of Muḥammad's death, he inherited an empire weakened by Byzantine wars and internal dissension.

Sāsānid weakness

The former Arab vassals on the empire's southwestern border realized that their moment had arrived, but their raids into Sāsānid territory were quickly taken up by Muḥammad's caliphs, or deputies, at Medina—Abū Bakr and ʿUmar (632–634; 634–644)—to become a Muslim, Pan-Arab attack on Iran.

An Arab victory at al-Qādisīyah in 636/637 was followed by the sack of the Sāsānid winter capital at Ctesiphon on the Tigris. The Battle of Nahāvand in 642 completed the Sāsānids' vanquishment. Yazdegerd fled to the empire's northeastern outpost, Merv, whose *marzbān*, or march lord, Mahūyeh, was soured by Yazdegerd's imperious and expensive demands. Mahūyeh turned against his emperor and defeated him with the help of Hephthalites from Bādghis. The Hephthalites, an independent border power, had troubled the Sāsānids since at least 590, when they had sided with Bahrām Chūbīn, Khosrow Parvīz's rebel general. A miller near Merv murdered the fugitive Yazdegerd for his purse.

The Sāsānid end was ignominious, but it was not the end of Iran. Rather, it marked a new beginning. Within two centuries, Iranian civilization was revived with a cultural amalgam, with patterns of art and thought, with attitudes and a sophistication that were indebted to its pre-Islāmic Iranian heritage—a heritage changed but also stirred into fresh life by the Arab-Muslim conquest.

Abū Muslim's revolution. Less time was needed before the Arabs' assimilation with Iranians in regions they colonized caused a new Islāmic beginning, Abū Muslim's movement, which began in Khorāsān, in 747. This revolution followed years of conspiracy directed from Medina and across to Khorāsān along the trade route that linked the Far East to Merv and thence with the West. Along the route merchants with contacts in the Mesopotamian Arab garrison cities of Kūfah, Wāsiṭ, and Basra acted as intermediaries. Iranians who by converting to Islām had become clients, or *mawālī*, of Arab patrons played direct and indirect parts in the revolutionary movement. The movement also involved Arabs who had partnered Khorāsānian and Transoxanian Iranians in ventures in the great east–west trade and intercity trade of northeastern Iran. The revolution was, nevertheless, primarily an Arabo-Islāmic movement, aimed to supplant a militaristic, tyrannical central government whose fiscal problems made it avid for revenue by one more sympathetic to the needs of the merchants of eastern Islām. Abū Muslim, a revolutionary of unknown origin, was able in Merv to exploit the discontent of the merchant classes as well as that of the Arab and Iranian settlers. The object of attack was the Umayyad government in Damascus.

Background of the revolution

When Muḥammad died in 632, his newly established community in Medina and Mecca needed a guiding counsellor, an imam, to lead them in prayers and an *amīr al-muʾminīn*, "Commander of the Faithful," to ensure proper application of the Prophet's divinely inspired precepts. As the Prophet, Muḥammad could never be entirely succeeded, but it was accepted that men who had sufficient dignity and who had known him could fulfil the functions, as his caliphs (*khulafāʾ*), or deputies, and imams. After Abū Bakr and ʿUmar, ʿUthmān was chosen for this role.

By ʿUthmān's time, factionalism was growing among Arabs, partly the result of the jealousies and rivalries consequent upon acquiring new territories, and partly the result of the competition between first arrivals in them and those who followed. There was also uncertainty over the most desirable kind of imamate. One faction, the Shīʿah, supported ʿAlī, the Prophet's cousin and husband of his favourite daughter, Fāṭimah, for the caliphate, since he had been an intimate of Muḥammad and seemed more capable than the other candidates of expressing Muḥammad's wisdom and virtue as the people's judge. The

desire for such a successor points to disenchantment with ʿUthmān's attempt to strengthen the central government and impose demands on the colonies. His murder in 656 left his Umayyad relatives poised to avenge it, while ʿAlī was raised to the caliphate. A group of his supporters, the Khārijites, desired more freedom than ʿAlī was willing to grant, with a return to the simplest interpretation of the Prophet's revelation in the Qurʾān, along puritanical lines.

The Khārijites

A Khārijite killed ʿAlī in 661. The Shīʿah thenceforth crystallized into the obverse position of the Khārijites, emphasizing ʿAlī's relationship to the Prophet as a means of making him and his descendants by Fāṭimah the sole legitimate heirs to the Prophet, some of whose spiritual power was even believed to have been transmitted to them. This Shīʿism centuries later became the official Islāmic sect of Iran. In the interim, Shīʿism was a rallying point for socially and politically discontented elements within the Muslim community. In addition to the Khārijites, another minority sect was thus formed, hostile from the beginning to the Umayyad government that seized power on ʿAlī's death. The majority of Muslims avoided both the Shīʿite and Khārijite positions but followed instead the *sunnah,* or "tradition," as these orthodox believers conceived the Prophet to have left it and as Abū Bakr, ʿUmar, ʿUthmān, and ʿAlī, too, the "rightly guided" first caliphs, had observed and codified it.

Abū Muslim's revolutionary movement was as much as anything representing Medinese mercantile interests in the Hejaz, dissatisfied with Umayyad inability to shelter Middle Eastern trade under a Pax Islamica. To promote the revolution aimed to destroy Umayyad power, the movement exploited Shīʿite aspirations and other forces of disenchantment. The Khārijites were excluded, since their movement opposed the idea of a caliphate of the kind Abū Muslim's adherents were fighting to establish—one that could command sufficient respect to hold together an Islāmic universal state. A discontented element ready to Abū Muslim's hand in Khorāsān, however, was not a religious grouping but Arab settlers and Iranian cultivators who were burdened by taxation.

In Iran, the first Arab conquerors had concluded treaties with local Iranian magnates who had assumed authority when the Sāsānid imperial government disintegrated. These notables—the *marzbān*s and landlords (*dehqān*s)—undertook to continue tax collection on behalf of the new Muslim power. The advent of Arab colonizers, who preferred to cultivate the land rather than campaign farther into Asia, produced a further complication. Once the Arabs had settled in Iranian lands, they were required to pay the *kharāj,* or land tax, collected by Iranian notables and their agents under treaty with the Muslim government. The Iranian collectors proved extortionate and aroused the hostility of both Arab and Persian.

Taxes levied

Another source of discontent was the head tax, or *jizyah,* which was applied to non-Muslims of the tolerated religions—Judaism, Christianity, and Zoroastrianism. Thus, on conversion to Islām, Iranians expected exemption from this degrading tax. But the Umayyad government, burdened with imperial expenses, often refused exemption to the Iranian converts.

The tax demands of the Damascus government were as distasteful to those urbanized Arabs and Iranians in commerce as they were to those in agriculture; and hopes of easier conditions under the new rulers than under the Sāsānids were not fully realized. The Umayyads ignored Iranian agricultural conditions, which required constant reinvestment to maintain irrigation works and to halt the encroachment of the desert. This no doubt made the tax burden, from which no returns were visible, all the more odious. Furthermore, the regime failed to maintain the peace so necessary to trade. Damascus feared the breaking away of remote provinces where the Arab colonists were becoming assimilated with the local populations. The government, therefore, deliberately encouraged tribal factionalism in order to prevent a united opposition against it.

Thus the revolution set out to establish an Islāmic oecumene above divisions and sectarianism, the Pax Islamica already referred to, which commerce required and which Iranian merchants without status in the Sāsānid social hierarchy looked to Islām to provide. Ease of communication from the Oxus to the Mediterranean was wanted but without what seemed like a nest of robbers calling themselves a government straddling the route at Damascus. In 750 Umayyad power was destroyed and the revolution gave the caliphate to the ʿAbbāsids (see ISLĀMIC WORLD).

Hejazi commercial interests had in a sense overcome the military party among leading Muslim Arabs. Greater concern for the East was manifested by the new caliphate's choice of Baghdad as its capital, situated on the Tigris a short distance north of Ctesiphon and designed as a new city, to be free of the factions of the old Umayyad garrison cities of Kūfah, Wāsiṭ, and Basra.

The ʿAbbāsid caliphate (750–821). The revolution that established the ʿAbbāsids represented a triumph of the Islāmic-Hejazi elements within the empire; the Iranian revival was yet to come. Nevertheless, ʿAbbāsid concern with fostering eastern Islām made the new caliphs willing to borrow the methods and procedures of statecraft employed by their Iranian predecessors. At Damascus the Umayyads had imitated Sāsānid court etiquette, but at Baghdad Persianizing influences went deeper and aroused some resentment among the Arabs, who were nostalgic for the legendary simplicity of human relations among the desert Arabs of yore. Self-conscious schools of manners grew up in the new metropolis, representing the competitive merits of the Arabs' or Persians' ancient ways. Regard for poetry—the Arabs' vehicle of folk memory—increased, and minds and imaginations were quickened. Philosophical enquiry was developed out of the need for precision about the meaning of Holy Writ and for the establishment of the authenticity of the Prophet's dicta, collected as *ḥadīth*s, or sayings traditionally ascribed to him, and recollected and preserved for posterity by his companions. An amalgam known as Islāmic civilization was thus being forged in Baghdad in the 8th and 9th centuries. The Iranian intellect, however, played a conspicuous part in what was still an Arab milieu. Works of Indian provenance were translated into Arabic from Pahlavi, the written language of Sāsānid Iran, notably by Ibn al-Muqaffaʿ (720–756/757). The wisdom of both the ancient East and West was received and discussed in Baghdad's schools. The metropolis's outposts confronted Byzantium as well as infidel marches in Afghanistan and Central Asia. Cultural influences came from both directions. Curiosity in the pursuit of knowledge had been enjoined by the Prophet "even as far as China." This cosmopolitanism was not new to the descendants of the urban Arabs of Mecca or to the Iranians, whose land lay across the routes from the Pacific to the Mediterranean. Both peoples knew how to transmute what was not originally their own into forms that were entirely Islāmic. Islām had liberated men of the scribal and mercantile classes who in Iran had been subject to the dictates of a taboo-ridden and excessively ritualized Zoroastrianism and in Arabia had been inhibited by tribal feuds and prejudices.

Islāmic civilization

Despite the development of a distinctive Islāmic culture, the military problems of the empire were left unsolved. The ʿAbbāsids were under pressure from the infidel on several fronts—the Turks in Central Asia, pagans in India and in the Hindu Kush, and Christians in Byzantium. War for the faith, or *jihād,* against these infidels was a Muslim duty. But while the Umayyads had been expansionists and had seen themselves as heads of a military empire, the ʿAbbāsids were more pacific and saw themselves as the supporters of more than an Arab-conquering militia. Yet rebellions within the imperial frontiers had to be contained and the frontiers protected.

Rebellion within the empire took the form of peasant revolts in Azerbaijan and Khorāsān, coalesced by popular religious appeals centred on men who assumed or were accorded mysterious powers. Abū Muslim, executed in 755 by the second ʿAbbāsid caliph al-Manṣūr, who feared his influence, became one such messianic figure. Another was al-Muquannaʿ, "the Veiled Prophet of Khorāsān," who used Abū Muslim's mystique and whose movement lasted from 777 to 780. The Khorram-dīnān, "Glad Religionists," under the Azerbaijanian Bābak (816–838) also necessitated vigorous military suppression. Not until

Revolts within the empire

two decades had elapsed was Bābak caught. He was brought to Baghdad for torture and death after so long defying the caliph in Azerbaijan and west Persia. These heresiarchs revived such creeds as that of the anti-Sāsānid religious leader Mazdak (died AD 528 or 529), expressive of social and millennial aspirations that were later canalized into Ṣūfism on the one hand and into Shīʿism on the other.

Sīstān, Iran's southeastern border area, had a tradition of chivalry as the ancient homeland of Iranian military champions. Their tales passed to posterity collectively in the deeds of Rostam, son of Zāl, in Ferdowsī's *Shāh-nāmeh* ("Book of Kings"), the Persian national epic. On the route to India, Seistan also had trade. Its agrarian masses were counterbalanced by an urban population whose economy could be bolstered by forays into still non-Muslim areas under the southern Hephthalites, the Zunbīls of the Hindu Kush's southwestern flanks, whose command of trade routes with India had to be contested when partnership in this command broke down.

Early exploitation of the province's agriculture by Arab governors had, however, debilitated the rural life, and Khārijites, who found refuge in Seistan from the Umayyads, organized or attracted bands of local peasants and of vagabonds who had strayed south from Khorāsān. The presence of these groups indicates agricultural depression following the first century of rule by nonagricultural Arabs who had failed to grasp the needs of the Iranian cultivator. Khārijite bands isolated the cities and threatened their supplies. Seistan needed an urban champion who could come to terms with the Khārijites and divert them to what could legitimately be termed *jihād* across the border, forming the gangsters into a well-disciplined loyal army. Such a man appeared in Yaʿqūb ebn Leyṯ, who founded the first purely Iranian dynasty and threatened the Muslim empire with the first resurgence of Iranian independence.

The "Iranian intermezzo" (821–1055). Yaʿqūb ebn Leyṯ's movement differed from Ṭāhir ibn al-Ḥusayn's establishment of a dynasty of Iranian governors over Khorāsān in 821. The latter's rise marks the caliph's recognition, after the difficulties encountered in Iran by Hārūn ar-Rashīd (786–809), that the best way for the imam and *amir al-muʾminīn* at Baghdad to ensure military effectiveness in eastern Islām was by appointing a great general to govern Khorāsān. Ṭāhir had won Baghdad from Hārūn's son al-Amīn in favour of his other son, al-Maʾmūn, in the civil war between the two after their father's death. Ṭāhir was descended from the *mawālī* of the great Arab leader to whom his forbears had become clients in eastern Khorāsān. He was, therefore, of Iranian origin, but, unlike Yaʿqūb, he did not emerge out of his own folk and because of a regional need. He rose as a servant of the caliphate, as whose lieutenant he was, in due course, appointed to govern a great frontier province. He made Nīshāpūr his capital. Though death followed his assumption of the right of having his name mentioned after the caliph's in the *khuṭbah* (the formal sermon at the Friday congregations of Muslims when those with authority over the community were mentioned after the Prophet), his family was sufficiently influential and respected at Baghdad for the governorship to continue in it until the Ṭāhirids were ousted from Nīshāpūr by Yaʿqūb in 873. Thereafter, they retired to Baghdad.

The Ṭāhirids

Discussion of the rise of "independent" Persian dynasties such as the Ṭāhirid in the 9th century has to be qualified not only by consideration of skillful ʿAbbāsid statecraft but also by recognition of the Muslims' need for legality in a juridical-religious setting. The majority of Muslims considered the caliph as the legitimate head of the Faith and the guarantor of the law. Such a guarantee was preeminently the need of merchants in the cities of Sīstān, Transoxania, and central Iran.

In the Caspian provinces of Gīlān and Ṭabaristān (Māzanderān) the situation was different. The Elburz Mountains had been a barrier against the integration of these areas into the caliphate. Small princely families—the Bāvands, including the Kāʾūsīyeh and the Espahbadīyeh (665–1349), and the Mosāferids, also known as Sallārids, or Kangarids (916–*c.* 1090)—had remained independent of Damascus and Baghdad in the mountains of Daylam. When Islām reached these old Iranian enclaves, it was brought by Shīʿite leaders in flight from metropolitan persecution. It was not the Islām of the Sunnī state.

The Ṣaffārids. Yaʿqūb ebn Leyṯ began life as an apprentice *ṣaffār* ("coppersmith"), hence his dynasty's name, Ṣaffārid. Taking to military freebooting, he mustered an army that he disciplined and regularly paid in cash, absorbing many Khārijites into its ranks. This and his extension of Islām into pagan areas of Sind and Afghanistan earned him the *amīr* al-Muʾminīn's gratitude, which Yaʿqūb courted by sending golden idols captured from infidels to be paraded in Baghdad. Yaʿqūb's attitude toward the imam's claiming political subservience was, nevertheless, strikingly similar to that of the caliph-rejecting Khārijites. He turned his attention inward instead of outside the pale of Islām. He seized Baghdad's breadbaskets—Fārs and Khūzestān. He drove out the Ṭāhirid emir from Nīshāpūr. His march on Baghdad itself was halted only by the stratagem devised by the caliph's commander in chief, whereby Yaʿqūb's army was inundated by burst dikes. Yaʿqūb died soon after, in 879. He had made an empire, minted his own coin, fashioned a new style of army loyal to its leader rather than to any religious or doctrinal concept, and required that verses in his praise be put into his own language—Persian—from Arabic, which he did not understand. He began the Iranian resurgence.

Yaʿqūb's empire

The collapse of the Ṭāhirid viceroyalty left Baghdad faced with a power vacuum in Khorāsān and southern Persia. Yaʿqūb's brother ʿAmr was confirmed as governor of Fārs and Khorāsān, albeit reluctantly. The caliph's recognition of the upstart was thrice withdrawn, ʿAmr's authority being disclaimed to the Khorāsānian pilgrims to the Hejaz when they passed through Baghdad. But so long as Khorāsān was victimized by the rebels ʿAbd Allāh al-Khujistānī and, for longer, Rāfiʿ ibn Harthama, ʿAmr was useful to Baghdad. After Rāfiʿ had been finally defeated in 896, ʿAmr's broader ambitions gave the caliph al-Muʿtaḍid (892–902) his chance. ʿAmr conceived designs on Transoxania, but there the Sāmānid ʿAbbāsid vassals held the caliph's license to rule, after having nominally been Ṭāhirid deputies. When ʿAmr demanded and obtained the former Ṭāhirid tutelage over the Sāmānids in 898, Baghdad could leave the Ṣaffārid and Sāmānid to fight each other, and the Sāmānid Esmāʿīl (892–907) won. ʿAmr was sent to Baghdad, where he was put to death in 902. His family survived as Sāmānid vassals in Sīstān and were heard of until the 16th century. Yaʿqūb remains a popular hero in Iranian history.

The Sāmānids. There was nothing of the popular hero in the Sāmānids' orgin. Their eponym was Sāmān-Khudā, a landlord in the district of Balkh and, according to the dynasty's claims, a descendant of Bahrām Chūbīn, the Sāsānid general. Sāmān became Muslim. His four grandsons were rewarded for services to the caliph al-Maʾmūn (813–833) and received the caliph's investiture for areas that included Samarkand and Herāt. They thus gained wealthy Transoxanian and east Khorāsānian entrepôt cities, where they could profit from trade across Asia, even as far as Scandinavia, and the provision of Turkish slaves, much in demand in Baghdad, while they protected the frontiers and provided security for merchants in Bukhara, Samarkand, Khojand, and Herāt. With one transitory exception, they upheld orthodoxy and at each new accession paid a tribute to Baghdad for the tokens of investiture from the caliph whereby their rule represented lawful authority. Thus, legal transactions in Sāmānid realms would be valid, and Baghdad received tribute in return for the insignia prayed over and signed by the caliph. This tribute took the place of regular revenue, so that it represented a solution of those taxation problems and the consequent resentments that had bedeviled the Umayyad regime. In modern assessments of imperial power, Baghdad may seem to have been politically the weaker for this type of arrangement, but ensuring the reign of Islām in peripheral provinces was important to the caliphs. Islām's portals to the Far East were adequately guarded, the supply of Turkish slaves was maintained, and Turkish pagan tribes were converted to Islām under the Sāmānid aura.

Tribute to the caliph

The Iranian renaissance. This Sāmānid aura lasted from 819 until eclipsed in 999. Its supremacy in northeastern Islām began in 875, when the Sāmānid emir, Naṣr I, re-

ceived the license to govern all Transoxania. Sāmānid emirs succeeded the Ṭāhirid-Ṣaffārid power in Khorāsān, and under them, the Iranian renaissance at last came to fruition. Shaped out of the vernacular of northeastern Iranian courts and households and making skillful use of additional Arabic vocabulary, the Persian language emerged as a literary medium. Persian notation had been used in the first Muslim *dīwān*s, or chancelleries, in accountancy, because the first civil servants in the old Iranian areas had been Iranians. In 697 the ruthless Umayyad governor Ḥajjāj ibn Yūsuf had ordered the change to Arabic notation, marking the final dethronement of Pahlavi characters. When "New Persian" began to emerge as a written language two centuries later, its alphabet was Arabic. It emerged as poetry, by which it was disciplined into a most expressive and flexible tongue, with the flexibility resulting from perfect control of a highly formal medium. The discipline was that of Arabic prosody, to which scenes of a verdure unknown to the Arab poet in the desert added, in the words of Iranian poets, a new and lustrous imagery. To rival the Arabs' tales of ancient valour, the Iranian legend was versified under Sāmānid impetus in the *Shāh-nāmeh.* Iran's "national epic" was completed by Ferdowsī of Ṭūs in Khorāsān in 1009/10.

Under the Sāmānids, Bukhara rivalled Baghdad as a cultural capital of Islām. Besides the Persian poet Rūdakī (died 940/941), who had crystallized the language and imagery of Persian lyrical poetry as Ferdowsī (died between 1020 and 1026) was to do for that of the epic, patrons such as Naṣr II (914–943) attracted Arabic poets and scholars to Bukhara, and many were bilingual. A written Persian evolved that has survived with remarkably little change.

The Ghaznavids. Rūdakī, in a poem about the Sāmānid emir's court, describes how "row upon row" of Turkish slave guards were part of its adornment. From these guards' ranks two military families arose—the Sīmjūrids and Ghaznavids—who ultimately proved disastrous to the Sāmānids. The Sīmjūrids received an appanage in the Qohestān region of southern Khorāsān. Alp Tigin founded the Ghaznavid fortunes when he established himself at Ghazna (modern Ghaznī, Afghanistan) in 962. He and Abū ol-Ḥasan Sīmjūrī, as Sāmānid generals, competed with each other for the governorship of Khorāsān and control of the Sāmānid empire by placing on the throne emirs they could dominate. Abū ol-Ḥasan died in 961, but a court party instigated by men of the scribal class—civilian ministers as contrasted with Turkish generals—rejected Alp Tigin's candidate for the Sāmānid throne. Manṣūr I was installed and Alp Tigin prudently retired to his fief of Ghazna. The Sīmjūrids enjoyed control of Khorāsān south of the Oxus but were hard pressed by a third great Iranian dynasty, the Būyids, and were unable to survive the Sāmānid collapse and rise of the Ghaznavids.

The struggles of the Turkish slave generals for mastery of the throne with the help of shifting allegiance from the court's ministerial leaders both demonstrated and accelerated the Sāmānid decline. Sāmānid weakness attracted into Transoxania the Qarluq Turks, who had recently converted to Islām. They occupied Bukhara in 992 to establish in Transoxania the Qarakhanid, or Ilek Khanid, dynasty. Alp Tigin had been succeeded at Ghazna by Sebüktigin (died 997). Sebüktigin's son Maḥmūd made an agreement with the Qarakhanids whereby the Oxus was recognized as their mutual boundary. Thus the Sāmānids' dominion was divided and Maḥmūd was freed to advance westward into Khorāsān to meet the Būyids.

The Būyids. The Būyids share with the Sāmānids the palm for having brought to fruition the Iranian renaissance. They achieved Iranian political reascendancy by doing what Yaʿqūb ibn Leyš had failed to do and what the Sāmānids would probably have considered it illegal to do: they captured Baghdad and made the caliph their puppet. As far east as the city of Rayy, western, central, and southern Iran were once more ruled by an Iranian family. At the peak of the Būyid Empire, second to Baghdad the Būyid base became Fārs, whence the Achaemenids and the Sāsānians had sprung. Politically, the Būyids effected the Iranization of the metropolitan government. Yet by the very fact that they saw in the caliphate an institution of enough purely political significance to merit its dramatic takeover, they paradoxically left the caliphate's political role emphasized by what at first sight might seem to have been deepest humiliation. Spiritually, the caliphate held no appeal for the Būyids, who were Shīʿite. Politically and juridically, as the stabilizing factor over the Islāmic peoples, the Būyids, in spite of their own religious affiliation, maintained the caliphate.

The homeland of the Būyids (or Buwayhids) was Daylam, in the Gīlān uplands in northern Iran. There, at the end of the 9th century, hardy valley dwellers had been stirred into martial activity by a number of factors, among them the rebel Rāfiʿ ibn Harthama's attempt to penetrate the region, ostensibly with Sāmānid support. ʿAmr ebn Leyš had pursued the rebel into the region. Other factors had been the formation of Shīʿite principalities in the area and the continued Sāmānid attempts to subjugate them. After the Ṭāhirid collapse, the lack of stability in northern Iran south of the Elburz Mountains attracted many Daylamite mercenaries into the area on military adventures. Among them, Mākān ebn Kākī served the Sāmānids with his compatriots, the sons of Būyeh, and their allies the Zeyārids under Mardāvīz. Mardāvīz introduced the three Būyid brothers to the Iranian Plateau, where he established an empire reaching as far south as Isfahan and Hamadān. He was murdered in 935 but his Zeyārid descendants sought Sāmānid protection. They adhered to the Sunnī orthodoxy and maintained themselves in the region southeast of the Caspian. The Zeyārid Qābūs ebn Vashmgīr (978–1012) built himself a tomb tower, the Gonbad-e Qābūs (1006–07), which remains one of Iran's finest monuments. Also still extant is his descendant ʿOnṣor ol-Maʿālī Keykāvūs' (1049–90), *Qābūs-nāmeh,* a prose "Mirror for Princes," which is a valuable document on the social and political life of the time.

Foundation of Būyid power

Mardāvīz' expansionism south of the Elburz was taken up by his Būyid lieutenants: the eldest brother, ʿAlī, consolidated power for himself in Isfahan and Fārs and obtained the Caliph's recognition; another brother, Ḥasan, occupied Rayy and Hamadān; the youngest brother, Aḥmad, took Kermān in the southeast and Khuzistan in the southwest. The caliphs al-Muttaqī (940–944) and Mustakfī (944–946) were at the mercy of the Turkish slaves in their palace guard. The generals of the guard competed with each other for the office of *amīr alumarā'* (commander in chief), who virtually ruled Iraq on behalf of the caliphs. When Aḥmad gained Khūzestān, he was close to the scene of the *amīr al-umarā'* contests, which he chose to settle by himself. Aḥmad entered Baghdad in 945 and assumed control of the caliphate's political functions. The caliph became the Būyid's protégé, and conferred on Aḥmad the title of Muʿizz ad-Dawlah. ʿAlī became ʿImād ad-Dawlah, and Ḥasan, Rukn ad-Dawlah. All of these titles implied that the Būyids were the upholders of the Muslim ʿAbbāsid *dawlah,* or state. In practice, however, the *dawlah* became the "Daylamite State." It should be noted that the titles did not include the world *dīn,* or faith, which was still in the caliph's sphere of action.

Later, Būyid titles increased in grandeur. Even the old Achaemenid title of *shāhanshāh,* king of kings, reappeared—a title Aḥmad may have thought appropriate for an Iranian whose family reconquered Iran south of the Elburz. As suggested above, Bùyid titles emphasized political and territorial sovereignty. This sovereignty reached its greatest extent under Rukn ad-Dawlah's son, ʿAḍud ad-Dawlah, who, after the deaths of his father and uncles, ruled an empire that comprised all of Persia west and south of Khorāsān and included Iraq, with Baghdad at its heart. ʿAḍud ad-Dawlah pursued peace negotiations with Byzantium, perhaps to free himself for his cherished project of an Egyptian campaign against the rival caliphate of the Fāṭimid Shīʿites, established in North Africa in 909, which had been relocated in Egypt in 969. ʿAḍud ad-Dawlah's concern with the middle kingdom and its westward extension toward the Mediterranean increased his hostility toward the Fāṭimids, despite his own Shīʿī persuasion. In the north, he drove the Zeyārids out of Ṭabarestān, which struck a blow against the Sāmānids' influence in the Caspian area.

Aḍud ad-Dawlah is celebrated for public works, of which the dam he built across the River Kor near Shīrāz, the "Band-e amīr," Emir's Dam, remains. He embellished the

tomb of ʿAlī at an-Najaf in Iraq, where he himself is buried. He built libraries, schools, and hospitals, and he was the patron of the Arabic poet Mutanabbī. Some Arabic verses of his own are still extant. Although ʿAḍud ad-Dawlah was undoubtedly one of Iran's greatest rulers, his fratricidal wars, conducted with terrible intractability on his way to power, initiated Būyid decline. The descendants of the early Būyids reversed the mutual fidelity of the first three brothers. The power this fidelity had achieved and ʿAḍud ad-Dawlah had made into a world force crumbled after his death in 983.

His base had been Shīrāz, which he beautified and established as a cultural centre, but he died at Baghdad, where he chose to keep close to the caliph, whose daughter he married and from whom he took the title "The Crown of the Community" and the privilege of, like the caliph, having drums beaten at his gate on the calls to prayer. He also had his name mentioned after that of the Caliph aṭ-Ṭaʾiʿ in the *khuṭbah*. The Būyids avoided the policy, which would have disrupted the empire, of favouring the Shīʿīs. Instead, they offered consolations of an emotional sort to the Shīʿīs in the form of public rites on the anniversaries of the Shīʿī martyrs, notably the one commemorating the massacre of ʿAlī's son Ḥusayn and his followers under the Umayyads at Karbalāʾ in Iraq.

ūyid ecline

Although the Būyids were careful to avoid sectarian strife, family quarrels weakened them sufficiently for Maḥmūd of Ghazna to gain Rayy in 1029. But Maḥmūd (998–1030) went no further: his dynasty paid great deference to the caliphate's legitimating power, and he made no bid to contest the Būyids' role as its protectors. Maḥmūd's agreement with the Sāmānids' Ilek Khanid successors, that the Oxus should be their and his boundary, held, but south of the river the Ghaznavids had to contend with their own distant relatives, the Oğuz Turks. Contrary to the sage counsel of Iranian ministers, Maḥmūd and his successor Masʿūd (1031–41) permitted these tribesmen to use Khorāsānian grazing grounds, which they entered from north of the Oxus. United under descendants of an Oğuz leader named Seljuq, between 1038 and 1040 these nomads drove the Ghaznavids out of northeastern Iran. The final encounter was at Dandānqān in 1040.

After their defeat by the Seljuqs, the Ghaznavids, patrons of Islāmic culture and letters, were deflected eastward into India, where Maḥmūd had already conducted successful raids. The raids took the form of *jihād*, or holy war, and the Ghaznavids carried Islām and Perso-Muslim art to the Indian subcontinent. In Iran, it was the Seljuqs' turn to create a new imperial synthesis with the ʿAbbāsid caliphs. Toghrïl Beg, the Seljuq sultan, entered Baghdad in 1055, and Būyid power was terminated, thus ending what Vladimir Minorsky, the great Iranologist, called the "Iranian intermezzo."

The Seljuqs and the Mongols. *The Seljuqs.* Toghrïl I had proclaimed himself sultan at Nīshāpūr in 1038 and had espoused strict Sunnī orthodoxy by which he gained the caliph's confidence and undermined the Būyid position in Baghdad. The Oğuz Turks had accepted Islām late in the 10th century, and their leaders displayed a convert's zeal in their efforts to restore a Muslim polity along orthodox lines. Their efforts were made all the more urgent by the spread of Fāṭimid propaganda by underground means in the eastern caliphate and by the threat posed by the Christian crusaders from the west.

The Būyids' usurpation of the caliph's secular power had given rise to a new theory of state formulated by al-Māwardī (died 1058). Al-Māwardī's treatise partly prepared the theoretical ground for Toghrïl's attempt to establish an orthodox Muslim state in which conflict between the caliph-imam's spiritual-juridical authority on the one side and the secular power of the sultan on the other could be resolved, or at least regulated, by convention. Al-Māwardī reminded the Muslim world of the necessity of the imamate; but the treatise realistically admitted the existence of, and thus accommodated, the fact of military usurpation of power. The Seljuqs' own political theorist al-Ghazālī (died 1111) carried this admission further by explaining that the position of a powerless caliph, overshadowed by a strong Seljuq master, was one in which the latter's presence guaranteed the former's capacity to defend and extend Islām.

The caliph al-Qāʾim (1031–75) replaced the last Būyid's name, al-Malik ar-Raḥīm, in the *khuṭbah* and on the coins with Toghrïl Beg's; and after protracted negotiation ensuring restoration of the caliph's dignity after Shīʿī subjugation, Toghrïl entered Baghdad in December 1055. The caliph enthroned him and married a Seljuq princess. After Toghrïl had campaigned successfully as far as Syria, he was given the title of "King of the East and West." The new situation was justified by the theory that existing practice was legal whereby a new caliph could be instituted by the sultan, who possessed effective power and sovereignty, but that thereafter the sultan owed the caliph allegiance because only so long as the caliph-imam's juridical faculties were recognized could government be valid.

Toghrïl Beg died in 1063. His heir, Alp-Arslan, was succeeded by Malik-Shāh in 1072, and the latter's death in 1092 led to succession disputes out of which Berk-yaruq emerged triumphant to reign until 1105. After a brief reign, Malik-Shāh II was succeeded by Muḥammad I (1105–18). The last "Great Seljuq" was Sanjar (1118–57), who had earlier been governor of Khorāsān. Alp-Arslan nearly annihilated the Byzantine Army at Manzikert in 1071, opening Asia Minor to those dependent tribesmen of the Seljuqs of whom Iran and the world were to hear more in the period of Ottoman power. Transoxania was subdued, the Christians in the Caucasus chastised, and the Egyptians expelled from Syria. An empire was for a short time achieved whose extent and stability enabled Alp-Arslan's and Malik-Shāh's great minister, Niẓām al-Mulk (died 1092), to pay an Oxus ferryman with a draft cashable in Damascus.

Battle of Manzikert

The building and maintenance of such a great empire necessitated a military regime and a vast war machine. The price to be paid later was oppression by military commanders and their units, set free after the machine fell out of the grasp of powerful sultans to compete with each other and harry the land. The soldiers had been remunerated by grants of land called *iqṭāʿs*. The grants later became nuclei out of which petty principalities grew with the decline of the central power. The cultivators were left at the mercy of military overlords in possession of the soil.

The great minister Niẓām al-Mulk was typical of the Iranian bureaucracy, which, in an area prone to invasion, was often called upon to attempt to cushion the impact of the brute military force of invaders and contain it within the bounds of administrative, economic, and cultural feasibility. He wrote a "Book of Government" (*Seyāsat-nāmeh*) for his Turkish masters in which he urged the regulation of court procedures in line with Sāmānid models and the restriction of the arrogance and cupidity of the military fief holders. His book is the measure of the Seljuqs' failure to provide enduring stability and equitable government. Had they done so, such a work would have been unnecessary.

The Ismāʿīlīyah. Of one disruptive force the book, in terms betraying near-panic, is dramatically descriptive. The Seljuqs failed to nip in the bud the power of the Ismāʿīlīyah, originally spread by Fāṭimid propagandists, but later split from the mainstream of events in Egypt to become an underground organization within the Seljuq Empire. This movement exercised power by terrorism, and the name given its adherents by Europeans in the Middle Ages, Assassins (from *ḥashīshī*, denoting a consumer of hashish), has become a common noun in English. The movement was a highly intellectual form of extremist Shīʿism, which recognized only seven of the imams in descent from ʿAlī and Fāṭimah, whereas the Shīʿism of the Būyids and of Iran later on recognized 12. The movement was brought to Iran by Ḥasan-e Ṣabbāḥ, who had been trained in Fāṭimid Egypt. In 1090 Ḥasan gained the castle of Alamūt in the Elburz Mountains, and the order's principal cells were thereafter situated, so far as possible, in similar impregnable mountain strongholds. From these centres, *fidāʾīs*, or devotees ready to sacrifice their lives, issued forth and permeated society, spreading their mission as peddlers and itinerant tailors and gaining influence among the urban artisan and weaving classes. They were often able to win also the confidence of many highly placed ladies and children, whom they could please with novelties of dress or toys. Niẓām al-Mulk himself was

The Assassins

assassinated by one of the *fidā'īs*, but it is possible that this was done with the connivance of Malik-Shāh's wife, whose son the vizier did not support for the succession.

The Ismā'īlīyah were able to puncture Seljuq power but not destroy it. In the end, the Seljuq Empire collapsed where it had begun—in Khorāsān, where Sultan Sanjar ultimately failed to control Turkmen tribes related to him by blood. Sanjar could not rely on military commanders his family had raised to high posts and had rewarded with land and provincial powers. The tribesmen refused to be coerced into paying taxes. In 1153 they captured the old sultan and, although allowing him all the respect of his regal position, kept him captive for three years.

The Khwārezm-Shāhs. Atsiz was the military leader who, after Sultan Sanjar's death in 1157, succeeded in supplanting Seljuq power in northeastern Iran. His ancestor, Anūshtegin, had been keeper of Malik-Shāh's kitchen utensils and had been rewarded with the governorship of Khwārezm on the Oxus, where he founded the Khwārezm-Shāh dynasty (1077–1231). Regions elsewhere in Iran, on the passing of Seljuq supremacy, became independent under *atabeg*s, who were originally proxy fathers and tutors sent with young Seljuq princes when these were deputed to govern provinces. At first the *atabeg*s took power in the names of Seljuq puppets. When this fiction lapsed, *atabeg* dynasties such as the Eldegüzids of Azerbaijan (1137–1225) and Salghurids of Fārs (1148–1270) split Iran into independent rival principalities.

Atabeg rule

The Salghurid court in Shīrāz especially fostered the arts, as parvenu, competitive courts are wont to do. The poet Sa'dī (died 1292) was a contemporary in Shīrāz of the Salghurid *atabeg* Abū Bakr ebn Sa'd ebn Zangī (1231–60), to whom he alludes by name in his *Būstān* ("The Orchard"), a book of ethics in verse. Abū Bakr's father, Sa'd, after whom Sa'dī took his pen name, conferred great prosperity on Shīrāz.

Sa'd ebn Zangī came to terms with the Khwārezm-Shāhs. Their power in Transoxania was secured by acceptance of tributary status to the infidel Karakitais of Central Asia. They endeavoured to emulate the Seljuqs by following an expansionist policy in Iran south of the Oxus. Sa'd ebn Zangī, in his relations with the Khwārezm-Shāh, set the pattern his successor Abū Bakr followed later. These *atabegs* saved Fārs from outright invasion by northern military powers by paying heavy tribute. This tribute was the price of Shīrāz's remaining the peaceful haven of the arts in which Sa'dī and after him Ḥāfeẓ (died 1390) flourished, to continue the Persian literary tradition begun under the Sāmānids and continued under both the Ghaznavids and the Seljuqs.

The collapse of the Karakitai Empire northeast of the Oxus was partly accelerated by the unsuccessful bid of Khwārezm-Shāh 'Alā' ad-Dīn Muḥammad (1200–20) to win Muslim approval while releasing himself from the Khwārezm-Shāhs' humiliating tributary status to an infidel power. But the *coup de grace* to the Karakitai Empire was delivered by its Gurkhan's own vassal from the east, Küchlüg Khan. Thus, the Khwārezm-Shāh was from 1211 onward faced by another hostile opponent in Central Asia—Küchlüg Khan. The Karakitai settlement had been destroyed; but the situation on the Khwārezm-Shāh's eastern border had worsened.

Meanwhile, Sultan 'Alā' ad-Dīn Muḥammad quarrelled with the caliph; he set up an anti-caliph of his own and further antagonized his Muslim subjects, unremittingly suspicious of a regime once subject to the Karakitai infidels and whose Kipchak mercenary militia and brutal commanders brought cruelty and desolation wherever they marched. Sultan Muḥammad Khwārezm-Shāh was unable to control his army leaders, who had tribal connections with such influential people at court as his own mother. The post-Karakitai wars between him and Küchlüg Khan damaged the safety of the Central Asian trade arteries from China to the West. The great Mongol leader Genghis (Chinghiz) Khan took Peking in 1215 and as Lord of China was concerned with Chinese trade outlets. The situation between Küchlüg and Sultan Muḥammad afforded scope as well as a pretext for the Mongols' westward advance, if only to restore the flow of trade.

The Mongol invasion. Misunderstanding of how essentially fragile Sultan 'Alā' ad-Dīn Muḥammad Khwārezm-Shāh's apparently imposing empire was, its distance away from the Mongols' eastern homelands, the strangeness of new terrain, all doubtless induced fear in Mongols, and this might partly account for the terrible events with which Genghis Khan's name has ever since been associated. The terror his invasion brought must also be ascribed to his quest for vengeance. Genghis Khan's first two missions to Khwārezmia had been massacred; but the place of commercial motives in the Mongol's decision to march to the west is indicated by the fact that the first was a trade mission. The massacre and robbery of this mission at Utrār by one of Sultan Muḥammad's governors before it reached the capital made Genghis single out Utrār for especially savage treatment when the murder of his second, purely diplomatic, mission left him no alternative but war.

Reasons for Mongol vengeance

His guides were Muslim merchants from Transoxania. They had to witness one of the worst catastrophes of history. The years 1220 and 1221 saw the razing of Bukhara, Samarkand, Herāt, Ṭūs, and Nīshāpūr, and the slaughter of whole populations. The Khwārezm-Shāh fled, to die on an island off the Caspian coast. His son Jalāl ad-Dīn survived until murdered in Kurdistan in 1231. He had eluded Genghis Khan on the Indus, across which his horse swam, enabling him to escape to India. He returned to attempt the restoration of the Khwārezmian Empire over Iran, but he failed to unite the Iranian regions, although Genghis Khan had withdrawn to Mongolia, where he died in August 1227. Iran was left divided, Mongol agents remaining in some districts, local adventurers profiting from the lack of order in others.

The Il-Khans. A second Mongol invasion began when Genghis Khan's grandson Hülegü Khan crossed the Oxus in 1256 and destroyed the Assassin fortress at Alamūt. With the disintegration of the Seljuq Empire, the caliphate had created a state in the area around Baghdad and in southwestern Iran. In 1258 Hülegü besieged Baghdad, where divided counsels prevented the city's salvation. Al-Musta'ṣim, the last 'Abbāsid caliph of Baghdad, was executed by being kicked to death. Eastern Islām fell to pagan rulers.

Hülegü hoped to consolidate Mongol rule over western Asia and to extend the Mongol Empire as far as the Mediterranean, an empire that would span the earth from China to the Levant. Hülegü made Iran his base, but the Mamlūks of Egypt (1250–1517) prevented him and his successors from achieving their great imperial goal. Instead, a Mongol dynasty, the Il-Khans, or "deputy khans" to the Great Khan in China, was established in Iran to attempt repair of the damage of the first Mongol invasion. But it failed in repeated attempts to reach the Mediterranean. The injuries Iran had suffered went deep, but it would be unfair to attribute them all to Ghengis Khan's invasion, itself the climax to a long period of social and political disarray under the Khwārezm-Shāhs and dating from the decline of the Seljuqs.

The Il-Khanid dynasty made Azerbaijan its centre, and established Tabrīz as its first capital until Solṭānīyeh were built early in the 14th century. At first repair and readjustment of a stricken society were complicated by the collapse of law. The caliphate, as the symbol of Muslim legality, had been eroded by Sultan Muḥammad Khwārezm-Shāh and by its own withdrawal into a temporal state in Iraq and the Tigris–Euphrates estuary region. But it had retained enough vitality for Sultan Muḥammad's action in setting up an anti-caliph to have alienated influential members of his subject people. After 1258 it was gone altogether, while Hülagü Khan showed considerable religious eclecticism and had, in any event, the *yāsā* of Genghis Khan to apply as the law of the Mongol state, in opposition to, or side by side with, the Sharī'ah, the law of Islām.

The Il-Khans' religious toleration released Christians and Jews from their restrictions under the Islāmic regime. Fresh talent thus became available, but competition for new favours marred what good effects this release might have had. It took time for Iranian administrators to resume their normal role after the invasion and to restore some semblance of administrative order and stability. Their process was impeded by the paganism of the new conquerors as well as by jostling for influence among classes of the conquered, not in this instance exclusively Muslim. At the same time,

a shattered agrarian economy was burdened by heavy taxes, those sanctioned by the Sharīʿah being added to by those the *yāsā* provided for, so that the pressure of exploitation was increased by Mongol tax innovations as well as by the invaders' cupidity.

The pressure was increased beyond the economy's endurance: the Il-Khanid government ran into fiscal difficulties. An experiment with paper money, modelled on the Chinese money, failed under Gaykhatu (1291–95). Gaykhatu was followed briefly by Baydu (died 1295), who

he reign
f Ghāzān

was supplanted by the greatest of the Il-Khans, Maḥmūd Ghāzān (1295–1304). Ghāzān abandoned Buddhism, the faith in which his grandfather Abagha, Hülegü's successor (1265–82), had reared him, and adopted Islām. One of his chief ministers was also his biographer, Rashīd ad-Dīn, of Jewish descent. He seems deliberately to have striven to present Ghāzān, whom he styles the "emperor of Islām" (*pādshāh-e islām*), as a ruler who combined the qualities and functions of both the former caliphs and ancient Iranian "great kings."

Ghāzān made strenuous efforts to regulate taxes, encourage industry, bring wasteland into cultivation, and curb the abuses and arrogance of the military and official classes. Facilities for home and foreign merchants were furnished. Buildings were constructed and irrigation channels dug. Medicinal and fruit-bearing plants were imported and the cultivation of indigenous ones was encouraged. Observatories were built and improved—a sure indication of concern with agricultural improvement, for seasonal planning required accurate calendars. He fostered Muslim sentiment by showing consideration for those who claimed descent from the Prophet's family, the Sayyids, and it seems probable that he wished to eradicate or overlay Shīʿī-Sunnī sectarian divisiveness, for Ghāzān's Islām appears to have been designed to appeal equally to both persuasions. Any slight bias in favour of the Shīʿah might be attributed to a desire to capture the emotions and imagination of many of the humble people who had reacted against the Seljuqs' orthodoxy and craved a teaching that included millennial overtones. Shīʿism had been liberated by the fall of the ʿAbbāsid Caliphate. Its belief in the reappearance of the Twelfth Imam, who was to inaugurate peace and justice in the world, satisfied this popular craving for religious solace.

Ghāzān's work was carried on but less successfully by his successor Öljeitü (1304–16). Between 1317 and 1335, though he finally relinquished the expensive campaigns against Egypt for the opening to the Mediterranean, Abū Saʿīd was unable to keep the Il-Khanid regime consolidated, and it fell apart on his death. Ghāzān's brilliant reign survives only in the pages of his historian, Rashīd ad-Dīn. Wars against Egypt and their own Mongol kinsmen in Asia had in fact hampered the Il-Khans in accomplishing a satisfactory reintegration of an Iranian polity.

As the *atabeg*s had done after the Seljuqs, after 1335, Il-Khanid military emirs began to establish themselves as independent regional potentates. At first, two of them, formerly military chiefs in the Il-Khans' service, competed for power in western Iran, ostensibly acting on behalf of rival Il-Khanid puppet princes. Ḥasan the Small of the Chūpānids was eventually defeated by Ḥasan the Tall of the Jalāyirids, who set up the Jalāyirid dynasty over Iraq, Kurdistan, and Azerbaijan; it lasted from 1336 to 1432. In Fārs, Il-Khanid agents, the Injuids, after a spell of power during which Abū Isḥāq Injū had been the poet Ḥāfeẓ's patron, were ousted by Abū Saʿīd's governor of Yazd, Mobārez od-Dīn Moẓaffar. Thus in 1353 Shīrāz became the Moẓaffarid dynasty's capital, which it remained until conquest by Timur (Tamerlane) in 1393.

The Timurids and Turkmen. Timur claimed descent from Genghis Khan's family. The disturbed conditions in Mongol Transoxania gave this son of a minor government agent in the town of Kish the chance to build up a kingdom in Central Asia in the name of the Chagatai Khans, whom he eventually supplanted. He entered Iran in 1380 and in 1393 reduced the Jalāyirids after taking their capital, Baghdad. In 1402 he captured the Ottoman Sultan Bayezid at Ankara. He conquered Syria and then turned his attention to campaigns far to the east of his tumultuously acquired and ill-cemented empire: he died in 1405 on an expedition to China. He left an awesome name and an ambiguous record of flights of curiosity into the realms of unorthodox religious beliefs, history, and every kind of enquiry concerning lands and peoples. He showed interest in Ṣūfism, a form of Islāmic mysticism that varied from a scholastic study of ascetic techniques for mastering the carnal self to complete abandonment of all forms of authority in the belief that faith alone is necessary for salvation. Ṣūfism had increased in the disturbed post-Seljuq era as both the consolation and refuge of desperate people. In Ṣūfism Timur may have hoped to find popular leaders whom he could use for his own purposes. His encounters with such keepers of the consciences of harried, exploited, and ill-treated Iranians proved that they knew him perhaps better than he knew himself. Whatever his motives may have been, the reverse of stability was his legacy to Iran. His division of his ill-assimilated conquests among his sons served to ensure that an integrated Timurid Empire would never be achieved.

Character of Timur

The nearest a Timurid state came to being an integrated Iranian Empire was under Timur's son Shāh Rokh Shāh (1405–47). Shāh Rokh endeavoured to weld Azerbaijan and western Persia to Khorāsān and eastern Persia to form a united Timurid state for a short and troubled period of time, but he only succeeded in loosely controlling western and southern Iran from his beautiful capital at Herāt. Azerbaijan demanded three major military expeditions from this pacific sovereign and even so could not long be held. Herāt he made the seat of a splendid culture, the atelier of great miniature painters (Behzād notable among them), and the home of a revival of Persian poetry, letters, and philosophy. This revival was not unconnected with an effort to claim for an Iranian centre once more the palm of leadership in the propagation of Sunnī ideology: Herāt sent copies of Sunnī canonical works on request to Egypt. The reaction in Shīʿism's ultimate victory under the Ṣafavid shahs of Persia was, however, already in preparation.

"Black Sheep" and "White Sheep"

Western Iran was dominated by the Kara Koyunlu, the "Black Sheep" Turkmen. In Azerbaijan they had supplanted their former masters, the Jalāyirids. Timur had put these Kara Koyunlu to flight, but in 1406 they regained their capital, Tabrīz. On Shāh Rokh's death, Jahān Shāh (reigned *c.* 1438–67) extended Kara Koyunlu rule out of the northwest deeper into Iran at the Timurids' expense. The Timurids relied on their old allies, the Kara Koyunlus' rival Turkmen of the Ak Koyunlu, "White Sheep" clans, who had long been established at Diyarbakir in Turkey. The White Sheep acted as a curb on the Black Sheep, whose Jahān Shāh was destroyed by the Ak Koyunlu Uzun Ḥasan by the end of 1467.

Uzun Hasan (1453–78) achieved a short-lived Iranian Empire and even briefly deprived the Timurids of Herāt. He was, however, confronted by a new power in Asia Minor—the Ottoman Turks. His relationship with the Christian Emperor at Trebizond (Trabzon) through his Byzantine wife, Despina, involved Uzun Ḥasan in attempts to shield Trebizond from the ineluctable Ottoman advance. The Ottomans crushingly defeated him in 1473. Under his son Yaʿqūb (1478–90), the Ak Koyunlu state was subjected to fiscal reforms associated with a government-sponsored effort to reapply rigorous purist principles of orthodox Islāmic rules for revenue collection. Yaʿqūb attempted to purge the state of taxes introduced under the Mongols and not sanctioned by the Muslim canon. But the inquiries made by the orthodox religious authorities antagonized the vested interests, damaged the popularity of the Ak Koyunlu regime, and discredited Sunnī fanaticism.

This attempt to revive religious orthodoxy through revenue reform or to effect the latter under the guise of religion no doubt gave impetus to the spread of Ṣafavid Shīʿī propaganda. Another factor must have been related to the same general economic decline that made Sultan Yaʿqūb's fiscal reforms necessary in the first place. Sheykh Ḥeydar led a movement that had begun as a Ṣūfī order under his ancestor Sheykh Ṣafī od-Dīn of Ardabīl (1252–1334). This order may be considered to have originally represented a puritanical, but not legalistically so, reaction against the sullying of Islām, the staining of Muslim lands, by the Mongol infidels. What began as a spiritual, otherworldly reaction against irreligion and the betrayal of spiritual aspirations developed

into a manifestation of the Shīʿī quest for dominion over a Muslim polity. By the 15th century, the Ṣafavid movement could draw on both the mystical emotional force and the Shīʿī appeal to the oppressed populace to gain a large number of dedicated adherents. Sheykh Ḥeydar inured his numerous followers to warfare by leading them on expeditions from Ardabīl into the nearby Caucasus. He was killed on one of these campaigns. His son Esmāʿīl was to avenge his death and lead his devoted army to a conquest of Iran whereby Iran gained a great dynasty, a Shīʿī regime, and in most essentials its shape as a modern nation state.

Esmāʿīl

In 1501 Esmāʿīl supplanted the Ak Koyunlu in Azerbaijan. Within a decade, he gained supremacy over most of Iran as a ruler regarded as divinely entitled to sovereignty. The Ṣafavids claimed descent, on grounds that modern research has shown to be dubious, from the Shīʿah imams. Islām in Iran, therefore, could regard itself as at last having a legitimate imam-ruler, who, as a descendant of ʿAlī, required no caliph to legitimate his position. Gone were the days of rule by converted and zealous Sunnī Turks or by Mongols of ambiguous spiritual allegiance. Iran's defilement was removed by the swelling tide of Shīʿism, which bore Esmʿīl to the throne his family was to occupy until 1722, in one of the greatest epochs of Iranian history.

The Ṣafavids (1502–1736). The new Iranian empire lacked the resources that had been available to the caliphs of Baghdad in former times through their dominion over Central Asia and the West: Asia Minor and Transoxania were gone, and the rise of maritime trade in the West was detrimental to a country whose wealth had depended greatly on its position on important east-west overland trade routes. The rise of the Ottomans impeded Iranian westward advances and contested with the Ṣafavids' control over both the Caucasus and Mesopotamia. Years of warfare with the Ottomans had imposed a heavy drain on the Ṣafavids' resources. The Ottomans threatened Azerbaijan itself. Finally, in 1639 a treaty gave Yerevan in the southern Caucasus to Iran and Baghdad in Mesopotamia to the Ottomans.

Shāh ʿAbbās I. The Ṣafavids were still faced with the problem of making their empire pay. The silk trade, over which the government held a monopoly, was a primary source of revenue. Esmāʿīl's successor, Shāh Ṭahmāsp (1524–76), encouraged carpet weaving on the scale of a state industry. Shāh ʿAbbās I (1588–1629) established trade contacts directly with Europe, but Iran's remoteness from Europe, behind the imposing Ottoman screen, made maintenance and promotion of these contacts difficult and sporadic. Shāh ʿAbbās I also transplanted a colony of industrious and commercially astute Armenians from Jolfā in Azerbaijan to a new Jolfā adjacent to Isfahan, the city he developed and adorned as his capital. The Ṣafavids had earlier moved their capital from the vulnerable Tabrīz to Kazvin. Since the Uzbek menace from east of the Caspian had been overcome, ʿAbbās could move his capital south to Isfahan, more centrally placed than Kazvin for control over the whole country, and for communication with the trade outlets of the Persian Gulf. ʿAbbās engaged English help to oust the Portuguese from the island of Hormuz in 1622. He also strove to lodge Ṣafavid power strongly in Khorāsān, where he developed the shrine of ʿAlī ar-Riḍā at Mashhad, the eighth Shīʿah imam, as a pilgrim centre to rival Shīʿī holy places in Mesopotamia, where visiting pilgrims took currency out of Ṣafavid into Ottoman territory.

Army reforms

Under Shāh ʿAbbās I Iran prospered. The old Ṣūfī bands, which had been formed into artificial tribal units for military purposes during the dynasty's formative period, were replaced by a standing army trained and equipped on European lines with the advice of Robert Sherley. Sherley was an English adventurer versed in artillery tactics who, accompanied by a party of cannon founders, reached Kazvin with his brother Anthony in 1598. The bureaucracy, too, was carefully reorganized, but the seeds of the sovereignty's weakness lay in the royal house itself, which lacked an established system of inheritance by primogeniture. A reigning shah's nearest and most acute objects of suspicion were his own sons. Among them, brother plotted against brother over who should succeed on their father's death. Intriguers, ambitious for influence in a subsequent reign, supported one prince against another. Shāh ʿAbbās did not adopt the Ottoman sultans' practice of eliminating royal males by murder (as a child he had been within a hair's breadth of being a victim of such a policy). Instead, he instituted the practice of immuring infant princes in palace gardens away from the promptings of intrigue and the world at large. As a result, his successors tended to be indecisive men, easily dominated by powerful religious dignitaries to whom the Ṣafavids had accorded considerable influence in an attempt to make Shīʿism the state religion.

The Afghan interlude. Shāh Solṭān Ḥoseyn (reigned 1694–1722) was of a religious temperament and especially influenced by the divines, whose conflicting advice, added to his own procrastination, sealed the sudden and unexpected fate of the Ṣafavid empire. One Maḥmūd, a former Ṣafavid vassal in Afghanistan, captured Isfahan and murdered Solṭān Ḥoseyn in his cell in the beautiful mosque-school, or *madrasah,* built in his mother's name.

The Afghan interlude was disastrous for Iran. In 1723 the Ottomans took advantage of the disintegration of the Ṣafavid realm and invaded from the west, ravaging western Persia. Nāder, an Afshārid Turkmen from northern Khorāsān, was eventually able to reunite Iran, a process he began on behalf of the Ṣafavid prince Ṭahmāsp II (1722–32), who had escaped the Afghans. After he had cleared the country of Afghans, Nāder was made governor of a large area of eastern Iran.

Nāder Shāh (1736–47). Nāder later dethroned Ṭahmāsp II in favour of another Ṣafavid puppet. His successful military exploits, however, which included victories over rebels in the Caucasus, made it feasible for this stern warrior himself to be proclaimed shah in 1736. He attempted to mollify Perso-Ottoman hostility by establishing in Iran a less aggressive form of Shīʿism, which would be less offensive to Ottoman susceptibilities; but this experiment did not take root. Want of money drove him to embark on his celebrated Indian campaign in 1738–39. His capture of Delhi and of the Mughal emperor's treasure gave Nāder booty in such quantities that he was able to exempt Iran from taxes for three years. His Indian expedition temporarily solved the problem of how to make his empire financially viable.

Attack on India

How large this problem loomed in Nāder's mind is demonstrated by his increasingly morbid obsession with treasure and jewels. After suspecting his son of complicity in a plot against him in 1741, Nāder's mind seems to have become unhinged; his brilliance and courage deteriorated into a meanness and capricious cruelty that could no longer be tolerated. In 1747 he was murdered by a group of his own Afshārs, together with some Qājār chiefs—a sad end to one of Iran's greatest leaders.

Nāder had been the first modern Iranian leader to perceive the importance of having his own navy, and in 1734 he had appointed an "Admiral of the Gulf." Ships were purchased from their British captains, and by 1735 the new Iranian navy had attacked Basra. What really mattered, however, were the land forces. Nāder's reign exemplified the fact that to be successful, a shah of Iran had to prove himself capable of defending his realm's territorial integrity and of extending its sources of wealth and production by conquest. To these ends, Nāder built up a large army comprised of tribal units under their own chiefs, such as his Afshārid kinsmen, and the Qājārs and Bakhtyārīs.

But on Nāder's death, his great military machine dispersed, its commanders bent on establishing their own states. Aḥmad Shāh Durrānī founded a kingdom in Afghanistan based on Qandahār. Shāh Rokh, Nāder's blind grandson, succeeded in maintaining himself at the head of an Afshārid state in Khorāsān, its capital at Mashhad. The Qājār chief Moḥammad Ḥasan took Mazanderan south of the Caspian Sea. Āzād Khān, an Afghan, held Azerbaijan, whence Moḥammad Ḥasan Khān Qājār ultimately expelled him. The Qājār chief, therefore, disposed of this post-Nāder Afghan remnant in northwestern Iran, but was himself unable to make headway against a new power arising in central and southern Iran, that of the Zands.

The Zand dynasty (1750–79). Moḥammad Karīm Khān Zand began his career as an ally of the Bakhtyārī chief ʿAlī Mardān Khān in a bid to oust Shāh Rokh's nominee, Abū ol-Fatḥ Bakhtyārī, from Isfahan. Victory over this representative of the Mashhad regime having been achieved, it was

agreed that Shāh Solṭān Ḥoseyn Ṣafavī's grandson, a boy named Abū Ṭarāb, should be proclaimed Shāh Esmā'īl III; but 'Alī Mardān Khān broke the compact and was killed. Karīm Khān gained supremacy over central and southern Iran and reigned as regent or deputy (*vakīl*) on behalf of the powerless Ṣafavid prince, never arrogating to himself the title of shah. Karīm Khān made Shīrāz his capital and did not contend with Shāh Rokh (1748–95) for the hegemony of Khorāsān. He concentrated on Fārs and the centre, but managed to contain the Qājārs in Mazanderan, north of the Elburz Mountains. He kept Āghā Moḥammad Khān Qājār a hostage at his court in Shīrāz, after repulsing Moḥammad Ḥasan Qājār's bids for extended dominion. (P.W.A.)

Prosperity under Karīm Khān

Karīm Khān's geniality and common sense inaugurated a period of peace and popular contentment, and he strove for commercial prosperity in Shīrāz, a centre accessible to the Persian Gulf ports and the Indian trade. After Karīm Khān's death in 1779, Āghā Moḥammad escaped to the Qājār tribal country in the north, gathered a large force, and embarked upon a war of conquest.

The Qājārs (1779–1925). *Aghā Moḥammad Khān.* Between 1779 and 1789 the Zands fought among themselves over their legacy. In the end, it fell to the gallant Loṭf 'Alī, the Zands' last hope. Āghā Moḥammad Khān relentlessly hunted him down until he overcame and killed him at the southeastern city of Kermān in 1794. In 1796 Āghā Moḥammad assumed the imperial diadem, and later in the same year he took Mashhad. Shāh Rokh died of the tortures inflicted on him to make him reveal the complete tally of the Afshārids' treasure. Āghā Moḥammad was cruel and he was avaricious. Karīm Khān's commercial efforts were nullified by his successors' quarrels. With cruel irony, attempts to revive the Persian Gulf trade were followed by a British mission from India in 1800, which ultimately opened the way for a drain of Persian bullion to India. This drain was made inevitable by the damage done to Iran's productive capacity during Āghā Moḥammad's campaigns to conquer the country.

European penetration. Fatḥ 'Alī Shāh (ruled 1797–1834), in need of revenue, relied on British subsidies but lost the Caucasus to Russia by the treaties of Golestān in 1813 and Turkmanchay in 1828. The last gave Russian commercial and consular agents entrance to Iran, and this began a diplomatic rivalry between Russia and Britain that victimized Iran. This rivalry was eventually resolved when in 1907 an Anglo-Russian convention established, in Iran, Afghanistan, and Tibet, exclusive Anglo-Russian spheres of influence.

Anglo-Russian rivalry

Hājjī Mīrzā Āghāsī, a minister of Moḥammad Shāh (ruled 1834–48), tried to activate the government in a revival of the sources of production and to cement ties with lesser European powers, such as Spain and Belgium, as an alternative to Anglo-Russian dominance, but little was achieved. Nāṣer od-Dīn Shāh (ruled 1848–96) made Iran's last effort to regain Herāt, but 1857 saw the end of such expansionist efforts. Popular and religious antagonism to the Qājār regime increased as Nāṣer od-Dīn Shāh strove to raise funds by selling concessions, ostensibly for the development of his country's resources, to Europeans. The money paid for concessions was squandered by the court and on the Shah's journeys to Europe.

Popular protest and the constitution. The effect of popular protest in bringing about cancellation of a tobacco concession in 1890 demonstrated two factors of crucial significance for the future: first, that unified popular protest could limit despotism's scope; and, second, that a mercantile class of sufficient prosperity existed in Iran to make use, with support from religious orators, of popular feeling. The Shah's suppression of the Bābī and Bahā'ī heterodoxies had not, in spite of its ugly severity, ingratiated the regime with the orthodox *'ulamā'*.

The "Tobacco Riots" were the prelude to the constitutional revolution of the reign of Moẓaffar od-Dīn Shāh (ruled 1896–1907). Iran remained on silver after the failure of bimetallism and the world slump in silver values from the 1870s onward. Silver bullion drained out of the country and copper money proliferated, causing bread riots. In 1906 the ailing Shah granted a constitution. In October of that year the first National Consultative Assembly (the Majles) was opened. In 1908, under Moḥammad 'Alī Shāh (ruled 1907–09), the Majles was suppressed with the aid of the Persian Cossack Brigade. The Majles was revived after a civil war that culminated in Moḥammad 'Alī's deposition.

Constitution of 1906

Rise of Reza Khan. During World War I, Iran was the scene of rival intrigues by pro-British and pro-German groups among the notables, a class that had succeeded in gaining control of the Majles. The disruption was exacerbated by famine and national bankruptcy.

In 1919 the Majles refused a British offer of financial and military assistance, and British financial and military experts were withdrawn from the country. Salvation came from another quarter, in the person of an Iranian officer, Reza Khan, of the Persian Cossack Brigade. In collaboration with a political writer, Sayyid Zia od-Din Tabataba'i, he staged a coup d'etat in 1921 and took control of all the military forces. Reza Khan's efforts between 1921 and 1925 as, successively, war minister and prime minister under Aḥmad Shāh resulted in the formation of an army loyal to him, the achievement of order, and finally, in 1925, the deposition of the last Qājār shah and the transference of sovereignty to himself.

The Pahlavi Dynasty (1925–79). *Reza Shah.* During the reign of Reza Shah Pahlavi (Reza Khan's imperial style), educational and juridical reforms were effected that lessened the influence of the religious classes and laid the basis of a modern state. Women were freed from the veil and divorce laws were modified in their favour. The nation's independence from foreign political interference was restored. In 1933 improved terms were gained for Iran on the oil concession granted to a British company in 1901. Iran's first railroad was inaugurated in 1938. Unfortunately, trade necessities, fear of the Soviet grip on the routing of Iranian goods to Europe, and fear of British influence in the south and of Soviet influence in the north made Reza Shah turn to Nazi Germany. His refusal to abandon what he conceived to be obligations toward numerous Germans in Iran in 1941 occasioned an Anglo-Soviet invasion of the country, to ensure the safe passage of American supplies to the Soviet front through Iran. In September 1941 Reza Shah abdicated and left Iran.

Mohammad Reza Shah. In wartime conditions, Reza Shah's son, Mohammad Reza Shah Pahlavi, succeeded to the throne. The Soviet Union and a Communist "popular" regime were removed from Azerbaijan (then the Northwestern Province of Iran) in 1946. In 1951 the Majles passed an act, introduced by Mohammad Mosaddeq, nationalizing Iranian oil; the British Oil Company withdrew. The disturbed political situation during Mosaddeq's premiership turned his nationalization triumph into a Pyrrhic victory. His period in office ended in turmoil in 1953.

By 1961 the Shah was able finally to take the initiative. Dissolving the 20th Majles in May of that year, he cleared the way for the first Land Reform Law, enacted in 1962. The landed minority had to give up its lands to the government for redistribution to cultivators. (Among those stripped of land was the Shī'ah Muslim religious establishment.) Profit sharing in industry was introduced, and the former landlords could receive compensation for their holdings in the form of shares in industries. Cultivators and workers were given more voice in national affairs, and cooperatives in rural areas began to replace the former landowners as sources of capital for irrigation and agrarian maintenance and development. A campaign was organized to reduce illiteracy, and education was further removed from the control of the clergy. The country's power structure was radically changed in a program termed the "White Revolution."

The White Revolution

On January 26, 1963, the White Revolution was overwhelmingly endorsed by the nation. By 1971, when land distribution ended, about 2,500,000 families, comprising a farming population of more than 12,000,000, were estimated to have benefitted from the reforms. During 1960–72 the percentage of owner-occupied farmland in Iran rose from 26 to 78 percent.

Per capita income rose from about $176 in 1960 to about $2,500 in 1978. During 1970–77 the gross national product was reported to have increased to an average annual

rate of 7.8 percent. Oil revenues financed the extraordinary growth of investment under Iran's successive development plans, rising from $68,455,000 under the 1949–56 plan to $9,802,300,000 (50 percent from oil) under the Fourth Plan of 1968–73 and to some $68,600,000,000 (more than two-thirds from oil) under the Fifth Plan of 1973–78.

Improvement and construction after 1961 were accompanied by an "independent national policy" in foreign relations. The main principles of this foreign policy were support for the United Nations and peaceful coexistence, with a positive approach in cementing friendly and mutually beneficial ties with other nations. Relations with the United States remained close. Iran played a major role in the Central Treaty Organization (Cento) and Regional Cooperation for Development (RCD) with Turkey and Pakistan. It also embarked upon trade and cultural relations with eastern Europe, the Soviet Union, France, Germany, and Scandinavia.

Cento and RCD

Iranian oil development was accelerated after 1954 by a multinational Western consortium led by British Petroleum. The National Iranian Oil Company (NIOC) embarked on all-around expansion. It formed a petrochemical subsidiary and concluded agreements, mainly on the basis of equal shares, with several international companies for exploitation of oil outside the area of the consortium.

National Iranian Oil Company

In July 1973 a new 20-year oil agreement with the consortium of Western firms was concluded. It had the effect of initiating a plain seller-buyer relationship between Iran and the oil companies and of giving Iran control over field operations. These operations, along with all facilities and installations previously worked by the consortium, were vested in NIOC. The consortium agreement was cancelled in 1979, leaving NIOC in control of the Iranian oil industry.

World monetary instability and fluctuations in Western oil consumption dangerously threatened an economy rapidly expanded after 1954 and directed on an unprecedented scale to high-cost development programs. Acutely aware of the danger of dependence on a diminishing asset, the Shah pursued a policy of diversification. Assembly of motor vehicles started in 1957, and in the early 1970s Iran became an exporter of motor vehicles to Egypt and Yugoslavia. Copper reserves were exploited, and in early 1972 Iran's first steel mill began producing structural steel. Iran purchased a major share in the Krupp firm of West Germany in 1974 and continued to press for barter agreements for the marketing of its oil and gas.

Population continued to rise, and the flight from rural areas to towns, particularly to the capital and other northern centres, presented a serious problem. Employment was artificially increased by loans and credits, while businesses were obliged to offer 49 percent of their stock for sale to workers. In 1975 a government-sponsored war on high prices resulted in arrests and fines of traders and manufacturers, injuring the market's confidence.

The Islāmic republic. *Revolution of 1978–79.* The sense that in both the agricultural and industrial spheres too much had been attempted too rapidly and that mistakes had been made and expectations disappointed was manifested in demonstrations against the government in 1978; many people were killed, and martial law was imposed in the major cities in September. This ended the relaxation of government controls, begun in 1977, that had encouraged protests and that had led to the emergence of religious activists allied with extremist "Dedicated Fighter" groups, the Mujāhedīn; these groups were opposed to the influx of foreigners, particularly Americans, and to a westernization they saw as threatening to those traditional values subsumed under the cloak of Shī'ite Islām.

Ruhollah Khomeini, an Islāmic jurist accorded the honorific title of ayatollah ("sign of God"), coordinated an upsurge of opposition—first from Iraq, where he had gone into exile in 1964, and then from France, after 1978 demanding the Shah's abdication. On January 16, 1979, under constitutional procedures, the Shah left Iran, and he died in Egypt on July 27, 1980.

The Regency and Supreme Army Councils established for the Shah's absence proved unable to function, and Prime Minister Shahpur Bakhtiar was unable to effect compromise with his former National Front colleagues or with Khomeini. Crowds in excess of 1,000,000 demonstrated in Tehrān, proving the wide appeal of Khomeini, who arrived in Iran amid wild rejoicing on February 1, 1979. Ten days later Bakhtiar went into hiding, eventually to find exile in Paris.

The republic. On April 1, after a landslide victory in a national referendum, Khomeini declared an Islāmic republic, subsequently invested with a new constitution reflecting his ideals of Islāmic government. Fundamentalist measures followed, with rules for the comportment and veiling of women and the repeal of modern divorce laws. Efforts were made to suppress Western influence, and many of the Western-educated elite fled the country.

In November 1979 supporters of the revolution took control of the U.S. embassy in Tehrān, seized 66 U.S. citizens there and at the foreign ministry, and, with the exception of 14 who were granted early release, held them hostage until January 20, 1981. Also in November 1979, the republic's first prime minister, Mehdi Bazargan, resigned. The republic's first president, Abolhassan Bani-Sadr, opposed the holding of the U.S. embassy. He was forced to flee to France, together with opposition leader Massoud Rajavi of the outlawed Mujāhedīn-e Khalq (Fighters for the People) faction. The Mujāhedīn stepped up a campaign of sporadic and highly demoralizing bombing in Tehrān, including the bombing on June 28, 1981, of the headquarters of the ruling Islāmic Republican Party.

War with Iraq

In September 1980 the president of Iraq ordered the invasion of the southwestern oil-producing Iranian province of Khūzestān, but a supposedly weakened Iranian army achieved surprising defensive success. By summer 1982, Iraq's initial territorial gains had been recaptured by Iranian troops that were stiffened with Revolutionary Guards and, to a disturbing degree, with young village boys attracted by a promise of rewards after life. Prolongation of the war caused Arab and international anxiety, centred on the possible threat to the oil-producing countries on the Persian Gulf.

Factionalism and corruption pointed to increased disillusionment among Iranians. The numbers of extremely young casualties in the Iran–Iraq war affected public morale, but the government was careful to provide for the poor through mosque-based *komitehs* (committees). Imports of foodstuffs were still high and, coupled with war expenditures, created a drain on an economy already stricken by a declining world demand for oil and by severe war damage to oil installations. Unrelenting executions on sometimes trivial allegations, rumours of torture, persecution of Bahā'īs, arbitrary arrests, and bad prison conditions tarnished the reputation of the republic's leaders.

For later developments in the political history of Iran, see the *Britannica Book of the Year* section in the BRITANNICA WORLD DATA ANNUAL. (P.W.A./Ed.)

BIBLIOGRAPHY

General. Prominent among histories that are also informative on contemporary Iranian cultures are JOSEPH M. UPTON, *The History of Modern Iran: An Interpretation* (1960, reprinted 1970); and DONALD N. WILBER, *Iran: Past and Present: From Monarchy to Islamic Republic,* 9th ed. (1981). CHARLES ISSAWI (ed.), *The Economic History of Iran, 1800–1914* (1971), contains documents, statistical data, and commentary on economic conditions prior to World War I; and TAREQ Y. ISMAEL, *Iraq and Iran: Roots of Conflict* (1982), is a well-documented history of Iran–Iraq relations, covering events from the conflict between the Ottoman and Persian empires over the territory of modern-day Iraq through the agreement reached by Iranian and Iraqi leaders in Algiers in 1975. ROBIN WRIGHT, *Sacred Rage: The Crusade of Modern Islam* (1985), recounts Iran's efforts to export its revolution to other Islāmic countries; see also NIKKI R. KEDDIE (ed.), *Religion and Politics in Iran: Shi'ism from Quietism to Revolution* (1983). JOHN I. CLARKE, *The Iranian City of Shiraz* (1963); and PAUL WARD ENGLISH, *City and Village in Iran: Settlement and Economy in the Kirman Basin* (1966), are two of the best books on modern Iranian cities. See also LUDWIG ADAMEC (ed.), *Historical Gazetteer of Iran* (1976–).

Land and people. W.B. FISHER (ed.), *The Cambridge History of Iran,* vol. 1, *The Land of Iran* (1968), is perhaps the single most comprehensive and informative work on geography and

social ecology, and Fisher's *Middle East: A Physical, Social, and Regional Geography,* 7th rev. ed. (1978), includes a brief survey of Iran. Also useful is the section on Iran in *The Middle East and North Africa* (annual), a country survey with up-to-date statistical data. Notable among the books on pastoral nomads are FREDRIK BARTH, *Nomads of South-Persia* (1961, reissued 1965); and MERIAN C. COOPER, *Grass* (1925), a dramatic eyewitness account of the spring migration of a Bakhtyārī group over the Zagros Mountains in 1924.

Economic conditions. M. FROOZĀN, M. SHIRĀZI, and I. EBTEHĀJ-SAMI'I, "The Development of the Gas Industry in Iran," *Tahqiqāt-e Eqtesādi: Quarterly Journal of Economic Research,* 7(19–20):25–47 (Summer and Autumn 1970), the text of a paper delivered to the 11th International Gas Congress; ANN K.S. LAMBTON, *The Persian Land Reform, 1962–1966* (1969), a study based on research in the field; DANIEL CRAIG, "The Impact of Land Reform on an Iranian Village," *Middle East Journal,* 32(2):141–154 (Spring 1978), a discussion of the problems created by the monarchy's land reform; and NIKKI R. KEDDIE, "Stratification, Social Control, and Capitalism in Iranian Villages: Before and After Land Reform," in RICHARD ANTOUN and ILIYA HARIK (eds.), *Rural Politics and Social Change in the Middle East,* pp. 364–402 (1972), also a field research study.

Government and social conditions. WILLIAM GREEN MILLER, "Political Organization in Iran: From Dowreh to Political Party," *Middle East Journal,* 23(2):159–167 (Spring 1969), and 23(3):343–350 (Summer 1969); E.A. BAYNE, *Persian Kingship in Transition: Conversations with a Monarch Whose Office Is Traditional and Whose Goal Is Modernization* (1968), a discussion with Mohammad Reza Shah Pahlavi of the political process; RUHOLLAH KHOMEINI, *Islamic Government* (1979; originally published in Fārsī, 1979), Khomeini's concept of the nature and function of an Islāmic state; and HAMID ALGAR (trans.), *Constitution of the Islamic Republic of Iran* (1980; originally published in Fārsī, 1979). Three works on the modern family, fertility, mortality, and related matters are ALI A. PAYDARFAR and MAHMOOD SARRAM, "Differential Fertility and Socioeconomic Status of Shirazi Women: A Pilot Study," *Journal of Marriage and the Family,* 32(4):692–699 (1970); PAUL VIEILLE, "Birth and Death in an Islamic Society," *Diogenes,* 57:101–127 (Spring 1967); and *Some Demographic Aspects of the Population of Iran* (1968), a collection of articles written mostly by Iranian social scientists. Two books that systematically consider many aspects of Iranian culture in depth and in the context of change are NORMAN JACOBS, *The Sociology of Development: Iran as an Asian Caste Study* (1966); and EHSAN YAR-SHATER (ed.), *Iran Faces the Seventies* (1971). A. REZA ARASTEH, *Education and Social Awakening in Iran, 1850–1968,* 2nd rev. ed. (1969), is a critical study of Iranian education.

Cultural life. S.H. NASR, "Ithnā 'Ashariyya," in *The Encyclopaedia of Islam,* new ed., vol. 4, pp. 277–279 (1978), an article in English on the beliefs of the Twelvers; 'ALLĀMAH SAYYID MUḤAMMAD ḤUSAYN ṬABĀṬABĀ'Ī, *Shī'ite Islam,* trans. from Fārsī, 2nd ed. (1977), an authoritative monograph on the origins and growth of Shī'ism; FAZLUR RAHMAN, *Major Themes of the Qur'ān* (1980); PETER J. CHELKOWSKI (ed.), *Ta'ziyeh: Ritual and Drama in Iran* (1979), a collection of essays by both Iranian and Western scholars; ARTHUR UPHAM POPE, *Masterpieces of Persian Art* (1945, reissued 1970); and HANS E. WULFF, *The Traditional Crafts of Persia: Their Development, Technology, and Influence on Eastern and Western Civilizations* (1966), a well-documented study with illustrations.

History. *Iran to the end of the Achaemenid period:* RICHARD N. FRYE, *The Heritage of Persia,* 2nd ed. (1976); ROMAN GHIRSHMAN, *Iran from the Earliest Times to the Islamic Conquest* (1954), a useful introduction; and GEOFFREY HANDLEY-TAYLOR, *Bibliography of Iran: Coronation Edition,* rev. ed. (1967). (*Prehistory*): R.H. DYSON, JR., "Problems in the Relative Chronology of Iran, 6000–2000 B.C.," in ROBERT W. EHRICH (ed.), *Chronologies in Old World Archaeology* (1965), an authoritative summary of prehistoric Iranian chronology; "The Archaeological Evidence of the Second Millennium B.C. on the Persian Plateau," *Cambridge Ancient History,* 3rd ed., vol. 2, part 1 (1973); and L. VANDEN BERGHE, *Archéologie de l'Iran ancien* (1959), a fairly complete survey by province and period of Iranian archaeology for all periods to the Sāsānian, with a good bibliography. (*Elam*): PIERRE AMIET, *Elam* (1966), a survey of Elamite art, containing good pictures and a good bibliography; GEORGE G. CAMERON, *History of Early Iran* (1936, reprinted 1976), a good general survey; WALTER HINZ, "Persia *c.* 2400–1800 B.C.," *Cambridge Ancient History,* rev. ed., fascicle 19 (1963); "Persia *c.* 1800–1550 B.C.," *Cambridge Ancient History,* 3rd ed., vol. 2, part 1 (1973); and RENÉ LABAT, "Elam *c.* 1600–1200 B.C.," *ibid.,* vol. 2, part 2 (1975), authoritative reviews. (*Protohistory*): R. LABAT, "Elam and Western Persia *c.* 1200–1000 B.C.," *ibid.*, a fine survey of Elamite history in the period; T. CUYLER YOUNG, JR., "A Comparative Ceramic Chronology for Western Iran, 1500–500 B.C.," *Iran,* vol. 3 (1965), an attempt to combine archaeological and written sources in a historical reconstruction. (*The Achaemenids*): ANDREW R. BURN, *Persia and the Greeks: The Defense of the West, c. 546–478 BC* (1962), a fairly balanced view of the Achaemenids in their dealings with the Greeks; *Cambridge Ancient History,* vol. 4, *The Persian Empire and the West* (1939), a standard summary of events but in some respects out-of-date; ALBERT T. OLMSTEAD, *History of the Persian Empire* (1948, reissued 1978), a good introduction.

The Parthian period: The publications of M.E. MASSON and of G.A. PUGACHENKOVA are indispensable for an acquaintance with this period, as are the works of G.A. KOCHELENKO. A detailed Russian bibliography may be found in GREGOIRE FRUMKIN, *Archaeology in Soviet Central Asia* (1970). See also FRANZ ALTHEIM, *Weltgeschichte Asiens im griechischen Zeitalter,* 2 vol. (1947–48), a brilliant study of Hellenism in the Orient, with particular attention to the role of the Iranians; FRANZ ALTHEIM and RUTH STIEHL, *Geschichte Mittelasiens im Altertum* (1970); N. DEBEVOISE, *A Political History of Parthia* (1938, reprinted 1969); JOSEF DOBIAS, "Les Premiers Rapports des Romains avec les Parthes et l'occupation de la Syrie," *Archiv Orientální,* 3:215–256 (1931), well-documented research; ALFRED VON GUTSCHMID, *Geschichte Irans und seiner Nachbarländer von Alexander dem Grossen bis zum Untergang der Arsaciden* (1888); and GEORGE RAWLINSON, *The Sixth Great Oriental Monarchy; or, The Geography, History and Antiquities of Parthia* (1873), both old but still quite valuable; MIKHAIL ROSTOVTSEV, "The Sarmatae and Parthians," *Cambridge Ancient History,* vol. 11 (1936), of capital importance for Parthian history; WERNER SCHUR, "Parthia," *Pauly-Wissowa Real-Encyclopädie,* vol. 36, col. 1987–2029 (1949); W.W. TARN, "Parthia," *Cambridge Ancient History,* vol. 9 (1932), and *The Greeks in Bactria and India,* 2nd ed. (1951), both works based on vast expertise, although certain details are still not universally accepted; JOSEF WOLSKI, "The Decay of the Iranian Empire of the Seleucids and the Chronology of the Parthian Beginnings," *Berytus,* 12:35–52 (1956–57); K.H. ZIEGLER, *Die Beziehungen zwischen Rom und dem Partherreich* (1964), a valuable work with a bias toward Rome; and G.L. RIDER, *Suse sous les Séleucides et les Parthes* (1965), providing an important listing of coins.

The Sāsānian period: (*History*): THEODOR NOLDEKE, *Geschichte der Perser und Araber zur Zeit der Sasaniden aus der arabischen Chronik des Ṭabarī* (1879), German trans. of at-Ṭabarī's (9th–10th century) history, with commentary, still essential; ARTHUR CHRISTENSEN, *L'Iran sous les Sassanides,* 2nd ed. rev. (1944), the only comprehensive history; FRANZ ALTHEIM and RUTH STIEHL, *Feudalismus unter den Sasaniden und ihren Nachbarn* (1954), and *Finanzgeschichte der Spätantike,* pp. 5–114 (1957); N. PIGULEVSKAJA, *Les Villes de l'état iranien aux époques parthe et sassanide* (1963; originally published in Russian, 1956); JEAN GAGE, *La Montée des Sassanides et l'heure de Palmyre* (1964), with translations from several original sources; GEO WIDENGREN, *Der Feudalismus im alten Iran* (1969). (*Chronology*): KURT ERDMANN, "Die Entwicklung der sasanidischen Krone," *Ars Islamica,* 15:87–123 (1951); ROBERT GOBL, *Sasanidische Numismatik* (1968), tables 1–14. (*Inscriptional materials*): ERNST HERZFELD, *Paikuli: Monument and Inscription of the Early History of the Sassanian Empire,* 2 vol. (1924), the first, now somewhat superseded, interpretation of the inscription of Narses; and MARTIN SPRENGLING, *Third Century Iran: Sapor and Kartir* (1953), the first interpretation of inscriptions of Shāpūr I and Kartēr.

Iran since c. AD 600: SIR PERCY M. SYKES, *A History of Persia,* 3rd ed., 2 vol. (1969), a general history; ALESSANDRO BAUSANI, *The Persians* (1971, originally published in Italian, 1962); E. DENISON ROSS, *The Persians* (1931); WILHELM BARTHOLD, *Turkestan Down to the Mongol Invasion,* 4th ed. (1977; originally published in Russian, 1898–1900), the essential survey of northeastern Iranian history from *c.* AD 600 to the 13th century; later research is represented by MUHAMMAD A. SHABAN, *The 'Ābbasid Revolution* (1970). The *Cambridge History of Iran,* vol. 5 (1968), covers the 12th–14th centuries; MARTIN B. DICKSON, *Shāh Tahmāsb and the Úzbeks* (1958), on the history of the first half of the 16th century; LAURENCE LOCKHART, *Nadir Shah* (1938, reprinted 1973), and *The Fall of the Safavī Dynasty and the Afghan Occupation of Persia* (1958), deal with the period 1722–46; PETER W. AVERY, *Modern Iran* (1965), is a general work on the 19th and 20th centuries to 1963. See also JULIAN BHARIER, *Economic Development in Iran: 1900–1970* (1971); EDWARD G. BROWNE, *The Persian Revolution of 1905–1909* (1910, reprinted 1966); R.N. FRYE, *The Heritage of Persia,* 2nd rev. ed. (1976); and AMIN BANANI, *The Modernization of Iran: 1921–1941* (1961). L.P. ELWELL-SUTTON, *Modern Iran* (1941), covers the period 1924–41, and his *Guide to Iranian Area Study* (1952) has a useful chronological table

and bibliography. Dynastic tables and essays on different aspects of Iranian history and culture are in A.J. ARBERRY (ed.), *The Legacy of Persia* (1953, reissued 1968). Sound modern research has produced articles on Iran in *The Cambridge History of Islam*, 2 vol. (1970, reissued 1977). An essential reference work is *The Encyclopaedia of Islam*, 4 vol. and suppl. (1913–38; new ed., 1960–). VLADIMIR F. MINORSKY, *Iranica: Twenty Articles* (1964), *Taḏhkirat al-Mulūk* (1943), and *Persia in A.D. 1478–1490* (1957), are recommended, as are ANN K.S. LAMBTON, *Landlord and Peasant in Persia* (1953, reprinted 1969), and *The Persian Land Reform, 1962–1966* (1969); GEORGE LENCZOWSKI (ed.), *Iran Under the Pahlavis* (1978); ROUHOLLAH K. RAMAZANI, *The Foreign Policy of Iran: A Developing Nation in World Affairs, 1500–1941* (1966), and *Iran's Foreign Policy, 1941–1973* (1975); SHAHRAM CHUBIN and SEPEHR ZABIH, *The Foreign Relations of Iran* (1974), a prerevolutionary source; FIRUZ KAZEMZADEH, *Russia and Britain in Persia 1864–1914* (1968); MARVIN ZONIS, *The Political Elite of Iran* (1971); SEPEHR ZABIH, *The Communist Movement in Iran* (1966); ERVAND ABRAHAMIAN, *Iran Between Two Revolutions* (1982); SHAHROUGH AKHAVI, *Religion and Politics in Contemporary Iran: Clergy-State Relations in the Pahlavī Period* (1980); JAMES A. BILL, *The Politics of Iran: Groups, Classes and Modernization* (1972); ROBERT GRAHAM, *Iran: The Illusion of Power*, rev. ed. (1980); FRED HALLIDAY, *Iran: Dictatorship and Development* (1979); AMIN SAIKHAL, *The Rise and Fall of the Shah* (1980); MICHAEL M.J. FISCHER, *Iran: From Religious Dispute to Revolution* (1980); NIKKI R. KEDDIE, *Roots of Revolution: An Interpretive History of Modern Iran* (1981); MICHAEL A. LEDEEN and WILLIAM LEWIS, *Debacle: The American Failure in Iran* (1981); HOMA KATOUZIAN, *The Political Economy of Modern Iran* (1980); LOIS BECK and N.R. KEDDIE (eds.), *Women in the Muslim World* (1978); MICHAEL E. BONINE and N.R. KEDDIE (eds.), *Modern Iran: The Dialectics of Continuity and Change* (1981); and FEREIDUN FESHARAKI, *Development of the Iranian Oil Industry* (1976).

Iraq

Iraq (al-Jumhūrīyah al-ʻIrāqīyah) is an independent Arab country of the Middle East, situated at the northwest end of the Persian Gulf. It is bounded on the north by Turkey, on the east by Iran, on the southeast by the Persian Gulf, on the west by Syria and Jordan, and on the south by Kuwait and Saudi Arabia. It covers an area of 168,878 square miles (437,393 square kilometres). Baghdad is the national capital. Called Mesopotamia (the Land Between the [Two] Rivers) by the classical world, the country became known as Iraq in the 7th century.

Although basically an agricultural nation, Iraq is internationally important as a major source of the world's oil. Its considerable wealth of oil reserves has enabled the country to embark upon economic development and land-reform programs. It has, however, been subject to political instability since the overthrow of the monarchy in 1958. The army and the Baʻth Party have progressively increased their hold over the political and economic structures of the country. Iraq, part of the Arab world, has attempted to affirm its unique national culture, stressing its past and its own identity. (I.A.A.-L.)

Physical and human geography

THE LAND

The Tigris and Euphrates

Relief and drainage. The fundamental elements in Iraq's physiography are the twin valleys of the Tigris and Euphrates rivers. Joined in the south but diverging in the north, they are separated by a tongue of higher land stretching southward from the Anatolian foothills to just north of Baghdad and known as al-Jazīrah (the Island).

Lower Iraq. The region begins at the ridge between ar-Ramādī and Baghdad and extends about 330 miles (530 kilometres) south-eastward to the Persian Gulf. The Tigris and Euphrates diverge east and west, respectively, below Baghdad, which is therefore in a narrower waist of lowland. Here the Tigris has a particularly tortuous course, and the river is marked by large numbers of meander channels and oxbow lakes. Because of the natural levees (raised embankments on either side of the river) and the difficult entry for tributary streams, there is much marsh. Many subsidiary rivers empty into the Hawr ("lake" or "marsh") as-Suwayqīyah depression, and navigation of the mainstream is difficult because of sharp bends and strong current. Below al-Kūt the course of the Tigris is much straighter and flatter. In its lowest section, especially from al-'Amārah southward, much of the waters are dispersed into distributary channels and marshes.

From ar-Ramādī southward the Euphrates flows at first in a well-defined channel. Natural levees occur, as on the Tigris. Between al-Musayyib and as-Samāwah the river discharges into various distributaries; the remnants of a previous swamp include old channels, levees, cutoffs, and lakes. From as-Samāwah there is a well-defined channel as far as an-Nāṣirīyah, or even Sūq ash-Shuyūkh, lying within an open plain that is now largely arid and almost featureless. Below an-Nāṣirīyah distributary channels take off the whole of the Euphrates water, which ultimately drains into Hawr al-Ḥammār, a vast expanse of reedy swamp. From al-Qurnah, the point of junction between the waters of Hawr al-Ḥammār and the Tigris, the river is known as the Shatt al-Arab. Away from the rivers, patches of swamp and marsh are separated by ridges.

Upper Iraq. This region comprises the valleys of the two main rivers, together with the somewhat higher ground that stretches southeastward between them. At its entry into Iraq, the Euphrates has cut a broad, flat valley with steep sides. Rejuvenation of the Euphrates led to many meanders being incised into the flat floor, giving a second set of terraces. Irregularities in rock strata have produced rapids and shoals, and the river tends to hug the western bank, producing a marked escarpment on the west and more open country to the east. The Tigris on leaving Turkey has cut an irregular winding passage among low foothills and ridges. Where the river flows southeastward, it tends to have a wide, shallow bed, with steep-sided low hills on the western (right) bank and open rolling country to the east. Separating these reaches are defiles that run from north to south, the narrowest of which is at Bāghlo-ja, about 14 miles below the confluence with the Nahr al-Khābūr on the Turkish–Iraqi frontier. Here the Tigris is only 120 feet wide, with a series of rapids that are almost cascades. Such conditions continue as far as Mosul, after which relief becomes much less accentuated, ultimately falling away to open steppe through which the Tigris flows in a broader channel. There the Tigris is joined by the Great and Little Zab rivers. One last, isolated defile occurs where the river breaks through the Jabal Ḥamrīn (Ḥamrīn Mountains) above Ba'ījī at a gorge that is now used to carry the Iraqi oil pipelines from Kirkūk to the Mediterranean. From Tikrīt southward the Tigris wanders on a flat plain, breaking up into several arms.

MAP INDEX

Al-Jazīrah region

Between the Euphrates and Tigris and bounded on the north by the Jabal Sinjār lies al-Jazīrah, a region of undulating steppe, small-scale ranges, and closed drainage basins. The warping of the whole area has produced closed drainage basins, the largest of which is the Wādī ath-Tharthār (a long defile running more or less parallel to the Tigris about 20 to 40 miles west of the river), now part of the Tigris flood-control project.

The northeastern region. Fronting the Tigris on the east, between the Turkish frontier and the broad Diyālā Valley paralleling the Iran border, is an upland area roughly rectangular in shape that rises in steps eastward from river level. The first step is the Jabal Ḥamrīn, and behind it lies an undulating territory of river basins, rolling plateaus, and irregular hills that ultimately pass into the main Zagros range in Iran. The lower (western) part, broken by the valleys of the Great and Little Zab, is the ancient region of Assyria. Farther east, as the mountain zone begins, there is an alternation of high ridges aligned northwest to southeast and separated by river basins. This is often spoken of as Iraqi Kurdistan. Here, the mountain ridges have a summit average of about 8,000 feet (2,440 metres). They attain elevations of 10,000 to 11,000 feet in a few places, culminating in Rawāndūz (12,001 feet; 3,658 metres), the highest point in Iraq. Between the ridges are trough valleys usually occupied by rivers that have eroded out basins. All the streams weave a tortuous way south and southwest toward the lowlands and are marked by gorge and defile sections (*darband*) where they skirt or cut through ridges. In a few places, such as as-Sulaymānīyah, al-ʿAmādīyah, and Rawāndūz town, patches of lowland allow cultivation, but much of Kurdistan is given over to nomadism.

The western desert. Lying to the west of the riverine lowlands, this region extends from Kuwait and Saudi Arabia on the south as far as Jordan and Syria. In the region of the Jordan frontier is the Bādiyat ash-Shām (Syrian Desert). The desert area slopes gently upward from the Euphrates lowland and is formed of ancient rocks that are often exposed as irregular pavement. In the extreme south, part of the frontier with Kuwait is formed by Wādī al-Bāṭin, a rift structure three miles wide running inland from az-Zubayr as far as central Arabia. To the northwest lies Ṣaḥrāʾ al-Ḥijārah, in the main a region of shallow, mud-lined depressions, rocky outcrops, and loose sand.

IRAQ

An extensive swamp lies northeast of this area, paralleling the Euphrates.

Farther north lies the Wādīyah region, with steeper slopes. Because of its steepness, normal drainage developed, and there is a network of dry valleys aligned northeastward to the Euphrates that carry floodwater for an hour or two each year. The region takes its name from these valleys, or *wādīs*. Since there is no fringe of continuous sand or salt marsh, as there is farther south, the Wādīyah offers more practicable routes westward and is now used for oil pipelines.

Soils. The soils fall into two contrasted groups—heavy alluvial deposits associated with the main rivers and very light soils in the rest of the country. The alluvial soils contain a significant proportion of humus and clay and dry out to a hard, tenacious mass that can be used for building. The light soils are deficient or entirely lacking in humus and have a low clay content, but they may contain a proportion of wind-deposited minerals, some of which are valuable plant nutrients.

The problem of soil salinity

For both groups of soils, there is an acute problem of salinity induced by conditions of sharply seasonal rainfall followed by a hot, arid season. This produces evaporation of soil moisture and consequent accumulation of alkaline salts at or near the surface in quantities sufficient to inhibit cultivation. On entering Iraq, the Tigris and Euphrates contain about 30 parts per 100,000 of salts; in their lower courses this proportion trebles. It was estimated in 1949 that 60 percent of all irrigated land in Iraq had become salinated, and an overall assessment is that 1 percent of the total cultivated area is abandoned each year because of salinity.

Climate. Because of the simplicity and regularity of relief, Iraq has a straightforward climatic regime. In the lowlands two contrasting seasons occur: a dry and intensely hot summer from May to October and a relatively cool, humid winter from December to March, with short transitional periods. Altitude exerts a considerable effect in the mountain zones, where winters can be severe.

From May onward the predominating climatic element is a persistent and regular northwesterly wind (*shamāl*) over the whole of Iraq. Because these air currents come from land areas, they are dry and few clouds form, so that for several weeks or even months the sun beats down uninterruptedly, producing extremely high temperatures. At Baghdad, July and August daily temperature means are about 95° F (35° C) and 88° F (31° C), respectively; mean daily maxima are about 110° F (43° C). Some drop is apparent close to water surfaces because of high evaporation, but the effect is hardly improved because of greater relative humidity. Strong winds produce blowing dust or sandstorms; July is the worst month, with an average of five storms at Baghdad and eight at ash-Shu'aybah. Usually, no rain falls between May and the end of October.

Conditions are more variable during the winter season, when the *sharqī*—a cool, damp southeasterly wind—brings rain. At other times a cold air mass from the interior of Asia may extend westward, bringing fine but cold conditions. Hot air masses from the south may also affect Iraq; January temperatures of more than 81° F (27° C) are known, but frost may occur anywhere, even at Basra. Such extremes, however, are rare. The northeast has its own climatic conditions; as much as 30 to 40 inches (760 to 1,000 millimetres) of rain occur on the highest mountains, with 15 to 25 inches in the northeastern piedmont (region at the base of mountains).

Two climatic provinces

There are therefore two climatic provinces within Iraq; the hot, arid lowland and the damper northeast, where rainfall is sufficient for cultivation without irrigation, summer temperatures are slightly lower, and a colder, continental winter brings up to three months of snow in some places. The northeast and Kurdistan apart, the main features of Iraqi climate are aridity and overwhelming summer heat, the difficulties of which are intensified by high atmospheric humidity near the rivers.

Plant and animal life. Iraq is a meeting place of two major plant groups, both of which show the predominating influence of drought. Toward the north and east, there is a steppe vegetation of perennial bushes and low shrubs, with mugwort (*Artemisia*), goosefoot (Chenopodiaceae), and grass species dominant, together with a "flush" of short-lived creepers and grasses that amounts to about two-thirds of the total vegetation. Toward the south and west, vegetation is often restricted to thorns (chiefly tamarisk and species of *Haloxylon,* commonly called saxual), a few shrubs such as rhanterium, papposum, and other salt-resistant plants. Poplar, willow, licorice, and tamarisk flourish in small clumps near the rivers. Below al-Qurnah, the marshland is an area of reeds, tall grasses, and sedge. The open oak forest on the Zagros Mountains, at altitudes between 2,000 and 6,000 feet, has been mostly reduced to scrub by intensive cutting and unrestricted grazing. Above this region is an Alpine zone of cushion (clumped and compacted) plants and dwarf species broadly similar to those of Alpine Europe.

Animal life has been much reduced. The oryx (a kind of gazelle), ostrich, and wild ass are now practically extinct, and the last known lion was killed around 1910. Bats, rats of various species, jackals, hyenas, and wildcats are the most common mammals, with wild pigs and gazelles in remoter regions. Reptiles are numerous and include lizards, the largest reaching four feet; snakes, mainly "racer" species and sand snakes; and two types of tortoise, of which one is peculiar to Iraq. Many kinds of fish occur, including the "Tigris salmon," a barbel that can attain seven feet in length. Iraq is also visited by vast numbers of migratory birds.

Settlement patterns. Traditionally, the country may be divided into the valleys of the two large rivers, which are relatively densely populated, and the deserts of the west, where nomadism is important. In the northeast (including Kurdistan), where rainfall is sufficient for cultivation without irrigation, a pattern of mixed agriculture and herding is found; this region therefore contrasts sharply with the riverine and desert areas.

Traditional regions

Towns play an important part in Iraq. Baghdad, the capital, is by far the largest; other large cities are Basra, Mosul, Kirkūk, al-Ḥillah, Irbīl, Karbalā', and an-Najaf. The rest are spread fairly evenly throughout the riverine areas. Special features of the settlement pattern are the number and even spread of towns of relatively small size (from 10,000 to 25,000 inhabitants) and the extent to which the populations of even large towns are partly agricultural. There is much less of the sharp distinction between town and country that is characteristic of Western countries.

Nomadism is important not only in the western deserts but also between the two rivers, both in al-Jazīrah and the drier and sandier parts as far south as the Shaṭṭ al-Gharrāf. Nomads are also an important element in the towns, which they frequent in large numbers at certain seasons. Religious pilgrimages to Karbalā', an-Najaf, and Sāmarrā' swell the local population. In Kurdistan, seasonal migration mainly from winter (lowland) to summer (upland) pastures is widely practiced. Some Kurdish tribes cross the frontiers into Iran and Turkey. (W.B.Fi.)

Nomadism

THE PEOPLE

Ethnic and religious characteristics. *Cultural origins.* The population, while increasingly assuming greater homogeneity, still reflects a certain degree of ethnolinguistic and religious diversity. The ancient peoples of Iraq, the Babylonians and the Assyrians, who were Semitic, have long been assimilated and absorbed by successive waves of migration and settlement.

Arabs and their descendants, along with the Arabized population, are to be found throughout Iraq, and they constitute an overwhelming majority in the central and southern regions. They are estimated to constitute slightly more than three-quarters of the population.

Throughout the centuries, Iraq's contiguity with Iran has brought constant streams of Persian migrants who settled principally in the east. From 50,000 to 60,000 of these, however, were deported to Iran in late 1971 and early 1972. Migrations from Central Asia also brought successive waves of Mongols, Turks, Turkmens, Kurds, and Circassians. Although the Mongols lost their special character as a result of fusion with the dominant population, this was less true of the Kurds, Turks, and Turkmens.

The Kurdish minority. The Kurds, inhabiting the mountainous regions of the north and northeast, retain their separate communal and individual qualities, continue to speak their own language, and are the most visible and articulate of the ethnic minorities. After World War I, the Kurds were persuaded to live under the Iraqi political system. But neither the Arabs nor the Kurds were prepared to merge into one nationality and create a new Iraqi nation. The Arabs were divided into two unequal communities on religious grounds (Sunnīs and Shīʿīs). The merging of the Kurds—a solidly Sunnī community—with the Sunnī Arabs was considered by the Shīʿīs to weaken their position and was resisted. Moreover, the Sunnī Arabs themselves were reluctant to merge with the Kurds because of the upsurge of Arab nationalism, which, in turn, encouraged Kurdish nationalism.

Kurdish nationalism

The Kurds welcomed the revolution of 1958, which brought Abdul Karim Kassem (Qassim) to power, and formed a Kurdish Democratic Party (KDP), advocating Kurdish nationalism and Communism. The Kassem regime (1958–63), however, did little or nothing to improve the social and economic conditions of the Kurds whose leaders despaired of improvement under the new regime.

Mustafa al-Barzani, a Kurdish leader exiled under the monarchy, returned in 1958. He soon found Kassem instigating rival leaders against him, and in June 1961 a protracted war against Kassem broke out. Unable to defeat Barzani's forces, the successor Baʿth government agreed that a democratic regime would be established and that the Kurds would enjoy autonomy but not independence. Negotiations led to no agreement, however, even after Barzani's acceptance of administrative decentralization instead of autonomy.

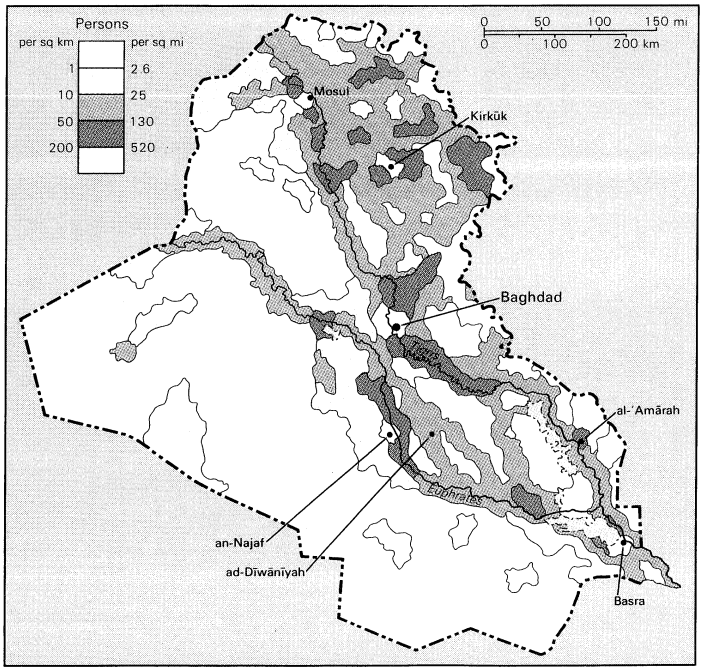
After achieving power in 1968, the Baʿth government began to take practical steps to settle the queston. The Baʿth Party and the Kurdish Democratic Party (KDP) laid down proposals agreed upon by both and embodying essential Kurdish national demands. These proposals, formally accepted by the Baʿth Revolutionary Command Council (RCC) and endorsed by the Progressive National Front (PNF) were issued in the form of a manifesto on March 11, 1970. The principal points may be summed up as recogniton of the legitimate existence of the Kurdish nationality; recognition of the Kurdish language and approval of a university in as-Sulaymānīyah and a Kurdish academy of letters; a provincial law embodying the principle of decentralization of local administration and creation of a new province, Dahūk (Dʿhok); and a general amnesty for all civil and military personnel who had taken part in "violent acts."

When the terms of the March Manifesto were put to the test, however, the Baʿth and Barzani found themselves going in different directions. Two attempts on Barzani's life (1971 and 1972) and arrests and shootings on both sides created the impression that the March Manifesto was but a temporizing measure. On the fourth anniversary of the proclamation of the March Manifesto, the Iraqi government declared that it would enforce the law governing self-rule and invited the Kurds to cooperate in its enforcement. Barzani, however, warned the Kurds against collaboration with the Baʿth regime, and in 1974 the Iraqi Army moved slowly into the Kurdish areas. In 1975 the agreement reached directly between the Shah of Iran and Saddam Ḥusayn on the Shatt al-Arab dispute left the Kurdish forces at the mercy of the Iraqi Army. Iran agreed to encourage Barzani to accept a cease-fire (March 13, 1975), and Iraq declared that amnesty would be granted to all Kurds who would surrender by April 1. The Iraqi Army took complete control of the Kurdish area by the end of March, and Barzani surrendered his power to other Kurdish leaders.

Turks, Turkmens, and other groups. Turks and Turkmens inhabit central and northwest Iraq, particularly those areas contiguous to Turkey; these elements in the population resulted from a lengthy and massive migration, with the first settlements dating from the 9th century AD. The ultimate incorporation of Iraq into the Ottoman Empire in the 16th century resulted in additional Turkish and Turkmen settlements. The Muslim affiliation of these groups facilitated their intermixture with the Arabs and with other Iraqi groups, so ethnic distinctions lost much of their significance.

Other ethnic groups are quite small. They include Yazīdīs living west and north of Mosul, who speak a Kurdish dialect. Mandaeans are to be found in Baghdad, while the Lurs, a Persian-speaking group, are to be found chiefly along the Iraqi–Iranian frontier.

Linguistic groups. The predominant language of the entire population is Arabic, although Turkish and Kurdish are still used in certain areas. Kurdish in particular is widely spoken by the Kurds, although the educated are bilingual. Turkish is spoken only by members of the oldest generation. The Turkmens speak Turkmen, an Altaic language. Persian is widely spoken in eastern Iraq, particularly in areas adjacent to Iran; Persian speakers tend to be bilingual.



Religious affiliations. Religious variation cuts across ethnic and linguistic divisions. Iraq is predominantly an Islāmic country. Jewish and Christian communities, however, are still to be found. Some among the Jewish community date their origin from the time of the Babylonian Exile (586–516 BC). Throughout the early period of statehood, Jews constituted about 2 percent of the total population. With the emergence of Zionism and the eventual establishment of Israel in 1948, the major part of the Jewish community emigrated to Israel, the United States, Canada, and Europe.

Religious minorities

The Christian communities are chiefly descendants of the ancient population that was not converted to Islām when it took root in Iraq in the 7th century. They are subdivided among various Christian sects, including Chaldeans affiliated with the Catholic Church, Jacobites, Nestorian Christians (Assyrians), and members of the Eastern Orthodox Church. They are to be found throughout the country.

Muslims are divided almost evenly between the two major sects of Islām—Sunnī and Shīʿah. The Shīʿīs predominate in the east, although they are found throughout the country. Ethnically and linguistically, the Shīʿīs are Arabs, with a very small community of Turkmens, while the Sunnīs include Arabs, Turks, Turkmens, and Kurds. The religious schism has had important impact on the politics of the country, much in the same way that ethnic divisions have affected stability. The Iraqi regime has attempted to centralize, fuse, modernize, and secularize Iraqi society in order to reduce the importance of the schism.

Demography. The annual growth rate results almost entirely from natural increase. Infant mortality, while still

Population density in Iraq.

relatively high, is declining rapidly as a result of vigorous health programs implemented since the 1960s. Immigration and emigration are minimal. The few migrants entering the country are chiefly nomadic Bedouins from Saudi Arabia and the Syrian Desert. The only significant emigration in recent times was that of many Iraqi Jews to Israel.

Growth of the urban areas

As is true in other developing countries, there is considerable internal migration. Migrants are chiefly rural people attracted by better employment opportunities in the cities. As a result, Iraqi cities and towns have experienced considerable growth since the late 1950s.

Roughly three-fifths of the Iraqi population live in cities and towns, while the rest are considered rural. The ratio has altered in favour of the urban sector as a result of increasing industrial and commercial activities.

By conventional standards, and especially in comparison with other countries of the region, Iraq has a relatively low ratio of people to land. Its developing economy is therefore expected to meet the demands of its increasing population, and, in that sense, future prospects are encouraging.

THE ECONOMY

Iraq had an almost exclusively agricultural economy until expansion in manufacturing, service industries, and nonagricultural activities began in the 1950s. The successive governments have committed themselves to industrial growth. Increasing income from oil production has enabled the Iraqi government to devote a considerable percentage of the national budget to industrial development and to modernization of its agricultural base. Land-distribution reforms initiated in 1959 and amended by the 1970 Agricultural Act, cooperative rural associations, and the decline of the landed aristocracy contributed to improved agricultural productivity and to a more equitable distribution of income.

Resources. With the exception of oil, Iraq has modest mineral resources. They include iron ore, chromite, copper, lead, and zinc deposits in the north. Limestone, gypsum, phosphates, and sulfur are abundant. The most important single mineral, however, is oil, which is exploited in the north, northeast, and south. Other oil deposits are known to exist in central Iraq but are uneconomic to exploit.

Oil extraction

Although oil was first discovered at Naft Khāneh in 1909, the first commercial oil field was developed at Kirkūk between the Zagros Mountains and the Mesopotamian plain in 1927. It has remained the country's main source of oil. The second largest field is located at Zubayr-Rumaylah near Basra. The Mosul field became operative in 1952 and produces lower grade oil, while the small field at Naft Khāneh, near Mandalī, produces oil for domestic consumption. Fields have also been developed at 'Ayn Zālah and Buṭmah, north of Mosul, and elsewhere.

Oil from the Zubayr field is shipped by tanker through the Persian Gulf. Production from Kirkūk, however, is transported by overland pipeline to Tripoli, Lebanon, and Bāniyās, Syria. The inauguration in 1977 of the oil pipeline between Kirkūk and Dörtyol, Turkey, and the completion in 1976 of a pipeline from Kirkūk to Basra minimized Iraq's previous dependence on Syrian pipeline facilities.

Until 1961, the prospecting, extracting, and exporting of oil were monopolized by the Iraq Petroleum Company (IPC), or its affiliates; mostly British owned, it was finally nationalized on July 1, 1972. In 1967 and 1969 agreements were reached with French and Soviet companies. Further agreements were reached in 1972 with Italy, France, and the Soviet Union for the purchase of nationalized oil. The National Petroleum Authority is the supreme agency concerned with the oil industry.

The country has suffered from the absence of strict controls over its biological resources. Trees have been greatly exploited as a form of wealth and as sources of fuel. Afforestation projects have effected minimal recovery. Important wild plants include licorice, which grows along the main rivers, and the valonia oak, which grows in the northeastern mountains and yields a tanning extract. Gum tragacanth is derived from the *Astragalus* (loco) bush, which occurs in the dry steppe regions.

The Tigris and Euphrates rivers constitute Iraq's main sources of hydroelectric power. They are limited, however, by seasonal flow and the largely level valleys through which they flow. The Tigris tributaries that flow from the Zagros Mountains—the Little Zab and Diyālā rivers—have been developed for power generation, as has the Tigris. Thermal power resources are also limited; deforestation has led to the importation of wood, and coal resources are small. Oil for domestic use is supplied by a field near Mandalī and is refined at Khānaqīn.

Agriculture, forestry, and irrigation. Two types of agricultural activity predominate—the one dependent upon rainfall in the north; the other dependent upon irrigation in the south. The best known agricultural product, and the largest source of foreign-currency revenue after oil, is the date, of which Iraq is one of the world's largest producers. Dates are grown chiefly around the Shatt al-Arab area in the south. Other crops include barley, wheat, linseed, lentils, and beans, as well as rice, sesame, maize (corn), and millet. Cotton production is hampered by soil salinity.

The diversified landscape has proved hospitable to livestock in greater varieties and quantities than is possible in many other Arab countries. Sheep, goats, camels, cattle, and donkeys are abundant. Trade in animals is traditional, and milk, wool, meat, and other animal products are extensively used. Wool is exported to Europe, and animals are exported to neighbouring Arab countries. Fishing is important domestically.

Forestry is negligible as an industry; building timber must be imported.

The problems of irrigation are complex because flooding usually occurs before many crops have completed their growing season, and excess water must be retained within the river between high banks. Variation in water levels allows for free-flow irrigation in some areas, while in others pumping is necessary. Stagnant water must be led back to the rivers as rapidly as possible, in order to avoid salination.

The Wādī ath-Tharthār project

The largest river-control project is that of the Wādī ath-Tharthār, completed in 1956. A canal 40 miles long leads from the Tigris at Sāmarrā' to the basin of the *wādī*, which thus accumulates floodwater. The project is also being used for the generation of electricity. A smaller project is located on the Euphrates at ar-Ramādī, where water is led into two basins at Hawr al-Ḥabbānīyah and Hawr Abū Dibs. Other dams, primarily for irrigation, with flood control and electricity generation as subsidiary features, were planned for construction during the fourth quarter of the century.

The irrigation works at Hindīyah directs the Euphrates water into an older channel running through al-Ḥillah. Also on the Euphrates are the Musayyib project and smaller works at the head of Hawr al-Ḥammār. At al-Kūt, on the Tigris, a barrage that is three times the size of the Hindīyah dam will ultimately improve irrigation to the south and southeast, but there is a restricted volume of water available in summer. The entire low-season flow of the Diyālā River below the Jabal Ḥamrīn is diverted for irrigation. Other irrigation works exist throughout the country on a smaller scale. There are also land-drainage projects to counter salination and windbreaks to prevent the silting up of irrigation and drainage channels.

The industrial sector

Industry. Textile factories are becoming increasingly important for the Iraqi market; several were built, especially at Mosul, with assistance from the Soviet Union. Steel mills are in operation at Baghdad and Khawr az-Zubayr. Power plants, water-supply facilities, breweries, cigar factories, spinning and weaving factories, and brick and cement establishments are located in the Baghdad metropolitan area. A bitumen plant at Qayyārah, south of Mosul, and two cement plants produce a sufficiency of asphalt and cement, respectively, for the home market. Sugar plants around Mosul were constructed with the assistance of the Soviet Union, and two additional plants were constructed at Missan, near Karbalā', and at as-Sulaymānīyah. There are also fertilizer factories and a paperboard factory around Basra. Approximately half of the existing manufacturing plants are to be found in Baghdad.

The petroleum and natural-gas industries support domestic and export-based refining and petrochemical in-

dustries, with major refineries at Basra and Dawrah, and five smaller facilities elsewhere. Petrochemicals, including fertilizers, urea, sulfuric acid, and ammonia gas, are produced well in excess of domestic agricultural needs at Abulfiluz, south of Basra.

The production of hydroelectric power is centred upon the Tigris River and its tributaries. Power dams are located on the Tigris at Wādī ath-Tharthār, on the Little Zab River at Dukān, and on the Upper Diyālā River at Darband-e Khān.

The country's first nuclear reactor, under construction near Baghdad, was destroyed by an Israeli air strike in June 1981; the government of Israel alleged that the facility was intended for nuclear weapons production. Stricter monitoring and controls for future installations were proposed by France, supplier of the technology.

Finance and trade. All banks and insurance companies, both domestic and foreign, were nationalized in 1964. The Central Bank of Iraq has the sole right of issuing currency. There are two commercial banks—the Commercial Bank of Iraq and the Rafidain Bank—and specialized banks for agriculture, construction, real estate, and industry.

The chief imports are manufactured goods, machinery, engines, automobiles, and pharmaceuticals. Iraq also imports some foodstuffs such as grains, sugar, and tea. After oil and dates, the chief exports are raw cotton, wool, hides and skins, fertilizers, essential oils and perfumes, and cement. Although Iraq's external trade was previously chiefly with western Europe, an increasing emphasis in the early 1970s on diversification of trading partners resulted in some alteration in the trade patterns. The Soviet Union and other Socialist states, the Far East, and neighbouring Arab countries now account for considerable trade. Iraq is a member of the Arab Common Market and has a special customs pact with Kuwait.

Transportation. Increasing modernization is reflected in changes of emphasis given to different parts of the transport system. Until the mid–20th century, transport was either by water or by animal. River transport had developed over the centuries to carry goods and persons, particularly from central to southern Iraq. The use of camels, horses, and horse-drawn carts complemented this system. Both of these modes were adequate for a traditional economy, but increasing commercialization and industrialization and the increasing scale of economic interaction between Iraq and its neighbours brought about fundamental changes.

Approximately one-third of the roads in Iraq are paved. Also, the desert land is sufficiently hard to allow cars, trucks, and buses to travel across it. The most developed parts of the road system are in central, northern, and southern Iraq. The opening of the Basra bridge in 1978 provided a direct link between Iraq's road network and the Asian Highway.

Three major railway lines connect the principal cities, and they all converge on Baghdad and Basra. Two narrow-gauge lines connect Baghdad with Basra, and link Baghdad with the northeast provinces east of the Tigris, and a standard-gauge railway connects Baghdad with Mosul and other northern cities and then continues on to Syria, Turkey, and beyond.

Five ports

Iraq's connection with the outside world through the seas is limited to five ports—one at Basra, 85 miles upstream on the Tigris from the Persian Gulf on the Shatt al-Arab; another at Umm Qaṣr, five miles from the Kuwait border; and three marine oil terminals at Fāw, Khor al-Amya, and Mina al-Bakr. All are accessible to oceangoing vessels; the facilities at Mina al-Bakr can accommodate supertankers. The Tigris is navigable by steamer from Basra to Baghdad; smaller power craft can travel upstream as far as Mosul. Only small local rivercraft use the Euphrates. Large rafts, however, carry goods downstream on both rivers.

Baghdad has two airports, one of which is international, and there is an international airport at Basra. The nation's one airline is controlled and owned by the Iraqi government and operates flights to airports in Asia, the Middle East, and Europe. Various Middle East and some major international airlines have landing privileges at Baghdad airport. Internal air traffic is insignificant.

ADMINISTRATIVE AND SOCIAL CONDITIONS

Government. While Iraq has had a series of constitutions, for all practical purposes Iraq is governed by an ad hoc constitution. It is officially a republic, with legislative power theoretically vested in an elected legislature, executive power in a president and a Council of Ministers, and judicial power in an independent judiciary. Because of the revolutionary nature of Iraqi politics since the overthrow of the monarchy in 1958, however, the political system operates with little reference to constitutional provisions. All legislative and executive powers are in fact exercised by the Council of Command of the Revolution, which since the early 1970s has been composed of 22 members, all of whom were members of the Regional Command of the Ba'th Arab Socialist Party and many of whom were army officers. The chairman of the council is also president of the republic, prime minister, and the commander of the armed forces. The president and the Council of Ministers are accountable to the Council of Command of the Revolution. Actual implementation and execution of broad policies are the function of each relevant minister. While each ministry is headed by a minister, an administrative officer, usually known as director general, is the actual day-to-day administrator. All employees of ministries are appointed civil servants.

The Council of Command of the Revolution

The country is divided for administrative purposes into 18 *muḥāfaẓāt* (governorates), three of which encompass the Kurdish Autonomous Region. Each *muḥāfaẓah* has a governor, or *muḥāfiẓ*, appointed by the minister of the interior, as chief administrative officer. Constitutional provision is made for an elective general council to assist the governor, but this provision met with obstacles to its implementation. Each *muḥāfaẓah* is administratively subdivided into districts headed by a *qā'im-maqām;* each district is then divided into *nāḥīyah*s headed by a *mudīr,* or director. The Kurdish Autonomous Region was formed by government decree in 1974. It contains the predominantly Kurdish provinces of Dahūk, as-Sulaymānīyah, and Irbīl, and is governed by a legislative council that meets in Irbīl city.

Towns and cities have their own municipal councils, each of which is directed by a *ra'īs al-baladīyah,* or mayor. The capital has special status and its own governor.

Political parties were outlawed with the overthrow of the monarchy in 1958. After the overthrow of Abdul Karim Kassem in 1963 by supporters of the Ba'th (an independent branch of the Syrian-based Ba'th Arab Socialist Party), Iraq became a one-party state. In 1970 the Democratic Kurdistan Party obtained permission to operate, primarily in the north. While the country is actually governed more by the armed forces than by the party, members of the Ba'th have nevertheless penetrated the armed forces. Nominally, all governing institutions espouse the Ba'thist ideology, which includes Socialism and a pan-Arab ideal. Constant turmoil and attempts by successive regimes to consolidate power have been used as justifications for perennial delay in resuming the conduct of normal political and constitutional processes. As a consequence, although Iraqis are assured of their rights to office and to voting, no election was held from 1958 until 1980, when a national legislature was elected.

Justice. Theoretically, Iraq has an independent judiciary, which combines French, Islāmic, and revolutionary elements. The system is supervised by a Judicial Council, headed by the minister of justice. There are three types of jurisdiction with corresponding court systems—the civil, religious, and special courts.

Dual system of justice

Civil courts deal with civil litigation, as well as all criminal cases. The courts of sessions hear serious criminal cases and serve as appellate courts in all criminal cases. Judgments in civil cases are appealed to the courts of appeal. The Court of Cassation is the highest court of the land and has original jurisdiction in crimes committed by public officials.

Each of the religious communities has its own religious court, which is governed by its respective religious law and which deals with all questions of personal status, marriage, and inheritance.

Special courts were formed in pursuance of the National

Security Act of 1965. They have original jurisdiction in all cases involving state security. Usually the majority of the judges are military officers.

Armed forces. The Iraqi Army is essentially the creation of the ousted Hashimite monarchy in its attempt to increase the power of the central government. It is a professional army whose officers are trained both in Iraq and in other countries. Since 1934 Iraqi males have been liable to a compulsory two-year service.

The army's military performance has been affected by the intervention of its officers in politics; since the mid–1930s, there has been a series of coups d'etat. These have generated tensions and have resulted in periodic dismissals of large numbers of officers. While the army is the most important branch of the defense force, there is a well-equipped air force and a small navy consisting of a few submarine chasers and torpedo boats. The Iraqi Army has seen action in the government's attempts to stem the secessionist activities of the Kurds. There are also an air force, a paramilitary People's Army, and a security force.

Education. Before 1921 the educational system was minimal, except for traditional, and particularly religious, instruction. Educational facilities were gradually expanded under the monarchy, and rapid expansion followed the revolution in 1958. The commitment to the ideal of universal compulsory education has fostered an increase in the percentage of females enrolled at all levels.

Higher education

Higher education is available at six Iraqi universities, located in Baghdad (three), Mosul, Basra, and as-Sulaymānīyah, and a technical institute. An agricultural college at Irbīl and various teachers' and technical colleges provide specialized instruction. The entire educational system is controlled closely by the Ministry of Education and the Ministry of Higher Education and Scientific Research, which also send considerable numbers of students to European and American universities for graduate training.

Health and welfare. The increasing Socialist commitment of the government has resulted in the expansion of welfare services, including health facilities and housing projects for the poor, particularly in Baghdad. The Law of Social Security of 1956 provides benefits for old age and illness. Other legislation provides for unemployment benefits and minimum wages and has established cooperative societies and industrial trade unions.

Trade unions

Iraq has had a vigorous although somewhat checkered trade-union movement since the 1930s. The strongest unions are those of workers in the oil industry. All the various trade unions are organized in the General Federation of Iraqi Trade Unions, which is a member of both the World Federation of Trade Unions and the International Confederation of Arab Trade Unions.

Employers' associations are relatively weak; they include the Iraq Federation of Industries and the Baghdad Chamber of Commerce. Similarly, peasant unions are somewhat less vigorous than urban-based trade unions. The General Federation of Peasant Societies was established in 1959. Other organizations include a teachers' union, a lawyers' association, and numerous urban and rural cooperative societies.

Social changes

The Iraqi social system—characterized in the past by rigid social and economic differentiation and ethnic, linguistic, and religious schisms—is being altered fundamentally by new, largely Western and Soviet ideologies, institutions, and cultural pursuits. The rapid expansion of the educational system, basic alterations in the system of landholding, and a greater commitment of the state to economic development are affecting Iraqi society and institutions. Poverty, though still prevalent, is declining. The gap is being narrowed between the rich few, who controlled the principal means of wealth and the political superstructure, and the many poor, primarily the peasants and the urban workers. An Iraqi middle class comprising the professional sector has emerged and is exercising a levelling effect on society. It controls the political system through the army and the Ba'th Party and is supported by the peasantry and workers.

CULTURAL LIFE

Traditional arts and crafts, including the weaving of world-famous rugs and carpets, derived their impetus from a rich, predominantly Arab, cultural legacy. Iraqis, like other Arabs, showed particular concern with poetry and prose literature; in that sense Iraq was but one part of Arab culture as a whole from which it derived and to which it contributed. Until the 20th century, cultural pursuits centred around religious schools and mosques. Folk tradition and dancing were also prevalent, particularly in the village and mountain areas of the country.

Increasing commercial, industrial, and urban activities and rapid changes in education and cultural orientation affected the traditional culture significantly. An increasing concern with Western-inspired models of culture, literature, and the arts began to take hold, and traditional arts experienced a decline.

Government support of traditional culture

The government, anxious to preserve some of the traditional creativity of the culture, assumed an increasingly active role in preserving and strengthening traditional folk arts and crafts. The Ministry of Culture and Information sponsored theatre and art groups whose purpose was to support traditional, as well as modern, cultural art and forms. The National Group for Acting, the Rashīd National Group, the Folklore Group, and the United Artists were established between 1965 and 1967 specifically to encourage the development of a "national" Iraqi culture. Both traditional and modern artistic and literary expressions are juxtaposed in contemporary Iraq, and the population supports each, according to its degree of modernization.

The government and several societies patronize the arts; magazines and radio and television stations periodically present performances or reviews of important cultural events. The Ministry of Culture supervises the country's excellent historical museums, such as the Iraqi Museum and the Mosul Museum, as well as the National Library in Baghdad and the public libraries. An Institute of Fine Arts, established in 1939 in Baghdad and strengthened after 1968, trains Iraqis in music, drama, and the plastic arts. Training in ballet and music is also offered by the School of Ballet and Music, the Institute of Rhythmical Studies, and the Institute of Fine Arts. Iraq has produced several excellent poets, such as Jawahiri and Nazik al-Malaa'ikah, and sculptors and painters, such as Khaled ar-Rahhal, Jawad Salim, Akram Shukri, and Hafidh ad-Durubi. For statistical data, see the "Britannica World Data" section in the current *Britannica Book of the Year.*

History

THE ORIGINS OF MESOPOTAMIAN HISTORY

The background. In the narrow sense, Mesopotamia is the area between the Euphrates and Tigris rivers, north or northwest of the bottleneck at Baghdad; it is al-Jazīrah (The Island) of the Arabs. South of this lies Babylonia, named after the city of Babylon. But in the broader sense the name Mesopotamia has come to be used for the area bounded on the northeast by the Zagros Mountains and on the southwest by the edge of the Arabian Plateau and that stretches from the Persian Gulf in the southeast to the spurs of the Anti-Taurus Mountains in the northwest. Only from the latitude of Baghdad do the Euphrates and Tigris truly become twin rivers, the *rāfidān* of the Arabs, which have constantly changed their courses over the millennia. The low-lying plain of the River Kārūn in Persia has always been closely related to Mesopotamia; but it is not considered part of Mesopotamia as it forms its own river system.

Mesopotamia, south of ar-Ramādī (about 70 miles, or 110 kilometres, west of Baghdad) on the Euphrates and the bend of the Tigris below Sāmarrā' (about 70 miles north-northwest of Baghdad), is flat alluvial land. Between Baghdad and the mouth of the Shatt al-Arab (the mouth of the Tigris and Euphrates) there is a difference in height only of about 30 feet (or 10 metres). As a result of the slow flow of the water, there are heavy deposits of silt; and the river-beds are raised. Consequently, the rivers often overflow their banks (and may even change their course) when they are not protected by high dikes or—in recent times—can be regulated above Baghdad by

the use of escape channels with overflow reservoirs. The extreme south is a region of extensive marshes and reed swamps, *hawr*s, which, probably since early times, have served as an area of refuge for oppressed and displaced peoples. The supply of water is not regular: as a result of the high average temperatures and a very low annual rainfall, the ground of the plain of latitude 35° S is hard and dry and unsuitable for plant cultivation for at least eight months in the year. Consequently, agriculture without risk of crop failure, which seems to have begun in the higher rainfall zones and in the hilly borders of Mesopotamia in the 10th millennium BC, began in Mesopotamia itself, the real heart of the civilization, only when artificial irrigation had been invented, bringing water to large stretches of territory through a widely branching network of canals. Since the ground is extremely fertile and, with irrigation and the necessary drainage, will produce in abundance, southern Mesopotamia became a land of plenty that could support a considerable population. The cultural superiority of north Mesopotamia, which may have lasted until *c.* 4000 BC, was finally overtaken by the south when men there had responded to the challenge of their situation.

The impetus of artificial irrigation

The present climatic conditions are fairly certainly similar to those of 8,000 years ago. An English survey of ruined settlements in the area 30 miles—about 50 kilometres—around ancient Hatra (180 miles northwest of Baghdad) has shown that the southern limits of the zone in which agriculture is possible without artificial irrigation has remained unchanged since the first settlement of al-Jazīrah.

The availability of raw materials is a historical factor of great importance, as is the dependence on those materials that had to be imported. In Mesopotamia, agricultural products and those from stock breeding, fisheries, datepalm cultivation, and reed industries—in short, corn, vegetables, meat, leather, wool, horn, fish, dates, and reed and plant-fibre products—were available in plenty and could easily be produced in excess of home requirements to be exported. There are bitumen springs at Hīt (90 miles west of Baghdad) on the Euphrates (the Is of Herodotus). On the other hand, wood, stone, and metal were rare or even entirely absent. The date palm—virtually the national tree of Iraq—yields a wood suitable only for rough beams and not for finer work. Stone is completely lacking in southern Mesopotamia, although limestone is quarried in the desert about 35 miles to the west; and "Mosul marble" is found not far from the Tigris in its middle reaches. Metal can only be obtained in the mountains, and the same is true of precious and semiprecious stones. Consequently, southern Mesopotamia in particular was destined to be a land of trade from the start. Only rarely could "empires" extending over a wider area guarantee themselves imports by plundering or by subjecting neighbouring regions.

The importance of clay

The raw material that epitomizes Mesopotamian civilization is clay: in the almost exclusively mud-brick architecture and in the number and variety of clay figurines and pottery artifacts, Mesopotamia bears the stamp of clay as does no other civilization; and nowhere in the world but in Mesopotamia and the regions over which its influence was diffused was clay used as the vehicle for writing. Such phrases as cuneiform civilization, cuneiform literature, and cuneiform law can apply only where men had held the idea of using soft clay not only for bricks and jars and for the jar stoppers on which a seal could be impressed as a mark of ownership but also as the vehicle for impressed signs to which established meanings were assigned—an intellectual achievement that amounted to nothing less than the invention of writing.

The character and achievements of ancient Mesopotamia. Questions as to what ancient Mesopotamian civilization did and did not accomplish, how it influenced its neighbours and successors, and what its legacy has transmitted of value are posed from the standpoint of 20th-century civilization and are in part coloured by ethical overtones, so that the answers can only be relative. Modern scholars assume the ability to assess the sum total of an "ancient Mesopotamian civilization"; but, since the publication of an article by Benno Landsberger, an Assyriologist, on "Die Eigenbegrifflichkeit der babylonischen Welt," it has become almost a commonplace to call attention to the necessity of viewing ancient Mesopotamia and its civilization as an independent entity.

Unique variety of the Mesopotamian civilization

Mesopotamia has many languages, many cultures, is broken up into many historical periods, has no real geographical unity, and above all no permanent capital city, so that by its very variety it stands out from other civilizations with greater uniformity, particularly that of Egypt. The script and the pantheon constitute the unifying factors, but in these also Mesopotamia shows its predilection for multiplicity and variety: written documents turned out in quantities and a pantheon consisting of more than 1,000 deities, even though many names may apply to different manifestations of a single god. Throughout 3,000 years of Mesopotamian civilization, each century gave birth to the next. Thus classical Sumerian civilization influenced that of the Akkadians; and the Ur III Empire, which itself represented a Sumero-Akkadian synthesis, exercised its influence on the first quarter of the 2nd millennium BC. With the Hittites, large areas of Anatolia were infused with the culture of Mesopotamia from 1700 BC onward. The contacts between Syrian and Palestinian scribal schools and Babylonian civilization during the Amarna period (14th century BC) must have led to the enrichment of the literature of the west Semitic lands: this, and not direct borrowing, is the explanation of the similarity of themes in cuneiform literature and the Old Testament, such as the story of the Flood or the motif of the righteous sufferer.

The world of mathematics and astronomy owes much to the Babylonians: for instance, the sexagesimal system for the calculation of time and angles, which is still practical because of the multiple divisibility of the number 60; the Greek day of 12 "double-hours"; and the zodiac and its signs. But often the origins and routes of borrowings are obscure, as in the problem of the survival of ancient Mesopotamian legal theory.

The achievement of the civilization itself may be expressed in terms of its best points—moral, aesthetic, scientific, and, not least, literary. Legal theory flourished and was sophisticated early on, being expressed in several collections of legal decisions, the so-called codes, of which the best known is the Code of Hammurabi. Throughout these codes recurs the concern of the ruler for the weak, the widow, and the orphan—even if, sometimes, the phrases were regrettably only literary clichés. The aesthetics of art are too much governed by subjective values to be assessed in absolute terms; but certain peaks stand out above the rest, notably the art of Uruk IV, the seal engraving of the Akkad period, and the relief sculpture of Ashurbanipal. Nonetheless, there is nothing in Mesopotamia to match the sophistication of Egyptian art. Science the Mesopotamians had, of a kind, though not as the word is understood of Greek science. From its beginnings in Sumer before the middle of the 3rd millennium BC, Mesopotamian science was characterized by endless, meticulous enumeration and ordering into columns and series, with the ultimate ideal of including all things in the world but without the wish or ability to synthesize and reduce the material to a system. Not a single general law has been found and only rarely the use of analogy. Nevertheless, it remains a highly commendable achievement that Pythagoras' law (that the sum of the squares on the two shorter sides of a right-angled triangle equals the square on the longest side), even though it was never formulated, was being applied as early as the 18th century BC. Technical accomplishments were perfected in the building of the ziggurats (temple towers like pyramids), with their huge bulk, and in irrigation, both in practical execution and in theoretical calculations beforehand. At the beginning of the 3rd millennium BC an artificial stone in use at Uruk (160 miles south-southeast of modern Baghdad) constitutes a forerunner of concrete, but the secret of its manufacture apparently was lost in subsequent years.

Scientific achievements

Writing pervaded all aspects of life and gave rise to a highly developed bureaucracy—one of the most tenacious legacies of the ancient East. Remarkable organizing ability was required to administer huge estates, in which, under the 3rd dynasty of Ur, for example, it was not unusual to prepare accounts for thousands of cattle or

tens of thousands of bundles of reeds. Above all, the literature of Mesopotamia is one of its finest cultural achievements. Though there are many modern anthologies and chrestomathies (compilations of useful learning), with translations and paraphrases of Mesopotamian literature, as well as attempts to write its history, it cannot truly be said that "cuneiform literature" has been resurrected to the extent that it deserves. There are partly material reasons for this: many clay tablets survive only in a fragmentary condition, and duplicates that would restore the texts have not yet been discovered, so that there are still large gaps. A further reason is the inadequate knowledge of the languages: insufficient acquaintance with the vocabulary and, in Sumerian, major difficulties with the grammar. Consequently, another generation of Assyriologists will pass before the great myths, epics, lamentations, hymns, "law codes," wisdom literature, and pedagogical treatises can be presented to the reader in such a way that he can fully appreciate the high level of literary creativity of those times.

The classical and medieval views of Mesopotamia; its rediscovery in modern times. Before the first excavations in Mesopotamia, around 1840, nearly 2,000 years had passed during which knowledge of the ancient Near East was derived from three sources only: the Bible, Greek and Roman authors, and the excerpts from the writings of Berosus, a Babylonian who wrote in Greek. In 1800 very little more was known than in AD 800, although these sources had served to stir the imagination of poets and artists, down to *Sardanapalus* by the 19th-century English poet Lord Byron. Apart from the building of the Tower of Babel, the Old Testament mentions Mesopotamia only in those historical contexts in which the kings of Assyria and Babylonia affected the course of events in Israel and Judah: in particular Tiglath-pileser III, Shalmaneser V, and Sennacherib, with their policy of deportation, and the Babylonian Exile introduced by Nebuchadrezzar II. Of the Greeks, Herodotus of Halicarnassus (5th century BC, a contemporary of Xerxes I and Artaxerxes I), was the first to report on "Babylon and the rest of Assyria"; at that date the Assyrian Empire had been overthrown for more than 100 years. The Athenian Xenophon took part in an expedition, during 401–399 BC, of Greek mercenaries who crossed Asia Minor, made their way down the Euphrates as far as the vicinity of Baghdad, and returned up the Tigris after the famous Battle of Cunaxa. In his *Cyropaedia* Xenophon describes the final struggle between Cyrus II and the Neo-Babylonian Empire. Later, the Greeks adopted all kinds of fabulous tales about King Ninos, Queen Semiramis, and King Sardanapalus. These stories are described mainly in the historical work of Diodorus Siculus (1st century BC), who based them on the reports of a Greek physician, Ctesias (405–359 BC). Herodotus saw Babylon with his own eyes, and Xenophon gave an account of travels and battles. But all later historians wrote at second or third hand, with one exception, Berosus (born *c.* 340 BC), who emigrated at an advanced age to the Aegean island of Cos, where he is said to have composed his three books of *Babylōniaka.* Unfortunately, only extracts from them survive, prepared by one Alexander Polyhistor (1st century BC), who, in his turn, served as a source for the church father Eusebius (who died AD 342). Berosus derided the "Greek historians" who had so distorted the history of his country. He knew, for example, that it was not Semiramis who founded the city of Babylon; but he was himself the prisoner of his own environment and cannot have known more about the history of his land than was known in Babylonia itself in the 4th century BC.

Greek views of Mesopotamia

Berosus' first book dealt with the beginnings of the world and with a myth of a composite being, Oannes, half fish, half man, who came ashore in Babylonia at a time when men still lived like the wild beasts. Oannes taught them the essentials of civilization: writing, the arts, law, agriculture, surveying, and architecture. The name Oannes must be derived from the cuneiform U'anna (Sumerian) or Umanna (Akkadian), a second name of the mythical figure Adapa, the bringer of civilization. The second book of Berosus contained the Babylonian king list from the beginning to King Nabonassar (Nabu-naṣir, 747–734 BC), a contemporary of Tiglath-pileser III. Berosus' tradition, beginning with a list of primeval kings before the Flood, is a reliable one; it agrees with the tradition of the Sumerian king list, and even individual names can be traced back exactly to their Sumerian originals. Even the immensely long reigns of the primeval kings, which lasted as long as "18 sars" (= 18 × 3,600 = 64,800) of years, are found in Berosus. Furthermore, he was acquaninted with the story of the Flood, with Cronus as its instigator and Xisuthros (or Ziusudra) as its hero, and with the building of an ark. The third book is presumed to have dealt with the history of Babylonia from Nabonassar to the time of Berosus himself.

Diodorus made the mistake of locating Nineveh on the Euphrates, and Xenophon gave an account of two cities, Larissa and Mespila, which, it is suspected, represented the ancient Kalakh (20 miles southeast of modern Mosul) and Nineveh (just north of modern Mosul), Mespila probably being nothing more than the word of the local Aramaeans for ruins: there can be no clearer instance of the rift that had opened between the ancient Near East and the classical West. In sharp contrast, the East had a tradition that the ruins opposite Mosul (in north Iraq) conceal ancient Nineveh. When a Spanish rabbi from Navarre, Benjamin of Tudela, was travelling in the Near East between 1160 and 1173, Jews and Muslims alike knew the position of the grave of the prophet Jonah. The credit for the rediscovery of the ruins of Babylon goes to an Italian, Pietro della Valle, who correctly identified the vast ruins north of modern al-Ḥillah (60 miles south of Baghdad); and he must have seen there the large rectangular tower that represented the ancient ziggurat. Previously, other travellers had sought the Tower of Babel in two other monumental ruins: Birs Nimrūd, the massive brick structure of the ziggurat of ancient Borsippa (near al-Ḥillah), vitrified by lightning, and the ziggurat of the Kassite capital, Dūr Kurigalzu, at Burj ʿAqarqūf, 22 miles west of Baghdad. Pietro della Valle also brought back to Europe the first specimens of cuneiform writing, stamped brick, of which highly impressionistic reproductions were made. Thereafter, European travellers visited Mesopotamia with increasing frequency, among them Carsten Niebuhr (an 18th-century German traveller); Claudius James Rich (a 19th-century Orientalist and traveller); and Ker Porter (a 19th-century traveller).

The work of Pietro della Valle

In modern times, a third Near Eastern ruin drew visitors from Europe—Persepolis, in the land of Persia east of Susiana near modern Shīrāz. In 1602 reports had filtered back to Europe of inscriptions that were not in Hebrew, Arabic, Aramaic, Georgian, or Greek. In 1700 an Englishman, Thomas Hyde, coined the term "cuneiform" for these inscriptions, and by the middle of the 18th century it was known that the Persepolis inscriptions were related to those of Babylon. Carsten Niebuhr distinguished three separate alphabets (Babylonian, Elamite, and Old Persian cuneiform). The first promising attempt at decipherment was made by G.F. Grotefend in 1802, by use of the kings' names in the Old Persian versions of the trilingual inscriptions, although his later efforts led him up a blind alley. Thereafter, the efforts to decipher cuneiform gradually developed in the second half of the 19th century into a discipline of ancient Oriental philology, which was based on results established through the pioneering work of Emile Burnouf, Edward Hincks, Sir Henry Rawlinson, and many others.

Today this subject is still known as Assyriology, because at the end of the 19th century the great majority of cuneiform texts came from the Assyrian city of Nineveh, in particular, from the library of King Ashurbanipal in the mound of Kouyunçik at Nineveh.

Modern archaeological excavations. One hundred and thirty years separate the first excavations in Mesopotamia—adventurous expeditions involving great personal risks and far from the protection of helpful authorities—from those of the present day with their specialist staffs, modern technical equipment, and objectives wider than the mere search for valuable antiquities. The progress of five generations of excavators has led to a situation in which less is recovered more accurately; in other words,

the finds are observed, measured, and photographed as precisely as possible. At first digging was unsystematic, with the consequence that although huge quantities of clay tablets and large and small antiquities were brought to light, the findspots were rarely described with any accuracy. Not until the beginning of the 20th century did excavators learn to isolate the individual bricks in the walls that had previously been erroneously thought to be nothing more than packed clay; the result was that various characteristic brick types could be distinguished, and successive architectural levels established. Increased care in excavation does, of course, carry with it the risk that the pace of discovery will slow down. Moreover, the eyes of the local inhabitants are now sharpened and their appetite for finds is whetted, so that clandestine diggers have established themselves as the unwelcome colleagues of the archaeologists.

Problems of mud-brick buildings

A result of the technique of building with mud brick (mass production of baked bricks was impossible because of the shortage of fuel) was that the buildings were highly vulnerable to the weather and needed constant renewal; layers of settlement rapidly built up, creating a *tall,* a mound of occupation debris that is the characteristic ruin form of Mesopotamia. The word itself appears among the most original vocabulary of the Semitic languages and is attested as early as the end of the 3rd millennium BC. Excavation is made more difficult by this mound formation, since both horizontal and vertical axes have to be taken into account. Moreover, the depth of each level is not necessarily constant, and foundation trenches may be dug down into earlier levels. A further problem is that finds may have been removed from their original context in antiquity. Short-lived settlements that did not develop into mounds mostly escape observation, but aerial photography can now pick out ground discolorations that betray the existence of settlements. Districts with a high water level today, such as the reed marshes (*hawr*s), or ruins that are covered by modern settlements, such as Arbīl, some 200 miles north of Baghdad, or that are surmounted by shrines and tombs of holy men are closed to archaeological research altogether.

Excavations in Mesopotamia have been almost exclusively national undertakings (France, England, the United States, Germany, Iraq, Denmark, Belgium, Italy, Japan, and the Soviet Union) and the "joint expedition" first sent to Ur (190 miles south-southeast of Baghdad) in the 1920s has remained a rare exception. The history of archaeological research in Mesopotamia falls into four categories, represented by phases of differing lengths: the first, and by far the longest, begins with the French expedition to Nineveh (1842) and Khorsabad (the ancient Dur Sharrukin, 20 miles northeast of modern Mosul; 1843–55) and that of the English to Nineveh (1846–55) and Nimrūd (ancient Kalakh, biblical Calah; 1845; with interruptions until 1880). This marked the beginning of the "classic" excavations in the important ancient capitals, where spectacular finds might be anticipated. The principal gains were the Assyrian bull colossuses and wall reliefs and the library of Ashurbanipal from Nineveh, whereas the ground plans of temples and palaces were quite as valuable. While these undertakings had restored to life the remains of the Neo-Assyrian Empire from the 1st millennium BC, new French initiatives in Tello (Arabic Tall Lūḥ), 155 miles southeast of Baghdad, from 1877 onward reached almost 2,000 years further back into the past. There they rediscovered a people whose language had already been encountered in bilingual texts from Nineveh—the Sumerians. Tello (ancient Girsu) yielded not only inscribed material that, quite apart from its historical interest, was critical for the establishment of the chronology of the second half of the 3rd millennium BC but also a large number of artistic masterpieces. Thereafter, excavations in important cities spread to form a network, including Susa, 150 miles west of Isfahan in Iran (France; 1884 onward); Nippur, 90 miles southeast of Baghdad (the United States; 1889 onward); Babylon, 55 miles south of Baghdad (Germany; 1899–1917 and again from 1957 onward); Ashur, modern ash-Sharqāṭ, 55 miles south of Mosul (Germany; 1903–14); Uruk (Germany; 1912–13 and from 1928 onward); and at Ur (England and the United States; 1918–34). Mention should also be made of the German excavations at Boğazköy in central Turkey, the ancient Hattusas, capital of the Hittite Empire, which have been carried on, with interruptions, since 1906.

Investigations after 1925

The second phase began in 1925 with the commencement of U.S. excavations at Yorgan Tepe (ancient Nuzu), 140 miles north of Baghdad, a provincial centre with Old Akkadian, Old Assyrian, and Middle Assyrian/Hurrian levels. There followed, among others, French excavations at Arslan Tash (ancient Hadatu; 1928); Tall al-Aḥmar (ancient Til Barsib; 1929–31); and above all at Tall Ḥarīrī (ancient Mari; 1933 onward); and U.S. excavations in the Diyālā region, 90 miles northeast of Baghdad; Tall al-Asmar (ancient Eshnunna), Khafājī, and other sites. Thus, excavation in Mesopotamia had moved away from the capital cities to include the "provinces." Simultaneously, it expanded beyond the limits of Mesopotamia and Susiana and revealed outliers of "cuneiform civilization" on the Syrian coast at Ras Shamra (ancient Ugarit; France, 1929 onward) and on the Orontes of northern Syria at alʿAṭshānah (ancient Alalakh; England, 1937–39, 1947–49), whereas Danish excavations on the islands of Bahrain and Faylakah, off the Tigris-Euphrates Delta, since 1954 have disclosed staging posts between Mesopotamia and the Indus Valley civilization.

In its third phase, archaeological research in Mesopotamia and its neighbouring lands has probed back into prehistory and protohistory. The objective of these investigations, initiated by U.S. archaeologists, was to trace as closely as possible the successive chronological stages in the progress of man from hunter and gatherer to settled farmer and, finally, to city dweller. These excavations are strongly influenced by the methods of the prehistorian, and the principal objective is no longer the search for texts and monuments. Apart from the United States investigations, Iraq itself has taken part in this phase of the history of investigation, as has Japan since 1956.

Finally, the fourth category, which runs parallel with the first three phases, is represented by "surveys," which do not concentrate on individual sites but attempt to define the relations between single settlements, their positioning along canals or rivers, or the distribution of central settlements and their satellites. Since shortage of time, money, and an adequate task force preclude the thorough investigation of large numbers of individual sites, the method employed is that of observing and collecting finds from the surface. Of these finds, the latest in date will give a rough termination date for the duration of the settlement, but, since objects from earlier, if not the earliest, levels work their way to the surface with a predictable degree of certainty or are exposed in rain gullies, an intensive search of the surface of the mound allows conclusions as to the total period of occupation with some degree of probability. If the individual periods of settlement are marked on superimposed maps, a very clear picture is obtained of the fluctuations in settlement patterns, of the changing proportions between large and small settlements, and of the equally changeable systems of riverbeds and irrigation canals—for when points on the map lie in line, it is a legitimate assumption that they were once connected by water courses. During the four phases outlined, the objectives and methods of excavation have broadened and shifted. At first the chief aim was the recovery of valuable finds suitable for museums, but at the same time there was, from early on, considerable interest in the architecture of Mesopotamia, which won for it the place it deserves in architectural history. Alongside philology, art history also made great strides, building up a chronological framework by the combination of evidence from stratigraphical and stylistic criteria, particularly in pottery and cylinder seals. The discovery of graves and a variety of burial customs threw new light on the history of religion, stimulated by the interest of Old Testament studies. Later, an increasing interest from neighbouring disciplines emerged. While pottery had been collected previously for purely aesthetic motives or from the point of view of art history, attention came to be paid increasingly to the everyday wares, and greater insight into social and economic history was based on knowledge of the distribution and frequency of shapes and materials.

Finally, the observation and investigation of animal bones and plant remains (pollen and seed analysis) supplied invaluable information on the process of domestication, the conditions of animal husbandry, and the advances in agriculture; such studies demand the cooperation of both zoologists and paleobotanists.

The emergence of Mesopotamian civilization. *The Late Neolithic period and the Chalcolithic period.* Between about 10,000 BC and the genesis of large permanent settlements, the following stages of development are distinguishable, some of which run parallel: (1) the change to sedentary life, or the transition from continual or seasonal change of abode, characteristic of hunter-gatherers and the earliest cattle breeders, to life in one place over a period of several years or even permanently; (2) the transition from experimental plant cultivation to the deliberate and calculated farming of grains and leguminous plants; (3) the erection of houses and the associated "settlement" of the gods in temples; (4) the burial of the dead in cemeteries; (5) the invention of clay vessels, made at first by hand, then turned on the wheel and fired to ever greater degrees of hardness, at the same time receiving almost invariably decoration of incised designs or painted patterns; (6) the development of specialized crafts and the distribution of labour; and (7) metal production (the first use of metal—copper—marks the transition from the Late Neolithic to the Chalcolithic period).

Pre-urban stages of development

These stages of development can only rarely be dated on the basis of a sequence of levels at one site alone. Instead, an important role is played by the comparison of different sites, starting with the assumption that what is simpler and technically less accomplished is older. In addition to this type of dating, which can be only relative, over the last 20 years the carbon-14 method has been of great assistance. By this method the known rate of decay of the radioactive carbon isotope (carbon-14) in wood, horn, plant fibres, and bones allows the time that has elapsed since the "death" of the material under examination to be calculated. Although a plus/minus discrepancy of up to 200 years has to be allowed for, this is not such a great disadvantage in the case of material 6,000 to 10,000 years old. Even when skepticism is necessary because of the use of an inadequate sample, carbon-14 dates are still very welcome as confirmation of dates arrived at by other means.

The first agriculture, the domestication of animals, and the transition to sedentary life took place in regions in which animals that were easily domesticated, such as sheep, goats, cattle, and pigs, and the wild prototypes of grains and leguminous plants, such as wheat, barley, bitter vetch, pea, and lentil, were present. Such centres of dispersion may have been the valleys and grassy border regions of the mountains of Iran, Iraq, Anatolia, Syria, and Palestine; but they could also be, for example, the northern slopes of the Hindu Kush. As settled life, which caused a drop in infant mortality, led to the increase of the population, settlement spread out from these centres into the plains—although it must be remembered that this process, described with the phrase Neolithic revolution, in fact took thousands of years.

Greek views of Mesopotamia

Representative of the first settlements on the borders of Mesopotamia are the adjacent sites of Zawi Chemi and Shanidar, which lie northwest of Rawāndūz. They date from the transition from the 10th to the 9th millennium BC and are classified as "pre-pottery." The finds included querns (primitive mills) for grinding grain (whether wild or cultivated is unknown), the remains of huts about 13 feet in diameter, and a cemetery with grave goods. The presence of copper beads is evidence of acquaintance with metal, though not necessarily with the technique of working it into tools; and the presence of obsidian (volcanic glass) is indicative of the acquisition of nonindiginous raw materials by means of trade. The bones found testify that sheep were already domesticated at Zawi Chemi-Shanidar.

At Karīm Shahir, a site that cannot be accurately tied chronologically to Shanidar, clear proof was obtained both of the knowledge of grain cultivation, in the form of sickle blades showing sheen from use, and of the baking of clay, in the form of lightly fired clay figurines. Still in the hilly borders of Mesopotamia, a sequence of about 3,000 years can be followed at the site of Qal'at Jarmo, east of Kirkūk, some 150 miles north of Baghdad. The beginning of this settlement can be dated to around 6750 BC; and excavations uncovered 12 archaeological levels of a regular village, consisting of about 20–25 houses built of packed clay, sometimes with stone foundations, and divided into several rooms. The finds included types of wheat (emmer and einkorn) and two-row barley, the bones of domesticated goats, sheep, and pigs, and obsidian tools, stone vessels, and, in the upper third of the levels, clay vessels with rough painted decorations, providing the first certain evidence for the manufacture of pottery. Jarmo must be roughly contemporary with the sites of Jericho (13 miles east of Jerusalem) and of Çatalhüyük in Anatolia (central Turkey). Those sites, with their walled settlements, seem to have achieved a much higher level of civilization; but too much weight must not be placed on the comparison, as no other sites in and around Mesopotamia confirm the picture deduced from Jarmo alone.

About 1,000 years later are two villages that are the earliest so far discovered in the plain of Mesopotamia: Ḥassūna, near Mosul, and Tall Ṣawwān, near Sāmarrā'. At Ḥassūna the pottery is more advanced, with incised and painted designs; but the decoration is still unsophisticated. One of the buildings found may be a shrine, to judge from its unusual ground plan. Apart from emmer there occurs, as the result of mutation, six-row barley, which was later to become the chief grain crop of southern Mesopotamia. In the case of Tall Ṣawwān, it is significant that the settlement lay south of the boundary of rainfall agriculture; thus, it must have been dependent on some form of artificial irrigation, even if this was no more than the drawing of water from the Tigris. This, therefore, gives a date after which the settlement of parts of southern Mesopotamia would have been feasible.

The emergence of cultures. For the next millennium, the 5th, it is customary to speak in terms of various "cultures" or "horizons," distinguished in general by the pottery, which may be classed by its colour, shape, hardness, and, above all, its decoration. The name of each horizon is derived either from the type site or from the place where the pottery was first found: Sāmarrā' on the Tigris, Tall Halaf in the central Jazīrah, Ḥassūna Level V, al-'Ubaid near Ur, and Ḥājj Muḥammad on the Euphrates, not far from as-Samāwah (some 150 miles south-southeast of Baghdad). Along with the improvement of tools, the first evidence for water transport (a model boat from the prehistoric cemetery at Eridu, in the extreme south of Mesopotamia, *c.* 4000 BC), and the development of terra-cottas, the most impressive sign of progress is the constantly accelerating advance in architecture. This can best be followed in the city of Eridu, which in historical times was the centre of the cult of the Sumerian god Enki.

The work of Pietro della Valle

Originally a small, single-roomed shrine, the temple in the Ubaid period consisted of a rectangular building, measuring 80 by 40 feet (24 by 12 metres), that stood on an artificial terrace. It had an "offering-table" and an "altar" against the short walls, aisles down each side, and a facade decorated with niches. This temple, standing on a terrace probably originally designed to protect the building from flooding, is usually considered the prototype of the characteristic religious structure of later Babylonia, the ziggurat. The temple at Eridu is in the very same place as that on which the Enki-ziggurat stood in the time of the 3rd dynasty of Ur (*c.* 2112–*c.* 2004 BC), so the cult tradition must have existed on the same spot for at least 1,500–2,000 years before Ur III itself. Remarkable as this is, however, it is not justifiable to assume a continuous ethnic tradition. The flowering of architecture reached its peak with the great temples of Uruk, built around the turn of the 4th to 3rd millennium BC (Levels Uruk VI to IV).

In extracting information as to the expression of mind and spirit during the six millennia preceding the invention of writing sketched above, it is necessary to take account of four major sources: decoration on pottery, the care of the dead, sculpture, and the designs on seals. There is, of

course, no justification in assuming any association with ethnic groups.

The most varied of these means of expression is undoubtedly the decoration of pottery. It is hardly coincidental that in regions in which writing had developed, high-quality painted pottery was no longer made. The motifs in decoration are either abstract and geometrical or figured, although there is also a strong tendency to geometric stylization. An important question is the extent to which the presence of symbols, such as the bucranium (a sculptured ornament representing an ox skull), can be considered as expressions of specific religious ideas, such as a bull cult, and, indeed, how much the decoration was intended to convey meaning at all.

It is not known how ancient is the custom of burying the dead in graves nor whether its intention was to maintain communication (by the cult of the dead) or to guard against the demonic power of the unburied dead left free to wander. A cemetery, or collection of burials associated with grave goods, is first attested at Zawi Chemi-Shanidar. The presence of pots in the grave indicates that the bodily needs of the dead person were provided for, and the discovery of the skeleton of a dog or, at Eridu, of a model boat in the cemetery suggests that it was believed that the activities of life could be pursued in the hereafter.

Early statuettes

The earliest sculpture takes the form of very crudely worked terra-cotta representations of women; the "Ubaid horizon," however, has figurines of both women and men, with very slender bodies, protruding features, arms akimbo and the genitals accurately indicated, and also of women suckling children. It is uncertain whether it is correct to describe these statuettes as idols, whether the figures were cult objects, such as votive offerings, or whether they had a magical significance, such as fertility charms, or, indeed, what purpose they did fulfill.

Seals are first attested in the form of stamp seals at Tepe Gawra, north of Mosul. Geometrical designs are found earlier than scenes with figures, such as men, animals, conflict between animals, copulation, or dance. Here again, it is uncertain whether the scenes are intended to convey a deeper meaning. Nevertheless, unlike pottery, a seal has a direct relationship to a particular individual or group; for the seal identifies what it is used to seal (a vessel, sack, or other container) as the property or responsibility of a specific person. To that extent, seals represent the earliest pictorial representations of persons. The area of distribution of the stamp seal was northern Mesopotamia, Asia Minor, and Iran. Southern Mesopotamia, on the other hand, was the home of the cylinder seal, which was either an independent invention or was derived from stamp seals engraved on two faces. The cylinder seal, with its greater surface area and more practical application, remained in use into the 1st millennium BC. Because of the continuous changes in the style of the seal designs, cylinder seals are among the most valuable of chronological indicators for archaeologists.

In general, the prehistory of Mesopotamia can only be described by listing and comparing human achievements, not by recounting the interaction of individuals or peoples. There is no basis for reconstructing the movements and migrations of peoples unless one is prepared to equate the spread of particular archaeological types with the extent of a particular population or the change of types with a change of population or the appearance of new types with an immigration.

The only certain evidence for the movement of men beyond their own territorial limits is provided at first by material finds that are not indigenous. The discovery of obsidian and lapis lazuli at sites in Mesopotamia or in its neighbouring lands postulates the existence of trade, whether it consisted of direct caravan trade or of a succession of intermediate stages.

Just as no ethnic identity is recognizable, so nothing is known of the social organization of prehistoric settlements. It is not possible to deduce anything of the "government" in a village nor of any supraregional connections that may have existed under the domination of one centre. Constructions that could only have been accomplished by the organization of men in large numbers are first found in Uruk Levels VI to IV: the dimensions of these buildings suggest that they were intended for gatherings of hundreds of people. As for artificial irrigation, which was indispensable for agriculture in south Mesopotamia, the earliest form was probably not the irrigation canal. It is assumed that at first floodwater was dammed up to collect in basins, near which the fields were located. Canals, which led the water farther from the river, would have become necessary when the land in the vicinity of the river could no longer supply the needs of the population.

Mesopotamian protohistory. Attempts have been made by philologists to reach conclusions as to the origin of the flowering of civilization in southern Mesopotamia by the analysis of Sumerian words. It has been thought possible to isolate an earlier, non-Sumerian substratum from the Sumerian vocabulary by assigning certain words on the basis of their endings to either a Neolithic or a Chalcolithic language stratum. These attempts are based on the phonetic character of Sumerian at the beginning of the 2nd millennium BC, which is at least 1,000 years later than the invention of writing. Quite apart, therefore, from the fact that the structure of Sumerian words themselves is far from adequately investigated, the enormous gap in time casts grave doubt on the criteria used to distinguish between Sumerian and "pre-Sumerian" vocabulary.

Analyses of Sumerian words

The earliest peoples of Mesopotamia who can be identified from inscribed monuments and written tradition—people in the sense of speakers of a common language—are, apart from the Sumerians, Semitic peoples (Akkadians or pre-Akkadians) and Subarians (the predecessors or near relatives of the Hurrians, who appear in northern Mesopotamia around the end of the 3rd millennium BC). Their presence is known, but no definite statements about their past or possible routes of immigration are possible.

At the turn of the 4th to 3rd millennium BC, the endlessly long span of prehistory is over, and the threshold of the historical era is gained, captured by the existence of writing. Names, speech, and actions are fixed in a system that is composed of signs representing complete words or syllables. The signs may consist of realistic pictures, abbreviated representations, and perhaps symbols selected at random. Since clay is not well suited to the drawing of curved lines, a tendency to use straight lines rapidly gained ground. When the writer pressed the reed in harder at the beginning of a stroke, it made a triangular "head," and thus "wedges" were impressed into the clay. It is the Sumerians who are usually given the credit for the invention of this, the first system of writing in the Near East. As far as they can be assigned to any language, the inscribed documents from before the dynasty of Akkad (*c.* 2334–*c.* 2154 BC) are almost exclusively in Sumerian. The extension, moreover, of the writing system to include the creation of syllabograms by the use of the sound of a logogram (sign representing a word), such as *gi,* "a reed stem," used to render the verb *gi,* "to return," can only be explained in terms of the Sumerian language. It is most probable, however, that Mesopotamia of the 4th millennium BC, just as in later times, was composed of many races. This makes it likely that, apart from the Sumerians, the interests and even initiatives of other language groups may have played their part in the formation of the writing system. A strong argument in favour of this is afforded by the system of numbers and measures, which, in contrast to the rudimentary methods of writing words, was very precise and complex from the beginning. In addition to the sexagesimal system indigenous to Sumerian, which has a progression of alternating tens and sixes (1, 10, 60, 600, 3,600, 36,000, and so on), there is the decimal system (1, 10, 100, and so on). Since the number 100 had no special significance for the Sumerians but was expressed in words as 60+40, the decimal system was probably intended to do justice to the numerals of a second, non-Sumerian language.

Sumerian is an agglutinative language: prefixes and suffixes, which express various grammatical functions and relationships, are attached to a noun or verb root in a "chain." Attempts to identify Sumerian more closely by comparative methods have as yet been unsuccessful

and will very probably remain so, as languages of a comparable type are only known from AD 500 (Georgian) or AD 1000 (Basque)—that is, 3,000 years later. Over so long a time the rate of change in a language, particularly one that is not fixed in a written norm, is so great that one can no longer determine whether apparent similarity between words goes back to an original relationship or is merely fortuitous. Consequently, it is impossible to obtain any more accurate information as to the language group to which Sumerian may once have belonged.

Urban development in the 4th millennium BC

The most important development in the course of the 4th millennium BC was the birth of the city. There were precursors such as the unwalled prepottery settlement at Jericho of *c.* 7000 BC, but the beginning of cities with a more permanent character came only later. There is no generally accepted definition of a "city." In this context, it means a settlement that serves as a centre for smaller places, one that possesses one or more shrines of one or more major deities, has extensive granaries, and, finally, displays an advanced stage of specialization in the crafts.

The earliest cities of southern Mesopotamia, as far as their names are known, are Eridu, Uruk, Bad-tibira, Nippur, and Kish (35 miles south-southeast of Baghdad). The archaeological surveys of Robert McCormick Adams and Hans Nissen have shown how the relative size and number of the settlements gradually shifted: the number of small or very small settlements was reduced overall, whereas the number of larger places grew. The clearest sign of urbanization can be seen at Uruk, with the almost explosive increase in the size of the buildings. Uruk Levels VI to IV had rectangular buildings covering areas as large as 275 by 175 feet; they are described as temples, since the ground plans are comparable to those of later buildings whose sacred character is beyond doubt.

The major accomplishments of the period Uruk VI to IV, apart from the first inscribed tablets (Level IV B), are masterpieces of sculpture and of seal engraving and also of the form of wall decoration known as cone mosaics. Together with the everyday pottery of black or red burnished ware, there is a very coarse type known as the *Glockentopf* ("bell pot"). These are vessels of standard size whose shape served as the original for the sign *sila,* meaning "litre." It is not too rash to deduce from the mass production of such standard vessels that they served for the issue of rations. This would have been the earliest instance of a system that remained typical of the southern Mesopotamian city for centuries: the maintenance of part of the population by allocations of food from the state.

Historians usually date the beginning of history, as opposed to prehistory and protohistory, from the first appearance of usable written sources. If this is taken to be the transition from the 4th to the 3rd millennium BC, it must be remembered that this only applies to part of Mesopotamia: the South, the Diyālā region, Susiana (with a later script of its own invented locally), and the district of the Middle Euphrates. It does not apply to regions that remained without writing for a longer time, such as the Middle Tigris region (Assyria), Syria, Asia Minor, and Iran.

SUMERIAN CIVILIZATION

The Sumerians to the end of the Early Dynastic period. Despite the Sumerians' leading role, the historical role of other races should not be underestimated. While with prehistory only approximate dates can be offered, historical periods require a firm chronological framework, which, unfortunately, is not yet established for the first half of the 3rd millennium BC. The basis for the chronology after about 1450 BC is provided by the data in the Assyrian and Babylonian king lists, which can often be checked by dated tablets and the Assyrian lists of eponyms (annual officials whose names served to identify each year). But it is still uncertain how much time separated the middle of the 15th century BC from the end of the 1st dynasty of Babylon, which is therefore variously dated to 1594 BC ("middle"), 1530 BC ("short"), or 1730 BC ("long" chronology). As a compromise, the middle chronology will be used. From 1594 BC several chronologically overlapping dynasties reach back to the beginning of the 3rd dynasty of Ur, *c.* 2112 BC. From this point to the beginning of the dynasty of Akkad (*c.* 2334 BC) the interval can only be calculated to within 20–30 years, via the ruling houses of Lagash and the rather uncertain traditions regarding the succession of Gutian viceroys. With Ur-Nanshe (*c.* 2520 BC), the first king of the 1st dynasty of Lagash, there is a possible variation of 50–60 years, and earlier dates are a matter of mere guesswork: they depend upon factors of only limited relevance, such as the computation of occupation or destruction levels, the degree of development in the script (paleography), the character of the sculpture, pottery, and cylinder seals, and their correlation at different sites. In short, the chronology of the first half of the 3rd millennium is largely a matter for the intuition of the individual author. Carbon-14 dates are at present too few and far between to be given undue weight. Consequently, the turn of the 4th to 3rd millennium is to be accepted, with due caution and reservations, as the date of the flourishing of the archaic civilization of Uruk and of the invention of writing.

Problems in chronological reconstruction

In Uruk and probably also in other cities of comparable size, the Sumerians led a city life that can be more or less reconstructed as follows: temples and residential districts; intensive agriculture, stock breeding, fishing, and date-palm cultivation, forming the four mainstays of the economy; highly specialized industries, carried on by sculptors, seal engravers, smiths, carpenters, shipbuilders, potters, and workers of reeds and textiles. Part of the population was supported with rations from a central point of distribution, which relieved people of the necessity of providing their basic food themselves, in return for their work all day and every day, at least for most of the year. The cities kept up active trade with foreign lands.

That organized city life existed is chiefly demonstrated by the existence of inscribed tablets. The earliest tablets contain figures with the items they enumerate and measures with the items they measure, as well as personal names and, occasionally, probably professions. This shows the purely practical origins of writing in Mesopotamia: it did not begin as a means of magic or as a way for the ruler to record his achievements, for example, but as an aid to memory for an administration that was ever expanding its area of operations. The earliest examples of writing are very difficult to penetrate because of their extremely laconic formulation presupposing a knowledge of the context and because of the still very imperfect rendering of the spoken word. Moreover, many of the archaic signs were pruned away after a short period of use and cannot be traced in the paleography of later periods, so that they cannot be identified.

Complexities in unravelling the nature of the power structure

One of the most important questions that has to be met when dealing with "organization" and "city life" is that of social structure and the form of government. But it can only be answered with difficulty, and the use of evidence from later periods carries with it the danger of anachronisms. The Sumerian word for ruler *par excellence* is *lugal,* which etymologically means "big man." The first occurrence comes from Kish around 2700 BC, since an earlier instance from Uruk is uncertain because it could simply be intended as a personal name: "Monsieur Legrand." In Uruk the ruler's special title was *en.* In later periods this word (etymology unknown), which is also found in divine names such as En-lil and En-ki, has a predominantly religious connotation that is translated, for want of a better designation, as "en-priest, en-priestess." *En,* as the ruler's title, is encountered in the traditional epics of the Sumerians (Gilgamesh is the "*en* of Kullab," a district of Uruk) and particularly in personal names, such as "The-*en*-has-abundance," "The-*en*-occupies-the-throne," and many others.

It has often been asked if the ruler of Uruk is to be recognized in artistic representations. A man feeding sheep with flowering branches, who is a prominent personality in seal designs, could thus represent the ruler or a priest in his capacity as administrator and protector of flocks. The same question may be posed in the case of a man depicted on a stele aiming an arrow at a lion. But these questions are purely speculative: even if the "protector of flocks" were identical with the *en,* there is no ground for

seeing in the ruler a person with a predominantly religious function.

Literary and other historical sources. The picture offered by the literary tradition of Mesopotamia is clearer but not necessarily historically relevant. The Sumerian king list has long been the greatest focus of interest. This is a literary composition, dating from Old Babylonian times, that describes kingship (*nam-lugal* in Sumerian) in Mesopotamia from primeval times to the end of the 1st dynasty of Isin. According to the theory—or rather ideology—of this work, there was officially only one kingship in Mesopotamia, which was vested in one particular city at any one time; hence the change in dynasties brought with it the change of the seat of kingship:

Kish–Uruk–Ur–Awan–Kish–Hamazi–Uruk–Ur–
Adab–Mari–Kish–Akshak–Kish–Uruk–Akkad–
Uruk–Gutians–Uruk–Ur–Isin.

The king list gives as coming in succession several dynasties that now are known to have ruled simultaneously. It is a welcome aid to chronology and history, but, so far as the regnal years are concerned, it loses its value for the time before the dynasty of Akkad: for here the lengths of reign of single rulers are given as more than 100 and sometimes even several hundred years. One group of versions of the king list has adopted the tradition of the Sumerian flood story, according to which Kish was the first seat of kingship after the Flood, whereas five dynasties of primeval kings ruled before the Flood in Eridu, Bad-tibira, Larak, Sippar, and Shuruppak. These kings all allegedly ruled for multiples of 3,600 years (the maximum being 64,800 or, according to one variant, 72,000 years). The tradition of the Sumerian king list is still echoed in Berosus.

The Sumerian king list

It is also instructive to observe what the Sumerian king list does not mention. It lacks all mention of a dynasty as important as the 1st dynasty of Lagash (from King Ur-Nanshe to Uru'inimgina, formerly known as Urukagina) and appears to retain no memory of the archaic florescence of Uruk at the beginning of the 3rd millennium BC.

Besides the peaceful pursuits reflected in art and writing, the art also provides the first information about violent contacts: cylinder seals of the Uruk IV Level depict fettered men lying or squatting on the ground, being beaten with sticks or otherwise maltreated by standing figures. They may represent prisoners of war being killed in order to dispose of them. It is unknown from where these captives came or what form "war" would have taken or how early organized battles were fought. Nevertheless, this does give the first, albeit indirect, evidence for the wars that are henceforth one of the most characteristic phenomena in the history of Mesopotamia; and it makes it all the more surprising that the Mesopotamian cities at the beginning of the 3rd millennium BC were not walled. The earliest city wall so far known, that of Uruk, dates only to 2700–2650 BC.

Just as with the rule of man over man, with the rule of higher powers over man it is difficult to make any statements about the earliest attested forms of religion or about the deities and their names without running the risk of anachronism. Excluding prehistoric figurines, which provide no evidence for determining whether men or anthropomorphic gods are represented, the earliest testimony is supplied by certain symbols that later became the cuneiform signs for gods' names: the "gatepost with streamers" for Inanna, goddess of love and war, and the "ringed post" for the moon god Nanna. A scene on a cylinder seal—a shrine with an Inanna symbol and a "man" in a boat—could be an abbreviated illustration of a procession of gods or of a cultic journey by ship. The constant association of the "gatepost with streamers" with sheep and of the "ringed post" with cattle may possibly reflect the area of responsibility of each deity. The Sumerologist Thorkild Jacobsen sees in the pantheon a reflex of the various economies and modes of life in ancient Mesopotamia: fishermen and marsh dwellers, date-palm cultivators, cowherds, shepherds, and farmers all have their special groups of gods.

Early religious beliefs

Both Sumerian and non-Sumerian languages can be detected in the divine names and place-names. Since the pronunciation of the names is known only from 2000 BC or later, conclusions as to their linguistic affinity are not without problems. Several, for example, have been reinterpreted in Sumerian by popular etymology. It would be particularly important to isolate the Subarian components (related to Hurrian), whose significance was probably greater than has hitherto been assumed. For the south Mesopotamian city HA.A (the noncommittal transliteration of the signs) there is a pronunciation gloss shubari, and non-Sumerian incantations are known in the language of HA.A, which have turned out to be Subarian.

There have always been in Mesopotamia speakers of Semitic languages (which belong to the Hamito-Semitic group and also include ancient Egyptian, Berber, and various African languages). This element is easier to detect in ancient Mesopotamia, but whether people began to participate in city civilization in the 4th millennium BC or only during the 3rd is unknown. Over the last 4,000 years Semites (Amorites, Canaanites, Aramaeans, and Arabs) have been partly nomadic, ranging the Arabian fringes of the Fertile Crescent, and partly settled; and the transition to settled life can be observed in a constant, though uneven, rhythm. There are, therefore, good grounds for assuming that the Akkadians (and other pre-Akkadian Semitic tribes not known by name) also originally led a nomadic life to a greater or lesser degree. Nevertheless, they can only have been herders of domesticated sheep and goats, which require changes of pasturage according to the time of year and can never stray more than a day's march from the watering places. The traditional nomadic life of the Bedouin makes its appearance only with the domestication of the camel at the turn of the 2nd to 1st millennium BC.

The spread of writing

The question arises as to how quickly writing spread and by whom it was adopted about 3000 BC or shortly thereafter. At Kish, in north Babylonia, almost 120 miles northwest of Uruk, clay tablets have been found with the same repertoire of archaic signs as at Uruk itself. This fact demonstrates that intellectual contacts existed between north and south Babylonia. The dispersion of writing in an unaltered form presupposes the existence of schools in various cities that worked according to the same principles and adhered to one and the same canonical repertoire of signs. It would be wrong to assume that Sumerian was spoken throughout the area in which writing had been adopted: it is linguistically significant that even the earliest of the Uruk texts use a sexagesimal and a decimal system side-by-side. Moreover, the use of cuneiform for a non-Sumerian language can be demonstrated with certainty from the 27th century BC.

First historical personalities. The specifically political events in Mesopotamia after the flourishing of the archaic culture of Uruk cannot be pinpointed. Not until about 2700 BC does the first historical personality appear—historical because his name, Enmebaragesi (Me-baragesi), was preserved in later tradition. It has been assumed, although the exact circumstances cannot be reconstructed, that there was a rather abrupt end to the high culture of Uruk Level IV. The reason for the assumption is a marked break in both artistic and architectural traditions: cylinder seals were replaced by others with an entirely new style; the great temples were abandoned—flouting the rule of a continuous tradition on religious sites—and on a new site a shrine was built on a terrace, which was to constitute the lowest stage of the later Eanna ziggurat. On the other hand, since the writing system developed organically and was continually refined by innovations and progressive reforms, it would be overhasty to assume a revolutionary change in the population.

In the quarter or third of a millennium between Uruk Level IV and Enmebaragesi, southern Mesopotamia became studded with a complex pattern of cities, many of which were the centres of small independent city-states, to judge from the situation in about the middle of the millennium. In these cities, the central point was the temple, sometimes encircled by an oval boundary wall (hence the term temple oval); but nonreligious buildings, such as palaces serving as the residences of the rulers, could also function as centres.

Enmebaragesi, king of Kish, is the oldest Mesopotamian

Enmebaragesi

ruler about whom there are authentic inscriptions. These are vase fragments, one of them found in the temple oval of Khafājī. In the Sumerian king list, Enmebaragesi is listed as the penultimate king of the 1st dynasty of Kish; a Sumerian epic, *Gilgamesh and Agga of Kish,* describes the siege of Uruk by Agga, son of Enmebaragesi. The discovery of the original inscriptions was of great significance because it enabled scholars to ask with somewhat more justification whether Gilgamesh, the heroic figure of Mesopotamia who has entered world literature, had actually been a historical personage. The indirect synchronism notwithstanding, the possibility exists that even remote antiquity knew its "Ninos" and its "Semiramis," figures onto which a rapidly fading historical memory projected all manner of deeds and adventures. Thus, though the historical tradition of the early 2nd millennium believes Gilgamesh to have been the builder of the oldest city wall of Uruk, such may not have been the case. The palace archives of Shuruppak (modern Tall Fa'rah, 125 miles southeast of Baghdad), dating presumably from shortly after 2600, contain a long list of divinities, including Gilgamesh and his father Lugalbanda. More recent tradition, on the other hand, knows Gilgamesh as judge of the nether world. However that may be, an armed conflict between two Mesopotamian cities such as Uruk and Kish would hardly have been unusual in a country whose energies were consumed, almost without interruption from 2500 to 1500, by clashes between various separatist forces. The great "empires," after all, formed the exception, not the rule.

Emergent city-states. Kish must have played a major role almost from the beginning. After 2500, southern Babylonian rulers, such as Mesannepada of Ur and Eannatum of Lagash, frequently called themselves king of Kish when laying claim to sovereignty over northern Babylonia. This is not to agree with some recent histories in which Kish is represented as an archaic "empire." It is more likely to have figured as a representative of the north, calling forth perhaps the same geographical connotation later evoked by "the land of Akkad."

Although the corpus of inscriptions grows richer both in geographical distribution and in point of chronology in the 27th and increasingly so in the 26th century, it is still impossible to find the key to a plausible historical account. Besides, history cannot be written on the sole basis of archaeological findings. Unless clarified by written documents, these findings contain as many riddles as they seem to offer solutions. This applies even to as spectacular a discovery as that of the royal tombs of Ur with their hecatombs (large-scale sacrifices) of retainers who followed their king and queen to the grave, not to mention the elaborate funerary appointments with their inventory of tombs. It is only from *c.* 2520 to the beginnings of the dynasty of Akkad that history can be written within a framework, with the aid of reports about the city-state of Lagash and its capital of Girsu and its relations with its neighbour and rival, Umma.

Sources for this are, on the one hand, an extensive corpus of inscriptions relating to nine rulers, telling of the buildings they constructed, of their institutions and wars, and, in the case of Uru'inimgina, of their "social" measures. On the other hand, there is the archive of some 1,200 tablets—insofar as these have been published—from the temple of Baba, the city goddess of Girsu, from the period of Lugalanda and Uru'inimgina (first half of the 24th century). For generations, Lagash and Umma contested the possession and agricultural usufruct of the fertile region of Gu'edena. To begin with, some two generations before Ur-Nanshe, Mesilim (another "king of Kish") had intervened as arbiter and possibly overlord in dictating to both states the course of the boundary between them; but this was not effective for long. After a prolonged struggle Eannatum forced the ruler of Umma, by having him take an involved oath to six divinities, to desist from crossing the old border, a canal. The text that relates this event, with considerable literary elaboration, is found on the Stele of Vultures. These battles, favouring now one side, now the other, continued under Eannatum's successors, in particular Entemena, until, under Uru'inimgina, great damage was done to the land of Lagash and to its holy places. The enemy, Lugalzaggesi, was vanquished in turn by Sargon of Akkad. The rivalry between Lagash and Umma, however, must not be considered in isolation. Other cities, too, are occasionally named as enemies, and the whole situation resembles the pattern of changing coalitions and short-lived alliances between cities of more recent times. Kish, Umma, and distant Mari on the Middle Euphrates are listed together on one occasion as early as the time of Eannatum. For the most part, these battles were fought by infantry, although mention is also made of war chariots drawn by onagers (wild asses).

Intercity rivalry between Lagash and Umma

The lords of Lagash rarely fail to call themselves by the title of *ensi,* of as yet undetermined derivation; "city ruler," or "prince," would only be approximate translations. Only seldom do they call themselves *lugal,* or "king," the title given the rulers of Umma in their own inscriptions. In all likelihood, these were local titles that were eventually converted, beginning perhaps with the kings of Akkad, into a hierarchy in which the *lugal* took precedence over the *ensi.*

Territorial states. More difficult than describing its external relations is the task of shedding light on the internal structure of a state like Lagash. For the first time, a state consisting of more than a city with its surrounding territory came into being because aggressively minded rulers had managed to extend that territory until it comprised not only Girsu, the capital, and the cities of Lagash and Nina (Zurghul) but also many smaller localities and even a seaport, Guabba. But it is not clear to what extent the conquered regions were also integrated administratively. On one occasion Uru'inimgina uses the formula "from the limits of the Ningirsu [that is, the city god of Girsu] to the sea," having in mind a distance of up to 125 miles. It would be unwise to harbour any exaggerated notion of well-organized states exceeding that size.

The Sumerian temple city

For many years views were conditioned by the slogan of the Sumerian temple city, used to convey the idea of an organism whose ruler, as representative of his god, theoretically owned all land, privately held agricultural land being a rare exception. The image of the temple city had its origin partly in the overinterpretation of a passage in the so-called reform texts of Uru'inimgina, which state that "on the field of the *ensi* [or else, his wife and the crown prince], the city god Ningirsu [or else, the city goddess Baba and the divine couple's son]" had been "reinstated as owners." On the other hand, the statements in the archives of the temple of Baba in Girsu, dating from Lugalanda and Uru'inimgina, were held to be altogether representative. Here is a system of administration, directed by the *ensi*'s spouse or by a *sangu* (head steward of a temple), in which every economic process, including commerce, stands in a direct relationship to the temple: agriculture, vegetable gardening, tree farming, cattle raising and the processing of animal products, fishing, and the payment in merchandise of workers and employees.

The conclusion from this analogy proved to be dangerous because the archives of the temple of Baba provide information about only a portion of the total temple administration and that portion, furthermore, is limited in time. Understandably enough, the private sector, which of course was not controlled by the temple, is scarcely mentioned at all in these archives. The existence of such a sector is nevertheless documented by bills of sale for land purchases of the pre-Sargonic period and from various localities. Written in Sumerian as well as in Akkadian language, they prove the existence of private land ownership or, in the opinion of some scholars, of lands predominantly held as undivided family property. Although a substantial part of the population was forced to work for the temple and drew its pay and board from it, it is not yet known whether it was year-round work.

Conscript of labour

It is probable, if unfortunate, that there will never exist a detailed and numerically accurate picture of the demographic structure of a Sumerian city. It is assumed that in the oldest city the government was in a position to summon sections of the populace for the performance of public works. The construction of monumental buildings

or the excavation of long and deep canals could be carried out only by means of such a levy. The large-scale employment of indentured persons and of slaves are of no concern in this context. Evidence of male slavery is fairly rare before Ur III, and even in Ur III and in the Old Babylonian period slave labour was never an economically relevant factor. It was different with female slaves. According to one document, the temple of Baba employed 188 such women; the temple of the goddess Nanshe, 180, chiefly in grinding flour and in the textile industry; and this continued to be the case in later times. For accuracy's sake it should be added that the terms male slave and female slave are used here in the significance they possessed around 2000 and later, designating persons in bondage who were bought and sold and who could not acquire personal property through their labour. A distinction is made between captured slaves (prisoners of war and kidnapped persons) and others who had been sold.

In one inscription, Entemena of Lagash boasts of having "allowed the sons of Uruk, Larsa, and Bad-tibira to return to their mothers" and of having "restored them into the hands" of the respective city god or goddess. Read in the light of similar but more explicit statements of later date, this laconic formula represents the oldest known evidence of the fact that the ruler occasionally endeavoured to mitigate social injustices by means of a decree. Such decrees might refer to the suspension or complete cancellation of debts or to exemption from public works. Whereas a set of inscriptions of the last ruler from the 1st dynasty of Lagash, Uru'inimgina (possibly the correct reading in lieu of the former "Urukagina"), has long been considered a prime document of social reform in the 3rd millennium, the designation "reform texts" is only partly justified. Reading between the lines, it is possible to discern that tensions had arisen between the "palace"—the ruler's residence with its annex, administrative staff, and landed properties—and the "clergy"; that is, the stewards and priests of the temples. In seeming defiance of his own interests, Uru'inimgina, who in contrast to practically all of his predecessors lists no genealogy and has therefore been suspected of having been a usurper, defends the clergy, whose plight he describes somewhat tearfully. If the foregoing passage about restoring the *ensi*'s fields to the divinity is interpreted carefully, it would follow that the situation of the temple was ameliorated and that palace lands were assigned to the priests. Along with these measures, which resemble the policies of a newcomer forced to lean on a specific party, are found others that do merit the designation of "measures taken toward the alleviation of social injustices"—for instance, the granting of delays in the payment of debts or their outright cancellation and the setting up of prohibitions to keep the economically or socially more powerful from forcing his inferior to sell his house, his ass's foal, and the like. Besides this, there were tariff regulations, such as newly established fees for weddings and burials, as well as the precise regulation of the food rations of garden workers, called blind men.

These conditions, described on the basis of source materials from Girsu, may well have been paralleled elsewhere; but it is equally possible that other archives, yet to be found in other cities of pre-Sargonic southern Mesopotamia, may furnish entirely new historical aspects. At any rate, it is wiser to proceed cautiously, by keeping to analysis and evaluation of the available material rather than to construct generalizations.

This, then, is the horizon of Mesopotamia shortly before the rise of the Akkadian Empire. In Mari, writing was introduced at the latest around the mid-26th century BC; and from that time this city, situated on the Middle Euphrates, forms an important centre of cuneiform civilization, especially in regard to its Semitic component. Reaching out across the Diyālā region and the Persian Gulf, Mesopotamian influences extended to Iran, where Susa is mentioned along with Elam and other, not yet localized, towns. In the west, the Amanus Mountains were known; and under Lugalzaggesi, the "upper sea" in other words, the Mediterranean, is mentioned for the first time. To the east, the inscriptions of Ur-Nanshe of Lagash already name the isle of Tilmun (modern Bahrain), which may have been even then a transshipment point for trade with the Oman coast and the Indus region, the Magan and Meluhha of more recent texts. Trade with Asia Minor and Afghanistan was nothing new to the 3rd millennium, even if these regions are not yet listed by their names. It was the task of the Akkadian dynasty to unite, within these boundaries, a territory that transcended the dimensions of a state of the type represented by Lagash.

Sumer and Akkad in 2350–2000 BC. There are several reasons for taking the year 2350 as a turning point in the history of Mesopotamia. For the first time, an empire arose on Mesopotamian soil. The driving force of that empire was the "Akkadians," so called after the city of Akkad, which Sargon chose for his capital (it has not yet been identified but was presumably located on the Euphrates between Sippar and Kish). The name Akkad becomes synonymous with a population group that stands side-by-side with the Sumerians. The "land of Sumer and Akkad" becomes a name for southern Mesopotamia; "Akkadian" becomes the name of a language; and the arts rise to new heights. But even this turning point was not the first time the Akkadians had emerged in history. Semites—whether Akkadians or a Semitic language group that had settled before them—perhaps had had a part in the urbanization that took place at the end of the 4th millennium. The earliest Akkadian names and words occur in written sources of the 27th century. The names of several Akkadian scribes are found in the archives of Tell Abu Ṣalābīkh near Sippar, synchronous with those of Shuruppak (shortly after 2600). The Sumerian king list places the 1st dynasty of Kish, together with a series of kings bearing Akkadian names, immediately after the Flood. In Mari, Akkadian script was probably used from the very beginning. Thus, the founders of the dynasty of Akkad were presumably members of a people who had been familiar for centuries with Mesopotamian culture in all its forms.

Sargon's reign. According to the Sumerian king list, the first five rulers of Akkad (Sargon, Rimush, Manishtusu, Naram-Sin, and Shar-kali-sharri) ruled for a total of 142 years; Sargon alone ruled for 56. Although these figures cannot be checked, they are probably trustworthy, because the king list for Ur III, even if 250 years later, did transmit dates that proved to be accurate.

As stated in an annotation to his name in the king list, Sargon started out as a cupbearer to King Ur-Zababa of Kish. There is also an Akkadian legend about Sargon, who is supposed to have been exposed after birth, brought up by a gardener, and beloved of the goddess Ishtar. Nevertheless, there are no historical dates about his career. Yet it is feasible to assume that in his case a high court office served as springboard for a dynasty of his own. The original inscriptions of the kings of Akkad that have come down to posterity are brief, more informative for geographical distribution than content. The main source material for Sargon's reign, with its high points and catastrophes, are copies made by Old Babylonian scribes in Nippur, from the very extensive originals that presumably had been kept there. They are in part Akkadian, in part bilingual Sumerian-Akkadian texts. According to these texts, Sargon is said to have fought against the Sumerian cities of southern Babylonia, thrown down city walls, taken prisoner 50 *ensi*s, and have "cleansed his weapons in the sea." He is also supposed to have captured Lugalzaggesi of Uruk, the former ruler of Umma, who had vigorously attacked Uru'inimgina in Lagash, forcing his neck under a yoke and leading him thus to the gate of the god Enlil at Nippur. "Citizens of Akkad" filled the offices of *ensi* from the "nether sea" (the Persian Gulf) upward, which was perhaps a device used by Sargon to further his dynastic aims. Aside from the 34 battles fought in the south, Sargon also tells of conquests in northern Mesopotamia: Mari, Tuttul on the Balīkh, where he venerated the god Dagan (Dagon), Ebla (Tall Mardīkh of Syria), the "cedar forest" (Amanus or Lebanon), and the "silver mountains"; battles in Elam and the foreshore of the Zagros are mentioned. Sargon also relates that ships from Meluhha (Indus region), Magan (possibly the coast of Oman), and Tilmun (Bahrain) made fast in the port of Akkad.

Source materials on Sargon

Impressive as they are at first sight by way of a terse synopsis, these reports have only a limited value because they cannot be arranged chronologically, and it is not known whether Sargon built a large empire. Akkadian tradition itself saw it in this light, however, and a learned treatise of the late 8th or the 7th century lists no fewer than 65 cities and lands belonging to that empire. But even if Magan and Kapturu (Crete) are given as the eastern and western limits of the conquered territories, it is impossible to transpose this to the 3rd millennium.

Sargon's daughter

Sargon appointed one of his daughters priestess of the moon god in Ur. She took the name of Enkheduana and was succeeded in the same office by Enmenana, a daughter of Naram-Sin. Enkheduana must have been a very gifted woman; two Sumerian hymns by her have been preserved, and she is also said to have been instrumental in starting a collection of songs dedicated to the temples of Babylonia.

Sargon died in very old age. The inscriptions, likewise preserved only in copies, of his son Rimush are full of reports about battles fought in Sumer and Iran, just as if there had never been a Sargonic empire. It is not known in detail how rigorously Akkad wished to control the cities to the south and how much freedom had been left to them; but they presumably clung tenaciously to their inherited local autonomy. From a practical point of view, it was probably in any case impossible to organize an empire that would embrace all of Mesopotamia.

Since the reports (that is, copies of inscriptions, as was their later elaboration into legend) left by Manishtusu, Naram-Sin, and Shar-kali-sharri speak time and again of rebellions and victorious battles and since Rimush, Manishtusu, and Shar-kali-sharri are themselves said to have died violent deaths, the problem of what remained of Akkad's greatness obtrudes. Wars and disturbances, the victory of one and the defeat of another, and even regicide constitute only one of the aspects suggested to us by the sources. Whenever they extended beyond the immediate Babylonian neighbourhood, the military campaigns of the Akkadian kings were dictated primarily by trade interests instead of being intended to serve the conquest and safeguarding of an empire. Akkad, or more precisely, the king, needed merchandise, money, and gold in order to finance wars, buildings, and the system of administration that he had instituted.

On the other hand, the original inscriptions that have been found so far of a king like Naram-Sin are scattered over a distance of some 620 miles as the crow flies, following the Tigris downriver: Diyarbakir on the Upper Tigris, Nineveh, Tall Birāk on the upper Khābūr (which had an Akkadian fortress and garrison), Susa in Elam, as well as Marad, Puzurish-Dagan, Adab (Bismāyah), Nippur, Ur, and Girsu in Babylonia. Even if all this was not part of an empire, it surely constituted an impressive sphere of influence.

Divine kingship

Also to be considered are other facts that weigh more heavily than high-sounding reports of victories that cannot be checked. After the first kings of the dynasty had borne the title of king of Kish, Naram-Sin had himself addressed as "king of the four quarters of the earth"; that is, of the universe. As if he were in fact divine, he also had his name written with the cuneiform sign "god," the divine determinative that was customarily used in front of the names of gods; furthermore, he assumed the title of "god of Akkad." It is legitimate to ask whether the concept of deification may be used in the sense of elevation to a rank equal to that of the gods. At the very least it must be acknowledged that in relation to his city and his subjects, the king saw himself in the role played by the local divinity as protector of the city and guarantor of its well-being. In synchronous judicial documents from Nippur, the oath is often taken "by Naram-Sin," with a formula identical with that used in swearing by a divinity. Documents from Girsu contain Akkadian date formulas of the type "in the year in which Naram-Sin laid the foundations of the Enlil temple at Nippur and of the Inanna temple at Zabalam." As evidenced by the dating procedures customary in Ur III and in the Old Babylonian period, the use of such formulas presupposes that the respective city acknowledged as its overlord the ruler whose name is invoked.

Ascendancy of Akkad. Under Akkad, the Akkadian language acquired a literary prestige that made it the equal of Sumerian; under the influence, perhaps, of an Akkadian garrison at Susa, it spread beyond the borders of Mesopotamia. After having employed for several centuries an indigenous script patterned after cuneiform writing, Elam adopted Mesopotamian script during the Akkadian period and with a few exceptions used it even when writing in Elamite rather than Sumerian or Akkadian. The so-called Old Akkadian manner of writing is extraordinarily appealing from the aesthetic point of view; as late as in the Old Babylonian era, it served as a model for monumental inscriptions. This bears out the fact that the plastic and graphic arts, especially sculpture in the round, relief work, and cylinder seals reached a high point of perfection.

Thus the reign of the five kings of Akkad may be considered one of the most productive periods of Mesopotamian history. Although separatist forces opposed all unifying tendencies, Akkad brought about a broadening of political horizons and dimensions. The period of Akkad fascinated historiographers as did few other eras; having contributed its share to the storehouse of legend, it has never disappeared from memory. With a phrase such as "There will come a king of the four quarters of the earth," liver omens (sooth-saying done by analyzing the shape of a sheep's liver) of the Old Babylonian period express the yearning for unity at a time when Babylonia had once again disintegrated into a dozen or more small states.

The end of the dynasty. Of the kings after Shar-kalisharri (*c.* 2217–*c.* 2193), only the names and a few brief inscriptions have survived. Quarrels arose over the succession, and the dynasty went under, although modern scholars know as little about the individual stages of this decline as about the rise of Akkad. Two factors contributed to its downfall: the invasion of the nomadic Amurrus (Amorites), called Martu by the Sumerians, from the northwest, and the infiltration of the Gutians, who came, apparently, from the region between the Tigris and the Zagros Mountains eastward. This argument, however, may be a vicious circle, as these invasions were provoked and facilitated by the very weakness of Akkad. In Ur III, the Martu, in part already sedentary, form one ethnic component along with Sumerians and Akkadians. The Gutians, on the other hand, played only a temporary role, even if the memory of a Gutian dynasty persisted until the end of the 17th century BC. As a matter of fact, the wholly negative opinion that even some modern historians have of the Gutians is based solely on a few stereotyped statements by the Sumerians and Akkadians, especially on the victory inscription of Utu-khegal of Uruk (2116–10). While Old Babylonian sources give the region between the Tigris and the Zagros Mountains as the home of the Gutians, these people probably also lived on the Middle Euphrates during the 3rd millennium. According to the Sumerian king list, the Gutians held the "kingship" in southern Mesopotamia for about 100 years. It has long been recognized that there is no question of a whole century of undivided Gutian rule and that some 50 years of this rule coincided with the final half century of Akkad. From this period there has also been preserved a record of a "Gutian interpreter." As it is altogether doubtful whether the Gutians had made any city of southern Mesopotamia their "capital" instead of controlling Babylonia more or less informally from outside, scholars cautiously refer to "viceroys" of this people. The Gutians have left no material records, and the original inscriptions about them are so slight that no binding statements about them are possible.

The Gutians' obscure role

The Gutians' influence probably did not extend beyond Umma. The neighbouring state of Lagash enjoyed a century of complete independence, between Shar-kalisharri and Ur III, during which time it showed expansionist tendencies and had widely ranging trade connections. Of the *ensi* Gudea (*c.* 2144–*c.* 2124) there are extant writings, exclusively Sumerian in language, which are of inestimable value. He had the time, power, and means to carry out an extensive program of temple construction during his reign; and in a hymn divided into two parts and preserved in two clay cylinders 12 inches (30 centimetres) high he describes explicitly the recon-

struction of Eninnu, the temple of the god Ningirsu. Comprising 1,363 lines, the text is second in length only to Eannatum's Stele of Vultures among the literary works of the Sumerians up to that time. While Gudea forges a link, in his literary style, with his country's pre-Sargonic period, his work also bears the unmistakable stamp of the period of Akkad. Thus, the regions that furnish him building materials reflect the geographical horizon of the empire of Akkad, and the *ensi*'s title "god of his city" recalls the "god of Akkad" (Naram-Sin). The building hymn contains interesting particulars about the work force deployed. "Levies" were organized in various parts of the country, and city of Girsu itself "followed the *ensi* as though it were a single man." Unfortunately, synchronous administrative archives of sufficient length to provide less summarily compiled information about the social structure of Lagash shortly before the 3rd dynasty of Ur are lacking. After the great pre-Sargonic archives of the Baba temple at Girsu, only the various administrative archives of the king of Ur III give a closer look at the functioning of a Mesopotamian state.

The 3rd dynasty of Ur. Ut-khegal of Uruk is given credit for having overthrown Gutian rule by vanquishing their king Tiriqan along with two generals. Utukhegal calls himself lord of the four quarters of the earth in an inscription; but this title, adopted from Akkad, is more likely to signify political aspiration than actual rule. If another inscription has been correctly restored, Utu-khegal was a brother of the Ur-Nammu who founded the 3rd dynasty of Ur ("3rd" because it is the third time that Ur is listed in the Sumerian King List). Under Ur-Nammu and his successors Shulgi, Amar-Su'en (Amar-Sin), Shu-Sin, and Ibbi-Sin, this dynasty lasted for a century (*c.* 2112–2004). Ur-Nammu was at first "governor" of the city of Ur under Utu-khegal. How he became king is not known, but there may well be some parallels between his rise and the career of Ishbi-Erra of Isin or, indeed, that of Sargon. By eliminating the state of Lagash, Ur-Nammu caused the coveted overseas trade (Tilmun, Magan, and Meluhha) to flow through Ur. As evidenced by a new royal title that he was the first to bear—that of "king of Sumer and Akkad"—he had built up a state that comprised at least the southern part of Mesopotamia. Like all great rulers, he built much, including the very impressive ziggurats of Ur and Uruk, which acquired their final monumental dimensions in his reign.

The Codex of Ur-Nammu

Assyriologists have given the name of Codex of Ur-Nammu to a literary monument that is the oldest hitherto-known example of a genre extending through the Code of Lipit-Ishtar in Sumerian to the Code of Hammurabi, written in Akkadian. It is a collection of sentences or verdicts mostly following the pattern of "If A [assumption], it follows that B [legal consequence]." The collection is framed by a prologue and an epilogue. The original was most likely a stele, but all that is known of the Code of Ur-Nammu so far are Old Babylonian copies. The term code as used here is conventional terminology and should not give the impression of any kind of "codified" law; furthermore, the content of the Code of Ur-Nammu is not yet completely known. It deals, among other things, with adultery by a married woman, the defloration of someone else's female slave, divorce, false accusation, the escape of slaves, bodily injury, the granting of security, as well as with legal cases arising from agriculture and irrigation.

Before its catastrophic end, under Ibbi-Sin, the state of Ur III does not seem to have suffered setbacks and rebellions as grievous as those experienced by Akkad. There are no clear indications pointing to inner unrest, although it must be remembered that the first 20 years of Shulgi's reign are still hidden in darkness. But from that point on until the beginning of Ibbi-Sin's reign, or for a period of 50 years at least, the sources give the impression of peace enjoyed by a country that lived undisturbed by encroachments from abroad. Some expeditions were sent into foreign lands, to the region bordering on the Zagros, to what later became Assyria, and to the vicinity of Elam, in order to secure the importation of raw materials, in a fashion reminiscent of Akkad. Force seems to have been employed only as a last resort; and every attempt was made to bring about peaceful conditions on the other side of the border through the dispatch of embassies or the establishment of family bonds, for example, by marrying the king's daughters to foreigners.

Shulgi, too, called himself king of the four quarters of the earth. Although he resided in Ur, another important centre was in Nippur, whence—according to the prevailing ideology—Enlil, the chief god in the Sumerian state pantheon, had bestowed on him the royal dignity. Shulgi and his successors enjoyed divine honours, as Naram-Sin of Akkad had before them; by now, however, the process of deification had taken on clearer outlines in that sacrifices were offered and chapels built to the king and his throne, while the royal determinative turned up in personal names. Along with an Utu-khegal (The Sun God Is Exuberance) there appears a Shulgi-khegal (Shulgi Is Exuberance), and so forth.

Administration. The highest official of the state was the *sukkal-makh,* literally "supreme courier," whose position may be paraphrased with "(state) chancellor." The empire was divided into some 40 provinces ruled by as many *ensi*s, who, despite their far-reaching authority (civil administration and judicial powers), were no longer autonomous, even if only indirectly, although the office was occasionally handed down from father to son. They could not enter into alliances or wage wars on their own. The *ensi*s were appointed by the king and could probably also be transferred by him to other provinces. Each of these provinces was obliged to pay a yearly tribute, the amount of which was negotiated by emissaries. Of special significance in this was a system called *bala,* "cycle" or "rotation," in which the *ensi*s of the southern provinces took part; among other things, they had to keep the state stockyards supplied with sacrificial animals. Although the "province" often corresponded to a former city-state, many others were no doubt newly established. The so-called land-register text of Ur-Nammu describes four such provinces north of Nippur, giving the precise boundaries and ending in each case with the statement: "King Ur-Nammu has confirmed the field of the god XX for the god XX." In some cities, notably in Uruk, Mari, or Dēr (near Badrah, Iraq), the administration was in the hands of a *shakana,* a man whose title is rendered partly by "governor" and partly by "general."

The available histories are practically unanimous in seeing in Ur III a strongly centralized state marked by the king's position as absolute ruler. Nevertheless, some caution is indicated. For one thing, the need to deal as tactfully as possible with the *ensi*s must not be underestimated. A further question arises from the borders between and relative extent of the "public" and the "private" sector; the latter's importance may have been underrated as well. What is meant by "private" sector is a population group with land of its own and with revenues not directly granted by a temple or a "palace," such as by the king's or an *ensi*'s household. The traditional picture is derived from the sources, the state archives of Puzurish-Dagan, a gigantic "stockyard" situated outside the gates of Nippur, which supplied the city's temples with sacrificial animals but inevitably also comprised a major wool and leather industry; other such archives are those of Umma, Girsu, Nippur, and Ur. All these activities were overseen by a finely honed bureaucracy that stressed the use of official channels, efficient administration, and precise accounting. The various administrative organs communicated with one another by means of a smoothly functioning network of messengers. Although almost 23,000 documents referring to the economy of Ur III have so far been published, they are still waiting to be properly evaluated. Nor is there yet a serviceable typology for them; only when that has been drawn up will it be possible to write a book entitled "*The Economic System of Ur III.*" Represented in the main by contracts (loans, leases of temple land, the purchase of slaves, and the like), the "private" sector makes up only a small part of this mass of textual material. Neither can the sites at which discoveries have been made so far be taken as representative; in northern Babylonia, for exam-

The bureaucracy

ple, scarcely any contemporary written documents have yet been recovered.

Ethnic, geographic, and intellectual constituents. From the ethnic point of view, Mesopotamia was as heterogeneous at the end of the 3rd millennium as it had been earlier. The Akkadian element predominated, and the proportion of speakers of Akkadian to speakers of Sumerian continued to change in favour of the former. Some scholars consider it altogether wrong to speak of "Sumerians" and "Akkadians" at this point, since the Sumerians had been living in southern Mesopotamia for at least 1,000 years, without any contact with possibly related peoples, whereas the Semitic population regenerated itself continually from the ranks of nomads who became sedentary. The third group, first mentioned under Sharkali-sharri of Akkad, are the Amorites. In Ur III, some members of this people are already found in the higher echelons of the administration, while the bulk, organized in tribes, still led a nomadic life. Their great days came in the Old Babylonian period. While clearly differing linguistically from Akkadian, the Amorite language, which can be reconstructed to some extent from hundreds of proper names, is fairly closely related to the so-called Canaanite branch of the Semitic languages, of which it may in fact represent an older form. The fact that King Shu-Sin had a regular wall built clear across the land, the "wall that keeps out the Tidnum" (name of a tribe), shows how strong the pressure of the nomads was in the 21st century and what efforts were being made to check their influx. The fourth major ethnic group comprised the Hurrians, who were especially important in northern Mesopotamia and in the vicinity of modern Kirkūk.

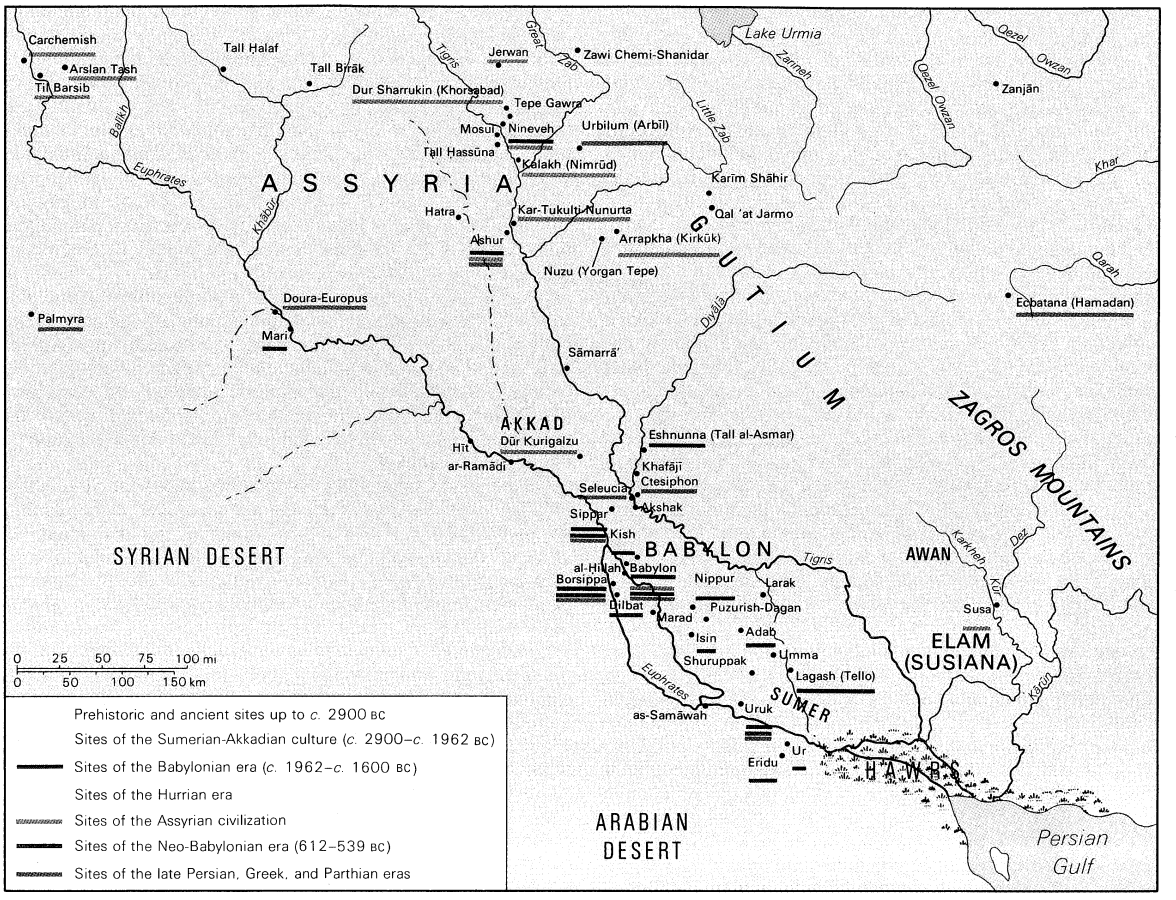
It is likely that the geographical horizon of the empire of Ur III did not materially exceed that of the empire of Akkad. No names of localities in the interior of Asia Minor have been found, but there was much coming and going of messengers between Mesopotamia and Iran, far beyond Elam. There is also one mention of Gubla (Byblos) on the Mediterranean coast. Oddly enough, there is no evidence of any relations with Egypt, either in Ur III or in the Old Babylonian period. It is odd if no contacts existed at the end of the 3rd millennium between the two great civilizations of the ancient Near East.

Literature of Ur III

Intellectual life at the time of Ur III must have been very active in the cultivation and transmission of older literature, as well as in new creations. Although its importance as a spoken tongue was diminishing, Sumerian still flourished as a written language, a state of affairs that continued into the Old Babylonian period. As shown by the hymn on the deified king, new literary genres arose in Ur III. If Old Babylonian copies are any indication, the king's correspondence with leading officials was also of a high literary level.

In the long view, the 3rd dynasty of Ur did not survive in historical memory as vigorously as did Akkad. To be sure, Old Babylonian historiography speaks of Ur III as *bala-Shulgi,* the "(reigning) cycle of Shulgi"; but there is nothing that would correspond to the epic poems about Sargon and Naram-Sin. The reason is not clear, but it is conceivable that the later, purely Akkadian population felt a closer identification with Akkad than with a state that to a large extent still made use of the Sumerian language.

Ur III in decline. The decline of Ur III is an event in Mesopotamian history that can be followed in greater detail than other stages of that history. There are some clear sources, such as the royal correspondence, two elegies on the destruction of Ur and Sumer, and an archive from Isin that shows how Ishbi-Erra, as usurper and king of Isin, eliminated his former overlord in Ur. Ibbi-Sin was waging war in Elam when an ambitious rival came forward in the person of Ishbi-Erra from Mari, presumably a general or high official. By emphasizing to the utmost the danger threatening from the Amorites, Ishbi-Erra urged the King to entrust to him the protection of the neighbouring cities of Isin and Nippur. Ishbi-Erra's demand came close to extortion, and his correspondence shows how skillfully he dealt with the Amorites and with individual *ensi*s, some of whom soon went over to his side. Ishbi-Erra also took advantage of the depression that the King suffered because the god Enlil "hated him": a phrase presumably referring to bad omens resulting from the examination of sacrificed animals, on which procedure many rulers based their actions (or, as the case may be, their inaction). Ishbi-Erra fortified Isin and, in the 10th year of Ibbi-Sin's reign, began to employ his own dating formula on documents, an act tantamount to a renunciation of loyalty. Ishbi-Erra, on his part, believed himself to be the favourite of Enlil, the more so as he ruled over Nippur, where the god had his sanctuary. In the end, he claimed suzerainty over all of southern Mesopotamia, including Ur.



While Ishbi-Erra purposefully strengthened his domains, Ibbi-Sin continued for 14 more years to rule over a decreasing portion of the land. The end of Ur came about through a concatenation of misfortunes: a famine broke out; and Ur was besieged, taken, and destroyed by the invading Elamites and their allies among the Iranian tribes. Ibbi-Sin was led away captive, and no more was heard of him. The elegies record in moving fashion the unhappy end of Ur, the catastrophe that had been brought about by the wrath of Enlil.

Ur's end

THE OLD BABYLONIAN PERIOD

Isin and Larsa. During the collapse of Ur III, Ishbi-Erra established himself in Isin and founded a dynasty there that lasted from 2017 to 1794; his example was followed elsewhere by local rulers, as in Dēr, Eshnunna, Sippar, Kish, and Larsa. In many localities an urge was felt to imitate the model of Ur; Isin probably took over unchanged the administrative system of that state. Ishbi-Erra and his successors had themselves deified, as did one of the rulers of Dēr on the Iranian border. For almost a century Isin predominated within the mosaic of states that were slowly reemerging. Overseas trade revived after Ishbi-Erra had driven out the Elamite garrison from Ur, and under his successor, Shu-ilishu, a statue of the moon god Nanna, the city god of Ur, was recovered from the Elamites who had carried it off. Up to the reign of Lipit-Ishtar (*c.* 1934–*c.* 1924), the rulers of Isin so resembled those of Ur, so far as the King's assessment of himself in the hymns is concerned, that it seems almost arbitrary to postulate a break between Ibbi-Sin and Ishbi-Erra. As a further example of continuity it might be added that the Code of Lipit-Ishtar stands exactly midway chronologically between the Code of Ur-Nammu and the Code of Hammurabi. Yet it is much closer to the former in language and especially in legal philosophy than to Hammurabi's compilation of judgments. For example, the Code of Lipit-Ishtar does not know the lex talionis (or "an eye for an eye and a tooth for a tooth"), the guiding principle of Hammurabi's penal law.

Political fragmentation. It is probable that the definitive separation from Ur III came about through changing components of the population, from "Sumerians and Akkadians" to "Akkadians and Amorites." An Old Babylonian liver omen states that "He of the steppes will enter, and chase out the one in the city." This is indeed an abbreviated formula for an event that took place more than once: the usurpation of the king's throne in the city by the "sheikh" of some Amorite tribe. These usurpations were regularly carried out as part of the respective tribes became settled, although this was not so in the case of Isin because the house of Ishbi-Erra came from Mari and was of Akkadian origin, to judge by the rulers' names. By the same linguistic token the dynasty of Larsa was Amorite. The fifth ruler of the latter dynasty, Gungunum (ruled *c.* 1932–*c.* 1906), conquered Ur and established himself as the equal and rival of Isin; at this stage—the end of the 20th century BC—if not before, Ur had certainly outlived itself. From Gungunum until the temporary unification of Mesopotamia under Hammurabi, the political picture was determined by the disintegration of the balance of power, by incessant vacillation of alliances, by the presumption of the various rulers, by the fear of encroachments by the Amorite nomads, and by increasingly wretched social conditions. The extensive archive of correspondence from the royal palace of Mari (*c.* 1810–1750) is the best source of information about the political and diplomatic game and its

Sites associated with ancient Mesopotamian history.

rules, whether honoured or broken: treaties, the dispatch and reception of embassies, agreements about the integration of allied armies, espionage, "situation reports" from "foreign" courts. Devoid of exaggeration or stylization, these letters, dealing as they do with everyday events, are preferable to the numerous royal inscriptions on buildings even when the latter contain historical allusions.

Literary texts and increasing decentralization. Another indirect but far from negligible source for the political and socioeconomic situation in the 20th–18th centuries BC is the literature of omens. These are long compendiums in which the condition of a sheep's liver or some other divinatory object (for instance, the behaviour of a drop of oil in a beaker filled with water, the appearance of a newborn baby, and the shape of rising clouds of incense) are described at length and commented on with the appropriate prediction: "The king will kill his dignitaries and distribute their houses and property among the temples"; "A powerful man will ascend the throne in a foreign city"; "The land that rose up against its 'shepherd' will continue to be ruled by that 'shepherd' "; "The king will depose his chancellor"; and "They will lock the city gate and there will be a calamity in the city."

The literature of omens as a source

Beginning with Gungunum of Larsa, the texts allow greater insight into the private sector than in any other previous period. There is a considerable increase in the number of private contracts and private correspondences. Especially frequent among the private contracts are those concluded about loans of silver or grain (barley), illustrating the common man's plight, especially when driven to seek out a creditor, the first step on a road that in many instances led to ruin. The rate of interest, murderously high at 20 percent in the case of silver and 33 percent in that of grain, increased further if the deadline for repayment, usually at harvest time, was not kept. Insolvency resulted in imprisonment for debt, slavery by mortagage, and the sale of children and even the debtor's own person. Many private letters contain entreaties for the release of family members from imprisonment at the creditor's hands. Yet considerable fortunes were also made, in "liquid" capital as well as landed property. As these tendencies threatened to end in economic disaster, the kings prescribed as a corrective the liquidation of debts, by way of temporary alleviation at least. The exact wording is known of one such decree from the time of Ammisaduqa of Babylon.

Until the Ur III period, the only archives so far recovered dealt with temples or the palace. But belonging to the Old Babylonian period, along with documents pertaining to civil law, were an increasing number of administrative records of privately managed households, inns, and farms: settlements of accounts, receipts, and notes on various transactions. Here was clearly a regular bourgeoisie, disposing of its own land and of means independent of temple and palace. Trade, too, was now chiefly in private hands; the merchant travelled (or sent his partners) at his own risk, not on behalf of the state. Among the civil-law contracts there was a substantial increase in records of land purchases. Also significant for the economic situation in the Old Babylonian era was a process that might be summarized as "secularization of the temples," even if all the stages of this development cannot be traced. The palace had probably possessed for centuries the authority to dispose of temple property, but, whereas Uru'inimgina of Lagash had still branded the tendency as leading to abuses, the citizen's relationship to the temple now took on individual traits. Revenues from certain priestly offices—benefices, in other words—went to private individuals and were sold and inherited. The process had begun in Ur, where the king bestowed benefices, although the recipients could not own them. The archives of the "canonesses" of the sun god of Sippar furnish a particularly striking example of the fusion of religious service and private economic interest. These women, who lived in a convent called *gagûm,* came from the city's leading families and were not allowed to marry. With their property, consisting of land and silver, they engaged in a lively and remunerative business by granting loans and leasing out fields.

Changing relationship between religious institutions and individuals

The tendency toward decentralization had begun in the Old Babylonian period with Isin. It concluded with the 72-year reign of the house of Kudur-Mabuk in Larsa (*c.* 1834–*c.* 1763). Kudur-mabuk, sheikh of the Amorite tribe of the Jamutbal, despite his Elamite name, helped his son Warad-Sin to secure the throne. This usurpation allowed Larsa, which had passed through a period of internal unrest, to flourish one more time. Under Warad-Sin and in the long reign of his brother Rim-Sin, large portions of southern Babylonia, including Nippur, were once again united in one state of Isin in 1794. Larsa on its part was conquered by Hammurabi in 1763.

Early history of Assyria. In contrast to southern Mesopotamia or the mid-Euphrates region (Mari), written sources in Assyria do not begin until very late, shortly before Ur III. By Assyria—a region that does not lend itself to precise geographical delineation—is understood the territory on the Tigris north of the river's passage through the mountains of the Jabal Ḥamrīn to a point north of Nineveh, as well as the area between Little and Great Zab (a tributary of the Tigris in northeast Iraq) and to the north of the latter. In the north, Assyria was later bordered by the mountain state of Urartu; to the east and southeast, its neighbour was the region around the old Nuzu (near modern Kirkūk, "Arrapachitis" [Arrapkha] of the Greeks). In the early 2nd millennium the main cities of Assyria were Ashur (160 miles north-northwest of modern Baghdad), the capital (synonymous with the city god and national divinity); Nineveh, lying opposite modern Mosul; and Urbilum, the later Arbela (today Arbīl, some 200 miles north of Baghdad).

In Assyria, inscriptions were composed in Akkadian from the beginning. Under Ur III, Ashur was the provincial capital. Assyria as a whole, however, is not likely to have been a permanently secured part of the empire, since two date formulas of Shulgi and Amar-Su'ena mention the destruction of Urbilum. Ideas of the population of Assyria in the 3rd millennium are necessarily very imprecise. It is not known how long Semitic tribes had been settled there. The inhabitants of southern Mesopotamia called Assyria Shubir in Sumerian and Subartu in Akkadian; these names may point to an older Subarean population that was related to the Hurrians. Gasur, the later Nuzu, belonged to the Akkadian language region about the year 2200 but was lost to the Hurrians in the first quarter of the 2nd millennium. The Assyrian dialect of Akkadian found in the beginning of the 2nd millennium differs strongly from the dialect of Babylonia. These two versions of the Akkadian language continue into the 1st millennium.

Language differences

In contrast to the kings of southern Mesopotamia, the Assyrian rulers styled themselves, not king but partly *iššiakum,* in short, the Akkadian for the Sumerian word *ensi,* partly *rubā'um,* or "great one." Unfortunately, the rulers cannot be synchronized precisely with the kings of southern Mesopotamia before the Assyrian Shamshi-Adad I (*c.* 1813–*c.* 1781 BC). For instance, it has not yet been established just when Ilushuma's excursion into Babylon, recorded in an inscription, actually took place. Ilushuma boasts of having freed of taxes the "Akkadians and their children." While he mentions the cities of Nippur and Ur, the other localities listed were situated in the region east of the Tigris. The event itself may have taken place in the reign of Ishme-Dagan of Isin (*c.* 1953–*c.* 1935 BC), although how far Ilushuma's words correspond to the truth cannot be checked; in the Babylonian texts, at any rate, no reference is made to Assyrian intervention. The whole problem of dating is aggravated by the fact that the Assyrians did not, unlike the Babylonians, use date formulas that often contain interesting historical details; instead, every year was designated by the name of a high official (eponymic dating). The conscious cultivation of an old tradition is mirrored in the fact that two rulers of 19th-century Assyria called themselves Sargon and Naram-Sin, after famous models in the Akkadian dynasty.

Aside from the generally scarce reports on projected construction, there is at present no information about the city of Ashur and its surroundings. There is, however, unexpectedly rewarding source material from the Assyrian trading colonies in Asia Minor. The texts come mainly from Kanesh (near modern Kayseri, in southeast Turkey) and from Hattusas (also southeast Turkey), the later Hittite capital. In the 19th century BC three generations of Assyrian merchants engaged in a lively commodity trade (especially in textiles and metal) between the homeland and Anatolia, also taking part profitably in internal Anatolian trade. Like their contemporaries in southern Mesopotamia, they did business privately and at their own risk, living peacefully and occasionally intermarrying with the "Anatolians." As long as they paid taxes to the local rulers, the Assyrians were given a free hand.

It is obvious that these forays by Assyrian merchants led to some transplanting of Mesopotamian culture into Asia Minor. Thus the Anatolians adopted cuneiform writing and used the Assyrian language as a means of communication. While this influence doubtless already affected the first Hittites arriving in Asia Minor, a direct line from the period of these trading colonies to the Hittite Empire cannot yet be traced.

From *c.* 1813 to *c.* 1781 Assyria was ruled by Shamshi-Adad I, a contemporary of Hammurabi and a personality in no way inferior to him. Shamshi-Adad's father—an Amorite, to judge by the name—had ruled near Mari. The son, not being of Assyrian origin, ascended the throne of Assyria as a foreigner and on a detour, as it were, after having spent some time as an exile in Babylonia. He had his two sons rule as viceroys, in Ekallatum on the Euphrates and in Mari, respectively, until the older of the two, Ishme-Dagan, succeeded his father on the throne. Through the archive of correspondence in the palace at Mari, scholars are particularly well informed about Shamshi-Adad's reign and many aspects of his personality. Shamshi-Adad's state had a common border for some time with the Babylonia of Hammurabi; in the west, it reached to the Mediterranean. Soon after Shamshi-Adad's death, Mari broke away, regaining its independence under an Amorite dynasty that had been living there for generations; in the end, Hammurabi conquered and destroyed Mari. After Ishme-Dagan's death, Assyrian history is lost sight of for over 100 years.

The Old Babylonian Empire. *Political fortunes.* Hammurabi (*c.* 1792–50 BC) is surely the most impressive and by now the most popular figure of the ancient Near East of the first half of the 2nd millennium BC. He owes his posthumous reputation to the great stele into which the "Code of Hammurabi" has been carved and indirectly also to the fact that his dynasty has made the name of Babylon famous for all time. In much the same way in which pre-Sargonic Kish exemplified the non-Sumerian area north of Sumer and Akkad lent its name to a country and a language, Babylon became the symbol of the whole country that the Greeks called Babylonia. This term has already been used anachronistically as a geographical concept in reference to the period before Hammurabi. Originally the city's name was probably Babilla, which was reinterpreted in popular etymology as Bab-ilu (Gate of the God).

The 1st dynasty of Babylon rose from insignificant beginnings. The history of the erstwhile province of Ur is traceable from about 1894 onward, when the Amorite Samu'abum came to power there. What is known of these events fits altogether into the modest proportions of the period when Mesopotamia was a mosaic of small states. Hammurabi played skillfully on the instrument of coalitions and became more powerful than his predecessors had been. But it was only in his 30th year, after his conquest of Larsa, that he gave concrete expression to the idea of ruling all of southern Mesopotamia by "strengthening the fundament of Sumer and Akkad," in the words of that year's dating formula. In the prologue to the Code of Hammurabi the King lists the following cities as belonging to his dominions: Eridu near Ur, Ur, Lagash and Girsu, Zabalam, Larsa, Uruk, Adab, Isin, Nippur, Keshi, Dilbat, Borsippa, Babylon itself, Kish, Malgium, Mashkan-shapir, Kutha, Sippar, Eshnunna in the Diyālā region, Mari, Tuttul on the lower Balīkh (a tributary of the Euphrates), and finally Ashur and Nineveh. This was on a scale reminiscent of Akkad or Ur III. Yet Ashur and Nineveh cannot have formed part

of this empire for long because at the end of Hammurabi's reign mention is made again of wars against Subartu—that is, Assyria.

Decline of Babylonia under Samsuiluna

Under Hammurabi's son Samsuiluna (*c.* 1749–*c.* 1712 BC) the Babylonian Empire greatly shrank in size. Following what had almost become a tradition, the south rose up in revolt; Larsa regained its autonomy for some time, and the walls of Ur, Uruk, and Larsa were levelled to the ground. Eshnunna, which evidently had also seceded, was vanquished in *c.* 1730. Later chronicles mention the existence of a state in the Sealand, with its own dynasty; by "sealand" is understood the marshlands of southern Babylonia. Knowledge of this new dynasty is unfortunately very vague, only one of its kings being documented in contemporary texts. In *c.* 1741 Samsuiluna mentions the Kassites for the first time; in *c.* 1726 he constructed a stronghold, "Fort Samsuiluna," as a bulwark against them on the Diyālā near its confluence with the Tigris.

Like the Gutians before them, the Kassites were at first prevented from entering Babylonia and pushed into the mid-Euphrates region; there, in the kingdom of Khana (centred on Mari and Terqa, both below the junction with the Khābūr), a king appears with the Kassitic name of Kashtiliashu, who ruled toward the end of the Babylonian dynasty. From Khana the Kassites moved south in small groups, probably as harvest workers. After the Hittite invasion under Mursilis I, who is said to have dethroned the last king of Babylon, Samsuditana, in 1595, the Kassites assumed the royal power in Babylonia. So far, the contemporary sources do not mention this epoch, and the question arises as to how the Kassite rulers named in king lists mesh with the end of the 2nd millennium BC.

The Code of Hammurabi

Babylonian law. The Code of Hammurabi is the most frequently cited cuneiform document in specialized literature. Its first scholarly examination in 1902 led to the development of a special branch of comparative jurisprudence, the study of cuneiform law. Following the division made by the first editor, Jean-Vincent Scheil, the Code of Hammurabi contains 280 judgments, or "paragraphs," on civil and criminal law, dealing in the main with cases from everyday life in such a manner that it becomes obvious that the "lawgiver" or compiler had no intention of covering all possible contingencies. In broad outline, the themes treated in the Code of Hammurabi are: libel; corrupt administration of justice; theft, receiving stolen goods, robbery, looting, and burglary; murder, manslaughter, and bodily injury; abduction; judicature of tax lessees; liability for negligent damage to fields and crop damage caused by grazing cattle; illegal felling of palm trees; legal problems of trade enterprises, in particular, the relationship between the merchant and his employee travelling overland, and embezzlement of merchandise; trust monies; the proportion of interest to loan money; the legal position of the female publican; slavery and ransom, slavery for debt, runaway slaves, the sale and vindication of slaves, and disclaimer of slave status; the rent of persons, animals, and ships and their respective tariffs, offenses of hired labourers, and the vicious bull; family law: the price of a bride, dowry, the married woman's property, wife and concubine, and the legal position of the respective issue, divorce, adoption, the wet nurse's contract, and inheritance; and the legal position of certain priestesses.

A similar if much shorter compendium of judgments, probably antedating that of Hammurabi by a generation or two, has been discovered in Eshnunna.

Hammurabi, who called his own work *dīnāt mīšarim,* or "verdicts of the just order," states in the epilogue that it was intended as legal aid for persons in search of advice. It is nevertheless doubtful whether these judgments were meant to have binding force in the sense of modern statutes. The Code of Hammurabi differs in many respects from the Code of Lipit-Ishtar, which was written in Sumerian. Its most striking feature lies in the extraordinary severity of its penalties and in the principle of the lex talionis. The same attitude is reflected in various Old Babylonian treaties in which defaulters are threatened with bodily punishment. It is often said, and perhaps rightly so, that this severity, which so contrasts with Sumerian judicial tradition, can be traced back to the Amorite influence.

There is yet another way in which the Code of Hammurabi has given rise to much discussion. Many of its "paragraphs" vary according to whether the case concerns an *awīlum,* a *muškēnum,* or a *wardum.* A threefold division of the populace had been postulated on the basis of these distinctions. The *wardum* is the least problematical of them all: he is the slave—that is, a person in bondage who could be bought and sold, unless he was able to regain his freedom under certain conditions as a debtor-slave. The *muškēnum* were, under King Hammurabi at least, persons employed by the palace who could be given land in usufruct without receiving it as property. *Awīlum* were the citizens who owned land in their own right and depended neither on the palace nor the temple. As the scholar I.M. Diakonoff points out, the distinction cannot have been very sharply drawn because the classes *awīlum* and *muškēnum* are not mutually exclusive: a man in high palace office could fairly easily purchase land as private property, whereas the free citizen who got into debt as a result of a bad harvest or some other misfortune had one foot in the slave class. Still unanswered is the question as to which segment of the population could be conscripted to do public works, a term that included the levy in case of war.

Economic legislation

Ammisaduqa (*c.* 1646–*c.* 1626 BC) comes a century and a half after Hammurabi. His edict, already referred to, lists, among others, the following social and economic factors: private debts in silver and grain, if arising out of loans, were cancelled; also cancelled were back taxes that certain officials owed the palace and that had to be collected from the people; the "female publican" had to renounce the collection of outstanding debts in beer and barley and was, in turn, excused from paying amounts of silver and barley to the king; taxes on leased property were reduced; debt slaves who had formerly been free (as against slaves made over from debtor to creditor) were ransomed; and high officials were forbidden on pain of death to press those who held property in fee into harvest work by prepayment of wages. The phrase "because the king gave the land a just order" serves as a rationale for many of these instances. In contrast to the "codes," about whose binding force there is much doubt, edicts such as those of Ammisaduqa had legal validity since there are references to the edicts of other kings in numerous legal documents of the Old Babylonian period.

Babylonian literature. The literature and the literary languages of Babylonia during the three centuries following Ur III deserve attention. When commenting on literary and historical texts such as the inscriptions of the kings of Akkad, it was pointed out that these were not originals but copies of Old Babylonian vintage. So far, such copies are the main source for Sumerian literature. But, while the Old Babylonian period created much literature itself (royal hymns of the kings of Isin, Larsa, and Babylon and elegies), it was above all a time of intensive cultivation of traditional literature. The great Sumerian poems, whose origins or first written version, respectively, can now be traced back to about 2600, were copied again and again. After 2000, when Sumerian as a spoken language rapidly receded to isolated regions and eventually disappeared altogether, texts began to be translated, line by line, into Akkadian until there came to be bilingual versions. An important part of this, especially in the instructional program in schools, were the so-called lexicographic texts. Sumerian word lists are almost as old as cuneiform writing itself because they formed the perfect material for those learning to write. In the Old Babylonian period, the individual lexical entries were translated and often annotated with phonetic signs. This led to the creation of "dictionaries," the value of which to the modern philologist cannot be exaggerated. Since Sumerian had to be taught much more than before, regular "grammatical treatises" also came into being: so far as it was possible, in view of the radically different structure of the two languages, Sumerian pronouns, verb forms, and the like were translated into Akkadian, including entire "paradigms" of individual verbs.

In belles-lettres, Sumerian still predominates, although there is no lack of Akkadian masterpieces, including the

oldest Akkadian version of the *Epic of Gilgamesh.* The very high prestige still enjoyed by Sumerian should not be underestimated, and it continued to be used for inscriptions on buildings and the yearly dating formulas. Aside from being the language of practical affairs (letters and contracts), there was a high incidence of Akkadian in soothsaying and divinatory literature. To be sure, the Sumerians also practiced foretelling the future from the examination of animal entrails, but as far as is known they did not write down the results. In Akkadian, on the other hand, there are extensive and "scientifically" arranged compendiums of omens based on the liver (as well as other omens), reflecting the importance that the divination of the future had in religion, in politics, and in all aspects of daily life.

Judging by its continually more refined juridical thought, its ability to master in writing ever more complicated administrative procedures, its advanced knowledge of mathematics, and the fact that it marks the beginning of the study of astronomy, the Old Babylonian period appears to have been a time of exceedingly active intellectual endeavour—despite, if not because of, its lack of political cohesiveness.

The Hurrians. The Hurrians enter the orbit of ancient Near Eastern civilization toward the end of the 3rd millennium BC. They arrived in Mesopotamia from the north or the east, but it is not known how long they had lived in the peripheral regions. There is a brief inscription in Hurrian language from the end of the period of Akkad, while that of King Arishen (or Atalshen) of Urkish and Nawar is written in Akkadian. The language of the Hurrians must have belonged to a widespread group of ancient Near Eastern languages. The relationship between Hurrian and Subarean has already been mentioned, and the language of the Urarteans, who played an important role from the end of the 2nd millennium to the 8th century BC, is likewise closely related to Hurrian. Soviet scholars claim to be able to show that the "Veinakh" group of northeastern Caucasian languages is an offspring of the Hurrian-Urartean group.

It is not known whether the migrations of the Hurrians ever took the form of aggressive invasion: 18th-century-BC texts from Mari speak of battles with the Hurrian tribe of Turukku south of Lake Urmia (some 150 miles from the Caspian Sea's southwest corner); but these were mountain campaigns, not the warding off of an offensive. Proper names in cuneiform texts, increasing in the period of Ur III, constitute the chief criterion for the presence of Hurrians. Nevertheless, there is no clear indication that the Hurrians had already advanced west of the Tigris at that time. An entirely different picture results from the 18th-century palace archives of Mari and from texts originating near the upper Khābūr. Northern Mesopotamia, west of the Tigris, and Syria now appear settled by a population that is mainly Amorite and Hurrian; and the latter have already reached the Mediterranean littoral, as shown by texts from Alalakh on the Orontes. In Mari, literary texts in Hurrian have also been found, indicating that Hurrian had by now become a full-fledged written language as well.

The high point of the Hurrian period was not reached until about the middle of the 2nd millennium. In the 15th century, Alalakh was heavily Hurrianized; and in the empire of Mitanni the Hurrians represented the leading and perhaps the most numerous population group. (D.O.E.)

THE KASSITES, THE MITANNI, AND THE RISE OF ASSYRIA

About 150 years after the death of Hammurabi, his dynasty was destroyed by an invasion of new peoples. Because there are hardly any written records of this era, the time from about 1600 BC to about 1450 BC (in some areas until 1400 BC) is called the dark ages. The remaining Semitic states, such as the state of Ashur, became minor states within the sphere of influence of the new states of the Kassites and the Hurrians-Mitanni. But the languages of the older cultures, the Akkadian and Sumerian, continued or were soon reestablished. The cuneiform script persisted as the only type of writing in the entire area. Cultural continuity was not broken off, either, particularly in Babylonia. A matter of importance was the emergence of new Semitic leading classes from the ranks of the priesthood and the scribes. These gained increasing power.

The people and the language of the Kassites

The Kassites in Babylonia. The Kassites had settled by 1800 BC in what is now western Iran in the region of Hamadan-Kermanshah. The first to feel their forward thrust was Samsuiluna, who had to repel groups of Kassite invaders. Increasing numbers of Kassites gradually reached Babylonia and southern Mesopotamia. There they founded principalities, of which little is known. No inscription or document in the Kassite language has been preserved. Some 300 Kassite words have been found in Babylonian documents. Nor is much known about the social structure of the Kassites or their culture. There seems to have been no hereditary kingdom. Their religion was polytheistic; the names of 30 gods are known.

The beginning of Kassite rule in Babylonia cannot be dated exactly. A king called Agum II ruled over a state that stretched from western Iran to the middle part of the Euphrates Valley; 24 years after the Hittites had carried off the statue of the Babylonian god Marduk, he regained possession of the statue, brought it back, and renewed the cult, making the god Marduk the equal of the Kassitic equivalent god, Shuqamuna. Meanwhile, native princes continued to reign in southern Babylonia. It was Ulamburiash who finally annexed this area around 1450 and began negotiations with Egypt in Syria. Karaindash built a temple with bas-relief tile ornaments in Uruk (Erech) around 1420. A new capital west of Baghdad, Dur Kurigalzu, was named after Kurigalzu I (*c.* 1415–*c.* 1390). His successors Kadashman-Enlil I (*c.* 1390–*c.* 1375) and Burnaburiash II (*c.* 1375–*c.* 1347) were in correspondence with the Egyptian rulers Amenhotep III and Akhenaton (Amenhotep IV). They were interested in trading their lapis lazuli and other items for gold as well as in planning political marriages. Kurigalzu II (*c.* 1345–*c.* 1324) fought against the Assyrians but was defeated by them. His successors sought to ally themselves with the Hittites in order to stop the expansion of the Assyrians. During the reign of Kashtiliash IV (*c.* 1242–*c.* 1235), Babylonia waged war on two fronts at the same time—against Elam and Assyria—ending in the catastrophic invasion and destruction of Babylon by Tukulti-Ninurta I. Not until the time of the kings Adad-shum-nasir (*c.* 1218–*c.* 1189) and Melishipak (*c.* 1188–*c.* 1172) was Babylon again able to experience a period of prosperity and peace. Their successors were again forced to fight, facing the conqueror, King Shutruk-Nahhunte of Elam (*c.* 1185–*c.* 1155). Cruel and fierce, the Elamites finally destroyed the dynasty of the Kassites during these wars (about 1155). Some poetical works lament this catastrophe.

Babylonia under the Kassites

Letters and documents of the time after 1380 show that many things had changed after the Kassites took power. The Kassite upper class, always a small minority, had been largely babylonized. Babylonian names were to be found even among the royalty, and they predominated among the civil servants and the officers. The new feudal character of the social structure showed the influence of the Kassites. Babylonian town life had revived on the basis of commerce and handicrafts. The Kassitic nobility, however, maintained the upper hand in the rural areas, their wealthiest representatives holding very large landed estates. Many of these holdings came from donations of the king to deserving officers and civil servants, considerable privileges being connected with such grants. From the time of Kurigalzu II these were registered on stone tablets or, more frequently, on boundary stones. After 1200 the number of these increased substantially, because the kings needed a steadily growing retinue of loyal followers. The boundary stones had pictures in bas-relief, very often a multitude of religious symbols, and frequently detailed inscriptions giving the borders of the particular estate; sometimes the deserts of the recipient were listed and his privileges recorded; finally, trespassers were threatened with the most terrifying curses. Agriculture and cattle husbandry were the main pursuits on these estates, and horses were raised for the light war chariots of the cavalry. There was an export trade in horses and vehicles, in exchange for raw material.

The decline of the Babylonian culture at the end of the

Old Babylonian period continued for some time under the Kassites. Not until approximately 1420 did the Kassites develop a distinctive style in architecture and sculpture. Kurigalzu I played an important part, especially in Ur, as a patron of the building arts. Poetry and scientific literature developed only gradually after 1400. The existence of earlier work is clear from poetry, philological lists, and collections of omens and signs that were in existence by the 14th century or before and have been discovered in the Hittite capital of Hattusas, in the Syrian capital of Ugarit, and even as far away as Palestine. Somewhat later, new writings appear—medical diagnoses and recipes, more Sumero–Akkadian word lists, and collections of astrological and other omens and signs with their respective interpretations. Most of these works are known today only from copies of more recent date. The most important of them all is the Babylonian epic of the creation of the world, *Enuma elish.* Composed by an unknown poet, in all probability in the 14th century, it tells the story of the god Marduk. He began as the god of Babylon and was elevated to be king over all other gods after having successfully accomplished the destruction of the powers of chaos. For almost 1,000 years this epic was recited during the new year's festival in the spring as part of the Marduk cult in Babylon. The literature of this time contains hardly any Kassitic words. Many scholars believe that the essential groundwork for the development of the subsequent Babylonian culture was laid during the later epoch of the Kassite era.

Kingdom of the Hurrians and the Mitanni. The weakening of the Semitic states in Mesopotamia after 1600 enabled the Hurrians to penetrate deeper into this region, where they founded numerous small states in the eastern parts of Asia Minor, Mesopotamia, and Syria. The Hurrians came from northwestern Iran, but their early history is almost unknown. After 1500, isolated dynasties appeared with Indo-Aryan names, but the significance of this is disputed. The fact that Old Indian technical terms appear in later records about horse breeding and that the names of Indian gods are used in some compacts of state led many scholars to assume that numerous groups of Aryans, closely related to the Indians, pushed into Asia Minor from the northeast. They were also credited with the introduction of the light war chariot with spoke wheels. This conclusion, however, is by no means established fact. So far it has not been possible to appraise the quantity and the political and cultural influence of the Aryans in Asia Minor relative to that of the Hurrians.

Empire of the Mitanni

Shortly after 1500 the kingdom of the Mitanni arose near the sources of the Khābūr River in Mesopotamia. Since no record or inscription of their kings has been unearthed, there is hardly anything known about the development and history of the Mitanni before King Tushratta. The Mitanni were known to the Egyptians under the name of Naharina, and Thutmose III fought frequently against them after 1468 BC. By 1440 the domain of the Mitanni king Saustatar (Saushatar) stretched from the Mediterranean all the way to the Zagros Mountains, in western Iran, including Alalakh, in northern Syria, as well as Nuzu and Arrapkha. The northern boundary dividing the Mitanni from the Hittites and the Hurrians was in all probability not fixed even under his successors Artatama and Shuttarna II, who married their daughters to the pharaohs Thutmose IV (1425–1417) and Amenhotep III (1417–1379). Tushratta (*c.* 1390–*c.* 1340), the son of Shuttarna, was able to maintain the kingdom he had inherited from his predecessors for many years. In his sometimes very long letters to Amenhotep III and Akhenaton he writes about commerce, his desire for gold, and marriage. Weakened by internal strife, the Mitanni kingdom eventually became a pawn between the rising kingdoms of the Hittites and the Assyrians.

The kingdom of the Mitanni was a feudal state led by a warrior nobility of Aryan or Hurrian origin. Frequently horses were bred on their large landed estates. Documents and contract agreements in Syria often mention a chariot-warrior caste that also constituted the social upper class in the cities. The aristocratic families usually received their landed property as an inalienable fief. Consequently, no documents on the selling of landed property are to be found in the great archives of Akkadian documents and letters discovered in Nuzu, near Kirkūk. The prohibition against selling landed property was often dodged, however, with a stratagem: the previous owner "adopted" a willing buyer against an appropriate sum of money. The wealthy lord Tehiptilla was "adopted" almost 200 times, acquiring tremendous holdings of landed property in this way without interference by the governmental authorities. He had gained his wealth through trade and commerce and in agriculture. For a long time, a prince was in charge of the royal governmental administration in the district capital. Society was highly structured in classes, ranks, and professions. The judiciary, patterned after the Babylonian model, was well organized; the documents place heavy emphasis on correct procedure.

Temple monuments of modest dimensions have been unearthed; in all probability, specific local traditions played a deciding factor in their design. The dead were probably buried outside the settlement. There is evidence that members of the royal family were cremated. Small artifacts, particularly seals, show a peculiar continuation of Babylonian and Assyrian traditions in their preference for the naturalistic representation of figures. There were painted ceramics with finely drawn decorations (white on a dark background). The strong position of the royal house was evident in the large palaces, existing even in district capitals. The palaces were decorated with frescoes. Because only a few settlements of the Mitanni have been unearthed in Mesopotamia, knowledge of the Mitanni arts and culture is as yet insufficient.

Assyria under Mitanni rule

The rise of Assyria. Very little can be said about northern Assyria during the 2nd millennium BC. Information on the old capital, Ashur, located in the south of the country, is somewhat more plentiful. The old lists of kings suggest that the same dynasty ruled continuously over Ashur from about 1670 on. All the names of the kings are given. But little else is known about Ashur before 1420. Almost all the princes had Akkadian names, and it can be assumed that their sphere of influence was rather small. Although Assyria belonged to the kingdom of the Mitanni for a long time, it seems that Ashur retained a certain autonomy. Located close to the boundary with Babylonia, it played that empire off against the Mitanni whenever possible. Puzur-Ashur III concluded a border treaty with Babylonia in 1490 as did Ashur-belnisheshu in 1415. Ashur-nadin-akhe II (*c.* 1402–*c.* 1393) was even able to obtain support from Egypt, which sent him a consignment of gold.

Ashur-uballit I (*c.* 1365–*c.* 1330) was at first subject to King Tushratta of the Mitanni. After 1350, however, he attacked Tushratta, presumably together with Suppiluliumas of the Hittites. Taking away from the Mitanni parts of northeastern Mesopotamia, Ashur-uballit I now called himself "Great King" and socialized with the King of Egypt on equal terms—arousing the indignation of the King of Babylonia. Ashur-uballit was the first to name Assyria the Land of Ashur, because the old name, Subartu, was often used in a derogatory sense in Babylonia. He ordered his short inscriptions to be partly written in the Babylonian language rather than the Assyrian, since this was considered refined. Marrying his daughter to a Babylonian, he intervened there energetically when Kassite nobles murdered his grandchild. Future generations came to consider him rightfully as the real founder of the Assyrian Empire. His son Enlil-nirari (*c.* 1328–*c.* 1320) also fought against Babylonia. Arik-den-ili (*c.* 1319–*c.* 1308) turned westward where he encountered Semitic tribes of the so-called Akhlamu-group.

Still greater successes were achieved by Adad-nirari I (*c.* 1307–*c.* 1275). Defeating the Kassite king Nazimaruttash, he forced him to retreat. After that he defeated the kings of the Mitanni, at first Shattuara I, then Wasashatta. This enabled him for a time to incorporate all of Mesopotamia into his empire as a province, although in later struggles he lost large parts to the Hittites. In the east, he was satisfied with the defense of his lands against the mountain people.

Adad-nirari's inscriptions were more elaborate than those

of his predecessors and were written in the Babylonian language. In them he declares that he feels called to these wars by the gods, a statement that was to be repeated by other kings after him. Assuming the old title of great king, he called himself "King of All." He enlarged the temple and the palace in Ashur and also developed the fortifications there, particularly at the banks of the Tigris River. He worked on large building projects in the provinces.

His son Shalmaneser I (*c.* 1274–*c.* 1245) attacked Uruatru (later called Urartu) in southern Armenia, which had allegedly broken away. But Shattuara II of Hanigalbat put him into a difficult situation, cutting his forces off from their water supplies. With courage born of despair, the Assyrians fought themselves free. They then set about reducing what was left of the Mitanni kingdom into an Assyrian province. The king claimed to have blinded 14,400 enemies in one eye—psychological warfare of a similar kind was used more and more as time went by. The Hittites tried in vain to save Hanigalbat. Together with the Babylonians they fought a commercial war against Ashur for many years. Like his father, Shalmaneser was a great builder. At the juncture of the Tigris and the Great Zab rivers he founded a strategically situated second capital, Kalakh (biblical Calah; modern Nimrūd).

His son was Tukulti-ninurta (*c.* 1244–*c.* 1208), the Ninos of Greek legends. Gifted but extravagant, he made his nation a great power. He carried off thousands of Hittites from eastern Anatolia. He fought particularly hard against Babylonia, deporting Kashtiliash IV to Assyria. When the Babylonians rebelled again, he plundered the temples in Babylon, an act regarded as a sacrilege, even in Assyria. The relationship between the king and his capital deteriorated steadily. For this reason the king began to build a new city, Kar-Tukulti-Ninurta, on the other side of the Tigris River. Ultimately, even his sons rebelled against him and laid siege to him in his city; in the end he was murdered. His victorious wars against Babylonia were glorified in an epic poem, but his empire broke up soon after his death. Assyrian power declined for a time, while that of Babylonia rose.

Assyria had suffered under the oppression of both the Hurrians and the Mitannis. Its struggle for liberation and the bitter wars that followed had much to do with its development into a military power. In his capital of Ashur, the king depended on the citizen class and the priesthood, as well as on the landed nobility that furnished him with the war-chariot troops.

Organization of the Assyrian state

Documents and letters show the important role agriculture played in the development of the state. Assyria was less dependent on artificial irrigation than was Babylonia. The breeding of horses was carried on intensively; remnants of elaborate directions for their training are extant. Trade and commerce were also of notable significance: metals were imported from Asia Minor or Armenia, tin from northwestern Iran, and lumber from the west. The opening up of new trade routes was oftentimes a cause and the purpose of war.

Assyrian architecture, derived from a combination of Mitannian and Babylonian influences, developed early quite an individual style. The palaces often had colourful wall decorations. The art of seal cutting, taken largely from the Mitanni, continued creatively on its own. The schools for scribes, where all the civil servants were trained, taught both the Babylonian and the Assyrian dialects of the Akkadian tongue. Babylonian works of literature were assimilated into Assyrian, often reworked into a partially different form. The Hurrian tradition remained strong in the military and political sphere while at the same time influencing the language.

ASSYRIA AND BABYLONIA AT THE END OF THE 2ND MILLENNIUM

Babylonia under the 2nd dynasty of Isin (c. 1156–c. 1025). In a series of heavy wars about which not much is known, Marduk-kabit-akheshu (*c.* 1156–*c.* 1139) established what came to be known as the 2nd dynasty of Isin. His successors were often forced to continue the fighting. The most famous king of the dynasty was Nebuchadrezzar I (*c.* 1124–*c.* 1103). He fought mainly against Elam, which had conquered most of Babylonia. His first attack miscarried because of an epidemic among his troops, but in a later campaign he conquered Susa, the capital of Elam, and returned the previously stolen statue of the god Marduk to its proper place. Soon thereafter the king of Elam was assassinated, and his kingdom fell apart into small states. This enabled Nebuchadrezzar to turn west, using the later years of peace to complete extensive building projects. After him, his son became king, succeeded by his brother Marduk-nadin-ahhe (*c.* 1098–*c.* 1081). At first successful in his wars against Assyria, he later experienced heavy defeat. A famine of catastrophic proportions triggered an attack from Aramaean tribes, the ultimate blow. His successors made peace with Assyria, but the country suffered more and more from repeated attacks by Aramaeans and other Semitic nomads. Even though some of the kings still had grand titles, they were unable to stem the progressive disintegration of their empire. There followed the era known as the 2nd dynasty of the Sealand (*c.* 1024–*c.* 1004), which included three usurpers. The first of these had the Kassitic name of Simbar-shikhu (*c.* 1024–*c.* 1007).

Toward the end of its reign, the dynasty of the Kassites became completely babylonized. The changeover to the dynasty of Isin, actually a succession of kings from different families, brought no essential transformation of the social structure. The feudal order remained. New landed estates came into existence in many places through grants to deserving officers; many boundary stones (*kudurru*) have been found that describe them. The cities of Babylonia retained much of their former autonomy. The border provinces, however, were administered by royally appointed governors with civil and military functions.

This was a period of creativity in the literary arts. The successes of Nebuchadrezzar I provided new material. One heroic epic, modelled upon older epics, celebrates his deeds, but unfortunately little of this is extant. Other material came from ancient myths. The best known poet is Sinleqeunnini (*c.* 1100–?) of Uruk (Erech), the poet of the later version of the *Epic of Gilgamesh* known as the Twelve-Tablet Poem. This version is distinguished by its greater stress on the human qualities of Gilgamesh and Enkidu, making it one of the great works of world literature. Another poet working at about the same time was the author of verses meditating on the workings of divine justice, a matter that had acquired vital importance in the contemporary religion of Babylon. This poem elaborates on the great suffering of a high official and his subsequent salvation by the god Marduk. Other religious poems have been preserved, but their time of origin is not certain. The later Babylonians with good reason regarded the time of Nebuchadrezzar I as one of the great eras of their history.

Assyria between 1200 and 1000. After a period of decline following Tukulti-Ninurta I, Assyria was consolidated and stabilized under Ashur-dan I (*c.* 1179–*c.* 1134) and Ashur-resh-ishi I (*c.* 1133–*c.* 1116). Several times forced to fight against Babylonia, the latter was even able to defend himself against an attack by Nebuchadrezzar I. According to the inscriptions, most of his building efforts were in Nineveh, rather than in the old capital of Ashur.

The reign of Tiglath-pileser I

His son Tiglath-pileser I (Tukulti-apal-Esharra, *c.* 1115–*c.* 1077) raised the power of Assyria to new heights. First he turned against a large army of the Mushki that had entered into southern Armenia from Asia Minor, defeating them decisively. After this he forced the small Hurrian states of southern Armenia to pay him tribute. Trained in mountain warfare themselves and helped by capable pioneers, the Assyrians were now able to advance far into the distant valleys of the interior. Their main enemies were the Aramaeans, the Semitic camel Bedouins whose many small states often combined against the Assyrians. Tiglath-pileser I also went to Syria and even reached the Mediterranean, where he took a sea voyage. After 1100 these campaigns led to conflicts with Babylonia. Tiglath-pileser conquered northern Babylonia and plundered Babylon, without decisively defeating Marduk-nadin-ahhe. In his own country the King paid particular attention to agriculture and fruit growing, improved the

administrational system, and developed more thorough methods of training scribes.

Three of his sons reigned after Tiglath-pileser, including Ashur-bel-kala (*c.* 1074–*c.* 1057). Like his father, he fought in southern Armenia and with Babylonia as his ally, against the Aramaeans. Disintegration of the empire could not be arrested, however. The grandson of Tiglath-pileser, Ashurnasirpal I (*c.* 1050–*c.* 1032), was sickly and unable to do more than defend Assyria proper against his enemies. Fragments of three of his prayers to the goddess Ishtar are preserved; among them is a penitential prayer in which he wonders about the cause of so much adversity. Referring to his many good deeds but admitting his guilt at the same time, he asks for forgiveness and health. According to the king, part of his guilt lay in neglecting to teach his subjects the fear of god in sufficient measure. After him, little is known for 100 years.

State, law, and justice under Tiglath-pileser

State and society during the time of Tiglath-pileser were not essentially different from those of the 13th century. Collections of laws, drafts, and edicts of the court exist that go back as far as the 14th century BC. Presumably, most of these remained in effect. One tablet defining the marriage laws shows that the social position of women in Assyria was lower than in Babylonia or Israel or among the Hittites. A man was allowed to send away his wife at his own pleasure with or without divorce money. In case of adultery, he was permitted to kill or maim her. Outside of her house the woman was forced to observe many restrictions, such as the wearing of a veil. It is not clear whether these regulations carried the weight of law, but they seem to have represented a reaction against practices that were more favourable to women. Two somewhat older marriage contracts, for example, grant equal rights to both partners, even in divorce. The women of the king's harem were subject to severe punishment, including beating, maiming, and death, along with those who guarded and looked after them. The penal laws of the time were generally more severe in Assyria than in other countries of the East. The death penalty was not uncommon. In less serious cases the penalty was forced labour after flogging. In certain cases there was trial by ordeal. One tablet treats the subject of landed property rights. Offenses against the established boundary lines called for extremely severe punishment. A creditor was allowed to force his debtor to work for him, but he could not sell him.

The greater part of Assyrian literature was either taken over from Babylonia or written by the Assyrians in the Babylonian dialect, who modelled their works upon Babylonian originals. The Assyrian dialect was used in legal documents, court and temple rituals, and collections of recipes—as, for example, in directions for manufacturing perfumes. A new art form was the picture tale: a continuing series of pictures carved on square steles of stone. The pictures, showing war or hunting scenes, begin at the top of the stele and run down around it, with inscriptions under the pictures explaining them. These and the finely cut seals show that the fine arts of Assyria were beginning to surpass those of Babylonia. Architecture and other forms of the monumental arts also began a further development, such as the double temple with its two towers (ziggurat). Colourful, enamelled tiles were used to decorate the façades.

ASSYRIA AND BABYLONIA C. 1000–C. 750 BC

Assyria and Babylonia until Ashurnasirpal II. The most important factor in the history of Mesopotamia in the 10th century was the continuing threat from the Aramaean seminomads. Again and again, the kings of both Babylonia and Assyria were forced to repel their invasions. Even though the Aramaeans were not able to gain a foothold in the main cities, there are evidences of them in many rural areas. Ashur-dan II (934–912) succeeded in suppressing the Aramaeans and the mountain people, in this way stabilizing the Assyrian boundaries. He was the first to use the Assyrian dialect in his written records.

The reign of Adad-nirari II

Adad-nirari II (*c.* 911–891) left very detailed accounts of his wars and his efforts to improve agriculture. He led six campaigns against Aramaean intruders from northern Arabia. In two campaigns against Babylonia he forced Shamash-mudammiq (about 930–904) to surrender extensive territories. Shamash-mudammiq was murdered, and a treaty with his successor, Nabu-shum-ukin (904–888) secured peace for many years. Tukulti-Ninurta II (890–884), the son of Adad-nirari II, reigned only for a short time. He preferred Nineveh to Ashur. His wars led him to southern Armenia. He was portrayed on steles in blue-yellow enamel in late Hittite style, showing him under the winged sun—a theme adopted from Egyptian art. His son Ashurnasirpal II (883–859) continued the policy of conquest and expansion. He left a very detailed account of his campaigns, which were impressive in their cruelty. Defeated enemies were impaled, flayed, or beheaded in great numbers. But mass deportations were found to serve the interests of the growing empire better than terror. Through the systematic exchange of native populations, conquered regions were denationalized. The result was a servile, submissive, mixed population in which the Aramaean element became the preponderant majority. This provided the labour force for the various public works in the metropolitan centres of the Assyrian Empire. Ashurnasirpal II rebuilt Kalakh, founded by Shalmaneser I, and made it his capital. Ashur remained the centre of the worship of the god Ashur—in whose name all the wars of conquest were fought. A third capital was Nineveh.

The reign of Ashurnasirpal II

Ashurnasirpal II was the first to use cavalry units to any large extent in addition to infantry and war-chariot troops. He was also the first to employ heavy, mobile battering rams and wall breakers in his sieges. Following after the conquering troops came officials from all branches of the civil service, because the king wanted to lose no time in incorporating the new lands into his empire. The supremacy of Assyria over its neighbouring states owed much to the proficiency of the government service under the leadership of the minister Gabbilani'-eresh. The campaigns of Ashurnasirpal II lead him mainly to southern Armenia and Mesopotamia. After a series of heavy wars, he incorporated Mesopotamia as far as the Euphrates River. A campaign to Syria encountered little resistance. There was no great war against Babylonia. Ashurnasirpal, like other Assyrian kings, may have been moved by religion not to destroy Babylonia, which had almost the same gods as Assyria. Both empires must have profited from mutual trade and cultural exchange. The Babylonians, under the energetic Nabu-apal-iddin (*c.* 887–855) attacked the Aramaeans in southern Mesopotamia and occupied the valley of the Euphrates River to about the mouth of the Khābūr River.

Ashurnasirpal, so brutal in his wars, was able to inspire architects, structural engineers, and artists and sculptors to heights never before achieved. He built and enlarged temples and palaces in several cities. His most impressive monument was his own palace in Kalakh, covering a space of 25,000 square metres (269,000 square feet). Hundreds of large limestone slabs were used in murals in the state rooms and living quarters. Most of the scenes were done in relief, but painted murals have also been found. Most of them depict mythological themes and symbolic fertility rites, with the king participating. Brutal war pictures were aimed to discourage enemies. The chief god of Kalakh was Ninurta, god of war and the hunt. The tower of the temple dedicated to Ninurta served also as an astronomical observatory. Kalakh soon became the cultural centre of the empire. Ashurnasirpal claimed to have entertained 69,574 guests at the opening ceremonies of his palace.

Shalmaneser III and Shamshi-Adad V of Assyria. The son and successor of Ashurnasirpal was Shalmaneser III (858–824). His father's equal in both brutality and energy, he was less realistic in his undertakings. His inscriptions, in a peculiar blend of Assyrian and Babylonian, record his considerable achievements but are not always able to conceal his failures. His campaigns were directed mostly against Syria. While he was able to conquer northern Syria and make it a province, in the south he could only weaken the strong state of Damascus and was unable, even after several wars, to eliminate it. In 841 he laid unsuccessful siege to Damascus. Also in 841 King Jehu of Israel was

Conquest of northern Syria

forced to pay tribute. In his invasion of Cilicia, Shalmaneser had only partial success. The same was true of the kingdom of Urartu in Armenia, from which, however, the troops returned with immense quantities of lumber and building stones. The king and, in later years, the general Daian-Ashur, went several times to western Iran, where they found such states as Mannai in northwestern Iran and, further away in the southeast, the Persians. They also encountered the Medes during these wars. Horse tribute was collected.

In Babylonia, Marduk-zakir-shumi I ascended the throne around the year 855. His brother Marduk-bel-usate rebelled against him, and in 851 the king was forced to ask Shalmaneser for help. Shalmaneser was only too happy to oblige; when the usurper had been finally eliminated (850), Shalmaneser went to southern Babylonia, which at that time was almost completely dominated by Aramaeans. There he encountered, among others, the Chaldeans, mentioned for the first time in 878 BC, who were to play a leading role in the history of later times; Shalmaneser made them tributaries.

During his long reign he built temples, palaces, and fortifications in Assyria as well as in the other capitals of his provinces. His artists created many statues and steles. Among the best known is the Black Obelisk, which includes a picture of Jehu of Israel paying tribute. The bronze doors of Imgur-Enlil in Assyria portray the course of his campaigns and other undertakings in rows of pictures, often very lifelike. Hundreds of delicately carved ivories were carried away from Phoenicia, and many of the artists along with them; these later made Kalakh a centre for the art of ivory sculpture.

In the last four years of the reign of Shalmaneser, the crown prince Ashur-danin-apal led a rebellion. The old King appointed his younger son Shamshi-Adad as the new crown prince. Forced to flee to Babylonia, Shamshi-Adad V (823–811) finally managed to regain the kingship with the help of Marduk-zākir-shumi I under humiliating conditions. As king he campaigned with varying success in southern Armenia and Azerbaijan, later turning against Babylonia. He won several battles against the Babylonian kings Marduk-balassu-iqbi and Baba-ahaiddina (about 818–12) and pushed through to Chaldea. Babylonia remained independent, however.

Adad-nirari III and his successors. Shamshi-Adad V died while Adad-nirari III (810–783) was still a minor. His Babylonian mother, Sammu-ramat, took over the regency, governing with great energy until 806. The Greeks, who called her Semiramis, credited her with legendary accomplishments, but historically little is known about her. Adad-nirari later led several campaigns against the Medes and also against Syria and Palestine. In 804 he reached Gaza, but Damascus proved invincible. He also fought in Babylonia, helping to restore order in the north.

Shalmaneser IV (*c.* 783–773) fought against Urartu, then at the height of its power under King Argishti (about 780–755). He successfully defended eastern Mesopotamia against attacks from Armenia. On the other hand, he lost most of Syria after a campaign against Damascus in 773. The reign of Ashur-dan III (772–755) was shadowed by rebellions and by epidemics of plague. Of Ashur-hirari V (754–746) little is known.

In Assyria, the feudal structure of society remained largely unchanged. Many of the conquered lands were combined to form large provinces. The governors of these provinces sometimes acquired considerable independence, particularly under the weaker monarchs after Adad-nirari III. Some of them even composed their own inscriptions. The influx of displaced peoples into the cities of Assyria created large metropolitan centres. The spoils of war, together with an expanding trade, favoured the development of a well-to-do commercial class. The dense population of the cities gave rise to social tensions that only the strong kings were able to contain. A number of the former capitals of the conquered lands remained important as capitals of provinces. There was much new building. A standing occupational force was needed in the provinces, and these troops grew steadily in proportion to the total military forces. The civil service also expanded, the largest administrative body being the royal court, with thousands of functionaries and craftsmen in the several residential cities.

The cultural decline around the year 1000 was overcome during the reigns of Ashurnasirpal II and Shalmaneser III. The arts in particular experienced a tremendous resurgence. Literary works continued to be written in Assyrian and were seldom of great importance. The literature that had been taken over from Babylonia was further developed with new writings, although one can rarely distinguish between works written in Assyria and works written in Babylonia. In religion, the official cults of Ashur and Ninurta continued, while the religion of the common people went its separate way.

In Babylonia, not much was left of the feudal structure; the large landed estates almost everywhere fell prey to the inroads of the Aramaeans, who were at first half nomadic. The leaders of their tribes and clans slowly replaced the former landlords. Agriculture on a large scale was no longer possible except on the outskirts of metropolitan areas. The predominance of the Babylonian schools for scribes may have prevented the emergence of an Aramaean literature. In any case, the Aramaeans seem to have been absorbed into the Babylonian culture. The religious cults in the cities remained essentially the same. The Babylonian Empire was slowly reduced to poverty, except perhaps in some of the cities. In 764, after an epidemic, the myth of pest god Erra was written by the poet Kabt-ilani-Marduk.

THE NEO-ASSYRIAN EMPIRE (746–609)

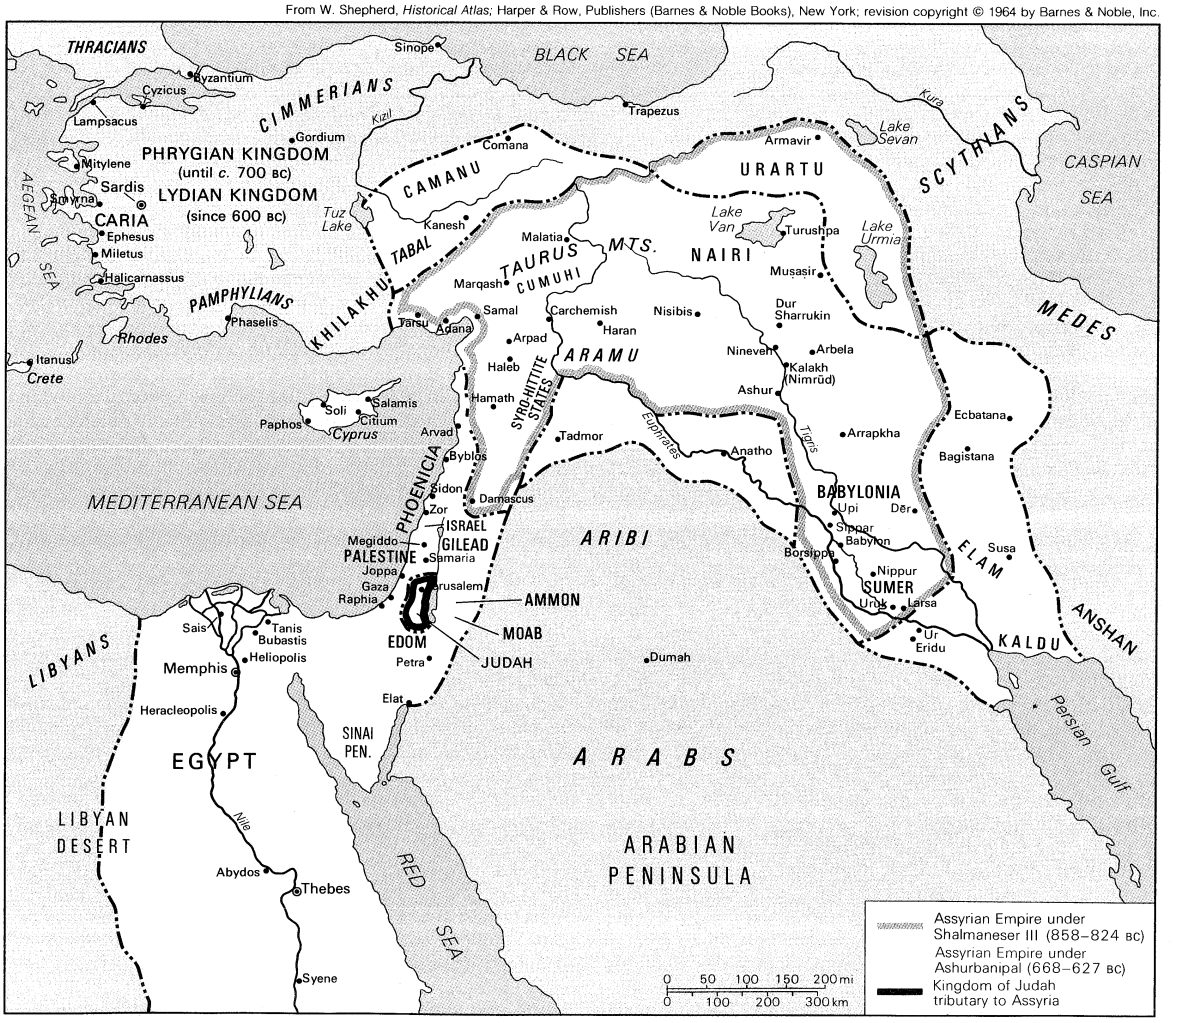
Tiglath-pileser III and Shalmaneser V. The decline of Assyrian power after 780 was notable; Syria and considerable lands in the north were lost. A military coup deposed King Ashur-nirari V and raised a general to the throne. Under the name of Tiglath-pileser III (746–727) he brought the empire to its greatest expanse. He reduced the size of the provinces in order to break the independence of the governors. He also invalidated the tax privileges of cities such as Ashur and Haran, in order to distribute the tax load more evenly over the entire realm. Military equipment was improved substantially. In 746 he went to Babylonia to aid Nabu-nasir (747–734) in his fight against Aramaean tribes. Tiglath-pileser beat the Aramaeans and then made visits to the large cities of Babylonia. Here he tried to get the support of the priesthood by patronizing their building projects. Babylonia retained its independence.

Assyria at its peak

His next undertaking was to throw back Urartu. His campaigns in Azerbaijan were designed to drive a wedge between Urartu and the Medes. In 743 he went to Syria, defeating there an army of Urartu. The Syrian city of Arpad, which had formed an alliance with Urartu, did not surrender so easily. It took Tiglath-pileser three years of siege to conquer Arpad, whereupon he massacred the inhabitants and destroyed the city. In 738 a new coalition formed against Assyria under the leadership of Samal of northern Syria. It was defeated, and all the princes from Damascus to eastern Anatolia were forced to pay tribute. Another campaign in 735, this time directed against Urartu itself, was only partly successful. In 734 Tiglath-pileser invaded Palestine, going as far as the Egyptian border. Damascus and Israel tried to organize resistance against him, seeking to bring Judah into their alliance. But Ahaz of Judah asked Tiglath-pileser for help. In 733 Tiglath-pileser devastated Israel and forced it to surrender large territories. In 732 he advanced upon Damascus, first devastating the gardens outside the city and then conquering the capital and killing the king, whom he replaced with a governor. The queen of southern Arabia, Samsia, was now obliged to pay tribute, being permitted in return to use the harbour of the city of Gaza, which was in Assyrian hands.

The death of King Nabonassar of Babylonia caused a chaotic situation to develop there, and the Aramaean Ukin-zer crowned himself king. In 731 Tiglath-pileser fought and beat him and his allies, but he did not capture Ukin-zer until 729. This time he did not appoint a new king for Babylonia but assumed the crown himself under the name Pulu (Pul in the Old Testament). In his

old age he abstained from further campaigning, devoting himself to the improvement of his capital Kalakh. He rebuilt the palace of Shalmaneser III, filled it with treasures from his wars, and decorated the walls with bas-reliefs. The latter were almost all of warlike character, as if designed to intimidate the onlooker with their presentation of gruesome executions. These pictorial narratives on slabs have also been found in several provincial capitals of Assyria.



Tiglath-pileser was succeeded by his son Shalmaneser V (726–722), who continued the policy of his father. As king of Babylonia he called himself Ululai. Almost nothing is known about his enterprises, since his successor destroyed all his inscriptions. The Old Testament relates that he marched against Hoshea of Israel in 724 after Hoshea had rebelled. He was probably assassinated during a three-year siege of Samaria. His successor maintained that the god Ashur had withdrawn his support of Shalmaneser V for acts of disrespect.

Sargon II (721–705) and Marduk-apal-iddina of Babylonia. It was probably a younger brother of Shalmaneser who ascended the throne of Assyria. Assuming the old name of Sharru-kin (Sargon in the Bible), meaning Legitimate King, he assured himself of the support of the priesthood and the merchant class by restoring privileges they had lost, particularly the tax exemptions of the great temples. The change of sovereign in Assyria triggered another crisis in Babylonia. An Aramaean prince from the south, Marduk-apal-iddina II (the biblical Merodach-Baladan), seized power in Babylon in 721 and was able to retain it until 710 with the help of Humbanigash I of Elam. A first attempt by Sargon to recover Babylonia miscarried when Elam defeated him in 721. During the same year the three-year siege of Samaria was brought to a close. The Samarian upper class was deported, and Israel became an Assyrian province. Samaria was repopulated with Syrians and Babylonians. Judah remained independent by paying tribute. In 720 Sargon squelched a rebellion in Syria that had been supported by Egypt. Then he defeated both Hanunu of Gaza and an Egyptian army near the Egyptian border. In 717 and 716 he campaigned in northern Syria, making the hitherto independent state of Carchemish one of his provinces. He also went to Cilicia in an effort to prevent further encroachments of the Phrygians under King Midas.

Sargon II's military campaigns

In order to protect his ally, the state of Mannai, in Azerbaijan, Sargon embarked on a campaign in Iran in 719 and incorporated parts of Media as provinces of his empire. But in 716 another war became necessary. At the same time, he was busy preparing a major attack against Urartu. Under the leadership of the crown prince Sennacherib, armies of agents infiltrated Urartu, which was also threatened from the north by the Cimmerians. Many of their messages and reports have been preserved. The longest inscription ever composed by the Assyrians about a year's enterprise (430 very long lines) is dedicated to this Urartu campaign of 714. Phrased in the style of a first report to the god Ashur, it is interlaced with stirring descriptions of natural scenery. The strong points of Urartu must have been well fortified. Sargon tried to avoid them by going through the province of Mannai and attacking the Median principalities on the eastern side of Lake Urmia. In the meantime, hoping to surprise the Assyrian troops, Rusas of Urartu had closed the narrow pass lying between Lake Urmia and Sahand Mount. Sargon, anticipating this, led a small band of cavalry in a surprise charge that developed into a great victory for the Assyrians. Rusas fled and died. The Assyrians pushed forward, destroying all the

The Assyrian Empire, 858–627 BC.

cities, fortifications, and even irrigation works of Urartu. They did not conquer Mannai itself but took possession of the mountain city of Muṣaṣir. The spoils were immense. The following years saw only small campaigns in Media, eastern Asia Minor, and against Ashdod, in Palestine. King Midas of Phrygia and some cities on Cyprus were quite ready to pay tribute.

Sargon was now free to settle accounts with Marduk-apal-iddina of Babylonia. Abandoned by his ally Shutruk-Nahhunte II of Elam, Marduk-apal-iddina found it best to flee: first to his native land on the Persian Gulf and later to Elam. Because the Aramaean prince had made himself very unpopular with his subjects, Sargon was hailed as the liberator of Babylonia. He complied with the wishes of the priesthood while at the same time putting down the Aramaean nobility. The modest title of governor of Babylonia was enough for him.

The founding of Dur Sharrukin

At first Sargon resided in Kalakh, but he then decided to found an entirely new capital north of Nineveh. He called the city Dur Sharrukin—Sargonsburg (now Khorsabad). He erected his palace on a high terrace in the northeastern part of the city. The temples to the main gods, smaller in size, were built within the palatial rectangle, which was surrounded by a special wall. This arrangement enabled Sargon to supervise the priests better than had been possible in the old, large temple complexes. One consequence of this design was that the figure of the king pushed the gods somewhat into the background, thereby gaining in importance. Wanting his palace to match the vastness of his empire, the King planned it in monumental dimensions. Stone reliefs of two winged bulls with human heads flanked the entrance—much larger than anything comparable built before. The walls were decorated with long rows of bas-reliefs showing scenes of war and festive processions. A comparison with a well-executed stele of the Babylonian king Marduk-apal-iddina shows that the fine arts of Assyria had far surpassed those of Babylonia. Sargon never completed his capital, though from 713 to 705 BC tens of thousands of labourers and hundreds of artisans worked upon the great city. Yet, with the exception of some magnificent buildings for public officials, only a few durable edifices were completed in the residential section. In 705, in a campaign in northwestern Iran, the King was ambushed and killed. His corpse remained unburied, to be devoured by birds of prey. Sargon's son Sennacherib, who had quarrelled with his father, was inclined to believe with the priests that the death of the King was a punishment from the gods.

Sennacherib. Sennacherib (Assyrian Sin-akhkhe-eriba; 704–681) was well prepared for his position as sovereign. With him Assyria acquired an exceptionally clever and gifted, though often extravagant, ruler. His father, interestingly enough, is not mentioned in any of his many inscriptions. He left the new city of Dur Sharrukin at once and resided in Ashur for a few years, until in 701 he made Nineveh his capital.

Sennacherib had considerable difficulty with Babylonia. In 703 Marduk-apal-iddina again crowned himself king with the aid of Elam, proceeding at once to ally himself with other enemies of Assyria. After nine months he was forced to withdraw when Sennacherib defeated a coalition army consisting of Babylonians, Aramaeans, and Elamites. The new puppet king of Babylonia was Bel-ibni (702–700), who had been raised in Assyria.

The siege of Jerusalem

In 702 Sennacherib undertook a predatory raid into western Iran, then moved against Syria and Palestine in 701 to smash a coalition of Phoenicians, Palestinians, and Egyptians. Sidon immediately expelled its ruler, who was hostile to Assyria. The other allies surrendered or were beaten. One Egyptian army was defeated at Eltekeh. Only Hezekiah of Judah did not surrender, fearing grave judgment and retribution. Failing in their efforts to incite the people of Jerusalem against their king, the Assyrians laid siege to the city. The Old Testament relates these events in great detail. The most likely reconstruction of events is that, when an epidemic broke out among the Assyrian troops during the siege of Jerusalem, Sennacherib found it advisable to return to Assyria. In the course of time several generations of storytellers in Judah swelled the number of Assyrian dead to 185,000. Hezekiah nevertheless paid tribute to Nineveh.

Bel-ibni of Babylonia seceded from the union with Assyria in 700. Sennacherib moved quickly, defeating Bel-ibni and replacing him with Sennacherib's oldest son, Ashurnadin-shum. The next few years were relatively peaceful. The King used this time to prepare a decisive attack against Elam, which time and again had supported Babylonian rebellions. The overland route to Elam had been cut off and fortified by the Elamites. Sennacherib had ships built in Syria and at Nineveh. The ships from Syria were moved on rollers from the Euphrates to the Tigris. The fleet sailed downstream and was quite successful in the lagoons of the Persian Gulf and along the southern coastline of Elam. The Elamites launched a counteroffensive by land, occupying Babylonia and putting a man of their choice on the throne. Not until 693 were the Assyrians again able to fight their way through to the north. Finally, in 689, Sennacherib had his revenge. Babylon was conquered and completely destroyed, the temples plundered and levelled with the ground. The waters of the Arakhtu Canal were diverted over the ruins, and the inner city remained almost totally uninhabited for eight years. Even many Assyrians were indignant at this, believing that the Babylonian god Marduk must be grievously offended at the destruction of his temple and the carrying off of his image. Marduk was also an Assyrian deity, to whom many Assyrians turned in time of need. A political-theological propaganda campaign was launched to explain to the people that what had taken place was in accord with the wish of most of the gods. A story was written in which Marduk, because of a transgression, was captured and brought before a tribunal. Only a part of the commentary to this botched piece of literature is extant. Even the great poem of the creation of the world, the *Enuma elish,* was altered: the god Marduk was replaced by the god Ashur. Sennacherib's boundless energies brought no gain to his empire, however, and probably weakened it. The tenacity of the King can be seen in his building projects: for example, when Nineveh needed water for irrigation, Sennacherib had his engineers divert the waters of a tributary of the Great Zab River. The canal had to cross a valley at Jerwan. An aqueduct was constructed, consisting of about 2,000,000 blocks of limestone, with five huge, pointed archways over the brook in the valley. The bed of the canal on the aqueduct was sealed with cement containing magnesium. Parts of this aqueduct are still standing today. The King wrote of these and other technological accomplishments in minute detail, with illustrations.

The destruction of Babylon

Sennacherib built a huge palace in Nineveh, adorned with reliefs, some of them depicting the transport of colossal bull statues by water and by land. Many of the rooms were decorated with pictorial narratives in bas-relief telling of war and of building activities. Considerable advances can be noted in artistic execution, particularly in the portrayal of landscapes and animals. Outstanding are the depictions of the battles in the lagoons, the life in the military camps, and the deportations.

In 681 BC there was a rebellion. Sennacherib was assassinated by one or two of his sons in the temple of the god Ninurta. This god, along with the god Marduk, had been badly treated by Sennacherib, and the event was widely regarded as punishment of divine origin.

Esarhaddon. Ignoring the claims of his older brothers, an imperial council appointed Esarhaddon (Ashur-akhiddina, 680–669) as the successor. The choice is all the more difficult to explain in that Esarhaddon, quite unlike his father, was friendly toward the Babylonians. It can be assumed that his energetic and designing mother, Nakija, who hailed from Syria or Judah, used all her influence in his behalf to override the national party of Assyria. He may very well have been a partner in plotting the murder of his father; at any rate, he was able to procure the loyalty of his father's army. His brothers had to flee to Urartu. In his inscriptions, Esarhaddon always mentions both his father and grandfather.

Esarhaddon's policies

Defining the destruction of Babylon explicitly as punishment by the god Marduk, the new king soon ordered the

reconstruction of the city. He referred to himself only as governor of Babylonia and by his policies obtained the support of the cities of Babylonia. At the beginning of his reign the Aramaean tribes were still allied with Elam against him, but Urtaku of Elam (675–664) signed a peace treaty and freed him for campaigning elsewhere. In 679 he stationed a garrison at the Egyptian border, because Egypt, under the Ethiopian king Taharqa, was intervening in Syria. He put down with great severity a rebellion of the combined forces of Sidon, Tyre, and other Syrian cities. The time was ripe to attack Egypt, which was suffering under the rule of the Ethiopians and by no means a united country. Esarhaddon's first attempt in 674/673 miscarried. In 671 BC, however, his forces took Memphis, the Egyptian capital. Assyrian consultants were assigned to assist the princes of the 22 provinces, their main duty being the collection of tribute.

Occasional threats came from the mountainous border regions of eastern Anatolia and Iran. Pushed forward by the Scythians, the Cimmerians in northern Iran and Transcaucasia tried to get a foothold in Syria and western Iran. Esarhaddon allied himself with the Scythian king Partatua by giving him one of his daughters in marriage. In so doing he checked the movement of the Cimmerians. Nevertheless, the apprehensions of Esarhaddon can be seen in his many offerings, supplications, and requests to the sun-god. These were concerned less with his own enterprises than with the plans of enemies and vassals and the reliability of civil servants. The priestesses of Ishtar had to reassure the King constantly by calling out to him, "Do not be afraid." Previous kings had never needed this kind of encouragement.

At home the King was faced with serious difficulties from factions in the court. His oldest son had died early. The national party suspected his second son Shamashshum-ukin of being too friendly with the Babylonians; he may also have been considered unequal to the task of kingship. The King's third son, Ashurbanipal, was given the succession in 672, Shamash-shum-ukin remaining crown prince of Babylonia. This arrangement caused much dissension, and some farseeing civil servants warned of disastrous effects. Nevertheless, the Assyrian nobles, priests, and city leaders were sworn to just such an adjustment of the royal line; even the vassal princes had to take an oath of allegiance to Ashurbanipal.

Another matter of deep concern for Esarhaddon was his failing health. He regarded eclipses of the moon as particularly alarming omens, and in order to prevent a fatal illness from striking him at such times he had substitute kings chosen who ruled during the three such critical periods that occurred during his 12-year reign. The replacement kings died or were put to death after their brief term of office. During his off terms Esarhaddon called himself "Mister Peasant." This practice implied that the gods could not distinguish between the real king and a false one—quite contrary to the usual assumptions of the religion.

Esarhaddon enlarged and improved the temples in both Assyria and Babylonia. He also constructed a palace in Kalakh, using many of the picture slabs of Tiglath-pileser III. The works that remain are not on the level of those of either his predecessors or of Ashurbanipal. He died while on an expedition to put down a revolt in Egypt.

Ashurbanipal (668–627) and Shamash-shum-ukin (668–648). Although the death of his father occurred far from home, Ashurbanipal assumed his kingship as planned. He may have owed his fortunes to the intercession of his grandmother Nakija, who had recognized his superior capacities. He tells of his diversified education by the priests and his training in armour making as well as in other military arts. He may have been the only king in Assyria with a scholarly background. As crown prince he had also studied the administration of the vast empire. The record notes that the gods granted him a record harvest during the first year of his reign. There were also good crops in subsequent years. During these first years he was also successful in foreign policy, and his relation to his brother in Babylonia was good.

Ashurbanipal's education and early years

In 668 he put down a rebellion in Egypt and drove out King Taharqa. But in 664 the nephew of Taharqa, Tanutamon, gathered forces for a new rebellion. Ashurbanipal went to Egypt, pursuing the Ethiopian prince far into the south. His smashing victory moved Tyre and other parts of the empire to resume regular payments of tribute. Ashurbanipal installed Psamtik as prince over the Egyptian region of Sais. In 656 Psamtik dislodged the Assyrian garrisons with the aid of Carian and Ionian mercenaries, making Egypt again independent. Ashurbanipal did not attempt to reconquer it again. A former ally of Assyria, Gyges of Lydia had now aided Psamtik in his rebellion. In return, Assyria did not help Gyges when he was attacked by the Cimmerians. Gyges lost his throne and his life. His son Ardys decided that the payment of tribute to Assyria was a lesser evil than conquest by the Cimmerians.

Graver difficulties loomed in southern Babylonia, which was attacked by Elam in 664. Another attack came in 653, whereupon Ashurbanipal sent a large army that decisively defeated the Elamites. Their king was killed, and some of the Elamite states were encouraged to secede. Elam was no longer strong enough to assume an active part on the international scene. This victory had serious consequences for Babylonia. Shamash-shum-ukin had grown weary of being patronized by his domineering brother. He formed a secret alliance in 656 with the Iranians, Elamites, Aramaeans, Arabs, and Egyptians, directed against Ashurbanipal. The withdrawal of defeated Elam from this alliance was probably the reason for a premature attack by Shamash-shum-ukin at the end of the year 652, without waiting for the promised assistance from Egypt. Ashurbanipal, taken by surprise, soon pulled his troops together. The Babylonian army was defeated and Shamash-shum-ukin was surrounded in his fortified city of Babylon. His allies were not able to stand on their own against the Assyrians. Reinforcements of Arabian camel troops were also defeated. The city of Babylon was under siege for three years. It fell in 648 amid scenes of horrible carnage, Shamash-shum-ukin dying in his burning palace.

Defeat of Shamash-shum-ukin

After 648 the Assyrians made a few punitive attacks on the Arabs, breaking the forward thrust of the Arab tribes for a long time to come. The main objective of the Assyrians, however, was a final settlement of their relationship with Elam. The refusal of Elam in 647 to extradite an Aramaean prince was used as pretext for a new attack that drove deep into its territory. The assault on the solidly fortified capital of Susa followed, probably in 646. The Assyrians destroyed the city, including its temples and palaces. Vast spoils were taken. As usual, the upper classes of the land were exiled to Assyria and other parts of the empire, and Elam became an Assyrian province. Assyria had now extended its domain to southwestern Iran. Cyrus I of Persia sent tribute and hostages to Nineveh, hoping perhaps to secure protection for his borders with Media. Little is known about the last years of Ashurbanipal's reign.

Ashurbanipal left more inscriptions than any of his predecessors. His campaigns were not always recorded in chronological order but clustered in groups according to their purpose. The accounts were highly subjective. One of his more remarkable accomplishments was the founding of the great library in Nineveh, which is today one of the most important sources for the study of that era. The King himself supervised its construction. Important works were kept in more than one copy, some intended for the King's personal use. The work of arranging and cataloging drew upon the experience of centuries in the management of collections in huge temple archives such as the one in Ashur. In his inscriptions Ashurbanipal tells of becoming an enthusiastic hunter of big game, acquiring a taste for it during a fight with marauding lions. In his palace at Nineveh the long rows of hunting scenes show what a masterful artist can accomplish in bas-relief; with these reliefs Assyrian art reached its peak. In the series picturing his wars, particularly the wars fought in Elam, the scenes are overloaded with human figures. Those portraying the battles with the Arabian camel troops are magnificent in execution.

One reason for the durability of the Assyrian Empire was

State and culture in the Neo-Assyrian Empire

the practice of deporting large numbers of people from conquered areas and resettling others in their place. This kept many of the conquered nationalities from regaining their power. Equally important was the installation in conquered areas of a highly developed civil service under the leadership of trained officers. The highest ranking civil servant carried the title of *tartan,* a Hurrian word. The *tartan*s also represented the king during his absence. In descending rank were the palace overseer, the main cupbearer, the palace administrator, and the governor of Assyria. The generals often held high official positions, particularly in the provinces. The civil service numbered about 100,000, many of them former inhabitants of subjugated provinces. Prisoners became slaves but were later often freed.

No laws are known for the empire, although documents point to the existence of rules and standards for justice. Those who broke contracts were subject to severe penalties, even in cases of minor importance: the sacrifice of a son or the eating of a pound of wool and drinking of a great deal of water afterward, which led to a painful death. The position of women was inferior, except for the queen and some priestesses.

Good estimates of the economic situation of the period do not exist. The arts and crafts experience a golden age in Assyria; many qualified artists and artisans went there, bringing renewed creativity and new ideas. Finds of Aramaic texts from the Assyrian era are notably few because neither papyrus nor parchment preserved well in the climate; evidence of literary efforts in other languages is lacking, except of course in the border areas of Syria-Palestine and Judah.

Babylonia lagged behind Assyria during the period. Many small wars severely hampered the development of the country, undermining agricultural production and commerce. The temples fared best because many Assyrians supported them, but they left no document—a fact that can hardly be regarded as accidental. The continuing existence of scholarly study can be inferred from extant letters and the continuation of old traditions. The pictorial arts, however, were neglected, and the Babylonian artists may have found better jobs in Assyria. This period saw the first use of ancestral names as family appelations.

The era apparently was not fruitful for literary accomplishments either in Babylonia or Assyria. The large inscriptions of the kings were the most important achievements in Assyria; there were also hymns and prayers, executed mostly in the traditional style, and unusual oracle texts in the Assyrian language. Both countries saw the beginnings of a historical literature, going far beyond the ordinary chronicals.

Decline of the Assyrian Empire. Few historical sources remain for the last 30 years of the Assyrian Empire. There are no extant inscriptions of Ashurbanipal after 640 BC, and the few surviving inscriptions of his successors contain only vague allusions to political matters. In Babylonia the silence is almost total until 625 BC, when the chronicles resume. The rapid downfall of the Assyrian Empire was formerly attributed to military defeat, although it was never clear how the Medes and the Babylonians alone could have accomplished this. More recent work has established that after 635 a civil war occurred, weakening the empire, so that it could no longer stand up against a foreign enemy. Ashurbanipal had twin sons. Ashur-etel-ilani was appointed successor to the throne, but his twin brother Sin-shar-ishkun did not recognize him. The fight between them and their supporters forced the old king to withdraw to Haran, in 632 at the latest, perhaps ruling from there over the western part of the empire until his death in 627. Ashur-etel-ilani governed in Assyria from about 633 on, but a general, Sin-shum-lisher, soon rebelled against him and proclaimed himself counterking. Some years later (629?) Sin-sharishkun finally succeeded in obtaining the kingship. In Babylonian documents dates can be found for all three kings. To add to the confusion, until 626 there are also dates of Ashurbanipal and a king named Kandalanu. In 626 the Chaldean Nabopolassar revolted from Uruk and occupied Babylon. There were several changes in government. King Ashur-etel-ilani was forced to withdraw to the west, where he died sometime after 625.

Internal struggles in the last years of the empire

Around the year 626 the Scythians laid waste to Syria and Palestine. In 625 the Medes became united under Cyaxares and began to conquer the Iranian provinces of Assyria. One chronicle relates of wars between Sin-sharishkun and Nabopolassar in Babylonia in 625–623. It was not long until the Assyrians were driven out of Babylonia. In 616 the Medes struck against Nineveh, but, according to the Greek historian Herodotus, were driven back by the Scythians. In 615, however, the Medes conquered Arrapkha (Kirkūk) and in 614 the old capital of Ashur, looting and destroying the city. Now Cyaxares and Nabopolassar made an alliance for the purpose of dividing Assyria. In 612 Kalakh and Nineveh succumbed to the superior strength of the allies. The revenge taken on the Assyrians was terrible: 200 years later Xenophon found the country still sparsely populated.

Sin-shar-ishkun, king of Assyria, found death in his burning palace. The commander of the Assyrian army in the west crowned himself king in the city of Haran, assuming the name of the founder of the empire, Ashuruballit II (611–609 BC). Ashuruballit had to face both the Babylonians and the Medes. They conquered Haran in 610, without, however, destroying the city completely. In 609 the remaining Assyrian troops had to capitulate. With this event, Assyria disappeared from history. The great empires that succeeded it learned a great deal from the hated Assyrians, both in the arts and in the organization of their states.

THE NEO-BABYLONIAN EMPIRE (626–539)

The Chaldean kings

The Chaldeans, who inhabited the coastal area near the Persian Gulf, had never been entirely pacified by the Assyrians. About 630 Nabopolassar became king of the Chaldeans. In 626 he forced the Assyrians out of Uruk and crowned himself king of Babylonia. He took part in the wars aimed at the destruction of Assyria. At the same time, he began to restore the dilapidated network of canals in the cities of Babylonia, particularly those in Babylon itself. He fought against the Assyrian Ashuruballit II and then against Egypt, his successes alternating with misfortunes. In 605 Nabopolassar died in Babylon.

Campaigns in Syria and Palestine

Nebuchadrezzar (Nabu-kudurri-usur) II. Nabopolassar had named his oldest son after the famous king of the second dynasty of Isin, had trained him carefully for his prospective kingship, and had shared responsibility with him. When the father died in 605, Nebuchadrezzar was with his army in Syria; he had just crushed the Egyptians in a cruel, bloody war and pursued them into the south. On receiving the news of his father's death, Nebuchadrezzar returned immediately to Babylon. In his numerous inscriptions he tells but rarely of his many wars. The Babylonian chronicle is extant only for the years 605–594, and not much is known from other sources about the later years of this famous king. He went very often to Syria and Palestine—at first to drive out the Egyptians. In 604 he took the Philistine city of Ashkelon. In 601 he tried to push forward into Egypt but was forced to pull back after a bloody, undecided battle and to regroup his army in Babylonia. After smaller incursions against the Arabs of Syria, he attacked Palestine at the end of 598. Joiakin of Judah had rebelled, counting on help from Egypt. According to the chronicle, Jerusalem was taken on March 16, 597, and King Joiakin, together with at least 3,000 Jews, were led into exile in Babylonia. They were treated well there, according to the documents. Zedekiah was appointed the new king. In 596, when danger threatened from the east, Nebuchadrezzar marched to the Tigris River and induced the enemy to withdraw. After a revolt in Babylonia had been crushed with much bloodshed, there were other campaigns in the west.

According to the Old Testament, Judah rebelled again in 589; Jerusalem was under siege. The city fell after 18 months of siege and was completely destroyed. Many thousands of Jews were forced into "Babylonian exile," and their country was reduced to a province of the Babylonian Empire. The revolt had been caused by an Egyptian invasion that pushed as far as Sidon. Nebuchadrezzar laid

siege to Tyre for 13 years without taking the city, because there was no fleet at his disposal. In 568/567 he attacked Egypt, again without much success, but from then on the Egyptians refrained from further attacks on Palestine. Nebuchadrezzar lived at peace with Media throughout his reign and acted as a mediator after the Median-Lydian war of 590–585.

The Babylonian Empire under Nebuchadrezzar extended to the Egyptian border. It had a well-functioning administrative system. Though he had to collect extremely high taxes and tributes in order to maintain his armies and carry out his building projects, Nebuchadrezzar made Babylonia one of the richest lands in western Asia—the more astonishing because it had been rather poor when it was ruled by the Assyrians. Babylon was the largest city of the "civilized world." The King maintained the existing canal systems and built many supplementary canals, making the land even more fertile. Trade and commerce flourished during his reign.

Nebuchadrezzar's building activities surpassed those of most of the Assyrian kings. He fortified the old double walls of Babylon, adding another triple wall outside the old wall. In addition, he erected another wall, the Median Wall, north of the city between the Euphrates and the Tigris rivers. According to Greek estimates, the Median Wall may have been about 30 metres (100 feet) high. He enlarged the old palace and added many wings, so that hundreds of rooms with large inner courts were now at the disposal of the central offices of the empire. Colourful glazed-tile bas-reliefs decorated the walls. Terrace gardens, called hanging gardens in later accounts, were added. Hundreds of thousands of workers must have been required for these projects. The temples were objects of special concern. He devoted himself first and foremost to the completion of the Tower of Babel. Its base measured 91 metres (about 300 feet) on each side and 91 metres in height. There were five terrace-like gradations surmounted by a temple, the whole tower being about twice the height of those of other temples. The wide street used for processions led along the eastern side by the inner city walls and crossed at the enormous Ishtar Gate with its world-renowned bas-relief tiles. The King also built many smaller temples throughout the country.

The Tower of Babel

The last kings of Babylonia. Awil-Marduk (in the Old Testament Evil-Merodach, 561–560), the son of Nebuchadrezzar, was unable to win the support of the priests of Marduk. His reign did not last long, and he was soon eliminated. His brother-in-law and successor, Nergal-sharusur (in classical sources, Neriglissar, 559–556), was a general who undertook a campaign in 557 into the "rough" Cilician land, which may have been under the control of the Medes. His land forces were assisted by a fleet. His still-minor son Labashi-Marduk was murdered not long after that, allegedly because he was not suitable for his job.

Nabonidus and Belshazzar

The next king was the Aramaean Nabonidus (555–539) from Haran, one of the most interesting and enigmatical figures of ancient times. His mother, Addagoppe, was a priestess of the god Sin in Haran, who came to Babylon and managed to get responsible offices for her son at court. The god of the moon rewarded her piety with a long life—she lived to be 102—and she was buried in Haran with all the honours of a queen in 547. It is not clear which powerful faction in Babylon supported the kingship of Nabonidus; it may have been one opposing the priests of Marduk, who had become extremely powerful. The King raided Cilicia in 555 and secured the surrender of Haran, which had been ruled by the Medes. He concluded a treaty of defense with Astyages of Media against the Persians, who had become a growing threat since 559 under their king Cyrus II. He also devoted himself to the renovation of many temples, taking an especially keen interest in old inscriptions. He gave preference to his god Sin and had powerful enemies in the priesthood of the Marduk temple. Modern excavators have found fragments of propaganda poems written against Nabonidus and also in support of him. Both traditions continued in Judaism.

Internal difficulties and the recognition that the narrow strip of land from the Persian Gulf to Syria could not be defended against a major attack from the east induced Nabonidus to leave Babylonia around 552 and to reside in Taima in northern Arabia. There he organized an Arabian province with the assistance of Jewish merecenaries. His viceroy in Babylonia was his son Belsharusur, the Belshazzar of the Book of Daniel in the Bible. Cyrus turned this to his own advantage by annexing Media in 550. Nabonidus, in turn, allied himself with Croesus of Lydia in order to fight Cyrus. But, when Cyrus attacked Lydia and annexed it in 546, Nabonidus was not able to help Croesus. Cyrus bode his time. In 542 Nabonidus returned to Babylonia, where his son had been able to maintain good order in external matters but had not overcome a growing internal opposition to his father. Consequently, Nabonidus' career after his return was of short duration, though he tried very hard to regain the support of the Babylonians. He appointed his daughter to be high priestess of the god Sin in Ur, thus returning to the Sumerian-Old Babylonian religious custom. The priests of Marduk looked to Cyrus, hoping to have better relations with him than with Nabonidus; they promised Cyrus the surrender of Babylon without a fight if he would grant them their privileges in return. In 539 Cyrus attacked northern Babylonia with a large army, defeating Nabonidus, and entered the city of Babylon without a battle. The other cities did not offer any resistance, either. Nabonidus surrendered, receiving a small territory in eastern Iran. Tradition has confused him with his great predecessor Nebuchadrezzar II. The Bible refers to him as Nebuchadrezzar in the Book of Daniel.

Babylonia's peaceful submission to Cyrus saved it from the fate of Assyria. It became a territory under the Persian crown but kept its cultural autonomy. Even the racially mixed western part of the Babylonian Empire submitted without resistance.

Culture of the Neo-Babylonian Empire

The Babylonians by 620 had grown tired of Assyrian rule. They were also weary of internal struggle. They were easily persuaded to submit to the order of the Chaldean kings. The result was a surprisingly quick social and economic consolidation, helped along by the fact that after the fall of Assyria no external enemy threatened Babylonia for more than 60 years. In the cities, the temples were an important element of the economy, having vast benefices at their disposal. The business class regained its strength, not only in the trades and commerce but also in the management of agriculture in the metropolitan areas. Livestock breeding—sheep, goats, beef cattle, and also horses—flourished, as did poultry farming. The cultivation of corn, dates, and vegetables grew in importance. Much was done to improve communications, both by water and by land, with the western provinces of the empire. The collapse of the Assyrian Empire had the consequence that many trade arteries were rerouted through Babylonia instead. Another consequence of the collapse was that the city of Babylon became a world centre.

The immense amount of documentary material and correspondence that has survived has not yet been fully analyzed. No new system of law or administration seems to have developed during that time. The Babylonian dialect gradually became Aramaicized, still written primarily on clay tablets that often bore added material in Aramaic lettering. Parchment and papyrus documents have not survived. In contrast to advances in other fields, there is no evidence of much artistic creativity. Aside from some of the inscriptions of the kings, especially Nabonidus, which were not comparable from a literary standpoint with those of the Assyrians, the main efforts were devoted to the rewriting of old texts. In the fine arts, only few monuments have any suggestion of new tendencies.

(W.T.v.S.)

MESOPOTAMIAN ART AND ARCHITECTURE

The name Mesopotamia has been used with varying connotations by ancient writers. If, for convenience, it is to be considered synonymous with the modern state of Iraq, it can be seen in terms of two fairly well defined provinces: a flat alluvial plain in the south and, in the north, the uplands through which the country's twin rivers flow in their middle courses. This geographical division of the

area is reflected in the history of its cultural development from the earliest times.

The first traces of settled communities are found in the northern region and date from the mid-6th millennium BC, a period that archaeologists associate with the transition from a Neolithic to a Chalcolithic age. It is of some importance that this period also corresponds to the earliest use of painted ornament on pottery vessels, since the designs used for this purpose are the most reliable criteria by which ethnological groupings and migratory movements can be distinguished. Archaeologically, such groupings are, for the most part, arbitrarily named after the site at which traces of them were first found, and the same names are sometimes attributed to the prehistoric periods during which they were predominant. Hence, Hassuna, Hassuna-Samarra, and Halaf in northern Iraq are names given to the first three periods during which known early settlements were successively occupied by peoples whose relations were apparently with Syria and Anatolia. The designs on their pottery, sometimes in more than one colour, usually consist of zones filled with "geometric" ornament in patterns reminiscent of woven fabrics, and they are often adapted to the shape of the vessels with creditable artifice. Only in Hassuna-Samarran pottery do devices occasionally appear that consist of animal, bird, or even human figures, ingeniously stylized and aesthetically attractive; but such motifs appear to be adopted from contemporary Iranian ceramics. The only other notable art form popular at this time is that of hominoid figurines of stone or clay, associated with primitive religious cults; however, their formal idiosyncracies vary greatly from group to group, and the meaning of their symbolism is unknown. Nor can they—or the pottery designs—be considered as ancestral to Mesopotamian art of historical times, the antecedents of which must be sought in southern Iraq.

Here, in the delta, the earliest phase of prehistory is associated with the name Ubaid 1; and, since this phase has a parallel in Susiana, north of the Iranian frontier, the first settlers in both areas may have a common origin. Among these settlers, according to some scholars, was the germ of Sumerian genius, but this is not indisputably authenticated until the end of the 4th millennium. By 3100 BC, however, the presence of the Sumerians is finally proved by the invention of writing as a vehicle for their own language; from then onward, successive phases in the evolution of Sumerian art can satisfactorily be studied.

Three factors influencing Mesopotamian art

Three factors may be recognized as contributing to the character of Mesopotamian art and architecture. One is the sociopolitical organization of the Sumerian city-states and of the kingdoms and empires that succeeded them. From the earliest times, cities were fortified by and adorned with public buildings; irrigation systems were organized and jealously protected; armies were efficiently equipped and troops trained in concerted action; victories were celebrated and treaties ratified. Because interestate warfare or foreign conquests were primary preoccupations of Mesopotamian rulers, it is understandable that in most periods a certain class of artworks was dedicated simply to the glorification of their military prowess. But a second and even more important factor is the major role played by organized religion in Mesopotamian affairs of state. For, particularly in Sumerian times, the municipal and economic organization of a city was the responsibility of the temple, with its hierarchical priesthood in which was vested an authority almost equal to that of the ruler and his advisory council of elders. Accordingly, in the early days of Sumer and Babylonia, architectural attention was paid primarily to religious buildings, and all sculpture served religious purposes. The elaboration and adornment of palaces was an innovation of Assyrian times (see below *Assyrian period*).

The third factor that contributed to the character of Mesopotamian art is the influence of the natural environment. The practical limitations imposed upon both artist and architect by the geology and climate of southern Iraq are immediately apparent. Since no stone or wood was available in the alluvial plain, sculptors were dependent on scarce imported material or compelled to use such substitutes as terra-cotta (baked clay). Architecture also was profoundly affected, first, by the restriction of building material to brickwork and, second, by problems of roof construction, only partially solved by the contrivance of brick vaulting, in the 2nd millennium BC. For the Assyrians, in the north, good quality stone was plentiful, but the cost of quarrying and transport, combined with an obstinate conservatism, caused it to be regarded as a luxury material and its use to be confined to sculptured ornament and conspicuous architectural features.

An equally apparent, if more abstract, association between Mesopotamian art and environment can be detected when the intellectual climate engendered by the latter is understood. In a country where summer and winter temperatures reach thermometrical extremes, where agriculture depends exclusively on the artificial distribution of river water and contends precariously with the timing of seasonal floods, where the herdsman is afflicted by the depredations of wild beasts and the cultivator by the menace of poisonous insects—in such a country, the inhabitants must have felt themselves in perpetual conflict with hostile and potentially destructive elements in nature. All of this confrontation and frustration is reflected in the melancholy undertones of their religious beliefs, particularly those of the Sumerians, for whom success and prosperity came to be identified with the principle of fertility and thus could only be attained by the appeasement of capricious deities. Such convictions are inherent in the fabric of their complicated mythology, which lends itself easily to expression in pictorial form and provides the predominant subject of almost all Sumerian art. Furthermore, since their mythical traditions and religious beliefs persisted for many centuries after the demise of the Sumerians themselves, they provided the basic imagery of almost all Mesopotamian art.

Sumerian period. *Architecture.* The beginnings of monumental architecture in Mesopotamia are usually considered to have been contemporary with the foundation of the Sumerian cities and the invention of writing, in about 3100 BC. Conscious attempts at architectural design during this so-called Protoliterate period (*c.* 3400–*c.* 2900 BC) are recognizable in the construction of religious buildings. There is, however, one temple, at Abū Shahrayn (ancient Eridu), that is no more than a final rebuilding of a shrine the original foundation of which dates back to the beginning of the 4th millennium; the continuity of design has been thought by some to confirm the presence of the Sumerians throughout the temple's history. Already, in the Ubaid period (*c.* 5200–*c.* 3500 BC), this temple anticipated most of the architectural characteristics of the typical Protoliterate Sumerian platform temple. It is built of mud brick on a raised plinth (platform base) of the same material, and its walls are ornamented on their outside surfaces with alternating buttresses (supports) and recesses. Tripartite in form, its long central sanctuary is flanked on two sides by subsidiary chambers, provided with an altar at one end and a freestanding offering table at the other. Typical temples of the Protoliterate period—both the platform type and the type built at ground level—are, however, much more elaborate both in planning and ornament. Interior wall ornament often consists of a patterned mosaic of terra-cotta cones sunk into the wall, their exposed ends dipped in bright colours or sheathed in bronze. An open hall at the Sumerian city of Uruk (biblical, Erech; Arabic, Tall al-Warkāʾ) contains freestanding and attached brick columns that have been brilliantly decorated in this way. Alternatively, the internal-wall faces of a platform temple could be ornamented with mural paintings depicting mythical scenes, such as at ʿUqair.

Sumerian platform temple

The two forms of temple—the platform variety and that built at ground level—persisted throughout the early dynasties of Sumerian history (*c.* 2900–*c.* 2400 BC). It is known that two of the platform temples originally stood within walled enclosures, oval in shape and containing, in addition to the temple, accommodation for priests. But the raised shrines themselves are lost, and their appearance can only be judged from facade ornaments discov-

ered at al-'Ubaid (Figure 1). These devices, which were intended to relieve the monotony of sun-dried brick or mud plaster, include a huge copper-sheathed lintel, with animal figures modelled partly in the round; wooden columns sheathed in a patterned mosaic of coloured stone or shell; and bands of copper-sheathed bulls and lions, modelled in relief but with projecting heads. The planning of ground-level temples continued to elaborate on a single theme: a rectangular sanctuary, entered on the cross axis, with altar, offering table, and pedestals for votive statuary (statues used for vicarious worship or intercession). Considerably less is known about palaces or other secular buildings at this time. Circular brick columns and austerely simplified facades have been found at Kish. Flat roofs, supported on palm trunks, must be assumed, although some knowledge of corbelled vaulting (a technique of spanning an opening like an arch by having successive cones of masonry project farther inward as they rise on each side off the gap)—and even of dome construction—is suggested by tombs at Ur, where a little stone was available.

Sculpture. Practically all Sumerian sculpture served as adornment or ritual equipment for the temples. No clearly identifiable cult statues of gods or goddesses have yet been found. Many of the extant figures in stone are votive statues, as indicated by the phrases used in the inscriptions that they often bear: "It offers prayers" or "Statue, say to my king (god). . . ." Male statues stand or sit with hands clasped in an attitude of prayer. They are often naked above the waist and wear a woollen skirt curiously woven in a pattern that suggests overlapping petals (commonly described by the Greek word, *kaunakes,* meaning "thick cloak"). A toga-like garment sometimes covers one shoulder. Men generally wear long hair and a heavy beard, both often trimmed in corrugations and painted black. The eyes and eyebrows are emphasized with coloured inlay. The female coiffure varies considerably but predominantly consists of a heavy coil arranged vertically from ear to ear and a chignon behind. The hair is sometimes concealed by a headdress of folded linen. Ritual nakedness is confined to priests.

Sumerian stone sculpture

It has been thought that the rarity of stone in Mesopotamia contributed to the primary stylistic distinction between Sumerian and Egyptian sculpture. The Egyptians quarried their own stone in prismatic blocks, and one can see that, even in their freestanding statues, strength of design is attained by the retention of geometrical unity. By contrast, in Sumer, stone must have been imported from remote sources, often in the form of miscellaneous boulders, the amorphous character of which seems to be retained by the statues into which they were transformed.

Beyond this general characteristic of Sumerian sculpture, two successive styles have been distinguished in the middle and late subdivisions of the Early Dynastic period. One very notable group of figures, from Tall al-Asmar, dating from the first of these phases, shows a geometrical simplification of forms that, to modern taste, is ingenious and aesthetically acceptable (Figure 2). Statues characteristic of the second phase, on the other hand, though technically more competently carved, show aspirations to naturalism that are sometimes overly ambitious. In this second style, some scholars see evidence of occasional attempts at portraiture. Yet, in spite of minor variations, all these figures adhere to the single formula of presenting the conventional characteristics of Sumerian physiognomy. Their provenance is not confined to the Sumerian cities in the south. An important group is derived from the ancient capital of Mari, on the middle Euphrates, where the population is known to have been racially different from the Sumerians; yet, here also there appears to have been no deviation from the sculptural formula, and the Mari statues are distinguished only by technical peculiarities in the carving.

Metal sculpture

Deprived of stone, Sumerian sculptors exploited alternative materials. Fine examples of metal casting have been found, some of them suggesting knowledge of the cire perdue (lost-wax) process, and copper statues more than half life-size are known to have existed. In metalwork, however, the ingenuity of Sumerian artists is perhaps best judged from their contrivance of composite figures. The earliest and one of the finest examples of such figures—and of Sumerian sculpture as a whole—comes from a Protoliterate level of excavation at Tall al-Warkā'. It is the limestone face of a life-size statue (Iraq Museum, Baghdad), the remainder of which must have been composed of other materials; the method of attachment is visible on the surviving face. Devices of this sort were brought to perfection by craftsmen of the Early Dynastic period, the finest examples of whose work are to be seen among the treasures from the royal tombs at Ur (Figure 3): a bull's head decorating a harp, composed of wood or bitumen covered with gold and wearing a lapis lazuli beard (British Museum); a rampant he-goat in gold and lapis, supported by a golden tree (University Museum, Philadelphia); the composite headdresses of court ladies (British Museum; Iraq Museum, Baghdad; and University Museum, Philadelphia); or, more simply, the miniature figure of a wild ass, cast in electrum (a natural yellow alloy of gold and silver) and mounted on a bronze rein ring (British Museum). The inlay and enrichment of wooden objects reaches its peak in this period, as may be seen in the so-called standard or double-sided panel from Ur (British Museum), on which elaborate scenes of peace and war are depicted in a delicate inlay of shell and semiprecious stones (Figure 4). The refinement of craftsmanship in metal is also apparent in the famous wig-helmet of gold (Iraq Museum), belonging to a Sumerian prince, and in weapons, implements, and utensils.

Relief carving in stone was a medium of expression popular with the Sumerians and first appears in a rather crude form in Protoliterate times. In the final phase

of the Early Dynastic period, its style became conventional. The most common form of relief sculpture was that of stone plaques, a foot or more square, pierced in the centre for attachment to the walls of a temple, with scenes depicted in several registers (horizontal rows). The subjects usually seem to be commemorative of specific events, such as feasts or building activities, but representation is highly standardized, so that almost identical plaques have been found at sites as much as 500 miles apart. Fragments of more ambitious commemorative stelae have also been recovered; the Stele of Vultures (Louvre) from Tello, for example. Although it commemorates a military victory, it has a religious content. Emphasized by its size, there is a figure of a patron deity rather than that of the king. The formal massing of figures suggests the beginnings of mastery in design, and a formula has been devised for mutiplying identical figures, such as chariot horses.

Cylinder seals

In a somewhat different category are the cylinder seals so widely utilized at this time. Used like the more familiar stamp seal and, likewise, engraved in negative (intaglio), the cylinder-shaped seal was rolled over wet clay on which it left an impression in relief. Delicately carved with miniature designs on a variety of stones or shell, they rank as one of the higher forms of Sumerian art.

Prominent among their subjects is the complicated imagery of Sumerian mythology and religious ritual. Still only partially understood, their skillful adaptation to linear designs can at least be easily appreciated. Some of the finest date from the Protoliterate period (Figure 5, top). After a slight deterioration in the first phase of the Early Dynasties, when brocade patterns or files of running animals were preferred (Figure 5, bottom), mythical scenes returned. Conflicts are depicted between wild beasts and protecting demigods or hybrid figures associated by some with the Sumerian *Epic of Gilgamesh*. The monotony of animated motifs is occasionally relieved by the introduction of an inscription.

Akkadian period. Sargon of Akkad's (*c.* 2334–*c.* 2279 BC) unification of the Sumerian city-states and creation of a first Mesopotamian empire profoundly affected the art of his people, as well as their language and political thought. The increasingly large proportion of Semitic elements in the population were in the ascendancy, and their personal loyalty to Sargon and his successors replaced the regional patriotism of the old cities. The new conception of kingship thus engendered is reflected in artworks of secular grandeur, unprecedented in the godfearing world of the Sumerians.

Architecture. One would indeed expect a similar change to be apparent in the character of contemporary architecture, and the fact that this is not so may be due to the paucity of excavated examples. It is known that the Sargonid dynasty had a hand in the reconstruction and extension of many Sumerian temples (*e.g.*, Nippur) and that they built palaces with practical amenities (Tall al-Asmar) and powerful fortresses on their lines of imperial

communication (Tell Brak, or Tall Birāk at-Tahtānī, Syria); their ruins, however, are insufficient to suggest either changes in architectural style or structural innovations.

Sculpture. Two notable heads of Akkadian statues have survived: one in bronze and the other of stone. The bronze head of a king (Figure 6), wearing the wig-helmet of the old Sumerian rulers, is probably Sargon himself (Iraq Museum). Though lacking its inlaid eyes and slightly damaged elsewhere, this head is rightly considered as one of the great masterpieces of ancient art. The Akkadian head (Iraq Museum) in stone, from Bīsmāyah, suggests that portraiture in materials other than bronze had also progressed. But, where relief sculpture is concerned, an even greater accomplishment is evident in the famous Naram-Sin (Sargon's son) stele (Louvre), on which a pattern of figures is ingeniously designed to express the abstract idea of conquest (Figure 7).

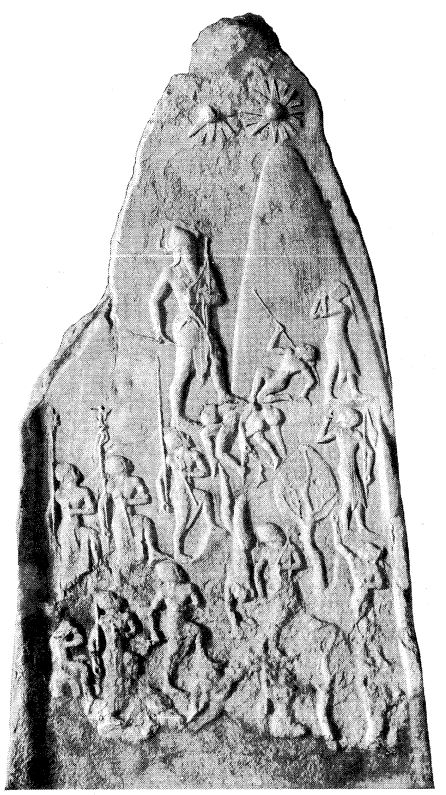

Figure 7: "Victory Stele of Naram-Sin," stone, Akkadian period, *c.* 2371–*c.* 2255 BC. In the Louvre, Paris. Height 1.98 m.

Other stelae and the rock reliefs (which by their geographical situation bear witness to the extent of Akkadian conquest) show the carving of the period to be in the hands of less competent artists. But two striking fragments in the Iraq Museum, which were found in the region of Nāṣirīyah, once more provide evidence of the improvement in design and craftsmanship that had taken place since the days of the Sumerian dynasties. One of the fragments shows a procession of naked war prisoners, in which the anatomical details are well observed but skillfully subordinated to the rhythmical pattern required by the subject.

Some compensation for the paucity of surviving Akkadian sculptures is to be found in the varied and plentiful repertory of contemporary cylinder seals. The Akkadian seal cutter's craft reached a standard of perfection virtually unrivalled in later times. Where the aim of his Sumerian predecessor had been to produce an uninterrupted, closely woven design, the Akkadian seal cutter's own preference was for clarity in the arrangement of a number of carefully spaced figures.

Posthumous flowering of Sumerian genius

The Akkadian dynasty ended in disaster when the river valley was overrun by the barbaric mountain tribes of northern Iran. Of all the Mesopotamian cities, only Lagash appears somehow to have remained aloof from the conflict and, under its famous governor, Gudea, to have successfully maintained the continuity of the Mesopotamian cultural tradition (Figure 8, left). In particular, the sculpture dating from this short interregnum (*c.* 2200 BC) seems to represent some sort of posthumous flowering of Sumerian genius. The well-known group of statues of the governor and other notables, discovered at the end of the 19th century, long remained the only criterion by which Sumerian art could be judged, and examples in the Louvre and British Museum are still greatly admired. The hard stone, usually diorite, is carved with obvious mastery and brought to a fine finish. Details are cleverly stylized; but the musculature is carefully studied, and the high quality of the carving makes the use of inlay unnecessary. The powerful impression of serene authority that these statues convey justifies their inclusion among the finest products of ancient Near Eastern art.

Sumerian revival. The short historical interlude represented by the Gudea sculptures was followed by a fullscale Sumerian revival, one which lasted for four centuries and culminated in the unification of the whole country under the rule of Hammurabi in the early 18th century BC. Dominated first by the powerful Third dynasty of Ur and later by the rival states of Isin and Larsa, the peoples of ancient Sumer reverted to their pre-Akkadian cultural traditions. On their northern frontiers the Sumerian culture was extended to increasingly prosperous younger city-states, such as Mari, Ashur, and Eshnunna (Tall al-Asmar), located on the middle courses of the Tigris and Euphrates rivers.

In all these cities, both old and new, the period is notable for the advances made in architectural planning and the large-scale reconstruction of ancient buildings. In the south, the early promise of Sumerian architecture had reached fulfillment, first in the great ziggurats, or stepped towers, rising above their walled temple enclosures at cities such as Ur, Eridu, Kish, Uruk, and Nippur. These huge structures, with their summit sanctuaries the appearance of which can only be guessed at, were faced with kiln-baked brick, panelled and recessed to break the monotony of their colossal facades, and were strengthened with bitumen and reinforced with twisted reeds. Tradition associates the ziggurat at Borsippa (Birs Nimrūd), near Babylon, with the biblical Tower of Babel. Surrounding temples at ground level were also much elaborated. The basic plan consisted of a tower-flanked entry, central court, antecella (or inner vestibule), and sanctuary, all arranged on a single axis; but in the larger examples this plan could be expanded by means of communicating courtyards. Facades were often elaborately decorated with panels of pilasters (recessed columns) or engaged half columns, skillfully modelled in mud-brick. At Ur, kiln-baked brick was again used to construct corbelled vaulting over huge subterranean tomb chambers, entered

through funerary chapels at ground level. Here, too, there are temple-palaces, the complicated planning of which is seldom self-explanatory.

Zimrilim palace

The better examples of residential palaces are found in the newer cities of the north, especially Mari, where a vast building with more than 200 rooms was constructed by a ruler called Zimrilim (*c.* 1779–*c.* 1761 BC). In this palace is found the standard reception unit common to all Babylonian palaces: a rectangular throne room that is entered by a central doorway from a square court of honour; and behind it a great hall, in this case apparently serving some religious purpose. There is also an immense outer courtyard, overlooked by a raised audience chamber, and, in the remotest corner of the building, a heavily protected residential suite. In some of the main chambers, mural paintings depicting ritual scenes and processions have been preserved.

The sculpture of this period is perhaps best represented by some well-preserved statues, also from the Mari palace (Figure 8, right). Their style owes much to the preceding Gudea period in the south, but they lack the authentic stamp of Sumerian design and workmanship. The same may be said of the few surviving pieces from the time of Hammurabi (early 18th century BC), whose conquests ended the epoch; *e.g.,* the relief at the head of the stela in the Louvre on which his law code is inscribed.

Assyrian period. *Architecture.* Ashur, a small Sumerian city-state on the middle Euphrates, began to gain political prominence during the pre-Hammurabi period just discussed. During the latter half of the 2nd millennium BC, the frontiers of Assyria were extended to include the greater part of northern Mesopotamia, and, in the city of Ashur itself, excavations have revealed the fortifications and public buildings constructed or rebuilt by a long line of Assyrian kings. The character of these buildings suggests a logical development of Old Babylonian architecture. There are certain innovations, such as the incorporation of small twin ziggurats in the design of a single temple, while in the temples themselves the sanctuary was lengthened on its main axis, and the altar itself was withdrawn into a deep recess. For the rest, the absence of ornament and the multiplication of buttressed facades with crenellated battlements tend to monotony.

Other forms of art are inconspicuous, except, perhaps, the contemporary cylinder seals, which show an interest in animal forms anticipating the relief carving of a later phase of Mesopotamian civilization. Sometimes known as Middle Assyrian, this later period corresponds to the occupation of southern Mesopotamia by the Kassites and to the Mitannian kingdom on the north Syrian frontier, neither of which have contributed greatly to the total development of ancient Near Eastern art.

Assyrian palaces

The fuller manifestation of Assyrian art and architecture is not seen until the 9th century BC, when Ashurnasirpal II transferred his capital from Ashur to Nimrūd (Calah). The rise of Assyria to imperial power during this and the centuries that followed gave increased vitality to

Mesopotamian architecture. The vast palaces brought to light in the 19th century emphasize the new interest in secular building and reflect the ostentatious grandeur of the Assyrian kings. Like the temples of earlier days, they are usually artificially raised up on a platform level with the tops of the city walls, astride which they often stand. Their gates are flanked by colossal portal sculptures in stone, and their internal chambers are decorated with pictorial reliefs carved on upright stone slabs, or orthostats. In addition to the 9th-century structure at Nimrūd, palace platforms have been exposed at Khorsabad (Dur Sharrukin), where Sargon II established a short-lived capital of his own in the late 8th century BC, and at Nineveh, which, after Sargon's rule, was rebuilt in the 7th century, first by his son Sennacherib and then by his grandson. On the platforms both at Nineveh and Nimrūd, palaces and temples were multiplied by successive kings.

The platform at Khorsabad is occupied by a single royal residence associated with a group of three modest temples and a small ziggurat. Similar buildings occupy a walled citadel at the foot of the platform, thus completing a complex that has been thoroughly excavated and provides the most informative example of typical contemporary architecture (Figure 9). Sargon's palace itself, like that of Zimrilim 1,000 years earlier (see above *Sumerian revival*), is planned, first, around a gigantic open courtyard accessible to the public and, second, around an inner court of honour. From the latter the great throne room is entered through triple doorways, around which, in common with the main outer entrance to the palace, are concentrated a fine array of portal sculptures. The throne room has an adjoining stairway leading to a flat roof and a suite of living apartments behind. Other staterooms, conventionally planned, open onto an open terrace facing the mountains beyond. All of the principal internal chambers are decorated with reliefs, except for the throne room itself, where mural painting seems to have been preferred. The individual purpose and function of the innumerable administrative and domestic offices must remain largely conjectural.

Sculpture. Any history of late Assyrian art must be concerned primarily with relief carving. Some statues in the round have been found, but the comparative ineptitude of the majority of them suggests that this form of expression did not come naturally to Assyrian sculptors. Portal sculptures, which many would consider the most characteristic Assyrian art form, are not statues in the round but "double-aspect" reliefs (*i.e.*, meant to be seen either from the front or the side), apparently derived from a Hittite invention of the 14th century BC. These impressive guardian figures—usually human-headed bulls or lions—decorate the arched gateways and are sometimes supplemented by others set at right angles on the adjoining facades, their heads facing sideways. Each is composed from a single block of stone weighing up to 30 tons, roughly shaped in the quarry and then carved *in situ*.

Less spectacular orthostat reliefs form a continuous frieze of ornament around the bases of interior wall-faces. There is evidence that they were placed in position before the walls that they decorate had been completed. Their carving *in situ* could thus be executed in full daylight. This form of architectural ornament dates from the first quarter of the 9th century BC and seems to have been a genuine Assyrian innovation. The earliest slabs, from the 9th-century palaces of Ashurnasirpal II and his son Shalmaneser III at Nimrūd, are about seven feet high, with the design arranged in two superimposed registers separated by a band of cuneiform inscription. In those from later buildings, such as Sargon II's palace at Khorsabad, the individual sculptured figures reach a height of nine feet.

Relief subjects and themes

The subjects of the designs on these reliefs are very rarely related in any way to religion. Superstitious symbols do occasionally appear in the form of benevolent winged beings, or genii, but the primary purpose of the picture is the glorification of the king himself, either by scenes of ceremonial homage or by extended pictorial narratives of his achievements. The most popular theme, giving rise to numerous variations, involves detailed scenes of military conquest and the ruthless suppression of revolt. These are often arranged episodically to represent successive events in the progress of a single campaign: the Assyrian army prepares for war; led by the king, it crosses difficult country on the way to attack a walled city; the city is taken, burnt, and demolished; the enemy leaders are punished with conspicuous brutality; and, finally, the victory is celebrated. Scenes such as these are distinguished above all by their stylistic vitality and fanciful detail. Animals as well as men are carefully observed and beautifully drawn. The principles of perspective, as later defined by the Greeks, are unknown, but attention is given to the relationship of figures in space and to devices for suggesting comparative distance. At Khorsabad, late in the 8th century BC; some notable stylistic changes are perceptible. The lively carving of narrative and historical subjects has been replaced by more tedious symbols of pomp and ceremony. In keeping with the winged bulls and genii of the portal sculptures, stiffly arranged files of courtiers, officials, and servants stand immobilized in the routine of ceremonial homage. The monotony of the figures is occasionally relieved by the sparing use of coloured pigment on the stone. In the 7th-century Ninevite palaces of Sennacherib and Ashurbanipal, the reliefs suggest a reaction in favour of narrative and violent activity. The slabs are covered to their full height by complicated battle scenes in which the progress of the fighting is suggested by episodic repetition. Types of landscape are depicted schematically, and significant episodes or individuals are identified by a short inscription, without impairing the overall rhythm of the design. In the intervals between their military campaigns, Assyrian kings appear to have been much preoccupied with hunting, and scenes from the chase provided an alternative subject for the reliefs. Lions hunted with spears from a light chariot and herds of wild asses (onager) or gazelles are subjects that stimulated the imagination and sensibility of the Assyrian artist (Figure 10).

Hirmer Fotoarchiv, Munchen

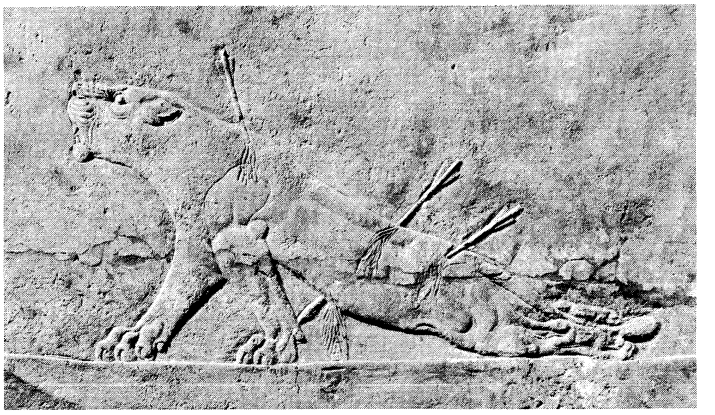

Figure 10: "Dying Lioness," detail of an alabaster mural relief from the North Palace of Ashurbanipal, Nineveh (now in Iraq), Assyrian period, *c.* 650 BC. In the British Museum.

A contrast to these descriptive carvings is provided by the formal monumentality of the Assyrian rock reliefs, secular or religious devices carved on vertical rock faces in localities such as Bavian and Maltai to commemorate historical events that took place there.

The Assyrian talent for relief ornament was not confined to sculpture in stone. First seen during the reign of Shalmaneser III (858–824 BC) are striking examples of relief modelling in bronze. The huge wooden gates of a minor palace at Imgur-Enlil (Balawat), near Nimrūd, were decorated with horizontal bands of metal, 11 inches high, each modelled by a repoussé process (relief hammered out from behind), with a double register of narrative scenes. Their subjects are much the same as the stone reliefs, but even greater ingenuity has been used in adapting the designs to so confined a space.

Relief modelling in bronze

Painting and decorative arts. When greater economy of labour and material was necessary, mural paintings were substituted for slab reliefs. At the time of Tiglath-pileser III (744–727 BC), a country palace at Til Barsip (modern

Tall al-Ahmar) was decorated in this way, with the conventional motifs of relief designs rather clumsily adapted to this very different medium. A few years later, such painting was extensively used to decorate both wall faces and ceilings in Sargon II's palace buildings at Khorsabad. One magnificent panel of formalized ornament has been reconstructed. It is painted in primary colours on a white ground.

There is evidence that the Assyrian palaces were well equipped with furniture. The wooden components have perished, but the ivory ornament with which it was enriched has survived in great quantities. Of these "Assyrian ivories"—relief panels, inlays, and other forms of ornament—only a small proportion can be attributed to indigenous workmanship. The remainder represent either loot from the cities of Syria and Phoenicia or the work of craftsmen imported from those regions. The carving is often technically superb, and the enrichment of the ivory with gold, semiprecious stones, or coloured paste by cloisonné or champlevé processes (whereby the applied decoration is outlined by raised metal strips or fills depressed areas of the surface that have been cut out to receive it) gives increased elegance. But the designs are for the most part a pastiche of misunderstood Egyptian symbolism and often less attractive than the purely Assyrian devices.

Neo-Babylonian period. During the half century following the fall of Nineveh, in 612 BC, there was a final flowering of Mesopotamian culture in southern Iraq, under the last dynasty of Babylonian kings. During the reigns of Nabopolassar (625–605 BC) and his son Nebuchadrezzar II (604–562 BC), there was widespread building activity. Temples and ziggurats were repaired or rebuilt in almost all the old dynastic cities, while Babylon itself was enormously enlarged and surrounded by a double enceinte, or line of fortification, consisting of towered and moated fortress walls. Inside the city the most grandiose effect was obtained by the disposal of public buildings along a wide Processional Way, leading through the centre of the town to the temple and ziggurat of its patron god, Marduk. Where the street passed through the innercity wall, the facades of the famous Ishtar Gate (Vorderasiatiches Museum, Berlin) and those facing the adjoining street were ornamented in brightly glazed brickwork, with huge figures of bulls, lions, and dragons modelled in relief. This form of decoration—a costly process, since each of the bricks composing the figures had to be separately cast—provided a solution for the problem of embellishing mud-brick facades. It appears again in the court of honour of Nebuchadrezzar's palace, using a more sophisticated design that suggests familiarity with Greek ornament. For the rest, there are few innovations in the planning of either palaces or temples during the Neo-Babylonian period. Also (strangely enough, in view of the prolonged excavations that took place at this site), examples of contemporary art are limited almost exclusively to cylinder seals and terracotta figurines of unpretentious design.

ASSYRO-BABYLONIAN LITERATURE

Akkadian, the language of ancient Babylonia and Assyria, is the earliest recorded Semitic language and hence of considerable importance for comparative linguistics. Its writing system was borrowed from Sumerian, the world's oldest written language. In the Assyro-Babylonian culture that flourished on the banks of the Tigris and Euphrates rivers, Akkadian replaced Sumerian as a spoken language in the 3rd millennium BC, though Sumerian continued in written usage almost to the end of the active use of Akkadian in the 1st century AD.

Many of the records of this civilization are of linguistic and historical rather than literary interest. There are numerous word lists of names of gods and of common words, the purpose of which was encyclopaedic: the systematic collection of all possible words and concepts. These lists may also have served pupils as spelling guides. Lists giving a word sign or signs with the Sumerian pronunciation and the Akkadian equivalent arranged in columns served as vocabularies, various types of which remained in use until the end of Babylonian scholarly activity. Of historical as well as linguistic interest are the earliest royal inscriptions, simple dedications of objects or buildings of the type "To god X has A, son of B, king of the city Y, given this vase" or "built this temple." The Assyrians further developed this pattern into what are known as "annals," detailed accounts of a king's military exploits for each year. Although popular and sometimes even mythological stories appear in some of these entries, their importance is chiefly historical.

Assyro-Babylonian literary texts have been found on tablets that are dated as early as *c.* 2500 BC and were about myths, epics about the deeds of early kings, hymns, and wisdom literature (proverbs). Of the greatest literary significance are two epics. *Enuma elish* (the *Epic of Creation*) told how Marduk, the city god of Babylon, slew the monster Tiamat and created the world out of her body, a deed for which the other gods rewarded him by granting him universal rule. The *Epic of Gilgamesh,* probably the most important work in Akkadian, related the story of the Sumerian hero Gilgamesh and his companion Enkidu.

The *Epic of Creation* and the *Epic of Gilgamesh*

The fullest text extant is that on tablets found at Nineveh in the library of Ashurbanipal, king of Assyria (668–627 BC). The epic was a creation of the Babylonians. It incorporated Sumerian stories about Gilgamesh and his friend and introduced a new motif, Gilgamesh's quest for immortality after the death of Enkidu. Of particular interest in the epic is the Babylonian version of the Flood, analogous to Noah's Flood in the Bible, which is recounted to Gilgamesh by a survivor, Utnapishtim. The Gilgamesh story, which was current in Asia Minor in languages other than Akkadian, may possibly have influenced the Greek *Odyssey;* and themes from it may occur also in the folklore of the Pacific.

MESOPOTAMIA UNDER THE PERSIANS

Cyrus united Babylonia with his country in a personal union, assuming the title of "King of Babylonia, King of the Lands." His son Cambyses was appointed vice king and resided in Sippar. The Persians relied on the support of the priests and the business class in the cities. In a Babylonian inscription, Cyrus relates with pride his peaceful, bloodless conquest of the city of Babylon. At the same time, he speaks of Marduk as the king of gods. His moderation and restraint were rewarded: Babylonia became the richest province of his empire. There is no indication of any national rebellion in Babylonia under Cyrus and Cambyses (529–522). That there must have been an accumulation of discontent became clear at the ascension to the throne of Darius I (522–486), when a usurper seized the throne of Babylonia under the name of Nebuchadrezzar (III), only to lose both the throne and his life after ten weeks. Darius waived any punitory action. He had to take more drastic measures in 521, when a new Nebuchadrezzar incited another rebellion against him. This usurper's reign lasted for two months. Executions and plundering followed; Darius ordered the inner walls of Babylon to be demolished and reformed the organization of the state. But Babylon remained the capital of the new satrapy and also became the administrative headquarters for the satrapies of Assyria and Syria. One result was that the palace had to be enlarged.

Cyrus as king of Babylonia

Babylonia remained a wealthy and prosperous land, in contrast to Assyria, which was still a poor country. At the same time, the administration of the kingdom was more and more in the hands of the Persians, and the tax burdens grew heavier. This produced discontent, centring especially on the large temples in Babylon. Xerxes (486–465) had his residence in Babylon while he was crown prince and knew the country very well. When he assumed his kingship, he immediately curtailed the autonomy of the satrapies. This, in turn, gave rise to many rebellions. In Babylonia there were two short interim governments of Babylonian pretenders during 484–482. Xerxes retaliated by desecrating and partially destroying the holy places of the god Marduk and the Tower of Babel in the city of Babylon. Priests were executed, and the statue of Marduk was melted down. The members of the royal family still resided in the palaces of the city of Babylon, but Aramaic

became more and more the language of the official administration. One source of information for this period are the clay-tablet archives of the commercial house of Murashu and Sons of Nippur for the years of 455–403, which tell much about the important role the Iranians played in the country. The state domains were largely in their hands. They controlled many minor feudal tenants, grouped into social classes according to ancestry and occupation. The business people were predominantly Babylonians and Aramaeans, but there were also Jews. The documents become increasingly sparse after 400. The cultural life of Babylon became concentrated in a few central cities, particularly Babylon and Uruk; Ur and Nippur were also important centres. The work of astronomers continued, as evidenced in records of observations. Nabu-rimanni, living and working around 500, and Kidinnu, 5th or 4th century BC, were also known to the Greeks; both astronomers are famous for their methods of calculating the courses of the Moon and the planets. In the field of literature, religious poetic works as well as texts of omens and Sumero-Akkadian word lists were constantly copied, often with commentaries.

(W.T.v.S.)

BABYLONIA UNDER ALEXANDER, THE SELEUCIDS, AND THE PARTHIANS

The end of Babylonian culture

Babylonia was once more to become the centre of the civilized world. Alexander the Great decided to make Babylon one of the capitals of his empire after he conquered the Persians. He began to build a large harbour. In 331 he ordered the restoration of the Marduk temples, among them also the high temple of Etemenanki; Marduk was henceforth recognized as the equal of the Greek god Zeus. After Alexander's death, Babylon lost its position of importance. In 312 Seleucus I Nicator entered Babylon. But soon he founded a new capital, Seleucia, on the Tigris River. Babylon's temples and scholarly institutions continued to receive the care and consideration of the kings of the Seleucid dynasty as well as of some of the later Parthian kings. Antiochus I Soter (281–261) even ordered a Babylonian inscription to be included in the walls of the Temple of Nabu when he undertook the rebuilding of the city of Borsippa. Babylonian business documents from the time of the Seleucids, written on clay tablets, are still extant. Greek and Aramaean documents did not survive. The city of Uruk was second in importance to Babylon as a cultural centre at this time. Uruk's god Anu—the god of the heavens—was recognized along with Marduk as the equal of the Greek Zeus. Two large temples were built for Anu and Ishtar. Written rituals indicate that the cult had remained true to the old traditions. The citizens of Uruk participated in these rituals in various functions, lucrative as well as honourable and respected. Some documents indicate that religious benefices were handled as stock and often sold in shares. Other documents deal with the selling of promises. The exact measurements and markings of the boundary lines are stated on these. While the names of the parties are mostly Babylonian, it is not unusual to find a second, Greek name added to the original Babylonian one.

The Babylonian astronomers

An important result of the mixture of Babylonian and Greek culture in Babylon and Uruk was the further development of the science of astronomy. The Babylonians contributed their methods of mathematical calculation, as well as an accumulation of observations covering several centuries. The Greeks contributed their training in logical thinking. Many documents of the Hellenistic princes who ruled in Asia Minor and along the Aegean Sea during this time show the cooperative efforts of the Greek and Babylonian astronomers. They laid the basis upon which astronomers of later times were able to build. One of them deserves particular mention: the Marduk priest Berosus, who founded a school for astrology and astronomy on the island of Kos around the year 280. He was also the author of a book about Babylonia, its history, and its religion (*Babylōniaka*). The book was written in Greek, and fragments of it still exist.

The decline of the empire of the Seleucids after 150 led to the incorporation of Babylonia into the empire of the Parthians in eastern Iran between 141 and 129. The result was by no means a great political catastrophe. Nevertheless, it hastened the decline of the late Babylonian city culture. There had been no new creative or cultural ideas for a long time, and the old schools for scribes slowly became extinct. Few literary texts and documents survive from the time between 140 BC and 80 BC. The knowledge of the cuneiform script was lost under the Greeks, who were hardly interested in foreign languages. Not until the 19th and 20th centuries did the discovery of tens of thousands of cuneiform texts lead to the decoding of this entirely forgotten writing. This permitted scholars to repossess a large part of the lost literature of Mesopotamia.

Parthian and Sāsānian periods

Mesopotamia (especially the district of Nisibis) was attached to the growing dominions of Armenia temporarily in the 1st century BC but was recovered for Parthia by Phraates III (reigned 70–58/57 BC). With the rise of Roman power in the Near East, it assumed the character of a border territory between the Roman and Parthian spheres of influence, though it usually remained under Parthian control. The Roman leader Crassus led an army into Mesopotamia in 54 BC but was defeated by the Parthians at Carrhae in 53. In AD 114–117 the emperor Trajan conquered the area and made it a Roman province, but it was abandoned once again to Parthia by Hadrian after Trajan's death. Beginning in 165, the Romans once more occupied the northwest portion of Mesopotamia.

During most of the period from the early 3rd century until the rise of Islām in the early 7th century, Mesopotamia remained a battleground between the Romans (in the 6th and 7th centuries, the Byzantines) and the Sāsānian successors of the Parthians. As during the Parthian period, Roman influence was for the most part confined to the extreme northwestern part of the country—the area around Carrhae, Edessa, and Nisibis, near the Syrian and Anatolian borders. The Sāsānian kings made their capital at Ctesiphon, near the midpoint of the Tigris, and their influence predominated in the rest of Mesopotamia. During this period, Mesopotamia became one of the chief centres of Nestorian Christianity and had a sizable Jewish community. (For the history of the Parthian and Sāsānian empires, see IRAN: *History*.)

(Ed.)

IRAQ FROM THE ARAB CONQUEST TO 1918

From the time of the Arab conquest in the 7th century to the second decade of the 20th century, Iraq existed not as an independent state but as a geographical expression for the flatlands between Baghdad and the Persian Gulf—an area of unavoidable passage between Central Asia and the Mediterranean. The history of Iraq in this period is dominated by the rivalry of the three strongest ethnic elements of the Muslim world: the Arabs, the Iranians, and the Turks. During this period Iraq was also a great centre of Islāmic culture as well as the place of origin of several religious sects that divided the community of Islām. The political history of the area may be summarized as follows: after being the metropolitan province of the Arabo-Islāmic Empire under the caliphs' more or less effective authority, Iraq fell successively under the control of the Būyid dynasty of Iran and the Seljuq Turks; and then, after the Mongol invasion, which hastened its decline, it became a dominion of Mongol and later Turkmen and Persian dynasties established in Iran and remained for almost four centuries under Ottoman rule, to emerge again as an independent state as a result of World War I.

The Arab conquest. From the 3rd century AD, the Lakhmids, a small dynasty of South Arabian origin, ruled al-Ḥīrah, on the Euphrates, as vassals of the Sāsānid rulers of Iran, who had entrusted them with keeping the Bedouins in check and holding the borders of Iran against the Byzantines; the Lakhmid capital was a flourishing centre of trade between Persia and Arabia as well as a focus of Arabic culture. In addition, some elements of such important Arab tribes as the Taghlib, the Bakr, and the Tamīm had taken the steppes of Lower Mesopotamia for pastureland, and relations had been established between

the Prophet and those Bedouins, perhaps with a view to subsequent operations in the area.

The rich area stretching south of al-Ḥīrah was protected by strongholds that were easily reduced on the occasion of mere reconnaissances made by Arab parties under al-Muthannā ibn Ḥārithah, a leader of the Bakr, who is said to have called in the famous general Khālid ibn al-Walīd to help him. Khālid seized Al-Ḥīrah in 633–634, but he was sent to Syria. Al-Muthannā was left in charge of the Arab forces in Lower Iraq. For three years, the progress of the conquest proceeded slowly, until 637, when Sa'd ibn Abī Waqqāṣ won a decisive victory over the Sāsānids at al-Qādisīyah, 20 miles (32 kilometres) southeast of al-Ḥīrah. The Arabs sacked Ctesiphon, the Persian capital, and seem to have been welcomed by the native population of the region. Those successes marked the beginning of the collapse of the Sāsānid Empire and made it possible for the Arabs to spread eastward. In 641 both Nineveh and Mosul fell to the Arabs. Sāsānid power was eventually destroyed in 642 at the battle of Nehāvand. This victory enabled the Arabs to control western and central Persia in addition to Mesopotamia.

Establishment of Basra and Kūfah

At that time two military camps, Basra and Kūfah, had been established, the former on the right bank of the Shatt al-Arab in 638 and the latter on the right bank of the Euphrates, near al-Ḥīrah, in 638–639. Both camps were to develop into large cities and play an outstanding part in the history of Iraq until the foundation of Baghdad in 762. Both towns received new inhabitants either from Arabia or the East as a result of conquests that brought them captives and booty as well as revenue from two Persian provinces (*māh al-Baṣrah* and *māh al-Kūfah*) within their scope. The area to the east of Basra and Kūfah was called as-Sawād (the Black Region), in reference to its fertility. The mixing of various ethnic elements promoted economical and intellectual development in the rival cities, while political events gave rise to the great politico-religious parties that were to divide Islām into discordant groups. Moreover, it was in Basra and Kūfah that all literary, philological, and historical materials that were to form the basis of Arabo-Islāmic culture were collected from Bedouins: it was there that Islāmic sciences such as grammar and lexicography came into existence. Qur'ānic exegesis and science of traditions developed, while several schools of thought, particularly Mu'tazilism (see below), took shape. It is true that Kūfah did not outlive for long the founding of Baghdad, but Basra was far enough from the capital to retain its identity. The whole history of Islām has been to some extent conditioned by events that occurred at Basra and Kūfah or were in connection with either city. 'Uthmān ibn 'Affān, the third orthodox caliph, was murdered in 656. 'Ā'ishah, a Prophet's widow, set out for Basra with her followers with the object of avenging the caliph and fighting 'Alī ibn Abī Tālib, the latter's successor. With the help of troops from Kūfah, 'Alī defeated the rebels in the so-called Battle of the Camel (for 'Ā'ishah was riding a camel) fought in Basra in December of 656. Here two parties of Muslims struggled against each other for the first time. In the following year 'Alī tried to subdue Mu'āwiyah, the powerful governor of Syria who had refused to obey an order of dismissal. Leaving Kūfah, where he had established the seat of his government, he met his rival at Ṣiffīn, on the right bank of the Euphrates. When 'Alī was about to win the day, Mū'āwiyah's troops raised leaves of the Qur'ān on their spears, meaning that they wished to leave it to God's decision. 'Alī agreed to stop fighting and both parties agreed to arbitration. On his return to Kūfah, 'Alī had to suppress a rebellion instigated by some soldiers who contested the very principle of arbitration, and he crushed these Khārijites ("Seceders") on July 17, 658, in an-Nahrawān. The survivors, however, continued the movement, scattering in various areas and recruiting new followers; thus, it was in Iraq that Khārijism, the earliest sect to rise within Islām, came into existence.

The Umayyads. After being deposed in January 659 by the arbitrators met in Adhruḥ, 'Alī tried to preserve the caliphate, but he was murdered by a Khārijite on January 24, 661, and Mu'āwiyah, who had asserted his dominion over Syria and Egypt, was proclaimed in the Arabian province of Hejaz. Mu'āwiyah moved the seat of the Umayyad caliphate to Damascus in Syria. Iraq became a single province but a privileged one, as it developed into the military base for the Muslim conquest of Eastern countries. Iraq continued to play a major political role in the empire of the caliphate.

Movement of the caliphate to Damascus

In Umayyad times and afterward, the limits of Iraq were roughly marked out by a line running some distance to the west of the Shatt al-Arab and the Euphrates up to al-Anbār (sometimes up to al-Ḥādīthah), thence to Takrīt on the Tigris, then on through Ḥulwān to the Persian Gulf east of 'Abbādān (now Abadan, in Iran); al-Jazīrah and Mosul were not included in Iraqi provinces except during certain periods.

Under the Umayyads, Kūfah inclined toward 'Alī and his party; it was there that revolts raised by his descendants or their followers, the Shī'ah, broke out. Basra seemed to be in favour of a more democratic regime, but it was anxious to preserve independence and scarcely accepted governors sent from Damascus. It was at Basra that the Khārijites, the most vehement opponents to the established order, caused disturbances. After the murder of 'Alī and the failure of a plot woven simultaneously by them against Mu'āwiyah and the Governor of Egypt, they constantly threatened Iraq and especially Basra during the following decades. While Iraqi troops were launched to the conquest of Oriental areas as far away as India, Basra had to defend itself against the rebels. Mu'āwiyah publicly recognized Ziyād (an alleged illegitimate son of his father) as his brother and appointed him governor of Basra in 665 and then of Basra and Kūfah from 670 to 675. Ziyād fought both Khārijites and Shī'īs with efficiency and, by promoting important drainage projects, did much to restore the economic life of Lower Iraq. His son, 'Ubayd Allāh, continued to rule firmly in Iraq, but, when Mu'āwiyah died in 680, the succession of his son engendered further revolts. Al-Ḥusayn, 'Alī's second son, was invited by his followers to Kūfah, where a revolt had been initiated in his support; on October 10, 680, al-Ḥusayn was intercepted at Karbalā', near Kūfah, and slaughtered, together with his small escort. This event had an enormous impact on the Muslim world: it inspired unspeakable abhorrence among the Shī'ah and other orthodox Muslims toward the Umayyads. A few years after Karbalā', in January 685, the so-called Penitents (Tawwābūn) tried, with little success, to foster disturbances in Iraq with a view to avenging the murder of al-Ḥusayn; next, a rebellion broke out under al-Mukhtar, who backed the cause of Muḥammad, another son of 'Alī. Al-Mukhtār succeeded in winning the support of some 'Alids (supporters of 'Alī) and *mawālī* (non-Arabs who had accepted Islām) and gained control over Kūfah for a few months. At that time, the anti-caliph 'Abd Allāh ibn az-Zubayr, who had revolted in Medina and established himself in Mecca, had appointed Muṣ'ab suppressed the uprising, and al-Mukhtār was killed in 687. Four years later, the Umayyads recovered their control over Iraq.

Despite this internecine warfare, Iraq prospered. The province profited by remote conquest, carried out by its armies, and witnessed an important development. In 694, the caliph 'Abd al-Malik ibn Marwān appointed an outstanding statesman, al-Ḥajjāj, as governor of Kūfah. With the support of Syrian forces, he established respect for the caliphal authority and restored order throughout the country. Eager to achieve some sort of a balance between the two cities of Basra and Kūfah, he founded a new city, which he called Wāsiṭ (intermediary), and made it the seat of his governorship. At the same time, important public utility works were undertaken: canals were dug, swamps drained, and agriculture revitalized. Arabic replaced Persian as the official language of government administration. New coins with Arabic inscriptions were minted at Wāsiṭ to replace Sāsānid money.

The founding of Wāsiṭ

A serious problem arose concerning the tax system. According to a general rule, those lands that had been left to their non-Muslim owners were subjected to the *kharāj* (land tax), while Muslim landowners paid only the tithe; thus, a large number of peasants embraced Islām in order

to escape paying the *kharāj*. But some tax collectors continued to levy the land tax; this caused a mass movement of the peasantry into the towns. Al-Ḥajjāj forcibly resettled them on the land, and their embittered discontent erupted into several revolts against the Umayyads. Under the caliph Hishām ibn ʿAbd al-Malik (724–743) it was decided that land tax should be imposed independently of the religion of *kharāj* landowners.

After al-Ḥajjāj's death (714), Yazīd ibn al-Muhallab, one of his successors, who had been put in jail and escaped, fomented a rebellion that was crushed in 721; order was temporarily restored by Khālid ib ʿAbd Allāh al-Qasrī, but increasing disturbances stirred up by Khārijites and ʿAbbāsid followers as well brought the Umayyad rule to an end. In Khorāsān a campaign aiming at overthrowing the Umayyads in favour of the ʿAbbāsids, who inclined more toward the Persian element, was successful; the example of Khorāsān was followed in other areas; Kūfah was the first town to rise, and it was in its great mosque that as-Saffāḥ, the first ʿAbbāsid caliph, was proclaimed on October 30, 749. Thenceforth, the history of Iraq intermingles with the ʿAbbāsids'.

The ʿAbbasids. The reign of Abū alʿAbbās as-Saffāḥ (749–754) was taken up with fighting the last Umayyads and asserting ʿAbbāsid power. His successor, al-Manṣūr (754–775), ruthlessly harried the Shīʿīs, whose revolts he suppressed in 755 and 762–763; in 755 he put to death Abū Muslim, to whom the ʿAbbāsids were principally indebted for their accession to power. His fame rests on his founding of the new capital, Baghdad, completed in 766, and in laying the foundations on which his successors were to build an elaborate administration. Al-Mahdī (775–785) distinguished himself in fighting the so-called *zanādiqah—i.e.,* heterdox sects and individuals, especially Manichaeans. He was succeeded by al-Hādī (785–786) and Hārūn ar-Rashīd (786–809). The latter's image has been somewhat idealized by the *Thousand and One Nights.*

The founding of Baghdad

The Umayyads had been an Arab dynasty; the ʿAbbāsids, however, who often had Iranian blood on their mothers' side, naturally turned east and organized their administration and court on the same lines as the Sāsānids'. The first ʿAbbāsid period was the golden age of Persian officials. Although deeply Arabicized, they did not fail to remember the old glory of their fatherland and to assume hostile attitudes toward the Arabs, which produced a racial movement known as Shuʿūbīyah and various conflicts between Arabs and non-Arabs. On the other hand, it is obvious that converts to Islām were not always absolutely sincere, and many of them secretly retained their own faiths. That is the reason al-Mahdī hunted out the *zanā-diqah* and put a great many of them to death. Al-Mahdī acted in self-defense; it is not preposterous to discern a feeling of the same kind in ar-Rashīd's reaction against the Barmakids.

As-Saffāḥ had taken as his chief associate Khālid ibn Barmak, a noble Persian who remained in the service of the caliphs. Yaḥyā, Khālid's son, became the vizier of ar-Rashīd, while al-Faḍl and Jaʿfar, who were Yaḥyā's sons, were both entrusted with high government offices. Suddenly, ar-Rashīd decided to execute Jaʿfar (January 803). He imprisoned Jaʿfar's father and brothers and seized the property of the whole family. The reason for ar-Rashīd's actions is not quite made clear by the sources, which speak of an affair between Jaʿfar and ʿAbbāsah, ar-Rashīd's sister; whether this situation was so or not, such an act of cruelty was regarded as an unbearable slur cast on Persians, at a time when the Shīʿīs, after some unsuccessful attempts at seizing power, fostered deep resentment against the ʿAbbāsids.

On ar-Rashīd's death, his succession gave rise to bloody conflicts between his sons al-Amīn (809–813) and al-Maʾmūn (813–833); the latter defeated his brother but was compelled to besiege Baghdad to recover the throne. Aiming at reconciling Shīʿīs and Sunnīs, al-Maʾmūn contemplated the designation of ʿAlī ar-Riḍā, the eighth Shīʿī *imām,* or leader of the community of Islām, as heir apparent; he was forced, however, to go back on his decision in view of the strong Sunnī opposition in Baghdad, a fact that was again jeopardizing the balance between Arabs and Persians, the latter supporting the Shīʿīs; such policy was all the more a failure as Shīʿīs suspected the caliph of having poisoned ar-Riḍā (died 818). In 815, Abū as-Sarāyā, allegedly backing the ʿAlids Ibn Ṭabāṭabā and Muḥammad ibn Zayd, occupied Kūfah, where he minted money, seized Wāsiṭ, Basra, and other towns; and set out for Baghdad. He was eventually defeated and was beheaded on October 18, 815.

Later, however, the political power of the caliphate asserted itself. Economic prosperity grew, and the Arabo-Islāmic civilization centred in Baghdad radiated far beyond the limits of the empire. The seventh ʿAbbāsid caliph, al-Maʾmūn, founded, or at least developed, in Baghdad the Bayt al-Ḥikmah (The House of Wisdom), where Greek philosophical and scientific works were translated into Arabic. A rich library was attached to the House of Wisdom, as were several astronomical observatories. A harmonious blending of cultural factors, borrowed from Greece, Persia, and India, enabled Arabo-Islāmic culture to rise to a high degree of refinement in such fields as medicine, mathematics, philosophy, theology, literature, and poetry. Iraq came to regard itself as a kind of privileged heir to all former civilizations and felt bound to accept, sort out, and develop their legacies. Aristotle was considered the master by an intellectual elite fascinated by his method of logical reasoning. The influence of Aristotle was reflected in Muʿtazilism, a school of thought that flourished in Basra before reaching its peak in Baghdad. Without breaking with orthodoxy, the Muʿtazilīs aimed at harmonizing reason and faith; therefore, they assigned free will to man and regarded the Qurʾān as created by God, unlike strict orthodox Sunnīs, who hold it uncreated, coeternal with God. Anticipating that he could rely on the support of the intellectual elite against his opponents, al-Maʾmūn embraced the Muʿtazilī doctrine, but he came up against difficulties when he wanted to enforce the createdness of the Qurʾān as a formal tenet. Al-Maʾmūn's religious policy alienated both the Shīʿīs and the Sunnīs, and in order to maintain his precarious position he inaugurated a severe inquisition (*miḥnah*).

The House of Wisdom

In ordering the *miḥnah* al-Maʾmūn had proved that the ʿAbbāsid caliph could become an *imām,* a spiritual ruler, although without any right of legislation on purely religious matters such as worship and canon law; in addition, he was a monarch whose powers were fixed by the Sharīʿāh, the Islāmic law. Though these powers were held in the person of the caliph, he frequently delegated them to a vizier placed at the head of the hierarchical central administration, which included the army, the chancery, the ministry of finance, the postal system, and the intelligence service. A great *qāḍī,* with his seat at Baghdad, headed the administration of justice. Provincial towns often were governed by ʿAbbāsid princes, who were closely connected with the central government, the orders of which they carried out.

Powers of the caliph

From the economic point of view, the founding of Baghdad shifted international trade toward Iraq and developed Basra as an emporium and transit centre. The capital was the hub of Middle Eastern trade. From Baghdad, merchants sailed to India, Ceylon, and even China, while overland trade routes converged on Baghdad from Asia Minor, Syria, Egypt, Arabia, and Persia.

It was not long, however, before Iraq shared in the political and economic decline of the caliphate. Religious conflicts had to some extent weakened the authority of the caliph and divided the Muslim community. Yet a powerful administration for some time kept up a semblance of cohesion, in spite of centrifugal forces tending to detach several outlying provinces from Baghdad.

When al-Muʿtaṣim (833–842) succeeded to power, he enrolled a number of foreign mercenaries, mainly Turkish slaves, in his bodyguard. The officers of the new Turkish guard rapidly distinguished themselves in war and rose to influential positions. Since the excesses of these troops created a dangerous state of tension in Baghdad, al-Muʿtasim in 836 moved his residence to a new city, Sāmarrāʾ, about 60 miles (97 kilometres) north of Baghdad. Henceforth, Turkish mercenaries dominated the

empire and controlled the succession of caliphs. Under al-Wāthiq (842–847), the commander of the Turkish guard was even given the title of sultan. Al-Mutawakkil (847–861) succeeded to the throne with the help of two Turkish chiefs. In a desperate attempt to restore the caliph's authority, al-Mutawakkil endeavoured to conciliate the orthodox Muslims (Sunnīs). He persecuted not only the Muʿtazilites but also the Shīʿīs and imposed severe restrictions on Jews and Christians, compelling them to wear distinctive dress.

ʿAbbāsid decline

These measures did not prevent the decline of the dynasty. Between 861 and 870 four caliphs appeared in succession; they were to suppress a revolt of the Turks leading to the siege of Baghdad in 865–866 and, more especially, a serious uprising of Negro slaves (the Zanj) settled in the swamps of Lower Mesopotamia; the operations launched against them during 15 years (869–883) wore out the resources of the government. Basra was sacked (871), Lower Iraq occupied, Wāsiṭ taken (878), and the country devastated. This social revolt threatened the caliphate, which at the same time was faced with other rebellions in Khorāsān, Egypt, Ṭabaristān, and in other areas.

About 890 Lower Iraq was again shaken by revolt, this time by Ḥamdān Qarmat, whose followers won tremendous victories and gained control over parts of Iraq, Syria, and Palestine. Al-Muʿtamid (870–892) reestablished the seat of the caliphate in Baghdad (892) shortly before he died, and his successors did not return to Sāmarrāʾ. Al-Muktafī (902–908) stopped the Qarmaṭian movement temporarily, but the rebels resumed their activity and plundered Kūfah in 925.

In addition to such factors of internal decay, centrifugal forces compelled the ʿAbbāsids to grant independence to some provinces, even on the borders of Iraq. As early as 890, the Ḥamdānids, who were to come into prominence in Aleppo during the 10th century, created an independent amirate in Mosul, and the Caliph himself was sometimes induced to ask their help. Less than two centuries after the beginning of ʿAbbāsid rule, Iraq became practically the sole possession of the caliphate. Struggles among the Turkish commanders and between the Turks and the Daylamite and other elements of the army reduced even Baghdad and the neighbourhood to anarchy.

The Buyids. In 936 the caliph ar-Rāḍī (934–940) introduced the title of *amīr al-umarāʾ*, (amir of the amirs) and bestowed it on Muḥammad ibn Rāʾiq, governor of Basra, retaining for himself only the religious leadership of the Muslim community. The new title brought about serious rivalries between several pretenders to it, until the Būyids, a Shīʿī family from Daylam, a mountainous region in Iran, made themselves masters of Basra, Wāsiṭ, and Baghdad, ushering in a new stage and giving the caliphate, which had retained part of its previous prestige, a still unknown character. Although it reached its lowest ebb during the period of Būyid supremacy, the caliphate was not entirely eliminated by the Būyids, who probably hoped to use such glamour as the ʿAbbasids still possessed. Moreover, the survival of a sunnī caliphate left them with a free hand for their own political and religious aims. They were content with the rank of *amīr al-umarāʾ* and with honorary titles ending with ad-Dawlah ("of the dynasty," *e.g.*, "friend of the dynasty," or "support of the dynasty"), but it is obvious that they held all powers in their hands.

The reign of the first of them, Muʿizz ad-Dawlah (945–967), was largely occupied by internal rebellions and a series of expeditions against the Ḥamdānids; confiscations of the property of officials on death or dismissal were common, and offices were put up to the highest bidder. The Amīr al-Umarāʾ did nothing to improve conditions and had no care for the local population; he also made grants of land to his troops, the result of which was to bring agriculture into a hopeless state of disorganization. Under his successor ʿIzz ad-Dawlah (967–977), Turkish mercenaries revolted and seized power. In 977 ʿAḍud ad-Dawlah became the chief of the family; he ruled first in Fars, and then in Fars and Iraq (977–983). A capable ruler, ʿAḍud ad-Dawlah kept up some prosperity, improved roads, dug canals, reorganized the postal system, stamped out brigandage, and fostered trade. After his death the Būyid dynasty rapidly declined; the western provinces of their dominions were torn by internecine strife, the administrative system collapsed, and agriculture fell into decay.

Rise of ʿAḍud ad-Dawlah

In the field of finance, reforms initiated by the Būyids were connected with the pay of troops: the caliphs had tended to grant to the military an increasing amount of lands subject to the tithe. When the treasury proved unable to cover the cost of the army, the Būyids introduced the practice of granting *iqṭāʿ*s, or lands hitherto subject to land tax (*kharāj*). The beneficiaries of *iqṭāʿ*s levied the revenue of the *kharāj* themselves and paid nothing to the treasury. The debilitating consequences of such a system contributed to the political disintegration of the empire.

As for religion, the Būyids did not fail to spread their Shīʿī doctrines and practices, erecting in particular mausoleums on the tombs of the *imām*s. In spite of their Daylamite origin, the Būyids were eager supporters of Arabic culture, although they also favoured the development of new Iranian influences. It was at that time that rhymed prose gained ground in the Chancery and literature, the *maqāmah* appeared, and a new style was initiated in epistolography, yet most of that activity took place beyong Iraq. Baghdad, where Arabic culture had reached its height—with prose writers such as al-Jāḥiẓ Ibn Qutaybah, al-Masʿūdī, and many others; historians such as al-Yaʿqūbī, aṭ-Ṭabarī, or ad-Dīnawarī; poets such as Abū Nuwās, Abū Tammān, al-Buḥturī, and others; philosophers such as al-Fārābī; and scientists such as al-Khwārizmī—was not quite superseded, but it was challenged by other centres, such as Shīrāz and Isfahan, let alone Cairo, where the Fāṭimids established themselves in 969, attracting a large part of the flow of trade that previously had converged on Iraq.

Daylamite culture

In fact, a large district of Iraq escaped Būyid control; just as Mosul was in the hands of the ʿUqaylids, so, as early as 1012, the Mazyadids were recognized as *amīrs* over an area extending from Basra to Hīt; they threatened Baghdad itself, where the *ʿayyārūn* were terrorizing the inhabitants, being actually the masters of the capital. The activities of the *ʿayyārūn* lasted until 1055—when the Seljuq ruler, Toghrïl Beg, entered Baghdad—and perhaps a little longer.

The Seljuqs. A former high official of the Būyids, al-Basāsīrī, who had risen to power in Baghdad, fled on Toghrïl's coming, but it was not long before he marched on the city, occupied it on December 27, 1058, and proclaimed the Fāṭimid al-Mustanṣir caliph; the ʿAbbāsid al-Qāʾim took refuge with the ʿUqaylids, and al-Basāsīrī extended his control over Basra and Wāsiṭ, with Mazyadid support. In 1059 Toghrïl reconquered Baghdad, and the caliph returned.

While the power of the Būyids had been usurped, that of the Seljuq Turks was given a legal basis. Unlike the Būyids, the Seljuqs were Sunnī, hence the caliph recognized them as sultans and delegated all his powers to them, entrusting them with eradicating Shīʿīsm from Iraq and other parts of the empire. With their eagerness to restore and assert Sunnism, they must be credited with the founding of *madrasah*s—high colleges intended for training future officials in both religious and secular matters. The most famous among those *madrasah*s is the Niẓāmīyah, founded at Baghdad in 1067. Nevertheless, the Seljuqs did not take Baghdad as their capital, since they lived at Isfahan and later (from 1157 onward) at Hamadan. During the Seljuq period, the history of Iraq is that of a succession of Turkish sultans who regarded the ancient centre of the Islāmic Empire as a kind of protectorate under religious leadership of the caliph, who was not more than a local ruler, certainly less powerful, in the political and military field, than the Zangids in Mosul or the Mazyadids in Lower Iraq. The Arab dynasty of the Mazyadids came to prominence in al-Jāmiʿān (called al-Ḥillah from 1101 onward); they were Shīʿī, as were the majority of the Arab tribes in the region, and ready to support ʿAlid movements against the Seljuqs or play off some of them against the others. Profiting by the struggles between Berk-yaruq and his brother Muḥammad, Ṣadaqah ibn Manṣūr extended his power over almost all Iraq by the end of the 11th century; the

towns of Hīt, Wāṣit, Basra, and Takrīt fell into his hands, but he was killed in a battle against the Seljuqs in 1108, and the dynasty of the Mazyadids eventually came to an end in 1163.

In 1118 there came to power a branch of Seljuqs who established an autonomous principality in Iraq that lasted until 1194. During this period the caliphs made some attempts to dispute the supremacy of the sultans and shake off their tutelage, but these actions resulted in struggles, notably in the reign of Sultan Masʿūd (1134–52). Al-Mustarshid (1118–35) was the first caliph in Seljuq times to assemble an army and lead it in person. But al-Mustarshid was executed in 1135, as was his successor, ar-Rashīd, in 1136. Subsequently, on the death of Masʿūd, al-Muqtafī (1136–60) established himself as the legitimate sovereign in Iraq, exercising both temporal and religious power. Later, the caliph an-Nāṣir (1180–1225) tried to restore some importance to the caliphate by conciliating Sunnīs and Shīʿīs and using associations of various kinds (grouped under the general name of *futūwah*) as instruments of moral and social education, hoping to restore the moral and political unity of the ʿAbbāsid Empire. Furthermore, about 1192, he appealed to the *khwārezm-shāh* Tekesh for help against Toghrïl III, the last of the Seljuq sultans of Iraq, who was defeated in 1194 and his dynasty overthrown. An-Nāṣir contended with Tekesh for Seljuqs' spoils and succeeded in taking Khuzistan and other Persian provinces. But Tekesh proved a more dangerous rival than Toghrïl; shortly before his death (1200), he demanded that the *khuṭbah* (the Friday sermon in the great mosques) should be read in Baghdad in the name of the Khwārezm-Shāh. An-Nāṣir refused, and in 1196 fighting took place between the Khwārezm-Shāh's army and the Caliph's, to the disadvantage of the latter. Some years later, Muḥammad ibn Tekesh reiterated his father's demand and met with an uncompromising refusal. The conflict culminated in 1216, when the Caliph had a former official of Tekesh assassinated. In the following year Muḥammad ibn Tekesh set out for Baghdad but was unable to take the city, his army being annihilated by the Kurds. An-Nāṣir played off the Mongol leader Genghis Khan against the Khwārezm-Shāh, and the latter was defeated in 1219.

Reform organizations

The Mongols. Unfortunately, an-Nāṣir's successors, aẓ-Ẓāhir (1225–26), al-Mustanṣir (1226–42), and al-Mustaʿṣim (1242–58), were weak and unable to carry on his policy. In the meantime, Hülegü, a descendant of Genghis Khan, who established Mongol power in Iran, invited the caliph al-Mustaʿṣim to surrender and, on his refusal, marched on Baghdad, which he took on February 10, 1258, after a siege of some seven weeks. Al-Mustaʿṣim and several members of his family were put to death; the city was sacked and its inhabitants slaughtered. Iraq, the core of the ʿAbbāsid Empire, was devastated and depopulated. It did not recover for centuries.

Until 1339 the province of Iraq remained under the domination of the Īl-Khāns, a Mongol dynasty founded in Persia by Hülegü. Under the Īl-Khāns, the western frontier of Mesopotamia was the political boundary of Persia, Baghdad being the capital of Lower Mesopotamia and Mosul the seat of another government. In 1295, Baydu, a grandson of Hülegü and governor of Iraq, seized power, but he was overthrown in the same year by Ghāzān, governor of Khorāsān. When Abū Saʿīd, the 9th Īl-Khān, died in 1335, Ḥasan Buzurg (died 1356) founded in Baghdad the dynasty of the Jalāyirids, who achieved some success, chiefly in Fars and Upper Mesopotamia, but they were compelled to suppress a succession of revolts in Baghdad. Restless Bedouin tribes in the south and Turkmens and Kurds in the north complicated the state of affairs and hastened the decline of a moribund country. This small dynasty of Mongol origin ruled from 1339 to 1410 and incorporated Mosul into its dominions in 1364. On two occasions, however, in 1393 and particularly in 1401, Timur (Tamerlane) took and sacked Baghdad, slaughtered its inhabitants, and pulled down a great part of the town. Aḥmad the Jalāyirid (died 1410), driven out by Timur, recovered Baghdad in 1394 and again in 1405 and tried to make good the damages.

The Jalāyirids

Until 1432, Jalāyirid rulers retained some power in Lower Mesopotamia (al-Ḥillah, Basra, Khuzistan) but were unable to preserve Baghdad, which fell (1411) into the hands of the Kara Koyūnlu (the Black Sheep), a Turkmen dynasty that ruled Asia Minor from 1375 to 1468. This period is also marked by political fragmentation and rivalries between Baghdad and Mosul. The rule of the Turkmens was challenged by the politico-religious movement of the Mushaʿshaʿ, who came into prominence in Khuzistan, attempted to extend their control over Lower Iraq, and harried the Kara Koyunlu as far as the outskirts of Baghdad, which they were not able to take. In 1468, the Ag Koyunlu (the White Sheep) took over from the Kara Koyunlu, ruling from Tabriz; in 1503, the last member of the dynasty was compelled to seek refuge at Baghdad, where he ruled till 1508, when Iraq, including Mosul, fell under the sway of the Shīʿī Ṣafavids and remained in their possession until the Ottomans conquered it. In spite of the weakness of the local government, Iraq enjoyed a fairly prosperous economy during this short period.

The Ottomans. Although Sultan Selim I (1512–20) had crushed the Ṣafavid armies at Chāldirān in 1514 and taken Tabriz, Mosul, Diyarbakir, and several Kurdish areas east of the Tigris in 1515–17, Iraq proper remained under Persian control for some time. In Baghdad, the Kurdish leader Dhū al-Faqār raised a revolt in 1527 that induced Shāh Ṭahmāsp (1524–76) to assert Persian authority over central Iraq more firmly than ever, but hostilities started again between him and Süleyman (Sulayman the Magnificent, 1520–66); the latter entered Baghdad in 1534, and Iraq remained in the possession of the Ottomans until March 1917, though not without trouble: the peace was somewhat disturbed by intermittent struggles between Turks and Iranians, resulting in the occupation of Baghdad by the Ṣafavids from 1623 to 1638; the Turkish communications were at the mercy of turbulent tribesmen; and parts of the country were semi-independent at one time or another. The long period of Ottoman rule, however, witnessed some revival of Baghdad, improvement of living conditions, and administrative reorganization on Western lines as well as the beginning of European penetration.

Süleyman the Magnificent

The Ottomans had assumed the title of caliph, and the capture of the last ʿAbbāsid puppet in Cairo (1517) had emphasized their feeling that they were the successors of the great Baghdadian dynasty; therefore, the conquest of Baghdad increased Süleyman's prestige, but it had another consequence: on the one hand, it temporarily brought to an end the rivalries between Shīʿīs and Sunnīs and materialized the triumph of Sunnism in the country where such religious conflicts were frequent; on the other hand, the conquest of Egypt had made the Ottomans the masters of the Red Sea, which retained, in spite of the discovery of the Cape route around Africa at the end of the 15th century, much of its former importance in international trade. As masters of the Persian Gulf, the Ottomans could control all the traffic in the Middle East. Last but not least, Iraqi territories were a kind of buffer against not only the rulers of Iran but also the restless tribes of Kurds and Arabs.

Basra, always eager to preserve independence, played a certain part under the Ottoman rule. At first a vassal of the Sultan, it tried to shake his suzerainty, but two expeditions sent from Baghdad in 1546 resulted in its incorporation into the Ottoman possessions in Iraq, which was divided at the time into five *eyalets*: Baghdad, Basra, Mosul, Shahrazūr, and al-Ḥasā, on the western shore of the Persian Gulf.

For almost two centuries the Ottomans tried to exercise a sort of direct rule over Iraq. Süleyman organized local administration, made a survey of the lands, appointed governors, sent Janissaries, and displayed some building activity, mainly in Baghdad, which became a prosperous centre of trade much admired by European travellers. Early in the 17th century, however, a Janissary officer named Bakr Ṣū Bāshī revolted, held sway over Baghdad—which he terrorized—and entered upon negotiations with Shāh ʿAbbās I (1587–1629) in order to strengthen his position, but Iraq was taken by the Ṣafavids in 1623, the Ottomans being able to preserve only Mosul and Shahrazūr. The Persians destroyed many buildings, including

Sunnī mosques, and several thousands of inhabitants were killed or sold as slaves.

Just as in al-Ḥasā a family of governors ruled from the late 16th century until 1663, so in Basra Afrāsiyāb an army officer of unknown origin purchased the governorship from the local pasha in 1612 and founded a small dynasty of governors who ruled the town until 1668 and favoured European penetration by opening the doors to English, Portuguese, and Dutch merchants trading in the Persian Gulf. Afrāsiyāb offered strong resistance to the Ṣafavids but did not support Baghdad against them.

Beginning of European penetration

In the meantime, Baghdad had been retaken in 1638 by Sultan Murad IV (1612–40), and a great many Shīʿīs were massacred. A treaty concluded in 1639 at Qaṣr-e Shīrīn between the Ottomans and Ṣafavids fixed the boundaries of the two states.

This Ottoman victory did not bring stability to Iraq, and the rulers had to suppress many disturbances caused by the turbulent garrison troops and unruly Arab and Kurdish tribes. In Lower Iraq, after the Afrāsiyāb dynasty was overthrown, the Arab tribes of al-Muntafiq and Ḥuwayza threatened the Ottoman supremacy, while Iranians penetrated into this region. After the Treaty of Karlowitz (1699) with Austria, Russia, Poland, and Venice, the Ottomans were able to send some troops to Iraq and recover Basra. In spite of the 1639 settlement, Baghdad was still the stake of struggles between Turks and Persians because of its being the most important city in the east of the Ottoman possessions.

From 1704 a new government system was introduced in Iraq by Hasan Paşa (governor from 1704 to 1724), his son Ahmad Paşa (1724–1747), and their successors. Themselves of Georgian origin, they relied on young Georgian slaves, trained in a special school, to become the chiefs of the main administrative services; those *mamlūk*s (slaves), known in Turkish as *kölemen,* sometimes reached governorship in Baghdad and applied personal policies; they suppressed revolts, restored order, annexed Basra, and promoted some prosperity in the country. In 1733, however, Nāder Shāh (later ruler of Iran from 1736 to 1747) besieged Baghdad but was compelled to withdraw from the capital; in 1742, he also failed to seize Mosul, governed by a native pasha, ʿAbd al-Jalīl, whose family, the Jalīlīs, ruled there from 1726 to 1834, and an agreement in 1746 confirmed the terms of the Qaṣr-e Shīrīn settlement. In 1775, Basra, where an agency of the British East India Company had been established as early as 1763, was lost for five years to Ṣādiq Khān, a brother of Karīm Khān Zand, the ruler of Persia. Süleyman Paşa (later known as Büyük the Great), governor of Basra, was transported to Shīrāz and came back on Karīm's death, took possession of Baghdad, and was given the governorship of Baghdad, Basra, and Shahrazūr by the Sultan. Under Büyük (1780–1802), the *Kölemen* rule reached its zenith. He fostered agriculture and trade, built several monuments, and, in 1798, permitted a permanent British resident to be appointed in the capital. Shortly before he died, however, Iraq was attacked by the Wahhābīs of Arabia, who penetrated into al-Ḥasā and, with their iconoclastic zeal, raided and sacked in 1802 Karbalāʾ, the holy city of Shīʿīs, despite the support of the Muntafiq confederacy to Baghdad.

The *kölemen* regime lasted until 1831, when Sultan Mahmud (1730–54) turned out Dawud Paşa from Baghdad after famine and flood had devastated and depopulated the city. From 1831, the Sublime Porte had high hand over Iraq, the history of which is henceforth characterized by administrative, economic, and social reform, together with European penetration. English, French, and Italian agencies and consulates were established in Basra. A company for river traffic between Basra and Baghdad was created; a telegraphic line linked Istanbul with Baghdad; but the Ottoman authority over the tribesmen was still weak. A new stage came with the governorship of Midhat Paşa (1869–72), who enforced the Ottoman law of *vilayet*s, introduced a new administrative system, including an elected town council, created a press and the earliest Iraqi newspaper (*az-Zawrāʾ*, 1869), founded primary and secondary military schools, and inaugurated the Baghdad-Kāẓimayn tramway line. This was a meritorious attempt at modernizing the country, at least Baghdad. Progress continued until the early 20th century, when Arabic-speaking Iraqi leaders began to lose confidence in the Ottomans and to dream about independence within the framework of a Pan-Arab and anti-Ottoman movement.

On November 20, 1914, an Anglo-Indian expeditionary force occupied Basra; Gen. Charles Townshend seized Kūt al-ʿAmārah in 1915 but was compelled to surrender on April 29, 1916; finally, the British took possession of Baghdad in March 1917, Mosul remaining in the hands of the Ottomans until the armistice of Mudros (October 30, 1918).

(C.L.P.P.)

IRAQ SINCE 1918

British occupation and the mandatory regime. The merging of the three provinces of Mosul, Baghdad, and Basra into one political entity and the creation of a nation out of the diverse religious and ethnic elements inhabiting these lands was accomplished by the events and circumstances following World War I. Action undertaken by the British military authorities during the war and the upsurge of nationalism after the war helped determine the shape of the new Iraqi state and the course of events during the postwar years, until Iraq finally emerged as an independent political entity in 1932.

British control of Iraq, however, proved to be short-lived. After the war Britain debated both its general policy in Iraq and the specific type of administration to establish. Two schools of thought influenced policy makers in London. The first, advocated by the Colonial Office, stressed a policy of direct control to protect British interests in the Persian Gulf and India. Assessing British policy from India, this school may be called the Indian school of thought. The other school, hoping to reconcile Arab nationalism, advised indirect control. In Iraq itself, British authorities were divided on the issue. Some, under the influence of Sir Arnold Wilson, the acting civil commissioner, advocated direct control; others, alarmed by growing dissatisfaction with the British administration, advised indirect control and suggested the establishment of an indigenous regime under British supervision. Britain was still undecided on which policy it should follow in 1920 when external events in other Arab countries radically changed the internal conditions of Iraq.

Early in 1920 the *amīr* Fayṣal I, son of the *sharīf* Ḥusayn, who had led the Arab Revolt in 1916, established an Arab government in Damascus and was proclaimed king of Syria. Meanwhile, a group of Iraqi nationalists met in Damascus to proclaim the *amīr* ʿAbd Allāh, older brother of Fayṣal, as king of Iraq. Under the influence of nationalist activities in Syria, nationalist agitation followed first in northern Iraq and then in the tribal areas of the Middle Euphrates. By the summer of 1920 the revolt had spread to all parts of the country except the big cities of Mosul, Baghdad, and Basra, where British forces were stationed.

Amīr ʿAbd Allāh proclaimed king

In July 1920, Fayṣal came into conflict with the French authorities over control of Syria. France had been given the mandate over Syria and Lebanon in April and was determined to obtain Fayṣal's acceptance of the mandate. Nationalists urged Fayṣal to reject the French demands, and conflict ensued between him and the French, resulting in his expulsion from Syria. Fayṣal went to London to complain about the French action.

Although the revolt in Iraq was suppressed by force, it prompted both Iraq and Great Britain to reconcile their differences. In Britain a segment of public opinion wanted to "get out of Mesopotamia" and urged relief from further commitments. In Iraq, the nationalists were demanding independence. When Fayṣal arrived in London, the question of Iraq had been the subject of discussion between the Colonial and Foreign offices. In 1921 Britain offered the Iraqi throne to Fayṣal along with the establishment of an Arab government under British mandate. Fayṣal wanted the throne if it were offered to him by the Iraqi people. He also suggested the replacement of the mandate by a treaty of alliance. These proposals were accepted by the British government, and Winston Churchill, then colonial

secretary, promised to carry them out. He was advised by T.E. Lawrence, known for his sympathy for the Arabs.

In March 1921 a conference presided over by Churchill was held in Cairo to settle Middle Eastern affairs. Fayṣal was nominated to the Iraqi throne, provided that a plebiscite be held to confirm the nomination. Sir Percy Cox, recently appointed a high commissioner for Iraq, was entrusted with carrying out the plebiscite before Fayṣal's accession to the throne. A provisional government set up by Cox shortly before the Cairo Conference passed a resolution on July 11, 1921, declaring Fayṣal king of Iraq, provided that his "Government shall be constitutional, representative and democratic." The plebiscite confirmed this proclamation, and Fayṣal was formally crowned king on August 23, 1921.

The establishment of the monarchy was the first step in the establishment of a national regime. Two other steps followed immediately: the signing of a treaty of alliance with Great Britain and the drafting of a constitution. It was deemed necessary that a treaty should precede the constitution and define relations between Iraq and Britain. The treaty was signed on October 10, 1922. Without direct reference, it reproduced most of the provisions of the mandate. Iraq undertook to respect religious freedom and missionary enterprises and the rights of foreigners, to treat all states equally, and to cooperate with the League of Nations. Britain was obligated to offer advice on foreign and domestic affairs, such as military, judicial, and financial matters (defined in separate and subsidiary agreements). Although the terms of the treaty were open to periodic revision, they were to last 20 years. In the meantime, Britain agreed to prepare Iraq for membership in the League of Nations "as soon as possible."

Treaty of alliance with Britain

It soon became apparent that the substance, though not the form, of the mandate was still in existence and that complete independence had not been achieved. Strong opposition to the treaty in the press made it almost certain it would not be ratified by the Constituent Assembly. Nor was British public opinion satisfied with the commitments to Iraq. During the general elections of 1922 there was a newspaper campaign against British expenditures in Iraq. In deference to public opinion, both in Britain and Iraq, a protocol to the treaty was signed on April 30, 1923, reducing the period of the treaty from 20 to four years. Despite the shortening of British tutelage, the Constituent Assembly demanded complete independence when the treaty was put before it for approval. Ratification of the treaty was accomplished on June 11, 1924, after England's warning that nonapproval would lead to the referral of the matter to the League of Nations.

The Constituent Assembly then moved to consider a draft constitution drawn up by a constitutional committee. The committee tried to give extensive powers to the king. Discussion on the draft constitution by the Constituent Assembly lasted a month, and, after minor modifications, it was adopted in July 1924. The Organic Law, as the constitution was then called, went into effect right after it was signed by the King on March 21, 1925. It provided for a constitutional monarchy, a parliamentary government, and a bicameral legislature. The latter was composed of an elected House of Representatives and an appointed Senate. The lower house was to be elected every four years in a free manhood suffrage. The first Parliament met in 1925. Ten general elections were held before the downfall of the monarchy in 1958, and over 50 Cabinets formed during the same period reflected the instability of the system.

The Organic Law

From the establishment of a national government, there was keen interest in organizing political parties. Three parties, organized in 1921, one by the group in power and two by opposition parties, had similar social and economic views and essentially the same political objective: termination of the mandate and the winning of independence. They differed, however, in the means of achieving the objective. After the achievement of independence in 1932, these parties dissolved, because their *raison d'être* had disappeared. It was only when social issues were discussed that new political groupings, even if not formally organized as political parties, began to emerge. The power struggle among these groups became exceedingly intense after World War II.

The Iraqi nationalists, though appreciating the free expression of opinion permitted under a parliamentary system, were far from satisfied with the mandate. They demanded independence as a matter of right, as promised in war declarations and treaties, rather than as a matter of capacity for self-government as laid down in the mandate. Various attempts were made to redefine Anglo-Iraqi relations, as embodied in the 1926 and 1927 treaties, without fundamentally altering Britain's responsibility. The British treaties were deemed by the nationalists as not only impeding the realization of Iraq's nationalist aspirations, but also inimical to the economic development of the country. The nationalists viewed the situation as a "perplexing predicament" (*al-waḍ ʿash-shadh*) —a term that became popular in Parliament and the press. It referred to the impossibility of government by the dual authority of the mandate. The nationalists argued that there were two governments in Iraq, one foreign and the other national, and that such a regime was an abnormality that, though feasible in theory, was unworkable in practice.

The "perplexing predicament"

In 1929 Britain decided to end this stalemate and reconcile its interests with Iraq's national aspirations. It notified Iraq that the mandate would be terminated in 1932 and a new treaty of independence negotiated. A new government was formed, headed by Gen. Nūrī as-Saʿīd, who helped in achieving Iraq's independence.

The new treaty was signed on June 30, 1930. It provided for the establishment of a "close alliance" between Britain and Iraq, with "full and frank consultation between them in all matters of foreign policy which may affect their common interests." Iraq would maintain internal order and defend itself against foreign aggression, supported by Britain. Any dispute between Iraq and a third state, involving the risk of war, was to be discussed with Britain in the hope of a settlement in accordance with the Covenant of the League of Nations. In the event of an imminent menace of war, the two parties would take a common defense position. Iraq recognized that the maintenance and protection of essential British communications was in the common interest of both parties. Air-base sites for maintaining British troops were therefore granted and installed near Basra and west of the Euphrates, but these forces "shall not constitute in any manner an occupation, and will in no way prejudice the sovereign rights of Iraq." This treaty, valid for 25 years, was to come into effect after Iraq had become a member of the League of Nations. On October 3, 1932, Iraq was admitted to the League of Nations as an independent state.

Independence, 1932–39. Since conflict among Iraq's political leaders centred essentially on how to end the mandate rather than on the right of independence, King Fayṣal sought the cooperation of opposition leaders after independence. Shortly after Iraq's admission to the League, General Nūrī, who had been prime minister since 1930, resigned. After an interim administration, King Fayṣal invited Rashīd ʿĀlī al-Gaylānī, one of the opposition leaders, to form a new government. For a short while it seemed that all the country's leaders would close ranks and devote all their efforts to internal reforms.

But internal dissension soon developed. The first incident was the Assyrian uprising of 1933. The Assyrians, a small Christian community living in Mosul Province, were given assurances of security by both Britain and Iraq. When the mandate was ended, the Assyrians began to feel insecure and demanded new assurances. Matters came to a head in the summer of 1933 when King Fayṣal was in Europe. The opposition, now in power, wanted to impress the public through a high-handed policy toward a minority group. In clashes with the Iraqi troops several hundred Assyrians were brutally killed. The incident was brought to the attention of the League less than a year after Iraq had given assurances that it would protect minority rights. Had King Fayṣal been in the country, he would have counselled moderation. Upon his hasty return to Baghdad, he found deep-seated divisions and events beyond his control. Suffering from heart trouble, he returned to Switzerland, where he died in September 1933. The Assyrian incident brought about the fall of Rashīd ʿĀlī and his replacement by a moderate government.

The Assyrian uprising of 1933

Fayṣal was succeeded by his son, King Ghāzī (1912–39), who was still young and inexperienced—a situation that gave political leaders an opportunity to compete for power. Without political parties to channel their activities through constitutional processes, politicians resorted to extraconstitutional, or violent, methods. One extraconstitutional method involved clever political manoeuvring. Opposition leaders tried to embarrass those in power by press attacks, palace intrigues, or incidents that would cause Cabinet dissension and force the prime minister to resign. The first five governmental changes after independence, from 1932 to 1934, were produced by these methods.

The second device used was the incitement of tribal uprisings in areas where there were tribal chiefs unfriendly to the group in power. Tribes, though habitually opposed to authority, had been brought under control and remained relatively quiet after 1932. When opposition leaders began to incite them against the government in 1934, however, they rebelled and caused the fall of three governments from 1934 to 1935.

The third method was military intervention. The opposition tried to obtain the loyalty of army officers, plan a coup d'etat, and force those in power to resign. This method, often resorted to by the opposition, proved to be the most dangerous because, once the army intervened in politics, it became increasingly difficult to reestablish civilian rule. From 1936 until the army was defeated in a war with Britain, in 1941, the army dominated domestic politics. The army again intervened in 1958, and it continues to dominate the political scene.

The coup d'etat of 1936

Two different sets of opposition leaders produced the first military coup d'etat in 1936. The first group, led by Ḥikmat Sulaymān, was a faction of old politicians who sought power by violent methods. The other was the Ahalī group, composed mainly of young men who advocated Socialism and democracy and sought to carry out reform programs. It was Ḥikmat Sulaymān, however, who urged Gen. Bakr Ṣiqī, commander of an army division, to stage a surprise attack on Baghdad, in cooperation with another military commander, and forced the cabinet to resign. It seems that young King Ghāzī had also been disenchanted with the group in power and so allowed the government to resign. Ḥikmat Sulaymān became prime minister in October 1936, and Bakr Ṣidqī was appointed chief of the general staff. Neither the Ahalī group nor Ḥikmat Sulaymān could improve social conditions, however, because the army gradually dominated the political scene. Supported by opposition leaders, a dissident military faction assassinated Bakr Ṣidqī, but civilian rule was not reestablished. The significance of this first military coup lies in the fact that it introduced a new factor in politics. Lack of leadership after the assassination of Bakr Ṣidqī left the army divided, while jealousy among leading army officers induced each faction to support a different set of civilian leaders. The army continued to influence political decisions behind the scenes and became virtually the deciding factor in Cabinet changes from 1936 to 1941.

Despite political instability, material progress continued under King Ghāzī's short reign: the Kūt al-ʿAmarah irrigation project, begun in 1934, was completed; other projects, to be financed by oil royalties, were laid down; the pipelines from the Kirkūk oil fields to the Mediterranean were opened in 1935; the railroads, still under British control, were purchased in 1935, and the Baʿījī-Tal Küçük section, the only missing railway link between the Persian Gulf and Europe, was completed in 1938; and there was a noticeable increase in construction, foreign trade, and in educational facilities. Several outstanding disputes with Iraq's neighbours were settled, including the dispute with Iran over the Shatt al-Arab in 1936 and the boundary with Syria, which was settled in Iraq's favour to include within its boundary the Jabal Sinjār. A nonaggression pact, called the Saʿdābād Pact, between Turkey, Iran, Afghanistan, and Iraq was signed in 1937. Arab cooperation was stressed in a nonaggression agreement with Saudi Arabia and Yemen. In 1939, shortly before the outbreak of World War II, King Ghāzī was killed in a car accident and his son Fayṣal II ascended the throne. As Fayṣal was only four years old, Fayṣal's uncle, Amīr ʿAbd al-Ilāh, was appointed regent and served in this capacity for the next 14 years.

World War II and British intervention, 1939–45. General Nūrī, author of the 1930 treaty, was prime minister when World War II broke out. Believing that the Anglo-Iraqi alliance was the best guarantee for Iraqi security, he wanted to declare war on Germany, but his ministers counselled caution as British victory was then in doubt. General Nūrī accordingly declared Iraq nonbelligerent and severed diplomatic relations with Germany. When Italy entered the war, however, Nūrī, then Minister of Foreign Affairs in Rashīd ʿĀlī al-Gaylānī's Cabinet, was unable to persuade the Cabinet to break off diplomatic relations with Italy. Under the influence of Pan-Arab leaders, public opinion in Iraq radically changed after France's fall, becoming especially hostile to Britain because other Arab countries remained under foreign control. Pan-Arabs urged Iraqi leaders to free Syria and Palestine and achieve unity among Arab countries. Extremists advocated alliance with Germany as the country that would foster independence and unity among Arabs.

Hostility toward Britain

Rashīd ʿĀlī was at first unwilling to side with the extremists and gave lip service to the Anglo-Iraqi alliance. But dissension among the Iraqi leaders forced Rashīd ʿĀlī to side with the Pan-Arabs. Leading army officers also fell under Pan-Arab influences and encouraged Rashīd ʿĀlī to detach Iraq from the British alliance. During 1940 and 1941 Iraqi officers were unwilling to cooperate with Britain, and the Pan-Arab leaders began secret negotiations with the Axis Powers. Britain decided to send reinforcements to Iraq. Rashīd ʿĀlī, while allowing the landing of a small British force in 1940, was overthrown from power early in 1941, but he was reinstalled by the army in April and refused further British requests for reinforcements.

British contingents entered Iraq from the Persian Gulf as well as from the Ḥabbānīyah air base during April and May 1941; armed conflict with the Iraqi forces followed. The hostilities lasted only 30 days, during which period a few Iraqi leaders, including the regent and General Nūrī, fled the country. By the end of May the Iraqi Army capitulated, and Rashīd ʿĀlī and his Pan-Arab supporters left the country.

The return of the regent and moderate leaders through British intervention had far-reaching consequences. Britain was given what it demanded: the use of transportation and communication facilities and a declaration of war on the Axis Powers in January 1942. Rashīd ʿĀlī's supporters were dismissed from the service and some of them interned for the duration of the war. Four officers who were responsible for the war were hanged.

Postwar reconstruction and social upheavals, 1945–58. During World War II, liberal and moderate Iraqi elements began to play an active political role. The entry of the United States and the Soviet Union into the war on the side of Britain and their declarations in favour of democratic freedoms greatly enhanced the position of the Iraqi democratic elements. The people endured shortages and regulations restricting personal liberty and the freedom of the press, trusting that the end of the war would bring the promised better way of life. The government, however, paid no attention to the new spirit, and the wartime regulations and restrictions continued after the war. The regent called a meeting of the country's leaders in 1945 and made a speech in which he attributed public disaffection to the absence of a truly parliamentary system. He called for the formation of political parties and promised full freedom for their activities and the launching of social and economic reforms.

The immediate reactions to the regent's speech were favourable, but, when political parties were formed in 1946 and certain regulations abolished, the older politicians and vested interests resisted, and the new government formed in January 1946 to honour the regent's promises was overthrown within a few months of its inception. General Nūrī then became prime minister and tried to enlist the cooperation of political parties, but the general elections held under his government's supervision were no different from previously controlled elections. The parties boycotted

Ṣāliḥ Jabr's government

the elections. General Nūrī resigned in March 1947, and Ṣāliḥ Jabr formed a new government.

Jabr, the first Shī'ī politician to become a prime minister, included in his cabinet a number of young men, but he himself was unacceptable to some liberal and nationalist elements who had been roughly handled when he was wartime Minister of Interior. Jabr tried to help the Arabs in Palestine in order to improve his image in nationalist circles, but he mishandled opposition leaders. Most damaging was his attempt to replace the Anglo-Iraqi treaty of 1930 by another—without consultation with the country's leaders. When his attention was called to the need for consultation, he consulted only with older politicians and excluded younger leaders.

Jabr entered into negotiations with Britain with the intention of enhancing his own position. When he found that Britain wanted to retain control of its air bases in Iraq, he insisted that Britain accept the principle of Iraqi control of the bases and allow Iraq the use of the bases for defensive purposes. He threatened to resign if Britain refused his proposals. It was with this understanding that Jabr proceeded to London early in 1948 to negotiate a new treaty. Jabr and Ernest Bevin, the British foreign secretary, quickly came to an agreement and signed a new 20-year treaty at Portsmouth on January 15, 1948. It provided for a new alliance between Iraq and Britain on the basis of equality and complete independence and stated "each of the high contracting parties undertake not to adopt in foreign countries an attitude which is inconsistent with the alliance or which might create difficulties for the other party." The annex to the treaty stressed the importance of the air bases as "an essential element in the defense of Iraq," but Britain's use of the air bases in the event of war, or threat of war, would be dependent on Iraq's invitation. The treaty also provided for the establishment of "a joint defence board," equally represented by Britain and Iraq, for common defense and consultation. Both parties agreed to grant each other necessary facilities for defense purposes. An improvement of the 1930 treaty, this treaty sought an alliance on the basis of mutual interests. The two air bases, which were often the subject of criticism, were returned to Iraq. British forces were to be evacuated, and Iraq would be supplied with arms and military training.

Anti-British rioting

Despite these advances, the treaty was repudiated immediately in a popular uprising. Street demonstrations had been going on before the treaty was signed, in defense of Arab rights in Palestine, but, when the news of the signing of the new treaty was broadcast in London, rioting and demonstrations in Baghdad led to clashes between students and the police. The regent called a meeting at the royal household on January 21, which was attended by the country's leaders. After deliberations, it was decided to repudiate the treaty. Jabr returned to Baghdad to defend his position but to no avail. Rioting, demonstrations, and clashes with the police increased, and Jabr was forced to resign. Obviously the new treaty was not the root cause of the uprising. The uprising was the culmination of events in a struggle between the liberal and young leaders who wanted to participate in political activities and the older leaders who insisted on excluding the younger elements from public affairs. The conflict between the older and younger leaders continued after the treaty had been rejected. The older politicians returned to power under General Nūrī's leadership. By 1952 another popular uprising, stirred by opposition leaders and carried out by students and extremists, again manifested itself in rioting and street demonstrations. The police were unable to control the mob, and the regent called on the army to maintain public order. The chief of the general staff governed the country under martial law for more than two months. Civilian rule was restored at the beginning of 1953, but there was no sign that the country's older leaders were prepared to share authority with their opponents. Meanwhile, King Fayṣal II, who had come of age, began to exercise his formal powers, and the period of regency came to an end. It was hoped that the regent would withdraw from active politics and allow the political forces of the country to create a new order. The former regent, who became the crown prince, continued to control political events from behind the scene. The struggle for power among the leaders continued with increasing intensity until the downfall of the monarchy in 1958.

Development of Iraq oil in the 1950's

Despite political instability, Iraq achieved material progress during the 1950s, thanks to a new oil agreement that increased royalties and the establishment of the Development Board. The oil agreement between the Iraqi government and the Iraq Petroleum Company (IPC), originally signed in 1925, had yielded relatively modest royalties, owing to certain technical limitations, such as construction of pipelines, and to war conditions. It was not until 1952 that construction of pipelines to Banias was completed. There were certain points of dispute between the government and the IPC that were not entirely resolved. The nationalization of the oil industry in Iran and the announcement of the 1950 agreement between Saudi Arabia and Aramco (Arabian American Oil Company), on a half-and-half basis of payment, induced the Iraqi government and IPC to negotiate a new agreement on the new pattern of the division of profits. Some of the opposition leaders demanded the nationalization of the oil industry, but the Iraq government and IPC, forestalling any serious move for nationalization, agreed to negotiate on the basis of the fifty-fifty formula, to the mutual advantage of Iraq and the company. The new agreement was signed in 1952, allowing Iraq to take in kind as part of its share and to receive an increasing amount of royalties specifically agreed upon between the two parties. It was then estimated that Iraq would receive no less than £30 million in 1953 and 1954 and no less than £50 million in 1955 and subsequent years.

Creation of the Development Board

In 1950 the government created the independent Development Board, an agency immune from political pressures and responsible directly to the prime minister. This agency provided for a body of six executive members, three of whom were to be experts in some branch of the development program. The prime minister, as chairman, and the minister of finance were ex-officio members. An amendment to the law increased membership by two and provided for a minister of development responsible directly to the head of the Cabinet. These members were appointed by the Cabinet, given equal voting rights, and might not hold any other official position. Two foreign members held positions as experts, and the Iraqi members were selected on merit and past experience. The board was composed of a council and ministry. Its staff was divided into technical sections and the ministry into a number of departments. The technical sections were for irrigation, flood control, water storage, drainage, transportation, and industrial and agricultural development. The board was financed from 70 percent of oil royalties and from loans and revenues from the board's own projects. The estimated expenditure of the first six-year program (1951–56) was £155,000,000, and in 1950 the World Bank provided a loan of $12,800,000 for the Wādī ath-Tharthār flood-control project.

The Tharthār project, completed in 1956, connects the River Tigris at Samarrā' (some 60 miles north of Baghdad) with the Wādī ath-Tharthār Depression. A barrage was constructed on the Euphrates at Ramādī, making it possible to divert water into Lake Ḥabbānīyah. Other flood-control plans, such as that at Bakhma (completed after the revolution of 1958), were laid down. Extensive work on bridges and public buildings, including schools, hospitals, a new Parliament building, and a royal house, was started, and it was completed after 1958. This work, especially the work on dams and irrigation projects, was a long-term investment, and many short-term projects of more direct benefit to the population were neglected. Opposition leaders attacked the Development Board for the stress on long-term projects whose beneficiary, they held, were the vested interests—landowners and tribal chiefs. Despite criticism, the board maintained an independent status rarely enjoyed by any other government department. Nevertheless, the public remained unaware of the far-reaching effects of the projects undertaken, while the opposition attacked the board for squandering funds on contracts given to wealthy landlords and influential politicians.

The revolution of 1958. Despite material progress, the monarchy failed to win public support and, in particular,

the confidence of the younger generation. Before the revolution, Iraq lacked an enlightened leadership capable of achieving progress and inspiring public confidence. The new generation offered such leadership, but the older leaders resisted and embarked on an unpopular foreign policy, including an alliance with Britain through participation in the Baghdad Pact and opposition to the establishment of the United Arab Republic (U.A.R.).

Rise of the Free Officers

The failure of younger civilians to obtain power aroused the concern of some young military officers who, required by military discipline to take no part in politics, called themselves the Free Officers and began to organize in small groups and to lay down revolutionary plans. The number of Free Officers was relatively small, but there was a considerably larger number of sympathizers. The officers worked in cells, and the identity of the participants was kept secret. Only the Central Organization, which supplied leadership of the movement, was known to all the Free Officers. The Central Organization was composed of 14 officers, headed by Abdul Karim Kassem, who held the highest military rank.

Of the several plots proposed, that laid down by Kassem and his close collaborator ʿAbd as-Salām ʿĀrif proved the most appropriate. The general staff issued an order to one of the brigades, in which ʿĀrif served, to proceed to Jordan on July 14, 1958, to reinforce Jordanian forces against alleged threats by Israel. Brigadier Kassem, in command of another brigade, was to protect the brigades going to Jordan. Kassem and ʿĀrif agreed that as the brigade proceeding to Jordan passed through Baghdad it would capture the city.

On July 14 the revolutionary forces captured the capital, declared the downfall of the monarchy, and proclaimed a republic. The leading members of the royal house, including the King and Crown Prince, and General Nūrī were executed. Kassem, head of the revolutionary force, formed a Cabinet, over which he presided, and appointed himself commander of the National Forces. He also assumed the portfolio of defense and appointed ʿĀrif both minister of the interior and deputy commander of the National Forces. A Council of Sovereignty, composed of three persons, was to act as head of state.

A provisional constitution declared that Iraq formed an integral part "of the Arab nation," and that "Arabs and Kurds are considered partners in this homeland." Iraq was declared a republic and Islām the religion of the state; all executive and legislative powers were entrusted to the Sovereignty Council and the Cabinet. It soon became clear, however, that power rested in Kassem's hands, supported by the army.

Pan-Arabism versus Iraqi nationalism

Conflicts among the officers developed, first between Kassem and ʿĀrif, and then between Kassem and his supporters. ʿĀrif championed the Pan-Arab cause and advocated Iraq's union with the U.A.R. Kassem rallied the forces against Arab unity—Kurds, Communists, and others—and stressed Iraq's own identity and internal unity. ʿĀrif was dropped from power in October, but in the following year Kassem's power was threatened by other factions. Kassem tried to divert public attention to foreign affairs by putting forth Iraq's claim to Kuwait's sovereignty in June 1961. This claim brought him into conflict not only with Britain and Kuwait but also with the other Arab countries. He opened negotiations with the Iraq Petroleum Company to increase Iraq's royalties, but his extreme demands resulted in the breakdown of negotiations in 1961. Public Law 80 was enacted to prohibit the granting of concessions to any foreign company and to transfer control over all matters connected with oil to an Iraq National Oil Company (INOC).

By 1963 Kassem had become isolated internally as well as externally; the only great power with which he remained friendly was the Soviet Union. When one faction of the army, in cooperation with one Arab nationalist group—the Iraqi regional branch of the Arab Socialist Baʿth ("Renaissance") Party—started a rebellion in February 1963, the Kassem regime suddenly collapsed, and Kassem was executed.

Recurrence of military coups, 1963–68. The military faction that brought about the collapse of the Kassem regime preferred to remain behind the scenes rather than to assume direct responsibility. The Baʿth Party, a group of young activists who advocated Arab nationalism and Socialism, was entrusted with power. Baʿth leaders invited ʿAbd as-Salām ʿĀrif to assume the presidency. A National Council for Revolutionary Command (NCRC), composed of civilian and military leaders, was established to assume legislative and executive powers. The premiership was entrusted to Col. Aḥmad Ḥassan al-Bakr, a Baʿthist officer.

Some of the Baʿth leaders wanted to carry out Baʿth Socialist ideas; others advised more caution. A compromise was finally reached in which the party's goals—Arab unity, freedom, and Socialism—were reaffirmed in principle, but it was decided to adopt a transitional program. Industrialization and economic development were stressed, and the role of the middle class was recognized. The dissension among Baʿth leaders, however, soon led to the collapse of the regime. President ʿĀrif, whose powers initially had been restricted by the Baʿth leaders, rallied the military forces to his side. On November 18, 1963, he placed the leaders of the Baʿth Party under arrest and took over control, becoming in fact, as in name, the real ruler of the country. In May 1964, a new provisional constitution was promulgated in which the principles of Arab unity and Socialism were adopted, and, in July, the banks and a number of the country's industries were nationalized.

ʿĀrif's alliance with the military forces

The idea of Arab Socialism attracted only a small group in Iraq, and ʿĀrif began to discover its unfavourable effects on the country. ʿĀrif himself had never been a believer in Socialism, but he had adopted it under the influence of Egypt. The adverse influence of nationalization gave him an excuse to replace the ideological group that supported Socialism with others who would pay attention to the reality of Iraq's economic conditions. Nor had ʿĀrif been happy with the group of officers who had elevated him to power. He began to prepare the way to entrust power to civilian hands willing to be guided by him as chief executive.

In September 1965 ʿĀrif invited Abd ar-Rahman al-Bazzaz, a distinguished lawyer, diplomat, and writer on Arab nationalism, to form a new government. Bazzaz did not feel that he should abolish Arab Socialism, but he offered to increase production and create a balance between the public and private sectors.

The Arab Baʿth Socialist regime since 1968. After the Baʿth fell from power, an internal conflict between Marxists and nationalists virtually crippled the party. In 1964 Aḥmad Ḥassan al-Bakr, an army officer highly respected by the party, was elected leader and put an end to internal dissension.

Premiership of Bazzaz

ʿĀrif died suddenly in a helicopter accident in April 1966. Even before his death, Premier Bazzaz, known for his opposition to military interference in politics, had begun to talk about the need to hold elections for a representative assembly; military officers pressured the new president, ʿAbd ar-Raḥman ʿĀrif, elder brother of the late president, to remove Bazzaz, and the Cabinet resigned in August 1966. Power remained in military hands, but factionalism in the army was accentuated and leadership frequently changed hands. The Arab defeat in the Arab–Israeli war of 1967, in which Iraq took only a nominal role, led to intense unrest within the country and within the party. The Baʿth, joined by other opposition leaders, called for the formation of a coalition government and the holding of general elections for a National Assembly. President ʿĀrif paid no attention to their demands.

The revolution of 1968. By July 1968, for the fourth time since the overthrow of the monarchy in 1958, the army had become the arbiter between the group in power and the opposition. Col. ʿAbd ar-Raḥman ad-Daud, Col. Hammad Shihab, and Col. ʿAbd ar-Razzaq an-Nayīf, leaders of the military officers, agreed to cooperate with the Baʿth Party, which accepted their help as a means to achieve power but which intended to bridle them at the earliest possible moment. It was agreed that Bakr, the Baʿth leader, would be president of the republic, Nayīf prime minister, and the Cabinet a coalition of various shades of opinion. The uprising, led by Bakr, took place on July 17, 1968.

The Revolutionary Command Council

The first official step was the establishment of a Revolutionary Command Council (RCC), which assumed supreme authority. Within the Cabinet a struggle for power began immediately between the Ba'th and the Nayīf-Daud group, chiefly over Socialism and foreign policy. The Ba'th leaders decided to remove the Nayīf-Daud group. On July 30, 1968, a group of officers led by Saddam Hussein at-Takrītī arrested Nayīf, who agreed to resign. Daud, on a mission in Jordan, agreed to remain there.

Bakr assumed the post of premier in addition to the presidency and presided over the RCC and the Regional Command of the Ba'th Party. Most of the Cabinet posts were given to Ba'th leaders. A temporary constitution, defining the regime as democratic and Socialist, was issued on September 21. Until the calling of a National Assembly, all powers were entrusted to the RCC. The party itself, already highly organized, began to infiltrate the government and almost all national organizations.

National Front. An uprising led by the head of the security police in 1973 had far-reaching effects on the Ba'th regime, which purged some of the security police and laid down rules curtailing security activities. Specific steps were undertaken to strengthen the regime by the establishment of a National Front and a settlement of the conflict with the Kurds.

Before the front could be established, it had been necessary to eliminate misunderstandings between the Ba'th and Communist parties. A Charter for National Action was made public in 1971, and in March 1972 the Ba'th and Communist leaders agreed to draw up a statute that defined the front as a voluntary union among progressive parties and groups that accepted cooperation under the charter. The statute also provided for a 16-member central executive committee, called the High Committee of the Progressive National Front (PNF), that included the Ba'th (eight seats), the Iraqi Communist Party (ICP; three), the Kurdish Democratic Party (three), and the Progressive Nationalists and Independent Democrats (one each). The Progressive National Front was declared in 1973.

Though President Bakr continued to preside over the RCC and the Iraqi Regional Command, Saddam Hussein, leader of the coup of July 30, 1968, emerged as the unrivalled leader not only in Ba'th circles but also in the country as a whole. In July 1979 Bakr resigned and Hussein succeeded as president of the republic in accordance with the temporary constitution. He promptly suppressed the ICP and other opponents.

Economic development to 1980. Perhaps the greatest assets of the Ba'th regime were the ambitious plans for reconstruction and the development laid down by its leaders. The struggle for power during 1958–68 had left little or no time for constructive work, and the Ba'th Party not only sought to transform the economic system from free enterprise to collectivism but also to assert the country's economic independence. The immediate objectives were to increase production and to raise the standard of living, but the ultimate objective was to establish a Socialist society in which all citizens would enjoy the benefit of progress and prosperity.

Socialist goals

The Five-Year National Economic Plan of 1965–70, followed by the Five-Year Plan of 1971–75, concentrated on raising the level of production, both in agriculture and industry, and aimed at reducing dependence on oil revenues as the primary source for development. But agriculture lagged far behind target, and industrial development was slow. In the third Five-Year Plan (1976–80), greater emphasis on agricultural production was noticeable, and industrial production slowed down.

Nationalization of the oil industry

The nationalization of the oil industry was considered by the Ba'th leaders as perhaps their greatest achievement. Between 1969 and 1972 a number of agreements with foreign powers—the Soviet Union and others—were concluded to provide the Iraq National Oil Company (INOC) with capital and technical skill to exploit the oil fields. In 1972 the operation of the North Rumayla field, rich in oil, started, and an Iraqi Oil Tankers Company was established to deliver oil to several foreign countries. Also in 1972 the Iraq Petroleum Company (IPC) was nationalized (with compensation) and a national company, the Iraqi Company for Oil Operations, was established to operate the fields. In 1973, when the fourth Arab–Israeli war broke out, Iraq nationalized U.S. and Dutch companies, and in 1975 it nationalized the remaining foreign interests in the Basra Petroleum Company.

Agrarian reform

The initial step in agrarian reform had been taken with the Agrarian Reform Law of 1958, which provided for the distribution to peasants of lands in excess of a certain minimum ownership. A decade later, less than half of the land had been distributed. In 1969 a revised Agrarian Reform Law relieved the peasants from payments for their land by abolishing compensation to landowners, and a year later a new Agrarian Reform Law was designed to improve the conditions of the peasantry, increase agricultural production, and correlate development in rural and urban areas. The results were disappointing, however, because of the difficulty of persuading the peasants to stay on their farms and their inability to improve the quality of agricultural production.

The Ba'th regime also completed work on irrigation projects that had already been underway and began new projects in areas where water was likely to be scarce in the summer. In the Five-Year Plan of 1976–80, funds were allocated to complete dams on the Euphrates, Tigris, Diyālā, and Upper Zab rivers and the lake known as Baḥr ath-Tharthār (in northern Iraq). Recognizing that a rapid transformation to full Socialism was neither possible nor in the country's best interest, the Ba'th provided for a private, though relatively small, sector for private investors, and a third, mixed sector was created in which private and public enterprises could cooperate.

Foreign relations. In 1972 a treaty of alliance with the Soviet Union was signed by which the two countries agreed to cooperate in political, economic, and military affairs, including the supply to Iraq of Soviet weapons. Iraq supported aims of the Palestine Liberation Organization, and in 1973 Iraq joined Egypt and Syria in the war they launched against Israel. Iraq disagreed with the United States on the settlement of the Arab–Israeli conflict, but economic and cultural relations between the two nations improved.

The war with Iran. In 1975 Iraq and Iran reached an agreement on their frontier differences in the Shatt al-Arab, but when the Iranian monarchy was overthrown in 1979, Iraq, threatened by the spread of revolution from Iran, denounced the settlement and demanded restoration of the eastern bank of the Shatt al-Arab as the border. The dispute erupted into all-out war with an Iraqi invasion of Iran in September 1980. Although air attacks on oil facilities proved spectacular, casualties on both sides at first remained low, owing to inefficient organization and lack of technical skill. As the conflict continued, however, a seesaw pattern of resurgences led to mounting losses of both equipment and personnel.

Economic consequences

Economic development slowed considerably as military spending increased. The damage to oil facilities and transportation lines led to a sharp decline of oil exports and revenue, and the government was forced to borrow heavily and to adopt austerity measures at home.

For later developments in the political history of Iraq, see the *Britannica Book of the Year* section in the BRITANNICA WORLD DATA ANNUAL. (M.Kh./Ed.)

Mesopotamia until 1600 BC: See the relevant chapters of *The Cambridge Ancient History,* rev. ed. (1962–68), each written by an individual author and richly documented; *Fischer Weltgeschichte, Die Altorientalischen Reiche,* 3 vol. (1965–67; Eng. trans., *The Near East: The Early Civilizations,* 1967), with contributions by JEAN BOTTERO (Akkad), D.O. EDZARD (Early history, Ur III, and Old Babylonian Period), and A. FALKENSTEIN (Prehistory and Protohistory), which gives a balanced picture of political, social, and economic history; J. MELLAART, *The Neolithic of the Ancient Near East* (1975); ROBERT W. EHRICH (ed.), *Chronologies in Old World Archaeology* (1965), with contributions on Mesopotamia by R.H. DYSON, JR., E. PORADA, and P.J. WATSON; J.B. PRITCHARD (ed.), *Ancient Near Eastern Texts Relating to the Old Testament,* 3rd ed. with suppl. (1969), a collection of important literary sources in English translation with bibliography; A. FALKENSTEIN, "La Cité-temple sumérienne," in *Cahiers d'histoire mondiale,* 1:784–814 (1954), a description and discussion of Sumerian temple economy and its political implications; I.M. DIAKONOFF (ed.), *Ancient, Mesopotamia: Socio-Economic History* (1969), English translation of representative articles by the editor and others on Mesopotamian history, with emphasis on social and economic aspects; W.W. HALLO, "Gutium-lexicon" article (English) in *Reallexikon der Assyriologie,* vol. 3, pp. 708–720 (1957–71), the best résumé available of the state of knowledge on the Gutians; D.O. EDZARD, *Die zweite Zwischenzeit Babyloniens* (1957), detailed monograph (the title is misleading) on the history of the Old Babylonian Period from Ur III to the end of Hammurabi; PAUL GARELLI, *Les Assyriens en Cappadoce* (1963), a standard work on the Old Assyrian trade colonies in Asia Minor; I.J. GELB, *Hurrians and Subareans* (1944), still the best book on the third cultural element in ancient Mesopotamian history.

Mesopotamia from 1600 BC to AD 630: See the relevant chapters of *The Cambridge Ancient History;* J. OATES, *Babylon* (1979); which deals with history and civilization; *Fischer Weltgeschichte* (*op. cit.*), an up-to-date paperback account by different authors; A. LEO OPPENHEIM, *Ancient Mesopotamia: Portrait of a Dead Civilization* (1964), including some controversial views; WOLFRAM VON SODEN, *Herrscher im alten Orient,* ch. 6–14 (1954), treats the more important kings; HARTMUT SCHMOKEL (ed.), *Kulturgeschichte des alten Orient* (1961), a good general account; and FIORELLA IMPARATI, *I Hurriti* (1964), a short synopsis in Italian. Standard works, now partly out of date, include A.T. OLMSTEAD, *History of Assyria* (1923, reprinted 1960); and BRUNO MEISSNER, *Babylonien und Assyrien,* 2 vol. (1920–25). J.A. BRINKMAN, *A Political History of Post-Kassite Babylonia, 1158–722 B.C.* (1968), is an extensive special study, with complete documentation.

Iraq from the Arab Conquest to 1918: There is no comprehensive history of medieval Iraq in English; some periods or towns form the subject of special works: GUY LE STRANGE, *Baghdad During the Abbasid Caliphate* (1900, reprinted 1924); REUBEN LEVY, *A Baghdad Chronicle* (1929); STEPHEN H. LONGRIGG, *Four Centuries of Modern Iraq* (1925). Travellers' accounts are of some importance: J.-B. TAVERNIER, *Les Six Voyages,* 2 vol. (1675; Eng. trans., 3 vol., 1677–78); EDWARD IVES, *Journey from Persia to England by an Unusual Route* (1773); KER PORTER, *Travels in Syria, Persia, Armenia, Ancient Babylonia,* 2 vol. (1817–20); JAMES S. BUCKINGHAM, *Travels in Mesopotamia* (1827); J.R. WELLSTED, *Travels to the City of the Caliphs . . . ,* 2 vol. (1840); HENRY SOUTHGATE, *Narrative of a Tour Through Armenia, Kurdistan, Persia and Mesopotamia,* 2 vol. (1840). For Iraq during World War I, see the ADMIRALTY NAVAL STAFF, *A Handbook of Mesopotamia,* 4 vol. (1916–17); and also *The Encyclopaedia of Islam,* new ed. (1960–). JACOB LASSNER, *The Shaping of ʿAbbāsid Rule* (1980), concentrates on the founding of Baghdad.

Iraq since 1918: The most comprehensive history of Iraq is STEPHEN H. LONGRIGG, *Iraq, 1900–1950* (1953). The period of the Mandate is adequately treated in PHILIP W. IRELAND, *Iraq: A Study in Political Development* (1937). A study of the political development of Iraq after independence is covered in considerable detail in MAJID KHADDURI, *Independent Iraq, 1932–1958: A Study in Iraqi Politics,* 2nd ed. (1960), *Republican Iraq: A Study in Iraqi Politics Since the Revolution of 1958* (1969), and *Socialist Iraq: A Study in Iraqi Politics Since 1968* (1978). For the economic development of Iraq, see the INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT, *The Economic Development of Iraq* (1952); KATHLEEN M. LANGLEY, *The Industrialization of Iraq* (1961); FAHIM QUBAIN, *The Reconstruction of Iraq, 1950–1957* (1958); and RONY E. GABBAY, *Communism and Agrarian Reform in Iraq* (1978). For a detailed reference book, see HANNA BATATU, *The Old Social Classes and the Revolutionary Movements of Iraq: A Study of Iraq's Old Landed and Commercial Classes and of its Communists, Baʿthists, and Free Officers* (1978). EDMUND GHAREEB, *The Kurdish Question in Iraq* (1981), details the government's dealings with the Kurds since 1968.

Ireland

The republic of Ireland, also known by its Irish name of Éire, occupies the greater part of an island lying to the west of Great Britain, from which it is separated—at distances ranging from 11 to 120 miles (from 18 to 193 kilometres)—by the Irish Sea. Located in the temperate zone between latitude 51°30′ and 55°30′ N, and longitude 6°00′ and 10°30′ W—as far north as Labrador or British Columbia in Canada, and as far west as Portugal, or the West African state of Liberia—it constitutes the westernmost outpost of the Atlantic fringe of the Eurasian landmass. Ireland, which, like Britain, once formed part of this landmass, lies on the European continental shelf, surrounded by seas that are generally less than 650 feet (200 metres) in depth. The greatest distance from north to south in the island is 302 miles (486 kilometres), and from east to west it is 171 miles (275 kilometres). The area of the 26 counties of the Republic of Ireland is 27,137 square miles (70,285 square kilometres). The capital is Dublin.

The magnificent scenery of Ireland's Atlantic coastline faces a 2,000-mile-wide expanse of ocean, and its geographical isolation has helped it to develop a rich heritage of culture and tradition linked initially to a separate language. By the late 20th century the perennial concerns of the republic—emigration, cultural and political identity, relations with Northern Ireland (that portion of the island remaining within the United Kingdom)—had been augmented by economic and political problems linked both to a deterioration in the international competitive position of the nation and to its entry in 1973 into the European Economic Community (EEC), or Common Market. The discussions and political developments discernible within the nation as a result of these difficulties evoked a high level of public interest not unaccompanied by a measure of emotion and conflict.

Ireland was an integral part of the United Kingdom from 1800 to 1922 when, by virtue of the Anglo-Irish agreement of Dec. 6, 1921, the Irish Free State was established as an independent member of the British Commonwealth. A new constitution, adopted by the people in a 1937 plebiscite, declared Ireland to be "a sovereign, independent, democratic state," and the last remaining link with the Commonwealth was severed by the Republic of Ireland Act of 1948.

Of the four traditional provinces of Ireland, the republic comprises the whole of Leinster (counties Carlow, Dublin, Kildare, Kilkenny, Laois [Leix], Louth, Longford, Meath, Offaly, Westmeath, Wexford, and Wicklow), the whole of Munster (counties Clare, Cork, Kerry, Waterford, Limerick, and Tipperary), the whole of Connacht (counties Galway, Leitrim, Mayo, Roscommon, and Sligo) and three counties (Cavan, Donegal, and Monaghan) of the nine counties of Ulster. The remaining six counties of Ulster constitute Northern Ireland. For information on the geography and history of Northern Ireland, see UNITED KINGDOM: *Northern Ireland.*

Physical and human geography

THE LAND

Relief. The territory of the republic consists of a broad and undulating central limestone plain, ringed almost completely by coastal highlands, which vary considerably in geological structure. The flatness of the central lowland—which lies for the most part between 200 and 400 feet above sea level—is relieved in many places by low hills between 600 and 1,000 feet high, while a multiplicity of lakes, large bog areas, and low ridges lend it considerable scenic attractions. The principal mountain ranges are the Wicklow Mountains (Lugnaquillia 3,039 feet [926 metres]), the Macgillycuddy's Reeks in Kerry (Carrantuohill 3,414 feet [1,041 metres]), the Knockmealdown and Comeragh mountains in Waterford, and The Twelve Pins in Connemara. In the west and southwest the wild and beautiful coast is heavily indented where the mountains of Donegal, Mayo, and Kerry thrust out into the Atlantic, separated by deep, wide-mouthed bays, some of which—Bantry Bay and Dingle Bay, for example—are, in fact, drowned river valleys. Bantry Bay, which is 20 miles long and between three and five miles wide, is one of the principal deep-sea anchorages in western Europe. The oil terminal at Whiddy Island in the bay, although capable of handling the largest tankers afloat, was closed following the explosion of a tanker there in 1979. The east coast, on the other hand, is little indented, but most of the country's trade passes through its ports because of their proximity to British and continental markets.

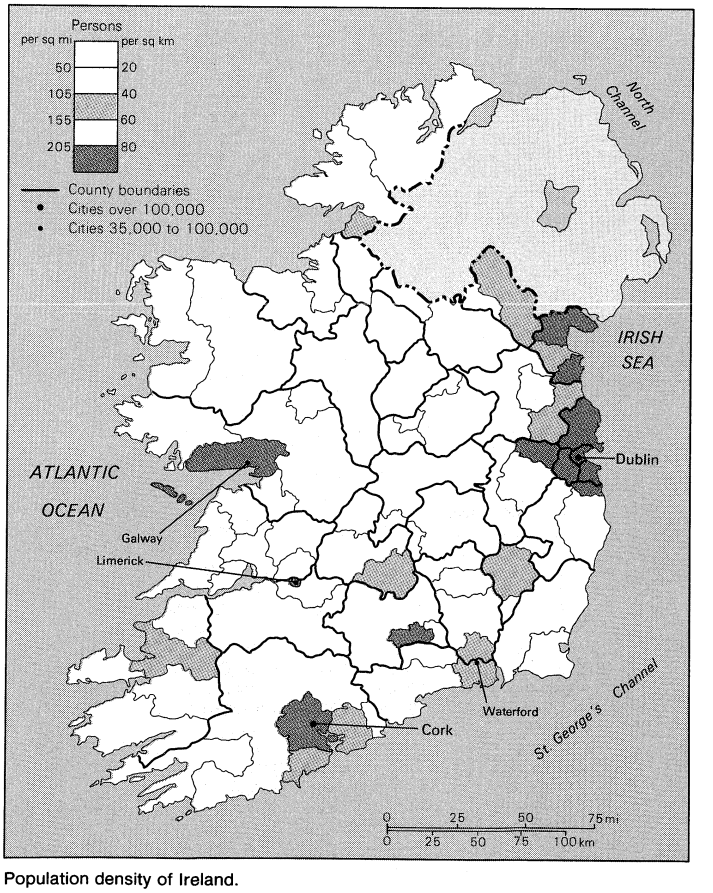
The coastal mountain fringe illustrates the country's complex geological history. In the west and northwest and in the east, the mountains are mainly composed of granite. Old Red Sandstone predominates in the south, where the mountain ridges are parallel east–west foldings separated by limestone river valleys. Ireland experienced two general glaciations, one covering most of the country and the other extending as far south as a line linking Limerick, Cashel, and Dublin. The characteristic diversity of Irish scenery owes much to the glacial influence, and the large areas of peat bog to be found throughout the country are a notable feature of the landscape. In the past they were the rural population's principal—if not its only—source of domestic fuel. By the 1980s, virtually all rural households were connected to the national electricity network, and peat, or turf, production had become mechanized and industrialized.

Drainage. The rivers that rise on the seaward side of the coastal mountain fringe are naturally short and rapid. The inland streams, however, flow slowly, often through marshes and lakes, and enter the sea—usually by way of waterfalls and rapids—long distances from their sources. The famed Shannon, for example, rises in the plateau country near Sligo Bay and flows sluggishly south-southwestward for 161 miles, reaching tidewater level at Limerick and draining a wide area of the central lowland on its way. Other major inland streams—some of them famous for their salmon fisheries—are the Slaney, Liffey, and Boyne in the east; the Nore, Barrow, and Suir in the southeast; the Blackwater, Lee, and Bandon in the south; and the Clare and the Moy in the west. Because of the porosity of the underlying Carboniferous limestones, an underground drainage system has developed, feeding the interlacing surface network of rivers and lakes. The state has implemented major arterial drainage projects, preventing flooding—and making more land available for cultivation—by improving the flow of water in the rivers and thereby lowering the levels of lakes. There are also state-aided farm drainage schemes designed to bring wasteland and marginal land into production.



Drainage improvement

Soils. Most Irish soils originate from drift, the ice-scoured waste formerly frozen to the base of the advancing glaciers. Some of the older rocks in the country's geological formation—quartzites, certain granites, and shales—weather into infertile and unproductive soils. In many places, however, these have been overlaid by patches of the ice-borne drift, mostly limestone-bearing, which are farmed with considerable success. The bare limestone regions remaining in western areas are a reminder of how much glacial drift cover has meant to the Irish agricultural economy.

Climate. Ireland's climate is of the type known to geographers as western maritime. The predominant influence is the Atlantic Ocean, which is no more than 70 miles from any inland location. The mild southwesterly winds and warm Gulf Stream waters contribute to the moderate quality of the climate. Temperature is almost uniform over the entire island. Average air temperatures lie mainly between limits of 39° and 45° F (4° and 7° C) in January and February, the coldest months of the year. In July and August, the warmest months, temperatures usually range between 57° and 61° F (14° and 16° C), although occasionally considerably higher readings are recorded. The sunniest months are May and June, when there is sunshine for an average duration of 5.5 and 6.5 hours a day, respectively, over most of the country, and the ancient patchwork of fields and settlements making up the landscape glows under a clear, vital light. Average annual rainfall varies from about 30 inches (760 millimetres) in the east, to more than 100 inches in the western areas exposed to the darkening clouds that often come scudding in from the Atlantic. The rainfall, combined with the equable climate, is particularly beneficial to the grasslands, which are the mainstay of the country's large livestock population. Snow is infrequent except in the mountains, and prolonged or severe snowstorms are rare.

Plant and animal life. Ireland was almost completely covered by the ice cap during one of the two glaciations it experienced, and its plant and animal life are consequently mainly—but not quite entirely—the result of the migration of species from other areas. As long as there was a land connection between Ireland and what was to become the rest of the British Isles, most species arrived overland from northern Europe. Irish plant and animal life nevertheless possesses certain unique features due partly to climatic conditions and partly to the fact that Ireland became separated from Britain by the Irish Sea some time before Britain itself became separated from the European continent. Common English animals such as the weasel and the mole do not exist in Ireland, which also has no snakes; tradition ascribes their absence to banishment at the hands of St. Patrick, the island's patron saint. In addition, there are only two kinds of mice—as against four in Britain—while the only reptile found in Ireland is a

Migration of species

Population density of Ireland.

species of lizard. Apart from flora imported from northern Europe, several plants common in Ireland are believed to have reached the country from the Mediterranean, along a subsequently drowned coastal route, and others appear to have migrated from North America, probably by way of Greenland and Iceland.

Settlement patterns. The smallness of the country makes for homogeneity and helps explain the nation's distinctive character; it also works against the development of significant regional or local divisions. One important regional distinction is, however, that between the part of the country east of the Shannon—with its expanding industrial employment, fertile farmlands, economic growth, and rising standard of living—and the poorer areas of the west—particularly west Donegal, Leitrim, west Mayo, west Galway, Clare, west Cork, and south Kerry—where incomes are among the lowest in the country, and the fertility of the land is in many cases insufficient to provide an acceptable standard of living for the people. These western areas include the districts, known collectively as the Gaeltacht, in which the Irish language and the traditional national culture are best preserved. Heavy emigration, however, constitutes a threat to the survival of this cultural heritage.

THE PEOPLE

Although Ireland has been invaded and colonized within historic times by Celts, Norsemen, Normans, English, and Scots, no racial or ethnic distinctions exist in the republic today. A large majority of the republic's population is Roman Catholic, with other religious groups (including Church of Ireland Episcopalians, Presbyterians, Methodists, and Jews) very much in a minority. There is no established church in Ireland; freedom of conscience and the free practice of religion are guaranteed by the constitution.

The Irish language

The constitution provides that Irish, as the national language, is the first official language; it recognizes English as the second official language. All official documents are published in both Irish and English. The Irish language, which is very similar to Scots Gaelic, was widely spoken up to the time of the Great Famine of the 1840s and the subsequent emigrations. From then on, its use declined until 1922, when the teaching of Irish was introduced into all schools. Although its use as a vernacular has decreased and is restricted to small Gaeltacht (*i.e.,* Irish-speaking) areas, it is certainly more widely read, spoken, and understood today than at any previous time in the 20th century. English is also taught in all the schools and is universally spoken.

The republic's marriage, birth, and death rates are broadly comparable with those of nearby countries, but the rate of emigration historically has been greatly in excess of the next highest rate in Europe. As a result of emigration, the number of Irish-born people living outside their native land is reckoned to total about 50 percent of the population of the republic.

Emigration

THE ECONOMY

The republic has a mixed economy. The constitution provides that the state shall favour private initiative in industry and commerce, but when the necessary private initiative is not forthcoming, the state itself undertakes essential services and promotes development projects. Thus, state corporations operate the country's air services, its rail and road transport, its television and radio stations, its electricity generation and distribution system, its sugar industry, its peat industry, its petroleum refinery, and other major national undertakings. State companies are also active in the fields of agricultural and industrial credit, food processing, fertilizers, hotels, and life insurance. In some cases, these companies are in direct competition with private enterprise.

State and private enterprise

Economic relations between the republic and the United Kingdom continue to be close. About half of the republic's imports come from Great Britain and Northern Ireland, and tourism and business relations are facilitated by the absence of a passport barrier between the two countries. Since the republic joined the EEC in 1973, the proportion of Irish exports destined for EEC countries other than the United Kingdom has increased, though Britain remains a principal export market. The Irish pound, or *punt,* which had been linked to the British pound sterling, was replaced by a separate currency in 1979 when the republic joined the European Monetary System. Ireland is also a member of the European Investment Bank.

Resources. The country is not rich in mineral resources. Discoveries of silver, lead, zinc, gypsum, and barite have been successfully developed, but the country's dependence on imports for its energy requirements is high. In the early 1980s offshore oil and natural gas wells began production in the Celtic Sea south of County Cork.

Agriculture. Agriculture, once the mainstay of the national economy, continues to be important. Most of Ireland's agricultural land is used as pasture or for growing hay. The country's climate produces abundant vegetable and other plant growth and is particularly beneficial to the rich grasslands that enable grazing stock to be kept on pasture almost the year round, only a limited amount of animal housing being required in winter. Most farms are

Porterfield-Chickering—Photo Researchers, Inc.

Blackfaced sheep on a small farm on the Atlantic coast of County Kerry, Ireland.

The family farm

family farms; only a small percentage of those employed in agriculture work as hired labour. Mixed farming is the general pattern, with the production of beef cattle tending to predominate in the midlands and dairy farming in the south. Cereal growing is an important activity in the east and southeast. Sheep raising is widespread on the rugged hills and mountain slopes throughout the country and particularly in the western area.

Most of the gross agricultural output consists of livestock and livestock products, cattle being the biggest single item, followed by milk and pigs. Other important products are cereals (particularly barley and wheat), poultry and eggs, sheep and wool, and root crops, including potatoes. Enough beets are grown to meet the country's sugar requirements. The bloodstock (Thoroughbred) industry is a thriving sector of the agricultural economy and has won worldwide fame for the Irish horse. Adverse conditions in export markets following World War II handicapped the expansion of Irish agriculture, and the subsequent growth of agricultural output was notably slower than that in the industrial and service sectors. This situation was ameliorated with the republic's entrance into the EEC in 1973. In the late 1970s, however, farm incomes began to decline again.

When the independent nation was founded in 1922, woodland represented less than 1 percent of the total land area, but state replanting since World War II has increased almost fivefold the acreage under forests and woodland. The sea-fishing industry, on the other hand, remains relatively underdeveloped. Judged by western European standards, home consumption of fish, particularly shellfish, is remarkably low.

Industry. Until World War II and for some years after it, official policy on manufacturing was nationalistic and protectionist. High tariffs and quotas protected young industries, which provided badly needed employment and helped to supply the home market, but which had little or no export potential. From the middle 1950s onward, the protectionist policy was progressively reversed. The principal basis of the government's Programmes for Economic Expansion was an industrial development policy designed, by means of tax concessions, financial grants, and other incentives, first, to encourage existing industries to increase their competitive strength and seek markets abroad and, second, to attract new manufacturing enterprises, whether foreign or Irish-owned, to the republic.

Protectionist and expansionist policies

The policy achieved a large measure of success. By the late 20th century a larger proportion of the labour force was employed in manufacturing than in agriculture, and the industrial sector accounted for most of Ireland's total export earnings. A competitive economy has become all the more desirable in view of the governmental obligation to demobilize protective tariffs in accordance with the Anglo-Irish Free Trade Agreement, to say nothing of the effect of Ireland's entry into the EEC. A wide range of manufactured products is exported, including electrical goods and apparatus, processed foods, beer and spirits, clothing, footwear, machinery, metal ores and concentrates, glassware, pharmaceuticals, and floor coverings. Machinery and transport equipment, chemical products, petroleum and petroleum products, food products, and textiles are among the major imports.

Tourist facilities

Tourism is the largest item in the country's net invisible earnings. Its value has increased considerably in recent years, due mainly to the promotional efforts of the Irish Tourist Board (Bord Fáilte Éireann) and to that body's work in encouraging new hotel construction, developing resort areas, extending sporting facilities, and increasing tourist amenities.

Trade unions. Almost all Irish trade unions are affiliated to the Irish Congress of Trade Unions (ICTU). There are also several employers' unions, some organized on a craft, and others on a regional, basis. The employers' central negotiating organization is the Federated Union of Employers. Wages and conditions of employment are normally matters for free collective bargaining, although industrial disputes may be referred to the Labour Court, an official body set up in 1946 with the main function of helping disputants to reach agreements.

Finance. The Central Bank of Ireland, established in 1942, is the national monetary authority and has responsibilities in regard to safeguarding the integrity of the currency. It does not transact business with the public, but it exerts a considerable influence on the volume of bank credit through the "advice" it gives to the commercial (or, to use the Irish term, the associated) banks. These are the Bank of Ireland, Allied Irish Banks, the Ulster Bank, and the Northern Bank. All four institutions have branches throughout the republic and in Northern Ireland as well. The Bank of Ireland and Allied Irish Banks are Irish-owned, while the other two banks are subsidiaries of London clearing banks. There is a trading floor of the London Stock Exchange in Dublin.

Transportation. *Roads and railways.* As a result of its scattered rural population, Ireland has a large road system. Most local roads are well-surfaced, and continuous progress has been made toward bringing the arterial roads up to the best modern standards.

The public transport system in the republic, including rail, road, and inland waterway services, is operated by a state company, the Irish Transport System (Córas Iompair Éireann; CIE). There are rail services between the principal cities and towns, but, as in other countries, many branch lines have become uneconomical and have been replaced by road services for passengers and goods. The city bus services in Dublin and the larger towns as well as a countrywide network of bus services are operated by the CIE. In addition, under contracts with the appropriate government authorities, it provides free transport for schoolchildren and free travel for old-age pensioners.

Waterborne traffic. There is no longer any commercial traffic on Irish canals. Of the two major canals in the country, the Royal, which joins the River Shannon with the Irish Sea via Mullingar and Dublin, is closed to navigation, but the Grand Canal, which also runs from the Shannon to the Irish Sea with a branch to the River Barrow, is maintained for use by pleasure craft.

Some of the smaller ports are of considerable importance to the local business communities concerned, but most of the country's seaborne trade tends to be conducted through the principal east and south coast ports, particularly Dublin, the country's major port, Waterford, and Cork. Dun Laoghaire, Dublin, Rosslare, and Cork are served by cross-channel passenger services to Britain. Overseas traffic in owner-driven automobiles has greatly increased since the introduction of ferry services to Britain at Dublin and Dun Laoghaire, and to Britain and the European continent at Rosslare.

The state-owned British and Irish (B & I) Steam Packet Company carries passengers, merchandise, and road vehicles between Irish and British ports. The trend toward larger vessels and the shipment of goods in containers has adversely affected the smaller Irish ports, as well as the smaller privately owned shipping companies. About half of the trade between the republic and continental ports is still carried in Irish ships, but the percentage of the country's total foreign trade carried in Irish vessels is considerably less.

Air facilities. There are international airports at Dublin, Shannon, Cork, and Knock. Shannon was the world's first duty-free airport; a state-sponsored company offers substantial tax and other advantages to manufacturing and warehousing concerns proposing to establish plants within the duty-free industrial estate at the airport. Aer Lingus-Irish International Airlines is a state-owned company.

ADMINISTRATION AND SOCIAL CONDITIONS

Government and justice. The Irish republic is a parliamentary democracy, although, unlike the United Kingdom, it has a written constitution, promulgated in 1937. Amendment to the constitution is by referendum.

The president of Ireland, head of state and first citizen, is elected by direct vote of the people for a term of seven years and is eligible for reelection for a second term. He normally acts on the advice of the government but acts in consultation with an advisory Council of State in the exercise of certain functions. The president signs and promulgates bills passed by the Oireachtas (Parliament) and,

when so advised by the *taoiseach* (prime minister), summons and dissolves Parliament. He may, however, refuse to dissolve Parliament on the advice of a *taoiseach* who has ceased to command a majority in the Dáil (House of Representatives). The president is the guardian of the constitution and may, in certain circumstances, submit a bill passed by Parliament to the people in a referendum, or refer it to the Supreme Court to decide on its constitutionality.

The president's role

There are two houses of the Oireachtas—the Dáil and the Seanad (Senate). Members of the Dáil are elected by adult suffrage in a secret ballot held at least every five years. There are 166 members of the Dáil and 60 members of the Seanad—11 appointed by the *taoiseach,* six elected by the Irish universities, and 43 elected to represent various economic, vocational, and cultural interests. The Seanad may delay, for a period of 90 days, bills passed by the Dáil, or it may suggest changes in them, but it cannot indefinitely block their passage into law.

The government, which consists of not fewer than seven or more than 15 members, is the executive power of the state and is headed by the *taoiseach,* who presides over its meetings. The *taoiseach,* the *tánaiste* (deputy prime minister), and the minister for finance must be members of the Dáil. The other ministers must be members of either house, but not more than two of them may be senators.

The major political parties are Fianna Fáil, Fine Gael, and the Labour Party. Fianna Fáil is a republican party founded by Eamon de Valera, who opposed the Anglo-Irish Treaty of 1921. The party boycotted the Dáil until 1927 but won the general election of 1932, when de Valera became prime minister, a position he held, with two intermissions, until 1959, when he became president. Fine Gael is the party of the Irish nationalists Arthur Griffith, Michael Collins, and W.T. Cosgrave, who supported the Treaty of 1921 and founded the Irish Free State. Fine Gael held office from 1922 to 1932 and, following World War II, participated in two coalition governments opposed to Fianna Fáil, as did the Labour Party.

Coalition government

The local government system comprises four county borough corporations, seven borough corporations in the major cities, and 27 county councils (one for each county except Tipperary, which for administrative purposes is divided into a North Riding and a South Riding, each having a county council). Each of these has a council elected, at regular intervals, by adult suffrage. County councils are responsible for physical planning, roads, health and public assistance services, sewerage and water supplies, housing, public libraries, fire services, and courthouses. County borough corporations have the same functions except that, in their case, health and public assistance are the responsibility of ad hoc authorities. Local government authorities in the republic have no functions in relation to police or education.

Important policy decisions—as on local taxes, borrowing, the making of bylaws—are made by the elected councils. Administration, on the other hand, is the responsibility of the county (or city) manager, who usually consults with members of the council before discharging important executive functions. There is a city manager for each county borough council and, for each county council, there is a county manager, who also acts as manager for the lesser local authorities within the country. Noncounty boroughs, urban districts, and towns have more limited duties, and, in regard to functions outside their scope, they form part of the administrative counties in which they are situated. The local government system is supervised by the national Department of Local Government.

Irish law is based partly on common law and partly on statute law. All judges are appointed by the president and normally serve until death or retirement. They may be removed from office only in the case of incapacity or misdemeanour and then only by resolution of both houses of the Oireachtas.

The judicial system

There are district courts and circuit courts, as well as a high court and a supreme court that acts as the court of final appeal. The supreme court consists of the chief justice, five other judges, and the president of the high court. The circuit court has jurisdiction to try all serious offenses except murder, treason, and piracy. Such trials take place before a jury. The central criminal court, which has unlimited criminal jurisdiction, consists of a high court judge sitting with a jury. Appeal lies from its decisions to the court of criminal appeal, which consists of a supreme court judge and two high court judges chosen by the chief justice. A special criminal court was established in 1972 with jurisdiction over cases of terrorism; appeal is made to the court of criminal appeal. All members of the judiciary, including district justices, have prescribed legal qualifications: there is no equivalent in the republic of the lay magistracy in England.

There are no local police forces in the republic. The Gárda Síochána (Civic Guard), established in 1922, is a nationwide force headed by a commissioner who is responsible to the minister for justice. A few hundred members of the force are assigned to detective duties; they are usually plainclothes officers and, when necessary, are armed. The rest of the force is uniformed and unarmed. Policewomen are employed on special duties.

Armed forces. The defense forces, including the air corps and the naval service, have played an active part in United Nations peacekeeping operations. Irish officers or forces served as UN observers in such places as Lebanon and other areas of the Middle East, Kashmir, the Congo (now Zaire), and Cyprus. There is no conscription in the republic; enlistment in the defense forces and the reserve force, as well as participation by enlisted men in overseas operations, is voluntary.

Education. Primary education is free, compulsory, and almost entirely denominational. There are five state-aided teachers' training colleges. The secondary school system is almost entirely denominational and privately owned. State grants are available to most secondary schools to enable them to waive payment of fees. Parallel to the secondary schools are the vocational schools, which are designed to provide primary schools' leavers with apprentice training and courses leading to qualifications in architecture, accountancy, engineering, and similar professions. The vocational education system includes schools of art, music, domestic science, and hotel training. Regional technical colleges provide advanced vocational courses. University education is given at the University of Dublin (Trinity College), founded in 1591, and at the National University of Ireland, founded in 1908. The latter has constituent colleges at Dublin, Cork, and Galway and several recognized colleges. National institutes for higher education in Limerick and Dublin emphasize applied studies in varied, flexible course structures. A higher education authority has been established to deal with the financial and organizational problems of higher education.

Health and welfare services. Health services are administered by eight regional health boards under the general supervision of the minister for health. School health examinations, child welfare clinics, and the treatment of tuberculosis and infectious diseases are available to all without charge. Otherwise, the cost of public health services to the patient depends on his means. Persons who cannot afford to pay are entitled to a comprehensive health service free of charge. A middle income group—insured workers, smaller farmers, and others of restricted means—is entitled to a free maternity and child welfare service and to free hospital and specialist services. People who are more comfortably off normally arrange and pay for their own medical advice and hospital services; but a voluntary health insurance program was established by law in 1957. Owing in large measure to the world-famous Irish Hospitals' Sweepstake, the republic developed an excellent system of hospitals.

The Irish Sweepstake

Pay-Related Social Insurance (PRSI) is paid by most employees aged 16 and over. Benefits include widows' and orphans' pensions, unemployment and disability benefits, deserted wives' allowances, and old-age pensions. Persons of inadequate means receive certain benefits on a noncontributory basis. These include widows' and orphans' pensions, old-age pensions, home assistance, unemployment assistance, and pensions for those disabled or blind. Children's allowances are paid to all households for each child under 16, irrespective of means.

CULTURAL LIFE

Although a few highly successful novels and plays have been written in Irish, the language has yet to produce a modern literature of significant proportions. The language steadily lost ground during the 18th and 19th centuries, but it never ceased to exert a strong, if imperceptible, influence on the English-speaking culture that was progressively taking its place. Many of the traditional modes of thought and expression characteristic of the Irish language were gradually absorbed into the English spoken in Ireland, and they served to enrich the creative imaginations and the powers of expression of those who wrote and spoke it. The remarkable contributions that Anglo-Irish literature and drama have made to the Western world may be ascribed, at least in part, to this cross-fertilization of two cultures. Be this as it may, it is noteworthy that so small a country should have nurtured so much creative literary genius—men like the great satirist Jonathan Swift, the orator and political theorist Edmund Burke, the novelist George Augustus Moore, the poet William Butler Yeats, and the modern prose masters James Joyce, Liam O'Flaherty, Frank O'Connor, Sean O'Faolain, Flann O'Brien, and Samuel Beckett. In the theatre, too, Irish talent has won world acclaim in the persons of William Congreve, Oliver Goldsmith, Richard Brinsley Sheridan, Oscar Wilde, George Bernard Shaw, and Sean O'Casey.

Literary heritage

The theatre continues to enjoy strong popular support. Dublin's famous Abbey Theatre, now rebuilt, stages Abbey classics as well as the work of new dramatists, in Irish as well as English. The Peacock Theatre, incorporated in the new Abbey building, concentrates on experimental theatre and theatre in Irish. There are a half dozen other small experimental theatres in Dublin alone, and Galway's Druid Theatre, which performs plays in Irish, is the most active provincial company. A vigorous amateur dramatic movement has spread throughout the country. The Wexford Opera Festival, held each year in the autumn, has an international reputation.

Many cultural institutions are specifically concerned with the popularization and preservation of various aspects of the traditional national culture—the Gaelic Athletic Association with the encouragement of the vigorous national games of hurling and football; the Gaelic League and other organizations with the spread of the Irish language; other bodies with the organization of folk-song and folk-music festivals (*feiseanna*) at which there are competitions in traditional storytelling and dancing as well as in music and singing. Some of these activities command large followings, particularly among the young.

Folk festivals

Other institutions are concerned with more general cultural interests—the Royal Irish Academy (1785) with science and humanities; the Royal Hibernian Academy (1823) with the fine arts; the Royal Dublin Society (1731) with the advancement of agriculture and the promotion of art and science; and the Royal Irish Academy of Music (1848). The Arts Council receives an annual grant from the state and in its turn assists the arts and artists by way of grants, scholarships, and awards. Individual writers, artists, and composers are also aided by tax concessions and by recognition and financial support from the Aosdána organization.

There is a healthy activity in the fine arts, and many younger artists and designers have gained international acclaim. The work of Irish painters, sculptors, and stained-glass artists is shown each year at three major exhibitions—the Exhibition of the Royal Hibernian Academy, the Oireachtas Exhibition, and the Exhibition of Living Art. The work of the Georgian Society and An Taisce (the National Trust of Ireland) has not been without impact in countering the effects of property developers on the architectural heritage of Dublin—one of the best-preserved 18th-century cities in Europe.

All radio and television stations in the republic are operated by Radio Telefís Éireann, an autonomous statutory body financed, as to capital, by repayable state grants, and as to current expenditure, by revenue from licenses and the sale of advertising time. Much of the country also can receive the British television networks.

For statistical data on the land and people of Ireland, see the *Britannica World Data* section in the BRITANNICA WORLD DATA ANNUAL. (F.H.B./J.O'B.R.)

History

Ireland, lying to the west of Britain, has always been to some extent cut off by it from direct contact with other European countries, especially the area between Sweden and the Rhine. Approach from France, Spain, and Portugal and even from Norway and Iceland has been more possible. Internally, the four ecclesiastical provinces into which Ireland was divided in the 12th century realistically denoted the main natural divisions of the country. Of these, the north had in the earliest times been culturally connected with Scotland, the east with Roman Britain and Wales, the south with Wales and France, and the southwest and west with France and Spain. In later times, despite political changes, these associations continued in greater or lesser degree.

The position of Ireland, geographically peripheral to western Europe, became central and thus potentially more important once Europe's horizons expanded, in the 15th and 16th centuries, to include the New World. But paradoxically it was in the earlier period that Ireland won especial fame as a notable and respected centre of Christianity, scholarship, and the arts. After the Middle Ages, subjugation to Britain stultified, or the struggle for freedom absorbed, much of Ireland's native energy. But its influence was always exercised as much through its emigrants as in its achievements as a nation. During the centuries of British occupation the successors of the great missionaries and scholars who, from the 7th to the 9th century, fostered Christianity and learning among the Germanic peoples of the Continent were those who formed a considerable element in the armies and clergy of Roman Catholic countries and had an incalculable influence on the later development of the United States. In British history innumerable great men of Anglo-Irish origin or nurture have, as statesmen or soldiers, played vital parts; the influence of Ireland itself on Britain has been constant and profound.

Ireland's influence

EARLY IRELAND

The human occupation of Ireland did not begin until a late stage in the prehistory of Europe. It has generally been held that the first arrivals were Mesolithic hunter-fisher people, represented largely by flintwork found mainly in ancient beaches in Antrim, Down, Louth, and Dublin. These artifacts have been named Larnian for the type site at Larne, County Antrim; dates from 6000 BC onward have been assigned to them. More recent work, however, casts considerable doubt on the antiquity and affinities of the people who were responsible for the Larnian industry; association with Neolithic remains suggests that they should be considered not as a Mesolithic people but rather as groups contemporary with the Neolithic farmers. The Larnian could then be interpreted as a specialized aspect of contemporary Neolithic culture. Lake and riverside finds, especially along the River Bann, show a comparable tradition. A single radioactive carbon date of 5725 ± 110 BC from Toome Bay, north of Lough Neagh, for woodworking and flint has been cited in support of a Mesolithic phase in Ireland, but such a single date cannot be relied on.

Neolithic Age. The general pattern of radioactive-carbon determinations suggests that the Neolithic period in Ireland began about 3000 BC. As in Britain, the most widespread evidence of early farming communities is long-barrow burial. The main Irish long-barrow series consists of megalithic tombs called court tombs because an oval or semicircular open space, or court, inset into the end of the long barrow, precedes the burial chamber. These court tombs number more than 300. They occur in the northern half of Ireland, and the distribution is bounded on the south by the lowlands of the central plain. Timber-built rectangular houses belonging to the court-tomb builders have been discovered at Ballynagilly, County Tyrone, and at Ballyglass, County Mayo. The court tombs are intimately related to the British long-barrow series of the

Megalithic tombs

Severn-Cotswold and chalk regions and probably derive from more or less common prototypes in northwestern France.

In Ireland a second type of megalithic long barrow—the so-called portal tomb—developed from the court tomb. There are more than 150 examples. They spread across the court tomb area in the northern half of Ireland and extend into Leinster and Waterford and also to western Wales and Cornwall.

A notable feature of the Irish Neolithic is the passage tomb. This megalithic tomb, unlike the long-barrow types, is set in a round mound, sited usually on hilltops and grouped in cemeteries. The rich grave goods of these tombs include beads, pendants, and bone pins. Many of the stones of the tombs are elaborately decorated with engraved designs. The main axis of the distribution lies along a series of great cemeteries from the River Boyne to Sligo (Boyne and Loughcrew in County Meath, Carrowkeel and Carrowmore in County Sligo). Smaller groups and single tombs occur largely in the northern half of the country and in Leinster. A specialized group of later, indeed advanced, Bronze Age date, near Tramore, County Waterford, is quite closely akin to a large group on the Scilly Islands and Cornwall. The great Irish passage tombs include some of the most magnificent megalithic tombs in all Europe—for example, Newgrange and Knowth in County Meath. While the passage tombs represent the arrival of the megalithic tradition in its fullest and most sophisticated form, the exact relation between the builders of these tombs and the more or less contemporary long-barrow builders is not clear. The passage tombs suggest rather more clearly integrated communities than do the long barrows.

To the final stage of the Neolithic probably belong the rich house sites of both rectangular and circular form at Lough Gur, County Limerick. The pottery shows a strong connection with the tradition of the long barrow (court tomb and portal tomb).

Bronze Age. Two great incursions establish the early Bronze Age in Ireland. One, represented by approximately 400 megalithic tombs of the wedge tomb variety, is associated with Beaker pottery. This group is dominant in the western half of the country. Similar tombs also associated with Beaker finds are common in Brittany, and the origin of the Irish series is clearly from this region. In Ireland the distribution indicates that these tomb builders sought well-drained grazing land, such as the Burren limestones in Clare, and also copper deposits, such as those on the Cork-Kerry coast and around the Silvermines area of Tipperary.

In contrast, in the eastern half of the country a people in the single-burial tradition dominate. Their burial modes and distinctive pottery, known as food vessels, have strong roots in the Beaker tradition that dominates in many areas of western Europe. They may have reached Ireland via Britain from the lowland areas around the Rhine or farther north.

Throughout the early Bronze Age Ireland had a flourishing metal industry, and bronze, copper, and gold objects were exported widely to Britain and the Continent. In the middle Bronze Age (about 1500 BC) new influences brought urn burial into eastern Ireland. From about 1200 BC elements of a late Bronze Age appear, and by about 800 BC a great late Bronze Age industry was established. A considerable wealth of bronze and gold is present, an example of which is the great Clare gold hoard. Nordic connections have been noted in much of this metalwork.

Iron Age. The period of the transition from the Bronze Age to the Iron Age in Ireland is fraught with uncertainties. There is little sign of a continental-like Hallstatt Iron Age in Ireland. La Tène culture, which may date in Ireland from 300 BC or earlier, is represented in metalwork and some stone sculpture, mainly in the northern half of the country. Connections with northern England are apparent. Hill-fort building seems also characteristic of the Iron Age. The problem of identifying archaeological remains with language grouping is notoriously difficult, but it seems on the whole likely that the principal Celtic arrivals occurred in the Iron Age. Irish sagas, which probably reflect the pagan Irish Iron Age, reflect conditions in many respects similar to the descriptions of the ancient classical authors, such as Poseidonius and Julius Caesar.

Early Celtic Ireland. *Political and social organization.* Politically, Ireland was organized into a number of petty kingdoms, or *tuatha,* each of which was quite independent under its elected king. Groups of *tuatha* tended to combine, but the king who claimed overlordship in each group had a primacy of honour rather than of jurisdiction. Not until the 10th century AD was there a king of all Ireland (*árd rí Éireann*). A division of the country into five groups of *tuatha,* known as the Five Fifths (Cuíg Cuígí), occurred about the beginning of the Christian Era. These were Ulster (Ulaid), Meath (Midhe), Leinster (Laigin), Munster (Muma), and Connaught (Connacht). The Five Fifths

Surrounding a king was an aristocracy (*airi aicme,* the upper class), whose land and property rights were clearly defined by law and whose main wealth was in cattle. Greater landowners were supported by *céilí,* or clients. These and other grades of society, minutely classified and described by legal writers, tilled the soil and tended the cattle. Individual families were the real units of society and exercised collectively powers of ownership over their farms and territory. At law the family (*fine*) did not merely act corporatively but was, by one of the oldest customs, held responsible for the observance of the law by its kindred, serfs, and slaves.

Rural economy and living conditions. There were no urban centres, and the economic basis of society was cattle rearing and agriculture. The principal crops were wheat, barley, oats, flax, and hay. The land was tilled with plows drawn by oxen. Sheep appear to have been bred principally for their wool, and the only animal reared specifically for slaughter was the pig. Fishing, hunting, fowling, and trapping provided additional food. Transport of goods over land was by packhorse, for wheeled vehicles appear to have been few. Sea transport was by currach, a wicker-framed boat covered with hides; the normal freshwater craft was the dugout.

The dwellings of the time were built on the post-and-wattle technique, and some, at least, were situated within the protected sites called by archaeologists ring forts. Excavations have shown that some of these may have existed even in the Bronze Age and that they remained a normal place of habitation down to medieval times. Advantage was also taken of the relative security of islands in rivers or lakes as dwelling places; and artificial islands, called crannogs, were also extensively made.

The Irish laws point to a large development of rural industry in the period in which they were first written down, shortly before the Norse invasions beginning at the end of the 8th century. They deal minutely not only with the management of land and animal rearing but also with innumerable further details of husbandry, including milling, dyeing, dairying, malting, meat curing, and spinning and weaving. Wool was spun with a wooden spindle weighted with a whorl of bone or stone, and it was woven on a loom. The outer garment worn by both men and women was a large woolen cloak (*brat*), fastened on shoulder or breast with a pin or brooch. The inner garment was a long linen tunic (*léine*), girded at the waist with a belt. Shoes of rawhide or tanned leather were worn, at least by the upper classes and the higher professional ranks. A large amount of metalwork reveals the adaptation by Irish craftsmen of many techniques originating in Britain or on the Continent. An instinct for design, added to the skillful use of these techniques, enabled them to produce many superb objects, of which the Tara brooch, dating from about the mid-8th century, is an outstanding example. The chief musical instrument of the period was the harp.

Early political history. The documentary history of Ireland begins only in the 7th century, which saw the production both in Latin and Irish of sufficiently rich and numerous records of all sorts. For events before that time historians must rely on literary sources such as the sagas, many of whose characters may represent only poetic imagination and in which the social or political circumstances portrayed reflect the fantasies of their authors rather than historical reality. Nevertheless, the traditions seem to indicate, during the early centuries of the Christian Era, a

process of political cohesion in Ireland through which the *tuatha* ultimately became grouped into the Five Fifths. Among these, Ulster seems at first to have been dominant; but by the time of Niall of the Nine Hostages (died early 5th century), hegemony had passed to his midland kingdom of Meath, which was then temporarily associated with Connaught. In the 6th century, descendants of Niall, ruling at Tara in northern Leinster, were claiming to be overkings of three provinces, Ulster, Connaught, and Meath. Later, they claimed to be kings of all Ireland, although their power rarely extended over Munster or the greater part of Leinster. Two branches of Niall's descendants, the Cenél nEogain, of the northern Uí Néill, and the Clan Cholmáin, of the southern Uí Néill, alternated as kings of Ireland from 734 to 1002, a fact that suggests a formal arrangement between the two septs. Inevitably, claims to a high kingship came to be contested by the rulers of Munster, who, from their capital at Cashel, had gradually increased their strength, depriving Connaught of the region that later became County Clare. But not until the reign of Brian Boru in the 11th century was Munster sufficiently strong to secure a real high kingship over all Ireland.

The Irish kingship

Irish raids and migrations. From about the middle of the 3rd century Latin writings make frequent reference to raiding expeditions carried out by the Irish, who were now given the new name, Scoti, rather than the older one, Hiberni. Native Irish traditions also suggest that such attacks took place. In the second half of the 4th century, when Roman power in Britain was beginning to crumble seriously, the raids became incessant, and settlements were made along the west coast of Britain and extensively in Wales and Scotland. From the early 5th century the rulers of Dalriada in northern Antrim extended their power over the Irish already settled in Argyll and the neighbouring islands. Ultimately the Scottish kingdom of Dalriada became separated from the Irish; and when, in the 9th century, it overcame the Picts, it gave its name, Scotland, to the whole area.

Early Christianity. *Conversion.* Little is known of the first impact of Christianity upon Ireland. Traditions in the south and southeast refer to early saints who allegedly preceded St. Patrick, and their missions may well have come through trading relations with the Roman Empire. The earliest firm date is AD 431, when St. Germanus, bishop of Auxerre in Gaul, proposed, with the approval of Pope Celestine I, to send a certain Palladius to "the Scots believing in Christ." Subsequent missionary history in Ireland is dominated by the figure of St. Patrick, whose 7th-century biographers, Tirechán and Muirchú, credited him with converting all the Irish to Christianity and won for him the status of national apostle.

St. Patrick

A 9th-century record, the *Book of Armagh,* includes a work by Patrick himself, the *Confessio* ("Confession," a reply to charges made by British ecclesiastics), in which he describes his life at a Roman villa in Britain, his capture by Irish raiders, and his seven years of slavery in Ireland. Recovering his freedom, he was educated and ordained to the priesthood and eventually managed to be sent as a missionary to Ireland. He concentrated on the north and west of the country, achieving remarkable success; he did not himself claim to have converted all Ireland. Confusion exists regarding the chronology of Patrick's life, and it is seriously contended that tradition came to merge the experience of two men, the continental Palladius and the Patrick of the *Confessio.* No sufficient evidence supports the traditional date (AD 432) for the beginning of Patrick's mission, while of the rival dates (AD 461/462 and AD 492/493) given for his death in annals and biographies, the latter is now preferred.

Irish monasticism. Though monks and monasteries were to be found in Ireland at the time of Patrick, their place was then altogether secondary. But in the course of the 6th and 7th centuries a comprehensive monastic system developed in Ireland, partly through the influence of Celtic monasteries in Britain, such as Candida Casa at Whithorn in Galloway and Llangarvan in Wales. Early attempts to organize the Irish Church on the usual Roman system—by which each bishop and his clergy exercised exclusive jurisdiction within a diocese—seem to have given way to one in which groups of Christian settlements were loosely linked together, usually under the auspices of some one or other of the great saints. Careful study of the lives of the early saints reveals the manner in which their reputations developed in proportion to the power of the political dynasties that became connected with them.

By the end of the 6th century, enthusiasm for Christianity was leading Irishmen to devote themselves to a most austere existence as monks, as hermits, and as missionaries to pagan tribes of Scotland, in the north of England, and in a great area of west central Europe, particularly between the Rhine, Loire, and Rhône rivers. St. Columba's foundation (*c.* 563) of the monastery of Iona off the northwest Scottish coast provided the best-known base for the Celtic Christianization of Scotland; and its offshoot, Lindisfarne, lying off the coast of the Anglo-Saxon kingdom of Northumbria, was responsible for the conversion of that area. Of the continental missionaries, the best known is St. Columban (*c.* 543–615), whose monastic foundations at Luxeuil near Annegray in the Vosges and at Bobbio in northern Italy became important centres of learning. Columban, however, by his individualism and austere puritanism, came into conflict not only with the Merovingian rulers of Gaul but also with the local ecclesiastical administration; his limitations exemplify those of the Irish monastic system as a whole and explain why, in the end, it was supplanted by the ordinary administrative system of the church.

Learning and art. Both at home and abroad the saints were succeeded by scholars, whose work in sacred and classical studies and particularly in elaborating an Irish Christian mythology and literature was to have profound effects upon the Irish language and was to be a major factor in its survival. The Irish monasteries became notable centres of learning; in Ireland itself those of Clonmacnoise (in County Offaly) and Clonard (in County Meath) were among the most famous. Christianity had brought to Ireland the Latin tongue and command of the Latin authors; not only Church Fathers but also classical writers were read and studied. Irish scribes produced manuscripts written in the clear hand known as Insular; this usage spread from Ireland to Anglo-Saxon England and to Irish monasteries on the Continent. Initial letters in the manuscripts were illuminated, usually with very intricate ribbon and zoomorphic designs. The most famous of the Irish manuscripts is the *Book of Kells,* a copy of the Four Gospels dating from about the 8th or 9th century. The earliest surviving illuminated manuscript, the *Book of Durrow,* was probably made about a century earlier.

Illuminated manuscripts

The adoption of Christianity made it necessary to relate the chronology of Irish tradition, history, and genealogies to the events recorded in the Bible. The *Book of Invasions* (*Leabhar Gabhála*), in which Irish history was linked with events in the Old Testament, was a notable example of this process. In this way Latin civilization in Ireland became linked to the Gaelic; and the association became closer under the impact of the Viking wars. Gradually the Latin products of the Christian schools became replaced by Irish works; Latin lives of the saints, for example, are almost always earlier in date than those written in Irish. Recurring bouts of puritanism and reforming movements in the church tended to remove secular literature from monastic control; ultimately, there developed a class of professional families who were its custodians from the 12th to the 17th century. The medieval secular writers, employing a degenerate form of Old Irish usually known as Middle Irish, were responsible for a large proportion of Irish literary achievement; their historical works, the annals, and the great genealogies, supplemented by the law collections, have enabled historians to reconstruct early Irish social history.

The Norse invasions and their aftermath. The first appearance of the Norsemen on the Irish coast is recorded in 795. Thereafter the Norsemen made frequent plundering raids, sometimes far inland. They seized and fortified two ports, Annagassan and Dublin, in 838; and the 840s saw a series of large-scale invasions in the north of the country. These invaders were driven out by Aed Finnliath, high

king from 862 to 879, but meanwhile the Norse rulers of Dublin were reaching the zenith of their power. They took Waterford in 914 and Limerick in 920. Gradually, without quite abandoning piracy, the Vikings became traders in close association with the Irish, and their commercial towns became a new element in the life of the country. The decline of Norse power in the south began when they lost Limerick in 968 and was finally effected when the Scandinavian allies of the king of Dublin were defeated by High King Brian Boru at the Battle of Clontarf in 1014.

Though the Battle of Clontarf removed the prospect of Norse domination, it brought a period of political unsettlement. High kings ruled in Ireland but almost always "with opposition," meaning that they were not acknowledged by a minority of provincial kings. The Viking invasions had, in fact, shown the strength and the weakness of the Irish position. The fact that power had been preserved at a local level in Ireland enabled a maximum of resistance to be made; and although the invaders established maritime strongholds, they never achieved any domination comparable to their control of eastern England or northwest France. After Clontarf they remained largely in control of Ireland's commerce but came increasingly under the influence of neighbouring Irish kings.

In the 11th and 12th centuries the ecclesiastical reform movement of western Europe was extended into Ireland. And as the kings of Munster and Connaught, Leinster and Ulster struggled each to secure the dominant position that had once been held by Brian Boru, they came to realize the value to them of alliance with the forces of church reform. Thus, with the aid of provincial rulers, the reformers were able to set up in Ireland a system of dioceses, whose boundaries were coterminous with those of the chief petty kingdoms. At the head of this hierarchy was established the archbishopric of Armagh, in association with the province of Ulster dominated by the royal family of Uí Néill. But the victory of the reformers was not complete, for the parochial system was not introduced until after the Anglo-Norman Conquest. Moreover, the reformers sought to influence Irish conduct as well as church organization. The enormities of Irish moral behaviour were colourfully described by St. Bernard of Clairvaux in his life of his contemporary St. Malachy, the reforming bishop who introduced the Cistercian monks into Ireland. The reforming popes Adrian IV and Alexander III encouraged Henry II's invasion of Ireland, believing that it would further church reform in that country. In a remarkable account of the conquest, Gerald of Wales provided a lurid description of the archaic Irish civilization that the invaders encountered. The recognition of Henry II as lord of Ireland and the linking of the church to a foreign administration terminated the independence of Gaelic Ireland and reduced the country to a position of subordination for centuries to come.

Church reform

FIRST CENTURIES OF ENGLISH RULE (C. 1166–C. 1600)

The Anglo-Norman invasion. Before the arrival of Henry II in Ireland (October 1171), Anglo-Norman adventurers—including Richard de Clare, earl of Pembroke, subsequently known as "Strongbow," invited by Dermot MacMurrough, a king of Leinster who had been expelled by the high king, Rory O'Connor (Roderic)—had conquered a substantial part of eastern Ireland, including the kingdom of Leinster, the towns of Waterford, Wexford, and Dublin, and part of the kingdom of Meath. Partly to avert any chance of Ireland's becoming a rival Norman state, Henry took action to impose his rule there. He granted Leinster to de Clare and Meath to Hugh de Lacy, who had gone to Ireland in the King's army; but he kept the chief towns in his own hands, exacted forms of submission from the Irish kings, and secured from a church synod recognition of his overlordship. During subsequent years the Anglo-Norman sphere in Ireland was extended; and while all the Irish kings, except in the northwest, agreed to recognize his supremacy, Henry was obliged to acquiesce in the establishment of new Norman lordships in Ulster under John de Courci and in Munster under de Cogan, de Braose, and others. By the Treaty of Windsor (1175), O'Connor, the high king, accepted Henry as his overlord and restricted his own style to that of king of Connaught. But he was permitted to exercise some vague authority over the other Irish kings and was charged with collecting from them tribute to be paid to Henry. This arrangement was unsuccessful, for thereafter O'Connor encountered opposition even in his own province, and he was ultimately obliged to abdicate.

King John, who visited Ireland in 1210, established there a civil government independent of the feudal lords, and during the 13th century it became more fully organized. An Irish exchequer had been set up in 1200, and a chancery followed in 1232. The country was divided into counties for administrative purposes, English law was introduced, and serious attempts were made to reduce the feudal liberties of the Anglo-Norman baronage. (Counties were civil administration districts, whereas liberties were lands held in the personal control of aristocratic families and the church.) Parliament started in Ireland, as in England; in 1297 the peers and prelates were joined by representatives of counties, and in 1300 the towns also sent members. But these represented the Anglo-Irish only; the native Irish, to some extent resurgent in Ulster under the O'Neills and O'Donnells, and in southwest Munster under the MacCarthys, were aloof and unrepresented.

The medieval Irish Parliament

The 14th and 15th centuries. A brief threat to English control of Ireland, made by Edward Bruce, brother of King Robert I of Scotland, ended when Bruce was killed in battle at Faughart near Dundalk (1318). English control was reasserted and strengthened by the creation of three new Anglo-Irish earldoms, that of Kildare, given to the head of the Leinster Fitzgeralds; that of Desmond, given to the head of the Munster Fitzgeralds; and that of Ormonde, given to the head of the Butlers, who held lands around Tipperary. But the increased power and lands of

Administrative units of late medieval Ireland.

the Anglo-Irish brought about an inevitable reaction; and the remainder of the 14th century witnessed a remarkable revival of Irish political power, which was matched by a flowering of Irish language, law, and civilization. The Gaels recovered large parts of Ulster, the midlands, Connaught, and Leinster, while the Anglo-Irish became increasingly Irish, marrying Irish women and often adopting Gaelic customs.

The English government, which in any case, because of its aim to curtail feudal privileges, was always to some extent opposed by the Anglo-Norman aristocracy, made an effort to restore control but achieved little more than a definition of the status quo. Edward III's son, Lionel, duke of Clarence, as viceroy from 1361 to 1367, passed in the Irish Parliament the Statutes of Kilkenny (1366), which listed the "obedient" (English-controlled) lands as Louth, Meath, Trim, Dublin, Carlow, Kildare, Kilkenny, Wexford, Waterford, and Tipperary. Intermarriage or alliances with the Irish were forbidden. The independent Irish outside the Pale (the area of English control) were regarded as enemies and were assumed to possess their lands only by usurpation. In practice they were feared, and their attacks were often bought off by almost regular payments. Visits by King Richard II in 1394–95 and 1399 achieved nothing. During the first half of the 15th century Ireland was, in effect, ruled by the three great earls, of Desmond, Ormonde, and Kildare, who combined to dominate the Dublin government. Desmond had sway in Counties Limerick, Cork, Kerry, and Waterford; Ormonde in Tipperary and Kilkenny; and Kildare in Leinster. Although both the Gaels and the Anglo-Irish had supported the Yorkist side in the Wars of the Roses, the Yorkist king Edward IV found them no less easy to subjugate than had his Lancastrian predecessors. Succeeding (1468) in bringing about the attainder and execution for treason of Thomas, earl of Desmond, he was, nevertheless, obliged to yield to aristocratic power in Ireland. The earls of Kildare, who thereafter bore the title of lord deputy (for the English princes who were lords lieutenant), were, in effect, the actual rulers of Ireland until well into the 16th century.

The Kildare ascendancy. The substitution (1485) of Tudor for Yorkist rule in England had no apparent effect in Ireland, where the ascendancy of the Fitzgerald earls of Kildare, established when Thomas, 7th earl, was created lord deputy in 1471, had passed (1477) to his son Garret More (Great Gerald). The fiction of the king's power was preserved by appointing an absentee lieutenant, from whom Kildare held as deputy; in practice, any real power was exercised largely through dynastic alliances with the chief Gaelic and Anglo-Irish lords. Opposition to Kildare was negligible so long as the king was unable to maintain a permanent power to which his opponents might turn; an attempt to displace him was made when Kildare gave support (1487) to Lambert Simnel, a pretender to the English throne. After the advent of a more dangerous pretender, Perkin Warbeck, it was decided (1494) to remove Kildare and rule through an Englishman, Sir Edward Poynings. Poynings subdued Kildare, but he could not reconquer the northern Gaelic Irish. At Drogheda (1494–95) he induced a Parliament to pass an act that came to be known as "Poynings' Law"; it subjected the meetings and legislative drafts of the Irish Parliament to the control of the English king and council. But his administrative expenses were too great, and Henry VII decided in 1496 to restore Kildare.

Sir Edward Poynings

On Kildare's death (1513), the deputyship passed to his son Garret Oge (Young Gerald), 9th earl of Kildare, who continued, though less impressively, to dominate the country. But James, 10th earl of Desmond, intrigued with the emperor Charles V; and Henry VIII became convinced that Kildare had lost the power to keep Ireland neutral. Therefore, when the divorce (1533) of Catherine of Aragon made the danger of imperial intervention particularly acute, the King summoned Kildare to England (1534). There were, thereafter, no Irish-born viceroys for more than a century.

The Reformation period. Rumours that Kildare had been executed precipitated the rebellion of Kildare's son, Thomas Fitzgerald, Lord Offaly, called Silken Thomas. The rebellion facilitated the transition to the new system. Silken Thomas had opposed Henry VIII's breach with Rome; his execution (1537) caused a revival of the power of the Butlers of Ormonde; Piers Butler, earl of Ossory, helped to secure the enactment of the royal (instead of papal) ecclesiastical supremacy by the Dublin Parliament of 1536–37. As a further step in getting rid of the pope, in 1541 a complaisant Parliament recognized Henry VIII as king of Ireland (his predecessors had held the title of lord of Ireland). Confiscation of monastic property, as well as the lands of the rebels, met most of the costs of the expanded administration. This loss of land inevitably drove the religious orders and the Anglo-Irish into the arms of the Gaelic Irish, thus weakening the old racial rivalries of medieval Ireland.

Sir Anthony St. Leger, lord deputy in 1540–48 and again in 1550–56, then began a conciliatory policy by which outstanding lords were persuaded, in order to gain new titles and grants of lands, to renounce the pope and recognize the king's ecclesiastical supremacy. This policy, however, required a steady series of efficient governors and disciplined administrators; in fact, neither in Tudor nor in Stuart times did the English succeed in converting elective chiefs into hereditary nobles holding offices delegated by the crown. Moreover, even those who had recently submitted were often condemned for religious conservatism and deprived of their lands. St. Leger's personal success was all the more remarkable because the first Jesuit mission to Ireland arrived in the north in 1542.

Under Edward VI (1547–53), the Dublin authorities carried out a forward policy in religion as well as in politics, but Protestantism got no support except from English officials. The official restoration of Roman Catholicism under Queen Mary (1553–58) revealed the strength of resentment in Ireland against Protestantism. As in England, the papal jurisdiction was restored, but otherwise the Tudor regulations of authority were observed. The pope was induced to recognize the conversion of the Tudor Irish lordship into a kingdom. Finally, Mary gave statutory approval for the plantation, or resettlement of Irish lands by Englishmen, of Leix, Offaly, and other Irish lordships of the central plain. Her viceroy was Thomas Radcliffe, earl of Sussex, lord deputy (1556–59), who was soon, as lord lieutenant (1559–66) for Elizabeth I, to restore the state's authority over the church.

Ireland under Elizabeth I. The Acts of Supremacy and Uniformity, enforcing the Anglican Church settlement, were passed in Ireland in 1560, but fear of driving the inhabitants of the Pale into alliance with the Gaelic Irish and perhaps with the Spanish made the government lenient in enforcing the terms of the Acts. Political affairs continued to preoccupy the administrators, so that the new Protestant church was unequipped to resist the forces of the Counter-Reformation. This was inevitable in an Ireland only superficially conformed to royal obedience; but the seriousness of the situation was shown by the three great rebellions of the reign, those of Shane O'Neill (1559), of the Fitzgeralds of Desmond (1568–83), and of O'Neill (Tyrone) and O'Donnell (1594–1603).

The rebellion of Shane O'Neill

The first of these rebellions, that of Shane O'Neill, fully exposed the weakness and later the folly of the government. O'Neill's father, Con Bacach (the Lame), who as the "O'Neill" was head of a whole network of clans, had been made earl of Tyrone in 1541, the succession rights of his illegitimate son Feardorchadh (Matthew) being recognized. Shane, younger but the eldest legitimate son, was, nevertheless, elected O'Neill on his father's death (1559), and soon afterward Feardorchadh was killed. O'Neill then took the field against the Dublin government, demanding recognition according to the laws of primogeniture, and he insisted that neither of Feardorchadh's sons, Brian and Hugh, had claims to the earldom. Elizabeth invited O'Neill to London to negotiate, but the opportunity for a statesmanlike settlement was lost. O'Neill was to be "captain of Tyrone" and was encouraged to expel from Antrim the MacDonnell (MacDonald or MacConnell) migrants from Scotland. Returning to Ireland in May 1562, O'Neill routed the MacDonnells, as well as the loyal O'Donnells of the northwest, and attempted to secure support from Scotland and France. Eventually the government was

saved from a serious situation only through the defeat of O'Neill by the O'Donnells and his murder in 1567 by the MacDonnells.

The lands of the O'Neills and even of loyal Gaelic lords were declared forfeit in 1569, and in a wave of enthusiasm for colonization, various questionable adventurers were permitted to attempt substantial plantations in Munster, Leinster, and Ulster. The folly of this policy was seen when the government, despite its having declared the position of "O'Neill" extinguished, yet allowed the O'Neills to elect Shane's cousin, Turloch Luineach, as their chief. Butlers and Munster Fitzgeralds also combined forcibly to resist the plantations. The only gleam of statesmanship shown in these years by Henry Sidney, lord deputy (1565–71, 1575–78), was that he managed to avoid a major combination against the government's religious policy. The Butlers were induced to submit, the planters were given only limited support, and a head-on collision with Turloch Luineach was averted. When the Ulster plantation plans could not be carried out against Irish resistance, the Queen wisely decided they should be dropped. The pardon of the Butlers pacified Leinster, and although in Munster the Earl of Desmond's cousin James Fitzgerald, called "Fitzmaurice," attempted to make the war one of religion, he too was eventually pardoned.

The Desmond wars

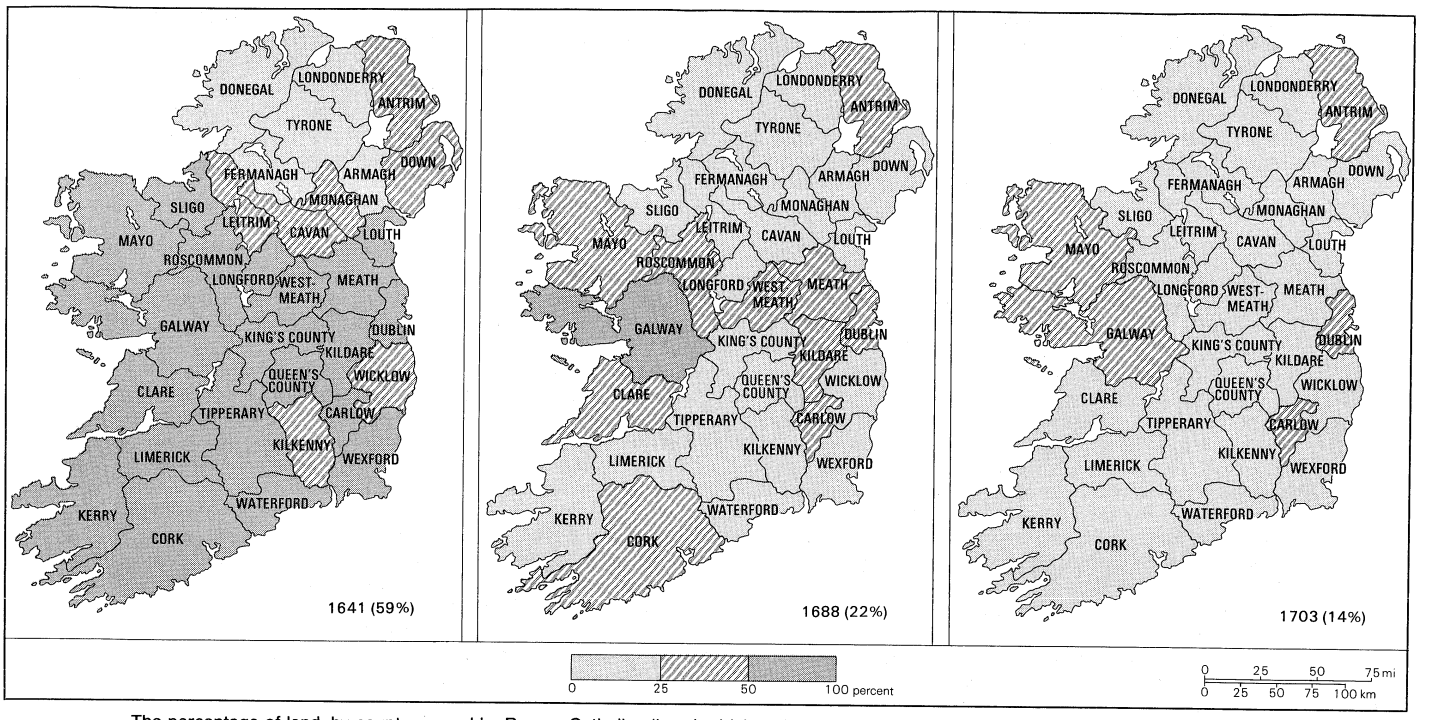
Despite his pardon, Fitzmaurice in 1575 fled to the Continent, returning to Ireland in 1579 with papal approval for a Roman Catholic crusade against Queen Elizabeth. Although neither France nor Spain supported it, and Fitzmaurice was surprised and killed in August 1579, the government was extremely apprehensive. Gerald Fitzgerald, 14th earl of Desmond, then assumed direction of the enterprise. As a military commander he was wholly deficient, and his mediocrity may well have kept outstanding figures in the north and west out of the movement. The rebels were defeated, and in November 1580 a force of Italians and Spaniards was massacred at Dún an Óir (Golden Fort), Smerwick Harbour, County Kerry.

The end of the Desmond rebellion gave the government the opportunity to confiscate more than 300,000 acres (100,000 hectares) in Munster and initiate more stringent proceedings against Roman Catholics. But the plantation was not a success. A more statesmanlike attitude was displayed in regard to Connaught land titles. When Sir John Perrot was lord deputy (1584–88), a number of agreements were made with individual landowners and chieftains, by which their titles were officially recognized in return for fixed regular payments. This was a step in the process of converting a great part of the country to English tenures. Perrot was less successful in handling the 1585–86 Parliament, in which the government's anti-Catholic program was defeated by the opposition.

The Tyrone war

The origins of the third rebellion, the O'Neill (Tyrone) war, remain in doubt. Both Hugh Roe O'Donnell and Hugh, younger son of Feardorchadh O'Neill, for whom the earldom of Tyrone had been revived in 1585 and who had had himself elected O'Neill on Turloch Luineach's death in 1595, certainly resented the extension of the royal administration, but the religious issue was probably more important. For a generation exiled Roman Catholics had been trained as missionaries in the continental colleges of the Counter-Reformation, and the majority of those who returned to Ireland concluded that Roman Catholicism could only survive there if Elizabeth were defeated. The outbreak of hostilities in Ulster in 1594 was at first confined to the northwest, where O'Donnell and Maguire, lord of Fermanagh, tried to drive out the English troops. The intervention of Hugh O'Neill was expected, if not inevitable. His participation with his brother-in-law O'Donnell proved decisive in the north and west, and the English were defeated both in Ulster and in Connaught. A more intimidating combination thus threatened Dublin than even in Shane O'Neill's time. Even in the Pale, arbitrary exactions and exclusion from offices won Hugh much sympathy, and it was said that he knew of Dublin Castle decisions before they were known in the city. Resentful of O'Neill's alleged ingratitude, Elizabeth became impatient of negotiations with him and finally sent Robert Devereux, earl of Essex, to Ireland (1599) to subdue him. But Essex lost his reputation by his inglorious progress through the country and by the speed with which he returned to England after a private conversation with O'Neill. Before Charles Blount, Lord Mountjoy, arrived (1600) to replace Essex, the Irish leaders had gained the qualified support of Pope Clement VIII and of King Philip III of Spain. But Philip could afford to send only a minimal force to aid the Irish rebels. Its leader, Juan del Aguila, occupied Kinsale and was besieged (1601) by Mountjoy. O'Neill marched south to relieve Aguila, but a rash attempt to surprise the English lines by night proved disastrous (Dec. 24, 1601); the Irish were defeated and the Spaniards surrounded. O'Neill held out in Ulster for more than a year but finally submitted a few days after the Queen's death (March 1603).

Viewed generally, Elizabeth's Irish policy had the distinction of having reduced the country to obedience for the first time since the invasion of Henry II. But the cost was a serious one. The loyalty of the Irish was perennially strained over the religious issue, so that further rebellion was almost inevitable and virtually predictable in 1640 when the English government was embarrassed by the Second Bishops' War with Scotland. Economically, the towns and the countryside were needlessly exploited by the new administrators and planters, while the Queen's expenditure was substantially increased. Commitments in Ireland were at least partly responsible for the poverty of the crown, which was to become a serious factor in precipitating its 17th-century conflict with Parliament.



MODERN IRELAND UNDER BRITISH RULE

The 17th century. *James I (1603–25).* James VI of Scotland, who also became King James I of England and Ireland in 1603, might have pursued an Irish policy more enlightened than that of Elizabeth, who had been committed to war against the papacy and against Spain. He did make peace with Spain, but his policy of guarded religious toleration was nullified by the intransigence of the established Anglican Church and of the papacy. Unfortunately, James allowed Irish policy to be dominated by the interests of the English governing class and also sought to provide in Ireland opportunities for his countrymen. He thereby virtually continued Elizabethan policy, and as a result the steady exodus of Irish soldiers and churchmen to Roman Catholic countries on the Continent was unabated. On a short-term basis, their absence contributed to peace; but their influence abroad made the Irish question an international one. In Ireland, the overwhelming majority of the Gaelic Irish and of the old Anglo-Irish remained detached from government in attitude as well as in way of life.

Plantation of Ulster

As soon as James's policy became clear, the earls of Tyrone and of Tyrconnel and other Ulster Gaelic lords joined the flight from Ireland. Their departure opened the way for the plantation of Ulster by a new landowning class, which included Scots as well as Englishmen. This proved the most successful British settlement made in Ireland, mainly because British tenantry and labourers were introduced as well as landlords. The newcomers were mainly from the Scottish Lowlands, and at first the English feared them almost more than they feared the Irish. In an attempt to counter their influence, the city of London was involved in the Ulster plantation, its name being combined with that of the historic ecclesiastical settlement of Derry to provide the name of a plantation. The Presbyterianism of the Scottish immigrants was successfully kept at bay until the time of the English Civil War; the Anglican bishoprics in Ireland were well endowed and powerful, and it was not until 1643 that the first presbytery was established in Belfast.

In the Parliament of 1613–15, summoned to ratify the Ulster plantation, a small Protestant majority was achieved because many new boroughs had been created in the newly planted areas. But government was concerned more with the appearance than the reality of consent, and no Parliament was called again until 1633. In the last years of James's reign, pressure from his Spanish and French allies caused him to concede toleration to the Roman Catholics; and from 1618 a Roman Catholic hierarchy was in residence in Ireland.

The percentage of land, by county, owned by Roman Catholics (*i.e.*, the Irish natives) in 1641, 1688, and 1703. The average percentage for all of Ireland is indicated after the year identifying each map.

From A. Orme, *Ireland*

Charles I (1625–49) and the Commonwealth (1649–60). Charles I conceived the idea of raising armies and money in Ireland in return for religious concessions, known as "the Graces," by which Roman Catholics were allowed to engage in various public activities. But this policy was abandoned by Thomas Wentworth, later earl of Strafford, lord deputy from 1633 to 1640. He set himself to break the power of the great and of trade monopolists, both Irish and English, including the London city companies. He induced the Roman Catholic members of the Irish House of Commons to join in voting large subsidies in the hope of obtaining further concessions but then abolished most of the existing Graces. He thus seriously weakened the loyalty to the crown of the old landowning classes; and later all his enemies in Ireland joined with those in England in bringing about his execution (1641). His Irish Army was disbanded, and control of the Irish government passed to Puritan lords justices.

Ireland during the English Civil War and its aftermath

A general rising of the Irish in Ulster was almost inevitable. It took place in October 1641, and thousands of colonists were murdered or fled. A Roman Catholic confederacy was formed at Kilkenny in 1642, but it did not succeed in welding together the various groups of which it was composed. During the period of the English Civil War there were Irish confederate armies in Ulster and in Leinster; English parliamentary armies operated in the north and south; and Dublin was held by James, duke of Ormonde, commanding an army of Protestant royalists. Negotiations for peace between Ormonde and the confederates were difficult and protracted; and in 1646, when it was clear that Charles I's cause was lost, Ormonde surrendered Dublin to a parliamentary commander. The confederates in isolation could offer little resistance (1649–50) to Oliver Cromwell. By 1652 all Irish resistance was over.

During the Commonwealth and Protectorate, authority in Ireland was exercised by parliamentary commissioners and chief governors. A union of the three kingdoms of England, Scotland, and Ireland, effected in 1653, resulted in Irish representatives attending Parliaments held in London in 1654, 1656, and 1659. By an Act of Settlement, Ireland, regarded as conquered territory, was parceled out among soldiers and creditors of the Commonwealth, and only those Irish landowners able to prove their constant support of the Parliamentary cause escaped having their estates confiscated. Of these, those who were Roman Catholics were still obliged to exchange land owned to the northeast or south of the River Shannon for land in Connaught. Roman Catholics and Anglicans were forbidden to practice their religion, but the campaign against Irish Catholicism was not successful. After the Restoration (1660) Charles II personally favoured complete religious toleration, but the forces of militant Protestantism sometimes proved too strong for him. The Commonwealth parliamentary union was, after 1660, treated as null and void.

The Restoration period and the Jacobite war. Most significant of the events of the Restoration was the second Act of Settlement (1662), which enabled Protestant loyalists to recover their estates. The Act of Explanation (1665) obliged the Cromwellian settlers to surrender one-third of their grants, providing a reserve of land from which Roman Catholics were partially compensated for losses under the Commonwealth. This satisfied neither group. Roman Catholics were prevented from residing in towns, and local power, in both borough and county, became appropriated to the Protestant interest. But Protestantism itself became permanently split; as in England, the Presbyterians refused to conform to Episcopalian order and practice and, in association with the Presbyterians of Scotland, organized as a separate church.

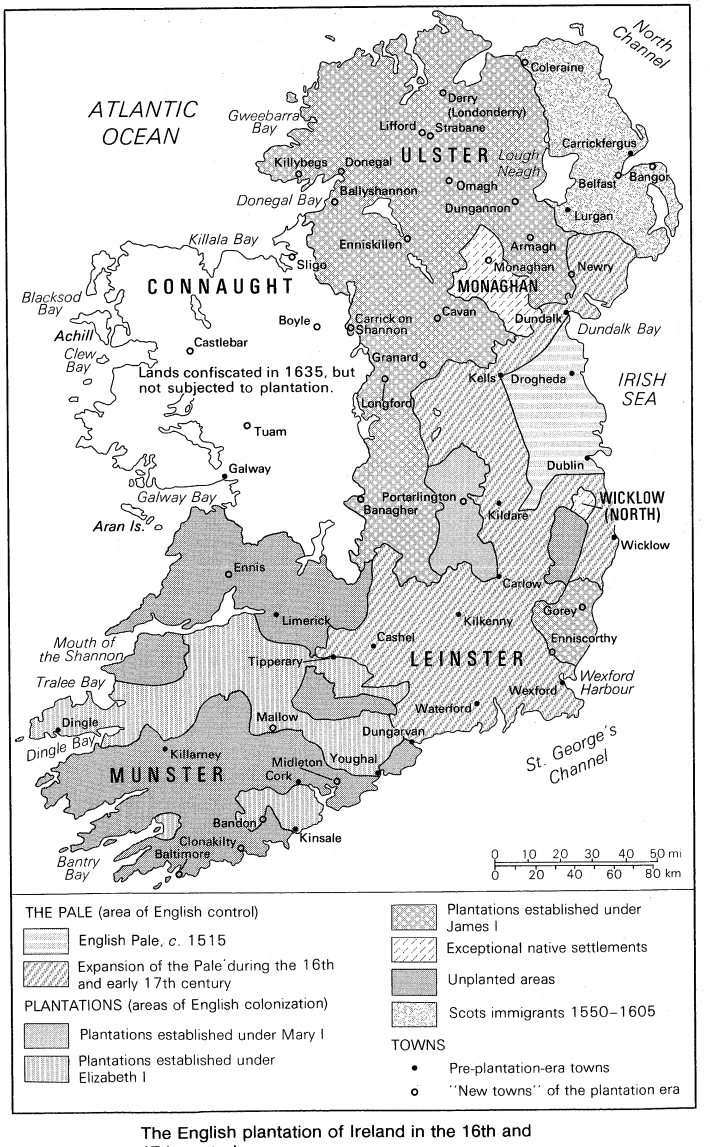
Under James II, advantage was taken of the King's Catholicism to reverse the tendencies of the preceding reign. After his flight from England to France (1688), James crossed to Ireland, where, in a Parliament, the Acts of Settlement and Explanation were repealed and provision was made for the restoration of expropriated Roman Catholics. When William III landed in Ireland to oppose James, the country divided denominationally, but the real issue was not religion but the land. After his defeat at the Battle of the Boyne (1690) James fled to France, but his Roman Catholic supporters continued in arms until defeated at Aughrim and obliged to surrender (1691) at Limerick. There, however, they secured either the right to go overseas or, if they accepted William's regime, immunity from discriminatory laws. But civil articles to secure toleration for the Roman Catholics were not ratified, thus enabling later Irish leaders to denounce the "broken treaty" of Limerick. Immediately after Limerick, the Protestant position was secured by acts of the English Parliament declaring illegal the acts of King James's Parliament in Ireland and restricting to Protestants mem-

bership of future Irish Parliaments. The sale of the lands forfeited by James and some of his supporters further reduced the Roman Catholic landownership in the country; by 1703 it was less than 10 percent. On this foundation was established the Protestant Ascendancy.

The Protestant Ascendancy

The 18th century. The Protestant Ascendancy was a supremacy of that proportion of the population, about one-tenth, which alone belonged to the established Protestant Episcopalian Church. They celebrated their position as a ruling class by annual recollections of their victories over their hated popish enemies. Not only the Roman Catholic majority but also the Presbyterians and other Nonconformists, whose combined numbers exceeded those of the church establishment, were excluded from full political rights, notably by the Test Act of 1704, which made tenure of office dependent upon willingness to receive communion according to the Protestant Episcopalian (Church of Ireland) rite. Owing to their banishment from public life, the history of the Roman Catholic Irish in the 18th century is concerned almost exclusively with the activities of exiled soldiers and priests, many of whom distinguished themselves in the service of continental monarchs. Details of the lives of the unrecorded Roman Catholic majority in rural Ireland can be glimpsed only from ephemeral literature in English and from the Gaelic poetry of the four provinces.

The Protestant Ascendancy of 18th-century Ireland began in subordination to that of England but ended in asserting its independence. In the 1690s commercial jealousy compelled the Irish Parliament to destroy the Irish woolen export trade, and in 1720 the Declaratory Act affirmed the right of the British Parliament to legislate for Ireland and transferred to the British House of Lords the powers of a supreme court in Irish law cases. By the end of the first quarter of the 18th century, resentment at this subordination had grown sufficiently to enable the celebrated pamphleteer Jonathan Swift to whip up a storm of protest over the affair of "Wood's halfpence." William Wood, an English manufacturer, had been authorized to mint coins for Ireland; the outcry against alleged exploitation of the lesser country by arbitrary creation of a monopoly became so violent that it could be terminated only by withdrawing the concession from Wood.



Nevertheless, it was another 30 years before a similar protest was made. In 1751 a group of patriots organized themselves to defeat government resolutions in the Irish Parliament appropriating a financial surplus as the English administrators rather than the Irish legislators saw fit. Although in 1768 the Irish Parliament was made more sensitive to public opinion by provision for fresh elections every eight years instead of merely at the beginning of a new reign, it remained sufficiently controlled by government to pass sympathetic resolutions on the revolt of the American colonies.

The American Revolution greatly influenced Irish politics, not least because it removed government troops from Ireland, and the Protestant Irish volunteer corps, spontaneously formed to defend the country against possible French attack, exercised a coercive influence for reform. A patriotic opposition, led by Henry Flood and Henry Grattan, began an agitation that led in 1782 to the repeal of the Declaratory Act of 1720, and to an amendment of Poynings' Law to give legislative initiative to the Irish Parliament. In this period many of the disabilities suffered by Roman Catholics in Ireland were abolished, and in 1793 the British government, seeking to win Roman Catholic loyalty on the outbreak of war against Revolutionary France, gave them the franchise and admission to most civil offices. The government further attempted to conciliate Roman Catholic opinion in 1795 by founding the seminary of Maynooth to provide education for the Roman Catholic clergy. But the Protestant Ascendancy had become concerned about its position and resisted efforts to make the Irish Parliament more representative. The outbreak of the French Revolution had effected a temporary alliance between an intellectual elite among the Presbyterians and leading middle-class Roman Catholics; these, under the inspiration of Wolfe Tone, founded societies of United Irishmen, a series of radical political clubs. After the outbreak of war, the societies, reinforced by agrarian malcontents, were driven underground. In despair they sought the military support of Revolutionary France, which, between 1796 and 1798, dispatched a series of abortive naval expeditions to Ireland. The United Irishmen were preparing for rebellion; it broke out in May 1798 but was widespread only in Ulster and in Wexford in the south. Although the rebellion was unsuccessful, it brought the Irish question forcibly to the attention of the British Cabinet, and the prime minister William Pitt planned and carried through an amalgamation of the British and Irish Parliaments, merging the kingdoms of Great Britain and Ireland into the United Kingdom. Despite substantial opposition in the Irish Parliament, the measure passed into law, having effect from Jan. 1, 1801. To Grattan and his supporters the Union seemed the end of the Irish nation; the last protest of the United Irishmen was made in Robert Emmet's abortive rebellion of 1803.

The Union with Great Britain

Social, economic, and cultural life in the 17th and 18th centuries. Although the late 16th century saw the destruction of Gaelic civilization in the upper levels of society, it was preserved for more than the next two centuries among the ordinary people of the northwest, west, and southwest, who continued to speak Irish and who maintained a way of life remote from that of the new landlord class.

The 17th-century confiscations made Ireland a land of great estates and, except for Dublin, of small towns decaying under the impact of British restrictions on trade.

The English plantation of Ireland in the 16th and 17th centuries.

Except on the Ulster plantations, the tenantry was relatively poor in comparison with that of England and employed inferior agricultural methods. Over large parts of the east and south, tillage farming had given way to pasturage. In the north of Ireland, a somewhat similar tendency, creating a decline in the demand for labour, led in the early 18th century to the migration of substantial numbers of Ulster Scots to North America. In Ulster there gradually emerged a tenantry who compelled their landlords to maintain them in their farms against the claims and bids of Roman Catholic competitors now once again legally entitled to hold land. This purpose immensely strengthened the Orange Order, founded in 1795 in defense of the Protestant Ascendancy. Increasingly it linked the Protestant gentry and farmers, while excluding Roman Catholics from breaking into this privileged ring. Tillage farming was maintained in Ulster more extensively than in the south and west, where there developed on the poorer lands a system of subdivision apparently necessitated by population increase. Little is known of the lives of the ordinary people, and even for those of the gentry the evidence, apart from that of estate records, is rarely extensive.

Little need be said of the culture of the Anglo-Irish in the same period, as it followed so closely the traditions of Britain and, very occasionally, those of the rest of Europe. Gradually, during the 18th century, the new landowning class developed some appreciation of the visual arts. But the really original achievement of the period was in literature, particularly in drama, where the rhetorical gifts of the people secured an audience. In this period there was a strong connection between rhetoric and the arts, as between oratory, themes of social decay, and the consoling power of language and form. Such works as Oliver Goldsmith's *Deserted Village* and *Traveller,* Edmund Burke's speeches, and the speeches and plays of Richard Brinsley Sheridan are manifestations of a rhetorical tradition central to Irish feelings.

The 19th and early 20th centuries. By the Act of Union it was provided that Ireland would have in the United Kingdom about one-fifth of the representation of Great Britain, with 100 members in the House of Commons. The union of the churches of England and Ireland as the established denominations of their respective countries was also effected, and the preeminent position in Ireland of Protestant Episcopalianism was further secured by the continuation of the British Test Act, which virtually excluded Nonconformists (both Roman Catholic and Protestant) from Parliament and from membership of municipal corporations. Not until 1828–29 did the repeal of the Test Act and the concession of Roman Catholic emancipation provide political equality for most purposes. It was also provided in the Union that there should be free trade between the two countries and that Irish merchandise would be admitted to British colonies on the same terms as British merchandise. But these advantages were not enough to offset the disastrous effect upon Ireland of exposure to the full impact of Britain's industrial revolution. Within half a century agricultural produce dropped in value and estate rentals declined, while the rural population increased substantially. When the potato, the staple food of rural Ireland, rotted in the ground through the onset of blight in the mid-19th century, perhaps as many as a million people died of starvation and fever in the Great Famine that ensued, and even more fled abroad.

At first, and perhaps for more than one-third of the 19th century, the auguries of success for the Union were favourable. After the defeat of Napoleon at Waterloo (1815), political discontent increased but became concentrated, so far as the Roman Catholics were concerned, on securing their emancipation. Until this was achieved there had not clearly emerged any notable difference in outlook between the Roman Catholics and Presbyterians; but the dramatic manner in which the Roman Catholic Daniel O'Connell was elected to a Parliamentary seat for County Clare (1828), subsequently sweeping the emancipation movement into victory, provoked a panic among timid Protestants and led to an alliance between the Presbyterians and their old oppressors, the Protestant Episcopalians.

Emergence of Daniel O'Connell

After emancipation, the middle-class Roman Catholics and Protestants drifted apart, the latter increasingly clinging to the Union, the former more slowly but at last decisively coming to seek its repeal.

O'Connell's adherence to the cause of repeal did not prevent him from participating actively in British politics. Lord Melbourne, the Whig prime minister, by a bargain known as the Lichfield House Compact (1835), secured O'Connell's support in return for a promise of "justice for Ireland." But meanwhile the Tories, led by Sir Robert Peel, exercised through their control of the House of Lords an effective restriction on promised social and economic reforms for Ireland, and when Peel returned to power in the early 1840s O'Connell, despairing of further concessions, began a massive campaign outside Parliament for repeal of the Union, notably by organizing large popular demonstrations. A climax was reached in October 1843 when troops and artillery were called out to suppress the mass meeting arranged at Clontarf outside Dublin. O'Connell's method of popular agitation within the law proved unavailing, however, and his influence thereafter rapidly declined.

Associated with O'Connell's repeal agitation was the Young Ireland movement, a group connected with a repeal weekly newspaper, *The Nation,* and led by its editor Charles Gavan Duffy, its chief contributor Thomas Osborne Davis, and its special land correspondent John Blake Dillon. But they became increasingly restless at O'Connell's cautious policy after Clontarf and in 1848 became involved in an abortive rising. Its failure, and the deportation or escape from Ireland of most of the Young Ireland leaders, destroyed the repeal movement.

For about 20 years after the Great Famine, political agitation was subdued, while emigration continued to reduce the population every year. The landowners had also suffered severely from inability to collect rents, and there was a wholesale transfer of estates to new owners. Evictions were widespread, and cottages were demolished at once by the landlords to prevent other impoverished tenants from occupying them. The flow of emigrants to the United States was encouraged by invitations from Irishmen already there. And in England, also, the new industrial cities and shipping centres attracted large settlements of hopeless and embittered exiles from Ireland.

Rise of Fenianism. Among the exiles both in the United States and in England, the Fenian movement spread widely. A secret revolutionary society named for the Fianna, the Irish armed force in legendary times, it aimed at securing Ireland's political freedom by exploiting every opportunity to injure English interests.

Imprisonment of Fenian leaders

In Ireland, Fenian ideals were propagated in the newspaper *The Irish People;* and in 1865 four Fenian leaders, Charles Kickham, John O'Leary, Thomas Clarke Luby, and Jeremiah O'Donovan Rossa were sentenced to long-term imprisonment for treasonable writing in it. During the next two years, plans gradually developed for a projected nationwide rising, financed largely by funds collected in the United States. It took place in March 1867 but was easily crushed and its leaders imprisoned. The prime minister, William Ewart Gladstone, at last recognized the necessity for drastic Irish reforms, disestablishing the Protestant Church in Ireland in 1869 and in 1870 introducing the first Irish Land Act, which conceded the principles of secure tenure and compensation for improvements made to property. He may also have been concerned at the cleavage between English and Irish public opinion caused by the execution at Manchester of William P. Allen, Michael Larkin, and Michael O'Brien for involvement in a Fenian prisoner-rescue operation that resulted in the shooting of a British police sergeant. To most Englishmen the "Manchester murderers" richly deserved their fate; to most Irishmen they were the "Manchester martyrs," celebrated in ballad and legend.

The Home Rule movement and the Land League. Soon afterward, in 1870, a constitutional movement, the Home Government Association (Home Rule League), was founded by Isaac Butt, a prominent Unionist lawyer interested in land reform. In the election of 1874 it returned about 60 members to Parliament. The movement was

tolerated rather than encouraged by the various groups of Irish nationalists, and it was not fully supported by the Roman Catholic clergy until the 1880s.

A return of bad harvests in 1879 brought new fears of famine, and Michael Davitt founded the Irish Land League, seeking to achieve for tenants security of tenure, fair rents, and freedom to sell property. A formidable agrarian agitation developed when Davitt was joined by Charles Stewart Parnell, a young landowner and member of Parliament in the Home Rule Party, which soon elected him as its leader in place of Butt. Parnell undertook a tour of North America to raise funds for the Land League; there he was influenced by two Irish Americans, John Devoy, a leading member of Clan na Gael, an effective American Fenian organization, and Pat Ford, whose New York paper *The Irish World* preached militant Socialism and hatred of England. At Westminster Parnell adopted a policy of persistent obstruction, which compelled attention to Irish needs by bringing parliamentary business to a standstill. Gladstone was forced to introduce his Land Act of 1881, conceding fixity of tenure, fair rents, and free sale of the tenant's interest.

Parnell's success was not achieved without serious difficulties, including the ultimate proscription of the Land League by the government and the imprisonment of its leaders. As a result, Parnell used his parliamentary party, then increased to 86, to defeat and thus dismiss from office Gladstone's Liberal government, already unpopular in England as a result of its failure to relieve General Gordon at Khartoum in 1884. For a while Conservatives and Liberals both negotiated with Parnell, but ultimately Gladstone became converted to Home Rule, introducing a bill to bring it into effect after he returned to office in 1886. The bill, however, was defeated by a combination of Conservative Unionists influenced by Irish Orangemen and splinter groups from the Liberal Party. There followed 20 years during which Irish Nationalist ambitions seemed frustrated, partly because Conservative-Unionists were mainly in power and partly because bitter internal rivalries discredited the Irish Nationalist Party after Parnell's involvement (1889) in a divorce suit. Meanwhile, Gladstone's second Home Rule Bill (1893) was rejected in the House of Lords. Only in 1900 was a Parnellite, John Redmond, able to reunite the Nationalists. In the last years of the century, partly in reaction to political frustrations, a cultural nationalist movement developed, led by Douglas Hyde and Eoin MacNeill. Through the Gaelic League much was done to revive interest in the speaking and study of Irish. These cultural movements were reinforced by others, such as that of the Sinn Féin ("Ourselves") movement led by Arthur Griffith, who preached a doctrine of political self-help. It subsequently emerged that a Fenian organization, the Irish Republican Brotherhood, had revived and was secretly recruiting membership through various cultural societies and through the Gaelic Athletic Association, founded to promote specifically Irish sports.

Gladstone's Home Rule bill

Around the close of the century the Conservatives initiated a policy designed to "kill Home Rule by kindness" by introducing constructive reforms in Ireland. Their most important achievement in this field was the Wyndham Land Purchase Act of 1903. This, by providing generous inducements to landlords to sell their estates, effected by government mediation the transfer of land ownership to the occupying tenants.

The 20th-century crisis. After the great Liberal victory of 1906, Redmond decided to force the Liberals to revive Home Rule, and when David Lloyd George's radical budget provoked a collision with the House of Lords in 1909, he seized his opportunity. He agreed to support the campaign of the prime minister, H.H. Asquith, against the Lords in return for the promise of a Home Rule bill. The reduction of the power of the Lords by the 1911 Parliament Act seemed to promise success for the third Home Rule bill, introduced in 1912. But in the meantime the Irish Unionists, under their colourful leader Sir Edward Carson, had mounted an effective countermovement, backed by most of the British Unionists. Thousands of Ulstermen signed the Ulster Covenant of resistance to Home Rule (1912), and Carson announced that a provisional government would be formed there. At first planning to reject Home Rule for all Ireland, the Unionists gradually fell back on a demand for Ulster to be excluded from its scope. Redmond's claim that there was "no Ulster question," implying that even among the Ulster members of Parliament there was a majority for Home Rule, hardened the Protestant and Unionist resistance in the areas around Belfast. Down, Antrim, Armagh, and Derry all contained Unionist majorities; Donegal, Cavan, and Monaghan had strong Home Rule majorities; and Tyrone and Fermanagh had small Home Rule majorities. The Ulster Volunteer Force was organized and boasted of active sympathy among army officers; their boasts became formidable when all the officers in the cavalry brigade at the Curragh suddenly announced (March 1914) that they would resign if ordered to move into Ulster. Meanwhile, to counter the Ulster Volunteers, a nationalist force, the Irish Volunteers, had been launched in Dublin in November 1913. Both forces gathered arms, and Ireland was on the verge of civil war when World War I broke out. Assured of Redmond's support in recruiting for the army, Asquith enacted Home Rule but followed this with a Suspensory Act, delaying implementation until the return of peace.

Meanwhile in Ireland, the revolutionary element gained support from those alienated by Redmond's pro-British attitude. Before the end of 1914 the Irish Republican Brotherhood had made full plans for a revolutionary outbreak. Sir Roger Casement went to Germany to solicit help, but he obtained only obsolete arms and was himself arrested on his return to Ireland on April 21, 1916. When the rising took place three days later, on Easter Monday, only about 1,000 of the small force available were actually engaged. A provisional Republican government was proclaimed. The General Post Office and other parts of Dublin were seized; street fighting continued for about a week until Patrick Pearse and other Republican leaders were forced to surrender. Their subsequent execution aroused Irish public opinion and led to the defeat and virtual extinction of Redmond's constitutional party at Westminster in the general election of December 1918. Their successful opponents, calling themselves Sinn Féin but supporting the Republican program announced in 1916, were led by Eamon de Valera, a surviving leader of the Rising. Again the Republicans set up their provisional government, elected by the Irish members of Parliament at a meeting in Dublin called Dáil Éireann, the "Irish Assembly." This provided a constitutional facade when British government was rapidly breaking down except in the northeastern counties. Simultaneously, the Irish Republican Army (IRA) was organized to resist British administration and to secure recognition for the Republican government. Its members soon engaged in widespread ambushes and attacks on barracks, while the government retaliated with ruthless reprisals. A large proportion of the Irish police resigned and were replaced by English recruits, known from their temporary uniforms as the Black and Tans.

The Easter Rising

In this condition of virtual civil war Britain gradually alienated Irish public opinion and was forced, partly under American influence, to pass the Government of Ireland Act (1920). By this measure Ireland was divided into two self-governing areas, Northern Ireland and Southern Ireland. Both were to enjoy, within the United Kingdom, limited powers of self-government. After a general election in Ireland, King George V opened the Parliament of Northern Ireland in Belfast (1921) and in his speech appealed for an end to fratricidal strife. The King's initiative forced the British prime minister Lloyd George to open negotiations with de Valera, but for some time progress proved impossible, because neither side would admit the other's legality. Ultimately, on Dec. 6, 1921, an Anglo-Irish treaty was signed on behalf of Great Britain by Lloyd George and leading members of his cabinet and on behalf of Ireland by Arthur Griffith, Michael Collins, and other members of the Republican Cabinet.

INDEPENDENT IRELAND

Establishment of the Irish Free State. The Anglo-Irish treaty provided that Ireland should in future have the

"same constitutional status in the community of Nations known as the British Empire as the Dominion of Canada, the Commonwealth of Australia, the Dominion of New Zealand, and the Union of South Africa with a parliament having powers to make laws for the peace, order and good government of Ireland and an Executive responsible to that parliament." The new dominion was to be known as the Irish Free State. This peace agreement, ratified by the British Parliament, became operative when it had also been passed (January 1922) by a meeting of the Dáil. The new state comprised only 26 of the 32 counties, the northeastern area, known as Northern Ireland, remaining separate.

But the terms of the treaty had been accepted by the Irish signatories only because Lloyd George had threatened war on Ireland if they were rejected. Particularly obnoxious were a prescribed oath of allegiance to the British crown and the provisions allowing Northern Ireland to remain outside the new state. De Valera and the Republicans immediately repudiated the treaty, and after its passage in the Dáil, de Valera resigned the presidency. Michael Collins, chairman of the provisional government set up according to the terms of the treaty, and Arthur Griffith, the new president, desired an immediate general election to obtain a verdict on the treaty; in the deteriorating conditions Collins eventually made with de Valera an agreement known as the Pact (May 20, 1922), in which it was settled that government and Republican candidates would not oppose each other and that de Valera would consider resuming office. But the Pact naturally could not bind other parties, and at the election (June 16) Republicans were ousted in favour of members of a labour party and a farmers' party and by independents, thus reducing the anti-treaty vote to a small minority. Before the Dáil could meet, civil war had broken out between the government and the Republicans, who were allegedly accessories to the assassination (June 22) in London of Field Marshal Sir Henry Wilson soon after his acceptance of the position of military adviser to the government of Northern Ireland. The Republicans in Dublin had occupied the Four Courts (central courts of justice) in April and in late June. Under pressure from Britain, which also provided military equipment, Collins ordered them to retire. Serious fighting ensued for a week, until the Courts were blown up, and Rory O'Connor, the Dublin Republican leader, surrendered. Meanwhile, de Valera, who had escaped to the southwest, was openly supporting the Republicans. Griffith and Collins decided that no further compromise was possible, and military operations were begun. The strain had told so heavily on Griffith that he died suddenly on August 12, while Collins, inspecting the military operations, was killed in an ambush on August 22.

Repudiation of the Anglo-Irish treaty

The provisional government had thus lost two of its most prominent leaders, and surviving ministers could not appear openly without armed protection. Moreover, there was urgency in that, by the terms of the treaty, the newly elected Dáil was required to frame its constitution before Dec. 6, 1922. It met on September 9, elected as the new president William Thomas Cosgrave, and, in the absence of the Republican deputies, quickly passed the clauses of the constitution defining the relations of the Free State with the British crown and outlining arrangements for imperial defense. Timothy Michael Healy, a veteran follower of Parnell who had later supported Sinn Féin, was then appointed governor general, and Cosgrave became president of the executive council. The new constitution was also ratified at Westminster.

The Cosgrave ministries. Both before and after the ratification of the constitution the government resorted to strong measures to quell disorder and violence. Its decision to execute those found in unauthorized possession of firearms embittered Irish politics for years afterward. Numerous Republican insurgents were also imprisoned, and 77 were executed. Although Republican opposition was at first more bitter than ever, it eventually became less well organized, and by May 1923, on de Valera's recommendation, armed resistance ended.

At the end of August 1923 the fourth Dáil was elected, on a basis of adult suffrage for men and women. De Valera retained his personal following, and his party won 44 seats out of 128. Cosgrave's party won less than half the total number of seats, but as the Republicans refused to sit in the new Dáil, he had a majority among those who did attend. The absence of any effective opposition party greatly strengthened the power of the new government, and in the following years it displayed great energy. Despite initial economic difficulties, it pursued an efficient farming policy and carried through important hydroelectric projects. Government was increasingly centralized, with the elimination of various corrupt borough corporations; Kevin O'Higgins, as minister for justice, carried through many judicial reforms, and an efficient civil service was organized, in which competence in the Irish language became an essential qualification for promotion.

The fourth Dáil

The Anglo-Irish treaty of 1921 had provided that, if Northern Ireland did not enter the Free State, a boundary commission must establish the frontier between the two countries. Two of the six excluded counties, Tyrone and Fermanagh, contained clear, though small, Nationalist majorities, and the southern portions of both Down and Armagh had for years returned Nationalist members. Despite Northern Ireland's reluctance, a commission was established and sat in secret session during 1925. But it only recommended minor changes, which all three governments rejected as less satisfactory than maintaining the status quo.

In the general election of June 1927 Cosgrave's support in the Dáil was further reduced, but he nevertheless formed a new ministry, in which O'Higgins became vice president of the Executive Council. O'Higgins' assassination on July 10 suddenly revived old feuds, and Cosgrave passed a Public Safety Act, declaring all revolutionary societies treasonable. He forced the Republicans to acknowledge allegiance to the crown before being seated in the Dáil, though de Valera decried the oath as an "empty political formula." Shortly thereafter the Republicans, allied with the Labour Party and the National League, almost defeated Cosgrave, who thereupon dissolved the Dáil. In new elections Cosgrave won 61 seats as compared to Fianna Fáil's 57 and again formed a ministry. In the depression of the early 1930s, unemployment and general discontent with the government led to its defeat in February 1932. Fianna Fáil won enough seats for de Valera, with Labour Party support, to be able to form a new government.

De Valera's governments (1932–48) and the establishment of Éire. De Valera entered office with a policy of encouraging industry and improving the social services. He abolished the oath of allegiance to the crown and also stopped payment to Britain of interest on the capital advanced under the Land Purchase Acts of the late 19th and early 20th centuries. This refusal led to a tariff war with Britain. The country endorsed his policies in January 1933 by returning him to the Dáil with 77 seats and the support of the Labour Party.

De Valera invoked the Public Safety Act against the Blue Shirts, a quasi-Fascist body organized (by Cosgrave's militant supporters) allegedly to protect Treatyites from Republican extremists at public meetings.

De Valera introduced proposals for a new constitution in 1937. The power of the crown was ended, and the office of governor general was replaced by that of a president elected by national suffrage. The first president was Douglas Hyde, a Celtic scholar who had been associated with the Gaelic revival since 1890. The new constitution did not proclaim an independent republic, but it replaced the title of the Irish Free State with the word Éire (Ireland). The new constitution was ratified by a plebiscite at the 1937 general election (in which de Valera was again victorious) and became operative on Dec. 29, 1937.

Establishment of Éire

An agreement in April 1938 ended British occupation of three naval bases that had been left in British hands by the Anglo-Irish treaty of 1921. The dispute over the land-purchase annuities was settled, and the economic warfare was abated. In this period government relations with the radical Republicans deteriorated; members of the IRA suspected of complicity in shootings were imprisoned, and some were executed.

At the outbreak of World War II, de Valera renewed his

statement, made in 1938, that Ireland would not become a base for attacks on Great Britain. His government, re-elected in 1943 and 1944, remained strictly neutral, despite German air raids on Dublin in 1941 and, after the United States entered the war in December 1941, pressure from U.S. president Franklin D. Roosevelt.

The Republic of Ireland. In the general election of 1948 Fianna Fáil won 68 of the 147 seats in the Dáil, but de Valera refused to enter a coalition. John A. Costello emerged as the leader of a bloc composed of his own party, Fine Gael, and several smaller groups. Out of office, de Valera toured the world advocating the unification and independence of Ireland. Fearful of de Valera's prestige, Costello introduced in the Dáil the Republic of Ireland Act, which ended the fiction of Commonwealth membership that had been maintained since 1937. Britain recognized the status of Ireland in 1949 but declared that cession of the six counties could not occur without consent of the Parliament of Northern Ireland. Economic difficulties and a controversy between the ministry and the Roman Catholic hierarchy over the Public Health Act weakened Costello's government, and after the general election of 1951, de Valera again became prime minister. His ministry aroused sufficient discontent for Costello to be returned to power in 1954, but economic troubles enabled Fianna Fáil to win a majority in 1957. This was to be de Valera's last administration. He retired as prime minister in 1959 and was elected to the presidency, serving until 1973.

(R.W.D.E./J.O'B.R./Ed.)

Economic growth. Sean Lemass, prime minister from 1959 to 1966, initiated measures to stimulate Ireland's seriously stagnating economy. Under the First Programme for Economic Expansion (1958–63), economic protection was dismantled and foreign investment was encouraged; a growth rate that was planned to reach 2 percent actually reached 4 percent. This prosperity brought profound social and cultural changes to what had been one of the poorest and most backward countries in Europe. Emigration substantially declined, consumer spending increased, and religious social teaching was challenged and often set aside by newly affluent Irish men and women.

Ireland, like Britain, suffered setbacks in attempting to join the European Economic Community (EEC), but both nations formally entered that organization on Jan. 1, 1973. In elections held later that year, the Fianna Fáil government of Jack Lynch (prime minister from 1966) was defeated by a Fine Gael–Labour coalition led by Liam Cosgrave. The oil crisis and recession of 1974–75 forced the imposition of deflationary economic policies, a wealth tax, and attempts to tax farmers' incomes. Jack Lynch returned to power in 1977, and the Fianna Fáil proposed an ambitious economic policy based on tax cuts and the creation of new enterprises by foreign borrowing.

Despite a brief boom, serious problems became evident in the Irish economy by 1980. These included declining agricultural prices, rising imports and rising prices for imported oil, only a small increase in output, and a rapidly growing population, nearly one-half of which was under 25 years of age. Foreign borrowing had increased, while unemployment and inflation rose steeply.

Unstable politics of the 1980s

The early 1980s proved politically volatile for the Irish republic. In the general election of 1981 no clear majority resulted, and Garret FitzGerald of the Fine Gael–Labour coalition took power, ousting Charles Haughey, who had succeeded Jack Lynch as Fianna Fáil prime minister in 1979. The major issues of the campaign were economic policy, including the imposition of a wealth tax, and the removal of a constitutional ban on divorce. The budget of the coalition government was defeated in January 1982, and another general election in February returned Fianna Fáil and Charles Haughey to power. The life of this government, too, proved short and uneasy. In the face of a budget deficit equal to 7 percent of the gross national product, a program of severe public spending cuts was introduced. The government was defeated on a no-confidence vote in November and another general election—the third in 18 months—followed. This time a Fine Gael–Labour coalition under the leadership of FitzGerald secured an overall majority of the vote.

By the mid-1980s the economy showed faint signs of improvement. Inflation was at its lowest level in nearly two decades, helped by lower oil prices. The budget deficit and high level of unemployment, however, continued to pose considerable problems. Emigration, a barometer of Irish economic health, again began to increase in the mid-1980s. The prolonged recession had once again brought to the surface doubts and anxieties about the future of the Irish state and its real independence.

Social changes. The close relationship between the Irish republic and the Roman Catholic Church was highlighted by the visit of Pope John Paul II to Ireland in 1979, the first visit there of a reigning pontiff. The relationship was to be tested in the 1980s, however, as attempts were made to alter Irish law in its relation to Roman Catholic doctrine. In 1983, after a campaign from Roman Catholic pressure groups, a referendum was held to approve a draft constitutional amendment reinforcing the republic's existing ban on abortion. After a divisive campaign less than 55 percent of the electorate participated in the referendum, and only 36 percent of the total electorate voted in favour of the amendment, which nonetheless was enough for approval.

In 1985 the Roman Catholic Church strenuously, but futilely, opposed the government's liberalization of legislation concerning contraception. Church–state relations were again tested the following year by a referendum to remove the constitutional ban against divorce. The government, which favoured removal of the ban, was defeated by 39 percent of the electorate.

Relations with Northern Ireland. During the late 1950s and early 1960s the Irish government had had to deal with IRA attacks on British Army posts along the Ulster border. An attempt to ease cross-border tensions was made in 1965, when Ireland's prime minister, Sean Lemass, and Northern Ireland's prime minister, Terence O'Neill, exchanged visits. In 1970, the republic's Prime Minister Lynch dismissed two Cabinet ministers following an attempt to import arms for use in Northern Ireland.

The Irish government was increasingly preoccupied by the situation in Northern Ireland during the 1970s. In 1973 Prime Minister Cosgrave participated in talks with Edward Heath, prime minister of Britain, and representatives of Northern Ireland, resulting in the Sunningdale Agreement. This accord recognized that the North's relationship with Britain could not be changed without agreement of a majority of the population in the North, and it provided for the establishment of a Council of Ireland composed of members from both the Dáil and the Northern Ireland Assembly. The agreement collapsed the next year.

Although the republic was little affected by the violence in Ulster, there were a number of serious terrorist incidents. The murder of the British ambassador in Dublin in 1976 led to a state of emergency and the unpopular measure of strengthening emergency powers legislation.

In 1981 Prime Minister FitzGerald launched a constitutional crusade to make the reunification of Ireland more attractive to Ulster Unionists. At the end of the year the Irish and British governments set up an Anglo-Irish intergovernmental council to discuss matters of common concern, especially security. The report of the New Ireland Forum—a discussion group that included representatives of the political parties in Ireland and Northern Ireland—in 1984 set out three possible frameworks for political development in Ireland, those of a unitary state, a federal state, and joint sovereignty. Fianna Fáil preferred a unitary state, while Fine Gael and Labour preferred the federal solution. In November 1985 at Hillsborough in Northern Ireland, Ireland and Britain again agreed that any change in the status of Northern Ireland would come about only with the consent of the majority of the people of Northern Ireland, and an intergovernmental conference was established to deal with political, security, and legal relations between the two parts of the island.

The Anglo-Irish Agreement

In February 1987 Fianna Fáil returned to power under Charles Haughey, but without an overall majority. The new Progressive Democrat Party, formed in 1985 by men and women who had split from Fianna Fáil, made a strong showing. Sinn Féin, the political wing of the

Provisional IRA—following a decision in November 1986 to drop its abstentionist policy and contest future Dáil elections, standing on a socialist and pro-IRA platform—failed to win a seat. Shortly after the election the leader of Fine Gael and former prime minister Garret FitzGerald resigned and was succeeded by Alan Dukes.

The new government embarked on a program of comprehensive public spending cuts. This secured the support of Fine Gael and the Progressive Democrats, but opinion within the Labour Party, traditionally committed to high public expenditure programs, was more critical.

In May 1987, following a Supreme Court decision, a constitutional referendum ratified the Single European Act and thus served to confirm Ireland's participation in the European Communities (EC). The act legislated for the harmonization of social and fiscal measures within the EC.

Despite Fianna Fáil's initial criticism of the 1985 Anglo-Irish Agreement, while in power the Haughey government maintained support for the agreement. Contacts between the Irish and British governments continued after February 1987 within the formal structure of the intergovernmental conference. Fears that the violence in Northern Ireland would spill into the republic as a consequence of closer Anglo-Irish cooperation in the wake of the agreement proved unfounded. (J.O'B.R.)

For later developments in the history of Ireland, see the *Britannica Book of the Year* section in the BRITANNICA WORLD DATA ANNUAL.

For coverage of related topics in the *Macropædia* and *Micropædia,* see the *Propædia,* sections 921, 923, 961, 963, and 972.

(1981); SÉAN P. Ó RÍORDÁIN, *Antiquities of the Irish Countryside,* 5th rev. ed., revised by RUAIDHRÍ DE VALERA (1979); R.B. MCDOWELL, *Irish Public Opinion, 1750–1800* (1943, reprinted 1975), *Public Opinion and Government Policy in Ireland, 1801–1846* (1952, reprinted 1975), and *The Irish Administration, 1801–1914* (1964, reprinted 1976), covering two centuries of developments in political and social life; ROBERT DUDLEY EDWARDS, *A New History of Ireland* (1972); JOHN O'BEIRNE RANELAGH, *A Short History of Ireland* (1983); J.C. BECKETT, *The Making of Modern Ireland, 1603–1923,* new ed. (1981); and A.T.Q. STEWART, *The Narrow Ground: Aspects of Ulster, 1609–1969* (1977). The turbulent history of the relationship between church and state in Ireland is the subject of KATHLEEN HUGHES, *The Church in Early Irish Society* (1966, reprinted 1980); LUDWIG BIELER, *Ireland, Harbinger of the Middle Ages* (1963, originally published in German, 1961), on the Irish religious missions and their influence in Europe; ROBERT DUDLEY EDWARDS, *Church and State in Tudor Ireland: A History of Penal Laws Against Irish Catholics, 1534–1603* (1935, reprinted 1972); TOM INGLIS, *Moral Monopoly: The Catholic Church in Modern Irish Society* (1987); and ROBERT G. CRAWFORD, *Loyal to King Billy: A Portrait of the Ulster Protestants* (1987).

(*Early and medieval history*): For special period studies see JAMES F. KENNEY, *The Sources for the Early History of Ireland: Ecclesiastical: An Introduction and Guide,* rev. ed. (1966, reprinted 1979), a treatment of religious manuscripts to the end of the 12th century; and RICHARD J. HAYES (ed.), *Manuscript Sources for the History of Irish Civilization,* 11 vol. (1965), an extensive index of manuscript sources on history from the 5th to the 20th century. Detailed histories include T.G.E. POWELL, *The Celts,* new ed. (1980, reprinted 1985); EOIN MACNEILL, *Celtic Ireland* (1921, reissued 1981); JAMES CHARLES ROY, *The Road Wet, the Wind Close: Celtic Ireland* (1986); GODDARD HENRY ORPEN, *Ireland Under the Normans,* 4 vol. (1911–20, reprinted 1968), which remains indispensable for the period of 1169–1333; A.J. OTWAY-RUTHVEN, *A History of Medieval Ireland,* 2nd ed. (1980), essential for the study of the period prior to 1496; ART COSGROVE (ed.), *Medieval Ireland, 1160–1534* (1987), a comprehensive selection of essays, in the "New History of Ireland" series; H.G. RICHARDSON and G.O. SAYLES, *The Administration of Ireland, 1172–1377* (1963), and *The Irish Parliament in the Middle Ages* (1952, reprinted 1964); RICHARD BAGWELL, *Ireland Under the Tudors: With a Succinct Account of the Earlier History,* 3 vol. (1885–90, reprinted 1965), and *Ireland Under the Stuarts and During the Interregnum* (1909–16, reprinted 1963).

(*The 18th and 19th centuries*): For the history of Ireland in the 18th and 19th centuries, see T.W. MOODY and W.E. VAUGHAN (eds.), *Eighteenth-Century Ireland, 1691–1800* (1986), a comprehensive history of the period; K.H. CONNELL, *The Population of Ireland, 1750–1845* (1950, reprinted 1975), a scholarly account; CECIL WOODHAM-SMITH, *The Great Hunger: Ireland 1845–1849* (1962, reissued 1987), on one of the worst disasters that influenced the course of Irish history; ROBERT DUDLEY EDWARDS and T. DESMOND WILLIAMS (eds.), *The Great Famine: Studies in Irish History, 1845–52* (1956, reissued 1976), another important source on the subject; and THOMAS GALLAGHER, *Paddy's Lament: Ireland 1846–1847: Prelude to Hatred* (1982, reissued 1987), on the repercussions of the potato famine on Irish society and its relations with England. Discussions of 19th-century Irish politics may be found in NICHOLAS MANSERGH, *The Irish Question, 1840–1921: A Commentary on Anglo-Irish Relations and on Social and Political Forces in Ireland in the Age of Reform and Revolution,* 3rd ed. (1975), an interpretative study of the political situation; KEVIN B. NOWLAN, *The Politics of Repeal: A Study in the Relations Between Great Britain and Ireland, 1841–50* (1965, reprinted 1975), a briefer examination of the problem; J.L. HAMMOND, *Gladstone and the Irish Nation* (1938, reprinted 1974), a standard work on Gladstone's Irish policy in 1869–93; JAMES LOUGHLIN, *Gladstone, Home Rule, and the Ulster Question, 1882–93* (1987), a later study that reconsiders the period; ANGUS MACINTYRE, *The Liberator: Daniel O'Connell and the Irish Party, 1830–1847* (1965); CONOR CRUISE O'BRIEN, *Parnell and His Party, 1880–90* (1964); F.S.L. LYONS, *Charles Stewart Parnell* (1977); R.F. FOSTER, *Charles Stewart Parnell: The Man and His Family,* 2nd ed. (1979); CONOR CRUISE O'BRIEN (ed.), *The Shaping of Modern Ireland* (1960, reprinted 1970); D.J. HICKEY and J.E. DOHERTY, *A Dictionary of Irish History Since 1800* (1980); and F.S.L. LYONS and R.A.J. HAWKINS (eds.), *Ireland Under the Union: Varieties of Tension* (1980), a collection of survey analyses.

(*The 20th century*): Twentieth-century developments are considered in F.S.L. LYONS, *Ireland Since the Famine,* 2nd rev. ed. (1973); DOROTHY MACARDLE, *The Irish Republic: A Documented Chronicle of the Anglo-Irish Conflict and the Partitioning of Ireland, with a Detailed Account of the Period 1916–1923* (1937, reissued 1965), a fascinating though partisan study; DEIRDRE MCMAHON, *Republicans and Imperialists: Anglo-Irish Relations in the 1930s* (1984), an authoritative account; J. BOWYER BELL, *The Secret Army: The IRA, 1916–1979,* rev. ed. (1979, reprinted 1983); PATRICK BISHOP and EAMONN MALLIE, *The Provisional IRA* (1987); TIM PAT COOGAN, *Ireland Since the Rising* (1966, reprinted 1976), a narrative work; and TERENCE BROWN, *Ireland: A Social and Cultural History, 1922 to the Present* (1985), an analysis of factors contributing to the sense of national identity since independence. Introductory surveys include OLIVER MACDONAGH, *Ireland: The Union and Its Aftermath,* rev. ed. (1977); JOHN A. MURPHY, *Ireland in the Twentieth Century* (1975); and DERVLA MURPHY, *Ireland* (1985), a pictorial work.
