Arbitration of interests. Arbitration of the terms of a new contract, referred to as arbitration of interests, may be instituted if management and the labour union are unable to agree on a new contract. In some industries, such as hotels, printing, transit, and utilities, such disputes are submitted to arbitration. In most countries, however, management and union are seldom inclined to forgo resort to lockouts and strikes in an attempt to obtain favourable new contracts, and interest arbitration is thus seldom used.

Compulsory arbitration, directed by legislative fiat, has been a controversial issue in the settlement of industrial disputes. It has been favoured in disputes in the transportation industry, which may involve great public inconvenience, and in disputes in the public-utilities sector when an immediate danger to public health and safety might occur. Compulsory arbitration has been declared unconstitutional in some states of the United States. More recently, however, it has been adopted as a regular procedure for the settlement of disputes with municipal employees in some U.S. cities.

INTERNATIONAL ARBITRATION

Controversies between sovereign states that are not settled by diplomatic negotiation or conciliation are often referred, by agreement of both parties, to the decision of a third disinterested party, who arbitrates the dispute with binding force upon the disputant parties. Such arbitration between states has a long history: it was used between city-states in ancient Greece and also in the Middle Ages, when the pope often acted as the sole arbitrator.

Historical development. The modern development of international arbitration can be traced to the Jay Treaty of 1794 between Great Britain and the United States, which established three arbitral commissions to settle questions and claims arising out of the American Revolution. In the 19th century many arbitral agreements were concluded by which arbitration tribunals were established ad hoc to deal with a specific case or to handle a great number of claims. Most significant was the "Alabama" claim arbitration under the Treaty of Washington (1871), by which the United States and Great Britain agreed to settle claims arising from the failure of Great Britain to maintain its neutrality during the U.S. Civil War.

Commissions consisting of members drawn from both disputant countries ("mixed arbitral commissions") were often used in the 19th century to settle pecuniary claims for compensation of injuries to aliens for which justice could not be obtained in foreign courts. Such was the purpose of a convention of 1868 between the United States and Mexico, by which claims of citizens of each country arising from the Civil War were settled. Boundary disputes between states were also often settled by arbitration.

Development of international arbitration procedures

International arbitration was given a more permanent basis by the Hague Conference of 1899, which adopted a convention on the pacific settlement of international disputes, revised by a Conference of 1907. The convention stated that:

> International arbitration has for its object the settlement of disputes between States by judges of their own choice and on the basis of respect for law. Recourse to arbitration implies an engagement to submit in good faith to the award.

A Permanent Court of Arbitration, composed of a panel of jurists appointed by the member governments, from which the litigant governments may select the arbitrators, was established at The Hague in 1899.

Twenty cases were arbitrated between 1902 and 1932, but, from that year until 1972, only five cases were dealt with. This was largely because the importance of the Permanent Court of Arbitration was lessened by the Permanent Court of Justice (established in 1922) and its successor, the International Court of Justice. More recently, in 1960, the court, which was originally devised for the settlement of disputes between states, has offered its services for the arbitration of controversies between states and individuals or corporations. Such a dispute was arbitrated in 1970 between a British company and the government of the Democratic Republic of Sudan. The case concerned the repudiation of a contract for building houses in the irrigation zone of the Khashm Al Qirbah Dam in The Sudan.

Arbitration provisions of international treaties. There are several multilateral treaties that provide for the pacific settlement of international disputes by arbitration, including the Geneva General Act for the Settlement of Disputes of 1928, adopted by the League of Nations and reactivated by the General Assembly of the United Nations in 1949, which provides for the settlement of various disputes, after unsuccessful efforts at conciliation, by an arbitral tribunal of five members. Other such treaties include the General Treaty of Inter-American Arbitration, signed in Washington in 1929, and the American Treaty on Pacific Settlement of Disputes, signed in Bogotá in 1948. More recently, the Council of Europe adopted the European Convention for the Peaceful Settlement of Disputes (1957).

Arbitration is also mentioned as a proper method of settling disputes between countries in the Charter of the United Nations, as it was in the Covenant of the League of Nations.

Model rules of the International Law Commission

The International Law Commission of the United Nations submitted to the General Assembly in 1955 a Convention on Arbitral Procedure. Its model rules would not become binding on any member-state of the United Nations unless they were accepted by a state in an arbitration treaty or in a special arbitral agreement. The model rules, however, have not yet been adopted in any arbitration arrangement between disputant governments, although in 1958 the General Assembly recommended the model rules for use by member-states when appropriate. It seems clear that states prefer flexibility in the resolution of their disputes by arranging the rules and proceedings of an arbitration according to circumstances.

Great impediments, indeed, still exist in the acceptance of international arbitration, especially in cases in which disputes between governments and foreign private parties are involved. In such cases, the state will often insist that its own local remedies—administrative and court proceedings—be exhausted. Generally, the government of the national who advances a claim against a foreign government will require evidence that the injured party has pursued all remedies in the foreign country before it presses a claim for international negotiation and adjudication, if, indeed, it decides to take up the case at all. Contracting parties may agree in their contract that they need not exhaust local remedies before resorting to arbitration, and one 1965 instrument, the Convention on the Settlement of Investment Disputes, states:

> Consent of the parties to arbitration under this Convention shall, unless otherwise stated, be deemed consent to such arbitration to the exclusion of any other remedy. A Contracting State may require the exhaustion of local administrative or judicial remedies as a condition of its consent to arbitration under this Convention.

The arbitration agreement in a general multilateral treaty, a bilateral convention, or in a specific contractual arrangement between two states often does not deal with the selection of the arbitrators and the appointment of an umpire, the procedure to be followed in the arbitration, the subject matter of the dispute, the specific issues to be submitted, the presentation of evidence, the place of the hearings, the law to be applied by the arbitrators, and the time when the award has to be rendered. These questions are usually dealt with in an agreement between the parties to the dispute known as compromis. If the compromis fails in some particular—to define the applicable law, for example—it is generally understood that the arbitrator shall apply international law.

An award rendered by an arbitral tribunal is customarily complied with by states: it is, in fact, invariably the case that unless a state is prepared to comply with an adverse decision, it will not submit the dispute to arbitration. The difficulties in the use of international arbitration thus consist less in the enforcement of arbitral awards than in persuading states involved in disputes to submit them to a third party, an arbitrator, or an arbitration tribunal.

Labour arbitration is treated in FRANK and EDNA ELKOURI, *How Arbitration Works*, rev. ed. (1960); and CLARENCE M. UPDEGRAFF and WHITLEY P. MCCOY, *Arbitration of Labor Disputes*, 2nd ed. (1961), are good accounts of the law and practice of labour arbitration. The historic development is described by E.E. WITTE, *Historical Survey of Labor Arbitration* (1952). Various aspects of international arbitration are dealt with by J.L. SIMPSON and HAZEL FOX, *International Arbitration: Law and Practice* (1959); in a *Report of a Study Group on the Pacific Settlement of International Disputes* (David Davies Memorial Institute 1966); in *International Arbitration: Liber Amicorum for Martin Domke*, ed. by PIETER SANDERS (1967); and in SAMUEL B. BACHARACH, *Bargaining: Power, Tactics, and Outcomes* (1981).

Kant and Kantianism

Immanuel Kant was the foremost thinker of the Enlightenment and one of the great philosophers of all time, in whom were subsumed new trends that had begun with the Rationalism (stressing reason) of René Descartes and the Empiricism (stressing experience) of Francis Bacon. He inaugurated a new era in the development of philosophical thought. His comprehensive and systematic work in theory of knowledge, ethics, and aesthetics greatly influenced all subsequent philosophy, especially the various German schools of Kantianism and Idealism.

This article deals with the man, his achievements, and the subsequent history of Kantianism. It is divided into the following sections:

Life and works

BACKGROUND AND EARLY YEARS

Kant was born on April 22, 1724, at Königsberg in East Prussia (since 1946 a part of the Soviet Union) and lived in that remote province for his entire life. His father, a saddler, was, according to Kant, a descendant of a Scottish immigrant, although scholars have found no basis for this claim; his mother, an uneducated German woman, was remarkable for her character and natural intelligence. Both parents were devoted followers of the Pietist branch of the Lutheran Church, which taught that religion belongs to the inner life expressed in simplicity and obedience to the moral law. The influence of their pastor made it possible for Kant—the fourth of nine children, but the eldest surviving child—to obtain an education.

Pietist rearing and schooling

At the age of eight Kant entered the Pietist school that his pastor directed. This was a Latin school, and it was presumably during the eight-and-a-half years he was there that Kant acquired his life-long love for the Latin classics, especially for the naturalistic poet Lucretius. In 1740 he enrolled in the University of Königsberg as a theological student. But, although he attended courses in theology and even preached on a few occasions, he was principally attracted to mathematics and physics. Aided by a young professor who had studied Christian Wolff, a systematizer of Rationalist philosophy, and who was also an enthusiast for the science of Sir Isaac Newton, Kant began reading the work of the English physicist and, in 1744, started his first book, dealing with a problem concerning kinetic forces. Though by that time he had decided to pursue an academic career, the death of his father in 1746 and his failure to obtain the post of undertutor in one of the schools attached to the university compelled him to withdraw and seek a means of supporting himself.

Tutor and Privatdozent. He found employment as a family tutor and, during the nine years that he gave to it, worked for three different families. With them he was introduced to the influential society of the city, acquired

social grace, and made his farthest travels from his native city—some 60 miles (96 kilometres) away to the town of Arnsdorf. In 1755, aided by the kindness of a friend, he was able to complete his degree at the university and take up the position of *Privatdozent,* or lecturer.

The three early dissertations

Three dissertations that he presented on obtaining this post indicate the interest and direction of his thought at this time. In one, *De Igne* (On Fire), he argued that bodies operate on one another through the medium of a uniformly diffused elastic and subtle matter that is the underlying substance of both heat and light. His first teaching was in mathematics and physics, and he was never to lose his interest in scientific developments. That it was more than an amateur interest is shown by his publication within the next few years of several scientific works dealing with the different races of men, the nature of winds, the causes of earthquakes, and the general theory of the heavens.

At this period Newtonian physics was important for Kant as much for its philosophical implications as for its scientific content. A second dissertation, the *Monodologia physica* (1756), contrasted the Newtonian methods of thinking with those employed in the philosophy then prevailing in German universities. This was the philosophy of Gottfried Wilhelm Leibniz, a universal scholar, as systematized and popularized by Wolff and by Alexander Gottlieb Baumgarten, author of a widely used text, the *Metaphysica* (1739). Leibniz' works as they are now known were not fully available to these writers; and the Leibnizian philosophy that they presented was extravagantly Rationalistic, abstract, and cut-and-dried. Yet it remained a powerful force, and the main efforts of independent thinkers in Germany at the time were devoted to examining its ideas.

In a third dissertation, *Principiorum Primorum Cognitionis Metaphysicae Nova Dilucidato* (1755), on the first principles of metaphysics, Kant analyzed especially the principle of sufficient reason, which, in Wolff's formulation, asserts that for everything there is a sufficient reason why it should be rather than not be. Although critical, Kant was cautious and still a long way from challenging the assumptions of Leibnizian metaphysics.

During his 15 years as a *Privatdozent,* Kant's fame as a teacher and writer steadily increased. Soon he was lecturing on many subjects besides physics and mathematics—including logic, metaphysics, and moral philosophy. He even lectured on fireworks and fortifications and every summer for 30 years gave a popular course on physical geography. He enjoyed great success as a lecturer; his style, which differed markedly from that of his books, was humorous and vivid, enlivened by many examples from his reading in English and French literature, and in travel and geography, science and philosophy.

Although he twice failed to obtain a professorship at Königsberg, he refused to accept offers that would have taken him elsewhere—including the professorship of poetry at Berlin that would have brought greater prestige. He preferred the peace and quiet of his native city in which to develop and mature his own philosophy.

Critic of Leibnizian Rationalism. During the 1760s he became increasingly critical of Leibnizianism. According to one of his students, Kant was then attacking Leibniz, Wolff, and Baumgarten, was a declared follower of Newton, and expressed great admiration for the moral philosophy of the Romanticist Jean-Jacques Rousseau.

The attack on Leibniz

His principal work of this period was *Untersuchung über die Deutlichkeit der Grundsätze der natürlichen Theologie und der Moral* (1764; "An Inquiry into the Distinctness of the Fundamental Principles of Natural Theology and Morals"). In this work he attacked the claim of Leibnizian philosophy that philosophy should model itself on mathematics and aim at constructing a chain of demonstrated truths based on self-evident premises. Kant argued that mathematics proceeds from definitions that are arbitrary, by means of operations that are clearly and sharply defined, upon concepts that can be exhibited in concrete form. In contrast with this method, he argued that philosophy must begin with concepts that are already given, "though confusedly or insufficiently determined," so that philosophers cannot begin with definitions without thereby shutting themselves up within a circle of words. Philosophy cannot, like mathematics, proceed synthetically; it must analyze and clarify. The importance of the moral order, which he had learned from Rousseau, reinforced the conviction received from his study of Newton that a synthetic philosophy is empty and false.

Besides attacking the methods of the Leibnizians, he also began criticizing their leading ideas. In an essay *Versuch, den Begriff der negativen Grössen in die Weltweisheit einzuführen* (1763), he argued that physical opposition as encountered in things cannot be reduced to logical contradiction, in which the same predicate is both affirmed and denied, and, hence, that it is pointless to reduce causality to the logical relation of antecedent and consequent. In an essay of the same year, *Der einzig mögliche Beweisgrund zu einer Demonstration des Daseyns Gottes,* he sharply criticized the Leibnizian concept of Being by charging that the so-called ontological argument, which would prove the existence of God by logic alone, is fallacious because it confuses existential with attributive statements: existence, he declared, is not a predicate of attribution. Moreover, with regard to the nature of space, Kant sided with Newton in his confrontation with Leibniz. Leibniz' view that space is "an order of co-existences" and that spatial differences can be stated in conceptual terms, he concluded to be untenable.

Investigation of the world of spirits

Some indication of a possible alternative of Kant's own to the Leibnizian position can be gathered from his curious *Träume eines Geistersehers erläutert durch Träume der Metaphysik* (1766). This work is an examination of the whole notion of a world of spirits, in the context of an inquiry into the spiritualist claims of Emanuel Swedenborg, a scientist and biblical scholar. Kant's position at first seems to have been completely skeptical, and the influence of the Scottish Skeptic David Hume is more apparent here than in any previous work; it was Hume, he later claimed, who first awoke him from his dogmatic slumbers. Yet Kant was not so much arguing that the notion of a world of spirits is illusory as insisting that men have no insight into the nature of such a world, a conclusion that has devastating implications for metaphysics as the Leibnizians conceived it. Metaphysicians can dream as well as spiritualists, but this is not to say that their dreams are necessarily empty; there are already hints that moral experience can give content to the ideal of an "intelligible world." Rousseau thus acted upon Kant here as a counterinfluence to Hume.

Early years of the professorship at Königsberg. Finally, in 1770, after serving for 15 years as a *Privatdozent,* Kant was appointed to the chair of logic and metaphysics, a position in which he remained active until a few years before his death. In this period—usually called his critical period, because in it he wrote his great *Critiques*—he published an astounding series of original works on a wide variety of topics, in which he elaborated and expounded his philosophy.

"Inaugural Dissertation" of 1770

The *Inaugural Dissertation* of 1770 that he delivered on assuming his new position already contained many of the important elements of his mature philosophy. As indicated in its title, *De Mundi Sensibilis atque Intelligibilis Forma et Principiis: Dissertatio,* the implicit dualism of the *Träume* is made explicit; and it is made so on the basis of a wholly un-Leibnizian interpretation of the distinction between sense and understanding. Sense is not, as Leibniz had supposed, a confused form of thinking but a source of knowledge in its own right, although the objects so known are still only "appearances"—the term that Leibniz also used. They are appearances because all sensing is conditioned by the presence, in sensibility, of the forms of time and space, which are not objective characteristics or frameworks of things but "pure intuitions." But though all knowledge of things sensible is thus of phenomena, it does not follow that nothing is known of things as they are in themselves. Certainly, man has no intuition, or direct insight, into an intelligible world; but the presence in him of certain "pure intellectual concepts, such as those of possibility, existence, necessity, substance, cause, enables him to have some descriptive knowledge of it. By means of these concepts he can arrive at an exemplar that provides him with "the common measure of all other things as far as real." This exemplar gives man an idea of perfection for both the theoretical and practical orders: in the first, it is that of the Supreme Being, God; in the latter, that of moral perfection.

After the *Dissertation,* Kant published virtually nothing for 11 years. Yet, in submitting the *Dissertation* to a friend at the time of its publication, he wrote:

> About a year since I attained that concept which I do not fear ever to be obliged to alter, though I may have to widen it, and by which all sorts of metaphysical questions can be tested in accordance with entirely safe and easy criteria, and a sure decision reached as to whether they are soluble or insoluble.

PERIOD OF THE THREE "CRITIQUES"

In 1781 the *Kritik der reinen Vernunft* (spelled "Critik" in the first edition; *Critique of Pure Reason*) was published, followed for the next nine years by great and original works that in a short time brought a revolution in philosophical thought and established the new direction in which it was to go in the years to come.

The Critique of Pure Reason. The *Critique of Pure Reason* was the result of some 10 years of thinking and meditation. Yet, even so, Kant published the first edition only reluctantly after many postponements; for although convinced of the truth of its doctrine, he was uncertain and doubtful about its exposition. His misgivings proved well-founded, and Kant complained that interpreters and critics of the work were badly misunderstanding it. To correct these wrong interpretations of his thought he wrote the *Prolegomena zu einer jeden künftigen Metaphysik die als Wissenschaft wird auftreten können* (1783) and brought out a second and revised edition of the first "critique" in 1787. Controversy still continues regarding the merits of the two editions: readers with a preference for an Idealistic interpretation usually prefer the first edition, whereas those with a Realistic view adhere to the second. But with regard to difficulty and ease of reading and understanding, it is generally agreed that there is little to choose between them. Anyone on first opening either book finds it overwhelmingly difficult and impenetrably obscure.

The cause for this difficulty can be traced in part to the works that Kant took as his models for philosophical writing. He was the first great modern philosopher to spend all of his time and efforts as a university professor of the subject. Regulations required that in all lecturing a certain set of books be used, with the result that all of Kant's teaching in philosophy had been based on such handbooks as those of Wolff and Baumgarten, which abounded in technical jargon, artificial and schematic divisions, and great claims to completeness. Following their example, Kant accordingly provided a highly artificial, rigid, and by no means immediately illuminating scaffolding for all three of his *Critiques.*

The *Critique of Pure Reason,* after an introduction, is divided into two parts, of very different lengths: A "Transcendental Doctrine of Elements," running to almost 400 pages in a typical edition, followed by a "Transcendental Doctrine of Method," which reaches scarcely 80 pages. The ". . . Elements" deals with the sources of human knowledge, whereas the ". . . Method" draws up a methodology for the use of "pure reason" and its a priori ideas. Both are "transcendental," in that they are presumed to analyze the roots of all knowledge and the conditions of all possible experience. The "Elements" is divided, in turn, into a "Transcendental Aesthetic," a "Transcendental Analytic," and a "Transcendental Dialectic."

The simplest way of describing the contents of the *Critique* is to say that it is a treatise about metaphysics: it seeks to show the impossibility of one sort of metaphysics and to lay the foundations for another. The Leibnizian metaphysics, the object of his attack, is criticized for assuming that the human mind can arrive, by pure thought, at truths about entities, which, by their very nature, can never be objects of experience, such as God, human freedom, and immortality. Kant maintained, however, that the mind has no such power and that the vaunted metaphysics is thus a sham.

As Kant saw it, the problem of metaphysics, as indeed of any science, is to explain how, on the one hand, its principles can be necessary and universal (such being a condition for any knowledge that is scientific) and yet, on the other hand, involve also a knowledge of the real and so provide the investigator with the possibility of more knowledge than is analytically contained in what he already knows; *i.e.,* than is implicit in the meaning alone. To meet these two conditions, Kant maintained, knowledge must rest on judgments that are a priori, for it is only as they are separate from the contingencies of experience that they could be necessary and yet also synthetic; *i.e.,* so that the predicate term contains something more than is analytically contained in the subject. Thus, for example, the proposition that all bodies are extended is not synthetic but analytic because the notion of extension is contained in the very notion of body; whereas the proposition that all bodies are heavy is synthetic because weight supposes, in addition to the notion of body, that of bodies in relation to one another. Hence, the basic problem, as Kant formulated it, is to determine "How [*i.e.,* under what conditions] are synthetic a priori judgments possible?"

The synthetic a priori in mathematics and physics

This problem arises, according to Kant, in three fields, viz., in mathematics, physics, and metaphysics; and the three main divisions of the first part of the *Critique* deal respectively with these. In the "Transcendental Aesthetic," Kant argued that mathematics necessarily deals with space and time and then claimed that these are both a priori forms of human sensibility that condition whatever is apprehended through the senses. In the "Transcendental Analytic," the most crucial as well as the most difficult part of the book, he maintained that physics is a priori and synthetic because in its ordering of experience it uses concepts of a special sort. These concepts—"categories," he called them—are not so much read out of experience as read into it and, hence, are a priori, or pure, as opposed to empirical. But they differ from empirical concepts in something more than their origin: their whole role in knowledge is different; for, whereas empirical concepts serve to correlate particular experiences and so to bring out in a detailed way how experience is ordered, the categories have the function of prescribing the general form that this detailed order must take. They belong, as it were, to the very framework of knowledge. But although they are indispensable for objective knowledge, the sole knowledge that they can give is of objects of possible experience; they yield valid and real knowledge only when they are ordering what is given through sense in space and time.

The synthetic a priori in metaphysics

In the "Transcendental Dialectic" Kant turned to consideration of a priori synthetic judgments in metaphysics. Here, he claimed, the situation is just the reverse from what it was in mathematics and physics. Metaphysics cuts itself off from sense experience in attempting to go beyond it and, for this very reason, fails to attain a single true a priori synthetic judgment. To justify this claim, Kant analyzed the use that metaphysics makes of the concept of the unconditioned. Reason, according to Kant, seeks for the unconditioned or absolute in three distinct spheres: (1) in philosophical psychology it seeks for an absolute subject of knowledge; (2) in the sphere of cosmology, it seeks for an absolute beginning of things in time, for an absolute limit to them in space, and for an absolute limit to their divisibility; and (3) in the sphere of theology, it seeks for an absolute condition for all things. In each case, Kant claimed to show that the attempt is doomed to failure by leading to an antinomy in which equally good reasons can be given for both the affirmative and the negative position. The metaphysical "sciences" of rational psychology, rational cosmology, and natural theology, familiar to Kant from the text of Baumgarten, on which he had to comment in his lectures, thus turn out to be without foundation.

With this work, Kant proudly asserted that he had accomplished a Copernican revolution in philosophy. Just as the founder of modern astronomy, Nicolaus Copernicus, had explained the apparent movements of the stars by ascribing them partly to the movement of the observers, so Kant had accounted for the application of the mind's a priori principles to objects by showing that the objects conform to the mind: in knowing, it is not the mind that conforms to things but things that conform to the mind.

The Critique of Practical Reason. Because of his insistence on the need for an empirical component in knowledge and his antipathy to speculative metaphysics, Kant is sometimes presented as a Positivist before his time; and his attack upon metaphysics was held by many in his own day to bring both religion and morality down with it. Such, however, was certainly far from Kant's intention. Not only did he propose to put metaphysics "on the sure path of science," he was prepared also to say that he "inevitably" believed in the existence of God and in a future life. It is also true that his original conception of his critical philosophy anticipated the preparation of a critique of moral philosophy. The *Kritik der praktischen Vernunft* (1788, spelled "Critik" and "practischen"; *Critique of Practical Reason*), the result of this intention, is the standard source book for his ethical doctrines. The earlier *Grundlegung zur Metaphysik der Sitten* (1785) is a shorter and, despite its title, more readily comprehensible treatment of the same general topic. Both differ from *Die Metaphysik der Sitten* (1797) in that they deal with pure ethics and try to elucidate basic principles; whereas the later work is concerned with applying what they establish in the concrete, a process that involved the consideration of virtues and vices and the foundations of law and politics.

Similarity between his ethics and epistemology

There are many points of similarity between Kant's ethics and his epistemology, or theory of knowledge. He used the same scaffolding for both—a "Doctrine of Elements," including an "Analytic" and a "Dialectic," followed by a "Methodology"; but the second *Critique* is far shorter and much less complicated. Just as the distinction between sense and intelligence was fundamental for the former, so is that between the inclinations and moral reason for the latter. And just as the nature of the human cognitive situation was elucidated in the first *Critique* by reference to the hypothetical notion of an intuitive understanding, so is that of the human moral situation clarified by reference to the notion of a "holy will." For a will of this kind there would be no distinction between reason and inclination; a being possessed of a holy will would always act as it ought. It would not, however, have the concepts of duty and moral obligation, which enter only when reason and desire find themselves opposed. In the case of human beings, the opposition is continuous, for man is at the same time both flesh and spirit; it is here that the influence of Kant's religious background is most prominent. Hence, the moral life is a continuing struggle in which morality appears to the potential delinquent in the form of a law that demands to be obeyed for its own sake—a law, however, the commands of which are not issued by some alien authority but represent the voice of reason, which the moral subject can recognize as his own.

In the "Dialectic," Kant took up again the ideas of God, freedom, and immortality. Dismissed in the first *Critique* as objects that men can never know because they transcend human sense experience, he now argued that they are essential postulates for the moral life. Though not reachable in metaphysics, they are absolutely essential for moral philosophy.

Kant is often described as an ethical Rationalist, and the description is not wholly inappropriate. He never espoused, however, the radical Rationalism of some of his contemporaries nor of more recent philosophers for whom reason is held to have direct insight into a world of values or the power to intuit the rightness of this or that moral principle. Thus, practical, like theoretical, reason was for him formal rather than material—a framework of formative principles rather than a content of actual rules. This is why he put such stress on his first formulation of the categorical imperative: "Act only on that maxim through which you can at the same time will that it should become a universal law." Lacking any insight into the moral realm, men can only ask themselves whether what they are proposing to do has the formal character of law—the character, namely, of being the same for all persons similarly circumstanced.

The Critique of Judgment. The *Kritik der Urteilskraft* (1790: spelled "Critik")—one of the most original and instructive of all of Kant's writings—was not foreseen in his original conception of the critical philosophy. Thus it is perhaps best regarded as a series of appendixes to the other two *Critiques*. The work falls into two main parts, called respectively "Critique of Aesthetic Judgment" and "Critique of Teleological Judgment." In the first of these, after an introduction in which he discussed "logical purposiveness," he analyzed the notion of "aesthetic purposiveness" in judgments that ascribe beauty to something. Such a judgment, according to him, unlike a mere expression of taste, lays claim to general validity; yet it cannot be said to be cognitive because it rests on feeling, not on argument. The explanation lies in the fact that, when a person contemplates an object and finds it beautiful, there is a certain harmony between his imagination and his understanding, of which he is aware from the immediate delight that he takes in the object. Imagination grasps the object and yet is not restricted to any definite concept; whereas a person imputes the delight that he feels to others because it springs from the free play of his cognitive faculties, which are the same in all men.

Critiques of aesthetics and natural teleology

In the second part, Kant turned to consider teleology in nature as it is posed by the existence in organic bodies of things of which the parts are reciprocally means and ends to each other. In dealing with these bodies, one cannot be content with merely mechanical principles. Yet if mechanism is abandoned and the notion of a purpose or end of nature is taken literally, this seems to imply that the things to which it applies must be the work of some supernatural designer; but this would mean a passing from the sensible to the suprasensible, a step proved in the first *Critique* to be impossible. Kant answered this objection by admitting that teleological language cannot be avoided in taking account of natural phenomena; but it must be understood as meaning only that organisms must be thought of "as if" they were the product of design, and that is by no means the same as saying that they are deliberately produced.

LAST YEARS

The critical philosophy was soon being taught in every important German-speaking university, and young men flocked to Königsberg as a shrine of philosophy. In some cases, the Prussian government even undertook the expense of their support. Kant came to be consulted as an oracle on all kinds of questions, including such subjects as the lawfulness of vaccination. Such homage did not interrupt Kant's regular habits. Scarcely five feet tall, with a deformed chest, and suffering from weak health, he maintained throughout his life a severe regimen. It was arranged with such regularity that people set their clocks according to his daily walk along the street named for him, "The Philosopher's Walk." Until old age prevented him, he is said to have missed this regular appearance only on the occasion when Rousseau's *Émile* so engrossed him that for several days he stayed at home.

Works on religion and the ban on them

With the publication of the third *Critique,* Kant's main philosophical work was done. From 1790 his health began to decline seriously. He still had many literary projects but found it impossible to write more than a few hours a day. The writings that he then completed consist partly of an elaboration of subjects not previously treated in any detail, partly of replies to criticisms and to the clarification of misunderstandings. With the publication in 1793 of his work *Die Religion innerhalb der Grenzen der blossen Vernunft,* Kant became involved in a dispute with Prussian authorities on the right to express religious opinions. The book was found to be altogether too Rationalistic for orthordox taste; he was charged with misusing his philosophy to the "distortion and depreciation of many leading and fundamental doctrines of sacred Scripture and Christianity" and was required by the government not to lecture or write anything further on religious subjects. Kant agreed but privately interpreted the ban as a personal promise to the King, from which he felt himself to be released on the latter's death in 1797. At any rate, he returned to the forbidden subject in his last major essay, *Der Streit der Fakultäten* (1798; "The Conflict of the Faculties").

The large work at which he laboured until his death—the fragments of which fill the two final volumes of the great Berlin edition of his works—was evidently intended to be a major contribution to his critical philosophy. What remains, however, is not so much an unfinished work as a series of notes for a work that was never written. Its original title was *Übergang von den metaphysische Anfangsgründe der Naturwissenschaft zur Physik* ("Transition from the Metaphysical Foundations of Natural Science to Physics"), and it may have been his intention to carry further the argument advanced in the *Metaphysische Anfangsgründe der Naturwissenschaft* (1786) by showing that it is possible to construct a priori not merely the general outline of a science of nature but a good many of its details as well. But judging from the extant fragments, however numerous they are, it remains conjectural whether its completion would have constituted a major addition to his philosophy and its reputation.

After a gradual decline that was painful to his friends as well as to himself, Kant died in Königsberg, February 12, 1804. His last words were "Es ist gut" ("It is good"). His tomb in the cathedral was inscribed with the words (in German) "The starry heavens above me and the moral law within me," the two things that he declared in the conclusion of the second *Critique* "fill the mind with ever new and increasing admiration and awe, the oftener and the more steadily we reflect on." (O.A.B.)

Kantianism

As a philosophical designation, Kantianism can signify either the system of thought contained in the writings of the epoch-making 18th-century philosopher Immanuel Kant or those later philosophies that arose from the study of Kant's writings and drew their inspiration from his principles. Only the latter is the concern of this section.

NATURE AND TYPES OF KANTIANISM

Diverse trends in Kantianism

The Kantian movement comprises a loose assemblage of rather diverse philosophies that share Kant's concern with exploring the nature, and especially the limits, of human knowledge in the hope of raising philosophy to the level of a science in some sense similar to mathematics and physics. Participating in the critical spirit and method of Kant, these philosophies are thus opposed to dogmatism, to expansive speculative naturalism (such as that of Baruch Spinoza, the Jewish Rationalist), and, usually, to irrationalism. The various submovements of Kantianism are characterized by their sharing of certain "family resemblances"; *i.e.,* by the preoccupation of each with its own selection of concerns from among the many developments of Kant's philosophy: a concern, for example, with the nature of empirical knowledge; with the way in which the mind imposes its own categorial structure upon experience, and, in particular, with the nature of the structure that renders man's knowledge and moral action possible, a structure considered to be a priori (logically independent of experience); with the status of the *Ding an sich* ("thing-in-itself"), that more ultimate reality that presumably lurks behind man's apprehension of an object; or with the relationship between knowledge and morality. A brief exposition of Kant's philosophical system may be found above.

A system such as the critical philosophy of Kant freely lends itself to reconstructions of its synthesis according to whatever preferences the private philosophical inclinations of the reader may impose or suggest. Kant's system was a syncretism, or union, of British Empiricism (as in John Locke, George Berkeley, and David Hume) that stressed the role of experience in the rise of knowledge; of the scientific methodology of Isaac Newton; and of the metaphysical apriorism (or Rationalism) of Christian Wolff, who systematized the philosophy of Gottfried Leibniz, with its emphasis on mind. Thus it constituted a synthesis of elements very different in origin and nature, which tempted the student to read his own presuppositions into it.

Varieties of Kantianism

The critical philosophy has been subjected to a variety of approaches and methods of interpretation. These can be reduced to three fundamental types: those that conceive of the critical philosophy as an epistemology or a pure theory of (scientific) knowledge and methodology; those that conceive of it as a critical theory of metaphysics or the nature of Being (ultimate reality); and those that conceive of it as a theory of normative or valuational reflection parallel to that of ethics (in the field of action). Each of these types—known, respectively, as epistemological, metaphysical, and axiological Kantianism—can, in turn, be subdivided into several secondary approaches. Historically, epistemological Kantianism included such different attitudes as empirical Kantianism, rooted either in physiological or psychological inquiries; the logistic Kantianism of the Marburg school, which stressed essences and the use of logic; and the realistic Kantianism of the Austrian Alois Riehl. Metaphysical Kantianism developed from the transcendental Idealism of German Romanticism to Realism, a course followed by many speculative thinkers, who—like nearly all contemporary Kantians—saw in the critical philosophy the foundations of an essentially inductive metaphysics, in accordance with the results of the modern sciences. Finally, axiological Kantianism—concerned with value theory—branched, first, into an axiological approach (properly so-called), which interpreted the methods of all three of Kant's *Critiques* (*i.e., Critique of Pure Reason, Critique of Practical Reason,* and *Critique of Judgment*) as normative disciplines of thought; and, second, into an eclectic or relativistic Kantianism, which regarded the critical philosophy as a system of thought dependent upon social, cultural, and historical conditions.

The chief representatives of these submovements are identified in the historical sections below.

It is essential to distinguish clearly between two periods within the Kantian movement: first, the period from 1790 to 1831 (the death of Hegel); and, second, the period from 1860 to the present—separated by a time when an antiphilosophical Positivism, a type of thought that supplanted metaphysics with science, was predominant. The first period began with the thorough study and emendation of Kant's chief theoretical work, *Kritik der reinen Vernunft* (2nd ed., 1787; the *Critique of Pure Reason,* 1929); but it soon became intermingled with the romantic tendencies in German Idealism. The second period, called specifically Neo-Kantianism, was, first of all, a conscious reappraisal, in whole or in part, of the theoretical *Critique,* but also, as a total system, a reaction against Positivism. Earlier Neo-Kantianism reduced philosophy to the theory of knowledge and scientific methodology; systematic Neo-Kantianism, arising at the beginning of the 20th century, expressed itself in attempts at building metaphysical structures.

EARLY KANTIANISM: 1790–1835

Kant himself

According to Immanuel Kant, his major work, the *Critique of Pure Reason,* comprised a treatise on methodology, a preliminary investigation prerequisite to the study of science, which placed the Newtonian method (induction, inference, and generalization) over against that of Descartes and Wolff (deduction from intuitions asserted to be self-evident). The result was a critique of metaphysics, the value of which lay not in science but in a realm of being accessible only to the pure intellect. In exploring this "noumenal" realm, as he called it, Kant placed his *Critique* in a positive role. Recalling the revolution that occurred in astronomy when Nicolaus Copernicus discerned, in the apparent motions of the planets, reflections of the earth's own motion, Kant inaugurated a Copernican revolution in philosophy, which claimed that the subject doing the knowing constitutes, to a considerable extent, the object; *i.e.,* that knowledge is in part constituted by a priori or transcendental factors (contributed by the mind itself), which the mind imposes upon the data of experience. Far from being a description of an external reality, knowledge is, to Kant, the product of the knowing subject. When the data are those of sense experience, the transcendental (mental) apparatus constitutes man's experience or his science, or makes it to be such. These transcendental elements are of three different orders: at the lowest level are the forms of space and time (technically called intuitions); above these are the categories and principles of man's intelligence (among them substance, causality, and necessity); and at the uppermost level of abstraction the ideas of reason—the transcendental "I," the world as a whole, and God. It is by virtue of the encounter between the forms of man's sensory intuition (space and time) and his perceptions that phenomena are formed. The forms arise from the subject himself; the perceptions, however—or the data of experience—have reference, ultimately, to things-in-themselves, which nevertheless remain unknowable, inasmuch as, in order to be known at all, it is necessary for things to appear clothed, as it were, in the forms of man's intuition and, thenceforth, to present themselves as phenomena and not as noumena. The thing-in-itself, accordingly, indicates the limit and not the object of knowledge.

Early criticism

These theses of Kant provoked criticism among the followers of Christian Wolff, the Leibnizian Rationalist, and doubts among the disciples of Kant, which, as they further developed into systems, marked the first period of Kantianism. Inasmuch as these disciples took the *Critique of Pure Reason* to be a *preface* to the study of the pure reason or of the transcendental system and not the system itself, they saw in this interpretation an explanation for the ambiguities to which the *Critique* (as they felt) was subject. Their doubts revolved around two points: first, Kant had erroneously distinguished three kinds of a priori knowledge, coordinate with the three aforementioned levels or faculties of the mind; and second, Kant had accepted the thing-in-itself as constitutive of knowledge. Regarding the first point, they claimed that Kant had accepted the three faculties and their respective transcendental characteristics without investigation, in which case this structure should be viewed, in accordance with the preliminary character of the *Critique,* as a triple manifestation of a single fundamental faculty. For this reason the distinction between the levels of intuition and understanding (or between the receptivity and spontaneity of the mind) had to be rejected—for the three transcendentals—space and time, the categories, and the ideas of reason—were not existents but were only functions of thought. Finally, these disciples argued that the existence of a single transcendental subject, the Ego, would render the thing-in-itself superfluous and even pernicious for the scientific treatment of epistemology.

This function of human thought (the transcendental subject), which serves as the absolute source of the a priori, was variously designated by different early Kantian thinkers: for the German Realist Karl L. Reinhold, it constituted the faculty of representation; for the Lithuanian Idealist Salomon Maimon, it was a mental capacity for constructing objects; for the Idealist Jakob S. Beck, a protégé of Kant's, it was the act of synthesis; for the empirical critic of Kantianism G.E. Schulze, it was experience in the sense intended by Hume—a volley of discrete sense impressions; for the theory of knowledge of the outstanding ethical Idealist Johann G. Fichte, it was the original positing of the Ego and the non-Ego—which meant, in turn, in the case of the aesthetic Idealist F.W.J. von Schelling, "the absolute self," and in the case of G.W.F. Hegel "the *Geist* or absolute Spirit," and finally, in the case of the pessimistic Romanticist Arthur Schopenhauer, "the absolute Will." In each case (excepting Schulze) the interpretation of the thing-in-itself in a realistic metaphysical sense was rejected in favour of various degrees of transcendental Idealism. Removed from the main current of Kantianism was the empirically oriented thinker Jakob Friedrich Fries (the one figure in this group who was not an Idealist in the true sense), who interpreted the a priori in terms of psychological faculties and elements.

Having earlier renounced these apostates on a large scale, Kant, at the end of his life, prepared a new exposition of the transcendental philosophy (the second part of his *Opus Postumum*), which showed that he was ready tacitly to accede to the criticisms of his adversaries.

NEO-KANTIANISM: SINCE 1860

General features of Neo-Kantianism

Nineteenth-century Neo-Kantianism. The rejection of all of philosophy by Positivism had the anomalous effect of, itself, evoking an awakening of Kantianism, for many thinkers wished to give to Positivism itself a philosophical foundation that, while respecting the phenomenological attitude, would yet be hostile to the metaphysics of Positivism, which was usually a tacit, but inconsequent, Materialism. It was justifiably held that Kant could provide such a foundation because of his opposition to metaphysics and his limitation of scientific knowledge to the sphere of phenomena. The complexity of the critical philosophy was such that the theoretical criticism could be approached in diverse ways and that, through the facts themselves, diverse interpretations of the *Critique of Pure Reason* could be obtained. In the order of their origin (though not of their worth or importance), there thus arose currents of Kantianism that were empiricist, logicist, realist, metaphysical, axiological, and psychological—of which the most important have survived into the 20th century.

The return to Kant was determined by the historical fresco of the incomparable historian of philosophy Kuno Fischer entitled *Kants Leben und die Grundlagen seiner Lehre* (1860; "Kant's Life and the Foundations of his Teaching"), which replaced the earlier work of the semi-Kantian Ernst Reinhold, son of the more notable Jena scholar (published 1828–30), and especially that of the outstanding historian of philosophy Johann Eduard Erdmann (published 1834–53). In 1865 the order: "Zurück nach Kant!" ("Back to Kant!") reverberated through the celebrated work of the young epistemologist Otto Liebmann, *Kant und die Epigonen* ("Kant and his Followers"), which was destined to extricate their spirits from the Positivistic morass and, at the same time, to divert the Germans from romantic Idealism.

Schools of Neo-Kantianism

Epistemological Neo-Kantianism. The empiricist, logistic, and realistic schools can be classed as epistemological.

Empiricist Neo-Kantianism was represented by the erudite pioneering physicist and physiologist Hermann L.F. von Helmholtz and, in part, by F.A. Lange, author of a famous study of Materialism. Helmholtz found support in Kant for his claim, first, that, although perception can *represent* an external thing, it usually does so in a way far removed from an actual description of its properties; second, that space and time comprise an empirical framework created for thought by the perceiving subject; and, third, that causality is an a priori law allowing the philosopher to infer a reality that is absolutely unknowable. Similarly, Lange reduced science to the phenomenal level and repudiated the thing-in-itself.

Logistic Neo-Kantianism, as represented in the most well-known and flourishing school of Kantianism, that at Marburg, originated with Hermann Cohen, successor of Lange at Marburg, who, in a book on Kant (1871), argued that the transcendental subject is not to be regarded as a psychic being but as a logical function of thought that constructs both the form *and* the content of knowledge. Nothing is *gegeben* ("given"), he urged; all is *aufgegeben* ("propounded," like a riddle) to thought—as when, in the infinitesimal calculus, the analyst generates motion by imagining thin slices of space and time and adding up their areas. Hence experience is a perfect construction of man's logical spirit. The example of Cohen inspired many other authors, among them Cohen's colleague at Marburg Paul Natorp, who, in his work on the logical foundations of the exact sciences, integrated even psychology into the Marburgian transcendentalism; and Ernst Cassirer, best known for stressing the symbolizing capacities of man, who, in his memorable work *Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit* (1906–20; *The Problem of Knowledge: Philosophy, Science, and History since Hegel,* 1966), transposed this same logisticism into a form that illumines the history of modern philosophy.

Realistic Neo-Kantianism, the third manifestation of epistemological Neo-Kantianism, was represented in the Realism of the scientific monist Alois Riehl and of his disciple Richard Hönigswald. In a work on the significance of the critical philosophy for the positive sciences (published 1876–87), Riehl held, in direct opposition to the Marburgian logisticism, that the thing-in-itself participates positively in the constitution of knowledge inasmuch as all perception includes a reference to things outside the subject.

Metaphysical Neo-Kantianism. Ten years after the appearance of the aforementioned ground-breaking book *Kant und die Epigonen,* its author, Otto Liebmann, introduced the new metaphysical approach in his book on the analysis of reality (1876), which came near to the Kantianism of Marburg. The Romanticist Johannes Volkelt, in turn, took up the theme of a critical metaphysics and expressed his persisting aspirations toward the Absolute in the claim that, beyond the certainties of man's own subjective consciousness, there exists a new kind of certainty in a transsubjective realm. Subjectivity is, thus, inevitably transcended, just as the sciences are surmounted when they presuppose a metaphysics. The influential spiritual moralist Friedrich Paulsen defended the claim that Kant had always behaved as a metaphysician, even in the *Critique of Pure Reason,* in spite of the epistemological restrictions that he imposed upon himself—a claim that made an impact that was felt throughout the following century.

Axiological Neo-Kantianism. Inasmuch as the two principal representatives of the axiological interpretation both taught at Heidelberg, this branch is also known as the Southwest German or Baden school. Its initiator was Wilhelm Windelband, esteemed for his "problems" approach to the history of philosophy. The scholar who systematized this position was his successor Heinrich Rickert, who had come from the tradition of Kuno Fischer. Drawing a parallel between the constraints that logic exerts upon thought and those that the sense of ought exerts upon ethical action, these thinkers argued that, while man's *action* must answer to an absolute value (the Good), his *thought* must answer to a regulative value (the True), which imposes upon him the duty of conforming to it. The *Critique of Pure Reason,* they held, elaborates this rule—which is not an entity but an imperative, or absolute, charge to act. Rickert regarded the critical endeavour as having been too narrow, since it was suited merely to physics. Actually, he charged, it should be the foundation for all of the sciences of the spirit. The distinctive characteristic of this school thus consisted in reintegrating German Idealism (as in Fichte and Hegel) into a rather personal Kantianism. Consequently, it succeeded in annexing more than one area of semi-Kantian thought: *e.g.,* "the philosophy of the spiritual sciences" of Wilhelm Dilthey, who held that intellectual life cannot be explained by means of naturalistic causality but only through historical understanding (*Verstehen*); "the life-philosophy" of the social philosopher Georg Simmel, who deviated from an earlier naturalistic relativism to the espousal of objective values; "the philosophy of value" of the experimental psychologist Hugo Münsterberg, author of one of the earliest systems of values; the "semi-Hegelianism" of Richard Kroner, a philosopher of culture and religion; and the general works of Bruno Bauch, Liebmann's successor at Jena. All of these philosophers were more or less related to axiological Neo-Kantianism.

Psychological Neo-Kantianism. An initial attempt to interpret Kantian transcendentalism in psychological terms was made by the Friesian Empiricist Jürgen Bona Meyer in his *Kants Psychologie* (1870). Later, a more important contribution in this field was made by the Göttingen philosopher of ethics and law Leonard Nelson and published in the *Abhandlungen der Fries'schen Schule* (1904 ff; "Acts of the Friesian School"). Even this title suggests an intimate agreement with the Kantianism of Fries's new critique of reason (1807); and Nelson, indeed, is regarded as the founder of the Neo-Friesian school. At a time when other Kantian schools were concerned with the transcendental analysis of objective or outer knowledge, Nelson held that, in the analysis of the subjective or inner self, the transcendental equipment of the mind—the a priori—is directly revealed. It thus fell to psychology to lay bare this equipment, which belongs in itself to the metaphysical order. It was upon this basis that the Marburg theologian Rudolf Otto, in his book *Das Heilige* (1917; *The Idea of the Holy,* 1958), ventured a type of religious phenomenology that has proved very successful.

Kantian philology

A discipline known as the Kant *Philologie,* concerned with the history, development, and works of Kant, has preempted a considerable portion of philosophical historiography since 1860. These studies began with the immense commentary on the *Critique of Pure Reason* produced in 1881–92 by Hans Vaihinger, known for his philosophy of the "As If" (which stresses man's reliance on pragmatic fictions), and with the founding of the new journal *Kantstudien* (1896) and the Kant-Gesellschaft ("Kantian Society," 1904)—both still extant. The most conspicuous result of this philological movement, however, was undeniably the monumental edition, in 23 volumes, of all of Kant's available works prepared (1900 ff) by the Academy of Sciences at Berlin under the editorship of the champion of humanistic studies, Wilhelm Dilthey. These volumes include: Sect. 1, Works; Sect. 2, Correspondence; Sect. 3, The "Nachlass." Since the transfer of this task to the University of Münster, Sect. 4, Kant's Lectures, has been undertaken. Those on logic and metaphysics (vols. 24–25) have been splendidly edited by Gerhard Lehmann.

Contemporary Neo-Kantianism. The recent development of Neo-Kantianism, except for innumerable historical studies, is very one-sided: no longer considered as exclusively epistemological, it merely prolongs the metaphysical school. Moreover, a large portion of the present Kant research is covered by the so-called *Problems of Kantianism* (see below). Important studies have been made on the development of Kant's philosophical thought, on Kant as a metaphysician, on his ontology and teachings on science, and on his transcendental deduction.

NON-GERMAN KANTIANISM

The Kantian awakening, in no wise limited to Germany, extended throughout Western philosophy. Its principal initiators were as follows: France was the first to open to its influence, beginning with the eclectic thinker Victor Cousin, who had studied German authors and made several trips to Germany. The relativistic personalist Charles Renouvier then defended a rather personal critical philosophy, which exerted an enduring influence through its impact upon the extreme Idealist Octave Hamelin of the Sorbonne; upon the metaphysician and cofounder of French neospiritualism Jules Lachelier; and upon his pupil, the philosopher of science Émile Boutroux.

English Kantianism

The English-speaking countries, on the other hand, have not seemed disposed to assimilate the critical philosophy as they did Hegelian Idealism. Except for the Scottish religious absolutist Edward Caird (*The Critical Philosophy of Immanuel Kant,* 1889), who was chiefly an Hegelian, there was in Britain at the close of the 19th century only another Scot, the critical Realist Robert Adamson, who was a Kantian. After him, however, can be cited the commentary, published in 1918, of Norman Kemp Smith, producer of the standard English translation of Kant's first *Critique,* and more recently, the remarkable exposition by the Oxford Kantian Herbert J. Paton, *Kant's Metaphysic of Experience* (2 volumes, 1936). Finally, Kantian methods can be discerned today in the later work of the prominent Oxford "ordinary language" philosopher, Peter F. Strawson, entitled *Individuals: An Essay in Descriptive Metaphysics* (1959). Kantianism became known in the United States toward 1840 primarily through the New England transcendentalist and poet Ralph Waldo Emerson—who was not, however, a Kantian himself. The physicist and logician Charles Sanders Peirce owes his Pragmatism largely to Kant's role as a counterweight against Hegelianism. The former southern California philosopher William H. Werkmeister represents a type of Neo-Kantianism inspired by the Marburg school (*The Basis and Structure of Knowledge,* 1948).

Italian scholars, on the other hand, have been vigorously engaged in Kantian studies since the initiative was taken by Alfonso Testa. The chief Neo-Kantian in Italy, however, was the Realist Carlo Cantoni, who took an anti-Positivist stance. Later, in the period from 1900 to 1918, Kantianism was represented by the extreme Realism of the theist Francesco Orestano. A school of Kantian philology has formed at Turin around the erudite Christian Idealist Augusto Guzzo and his journal *Filosofia.* More independent in spirit is the work of the critical ontologist Pantaleo Carabellese, Giovanni Gentile's successor at Rome.

ASSESSMENT OF KANTIANISM

At the present time there does not exist, either in Germany or elsewhere, a purely Kantian philosopher; but all acknowledge the obligation to come to grips with him. Within the four great currents of contemporary thought, however—*i.e.,* in Phenomenology, in the traditionalistic metaphysics, in Existentialism, and in the Positivistic Empiricism of the Vienna Circle and of Analytical philosophy—the predominant attitude toward Kant is negative.

Empiricist criticism

Problems of Kantianism. As far as epistemology is concerned, the critical philosophy constitutes a theory of science that agrees with current trends; for science must have a base that is empirical though also real. On the other hand, the transcendental or a priori is implicated; and severe complications ensue whenever the question is posed whether a type of apprehension can be acquired apart from experience that conveys, however, some new and genuine knowledge—whether, in short, synthetic a priori judgments can be made. Significantly, the founder of Phenomenology, the German philosopher Edmund Husserl, came back to the fold of Kantian transcendentalism after previously opposing it bitterly. As against the Kantian position, Empiricism entirely rejects the possibility (and even the meaning) of the synthetic a priori and, robbed thereby of everything traditionally regarded as the subject matter of philosophy, directs its philosophical inquiries principally to the study of language. The foremost recent analyst of language, however, the pioneering philosopher Ludwig Wittgenstein, imposed upon philosophy the obligation to limit reason (or the transcendental element in knowledge)—a semi-Kantian position, which he nonetheless later renounced. As for Existentialism, one of recent Germany's foremost philosophers, Martin Heidegger, has presented in his *Kant und das Problem der Metaphysik* (1929; Eng. trans., *Kant and the Problem of Metaphysics,* 1962) a highly personalized interpretation. A student of Cohen at Marburg, the metaphysician Nicolai Hartmann, became the harbinger of the Realistic approach, elaborating in his analysis of the metaphysics of knowledge (1921) an ontological relation that he discerned to obtain between two forms of being: between thought and reality. Accordingly, the principles of thought correspond, in his view, to those of reality—a position at odds with Kant (even when he is interpreted as a Realist). Moreover, Hartmann treated the problems of mathematics—so urgent in current philosophy—in a manner that is again completely opposed to Kant; in particular, he questioned the validity of Kant's a priori intuition (or positing) of the spatiotemporal framework in terms of which man thinks about the world, challenging Kant at this point not merely to accommodate the non-Euclidean geometries (with curved space) that afforded a Realist alternative to the a priori but above all to reflect the distinctly logistic position regarding the foundations of mathematics to which he adhered. Discussion of the status of the thing-in-itself in man's knowledge of the real remained on the philosophical agenda both during and after Hartmann's time, but invoked the same indecision as it always had. At a time when Hartmann was accepting the thing-in-itself almost naïvely, Empiricism (in all its forms) rejected it categorically and attempted to construe the real in terms merely of what Kant had called phenomena. In the realm of ethics, Phenomenologists and Existentialists were dissatisfied with the purely formal character of Kant's ethics—*i.e.,* with its lack of specificity—and substituted a "material" ethic, of concrete duties, which was no less absolute than that of Kant. For their part, Empiricists were only interested in the analysis of expressions of moral judgment, which they reduced to imperative statements that are emotive and aimed at winning adherents.

Objections to Kantianism. It must be acknowledged that Kant has furnished many of the most significant themes that are found in the currents of contemporary philosophy, even in the forms that they still assume today. Yet, as compared with the state of affairs that existed from 1860 to 1918, Kantianism has suffered an impressive decline—though a slight recovery seems to have occurred during the third quarter of the 20th century.

Scientism, formalism, subjectivism

What were the reasons for this decline? In general, since World War I the reduction of philosophy to the philosophy of science has no longer been accepted, though contemporary Positivistic Empiricism has offered hardly any objection to it. The philosophy of science comprises, in fact, only *one* problem area, not the entire assemblage of philosophical problems. From this a second objection arises: Kantianism in general is too formalistic to satisfy man's actual inquisitiveness, which inclines more and more toward concrete concerns. Kantianism restricts itself to examining the a priori forms of thought and cares little for its diverse contents. Were this objection pertinent only to the exact sciences, it would not be serious—for these sciences attend to their own applications; but the objection becomes very grave for the field of ethics. For this reason, the objection against Kant's formalism has been raised most passionately against his ethical treatise, the *Critique of Practical Reason*—as by Hartmann, by the Phenomenologist Max Scheler, and by others. This transcendental formalism immediately encounters the further objection of subjectivism—in spite of efforts (from the side of logic) to evade it—*i.e.,* it is blamed for obstructing man's apprehension of the real universality of his Ego, of the thinking subject, and for inexorably impelling the scholar to the view that man's knowledge is merely the product of subjective construction. This subjectivistic transcendentalism, by its intrinsic logic, denies man access to the external world. Not only does it debar him from the world of things-in-themselves but it also prevents him from granting objective reality to phenomena as such, inasmuch as the transcendental source is here viewed as playing a constructive role with respect to experience and the phenomenon.

These three major objections, which stand out in the midst of many criticisms of minor details, recur constantly in the Kantian literature of the past quarter of a century. The result of these objections, as far as the evaluation of the critical philosophy is concerned, is that it is repudiated in its entirety—without, however, being thereby considered barred by limitation. Kant thus remains, in spite of everything, an inexhaustible source of problems and ideas, comparable in this respect to Plato and Aristotle, with whom he forms the great triad of Western philosophical thought. (H.J. de V.)

MAJOR WORKS

PRE-CRITICAL WRITINGS: *Gedanken von der wahren Schätzung der lebendigen Kräfte und Beurteilung der Beweise derer sich Herr von Leibniz und anderer Mechaniker in dieser Streitsache bedient haben* (1746); *Allgemeine Naturgeschichte und Theorie des Himmels* (1755; *Kant's Cosmogony . . . ,* 1900 and 1968; *Universal Natural History and Theories of the Heavens,* 1969); *Principiorum Primorum Cognitionis Metaphysicae Nova Dilucidatio* (1755; Eng. trans. by F.E. England in *Kant's Conception of God,* 1929); *Metaphysicae cum geometria iunctae usus in philosophia naturali, cuius specimen I. continet Monadologiam physicam* (1756); *Versuch einiger Betrachtungen über den Optimismus* (1759); *Die falsche Spitzfindigkeit der vier syllogistischen Figurerewiesen* (1762; trans. in *Kant's Introduction to Logic and His Essay on the Mistaken Subtilty of the Four Figures,* 1963); *Der einzige mögliche Beweisgrund zu einer Demonstration des Daseyns Gottes* (1763; *Enquiry into the Proofs for the Existence of God,* 1836); *Versuch, den Begriff der negativen Grössen in die Weltweisheit einzuführen* (1763; *An Attempt to Introduce the Conception of Negative Quantities into Philosophy,* 1911); *Untersuchung über die Deutlichkeit der Grundsätze der natürlichen Theologie und der Moral* (1764); *Beobachtungen über das Gefühl des Schönen und Erhabenen* (1764, 1766, 1771; *Observations on the Feeling of the Beautiful and Sublime,* 1960); *Träume eines Geistersehers erläutert durch Träume der Metaphysik* (1766; *Dreams of a Spirit-Seer, Illustrated by Dreams of Metaphysics,* 1900; *Dreams of a Spirit Seer, and Other Related Writings,* 1969); *De Mundi Sensibilis atque Intelligibilis Forma et Principiis: Dissertatio* (1770; *Kant's Inaugural Dissertation and Early Writings on Space,* 1929); *Von den Verschiedenen Racen der Menschen* (1775).

CRITICAL AND POST-CRITICAL WRITINGS: *Critik der reinen Vernunft* (1781; rev. ed., *Kritik der reinen Vernunft,* 1787; *Critique of Pure Reason,* 1929, 1950); *Prolegomena zur einer jeden künftigen Metaphysik die als Wissenschaft wird auftreten können* (1783; *Prolegomena to Any Future Metaphysics,* 1951); *Grundlegung zur Metaphysik der Sitten* (1785; *The Fundamental Principles of the Metaphysic of Ethics,* 1938; *The Moral Law; or, Kant's Groundwork of the Metaphysic of Morals,* 1948; *Foundations of the Metaphysics of Morals,* 1969); *Metaphysische Anfangsgründe der Naturwissenschaft* (1786; *Metaphysical Foundations of Natural Science,* 1970); *Critik der practischen Vernunft* (1788; *Critique of Practical Reason,* 1949); *Critik der*

Urteilskraft (1790, 2nd ed. 1793; *Kant's Kritik of Judgment,* 1892, reprinted as *Kant's Critique . . .,* 1914; new version, *Critique . . .,* vol. 1, *Kant's Critique of Aesthetic Judgment* and vol. 2, *Critique of Teleological Judgment,* 1911–28, republished 1952); *Über eine Entdeckung, nach der alle neu Critik der reinen Vernunft durch eine ältere entbehrlich gemacht werden soll* (1790; 2nd ed., 1791); *Die Religion innerhalb der Grenzen der blossen Vernunft* (1793; 2nd ed., 4 pt., 1794; *Religion Within the Boundary of Pure Reason,* 1838; *Religion Within the Limits of Reason Alone,* 2nd ed., 1960); *Zum ewigen Frieden* (1795; 2nd ed., 1796; *Project for a Perpetual Peace,* 1796, many later editions called *Perpetual Peace;* 1915 ed. reprinted 1972); *Die Metaphysik der Sitten* (1797; 2nd ed., 1798–1803; *The Metaphysic of Morals,* 2 vol., 1799 and 1965; *The Metaphysic of Ethics,* 1836), comprising *Metaphysische Anfangsgründe der Rechtslehre* (*The Philosophy of Law,* 1887) and *Metaphysische Anfangsgründe der Tugendlehre* (*The Doctrine of Virtue,* 1964); *Der Streit der Facultäten* (1798); *Von der Macht des Gemüths durch den blossen Vorsatz seiner krankhaften Gefühle Meister zu seyn* (1798; *Kant on the Art of Preventing Diseases,* 1806); *Anthropologie in pragmatischer Hinsicht abgefasst* (1798; improved ed., 1800; *The Classification of Mental Disorders,* 1964); *Immanuel Kants Physische Geographie,* 3 vol. in 6 pt., 1801–04); *I. Kants Logik: Ein Handbuch zu Vorlesungen* (1800; *Logic,* 1819); *Immanuel Kant über Pädagogik* (1803; *Kant on Education,* 1899; *The Educational Theory of Immanuel Kant,* 1904; *Education,* 1960); *Welches sind die wirklichen Fortschritte, die Metaphysik seit Leibnizens und Wolf's Zeiten in Deutschland gemacht hat?* (1804).

BIBLIOGRAPHY

Kant. *Biography:* The main sources for Kant's life are three memoirs published in 1804: LUDWIG ERNEST VON BOROWSKI, *Darstellung des Lebens und Charakters Immanuel Kants* (reprinted 1968); REINHOLD B. JACHMANN, *Immanuel Kant geschildert in Briefen an einen Freund* (reprinted 1968); and CHRISTOPH WASIANSKI, *Immanuel Kant in seinen letzten Lebensjahren* (the basis of THOMAS DE QUINCEY's "The Last Days of Kant" included in his *Works*). See also JOHN H.W. STUCKENBERG, *The Life of Immanuel Kant* (1882); FRIEDRICH PAULSEN, *Immanuel Kant: His Life and Doctrine* (1902, reissued 1963; originally published in German, 1898); ERNST CASSIRER, *Kant's Life and Thought* (1981; trans. of 2nd German ed., 1921); and KARL VORLÄNDER, *Immanuel Kants Leben,* 3rd ed. (1974), and *Immanuel Kant: Der Mann und das Werk,* 2 vol. (1924, reissued 1977).

Editions: The standard edition of Kant's works is that of the Berlin Academy (later the DDR Academy), *Gesammelte Schriften* (1902–), 29 vol. by 1980, which contains Kant's lectures, correspondence, and literary remains as well as his published writings. There are also modern collected editions by ERNST CASSIRER, 11 vol. (1912–23); and by KARL VORLÄNDER, 10 vol. (1920–29). A convenient edition of the *Critique of Pure Reason* is that by RAYMOND SCHMIDT, 1926).

Aids to study: RUDOLF EISLER, *Kant-lexicon* (1930, reprinted 1971); HEINRICH RATKE, *Systematisches Handlexikon zu Kants Kritik der reinen Vernunft* (1929, reprinted 1965).

General works: The best introduction is STEPHAN KÖRNER, *Kant* (1955, reissued 1982). See also EDWARD CAIRD, *The Critical Philosophy of Immanuel Kant,* 2 vol. (1889, reprinted 1969); KUNO FISCHER, *Kants Leben und die Grundlagen seiner Lehre* (1860); ALOIS RIEHL, *Der philosophische Kriticismus . . . ,* 3rd ed., 3 vol. (1924–26); BRUNO BAUCH, *Immanuel Kant,* 4th ed. (1933), in German; HENRICH RICKERT, *Kant als Philosoph der modernen Kultur* (1924); MAX WUNDT, *Kant als Metaphysiker* (1924); MARTIN HEIDEGGER, *Kant and the Problem of Metaphysics* (1962, reissued 1972; originally published in German, 1929); HERMAN J. DE VLEESCHAUWER, *La Déduction transcendentale dans l'oeuvre de Kant,* 3 vol. (1934, reissued 1976), and *L'Évolution de la pensée kantienne* (1939); PANTALEO CARABELLESE, *Il problema della filosofia in Kant* (1938); GOTTFRIED MARTIN, *Kant's Metaphysics and Theory of Science* (1955, reissued 1974; originally published in German, 1951); HEINZ HEIMSOETH, *Studien zur Philosophie Immanuel Kants,* 2nd ed. (1971); RICHARD KRONER, *Kant's Weltanschauung* (1956; originally published in German, 1914); FRIEDRICH DELEKAT, *Immanuel Kant,* 3rd ed. (1969), in German.

Precritical writings: MARIANO CAMPO, *La genesi del criticismo kantiano* (1953); GIORGIO TONELLI, *Elementi metodologici e metafisici in Kant dal 1745 al 1768* (1969), in German.

The "Critique of Pure Reason": NORMAN KEMP SMITH, *A Commentary to Kant's "Critique of Pure Reason,"* 2nd ed. rev. (1923, reissued 1979); HERBERT J. PATON, *Kant's Metaphysic of Experience,* 2 vol. (1936); ALFRED C. EWING, *A Short Commentary on Kant's Critique of Pure Reason* (1938, reprinted 1974); THOMAS D. WELDON, *Kant's Critique of Pure Reason,* 2nd ed. (1958); HERMANN COHEN, *Kants Theorie der Erfahrung,* 4th ed. (1925), and *Kommentar zu Immanuel Kants Kritik der reinen Vernunft,* 4th ed. (1925); HANS VAIHINGER, *Kommentar zu Kants Kritik der reinen Vernunft,* 2nd ed., 2 vol. (1922, reissued 1970); HEINZ HEIMSOETH, *Transzendentale Dialektik,* 3rd vol. (1966–69). See also GRAHAM BIRD, *Kant's Theory of Knowledge* (1962, reissued 1973); PETER F. STRAWSON, *The Bounds of Sense* (1966, reissued 1975).

Ethical writings: JEFFIRIE G. MURPHY, *Kant: The Philosophy of Right* (1970); PAUL A. SCHILPP, *Kant's Pre-Critical Ethics,* 2nd ed. (1960, reprinted 1977); HERBERT J. PATON, *The Categorical Imperative* (1947, reissued 1971); ORNA NELL, *Acting on Principle: An Essay on Kantian Ethics* (1975); VIGGO ROSSVAER, *Kant's Moral Philosophy: An Interpretation of the Categorical Imperative* (1979); LEWIS W. BECK, *A Commentary on Kant's Critique of Practical Reason* (1960); A.E. TEALE, *Kantian Ethics* (1951, reprinted 1975); WILLIAM D. ROSS, *Kant's Ethical Theory* (1954, reprinted 1978); HERMANN COHEN, *Kants Begründung der Ethik,* 2nd ed. (1910); MAX SCHELER, *Der Formalismus in der Ethik und die materiale Wertethik,* 6th ed. (1980). WEBB, *Kant's Philosophy of Religion* (1926, reprinted 1970); JOSEF BOHATEC, *Die Religionsphilosophie Kants . . .* (1938, reprinted 1966); ALLAN W. WOOD, *Kant's Rational Theology* (1978). (*Comparative studies*): JOHANNES B. LOTZ (ed.), *Kant und die Scholastik heute* (1955); KARL JASPERS, *Die grossen Philosophen,* 2 vol. (1957–81; abridged Eng. trans., *The Great Philosophers,* ed. by HANNAH ARENDT, 1966). (*Aesthetics*): DONALD W. CRAWFORD, *Kant's Aesthetic Theory* (1974); PAUL GUYER, *Kant and the Claims of Taste* (1979).

Opus postumum: ERICH ADICKES, *Kants Opus Postumum* (1920, reprinted 1978); GERHARD LEHMANN, *Kants Nachiasswerk und die Kritik der Urteilskraft* (1939).

Journals: Many important works of Kantian scholarship have been published in the periodical *Kant-studien* (quarterly).

Kantianism. Though the literature on Kant himself comprises innumerable titles, that on Kantianism is relatively scanty. One work that contains the complete history of Kantianism is *Freidrich Ueberwegs Grundriss der Geschichte der Philosophie,* 13th ed. (1953), vol. 3:606–620 and 4:1–128 for the first period and pp. 410–483 for the second. For the first period, there is an abundant literature. Of particular interest for the present purposes are JOHANN E. ERDMANN, *Versuch einer wissenschaftlichen Darstellung der Geschichte der neuern Zeit,* 2nd ed., vol. 3 (1923); and G. LEHMANN, "Kant im Spätidealismus und die Anfänge der neukantischen Bewegung," in *Zeitschrift für philosophische Forschung,* 17:438–456 (1963). For the second period, MARIANO CAMPO has begun the history in his *Schizzo storico della esegesi e critica Kantiana* (1959); and summaries have been written by LEWIS W. BECK in the *Encyclopedia of Philosophy,* 5:468–473 (1967, reissued 1972); and by HERMANN NOACK in his *Die Philosophie Westeuropas,* pp. 143–196 (1962). See also the *Enciclopedia Filosofica,* new ed., vol. 3, col. 1225, and vol. 4, col. 953 (1967); WOLFGANG RITZEL, *Studien zum Wandel der Dantauffassung* (1952); HENRI DUSSORT, *L'École de Marbourg* (1963); and HEINRICH RICKERT, *Die Heidelberger Tradition und Kants Kritizismus* (1934).

Karāchi

Karāchi, the principal seaport and the largest city in Pakistan, is located on the coast of the Arabian Sea immediately northwest of the Indus River Delta. It is the capital of the province of Sind as well as the headquarters of the district of Karāchi. It is also a major commercial and industrial centre. The city proper covers an area of 228 square miles (591 square kilometres), while the metropolitan area of Greater Karāchi spreads out over an area of 560 square miles.

The city has been variously called Caranjee, Crochey, Krotchey, Currachee, and Kurrachee. All its names are believed to be derived from the Sindhi name of the original settlement that initially stood on the spot—Kalachi-Jo-goth (meaning the village of Kalachi—the headman of the tribe).

The impetus to Karāchi's development originally came from its role as the port serving the Indus River Valley and the Punjab region of British India. The development of air travel subsequently increased Karāchi's importance. It is also the port serving the landlocked country of Afghanistan.

This article is divided into the following sections:

Physical and human geography

THE LANDSCAPE

The city site. Karāchi Harbour, on the shores of which the city is situated, is a safe and beautiful natural harbour. It is protected from storms by Kiamāri Island, Manora Island, and Oyster Rocks, which together block the greater part of the harbour entrance in the west.

A low-lying coastal strip runs along the shore of the harbour. Away from the coast, the ground rises gently to the north and east to form a large plain, from five to 120 feet (1 1/2 to 37 metres) above sea level, on which the city of Karāchi is built. The Malīr River, a seasonal stream, passes through the eastern part of the city, and the Layāri River, also seasonal, runs through the most densely populated northern section. Some ridges and isolated hills occur in the north and east; Mango Pīr, the highest elevation, is 585 feet high.

The 560 square miles that comprised the Federal Capital Area of Pakistan in 1948 are considered, for all practical purposes, to form the Karāchi metropolitan area. Almost half of the area is occupied by the city and its suburbs, and the surrounding 332 square miles consist of agricultural land and government wasteland.

Climate. Karāchi has pleasant weather for the greater part of the year. May and June are the hottest months, when the mean maximum temperature is about 93° F (34° C). Spells of enervating weather occasionally prevail in May and October, during which the temperature shoots up to 105° F (41° C). The coolest months are January and February, during which the mean minimum temperature remains about 56° F (13° C). A biting north wind occasionally blows in these months, during which the temperature may drop to 40° F (4° C). The relative humidity varies from 58 percent in October, the driest month, to 82 percent in August, the wettest month. The average rainfall is eight inches (203 millimetres); most of the rain falls during a total of nine or 10 days in the months of June, July, and August.

The city faces some pollution problems. High humidity in the region does not permit evaporation of stagnant water in some places, while fumes from factories and automobiles contribute to air pollution, in spite of land and sea breezes.

Plant and animal life. The natural vegetation is scanty. Seaweed rises in tangles, and mangroves grow along some of the shores. Coarse grass, cactus, and castor plants occur on the plains and hills, and date and coconut palms grow in the river valleys.

The common wild animals are wolves, chinkaras (a type of gazelle), hog deer, jackals, wild cats, and hares. Domestic animals include sheep, goats, horses, and cows. Local birds include geese, ducks, snipe (game birds related to the woodcock), cranes, flamingos, and ibis (wading birds related to the heron). There are various types of snakes found in the region, particularly cobras, kraits, vipers, and python.

The city layout. The most striking aspect of Karāchi's layout is the west-to-east parallel alignment of the four arterial roads—Nishter Road (formerly called Lawrence Road), Mohammed Ali Jinnah Road (formerly Bandar Road), Shahrah-e-Liaquat (Frere Road), and I.I. Chundrigar Road (McCleod Road). Beginning at Mereweather Tower in the vicinity of the port, these roads run through the centre of the city. Several roads, such as Napier Road, Dr. Zia-ud-din Ahmed Road (Kutchery Road), and Garden Road, cut perpendicularly across these arteries from north to south.

The old town

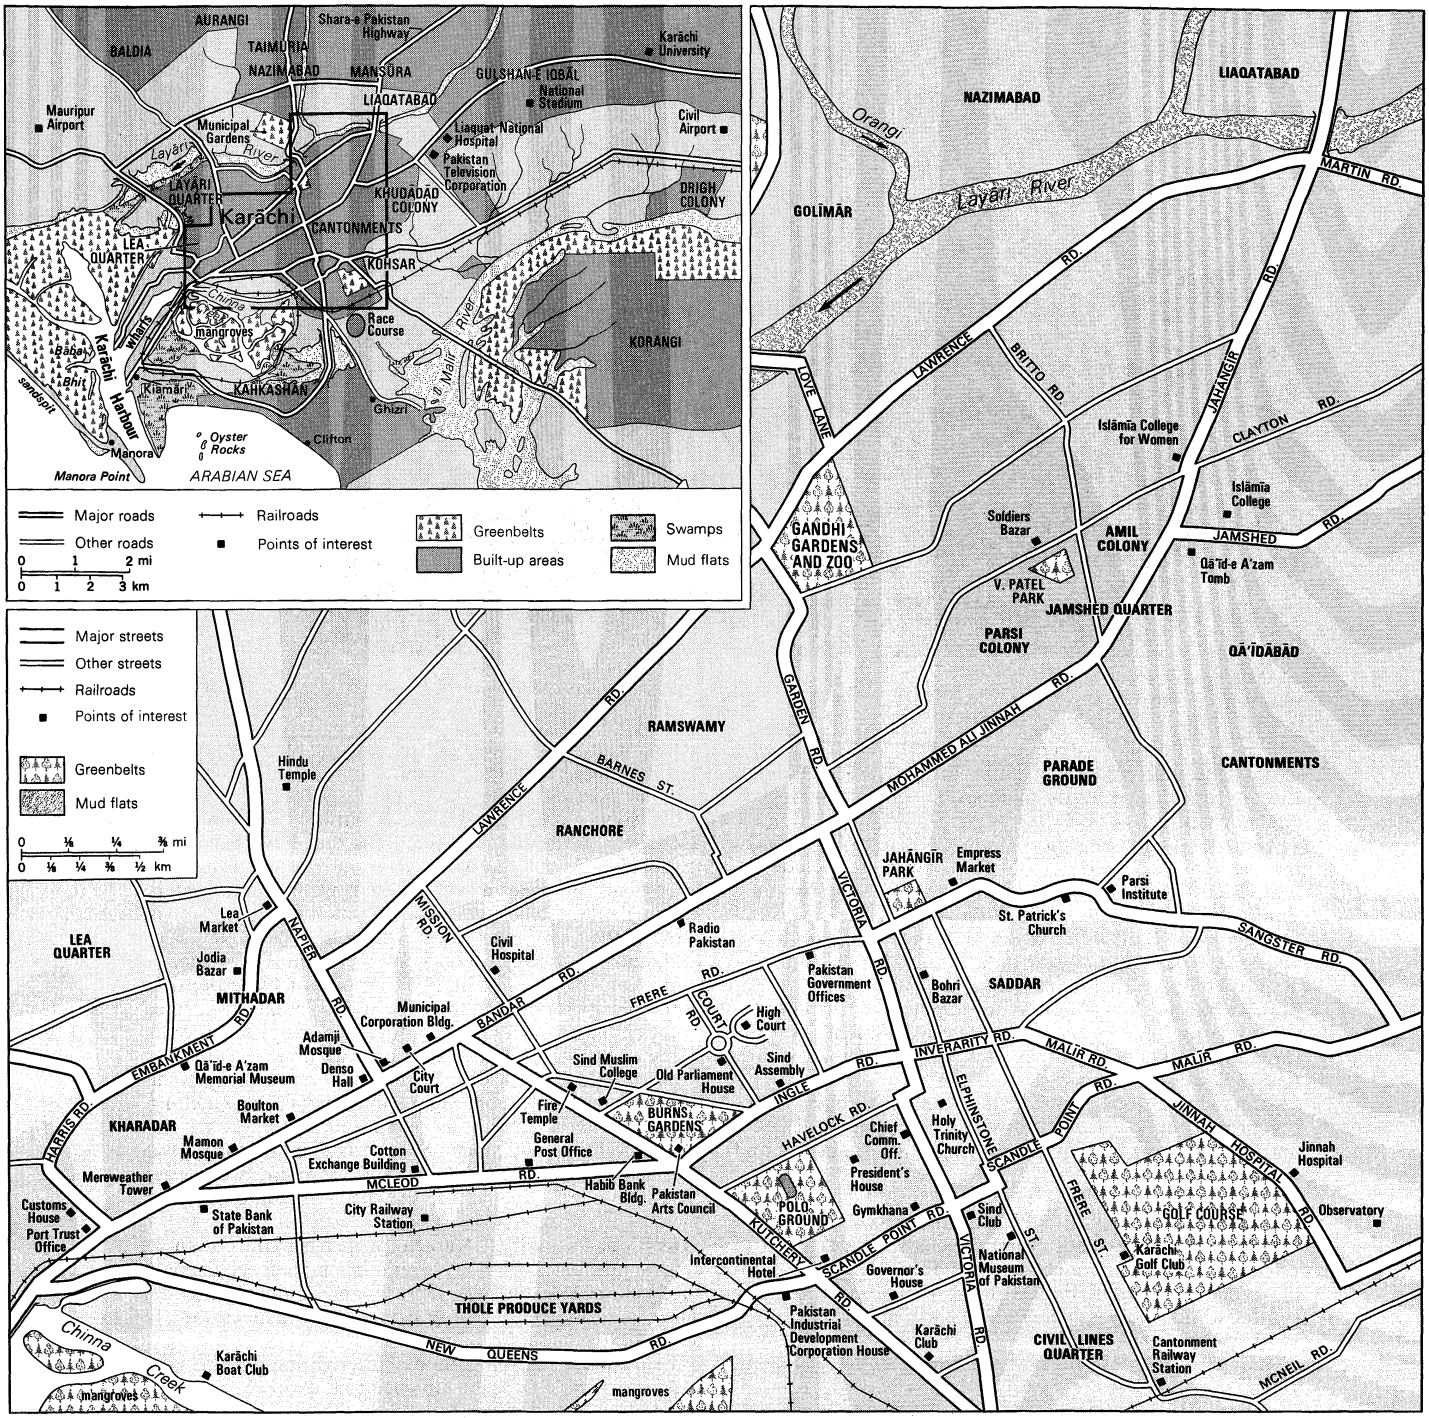
The old town lies near the port, to the north of M.A. Jinnah Road, and with extensions stretching along the material roads for over a mile; unplanned, it is reminiscent of medieval towns of the Near East or Europe. East of the old town are such districts as the Drigh Cantonment, the Civil Lines (residential areas for senior civil service officers), and the Saddar Bazar. This area is planned on a checkerboard pattern, and shows European characteristics. Beyond this stretch several radial roads, along which growth has taken the form of neighbourhood units; each unit is laid out with straight, broad roads connected by smaller streets.

Land use

The land-use pattern of the city is complex. In the central area, the preponderance of residential property tends to form a matrix within which all other functions are distributed. There is, however, a marked concentration of commercial buildings at the western ends of M.A. Jinnah Road and I.I. Chundrigar Road. Wholesale businesses are located in the old town, retail businesses along M.A. Jinnah Road and in Saddar Bazar, and the government offices on Shahrah-e-Liaquat, near Saddar. The outer areas are dominated by dormitory suburbs interspersed with a scattering of cantonments (military quarters), agricultural tracts, salt works, airports, railway stations, and marshalling yards.

The city proper has old and decayed buildings, occupied by members of the middle and lower income groups. Further from the city centre are modern bungalows occupied by richer persons; the outer zone is occupied by workers.

Karāchi has a variety of types of buildings. The central area contains apartment bungalows, barracks, and mul-



The city of Karāchi and (inset) its metropolitan area.

tistoried buildings; the outer areas are characterized by bungalows, blocks of flats, and quarters (streets of small houses). Buildings of the British period were constructed with stone in western styles of architecture; other stone buildings in the central city show a blending of Eastern and Western styles, and have towers, domes, pillars, arches, hanging balconies, and rectangular courtyards. Buildings in the outer areas are built of cement blocks, and with few exceptions they show no uniformity in design. Some follow contemporary North American design, while others incorporate features of traditional Muslim architecture.

THE PEOPLE

No ethnic group predominates in the city. Cultural and social activities essentially revolve around religion. The population is almost entirely Muslim, but there are also small Christian, Hindu, Parsi, Buddhist, and Jain minorities. Most of the Muslims derive from Indo-Pakistani stock, except for "Makranis" and "Shiddies," who are also descended from Negro elements, and who originated during the era of the slave trade in the days before British rule, when Karāchi was an important slave-trading centre. Some of the members of the Christian minority are of Indo-Pakistani origin, while others are descended from Portuguese or other European groups.

THE ECONOMY

Manufacturing

Industry. Textiles and footwear are the principal items manufactured, followed by such items as metal products, food and beverages, paper and printing, wood and furniture, machinery, chemicals and petroleum, leather and rubber, and electrical goods. Karāchi is also an important centre for handicrafts and cottage industries that produce handloomed cloth, lace, carpets, articles made of brass and

The Defence Society Mosque in Karāchi.
William MacQuitty—Camera Press

bell metal (an alloy of copper and tin), pottery, leather goods, and gold and silver embroidery. Karāchi handles the entire seaborne trade of Pakistan and of landlocked Afghanistan.

Finance. There are more than 25 banks in Karāchi that have branches throughout Pakistan; these include the State Bank of Pakistan, the Habib Bank Ltd., the National Bank of Pakistan, the United Bank Ltd., the Industrial Development Bank of Pakistan, and the Agricultural Development Bank of Pakistan. The city is also the centre of about two dozen insurance companies, which play an important role in the economic development of the country by investing large sums in power development, housing programs, jointstock companies, government loan securities, and savings certificates.

Karāchi has a stock exchange that handles an overwhelming proportion of transactions in government securities and in the shares of most of the important industrial and financial institutions.

Transportation. The Karāchi–Peshāwar highway links the city with the interior of Pakistan, while the Karāchi–Ormāra highway extends along the coast. The Karāchi to Zāhedān highway connects it with Iran and other Middle Eastern countries. Express roads radiate from the city centre, while feeder roads connect the express roads with local streets.

Karāchi is the terminus of Pakistan's railway system, which mainly serves to transport goods between Karāchi and the interior. There are also passenger trains, as well as a circular railway that skirts the city on the north and the east, for commuter traffic and the transport of goods between the port and the industrial areas.

Karāchi Airport provides international and domestic services. The port of Karāchi is one of the busiest east of Suez.

ADMINISTRATIVE AND SOCIAL CONDITIONS

Government. The city is administered by five institutions, the heads of which are appointed by the government. The Karāchi Municipal Corporation, constituted in 1852, performs a large number of civic functions affecting more than three-fourths of the population of Greater Karāchi. The Korangi-Lāndhi and Drigh-Malīr municipal committees were established in 1966 and 1970, respectively, to provide civic facilities to the suburban areas developed after 1947. The Karāchi Cantonment Board is the administrative body for the areas where the military are quartered. The Karāchi Port Trust administers the affairs of the port and is entrusted with the development and maintenance of the harbour.

Sources of water supply

Public utilities. The three main sources of the city's water supply are Lake Hāleji, 55 miles (90 kilometres) away, fed by the Indus River; wells that have been sunk in the dry bed of the Malīr River, 18 miles away; and Lake Kalri, 60 miles away, also fed by the Indus waters. Although the city's water mains stretch for many miles, some of the outer areas, such as Lāndhi, Malīr, New Karāchi, and Mauripur, still have an acute water shortage.

The Karāchi Electric Supply Corporation is responsible for electricity services. It has several power stations located in the city; these stations use natural gas, diesel oil, or both. A nuclear power station is operated at Paradise Point.

Karāchi Municipal Corporation maintains a fleet of vehicles for refuse collection, night soil removal, dog catching, and antimalarial and antifly operations. Sweepers are employed to clean the streets. Sewage is disposed of by two underground drainage systems, and there are two sewage treatment plants, one serving the city proper and the other the outlying areas.

Health and security. Karāchi proper has more than 20 general hospitals, as well as several hospitals specializing in tuberculosis, skin diseases, leprosy, and epidemic diseases. There are also child-welfare centres and dispensaries, in addition to general hospitals in the suburbs.

There are several well-equipped fire-fighting stations; separate fire brigade units are attached to the railway network. In addition, the Port Trust and Pakistan International Airlines (PIA) have services that can be used in emergencies.

The police are administered by the Sind provincial administration; the inspector general of police is assisted by a force of more than 1,100. The city is divided into 40 police districts.

Education. Karāchi has more than 900 schools, of which the majority are primary schools and the rest are secondary schools. More than half of all these are privately run, the rest being run by the government. Among schools established by different religious communities are Karāchi Grammar School, St. Joseph's Convent School, and St. Patrick's High School, all of which are Christian; a school for the Parsi community; and Sind Madrassa, a Muslim school.

The University of Karāchi

The University of Karāchi is the primary institution of higher education. It has more than 20 graduate departments in arts and sciences, as well as a graduate school of business administration. Courses in a variety of subjects, including commerce and law, are provided by about 75 colleges affiliated to the university. In addition, there is a medical college, as well as two engineering colleges, a polytechnic institute, a college of home economics, and two teacher-training colleges.

CULTURAL LIFE

The Arts Council of Pakistan is the primary cultural institution in the city; it organizes various cultural functions including art exhibitions, and offers training in music. The Ghanshyam Art Centre and the Bulbul Academy promote Pakistani dancing and other cultural activities.

Karāchi does not have well-established theatre, but amateur dramas and variety shows are frequently staged in Katrak Hall. Motion pictures are more popular, and there are more than 50 cinemas.

Karāchi has a small museum containing relics of the early Indus Valley civilization and examples of the Greco-Buddhist art of Gandhāra (a region of ancient India in what is now northwestern Pakistan); it also has some ethnological collections representing life in different regions of Pakistan.

The library of the University of Karāchi is the city's largest, but there are other libraries containing books of a popular nature. Material of a more scholarly nature is to be found in the British Council Library, the American Center Library, and the Liaquat Memorial Library. The departmental libraries of the State Bank of Pakistan, the Pakistan Institute of Development Economics, and the National Archives contain collections of books on economics and on national matters.

There is a general shortage of open spaces and parks in Karāchi. Gandhi Gardens and Fatima Jinnah (Burns) Gardens are popular parks. There are a number of fine swimming and fishing beaches, such as Paradise Point, Hawkes Bay, Sandspit, Manora, and Clifton. The Karāchi Zoo is located in the Gandhi Gardens, and contains a varied collection of animals, birds, and reptiles.

Sports and games facilities are mostly provided by such associations as the Karāchi Gymkhana, the Parsi Gymkhana, the Agha Khan Gymkhana, and the Young Men's Christian Association (YMCA). Various organizations and educational institutions have their own playgrounds. The largest sports area is the National Stadium, which contains playgrounds for cricket, hockey, football (soccer), and tennis. There are also boating, yachting, and flying clubs.

History

Origins of the port

Karāchi was a small fishing village when a group of traders moved there in the early 18th century from the decaying port of Kharak Bandar nearby. Besides the natural protection against monsoon storms, Manora Head furnished an excellent site for the defense of the harbour, and the Talpura *amīr*s who gained Karāchi from the *khān* of Kalāt in 1795 erected a permanent fort on it. The settlement expanded rapidly, and was already of significance when it was captured in 1839 by the British, who annexed it in 1842, together with the province of Sind. It then became an army headquarters for the British, and also began to develop from a fishing village into the principal port for the Indus River region.

In 1843 a river-steamer service was introduced between Karāchi and Multān, about 500 miles up the Indus. Port facilities were improved from 1854 onward. In 1861 a railway was built from Karāchi to Kotri, 90 miles upstream on the right bank of the Indus, opposite Hyderābād. In 1864 direct telegraph communications were established with London and with the interior. With the opening of the Suez Canal in 1869, the importance of Karāchi grew, and it became a full-fledged seaport. By 1873 it possessed an efficient and well-managed harbour.

Karāchi was connected directly with the hinterland when the railway line was extended from Kotri in 1878 to join the Delhi-Punjab railway system at Multān. In 1886, the Karāchi Port Trust was established as the port authority, and between 1888 and 1910 the East Wharf—186,000 feet in length—was constructed. When the Punjab emerged as the granary of India in the 1890s, Karāchi became the region's principal outlet. By 1914 it had become the largest grain exporting port of the British Empire.

After World War I, manufacturing and service industries were installed. By 1924 an aerodrome had been built, and Karāchi became the main airport of entry to India. The city became the provincial capital of Sind in 1936.

Growth after 1947

With the creation of Pakistan in 1947, Karāchi not only became the capital and premier port of the new country but also a centre for industry, business, and administration. Although Rāwalpindi became the interim capital in 1959, some governmental agencies, including the Public Service Commission, as well as "skeleton" staffs of various ministries, remained in Karāchi, which continued to play a role as a multifunctional city serving the entire country.

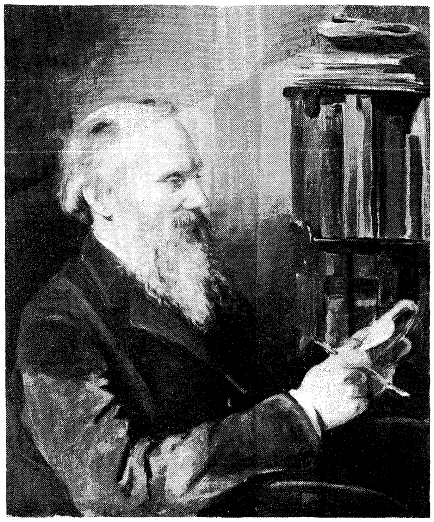
Kelvin

William Thomson, who was knighted in 1866 and was raised to the peerage in 1892 (as Baron Kelvin of Largs) in recognition of his work in engineering and physics, was foremost among the small group of British scientists who helped to lay the foundations of modern physics. His contributions to science included a major role in the development of the second law of thermodynamics; the absolute temperature scale (measured in kelvins); the dynamical theory of heat; the mathematical analysis of electricity and magnetism, including the basic ideas for the electromagnetic theory of light; the geophysical determination of the age of the Earth; and fundamental work in hydrodynamics. His theoretical work on submarine telegraphy and his inventions for use on submarine cables aided Britain in capturing a preeminent place in world communication during the 19th century.

The style and character of Thomson's scientific and engineering work reflected his active personality. While a student at the University of Cambridge, he was awarded



Kelvin, oil painting by Elizabeth King, 1886–87. In the National Portrait Gallery, London.

silver sculls for winning the university championship in racing single-seater rowing shells. He was an inveterate traveller all of his life, spending much time on the Continent and making several trips to the United States. In later life he commuted between homes in London and Glasgow. Thomson risked his life several times during the laying of the first transatlantic cable.

Thomson's worldview

Thomson's worldview was based in part on the belief that all phenomena that caused force—such as electricity, magnetism, and heat—were the result of invisible material in motion. This belief placed him in the forefront of those scientists who opposed the view that forces were produced by imponderable fluids. By the end of the century, however, Thomson, having persisted in his belief, found himself in opposition to the positivistic outlook that proved to be a prelude to 20th-century quantum mechanics and relativity. Consistency of worldview eventually placed him counter to the mainstream of science.

But Thomson's consistency enabled him to apply a few basic ideas to a number of areas of study. He brought together disparate areas of physics—heat, thermodynamics, mechanics, hydrodynamics, magnetism, and electricity—and thus played a principal role in the great and final synthesis of 19th-century science, which viewed all physical change as energy-related phenomena. Thomson was also the first to suggest that there were mathematical analogies between kinds of energy. His success as a synthesizer of theories about energy places him in the same position in 19th-century physics as Sir Isaac Newton has in 17th-century physics or Albert Einstein in 20th-century physics. All of these great synthesizers prepared the ground for the next grand leap forward in science.

Early life. William Thomson was born on June 26, 1824, in Belfast, Ireland, the fourth child in a family of seven. His mother died when he was six years old. His father, James Thomson, who was a textbook writer, taught mathematics, first in Belfast and later as a professor at the University of Glasgow; he taught his sons the most recent mathematics, much of which had not yet become a part of the British university curriculum. An unusually close relationship between a dominant father and a submissive son served to develop William's extraordinary mind.

Influences on his career

William, age 10, and his brother James, age 11, matriculated at the University of Glasgow in 1834. There William was introduced to the advanced and controversial thinking of Jean-Baptiste-Joseph Fourier when one of Thomson's professors loaned him Fourier's pathbreaking book *The Analytical Theory of Heat,* which applied abstract mathematical techniques to the study of heat flow through any solid object. Thomson's first two published articles, which appeared when he was 16 and 17 years old, were a defense of Fourier's work, which was then under attack by British scientists. Thomson was the first to promote the idea that Fourier's mathematics, although applied solely to the flow of heat, could be used in the study of other forms of energy—whether fluids in motion or electricity flowing through a wire.

Influence of Fourier

Thomson won many university awards at Glasgow, and at the age of 15 he won a gold medal for "An Essay on the Figure of the Earth," in which he exhibited exceptional mathematical ability. That essay, highly original in its analysis, served as a source of scientific ideas for Thomson throughout his life. He last consulted the essay just a few months before he died at the age of 83.

Thomson entered Cambridge in 1841 and took his B.A. degree four years later with high honours. In 1845 he was given a copy of George Green's *An Essay on the Application of Mathematical Analysis to the Theories of Electricity and Magnetism.* That work and Fourier's book were the components from which Thomson shaped his worldview and which helped him create his pioneering synthesis of the mathematical relationship between electricity and heat. After finishing at Cambridge, Thomson went to Paris, where he worked in the laboratory of the physicist and chemist Henri-Victor Regnault to gain practical, experimental competence to supplement his theoretical education.

The chair of natural philosophy (later called physics) at the University of Glasgow fell vacant in 1846. Thomson's father then mounted a carefully planned and energetic campaign to have his son named to the position, and at the age of 22 William was unanimously elected to it. Despite blandishments from Cambridge, Thomson remained at Glasgow for the rest of his career. He resigned his university chair in 1899, at the age of 75, after 53 years of a fruitful and happy association with the institution. He was making room, he said, for younger men.

Thomson's scientific work was guided by the conviction that the various theories dealing with matter and energy were converging toward one great, unified theory. He pursued the goal of a unified theory even though he doubted that it was attainable in his lifetime or ever. The basis for Thomson's conviction was the cumulative impression obtained from experiments showing the interrelation of forms of energy. By the middle of the 19th century it had been shown that magnetism and electricity, electromagnetism, and light were related, and Thomson had shown by mathematical analogy that there was a relationship between hydrodynamic phenomena and an electric current flowing through wires. James Prescott Joule also claimed that there was a relationship between mechanical motion and heat, and his idea became the basis for the science of thermodynamics.

Joule's theory of interconvertability

In 1847 Thomson first heard Joule's theory about the interconvertability of heat and motion at a meeting of the British Association for the Advancement of Science. Joule's theory went counter to the accepted knowledge of the time, which was that heat was an imponderable substance (caloric) and could not be, as Joule claimed, a form of motion. Thomson was open-minded enough to discuss with Joule the implications of the new theory. At the time, though he could not accept Joule's idea, Thomson was willing to reserve judgment, especially since the relation between heat and mechanical motion fit into his own view of the causes of force. By 1851 Thomson was able to give public recognition to Joule's theory, along with a cautious endorsement in a major mathematical treatise, "On the Dynamical Theory of Heat." Thomson's essay contained his version of the second law of thermodynamics, which was a major step toward the unification of scientific theories.

Thomson's work on electricity and magnetism also began during his student days at Cambridge. When, much later, James Clerk Maxwell decided to undertake research in magnetism and electricity, he read all of Thomson's papers on the subject and adopted Thomson as his mentor. Maxwell—in his attempt to synthesize all that was known about the interrelationship of electricity, magnetism, and light—developed his monumental electromagnetic theory of light, probably the most significant achievement of 19th-century science. This theory had its genesis in Thomson's work, and Maxwell readily acknowledged his debt.

Thomson's contributions to 19th-century science were numerous. He advanced other scientists' ideas, including those of Michael Faraday, Fourier, and Joule. Thomson subjected experimenters' results to mathematical analysis and showed the generality of the experimental results. He formulated the concept that was to be generalized into the dynamical theory of energy. He also collaborated with a number of leading scientists of the time, among them Sir George Gabriel Stokes, Hermann von Helmholtz, Peter Guthrie Tait, and Joule. With these partners he advanced the frontiers of science in several areas, particularly hydrodynamics. Furthermore, Thomson originated the mathematical analogy between the flow of heat in solid bodies and the flow of electricity in conductors.

The transatlantic cable

Although a mild man by nature, Thomson became involved in several controversies, and one, over the feasibility of laying a transatlantic cable, changed the course of his professional work. His involvement with the project began with an inquiry from Stokes, a lifelong correspondent on scientific matters, who asked in 1854 for a theoretical explanation of the apparent delay in an electric current passing through a long cable. In his reply Thomson referred to his early paper "On the Uniform Motion of Heat in Homogeneous Solid Bodies, and its Connexion with the Mathematical Theory of Electricity" (1842). Thomson's idea about the mathematical analogy between heat flow and electric current worked well in his analysis of the problem of sending telegraph messages through the planned 3,000-mile (4,800-kilometre) cable. His mathematical equations describing the flow of heat through a solid wire, as Thomson showed, were applicable to questions arising over the velocity of a current in a cable.

The publication of Thomson's reply to Stokes prompted a rebuttal by E.O.W. Whitehouse, the Atlantic Telegraph Company's chief electrician. Whitehouse claimed that practical experience refuted Thomson's theoretical findings, and for a time Whitehouse's view prevailed with the directors of the company. Despite their disagreement, Thomson participated, as chief consultant, in the hazardous early cable-laying expeditions. In 1858 Thomson patented his telegraph receiver, called a mirror galvanometer, for use on the Atlantic cable. (The device, along with his later modification called the siphon recorder, came to be used on most of the worldwide network of submarine cables.) Eventually the directors of the Atlantic Telegraph Company fired Whitehouse, adopted Thomson's suggestions for the design of the cable, and decided in favour of the mirror galvanometer. In doing so the company saved years of effort and a large amount of money, and in 1866 Thomson was knighted by Queen Victoria for his work.

Later life. After the successful laying of the transatlantic cable, Thomson became a partner in two engineering consulting firms. These companies played a major role in the planning and construction of submarine cables during the frenzied era of expansion that resulted in a worldwide network of telegraph communication. In the process, Thomson became a wealthy man who could afford a 126-ton yacht and a baronial estate.

Thomson's broad interests in science not only encompassed electricity, magnetism, thermodynamics, and hydrodynamics but also included geophysical questions concerning tides, the shape of the Earth, atmospheric electricity, thermal studies of the ground, rotation of the Earth on its axis, and geomagnetism. Believing that all science must be subjected to the same analytical rigour, he did not hesitate to enter the controversy over Charles Darwin's theory of evolution. Thomson opposed Darwin, remaining "on the side of the angels."

Investigations of the age of the Earth

Thomson challenged the views on geological and biological change of the early uniformitarians, including Darwin, who claimed that the Earth and its life had evolved over an incalculable number of years, during which the forces of nature always operated as at present. On the basis of thermodynamic theory and Fourier's studies, Thomson estimated in 1862 that more than 1,000,000 years earlier the Sun's heat and the temperature of the Earth must have been considerably greater and that these conditions had produced violent storms and floods and an entirely different type of vegetation. His views, published in 1868, particularly angered Darwin's supporters. Thomas Henry Huxley used the occasion of the Anniversary Address of the President of the Geological Society of London in 1869 to reply to Thomson. Although Thomson's speculations as to the age of the Earth and the Sun were inaccurate, he did succeed in pressing his contention that biological and geological theory had to conform to the well-established theories of physics.

In 1884 Thomson delivered a series of lectures at Johns Hopkins University on the state of scientific knowledge and wondered aloud about the failures of the wave theory of light to explain certain phenomena. Even when relaxing, Thomson questioned. The time spent on his yacht, the "Lalla Rookh," roused his interest in the sea, and from that interest came a number of patents: a compass that was adopted by the British Admiralty; a form of analogue computer for measuring tides in a harbour and for calculating tide tables for any hour, past or future; and sounding equipment. He established a company to manufacture these items and a number of electrical measuring devices. Like his father, he published a textbook, *Treatise on Natural Philosophy* (1867), a work on physics that he coauthored with Tait, which helped shape the thinking of the the next generation of physicists.

Thomson was said to be entitled to more letters after his name than any other man in the Commonwealth. He received honorary degrees from major universities throughout the world and was lauded by many engineering societies and scientific organizations. He was elected a fellow of the Royal Society in 1851 and served as its president from 1890 to 1895. He published more than 600 papers and was granted dozens of patents. He died on December 17, 1907, at Netherhall, his estate near Largs, North Ayrshire, Scotland, and he was buried in Westminster Abbey, London.

BIBLIOGRAPHY. HAROLD ISSADORE SHARLIN and TIBY SHARLIN, *Lord Kelvin: The Dynamic Victorian* (1979), provides an interpretation of the sources of Thomson's originality. SILVANUS P. THOMPSON, *The Life of Lord Kelvin*, 2nd ed., 2 vol. (1976), written by a man who knew and admired Thomson, includes a complete bibliography of his published works and complete lists of his patents and of his honours and awards. ANDREW GRAY, *Lord Kelvin: An Account of His Scientific Life and Work* (1908, reprinted 1973), is an admiring but not thorough account. ELIZABETH THOMSON KING, *Lord Kelvin's Early Home* (1909), consists of reminiscences of Thomson's early family life by his oldest sister. DAVID B. WILSON (comp.), *Catalogue of the Manuscript Collections of Sir George Gabriel Stokes and Sir William Thomson, Baron Kelvin of Largs in Cambridge University Library* (1976), is a guide to the large collection of Kelvin's papers at Cambridge and to the papers of Stokes, Kelvin's lifelong scientific correspondent. JOE D. BURCHFIELD, *Lord Kelvin and the Age of the Earth* (1975), gives an account of Kelvin's role in the argument between Darwin and British geologists.

(H.I.S.)

Kepler

The Renaissance astronomer and astrologer Johannes Kepler is best known for his discovery of the three principles of planetary motion, by which he clarified the spatial organization of the solar system. Moreover, he founded modern optics by presenting the earliest correct explanation of how human beings see. He was the first to set forth accurately what happens to light after it enters a telescope, and he designed a particular form of that instrument. His ideas provided a transition from the ancient geometrical description of the heavens to modern dynamical astronomy, into which he introduced the concept of physical force.

Early life. On December 27, 1571, in the German town of Weil der Stadt, then a "free city" within the Holy Roman Empire, Johannes was born prematurely, the offspring of an unhappy marriage. His father was a ne'er-do-well mercenary soldier, his mother the quarrelsome daughter of an innkeeper. Small in stature, Johannes never enjoyed robust health, but his superior intelligence was recognized even when he was a young child. Coming from a poor family, he would have received no education had not the dukes of Württemberg adopted the enlightened policy of providing generous scholarships for the bright sons of their impoverished subjects.

With such help Kepler in 1587 was able to attend the University of Tübingen, where he had the good fortune to study astronomy under Michael Mästlin, a professor who may have been unique in his day, for he was convinced that the astronomical system propounded by Nicolaus Copernicus was basically true: the Earth is a planet that rotates daily around its own axis and revolves annually around the Sun. Kepler's youthful acceptance of Copernican astronomy profoundly affected the subsequent course of his life.

Major achievements. After obtaining the B.A. in 1588 and the M.A. in 1591, Kepler planned to become a Lutheran minister. But in 1594, during his last year of training in theology at Tübingen, the teacher of mathematics in the Lutheran high school of Graz, in Austria, having died, Kepler was strongly recommended by the Tübingen faculty to fill the vacancy. Kepler did not finish the theology course at Tübingen but went to Graz the same year. On a summer day in 1595, while he was teaching a class, a spectacular idea flashed through his mind. Ancient Greek geometry had proved that there were five regular solids, or "Platonic bodies": tetrahedron (pyramid), cube, octahedron (formed by eight equilateral triangles), dodecahedron (12 pentagons), and icosahedron (20 equilateral triangles). The ancients knew that these five solids could be enclosed in a sphere, and that there can be no additional regular solids. Sustained by a vision of mathematical harmonies in the skies, a vision he derived from the philosophy of Plato and the mathematics of the Pythagoreans, Kepler tried to relate planetary orbits with geometrical figures.

Kepler, engraving by an unknown artist, *c.* 1730, after a contemporary painting.
Archiv fur Kunst und Geschichte

The notion of cosmic harmony

According to Copernican astronomy there were six planets, whose orbits were regulated by the turning of invisible spheres. But why were there only six planets and not nine or 100? Was the cosmos so constructed that one of the five regular solids intervened between each pair of the unseen spheres, which carried the six Copernican planets? This nest of alternating planets and regular solids constituted the main theme in Kepler's *Prodromus Dissertationum Mathematicarum Continens Mysterium Cosmographicum* ("Cosmographic Mystery"), which he published in 1596 under the auspices of the Tübingen faculty. The Platonic and Pythagorean components in Kepler's conception of celestial harmony, however mystical in origin, helped to lead him to the three principles of planetary motion now known by his name.

Kepler sent copies of his first major work to a number of scientists, including Tycho Brahe, who was soon to become the imperial mathematician of the Holy Roman Empire. Although Brahe did not agree with the underlying Copernican foundation of Kepler's *Mysterium Cosmographicum,* he was so impressed by the author's knowledge of astronomy and skill in mathematics that in 1600 he invited him to join his research staff in the observatory at Benatek (now Benátky nad Jazerou), outside Prague. When Brahe died the next year, Kepler was promptly appointed his successor as imperial mathematician. His first publication at Prague, *De Fundamentis Astrologiae Certioribus* (1601; "The More Reliable Bases of Astrology"), rejected the superstitious view that the stars guide the lives of human beings. Nonetheless, his deep feeling for the harmony of the universe included a belief in the harmony between the universe and the individual, and his skill in astrological prediction was much in demand.

While Kepler was watching a rare conjunction of Mars, Jupiter, and Saturn in October 1604, a supernova appeared that remained visible for 17 months. This event was evidence that the realm of the fixed stars, considered since ancient times as pure and changeless, could indeed experience change. He published the results of his observations in 1606 as *De Stella Nova in Pede Serpentarii* ("The New Star in the Foot of the Serpent Bearer").

Contributions to optics

Kepler now had access to Brahe's incomparable collection of astronomical observations, the result of decades of unremitting and painstaking toil by the greatest naked-eye observer of the heavens and the leader of a highly qualified team of astronomers. As a member of the team, Kepler had been assigned to investigate the planet Mars. But, before he could use the raw observations, Kepler felt that he had to solve the problem of atmospheric refraction: how is a ray of light, coming from a distant heavenly body located in the less dense regions of outer space, deflected when it enters the denser atmosphere surrounding the Earth?

Kepler incorporated his results in a book that he modestly entitled *Ad Vitellionem Paralipomena, Quibus Astronomiae Pars Optica Traditur,* (1604; "Supplement to Witelo, Expounding the Optical Part of Astronomy"); Witelo (Latin Vitellio) had written the most important medieval treatise on optics. But Kepler did much more than add to his work. He made an analysis of the process of vision that provided the foundation for all of the advances in the understanding of the structure and function of the human eye. Kepler wrote that every point on a luminous body in the field of vision emits rays of light in all directions, but that only those rays can enter the eye that impinge on the pupil, which functions as a diaphragm. He stated that the rays emanating from a single luminous point form a cone, the circular base of which is in the pupil. All of the rays are then refracted within the normal eye to meet again at a single point on the retina, identified by Kepler as the sensitive receptor of the eye. If the eye is not normal, the second short interior cone comes to a point not on the retina but in front of it or behind it, causing blurred vision. For more than three centuries eyeglasses had helped older persons to see better. But nobody before Kepler was able to explain how these little pieces of curved glass had worked.

After the invention of the telescope had been reported to Galileo, who promptly proceeded to make his astounding discoveries, Kepler applied the same ideas concerning optics to the explanation of how the telescope works. Although Galileo's findings were received in general with skepticism and ridicule, Kepler acknowledged the Italian's accomplishments in his *Dissertatio cum Nuncio Sidereo Nuper ad Mortales Misso a Galilaeo Galilaeo* in 1610.

Kepler's three principles of planetary motion

Galileo did not return the compliment. He chose to ignore the epoch-making results Kepler had published the preceding year. In his *Astronomia Nova* ("New Astronomy") of 1609, Kepler had demonstrated that the orbit of the planet Mars is an ellipse. Although it had been believed since antiquity that the planets, being heavenly bodies, were perfect and therefore could move only in perfect circles or combinations of circles, Copernicus had correctly classified the Earth as one of the planets; and it was fully accepted that the Earth was far removed from perfection. Kepler extended Copernicus' reasoning to the other planets and was the first to declare that the other planets resemble the Earth in being material bodies. That a material body, being imperfect, need not travel in a perfectly circular orbit was a conclusion made by Kepler after he tried unsuccessfully to fit the orbit of Mars to Brahe's observations in every possible combination of circles his ingenuity could devise. Because none of them worked, he tried noncircular paths until he found the true solution: Mars revolves in an elliptical orbit with the Sun occupying one of its two focuses.

The pre-Keplerian dogma that permitted only circular paths entailed the concept of uniform motion—*i.e.,* the moving body or point must traverse equal arcs in equal intervals of time. Such a conception of uniform motion as measured along an arc was, of course, incompatible with an elliptical orbit. But Kepler found an alternative form of uniformity. This new uniformity equated equal areas with equal times. With the Sun remaining stationary in one focus of the ellipse, the planet, while revolving along the periphery of its elliptical orbit, would sweep out, in equal intervals of time, equal areas of the ellipse, not equal arcs along the periphery of the ellipse.

In 1619, 10 years after Kepler published these first two principles of planetary motion (the elliptical orbit and equality of areas), he published the *Harmonice Mundi (Harmonics of the World),* in which he expounded his third principle, which related a planet's mean distance from the Sun to the time it takes to complete its elliptical orbit around the Sun. The cube of the distance proved to be in a constant ratio to the square of the time required for all the planets to complete such an orbit. The enunciation of this rule (which is sometimes called the $^{3}/_{2}$ ratio) completed Kepler's contribution to the understanding of planetary motion and helped to prepare the way for Sir Isaac Newton's exposition of universal gravitation, which affects all of the material bodies in the physical universe.

Later life. Meanwhile, Kepler's patron, the Holy Roman Emperor, had been compelled by his brother to abdicate, and Kepler himself had found it desirable to leave Prague, then the capital of the empire. Although he was reappointed imperial mathematician by the new emperor, Kepler moved to Linz, in Austria. His first wife had died in Prague; Kepler remarried in 1613. Once, when buying supplies for his new home, Kepler became unhappy about the rough-and-ready methods used by the merchants to estimate the liquid contents of a wine barrel. Because the curved containers they used were of various shapes, Kepler sought a mathematical method for determining their volumes. Following the model established by Archimedes, the most talented mathematician of antiquity, Kepler, in his volumetric researches, investigated the properties of nearly 100 solids of revolution—made by rotating a two-dimensional surface on one of its axes—that had not been considered by Archimedes. Starting with an ordinary wine barrel, Kepler enormously extended the range of Archimedes' results. He did so by refusing to confine himself, as Archimedes had done, to cases in which a surface is generated by a conic section—a curve formed by the intersection of a plane and a cone—rotating about its principal axis. Kepler's additional solids are generated by rotation about lines in the plane of the conic section other than its principal axis.

While he was in Linz, Kepler published his *Epitome Astronomiae Copernicanae* (1618–21; *Epitome of Copernican Astronomy*). He modelled this title after the highly successful introduction to astronomy that had been published by his former Tübingen professor in a number of editions. But, whereas Mästlin had deemed it prudent pedagogical practice to keep Copernicanism out of an elementary textbook, which he therefore entitled simply "Epitome of Astronomy," Kepler emphasized his open espousal of the new cosmology by inserting the provocative label "Copernican."

Witchcraft trial of his mother

In Linz in 1620, Kepler heard that his mother had been indicted on the charge of being a witch. Such a defendant was often subjected to torture and, if convicted, was usually burned at the stake. If his mother had suffered this fate, Kepler's own status as imperial mathematician of the Holy Roman Empire and mathematician of Upper Austria might have been irreparably impaired. He rushed to her defense, therefore, not only out of filial devotion but also out of prudent self-interest. Only his skillful intervention saved her from torture and a fiery death.

Kepler had planned to publish his *Tabulae Rudolphinae* (*Rudolphine Tables*), named in honour of his first imperial patron, Rudolph II, in Linz. But this work, the final outcome of long years of unceasing reflection and tireless calculation, could not be printed there because of a rebellion by the peasants, who were infuriated by a combination of being forced to return to Catholicism and to pay heavy taxes. Kepler had to find another home and a new patron.

Albrecht von Wallenstein, duke of Friedland and Żagań, a successful soldier of fortune who had put his private army at the disposal of the empire in the Thirty Years' War, accepted the responsibility of satisfying Kepler's financial needs. The astronomer moved to Żagań in Silesia, where he was able to establish his own printing press. The *Rudolphine Tables* were printed at Ulm, Germany, in 1627, before Kepler went to Żagań in 1628. But Wallenstein turned out to be someone on whom Kepler could not rely.

Leaving his family behind in Żagań, Kepler went west to collect the interest due on two promissory notes he held in exchange for money he had deposited in Austria. On his way he stopped at Regensburg, where the Imperial Diet was in session. He fell acutely ill and died on November 15, 1630. The tremendous upheavals suffered by Germany in the Thirty Years' War later obliterated his grave.

(Ed.R./Ed.)

Kiev

The capital of the Ukrainian Soviet Socialist Republic, a port on the Dnepr River, and a large railroad junction, Kiev is the third largest city of the Soviet Union and first among cities of the Ukraine. Kiev has an ancient and proud history. As the centre of Kievan Rus, the first Russian state, 1,000 years ago, it acquired the title "Mother of Russian Cities." It was severely damaged during World War II, but by the mid-1950s it was fully restored and by the 1970s had become a thriving, modern capital, with a well-developed economic and cultural life.

Physical and human geography

THE LANDSCAPE

Site. The city stands on the Dnepr River just below its confluence with the Desna and 591 miles (951 kilometres) from its mouth in the Black Sea. The original location was on the high and steep right bank, which rises above the river in an imposing line of bluffs, culminating in Batyyeva Hill, 330 feet (100 metres) above mean river level. This precipitous and wooded bank, topped by the golden domes and spires of churches and bell towers and by modern high-rise apartment buildings, makes the city an attractive and impressive sight from across the Dnepr. Since World War II, Kiev has extended on to the wide, low, and flat floodplain on the left bank.

Climate. Kiev has a moderately continental climate. The average January temperature is 21.6° F (−5.8° C), and winter days with temperatures above freezing are not uncommon; in cold spells with a northerly or northeasterly airstream, temperatures may drop sharply, and an absolute minimum of −27.4° F (−33° C) has been recorded. Snow cover lies usually from mid-November to the end of March; on average, the frost-free period lasts 180 days but in some years surpasses 200 days. Summers are warm, with a July average of 67.1° F (19.5° C) and a recorded maximum of 102.2° F (39° C). The mean annual rainfall is 25 inches (625 millimetres), with maximum precipitation in June and July.

Layout. The city limits enclose an area of 300 square miles (780 square kilometres) on both banks of the Dnepr. It is divided into 12 administrative wards: Darnitsky, Dneprovsky, Leningradsky, Leninsky, Minsky, Moskovsky, Pechersky, Podolsky, Radyansky, Shevchenkovsky, Zaliznichny, and Zhovtnevy.

The Upper Town

The focus of Kiev is the area of the ancient Upper Town, crowning the high bluff of the Dnepr. Although very largely of postwar construction, this central area retains its old street pattern, and most of the surviving historical and architectural monuments are located there. First among these is the Cathedral of St. Sophia, now a museum. It was founded in the 11th century and remains, despite certain Baroque modifications in the 18th century, one of the finest and most beautiful examples of early Russo-Byzantine ecclesiastical architecture. It has a nave and four aisles, and it is crowned by five domes. The interior is magnificently decorated with frescoes and mosaics; it contains the tomb of Yaroslav, during whose reign the cathedral was built.

Close by is the Baroque Church of St. Andrew (Andreyevskaya), designed by Bartolomeo Rastrelli and built in the mid-18th century; its site on the crest of the steep slope to the river makes it a striking landmark. Other historical relics in the central area include the ruins of the Golden Gate, also built in the 11th century in the reign of Yaroslav; the Zaborovsky Gate, built in 1746–48; and the remains of the Desyatinnaya church, or Church of the Tithes, built in 989–996 by St. Vladimir.

Within and immediately adjacent to the area of the former Old Town are many of the city's museums, theatres, and public buildings as well as the principal shops, including the central department store and the covered market. The axis of the centre is the street known as Kreshchatik, which runs along the bottom of a small valley the sides of which have in part been landscaped with terraced gardens interspersed with tall, modern office and apartment buildings. The greenery of the gardens, the trees lining the street, the squares that it intersects—all combine with the variegated colours of brick, red and gray granites, and decorative ceramic tiles to give Kreshchatik an attractive and colourful aspect, much admired by Kiev's inhabitants. Among important buildings on the street is that of the city council, where the 800 elected deputies hold their meetings.

Intersecting Kreshchatik at right angles is the wide, poplar-lined Boulevard of Taras Shevchenko, on which stands the university with its eye-catching red-washed walls. There too is the Cathedral of St. Vladimir (still in use as a church), built in 1850–96 in Byzantine style and containing impressive paintings by Viktor Vasnetsov and other Russian artists. Notable among the many statues in central Kiev are those that commemorate the Cossack leader Bohdan Khmelnytsky and the Ukrainian poet Taras Shevchenko.

North of the old centre is the former trading and Jewish quarter, Podol, with a rectangular pattern of streets and the old merchants' trading exchange, the House of Contracts, built in 1817. There too is the river port. South of the centre is the Pechersky district, along the top of the river bank. This district contains many of the principal buildings of the Ukrainian republican government, including the glass-domed palace of the Supreme Soviet of the Ukrainian S.S.R., built in 1936–39, and the 10-story block that houses the Council of Ministers. Nearby is the attractive Mariinsky Palace, built in 1752–55 for the tsaritsa Elizabeth and reconstructed in 1870; it is now used for receptions by the Ukrainian government.

Pechersky district

At the southern end of this district is the Kievo-Pecherskaya Lavra (Monastery of the Caves), one of the most famous and important monasteries in Russian history, founded in the early 11th century. It was at the *lavra* that the monk Nestor wrote the earliest surviving Russian chronicle. Although the Cathedral of the Assumption (inside the walls of the monastery) was blown up in 1941, Trinity Church, of the same period, survives. Also within the walls are the 17th-century Church of All Saints and an impressive 18th-century bell tower, rising 315 feet. A major feature of the monastery is the system of catacombs beneath it in which are the mummified bodies of early monks and saints, including that of Nestor. Although a museum open to the public, the Pecherskaya Lavra is still in use as a monastery.

South from the *lavra* is yet another monastery, the Vydubetsky, dating from the 11th century; it too was severely damaged in World War II.

All along the steep river bank, fronting the Upper Town and Pechersky district, an attractively landscaped park has been laid out overlooking the Dnepr. With the views it affords, the park forms one of the most striking features of the city. It contains an open-air theatre, sports stadium, and restaurant, and a funicular railway climbs the 300-foot slope. Within the park are also many memorials. Dominating the northern end is the statue of Prince Vladimir, who brought Christianity to Russia, the statue that marks the place where in 988 the people of Kiev were baptized en masse. The southern end, called the Park of Glory, has an 85-foot granite obelisk rising above the grave of the Unknown Soldier and a memorial garden. Also located in the park are the grave of Gen. Nikolay Vatutin, commander of the Soviet forces that liberated Kiev in 1943, and a rotunda marking the supposed grave of the early Varangian chief Askold.

Suburbs

Around these central districts of Kiev stretch extensive suburbs of factories and residential neighbourhoods. The low priority given to housing during the Stalin period means that the greater part of these suburbs has been built since 1956. The neighbourhood units, known as microregions, consist of groupings of apartment buildings housing 2,500 to 5,000 people, together with basic services, local shops, a health centre, cinema, and primary school. Since the late 1960s the apartment buildings have usually been of 12 to 20 stories and of prefabricated construction. Most apartments have only two or three rooms, and population densities are therefore high, in the new residential developments as much as in the older central areas. The growing ownership of private cars poses problems in the provision of garage space in these new districts. A feature of development since World War II has been the rapid spread of the city on the low left bank of the Dnepr, previously almost devoid of settlement. The left bank is linked to the main part of Kiev by a railway bridge and by the imposing Ye.O. Paton road bridge, which is 4,920 feet long and named after its designer.

Between the neighbourhood units are substantial areas of park and green space. These include the very large botanical gardens of the Ukrainian Academy of Sciences, the smaller university botanical gardens (established in the mid-19th century), and in the southwestern suburbs the extensive permanent exhibition of the Ukrainian economy. On the city outskirts are several areas of forest, which are much used for recreation. In the south is the Goloseyevsky Forest Park, dominated by deciduous trees, and to the north are nearly 10,000 acres (4,450 hectares) of the Pushcha-Voditsa Forest Park, mainly covered by coniferous species.

Soviet cities on the whole tend to a certain monotony of appearance. A number of factors combine to make Kiev an exception to this rule and one of the most attractive urban places in the Soviet Union—the site, with its sharply contrasted relief and wide views across the Dnepr, the abundance of greenery in and around the city, and the many buildings of historic interest and beauty.

THE ECONOMY

Industry. Kiev, as capital of the Ukraine, has major administrative functions, with considerable employment in the offices of ministries responsible for the republic's economy. The city is also an important industrial centre, possessing a wide range of manufactures. Factories are found in all quarters of the city, with major concentrations to the west of the city centre and on the Dnepr left bank.

Engineering industries, based on metal from the iron and steel plants of the Dnepr bend region and the Donbass coalfield, take pride of place and include the production of complex machinery and precision tools and instruments. The Bolshevik plant makes equipment for chemical works, such as conveyor lines for vulcanized rubber, linoleum, and fertilizer factories; the Gorky works producesmetal-cutting machines. Other engineering products are aircraft, hydraulic elevators, electrical instruments, armatures, river- and seagoing craft, motorcycles, and cinematography apparatus.

Chemical industry

Another important sector is the chemical industry, making resin products, fertilizers, plastics and chemical fibres, the last at the Darnitsa viscose rayon plant on the left bank. Timber working and the making of bricks and reinforced concrete items are also well developed. Consumer goods manufactured include cameras, thermos flasks, knitwear, footwear, a range of foodstuffs, and watches. Kiev is also a large publishing centre.

Power for the many enterprises is supplied by natural gas, piped from Dashava in the western Ukraine, and by electricity from the Kiev hydroelectric station on the Dnepr. This station, completed in 1968, is at Vyshgorod, just upstream of the city. Twenty-five miles southeast of Kiev is the still more powerful Tripolye thermal electric station.

Transportation. Transportation for the industries and for the city as a whole is provided by a good communications network. Trunk railways and all-weather roads link Kiev to Moscow, to Kharkov and the Donets Basin (Donbass), to the southern Ukraine and the port of Odessa, and to the western Ukraine and Poland. The navigability of the Dnepr has been improved by a series of barrages and reservoirs. Borispol airport operates direct flights to most major Soviet cities and to many Ukrainian towns, as well as some international connections to Romania and Bulgaria. Within Kiev itself there is efficient subway and rail, bus, streetcar, and trolleybus service.

SOCIAL AND CULTURAL LIFE

Kiev's ancient tradition as a cultural centre is still vigorously alive. The Kiev State University heads an array of 20 institutions of higher education, notable among which are the Polytechnic (founded in 1898), the Agricultural Academy, and the medical, art, and architectural institutes.

There is a large number of general secondary schools, evening schools for adults, and specialist technical schools. A range of research establishments is headed by the Academy of Sciences of the Ukrainian S.S.R., established in 1919, which also maintains the largest of the city's many libraries. Kiev is particularly noted in the Soviet Union for medical and cybernetic research. The emphasis on applied research is illustrated by the academy's Ye.O. Paton Institute of Electrical Welding.

There are several theatres, notably the Shevchenko Theatre of Opera and Ballet. Plays are presented at the Lesya Ukrainka and Ivan Franko theatres, which specialize in Russian and Ukrainian drama, respectively; drama is also frequently staged in the 4,000-seat auditorium of the Palace of Culture and in the Palace of Sport, which can seat 12,000 people. In addition there are youth, open-air, and musical comedy theatres. Kiev has a circus and more than 130 cinemas; films are made in a studio in the city. Concerts are regularly given at the Tchaikovsky Conservatory. The most important of the city's many museums are the Kiev State Historical Museum, the Kiev State Museum of Russian Art, and the Kiev State Museum of Ukrainian Art.

Sports

Kiev has good facilities for sports; the largest of its 15 stadiums, the Central Stadium, can accommodate 100,000 people. Aquatic sports take place on the reservoir of the Kiev dam at Vyshgorod and also on Trukhanov Island in the Dnepr opposite the city centre, where there is a fine beach and water sports centre. The city is well provided with health facilities, including general and specialized hospitals and local polyclinics, the latter serving residential neighbourhoods. Since the majority of women are employed, a number of nursery schools and crèches care for children below school age. Around the outskirts of Kiev are health resorts, sanatoriums, and children's holiday camps.

History

THE EARLY PERIOD

Origins and foundation. Kiev has a long, rich, and often stormy history. Its beginnings are lost in antiquity. Archaeological findings of stone and bone implements, the remains of primitive dwellings built of wood and skins, and large accumulations of mammoths' bones indicate that the first settlements in the vicinity date from the Late Paleolithic Period (some 15,000 to 40,000 years ago). As early as 3000 BC in the Neolithic Period and subsequently at the time of the Cucuteni-Tripolye culture at the end of the Neolithic, tribes engaged in agriculture and animal husbandry lived on the site of modern Kiev. Excavations continue to uncover many artifacts from settlements dating from the Copper, Bronze, and Iron ages. The tribes of the area traded with the nomadic peoples of the steppe to the south, Scythians, Sarmatians, and later Khazars, and also with the ancient Greek colonies that were located on the Black Sea coast.

According to the 12th-century chronicle *Povest vremennykh let* ("Tales of Bygone Years," also known as *The Russian Primary Chronicle*), Kiev was founded by three brothers, Kiy, Shchek, and Khoriv, leaders of the Polyane tribe of the East Slavs. Each established his own settlement on a hill, and these became the town of Kiev, named for the eldest brother, Kiy; a small stream nearby was named for their sister Lybed. Although the chronicle account is legendary, there are contemporary references to Kiev in the writings of Byzantine, German, and Arab historians and geographers. Archaeological evidence suggests that Kiev was founded in the 6th or 7th century AD.

The first Russian capital. Less legendary is the chronicle account of the Varangians, who seized Kiev in the mid-9th century. As in Novgorod to the north, a Russo-Varangian ruling elite developed. Kiev, with its good defensive site on the high river bluff and as the centre of a rich agricultural area and a group of early Russian towns, began to gain importance. In about 882 Oleg (Ukrainian Oleh), the ruler of Novgorod, captured Kiev and made it his capital, the centre of the first Russian state, Kievan (or Kiev) Rus. The town flourished, chiefly through trade along the Dnepr, going south to Byzantium and north over portages to the rivers flowing to the Baltic, the so-called "road from the Varangians to the Greeks," or "water road." Trade also went to the Caspian Sea and Central Asia.

Christianization

In 988 the introduction of Orthodox Christianity to Kiev enhanced its significance as the spiritual centre of Rus. By the 12th century, according to the chronicles, the city's wealth and religious importance was attested to by its more than 400 churches. The Cathedral of St. Sophia, parts of the Kievo-Pecherskaya Lavra, and the ruins of the Golden Gate remain today as witnesses to Kiev at the height of its splendour. The town was famed for its art, the mosaics and frescoes of its churches, its craftsmanship in silver, and the quality of many of its manufactures. One of Europe's major cities, Kiev established diplomatic relations with Byzantium, England, France, Sweden, and other countries. Travellers wrote of its population as numbering tens of thousands.

Throughout the period of Kievan Rus, however, the city was engaged in a succession of wars against the nomadic warrior peoples who inhabited the steppes to the south, in turn the Khazars, Pechenegs, and Polovtsy (Kipchaks). These conflicts weakened the city, but even greater harm was done by the endless, complex internecine struggles of the Russian princedoms into which Rus was divided. In 1169 Prince Andrew Bogolyubsky of Rostov-Suzdal captured and sacked Kiev. Thus by the late 12th century the power of the city had declined, and in the following century it was unable to resist the rising and formidable power of the Mongols. In 1238 a Mongol army under Batu, grandson of Genghis Khan, invaded Rus and, having sacked the towns of central Russia, in 1240 besieged and stormed Kiev. Much of the city was destroyed and most of its population killed. The Italian traveller Giovanni da Pian del Carpini six years later reported only 200 houses surviving in Kiev.

Kiev under Lithuania and Poland. In the 14th century, what was left of Kiev and its surrounding area came under the control of the powerful and expanding Grand Duchy of Lithuania, which captured it in 1362. For a long time thereafter Kiev had little function except as a fortress and minor market on the vaguely defined frontier between Lithuania and the steppe Tatars, based in the Crimea. It frequently came under attack from the Tatars; in 1482 the Crimean khan, Mengli Giray, took and sacked the town. Almost the only survival of Kiev's former greatness was its role as the seat of an Orthodox metropolitan. A step forward came in 1516, when the grand duke Sigismund I granted Kiev a charter of autonomy, thereby much stimulating trade.

In 1569 the Union of Lublin between Lithuania and Poland gave Kiev and the Ukrainian lands to Poland. Kiev became one of the centres of Orthodox opposition to the expansion of Polish Roman Catholic influence, spearheaded by vigorous proselytization by the Jesuits. In the 17th century a religious Ukrainian brotherhood was established in Kiev, as in other Ukrainian towns, to further this opposition and encourage Ukrainian nationalism. Peter Mogila (Mohyla), a major theologian and metropolitan of Kiev from 1633 to 1646, founded there the Collegium (later the Academy of Kiev), which became a major focus of the struggle with Roman Catholicism.

The Cossack state

In the 17th century there was also increasing unrest among the Zaporozhian Cossacks of the Dnepr downstream of Kiev and an ever-growing struggle between them and the Polish crown. This culminated in the revolt of Bohdan Khmelnytsky, who, assisted by the Crimean Tatars, entered Kiev with his insurgent Cossacks in 1648. Under heavy pressure from the Polish forces, in 1654 Khmelnytsky and the Cossacks offered their allegiance to Moscow (the Pereyaslav Agreement); this was followed by a prolonged and confused period of strife and destruction, leading in 1667 to the Treaty of Andrusovo, by which Kiev and the Dnepr left bank part of the Ukraine became an autonomous Cossack state under the suzerainty and protection of Moscow. Thereafter further struggle ensued against the Turks, with the Cossacks constantly changing sides and engaging in internecine disputes. In 1686 Kiev was finally yielded to Russia by Poland and stood as the sole Russian outpost on the right bank of the Dnepr.

EVOLUTION OF THE MODERN CITY

Kiev under the tsars. The Second Partition of Poland in 1793, under Catherine the Great, brought the right bank Ukraine into Russia, and Kiev, assisted by the abolition in 1754 of the tariff barriers between Russia and the Ukrainian lands, began to grow in commercial importance. Catherine's reign was marked by the abolition of the old administrative system and of the post of Cossack hetman and the division of the Ukraine into new administrative provinces, for one of which Kiev became the centre. Subsequently it became the centre of a governor generalship, covering three provinces.

In the first half of the 19th century, Kiev developed as a major focus of Ukrainian nationalism, although severe persecution from the tsarist government forced the movement to shift the brunt of its activities to Lvov in the Austrian Ukraine. In Kiev, as in other Russian cities, there was clandestine revolutionary activity (beginning with the Dekabrists in the early 19th century) that culminated in a series of strikes and demonstrations leading to the revolution of 1905. An important role in this revolutionary movement was taken by students of the University of Kiev (now Kiev T.G. Shevchenko State University), which had been established in 1834.

In the 19th century the expanding economic importance of the Ukraine, and especially the growing export of grain, brought further commercial development to Kiev. Modern factory industry appeared; to the Arsenal, set up as early as the 18th century, were added timber working and the building of river craft. The town had significant industries processing agricultural products—leather, tobacco, distilling, brewing, and textiles. In the late 1860s Kiev was connected by rail to both Moscow and the Black Sea port of Odessa, further enhancing its role as a centre of industry, commerce, and administration. By the outbreak of World War I, the city had a population of some 350,000.

The revolutionary period. With the outbreak of the Revolution in 1917, a revolutionary soviet, the Central Rada (*rada,* "council"), was elected by the city workers, consisting primarily of Menshevik and Social Revolutionary members, with strong support from Ukrainian nationalist groups. In January 1918 the Rada proclaimed an independent Ukrainian state with Kiev as its capital. Minor uprisings by Bolshevik workers, who were mostly concentrated in the Arsenal works, were suppressed, but Red Army troops came to their aid and on February 8, 1918, entered Kiev.

Petlyura government

By the Treaty of Brest-Litovsk (March 3) between the Bolshevik government and the Germans, however, the new Soviet government recognized the independence of the Ukraine, which was promptly occupied by German troops. A puppet Ukrainian government was set up in Kiev by the Germans, but it collapsed with the German surrender to the Allies in November 1918 and the subsequent withdrawal of German troops. Once more an independent Ukraine was declared in Kiev, under the leadership of Simon Petlyura, but its brief and stormy history was a series of struggles between Ukrainian nationalist, White, and Red forces. In November 1919 Kiev was briefly taken by the White armies under Gen. A.I. Denikin before being finally occupied by the Red Army. Peace was still denied the city, with the outbreak of the Russo-Polish War. In May 1920 the Poles captured Kiev but were driven out in a counterattack.

The Soviet period. Kiev's role as the centre for Ukrainian nationalists caused the Soviet government to transfer the capital of the new Ukrainian Soviet Socialist Republic to Kharkov, and it was not until 1934 that Kiev resumed its capital status. Meanwhile, restoration of the city's shattered economy was undertaken. During the first Five-Year Plans, between 1928 and 1940, new machine tool, electrical, and chemical industries were established. By 1939 the population had reached 846,724. The German invasion in 1941 again brought severe suffering and destruction to the city. After a fierce 80-day battle, German forces entered it on September 19, 1941. More than 30,000 Jews, Soviet prisoners of war, and partisans who had remained in the city were massacred within days in a nearby ravine known as Baby Yar. Many of Kiev's other inhabitants were deported for forced labour and to concentration camps, including almost all the large prewar Jewish segment. In 1943 the advancing Soviet troops forded the Dnepr and, after bitter fighting, liberated Kiev on November 6. The city itself had suffered great destruction, including more than 40 percent of its buildings and some 800 of its industrial enterprises.

For its role in the war Kiev was later honoured by the Soviet government with the Order of Lenin, the title of Hero-City, and the Gold Star medal. In the first postwar Five-Year Plan, rapid reconstruction was undertaken. Since then Kiev has continued to grow and to strengthen its industrial base.

Kinshasa

Kinshasa, the capital of the Republic of Zaire, lies about 320 miles (515 kilometres) from the Atlantic Ocean on the south bank of the Congo (locally called the Zaire) River. One of the largest cities of sub-Saharan Africa, it is a special political unit equivalent to a Zairian region, with its own governor. The city's inhabitants are popularly known as Kinois.

Kinshasa is distinctive not only as the capital of Zaire but also as the centre of the dynamic and contradictory influences that have shaped the country's character in modern Africa. The only city not clearly identified with any particular region of the country, it is the seat of a long-lasting military government based, on the one hand, on the strength of the armed forces and, on the other, on a technique of political and social compromise that has gained the rather grudging collaboration of most of the citizens. Caught between spectacular wealth and massive poverty, most Kinois must spend a considerable amount of their time scrambling for necessities that are in erratic supply. Nevertheless, they have found the means to make Kinshasa a source of distinctive influence in intellectual and popular culture that has been felt throughout Africa.

This article is divided into the following sections:

Physical and human geography

THE LANDSCAPE

The city site and climate. Kinshasa spreads out southward from the shoreline of the Congo River at Malebo Pool, a widening of the river. The plain on which the city lies varies mostly between 918 and 1,148 feet (280 and 350 metres) above sea level and is partly encircled by higher ground. The most heavily inhabited area of Kinshasa covers 58 square miles (about 150 square kilometres). The total area subject to city government, much of it sparsely populated, is 3,847 square miles.

The climate is hot year-round, with a dry season from May to September and a rainy season from October to May. The mean annual rainfall is slightly more than 60 inches (1,524 millimetres). Violent rainstorms occur frequently but seldom last more than a few hours. The hottest month is April, with mean daily maximum and minimum temperatures of 89° F (32° C) and 71° F (22° C), respectively. The corresponding figures for July, the coldest month, are 81° F (27° C) and 64° F (18° C). The higher suburbs are somewhat cooler than the central city. The surrounding countryside is heavily farmed savanna and gallery forest; the chief crops are cassava, sugarcane, oil palms, plantains, corn (maize), peanuts (groundnuts), and beans.

The city layout. The built-up area of Kinshasa is divided into industrial, residential, and commercial zones. Along the western edge of the central city an industrial zone (before 1966 called Léo-Ouest) flourishes near the site of the first depot established by Sir Henry Morton Stanley. To its east lies the riverside residential and administrative district of Gombe, which houses most of the European population and the Zairian elite; the central government buildings and the embassy district are located there. The eastern sector (known before 1966 as Léo-Est), of which the wide Boulevard du 30-Juin forms the main artery, is a major commercial area. The waterfront, along Kinshasa's northern edge, is lined with quays and large warehouses. Ndolo, east of Gombe, comprises a complex of port facilities and industrial plants. The poorer areas extend southward on the east and west of Kinshasa. Among Kinshasa's satellite cities, Ndjili, to the southeast, has become a residential area, while Kimpoko upstream has been developed as an outer port. During the 1970s, wealthy businessmen and politicians built mansions, often of spectacular opulence, in Binza, an area in the western hills overlooking the city.

Government and residential section

There are a variety of architectural styles in Kinshasa. High-rise apartment blocks, luxuriously appointed banks, stores, and the offices of large corporations and government agencies characterize the centre of town. Some date from shortly after World War II, but the most prominent were constructed during the economic boom of the early 1970s. They include the Parliament, the president's palace (built by the Chinese), the headquarters of the national broadcasting corporation (the Voice of Zaire), the International Trade Center, the headquarters of the mineral marketing agency, and the unfinished tower dedicated to Patrice Lumumba. Spacious villas surrounded by ornamental shrubs and flower gardens, and often also by high walls and iron bars, stand on tree-lined, paved boulevards that mark the elite residential districts. Dwellings in the less affluent communities often consist of tin-roofed, concrete-block houses and multi-unit dwellings on unpaved streets, often inaccessible to vehicles. These in turn give way to hastily assembled shelters and rough pathways in the extensive squatting zones of the city, where many of the most recent immigrants reside.

Architectural landmarks

THE PEOPLE

The population of Kinshasa grew slowly at first (from 5,000 people in 1889 to 23,000 in 1923) but increased rapidly after 1940; after 1950 it doubled about every five years and by the 1980s was estimated to be more than 3,000,000, of whom about one-third lived in the squatting zones. Much of the population growth has been the result of Zairian migration and government expansion, but widening of the city's boundaries has caused some of the increase. Kinshasa has a young population. More than half the people are under 22 years of age, and only about 3 percent of the population is over 50.

Migration of peoples from the rural areas intensified greatly after independence as colonial restrictions were relaxed. Political troubles and the economic decline of rural areas and their lack of amenities and opportunities, as well as the attractions of the city, have contributed to this rural exodus. In its early years the city received immigrants from West Africa and the various neighbouring countries of Central Africa; since independence, however, most new inhabitants have come from within Zaire, especially the nearby regions of Bandundu, to the west, and Bas-Zaïre (Lower Zaire), to the south and east.

Population growth through migration

THE ECONOMY

Industry and commerce. Kinshasa is the most important consumer centre of the republic and the core of its industrial and commercial activity. The city serves as the headquarters of major public corporations and of privately owned industrial and commercial companies. It dominates the financial and commercial life of the republic and

Dynamic centre of Zairian commerce and industry houses the head offices of the principal banks. Among Kinshasa's main industries are food processing, and those producing beer, textiles, footwear, woodwork, paper, packing cases, tires, metalwork, tobacco, and chemicals. Construction and various service industries also contribute to the city's economy.

The rapid expansion of the city's population has created serious problems of food supply; there is a constant threat of shortages, posing an implicit political problem as well. The busy central market is complemented by suburban markets lined with wooden stalls and by hawkers and street vendors selling in minute quantities to passers-by. The region of Bas-Zaïre supplies at least half of the food consumed in the capital. Other foodstuffs come from more distant regions of Zaire or are imported. For those who can afford it, South Africa has been an important source of meat and fruit and vegetables, which are flown in. For the poor, however, Kinshasa is in some ways like an overgrown village, whose people forage at a considerable distance for firewood and keep gardens where they can find good soil. The demands of this vast urban population have caused extensive erosion in the surrounding countryside, as the soil is exhausted from overcultivation and trees cut for charcoal have not been replanted.

Transportation. Kinshasa's transportation system is inadequate in many respects. Economic problems and shortage of foreign exchange have caused severe deterioration, and there has been a continual crisis for lack of spare parts and replacement vehicles. Kinshasa is well served by roads, but its dense and rapidly increasing population causes much congestion. The city is connected by a paved road to Matadi, Zaire's principal port at the head of navigation on the Congo estuary, and by another to Kikwit, to the east. The railway line from Matadi, bypassing the rapids on the river below Kinshasa, brings in most of the country's imports, some of which are then conveyed upriver. The Congo is navigable to Kisangani, 1,050 miles upstream, and a vast network of navigable stretches on its tributaries, connected by railways, brings almost all inland traffic carrying exports destined for Matadi down the Congo and through the port of Kinshasa. Ndjili International Airport, to the southeast, is one of Africa's largest air stations. A busy ferry connects the city to Brazzaville, the capital of the People's Republic of the Congo, across Malebo Pool. Within Kinshasa public transportation consists of grossly overcrowded buses, minibuses, taxis, and *fula-fula* (trucks adapted to carry passengers).

The port of Matadi

ADMINISTRATION AND SOCIAL CONDITIONS

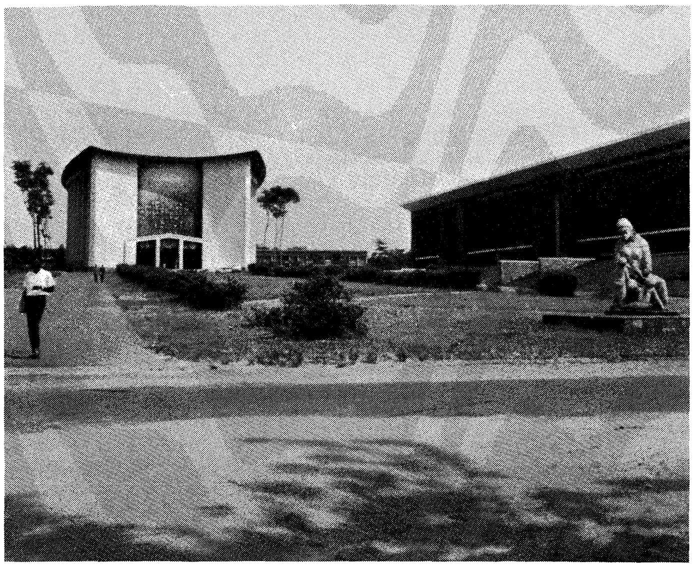
Government and services. Despite the government's declared policy of decentralization, the capital remains the place where all administrative decisions of importance are made; consequently, it is the centre of the nation's political life. The city houses the national government: the office of the president, the Political Bureau (the highest organ of the single party, the Mouvement Populaire de la Révolution [MPR]), the Central Committee of the party, and the executive and legislative councils. Since 1982 the urban administration has consisted of a governor and two vice-governors, appointed by the president. They head the city council, consisting of the 24 zone commissioners appointed, also by the president, from among the councillors elected in each zone. Despite a pervasive sense of tension, political disturbances have been few.

City government structure

The administration is unable to adequately provide such services as running water, electricity, and sanitation throughout the city; town-planning and building-control agencies have had difficulty coping with the rapid growth of the city, much of which consequently lacks basic urban facilities. Some areas suffer from eroded housing lots and roadways, clogged open drains, and accumulated trash. Although there has been some increase, the rate of violent crime is relatively low.

Health and education. Medical facilities, like other city services, are overwhelmed by the expansion of the population. The hospitals, clinics, and dispensaries of the public health system are insufficient in number and unevenly distributed, which, coupled with the problems of transportation, limits the health care they can provide for the public.

Health and education problems



Campus of the Université de Kinshasa.
Michel Huet—HOA-QUI

The primary and secondary education system is similarly overextended, lacking sufficient facilities and teachers to cope with population growth. Institutions of higher education include the Université de Kinshasa (formerly Lovanium University), the largest of the country's three universities; a teacher-training college; a national school of administration and law; a school of telecommunications; and an academy of fine arts, as well as institutes of social research, political party indoctrination, medical training, and commerce. Kinshasa's School of Catholic Theology is internationally distinguished.

CULTURAL LIFE

Kinshasa is the dynamic centre of the nation's popular culture, of which the language is Lingala, the urban lingua franca. Zaire's popular music is renowned throughout Africa; well-established bands from the country tour abroad to Europe and the Americas; popular music celebrities receive wide attention, and it is not unusual for their latest hit song to give their names to fashions in women's dress materials, a medium of intense social competition. Like the popular songs, paintings sold on sidewalks express the social themes of the day. Daily papers, which are closely censored, and several periodicals are available to the populace. Television is an important medium of official communication to the people; it broadcasts news, presidential speeches, a form of propaganda entertainment called "animation," popular bands, and occasional old European films. Radio and television broadcasting is in French, the official language, and local languages.

Radio and television

Modern Kinshasa has produced a considerable flowering of literature in novels, plays, and poetry by local writers. Painting and sculpture produced by artists of the Académie des Beaux-Arts are exhibited and sold at the academy. The collection of the Institut des Musées Nationaux is of great archaeological, ethnographic, and musicological as well as aesthetic interest, and it is of immense importance for scholars of traditional African art. Although traditional art of value may no longer be available in the city, workshops in the suburbs turn out imitations of masks and sculptures that represent all parts of Africa, as well as carved work in ivory and malachite. The city is known for some excellent restaurants and is the site of numerous nightclubs and motion-picture theatres.

History

The land on which Kinshasa grew was inhabited in ancient times, as were all the shores of Malebo Pool. The present city evolved from two villages, Nshasa and Ntamo (later known as Kintamo), dominated by the Bahumbu and frequented by Bateke fishermen and traders. The explorer

Sir Henry Morton Stanley, on his visit in 1877, formed an alliance with the ruler of Kintamo, a wealthy ivory trader, and, despite French efforts to forestall him, was able to acquire a trading post site on his return in 1881. He named this post Léopoldville, after his patron, Léopold II, king of the Belgians. Although Stanley succeeded in opening river traffic as far north as Stanleyville (Kisangani since 1966) by portaging prefabricated steamers around the cataracts of the lower river, Léopoldville remained unimportant until the railway line from downstream Matadi was completed in 1898. A pipeline from Matadi to carry crude oil to the upriver steamers at Léopoldville was completed in 1914, and an air service was inaugurated between Léopoldville and Stanleyville in 1920. As a result, the administrative headquarters of the then Belgian Congo was transferred there from Boma in 1923.

Rail and pipelines spur growth

As industries were established, residential zones grew up around them. In the 1930s the zones of Kinshasa, Barumbu, and Lingwala grew up near the port. After 1950 Lemba, Matete, and parts of Ndjili, to the southeast, were built to house the workers of the new industrial district of Limete, but the more centrally located communes (now zones) of Dendale (now Kasa-Vubu), Bandalungwa, and Ngiri-Ngiri became the social and political heart of the city. In 1960 Léopoldville became the capital of the new republic. Its name was changed to Kinshasa in 1966.

BIBLIOGRAPHY. A full description of Kinshasa is contained in MARC PAIN, *Kinshasa: Écologie et organisation urbaines,* 3 vol. (1978–79); the Republic of Zaire's *Atlas de Kinshasa,* issued by the INSTITUT GÉOGRAPHIQUE DU ZAÏRE, BUREAU D'ÉTUDES D'AMÉNAGEMENTS URBAINES (1975), contains an excellent descriptive text supporting the 44 thematic maps. Works of historical significance include HENRY M. STANLEY, *The Congo and the Founding of Its Free State,* 2 vol. (1885, reprinted 1970); and CRAWFORD YOUNG, *Politics in the Congo: Decolonization and Independence* (1965). JEAN S. LA FONTAINE, *City Politics: A Study of Leopoldville, 1962–63* (1970), describes the city's social organization; and MBUMBA NGIMBI, *Kinshasa, 1881–1981: 100 ans après Stanley: Problèmes et avenir d'une ville* (1982), describes its administrative history and problems. KANKUENDA M'BAYA, *Les Industries du pôle de Kinshasa* (1977), discusses the city's economic role.

Korea

Extending southward from the Chinese historic area of Manchuria (now the provinces of Liaoning, Kirin, and Heilungkiang) and the U.S.S.R. on the northeastern Asian mainland, the peninsula of Korea is approximately 600 miles (970 kilometres) long and from 125 to 200 miles (200 to 320 kilometres) wide. It reaches southwest to within approximately 120 miles of Honshu, the principal island of Japan, and to within approximately the same distance of the Shantung Peninsula of China. Elongated and irregular in shape, the Korean peninsula separates the Yellow Sea and the Sea of Japan (called the East Sea in Korea). There are about 3,500 islands, mainly along the southern and western coastline.

The name by which Korea is best known to its own people is Chosŏn, which may be translated as "land of the morning calm." The Republic of Korea (south) uses Tae Han for its official name; the Democratic People's Republic of Korea (north) continues to use the name Chosŏn. The western name, Korea, was derived from the Koryŏ dynasty (AD 918 to 1392) and may be literally translated as "high and beautiful."

Because of its strategic location between China, Japan, and the Soviet Far East, Korea has long suffered from the inroads of aggressive neighbours. At the end of World War II, Korea was divided by an artificial barrier, the 38th parallel, for the purpose of accepting the surrender of Japanese troops. This division was perpetuated by the U.S. occupation of the south and the U.S.S.R. occupation of the north. In 1948 the Republic of Korea was formed in the south, and the Democratic People's Republic of Korea came into being in the north. Aggression from the north in June 1950 brought on the Korean War, with resultant devastation to many parts of the peninsula. Since the truce of 1953, reconstruction and development have taken place. The peninsula is still divided by a demilitarized zone that cuts across the land in a wavy line from north of the 38th parallel in the east to south of it in the west.

The article is divided into the following sections:

Physical and human geography

Korea is a mountainous land of diverse geology. The northern interior forms a broad continental base; it is similar geologically to the adjacent areas of Manchuria. The drainage divide of central Korea lies in the eastern part of the peninsula: a high, mountainous terrain composed chiefly of Archeozoic (Early Precambrian) rocks—granites, gneiss, mica schist, and other metamorphics. The southeastern part of the peninsula, of considerably less relief, is composed largely of Cretaceous and Tertiary sedimentary rocks interspersed by Late Tertiary granitic intrusions. The latest major mountain-building episode in Korea appears to have occurred during Jurassic time, all older rocks undergoing the deformation. The latest uplifts have determined the orientation of the peninsula.

Although volcanism is recorded in the dike rocks and lava flows associated with both the geosynclinal sedimentaries and later Mesozoic deposits, it has not been pronounced in more recent geologic time. Korea has no active volcanoes and very rare earthquake shocks, a striking contrast with nearby Japan.

Archaeological, linguistic, and legendary sources support the view that the Korean peninsula was settled by tribes, Tungusic in origin, that migrated in waves from Manchuria and Siberia. They settled along the coasts and moved up the river valleys. These people formed the dominant racial stock of the Korean people and were the originators of the Korean language. Physically, the Koreans are Mongoloid, like the Chinese and Japanese, and share many of their characteristics. Chinese cultural influence is obvious in much borrowed vocabulary as well as in the written language; Chinese was the classical language for many centuries.

(Ed.)

History

Cultural ancestry

The Korean people share a common racial origin with other peoples of North Asia, and the Korean language belongs to the Altaic language family of the region. There was a close relationship between Korean culture and that of neighbouring peoples in the Neolithic Period and the Bronze Age. For example, Korean combware pottery, widely used in the Neolithic Period, is commonly found in the region; Korean bronze daggers, belt hooks, and multi-knobbed mirrors also display the traits of bronze tools unearthed in the area. In this manner, the lineage and formation of early Korean culture can be roughly traced. One branch of the cultural ancestry went as far as the Shantung Peninsula and formed an element of ancient Chinese culture; another went southward to Japan to form the main current of early Japanese culture.

Because of this background, the early Korean people were in constant confrontation with the Chinese. China was antagonistic toward the northern peoples, with whom the Koreans were associated, and naturally assumed an aggressive attitude toward the Koreans. Thus, Korea's formation and development were nurtured in its struggles against China.

After the unification of the Korean peninsula by Silla, Korea maintained friendly relations with China out of the need to deter invasions by the northern nomadic peoples. Later, Manchuria and Mongolia came under the successive control of the northern nomadic peoples and served as a base for invasion of Korea and China. To cope with this threat, Korea and China felt the need for a military alliance.

An even more important reason for friendly relations between Korea and China was cultural homogeneity. After the Iron Age, both China and Korea developed agricultural economies and thus shared many cultural similarities. China's culture was more advanced than Korea's, however, and Korea absorbed much from China—*e.g.,* written Chinese characters, laws and decrees, Confucianism, and painting. Nevertheless, Korea had its own language and invented its own alphabet; it developed its own way of life and adapted and improved upon all its borrowed culture to fit its own needs.

By the late 19th century the influence of the West began to be felt in East Asia. This was chiefly because Japan, the less advanced nation in the region, took the lead after opening its doors to the West. Stimulated by Japan's Westernization program, Korea tried to carry out reforms, doing away with traditional systems. But Korea fell prey to Japanese imperialism, which took advantage of reform movements in Korea for its own benefit. On liberation from Japanese rule in 1945, Korea was thrown into the vortex of world politics.

THE DAWN OF HISTORY

The Stone Age. Stone artifacts of the Paleolithic Period were unearthed at Kulp'o-ri in North Hamgyŏng Province (Hamgyŏng-pukto) and at Sŏkch'ang-ni in South Ch'ungch'ŏng Province (Ch'ungch'ŏng-namdo). Of 13 stratified Paleolithic sites, each cultural stratum produced chipped-stone tools of different shapes. Radioactive-carbon dating indicates the Paleolithic provenance of Sŏkch'ang-ni. Inhabited sites with round fireplaces were discovered there along with carved pebbles.

Neolithic life

The Neolithic Period was well established by 3000 BC, and a major characteristic was the use of combware pottery, chiefly found at seashore and river-basin sites, where inhabited places and shell mounds were also discovered. Stone spears and flint arrowheads have also been found, as well as bone hooks and stone weights, used for fishing. Remains of the Late Neolithic Period include stone plows and sickles, which indicate the beginning of farming. People lived in dugouts, mostly shallow round or rectangular hollows with fireplaces in the centre and possibly covered with thatched roofs. These shelters were huddled together in groups. The size of such villages is yet to be determined, but legends indicate the family members might have lived together, forming clan communities.

The use of metals and the emergence of tribal states. Bronzeware was probably first used about the 8th century BC, though some scholars think that it predates the 10th century. As the Bronze Age started, the design of pottery changed to undecorated earthenware. The uncovering of such pottery indicates that Bronze Age Korean people lived on hillsides, in dugouts raised slightly above ground. Half-moon-shaped stone knives and grooved stone axes show that rice farming was practiced, and bronze daggers and bronze arrowheads indicate wars of conquest. Dolmens, used as tombs, which were discovered in south Manchuria and the Korean peninsula, show the boundary of ancient Korean culture. Because only important persons were buried in dolmens, their number and location indicate that many small Bronze Age tribal states were probably established by powerful men.

The most advanced state was ancient Chosŏn, established in the Taedong-gang (Taedong River) Basin. According to myth, the son of Heaven, Hwanung, descended to Earth and married a bear-turned-girl, who bore a son, Tangun, the founder of Chosŏn. Perhaps Tangun, who called himself a grandson of Heaven, ruled a tribal state in which rituals and politics were not separated.

Chosŏn developed into a league of tribes in the area of the Taedong and Liao rivers (*c.* 4th century BC). Around this time ironware came to be used. Iron plows and sickles indicate the use of animals in farming and more efficient harvesting methods. Wooden houses were built on the ground, and *ondol,* a floor-heating system, was developed. Iron weapons were manufactured. The appearance of horse equipment and coaches indicates that horses and chariots were employed in wars.

Wiman (Wei Man in Chinese), said to have defected from China, became ruler of Chosŏn about 194 BC. More likely, he was indigenous to Chosŏn. Wiman's Chosŏn was overthrown by the Han Empire of China and replaced by four Chinese colonies in 108 BC.

DEVELOPMENT OF ANCIENT STATES

The Three Kingdoms. Apart from Chosŏn, the region of Korea developed into tribal states. To the north, Puyŏ developed in the Sungari River Basin in Manchuria. Chin, south of the Han-gang (Han River), was split into three—Mahan, Chinhan, and Pyŏnhan. These states were leagues, tribal federations centred on a leading state. The tribal league states stretched across a wide area from the Sungari Basin in Manchuria to the southern Korean peninsula. They evolved into three conflicting kingdoms—Koguryŏ, Paekche, and Silla. According to myths, Koguryŏ was founded by Chu-mong in 37 BC, Paekche by Onjo in 18 BC, and Silla by Pak Hyŏkkŏse in 57 BC. The actual development of a state, however, was begun for Koguryŏ by King T'aejo (reigned AD 53–146?), for Paekche by King Koi (reigned 234–286), and for Silla by King Naemul (reigned 356–402).

Common characteristics of the Three Kingdoms

The Three Kingdoms shared several common characteristics. They evolved into statehood through frequent wars of expansion. Centralized military systems were organized, and training institutions (*kyŏndang* in Koguryŏ, *hwarangdo* in Silla) were developed. The power of the king in each state was strengthened. Royal hereditary systems were established.

Another common trait was the appearance of central aristocrats, tribal chiefs who moved to the capital. These aristocrats were divided into several social classes and gained certain privileges as they advanced socially and politically. The typical class system was Silla's Kolp'um, or bone-rank system, in which the families of rulers customarily monopolized political power. Silla had a state conference, Hwabaek, composed of men of *chin'gol,* or "true bone" (royal or formerly royal origin), which made important state decisions.

Korea during the Three Kingdoms period (*c.* AD 400).

The states all experienced a centralization of power. The nations were divided into administrative units—the largest called *pu* in Koguryŏ, *pang* in Paekche, *chu* in Silla—that controlled many castles. The central government sent officials to these provincial units, where they saw to it that the people, as royal subjects, provided taxes and corvée labour.

The Three Kingdoms developed highly advanced cultures. Each compiled its history, apparently to consolidate the authority of the state. Also noteworthy was the introduction of Buddhism, characterized at the time as a nationalistic religion praying for the protection and welfare of the state.

Unified Silla. With the support of China, Silla conquered and subjugated Paekche in 660 and Koguryŏ in 668. Not until 676 did Silla drive out the Chinese and gain complete control of the Korean peninsula. But the surviving Koguryŏ people in northern Manchuria established Parhae, under the leadership of Dae Cho-yŏng, which soon came into direct confrontation with Silla. This period could well be called an age of opposing southern and northern states, but it is customary to place the primary focus on Silla because little is known about Parhae (though it built a highly civilized state that the Chinese referred to as Haedong-sŏngguk, the Prosperous Country of the East). After Parhae's collapse its territory was controlled by the northern nomadic peoples and was thus not part of Korean history.

Unified Silla saw the flowering of absolute monarchy, which reduced almost to nothing the influence of the Hwabaek. A central administrative body called Chipsabu was established to execute royal decrees. Aristocrats were now granted salaries and given land, but the latter was to revert to the state after tenure, thus reducing direct control of land and of the governed by the aristocracy. Monarchs built extravagant palaces and annexes and royal tombs. The nation was divided into administrative units: state, county, and ward. Five provincial capitals prospered as cultural centres.

Among the aristocracy, Avataṃsaka Buddhism provided the ideological backing for autocratic monarchy. The underprivileged general public was attracted most to the *Sukhāvatī-vyūha-sūtra,* promising bliss in the next world. The flowering of Buddhism produced many beautiful temples and great works of art, the most remarkable of which were Pulguk-sa, Sŏkkuram (a grotto shrine), and the bell at Pongdŏk-sa.

Confucianism prospered among low-echelon aristocrats, who used it as a foothold for political advancement. The National School, Kukhak, was established, and a sort of civil service examination system, called *toksŏ samp'um kwa,* was installed.

Disputes over succession in the 8th century

Emergence of provincial magnates. Frequent conflicts and rebellions over succession took place among the Silla aristocracy in the late 8th century. Aristocrats eventually restored the authority of the Hwabaek, overthrowing royal despotism. Even lower-ranking aristocrats demanded the abolition of restrictions imposed by the strict status system. New powerful families appeared in many provinces and grew because of the weakening of central control. Provincial military fortresses were established to repel Chinese pirates. The most active was the Ch'ŏnghae fortress led by Chang Po-go, who almost monopolized trade with China and Japan and had a private army of 10,000. Silla settlements in Chinese coastal cities in the Shantung Peninsula were also engaged in trade. Also powerful were the village rulers, who became castle lords by reinforcing control over military, administrative, and economic affairs. Many farmers, taxed by both the central government and castle lords, chose to become drifters or robbers, often staging rebellions.

Largely as a result of these trends, two provincial leaders, Kyŏnhwŏn and Kungye, established the Later Paekche (892) and Later Koguryŏ, also called Majin or T'aebong (901), kingdoms, which, along with Silla, are commonly referred to as the Later Three Kingdoms. In this period Sŏn (Zen) Buddhism was most popular, emphasizing the importance of realizing, through contemplation, the inborn Buddha nature of the individual.

KORYŎ

Social structure and culture. Koryŏ was founded in 918 at Songak (Kaesŏng) by Wang Kŏn, who in 935 established a unified kingdom in the Korean peninsula. Wang Kŏn went to great lengths to absorb the people of the overthrown states, even accepting the survivors of Parhae, which had been destroyed by the Khitan (Liao). Proudly declaring itself the successor of Koguryŏ, Koryŏ launched active campaigns to recover lost territory, clashing frequently with the Khitan in the north. Koryŏ eventually expanded its territory to the Yalu River (Korean Amnok-kang).

The Koryŏ ruling class consisted largely of provincial castle lords and former Silla aristocrats. The rulers regarded their family lineage highly. Marriage into a powerful family, especially a family of royal blood, was an important means for maintaining and elevating social and political status. Sons of a family above the fifth of nine official grades received official posts without going through civil service examinations.

The central government was run by the two supreme organs—Samsŏng, the highest administrative body, and Chungch'uwŏn, the secretariat to the king. These two formed the Supreme Council of State. Koryŏ thus practiced aristocratic council-centred politics. Central aristocrats were granted land that was later to be returned to the state. Officials above the fifth grade were given land for permanent possession. Even the land supposed to be returned was actually handed down for generations because the grantees' sons usually became officials. Aristocrats expanded their land by reclaiming, purchasing, or seizing by force, and land became the primary source of wealth.

Aristocrats believed in Buddhism as a religion, for spiritual fulfillment and personal happiness; and in Confucianism, for its political precepts and ethical principles. The same was true of the government, which built grand Buddhist temples, such as Hŭngwang-sa, to observe rituals and pray for the prosperity of the nation, but also set up a school named Kukchagam to teach Confucianism.

Military rule. Civilian officials constituted the core of the ruling class; the military was generally discriminated against. Indeed, the supreme commander for military affairs was a civilian. Military officials were not eligible for the second grade of the official hierarchy and were excluded from the Supreme Council. Even in the same official grade, military men received less land than did their civilian counterparts. This discrimination eventually led to a military coup d'etat in 1170. The revolutionaries massacred a large number of civilian officials and gained complete control of government. Struggles for hegemony soon occurred among the leaders and were ended by Gen. Ch'oe Ch'ung-hŏn, who established a military regime of his own that lasted about 60 years.

The military coup of 1170

The monarch remained as a figurehead, deprived of political power, which was in the hands of the Ch'oe families. The Ch'oes set up a private army for personal security and a new public military organization for national security, but the latter also served, in effect, as their private army. They also established a body of civilian officials to take care of the state personnel administration, thus controlling both military and civilian leaders.

Buddhism was suppressed and retreated to remote mountain areas, where it formed a new Sŏn sect called Chogye-jong, which became the main current of Korean Buddhism. The underprivileged farmers, stimulated by a general political atmosphere in which subordinates rose against superiors, staged rebellions across the country over a period of 30 years. The upheavals were at first natural and spontaneous protests against unfair oppression, but they developed into organized campaigns for liberation and for the seizure of power. The rebellions, eventually brought under control through appeasement and the use of naked force, were nevertheless instrumental in improving the lot of the underprivileged.

In 1231 the Mongols invaded Koryŏ, and the Ch'oe regime resisted for about 30 years. Even farmers and servants stood up bravely, and the Mongols, who had conquered most of Eurasia, could not take Koryŏ by force. As the exploitation of farmers by the Ch'oe grew more severe, however, the people became estranged, and the regime was finally overthrown by civilian leaders, who concluded a peace treaty with the invaders.

Social change in later Koryŏ. After the peace treaty Koryŏ was subject to some political interference from the Mongols but retained its political and cultural independence. Koryŏ went to some lengths to show its national and cultural superiority over the invaders by turning out highly advanced poems and national history books.

This period saw the remarkable development of huge farms, run by powerful aristocrats, which were scattered across the country. The landowners lived in the capital and sent private vassals or servants to collect taxes from the tenants, the common people who farmed the land. These tenants were often required to pay taxes to more than one owner because it became popular for landholders to share ownership. Tenants were also subject to forced labour and military duty for the state. Many farmers chose to become servants, thus getting protection from the aristocrats and avoiding the state duties. Some aristocrats also caught drifters and illegally made them servants. Thus, the number of servants increased, but these servants were actually on a level with tenants. They were not slaves in the Western sense but were more like serfs. The increase in the number of landholders and servants reduced the source of state tax revenue and the number of people to be mobilized in war.

Through civil-service examinations, the central government recruited a new bureaucratic force consisting of *sadaebu* (scholar officials), who generally had small farms in their native towns under their own management. These men were usually not satisfied with Buddhism and mere interpretations of the classics, and they adopted Neo-Confucianism, which brought a metaphysical approach to the understanding of the universe. Because of the financial straits of the government, the new officials could not receive land commensurate to their rank; thus, their demand for land reform was strong. Eventually, with the support of Gen. Yi Sŏng-gye, they seized power and established a new land-distribution system, under which land was granted according to the rank of office. These reforms ended the Koryŏ dynasty in 1392 and established the Yi dynasty. (K.-b.L.)

End of the Koryŏ dynasty

THE YI DYNASTY

The establishment of a Confucian state. The Yi dynasty was established and the region under its control named Chosŏn with permission of the emperor of China. The Yi dynasty, with 26 monarchs, ruled until the Japanese annexation of Korea in 1910. Hanyang (now Seoul) was made the capital. The Confucian ethical system was adopted officially and replaced Buddhism, which had become corrupt. Many Confucian institutions of learning were set up, and Neo-Confucian scholars gained government posts through civil-service examinations.

The early Yi dynasty flourished intellectually and culturally, especially in the reign of Sejong the Great, the fourth monarch. With the technique of movable-type printing, developed in Korea in 1234, many publications in such fields as medicine, astronomy, geography, history, and agriculture were produced. In 1420 a royal academy called Chiphyŏnjŏn was established, and many promising young scholars engaged in study and research there. In 1443 the Korean phonetic alphabet, Han'gŭl, was completed under Sejong's direction.

In the reign of Sejo, the seventh monarch, a powerful centralized and civilian-oriented government structure emerged. Laws were codified. The highest administrative body was the Supreme State Council. The country was divided into eight administrative provinces, and all officials were appointed by the central government.

Late in the 15th century, Korean scholars made original contributions to the theoretical refinement of Confucianism. In the mid-16th century many of these scholars were recruited to government positions. Idealistic in orientation, they criticized the bureaucratic establishment and recommended drastic measures toward the realization of Confucian ideals. But relentless counterattacks and pressures forced most of the scholars to quit their posts. They set up private academies of Confucian learning, called *sŏwŏn.* These academies produced many eminent scholars, including Yi Hwang (T'oegye) and Yi Yi (Yulgok), whose distinct theories of the universe evolved into mutually antagonistic schools.

Foreign invasions. In 1592 Toyotomi Hideyoshi, the military ruler of Japan, sent a large expeditionary force to Korea in an alleged attempt to invade China. Korean land forces suffered a series of defeats, but Korean naval forces, led by Adm. Yi Sun-shin, secured full control of the sea. Yi won the greatest naval victory in Korean history over the Japanese troops off the southern coast. People of almost all ranks, even Buddhist priests, volunteered to fight the Japanese. Contingents came from Ming China to help Korea. After about a year the Japanese were forced to withdraw. In 1597 Toyotomi launched another invasion, but, after his sudden death in 1598, the Japanese again withdrew. The war left most of Korea in waste. Palaces, government buildings, and private houses were burned; cultural treasures were lost or destroyed. Some scholars and artisans were taken to Japan, where they were required to teach the methods of Korea's more advanced technology.

Korea's greatest naval victory

In the early 16th century, nomadic Manchu violated the borders of both Ming China and Korea. Ming and Korean punitive attacks on Manchu strongholds in 1619 were beaten back, and in 1627 Manchu nomads overran the northern regions of Korea. Only after Korea had agreed to recognize their claim to "brotherhood" did the Manchu pull out of the occupied territory. In 1637 the Manchu captured Seoul and wrested an unconditional surrender from the king. The Manchu then overthrew the Ming and established the Ch'ing dynasty. Thus, the tribute that Korea had paid to the Ming now had to be switched to the Ch'ing.

Silhak and popular culture. A series of significant changes in Korea began in the mid-17th century and made a great impact on virtually every sector of Korean society in the 18th century. In agriculture, rice transplantation became popular. Irrigation systems were improved. Advances in farming brought dramatic boosts in agricultural produce and raised the standard of living for farmers. With the cultivation of such special crops as tobacco and ginseng, commerce and trade developed apace. The government started minting coins and collecting farm rents in cash. Markets were held in many places across the country. Particularly active were merchants from Kaesŏng, who had a nationwide network that put every fair in the country within their sphere of influence.

In the realm of scholarship, attention shifted from traditional theorizing to matters of relevance—to the needs of the society and nation. Such scholars are often referred to as the Silhak, or Practical Learning school. Silhak scholars fell into four major groups. One group advocated comprehensive administrative reform, calling upon the government to rationalize the systems of civil-service examination, education, taxation, and land administration. Another group stressed the need to foster commerce, industry, and technology. A third conducted critical examinations of the Confucian Classics. The fourth group focussed on the study of the history, geography, and language of Korea. Their research and publications provided a basis for study for the generations that followed.

Comparable new trends appeared in arts and letters. Mass-oriented literary and artistic works came into fashion, a great change from the tradition of catering exclusively to the upper classes. The new works were not only written in the easy-to-read Han'gŭl but also gave frank expression to popular discontent. Singing dramas or traditional Korean operas, most of them adapted from popular novels, were also popular with the masses. Many artists specialized in pictures of blacksmiths at work, farmers in the field, traditional wrestling matches, and in landscapes of the countryside. Pottery with a simple blue and white glaze was produced in large quantities for mass consumption.

Arrival of Europeans

The introduction of Catholicism. Europeans began to arrive in East Asia in the mid-17th century. In 1656 a Dutch merchant ship went aground off the southern shore of Cheju-do (Cheju Island). The 36 survivors were taken to Seoul for detention. About 13 years later Hendrik Hamel and seven others escaped and returned home. Hamel wrote an account of his experiences—the first book on Korea published in the West.

Along with the European merchants in East Asia came Catholic priests. Korea's first contact with Christianity was through missionaries in China. Korean envoys to China in the 16th century brought back with them a world atlas and scientific instruments made by the priests, as well as literature on science and Christianity. Some Silhak scholars had converted to Catholicism by the late 18th century, even before missionaries reached Korea. Most of the early converts were aristocratic scholars. A number of commoners were later attracted to the Catholic Church, finding a hope of salvation in the Christian doctrine of equality of all men before God and a new source of joy in the Christian belief in life after death. Catholicism spread from Seoul to the provinces slowly but steadily.

The incompatibility of Catholicism with Confucianism posed a serious problem. The two sides could not compromise on the great importance Confucianism attached to ancestor worship, which Catholicism rejected as pure idolatry. The government began to suppress the Catholic Church in the belief that it defied the existing sacrosanct mores of Confucianism. During persecutions in 1801, 1839, and 1866, scholar converts were either put to death or forced to turn renegade; foreign missionaries were ferreted out and beheaded. But rank-and-file Catholics rallied around the church and kept it alive. In 1831 the Holy See set up a Korean parish. French priests smuggled themselves into the country and engaged in clandestine activities.

The advent of Silhak, mass-oriented arts, and Catholicism in the 17th and 18th centuries is an indication of a modern Korea in the making. But in the 19th century young princes came to the throne, and power-hungry maternal relatives seized power and plunged the government into a state of collapse. One peasant uprising followed another in the provinces, and the whole nation was seething with popular discontent and resentment.

Many farmers sought refuge in religion. A new religion founded (*c.* 1860) by Ch'oe Che-u, a fallen aristocrat scholar, advocated sweeping social reform; it had much in common with traditional animism, and it appealed to the farmers. This religion was called Tonghak, or Eastern Learning, as a counterpoise to Sŏhak, or Western Learning—*i.e.,* Catholicism.

CONTACT WITH WORLD POWERS

The opening of the door. King Kojong was too young to rule when he ascended the throne in 1864, and his father, Taewŏn-gun, was appointed regent. Taewŏn-gun set out to restore all the powers of the monarchy and pursued a policy of national isolation. He put into force bold political reform measures, such as liberal civil service recruitments and the abolition of a great number of private Confucian academies.

During his regency Western men-of-war and merchant vessels came in search of trade and friendship, but the regent refused them. Korean soldiers and civilians burned and sank the United States merchant ship "General Sherman" at P'yŏngyang in revenge for acts of plunder committed by the crew. Korean forces repulsed two attacks by French warships in 1866. In 1871 a United States flotilla came to retaliate for the "General Sherman" but was beaten back. Such incidents strengthened Taewŏn-gun's resolve to keep the country's doors closed.

Japan repeatedly made futile attempts to establish diplomatic relations with Korea. The Japanese military thereupon raised an outcry for a war of conquest on Korea. Meanwhile, Taewŏn-gun came under widespread criticism for the enormous financial burden he had imposed on the people. Popular resentment forced him to step down as regent in 1873. Relatives of Queen Min took over the helm of state and initiated policies opposed to Taewŏn-gun's. Japan, which had been watching every development in Korea, now dispatched a fleet and pressured Korea to sign a treaty of trade and friendship. The ports of Pusan, Wŏnsan, and Inch'ŏn were opened to the Japanese in 1876.

Treaty with Japan

The growing Japanese presence in Korea was disturbing to the Ch'ing rulers of China. When conservative soldiers tried to restore Taewŏn-gun, the Ch'ing used it as an excuse for stationing forces in Korea. Thus began a period of open Ch'ing interference in Korean affairs. The Ch'ing forced Korea to sign a treaty of trade that heavily favoured Chinese merchants. Korea signed a treaty of trade and friendship with the United States through the offices of China. Similar treaties with Great Britain, Germany, Russia, and France followed, and resident foreign missions were established in Seoul.

Once the doors were opened, a modernization movement was begun. Students and officials were sent to Japan and China. Western-style schools and newspapers were founded. The government, however, could not push ahead with a consistent policy of modernization, for the King was feebleminded and the ruling classes were hopelessly divided into radicals and moderates.

In a coup of 1884 the Radicals seized power and drew up a bold blueprint for reform. But a Ch'ing contingent moved in and overthrew their three-day-old regime. This led to the signing of the Li-Itō Convention, designed to guarantee a Sino-Japanese balance of power in the Korean peninsula.

The Tonghak Revolt and government reform. Government expenditures greatly increased, largely because of appropriations for machinery imports and government reorganization, and the financial picture was aggravated by obligations to pay reparations to foreign governments. Heavier tax levies were imposed on farmers, who provided the bulk of government revenue. The import of such necessities as cotton textiles upset the traditional self-sufficiency of the farming community. Usurious loans by Japanese rice dealers helped reduce the peasantry to abject poverty. Angry farmers turned increasingly to Tonghak.

Despite ruthless government persecution, Tonghak took deep root in the peasantry. Its followers staged large-scale demonstrations calling for an end to injustice. Negative official response precipitated the Tonghak Revolt (1894), in which the Tonghak followers and the peasantry put up a united front for popular liberation. Government troops armed with Western weapons suffered ignominious defeats in southern Korea, weakening the government's military grip on the country. Foreign intervention seemed the last resort open to the rulers. Ch'ing troops soon moved in at the request of the government. Then Japan dispatched its large units uninvited, and the two alien powers were in sharp and sudden confrontation.

Japanese hegemony

The rebels laid down their arms voluntarily to defuse the threat. But a war broke out in 1894; Japan emerged victorious, and the two powers signed the Treaty of Shimonoseki, recognizing Japanese hegemony in Korea.

The Japanese dictated to the Korean government a wide range of reforms. Korea set up a council to plan and initiate reforms and issued pertinent decrees. Western-style institutions and a cabinet were formed. Civil-service examinations were discontinued. Such social practices as class discrimination were abolished. But public reaction to the reform policy was unfavourable. The government realized that old practices and institutions die hard and that reform takes more than mere decrees and imitation of things Western.

International power struggle and Korea's resistance. Japan's supremacy in Korea and its subsequent seizure of the Liaotung Peninsula in Manchuria was more than Russia, with its long-cherished dream of southward expansion, could tolerate. With German and French support, Russia pressured Japan to return the peninsula to China. At the same time, encouraged by Russia, the Korean government showed signs of drifting toward an anti-Japanese course. The Japanese government, however, promptly engineered the assassination of Queen Min (October 1895), the suspected mastermind behind the anti-Japanese attitude. Fearing for his own life, the King took refuge in the Russian Legation, granting such concessions as mining and lumbering rights to Russia and other powers.

Popular movements for the restoration of Korean sovereignty arose under the leadership of such figures as Sŏ Chae-p'il (Philip Jaisohn). After many years of exile Sŏ organized, in 1896, a political group called the Tongnip Hyŏphoe (Independence Association); he also published a daily newspaper named *Tongnip Sinmun* (The Independent) as a medium for awakening the populace to the importance of sovereignty and civil rights. On the urging of the Tongnip Hyŏphoe, the King returned to his palace and declared himself emperor and the Korean empire equal to other nations.

The Boxer Rebellion in China led to a Russian invasion of Manchuria and to the Russo-Japanese War (1904–05). The Korean government at first declared neutrality. But under Japanese pressure, it signed an agreement allowing Japan to use much of the country for operations against the Russians.

Japan won the war, and the resulting Treaty of Portsmouth (September 1905), signed through the mediation of the United States, recognized Japan's undisputed supremacy in Korea. Its hand thus strengthened, Japan forced the Korean emperor into signing a treaty that made Korea a Japanese protectorate (December 1905).

Although the Korean emperor sent a secret emissary to the international peace conference held at The Hague in 1906 to urge the big powers to intercede with Japan on behalf of Korea, the mission failed, serving only to infuriate Japan. Under Japanese coercion, the Emperor then abdicated in favour of his son, Emperor Sunjong. The Korean Imperial Army was disbanded, and in 1910 Japan annexed Korea.

Japanese annexation of Korea

A Korean Army, led by deposed officials and Confucian scholars, had arisen against the Japanese in the southern provinces following the 1905 treaty. For five years the militiamen effectively harassed the Japanese occupation forces, especially in 1908 and 1909. With the annexation, however, they were driven into Manchuria. Large numbers of Koreans emigrated to Manchuria, Shanghai, and Hawaii around this time.

KOREA UNDER JAPANESE RULE

Military control. Japan set up a government in Seoul, with the governor generalship filled by generals or admirals appointed by the Japanese emperor. Koreans were deprived of freedom of assembly, association, the press, and speech. Many private schools were closed because they did not meet certain arbitrary standards. The colonial authorities used their own school system as a tool for assimilating Korea to Japan, placing heavy stress on the Japanese language and excluding such subjects as the language and history of Korea. The Japanese built a nationwide transportation and communications network and established a new monetary and financial system. They also encouraged Japanese commerce in Korea while barring Koreans from similar activities.

The government promulgated a land-survey ordinance that forced landowners to report the size and area of their land. By failing to report, many farmers were deprived of their land. Land and forestry owned jointly by a village or a clan were also appropriated by the Japanese because no single individual could lay claim to them. Much of the land acquired by the government was sold cheaply to Japanese. Many of the dispossessed took to the woods and became brand tillers; others emigrated to Manchuria and Japan in search of jobs (the majority of Korean residents in Japan today are their descendants).

The March 1st Movement. A turning point in Korea's resistance movement came on March 1, 1919, when nationwide anti-colonial rallies were staged. The former emperor Kojong, the supreme symbol of independence, had died a few days before, bringing mourners from all parts of the country into Seoul. A declaration of independence was read at a rally in Seoul on March 1. Waves of students and citizens took to the streets, calling for independence. This movement took the form of peaceful demonstrations appealing to the conscience of the Japanese. An estimated 2,000,000 persons took part. The authorities responded with brutal repression, unleashing their gendarmerie and army and navy units and thus ending the demonstrations. They arrested some 47,000 Koreans, of whom about 10,500 were indicted, and killed and wounded nearly 23,000.

In April, independence leaders, including Syngman Rhee, An Ch'ang-ho, and Kim Ku, formed a Korean provisional government in Shanghai. It brought together all Korean exiles and established an efficient liaison with leaders inside Korea. Japan realized that its iron rule had to be replaced with more sophisticated methods. The gendarmerie gave way to an ordinary constabulary force, and some freedom of the press was granted. But the oppressive and exploitative Japanese colonial policy remained as ruthless as ever though with less conspicuous methods.

Korean provisional government in exile

Taking advantage of a wartime business boom, Japan took leaps forward as a capitalist country. Korea became not only a market for Japanese goods but also a fertile and untapped market for capital investment. Meanwhile, industrial development in Japan was achieved at the sacrifice of agricultural production, creating a chronic shortage of rice. The government enforced projects for the improvement of rice production throughout Korea. Many farmers were ordered to turn their dry fields into paddies. The program was temporarily discontinued during the worldwide depression in the early 1930s. But it was soon resumed to meet the increased needs of the Japanese military in its war against China, which began in 1931. Most Koreans were forced to subsist on low-quality cereals imported from Manchuria instead of their own rice.

The end of Japanese rule. Of the several dailies and magazines founded shortly after the March 1st Movement, the newspapers *Dong-a Ilbo* and *Chosun Ilbo* spoke the loudest for the Korean people and inspired them with the ideals of patriotism and democracy. In the academic community, scholars conducted studies of Korean culture and tradition. Many novels and poems were written in colloquial Korean.

A major anti-Japanese mass rally was held in Seoul in 1926, occasioned by the funeral of Sunjong. A nationwide student uprising originated in Kwangju on November 11, 1929, calling an end to Japanese discrimination. These and other resistance movements were led by the New Cadre, composed of a whole spectrum of Korean intellectuals.

In 1931 the Japanese imposed military rule once again. After the outbreak of the Sino-Japanese War (1937) and of World War II (1941), Japan tried to obliterate Korea as a nation, forcing Koreans to worship at Shintō temples and even to adopt Japanese names and banning academic societies devoted to Korean studies as well as newspapers and magazines published in Korean. The Japanese needed manpower to replenish the dwindling ranks of their military and labour forces. They drafted hundreds of thousands of able-bodied Koreans to fight for Japan and to work in mines, factories, and military bases.

When Shanghai fell to the Japanese, the Korean provisional government moved to Chungking. It soon formed a liberation army of Korean independence fighters scattered all over China and declared war on Japan in 1942. The small liberation army fought with the Allied forces in China until the Japanese surrender in 1945, which ended 36 years of Japanese rule over Korea. (K.-r.L.)

DIVISION OF KOREA

The Cairo Declaration, issued on December 1, 1943, by the United States, Great Britain, and China, pledged independence for Korea "in due course." The vague phrase aroused the Korean provisional government in Chungking (southwest China) to request interpretation from the United States. Their request, however, received no answer.

At the Yalta Conference held in February 1945, Pres. Franklin D. Roosevelt proposed to Joseph Stalin of the U.S.S.R. a four-power trusteeship for Korea between the U.S., Great Britain, the U.S.S.R., and the Republic of China. Stalin generally agreed to Roosevelt's offer, but they did not reach any formal agreement on the future state of Korea, and after the Yalta meeting there was a growing uneasiness between the Anglo-American allies and the U.S.S.R.

Initial concord on Korea

Throughout the Potsdam Conference in July 1945, U.S. military leaders insisted on encouraging Soviet entry into the war against Japan. The Soviet leaders asked the U.S. about invading Korea, and the U.S. declined to do so on the grounds that such an expedition would not be practicable until after a successful landing had taken place on the Japanese mainland. The ensuing Potsdam Declaration included the statement that "the terms of the Cairo Declaration," which promised Korea its independence, "shall be carried out. . . ." In the terms of its entry into the war against Japan on August 8, the U.S.S.R. subscribed to support the independence of Korea. On the following day Soviet troops went into action in Manchuria and landed on the northern tip of Korea.

The General Order No. 1, drafted on August 11 by the United States for Japanese surrender terms in Korea, provided that Japanese forces north of the 38th parallel of latitude were to surrender to the Soviet commanders while those south of that line were to surrender to the U.S. commander. Stalin did not raise objections to the contents of the order, and on September 8 American troops arrived in southern Korea almost a month after the first Soviet entry. On the following day the United States received the Japanese surrender in Seoul. There were now two zones, for the Soviets had already begun to seal off the 38th parallel.

The historic decision to divide the peninsula has aroused speculation on several counts. Some believe that the division of Korea was made simply for the sake of military expedience in receiving the Japanese surrender. Others tend to think that the division was politically motivated to prevent the Soviet forces from occupying the whole of Korea. Considering the fact that American policy toward Korea during World War II had aimed to prevent any single power's domination of Korea, it may be reasonably concluded that the reason for the division was to stop the Soviet advance south of the 38th parallel.

After the simple discussion on trusteeship between Stalin and Roosevelt at the Yalta meeting, it was not until May 1945, at a meeting with the Chinese foreign minister in Moscow, that Stalin confirmed his agreement to set up a four-power trusteeship. The ensuing Moscow Conference, held in late December, created a four-power trusteeship and established a Joint U.S.–U.S.S.R. Commission of the rival U.S. and Soviet military commands in Korea for the settlement of the question of a unified Korea. When the Joint Commission convened in Seoul from March to May 1946, the Soviet delegates demanded that those Korean political groups that had opposed trusteeship be excluded from consultation. The United States refused, and on this rock foundered all attempts by the commission to prepare for the unification of Korea. The commission met again from May to August 1947, but it achieved nothing for the creation of a unified Korea.

The United States presented the entire matter of Korean unification to the United Nations in September 1946. The United Nations General Assembly adopted a resolution, proposed by the United States, rejecting the Soviet position. The resolution called for general elections in Korea under the observation of a UN Temporary Commission on Korea, those elected to make up a National Assembly, establish a government, and arrange with the occupying powers for the withdrawal of their troops from Korea. But the U.S.S.R. barred the Temporary Commission from entering North Korea. The South, however, held elections under the supervision of the Temporary Commission on May 10, 1948. The National Assembly convened on May 31 and elected Rhee as its speaker. Shortly afterward a constitution was adopted, and Rhee was elected president on July 20. Finally, on August 15, the Republic of Korea was inaugurated, and the military government came to an end. On December 12 the UN General Assembly declared that the republic was the only lawful government in Korea.

Construction of the People's Republic

Meanwhile, on November 18, 1947, the Supreme People's Assembly of North Korea set up a committee to draft a North Korean constitution. The committee adopted a new constitution in April 1948, and on August 25 elections for members of the Supreme People's Assembly were held with a single list of candidates. On September 3 the constitution of the Democratic People's Republic of Korea was ratified by the Supreme People's Assembly, which was holding its first meeting in P'yŏngyang. Kim Il-sung was appointed premier of the People's Republic, and on September 9 the Democratic People's Republic of Korea was proclaimed. The U.S.S.R. recognized the People's Republic as the only lawful government in Korea on October 12. (B.-h.H.)

South Korea

In 1948, by a United Nations resolution, the Republic of Korea (South Korea) was formed in the south, and in the same year the Democratic People's Republic of Korea (North Korea) was formed in the north. As a result of the Korean War, which began in June 1950, following an invasion of South Korea by troops from North Korea, a demilitarized zone was established in 1953. It runs roughly from the mouth of the Han-gang (Han River) on the west to a little south of the town of Kosŏng on the east coast and is about 150 miles (240 kilometres) in length. The present effective administrative area of South Korea is about 45 percent of undivided Korea: 38,221 square miles (98,993 square kilometres). South Korea is divided administratively into nine provinces (*do* or *to*) and two special cities (*t'ŭkpyŏlsi*), Seoul (Sŏul) and Pusan. It maintains diplomatic and trade relations with more than 100 countries. South Korea has not been admitted to the United Nations but has joined almost all of the United Nations agencies. The country has made considerable economic progress since the 1950s, with the government pursuing ambitious industrialization programs with special emphasis on mobilization of domestic capital and the promotion of export industries.

PHYSICAL AND HUMAN GEOGRAPHY

The land. *Relief.* Korea is largely mountainous, with small valleys and narrow coastal plains. The Taebaek-sanmaek (Taebaek Mountains), forming the backbone of the peninsula, run in a north–south direction along the eastern coastline. From them extend several mountain ranges oriented in a northeast–southwest direction. Principal rivers (*gang*), such as the Han, Kum, and Naktong, all have their sources in the Taebaek-sanmaek, and they flow between the ranges. These mountains are not very high, none exceeding 5,700 feet (1,737 metres) above sea level. The highest peak in South Korea, Halla-san on Cheju-do (Cheju Island) is 6,398 feet (1,950 metres) above sea level. There are comparatively extensive lowlands along the lower parts of the Han, Kum, and Naktong rivers. The eastern coastline is relatively straight, whereas the west has an extremely complicated ria (*i.e.,* creek-indented) coastline with many islands. The Yellow Sea and the complex coastline causes one of the highest tidal ranges in the world—about 30 feet (nine metres) maximum at Inch'ŏn, the entry port for Seoul.

Geological foundation

Geologically, the Korean peninsula consists in large part of Precambrian rocks (more than 570,000,000 years old), such as granite and gneiss. There are two volcanic islands, Cheju and Ullŭng, and a small-scale lava plateau in Kangwŏn Province (Kangwŏn-do). Most soils derive from granite and gneiss. Sandy and brown-coloured soils are common, and they are generally well leached and have little humus content. Podzolic soils are found in the highlands resulting from the cold of the long winter season.

Climate. Because of continental influences the climate of Korea is characterized by a cold winter and a hot summer. The annual range of temperature is greater in the north and in interior regions than in the south and along the coast. The average monthly temperature in January drops below freezing except along the southern coast, and the July average monthly temperature rises to about 78° F (25° C). The average monthly temperature in January at Seoul is about 23° F (−5° C), and about 78° F (25° C) in August; at Pusan, on the southeast coast, the average January temperature is 35° F (2° C), and the August average is about 78° F (25° C), as in Seoul. The annual rainfall varies from about 40 to 55 inches (1,016 to 1,397 millimetres). Taegu, the driest area, has 38 inches, and Pusan, one of the wettest areas, receives 55 inches of annual rainfall. About 70 percent of the annual rainfall is received during the summer monsoons and shifting polar fronts. Occasionally, late summer typhoons cause heavy showers and storms along the southern coast. The frost-free season varies from 170 to 226 days.

Plant and animal life. The long, hot, humid summer is favourable for the development of extensive forests, which cover about two-thirds of the total land area. Because of fuel needs in the long cold winter, however, and the high population pressure, the original forest has almost disappeared. Except for subtropical broadleaf forests in a narrow belt along the southern coast, most areas contain broadleaf and coniferous trees. Wild-animal life is similar to that of northern China and the Manchurian region. Tigers, leopards, lynxes, and bears, formerly abundant, have almost disappeared, even in remote areas.

Settlement patterns. The pace of urbanization since 1960 has caused decreases in rural population, not only proportionally but also absolutely. Agriculture is the most important occupation in rural areas, and rural settlements are thus found close to arable lands—mainly in river valleys and coastal lowlands. Agglomerated villages are common, ranging from a few houses to several hundred. Villages are frequently located along the foothills facing toward the south, backed by hills that give protection from the severe northwestern winter monsoon winds. Fields are divided into tiny plots and are cultivated by manual labour and animal power. Two types are found: rice fields and upland fields. Rice fields are usually irrigated, while upland fields are unirrigated dry fields, in which barley, wheat, soybeans, and millet are grown. Along the coastline small clustered fishing villages are found. Although the fishing population is not a large portion of the rural population, fishing is an important industry for export and for obtaining protein foods. Logging, mainly of coniferous trees, is limited to the mountain areas of Kangwŏn and Kyŏngsang provinces. Settlements in mountain areas are usually scattered, in contrast to the lowlands. Logging is usually practiced during the off-season for agriculture.

Urban expansion

Rapid expansion of urban areas in the past decade, especially the expansion of Seoul and Pusan, has resulted in considerable changes in urban landscapes. Before 1960 there were very few high-rise buildings; even in Seoul most structures were lower than 10 stories. By the early 1970s, however, buildings of more than 20 stories had become common in the city. Because of this rapid growth, city services, such as water, transportation, and sewage systems, have not met the increasing needs. The difficulties in improving these services is exacerbated by the fact that old and new buildings are still located side by side; modern high-rise buildings stand next to traditional one-story Korean houses, even in the business district.

The people. *Ethnic distribution.* The Korean people may originally have had links with the people of Central Asia, the Baikal region, Mongolia, and the coastal areas of the Yellow Sea. Tools of Paleolithic type and other artifacts found in Sokch'ang-ni, near Kongju, are quite similar to those of the Baikal and Mongolian areas. The physical characteristics of Koreans show Mongolian racial traits, such as dark straight hair, straight noses, high cheek bones, and the Mongolian eyelid fold. The population is quite homogeneous, with only a small percentage of foreigners, most of them urban Chinese, in South Korea.

Since 1960 birth and mortality rates have decreased rapidly. The decrease in the birth rate has been caused chiefly by a national campaign for family planning conducted since 1965. It also reflects the increasing number of educated people in South Korea. The country, however, continues to struggle to reduce its population growth.

Migration patterns

Before World War II, Koreans migrated to two major regions: Manchuria and Japan. People migrating into Manchuria were mainly from northern Korea, while those who went to Japan were mostly from southern Korea. It is estimated that in 1945 about 2,000,000 Koreans lived in Manchuria and Siberia and about the same number in Japan. About one-half of the Koreans in Japan returned to South Korea just after 1945. The most important migration, however, was the north-to-south movement of people after World War II, especially the movement that occurred during and after the Korean War. About 2,000,000 people migrated to South Korea from the North during that period, settling largely in the major cities.

More than one-half of the South Korean population lives in 30 cities and the country's two metropolises, Seoul and Pusan. Seoul, the capital, contains about one-fifth of the total population.

Religion. There is little uniformity of religious belief in Korea, which is confusing to outsiders. In a typical Korean family, the women may adhere to the Buddhist religion, while the men may be followers of the Confucian ethical system. The teachings of Confucius, including ancestor worship, are probably the most important basic belief and are especially strong in the rural areas. Deep-rooted Buddhism is more popular with women, and old Buddhist temples are part of the typical rural and urban scene. Christianity is relatively new in Korea, although it claims a large number of devoted adherents and has had a profound effect on the modernization of Korean society. An eclectic religion, Ch'ŏndogyo—a combination of Buddhism, Confucianism, Christianity, and even Taoism—spread widely in the latter part of the 19th century. Shamanism still remains strong in the minds of rural people, especially among women. Ch'angga Hakhoe (Value Creation Learning Society), introduced from Japan in 1963, has become popular in the low-income areas of major cities; it is a militant society of followers of the 14th-century Japanese Buddhist Nichiren, organized in Tokyo as the Sōka-gakkai in the early 1930s.

MAP INDEX

Political subdivisions

Cheju-do	33·20n	126·30e
Chŏlla-namdo	34·45n	127·00e
Chŏlla-pukto	35·45n	127·15e

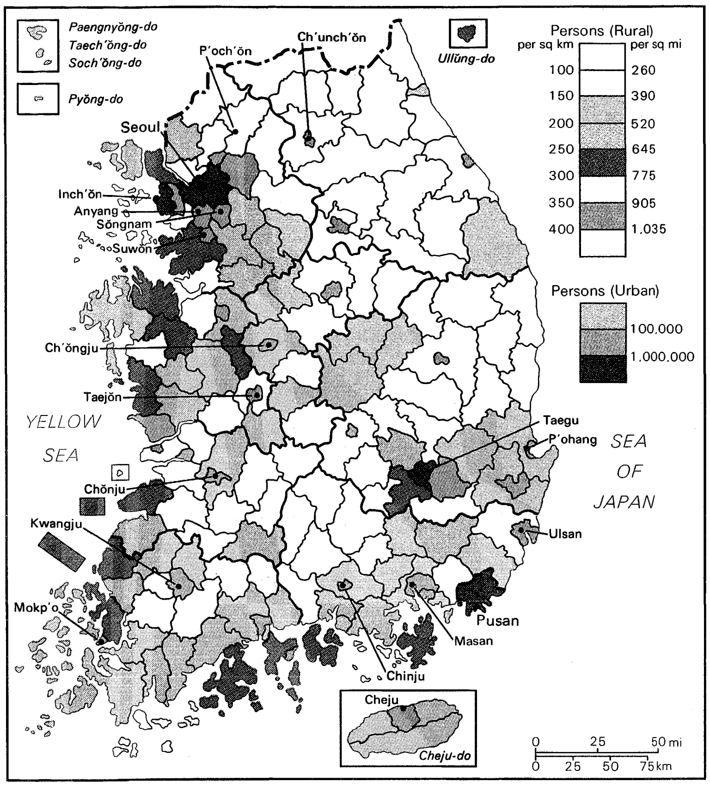
0 25 50 100 150 km

0 25 50 100 mi

The economy. The South Korean economy has progressed rapidly in the manufacturing and mining sectors under its economic development plans. Export-oriented manufacturing, which has received strong government support, has been particularly successful, and the country's balance of payments has steadily improved, although a payments deficit continued to exist into the early 1980s.

Resources. Natural resources in South Korea are meagre. The leading resources are coal, iron ore, graphite, gold and silver, tungsten, lead, and zinc, comprising almost two-thirds of the total value of mineral resources. Iron ore is exported mainly to Japan, and tungsten is exported to the United States. Both are produced in Kangwŏn Province. Gold and silver are produced mostly in Ch'ungch'ŏng and Kyŏngsang provinces.



Urban population distribution and rural population density of South Korea.

Energy resources consist mainly of coal, petroleum, and hydroelectric potential. Anthracite coal is the major exploited energy resource, production having increased rapidly after 1960. Almost three-fourths of the hydroelectric power stations are located along the Han River, not far from Seoul. Thermal electric-power stations are located in the urban centres, with the exception of one near the coal-producing area. Since the first oil refinery started to produce petroleum products in 1964, power stations have changed gradually from coal to oil. In contrast to North Korea, thermal electric power is far more important than hydroelectric power.

Agriculture and forestry. Both the farm population and the proportion of national income from agriculture are gradually decreasing, with less than one-third of the population engaged in agriculture. More than one-seventh of the gross national product comes from agriculture, forestry, and fishing; and less than one-fourth of the republic's area is cultivated for rice, barley, wheat, soybeans, and other crops. Rice is the most important crop, constituting about two-fifths of all farm products in value. Double cropping of rice and barley is common in Kyŏngsang and Chŏlla provinces.

Development of industry

Industry. The economic development plans stress improvement of mining and manufacturing. Heavy industry, including chemical, metal, and machinery industries, continues to be developed and constitutes about one-third of all industrial products in value. The textile industry has been the most important single industry in terms of value and employment, although its share of the market has decreased. South Korea's principal export markets are the United States, Japan, and Southeast Asian countries.

The government exercised strong controls on industrial development after 1962, giving most support to such large industrial establishments as fertilizer plants and oil refineries. As a result, small and middle industries that were privately managed became increasingly difficult to finance, and consumer goods and consumer spending were discouraged. By the beginning of the Fifth Republic in 1980, however, these trends began to be reversed, especially in credit policies, as the government increasingly divested itself of direct involvement in industry.

Transportation. South Korea's transportation system has expanded and improved to a considerable extent, especially with the introduction of modern highway and air services. It has not met the needs of the country, however, as indicated by congested urban transportation facilities. Bus transportation networks are well developed and serve most of the rural centres. In the rural areas agricultural products are still hauled by oxcart and by human labour. Internal air transportation began in the early 1970s under the aegis of Korean Air Lines. Major cities, such as Pusan, Taegu, Kwangju, Cheju, and Kangnŭng, have scheduled air services. The international airport of Kimp'o, near Seoul, serves most international airlines. In the 1970s the government expanded port facilities at Pusan, Inch'ŏn, and Cheju, which increased their freight-handling capabilities more than fourfold.

The bulk of Korean railroads are government owned. Until 1960 railway travel was the major means of inland transportation for both freight and passengers, but road transport has since become more important. Railroads are almost all of standard gauge, and the Seoul–Pusan line through Taejŏn and the Seoul–Inch'ŏn line are double-tracked. A four-lane highway from Seoul to Inch'ŏn was opened in 1968, and a modern superhighway between Seoul and Pusan was opened in 1970. Road transport has come to account for more than 90 percent of passenger travel and 60 percent of freight transport. (C.Le.)

Administrative and social conditions. *Government.* The government instituted after a constitutional referendum in 1980 is known as the Fifth Republic; that name was retained after another constitutional referendum in 1987. The republic is patterned mainly after the presidential system of the United States and is based on separation of powers among the legislature, the executive, and the judiciary. The government system, highly centralized during the Third and Fourth republics, is less so under the Fifth Republic. The president, since 1987 chosen by direct popular election, is the chief of state, head of the executive branch, and commander of the armed forces. The State Council, the highest deliberative body, is composed of the president, the chairman, the prime minister, the heads of executive ministries, and ministers without portfolio. The prime minister is appointed by the president and approved by the elected National Assembly. Provincial governors are appointed by the central government.

Provisions for presidential government

Extensive constitutional revisions were adopted by referendum in October 1987, modifying considerably revisions that had been adopted in 1980. Under these reforms the president's term of office was limited to one five-year term with no reelection. The powers of the National Assembly, which had been reinstated in 1980 after a period of curtailment, were strengthened, with its 276 members chosen, as previously, by a combination of direct and indirect election to four-year terms. All restrictions on political parties were ended.

South Korea had a two-party system until 1972, when the power of the pro-government party increased substantially and the activity of the opposition was restricted. During the 1980s the opposition was allowed to resume political participation, but it also tended to fragment; thus, the political system became more multiparty in character. The Democratic Justice Party (until 1981 called the Democratic Republican Party) has been the ruling party since its founding in 1963. The New Korea Democratic Party (NKDP), founded in 1985 as a coalition of opposition groups, and the Reunification Democratic Party, an offshoot of the NKDP founded in 1987, have become the major opposition parties. (C.Le./Ed.)

Justice. The judicial branch comprises the Supreme Court, three appellate courts, 12 district courts, and a family court. The Supreme Court is empowered to interpret the constitution and all other state laws and to review the legality of government regulations and activities. The chief justice is appointed by the president with the consent of the National Assembly, upon recommendation of the Judge Recommendation Council.

Education. Six years of primary school education is compulsory, and by 1980 almost all children of school age were enrolled. Most primary school graduates go on to three years of middle school, and many middle school graduates go on to high school or to technical schools. About half of the high-school graduates go to higher educational institutions. Before World War II there were fewer than 20 major college-level institutions in South Korea, but in the decades following the war the number has increased more than fourfold. Admission to the colleges and universities is in most cases granted through competitive entrance examinations.

Health and welfare. The availability of medical services has increased, but medical facilities and the number of personnel are inadequate to meet the country's needs. Improvement has been hampered partly by a continuous migration of medical personnel to foreign countries.

Government welfare activities

Government welfare activities are new and limited in range. The programs include care of disabled war veterans, homes for the aged and for homeless and disabled war widows and orphans, vocational training of women, and care of juvenile delinquents. Since the devastation of the Korean War, United Nations agencies, civilian and military agencies of the United States, and private volunteer agencies have played a significant role in improving living conditions in the south. The shortage of housing remains a problem, but it has been partially solved by central and local government-housing programs in metropolitan areas. The national police force is strongly developed in order to counteract Communist infiltration.

Living conditions in South Korea, relatively poor compared to conditions in developed nations at the end of the Korean War, have improved steadily. From 1968 to 1979 per capita disposable income increased more than sevenfold. Public health and sanitation have been greatly improved, thus reducing epidemics. Average life-expectancy rates rose from about 53 years in the late 1950s to about 70 years by the mid-1980s. Despite improvement of social conditions there is little sign of a narrowing of the gap between rural and urban and low- and high-income groups.

Cultural life. Shamanism, Buddhism, and the philosophy of Confucius constitute the most important background of modern Korean culture. Since World War II, especially after the Korean War in 1950, the modern trends have rapidly progressed. Traditional thought, however, still plays an important role under the surface. Korea belongs to the Chinese cultural realm, although Koreans have maintained a distinct cultural identity throughout their history. The National Museum maintains artifacts of Korean culture, including many national treasures, chiefly in the central museum in Seoul. Its four branches are located at Kyŏngju, Puyŏ, Kongju, and Chŏnju.

Architecture. After the Three Kingdoms period, Korean culture was strongly influenced by the Chinese, although this influence was given a distinctive Korean stamp. Korean architecture shows Chinese influence, but it is adapted to local needs and environment, utilizing wood and granite, the most abundant building materials. Beautiful examples are found in old palaces, Buddhist temples, stone tombs, and Buddhist pagodas.

Painting and ceramics. One of the earliest examples of Korean painting is found in the mural paintings in the kings' tombs of Koguryŏ. The best known mural paintings are those in the Sangyong Tomb, at Yonggang, located in North Korea. Ceramic arts became highly developed, flourishing during the Koryŏ period and diffusing to Japan, and every province continues to produce its distinctive ceramic wares.

Dance and music. Folk dances survive, and folk music, accompanied by native musical instruments, is performed occasionally at ceremonies and festive occasions. The government has made an effort to preserve the traditional arts. The National Classical Music Institute (formerly the Prince Yi Conservatory), for example, plays an important role in the preservation of folk music. It has had its own training centre for national music since 1954. The Korean National Symphony Orchestra and the Seoul Symphony Orchestra give concerts in Seoul and Pusan. (C.Le.)

For statistical data on the land and people of South Korea, see the *Britannica World Data* section in the BRITANNICA WORLD DATA ANNUAL.

HISTORY

The end of Japanese rule after World War II caused political confusion among Koreans in both zones. In South Korea various political parties sprang up. Although they were roughly divided into rightists, leftists, and middle-of-the-roaders, they had a common goal: the immediate attainment of self-government. As early as August 16, 1945, some Koreans organized a Committee for the Preparation of Korean Independence. On September 6 the People's Republic of Korea was proclaimed by delegates attending a national assembly called by the committee. The republic was headed by Woon-hyung Lyuh, who was closely associated with the leftists. But the U.S. military government, under Lt. Gen. John R. Hodge, the commanding general of the United States armed forces in Korea, refused to recognize the republic, asserting that the military government was the "only government" in Korea, as stipulated in General Order No. 1. The U.S. policy in Korea was to establish a trusteeship that would supersede both the U.S. and the Soviet occupation forces in Korea. The exiled Korean provisional government, on returning, declared itself a political party, not a government.

In late December the Council of Foreign Ministers (representing the United States, the Soviet Union, and Great Britain) met in Moscow and decided to create a four-power trusteeship of up to five years. On receiving the news, Koreans reacted violently. On February 14, 1946, to soothe the discontent, the military government created the Representative Democratic Council as an advisory body to the military government. This body was composed of Koreans and had as its chairman Syngman Rhee, former president of the Korean government in exile.

In October the military government created an Interim Legislative Assembly, half of whose members were elected by the people and half appointed by the military government. The assembly was empowered to enact ordinances on domestic affairs but was subject to the veto of the military government. The anti-trusteeship feeling came to a climax a few months later, when the assembly condemned trusteeship in Korea.

Elections were held in South Korea on May 10, 1948, under the supervision of the United Nations Temporary Commission on Korea. The National Assembly met for the first time on May 31 and elected Syngman Rhee as its speaker. In July a constitution was adopted, and Rhee was elected president. The Republic of Korea was inaugurated on August 15, and the military government ended. On December 12 the UN recognized the new government as the only lawful government in Korea.

The Korean War. South Korea began to organize a police constabulary reserve in 1946. On December 14, 1948, the Department of National Defense was established. By June 1950, when the war broke out, South Korea had a 98,000-man force equipped only with small arms, which was barely enough to deal with internal revolt and border attacks. The United States occupation forces completely withdrew from Korea by June 29, 1949, leaving behind them a force of about 500 men as a U.S. Military Advisory Group to the Republic of Korea to train the South Korean armed forces. On June 7, 1949, in a message to the United States Congress calculating the security measures necessary for the protection of the Pacific from Communist domination, Pres. Harry S. Truman declared that Korea had become a testing ground in the ideological conflict between Communism and democracy. On that ground, he asserted, U.S. aid should be granted with a long-range program. On October 6, 1949, the United States granted South Korea $10,200,000 for military aid and $110,000,000 for economic aid for the fiscal year 1950, the first year of a contemplated three-year program. In addition, the U.S. Congress approved $10,970,000 for military aid on March 15, 1950. The military equipment committed under the U.S. military-assistance program was still en route, however, when North Korean troops invaded the South. South Korea was unprepared to resist the total invasion from the North.

Early in 1946 the Soviet authorities in North Korea had organized a 20,000-man constabulary and army units, and in August 1946 the North Korean Army was established, its title being changed to the Korean People's Army in February 1948. The Soviet occupation forces left North Korea in December 1948, leaving behind 150 advisors for each army division for training purposes. On March 17, 1949, the U.S.S.R. concluded a reciprocal-aid agreement with North Korea in which it agreed to furnish heavy military equipment; and by June 1950 North Korean forces numbered 135,000, including a tank brigade. As early as 1946, the Soviets were sending thousands of Koreans to the U.S.S.R. for specialized training, and during 1949–50 the People's Republic of China transferred about 12,000 Korean troops from its army to the North Korean forces. The North Korean forces were thus far superior to the forces of South Korea in training and equipment.

Cost of the war

The North Korean troops launched a full-scale invasion of South Korea on June 25, 1950. The war concluded with an armistice on July 27, 1953, having lasted for three years and one month and having accounted for about 4,000,000 casualties, including civilians. South Korean casulties were some 1,313,000 (1,000,000 civilians); Communist casualties were estimated at about 2,500,000 (including 1,000,000 civilians). The United States lost 33,629 dead in action, South Korea 47,000, and the UN forces 3,194; but the estimated losses of the People's Republic of China in action were 900,000 men and of North Korea 520,000. During the war, 43 percent of Korea's industrial facilities was destroyed and 33 percent of its homes devastated.

UN intervention. On June 26 (June 25, New York time) the UN Security Council approved a resolution describing the invasion of South Korea as a "breach of the peace and an action of aggression" and called upon the members to render every assistance in restoring peace. The Soviet Union was unable to impose a veto because its delegate had been boycotting the meetings to protest the fact that the People's Republic of China had no seat in the United Nations. On June 27 President Truman issued the order for United States air and naval forces to resist Communist aggression in Korea, and that afternoon the Security Council of the United Nations ratified Truman's decision to send air and sea aid to Korea, calling upon the UN members to render such assistance to Korea as might be necessary to restore peace. But Seoul, the South Korean capital, fell on June 28, and most of the South Korean Army was destroyed. On June 30 Truman ordered United States ground forces in Japan into Korea; the first U.S. troops reached the battlefield on July 4. The UN approved the creation of a unified command in Korea, and Gen. Douglas MacArthur was appointed commander. Sixteen member nations sent armed contingents, but the United States furnished the great bulk of the air units, naval forces, supplies, and money.

The North Koreans continued to advance recklessly despite the presence of U.S. troops in the field. In early August the UN retreat came to an end in a defense perimeter along the Naktong-gang (Naktong River) line (forming a semicircle in southeast Korea). South Korea was now almost overrun by the North Koreans, except for the small beachhead around Pusan-hang (Pusan Harbor, in Korea's extreme southeast). On September 15 MacArthur counterattacked, catching the Communists on the flank by an amphibious attack on Inch'ŏn (on the coast west of Seoul). They were trapped and either surrendered or fled in panic. By October 1 the UN forces were back at the 38th parallel. On September 27 the U.S. Joint Chiefs of Staff ordered MacArthur to destroy the North Korean armed forces, and two days later Truman authorized him to advance into North Korea. On October 7 the UN General Assembly approved the resolution to permit entry into North Korea and created a UN Commission for the Unification and Rehabilitation of Korea. On October 20 the UN forces entered P'yŏngyang, the North Korean capital, and on October 26 reached the Manchurian border at the Yalu River.

Chinese intervention. The Chinese Communists, who had moved troops along the Yalu after the Inch'ŏn landing, in November entered Korea in overwhelming numbers. By the end of 1952, 1,200,000 Chinese were engaged in the war under the command of P'eng Te-huai. They forced the UN forces to retreat in disorder, and Seoul was re-evacuated on January 4, 1951. But around P'yŏngtaek (about 30 miles south of Seoul) the Chinese were halted, and in February the UN General Assembly formally condemned the People's Republic of China as an aggressor. The UN counteroffensive began in late January. By March 31 the UN forces had again reached the 38th parallel. MacArthur now publicly advocated an extension of the war to China because of the Chinese intervention, but this advocacy was regarded as a challenge to the United States president's conduct of foreign policy. Consequently, on April 11, Truman dismissed MacArthur from all of his commands, and Gen. Matthew B. Ridgway took his place. From then until the armistice, the UN forces fought a holding action along the 38th parallel; indeed, in many places the UN forces were slightly north of the line.

Armistice and aid. The Soviet delegate to the United Nations proposed a discussion of a cease-fire and an armistice on June 23, 1951, and on July 10 negotiations began between the United Nations and the Communist commanders at Kaesŏng, later resumed at P'anmunjŏm (both about 30 miles northwest of Seoul; the former in North Korea, the latter in South Korea). Many issues stood between the two negotiators, the first being the Chinese demand that all foreign troops be withdrawn from Korea in the face of the steadfast refusal of the United States to withdraw all UN troops from South Korea. The second issue was the boundary: the Communists demanded the restoration of the 38th parallel, but the United States insisted on the existing battle line. The third and most important issue was that of prisoners. The UN forces held 171,000 prisoners, 50,000 of them unwilling to return to their Communist countries. The Communists, not to lose face, were determined to have all prisoners back. On this matter the negotiations were deadlocked and did not resume until after the death of Joseph Stalin in March 1953. The United States administration under Dwight D. Eisenhower was inaugurated in early 1953 and, deeply concerned with balancing the budget, was determined to end the impasse even if this involved resumption of hostilities. On the other hand, the war weariness of the Communists was increasing. In April the first 6,670 Communists and the 684 UN personnel were exchanged at P'anmunjŏm. Soon the prospects for armistice negotiations seemed to improve. The Communists agreed to hand over to a neutral commission the UN-held prisoners of war who did not wish to be repatriated. But Syngman Rhee opposed any term that would leave Korea divided and demanded that the military offensive be resumed. On June 18 Rhee suddenly released 27,000 North Korean anti-Communist prisoners in defiance of the United Nations, whereupon the Communists broke off negotiations. On July 20 negotiations were resumed. Rhee gave in and agreed to support the armistice even though he would not sign it. In return the United States promised to extend economic aid and conclude a mutual-security pact to protect South Korea against further aggression.

Negotiating difficulties

Armistice signed

The armistice was signed on July 27, 1953. The United Nations had won most of its demands. The military line became the boundary between North and South Korea, and commissions were established to enforce the cease-fire regulations. A Neutral Nations Commission for Repatriation was entrusted with the repatriation of prisoners, 21,809 of whom—among them 7,582 Korean and 14,227 Chinese—chose to stay in South Korea or go to Taiwan.

The U.S. Army provided Korea with $181,200,000 during the occupation period of 1946–48. This money, which was provided under the assistance programs for occupied areas, was spent mainly on preventing hunger and disease. For the period of 1949–52, the U.S. provided $485,600,000 for economic aid and $12,500,000 for military aid. Following the war the UN Korean Reconstruction Agency (UNKRA) was established to carry out economic aid to South Korea, 34 member and five nonmember states contributing $148,500,000. The UNKRA came to an end in 1958, but meanwhile UN Emergency Relief also contributed $474,400,000 and other international voluntary agencies $85,000,000. Most of the UN contributions were provided by the United States, and total U.S. aid to South Korea from 1946 to 1978 exceeded $5,893,900,000.

Postwar South Korea. The political experience of the people of the Republic of Korea since 1948 represents a wide range of variation. They lived under 12 years of Syngman Rhee's authoritarian rule, tempered by the rise of a vocal opposition coalition under semicompetitive conditions; the collapse of this system after student demonstrations that brought the nation close to civil war in April 1960; nine months of multiparty liberalism under the cabinet system of Prime Minister Chang Myŏn that permitted competition among conservative and emergent socialist parties; and, after May 1961, a presidential system dominated by the armed forces, which had maintained a tight and effective rule over Korea.

Early disagreement over president's role

The First Republic. The first Korean republic, established in 1948, adopted a presidential system and elected Syngman Rhee as the first president. He was re-elected in August 1952 while the nation was still at war. Even before the outbreak of the Korean War there had been a serious conflict between Rhee and the opposition-dominated National Assembly that elected him in 1948. The dispute involved a constitutional amendment bill that the opposition introduced in an attempt to defeat Rhee by replacing the presidential system with a parliamentary cabinet system. The bill was defeated, but the dispute was carried to Pusan, the wartime provisional capital, where the National Assembly was reconvened.

When the opposition introduced another amendment bill in favour of a parliamentary system, Rhee counteracted by pushing through an amendment bill that provided for the popular election of the president. Later, in 1954, Rhee succeeded in forcing the National Assembly, then dominated by the ruling party, to pass a constitutional amendment bill providing a life-term presidency for himself. On the basis of the revised constitution, Rhee was able to run successfully for his third term of office in May 1956. Rhee's election for the fourth time, in March 1960, was preceded by a period of tension and violence, followed by student demonstrations resulting in many casualties. Rhee resigned under pressure and fled to exile in Hawaii, where he died in 1965 at the age of 90.

The Second Republic. The second Korean republic, which adopted a parliamentary system in place of the presidential system, lasted only nine months before it was overthrown by a military coup in May 1961. With a figurehead president elected by both houses of the legislature, power was shifted to the office of Prime Minister Chang Myŏn, who was elected by the lower house by a narrow margin of 10 votes.

In spite of some strenuous efforts to initiate reforms in a society already blemished by social and economic ills accumulated over a long period of time, the Chang regime was unsuited to deal with the explosive situation created as an aftermath of a violent political change. To make the situation worse, factionalism came to prevail in political life. As the ultimate source of authority now shifted to the office of the prime minister, constant efforts were made by conservative and more moderate factions to coalesce with a group of independents, either to keep or upset the majority within the legislature. Even before the Chang regime launched a full program of economic reform, the Democratic elite was seriously weakened by these factional struggles within its ranks.

Military junta of 1961

The military coup. With the military seizure of political power, postliberation Korean politics entered a new phase characterized by inflow of military officers into the government. The military junta that took over the government on May 16, 1961, dissolved the National Assembly and imposed a strict prohibition on political activity. The nation was then placed under martial law, and the Supreme Council for National Reconstruction (SCNR), headed by Maj. Gen. Park Chung Hee, took the reins and began to establish a new system of national government.

In November 1962 the SCNR made public a constitutional amendment bill that provided for a strong president and a weak, single-chamber National Assembly. The bill was approved by a national referendum held one month later. Then, in February 1963, Chairman Park of the SCNR issued a statement that he would not take part in the civilian government to be formed later in the year if civilian political leaders would uphold a nine-point "political stabilization proposal." On February 27, 1963, Chairman Park made a public pledge not to take part in the new government, for 53 political and military leaders had sworn to support his stabilization proposal.

In March, however, following bitter turbulence in the ruling junta itself and a chaotic situation created by the proliferation of minor political parties, Chairman Park proposed that military rule be extended for four years. The proposal met vigorous opposition from civilian political leaders, but some 160 military commanders, most of general officer rank, submitted a resolution to Park supporting the extension. Under considerable pressure, Park again changed course and announced, on April 8, 1963, a plan for holding elections toward the end of the year. In late May, Park was named presidential candidate of the Democratic Republican Party.

Election of Park Chung Hee

The Third Republic. The election for the president of the Third Republic took place on October 15, 1963. Park, by a narrow margin, defeated the opposition candidate, Yun Po-sun, former president of the Second Republic, who had remained in office (more or less as a figurehead) at the request of the junta to provide constitutional continuity for the military regime. When political activity was permitted to resume, Yun took the initiative in mustering opposition groups and became the presidential candidate of the Civil Rule Party. In May 1967 Park was elected to his second term of office, and the Democratic Republican Party won a large majority of the seats in the National Assembly. Members of the opposition New Democratic Party, whose candidate, Yun, had been defeated for the second time, claimed election fraud and refused to take their seats in the National Assembly until some months later.

During his second term, President Park was confronted with the constitutional provision that limited the president to two consecutive four-year terms. After considerable political turmoil and demonstrations by the opposition and students, Democratic Republican Party members in the legislature passed an amendment that provided for the incumbent president to become eligible for three consecutive four-year terms. The amendment was approved by a national referendum in October 1969. In the presidential elections held on April 27, 1971, Park defeated his opponent, Kim Dae-jung of the New Democratic Party; in elections for the eighth National Assembly, however, the New Democrats made impressive gains, securing 89 seats as compared with the 113 seats of the ruling Democratic Republicans.

The Yushin system. In December 1971, shortly after his election to a third term of office, Park declared a state of national emergency on the basis of the "dangerous uncertainties of the international situation," and ten months later, in October 1972, he suspended the constitution and dissolved the legislature. A new constitution, which extended the power and permitted the re-election of the president for an unlimited number of six-year terms, was promulgated in December.

National Conference for Unification

The institutional framework of the Yushin (Revitalization–Reform) system departed radically from the Third Republic. The National Conference for Unification was created as "a national organization based on the collective will of the people as a whole to pursue peaceful unification of the fatherland." The conference is a body of not less than 2,000 nor more than 5,000 members, who are directly elected by the voters for a six-year term. The president is the chairman of the conference; and until 1987 the conference was charged with the election of the president. Other functions of the conference include approving a list of one-third of the members of the National Assembly, who are appointed by the president for a three-year term (other members of the legislature are elected directly by the voters for a six-year term), and approving constitutional amendments proposed by the National Assembly. Under this arrangement, Park was elected without opposition in December 1972 and was reelected in December 1978.

Under the Yushin system, the Park government continued to achieve a high rate of economic growth. Despite the balance-of-payments difficulties in the mid-1970s, a consequence of the petroleum crisis of 1973, and a much less favourable international environment than expected, growth in gross national product averaged 11.2 percent a year during the third Five-Year Economic Plan (1972–76). Although the net growth in world trade in manufactured goods was sluggish during 1973–76, Korea's export volume more than doubled. At the same time, Koreans experienced great success in obtaining construction contracts in the Middle East. (B.-h.H.)

The assassination of Park. In October 1979 Korea faced a major national crisis that culminated in the assassination of President Park. Prime Minister Choi Kyu-hah became acting president under Article 48 of the Yushin constitution and was elected president in December. Although the initial impression was that a liberalization program was about to be put into effect, the country slipped quickly into stern military rule again. The military did away with all trappings of civilian government in May 1980, extending martial law, banning all political activity, and closing universities and colleges.

The Fifth Republic

In August 1980, following a period of internal upheaval, Chun Doo Hwan was elected president with the promise of a new constitution and a new government based on free elections. The new constitution was approved in October, ushering in the Fifth Republic; the powers of the president were reduced in favour of the National Assembly, and the president was limited to one seven-year term. In January 1981 martial law was lifted, and in February Chun won election with an overwhelming majority. Under Chun the nation's economy grew at a tremendous rate, and South Korea emerged as a strong competitor with Japan for foreign markets. The political climate became more relaxed, but Chun's administration had to endure several scandals and incidents—most notably a bombing in Rangoon (October 1983), which killed several members of the South Korean government—that shook government confidence.

By 1987 popular dissatisfaction with the government had become widespread. The government agreed to draw up another constitution, which was approved by national referendum in October. Among the new document's principal provisions were a reduction in the presidential term from seven to five years and the direct popular election of the president. Roh Tae Woo was elected president in December and took office in February 1988. Later in the year South Korea hosted the Summer Olympic Games in Seoul. (B.-h.H./Ed.)

For later developments in the history of South Korea, see the *Britannica Book of the Year* section in the BRITANNICA WORLD DATA ANNUAL.

North Korea

The Democratic People's Republic of Korea (Chosŏn Minjujuŭi In'min Konghwaguk) occupies the northern section of the Korean peninsula, which juts out from the Asian mainland between the Sea of Japan (East Sea) and the Yellow Sea. The country is bordered by China and the Soviet Union to the north and by the Republic of Korea (South Korea) to the south.

North Korea has an area of 46,800 square miles (121,200 square kilometres), occupying about 55 percent of the peninsula. The national capital, P'yŏngyang, is a major industrial and transport centre near the west coast.

North Korea was created in 1948 as a result of the post-World War II military occupation by the United States in the south of the peninsula and by the Soviet Union in the north. In close alliance with China and the Soviet Union, the North Korean government has endeavoured to transform the prewar agricultural country into a self-sufficient industrial nation. Economic programs have been successful, but the industrialization has been at the expense of agriculture and of personal freedom. The government, run by the Korean Workers Party, has attempted to achieve strict production quotas with the use of forced labour, socialization of the entire economy, and ideological indoctrination.

Foreign relations are oriented toward the Communist countries and those non-Communist nations such as Japan that are active in the Afro-Asian solidarity movement. Close economic and political ties have been maintained with the Soviet Union and China, while a hostile attitude has been sustained toward the United States and, generally, South Korea.

PHYSICAL AND HUMAN GEOGRAPHY

The Kaema Plateau and Nangnim-sanmaek

The land. *Relief.* Mountains and valleys characterize most of the country. The Kaema Plateau in the northeast has an average elevation of 3,300 feet (1,000 metres) above sea level and forms the topographic roof of the entire Korean peninsula. Paektu-san (9,003 feet [2,744 metres]), the highest mountain in North Korea, rises at the northern edge of this plateau; it is an extinct volcano topped by a large crater lake. The Nangnim-sanmaek (Nangnim Mountain Range) runs from north to south through the middle of the country, forming a divide between the eastern and western slopes of the peninsula. The Kangnam, Myohyang, Ŏnjin, and Myŏrak mountains, with their roots in the Nangnim-sanmaek, extend parallel to each other toward the southwest. Large river valley plains have developed between the western mountains; they merge along the narrow, irregular coastal plain on the west coast. The Hamgyŏng mountains, extending from the Nangnim-sanmaek to the northeast, form a steep slope between the Kaema Plateau and the Sea of Japan. The T'aebaek-sanmaek of South Korea extends into North Korea; one peak, Kŭmgang-san (5,373 feet [1,638 metres]), is famous for its scenic beauty.

Drainage and soils. The longest river of North Korea is the Yalu, known as the Amnok-kang. It rises at Paektu-san (Paektu Mountain) and flows southwestward for 501 miles (806 kilometres) to its mouth on Korea Bay. The Tumen River also begins at Paektu-san but runs northeastward for 324 miles (521 kilometres) to the Sea of Japan. There are no large streams along the east coast except for the Tumen River, and all the significant rivers, such as the Yalu, Ch'ŏng-ch'ŏn, Taedong, Chaeryŏng, and the Yesŏng, drain to the Yellow Sea. The relatively large valley plains of the western rivers are major agricultural regions.

More than 60 percent of the soils are locally derived from the weathering of granitic rocks or various kinds of schists (crystalline rocks). The soils are generally brownish, abundant in sandy materials, and low in fertility. Well-developed reddish brown soils derived from limestone are found in North Hwanghae Province (Hwanghae-pukto) and the southern part of South P'yŏngan Province (P'yŏngan-namdo). The Kaema Plateau shows development of podzolic soils (ash-gray forest soil) as a result of its cold climate and coniferous forest cover. Although most of the soils are infertile and lacking in organic content, the valley plains have relatively rich alluvial soils.

Climate. North Korea has a generally cool continental climate. The winter season from December to March is long and cold; mean temperatures in January range between 21° F (−6° C) in the south and −8° F (−22° C) in the northern interior. The summer, from June to September, is warm, with mean July temperatures above 68° F (20° C) in most places. Accordingly, the annual range of temperatures is large—about 54° F (30° C) at P'yŏngyang and about 77° F (43° C) at Chung-gangjin, where the lowest temperature in the Korean peninsula, −46.5° F (−43.6° C), has been recorded. Because of ocean currents and the mountain ranges bordering the narrow coastal lowlands, winter temperatures on the east coast are about 4° or 5° F (2° or 3° C) higher than those of the west coast.

Most of the country receives around 40 inches (1,000 millimetres) of precipitation annually. The northern inland plateau, however, receives 24 inches (610 millimetres) and the lower reaches of the Taedonggang (Taedong River) Valley 32 inches (810 millimetres). The upper Ch'ŏngch'ŏn-gang area averages between 48 and 52 inches (1,220 and 1,320 millimetres) yearly. Approximately 70 percent of the annual precipitation falls in the four months from June to September; this heavy concentration of rainfall is related to the humid summer monsoon from the Pacific. Less than 5 percent of the total precipitation occurs in winter. There are about 200 frost-free days along the coast and fewer than 150 inland.

Plant and animal life. Vegetation on the Kaema Plateau, especially around Paektu-san, is composed of coniferous trees, such as the Siberian fir, spruce, pine, and Korean cedar. The western lowlands were originally covered by temperate mixed forests with many types of plants, but continuous deforestation has resulted in only remote patches of the original forests. Most of the lowlands are now cultivated, except for some of the hills that are covered with small pine groves mixed with oaks, chestnuts, and elders. Along streams that are subject to flooding, or where the ground is too stony for cultivation, reeds, sedges, wild mulberry trees, and Italian poplars are found. Common river fish include carps and eels.

Because of deforestation, the population of deer, mountain antelopes, goats, tigers, leopards, and panthers has greatly decreased and is restricted to the remote forests. In the plains, however, it is still possible to see wild pigeons, herons, cranes (which nest near human habitations), and many migratory water fowl, which alight in the rice fields.

Historic provincial divisions

Settlement patterns. Close examination reveals numerous distinct regions, each with a different natural environment and historical background. Of the eight Korean provinces of the Yi dynasty (1392–1910), North Korea contains the three provinces of P'yŏngan, Hwanghae, and Hamgyŏng and the northern parts of Kangwŏn and Kyŏnggi provinces. Each province was not only a political unit but also had characteristics of a cultural region in terms of dialect, customs, and a way of life. North Korea may also be divided into the two larger traditional regions of Kwanso to the west and Kwanbuk to the east, roughly divided by the Nangnim-sanmaek. Kwanso comprises the provinces of North P'yŏngan (P'yŏngan-pukto), South P'yŏngan (P'yŏngan-namdo), North Hwanghae (Hwanghae-pukto), South Hwanghae (Hwanghae-namdo), and Chagang, while Kwanbuk includes North Hamgyŏng, South Hamgyŏng, and Yanggang provinces.

Urbanization increased rapidly after 1953. Most of the rural population inhabits the eastern and western coastal lowlands and river valley plains. The inland areas of Chagang and Yanggang provinces are sparsely settled because of the lack of arable land and the cold climate, which is not suitable for rice culture. Villages in the lowlands and valley plains are usually clustered together on the southern foot of hills, which offer protection against the cold northwestern winter wind. Scattered fire fields are tilled by a small number of shifting cultivators in the Kaema Plateau, especially in Yanggang Province. The Upper Yalu and Tumen river valleys contain settlements associated with lumbering, and fishing villages are numerous along the coast, especially on the east.

Urban settlement

Cities that developed during the Japanese occupation (1910–45) were largely associated with the exploitation of natural resources, industry, and transportation. P'yŏngyang is the hub of the national railway system, Namp'o is a western port, Songnim contains an iron-ore refinery, and Sinŭiju contains factories for the production of electrical equipment, chemicals, textiles, and consumer goods. Mining cities include Aoji, Chaeryŏng, Iwŏn, Kilchu, Musan, and Pukchin. The Communist regime's heavy emphasis on manufacturing resulted in the continuous expansion of the early industrial centres and caused a population flow into the urban areas from the countryside. Most of the cities were destroyed during the Korean War (1950–53) and have since been rebuilt. There are no high-rise buildings, but seven- and eight-story buildings line the main streets of P'yŏngyang. Workers are expected to live in apartments rather than individual homes, and housing projects are supported almost solely by the government. Heating systems in the apartments and urban water supplies are inadequate. The streets are strangely empty of pedestrians, as the Koreans have few leisure hours.

The people. *Ethnic distribution.* Because they are a nation with a long history, Koreans believe that they belong to a single racial stock. Physical and cultural characteristics vary only slightly from one region to another. Koreans all have typical Mongoloid physical features; their average stature is a little shorter than that of the northern Chinese and slightly taller than that of the Japanese. All Koreans speak the Korean language, which is related to Japanese and contains Chinese loan-words. The Korean script, known in North Korea as Chosŏn muntcha (and in South Korea as Han'gŭl), is composed of phonetic symbols for the ten vowels and 14 consonants. In North Korea Chosŏn muntcha has been used exclusively without Chinese characters in newspapers and other publications since 1945.

The stress on industrialization since 1945 has promoted migration to the cities, and the farm labour shortage is severe. North Korea is not concerned with overpopulation because an abundant labour force is needed for its unusually high goals of economic achievement. There is a campaign to repatriate Koreans living in Japan. The coastlines are heavily populated, while the interior is only sparsely so.

Religion. The way of life and the value system of Koreans are based fundamentally on Confucian thought. To a lesser extent, Buddhism is also important. Roman Catholic and Protestant beliefs were introduced in the 17th and 19th centuries; Sŏn-ch'on and P'yŏngyang were major centres of Christian activities. World War II brought repression of Christianity, and all foreign missionaries were expelled from the country.

The monotheistic religion of Ch'ŏndogyo ("Society of the Heavenly Way"; originally known as Tonghak) was founded by the Confucian teacher Ch'oe Che-u in 1860. A combination of Buddhism, Confucianism, and Christianity, Ch'ŏndogyo played a leading role in the independence movement of 1919. Shamanism—the religious belief in gods, demons, and ancestral spirits responsive to a priest, or shaman—existed in Korea before the introduction of Buddhism and Confucianism and still prevails in rural villages.

Religious repression

The Communist regime has constitutionally confirmed freedom of religion but does not practice it, allegedly for fear that it will weaken the Communist Party and the government. Ch'ŏndogyo, however, is used as a means of propaganda. After the Korean War, churches and Buddhist temples were confiscated and looted, and many were converted to other purposes.

The economy. The means of production are socialized, and priorities and emphases in economic development are set by the government. The economy is self-sufficient except for industrial needs such as fuel and machinery. Like other Communist countries, North Korea places special emphasis on capital goods rather than consumer goods.

Resources. North Korea contains about 80 to 90 percent of all known mineral deposits on the peninsula. It is estimated that 200 minerals are of economic value, including gold, tungsten, graphite, magnesite (magnesium carbonate), barite (barium sulfate), and molybdenum (a metallic element used in hardening steel).

Major iron and coal deposits

Iron-ore reserves are estimated at about 2,400,000,000 tons; the deposits at Musan, North Hamgyŏng Province, are of low quality, while those of North Hwanghae Province and South P'yŏngan Province are of high grade. Rich deposits of anthracite (hard coal) occur along the Taedong-gang, not far from P'yŏngyang, and there are small amounts of lignite (brown coal) at Aoji and Anju.

The northern interior contains large forest reserves of larch, spruce, and pine trees. Most of the coastal slopes have been excessively deforested, however, and reforestation programs stress economic forestry. Hydroelectric-power resources were developed highly during the Japanese regime along the Yalu River and its upper tributaries, such as the Changjin, Pujŏn, and Hŏch'ŏn rivers. Power production is based mainly on hydroelectricity, but thermal electricity is becoming important because of the increasing demands of industrialization and the deficiency of hydroelectric power during the dry season.

Farm cooperatives

Agriculture. Despite the disproportionately small agricultural contribution resulting from the labour shortage and low productivity, there has been an increase in cultivated land, irrigation projects, chemical fertilizer supplies, and mechanization through the government program of socialization. By 1958 all farms were incorporated into more than 3,000 cooperatives; each cooperative is comprised of about 300 families on about 1,000 acres (405 hectares). The farm units are controlled by management committees, which issue orders to the work teams, set the type and amount of seed and fertilizer to be used, and establish production quotas. Produce is delivered to the government, which controls distribution through state stores. Each farmer is paid for his labour in money or in kind and is allowed to keep chickens, bees, fruit trees, and a garden.

There are also state and provincial model farms for research and development. The workers are paid in money and are allowed a garden. Livestock husbandry is concentrated on the state farms because the land is little suited to grazing, and few feed grains are grown.

The main food crops are grains, such as rice, corn (maize), millet, barley, and wheat. Although production has increased since the 1950s, grain must still be imported. Sweet potatoes, soybeans, and fruit trees are raised extensively. Industrial crops include tobacco, cotton, flax, and rape (an herb grown for its oilseeds).

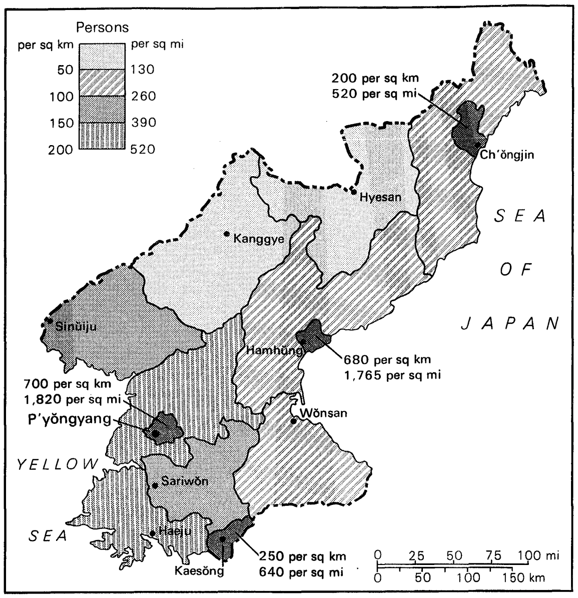
NORTH KOREA

Size of symbol indicates relative size of town ∘ ○ ◎ ▣ ▣ ■

Elevations in metres

0 25 50 100 150 km

0 25 50 100 mi



Population density of North Korea.

Forestry has declined since World War II. The sea is the main source of protein for North Koreans, and the government has continually expanded commercial fishing since the 1950s. Most fishing activity centres on the east coast and on Tasa-do (Tasa Island) in the mouth of the Yalu River. The annual marine catch includes anchovy, mackerel, pollack, tuna, crustaceans, and seaweed.

Mining is a state enterprise under the direction of a manager who is appointed by the government. The most emphasis is given to the extraction of coal and iron ore. There are more than 100 small coal mines, an iron mine at Sunhŭng, a nickel mine at Puyun, and a copper mine at Mandŏk.

Industry. Since World War II, North Korea has changed from an agricultural to an industrial nation. The three most important industries are concerned with the production of iron and steel, centred at Songnim and Ch'ŏngjin; of industrial and agricultural machinery at Kangsŏn, near P'yŏngyang; and of textiles, centred at P'yŏngyang and Hamhŭng. Other industrial products include chemicals, armaments, vehicles, cement, glass, ceramics, and some consumer goods.

Industrial development is related to the country's large supply of electric power. Production of electricity has increased steadily, although it has not kept pace with industry, and electricity is sold to China. Most power is provided by hydroelectric facilities, such as those at Sup'ung, Puryŏng, Kŭm'gang, and Kanggye. There has been expansion of thermal facilities through aid from the Soviet Union and China.

Finance and trade. The North Korean Central Bank is the sole bank of issue. It receives all national revenues and precious metals and provides government agencies with working capital. The Industrial Bank has branches in every farm cooperative; it administers the government insurance system, operates savings accounts for government and individuals, and is the only bank to grant loans. The Foreign Trade Bank handles all foreign transactions and currencies and is supervised by the Central Bank.

More than 80 percent of foreign trade is conducted with the Soviet Union and China. Since the 1960s, trade has been permitted with non-Communist countries, including Japan, France, Australia, West Germany. Hong Kong, The Netherlands, and the United Kingdom. Imports mainly consist of machinery (including machine tools and precision instruments), fuel and related oil, chemical, or rubber products; exports are pig iron, magnesia products, iron ore, and nonmetallic minerals.

Administration of the economy. The farm cooperative is not only an economic unit but also the basic unit of technical, ideological, and political control. A Cooperative Farm Management Committee was established in 1961 in each county (*kun*) in order to tighten control over the individual units. Since grain is marketed only through state-operated stores, the government controls production, pricing, and distribution of grain. The industrial sector is organized into state-owned enterprises and production cooperatives, the latter being confined largely to handicrafts, marine processing, and other small-scale operations.

Through the three national economic plans promulgated since 1954, the government has given high priority to manufactures—especially the chemical and heavy industries—at the expense of agriculture. In order to increase the low productivity of labour, the state adopted an independent accounting system and a mass-mobilization measure that is known as the Ch'ŏllima ("Flying Horse") campaign.

The nation's railways

Transportation. Railroads are the principal means of transportation. The basic railway pattern runs in a north–south direction roughly parallel to the coasts with branch lines to the river valleys. Because of the high mountains, there is only one east–west railway line between P'yŏngyang and Wŏnsan. The Kyŏng-Ui line on the west coast runs from Kaesŏng near the South Korean border to Sinŭiju on the Chinese border, connecting the major cities. From this major line a branch from P'yŏngyang southwestward to Namp'o connects centres of machine building and foundries. The Manp'o line, which runs northward from P'yŏngyang to Manp'o on the Yalu River, connects the western interior to China's Northeast (formerly Manchuria). The Wŏlla line is the major railway on the east coast; it runs from Wŏnsan northward to Najin and continues to Namyang on the Chinese border. Several branch lines serve the inland areas and mining centres.

Highway transportation is not as important as railroads because few motor vehicles are available. Major roads parallel the rail lines, and there are few east–west roads. Most roads are not paved.

River transportation plays an important role in transporting agricultural products and minerals. The most important rivers utilized for freight transportation are the Yalu, Taedong, and Chaeryŏng. Namp'o—the entry port to P'yŏngyang—Haeju, and Tasado are the major ports on the west coast, as are Wŏnsan, Ch'ŏngjin, and Najin in the east.

Air services are controlled by the air force. Flights are maintained between the major cities, and international services connect P'yŏngyang with Peking and Moscow. Sunan Airport, 10 miles north of P'yŏngyang, serves as the international airport; domestic airports are located at Hamhŭng, Ch'ŏngjin, and Wŏnsan.

Administrative and social conditions. *Government.* Constitutionally, the 45-member Cabinet, Supreme Court, and Supreme Procurator (an agency that maintains surveillance over all citizens) are responsible to the Supreme People's Assembly, which is the highest organ of state power. The actual source of authority, however, derives from the extraconstitutional political body of the Korean Workers Party. The government is highly centralized and totalitarian in nature and is often officially described as a transmission body of the party.

There are nine provinces (*do* or *to*); three special cities (*si*) of P'yŏngyang, Ch'ŏngjin, and Hamhŭng; and one special region (*chigu*) of Kaesŏng. These are further subdivided into cities, counties, and *ri,* the smallest administrative unit. Local people's assemblies elect the members of their people's committees, which execute administration duties and make local economic plans and budgets with the approval of higher authorities.

Control of political activity

There are a number of political parties and social organizations that serve to support the Korean Workers Party. All political activities are sponsored by the party or require its sanction and must closely follow the party line and policies. Elections provide a means whereby assent is registered for the policy and program of the party; they do not allow freedom of expression. There is seldom more than one candidate on the ballot for each constituency, and the electoral system is completely controlled by the party.

The judicial system consists of the courts and the procuracy. They are independent of each other, and actually the procurator's office functions as the fourth branch of government. The courts consist of the Supreme Court, whose judges are elected for three-year terms by the Supreme People's Assembly, and the provincial and people's courts, whose members are elected by local people's assemblies. Judges are usually party members or are controlled by the party.

Since 1966 there has been an emphasis on military preparedness, and economic plans have been altered to support military expenditures. The army is the largest force; there is also an air force and a navy. Both men and women are subject to conscription for three to four years service. There is also a paramilitary militia.

Education. Education is directly controlled by the party and serves as a process of indoctrination in Communist ideology and a means to supply skilled workers, technicians, and scientists to meet the government's economic goals. All students are required to engage in productive labour along with their studies, which emphasize science and technology. In 1967 education was made compulsory for those between the ages of seven and 16, later changed to between five and 16. The system comprises one year of preschool, four years of primary, and six years of secondary school. Institutions of higher education offer programs of two to six years in length; the most important school is Kim Il-sung University in P'yŏngyang. There is also a well-developed system of adult education, the major components of which are technical schools located in large industrial centres.

Health and welfare. Medical care is free, and there is at least one clinic in each village, but there is a shortage of physicians and medicine. Medical benefits are provided by social insurance for workers who are temporarily or permanently disabled and women during pregnancy and childbirth. There are also funeral benefits and old-age pensions. Homes for the aged in each province have been operative under the Ministry of Labour since 1964.

Reconstruction of houses after the Korean War was given high priority, and dwellings have improved considerably. Rural mud-walled, thatched-roofed huts have been replaced by brick buildings with tile or slate roofs. Urban housing is classified into five groups that range from one room and a half-sized kitchen to individual houses with gardens.

The national police and secret agencies under the Ministry of Social Security control people's movements and social activities even down to the household level. Because of the high priority for industrialization and defense, the provision of consumer goods and social services has long been inadequate. The material economy and the lot of the peasant have improved since World War II, however, with adequate supplies of such basic goods as food and clothing generally being available.

Cultural life. The compound religious thoughts of shamanism, Buddhism, and Confucianism have deep roots in Korean culture. Although the country has received continuous streams of foreign cultural influence mainly from China, Koreans have kept their identity and maintained and developed their unique language and customs. Westernization, begun in the late 19th century, was in harmony with Korean tradition and slowly transformed the culture without much conflict until the 1940s. After World War II, the occupying Soviets did not recognize the Korean traditional family system or Confucian philosophy; age-old lineage records were burned, and the kinship system was broken. Through education, people were molded to fit the pattern of party idealism, and private life and individual freedom became extremely limited.

Development plans since the Korean War have demanded almost superhuman patience and labour from the North Koreans. As a result, the people have had to lead an austere existence. The standard of living has improved, but leisure and cultural activities have continued to be regimented and geared toward organized group activities, such as rallies and museum tours. The government strongly believes in nationalism and is concerned with the maintenance and advancement of the traditional fine arts and other cultural features. The selection of cultural items is based on Communist ideology, and writers and artists attempt to enhance class consciousness and propagate the superiority and independence of Korean culture.

The state of the arts

All of the writers, artists, dancers, and musicians are assigned to government institutions, such as the National Theatre for the Arts, National Orchestra, and National Dancing Theatre in P'yŏngyang and to provincial organizations of music, ballet, and drama. Museums have been well sponsored by the government, and many archaeological sites have been excavated to promote the growth of a strong nationalistic feeling. There are more than a dozen museums, including the Korean Revolutionary Museum and the Korean Fine Arts Museum in the capital. Archaeological sites are located in Nangnang district of P'yŏngyang and at Kungsan, near Yonggang.

Of the daily newspapers, the Korean Workers Party Central Committee's *Nodong sinmun,* the government's *Minju Chosŏn,* and the General Federation of Korean Trade Union's *Nodongja sinmun* have the largest circulations. The Korean Central News Agency controls the dissemination of information, and all papers are strictly censored. The government considers radio and television to be important mass media, and they play a great role in ideological education. Radio broadcasts reach all parts of the country; most people in the rural areas listen to wire receivers given to every village by the government. Almost all North Korean households have access to radio broadcasts as a result of a government project to link household loudspeakers to village receivers. Television broadcasting in North Korea has been made available to all parts of the country, and the number of television sets, both imported and domestically produced, has increased annually.

For statistical data on the land and people of North Korea, see the *Britannica World Data* section in the BRITANNICA WORLD DATA ANNUAL. (C.Le.)

HISTORY

Unlike the U.S. forces in the South, the Soviet Army marched into the North in 1945 accompanied by an army of Korean Communists. By placing the latter in key positions of power, the Soviet Union easily set up a Communist-controlled government in the North. On August 25 the People's Executive Committee of South Hamgyŏng Province was created by the South Hamgyŏng Province Communist Council and other nationalists. The Soviet authorities recognized the committee's administrative power in the province, thus setting a pattern for the committee's role throughout the North Korean provinces. In this way the Soviet Union placed the North under its control without actually establishing a military government. In October the people organized the Bureau of Five Provinces Administration, a central governing body; but this was replaced in February 1946 by a Provisional People's Committee for North Korea. This new agency adopted the political structure of the Soviet Union.

Kim Il-sung, who arrived in P'yŏngyang in the uniform of a major of the Red Army, was introduced to the people as a national hero on October 14, 1945. Shortly after his public appearance, Kim was elected as the first secretary of the North Korean Central Bureau of the Communist Party. After the Provisional People's Committee for North Korea was organized, with Kim as its chairman, it took over the existing central administrative bureaus. A year later, in February 1947, a legislative body was established under the name of the Supreme People's Assembly, and with the strong support of the Soviet occupation authorities Kim began to consolidate his political power.

Rise of Kim Il-sung

In 1948, when the Democratic People's Republic of Korea was established, Kim became the first premier of the North Korean Communist regime, and in 1949 he became chairman of the Korean Workers Party (KWP), which had been created on August 23, 1946.

After 1956, as the Sino-Soviet conflict intensified, Kim was compelled to shift his positions vis-à-vis Moscow and Peking no fewer than three times: from pro-Soviet to neutral, from neutral to pro-Chinese, and from pro-Chinese to independent. The division between the two great powers was also reflected in conflicts within the North Korean leadership. The pro-Chinese group, known as the Yenan faction, was purged by Kim during 1956–58. At about the same time, he eliminated a pro-Soviet faction from the Central Committee of the Korean Workers Party.

In 1966, after a visit to P'yŏngyang by the Soviet prime minister, Aleksey N. Kosygin, Kim announced what became known as the independent party line in North Korea, in which he stressed the principles of "complete equality, sovereignty, mutual respect, and noninterference among the Communist and Workers' Parties." From this statement, the KWP ideologists worked out four principles: "*juche* [or *chuch'e;* 'autonomy,' or 'identity'] in ideology," "independence in politics," "self-sustenance in economy," and "self-defense in national defense."

In the late 1960s the Kim regime carried out a program of strengthening the military forces, turning the country into a fortress with a large standing army and much modern equipment. There was also a strong militia.

North Korea's emphasis on strengthening its military forces proceeded in parallel with its continued stress on the construction of a self-reliant economy. With aid from the Soviet Union, the People's Republic of China, and the countries of eastern Europe, North Korea implemented a series of economic development plans and made significant gains. When the Soviet Union, under Nikita S. Khrushchev, suspended its aid to North Korea, the Seven-Year Plan (1961–67) of the North Korean regime was seriously affected, as indicated by the extension of the plan for another three years. (B.-h.H.)

Two subsequent plans, a Six-Year Plan (1971–76, extended to 1977) and a Seven-Year Plan (1978–84), also failed to achieve their stated goals. Significant economic gains were made during those periods, but growth was hampered by the country's heavy expenditures on defense.

In 1980 the KWP held its first party congress in a decade. During the proceedings, Kim's son, Kim Chong Il, was named to three powerful party posts, thus making him the second most influential person in the government. During the 1980s the younger Kim consolidated his power and gradually assumed greater control of the day-to-day administration of the government.

The North Korean government continued to maintain its balanced diplomatic position between China and the Soviet Union, alternately favouring one and then the other. The country remained, however, one of the most isolated in the international community, a position that was reinforced by two incidents of terrorist violence against South Korea for which the North Korean government was widely held responsible: a bombing in Rangoon (October 1983) that killed several members of the South Korean government; and the destruction of a South Korean airliner (November 1987), presumably by a bomb, over the Thai–Burmese border. (Ed.)

Korean Literature

Although Korea has had its own language for several thousand years, it has had a writing system only since the mid-15th century, when the Korean alphabet, Han'gŭl, was invented. As a result, early literary activity was in Chinese characters. Korean scholars were writing poetry in the traditional manner of classical Chinese at least by the 4th century AD. A national academy was established shortly after the founding of the Unified Silla dynasty (668–935); and, from the institution of civil-service examinations in the mid-10th century until their abolition in 1894, every educated Korean had read the Confucian Classics and Chinese histories and literature. The Korean upper classes were therefore bilingual in a special sense: they spoke Korean but wrote in Chinese.

By the 7th century a system, called *idu,* had been devised that allowed Koreans to make rough transliterations of Chinese texts. Eventually, certain Chinese characters were used for their phonetic value to represent Korean particles of speech and inflectional endings. A more extended system of transcription, called *hyangch'al,* followed shortly thereafter, in which entire sentences in Korean could be written in Chinese. In another system, *kugyŏl,* abridged versions of Chinese characters were used to denote grammatical elements and were inserted into texts during transcription. Extant literary works indicate, however, that before the 20th century much of Korean literature was written in Chinese rather than in Korean, even after the invention of Han'gŭl.

In general, then, literature written in Korea falls into three categories: works written in the early transcription systems, those written in Han'gŭl (Hankul), and those written in classical Chinese.

This article is divided into the following sections:

TRADITIONAL FORMS AND GENRES

Poetry. There are four major traditional poetic forms: *hyangga* ("native songs"); *pyŏlgok* ("special songs"), or *changga* ("long poems"); *sijo* ("current melodies"); and *kasa* ("verses"). Other poetic forms that flourished briefly include the *kyŏnggi*-style, in the 14th and 15th centuries, and the *akchang* ("words for songs") in the 15th century. The most representative *akchang* is *Yongbi ŏch'ŏn ka* (1445–47; *Songs of Flying Dragons*), a cycle compiled in praise of the founding of the Yi dynasty. Korean poetry originally was meant to be sung, and its forms and styles reflect its melodic origins. The basis of its prosody is a line of alternating groups of three or four syllables, which is probably the most natural rhythm to the language.

The oldest poetic form is the *hyangga,* poems transcribed in the *hyangch'al* system, dating from the middle period of the Unified Silla dynasty to the early period of the Koryŏ dynasty (935–1392). The poems were written in four, eight, or 10 lines; the 10-line form—comprising two four-line stanzas and a concluding two-line stanza—was the most popular. The poets were either Buddhist monks or members of the Hwarangdo, a school in which chivalrous youth were trained in civil and military virtues in preparation for state service. Seventeen of the 25 extant *hyangga* are Buddhist in inspiration and content.

The *pyŏlgok,* or *changga,* flourished during the middle and late Koryŏ dynasty. It is characterized by a refrain either in the middle or at the end of each stanza. The refrain establishes a mood or tone that carries the melody and spirit of the poem or links a poem composed of discrete parts with differing contents. The theme of most of these anonymous poems is love, the joys and torments of which are expressed in frank and powerful language. The poems were sung to musical accompaniments chiefly by women entertainers, known as *kisaeng.*

Sijo and *kasa*

The *sijo* is the longest enduring and most popular form of Korean poetry. Although some poems are attributed to writers of the late Koryŏ dynasty, the *sijo* is primarily a poetic form of the Yi dynasty (1392–1910). *Sijo* were still being written in the second half of the 20th century. They are three-line poems in which each line has 14 to 16 syllables, and the total number of syllables seldom exceeds 45. Each line consists of groups of four syllables. *Sijo* may deal with Confucian ethical values, but there are also many poems about nature and love. The principal writers of *sijo* in the first half of the Yi dynasty were members of the Confucian upper class (*yangban*) and *kisaeng.* In the latter part of the Yi dynasty, a longer form, called *sasŏl sijo* ("narrative *sijo*"), evolved. The writers of this form were mainly common people; hence, the subject matter included more down-to-earth topics, such as trade and corruption, as well as the traditional topic of love. In addition, *sasŏl sijo* frequently employed slang, vulgar language, and onomatopoeia.

The *kasa* developed at about the same time as the *sijo.* In its formative stage, *kasa* borrowed the form of the Chinese *tz'u* (lyric poetry) or *fu* (rhymed prose). The *kasa* tends to be much longer than other forms of Korean poetry and is usually written in balanced couplets. Either line of a couplet is divided into two groups, the first having three or four syllables and the second having four syllables. The history of the *kasa* is divided into two periods, the division being marked by the Japanese invasion of 1592–97. During the earlier period the poem was generally about 100 lines long and dealt with such subjects as female beauty, war, and seclusion. The writers were usually *yangban.* During the later period the poem tended to be longer and to concern itself with moral instruction, travel accounts, banishment, and the writer's personal misfortunes. The later writers were usually commoners.

Akchang poems

Immediately after the founding of the Yi dynasty at the end of the 14th century and the establishment of the new capital in Seoul, a small group of poetic songs called *akchang* was written to celebrate the beginning of the new dynasty. In its earliest examples the form of *akchang* was comparatively free, borrowing its style from early Chinese classical poetry. Whereas the early *akchang* are generally short, the later *Yongbi ŏch'ŏn ka* consists of 125 cantos.

Prose. Korean prose literature can be divided into narratives, fiction, and literary miscellany. Narratives include myths, legends, and folktales found in the written records. The principal sources of these narratives are the two great historical records compiled during the Koryŏ dynasty: *Samguk sagi* (1146; "Historical Record of the Three Kingdoms") and *Samguk yusa* (1285; "Memorabilia of the Three Kingdoms"). The most important myths are those concerning the Sun and the Moon, the founding of Korea by Tangun, and the lives of the ancient kings. The legends touch on place and personal names and natural phenomena. The folktales include stories about animals; ogres, goblins, and other supernatural beings; kindness rewarded and evil punished; and cleverness and stupidity. Because the compiler of the *Samguk yusa* was a Zen master, his collection includes the lives of Buddhist saints; the origin of monasteries, stupas, and bells; accounts of miracles performed by Buddhas and bodhisattvas; and other tales rich in shamanist and Buddhist elements. The compilations made in the Koryŏ period preserved the stories of prehistoric times, of the Three Kingdoms, and of the Silla dynasty and have remained the basic sources for such material. Later compilations made during the Yi dynasty served as a major source of materials for later Yi dynasty fiction.

Korean fiction can be classified in various ways. First, there is fiction written in Chinese and that written in Korean. Second, there are the short works of one volume, "medium" works of about 10 volumes, and long works of more than 10 volumes. Third, there are works of *yangban* writers and those of common writers. In respect to the last classification, however, there is also a group of fictional works in which the viewpoints of the *yangban* and the commoner are combined. Most of this fiction was based on the narratives mentioned above, the author adding incidents and characters to the original story. It is not possible to assign definite dates or authors to most of these works. The stories are generally didactic, emphasizing correct moral conduct, and almost always have happy endings. Another general characteristic is that the narratives written by *yangban* authors are set in China, whereas those written by commoners are set in Korea.

The literary miscellany consists of random jottings by the *yangban* on four broad topics: history, biography, autobiography, and poetic criticism. Like fiction, these jottings were considered to be outside of the realm of officially sanctioned Chinese prose (*e.g.,* memorials, eulogies, and records), but they provided the *yangban* with an outlet for personal expression. Thus, their portrayal of the customs, manners, and spirit of the times in which they were composed make these writings an essential part of Korean prose.

Oral literature. Oral literature includes all texts that were orally transmitted from generation to generation until the invention of Han'gŭl—ballads, legends, mask plays, puppet-show texts, and *p'ansori* ("story singing") texts.

In spite of the highly developed literary activity from early in Korean history, song lyrics were not recorded until the invention of Han'gŭl. These orally transmitted texts are categorized as ballads and are classified according to singer (male or female), subject matter (prayer, labour, leisure), and regional singing style (capital area, western, and southern). The songs of many living performers, some of whom have been designated as "intangible national treasures" by the South Korean government, are still being recorded.

Legends include all those folk stories handed down orally and not recorded in any of the written records. These legends were for long the principal form of literary entertainment enjoyed by the common people. They deal with personified animals, elaborate tricks, the participation of the gods in human affairs, and the origin of the universe.

Mask plays

The mask plays are found in Hahoe, Chinju, T'ongyŏng, Kimhae, and Tongnae in North and South Kyŏngsang provinces; Yangju in Kyŏnggi Province; Pongsan in Hwanghae Province; and Pukch'ŏng in south Hamgyŏng Province. The most representative plays are the *sandae kŭk* genre of Yangju, the *pyŏlsin kut* of Hahoe, and the *okwangdae nori* (five-actor play) of Chinju. Although the origin of these plays is uncertain, they are generally presumed to have developed from primitive communal ceremonies. Gradually, the ceremonial aspect of the plays disappeared, and their dramatic and comic possibilities were exploited. The dialogue was somewhat flexible, the actors being free to improvise and satirize as the occasion demanded. The plays were not performed on a stage, and there were no precise limits as to the space or time in which the performances took place. The audience also traditionally responded vocally to the play as well as passively watching it. The organization of the mask plays—through repetition and variety—achieves a remarkable effect of dramatic unity.

Only two puppet-show texts are extant, *Kkoktukaksi nori* (also called *Pak Ch'ŏmjikuk;* "Old Pak's Play") and *Mansŏk chung nori.* Both titles are derived from names of characters in the plays. No theory has been formulated as to the origin and development of these plays. The plots of the puppet plays, like those of the mask plays, are full of satiric social criticism. The characters—Pak Ch'ŏmji, governor of P'yŏngam, Kkoktukaksi, Buddhist monk, and Hong Tongji—dance and sing, enacting familiar tales that expose the malfeasance of the ruling classes.

The final type of folk literature is found in the texts of *p'ansori* of the Yi dynasty. These texts were first recorded in the 19th century as verse, but the written forms were later expanded into *p'ansori* fiction, widely read among the common people. This transformation from poetry to narrative fiction was easily accomplished, since *p'ansori* were always narrative. Originally the entire *p'ansori* performance repertoire consisted of 12 *madang* ("titles"). Although all 12 remain as narrative fiction, only five of them are sung today. The texts evolved gradually from the legends, which provided their sources and were altered and expanded as they were passed from one performer to another.

HISTORY

The earliest literature: before 57 BC. From the earliest times, poetry and music have played an important part in the daily life of the Korean people. This love for song and dance impressed the ancient Chinese, whose observations are found in their early records. Ancient Korean songs, closely allied to the religious life of the people, were performed at such rites as the worship of heaven in the north and the sowing and harvest festivals in the south. These songs were transmitted orally and were thought to have magical properties.

Early songs

Three songs are handed down in Chinese translation: "Kuji ka" (or "Yŏng singun ka"; "Song for Welcoming the Gods," in the *Samguk yusa*), "Hwangjo ka" (17 BC; "Song of Orioles," in the *Samguk sagi*), and "Kong mudoha ka" (or "Konghuin"; "A Medley for the Harp," in the *Haedong yŏksa*). The "Kuji ka" is related to the myth of the founding of the Karak state, but it appears to have been a prayer sung at shamanist rituals. Some have interpreted it as being a song of seduction sung by women. The "Hwangjo ka," attributed to King Yuri, seems to be a fragment of a love song. The hero of "Kong mudoha ka" is thought to have been a shaman who drowned himself while in a trance. Perhaps the poem indicates the loss of the shaman's efficacy and authority when ancient Korea was transformed into a structured state. The story also includes other characters such as the sailor, his wife, and her friend. Another song, the "Tosol ka" (AD 28), is mentioned in the *Samguk sagi* as the beginning of secular poetry, but the poem itself has not survived.

Literature of the Three Kingdoms: 57 BC–AD 668. In contrast to the literature of the earliest ages, which is characterized by collective artistic activity, that of later ages shows the effects of political, economic, and cultural changes as the peninsula increased in wealth and widened its contacts with other areas. The introduction of Buddhism and Chinese characters to the Three Kingdoms enriched their literature and changed their worldview greatly. In consequence, their artistic activity advanced far beyond collective singing and dancing to the direct expression of individual feelings. The heroes of this literature were human beings with individual personalities in contrast to the more idealized tribal heroes of earlier times.

The three kingdoms of this period were Koguryŏ, in the north; Paekche, in the southwest; and Silla, in the southeast. The writers of Koguryŏ, the geographical location of which provided close contact with the Chinese mainland, seem to have retained something of the original pioneer spirit from the times when Koreans came from the northern regions and settled on the peninsula; their poems tended to be heroic tales in epic form. The foundation myth of Koguryŏ concerns the migration of King Tongmyŏng and his people into the region. The stories of Ondal, King Mich'ŏn, Prince Hodong, the heir apparent Yuri, and others that had their origin in Koguryŏ are still used today as the bases for dramas and motion pictures.

In contrast to that of Koguryŏ, the literature of Paekche and Silla tended to be lyrical, perhaps because of the milder climate and easier life in the south. Although little literature from Paekche has survived, the legends and songs contained in the *Samguk sagi* give a hint of its original extent and richness. For example, "Chŏngŭpsa" ("Song of Chŏngŭp")—in which the wife of an itinerant merchant asks the Moon to protect her husband—was passed down from Paekche through the Koryŏ and Yi dynasties and is still appreciated in the 20th century.

Silla led the other two kingdoms both politically (as proved by its subsequent unification of Korea) and artistically, in spite of the fact that it was farthest removed from contact with Chinese culture. The geographical and cultural distance from China, however, seems to have been an advantage, since the culture of Silla was able to create a true synthesis of native and foreign elements.

Absorption of Chinese culture

Literature of Unified Silla: 668–935. After the mid-7th century Silla absorbed Koguryŏ and Paekche and created a stable political system covering most of the Korean peninsula. During the Unified Silla dynasty many students were sent at government expense to study in T'ang China. The consequent absorption of Chinese culture and the flourishing of Korean Buddhism both contributed to the remarkable artistic flowering of Silla. In particular, the spiritual life of the Silla nobility—the monks and the chivalrous Hwarangdo—was dominated by Buddhism, and Buddhism thus became the driving force behind virtually all artistic activity.

The *hyangga* was the crown of Silla's literary achievement. Although the term *hyangga* is used generally to distinguish Korean songs from Chinese poetry, it more specifically denotes the 25 extant poems transcribed in the newly devised *hyangch'al* system in the Unified Silla and early Koryŏ periods. The texts of 14 *hyangga* are preserved in the *Samguk yusa* and those of 11 devotional poems by the Buddhist monk Kyunyŏ in *Kyunyŏ chŏn* (1075; "Life of Kyunyŏ"). A large collection, *Samdaemok,* compiled by the monks Taegu and Wi Hong in 888, has not survived. The poems that remain reveal a delicate and elegant style. Two examples written in the 8th century include "Ch'an Kip'arang ka" ("Ode to the Knight Kip'a"), which praises a member of the Hwarangdo, and "Che mangmae ka" ("Song of Offerings to a Deceased Sister"), a funeral hymn.

At the same time, a great body of prose narratives was also being written in classical Chinese. These include hundreds of volumes of commentaries on Buddhist scriptures by such monks as Wŏnhyo, Ŭisang, Wŏnch'ŭk, Taehyŏn, and Kyŏnghŭng; stories of miracles performed by eminent monks, tales of the efficacy of Buddhist statues, and the origins of Buddhist monasteries; stories of valour by members of the Hwarangdo; and stories inspired by the Chinese narrative form *ch'uan-ch'i* ("tales of marvels"). The last three types of narratives in particular became the basis of classical fiction in later dynasties.

Literature of Koryŏ: 935–1392. The last master of the *hyangga* was the monk Kyunyŏ, who wrote voluminous commentaries on, and was a great popularizer of, Buddhism. He composed his poems in Korean, transmitted them orally, and encouraged his followers to chant and memorize them. The poems in his *Kyunyŏ chŏn,* based on the 10 vows of the bodhisattva Samantabhadra, were transcribed frcm this oral transmission. The new poetic form that flourished during the period was the *pyŏlgok,* which was of folk origin. The *pyŏlgok* was intended for large-scale performances on festive occasions, especially the Harvest Festival and the Lantern Festival. Many *pyŏlgok* were written and performed by women, and such poems as "Tongdong" ("Ode on the Seasons") and "Isanggok" ("Winter Night") are among the most moving love lyrics in the Korean language.

The Koryŏ dynasty was a time of social instability. Internal and external crises abounded, the result of a factious and oppressive nobility and army, constant border harassment by the Khitan and Juchen peoples, and the invasions of the Mongols. Under such conditions established scholarly writers tended to be introspective or hedonistic. Consequently, the new intellectuals who arose toward the end of the dynasty began to adopt Confucian and Taoist dualistic thought as their philosophy. They were dissatisfied with *pyŏlgok* and sought a different form of poetic expression. This was the genesis of the *sijo,* which became a popular poetic form in the Yi dynasty.

Prose narratives underwent much development during the Koryŏ period. These included myths, legends, folklore, Buddhist stories and lives of saints, and literary miscellany. One notable class of tales is that in which the hero is represented by a personified inanimate object, such as wine, paper, a cane, ice, or a coin, or by an animate object, such as bamboo or a turtle. Representative of this form is *Kongbang chŏn* ("Tale of the Square-Holed Coin"), by Im Ch'un. Another major style is heroic narrative poetry, of which the masterpiece is the "Tongmyŏng wang p'yŏn" (1193; "Lay of King Tongmyŏng"), by Yi Kyubo, written in an old, pentasyllabic style. A work in a similar vein is the *Chewang ungi* (1287; "Rhymed History of Emperors and Kings"), by Yi Sŭnghyu, written in lines of five and seven syllables. A notable example of hagiography is the *Haedong kosŭng chŏn* (1215; "Lives of Eminent Korean Monks"), by Kakhun. The first collection of essays on poetry and other current subjects written in Korea is the *P'ahan chip* (1260; "Jottings to Break Up Idleness"), by Yi Inno (or Yi Illo). In addition to poetic criticism, the random jottings of Yi Inno contain autobiographical information in diary form; biographical notes on his friends and associates, including their life-styles and literary tastes; and remarks on contemporary manners and mores. The *P'ahan chip* inaugurated a long tradition of similar works written in the late Koryŏ and Yi dynasties.

Literature of the early Chosŏn period: 1392–1598. The literature of the Yi dynasty falls naturally into two periods, with the end of the Japanese invasion (1597) serving as a dividing line. The early period is notable for its poetry; the later, for its prose. Inheriting the tradition of Silla and Koryŏ, the writers of the early Yi dynasty raised Korean literature to new heights.

Invention of Korean alphabet

The early Yi dynasty also marks the initiation of a new era in Korean literary history with the invention of Han'gŭl in 1443–44, during the reign of King Sejong. This important event finally enabled Korean writers to record works in their native language.

The extraordinary king Sejong was not only the motivating force behind the invention of Han'gŭl but also had his scholars compile *Yongbi ŏch'ŏn ka* to praise the founding of the Yi dynasty, especially the valour and virtue of his father and grandfather. He himself compiled *Wŏrin ch'ŏngang chigok* (1447; "Songs of the Moon's Reflection on a Thousand Rivers") in praise of the life of the Buddha. Both works helped test and demonstrate the practicality of Han'gŭl as a means of literary expression and were the prototype of the new *akchang* form. Scholar-officials used the form to justify the founding of the new dynasty and to praise the virtues of its founder and the beauty of the new capital. As a literature of the privileged class, the popularity of the *akchang* was always limited, and it was soon eclipsed by the most important forms of the Yi dynasty—*sijo* and *kasa.*

These forms owe their popularity to two factors. First, their style of expression was rich and natural and was widely appreciated by readers. Second, they were popular with writers because together the forms provided ideal outlets for the two sides of the Confucian temper: the brief and simple *sijo* were perfect vehicles for intense lyrical expression, whereas the longer *kasa* gave writers an opportunity to expound at greater length on the more practical aspects of Confucian thought.

The expressive content of the *sijo* ranges from the idealistic union of man and nature (often coupled with the poet's pride in his poverty) to the longing for sovereigns by subjects in exile (allegorical pieces in which an analogy is drawn between fidelity and romantic love) to the deeper exploration of human problems. Writers of *sijo* include Maeng Sasŏng, Yi Hyŏnbo, Yi Hwang, and Yi I. Representative poets of *kasa* include Chŏng Ch'ŏl and Hŏ Nansŏrhŏn.

Even after the invention of Han'gŭl, prose continued to be written in Chinese. The five stories contained in the *Kŭmo sinwha* ("New Stories from Golden Turtle Mountain") by Kim Sisŭp, for example, are in the tradition of the *ch'uan-ch'i.* Subject material includes love affairs between mortals and ghosts and dream journeys to the underworld or to the Dragon Palace. Two collections of literary miscellany, the *P'aegwan chapki* ("The Storyteller's Miscellany") by Ŏ Sukkwŏn and the *Yongjae ch'onghwa* ("Miscellany of Yongjae") by Sŏng Hyŏn, were written in Chinese and influenced the growth and development of vernacular prose in the later Yi dynasty.

Shift from poetry to prose

Literature of the later Chosŏn period: 1598–1894. The shift in emphasis from poetry to prose after the Japanese invasion represents a significant step in the evolution toward modern literature. It also reflects a basic change in the philosophical outlook of Korean society. The Yi dynasty had suffered from the rigid formalism of Confucian officials, whose doctrine was based on the principles of the 12th-century Chinese philosopher Chu Hsi. This Neo-Confucian philosophy was gradually replaced by the Sirhak, or Silhak ("Practical Learning"), school, which was based on reason and the scientific spirit of criticism. The introduction of Roman Catholicism from the West and of new scientific ideas from China also stimulated the reform measures advocated by the champions of the new school.

Practical Learning gave impetus to literary activity and awakened the self-consciousness of the common people. Poetry, which had been the monopoly of the lettered class, came to be written by the common people. Women also were admitted into the literary world as the principal audience for traditional fiction. The later active compilation of *sijo* and prose narratives reveals the awakening interest in rediscovering and reappraising the past.

Prose. The traditional vernacular fiction—commonly called *sosŏl* ("small talk")—that emerged during this period consisted of stories, romances, and fables. The 15th-century *Kŭmo sinwha,* written in Chinese, was an important precursor, but the first work of the genre was *Hong Kiltong chŏn* ("Tale of Hong Kiltong"), written in the early 17th century by the scholar Hŏ Kyun. Kim Manjung, building on this style, wrote two major works: *Kuun mong* (1687–88; "Dream of Nine Clouds"), the story of a Buddhist monk's search for Enlightenment, and *Sassi namjŏng ki* (*c.* 1689–92; "Story of Lady Sa's Journey to the South"), a satire against the institution of concubinage. The most popular stories of the 18th century were all anonymous: *Ch'unhyang chŏn* ("Story of Spring Fragrance"), *Shim Ch'ŏng chŏn* ("Story of Shim Ch'ŏng"), *Changhwa hongnyŏn chŏn* ("Tale of Rose Flower and Pink Lotus"), and *Hŭngbu chŏn* ("Story of Hŭngbu"). These stories were written in a simple and natural style, their characters being modeled on common people, and they have become deeply rooted in Korean consciousness.

Court literature

Stories set at court and written by women also flourished during this period. Memorable works of court literature include the *Hanjung nok* (1795–1805; "Record of Sorrowful Days"), the tragic story of a succession dispute written by Lady Hong, princess of Hyegyŏng Palace; *Kyech'uk ilgi* ("The Diary of Kyech'uk"), the anonymous record of Queen Inmok's confinement after the assassination of her son; and *Inhyŏn wanghu chŏn* ("Tale of Queen Inhyŏn"), an anonymous account of the rivalry between the Queen and the King's concubine. All three of these works described events that had actually taken place. Other prose works written by women in Han'gŭl include diaries, travel records, letters, and portraits. These works, written in prose that verged on lyricism, could easily be chanted and memorized by a growing female readership.

Poetry. During the later Yi dynasty there was also a great flowering of poetry by scholar-officials and commoners. The most gifted poet of the period was Yun Sŏndo. His 77 *sijo* poems, including *Ŏbu sasi sa* (1651; *The Angler's Calendar*), a cycle of 40 poems on the theme of the fisherman as sage, show his mastery of topics and techniques of the *sijo.* Gradually, the *sijo* was superseded in popularity by the *sasŏl sijo.* The growth of this new form, together with the rise of fiction, drama, genre painting, and *p'ansori,* reflects the rise of the middle class and changes in the approach to life.

Pak Inno, the master of *kasa* in the 17th century, wrote in a style that combined erudition and lyricism. He produced seven pieces between 1598 and 1636; the theme of his first two *kasa* was the Japanese invasion, during which he served in the navy. The desire to reevaluate the past and to re-create the world of literature led to changes in the *kasa,* as exemplified in the anonymous *kasa* by women and commoners. Women writers of *kasa* were mainly from the southern regions of Korea. They expressed their joys, angers, griefs, and pleasures, and discoursed on the etiquette for entertaining guests, religious rites, and the principles of being a wise mother and a good wife. *Kasa* written by the commoners were marked by the same style as those written by women and played a similar role in the literary activity of the general masses. There are two other forms of *kasa* written by the literati: travel records and accounts of life in exile. To the first belong *Iltong changyu ka* (1764; "Song of a Grand Trip to Japan"), written by Kim In'gyŏm upon his return from an official trip to Japan; and the *Yŏnhaeng ka* (1866; "Song of a Journey to Peking"), written by Hong Sunhak upon his return from an official trip to Peking. The second includes *Pukkwan kok* ("Song of the Northern Pass"), written by Song Chusŏk, who in 1675 accompanied his grandfather, Song Siyŏl, to his place of exile in the northeast; the *Manŏnsa* ("Song of Ten Thousand Words"), written by An Towŏn (or An Chohwan) during his banishment on the lonely island of Ch'uja, off the southeast coast of Korea; and the *Pukch'ŏn ka* (1853; "Song of a Northern Exile"), written by Kim Chinhyŏng, depicting the life of exile in the northeast.

Oral literature. Another feature of the later Yi dynasty was the formation, by the common people, of *p'ansori* texts. *P'ansori* seem to have originated during the reign of Sukchong (1675–1720), when old folktales were first sung. Their style and form were fixed by the *kwangdae,* or professional singers, and a group of amateurs in Chŏlla and Ch'ungch'ŏng provinces. Six of the original 12 titles were revised by the master *p'ansori* writer Sin Chaehyo, of which five are still performed.

Mask plays and puppet shows

The representative mask play is *Sandae kŭk.* Of unknown origin, it was usually performed on a makeshift, open-air stage in 12 scenes, or acts. The masked actors followed a script that presented a story in dialogue interspersed with dances and songs. As the puppets of the *Kkoktukaksi nori* show were made of *pak* (a gourd, rhyming with the Korean name Pak), it was also called *Pak Ch'omji kŭk* ("Old Pak's Play"). Through keen satire presented in a unique and distinguished style, the contents of the masked drama and the puppet show strongly reflect the environment and the feelings of the common people of the later Yi dynasty.

Transitional literature: 1894–1910. By the time of the 1894 reforms, enough social and intellectual change had occurred to suggest the beginnings of a division between traditional and modern literature. But, just as conservatism did not favour sudden changes in the political and social structure, literature, too, faced a period of transition toward its modern transformation. Schools were established by the educational ordinance of 1895, and the organization of learned societies and "enlightenment" movements followed soon after. Vernacular publications, the *Tongnip sinmun* ("Independent") and the *Cheguk sinmun* ("Imperial Post"), along with the establishment of the Korean Language Institute and the scientific study, consolidation, and systematization of Korean grammar, also helped open the way for the modern literary movement.

The first literary forms to appear after the 1894 reforms were the *sinsosŏl* ("new novel") and the *ch'angga* ("song"). These transitional literary forms were stimulated by the adaptation of foreign literary works and the rewriting of traditional stories in the vernacular. The *ch'angga,* which evolved from hymns sung at churches and schools in the 1890s, became popular upon the publication of the "Aeguk ka" ("National Anthem"), by Yi Yongu, and "Tongsim ka" ("A Boy's Mind"), by Yi Chungwŏn, in an issue (1896) of the *Tongnip sinmun.* Songwriters still used such traditional verse forms as the *sijo* and *kasa* or a song form, the predominant pattern of which (seven and five syllables) showed the influence of popular Japanese songs (*shōka*). Most songs denounced corruption in the government and stressed independence, patriotic fervour, and modernization.

The *sinsosŏl*

Three distinctly traditional elements were inherited by the *sinsosŏl*. First was the basic moral stance of reproving vice and rewarding virtue. Owing to the prevailing atmosphere of the "enlightenment" period, advocates of modernization were cast as virtuous, while the wicked were conservative. Second, the development of the plot was governed by coincidence, and events that lacked causality were nevertheless arbitrarily connected. Finally, the dialogue and the accompanying narrative were fused into one expository structure. The pioneering aspects of the *sinsosŏl,* however, were that it was written wholly in prose, whereas a considerable part of traditional fiction had been in verse; and it tried to depict a plausible human existence with backgrounds and events that more closely resembled reality than was the case in traditional fiction, which tended to follow certain model stories with their established plot lines and stereotyped characterizations. Writers of *sinsosŏl* also tried to unify the spoken and written language. Typical writers and their works are Yi Injik, *Kwi ŭi sŏng* (1907; "A Demon's Voice"); Yi Haejo, *Chayujong* (1910; "Liberty Bell"); and Ch'oe Ch'ansik, *Ch'uwŏlsaek* (1912; "Colour of the Autumn Moon"). In their works these writers advocated modernization, a spirit of independence, contact with advanced countries, study abroad, the diffusion of science and technology, and the abolition of conventions and superstition.

Modern literature: 1910 to the present. The modern literary movement was launched by Ch'oe Namsŏn and Yi Kwangsu. In 1908 Ch'oe published the poem "Hae egeso pada ege" ("From the Sea to Children") in *Sonyŏn* ("Children"), the first literary journal aimed at producing cultural reform. Inspired by Byron's *Childe Harold's Pilgrimage,* Ch'oe celebrates, in clean masculine diction, the strength of the young people who will carry out the necessary social and literary revolution. The poem's inventions include the use of punctuation marks, stanzas of unequal length, and reference to the sea and children, hitherto little mentioned in classical poetry. Neither Ch'oe nor his contemporaries, however, could escape the bounds of traditional prosody or succeed in modernizing traditional forms of speech and allusion. In his stories, which dealt with the enlightened pioneers who championed Western science and civilization, Yi Kwangsu adopted a prose style that approximated the everyday speech of common people. Yi's reputation was established by *Mujŏng* (1917; "The Heartless"), the first modern Korean novel.

In 1919, shortly before the unsuccessful movement for independence from Japan, translations of such Western poets as Paul Verlaine, Rêmy de Gourmont, and Stéphane Mallarmé began to exert a powerful influence on Korean poetry. The indirection and suggestiveness of French Symbolist literature were introduced by Kim Ŏk, the principal translator. Against the didacticism of the age Kim set Mallarmé, and against its rhetoric and sentimentality he set Verlaine, concluding in the process that free verse was the supreme creation of the Symbolists. Kim's fascination with the Symbolist movement culminated in the publication of *Onoe ŭi mudo* (1921; "Dance of Anguish"), the first Korean collection of translations from Western poetry. The exotic and melancholy beauty of autumn and expressions of ennui and anguish appealed to poets who sought to vent their frustration and despair at the collapse of the independence movement.

Naturalism

The movement for literary naturalism was launched in the 1920s by a group of young writers who rallied around a new definition of universal reality. Yŏm Sangsŏp, the first to introduce psychological analysis and scientific documentation into his stories, defined naturalism as an expression of awakened individuality. Naturalism's purpose, Yŏm asserted, was to expose the sordid aspects of reality, especially the sorrow and disillusionment occurring as authority figures are debased and one's idols are shattered. Many works of naturalist fiction were first-person narratives in which writers presented themselves as the subjects of case studies. The disharmony between the writer and his society often induced the writer to turn to nature; the land and simple folk furnished themes and motifs for some of the better stories in the Zolaesque tradition, among them "Pul" (1925; "Fire") by Hyŏn Chingŏn and "Kamja" (1925; "Potato") by Kim Tongin.

The 1920s produced several major poets, Han Yongun published *Nim ŭi ch'immuk* (1926; "The Silence of Love"), comprising 88 meditative poems. Han sought insight into the reasons why he and his country had to endure Japanese occupation, and he found Buddhist contemplative poetry the lyric genre most congenial to this pursuit. The nature and folk poet Kim Sowŏl used simplicity, directness, and terse phrasing to good effect. Many of his poems in *Chindallaekkot* (1925; "Azaleas") were set to music.

The Mukden, or Manchurian, Incident (1931) and the Japanese invasion of China in 1937 induced the Japanese military authorities to impose wartime restrictions. The grinding poverty of the lower classes at home and abroad, especially in the Korean settlements in southern Manchuria, was the chief concern of the writers of the "new tendency" movement, which opposed the romantic and "decadent" writers of the day and later became proletarian in spirit. Writers of the class-conscious Korean Artist Proletariat Federation (KAPF), organized in 1925, asserted the importance of propaganda and regarded literature as a means to establish socialism.

Modern Korean literature attained its maturity in the 1930s through the efforts of a group of talented writers. They drew freely upon European examples to enrich their art. Translation of Western literature continued, and works by I.A. Richards, T.S. Eliot, and T.E. Hulme were introduced. This artistic and critical activity was a protest against the reduction of literature to journalism and its use as propaganda by leftist writers.

The first truly successful poet of modern Korea was Chŏng Chiyong, who was influenced by William Blake and Walt Whitman. *Paengnoktam* (1941; "White Deer Lake"), his second book of poetry, symbolically represents the progress of the spirit to lucidity and the fusion of man and nature. A poetry of resistance, voicing sorrow for the ruined nation with defiance but without violence or hatred, was produced by Yi Yuksa and Yun Tongju. In Yi's poem "Chŏlchŏng" (1939; "The Summit"), he recreates the conditions of an existence in extremity and forces the reader to contemplate his ultimate destiny. The poetry of Yun Tongju, a dispassionate witness to Korea's national humiliation, expresses sorrow in response to relentless tyranny.

Literature since World War II

Korean fiction of the 1930s took shape in the void created by the compulsory dissolution of KAPF in 1935. Barred from all involvement with social or political issues, some writers returned to nature and sex; others retreated to the labyrinth of primitive mysticism, superstition, and shamanism; still others sympathetically portrayed characters born out of their time, defeated and lonely. In the early 1940s, the Japanese suppressed all writings in Korean. Censorship, which had begun with the Japanese annexation of Korea in 1910, was intensified. Korea was liberated in August 1945, and the Republic of Korea (South Korea) was established three years later. The literary scene experienced the revival of the controversy between left and right that had raged in the late 1920s and early 1930s. There were frantic groupings and regroupings, and most of the hardcore leftist writers, such as Yi Kiyŏng and Han Sŏrya, were in North Korea by 1948.

The liberation of 1945 produced a flowering of poetry of all kinds. Some poets were determined to bear witness to the events of their age; some sought to further assimilate traditional Korean values, while others drew variously on Western traditions to enrich their work. Sŏ Chŏngju and Pak Tujin are known for their lifelong dedication and contributions to modern Korean poetry. Considered to be the most "Korean" of contemporary poets, Sŏ is credited with exploring the hidden resources of the language, from sensual ecstasy to spiritual quest, from haunting lyricism to colloquial earthiness. Pak is capable of a wide range of moods, and his language and style impart a distinctive tone to his Christian and nationalistic sentiments. Marked by sonorific intricacies and incantatory rhythms, Pak's poems are imbued with a strong historical and cultural consciousness that bears testimony to contemporary reality.

The single overwhelming reality in Korean fiction since the Korean War has been the division of the country. The 38th parallel torments the conscience of every fictional protagonist, for it is a symbol not only of Korea's trials but also of the division of mankind and of the protagonist's alienation from himself and his world. Some have attempted to capture the images of the people in lyrical prose; others have delved into the conscience of the war's lost generation or into the inaction, self-deception, and boredom of the alienated generation of the 1960s. Some have studied the defeat and disintegration of good people; others have investigated the ways in which modern society negates freedom and individuality. Outstanding among writers of the roman-fleuve is Pak Kyŏngni, the mother-in-law of the poet Kim Chiha. Pak's multivolume *T'oji* (1969; "Land") has been acclaimed for its commanding style and narrative techniques.

In the last quarter of the 20th century a host of talented writers have been perfecting the art of being themselves. The poet Hwang Tonggyu, for example, has drawn material not only from his own experiences but also from the common predicament of the Korean people, expressing what others know but do not think of saying or cannot say. The novelist Yun Hŭnggil is another example of a writer who has cultivated fiction as an instrument of understanding himself and others. In his *Changma* (1973; "The Rainy Spell"), for example, Yun says that ideological differences imposed upon the Korean people by history can be overcome if they delve into the native traditions that have given them cohesion.

Drama

The "new" drama movement, which began in 1908, saw the rise and fall of small theatre groups, such as the T'owŏrhoe, organized in 1923, and finally the Kŭk Yesul Yŏnguhoe ("Theatrical Arts Research Society"), organized in 1931. Through their experimental theatre, the members of the society staged contemporary Western plays and encouraged the writing of original plays, such as Yu Ch'ijin's *T'omak* (1933; "Clay Hut"). The paucity of first-rate playwrights and actors, the dearth of plays that satisfy dramatic possibilities, the general living standards of the audience, as well as the lack of government support have limited dramatic activity. Domestic plays and historical pieces, however, have continued to be written and staged.

BIBLIOGRAPHY

Poetry: PETER H. LEE (comp. and ed.), *Anthology of Korean Literature from Early Times to the Nineteenth Century* (1981), collects representative poetic and prose works written in Chinese and Korean and supplies commentary and criticism; his *Lives of Eminent Korean Monks* (1969) is an annotated translation of KAKHUN, *Haedong kosŭng chŏn* (1215), with an introduction. RICHARD RUTT (ed. and trans.), *The Bamboo Grove* (1971), introduces *sijo* arranged by themes. WON KO (trans. and comp.), *Contemporary Korean Poetry* (1970), is another collection. PETER H. LEE (ed.), *The Silence of Love: Twentieth-Century Korean Poetry* (1980), contains translations of 16 major modern poets. DAVID R. MCCANN (trans.), *The Middle Hour: Selected Poems of Kim Chi Ha* (1980), contains 40 poems. Another selection of poems, prose pieces, and a play by the same author is presented in CHONG SUN KIM and SHELLY KILLEN (eds.), *The Gold Crowned Jesus and Other Writings* (1978).

Prose: RICHARD RUTT and CHONG-UN KIM (trans.), *Virtuous Women* (1974, reprinted 1979), contains translations of "Dream of Nine Clouds," "Tale of Queen Inhyŏn," and "The Song of a Faithful Wife, Ch'un Hyang." IN-SŎP CHŎNG (ed. and trans.), *Folk Tales from Korea* (1952, reprinted 1969), is a representative selection. DUK-SOON CHANG *et al.* (eds.), *The Folk Treasury of Korea: Sources in Myth, Legends, and Folktale*, trans. by TAE-SUNG KIM (1970), is a collection of oral literature. SOUN KIM, *The Story Bag* (1955), collects 30 folktales. For modern prose see KEVIN O'ROURKE (comp.), *Ten Korean Short Stories* (1973, reissued 1981); PETER H. LEE (ed.), *Flowers of Fire: Twentieth-Century Korean Stories* (1974, rev. ed. 1986); CHONG-WHA CHUNG (ed.), *Modern Korean Short Stories* (1980); CHONG-UN KIM (ed.), *Postwar Korean Short Stories*, 2nd ed. (1983); and JI-MOON SUH (trans.), *The Rainy Spell and Other Korean Stories* (1983).

Literary criticism: PETER H. LEE, *Korean Literature: Topics and Themes* (1965), is an introduction to Korean literature, and his *Songs of Flying Dragons: A Critical Reading* (1974) is an annotated translation of *Yongbi ŏch'ŏn ka* (1445–47). W.E. SKILLEND, *Kodae Sosŏl: A Survey of Korean Traditional Style Popular Novels* (1969), is a catalog of Korean fiction.

Kyōto

The capital of Japan for more than 1,000 years (from 794 to 1868), Kyōto (literally, "Capital City") has been called a variety of names through the centuries—Heian-kyō ("Capital of Peace and Tranquillity"), Miyako ("The Capital"), and Saikyō ("Western Capital"), its name after the Meiji Restoration (1868) when the Imperial Household moved to Tokyo. The contemporary phrase *sekai no Kyōto* ("the world's Kyōto") reflects the reception of Japanese culture abroad and Kyōto's own attempt to keep up with the times. Nevertheless, Kyōto is the centre of Japanese culture and of Buddhism, as well as of fine textiles and other traditional Japanese products. The deep feeling of the Japanese people for their culture and heritage is represented in their special relationship with Kyōto—all Japanese try to go there at least once in their lives, with almost a third of the country's population visiting the city annually.

Kyōto is located on the island of Honshu some 29 miles (47 kilometres) northeast of the industrial city of Ōsaka and about the same distance from Nara, another ancient centre of Japanese culture. Gently sloping downward from north to south, the city averages 180 feet (55 metres) above sea level, and it covers an area of about 236 square miles (611 square kilometres). It is the capital of Kyōto-fu (Kyōto Urban Prefecture), which is at the centre of the Kinki-chihō (Kinki Region). The city is also one of the centres (with nearby Ōsaka and Kōbe) of the Keihanshin Industrial Zone, the second largest urban and industrial agglomeration in Japan.

Physical and human geography

THE LANDSCAPE

The city site. Designated as the site of the new capital by the emperor Kammu, Kyōto was laid out in 794 on the model of Ch'ang-an (modern Sian), the capital of the T'ang dynasty in China. The plan consisted of a rectangular enclosure with a grid street pattern, 3.2 miles north to south and 2.8 miles east to west. The Imperial Palace, surrounded by government buildings, was in the north-central section of the city. Following Chinese precedent,

City layout

care was taken when the site was selected to protect the northern corners, from which, it was believed, evil spirits could gain access. Thus, Hiei-zan (Mt. Hiei; 2,782 feet) to the northeast and Atago-yama (Mt. Atago; 3,031 feet) to the northwest were considered natural guardians. Hiei-zan especially came to figure prominently in the fate of the city: between the 11th and 16th centuries warrior-monks from its Tendai Buddhist monastery complex frequently raided the city and influenced politics. The Kamo and Katsura rivers—before joining the Yodo-gawa (Yodo River) to the south of the city—were, respectively, the original eastern and western boundaries. But the attraction of the eastern hills kept the city from filling out to its original western border until after World War II. Kyōto is actually cradled in a saucer of hills on three sides that opens to the southwest toward Ōsaka.

Climate. During spring and fall Kyōto is in its prime; the rainy season (June–July), lasting three to four weeks, is unavoidable; and summers are hot and humid. Winter brings two or three light snows and a unique "chilling from below" (*sokobie*), which must be tolerated. The yearly mean temperature of Kyōto is about 59° F (15° C); the highest monthly mean, 80° F (27° C), is in August, and the lowest, 38° F (3° C), is in January. The average yearly rainfall is about 62 inches (1,574 millimetres).

The city layout. The original grid pattern of the streets has been retained. Numbered avenues run east and west, Shijō-dōri ("Fourth Street") being the busiest. Karasuma-dōri, running north from the Japanese National Railways station, divides the city roughly into halves. Under it is the single line of the municipal subway. Kyōto was the first city in Japan to have electric streetcars (starting in 1895), which eventually made it necessary to widen the major thoroughfares to allow for citywide service.

Kyōto is a city with few large factories or businesses, a fact reflected in the look of the inner city—shops and workshops, residences, and offices all standing side by side. Stringent building codes limit the height of buildings in order to preserve the overall look of the historic city. Characteristic of the architecture are tiled roofs and wood weathered to dark brown, but telephone poles (now made of concrete) and a forest of television antennas protrude at every turn. A typical Kyōto house presents a narrow and low front to the street, but as it recedes it gains in height and embellishment—all this a reflection of its past history and character: wariness of the marauding monk, the zealous revenue collector, or the curious neighbour. Rarely does one enter a home beyond the front vestibule; if one is invited in, it is good form to demur.

Architecture

Because of earthquakes and conflagrations, the attacks of monks from Hiei-zan, and the Ōnin War (1467–77), which utterly destroyed the city, Kyōto's historical architecture rarely predates the 17th century. Replacements and renovations, of course, followed previous plans, but the single shining example of Heian-period architecture remaining is the soaring Hōō-dō ("Phoenix Hall") of the Byōdō-in ("Byōdō Temple"), located a few miles southeast of the city on the banks of Uji-gawa.

Temples and shrines

Buddhist temples and Shintō shrines abound. Their grounds and those of the Kyōto Gosho ("Kyōto Imperial Palace") and Nijō-jo ("Nijō Castle") give Kyōto more green areas than most Japanese cities. Kyōto claims some 1,660 Buddhist temples, more than 400 Shintō shrines, and even some 90 Christian churches. Major Buddhist institutions include Higashi and Nishi Hongan-ji ("East and West Hongan" temples), the former with the world's largest wooden roof of its kind and the latter containing a repository of the grandeur of Toyotomi Hideyoshi; Ryōan-ji, with its famous rock-and-sand Zen garden; Tenryū-ji, in the Arashiyama district to the west; Kiyomizu-dera, built on stilts on the side of the eastern hills; and Kinkaku-ji, the "Golden Pavilion" (burned down by a deranged student in 1950 but rebuilt exactly), and Ginkaku-ji, the "Silver Pavilion," both of which were products of the Ashikaga shoguns' attraction to Zen. The great Shintō shrines are Kitano, Yasaka, and Heian, the last built in 1894 to commemorate the 1,100th anniversary of Kyōto's founding.

The buildings of the Kyōto Gosho, originally located farther west, date from 1855 and replaced in the same "monumental" Japanese style the earlier structures that were destroyed by fire. Nijō-jo, built by the Tokugawa shogunate, is a "token" castle, but it contains many cultural treasures; it is known for its "chirping floors" (to signal the approach of an intruder) and elaborate wall paintings of the Kanō school. The two foremost examples of traditional Japanese landscape architecture are the Katsura Rikyū ("Katsura Detached Palace") in the southwest corner of the city and the Shūgakuin Rikyū set in the northeast hills. Katsura underwent a complete renovation using perfectly matched modern materials; its buildings are models of Japanese architectural proportions. Shūgakuin contains three gardens, the third with an artificial lake. From there one can view the entire expanse of the city stretching out to the south.

THE PEOPLE

Kyōto is one of the largest cities in Japan. Its population—which includes a sizable foreign community comprising mainly Koreans (many brought there forcibly during World War II), Chinese, and Americans—has remained relatively stable for a number of years. Most of the city's residents live in the central districts, but increasingly people are moving to outlying and suburban areas.

A major item remaining on the municipal agenda has been how to assimilate the thousands of *burakumin,* the historical outcaste group, who live in segregated communities in the city. This has been a continuing social problem largely in the older urban areas of western Japan, particularly Kyōto, Ōsaka, and Kōbe. Despite the fact that the last discriminatory legal bars were removed in 1969, social and occupational progress has lagged.

THE ECONOMY

Industry. Kyōto is a city of thousands of medium and small industries, many of them family owned and operated. Traditional handicrafts abound, and their manufacture for the tourist trade is an important element of Kyōto's economic life. The central part of the city is crowded with small workshops, which produce such typical Japanese goods as fans, dolls, Buddhist altar fittings, and lacquer ware. Antipollution measures have forced the once-thriving Kiyomizu pottery kilns to move to nearby Yamashina.

Silk weaving

For centuries silk weaving, centred in the north-central Nishijin district, has been Kyōto's major industry. Along with the geisha and entertainment industry, the fine textiles, delicate fabrics, and embroidery represent a continuity of Kyōto's traditional role as the centre of Japanese culture. In addition, the Fushimi district in southern Kyōto, favoured with excellent water, produces some of Japan's finest sake. Also located in southern Kyōto are several industries established after World War II. The most important of these produce industrial ceramics, women's garments, and medical instruments.

Commerce. Kyōto is mainly a consumer city. It is the national centre of silk and fine textile wholesaling, but its main commercial activity is retail trade. The Gion and Pontocho districts, famed for their geisha and *maiko* (apprentice geisha), offer a variety of traditional and foreign food and drink. During the summer *yuka* (platforms on stilts) are set up on the banks of the Kamo-gawa in the heart of town, and strolling troubadours pass below as a reminder of how Kabuki originated. Traditional Japanese inns (*ryōkan*) abound, and many Western-style hotels cater to the wedding, tourist, and convention trades. A large conference centre near the foot of Hiei-zan hosts major industrial exhibitions and international conferences.

Transportation. Most of Japan's east–west traffic must come through Kyōto. During the Tokugawa period (1603–1867) the city was the western terminus of the Tōkaidō, the road that connected Kyōto to Edo (now Tokyo). River traffic to Ōsaka favoured the Yodo-gawa. Today the numerous, high-speed "bullet" trains of the Shinkansen give reliable service to major cities east and west. Interurban lines between Kyōto and Ōsaka–Kōbe and Nara provide fast and frequent local service. Kyōto itself finally abandoned streetcars in the 1970s. The Meishin Expressway links Kyōto to Ōsaka and Nagoya.

Camera Tokyo

ADMINISTRATION AND SOCIAL CONDITIONS

Government. Kyōto Urban Prefecture, which extends to the Japan Sea, is under the administration of an elected governor, while the city is administered by an elected mayor and city council of 72 members.

Education. Kyōto was traditionally organized into extended neighbourhoods, called *machi*, and after the Meiji Restoration it was found that this was a good base by which to quickly establish general public education; as such, the city preceded the national effort to systematize primary education. Kyōto is surpassed only by Tokyo in its number of institutions of higher learning, but it claims several Nobel Prize laureates that Tokyo, with none, is reminded of from time to time. The city's relatively calm atmosphere, its distance from the hurly-burly of national government, and its numerous cultural and religious institutions and facilities are cited as prime reasons for its educational advantages. There are more than 40 two-year and four-year colleges and universities with a total annual enrollment of more than 100,000 students. The state-run Kyōto Daigaku (Kyōto University), established in 1897, is the nation's second most prestigious school. Dōshisha Daigaku, the leading private institution, was founded in 1875 by Niijima Jō (also called Joseph Hardy Neesima), the first Japanese to graduate from a Western college (Amherst College in 1870). Major Buddhist universities include Ryūkoku, Ōtani, and the smaller Hanazano.

Higher education

CULTURAL LIFE

The millennium as the nation's capital and residence of the Imperial family has meant that Kyōto devolved as the preserver of the Japanese "spirit." This is exemplified in its varied and unique cultural institutions: the schools of tea ceremony (*cha-no-yu*) and flower arranging (*ikebana*); the theatrical arts of Nō, Kabuki, and traditional dance; or the masterpieces of calligraphy, painting, sculpture, and architecture that can be found everywhere in the city. Kyōto is the repository of hundreds of designated "national treasures" and "important cultural objects," representing a significant proportion of the national total. Included among these are individuals who have been named "living national treasures" (*ningen kokuhō*) in recognition of their superior skills in the traditional arts and crafts.

Most of the important works of art are housed in Kyōto's temples and shrines, many of which are themselves listed as national treasures. Even institutions that do not normally display their collections periodically have public "airings" at which their treasures can be viewed. Kyōto also has numerous museums, including Kyōto Kokuritsu Hakubutsukan (Kyōto National Museum; founded 1889), containing national treasures; Kyōto-shi Bijitsukan (Kyōto Municipal Art Museum; 1933); and Kyōto-shi Dentō Sangyō Kaikan (Kyōto Municipal Commercial and Crafts Museum; 1976).

Museums

The birthplace of traditional Japanese drama, Kyōto maintains an active theatrical life. Several Nō stages offer frequent performances, and the annual opening performance (*kaomise*) at the Minami-za is the customary inauguration of the national Kabuki season. A traditional form of humorous pantomime, *Mibu kyōgen,* is performed faithfully by troupes of amateurs.

The three major festivals (*matsuri*)—Aoi in May, Gion in July, and Jidai in October—are almost national events. The Jidai-matsuri ("Festival of the Ages") is a parade depicting, in period costume, Japan's entire history. The Gion-matsuri dates from the 9th century and features more than 30 elaborate, carefully preserved, hand-drawn floats, some decorated with French Gobelin tapestries imported through Nagasaki during Tokugawa times. The northern hills—Hiei-zan with its scenic drive and the Takao district for its fall foliage—are famed for their well-tended stands of Japanese cedar (*sugi*).

History

The ancient city

Kyōto as the national capital dates from 794, although the area was settled earlier by Korean immigrants who brought with them the skills of sericulture and silk weaving. As noted above, the planned city was between the Katsura and Kamo rivers, but it soon extended beyond the eastern banks of the Kamo. The powerful Fujiwara family dominated the Heian period. Excessive Buddhist influence at the old capital of Nara had occasioned the removal of the government to Nagaoka and then to Kyōto, where the building of Buddhist temples was proscribed. As an exception, Rashōmon, the great southern gateway, was flanked by Tō-ji on the east and Sai-ji on the west; Sai-ji was short-lived, but the handsome, five-tiered pagoda of Tō-ji is a classic landmark.

Following the decline of the Fujiwara and the ascendance of the Minamoto in the late 12th century, political and military leadership was vested in a shogun ("generalissimo"), the first of whom, Minamoto Yoritomo, chose to administer the expanding domains from Kamakura to the east. It was during the Kamakura period (1192–1333) that many of the Buddhist temples were established, and indigenous sects of Buddhism, together with Zen from the continent, appeared. During the ensuing Muromachi period (1338–1573), the Ashikaga shogunate moved the government back to Kyōto. The aristocratic culture of the Heian era blended with the culture of Zen that had developed under the samurai (warriors), resulting in the refinement of the Nō theatre, the tea ceremony and flower arranging, and pottery making.

By the mid-16th century, however, the city had been so devastated that St. Francis Xavier, on a pilgrimage to Kyōto, could not even locate the Imperial court, much less seek an Imperial audience. The city's fortunes revived under the regimes of the national unifiers Oda Nobunaga and Toyotomi Hideyoshi. Buddhists, especially the Tendai monks on Hiei-zan, were such an anathema to Nobunaga that he set fire to the entire monastery complex; but under Hideyoshi, an ardent patron of the arts, Kyōto flourished. One of his tea parties was attended by thousands of people and went on for days.

With the ascendance of the Tokugawa shogunate at the beginning of the 17th century, the political centre again moved, this time to Edo (modern Tokyo). The Imperial court was left to pursue its ceremonial functions, and access to it was carefully monitored. Only after the arrival of Matthew Perry in 1853 and the collapse of the Tokugawa did Kyōto again come to the fore. At the Nijō-jo in 1867 the last Tokugawa shogun finally turned back to the Imperial court his mandate to rule the nation, marking the first time in more than 200 years that a ruling Tokugawa had set foot in Kyōto.

Shortly after the proclamation of the Meiji Restoration, however, the young Meiji emperor took up residence in the new capital, Tokyo—a move that has not been forgotten in Kyōto. Kyōto busied itself in outbidding Ōsaka to become in 1872 the site of an annual exhibition that was held for more than 30 years. During World War II U.S. Secretary of War Henry L. Stimson, recalling his visits to Kyōto, struck the city from the list of targets for aerial bombing. Its cultural treasures intact, it maintains a special place in the hearts of the Japanese and, increasingly, in the eyes of the world.

The modern city

OTIS CARY, *Mr. Stimson's "Pet City": The Sparing of Kyoto, 1945* (1975), details Kyōto's survival during World War II. On social life and customs, see RUTH L. GAINES, *City-Royal: A Memory of Kyōto* (1953). HERBERT E. PLUTSCHOW, *Introducing Kyoto* (1979), is a good guidebook.

(O.C.)

Lakes

A lake is a body of slowly moving or standing water that occupies an inland basin. Definitions that precisely distinguish lakes, ponds, swamps, and even rivers and other bodies of nonoceanic water are not well established. It may be said, however, that rivers and streams are relatively fast moving; marshes and swamps contain relatively large quantities of grasses, trees, or shrubs; and ponds are relatively small in comparison to lakes. Geologically defined, lakes are temporary bodies of water.

This article treats lake basins and sedimentation; the physical and chemical properties of lake waters; lake currents, waves, and tides; and the hydrologic balance of lakes. For information on related systems, see the article RIVERS. The place of lakes within the hydrologic cycle is further dealt with in HYDROSPHERE; as are certain aspects of lake sedimentation and water chemistry. See ECOSYSTEMS for information on lacustrine life-forms.

This article is divided into the following sections:

General considerations

OCCURRENCE

Within the global hydrologic cycle, freshwater lakes play a very small quantitative role, constituting only about 0.009 percent of all free water, which amounts to less than 0.4 percent of all continental fresh water. Saline lakes and inland seas contain another 0.0075 percent of all free water. Freshwater lakes, however, contain well over 98 percent of the important surface waters available for use. Apart from that contained in saline bodies, most other continental waters are tied up in glaciers and ice sheets and the remainder is in groundwater.

Four-fifths of the 125,000 cubic kilometres (30,000 cubic miles) of lake waters occur in a small number of lakes, perhaps 40 in all. Lake Baikal, in central Asia, contains about 22,000 cubic kilometres (5,000 cubic miles) of water, and Lake Tanganyika (19,000 cubic kilometres [4,500 cubic miles]) and Lake Superior (12,000 cubic kilometres [3,000 cubic miles]) are the next largest. The Great Lakes of North America contain a total of about 25,000 cubic kilometres (6,000 cubic miles) of water and, together with other North American lakes larger than 10 cubic kilometres (two cubic miles), constitute about one-fourth of the world's lake waters.

Distribution

Although lakes are to be found throughout the world, the continents of North America, Africa, and Asia contain about 70 percent of the total lake water, the other continents being less generously endowed. A fourth of the total volume of lake water is spread throughout the world in uncounted numbers of small lakes. Anyone who has flown over much of the Canadian plains area cannot help but be struck by the seemingly endless skein of lakes and ponds covering the landscape below. Though the total volume of water involved is comparatively small, the surface area of lake water is substantial. The total surface area of all Canadian lakes has been estimated to exceed the total surface area of the province of Alberta. The state of Alaska has over 3,000,000 lakes with surface areas greater than eight hectares (20 acres).

The larger, deeper lakes are a significant factor within the cycle of water—from rain to surface water, ice, soil moisture, or groundwater and thence to water vapour. These lakes receive the drainage from vast tracts of land, store it, pass it on seaward, or lose it to the atmosphere by evaporation. On a local basis, even the smaller lakes play an important hydrologic role. The relatively high ratio of exposed surface area to the total water volume of these lakes accentuates their effectiveness as evaporators. In some cases the efficiency of lakes in losing water to the atmosphere is locally undesirable, because of demands for it by public and industrial requirements. In some basins, lakes are the terrestrial end point of the hydrologic cycle. With no outflow downstream toward the oceans, these closed lakes swell or recede according to the balance of local hydrologic conditions.

USES AND ABUSES OF LAKES

Importance to man

In today's industrial societies, requirements for water—much of which is derived from lakes—include its use for dilution and removal of municipal and industrial wastes, for cooling purposes, for irrigation, for power generation, and for local recreation and aesthetic displays. Obviously, these requirements vary considerably among regions, climates, and countries.

In another vein, it is convenient to use water to dilute liquid and some solid wastes to concentrations that are not intolerable to the elements of society that must be exposed to the effluent or wish to use it. The degree of dilution that may be acceptable varies from situation to situation and is often in dispute. In some cases, dilution is used purely to facilitate transport of the wastes to purification facilities. The water may then be made available for reuse.

Lake water is also used extensively for cooling purposes. Although this water may not be affected chemically, its change in thermal quality may be detrimental to the environment into which it is disposed, either directly, by affecting fish health or functions, or indirectly, by causing an excessive plant production and ultimate deoxygenation due to biological decay. Both fossil- and nuclear-fuelled power plants are major users of cooling water. Steel mills and various chemical plants also require large quantities.

Concern with thermal pollution of surface waters is concentrated principally on rivers and small lakes. With power requirements in modern societies increasing by about 7 percent per year, however, some apprehension has been expressed about the future thermal loading of even the largest lakes. It has been predicted that thermal inputs to each of the North American Great Lakes will increase by nearly 11 times by the year 2000. In terms of energy to be disposed in this fashion, the numbers are staggeringly large. These lakes have such large volumes, however, and such large surface areas (from which much of the heat goes into the atmosphere) that there is some question about the nature and magnitude of the actual effects.

The economic importance of waterways as communication links is enormous. In the earliest times, when travel by many societies was substantially by water, travel routes became established that resulted in relationships between cultural factors and surface hydrology networks. Today, river and lake systems serve as communication links and play an important role in shipping because of the large cargo capacities of merchant vessels and the still fairly uncongested condition of inland waterways. Oceanic shipping lanes play the major role, but river and lake systems, which link inland ports with the oceans, have been key factors in the rates of economic growth of many large inland ports.

Commercial fisheries and other food industries reap great harvests from the major lakes of the world. The quality of the fish catch has steadily decreased, however, as a result of pollution in many lakes, with the more desirable species becoming less plentiful and the less desirable species gradually dominating the total. Other commercial harvesting from lakes includes waterfowl, fur-bearing mammals, and some plant material, such as rice.

Each of the uses described has associated with it the means for abuse of the very characteristics of lakes that make them desirable. Wise management of natural resources has never been man's forte. Municipalities and industries have polluted lakes chemically and thermally, the shipping that plies large inland water bodies leaves oil and other refuse in its wake, water used for irrigation often contains chemical residues from fertilizers and biocides when it is returned to lakes, and the populace that so desperately demands clean bodies of water for its recreation often ignores basic sanitary and antipollution practices, to the ultimate detriment of the waters enjoyed.

Major problems

Among the major problems affecting the optimum utilization and conservation of lake waters are eutrophication (aging processes), chemical and biological poisoning, and decreases in water volumes. In the former case, discussed in more detail later, the enrichment of lakes with various nutrients supports biological productivity to an extent in which the ultimate death and decay of biological material places an excessive demand on the oxygen content, resulting in oxygen depletion in the worst cases. Phosphates and nitrates are two of the types of nutrients that are most important in this connection, particularly since they are often introduced in critical quantities in waste effluents from human sources. Other examples of chemical pollution of lakes include the introduction of DDT and other pesticides and heavy metals such as mercury. Bacteriological contamination of lake waters resulting in levels that constitute a hazard to health is another common result of man's inhumanity to his natural environment.

Water-quantity problems are complex, being related to natural vagaries of supply and levels of consumptive utilization of water. In the latter case, the percentage of water returned to the source after utilization varies with the use. The largest losses are due to actual water diversions and processes that result in evaporative losses. The use of large quantities of lake water for cooling purposes by industry and utilities, for example, may raise lake temperatures near the effluents sufficiently to cause increased evaporation. The use of certain types of cooling towers results in even larger losses. Some of the water evaporated will stay within the lake basin, but some will be lost from it.

Another example of this type of loss is connected with the possible application of weather-modification techniques to alleviate the heavy lake-effect snowfalls experienced along the lee shores of large lakes in intermediate latitudes. Redistribution of precipitation always raises the possibility of redistribution of water among various basins.

Lake-effect snowfall is just one example of the influence of lakes on local climate. The ability of large bodies of water to store heat during heating periods and to lose it more gradually than the adjacent landmasses during cooling periods results in a modifying influence on the climate. Because of this propensity, a lake cools air passing over it in summer and warms air passing over it in winter. Consequently, the predominantly downwind side of a lake is more influenced by the ameliorating effects of a lake.

In most instances, moisture is also passed to the atmosphere. In summer, lake cooling serves to stabilize the air mass, but winter heating tends to decrease stability. The moisture-laden, unstable winter flows off lakes produce so-called snowbelts, which affect downwind cities. The snowbelts are usually of limited extent, often within about a kilometre of the lake shore. (R.K.L./Ed.)

Lake basins

CLASSIFICATION OF BASINS

Limnology

The name given to the study of lakes is limnology. Limnologists have used several criteria for the development of systems for classifying lakes and lake basins but have resorted particularly to the mechanisms that have produced lake basins. These have been summarized and examined in *A Treatise on Limnology,* by the American limnologist G.E. Hutchinson, which includes treatment of tectonism, volcanism, landslides, glaciation, solution, river action, wind action, coastline building, organic accumulation, animal activity, meteoritic impact, and human activity.

Basins formed by tectonism, volcanism, and landslides. Tectonism—or movements of the Earth's crust—have been responsible for the formation of very large basins. During the late Miocene (the Miocene Epoch includes the time interval from 26,000,000 to 7,000,000 years ago), broad, gentle earth movements resulted in the isolation of a vast inland sea across southern Asia and southeastern Europe. Through most of the Tertiary Period (from 65,000,000 to 2,500,000 years ago), sub-basins developed that gradually were characterized by a great range of salinities. Resumption of communication with the oceans occurred later, and there is evidence of considerable variation in water levels. The present remnants of these inland bodies of water include the Caspian Sea and the Aral Sea, along with numerous smaller lakes. The Black Sea, which was also once part of this large inland basin, is now in direct communication with the oceans.

In some cases, elevated land areas may already contain depressions that eventually form lake basins. Lake Okeechobee, Florida, is cited as being such a basin, formed by uplift of the ocean floor.

Tectonic uplift may interfere with natural land-drainage patterns in such a way as to produce lake basins. The Great Basin of South Australia, some of the lakes in Central Africa (*e.g.,* Lakes Kioga and Kwania), and to some extent Lake Champlain, in the northeastern United States, are examples of this mechanism. Land subsidence, due to earthquake activity, also has resulted in the development of depressions in which lakes have evolved. Many such cases have been reported within the past 300 years.

The damming of valleys as a result of various tectonic phenomena has resulted in the formation of a few lake basins, but faulting, in its great variety of forms, has been responsible for the formation of many important lake basins. Abert Lake, in Oregon, lies in the depression formed by a tilted fault block against the higher block. Indeed, many lakes in the western United States are located in depressions formed through faulting, including Lake Tahoe, in the Sierra Nevada, California. Great Salt Lake, Utah, and other nearby salt lakes are remnants of a large Pleistocene lake, Lake Bonneville, which was formed at least partly by faulting activity (the Pleistocene Epoch includes the interval from about 2,500,000 to about 10,000 years ago).

In other parts of the world, faulting has also played an important role in basin formation. Lake Baikal and Lake Tanganyika, the two deepest lakes in the world, occupy basins formed by complexes of grabens (downdropped faulted blocks). These lakes are among the oldest of modern lakes, as are other graben lakes, particularly those within the East African rift system, which extends through the East African lake system and includes the Red Sea (see further CONTINENTAL LANDFORMS: *Rift valleys*).

Crater lakes and lava damming

Basins formed from volcanic activity are also greatly varied in type. The emanation of volcanic material from beneath the surface can be explosive, or it can issue in a gentle and regular manner. This range of activity and the variation of types of material which may be involved result in the possible development of many different types of basins.

One broad category includes those occupying the actual volcanic craters or their remnants. Crater lakes may occupy completely unmodified cinder cones, but these are rare. Craters caused by explosions or by the collapse of the roofs of underground magma (molten silica) chambers and those caused by explosion of new volcanic sources and that are built of nonvolcanic material are other examples. The latter are termed maars, following the local name for such forms in Germany. They are found, however, in several locations, including Iceland, Italy, and New Zealand. The maars of the volcanic district of Eifel, West Germany, are among the best known of these formations.

The collapse of magma chambers and the development of very large surface craters called calderas is an important source of lake basins. Crater Lake, Oregon, is a typical example, exhibiting characteristically great depth and a high encircling rim. Some caldera basins evolved with gently sloping sides, however, due to the deposition of material from a series of explosions and a gentler collapse of the structure. Secondary cones may develop within calderas, as shown by Wizard Island, in Crater Lake. The largest caldera in the world, which contains Lake Toba, in Sumatra, was formed through a combination of volcanic action and tectonic activity. Lake Toba's basin is contained in a strike-slip fault belt along the entire length of the Barisan Mountains of Sumatra. A vast, initial eruption of lava under gas pressure collapsed the magma reservoir, forming a depression that filled with water, producing the lake. Renewed volcanic activity subsequently led to the formation of an island in the centre, but a second collapse later cut it in two. Additional tectonic activity has further modified the lake's configuration.

Lake basins may also arise from the action of lava flows that emanate from volcanic fissures or craters. Lake Mývatyn, in Iceland, was formed in a basin arising from the collapse of the interior part of a large lava flow. Other basins have formed as the result of volcanic damming. This usually happens where a lava flow interrupts the existing drainage pattern.

Lake basins also may form following the blockage of a drainage depression by landslides. These may be temporary in nature because of the eroding action of the lake on the damming material. Lake Sārez in the Pamirs is stable, being dammed by a rockslide.

Basins formed by glaciation. The basin-forming mechanism responsible for the most abundant production of lakes, particularly in the Northern Hemisphere, is glaciation. The Pleistocene glaciers, which seem to have affected every continent, were especially effective in North America, Europe, and Asia. The retreat of ice sheets produced basins through mechanical action and through the damming effect of their ice masses at their boundaries.

In some cases, lakes actually exist in basins made of ice. In other cases, water masses may form within ice masses. Such occurrences are rare and are not very stable. Damming by ice masses is a more common phenomenon but is also likely to be relatively temporary. Glacial moraine (heterogeneous sedimentary deposits at glacier margins) is also responsible for the occurrence of dammed lake basins. The Finger Lakes of New York State are dammed by an endmoraine.

Ice-scour lakes, cirque lakes, and fjords

Ice sheets moving over relatively level surfaces have produced large numbers of small lake basins through scouring in many areas. This type of glacial rock basin contains what are known as ice-scour lakes and is represented in North America by basins in parts of the high Sierras and in west central Canada (*e.g.,* near Great Slave Lake). Tens of thousands of these lakes are found in the ice-scoured regions of the world. Many of them are interconnected with short streams and may contain narrow inlets. Characteristically, they may be dotted with numerous islands and sprawling bays. Many are comparatively shallow. Where they are particularly abundant, they may cover up to 75 percent of the total surface, as in Quetico canoe country of Minnesota.

Glacier scouring associated with the freezing and thawing of névé (granular snow adjacent to glacier ice) at the head of a glaciated valley may produce a deepened circular basin termed a cirque. These are found in widely scattered mountain locations. The action of glaciers in valleys can produce a similar type of basin, often occurring in series and resembling a valley staircase. Ice movement from valleys through narrow openings has produced another type of rock basin, known as glint lake basins, particularly in Scandinavian regions.

Piedmont and fjord (*i.e.*, a river valley that has been "drowned" by a rise of sea level) lakes are found in basins formed by glacial action in long mountain valleys. Excellent examples are found in Norway, the English Lake District, the European Alps, and the Andes. In North America, several regions contain this type of lake basin. In British Columbia, many good examples exist, the largest of which are the Okanagan and Kootenay systems. These are long, narrow lakes of substantial depth. In northwestern Canada, some of the largest lakes, including Lake Athabaska, Great Slave Lake, and Great Bear Lake, are of this type, although they are not found in the same type of mountainous terrain. These lakes, as well as the North American Great Lakes, resulted from the movements of large ice sheets that deepened existing valleys.

The Wisconsin (latest stage of Pleistocene glaciation) ice sheet was responsible for shaping the present Great Lakes system, which drains mainly eastward to the Atlantic through the St. Lawrence River, during its retreat. The principal stages in the history of these lakes have received much study, and several stages of retreat and advance of the ice sheet have been identified. Behind the lobes of the ice sheet, ice lakes developed that drained according to the modifications of preexisting valleys for glacial action. As the mass of ice retreated far to the north, glacial rebound (uplift of the Earth's crust in response to removal of the loading by ice) caused a general tilting of the land surface; the new lake basins also contributed to the subsequent changes through their own erosional action.

The material comprising glacial moraines or glacial outwash may provide dams that confine postglacial waters. The Finger Lakes, in New York State, constitute one interesting group of this type. These lakes were formed through glacial scouring of existing valleys, which were blocked at both the northern and southern ends by morainic deposits.

A variety of basin types have been formed in the different types of glacial drift deposits, including basins in morainic material, kettle lakes, channels formed by water movement in tunnels beneath the ice masses, and lake basins formed by thawing in permafrost. An interesting example of glacial action is the formation of giant's kettles; these are glacial potholes in the form of deep cylindrical holes. Their origin is still uncertain. Sand, gravel, or boulders are sometimes found at their bottom. The kettles vary from a few centimetres to a metre or more in diameter. Good examples are found in the Alps, Germany, Norway, and in the United States.

Formation of natural dams

Basins formed by fluvial and marine processes. Fluvial action in several forms can produce lake basins; the most important processes include waterfall action, damming by sediment deposition from a tributary (fluviatile dams), sediment deposition in river deltas, damming by tidal transport of sediments upstream, changes in the configuration of river channels (*e.g.*, oxbow lakes and levee lakes), and solution of subsurface rocks by groundwater.

This last mechanism has produced the well-known formations in the Karst region, in Yugoslavia, which include subterranean and surface cavities and basins in limestone. The term karstic phenomena is applied to similar cases in many parts of the world (see further CONTINENTAL LANDFORMS: *Caves and karst landscape features*). Solution lakes in Florida (*e.g.*, Deep Lake) are also of this origin, as are Lünersee and Seewlisee, in the Alps. Other rock types susceptible to solution basin formation include gypsum and halite. Mansfeldersee in Saxony was formed in this manner.

In some coastal areas, longshore marine currents may deposit sufficient sediment to block river outflows. This damming action may be of varying intensity, and it may also occur in lake regions, where such current action causes sediment deposition that leads to the formation of multiple lakes. Accumulation of organic plant material can also result in structures that produce lake basins; Silver Lake, Nova Scotia, evolved from damming by plant material. Structural formations of coral are another potential cause of damming.

Basins formed by wind action, animal activity, and meteorites. Wind action may lead to dam or dune construction or erosion and thus can play a role in lake-basin formation. The latter case has been demonstrated in North America; a number of basins in Texas and northward, on the plains east from the Rocky Mountains, are thought to have originated from wind erosion—at least in part. Moses Lake in Washington state was formed by windblown sand that dammed the basin.

Mammals have constructed lake-forming dams; the American beaver is highly skilled at this, and its activities in this connection have established it as a symbol of industriousness. Man has also been busy in this regard and is fully capable of producing lakes that would rival the largest of the more natural variety. Plans once proposed for the damming of the Yukon River in Alaska would, if carried through, result in the formation of a lake larger than Lake Erie in surface area. Other human activities, such as quarrying and mining, also have produced cavities suitable for lake formation.

The last major mechanism of basin formation is that due to meteoritic impact. Meteorite craters are best preserved in arid climates and are often dry for this reason. A few lakes are known in craters, however, including Ungava Lake, in Quebec. In many other cases, it has not been possible to definitely confirm that basins that have the appearance of meteorite craters have, indeed, been produced by meteorite impact. Controversial ones include the bay lakes of southeast North America.

TOPOGRAPHY OF BASINS

Lakes meet with both the atmosphere and the underlying material of their terrestrial basins and interact with each. The topography and configuration of the lake bottom and the nature of the bottom materials vary considerably. They are of sufficient importance to most lake processes to warrant recognition as basic lake characteristics.

The surface area of a lake can easily be determined by cartographic techniques, but lake-volume determinations require knowledge of lake depths. Throughout the world, lakes important enough to warrant study have been sounded, and many nations have completed comprehensive programs to determine the bathymetry of large numbers of lakes. Lake sounding involves traversing a lake to collect either point or continuous measurements of depth until an accurate survey is made. Modern sounding devices measure the time taken for emitted sound to return after reflection from the bottom, relying on a knowledge of the speed of sound in water. The more sophisticated of these also provide for detection of the depths of stratification in sedimentary materials on the lake bottom. The employment of laser devices from aircraft is a recent development that is based on the transmission of light beams with wavelengths that will penetrate water.

For more practical purposes, lake morphology is a stable characteristic. Shore erosion, sediment deposition and transfer, and other processes, however, including dredging by man, may significantly alter a lake's bottom topography and thus affect navigation, currents, and ecological factors, such as fish spawning grounds.

SEDIMENTS AND SEDIMENTATION

Lake sediments are comprised mainly of clastic material (sediment of clay, silt, and sand sizes), organic debris, chemical precipitates, or combinations of these. The relative abundance of each depends upon the nature of the local drainage basin, the climate, and the relative age of a lake. The sediments of a lake in a glaciated basin, for example, will first receive coarse clastics, then finer clastics, chemical precipitates, and then increasingly large amounts of biological material, including peats and sedges.

Clues to lake history

Geologists can deduce much about a lake's history and the history of the lake basin and climate from the sedimentary records on its bottom. A sediment core contains such clues as ripple marks caused by current or wave action, carbonaceous layers, and alternations of strata that include cold- and warm-water species of fossils, pollen, and traces of chemicals of human derivation. These data provide the basis for extensive documentation of lake history (paleolimnology). Some well-known historical events, such as major volcanic eruptions, the clearing of North American forests by early settlers as revealed by pollen concentrations, the first extensive use of certain heavy metals by industry, and nuclear explosions, provide reference points in the sediment record.

Many of the materials that are detrimental to the ecology of a lake—*e.g.,* excessive quantities of nutrients, heavy metals, pesticides, oil, and certain bacteria—are deposited in lake sediments by chemical precipitation or the settling of particulate matter. These materials are potentially available for regeneration into the lake water and must be considered in any planning for measures to abate lake pollution. Within the uppermost lake sediments, large volumes of interstitial water are often present. This water may have high concentrations of nutrients and other constituents and enhance the exchange potential with the lake proper.

Clastic sediments. Waters draining into a lake carry with them much of the suspended sediment that is transported by rivers and streams from the local drainage basin. Current and wave action along the shoreline is responsible for additional erosion and sediment deposition, and some material may be introduced as a result of wind action. Rivers and streams transport material of many different sizes, the largest being rolled along the riverbed (the bed load). When river water enters a lake, its speed diminishes rapidly, bed-load transport ceases, and the suspended load begins to settle to the bottom, the largest sizes first. Lake outlets carry with them only those materials that are too small to have settled out from the inflows or those that have been introduced adjacent to the outflow. Because dynamic processes that keep materials suspended are generally more active near the shore, lake sediments are usually sorted by size; the rocks, pebbles, and coarse sands occur near shore, whereas the finer sands, silts, and muds are, in most cases, found offshore.

Clastic material over most of a lake basin consists principally of silts and clays, especially away from shores and river mouths, where larger material is deposited. Clays exist in a variety of colours, black clays containing large concentrations of organic matter or sulfides and whiter clays usually containing high calcium carbonate concentrations. Other colours, including reds and greens, are known to reflect particular chemical and biological influences.

Organic sediments are derived from plant and animal matter: *Förna* is recognizable plant and animal remains, *äfja* finely divided remains in colloidal suspension, and *gyttja* is a deposit formed from *äfja* that has been oxidized. Rapid accumulation of organic matter in still lakes is not uncommon; in the English Lake District, five metres (15 feet) of lake sediment of organic origin accumulated in 8,000 years. Pollen analysis has been used to accurately decipher climatic conditions of the lake in the past.

Varved deposits are the product of an annual cycle of sedimentation; seasonal changes are responsible for the information. Varves are a common feature in many areas and especially so where the land has received meltwaters from ice sheets and glaciers. The deposits consist of alternating layers of fine and coarse sediments.

Coarse clastic materials seldom are larger than boulders (25 centimetres [10 inches]), and the type of material in sizes larger than silt and clay often reveals its source. Materials along lakeshores can usually be traced back to a particular eroded source within the local drainage basin, and the distribution of this material provides evidence of the predominant current or wave patterns in the lake.

Volcanic ash is deposited downwind from its source. Ash from volcanic activity during the Pleistocene Epoch can often be dated and used as a stratigraphic marker. Lakes throughout the northwestern United States contain some of the best examples (the Mazama ash), and one deposit in the central United States, called the Pearlette ash deposit, occurs in beds as thick as three metres (10 feet).

Deposition of salts

Chemical precipitates. The major chemical precipitates in lake systems are calcium, sodium, and magnesium carbonates and dolomite, gypsum, halite, and sulfate salts. Calcium carbonate is deposited as either calcite or aragonite when a lake becomes saturated with calcium and bicarbonate ions. Photosynthesis can also generate precipitation of calcium carbonate, when plant material takes up carbon dioxide and bicarbonate and raises the pH above about 9 (the term pH is a measure of the acidity or alkalinity of water; acid waters have a pH of less than 7, and the pH of alkaline waters range from 7 to 14).

Dolomite deposition occurs in very alkaline lakes when calcium carbonate and magnesium carbonate combine. Recent dolomites have been found in Lake Balkhash, in the Soviet Union. In many saline lakes, gypsum deposition has occurred; Lake Eyre, Australia, is estimated to contain more than 4,000,000,000 tons of gypsum. For gypsum to be deposited, sulfate, calcium, and hydrogen sulfide must be present in particular concentrations. Hydrogen sulfide occurs in deoxygenated portions of lakes, usually following the depletion of oxygen resulting from decomposition of biological material. Bottom-dwelling organisms are usually absent.

Lakes that contain high concentrations of sodium sulfate are called bitter lakes, and those containing sodium carbonate are called alkali lakes. Soda Lake, California, is estimated to contain nearly 1,000,000 tons of anhydrous sulfate. Magnesium salts of these types are also quite common and can be found in the same sediments as the sodium salts. Other salts of importance occurring in lake sediments include borates, nitrates, and potash. Small quantities of borax are found in various lakes throughout the world. Mono Lake, in California, due to its high alkalinity is devoid of any life.

The gradual increase of sediment thickness through time may threaten the very existence of a lake. When a lake becomes shallow enough to support the growth of bottom-attached plants, these may accelerate the extinction of a lake. In several European countries, steps are being taken to restore lakes threatened by choking plant growth. Lake Hornborgesjön, Sweden, which has been prized as a national wildlife refuge, became the subject of an investigation in 1967 that may lead to a program involving the cutting and removal of plants that have seriously reduced the area of exposed water. It is expected that the lake level may be raised at least one metre above the present mean summer level. Lake Trummen, also in Sweden, has been treated by dredging its upper sediments. In Switzerland, Lake Wiler (Wilersee) has been treated by the removal of water just above the sediments during stagnation periods.

Lake waters

CHEMICAL COMPOSITION

Although the chemical composition of lakes varies considerably throughout the world, due to the varying chemistry of the erosion products of different lake basins, in most cases the principal constituents are similar. Human influences have also contributed greatly to the chemical makeup of lakes, and, although industrial effluents vary from lake to lake, many of the chemical effects of human activities are similar throughout the world. Another source in the chemical balance of lakes is the dissolved and suspended material contained in precipitation. Again, human activities have been responsible for steadily increasing concentrations of this input.

Concentration of salts in lake water

Salinity, nutrients, and oxygen. Salinity is the total concentration of the ions present in lake water and is usually computed from the sodium, potassium, magnesium, calcium, carbonate, silicate, and halide concentrations. Several important bodies of inland waters, often called inland seas, have very high salinities. Great Salt Lake, in Utah, has a salinity of about 200,000 milligrams per litre, as compared to Lake Superior's value of about 75 and an estimated mean for all rivers of 100 to 150. These ions are steadily introduced to lakes from rivers and rainwater, where they concentrate because of the evaporative loss of relatively pure water.

Where inflowing rivers erode igneous rocks, lake salinity values are relatively low, but, where soluble salts are available for erosion, salinities are relatively high. In general, it has been found that, of the cations (positively charged ions), calcium concentrations are highest, followed by magnesium, sodium, and potassium, in that order. Of the major anions (negatively charged ions), carbonate is usually the most abundant, followed by sulfate and chloride.

Other inorganic ions, though present in smaller concentrations, are of great importance. In particular, the nutrients (especially phosphate, nitrate, and silicate), heavy metals (*e.g.,* mercury, manganese, copper, lead), and polychlorinated hydrocarbons (DDT, for example) have attracted recent interest because of their role in ecological problems. Although sources of nutrients and mercury exist that are not directly related to human activities, budget studies and studies of the historical records available in sediment cores clearly reveal the great impact of human disposal of these constituents in lakes. Rainfall and dry fallout are small but significant chemical inputs to lakes. The release of gases and particulate matter into the atmosphere from factories and similar sources has increased dramatically in recent years, with consequent alterations in the chemistry of rainwater. It has been estimated, for example, that 16,000 tons of nitrogen, about 8 percent of the total from all sources, is introduced annually to Lake Erie from atmospheric action.

Factors affecting oxygen concentration within lakes

The substance of most interest in lakes is oxygen; once introduced to the lake water, its concentration is subject to factors within the water. Biological production (photosynthesis) releases oxygen into the water, while biological decay consumes it. Various chemical reactions within the lake system also affect the concentration of dissolved oxygen. The main source is the passage of oxygen through the air-water interface, which is affected principally by the lake temperatures; at low temperatures the partial pressure of dissolved oxygen in water is reduced. Consequently, during cold seasons, especially when vertical mixing is greatly enhanced due to lack of thermal structure and increased wind stirring, lakes are replenished with oxygen. In the warmer seasons, although surface waters may remain more or less saturated and even supersaturated, the concentrations are lower. Beneath the surface, oxygen consumption due to biological decay may cause serious depletion. Oxygen depletion also occurs near the bottom due to processes at the mud-water interface, many of which are still inadequately explained.

In winter months, a rapid formation of ice or the establishment of strong winter thermal stratification may significantly inhibit the replenishment of oxygen. Where ice cover lasts for long periods, a loss of oxygen at the mud-water interface may have repercussions for the whole lake, particularly if density currents cause significant vertical transport.

In tropical regions, where the winter replenishment mechanism (turnover) is absent, there is great reliance on the occasional occurrence of cold spells or on significant nighttime cooling to promote oxygen replenishment. Deep lakes in these regions are often anoxic (lacking in oxygen) in the deeper portions.

At any particular time, lake waters or waters entering a lake may have a biological or chemical potential for oxygen utilization. Measurements of this are termed BOD (biological oxygen demand) or COD (chemical oxygen demand). These concepts are used as partial indicators of the quality of waters being introduced to a lake.

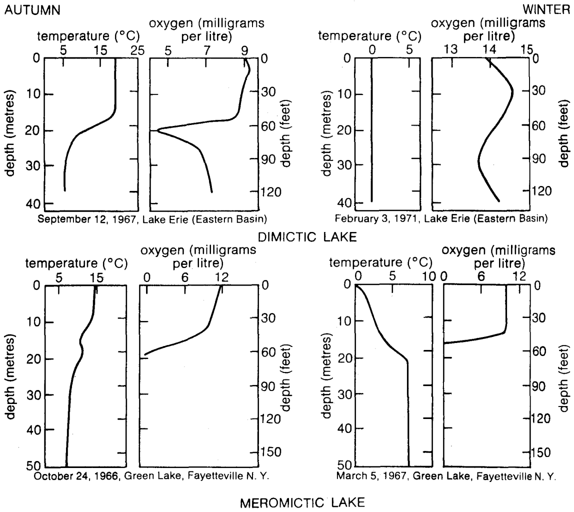

Figure 1: Seasonal variation of temperature and dissolved oxygen in dimictic (having two circulation periods annually) and meromictic (undergoing incomplete circulation at the fall overturn) lakes (see text).

Lakes that have a vertical salinity gradient strong enough to prevent winter turnover will usually be deoxygenated at depths where the vertical diffusion of oxygen is less than the oxygen demand. Such lakes are termed meromictic.

Carbon dioxide. Another gaseous substance of great importance that is exchanged with the atmosphere at the surface is carbon dioxide. Photosynthesis requires the presence of carbon dioxide, and it is released during biological breakdown.

Relation of carbon dioxide to pH and carbonate solubility

Carbon dioxide is very soluble in lake water; it forms carbonic acid, which dissociates and raises the concentration of hydrogen ions (lowering the pH). The relative proportions of bicarbonate, carbonate, and free carbon dioxide depend upon the pH. At high values of pH, carbonate ions will predominate; at low values, free carbon dioxide and carbonic acid will predominate.

Various carbonates (particularly sodium, calcium, potassium, and magnesium) are important to the carbon dioxide system. Increased pressure of carbon dioxide in the system increases the solubilities of these carbonates. In some cases, photosynthetic activity results in precipitation of certain carbonates. The entire carbon dioxide system and its behaviour at various pH values is very complex but can be interpreted from historical knowledge of lake sediments.

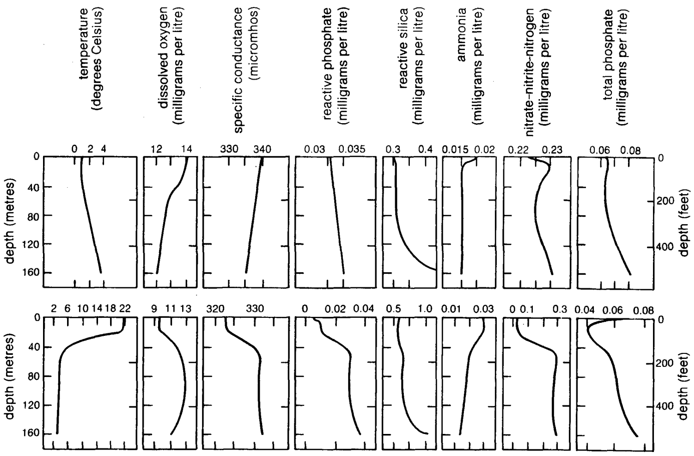

Figure 2: Distribution of some physical and chemical variables in central Lake Ontario in (bottom) July 1969 and (top) June 1970.

In waters that are neither very acidic (pH much less than 7) nor very basic (pH much greater than 7 but less than 14), the carbon dioxide system serves as a buffer, because, within limits, a change in pH will cause a shift within the system that ultimately serves to offset the pH change. Consequently, most lakes have a pH between 6 and 8. Some volcanic lakes are extremely acid, however, with pH values below 4, and some lakes with very high pH values, such as Lake Nakuru, Kenya, also occur in nature.

Sulfates, nitrates, and phosphates. Sulfate usually occurs as a principal ion in lake waters. Under anaerobic conditions in which bacteria persist in the oxidation of biological material, hydrogen sulfide is produced. When anoxic conditions exist in the deep waters just above the sediments, and the water is acidic enough to precipitate the iron present, hydrogen sulfide occurs. The characteristic and unpleasant odour of this gas is often popularly identified with the "death" of a lake. Big Soda Lake, Nevada, is extremely rich in this substance.

Nitrogen and its various compounds form another complex system in lakes, appearing as free nitrogen in solution, organic compounds, ammonia, nitrite, and nitrate. Sources of nitrogen compounds include influents to the lake (the most important source), fixation in the lake, and precipitation. Losses are experienced mainly through effluents but also by denitrification, sediment formation, and loss to the atmosphere.

Orthophosphate and various organic phosphates are the most important phosphorous compounds in lakes. Phosphates and nitrates are heavily consumed in the upper portion of lakes during periods of high productivity of phytoplankton. Increased concentrations occur in deeper portions due to decay of falling biological material and regeneration from the sediments, especially during anoxic conditions or stormy periods in shallow lakes. As limiting nutrients in many lake productivity cycles, phosphates and nitrates are often identified as controllable elements in situations where abatement is necessary to control eutrophication. Carbon is also a necessary constituent for production and in some cases can be the limiting component. Because carbon is less easily controlled and not often limiting, however, phosphates are most frequently named as substances to be reduced in effluents from industry and municipalities.

Silica also is present in lake waters, and, as with the other nutrients, it is introduced in influents and to some extent from the sediments. The production of diatom blooms is a major process for reducing silicate concentrations. Within this context, silica can also be regarded as a limiting nutrient.

THERMAL PROPERTIES

Basic physical data

Pure water freezes at 0° C (32° F), boils at 100° C (212° F), and has a latent heat of evaporation of 539.55 calories per gram, a latent heat of sublimation (ice) of 679 calories per gram, and a specific heat of 1.01 calories per gram, per ° C, at 0° C. The temperature of maximum density at atmospheric pressure occurs at 3.94° C (39.09° F). At the freezing point, ice has a lower density than water. For natural waters with high salinities, such as the oceans and inland seas, each of the values above is significantly altered. In most lakes, however, they are quite representative.

The density of water increases at pressures above one atmosphere (the pressure at sea level). Thus, pure water at 10°C (50° F) has a density of 0.9995 at one atmosphere and 1.0037 at the pressure existing at a lake depth of 1,000 metres (3,000 feet). Water raised from great depths to conditions of lower pressure experiences adiabatic cooling (without significant heat exchange with surrounding water), but there are very few lakes in which this factor can be of much significance.

Vertical mixing and overturn. It is useful to know how the temperature of maximum density changes with depth (*e.g.*, from 3.94° C at the surface to 3.39° C at 500 metres depth [38.10° F at 1,500 feet]). The fact that the temperature of maximum density of most lake waters is close to 4° C (39° F), whereas ice forms at temperatures close to 0° C in response to surface cooling, vertical mixing takes place. When density increases with depth, the lake is said to be stable. Unstable conditions exist when density decreases with depth. Cooling at the surface to temperatures below 4° C establishes stability based on a negative thermocline (a positive thermocline is a vertical decrease in temperature with depth), because density will increase with depth. Ice then forms at the surface, enabling liquid water to exist beneath the ice in lakes, unless they are shallow enough to freeze to the bottom.

During the warming season, after ice has melted, heating increases the density of the surface waters, causing them to sink until stability is achieved. When surface heating proceeds above the temperature of maximum density, this process ceases, and the vertical thermal structure maintains and strengthens its stable condition, based on a positive thermocline. Turnovers tend to be seasonal.

Dimictic, monomictic, holomictic, and meromictic lakes

Mixing due to cooling or warming processes that increase the density of surface waters sufficiently to cause them to sink results in what is termed circulation, or overturn, of lake waters. Lakes that cool to below 4° C in winter experience two turnover periods, as just described, and are called dimictic lakes. Most lakes in temperate regions fall into this category. Lakes that do not cool to below 4° C undergo overturn only once per year and are called warm monomictic. Lakes that do not warm to above 4° C also experience only one overturn period per year and are called cold monomictic. There are many examples of the former, including lakes in the tropical regions and generally as far north as about 40°. The cold monomictic type, however, is less common but can be found at high latitudes and at high altitudes (in the Alps, for example).

All the types described that circulate at least once throughout are called holomictic. It is possible, however, for lakes to be stable despite the thermal processes that normally induce overturn due to the existence of a positive salinity gradient with depth (chemocline). This type is called meromictic, and, in those cases where stability is permanent in at least part of the lake, the deep waters do not experience overturn and consequently are deoxygenated. Three principal origins of meromixis have been recognized. Ectogenic meromixis results from either the intrusion of seawater into a lake, as in the case of flooding from an unusually high sea level (*e.g.*, Hemmelsdorfersee, in Germany), or the introduction of fresh water through land drainage and precipitation to a saline lake (*e.g.*, Soda Lake, Nevada). Crenogenic meromixis is due to the introduction of saline water by springs, and biogenic meromixis is due to the uptake of salts from the lake sediments. North American examples include Lake Mary, Wisconsin, and Sodon Lake, Michigan.

A strong vertical salinity gradient that exists in the upper portion of a lake will affect the thermal structure by inhibiting the downward mixing of heat. In holomictic lakes, however, the downward mixing of heat due primarily to wind action usually compresses or concentrates the thermocline until it essentially separates an upper layer (epilimnion) from a lower layer (hypolimnion), each possessing weak or nonexistent vertical thermal gradients. The thermocline normally begins to grow at the beginning of the warming season. As summer passes and autumn commences, it intensifies and deepens. The onset of the cooling sees the beginning of the decay of the thermocline from above, although it usually continues to deepen until it is completely destroyed. The process just described is commonly found in lakes in temperate regions and is a seasonal phenomenon. During any period of strong warming, one or more shallower thermoclines may be observed to develop and move downward to the seasonal thermocline.

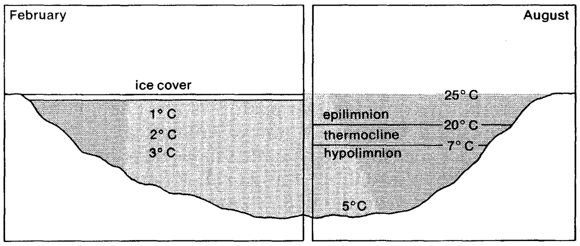

Figure 3: Temperature distribution in lakes in the middle latitudes of North America in winter and summer.

The heat budget of lakes. The heat budget of a lake includes several major factors: net incoming solar radiation, net exchange of long-wave radiation emitted by the lake surface and the atmosphere, transfer of sensible heat at the surface interface, and latent-heat processes. Those processes that are usually of much smaller importance include net inflow and outflow of heat advected by streamflow, precipitation, and groundwater flow, conduction from terrestrial heat flow, and dissipation of kinetic energy. In some cases, however, river inflow may be of more importance, such as where flow is from a nearby glacier or where the volume inflow is a significant fraction of the lake volume. Within a large lake the heat-budget considerations for a particular location must also take into account the local advection of heat within the lake by currents.

Seasonal variations in incoming solar radiation

Incoming solar energy varies seasonally and with the latitude and is greatly influenced by cloud cover. The fraction that is reflected away from the lake surface depends upon the solar angle, the turbidity of the atmosphere, and the wave state, or surface roughness. In middle latitudes this ranges from about 6 percent in summer months to about 14 percent in winter.

The amount of radiation emitted by the lake surface is proportional to the fourth power of the surface temperature, whereas the radiation emitted by the clouds and atmosphere overlying the lake depends primarily upon the amount and height of the clouds and the temperature and moisture content of the atmosphere near the lake surface.

The fluxes of sensible heat and moisture at the lake surface are of great importance yet are still poorly understood. They depend upon the vertical gradients of temperature and vapour pressure above the water, respectively, and upon the factors that influence the transfer processes, such as wind and atmospheric stability. The transfer of sensible heat may be either into or out of the lake surface, usually on a seasonal basis but also sometimes on a diurnal basis. It is also possible but less likely for condensation to occur on a lake surface.

Heat flow through the bottom of lakes is normally of small significance, but exceptions exist. In a very deep lake where low rates of heating are important, such as Lake Baikal, Soviet Union, the results may be detectable. In some ice-covered lakes where other sources of heating are small, heat flux through sediments also has been shown to be significant.

The dissipation of wind energy that has been transferred to water movements is quite insignificant, as is the effect of heat transfer due to chemical and photosynthetic processes.

In latitudes and altitudes where ice is a factor, the latent heats of fusion and of evaporation of ice must also be considered within any heat-budget considerations. Heat-balance studies have been performed for lakes that are always ice covered. Solar radiation is often an important factor where ice thickness and consistency permits penetration. The heat balance of the ice is often difficult to assess, as long-wave radiation and evaporation factors are not easily measured and are very important. The exchange of sensible heat may not be large during summer months in these cases but is likely to be significant in the colder months. Several lakes that are ice covered have been shown to be meromictic; two examples are Lake Tuborg, Ellesmere Island and Lake Bonney, Antarctica.

Heat balance of two representative lakes

Heat-balance measurements or estimates have been made for many lakes throughout the world. Results show that the difference between the highest and lowest heat content for each lake varies from around 5,000 calories per square centimetre for high and low latitudes to around 45,000 calories for some midlatitude lakes.

The relative importance of each of the major terms of the heat budget is shown by data for two North American lakes: Lake Ontario, a large, deep, middle-latitude lake; and Lake Hefner, a relatively small, shallow lake in Oklahoma. The energy unit frequently employed is the langley (one gram calorie per square centimetre), and the figures given are approximate monthly means of langleys per day. Net solar radiation input to Lake Ontario varies from 80 to 600 (Lake Hefner varies from 200 to 600), midwinter to midsummer. Net losses due to long-wave radiation from Lake Ontario are nearly 100 throughout the year (Lake Hefner varies from 100 to 200). Evaporation losses for Lake Ontario vary from 250 in midwinter to slightly negative values in early summer (Lake Hefner varies from 450 in late summer to 150 in spring). Conduction of heat from the surface of Lake Ontario varies from 250 in winter to about minus 100 in summer (Lake Hefner varies considerably from 80 to -80 for the same time interval).

Heat added to a lake at the surface is usually mixed mechanically downward as a result of wind action. This process keeps the upper portion of a lake relatively uniform thermally. Consequently, a thermal gradient (thermocline) becomes established between the upper mixed layer (epilimnion) and the deep portion of the lake (hypolimnion). In shallow lakes or shallow portions of large lakes, the thermocline will eventually intercept the lake bottom so that no hypolimnion exists. Normally, as the heating season progresses, the thermocline intensifies and deepens. Secondary thermoclines may develop in the epilimnion, and these will migrate downward to the main seasonal thermocline. On very warm, still days, a thin surface layer may store heat before a mixing episode transfers heat downward. When the cooling season commences, the mixing that tends to destroy the thermocline is enhanced by vertical convection. If the cooling continues until the entire thermocline is eliminated, the lake becomes essentially isothermal and no longer exhibits the characteristics of a two-layered system.

When a lake is stratified, the most important process for downward transfer of heat to the hypolimnion is through eddy conduction. The coefficient of eddy conductivity is determined empirically and varies substantially from lake to lake. Mixing processes are generally more active in coastal areas, so that isotherms can be expected to slope downward toward shore. In large, relatively unprotected lakes, wind stress at the surface causes convergence or divergence or both of shallow waters along coastlines. Isotherms will slant upward toward the shore, and hypolimnion water may even become exposed at the surface. These occurrences are of great importance with regard to the distribution of heat within stratified lakes.

Thermal pollution in lakes

Heat introduced to lakes in large quantities, as a waste product of cooling processes in power-generating plants and other industrial concerns, is presently viewed with some concern as a pollutant, especially in small lakes. If the heat is injected at the surface it will spread initially according to the momentum of the influent and the speed and direction of ambient surface currents. When the initial momentum is sufficiently dissipated, the heat will spread mainly as a consequence of turbulent mixing processes. Throughout these events, substantial losses of heat to the atmosphere may occur, so that the full effects of the thermal input are not borne solely by the lake. Temperature values at the surface, adjacent to the influent-heat source, may be raised to a very high level—as much as several centigrade degrees. Under certain conditions fish-activity tolerances may be exceeded, and undesirable algae and plankton production may be stimulated.

If waste heat is not released at the surface but is diffused over a large depth range or injected at depth, the large local-surface-temperature problem is avoided. Losses to the atmosphere in this case, however, are also greatly reduced, and the net heat input to the lake as a whole is much greater. Over a long period, this may prove to be more detrimental to the general ecology than near-surface injection.

Lake hydraulics

CURRENTS

The principal forces acting to initiate water movements in lakes are those due to hydraulic gradients, wind stress, and factors that cause horizontal or vertical density gradients. Lake water movement is usually classified as being turbulent.

Hydraulic effects are frequently the result of inflows and outflows of water. These may be substantial and continuous or weak and sporadic; in terms of the ratio of the volume of the inflow or outflow to the lake volume, the latter is the most frequently observed situation.

The stress of wind moving over the lake surface causes a transport of water within the lake, as well as the movement of energy downwind through the mechanism of surface waves. The wind is therefore one of the most important external forces on a lake. It can be relatively consistent in speed and direction, or it can be highly variable in either or both.

Pressure gradients. Water movements can occur as a result of internal pressure gradients and from density gradients caused by variations in temperature, sediment concentration, or the concentration of dissolved substances. Surface water in lakes can become denser than underlying water either by cooling or heating, because the temperature of maximum density for pure lake water is about 4° C (39° F). Water entering a lake from rivers with a high concentration of dissolved substances will sink to a lake level of similar density. These movements are both horizontal and vertical, but the net effect is downward, if not vertical, motion.

Horizontal pressure gradients can result from many different processes that act to produce density gradients.

One example is the situation of solar heating in a shallow nearshore region, where the heat is committed to the warming of a relatively small volume of water. This produces a water of lower density than the near-surface water of an adjacent deep region, where the heat is spread throughout a greater volume. Consequently, the pressure gradient force will act to move the warmer water offshore and to replace it from below with cooler water.

Influence of the Coriolis effect

Lake currents are the result of complex interactions of forces, but in many cases a small number of particular forces dominate. In the case of horizontal flow in the absence of horizontal pressure gradients, assuming no friction, water set in motion will curve to the right in the Northern Hemisphere because the Earth rotates from west to east. This effect is called the Coriolis force, and it will continue to influence water motion until there is a balance with the centrifugal force. This movement causes free-floating markers to move in an elliptical manner with a period that depends upon the latitude. In Lake Ontario, for example, it is about 17 hours. Where a dominating pressure gradient exists, the balance of the pressure-gradient force with the Coriolis force results in the so-called geostrophic flow, at right angles to the pressure gradient, with low pressure on the left (Northern Hemisphere). These conditions are most nearly realized only in very large lakes and in the oceans.

In those small lakes where hydraulic effects dominate, steady flow conditions may be achieved through balance with friction. This situation is commonly encountered in rivers, and relationships exist between mean current speed and the slope and mean depth of the river or narrow lake. These are called gradient currents and occur following situations where the wind or atmosphere pressure gradient causes a tilting of the lake surface (denivellation). In cases where the Coriolis force is a significant factor, the flow down a lake will tend to move toward the right (in the Northern Hemisphere). The development of a deeper countercurrent to the left will occur to compensate for the piling up of water on the right side.

Horizontal pressure gradients will be important in lakes where there are significant inflows of water with markedly different density from ambient lake density or where significant differential surface heating occurs.

Wind stress. Currents resulting from wind stress are the most common in lakes. Considerable research is still underway into the mechanism of transfer of wind momentum to water momentum. The stress on the lake is proportional to some power of wind speed, usually taken to be 2, although it evidently varies with wind speed, wave conditions, and atmospheric stability. In large, deep lakes, away from the boundaries, where wind-stress effects may be balanced by Coriolis-force effects, theory suggests that the surface current will move in a direction 45° to the right of the wind and that deeper currents are progressively weaker and directed farther to the right. The depth at which flow is opposite to the wind direction is effectively the depth below which there is no influence from the wind. This depth, designated *D*, can theoretically occur at about 100 metres (300 feet) in large, deep, midlatitude lakes. Observations show varying degrees of fidelity to theory because of complications from coastal effects and thermal stratification.

In coastal regions, if water depth is a significant fraction of or greater than *D*, winds blowing parallel to the shore will transport water either onshore or offshore. In the latter case, where the coast is to the left of the wind flow (Northern Hemisphere), the water driven offshore is replaced by cooler, deeper water (upwelling).

Internal waves and Langmuir circulation. Under stratified conditions a strong thermocline will essentially separate a lake into two layers. Shearing forces that develop between these layers cause a motion, termed internal waves, that may serve to directly dissipate a substantial portion of a lake's kinetic energy and act as a coupling between motion in the epilimnion and hypolimnion. A great range of periodicities is observed in the oscillations of the thermoclines, particularly in large lakes. Internal seiches, which are responsible for relatively long-period internal waves, are discussed later.

Effect of shearing forces

A small-scale circulation phenomenon that has aroused considerable attention on lakes is Langmuir circulation. On windy days, parallel "streaks" can be observed to develop on the water surface and exhibit continuity for some distance. These streaks may be caused by convergence zones where surface froth and debris collect. Langmuir circulation thus appears to be a relatively organized mixing mechanism wherein sinking occurs at the streaks and upwelling occurs between the streaks. Under favourable circumstances, this appears to be a key process for mixing heat downward in lakes.

SURFACE WAVES

Wind blowing over a calm lake surface first produces an effect that may appear as a widely varying and fluctuating ruffling of the surface. The first wave motion to develop is relatively regular, consisting of small, uniformly developed waves called capillary waves. These are quite transient, dissipating rapidly if the wind dies away or developing to the more commonly observed and more persistent gravity waves.

Energy will be continually fed to the waves by the frictional drag of the air moving over the water and by the direct force of the wind on the upwind face of the waves. The latter effect occurs only while the waves move more slowly than the wind. Pressure differences at the air–water interface also contribute energy to surface waves. Energy losses occur due mainly to turbulence in the water and, to a smaller extent, to the effects of viscosity.

Growth and movement of waves

Waves will continue to grow as long as there is a net addition of energy to them. Their height will increase as a function of wind speed and duration and the distance over which it blows (fetch). Most lakes are so small that fetch considerations are unimportant. Studies in larger lakes, however, have shown that the height of the highest waves are related to the fetch. In these lakes, waves as high as several metres are common, although waves of about seven metres (23 feet) are the highest to be expected. Wave heights in a given portion of a lake may vary considerably, due to interactions that suppress some waves and amplify others. As waves develop, their lengths increase, even after their height has stopped increasing. The phenomenon of swell, commonly observed in the oceans, is not truly realized, even in the largest lakes.

Waves travel in the same direction as the wind that generated them and at right angles to their crests. If they meet a solid object rather than a sloping beach, much of their energy will be reflected. If they enter shallow water obliquely, they are refracted. Wave speed, for waves longer than four times the depth of the water, is approximately equal to the square root of the product of the depth and the gravitational acceleration. For waves in relatively deep water, the wave speed is proportional to the square root of the wavelength.

As wave height increases, the sharpening of the wave crest may result in instability and a breaking off of the crest, a process hastened by the wind. This results in the familiar whitecaps. Waves that run ashore break up in surf. The wave height first decreases slightly, then increases, and the speed decreases, and eventually the wave form disappears as it crumbles into breakers. These can be plunging forms, in which the top curls right over the forward face, or of the spilling type, in which the crest spills down the forward face. A particular wave may break several times before reaching shore.

SEICHES

Cause and characteristics. If a denivellation, or tilting of a lake's surface, occurs as a result of a persistent wind stress or atmospheric pressure gradient, the cessation of the external forcing mechanism will result in a flow of water to restore the lake level. The flow would be periodic and uniform with depth, except for the damping effects of the lake-bottom friction and internal turbulence. Because of this, each successive tilt of the lake surface in the opposite direction occurs at a level slightly less than the previous one. The oscillation proceeds, moving the water back and forth until damping levels the water or until wind and pressure effect another tilt. This process is seiching; the lake oscillation is a seiche. The basic seiche has a single node, but harmonics of the oscillation occur, with several nodes being possible.

Seiche periods

The period of the uninodal seiche can be estimated from a formula that equates it to twice the length in the direction of the tilt, divided by the square root of the product of the mean lake depth and the gravitational acceleration.

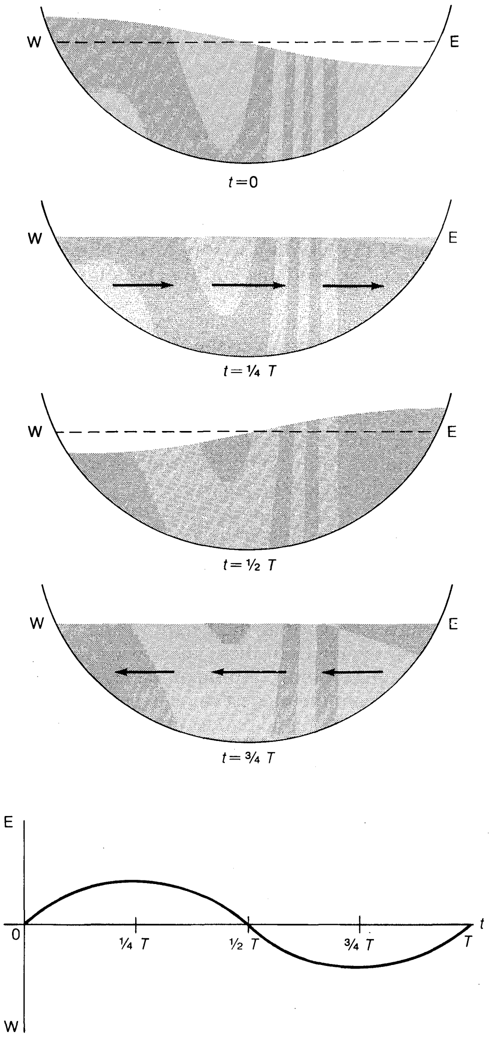

Figure 4: Four phases of elevations and currents. Below, time graph of current at centre of lake (*t* is time and *T* is seiche period; see text).

Seiches have been noted, recorded, and studied for hundreds of years. Lake Geneva, Switzerland, was one of the first lakes to be studied in connection with seiching; it has an observed uninodal period of about 74 minutes and a binodal period of about 35 minutes. The observed uninodal periods of Loch Treig and Loch Earn, Scotland; Lago di Garda, Italy; Lake Vetter, Sweden; and Lake Erie, North America, are approximately nine, 14.5, 43, 179, and 880 minutes, respectively.

Long, relatively narrow lakes that are exposed to a predominance of wind flow along their major axes are most likely to exhibit so-called longitudinal seiches. Transverse seiching can occur across the narrower dimension of a lake; that observed in Lake Geneva, for example, has a period of about 10 minutes.

The height of the denivellation depends upon the strength and duration of the forcing mechanism, as well as on the lake size and dimensions. In small lakes, level changes of a few centimetres are common, whereas, in the Great Lakes, intense storms can produce changes as great as two metres (seven feet). If the disturbance causing the tilting moves across the lake at close to the speed of the shallow-water wave speed, a profound amplification can occur, with possible disastrous consequences.

True tides that result from the gravitational effects of the Moon and Sun are rarely measurable in lakes, but small values of tidal components occasionally have been discerned.

Internal seiches. Internal seiching results from thermal stratification. The layers separated by the thermoclines oscillate relative to one another. Observed uninodal periods for Loch Earn, Lake Geneva, Lake Baikal, and Lake Cayuga (New York) are approximately 16, 96, 900 (binodal), and 65 hours, respectively.

Because hypolimnion water is very different from epilimnion water with regard to both thermal and biological characteristics, the massive movements of water and the turbulent exchanges that can occur during internal seiching are very important. Substantial portions of the bottom of shallow lakes can experience periodic alternation of exposure to hypolimnetic and epilimnetic water, and hypolimnetic water can be periodically exposed to the surface.

EFFECTS OF WAVE AND CURRENT ACTION

Shore erosion and coastal features. In a lake's early stages of existence, its shore is most susceptible to changes from wave and current action. As these changes occur, there is a tendency over time to an equilibrium condition—a balance between form and processes that depends upon the nature of the materials present (*e.g.*, the size of sand and gravel present). The effectiveness of waves in the erosion process depends in part upon the depth and slope of the lake bottom. Where the shore consists of a sheer cliff adjacent to deep water, wave energy will be reflected away without much erosional effect. The refraction of waves in zones of irregular coastline tends to concentrate wave energy at some locations and dilute it in others. Thus, features extended out into the lake will receive more wave energy, and the tendency is to smooth out an irregular coastline. Other net effects of shore erosion are an increase in the surface area of a lake and a reduction in its mean depth.

Changes in the coastline

As erosion takes place, the distribution of erosion products results in transport of finer material offshore. The resulting terrace is called the beach in its above-water manifestation and the littoral shelf where it is below water. Landward, beyond the beach, a wave-cut cliff is usually found. The steeper slope that often separates the littoral shelf from the benthos (bottom) zone in the central part of the lake is called the step-off by some limnologists.

Water movement directed at an angle to the coastline will result in the generation of currents along the shore. Erosion products will then be transported down the coast and may be deposited in locations where transport energy is dissipated due to movement around a bend or past an obstruction. A buildup of such material is called a spit. If a bay becomes completely enclosed in this way, the spit is called a bar.

Water in very shallow lakes that are subjected to strong winds may be piled against the lee shore to such an extent that countercurrents will develop from along the lee shore around each side of the lake. The cutting effects of these currents are known as end-current erosion and may characteristically alter the shape of a lake frequently subjected to winds from a particular direction.

Bottom morphology. The bottom morphology of a lake can be greatly influenced by deposition of sediment carried by inflowing rivers and streams. Although this process can be modified by wave and current action, most lakes are sufficiently quiet to permit the formation of substantial deltas. In very old lake basins the relief may become so extensively decreased due to the great buildup of deltaic deposits and the long-term effects of river widening, that deposition on the outer portions of a delta will fail to balance the effects of wave erosion. A delta, in these circumstances, will begin to shrink in size (see further RIVERS: *River deltas*).

Problems with artificial lakes

It is very important to understand lake processes that affect the basin morphology and to be able to predict their trends and their impact on human activities. Increasingly, man is imposing his ability to change natural events in lakes, and he has often encountered problems by not anticipating a lake's reaction to his projects. The actual creation of a lake by damming a river is a major undertaking of this type. One fairly recent example is Lake Diefenbaker, in Saskatchewan. In this region of prairie farmland, the banks of the new lake are extremely vulnerable to erosion, and planners have had to contend with the consequences of bank cutting and infilling of the basin. There are many examples of lesser engineering undertakings that have had to face the consequences of a lake's reaction. The building of jetties or breakwaters, for example, may interfere with natural circulation features. In some cases this has resulted in the reduction of flow past a harbour and increase in flow past a previously stable shoreline, with the result that the harbour has filled in or been blocked by sediment deposition, while the stable shoreline has become badly eroded.

The hydrologic balance of the lakes

THE WATER BUDGET

The role of lakes within the global hydrologic cycle has been described earlier. Lakes depend for their very existence upon a balance between their many sources of water and the losses that they experience. This so-called water budget of lakes is important enough to have warranted considerable study throughout the world, with each lake or lake system possessing its own hydrologic idiosyncracies. Aside from being of scientific interest, water-budget studies serve to reveal the dependence of each lake on particular hydrologic factors, thus enabling better management practices. These may include restrictions on water utilization during drought conditions, dike construction and evacuations prior to flooding, control of water levels to ensure efficient power production, and major decisions associated with diversions of watercourses in order to enhance water-quantity- and water-quality-management activities.

Importance of water-budget studies

Often, man is able to react to predicted imbalances in the hydrologic budget, although he is usually unable to influence the basic natural factors that cause the imbalances. Precipitation and evaporation, for the most part, are uncontrollable, although some advances have been made in evaporation suppression from small lakes through the use of monomolecular surface films. Groundwater flow is not controllable, except where highly restricted flow can be tapped. Rivers and streams, however, can be subjected to regulation by well-established practices through the use of dams, storage reservoirs, and diversions. It is mainly through these controls that efforts are made to make the most efficient usage of water as a resource.

When man takes steps to alter elements of a basin's water budget, careful consideration must be given to the consequences of the hydrology and ecology of the entire watershed. Dredging operations for the purpose of harbour clearance or improvements to a navigable channel, for example, may increase the outflow from an upstream lake, increase shore erosion, or regenerate undesirable sedimentary constituents into the lake or river water. The damming of a river or a lake outlet to increase local water storage may also result in undesirable effects, such as an increased evaporation from the larger surface area, the restriction of fish movement, or changes in the thermal climate of the downstream flow. Diversions and dam-site construction may also result in flooding of important bird-breeding areas or a lowering of other lakes in the system, resulting in undesirable consequences.

Water input. The usual major input of water to a lake derives from streams and rivers, precipitation, and groundwater. In some cases inflow may come directly from glacier melt. The relative importance of each of the major sources varies from lake to lake.

Stream and river flow are usually seasonally variable, depending upon precipitation cycles and snowmelt. At low altitudes some rivers exhibit a peak during a high precipitation period in winter and then a second peak associated with a subsequent spring snowmelt that feeds the nearby high-altitude tributaries. In regions where precipitation can occur in great quantities at high rates, streams swell quickly and water is delivered in relatively large volumes to downstream lakes.

A great deal of work has been done to improve the ability to measure and record streamflow. Consequently, it is usually the most accurately known of the inflow terms in the water budget. Most frequently, the height of the river level (stage) correlates well with the water discharge. In other cases, direct river-flow measurements are taken periodically with flow meters.

Precipitation over lake basins

Precipitation reaching a lake's surface directly may be the major input; this is true of Lake Victoria, Kenya–Tanganyika. In other cases, where the lake basin is large with well-developed drainage to a deep lake of small surface area, precipitation may be a small component. Precipitation that falls elsewhere in the lake basin may reach the lake through either surface or groundwater flow, or it may be lost due to evapotranspiration.

Measurements or estimates of precipitation for a basin are difficult to achieve. Even where elaborate networks of rain gauges exist or where these are supplemented by meteorological radar installations, total basin-precipitation data are still considered to be poor. Measurements of direct precipitation over lakes are exceedingly rare; this situation is especially serious in the case of a large lake for which nearby land data are not necessarily representative of conditions over the lake. Each climatic region throughout the world has its typical precipitation pattern, and the lakes within the regions are affected accordingly.

Groundwater controls on lake level

Groundwater reaches lakes either through general seepage or through fissures (springs). Groundwater is taken to be water in that zone of saturation that has as its surface the water table. The depth of the water table can be determined by digging a well into the saturated zone and noting the level of water—unless the water is under pressure, in which case it will rise in the well to a level above the water table. Clearly, it is possible for a lake level to coincide with the water table. In fact, unless impermeable material intervenes, the water table will drop to, rise to, or lie level with a lake surface. Groundwater that is lost from the saturated zone to a lake is termed groundwater discharge. Groundwater introduced to the saturated zone from a lake is termed recharge. The rate at which groundwater is exchanged between a lake and the saturated zone depends mainly upon the level of the water table and the pressure conditions within the saturated zone.

In permeable materials the zone above the water table is called the zone of aeration, and water within it is called soil moisture. Soil moisture is classified into three types: hygroscopic water adsorbed on the surface of soil particles; water held by surface tension in capillary spaces in the soil and moving in response to capillary forces; and water that drains through the soil under gravitational influence. The latter will most significantly contribute to groundwater recharge and to the water balance of a lake. The second category will generally be subject to loss due to transpiration by plants.

Water output. Lakes that have no outlets, either above or below surface, are termed closed lakes, whereas those from which water is lost through surface or groundwater flows are called open lakes. Closed lakes, therefore, lose water only through evaporation. In these cases, the loss of water that is less saline than the source water results in an increasing lake salinity.

Evaporation losses from lake surfaces

The process of evaporation results from a vertical gradient of vapour pressure over the water surface. Next to the water surface, saturation conditions exist that are a function of the temperature at the interface. The vapour pressure in the air above the surface is calculated from the temperature of the air and the wet-bulb temperature. The rate at which evaporation occurs also depends upon the factors that affect the removal of the saturated air above the surface (for example, wind speed and thermal convection).

Studies of evaporation must surely constitute a sizable proportion of all hydrological and oceanographic work. The principal categories of evaporation studies are water budget, energy budget, bulk aerodynamic techniques, and direct measurements of vapour flux (see further HYDROSPHERE).

The so-called aerodynamic technique is based upon Dalton's formula, which correlates evaporation with the product of the vapour pressure gradient and the wind speed. Studies during the past 20 years have produced a host of variations of this equation, determined empirically using independent measurements of evaporation. One of the most often used of these was developed in a study of Lake Hefner, and even this work has been subsequently modified to suit other climates and conditions. Few workers are satisfied with the present state of the art in the use of the aerodynamic equations. Nevertheless, once an equation of this type is satisfactorily developed for a particular lake, having been checked with independent methods, it is attractive because it usually employs data that can be routinely observed.

The direct measurement of vapour fluxes is an extremely intricate proposition, as motions over a water surface are usually turbulent, and instruments capable of measuring rapidly changing vertical motions and humidities are required. Not the least of the difficulties is the likelihood that the kind of turbulence over large bodies far from land is significantly different from that over land. Recent advances in theoretical developments and instrumentation continue to encourage this type of study. In turn, successes in this field offer the opportunity for the refinement of empirical techniques more practically suited for general lake investigators.

In many lake studies, data from evaporation pans have been used to determine lake evaporation. Pans have even been developed for flotation on lakes. Pans cannot truly simulate lakes, however, as they constitute a different type of system (they are not exposed to the atmosphere in the same way, they exchange heat through their sides, and they do not store heat in the same way as lakes).

Some examples of evaporation estimates include annual totals of between 60 and 90 centimetres (two and three feet) for Lake Ontario (using different techniques and for different years); about 75 centimetres (2.5 feet) for Lake Mendota, Wisconsin; over 210 centimetres (seven feet) for Lake Mead, Arizona and Nevada; about 140 centimetres (4.5 feet) for Lake Hefner; about 660 millimetres (26 inches) for the IJsselmeer, in The Netherlands; and about 109 millimetres (4.25 inches) for Lake Baikal.

Water output from a lake in the form of surface-water outflow generally depends upon the lake level and the capacity of the effluent channel. Although lakes often have many surface inflows or at least several incoming streams or rivers, they generally have but one surface effluent.

Water-level fluctuations. The net water balance for a particular lake will vary according to the periodic and nonperiodic variations of the inputs and outputs and is reflected in the fluctuations of the lake level. Because the prime influencing factors are meteorological, the periodicity of seasonal events are often seen in water-level records.

Seasonal variations of level

Lake-level rises generally coincide with or closely follow seasons of high precipitation, and falls of level generally coincide with seasons of high evaporation. Complications are introduced by a variety of factors, however. The storage of heavy winter precipitation as snowpack is one example. The release of this water during the spring thaw may also be hampered by the presence of river ice, resulting in late-spring or summer peaks. In large drainage basins the full effects of heavy precipitation may not be immediately realized in the lake-water balance because of the time required for basin drainage. Where glacier melt is a major input to a lake, the changes in level respond to seasonal heating as well as seasonal precipitation.

Although artificial controls, in the form of diversions, river dredging, and dams, affect the levels of the Great Lakes, the latter provide good examples of seasonal variations because of the lengthy record of levels available. The rivers draining to these large lakes are relatively stable; that is, the ratio of maximum to minimum flow is about 2 or 3 to 1, compared to 30 to 1 for the Mississippi River and 35 to 1 for the Columbia River. A 67-year average of lake levels by month shows that high water occurs, on the average, in September for Lake Superior and in June for Lake Ontario. Lows occur in March and December–January, respectively. The mean range in seasonal levels, for this period, is about 30 centimetres (one foot) for Lake Superior and about 45 centimetres (1.5 feet) for Lake Ontario. The pattern varies considerably from year to year, however, and periods of exceptional precipitation and drought are shown in the records. These events ultimately affect the downstream lakes, but, because of their relatively small discharge volumes, it takes 3.5 years for 60 percent of the full effect of a supply change to Lake Huron–Michigan to appear in the outflow from Lake Ontario.

The seasonal changes in a lake's level may be superimposed on longer term trends, which in some cases dominate. Several of the large lakes of the world have lengthy water-level records that illustrate long-term periods of relative abundance of water and drought. In Central Africa, Lakes Victoria, Albert, Tanganyika, and Nyasa exhibit substantial long-term features, some of which are consistent, suggesting that a common climatological factor is responsible for their existence (see further CLIMATE AND WEATHER). Nevertheless, others of these features are not consistent within the lakes and have not been adequately explained.

The principal climatological factors that would most affect long-term lake-level variations have not been recorded for long periods at many locations. Regular precipitation observations were not made before about 1850. Some useful evidence is found in such natural records as tree rings and peat-bog stratigraphy.

On a worldwide basis, there is evidence of a period of low levels in the middle 19th century and near the end of the first quarter of the 20th century. Lake George, in Australia, the Caspian Sea, several lakes in western North America, and Pangong Lake, in Tibet, are examples that have exhibited these features.

LAKE EXTINCTION

Possible causes of lake extinction

The life history of a lake may take place over just a few days, in the case of one formed by a beaver dam, or, for the largest lakes, it may cover geological time periods. A lake may come to its end physically through loss of its water or through infilling by sediments and other materials. Reference has previously been made to the chemical-biological death of a lake, which is not necessarily the end of it as a physical entity but may in fact be its termination as a desirable body of water.

Geological processes involving the uplift and subsequent erosion of mountains and the advance and retreat of glaciers, establish lake basins and then proceed to destroy them through infilling. Lake basins may also lose their water through drought or through changes in the drainage pattern that result in depletion of water inflows or enhancement of outflows.

The chemical-biological changes within a lake's history offer a fine example of ecological succession. In the early stages a lake contains little organic material and has a poorly developed littoral zone. Particularly in temperate zones, such conditions favour a plentiful oxygen content, and the lake is said to be oligotrophic. As erosion progresses and as lake enrichment and organic content increase, the lake may become sufficiently productive to place an excessive demand upon the oxygen content. When periods of oxygen depletion occur, a lake is said to be eutrophic. An intermediate stage in this course of events is called mesotrophy. In the case of oligotrophy the vertical oxygen distribution is essentially uniform, or orthograde. Under eutrophic conditions, oxygen values decrease with depth, and the vertical distribution is called clinograde.

The limits of oligotrophic and eutrophic conditions have been set in terms of the rate at which oxygen is depleted from the hypolimnion. These limits are arbitrary but are approximately 0.03 and 0.05 milligrams per square centimetre per day as the upper limit of oligotrophy and the lower limit of eutrophy, respectively.

As eutrophic conditions develop, bottom sediments become enriched in organic material, and bottom plants spread throughout the littoral zone. As infilling proceeds, the plant-choked littoral zone spreads lakeward. Eventually, the littoral zone becomes a marsh, and the central part of the lake diminishes to a pond. When the lake finally ceases to exist, terrestrial vegetation may flourish, even to the extent of forestation.

Lamp Shells: Phylum Brachiopoda

The Brachiopoda are a phylum of marine invertebrates that are covered by two valves, or shells; one valve covers the dorsal, or top, side; the other covers the ventral, or bottom, side. The valves, of unequal size, are bilaterally symmetrical; *i.e.,* the right and left sides are mirror images of one another. Brachiopods (from the Greek words meaning "arm" and "foot") are commonly known as lamp shells because they resemble early Roman oil lamps.

Brachiopods occur in all oceans. Although no longer numerous, they were once one of the most abundant forms of life.

Members of this phylum first appeared rather early in zoological history. It is possible, by means of fossil representatives, to survey their evolution from the Cambrian Period (about 570,000,000 years ago) to the present. Although some of the evolutionary development is revealed, it is still imperfectly understood. Other than their usefulness in dating geological periods, members of this phylum have no economic value, except as curios and museum pieces.

This article is divided into the following sections:

GENERAL FEATURES

Size range and diversity of structure. Most brachiopods are small, 2.5 centimetres (about one inch) or less in length or width; some are minute, measuring one millimetre (more than 1/30 of an inch) or slightly more; some fossil forms are relative giants—about 38 centimetres (15 inches) wide. The largest modern brachiopod is about 10 centimetres (four inches) in length.

Great diversity existed among brachiopods in the past; modern brachiopods, however, exhibit little variety. They are commonly tongue-shaped and oval lengthwise and in cross section. The surface may be smooth, spiny, covered with platelike structures, or ridged. Most modern brachiopods are yellowish or white, but some have red stripes or spots; others are pink, brown, or dark gray. The tongue-shaped shells (*Lingula*) are brown with dark-green splotches; rarely, they are cream yellow and green.

Distribution and abundance. Today, brachiopods, numbering about 300 species representing 80 genera, are abundant only locally. In parts of the Antarctic they outnumber all other large invertebrates. They are common in the waters around Japan, southern Australia, and New Zealand. Although rare in the Indian Ocean, some unusual types are common along the coast of South Africa. In Caribbean and West Indian waters, 12 species occur. The east and west coasts of the North Atlantic Ocean are sparsely occupied by brachiopods; the waters around the British Isles contain a few species, and a few genera live in the Mediterranean Sea. The West Coast of the United States and Hawaii have a number of brachiopod species, and the coasts of Chile and Argentina have a considerable variety, including the largest living species. Some live in the polar regions, and a few are abyssal; *i.e.,* they inhabit deep parts of the ocean.

NATURAL HISTORY

Reproduction. Not much is known about the reproduction of brachiopods. Except in three genera, the sexes are separate. Eggs and sperm are discharged into the mantle cavity through funnel-shaped nephridia, or excretory organs, on each side of the mouth. Fertilization takes place outside the shell. In a few genera the young develop inside the female in brood pouches formed by a fold of the mantle, a soft extension of the body wall. Some fossil forms had internal cavities that may have served as brood chambers. The egg develops into a free-swimming larva that settles to the bottom. The free-swimming stage of the articulate brachiopods (whose valves articulate by means of teeth and sockets) lasts only a few days, but that of the inarticulates may last a month or six weeks. In inarticulate larvae the pedicle, a stalklike organ, develops from a so-called mantle fold along the valve margin; in articulates it develops from the caudal, or hind, region.

Articulate and inarticulate forms

Behaviour and ecology. About 60 percent of brachiopods live in shallow water (less than 100 fathoms—about 180 metres [600 feet]) on the shelf areas around the continents. More than 35 percent occupy waters deeper than 100 fathoms, and a few live in the abyss down to more than 6,000 metres (about 20,000 feet). *Lingula* lives from the tidal zone to 23 fathoms (about 42 metres [138 feet]). Most modern branchiopods anchor by the pedicle to pebbles, to the undersides of stones, or to other hard objects. They prefer quiet water and protected surroundings. *Lingula* lives in mud or sand and is attached at the bottom of its burrow.

Brachiopods feed by opening the shell and bringing in food-bearing currents by lashing of the cilia (hairlike structures) attached to the filaments of the lophophore, a horseshoe-shaped organ that filters food particles from the seawater. Cilia in lophophore grooves bring food particles, often trapped in mucus, to the mouth. Brachiopods feed on minute organisms or organic particles. Articulate brachiopods, which have a blind intestine, may depend partly on dissolved nutrients.

Shells of some articulate brachiopods have a fold, which forms a trilobed anterior that helps keep lateral, incoming food-bearing currents separated from outgoing, waste-bearing currents. When feeding, *Lingula* protrudes its an-

terior (front) end above the mud and arranges its setae (bristle-like structures) into three tubes. These channel the water into lateral incoming and medial, or central, outgoing currents. Some coralliform brachiopods of the Permian Period (280,000,000 to 225,000,000 years ago) are thought to have fed by rapid beating of the dorsal valve, causing a sucking in and expulsion of food-bearing water. Some ostreiform (oyster-shaped) types of the same period are believed to have fed by gentle pulsation of the dorsal valve.

FORM AND FUNCTION

Two major groups of brachiopods are recognized, based on the presence or absence of articulation of the valves by teeth and sockets. The valves of inarticulate brachiopods are held together by muscles. *Lingula,* with its elongated, tonguelike shell, is an example. Its convex valves bulge outward at the middle and taper posteriorly, or away from the hinge. A long, fleshy pedicle protrudes between the valves at the tapered end. The pedicle of *Lingula* differs from that of most other brachiopods in being flexible and capable of movement—an aid in burrowing and in attaching the animal in its burrow. The shell interior is divided into posterior coelomic (internal-body) and anterior mantle cavities. The internal organs are located in the coelom. The digestive system consists of mouth, gullet, stomach, intestine, and anus, all surrounded by a liver, or digestive gland. A complex set of muscles opens the valves and slides them laterally, or sideways, when feeding. The mantle cavity is occupied by the lophophore. *Lingula* lives in a burrow in mud or sand with the tip of its pedicle attached in mucus at the bottom of the burrow. The contractile pedicle permits extension of the shell when feeding or retraction if the animal is startled.

The cavities within the shell

The articulate-brachiopod shell is typified by *Waltonia,* which is small (about two centimetres [3/4 inch]) and red in colour, with a smooth or slightly ridged shell. This type of shell is more highly specialized than that of most inarticulate species and is composed of three layers. The outer layer, called periostracum, is made of organic substance and is seldom seen in fossils. A middle layer consists of calcium carbonate (calcite). The inner layer is composed of calcite fibres and may be punctate—*i.e.,* perforated by minute pits—or it may be pseudopunctate, with rods (taleolae) of calcite vertical to the surface. Impunctate shells have neither pits nor taleolae.

Many hinged brachiopods attach to the substrate, or surface, by a tough, fibrous pedicle; but some specialized forms are cemented to the substrate by the beak of the ventral valve. Cemented forms are commonly distorted, scalelike, or oyster shaped or resemble a cup coral. The pedicle of some brachiopods is atrophied; their shells lie loose on the sea floor.

The shell of an articulate brachiopod tapers posteriorly to a beak. The ventral valve is usually the larger. The hinge may be narrow or wide. Many hinged genera have a flat or curved shelf, called the palintrope, between the beak and the hinge line. The ventral palintrope is divided at the middle by the delthyrium, a triangular opening for the pedicle. The delthyrium may remain open or be wholly or partly closed by small plates growing from its margins. In some families the delthyrium is closed completely or partly by one plate, the pseudodeltidium, anchored to the delthyrial margins. The articulating teeth occur at the angles of the delthyrium and may or may not be supported by vertical dental plates, which may be separate or united to form a so-called spondylium. Teeth are of two types, deltidiodont and cyrtomatodont. Deltidiodont teeth grow anteriorly with the palintrope and leave a growth path along the delthyrial edge; cyrtomatodont teeth are knoblike and occur in shells without a hinge line. They grow anteriorly but are kept knoblike by posterior resorption.

Muscles, sockets, and related structures

The dorsal valve contains structures called crura that diverge from the beak. In some fossil forms the crural bases (brachiophores) bound a triangular cavity, the notothyrium, in which the diductor, or opening, muscles are attached onto the floor or to a ridge, or boss, called the cardinal process at the apex. The notothyrium may be closed by a solid plate, the chilidium. In more highly developed genera a hinge plate bearing the pedicle or dorsal adjustor muscles occurs between the crural bases. The hinge plate is said to be divided when it is incomplete but undivided when it forms a flat or concave structure. The hinge plate is often supported by a median septum, or wall. The hinge sockets are located between the inside shell wall and a socket ridge to which the hinge plate is

attached. In many specialized genera the crura support calcareous loops or spires (brachidia), the inner skeleton of the lophophore. Structures corresponding in function but of different origin and with different names occur in the pedicle region of some inarticulate brachiopods.

The fleshy body of the articulate brachiopod is divided transversely by the body wall into a posterior visceral cavity filled with coelomic fluid and an anterior mantle cavity filled with seawater. The visceral cavity contains the U-shaped digestive canal, four reproductive glands, and a liver, or digestive gland, held in place by mesenteries (sheets of tissue). Extensions of the coelom into the mantle hold the eggs and sperm. The mouth leads into a saclike stomach that ends in an intestine; there is no anus. The liver surrounds the stomach. Waste is excreted through the mouth. The nervous system, which consists of two principal ganglia, or nerve centres, encircles the esophagus and sends branches to other parts of the body. One pair of excretory organs (nephridia) occurs in most brachiopods, but two pairs may be present.

The mantle cavity is lined by the thin, shell-secreting mantle that is fringed by setae at its edges. Within the mantle cavity is the lophophore, which may be a simple or complicated loop, often horseshoe-shaped. Ciliated filaments along the loop direct food-bearing currents to the mouth, which is located on the body wall between the branches of the lophophore and crura.

The shell opens by contraction of diductor muscles that extend from near the centre of the ventral valve to the process under the dorsal beak. These muscles pull the dorsal beak forward, rotating it on a line joining the hinge teeth. Contraction of the adductor muscles closes the valves; in the ventral valve these are located between the diductors. Pedicle muscles or adjustors extending from the pedicle to the hinge plate of the dorsal valve rotate the shell on the pedicle. Where the muscles are attached to the shell there are scars, which are helpful in the identification of genera.

PALEONTOLOGY

Early evolution

Brachiopods were among the first animals to appear at the beginning of the Cambrian Period (570,000,000 years ago). Their evolution and distribution was wide and rapid. More than 35,000 species in more than 2,500 genera are known, and the number of described species increases yearly. Articulate and inarticulate brachiopods appeared at the same time in a relatively advanced state of development, indicating a long evolution from forms without shells, an evolution apparently lost or unrecorded in Precambrian times.

The Inarticulata, the most abundant brachiopods of the Cambrian, soon gave way to the Articulata and declined greatly in number and variety toward the end of the Cambrian. They were represented in the Ordovician (500,000,000 to 430,000,000 years ago) but decreased thereafter. In the Cretaceous (136,000,000 to 65,000,000 years ago) the punctate calcareous Inarticulata proliferated, but this trend soon ended. The Inarticulata dwindled through the Cenozoic (65,000,000 years ago) to the Recent. Only nine genera are known during the Recent Epoch (last 10,000 years). Inarticulate genera represent about 6.5 percent of all brachiopod genera.

The Articulata, diverse and most numerous from Ordovician times to the present, were, in the Cambrian, represented by several specialized forms. Articulate evolution tended toward shell elaboration for bottom dwelling and perfection of feeding mechanisms from the simple looped lophophore to the elaborate lobate and spiral forms. The Orthida, the most common articulate brachiopods of the Cambrian and Ordovician, decreased in numbers after the Ordovician, and the impunctate Orthida became extinct in the Early Devonian (about 395,000,000 years ago); the punctate Orthida lingered into the Permian Period (280,000,000 to 225,000,000 years ago). The Strophomenida appeared in the Early Ordovician and increased rapidly. They were abundant and varied in the Devonian, becoming even more so by Permian times. This large order became greatly reduced at the end of the Permian Period. The Pentamerida, never prolific, flourished in the Ordovician; an evolutional burst of huge forms occurred in the Silurian (430,000,000 to 395,000,000 years ago), but after that the pentamerids decreased into the Devonian (395,000,000 to 345,000,000 years ago) and became extinct early in the late part of that period. The Spiriferida are conspicuous for the great elaboration of the spiral brachidium. They appeared in the Ordovician, were widely distributed into the Permian, and survived into the Jurassic, which began 190,000,000 years ago. The Rhynchonellida were abundant from mid-Ordovician throughout the Paleozoic. They survived into the Triassic (225,000,000 to 190,000,000 years ago) and had a rebirth in the Jurassic, after which they declined into the Cenozoic. They now number only 14 genera.

Development of modern dominant forms

The Terebratulida, now the dominant group, appeared in the early Devonian and rapidly expanded in the mid-Devonian to produce a number of gigantic forms; a few long-looped and short-looped genera persisted into the Permian. The Terebratulida survived the Permian and were widely distributed in the Triassic and evolved into a great variety of forms in the Jurassic, especially the short-looped types. Decline of the short-looped terebratulids began in the Late Cretaceous (75,000,000 years ago); they have continued to dwindle into the present and are now outnumbered by the long-looped terebratulids.

CLASSIFICATION

Distinguishing taxonomic features. Brachiopods possess a lophophore (a feeding structure that filters food from seawater), excretory organs (nephridia), and simple circulatory, nervous, and reproductive systems. Brachiopods have usually been divided into two classes, Articulata and Inarticulata.

Annotated classification. The classification below is based on that proposed by A. Williams and A.J. Rowell in 1965 in *Treatise on Invertebrate Paleontology.*

PHYLUM BRACHIOPODA (lamp shells)
Marine invertebrates with two valves, or shells; lophophore horseshoe-shaped; about 300 living species known; more than 30,000 extinct species described; occur in all oceans.

Class Inarticulata
Shell does not articulate, is usually composed of chitinophosphatic material; shell muscles complex; pedicle (stalk) develops from ventral mantle, a soft extension of the body wall; intestine with anal opening.

Order Lingulida
Shell usually contains phosphate, rarely calcareous, biconvex (*i.e.,* both valves convex), beak for attachment to surface apical, or located at the tip, in both valves; fleshy pedicle emerging between the valves at the tapered end; about 51 genera; Cambrian to Recent.

Order Acrotretida
Usually circular in outline; shell either contains phosphate or is punctate calcareous; pedicle opening confined to the ventral valve; 62 genera; Early Cambrian (550,000,000 years ago) to Recent.

Order Obolellida
Mostly calcareous, biconvex, shape nearly circular to elongated; position of pedicle opening variable; dorsal valve with marginal beak; 5 genera; Early to mid-Cambrian.

Order Paterinida
Shell with phosphate, rounded or elliptical; pedicle opening partly closed by cover called homeodeltidium; dorsal valve similar to the ventral but with a convex homeochilidium; 7 genera; Early Cambrian to mid-Ordovician (450,000,000 years ago).

Class Articulata
Shells articulate by means of teeth and sockets; shells always calcareous; musculature less complicated than in Inarticulata; larval pedicle develops from rear region; no outside opening from intestine.

Order Kutorginida
Calcareous, biconvex interarea (smooth surface in area between beak and hinge line) present; delthyrium (opening in the pedicle) closed by a plate, the pseudodeltidium; dorsal valve with interarea; muscle area narrow and elongated in both valves; 3 genera; Early to mid-Cambrian.

Order Orthida
Usually biconvex, wide-hinged, with interareas in both valves; teeth deltidiodont (leave a growth path along margin of pedicle opening); hinge structures consist of brachiophores (supporting

structures), shell substance punctate or impunctate—*i.e.*, with or without pits; more than 200 genera; Early Cambrian through Permian (225,000,000 years ago).

Order Strophomenida

Teeth deltidiodont when present; ventral muscles large; shell substance pseudopunctate (with rods of calcite), rarely impunctate; more than 400 genera; Early Ordovician (490,000,000 years ago) to Early Jurassic (180,000,000 years ago).

Order Pentamerida

Biconvex, ventral valve usually with a spondylium (united dental plates); delthyrium usually open; dorsal-valve brachiophores supported by bracing plates; impunctate; nearly 100 genera; mid-Cambrian to Late Devonian (350,000,000 years ago).

Order Rhynchonellida

Narrow-hinged with functional pedicle; dorsal valve with or without a median septum; lophophore (of Recent genera) dorsally spiral and attached to crura (supporting structures); spondylia rare; nearly 300 genera; Ordovician to Recent.

Order Spiriferida

Lophophore supported by a calcareous spiral structure (brachidium); punctate or impunctate, usually biconvex; delthyrium open or closed; more than 300 genera; mid-Ordovician to Jurassic (136,000,000 years ago).

Order Terebratulida

Pedicle functional, cyrtomatodont teeth; lophophore supported wholly or in part by a calcareous loop, short or long and free or attached to a median septum; more than 300 genera; Early Devonian to Recent.

Critical appraisal. The classes Articulata and Inarticulata were first proposed by T.H. Huxley in 1869. Before 1932 they were further subdivided into four orders based on the imperfectly known larval development and formation of the shell around the pedicle opening. In 1927 a fifth order was proposed, and it was suggested that a classification be based on the pedicle development of the larvae.

Most brachiopods are extinct, and larval development can only be conjectured. Because of this, the early classification schemes have been abandoned. Eleven orders distributed in Huxley's classes have been retained in the present classification, which is still being modified. On the basis of hinge and tooth types some systematists have divided the Articulata into two subclasses, Protremata and Telotremata. The Protremata are wide-hinged forms with deltidiodont teeth. The Telotremata are narrow-hinged brachiopods with cyrtomatodont teeth.

Land Reform and Tenure

The concept of land reform has varied over time according to the functions performed by land itself: as a factor of production, a store of value and wealth, a status symbol, or a source of social and political influence. Land value reflects its relative scarcity, which in a market economy usually depends on the ratio between the area of usable land and the size of the population. As the per capita land area declines, the relative value of land rises, and land becomes increasingly a source of conflict among economic and social groups in the community.

The patterns of wealth and income distribution and of social and political influence are partly determined by the laws governing land tenure. These laws specify the acceptable forms of tenure and the privileges and responsibilities that go with them. They define the land title and the extent to which the owner can freely dispose of it and of the income accruing from its use. In this sense, the form of tenure determines the wealth and income distribution based on the land: if private ownership is permitted, class differentiation is unavoidable; in contrast, public ownership eliminates such distinctions. The forms of tenure range from temporary, conditional holding to ownership in fee simple, which confers total unencumbered rights of control and disposal over the land.

This article is divided into the following sections:

The purposes of land reform

Historically, land reform meant reform of the tenure system or redistribution of the land ownership rights. In recent decades the concept has been broadened in recognition of the strategic role of land and agriculture in development. Land reform has therefore become synonymous with agrarian reform or a rapid improvement of the agrarian structure, which comprises the land tenure system, the pattern of cultivation and farm organization, the scale of farm operation, the terms of tenancy, and the institutions of rural credit, marketing, and education. It also deals with the state of technology, or with any combination of these factors, as shown by recent reform movements, regardless of the political or ideological orientation of the reformers.

OBJECTIVES OF REFORM

Reform is usually introduced by government initiative or in response to internal and external pressures, to resolve or prevent an economic, social, or political crisis. Reform, therefore, may be considered a problem-solving mechanism. The true motives for reform, however, may be quite different from those announced by the reformer.

The distinction between the real and proclaimed objectives may be especially significant if the proclaimed objectives have been forced upon reformers who do not lend their full support to those objectives. The reformers may proclaim certain objectives merely to appease the peasants, to undermine the opposition, to win international backing, or to safeguard their own positions. The proclaimed purposes of land reform, however, will be taken as a point of departure in this article.

Political and social objectives. The most common proclaimed objective of land reform is to abolish feudalism, which usually means overthrowing the landlord class and transferring its powers to the reforming elite or its surrogates. If "foreigners" happen to be among the landlord class, the objectives become the defeat of imperialism and the end of foreign exploitation.

Another common objective is to free the peasants from subjugation to and dependence on the exploiters and make them active citizens by restoring what assertedly had been taken away from them.

A third objective is to create democracy—a stated purpose of both capitalist and Communist reformers. Most capitalist reforms are based on the premise that individual private ownership in the form of independent family farms will promote and sustain democratic institutions.

Communist reformers, in contrast, usually aim at overthrowing both feudalism and capitalism on the premise that, as a means of production, private ownership of land inherently breeds exploitation. In practice, this means "returning land to the tillers" and creating a classless, democratic society. A more immediate and practical goal of Communist reformers has often been to rally the peasants in support of the new order and against the former regime.

Finally, reform may be introduced simply as the most expedient way to resolve a crisis or avoid a revolution. The reformer, in this case, will introduce and implement just enough reform to appease the peasants and contain the conflict. This happens especially when the reformers are still in sympathy with the landlord class and consciously prefer a moderate rather than a radical reform.

These political objectives tend to undergo change during the period of implementation and are, therefore, kept vague enough to permit flexibility and modification as conditions change.

All land reforms emphasize the need to improve the peasants' social conditions and status, to alleviate poverty, and to redistribute income and wealth in their favour. They try to create employment opportunities and education and health services and to redistribute the benefits to the community at large, the younger generation as the main target.

Economic objectives. Economic development has become a major objective of governments and political parties in recent decades. Efforts have been made to encourage agricultural progress by means of agrarian reform in favour of the peasant who does not own his land or whose share of the crop is relatively small, and who therefore has little incentive to invest capital or expend effort to improve the land and raise productivity. Another mechanism has been to encourage labour-intensive cultivation, on the assumption that traditional or feudal landowners often use their land extensively and wastefully.

An equally important economic objective is to promote optimum-scale farming operations. Excessively large farms (*latifundia*) and excessively small farms (*minifundia*) tend to be inefficient. Therefore, reform aims at creating farms of optimum size given the land quality, the crop, and the level of technology.

Finally, reform aims at coordinating agriculture with the rest of the economy. In their quest for economic development and industrialization, reformers attempt to make the rural sector more responsive to the needs of the industrial sector for labour, food, industrial raw materials, capital, and foreign currency. These functions are often expected to be performed simultaneously.

TYPES OF REFORM

Whether it is called land reform or agrarian reform, the operational concept covers five main types of reform, classified according to whether they deal with land title and terms of holding, land distribution, the scale of operation, the pattern of cultivation, or supplementary measures such as credit, marketing, or extension services.

Title settlement and terms of holding land

Reforms concerned with the title to land and the terms of holding reflect a transition from tradition-bound to formal and contractual systems of landholding. Their implementation involves property surveys, recording of titles, and provisions to free the landholder from restrictions or obligations imposed by tradition. Property surveys are conducted wherever land is held by a tribe or clan or where reallocation of cultivable land routinely follows tradition. In these situations the landholder may lack the incentive to improve the land because the right of disposal belongs to the tribe, clan, or feudal lord, as in medieval Europe and in parts of present-day Africa and the South Pacific islands. Such reform affects landholding in at least three ways: it may increase security of tenure and hence incentives; it may reorganize the system of inheritance in favour of offspring; and it may bring land onto the market so that land transactions become possible. This reform, however, has little immediate effect on the scale of operation, but it does facilitate future land concentration and fragmentation. In countries where the terms of holding and tenancy are regulated by tradition, reform may seek to convert tenancy into a contractual agreement that offers some protection to the tenant and more security and incentive to improve the land and advance technology, as in Japan, India, and Pakistan.

The redistribution of land

The most common type of reform involves the redistribution of land titles from one individual to another, from individuals to a group or community at large, or from a group to individuals. The land of one landlord may be redistributed to many individuals, as in Egypt, Iran, or Ireland. Or the land of individuals may be reallocated in favour of the community at large by abolishing private ownership, as in the Soviet Union and China. Or, again, public land may be distributed to individuals, as in various parts of Latin America.

The impact of redistribution on the scale of operations and on marketability of the land depends on the form it takes and the restrictions attached to it. If the redistributed farm was previously operated as a unit, its division means fragmentation and reduction of scale; however, if it was operated in fragments by tenants, transfer of title to the tenants would not affect the scale. The final results depend on the measures taken to prevent adverse effects.

Efforts to improve the scale of operation

Land-tenure reform, of course, can improve the scale of operations by enlarging the farm or by reducing it. Enlargement applies when the holding is increased in size, either by adding to it or by consolidating its fragmented parts. Farm consolidation involves reallocation of the total farmland within a region by land exchange, sale, or lease such that no one loses and all gain by increasing efficiency. The scale of operations may be increased by pooling resources, as in farm cooperatives and collectives that offer facilities otherwise inaccessible to a small farm.

An equally common approach is to divide large, extensively cultivated farms into smaller and more intensively cultivable units. Reduction of the scale, however, has potential problems since it may result in excessively small units or in the breakup of efficiently run farms. Operations below the optimum level may inhibit improvements in technology, capital investment, and diversification.

Changing the pattern of cultivation

Changes in the pattern of cultivation relate directly to cultivation, land yield, and labour productivity. While other types of reform may influence productivity indirectly by enhancing security of tenure and the scale of operation, improvements in the pattern of cultivation affect productivity directly, through advances in technology, improved irrigation, and the application of chemicals.

Technological advance usually implies mechanization, although it may be biological and organizational only, as in crop rotation, reconditioning of the soil, improved seeding, or better utilization of available technology. The state of technology determines the level of productivity or the ratio between outputs and inputs. More advanced technology permits the cultivation of more land per unit of labour, deeper plowing, better timing of farm operations, reclamation of areas previously inaccessible, and possibly wider diversification of the crops than previously attainable. By easing the physical burden of farm work, it helps to conserve human energy. Improved technology may also be the most direct way to modify tradition without an open confrontation or a political revolution. Mechanization and advanced technology may, of course, cause displacement of labour, unemployment, or the absorption of capital at the expense of other sectors, at least in the short run; in the long run, the positive effects tend to prevail.

Improvements in irrigation include increasing the water supply, draining swampy land, and regulating the quantity and quality of water flow. Irrigation is especially important in that it involves large investments and infringes on tenure rights, both matters that invite public responsibility and intervention. Irrigation and technology are closely related to the use of fertilizer and other chemicals. Chemicals may be difficult to apply without irrigation, and neither may be practical unless farming technology has advanced beyond relatively primitive methods. Improvement of the pattern of cultivation may be inhibited, however, by traditional attitudes, the lack of skills, or the scarcity of capital. Another difficulty is that changes in the pattern of cultivation are usually long-term investments that may be too slow to satisfy immediate pressures for reform.

Measures that supplement land reform

Many improvements and changes may have to be implemented in areas outside the immediate sphere of agriculture, such as credit, marketing, and education. Unless the farmer is able and ready to take advantage of new opportunities and his product can be marketed profitably, reform efforts may be futile. Costly or inaccessible credit and the excessive charges of middlemen increase the relative costs of farming. Therefore, supervised credit, subsidies, and low-interest loans that help to replace traditional sources of credit have been common, and credit and marketing cooperatives and market regulation have been used to protect farmers against exploitation by middlemen.

Finally, improvements in general education are essential in any reform that involves the modernization of agriculture. Extension services, literacy promotion programs, the teaching of home economics, and vocational training are of special importance in helping the young and unemployed and in providing skilled labour for industry.

EVALUATION AND CRITERIA OF SUCCESS

The difficulties of appraising agricultural reforms

Agrarian reform is a complex process of directed change, and its effects touch society in many ways. Therefore its evaluation may be difficult because the various social, political, and economic objectives may be inconsistent with each other. Even champions of reform and planners may have different ideas about it. Moreover, there are no generally accepted criteria for determining the success of such a program, nor adequate tools for measuring its progress.

Economic criteria. Economic indicators and criteria are basically the requisites of economic development. Economic development may be defined as a sustained increase in and achievement of a given level of per capita real income. To be sustained, the rise of per capita real income must be accompanied by changes in the economic and social structures of society, increase in total investment (capital formation), higher productivity, and full employment.

Capital formation in agriculture implies that more resources will be put at the disposal of the farmer in the form of machinery, fertilizers, and irrigation and drainage facilities, all of which contribute to the productive capacity and productivity of the land and the worker. Because capital formation partly depends on domestic saving, a higher rate of capital formation may thus be an indicator of the success of the reform in aiding economic development.

Another indicator is change in land yield or labour productivity. A rise in yield or productivity implies higher efficiency, better use of resources, and an advance in the state of technology. It also suggests an increase in the level of income and potential saving and investment. In fact, the increase in productivity may be the most important single indicator of the contribution made by reform to economic development. Change in the level of rural employment or unemployment provides another indicator, which should be reflected in the level and distribution of income.

Finally, an important indicator may be the change in agriculture's responsiveness to the demands of industry and manufacturing. The ability of agriculture to provide labour, food, industrial raw materials, and a market for industrial products is a significant measure of its contribution to industrialization and development.

Social criteria. Social and political accomplishments are more difficult to measure. One of the important indicators may be the degree of peasant participation in activities such as voting, representation, and decision making. Social and political stability, or the tendency to change governments by constitutional and nonviolent means and continuity of the social and political order without resort to force, are other indicators.

But these various indicators can only suggest that change has taken place. The results depend on the magnitude and relevance of the change. Assuming that measurement is feasible, three approaches to evaluation may be followed: the goal achievement approach, the perceived achievement approach, and the closing-the-gap (integrative) approach.

Goal achievement considers a program successful to the extent that it realizes the goals specified prior to the reform. Probably the most common economic goal is maximization, according to which efficiency dictates that reform should continue up to the point where the marginal benefit of reform is equal to its marginal cost. Land distribution in this case will continue up to the point where its net benefit is zero. Another common goal is to realize incremental gains as the reform proceeds. The reform would be successful to the extent that the effects have been positive. A 20-percent increase in capital formation in a capital-poor economy, however, may be more significant than a 20-percent increase in a capital-rich economy. Similarly, a 20-percent decline in the number of dissatisfied peasants in a peaceful or democratic society may be more conducive to stability and harmony than a 20-percent decline in a radical or violent society. Hence, this approach requires that a critical minimum achievement be specified as a criterion of success in each situation. Or, as a third alternative, the evaluation may compare the results with targets proclaimed in advance. The degree of success will be the extent to which those targets have been realized. Problems, however, will arise, especially when the goals happen to be contradictory or change over time.

Methods of assessment

Perceived achievement considers reform successful if the relevant parties perceive their goals as having been satisfied. One of the main objectives of reform has been to reduce conflict and promote harmony, both of which depend on whether a person or group perceives its expectations as fulfilled, whether it has hope that these expectations will be fulfilled, and whether it is able to express these expectations openly. The evaluation, therefore, is primarily subjective, and the net impact can be assessed only by synthesizing the views of the parties affected, including those who might be satisfied to have their losses minimized, just as much as others would want their gains maximized.

The closing-the-gap approach considers a reform successful to the extent that it closes the gap between the sector subject to reform and the more advanced sectors in society; in other words, reform would be expected to help integrate agriculture with the rest of the economy and the rural population with the urban community in terms of opportunities and levels of living. In this sense the reform would remove the dualism between the agrarian and the nonagrarian, between the technologically backward and the technologically advanced, and thus would increase labour mobility in response to the demands of the economy and development.

HISTORY OF LAND REFORM

The ideas and principles discussed so far may be illustrated by a selective survey of the history of land reform.

Greek system and reforms

Ancient reforms. The recorded history of reform begins with the Greeks and Romans of the 6th and 2nd centuries BC, respectively. Land in ancient Athens was held in perpetuity by the tribe or clan, with individual holdings periodically reallocated according to family size and soil fertility. Population increase, expansion of trade, growth of a money economy, and the opening up of business opportunities eventually made financial transactions in land an economic necessity. Land itself continued to be inalienable, but the right to use the land could be mortgaged. Thus, peasants could secure loans by surrendering their rights to the product of the land, as "sale with the option of redemption." Lacking other employment, the debtor continued to cultivate the land as *hektēmor,* or sixth partner, delivering five-sixths of the product to the creditor and retaining the rest for himself. Mortgaged land was marked by *horoi,* or mortgage stones, which served as symbols of land enserfment. When Solon was elected archon, or chief magistrate, *c.* 594 BC, his main objective was to free the land and destroy the *horoi.* His reform law, known as the *seisachtheia,* or "shaking-off the burdens," cancelled all debts, freed the *hektēmoroi,* destroyed the *horoi,* and restored land to its constitutional holders. Solon also prohibited the mortgaging of land or of personal freedom on account of debt.

The impact of the reform was extensive but of short duration. The *hektēmoroi* were freed, but since no alternative sources of support or credit were provided and creditors were uncompensated, dissatisfaction and instability persisted. Two decades of anarchy were followed by a revolution, *c.* 561 BC, that brought Peisistratus to power. He enforced the reform and distributed lands of his adversaries (who were killed or exiled) among the small holders. He also extended loans to aid cultivation and prevent migration to the city and expanded silver mining to create employment. Although the amount of land redistributed is unknown, Peisistratus was apparently able to satisfy the peasantry, secure their loyalty, and stay in power for life, but the economic effects are too vague to evaluate.

The reforms of the Gracchi

The Roman reform by Tiberius and Gaius Gracchus came between 133 and 121 BC. The land reform law, or *lex agraria,* of Tiberius was passed by popular support against serious resistance by the nobility. It applied only to former public land, *ager publicus,* which had been usurped and concentrated in the hands of large landholders. Land concentration reduced the number of owners and hence the number of citizens and those eligible to serve in the army. In addition, such concentration was accompanied by a shift from cultivation to grazing, which reduced employment and increased the poverty of the peasants, producing a crisis. The motives of the reformers continue to be debated, but it would appear that concern for the poor and political stability were major factors.

The *lex agraria* specified minimum and maximum individual landholdings, with an allowance for male children of the family. Excess land would be expropriated and compensation paid for improvements. A standing *collegium,* or commission, was to enforce the law, but implementation was delayed because Tiberius was killed in the year of its passage. When Gaius was elected tribune about a decade later, he revived the reform and went even further. He colonized new land and abolished rent on small holdings since rent on large holdings had been suspended as compensation for expropriation. Gaius was killed in 121 BC, however, and within a decade the reform was reversed: private acquisition of public land was legalized, the land commission was dissolved, rent on public land was abolished, all holdings were declared private property, and squatting on public land was prohibited. Even colonization was ended, and colonies established by Gaius were broken up. Another period of land concentration was inaugurated.

Modern European reforms. The French Revolution brought a new era in the history of land reform. Reform meant dealing with survivals of the medieval tenures that had left a common heritage in most European countries and, through them, in the colonies. The measures and approaches varied from place to place and period to period.

The French Revolution and after

On the eve of the Revolution, French society was polarized, with the nobility and clergy on one side and the rising business class on the other. The middle class was relatively small, especially in the rural areas. The majority of the peasants were hereditary tenants, either *censiers,* who paid a fixed money rent, or *mainmortables,* or serfs, who paid rent in the form of labour services, *corvée,* of about three days a week. The peasants paid various other feudal dues and taxes, from which the nobility and clergy were exempted. The Revolution overthrew the ancien régime and the feudal order and introduced land reform.

The reform repealed feudal tenures, freed all persons from serfdom, abolished feudal courts, and cancelled all payments not based on real property, including tithes. Rents based on real property were redeemable. Once the law had been passed, however, the peasants seized the land and refused to pay any rents or redemption fees; in 1792 all payments were finally cancelled. Land of the clergy and political emigrants was confiscated and sold at auction, together with common land. The terms of sale, however, often favoured the wealthy, which may explain the rise of a new class of large landowners among the supporters of Napoleon.

The social and political objectives of the reformers were fully realized. The *censiers* and serfs became owners. Feudalism was destroyed, and the new regime won peasant support. The economic effects, however, were limited. Incentives could not be increased substantially since the peasants already had full security of tenure prior to the reform. The scale of operations was not changed; and no facilities for credit, marketing, or capital formation were created. The major achievements were the reinforcement of private, individual ownership and perpetuation of the small family farm as a basis of democracy. The small family farm has characterized French agriculture ever since.

There were other reforms in most European countries. England resolved its land problems by the enclosure movement, which drove the small peasants into the towns, consolidated landholdings, and promoted large-scale operation and private ownership. Sweden and Denmark pioneered between 1827 and 1830 by peacefully abolishing village compulsion, or imposed labour service, and the strip system of cultivation, by consolidating the land, and by dividing the commons among the peasants. Though influenced by the French Revolution, only after the 1848 revolutions did Germany, Italy, and Spain free the peasants and redistribute the land. Reform in Ireland took a whole century before substantive results were achieved, in the mid-1930s, after Ireland was divided into Northern Ireland and the Irish Free State. The tenants were converted into owners by subsidized purchase of the land.

Russian reforms

The first major Russian reform was the emancipation of the serfs in 1861. At the time of emancipation about 45 percent of the land was private property and the remainder was held as allotment land, cultivated in units averaging 9.5 acres (3.8 hectares) by the peasant serfs against rent in kind and labour, payable to feudal lords. In contrast, fewer than 1,000 noble families owned about 175,000,000 acres (70,000,000 hectares) and received rent therefrom. Conflict between such extremes of poverty and wealth caused restlessness among the peasants and rendered reform inevitable. As Tsar Alexander II put it: "It is better to abolish serfdom from above than to await the day when it will begin to abolish itself from below."

The Emancipation Act of 1861 abolished serfdom and distributed allotment land among the peasants. The homestead became hereditary property of the individual, but the field land was vested in the village *mir* as a whole. The peasant paid redemption through the village authority, while the landlord received state bonds as compensation equal to 75 to 80 percent of the land market value. Though legally freed, the private serf had to ransom his freedom by surrendering a part of the allotment land. In contrast, serfs belonging to the imperial family were emancipated in 1863 and received the maximum amount of land fixed by law. Serfs of the state were emancipated in 1866 and allowed to keep the land they occupied against money rent. The Cossacks received two-thirds of the land, to be held in common, but in lieu of redemption payments they had to serve 20 years in the army. The serfs in mines and households were freed but received no economic assets.

Redemption payments, however, soon proved too burdensome, village restrictions were tight, and the allotment land area declined, all of which led to renewed restlessness and disturbances. Following the revolt of 1905, the government, under Pyotr Stolypin, tried to create middle-class, independent farmers by replacing the village tenure with private ownership, consolidating holdings, and encouraging land purchase by individuals; but the time was too short for effective implementation. The Soviet Revolution overthrew the tsarist regime and introduced the concepts of public ownership and collectivization.

By decree in 1918, the Soviets abolished private ownership of land, made farming the sole basis of landholding, and declared collectivization a major objective of policy. Marketing of agricultural products became a state monopoly. In 1929 Stalin embarked on a full course of collectivization, and by 1938 collective farms occupied 85.6 percent of the land and state farms 9.1 percent. Credit facilities and tractor stations supplemented collectivization, while agricultural production was integrated in the national plan for industrialization and development.

The costs of Soviet reform included the destruction of capital and the death of large numbers of kulaks, or rich peasants. Total output and productivity increased, however, and capital formation was made possible through forced saving, taxes, and regulated prices. The peasant received extensive social services such as health care, and education and better working conditions. The objectives of the decree of 1918 have been fully realized.

Reform in eastern Europe

Reform in eastern Europe was complicated by the fact that most of the eastern European countries remained under foreign rule until the middle of the 19th century or later. In Hungary, the Decree of 1853 abolished the *robot,* or forced labour and feudal dues, freed the serfs, liberalized land transaction, and encouraged consolidation. The Romanian reform of 1864 freed the serfs and distributed both the land and the redemption payments in proportion to the number of cows or oxen each peasant had. Formal emancipation in Bulgaria was introduced by the Turkish government in the 1850s, but actual reform came in 1880, after independence. Each peasant, including sharecroppers and wage workers, who had worked the land for 10 years without interruption, was entitled to the land he had cultivated. With the exception of Bulgaria, the distribution of ownership throughout most of eastern Europe remained highly uneven. Political instability reached a dangerous point between the two world wars. Following World War II, the eastern European countries established Communist governments with a strong tendency toward collective, cooperative, and mechanized agriculture.

Land reform in Mexico

Mexico. The Mexican reform of 1915 followed a revolution and dealt mainly with lands of Indian villages that had been illegally absorbed by neighbouring haciendas (plantations). Legally there was no serfdom; but the Indian wage workers, or peons, were reduced to virtual serfdom through indebtedness. Thus, the landlords were masters of the land and of the peons. The immediate aim of reform was to restore the land to its legal owners, settle the title, and use public land to reconstruct Indian villages. The motives were mainly to reduce poverty and inequality and to secure political stability, which was then in the balance. A decree of 1915 voided all land alienations that had taken place illegally since 1856 and provided for extracting land from haciendas to reestablish the collective Indian villages, or ejidos. The 1917 constitution reaffirmed those provisions but also guaranteed protection of private property, including haciendas. Nevertheless, a combination of loopholes, litigation, and reactionary forces slowed implementation, and effective reform came only after passage of the Agrarian Code of 1934 and the sympathetic efforts of Pres. Lázaro Cárdenas.

The reform restored many villages and freed the peons, but land concentration and poverty continued. In 1950, more than 31 percent of the private cropland was owned by fewer than 0.5 percent of the owners. Small-scale operation was retained or encouraged, a fact explaining the decline of output in the early years. More recently, efficiently run farms have been exempted from distribution.

The social and political impact was more positive. The peasants acquired more land and liberty, and control by landlords was reduced, although it was replaced by village restrictions. At least legally, farming became the basis of landholding. Some have seen in land reform the reason for Mexico's political stability, although there have been sporadic peasant uprisings and other violent encounters.

REFORMS SINCE WORLD WAR II

Communist and capitalist reforms

Recent decades have witnessed widespread, comprehensive reform programs, but the concept has undergone major changes. The eastern European countries and China originally followed the Soviet model, with different modifications in the individual countries. A few other countries have continued to follow that model, with major emphasis on "land to the tiller," cooperation, collective ownership, large-scale operation, and mechanization, and with economic development as the common denominator. In capitalist-oriented reforms, private ownership, family farming, and dual tenures have remained basic objectives with the aim of promoting democracy, equality, stability, and development. Under the influence and with the guidance of the United Nations, nonsocialist reforms of the 1950s were equated with community development and emphasized institutional and rural self-help in addition to land redistribution. In the 1960s the emphasis shifted to agricultural productivity and economic development by means of large-scale operation, new technology, and cooperation. The 1970s witnessed the advent of "integrated rural development" as the focus of reform and as a way of combining productive activities with improvements in the social and physical infrastructure. The integrated approach, however, soon proved to be unmanageable, and the emphasis shifted to the "target" group as the focus of reform. The most recent conception of reform has been to satisfy "basic needs," with or without land distribution, although no policymaker in the capitalist countries would openly question the idea of land redistribution or the creation of small family farms. These experiments with the concept of reform have been accompanied by attempts to broaden the concept to incorporate women as equal beneficiaries of reform in their own right. The results have been mixed.

Japan. The Japanese reform came immediately after World War II at the insistence of the Allied Occupation Army. The reform was designed to fit the uniquely high literacy rate and advanced industrial level of the country. Although the Meiji government had formally abolished feudalism and declared the land to be the property of the peasants, usurpation of land by the rich and by moneylenders had created classes of perpetual tenants and absentee landlords. In 1943, 66 percent of the land was operated by tenants against rent in kind that averaged 48 percent of the farmers' product, while population pressure resulted in fragmentation of holdings. The social class structure was closely tied to tenure, the owners in each village being at the top of the structure. Conflict between landlords and peasants was widespread.

After the war, the crisis was revived by food shortages, the breakdown of the urban economy, and the return of absentee landlords to the land. The Occupation Army insisted on reform, presumably to democratize the society and rehabilitate the economy. The reform law of 1946 established a ceiling on individual holdings and provided for expropriation and resale of excess land to the tenants against long-term payments. The government compensated the landlords in cash and bonds redeemable in 30 years. Tenants were protected by contract, and rents were reduced to a maximum of 25 percent of the product. The redistributed land was made inalienable, though this restriction was relaxed four years later. The program also provided for marketing and credit cooperatives. An important supplementary measure was the Local Autonomy Law of 1947, which decentralized the power structure and put village affairs in the hands of the villagers.

Within two years tenancy declined by more than 80 percent. Rent control and land distribution helped to equalize incomes in the villages and rehabilitate the sociopolitical status of the peasants. Crop yields per unit of land increased, but despite improved techniques the output per worker declined. In general the reform seemed to realize the objectives of the reformers and the peasants, although smallness of scale, low per capita incomes, underemployment, and insufficient mechanization have persisted. Even black market rents developed. These problems were tolerable because their effects were mitigated by the upsurge of the urban economy and the ability of the Japanese farmer to supplement the family income from nonagricultural employment. Even so, the farmers continue to depend on government subsidy to stay in farming.

Egypt. The Egyptian reform of 1952 followed the revolution that overthrew the monarchy and brought young middle-class leaders to the helm. Though affecting only about 12 percent of the arable land, it was applied thoroughly and touched all aspects of rural life. Egypt had two main forms of tenure: private ownership and *waqf,* or land held in trust and dedicated to charitable or educational purposes. *Waqf* land was inalienable, but private land was subject to speculation and concentration. In 1950, 1 percent of the owners had more than 20 percent of the private land, and 7 percent had more than two-thirds. The operating unit was small, with 77 percent of all the holdings occupying less than one acre each. Tenancy was widespread and rents were exorbitant. The peasants were exploited by middlemen who sublet the land to tenants, mediated between them and the market, and extended credit at high rates of interest.

The Reform Law of 1952

The revolutionary reformers aimed at abolishing feudalism, recruiting peasant support, promoting economic development, and bringing the villagers back into the stream of national life. The Agrarian Reform Law of 1952 put a ceiling on individual holdings at 200 *faddān*s (one *faddān* = 1.038 acres), later reduced to 100 *faddān*s, with special allowance for male children. The excess land was expropriated and distributed to the peasants in parcels not exceeding five *faddān*s. Compensation was given in bonds, while land recipients had to repay in annual installments. The new owners were obligated to join cooperatives for production, marketing, and credit. Tenancy conditions were also regulated, with contract replacing traditional terms; rent could not exceed 50 percent of the product, nor could a tenant hold more than 50 acres, to avoid subletting. An interesting feature of the reform was the special attention given to college graduates by allowing them up to 20-*faddān* parcels.

The reform was enforced quickly and had a great impact on the morale of the peasants. The economic effects, however, were minor since agriculture was intensive and land yield high. Producer cooperatives served only to offset the impact of distribution on the scale of operation. Some increases in yield have been claimed, but the evidence is still inconclusive. Furthermore, little capital was redirected into productive investment since the compensation bonds were not negotiable. Peasant savings remained limited, income increments being spent mostly on consumption. Finally, underemployment in agriculture has remained widespread. The defects of the agrarian structure continue to prevail, and relatively large ownerships exist, while certain groups in Egypt are calling for reversal of the reform.

The social and political effects, however, were far reaching. Redistribution and regulation of rent raised the incomes of small owners and tenants. Cooperatives replaced the middleman and captured his share for the farmer. The peasant gained social status and enjoyed a higher level of political participation, mostly in support of the revolutionary regime. These effects, however, can be easily exaggerated. The peasants became dependent on the cooperatives whether they liked them or not. Great differences in landholding continued to exist, and peasant incomes remained low. Black market rents appeared. The example of Egypt suggests that successful reform in densely populated countries requires an upsurge in the industrial sector to relieve population pressure and permit technical advance and higher productivity in agriculture.

Southeast Asia. The model of Japan's reform has been attempted in Southeast Asia, especially in Taiwan, South Korea, and South Vietnam, all influenced by American experts and by the anti-Communism of the respective governments. The objectives were to sustain the political order, raise living standards, and promote some degree of economic development. The reforms began with regulation of tenancy, restriction of rent, and the institution of written contract for leases, following which tenants were to be transformed into owners. Taiwan's reform was implemented between 1949 and 1953, in three stages. First, rents, which had sometimes reached 70 percent of the product, were reduced to 37.5 percent. Next, tenant-farmed public land was sold to the tenants. Finally, tenant-farmed private land was bought by the government and resold to the tenants.

The Vietnamese reform was introduced in 1955. Rents were reduced to a maximum of 25 percent of the product. A ceiling of 247 acres (100 hectares) was put on individual holdings, however, and only the excess land was subject to redistribution in parcels of 7.4 to 12.4 acres (three to five hectares) to the tenants. The collapse of the South Vietnamese regime and the unification of South and North Vietnam ended that reform and replaced it with the socialist model of North Vietnam.

The reform in Taiwan, as in South Vietnam prior to unification, was supplemented by other measures described as community development, such as adult education, credit facilities, improved technology, and other social services. Though land consolidation was attempted, the scale of operation was little affected. The main effect seems to have been the regulation of tenancy and the redistribution of rent incomes. An innovation of Taiwan's reform was the partial compensation of landlords with industrial shares in public enterprises, which helped them and helped industry.

Taiwan's reform has been hailed as a major success, in both economic and political terms. Some observers, however, are unwilling to reach such a conclusion until restrictions are removed and the peasants have a free choice of tenure and farm organization.

South Korea's land reform (under the Land Reform Law of June 1949) roughly followed the Japanese model by removing tenancy, creating small ownerships, implementing the law thoroughly and promptly, and depending heavily on nonagricultural (basically industrial) employment to absorb labour and supplement rural income. Like the Japanese and Taiwanese reforms, Korea's successful reform was generously supported by foreign aid.

The Philippines introduced a reform program in 1963, which aimed primarily at replacing share tenancy with lease contracts and eventually with ownership, and at revitalizing agriculture through extension services. By the mid-1980s the program had given titles to about 400,000 tenants and secure leases to another 600,000, but the economic viability of the new units has been uncertain because of their small scale and the lack of supplementary facilities. The main effects initially were seed improvement, greater use of fertilizers, and an increase in contractual tenancy. To combat the negative effects of small-scale farming, the Philippine government has resorted to what it calls the "compact farm," which is a voluntary grouping of small farms to be operated under one management as one consolidated farm. The problem of surplus labour, however, remains to be solved.

Reform in Malaysia

Various other reforms have been introduced in Southeast Asia, but the only innovative program has been that of Malaysia. The program in Malaysia has been highly organized and development oriented. It tries to promote social and economic objectives by emphasizing the production of rubber and palm oil for export and gradually transforming the landless into hereditary tenants on newly reclaimed and settled plantations. A typical plantation covers 4,500 to 5,000 acres (1,800 to 2,000 hectares) of jungle land and absorbs about 400 families. The land is cleared and planted by contract, and a village is constructed, with all the necessary services, before the settlers arrive. Each house has a quarter of an acre for a household garden. Cropland is divided in blocks of 120 to 200 acres (48 to 80 hectares), to be worked by a team of 15 to 25 people until the plants have matured. Upon maturation, each settler receives a share by lottery and a lease title for 99 years. This tenure arrangement precludes alienation, subdivision, or subleasing; it thus protects the tenant farmer and sidesteps the Islāmic laws of inheritance, which tend toward fragmentation of the land.

The settler is responsible for the cost of clearing and planting, but the government pays the administrative costs. The settler is guaranteed supplementary employment to earn subsistence income pending maturity of the plants, and cultivation is guided by experts. The rate of settlement is determined by the overall economic plan. It is clear that landholding has become tied to cultivation; fragmentation and diseconomies of scale have been avoided, and cultivation has become a rational economic operation. The Malaysian program has much in common with the cooperative settlements of Israel and the Gezira Scheme in The Sudan.

Latin America. Except for the early example of Mexico, reform in Latin America has been recent and appears to have come only in response to the threat of social and political instability and mounting international pressures. Reform in Latin America after World War II must be seen against a background of rapidly increasing population and of extreme contrasts between plantation economies and small units; high concentration of land ownership, income, and power and dire poverty; modern farming and relatively backward cultivation methods; and nationalism and extensive foreign ownership of land. In addition, Latin-American society is complicated by its ethnic mixtures and by dependence on staple trade items such as sugar, tobacco, cocoa, coffee, and beef cattle.

Reform in Latin America has reflected the ideologies and objectives of the regime in power. Brazil has had several attempts at reform. The measures have been indirect and relatively mild, the most important being taxation of idle land and large plantations and reclamation and settlement of the Amazon region, with provisions for credit and tenancy protection. The results have been modest, however, largely because of the physical and biological hardships faced by settlers in the tropical Amazon environment. Peru has deviated by creating collective administrations of the nationalized feudal estates. The title resides in the nation, and the estates are run by the Agricultural Societies of Social Interest (SAIS), a mechanism devised to avoid breaking up economically efficient enterprises rather than to modify the tenure institutions.

Reform in Cuba

At the other end of the Latin-American spectrum is the Cuban reform that followed the revolution of 1958. Cuba retained private ownership but reduced it substantially in favour of the public sector. As proclaimed a few months before the overthrow of the old regime, the reform aimed at the elimination of *latifundia* tenure, expropriation of land owned by foreign companies, higher standards of living for the peasantry, and national economic development. It began by setting a ceiling of 30 *caballerías* (one *caballería* = 33 acres, or 13.4 hectares) on individual holdings, with a maximum of 100 *caballerías* if economic operations required such a scale. All foreign-owned land was nationalized. Public land on which rice and cattle were raised was converted into state farms, and the peasants became permanent wage workers on these farms. Sugar plantations were converted into cooperatives to avoid their subdivision into small uneconomic units. Before long the ceiling on individual holdings was lowered to five *caballerías,* and all such holdings became private family farms. The rest were nationalized, and the expropriated owners were compensated with a pension for life. The reform was supplemented by the organization of national farmer associations; people's stores; credit, housing, and educational facilities; and the production of machinery and fertilizers. In 1963 a major reorganization of state farms took place; they were subdivided on the basis of crop specialization into smaller operational units of about 469 *caballerías.*

Effects of the reform were comprehensive and immediate. The tenure institutions were radically changed in favour of public ownership, while *minifundia* and tenancies were abolished. Socially and politically, the reform realized the objectives of the reformers. Economically, the government claimed higher yields of sugarcane, vegetables, and fruit, but this claim has been disputed by foreign observers.

Other Latin-American reforms fall between those of Brazil and Cuba, though closer to the former than to the latter in comprehensiveness and thoroughness. For example, the reform in Costa Rica has overlooked land concentration and income inequality and concentrated on the squatters, or *parásitos,* who in 1961 numbered between 12,000 and 16,000 people. The reform aimed at legalizing existing squatter holdings, preventing further squatting, and conserving virgin land. Even this modest program was implemented very slowly. As late as 1973, 7.3 percent of the landholdings comprised 67 percent of the total agricultural land. Colombia has had reform programs for at least 30 years, but concentration of ownership, fragmented holdings, backward methods of cultivation, inequality of income distribution, and widespread poverty have remained characteristic; in 1970, 4.3 percent of the holdings contained 67.4 percent of the total area.

Chile

Chile undertook various reform programs before achieving concrete results. In 1962 a program was enacted to encourage settlement of new land, but only about 1,000 families were settled. A comprehensive reform was introduced in 1965 with three main objectives: to make the agricultural workers owners of the land they had cultivated previously, to increase agricultural and livestock production, and to facilitate social mobility and peasant participation in political life. The Chilean reform was unique in its method of implementation. Once the plantation had been designated for expropriation and the prospective owners selected, they were organized into *asentamientos,* or settlement groups. The group elected a committee to take charge of settlement. The members cultivated the land as a team for three to five years. Meanwhile they received training and guidance in social participation, decision making, and modern farming. Upon completion of the transition period, the land was divided among those who had shown promise, to be held outright and without restriction. All new owners were obligated to join cooperatives, the form of these being determined by the members. The socialist regime that came into office in 1970 expedited the expropriation process and the creation of settlement groups or cooperative farms under peasant committees. By 1972 all the potential land, which had been in farms larger than 200 acres (80 hectares), had been expropriated and reallocated. The new regime that took over in 1973 decided, however, to privatize the land and reverse much of the reform by returning large areas to the former owners, dissolving the cooperatives, and creating private ownerships in their place. Most of the reverse changes had been completed by 1979. Nevertheless, most of the excess land in farms of more than 200 acres remained in the hands of the reform beneficiaries. Owners of less than 12 acres (five hectares) were hardly affected; those who owned between 12 and 50 acres (five and 20 hectares) benefitted most. In the final analysis, less than 15 percent of the agricultural land was affected by the reform between 1965 and 1979 under three regimes.

Observers of the Latin-American scene have been pessimistic regarding the adequacy of these land reform programs. With the exception of Cuba, capital formation in agriculture has not increased substantially; the pattern of land distribution has undergone little change; social and political stability have remained in question; and the agrarian structure is still considered defective.

Other recent reforms. Attempts to reform the agrarian structure have been made in most other countries, with varying degrees of seriousness. India and Pakistan have concentrated on abolishing intermediaries who prevailed as survivals of traditional and feudal tenures. In India the tenants have become hereditary holders, with the title vested in the state. India has left reform to the states and emphasized peaceful and compensatory methods; hence the results have varied from one state to another. Pakistan, following the revolution of 1958, enacted a reform that made most of the tenants owners. In both countries, however, small-scale farming has persisted, while Pakistan has continued to tolerate and protect owners of up to 500 acres (200 hectares). In neither country has fragmentation been effectively reduced or have capital formation and cultivation methods significantly advanced.

India and Pakistan

In contrast, after the Communists came to power in China, private ownership was eliminated and the peasants were organized in village communes. Extensive supplementary measures have been tried, and the role and organization of the commune have varied according to the pressures on the economy. The most recent innovation in China's agriculture has been the "production responsibility system," which allows the commune to contract with its members for quotas of output; the members are free to sell the surplus on the open market. The change is seen as an incentive generator, but land cannot be rented, bought, sold, or used except as authorized by the commune. The effects of China's agrarian policy on peasant living conditions and the Chinese economy have been generally accepted as positive, genuine, and impressive.

In 1962 Iran made owners of most of the former sharecroppers, in the classic tradition of Western-type reform, mainly to create political stability. Given Iran's revolution of 1979, however, the reform evidently was not sufficient to sustain the old social order. Reform was also introduced in Syria, Iraq, Algeria, Libya, and other countries of the Middle East and North Africa following independence or revolution. Most of these reforms were influenced by the Egyptian example, with the state playing a major role. In all cases emphasis has been placed on farm cooperatives, although they have been largely ineffective.

In contrast, tropical Africa has witnessed a wave of innovative reform in recent years. Reform has sometimes come in "packages," which combine tenure reform and other measures affecting cultivation and productivity. Among the innovations is the "villagization," or *ujamaa,* program of Tanzania, according to which a group of families lives, works, and makes decisions together and shares the costs and benefits of farming the land. The program began as a voluntary movement in 1967, but by 1977 it had become almost mandatory. At the same time, "block farming" and individual holdings had become acceptable forms of cooperation. The Ujamaa Villages Act of 1975 made the village the main rural administration and development unit. The most radical reforms in Africa, however, have been those of Ethiopia in 1975 and of Mozambique in 1979. Both vested the land title in the nation and abolished rent, sale, and absentee control of the land. The land was placed in the hands of the tillers, who have guaranteed right of use for themselves and for their descendants. Except in the public sector, farming is a small, family operation with a high degree of equality of landholding but of uncertain efficiency.

CONCLUSIONS

Land reform and agrarian reforms have become synonymous, indicating that reform programs have become more comprehensive and encompass much more than the reform of land tenure or land distribution. Reform movements have recurred throughout history, as have the crises they are intended to deal with, because reform has rarely dealt with the roots of the crises. Reform has served as a problem-solving mechanism and therefore has only been extensive enough to cope with the immediate crisis. Reformers have often faced hard choices: to promote and sustain private ownership with inequality or to institute public or collective ownership with equality but with restrictions on the individuals' private interests; to spread employment by supporting labour-intensive, low-productivity techniques or to promote high productivity through capital-intensive, efficient methods; to pursue gradual "repair and maintenance" reform that is basically ineffective or to promote revolutionary, comprehensive, effective but disruptive reform. In capitalist reforms these contradictions have usually been resolved in favour of the first set of options; in socialist reforms, in favour of the second. Land tenure reform seems to have been of little significance in creating substantive economic change, although it has been important for improving the status of peasants and maintaining social and political stability. Most reforms have narrowed the gap between reform beneficiaries and other farmers through land redistribution and tenancy control, but only the comprehensive socialist reforms have narrowed the gap between agriculture and other sectors of the economy.

Land redistribution programs have had limited success for several reasons. They often have deprived the farm of the former landlord's contributions without providing a substitute. They have inhibited mobility of labour by giving the peasant a stake in the land, though only in the form of an inefficient minifarm. They frequently have threatened large, efficiently run farms and therefore have had to be compromised. They have provided compensation for the expropriated land and hence left wealth and income distribution largely unaffected. They have been conditional upon peasant participation in social and political activity and cooperative organization, even though the peasant was unprepared for these activities. Moreover, the redistribution of land has rarely been fortified by protective measures that could prevent reconcentration of ownership and the recurrence of crises. Nevertheless, major efforts have been expended by the Food and Agriculture Organization of the United Nations and other international bodies and by governments to devise viable frameworks for solving agricultural and rural problems emanating from defective agrarian structures. (E.H.T.)

SANDERSON, *Agrarian Populism and the Mexican State: The Struggle for Land in Sonora* (1981), covering 1917–76, with much discussion of the national situation.

Language

Language interacts with every other aspect of human life in society, and it can be understood only if it is considered in relation to society. This article attempts to survey language (both spoken and written) in this light and to consider its various functions and the purposes it can and has been made to serve. Because each language is both a working system of communication in the period and in the community wherein it is used and also the product of its past history and the source of its future development, any account of language must consider it from both these points of view.

The science of language is known as linguistics. It includes what are generally distinguished as descriptive linguistics and historical linguistics. Linguistics is now a highly technical subject; it embraces, both descriptively and historically, such major divisions as phonetics, grammar, and semantics, dealing in detail with these various aspects of language. For a full account of the theory and methods of linguistic science, see the article LINGUISTICS. For a general survey of known living and dead languages, consult the article LANGUAGES OF THE WORLD.

This article is divided into the following sections:

Characteristics of language

DEFINITIONS OF LANGUAGE

Many definitions of language have been proposed. Henry Sweet, an English phonetician and language scholar, stated: "Language is the expression of ideas by means of speech-sounds combined into words. Words are combined into sentences, this combination answering to that of ideas into thoughts." The U.S. linguists Bernard Bloch and George L. Trager formulated the following definition in their *Outline of Linguistic Analysis* (1942): "A language is a system of arbitrary vocal symbols by means of which a social group cooperates." Definitions like these and, indeed, any succinct definition make a number of presuppositions and beg a number of questions. The first, for example, puts excessive weight on "thought," and the second uses "arbitrary" in a specialized, though legitimate, way (see below).

A number of considerations enter into a proper understanding of language as a subject:

1. Every physiologically and mentally normal person acquires in childhood the ability to make use, as both speaker and hearer, of a system of vocal communication that comprises a circumscribed set of noises resulting from movements of certain organs within his throat and mouth. By means of these he is able to impart information, to express feelings and emotions, to influence the activities of others, and to comport himself with varying degrees of friendliness or hostility toward persons who make use of substantially the same set of noises.

2. Different systems of vocal communication constitute different languages; the degree of difference needed to establish a different language cannot be stated exactly. No two people speak exactly alike; hence, one is able to recognize the voices of friends over the telephone and to keep distinct a number of different unseen speakers in a radio broadcast. Yet, clearly, no one would say that, for that reason, they speak different languages. Generally, systems of vocal communication are recognized as different languages if they cannot be understood without specific learning by both parties, though the precise limits of mutual intelligibility are hard to draw and belong on a scale rather than on either side of a definite dividing line. Substantially different systems of communication that may impede but do not prevent mutual comprehension are referred to as dialects of a language. In order to describe in detail the actual different speech patterns of individuals, the term idiolect, meaning the speech habits of a single person, has been coined.

Languages, dialects, and idiolects

3. Normally, people acquire a single language initially—their first language, or mother tongue, the language spoken by their parents or by those with whom they are brought up from infancy. Subsequent "second" languages are learned to different degrees of competence under various conditions, but the majority of the world's population remains largely monolingual. Complete mastery of two languages is designated as bilingualism; in a few special cases—such as upbringing by parents speaking different languages at home—speakers grow up as bilinguals, but ordinarily the learning, to any extent, of a second or other language is an activity superimposed on the prior

mastery of one's first language and is a different process intellectually.

4. Language, as described above, is species-specific to man. Other members of the animal kingdom have the ability to communicate, through vocal noises or by other means, but the most important single feature characterizing human language (that is, every individual language), against every known mode of animal communication, is its infinite productivity and creativity. Human beings are unrestricted in what they can talk about; no area of experience is accepted as necessarily incommunicable, though it may be necessary to adapt one's language in order to cope with new discoveries or new modes of thought.

Animal communication systems are by contrast very tightly circumscribed in what may be communicated. Indeed, displaced reference, the ability to communicate about things outside immediate temporal and spatial contiguity, which is fundamental to speech, is found elsewhere only in the so-called language of bees. Bees are able, by carrying out various conventionalized movements (referred to as bee dances) in or near the hive, to indicate to others the locations and strengths of nectar sources. But nectar sources are the only known theme of this communication system. Surprisingly, however, this system, nearest to human language in function, belongs to a species remote from man in the animal kingdom and is achieved by very different physiological activities from those involved in speech. On the other hand, the animal performance superficially most like human speech, the mimicry of parrots and of some other birds that have been kept in the company of humans, is wholly derivative and serves no independent communicative function. Man's nearest relatives among the primates, though possessing a vocal physiology very similar to that of humans, have not developed anything like a spoken language.

HISTORICAL ATTITUDES TOWARD LANGUAGE

As is evident from the introduction above, human life in its present form would be impossible and inconceivable without the use of language. People have long recognized the force and significance of language. Naming—applying a word to pick out and refer to a fellow human being, an animal, an object, or a class of such beings or objects—is only one part of the use of language, but it is an essential and prominent part. In many cultures men have seen in the ability to name an ability to control or to possess; this explains the reluctance, in several primitive and other communities, with which names are revealed to strangers and the taboo restrictions found in several parts of the world on using the names of persons recently dead. Lest it be thought that attitudes like this have died out in modern civilized communities, it is instructive to consider the widespread and perhaps universal taboos on naming directly things considered obscene, blasphemous, or very fearful. Indeed, use of euphemistic substitutes for words referring to death and to certain diseases actually seems to be increasing in some civilized areas.

The practice of naming

Not surprisingly, therefore, several independent traditions ascribe a divine or at least a supernatural origin to language or to the language of a particular community. The biblical account, representing ancient Jewish beliefs, of Adam's naming the creatures of the Earth under God's guidance is well known:

> So out of the ground the Lord God formed every beast of the field and every bird of the air, and brought them to the man to see what he would call them; and whatever the man called every living creature, that was its name (Gen. 2:19).

Norse mythology preserves a similar story of divine participation in the creation of language, and in India the god Indra is said to have invented articulate speech. In the much more sophisticated debate on the nature and origin of language given in Plato's Socratic dialogue *Cratylus,* Socrates is made to speak of the gods as those responsible for first fixing the names of things in the proper way.

A similar divine aura pervades early accounts of the origin of writing. The Norse god Odin was held responsible for the invention of the runic alphabet. The inspired stroke of genius whereby the ancient Greeks adapted a variety of the Phoenician consonantal script so as to represent the distinctive consonant and vowel sounds of Greek, thus producing the first alphabet such as is known today, was linked with the mythological figure Cadmus, who, coming from Phoenicia, was said to have founded Thebes and introduced writing into Greece. The Arabs had a traditional account of their script, together with the language itself, being given to Adam by God.

Biblical traditions concerning language

The later biblical tradition of the Tower of Babel (Gen. 11:1–9) exemplifies three aspects of early thought about language: (1) divine interest in and control over its use and development, (2) a recognition of the power it gives to man in relation to his environment, and (3) an explanation of linguistic diversity, of the fact that people in adjacent communities speak different and mutually unintelligible languages, together with a survey of the various speech communities of the world known at the time to the Hebrews.

The origin of language has never failed to provide a subject for speculation, and its inaccessibility adds to its fascination. Informed investigations of the probable conditions under which language might have originated and developed are seen in the late-18th-century essay of the German philosopher Johann Gottfried von Herder, "Abhandlung über den Ursprung der Sprache" ("Essay on the Origin of Language"), and in numerous other treatments. But people have tried to go further, to discover or to reconstruct something like the actual forms and structure of man's first language. This lies forever beyond the reach of science, in that spoken language in some form is almost certainly coeval with *Homo sapiens.* The earliest records of written language, the only linguistic fossils man can hope to have, go back no more than about 4,000 or 5,000 years. Attempts to derive human speech from imitations of the cries of animals and birds or from mere ejaculations of joy and grief, as if onomatopoeia were the essence of language, were ridiculed for their inadequacy by the Oxford philologist F. Max Müller in the 19th century and have been dubbed the bowwow and pooh-pooh theories.

On several occasions attempts have been made to identify one particular existing language as representing the original or oldest tongue of mankind, but, in fact, the universal process of linguistic change rules out any such hopes from the start. The Greek historian Herodotus told a story that King Psammetichus of Egypt caused a child to be brought up without ever hearing a word spoken in its presence. On one occasion it ran up to its guardian as he brought it some bread, calling out "bekos, bekos"; this, being said to be the Phrygian word for bread, proved that Phrygian was the oldest language of mankind. The naïvetè and absurdity of such an account have not prevented its repetition elsewhere and at other times.

In Christian Europe the position of Hebrew as the language of the Old Testament gave valid grounds through many centuries for regarding Hebrew, the language in which God addressed Adam, as the parent language of all mankind. Such a view continued to be expressed even well into the 19th century. Only since the mid-1800s has linguistic science made sufficient progress finally to clarify the impracticability of speculation along these lines.

Language and thinking

When people have begun to reflect on language, its relation to thinking becomes a central concern. Several cultures have independently viewed the main function of language as the expression of thought. Ancient Indian grammarians speak of the soul apprehending things with the intellect and inspiring the mind with a desire to speak; and in the Greek intellectual tradition Aristotle declared, "Speech is the representation of the experiences of the mind" (*On Interpretation*). Such an attitude passed into Latin theory and thence into medieval doctrine. Medieval grammarians envisaged three stages in the speaking process: things in the world exhibit properties; these properties are understood by the mind of man; and, in the manner in which they have been understood, so they are communicated to others by the resources of language.

Rationalist writers on language in the 17th century gave essentially a similar account: speaking is expressing thoughts by signs invented for the purpose, and words of different classes (the different parts of speech) came into being to correspond to the different aspects of thinking.

Such a view of language continued to be accepted as generally adequate and gave rise to the sort of definition proposed by Henry Sweet and quoted above. The main objection to it is that it either gives so wide an interpretation to thought as virtually to empty the word of any specific content or gives such a narrow interpretation of language as to exclude a great deal of normal usage. A recognition of the part played by speaking and writing in social cooperation in everyday life has highlighted the many and varied functions of language in all cultures, apart from the functions strictly involved in the communication of thought, which had been the main focus of attention for those who approached language from the standpoint of the philosopher. To allow for the full range of language used by speakers, more comprehensive definitions of language have been proposed in recent years on the lines of the second one quoted above (*i.e.,* "A language is a system of arbitrary vocal symbols by means of which a social group cooperates").

A rather different criticism of accepted views on language began to be made in the 18th century, most notably by the French philosopher Étienne Bonnot de Condillac in "Essai sur l'origine des connaissances humaines" (1746; "Essay on the Origin of Human Knowledge") and by Johann Gottfried von Herder. These men were concerned with the origin and development of language in relation to thought in a way that earlier students had not been. The medieval and rationalist views implied that man as a rational, thinking creature invented language to express his thoughts, fitting words to an already developed structure of intellectual competence. With the examination of the actual and the probable historical relations between thinking and speaking, it became more plausible to say that language emerged not as the means of expressing already formulated judgments, questions, and the like but as the means of thought itself, and that man's rationality developed together with the development of his capacity for speaking.

Language as a means of thought itself

The relations between thought and speech are certainly not fully explained today, and it is clear that it is a great oversimplification to define thought as subvocal speech, in the manner of some behaviourists. But it is no less clear that propositions and other alleged logical structures cannot be wholly separated from the language structures said to express them. Even the symbolizations of modern formal logic are ultimately derived from statements made in some natural language and are interpreted in that light.

The intimate connection between language and thought, as opposed to the earlier assumed unilateral dependence of language on thought, opened the way to a recognition of the possibility that different language structures might in part favour or even determine different ways of understanding and thinking about the world. Obviously, all people inhabit a broadly similar world, or they would be unable to translate from one language to another; but, equally obviously, they do not all inhabit a world exactly the same in all particulars, and translation is not merely a matter of substituting different but equivalent labels for the contents of the same inventory. From this stem the notorious difficulties in translation, especially when the systematizations of science, law, morals, social structure, and so on are involved. The extent of the interdependence of language and thought—linguistic relativity, as it has been termed—is still a matter of debate, but the fact of such interdependence can hardly fail to be acknowledged.

WAYS OF STUDYING LANGUAGE

Languages are immensely complicated structures. One soon realizes how complicated any language is when trying to learn it as a second language. If one tries to frame an exhaustive description of all the rules embodied in one's language—the rules by means of which a native speaker is able to produce and to understand an infinite number of correct, well-formed sentences—one can easily appreciate the complexity of the knowledge acquired by a child in mastering his mother tongue. The descriptions of languages written so far are in most cases excellent as far as they go, but they still omit more than they contain of an explicit account of a native speaker's competence in his language, by virtue of which one calls him a speaker of English, French, Swedish, or Swahili. The most recent developments in the study of language have served to reveal just how much more there is to do to bring palpable fact within systematic statement.

A detailed treatment of the science of linguistics is found elsewhere (see LINGUISTICS). Here it is proposed simply to give a brief outline of the way language or languages can be considered and described from different points of view, or at different levels, each contributing something essential and unique to a full understanding of the subject.

Phonetics and phonology. The most obvious aspect of language is speech. Speech is not essential to the definition of an infinitely productive communication system, such as is constituted by a language. But, in fact, speech is the universal material of human language, and the conditions of speaking and hearing have, throughout human history, shaped and determined its development. The study of speech sounds and of the physiology of speaking is called phonetics; this subject is dealt with further below, as well as in the article SPEECH: *The phonetics of speech.* Articulatory phonetics relates to the physiology of speech and acoustic phonetics to the physics of sound waves, their transmission and reception.

Speech, the universal material of human language

Phonetics covers much of the ground loosely referred to in language study as pronunciation. But, from a rather different point of view, speech sounds are also studied in phonology. Every language makes use of a very wide range of the articulations and resultant sounds that are available within the human vocal and auditory resources. Each language uses a somewhat different range, and this is partly responsible for the difficulty of learning to speak a foreign language and for speaking it "with an accent." But mere repertoires of sounds are not all that is involved. Far fewer general classes of sounds are distinctive (carry meaning differences) in any language than the number of sounds that are actually phonetically different. The English *t* sounds at the beginning and end of "tot" and in the two places in "stouter" are all different, though these differences are not readily noticed by English speakers; and, rightly, the same letter is used for them all. Similar statements could be made about most or all of the other consonant and vowel sounds in English.

What is distinctive in one language may not be distinctive in another or may be used in a different way; this is an additional difficulty to be overcome in learning to speak and understand a foreign language. In Chinese and in several other languages loosely called tone languages, the pitch, or tone, on which a syllable is said helps to distinguish one word from another: *ma* in northern Chinese on a level tone means "mother," on a rising tone means "hemp," and on a falling tone means "to curse." In English and in most of the languages of Europe (though not all—Swedish and Norwegian are exceptions) pitch differences do not distinguish one word from another, but form part of the intonation tunes that contribute to the structure and structural meaning of spoken sentences.

Languages differ in the ways in which consonant and vowel sounds can be grouped into syllables in words. English and German tolerate several consonants before and after a single vowel: "strengths" has three consonant sounds before and three after a single vowel sound (*ng* and *th* stand for one sound each). Italian does not have such complex syllables, and in Japanese and Swahili, for example, the ratio of consonant and vowel sounds in syllables and in words is much more even. Speakers of such languages find English words of the sort just mentioned very hard to pronounce, though to an Englishman they are perfectly "natural," "natural" in this context meaning "within the sounds and sound sequences whose mastery is acquired in early childhood as part of one's mother tongue."

All these considerations relating to the use of speech sounds in particular languages fall under the general heading of phonology; phonology is often regarded as one component of language structure.

Grammar. The other component is grammar. There is more to language than sounds, and words are not to be regarded as merely sequences of syllables. The concept

Relations between words in sentences

of the word is a grammatical concept; in speech, words are not separated by pauses, but they are recognized as recurrent units that make up sentences. Very generally, grammar is concerned with the relations between words in sentences. Classes of words, or parts of speech, as they are often called, are distinguished because they occupy different places in sentence structure, and in most languages some of them appear in different forms according to their function (English "man," "men"; "walk," "walked"; "I," "me"; and so on). Languages differ in the extent to which word-form variation is used in their grammar; Classical Chinese had almost none, English does not have much, and Latin and Greek had quite a lot. Conversely, English makes much more use of word order in grammar than did Latin or Greek.

Traditionally, grammar has been divided into syntax and morphology, syntax dealing with the relations between words in sentence structure, morphology with the internal grammatical structure of words. The relation between "boy" and "boys" and the relationship (irregular) between "man" and "men" would be part of morphology; the relation of concord between "the boy [or "man"] is here" and "the boys [or "men"] are here" would be part of syntax. It must, however, be emphasized that the distinction between the two is not as clear-cut as this brief illustration might suggest. This is a matter for debate among linguists of different persuasions; some would deny the relevance of distinguishing morphology from syntax at all, referring to grammatical structure as a whole under the term syntax.

Grammar is different from phonology, though the word grammar is often used comprehensively to cover both aspects of language structure. Categories such as plural, past tense, and genitive case are not phonological categories. In spoken language they are, like everything else, expressed in speech sounds, but within a language these may be very different for one and the same category. In English noun plurals, the added *-s* in "cats," the vowel changes in "man, men" and in "goose, geese," and the *-en* in "oxen" are quite different phonologically; so are the past-tense formatives such as *-ed* in "guarded," *-t* in "burnt," vowel change in "take, took," and vowel and consonant change in "bring, brought." In Latin the genitive case can be represented in singular nouns by *-ī, -is, -ae, -ūs,* and *-eī.* The phonological difference does not matter, provided only that the category distinction is somehow expressed.

The same is true of the orthographic representation of grammatical differences, and the examples just given illustrate both cases. This is why the grammar of written language can be dealt with separately. In the case of dead languages, known with certainty only in their written forms, this must necessarily be done; insofar as the somewhat different grammar of their spoken forms made use of sound features not represented in writing (*e.g.,* stress differences), this can, at best, only be inferred or reconstructed.

Meaning expressed by grammatical forms, vocabulary, and intonation

Grammatical forms and grammatical structures are part of the communicative apparatus of languages, and along with vocabulary, or lexicon (the stock of individual words in a language), they serve to express all the meanings required. Spoken language has, in addition, resources such as emphatic stressing and intonation (see below). This is not to say, however, that grammatical categories can be everywhere directly related to specific meanings. Plural and past tense are fairly clear as regards meaning in English, but even here there are difficulties; in "if I knew his address I would tell you," the past-tense form "knew" refers not to the past but to an unfulfilled condition in the present. In some other languages greater problems arise. The gender distinctions of French, German, and Latin are very much part of the grammar of these languages, but only in a small number of words do masculine, feminine, and neuter genders correspond with differences of sex, or with any other category of meaning in relation to the external world (see also LINGUISTICS).

Semantics. Language exists to be meaningful; the study of meaning, both in general theoretical terms and in reference to a specific language, is known as semantics. It embraces the meaningful functions of phonological features, such as intonation, and of grammatical structures and the meanings of individual words. Once again, it must be stressed that questions arising from the relations between grammar and meaning and between grammar and phonology are the subjects of continuing controversy today (see also LINGUISTICS: *Semantics*).

Language variants

The word language contains a multiplicity of different designations. Two senses have already been distinguished: language as a universal species-specific capability of mankind, and languages as the various manifestations of that capability, as with English, French, Latin, Swahili, Malay, and so on. There is, of course, no observable universal language over and above the various languages that have been or are spoken or written; but one may choose to concentrate on the general and even the universal features, characteristics, and components of different languages and on the ways in which the same sets of descriptive procedures and explanatory theories may be applied to different languages. In so doing one may refer to language (in general) as one's object of study. This is what is done by linguists, or linguistic scientists, persons devoting themselves to the scientific study of languages (as opposed to the popular sense of polyglots, persons having a command of several different languages).

DIALECTS

Intercomprehensibility of dialects

It has already been pointed out that no two persons speak exactly alike, and within the area of all but the smallest speech communities (groups of people speaking the same language) there are subdivisions of recognizably different types of language, called dialects, that do not, however, render intercommunication impossible nor markedly difficult. Because intercomprehensibility lies along a scale, the degree required for two or more forms of speech to qualify as dialects of a single language, instead of being regarded as separate languages, is not easy to quantify or to lay down in advance, and the actual cutoff point must in the last resort be arbitrary. In practice, however, the terms dialect and language can be used with reasonable agreement. One speaks of different dialects of English (Southern British English, Northern British English, Scottish English, Midwest American English, New England American English, Australian English, and so on, with, of course, many more delicately distinguished subdialects within these very general categories), but no one would speak of Welsh and English or of Irish and English as dialects of a single language, although they are spoken within the same areas and often by people living in the same villages as each other. (Ro.H.R./Ed.)

Varieties of dialects. *Geographic dialects.* The most widespread type of dialectal differentiation is geographic. As a rule, the speech of one locality differs at least slightly from that of any other place. Differences between neighbouring local dialects are usually small, but, in travelling farther in the same direction, differences accumulate. Every dialectal feature has its own boundary line, called an isogloss (or sometimes heterogloss). Isoglosses of various linguistic phenomena rarely coincide completely, and by crossing and interweaving they constitute intricate patterns on dialect maps. Frequently, however, several isoglosses are grouped approximately together into a bundle of isoglosses. This grouping is caused either by geographic obstacles that arrest the diffusion of a number of innovations along the same line or by historical circumstances, such as political borders of long standing, or by migrations that have brought into contact two populations whose dialects were developed in noncontiguous areas.

Local and regional dialects

Geographic dialects include local ones (*e.g.,* the Yankee English of Cape Cod or of Boston, the Russian of Moscow or of Smolensk) or regional ones, such as Delaware Valley English, Australian English, or Tuscan Italian. Such entities are of unequal rank; South Carolina English, for instance, is included in Southern American English. Regional dialects do have some internal variation, but the differences within a regional dialect are supposedly smaller than differences between two regional dialects of the same rank. In a number of areas ("linguistic landscapes") where the dialectal differentiation is essentially even, it is hardly justified to speak of regional dialects. This uniformity has led many linguists to deny the meaningfulness of such a notion altogether; very frequently, however, bundles of isoglosses—or even a single isogloss of major importance—permit the division of a territory into regional dialects (see Figure 1 for the dialectal division of American English in the Atlantic states). The public is often aware of such divisions, usually associating them with names of geographic regions or provinces, or with some feature of pronunciation; *e.g.,* Southern English or Russian *o*-dialects and *a*-dialects. Especially clear-cut cases of division are those in which geographic isolation has played the principal role; *e.g.,* Australian English or Louisiana French.

Figure 1: Dialect areas of the eastern United States.

Social dialects. Another important axis of differentiation is that of social strata. In many localities, dialectal differences are connected with social classes, educational levels, or both. More highly educated speakers and, often, those belonging to a higher social class tend to use more features belonging to the standard language, whereas the original dialect of the region is better preserved in the speech of the lower and less educated classes. In large urban centres, innovations unknown in the former dialect of the region frequently develop. Thus, in cities the social stratification of dialects is especially relevant and far-reaching, whereas in rural areas, with a conservative way of life, the traditional geographic dialectal differentiation prevails.

Technical terminology and slang

Educational differences among speakers strongly affect the extent of their vocabulary. In addition, practically every profession has its own expressions, which include the technical terminology and sometimes also the casual words or idioms peculiar to the group. Slang, too, is characterized mainly by a specific vocabulary and is much more flexible than an ordinary dialect, as it is subject to fashion and depends strongly on the speaker's age group. Slang—just as a professional dialect—is used mainly by persons who are in a sense bidialectal; *i.e.,* they speak some other dialect or the standard language, in addition to slang. Dialectal differences also often run parallel with the religious or racial division of the population.

Dialectal change and diffusion. The basic cause of dialectal differentiation is linguistic change. Every living language constantly undergoes changes in its various elements. Because languages are extremely complex systems of signs, it is almost inconceivable that linguistic evolution could affect the same elements and even transform them in the same way in all localities where one language is spoken and for all speakers in the same locality. At first glance, differences caused by linguistic change seem to be slight, but they inevitably accumulate with time (*e.g.,* compare Chaucer's English with modern English or Latin with modern Italian, French, Spanish, or Romanian). Related languages usually begin as dialects of the same language.

When a change (an innovation) appears among only one section of the speakers of a language, this automatically creates a dialectal difference. Sometimes an innovation in dialect A contrasts with the unchanged usage (archaism) in dialect B. Sometimes a separate innovation occurs in each of the two dialects. Of course, different innovations will appear in different dialects, so that, in comparison with its contemporaries, no one dialect as a whole can be considered archaic in any absolute sense. A dialect may be characterized as relatively archaic, because it shows fewer innovations than the others; or it may be archaic in one feature only.

After the appearance of a new dialectal feature, interaction between speakers who have adopted this feature and those who have not leads to the expansion or the curtailment of its area or even to its disappearance. In a single social milieu (generally the inhabitants of the same locality, generation, and social class), the chance of the complete adoption or rejection of a new dialectal feature is very great; the intense contact and consciousness of membership within the social group fosters such uniformity. When several age groups or social strata live within the same locality and especially when people speaking the same language live in separate communities, dialectal differences are easily maintained.

Natural barriers and language change

The element of mutual contact plays a large role in the maintenance of speech patterns; that is why differences between geographically distant dialects are normally greater than those between dialects of neighbouring settlements. This also explains why bundles of isoglosses so often form along major natural barriers—impassable mountain ranges, deserts, uninhabited marshes or forests, or wide rivers—or along political borders. Similarly, racial or religious differences contribute to linguistic differentiation because contact between members of one faith or race and those of another within the same area is very often much more superficial and less frequent than contact between members of the same racial or religious group. An especially powerful influence is the relatively infrequent occurrence of intermarriages, thus preventing dialectal mixture at the point where it is most effective; namely, in the mother tongue learned by the child at home.

Unifying influences on dialects. Communication lines such as roads (if they are at least several centuries old), river valleys, or seacoasts often have a unifying influence. Also, important urban centres, such as Paris, Utrecht, or Cologne, often form the hub of a circular region in which approximately the same dialect is spoken. In such areas, the prestige dialect of the city has obviously expanded. As a general rule, those dialects, or at least certain dialectal features, with greater social prestige tend to replace those that are valued lower on the social scale.

In times of less frequent contact between populations, dialectal differences increase; in periods of greater contact, they diminish. The general trend in modern times is for dialectal differences to diminish, above all through the replacement of dialectal traits by those of the standard language. Mass literacy, schools, increased mobility of populations, and, in the last few decades, the evergrowing role of mass communications all contribute to this tendency. Naturally, the extent of such unifying action varies greatly in different linguistic domains, depending on the level of civilization. Nevertheless, the most thorough example of linguistic force exerted by a single dominating civilization belongs to ancient times: in the Hellenistic era, almost all ancient Greek dialects were replaced by the so-called koine, based on the dialect of Athens.

Mass migrations may also contribute to the formation

Dialect differentiation and population movements

of a more or less uniform dialect over broad geographic areas. Either the resulting dialect is that of the original homeland of a particular migrating population or it is a dialect mixture formed by the levelling of differences among migrants from more than one homeland. The degree of dialectal differentiation depends to a great extent on the length of time a certain population has remained in a certain place. Thus, it is understandable that the diversification of the English language is far greater in the British Isles than, for example, in North America (especially if the number of dialectal differences is considered on a comparable area basis, such as how many per 1,000 square miles). In the U.S. itself much greater diversity is evident among dialects in old colonial America—along the Atlantic coast—than among dialects west of the Appalachians. It is also typical that phonological differences are more far-reaching in Switzerland among Swiss-German dialects than throughout the vast territory where the Russian language is spoken, extending from Leningrad to eastern Siberia. Such a situation results not only from migrations of the Russian population, (as compared to the centuries of Swiss stability) but also from the contrasting geographical configurations: in the U.S.S.R., there is unobstructed communication in all directions; in mountainous Switzerland, the territory is carved into small, isolated units.

Migrations and, more rarely, geographical phenomena may in some areas cause a much stronger dialectal differentiation in one direction than in others. Isoglosses in the U.S., for example, run predominantly in an east-west direction, reflecting the westward stream of migration during the colonization of areas west of the Appalachians. Similarly, the majority of isoglosses in Russia follow latitude, but in the opposite (west–east) direction.

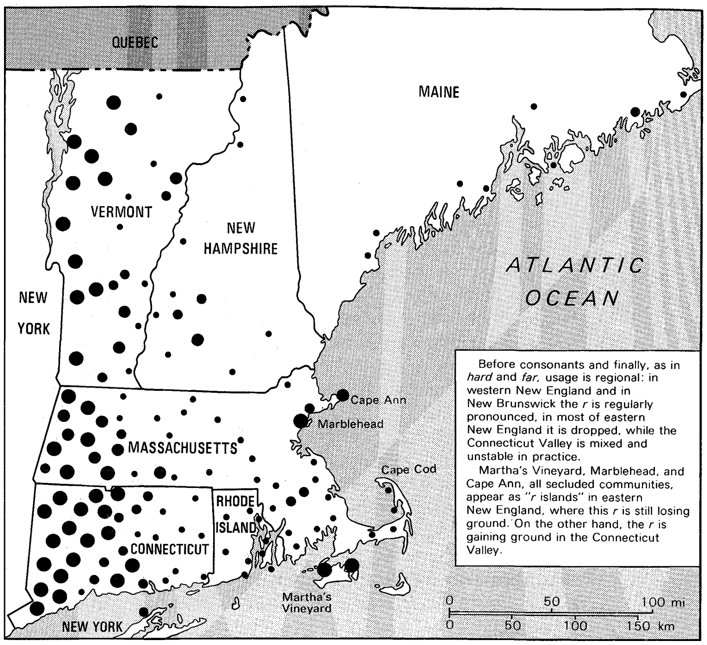
Focal, relic, and transitional areas. Dialectologists often distinguish between focal areas—which provide sources of numerous important innovations and usually coincide with centres of lively economic or cultural activity—and relic areas—places toward which such innovations are spreading but have not usually arrived. (Relic areas also have their own innovations, which, however, usually extend over a smaller geographical area.) Relic areas or relic phenomena are particularly common in out-of-the-way regional pockets or along the periphery of a particular language's geographical territory. An example of a focal area in the U.S. would be the Boston region, while rural Maine and New Hampshire and Cape Cod and Nantucket Island would be typical relic areas (see Figure 2).

The borders of regional dialects often contain transitional areas that share some features with one neighbour and some with the other. Such mixtures result from unequal diffusion of innovations from both sides. Similar unequal diffusion in mixed dialects in any region also may be a consequence of population mixture created by migrations.

In regions with many bilingual speakers (*e.g.*, along the border between two languages) dialects of both languages will often undergo changes influenced by the other tongue. This is manifested not only in numerous loanwords but often also in the adoption of phonological or grammatical features. Such phenomena are particularly frequent in a population that once spoke one language and only later adopted the second language. In extreme cases, a so-called creolized language develops. (Creoles are pidgin languages that have become the only or major language of a speech community. See LANGUAGES OF THE WORLD: *Pidgin*.)

Written form of dialects

Standard languages. Standard languages arise when a certain dialect begins to be used in written form, normally throughout a broader area than that of the dialect itself. The ways in which this language is used—in administrative matters, literature, economic life—lead to the minimization of linguistic variation. The social prestige attached to the speech of the richest, most powerful, and most highly educated members of a society transforms their language into a model for others; it also contributes to the elimination of deviating linguistic forms. Dictionaries and grammars help to stabilize linguistic norms, as do the activity of scholarly institutions and, sometimes, governmental intervention. The base dialect for a country's standard language is very often the original dialect of its capital—in France, Paris; in England, London; in Russia, Moscow. Or the base may be a strong economic and cultural centre—in Italy, Florence. Or the language may be a combination of several regional dialects; *e.g.*, German or Polish.



Before consonants and finally, as in *hard* and *far,* usage is regional: in western New England and in New Brunswick the *r* is regularly pronounced, in most of eastern New England it is dropped, while the Connecticut Valley is mixed and unstable in practice.

Martha's Vineyard, Marblehead, and Cape Ann, all secluded communities, appear as "*r* islands" in eastern New England, where this *r* is still losing ground. On the other hand, the *r* is gaining ground in the Connecticut Valley.

Figure 2: New England pronunciation of preconsonantal and final *r*. The largest circles indicate regular use of this *r*, the smallest ones sporadic use, and the two intermediate sizes rather evenly divided usage.

Adapted from A.J. Bronstein, *The Pronunciation of American English—An Introduction to Phonetics* (1960), Appleton-Century-Crofts; with permission from the American Council of Learned Societies

Even a standard language that was originally based on one local dialect changes, however, as elements of other dialects infiltrate into it over the years. The actual development in any one linguistic area depends on historical events. Sometimes even the distribution of standard languages may not correspond to the dialectal situation. Dutch and Flemish dialects are a part of the Low German dialectal area, which embraces all of northern Germany, as well as the Netherlands and part of Belgium. In one part of the dialectal area, however, the standard language is based on High German, and, in the other part, the standard language is Dutch or Flemish, depending on the nationality of the respective populations. In the U.S., where there is no clearly dominant political or cultural centre—such as London or Paris—and where the territory is enormous, the so-called standard language shows perceptible regional variations in pronunciation.

In most developed countries, the majority of the population has an active (speaking, writing) or at least passive (understanding) command of the standard language. Very often the rural population, and not uncommonly the lower social strata of the urban population as well, are in reality bidialectal. They speak their maternal dialect at home and with friends and acquaintances in casual contacts, and they use the standard language in more formal situations. Even the educated urban population in some regions uses the so-called colloquial language informally. In the German-, Czech-, and Slovene-speaking areas of middle Europe, for example, a basically regional dialect from which the most striking local features have been eliminated is spoken. The use of this type of language is supported by psychological factors, such as feelings of solidarity with a certain region and pride in its traditions or the relaxed mood connected with informal behaviour. (P.I./Ed.)

SLANG

The above-mentioned social and regional dialect variations within languages are more or less natural; that is, they arise largely from the conditions of language use and language transmission, without deliberate intent on the part of speakers. There are, however, some deliberately created variations within languages. The socially unifying force of a single language or dialect and the divisive force of language and dialect differences have always been apparent. Language was a main inspiration in 19th-century European nationalism and is one of the factors in nationalist movements in the world today. Not surprisingly, groups within a society that set a special value on group identity and group consciousness deliberately develop and foster private dialects that are known to insiders but are mysterious and baffling to those not belonging to the group. The various underworld jargons and special trade argots can be cited, such as Loucherbème in Paris (from *boucher* "butcher," by systematic deformation), the private slang vocabulary of many schools and colleges, and the systematic and regular alteration of certain words in some private languages of schoolboys and students—American "pig Latin" and the former "Oxford" and British public-school "-agger" talk ("nogger," meaning agnostic; "wagger pagger bagger," meaning wastepaper basket), developed from universally recognized forms such as "rugger," Rugby football. From all over the world the transient but zealously cherished speech styles of teenagers can be noted, whereby, along with particular fashions in clothes, they maintain and assert their identity over against the childhood they have left and the adult world they do not yet recognize. (Ed.)

Group identity and private dialects

Development of slang. Slang emanates from conflicts in values, sometimes superficial, often fundamental. When an individual applies language in a new way to express hostility, ridicule, or contempt, often with sharp wit, he may be creating slang, but the new expression will perish unless it is picked up by others. If the speaker is a member of a group that finds that his creation projects the emotional reaction of its members toward an idea, person, or social institution, the expression will gain currency according to the unanimity of attitude within the group. A new slang term is usually widely used in a subculture before it appears in the dominant culture. Thus slang—*e.g.,* "sucker," "honkey," "shave-tail," "jerk"—expresses the attitudes, not always derogatory, of one group or class toward the values of another. Slang sometimes stems from within the group, satirizing or burlesquing its own values, behaviour, and attitudes; *e.g.,* "shotgun wedding," "cake eater," "greasy spoon." Slang, then, is produced largely by social forces rather than by an individual speaker or writer who, single-handed (like Horace Walpole, who coined "serendipity" more than 200 years ago), creates and establishes a word in the language. This is one reason why it is difficult to determine the origin of slang terms.

The specialized languages of subcultures

Creators of slang. Civilized society tends to divide into a dominant culture and various subcultures that flourish within the dominant framework. The subcultures show specialized linguistic phenomena, varying widely in form and content, that depend on the nature of the groups and their relation to each other and to the dominant culture. The shock value of slang stems largely from the verbal transfer of the values of a subculture to diametrically opposed values in the dominant culture. Names such as fuzz, pig, fink, bull, and dick for policemen were not created by officers of the law. (The humorous "dickless tracy," however, meaning a policewoman, *was* coined by male policemen.)

Occupational groups are legion, and while in most respects they identify with the dominant culture, there is just enough social and linguistic hostility to maintain group solidarity. Terms such as scab, strike-breaker, company-man, and goon were highly charged words in the era in which labour began to organize in the United States; they are not used lightly even today, though they have been taken into the standard language.

In addition to occupational and professional groups, there are many other types of subcultures that supply slang. These include sexual deviants, narcotic addicts, ghetto groups, institutional populations, agricultural subsocieties, political organizations, the armed forces, Gypsies, and sports groups of many varieties. Some of the most fruitful sources of slang are the subcultures of professional criminals who have migrated to the New World since the 16th century. Old-time thieves still humorously refer to themselves as FFV—First Families of Virginia.

In criminal subcultures, pressure applied by the dominant culture intensifies the internal forces already at work, and the argot forming there emphasizes the values, attitudes, and techniques of the subculture. Criminal groups seem to evolve about this specialized argot, and both the subculture and its slang expressions proliferate in response to internal and external pressures.

Sources. Most subcultures tend to draw words and phrases from the contiguous language (rather than creating many new words) and to give these established terms new and special meanings; some borrowings from foreign languages, including the American Indian tongues, are traditional. The more learned occupations or professions like medicine, law, psychology, sociology, engineering, and electronics tend to create true neologisms, often based on Greek or Latin roots, but these are not major sources for slang, though nurses and medical students adapt some medical terminology to their slang, and air force personnel and some other branches of the armed services borrow freely from engineering and electronics.

Linguistic processes forming slang. The processes by which words become slang are the same as those by which other words in the language change their form or meaning or both. Some of these are the employment of metaphor, simile, folk etymology, distortion of sounds in words, generalization, specialization, clipping, the use of acronyms, elevation and degeneration, metonymy, synecdoche, hyperbole, borrowings from foreign languages, and the play of euphemism against taboo. The English word trip is an example of a term that has undergone both specialization and generalization. It first became specialized to mean a psychedelic experience resulting from the drug LSD. Subsequently, it generalized again to mean any experience on any drug, and beyond that to any type of "kicks" from anything. Clipping is exemplified by the use of "grass" from "laughing grass," a term for marijuana. "Funky," once a very low term for body odour, has undergone elevation among jazz buffs to signify "the best"; "fanny," on the other hand, once simply a girl's name, is currently a degenerated term that refers to the buttocks (in England, it has further degenerated into a taboo word for the female genitalia). There is also some actual coinage of slang terms.

Characteristics of slang. Psychologically, most good slang harks back to the stage in human culture when animism was a worldwide religion. At that time, it was believed that all objects had two aspects, one external and objective that could be perceived by the senses, the other imperceptible (except to gifted individuals) but identical with what we today would call the "real" object. Human survival depended upon the manipulation of all "real" aspects of life—hunting, reproduction, warfare, weapons, design of habitations, nature of clothing or decoration, etc.—through control or influence upon the *animus,* or imperceptible phase of reality. This influence was exerted through many aspects of sympathetic magic, one of the most potent being the use of language. Words, therefore, had great power, because they evoked the things to which they referred.

Primitive origins of slang

Civilized cultures and their languages retain many remnants of animism, largely on the unconscious level. In Western languages, the metaphor owes its power to echoes of sympathetic magic, and slang utilizes certain attributes of the metaphor to evoke images too close for comfort to "reality." For example, to refer to a woman as a "broad" is automatically to increase her girth in an area in which she may fancy herself as being thin. Her reaction may, thus, be one of anger and resentment, if she happens to live in a society in which slim hips are considered essential to feminine beauty. Slang, then, owes much of its power to shock to the superimposition of images that are incongruous with images (or values) of others, usually members of the dominant culture. Slang is most popular when its imagery develops incongruity bordering on social satire. Every slang word, however, has its own history and reasons for popularity. When conditions change, the term may change in meaning, be adopted into the standard language, or continue to be used as slang within certain enclaves of the population. Nothing is flatter than dead slang. In 1910, for instance, "Oh you kid" and "23-skiddoo" were quite stylish phrases in the U.S. but they have gone with the hobble skirt. Children, however, unaware of anachronisms, often revive old slang under a barrage of older movies rerun on television.

Some slang becomes respectable when it loses its edge; "spunk," "fizzle," "spent," "hit the spot," "jazz," "funky," and "p.o.'d," once thought to be too indecent for feminine ears, are now family words. Other slang survives for centuries, like "bones" for dice (Chaucer), "beat it" for run away (Shakespeare), "duds" for clothes, and "booze" for liquor (Dekker). These words must have been uttered as slang long before appearing in print, and they have remained slang ever since. Normally, slang has both a high birth and death rate in the dominant culture, and excessive use tends to dull the lustre of even the most colourful and descriptive words and phrases. The rate of turnover in slang words is undoubtedly encouraged by the mass media, and a term must be increasingly effective to survive.

Transience and persistence

While many slang words introduce new concepts, some of the most effective slang provides new expressions—fresh, satirical, shocking—for established concepts, often very respectable ones. Sound is sometimes used as a basis for this type of slang, as, for example, in various phonetic distortions (*e.g.,* pig Latin terms). It is also used in rhyming slang, which employs a fortunate combination of both sound and imagery. Thus, gloves are "turtledoves" (the gloved hands suggesting a pair of billing doves), a girl is a "twist and twirl" (the movement suggesting a girl walking), and an insulting imitation of flatus, produced by blowing air between the tip of the protruded tongue and the upper lip, is the "raspberry," cut back from "raspberry tart." Most slang, however, depends upon incongruity of imagery, conveyed by the lively connotations of a novel term applied to an established concept. Slang is not all of equal quality, a considerable body of it reflecting a simple need to find new terms for common ones, such as the hands, feet, head, and other parts of the body. Food, drink, and sex also involve extensive slang vocabulary. Strained or synthetically invented slang lacks verve, as can be seen in the desperate efforts of some sportswriters to avoid mentioning the word baseball—*e.g.,* a batter does not hit a baseball but rather "swats the horsehide," "plasters the pill," "hefts the old apple over the fence," and so on.

The most effective slang operates on a more sophisticated level and often tells something about the thing named, the person using the term, and the social matrix against which it is used. Pungency may increase when full understanding of the term depends on a little inside information or knowledge of a term already in use, often on the slang side itself. For example, the term Vatican roulette (for the rhythm system of birth control) would have little impact if the expression Russian roulette were not already in wide usage.

Diffusion of slang. Slang invades the dominant culture as it seeps out of various subcultures. Some words fall dead or lie dormant in the dominant culture for long periods. Others vividly express an idea already latent in the dominant culture and these are immediately picked up and used. Before the advent of mass media, such terms invaded the dominant culture slowly and were transmitted largely by word of mouth. Thus a term like snafu, its shocking power softened with the explanation "situation normal, all fouled up," worked its way gradually from the military in World War II by word of mouth (because the media largely shunned it) into respectable circles. Today, however, a sportscaster, news reporter, or comedian may introduce a lively new word already used by an in-group into millions of homes simultaneously, giving it almost instant currency. For example, the term uptight was first used largely by criminal narcotic addicts to indicate the onset of withdrawal distress when drugs are denied. Later, because of intense journalistic interest in the drug scene, it became widely used in the dominant culture to mean anxiety or tension unrelated to drug use. It kept its form but changed its meaning slightly.

Slang and the mass media

Other terms may change their form or both form and meaning, like "one for the book" (anything unusual or unbelievable). Sportswriters in the U.S. borrowed this term around 1920 from the occupational language of then legal bookmakers, who lined up at racetracks in the morning ("the morning line" is still figuratively used on every sports page) to take bets on the afternoon races. Newly arrived bookmakers went to the end of the line, and any bettor requesting unusually long odds was motioned down the line with the phrase, "That's one for the end book." The general public dropped the "end" as meaningless, but old-time gamblers still retain it. Slang spreads through many other channels, such as popular songs, which, for the initiate, are often rich in double entendre.

When subcultures are structurally tight, little of their language leaks out. Thus the Mafia, in more than a half-century of powerful criminal activity in America, has contributed little slang. When subcultures weaken, contacts with the dominant culture multiply, diffusion occurs, and their language appears widely as slang. Criminal narcotic addicts, for example, had a tight subculture and a highly secret argot in the 1940s; now their terms are used freely by middle-class teenagers, even those with no real knowledge of drugs.

Uses of slang. Slang is used for many purposes, but generally it expresses a certain emotional attitude; the same term may express diametrically opposed attitudes when used by different people. Many slang terms are primarily derogatory, though they may also be ambivalent when used in intimacy or affection. Some crystallize or bolster the self-image or promote identification with a class or in-group. Others flatter objects, institutions, or persons but may be used by different people for the opposite effect. "Jesus freak," originally used as ridicule, was adopted as a title by certain street evangelists. Slang sometimes insults or shocks when used directly; some terms euphemize a sensitive concept, though obvious or excessive euphemism may break the taboo more effectively than a less decorous term. Some slang words are essential because there are no words in the standard language expressing exactly the same meaning; *e.g.,* "freak-out," "barn-storm," "rubberneck," and the noun "creep." At the other extreme, multitudes of words, vague in meaning, are used simply as fads.

Slang expressing emotional attitudes

There are many other uses to which slang is put, according to the individual and his place in society. Since most slang is used on the spoken level, by persons who probably are unaware that it is slang, the choice of terms naturally follows a multiplicity of unconscious thought patterns. When used by writers, slang is much more consciously and carefully chosen to achieve a specific effect. Writers, however, seldom invent slang.

It has been claimed that slang is created by ingenious individuals to freshen the language, to vitalize it, to make the language more pungent and picturesque, to increase the store of terse and striking words, or to provide a vocabulary for new shades of meaning. Most of the originators and purveyors of slang, however, are probably not conscious of these noble purposes and do not seem overly concerned about what happens to their language.

Attitudes toward slang. With the rise of naturalistic writing demanding realism, slang began to creep into English literature even though the schools waged warfare against it, the pulpit thundered against it, and many women who aspired to gentility and refinement banished it from the home. It flourished underground, however, in such male sanctuaries as lodges, poolrooms, barbershops, and saloons.

By 1925 a whole new generation of U.S. and European naturalistic writers was in revolt against the Victorian restraints that had caused even Mark Twain to complain, and today any writer may use slang freely, especially in fiction and drama. It has become an indispensable tool in the hands of master satirists, humorists, and journalists. Slang is now socially acceptable, not just because it is slang but because, when used with skill and discrimination, it adds a new and exciting dimension to language. At the same time, it is being seriously studied by linguists and other social scientists as a revealing index to the culture that produces and uses it. (D.W.M./Ed.)

Slang in literature

OTHER SPECIALIZED LANGUAGES

Jargon. Sometimes, as in the case of criminal argots, part of the function of special languages is deliberately to mislead and obstruct the rest of society and the authorities in particular; they may even become wholly impenetrable to outsiders. But this is not the sole or main purpose of most specialized varieties of language. Professions whose members value their standing in society and are eager to render their services to the public foster their own vocabulary and usage, partly to enhance the dignity of their profession and the skills they represent but partly also to increase their efficiency. An example of this is the language of the law and of lawyers.

The cultivation and maintenance of specialized types of language by certain professions should not be regarded as trivially or superficially motivated. In general usage, languages are necessarily imprecise, or they would lack the flexibility and infinite extensibility demanded of them. But for certain purposes in restricted situations much greater precision is required, and part of the function of the particular style and vocabulary of legal language is the avoidance, so far as may be possible, of all ambiguity and the explicit statement of all necessary distinctions. This is why legal texts, when read out of their context, seem so absurdly pedantic and are an easy target for ridicule. Similar provision for detail and clarity characterizes the specialist jargons of medicine and of the sciences in general and also of philosophy. Indeed, one might regard the formulas of modern symbolic logic as the result of a consciously developed and specialized written language for making precise the relations of implication and inference between statements that, when couched in everyday language, are inexact and open to misinterpretation. Some would go as far as to say that traditional metaphysics is no more than the result of misunderstanding everyday discourse and that the main purpose of philosophy is to resolve the puzzles that arise from such misunderstandings.

Stereotyped language of games

The use of specialized types of language in fostering unity is also evidenced in the stereotyped forms of vocabulary employed in the playing of certain games. Tennis scores use the sequence "love, 15, 30, 40, and game"; cricketers verbally appeal to the umpire when a batsman may be out by calling "How's that?" and the ways of being out are designated by stereotypes, "run out," "leg before wicket," "stumped," and so forth. The esoteric language of horse racing and its associated wagering of money is well known, though not readily understood by outsiders.

The ancient but persistent recognition of the power of language is apparent in the respect for correctness in the use of language in any sphere of life having supernatural connections. Those credited with such connections employ special formulas and rigidly prescribed modes of diction; examples of the language of magic and of magicians are widespread, ranging from the usages of shamans and witch doctors to the ritual "abracadabra" of the mock magic displayed by conjurors at children's parties.

The efficacy of religious worship and of prayers is frequently associated with the strict maintenance of correct forms of language, taught by priests to their successors, lest the ritual become invalid. In ancient India the preservation in all its supposed purity of the language used in the performance of certain religious rituals (Sanskrit) gave rise to one of the world's most important schools of linguistics and phonetics. In the Christian churches one can observe the value placed by Church of England and Episcopalian churchmen on the formal English of the Authorized Version of the Bible and of *The Book of Common Prayer,* despite recent attempts at replacing these ritual forms of language by forms taken from modern spoken vernaculars.

Pidgins and creoles. Some specialized languages were developed to keep the outsider at bay. In other circumstances, languages have been deliberately created to facilitate communication with outsiders. This happens when people speaking two different languages have to work together, usually in some form of trade relation or administrative routine. In such situations the so-called pidgins arise, more or less purposively made up of vocabulary items from each language, with mutual abandonment of grammatical complexities that would cause confusion to either party. Pidgins have been particularly associated with areas settled by European traders; examples have been Chinook Jargon, a lingua franca based on an American Indian language and English and formerly used in Washington and Oregon, and Beach-la-mar, an English-based pidgin of parts of the South Seas.

Creolization of a pidgin language

Sometimes, as the result of relatively permanent settlement and the intermixture of two speech communities, a pidgin becomes the first language, or mother tongue, of later generations, ultimately displacing both the original languages. First languages arising in this way from artificially created pidgins are called creoles. Notable among creoles is the language of Haiti, Haitian Creole, built up from the French of the settlers and the African language of the former slaves; it shows lexical and grammatical features of both sources.

Creoles differ from pidgins in that, as first languages, they are subject to the natural processes of change like any other language (see below *Linguistic change*); and, despite the deliberately simplified form of the original pidgin, in the course of generations creoles develop their own complexities. The reason is plain to see. The restricted uses to which pidgins were first put and for which they were devised did not require any great flexibility. Once such a language becomes the first or only language of many people, it must perforce acquire the resources (*i.e.,* the complexity) to respond adequately to all the requirements of a natural language (see also LANGUAGES OF THE WORLD).

Nonverbal language. Speech and writing are, indeed, the fundamental faculties and activities referred to by the term language. There are, however, areas of human behaviour for which the term is used in a peripheral and derivative sense.

When individuals speak, they do not normally confine themselves to the mere emission of speech sounds. Because speaking usually involves at least two parties in sight of each other, a great deal of meaning is conveyed by facial expression, tone of voice, and movements and postures of the whole body but especially of the hands; these are collectively known as gestures. The contribution of bodily gestures to the total meaning of a conversation is in part culturally determined and differs in different communities. Just how important these visual symbols are may be seen when one considers how much less effective telephone conversation is as compared with conversation face to face; the experience of involuntarily smiling at the telephone receiver and immediately realizing that this will convey nothing to the hearer at the other end of the line is common. Again, the part played in emotional contact and in the expression of feelings by facial expressions and tone of voice, quite independently of the words used, has been shown in tests in which subjects have been asked to react to sentences that appear as friendly and inviting when read but are spoken angrily and, conversely, to sentences that appear as hostile but are spoken with friendly facial expressions. It is found that it is the visual accompaniments and tone of voice that elicit the main emotional response. A good deal of what goes under the heading of sarcasm exploits these contrasts.

Expression by vocal, nonlinguistic utterances

Just as there are paralinguistic activities such as facial expressions and bodily gestures integrated with and assisting the communicative function of spoken language, so there are vocally produced noises that cannot be regarded as part of any language, though they help in communication and in the expression of feeling. These include laughter, shouts and screams of joy, fear, pain, and so forth, and conventional expressions of disgust, triumph, and so on, traditionally spelled "ugh!," "ha ha!," etc., in English. Such nonlexical ejaculations differ in important respects from language: they are much more similar in form and meaning throughout mankind as a whole, in contrast to the great diversity of languages; they are far less arbitrary than most of the lexical components of language; and they are much nearer the cries of animals produced under similar circumstances and, as far as is known, serve similar expressive and communicative purposes. As noted above, some people have tried to trace the origin of language itself to them.

A language is a symbol system. It may be regarded, because of its infinite flexibility and productivity, as the symbol system *par excellence.* But there are other symbol systems recognized and institutionalized in the different cultures of mankind. Examples of these exist on maps and blueprints and in the conventions of representational art (*e.g.,* the golden halos around the heads of saints in religious paintings). Other symbol systems are musical notation and dance notation, wherein graphic symbols designate musical pitches and other features of musical performance and the movements of formalized dances. More loosely, because music itself can convey and arouse emotions and certain musical forms and structures are often associated with certain types of feeling, one frequently reads of the "language of music" or even of "the grammar of music." The terms language and grammar are here being used metaphorically, however, if only because no symbol system other than language has the same potential of infinite productivity, extension, and precision.

Languages are used by human beings to talk and write to other human beings. Derivatively, bits of languages may be used by humans to control machinery, as when different buttons and switches are marked with words or phrases designating their functions. A recent and specialized development of man-machine language is seen in the various "computer languages" now in use; *e.g.,* Cobol, Algol, and Fortran. These are referred to as programming languages, and they provide the means whereby sets of "instructions" and data of various kinds can be supplied to computers in forms acceptable to these machines. Various types of such languages are in use for different purposes. The development and use of computer languages must now be regarded as a distinct science in itself (for more information, see INFORMATION PROCESSING AND INFORMATION SYSTEMS: *Programming systems and programming language categories*).

Physiological and physical basis of speech

Primacy of speech in language

For an adequate understanding of human language it is necessary to keep in mind the absolute primacy of speech. In societies in which literacy is all but universal and language teaching at school begins with reading and writing in the mother tongue, one is apt to think of language as a writing system that may be pronounced. In point of fact, language is a system of spoken communication that may be represented in various ways in writing.

Man has almost certainly been in some sense a speaking animal from early in the emergence of *Homo sapiens* as a recognizably distinct species. The earliest known systems of writing go back perhaps some 5,000 years. This means that for many hundreds of thousands of years human languages were transmitted from generation to generation and were developed entirely as spoken means of communication. Moreover, in the world as it is today, literacy is still the privilege of a minority in many language communities. Even when literacy is widespread, some languages remain unwritten if they are not economically or culturally important enough to justify creating an alphabet for them and teaching them; then literacy is acquired in a second language learned at school. Such is the case with many speakers of South American Indian languages, who become literate in Spanish or Portuguese. A similar situation prevails in some parts of Africa, where reading and writing are taught in languages spoken over relatively wide areas. In all communities, speaking is learned by children before writing, and all people act as speakers and hearers much more than as writers and readers.

It is, moreover, a total fallacy to suppose that the languages of illiterate or so-called primitive peoples are less structured, less rich in vocabulary, and less efficient than the languages of literate civilizations. The lexical content of languages varies, of course, according to the culture and the needs of their speakers, but observation bears out the statement of the U.S. anthropological linguist Edward Sapir made in 1921: "When it comes to linguistic form, Plato walks with the Macedonian swineherd, Confucius with the head-hunting savage of Assam."

All this means that the structure and composition of language and of all languages have been conditioned by the requirements of speech, not those of writing. Languages are what they are by virtue of their spoken, not their written, manifestations. The study of language must be based on a knowledge of the physiological and physical nature of speaking and hearing. The details of these aspects of language are covered in SPEECH: *The phonetics of speech* and *The physiology of speech*; only the essentials are given here.

SPEECH PRODUCTION

Speaking is in essence the by-product of a necessary bodily process, the expulsion from the lungs of air charged with carbon dioxide after it has fulfilled its function in respiration. Most of the time one breathes out silently; but it is possible, by adopting various postures and by making various movements within the vocal tract, to interfere with the egressive airstream so as to generate noises of different sorts. This is what speech is made of.

Vocal tract and speech organs

The vocal tract comprises the passage from the trachea (windpipe) to the orifices of the mouth and nose; all the organs used in speaking lie in this passage. Conventionally, these are called the organs of speech, and the use in several languages of the same word for the tongue as a part of the body and for language shows the awareness people have of the role played by this part of the mouth in speaking. But few if any of the major organs of speech are exclusively or even mainly concerned with speaking. The lips, the tongue, and the teeth all have essential functions in man's bodily economy, quite apart from talking; to think, for example, of the tongue as an organ of speech in the same way that the stomach is regarded as the organ of digestion is fallacious. Speaking is a function superimposed on these organs, and the material of speech is a waste product, spent air, exploited to produce perhaps the most wonderful by-product ever created.

Relatively few types of speech sounds are produced by other sources of air movement; the clicks in some South African languages are examples, and so is the fringe linguistic sound used in English to express disapproval, conventionally spelled "tut." In all languages, however, the great majority of speech sounds have their origin in air expelled through the contraction of the lungs. Air forced through a narrow passage or momentarily blocked and then released creates noise, and characteristic components of speech sounds are types of noise produced by blockage or narrowing of the passage at different places.

If the vocal cords (really more like two curtains) are held taut as the air passes through them, the resultant regular vibrations in the larynx produce what is technically called voice, or voicing. These vibrations can be readily observed by contrasting the sounds of *f* and *v* or of *s* and *z* as usually pronounced; "five" and "size" each begin and end with voiceless and voiced sounds, respectively, which are otherwise formed alike, with the tongue and the lips in the same position. Most consonant sounds and all vowel sounds in English and in the majority of languages are voiced, and voice, in this sense, is the basis of singing and of the rise and fall in speaking that is called intonation, as well as of the tone distinctions in tone languages. The vocal cords may be drawn together more or less tightly, and the vibrations will be correspondingly more or less frequent. A rise in frequency causes a rise in perceived vocal pitch. Speech in which voice is completely excluded is called whispering.

Above the larynx, places of articulation in frequent use are between the back of the tongue and the soft palate, between the blade of the tongue and the ridge just behind the upper front teeth, and between the lips. Stoppage and release (technically, plosion) at these places form the *k* (often written as *c,* "cat"), *t,* and *p* sounds in English and, when voicing is also present, the *g* (as in "gay"), *d,* and *b* sounds. Obstruction at these and other places sufficient to cause noise gives rise to what are called fricative sounds; in English these include the normal pronunciations of *s, z, f,* and *v* and the *th* sounds in "thin" and "then." A vowel is characterized as the product of the shape of the entire tract between the lips and larynx, without local obstruction though usually with voicing from the vocal

Formation of vowels

cords. It is contrasted with a consonant, though the exact division between these two categories of speech sound is not always easy to draw. Different shaping of the tract produces the different vowel sounds of languages.

The soft plate may be raised or lowered. It is lowered in normal breathing and allows air to pass in and out through the nose. In the utterance of most speech sounds it is raised, so that air passing through the mouth alone forms the sound; if it is lowered, air passes additionally or alternatively through the nose, thus producing the nasal sounds. All but a very few languages have nasal consonants (the English sounds *m, n,* and *ng* as in "sing") and some, such as French, have nasalized vowels as well. A few speakers regularly allow air to pass through their nasal passages all the time while they are speaking; such persons are said to "speak through the nose."

All articulatory movements, including the initial expulsion of air from the lungs, may be made with greater or less vigour, giving rise to louder or softer speech as a whole or to greater loudness on one part of what is said for emphasis or contrast.

Every different configuration and movement of the vocal tract creates corresponding differences in the air vibrations that comprise and transmit sound. These vibrations, like those of all noises, extend outward in all directions from the source, gradually decreasing to zero or to below the threshold of audibility. They are called sound waves, and they consist of rapid rises and falls in air pressure. The speed at which pressure rises and falls is the frequency. Speech sounds involve complex waves containing vibrations at a number of different frequencies, the lowest being the voice pitch of singing and intonation, produced by the vocal cords in voiced sounds.

Articulatory and acoustic descriptions of speech

The eardrum responds to the different frequencies of speech, provided they retain enough energy, or amplitude (*i.e.,* are still audible). The perceptibly different speech sounds that comprise the spoken utterances of any language are the result of the different impacts on one's ears made by the different complexes of frequencies in the waves produced by different articulatory processes. As the result of careful and detailed observation of the movements of the vocal organs in speaking, aided by various instruments to supplement the naked eye, a great deal is now known about the processes of articulation. In recent years an array of other instruments has provided much information about the nature of the sound waves produced by articulation. Speech sounds may be and have been described and classified both from an articulatory viewpoint, in terms of how they are produced, and from an acoustic viewpoint, by reference to the resulting sound waves (their frequencies, amplitudes, and so forth). Articulatory descriptions are more readily understood, being couched in terms such as nasal, bilabial lip-rounded, and so on. Acoustic terminology requires a knowledge of the technicalities involved for its comprehension. In that almost every person is a speaker and a hearer, it is clear that both sorts of description and classification are important, and each has its particular value for certain parts of the scientific study of language.

LANGUAGE ACQUISITION

As far as the production of speech sounds is concerned, all human beings are physiologically alike. People have differently shaped faces, as much as they differ in other aspects of bodily build, but it has been shown time and again that a child learns to speak the language of those who bring him up from infancy. In most cases these are his biological parents, especially his mother, but one's first language is acquired from environment and learning, not from physiological inheritance. Adopted infants, whatever their race or physical type and whatever the language of their actual parents, acquire the language of the adoptive parents who raise them just as if they had been their own children.

Different shapes of lips, throat, and other parts of the vocal tract have an effect on the voice quality of people's speech, and this is part of the individuality of each person's voice referred to above. Physiological differences, including size of throat and larynx, both overall and in relation to the rest of the vocal tract, are largely responsible for the different pitch ranges characteristic of men's, women's, and children's speech. But these individual differences do not affect one's ability or aptitude to acquire and speak any particular language.

Speech is species-specific to mankind. Physiologically, animal communications systems are of all sorts. The type that is in some ways functionally the nearest to human language, the system of bee dances, is entirely remote from human speech and does not make use of sound at all. The animal sounds superficially most resembling speech, the imitative cries of parrots and some other birds, are produced by very different physiological means: birds have no teeth or lips but vocalize by means of the syrinx, a modification of the windpipe above the lungs. Almost all mammals and many other animal species make vocal noises and evince feelings thereby and keep in contact with each other through a rudimentary sort of communication, but those members of the animal kingdom nearest to man genetically, the primates, have proved highly resistant to the acquisition of speech.

Advantages of speech as a means of communication

Man's development of speech has been linked to his upright posture and the freeing of his vocal cords from the frequent need to "hold one's breath" in using the arms for locomotion. Certainly, speaking and hearing—as man's primary means of communication—have a number of striking advantages: speech does not depend on daylight or on mutual visibility, it can operate in all directions over reasonably wide areas, and it can be adjusted in loudness to cope with distance. As is seen in crowded rooms, it is possible to pick out some one person's voice despite a good deal of other noise and in the midst of other voices speaking the same language. In addition, the physical energy required in speaking is extremely small in relation to the immense power wielded by speech in man's life, and scarcely any other activity, such as running, walking, or tool using, interferes seriously with the process (even eating and drinking can be carried on simultaneously with talking, and the reluctance one may feel for "speaking with one's mouth full" is more a matter of cultural convention and good manners than of physiological difficulty).

The characteristics just outlined pertain to all of the world's languages, including those of the allegedly primitive peoples. What is more a matter of controversy is the extent to which man's biological inheritance is involved in language acquisition and language use. The fact that language is species-specific to man argues an essential cerebral or mental component, and in the last century certain aspects of speech control and use were located in a particular part of the human brain (Broca's convolution).

No one inherits the ability to speak a particular language, but every normal human child is born with the ability and the drive to acquire a language, namely, the one to which he is predominantly exposed from infancy. He brings to this task a very considerable innate ability, because his exposure is largely to a random selection of utterances (apart from any attempts at systematic teaching that he may encounter) occuring within his earshot or addressed to him. Yet by late childhood he has, through progressive stages, acquired the central or basic vocabulary of the language, together with its phonological and grammatical structure. Observation shows that this is substantially the same situation the world over, among literate and illiterate communities, and that much the same number of years of childhood is taken up by the process. Thus, it would appear that, objectively considered, all languages are roughly equal in complexity and in difficulty of mastery.

Innate human capacity for language acquisition

It is, therefore, clear that all normal humans bring into the world an innate faculty for language acquisition, language use, and grammar construction. The last phrase refers to the internalization of the rules of the grammar of one's first language from a more or less random exposure to utterances in it. The human child is very soon able to construct new, grammatically acceptable sentences from material he has already heard; unlike the parrot in human society, he is not limited to the mere repetition of whole utterances.

What is currently under debate is the part played by this innate ability and its exact nature. Until the 1950s scholars considered language acquisition to be carried out largely by analogical creation from observed patterns of sentences occurring in utterances heard and understood by the child. Such a view, much favoured by persons inclined to a behaviourist interpretation of human learning processes (*e.g.,* the U.S. linguist Leonard Bloomfield), stressed the very evident differences between the structures of different languages, particularly on the surface. Since the late 1950s, a number of linguists have been placing much more emphasis on the inherent grammar-building disposition and competence of the human brain, which is activated by exposure to utterances in a language, especially during childhood, in such a way that it fits the utterances into predetermined general categories and structures. Such linguists, inheritors of the 17th- and 18th-century interest in "universal grammar," put their stress on the underlying similarities of all languages, more especially in the deeper areas of grammatical analysis (for the distinction between deep structure and surface structure in grammar, see the article LINGUISTICS).

Meaning and style in language

The whole object and purpose of language is to be meaningful. Languages have developed and are constituted in their present forms in order to meet the needs of communication in all its aspects.

It is because the needs of human communication are so various and so multifarious that the study of meaning is probably the most difficult and baffling part of the serious study of language. Traditionally, language has been defined, as in the definition quoted above, as the expression of thought, but, as was seen, this involves far too narrow an interpretation of language or far too wide a view of thought to be serviceable. The expression of thought is just one among the many functions performed by language in certain contexts.

TYPES OF MEANING

Distinguishing meaning by word order or grammatical form

Structural, or grammatical, meaning. First, one must recognize that the meaning of any sentence comprises two parts, the meanings of the words it contains and the structural or grammatical meaning carried by the sentence itself. In English "the dog chased the cat" and "the boy chased the cat" differ in meaning because "dog" and "boy" are different words with different word meanings; the same applies to equivalent sentences in other languages. The two sentences "the dog chased the cat" and "the cat chased the dog," though containing exactly the same words, are different in meaning because the different word orders distinguish what are conventionally called subject and object. In Latin the two corresponding sentences would be distinguished not by word order, which is grammatically indifferent and largely a matter of style, but by different shapes in the lexical equivalents of "dog" and "cat." In Japanese the grammatical distinction of subject and object, normally marked by the word order subject-object-verb, can be reinforced by a subject particle after the first word and an object particle after the second.

The formal resources of any language for making distinctions in the structural meanings of sentences are limited by two things: the linear (time) dimension of speaking and the limited memory span of the human brain. Writing copies the time stream of speech with the linear flow of scripts. Diagrams and pictures employ two dimensions, and models employ three; but writing is partially relieved of memory-span restrictions by the permanence of visual marks. Because written texts are almost entirely divorced from oral pronunciation, sentence length and sentence complexity can be carried to extremes, as may be observed in some legal and legislative documents that are virtually unintelligible if read aloud.

Within these linear restrictions, distinctions corresponding to the main uses of language can be made. All languages can employ different sentence structures to state facts (declarative), to ask questions (interrogative), and to enjoin or forbid some course of action (imperative). More delicate means exist to soften or modify these basic distinctions: *e.g.,* "It's cold today, isn't it?"; "Isn't it still raining?"; "Shut the door, would you mind"; "Don't be long, will you?" Languages use their resources differently for these purposes, but, generally speaking, each seems to be equally flexible structurally. The principal resources are word order, word form, syntactic structure, and, in speech, pitch and stress placement. In English, as an example, a word or phrase can be highlighted by being placed first in the sentence when it would not normally occur there: compare "he can't bear loud noises" with "loud noises he can't bear" or "loud noises, he can't bear them." The object noun or noun phrase can also be put first by making the sentence passive; this allows the original subject to be omitted if one does not know or does not want to refer to an agent: "the town was destroyed (by the revolutionaries)." Within and together with all these possibilities, almost any word can be made contrastively prominent by being stressed (spoken more loudly) or by being uttered on a higher pitch, and very often these two are combined: "I asked you for *red* roses (not yellow)"; "I meant it for *you* (not her)"; "*I* know nothing about it (someone else may)." Prominence is especially associated with intonation, itself an important carrier of structural meaning in speech. One may state facts, ask questions, and give instructions with a variety of intonations indicating, along with visible gestures, different attitudes, feelings, and social and personal relations between speaker and hearer.

The possibilities of expressing structural meanings are a most important part of any language. They are acquired along with the rest of one's first language in childhood and are learned more slowly and with more difficulty in mastering a second or later language. Scholars are still only at the beginning of a full formal analysis of these resources, as far as most languages are concerned, and are still further from an adequate understanding of all the semantic functions performed by means of these resources.

Meanings of words

Lexical meaning. The other component of sentence meaning is word meaning, the individual meanings of the words in a sentence, as lexical items. The concept of word meaning is a familiar one. Dictionaries list words and in one way or another state their meanings. It is regarded as a sensible question to ask of any word in a language, "What does it mean?" This question, like many others about language, is easier to ask than to answer.

It is through lexical resources that languages maintain the flexibility their open-ended commitments demand. Every language has a vocabulary of many thousands of words, though not all are in active use, and some are known only to relatively few speakers. Perhaps the commonest delusion in considering vocabularies is the assumption that the words of different languages, or at least their nouns, verbs, and adjectives, label the same inventory of things, processes, and qualities in the world but unfortunately label them with different labels from language to language. If this were so, translation would be easier than it is; but the fact that translation, though often difficult, is possible indicates that people are talking about similar worlds of experience in their various languages.

Languages in part create the world in which men live. Of course, many words do name existing bits and pieces of earth and heaven: "stone," "tree," "dog," "woman," "star," "cloud," and so on. Others, however, do not so much pick out what is there as classify it and organize one's relations with it and with each other with regard to it. A range of living creatures are mammals or are vertebrates, because people classify them in these ways, among others, by applying selected criteria and so determining the denotation of the words mammal and vertebrate. Plants are vegetables or weeds according as groups of people classify them, and different plants are included and excluded by such classifications in different languages and different cultures.

Time and its associated vocabulary ("year," "month," "day," "hour," "minute," "yesterday," "tomorrow," and so on) do not refer to discrete sections of reality but enable people to impose some sort of order, in agreement with others, on the processes of change observed in the world. Personal pronouns pick out the persons speaking, spoken to, and spoken about; but some languages make different distinctions in their pronouns from those made in English. For example, in Malay, *kita,* which means "we," including the person addressed, is distinct from *kami,* a form for "we" that includes the speaker and a third person or persons but excludes the person addressed. In Japanese and in several other languages, a variety of words denoting the 1st and 2nd persons indicate additionally the observed or intended social relationship of those involved.

Other word meanings are even more language and culture bound, and in consequence harder to translate. "Right" and "wrong," "theft," "inheritance," "property," "debt," "sin," and "crime" (as different sorts of wrongdoing) are just a few of the words regulating one's conduct and relations with one's fellows in a particular culture. Translation becomes progressively harder as one moves to languages of more remote cultures, and it has been said that it requires "a unification of cultural context." Insofar as a person's understanding of the universe and of the relations between himself and other people is closely linked with the language he speaks, it must be assumed, and the evidence confirms this assumption, that the child progressively acquires such understanding along with his language.

Onomatopoeic words

The great majority of word shapes bear no direct relation to their lexical meanings. If they did, languages would be more alike. What are called onomatopoeic words are rather similar in shape through different languages: French *coucou,* English "cuckoo," and German *Kuckuck* directly mimic the call of the bird. English "dingdong" and German *bim-bam* share several sound features in common that partially resemble the clanging of bells. More abstractly, some direct "sound symbolism" has been seen between certain sound types and visual or tactile shapes. Most people agree that the made-up word "oomboolu" would better designate a round, bulbous object than a spiky one. In addition, the appropriateness of the vowel sound represented by *ee* in English "wee" and *i* in French *petit* "small" and Italian *piccolo* "small" for expressing things of small size has been traced in several languages.

All this, however, is a very small part of the vocabulary of any language. For by far the largest number of words in a language there is no direct association between sound and meaning. English "horse," German *Pferd,* French *cheval,* Latin *equus,* and Greek *hippos* are all unrelated to the animal so named, except that these words are so used in the languages concerned. This is what is meant by the term arbitrary in the second definition of language quoted at the beginning of this article. Vocabulary has to be largely arbitrary, because the greater part of the world and of man's experience is not directly associated with any kind of noise, and it is a contingent, though universal, fact of history and biology that sound and not the material of some other sense is the basis of human language.

The relations between sentence structure and structural meanings are also largely arbitrary and tacitly conventional. Though loudness and stress for emphasis and certain linguistic indications of anger, excitement, and the like are more closely akin to nonlinguistic ejaculations and are somewhat similar across language divisions, actual intonations and features such as word order, word inflection, and grammatical particles, used in maintaining distinctions in structural meaning, differ markedly in different languages.

SEMANTIC FLEXIBILITY

Not only are word meanings somewhat different in different languages; they are not fixed for all time in any one language. Semantic changes take place all along (see below), and at any moment the semantic area covered by a word is indeterminately bordered and differs from context to context. This is a further aspect and condition of the inherent and necessary flexibility of language.

General and specific designations. A person can be as precise or as imprecise as he needs or wishes to be. In general, words are fairly imprecise; yet for particular purposes their meanings can be tightened up, usually by bringing in more words or phrases to divide up a given field in more detail. "Good" contrasts generally with "bad"; but one can, for example, grade students as "first-class," "excellent," "very good," "good," "fair," "poor," and "failed" (or "bad"). In this case, "good" now covers a restricted and relatively low place in a field of associated terms. Colour words get their meanings from their mutual contrasts. The field of visually discriminable hues is very large and goes far beyond the resources of any vocabulary as it is normally used. Children learn the central or basic colour words of their language fairly early and at the same time; such terms as red and green are normally learned before subdivisions such as crimson and scarlet or chartreuse. It is well known that languages make their primary divisions of the spectrum of colours in different places; Japanese *aoi* covers many of the hues referred to in English by "green" and "blue," while "blue" covers much of the range of the two Russian words *goluboy* and *siny.* While the actual colour vocabularies of languages differ, however, recent research by Brent Berlin and Paul Kay has tried to show that "there exist universally for humans eleven basic perceptual color categories" that serve as reference points for the colour words of a language, whatever number may be regularly employed at any time.

Precision and imprecision of words

Ordinarily, considerable areas of indeterminate designation in colour vocabulary and in other fields are tolerated; between "red" and "purple" and between "purple" and "blue" there are hues that one would hesitate to assign firmly to one or the other and on which there would be considerable personal disagreement. When greater precision than normal is required—as, for example, in listing paint or textile colours—all kinds of additional terms can be brought into service to supplement the usual vocabulary: "off-white," "light cream," "lemon," "blush pink," and so on.

The vocabulary of kinship terms varies from language to language, reflecting cultural differences. English distinguishes the nearer kinsfolk by sex: "mother, father"; "sister, brother"; "aunt, uncle"; and others. Other languages, such as Malay, make a lexical distinction of age the primary one, with separate words for elder brother or sister and younger brother or sister. Still other languages—for example, some American Indian ones—use different words for the sister of a man and for the sister of a woman. But beyond this any language can be as precise as the situation demands in kin designation. When it is necessary, English speakers can specify "elder sister" and "female cousin," and within the overall category it is possible to distinguish "first and second cousins" and "cousins once removed," distinctions that it is ordinarily pedantic to make.

Vocabulary of mathematics

The best example of infinite precision available from a strictly limited lexical stock is in the field of arithmetic. Between any two whole numbers a further fractional or decimal number may always be inserted, and this may go on indefinitely: between 10 and 11, 10½ (10.5), 10¼ (10.25), 10⅛ (10.125), and so on. Thus, the mathematician or the physical scientist is able to achieve any desired degree of quantitative precision appropriate to his purposes; hence the importance of quantitative statements in the sciences—any thermometric scale contains far more distinctions of temperature than are reasonably available in the vocabulary of a language ("hot," "warm," "cool," "tepid," "cold," and so on). For this reason mathematics has been described as the ideal use of language, but for many purposes in everyday life the very imprecision of natural languages is the source of their strength and adaptability.

Neologisms. Every living language can readily be adapted to meet changes occurring in the life and culture of its speakers, and the main weight of such changes falls on vocabulary. Grammatical and phonological structures are relatively stable and change noticeably over centuries rather than decades (see below); but vocabularies can change very quickly both in word stock and in word meanings. Consider as an example the changes wrought by modern technology in the vocabularies of all European languages since 1945. Before that date "transistor" and "cosmonaut" did not exist, and "nuclear disarmament" would scarcely have had any clear meaning.

Every language can alter its vocabulary very easily, which means that every speaker can without effort adopt new words, accept or invent new meanings for existing words, and of course, cease to use some words or cease to use them in certain meanings. Dictionaries list some words and some meanings as "obsolete" or "obsolescent" to indicate this process. No two speakers share precisely the same vocabulary of words readily used and readily understood, though they may speak the same dialect. They will, however, naturally have the great majority of words in their vocabularies in common.

Languages have various resources for effecting changes in vocabulary. Meanings of existing words may change. With the virtual disappearance of falconry as a sport in England, "lure" has lost its original meaning of a bunch of feathers on a string by which hawks were recalled to their handler and is used now mainly in its metaphorical sense of enticement. The additional meaning of "nuclear" has already been mentioned; one may list it with words such as computer and jet, which acquired new ranges of meaning in the mid-20th century.

Creation of new words

All languages have the means of creating new words to bear new meanings. These can be new creations; "Kodak" is one such, invented at the end of the 19th century by George Eastman; "chortle," now in general use, was a jocular creation of the English writer and mathematician Lewis Carroll (creator of *Alice in Wonderland*); and "gas" was formed in the 17th century by the Belgian chemist and physician Jan Baptist van Helmont as a technical term in chemistry, loosely modelled on the Greek *chaos* ("formless void"). But mostly languages follow definite patterns in their innovations. Words can be made up without limit from existing words or from parts of words; the sources of "railroad," "railway," and "aircraft" are obvious, and so are the sources of "disestablishment," first cited in 1806 and thereafter used with particular reference to the status of the Church of England. The controversy over the relations between church and state in the 19th and early 20th centuries gave rise to a chain of new words as the debate proceeded: "disestablishmentarian," "antidisestablishmentarian," "antidisestablishmentarianism." Usually, the bits and pieces of words used in this way are those found in other such combinations, but this is not always so. The technical term permafrost (terrain that never thaws, as in the Arctic) contains a bit of "permanent" probably not hitherto found in any other word.

A particular source of technical neologisms in European languages has been the words and word elements of Latin and Greek. This is part of the cultural history of western Europe, in so many ways the continuation of Greco-Roman civilization. "Microbiology" and "dolichocephalic" are words well formed according to the rules of Greek as they would be taken over into English, but no records survive of *mikrobiologia* and *dolichokephalikos* ever having been used in Ancient Greek. The same is true of Latinate creations such as "reinvestment" and "longiverbosity." The long tradition of looking to Latin and, since the Renaissance, to Greek also as the languages of European civilization, keeps alive the continuing formation of learned and scientific vocabulary in English and other European languages from these sources. The dependence on the classical languages in Europe is matched by a similar use of Sanskrit words for certain parts of learned vocabulary in some modern Indian languages (Sanskrit being the classical language of India). Such phenomena are examples of loanwords, one of the readiest sources for vocabulary extension.

Transmission of loanwords

Loanwords are words taken into a language from another language (the term borrowing is used for the process). Most obviously, this occurs when new things come into speakers' experiences as the result of contacts with speakers of other languages. This is part of the history of every language, except for one spoken by an impossibly isolated community. "Tea" from Chinese, "coffee" from Arabic, and "tomato," "potato," and "tobacco" from American Indian languages are familiar examples of loanwords designating new products that have been added to the vocabulary of English. In more abstract areas, several modern languages of India and Pakistan contain many words that relate to government, industry, and current technology taken in from English. This is the result of British rule in these countries up to indpendence and the worldwide use of English as a language of international science since then.

In general, loanwords are rapidly and completely assimilated to the prevailing grammatical and phonological patterns of the borrowing language. The German word *Kindergarten,* literally "children's garden," was borrowed into English in the middle of the 19th century to designate an informal school for young children. It is now regularly pronounced as an English word, and the plural is kindergartens (not *Kindergärten,* as in German). Occasionally, however, some loanwords retain marks of their foreign origin: examples include Latin plurals such as cacti and narcissi (as contrasted with native patterns such as cactuses and narcissuses).

Languages differ in their acceptance of loanwords. An alternative way of extending vocabulary to cope with new products is to create a descriptive compound from within one's own language. English "aircraft" and "aeroplane" are, respectively, examples of a native compound and a Greek loan creation for the same thing. English "potato" is a loan; French *pomme de terre* (literally, "apple of the earth") is a descriptive compound. Chinese is particularly resistant to loans; "aircraft," "railway," and "telephone" are translated by newly formed compounds meaning literally "fly machine," "fire vehicle," and "lightning (electricity) language."

LANGUAGE AND CONCEPTUALIZATION

The ability to speak and the ability to conceptualize are very closely linked, and the child learns both these skills together at the same time. This is not to say that thinking is no more than subvocal speech, as some behaviourists have proposed; most people can think pictorially and in simple diagrams, some to a greater degree than others, and one has the experience of responding rationally to external stimuli without intervening verbalization. But, as 18th-century thinkers saw, man's rationality developed and still goes hand in hand with his use of language, and a good deal of the flexibility of languages has been exploited in man's progressive understanding and conceptualizing of the world he lives in and of his relations with other men. Different cultures and different periods have seen this process differently developed. The anthropological linguist Edward Sapir put it well: "The 'real world' is to a large extent unconsciously built up on the language habits of the group."

Language and thought patterns

Much of this lies in the irrecoverable prehistory of languages. The idea that there are still some primitive, almost "fossil" languages, embodying a very low level of conceptualization, is a vain one. All that can be said is that languages are different and that, in part, the world is seen differently through the eyes of speakers of different languages. But, in some cases, part of the lexical adaptation of a language to developing thought patterns can be followed through. Ancient Greece saw a wholly unique growth and flowering of civilization in the 1st millennium BC, which has put virtually the entire civilized world in its debt ever since. In Greek, along with the emergence of certain abstract concepts and ways of thinking, one can follow some of the changes of word meanings and the coining of new words that accompanied this. As an example, the word *dikē* originally meant "way" or "manner"; thereafter, it acquired the meaning of the right way of doing something, the right way of behaving, and finally abstract right. Its derivative *dikaiosynē,* traditionally translated "justice," became the subject of philosophical debate and analysis by the Greek philosophers and covered almost the whole range of moral obligation involved in the relations of one person with others in society. Similar debate and refinement of key terms in the various branches of thought covered by Greek philosophy can be followed through; indeed, the term philosophy is directly taken from Greek *philosophia,* a compound formed not later than the 5th century BC from *philo-* (compare *philein* "to love") and *sophia* "wisdom" to refer to abstract speculation and debate of a fundamental nature about the world and man's place in it.

More recently, the development of the lexical resources of the languages of civilization can be observed, in one way or another, as they keep up with the scientific progress that dominates contemporary life.

An examination of the lexical structure of languages throws some light on the relations among various aspects of man's conceptualization. Spatial relations and their expression seem to lie very deep in the content of vocabulary. Words referring to time are drawn metaphorically from spatial words with great frequency: "a long/short time," "the near future," "far ahead/separated in time." Although time is a continuum, people readily divide it up into bits and record it rather as they do materials extended in space: "five years," "three months," "six seconds." This last use of vocabulary may be a particular trait of European languages and some others. An American Indian language is reported not to do this nearly so readily; it uses cardinal numbers only for discrete, countable objects. A separate class of words aligns the vocabulary of sequential time with that of intensity, so that repetition of the same activity again and again (to a European) is rather the intensification of a single activity. Certain differences in cultural attitudes and world outlook are said to accompany this kind of linguistic difference.

Expression of abstract relationships

Spatial terms are also freely used in the expression of other, more abstract relationships: "higher temperature," "higher quality," "lower expectations," "summit of a career," "far removed from any sensible course of action," "a distant relationship," "close friends," "over and above what had been said." It has been theorized that the linguistic forms most closely associated semantically with the expression of relations—case inflections in languages exhibiting this category—are originally and basically spatial in meaning. This "localist" theory, as it has been called, has been debated since the beginning of the 19th century and probably cannot be accepted as it stands, but the fact that it can be proposed and argued shows the dominant position that spatial relations hold in the conceptualization and verbalization of relations in other realms of thought.

It has been maintained that the human brain has a preference for binary oppositions, or polarities. If this is so, it will help explain the numerous pairs of related antonyms that are found: "good, bad"; "hot, cold"; "high, low"; "right, wrong"; "dark, light"; and so on. For finer discriminations, these terms can be put into more narrowly specified fields containing more than two terms taken together, but their most general use is in binary contrasts. Here, however, one term seems to represent the fundamental semantic category in question. In asking about size, one asks "How big is it?"; about weight, "How heavy is it?"; and about evaluation, "How good is it?" It is possible to ask how small, how light, or how bad something is, but such questions presuppose that the thing in mind has already been graded on the small side, on the light side, or on the bad side.

STYLE

The capacity for conceptualization possessed and developed by languages is by no means the only purpose language serves. A person's speech, supplemented by facial expression and gesture when speaker and hearer are mutually in sight, indicates and is intended to indicate a great deal more than factual information, inquiries, and requests. The fact that some of these other functions are performed by parts of a language usually mastered later by foreign learners gives rise to misinterpretation and often makes foreign speakers appear rude or insensitive when they are, in actuality, simply deploying fewer resources in the language.

Expression of emotional attitudes

Within the range of the structural and lexical possibilities of a language, speakers are able to convey their emotional attitudes and feelings toward the person or persons they are addressing and toward the subject matter of what they are saying. They are also able to conceal such feelings as one form of linguistic deception, though this is usually a harder task. These same resources are also exploited to arouse appropriate feelings and responses in others, again independently of any factual content. This is the chosen field of the propagandist, the preacher, the orator, the barrister, and the advertiser. All languages make use of intonation and voice qualities in these different ways; a person can produce and recognize the intonation and type of voice employed in coaxing, in pleading, in browbeating, and in threatening, in pleasure, and in anger, as well as those appropriate for matter-of-fact statements and the exposition of details about which the speaker has little or no emotional involvement. To describe exactly which phonetic features are brought into play is quite another matter, involving advanced competence in phonetic discrimination and analysis. This is one of the areas of speech about which all too little is currently known. Grammar and vocabulary are equally involved, though differently in each language. English speakers know the difference between "Come and give me a hand!" and "Could you possibly come and help me?"; "He's got the gift of gab" and "He is undoubtedly a fluent and persuasive speaker" are each appropriate for different occasions. By greetings and leave-takings a great deal of intended interpretation of the social relations between individuals can be expressed. Much of this is the "good manners" taught to children and expected of adults; these aspects of language behaviour vary from culture to culture, but in none are they wholly absent. It is, of course, equally possible to be deliberately bad mannered or deliberately to flout a linguistic convention or expectation, but this can be done only by knowing what is expected in the situation. The refinements of rudeness, like the refinements of politeness, insofar as the use of language is involved, require a very good knowledge of a language if it is other than one's mother tongue.

Written language is no less adapted to conveying more than just factual information, asking factual questions, and giving instructions. Intonation and tone of voice are clearly not reproducible in existing orthographic systems, but part of the skill of a novelist or a reporter is to convey these features of speech in his descriptions. Additionally, grammatical and lexical choices are available to the writer, as reading the examples above will show, and everyone knows the special artistry and techniques involved in composing written memorandums or letters if they are to achieve precisely the purpose for which they are intended.

Styles: variations within a language

These variations, written and spoken, within a language or within any dialect of a language, may be referred to as styles. Each time a person speaks or writes he does so in one or another style, deliberately chosen with the sort of considerations in mind that have just been mentioned, even though in speech the choice may often be routine. Sometimes style, especially in literature, is contrasted with "plain, everyday language." In using such plain, unmarked types of speaking or writing, however, one is no less choosing a particular style, even though it is the most commonly used one and the most neutral in that it conveys and arouses the least emotional involvement or personal feelings.

Stylistic differences are available to all mature native speakers and in literate communities to all writers, as well as to foreigners who know a second language really well. But there is undoubtedly a considerable range of skills in exploiting all the resources of a language, and, whereas all normal adults are expected to speak correctly and, if literate, to write correctly, communities have always recognized and usually respected certain individuals as preeminently skilled in particular styles, as orators, storytellers, preachers, poets, scribes, belletrists, and so forth. This is the material of literature. Once it is realized that oral literature is just as much literature as the more familiar written literature, it can be understood that there is no language devoid of its own literature.

In all languages certain forms of utterance have been considered worthy of preservation, study, and cultivation. In writing, the nature of written surfaces makes this fairly easy, though not all written material is deliberately preserved; much of it is deliberately destroyed, and, although the chance survival of inscriptions on stone or clay is of the greatest value to the archaeologist and historian, a good deal of such material was never intended to survive. Literature, on the other hand, is essentially regarded as of permanent worth. Printing and, in earlier days, the copying of manuscripts are the means of preserving written literature. In illiterate communities certain persons memorize narratives, poems, songs, prayers, ritual texts, and the like, and these are passed on, with new creations in such styles, to succeeding generations. Such skills, preservative as well as creative, are likely to be lost along with much of the surrounding culture under the impact of literacy. Here, modern technology in the guise of the tape recorder has come to the rescue, and many workers in the field of unwritten languages are recording specimens of oral literatures with transcriptions and translations while speakers having the requisite knowledge and skills are still available. A great amount of such material, however, must have been irretrievably lost from illiterate cultures before the 20th century.

Culture and literature

All languages have a literature, but different types of literature flourish in different languages and in different cultures. A warrior caste or a general respect for martial prowess fosters heroic verse or prose tales; strongly developed magical and mystery cults favour ritualistic types of oral or written literature; urban yearnings for the supposed joys of country life encourage the development of pastoral poetry, itself an outgrowth of the songs of shepherds and rural workers; and the same sense of the jadedness of city life is the best ground for the cultivation of satirical verse and prose, a form of literature probably confined largely to urban civilizations. Every language has the resources to meet these and other cultural requirements in its literature as the occasions arise, but some literary forms are more deeply involved in the structure of the language itself; this is made clear by the relative difficulty of translating certain types of literature and literary styles from one language to another. Poetry, in particular, is closely bound to the structure of the language in which it is composed, and poetry is notoriously difficult to translate from one language into another.

The special vocabularies and linguistic forms used in several games have already been mentioned. Here one may point to the widespread existence of verbal games themselves, based on the accidental features of a particular language. English-speaking children are accustomed to riddles, puns, and spelling games: "I spy with my little eye something beginning with *p*" (notice the regular formula with which this opens). These and similar word games have been found all over the world. Homer records the punning use by Odysseus of No-man (Greek *Outis*) as his name when he was about to attack Cyclops, who then roared out "No-man is killing me!" and so failed to attract any help (*Odyssey* 9:366–408). In some languages that make use of lexically distinctive tones, tone puns (words alike but for having different tones) are a form of word play.

As an intellectual challenge, the crossword puzzle in all its varieties, originally an American development early in the 20th century, has maintained and indeed greatly increased its popularity over much of the literate world that employs the Latin (Roman) alphabet. Crossword-puzzle solvers rely heavily on the relative probabilities of letter sequences in written words to suggest an answer to a partly filled line; and, depending on the particular style of the originator, crossword clues make use of many sorts of formal features in the language, among them spelling puns, spoken puns, and accidental letter sequences in words and phrases. To be able to solve a crossword puzzle in a second language shows a high degree of skill and knowledge therein.

Language and culture

It has been seen that language is much more than the external expression and communication of internal thoughts formulated independently of their verbalization. In demonstrating the inadequacy and inappropriateness of such a view of language, attention has already been drawn to the ways in which one's mother tongue is intimately and in all sorts of details related to the rest of one's life in a community and to smaller groups within that community. This is true of all peoples and all languages; it is a universal fact about language.

Language as a part of culture

Anthropologists speak of the relations between language and culture. It is, indeed, more in accordance with reality to consider language as a part of culture. "Culture" is here being used, as it is throughout this article, in the anthropological sense, to refer to all aspects of human life insofar as they are determined or conditioned by membership in a society. The fact that a man eats or drinks is not in itself cultural; it is a biological necessity that he does so for the preservation of life. That he eats particular foods and refrains from eating other substances, though they may be perfectly edible and nourishing, and that he eats and drinks at particular times of day and in certain places are matters of culture, something "acquired by man as a member of society," according to the now-classic definition of culture by the English anthropologist Sir Edward Burnett Tylor. As thus defined and envisaged, culture covers a very wide area of human life and behaviour; and language is manifestly a part, probably the most important part, of it.

Although the faculty of language acquisition and language use is innate and inherited, and there is legitimate debate over the extent of this innateness, every individual's language is "acquired by man as a member of society," along with and at the same time as other aspects of that society's culture in which he is brought up. Society and language are mutually indispensable. Language can have developed only in a social setting, however this may have been structured, and human society in any form even remotely resembling what is known today or is recorded in history could be maintained only among people speaking and understanding a language in common use.

TRANSMISSION OF LANGUAGE AND CULTURE

Language is transmitted culturally; that is, it is learned. To a lesser extent it is taught, when parents deliberately encourage their children to talk and to respond to talk, correct their mistakes, and enlarge their vocabulary. But it must be emphasized that children very largely acquire their mother tongue (*i.e.,* their first language) by "grammar construction" from exposure to a random collection of utterances that they encounter. What is classed as language teaching in school either relates to second-language acquisition or, insofar as it concerns the pupils' first language, is in the main directed at reading and writing, the study of literature, formal grammar, and alleged standards of correctness, which may not be those of all the pupils' regional or social dialects. All of what goes under the title of language teaching at school presupposes and relies on the prior knowledge of a first language in its basic vocabulary and essential structure, acquired before school age.

Transmission of culture through language

If language is transmitted as part of culture, it is no less true that culture as a whole is transmitted very largely through language, insofar as it is explicitly taught. The fact that mankind has a history in the sense that animals do not is entirely the result of language. So far as researchers can tell, animals learn through spontaneous imitation or through imitation taught by other animals. This does not exclude the performance of quite complex and substantial pieces of cooperative physical work, such as a beaver's dam or an ants' nest, nor does it preclude the intricate social organization of some species, such as bees. But it does mean that changes in organization and work will be the gradual result of mutation cumulatively reinforced by survival value; those groups whose behaviour altered in any way that increased their security from predators or from famine would survive in greater numbers than others. This would be an extremely slow process, comparable to the evolution of the different species themselves.

There is no reason to believe that animal behaviour has materially altered during the period available for the study of human history, say the last 5,000 years or so, except, of course, when man's intervention by domestication or other forms of interference has itself brought about such alterations. Nor do members of the same species differ markedly in behaviour over widely scattered areas, again apart from differences resulting from human interference. Bird songs are reported to differ somewhat from place to place within species, but there is little other evidence for areal divergence. By contrast with this unity of animal behaviour, human cultures are as divergent as are human languages over the world, and they can and do change all the time, sometimes with great rapidity, as among the industrialized nations of the 20th century.

The processes of linguistic change and its consequences will be treated below. Here, cultural change in general and its relation to language will be considered. By far the greatest part of learned behaviour, which is what culture involves, is transmitted by vocal instruction, not by imitation. Some imitation is clearly involved, especially in infancy, in the learning process, but proportionately this is hardly significant.

Through the use of language, any skills, techniques, products, modes of social control, and so on can be explained, and the end results of anyone's inventiveness can be made available to anyone else with the intellectual ability to grasp what is being said. Spoken language alone would thus vastly extend the amount of usable information in any human community and speed up the acquisition of new skills and the adaptation of techniques to changed circumstances or new environments. With the invention and diffusion of writing, this process widened immediately, and the relative permanence of writing made the diffusion of information still easier. Printing and the increase in literacy only further intensified this process. Modern techniques for almost instantaneous transmission of the written and spoken word all over the globe, together with the rapid translation services now available between the major languages of the world, have made it possible for usable knowledge of all sorts to be made accessible to people almost anywhere in the world in a very short time. This accounts for the great rapidity of scientific, technological, political, and social change in the contemporary world. All of this, whether ultimately for the good or ill of mankind, must be attributed to the dominant role of language in the transmission of culture.

Diffusion of knowledge through writing and printing

LANGUAGE AND SOCIAL DIFFERENTIATION AND ASSIMILATION

The part played by varations within a language in differentiating social and occupational groups in a society has already been referred to above. In language transmission this tends to be self-perpetuating unless deliberately interfered with. Children are in general brought up within the social group to which their parents and immediate family circle belong, and they learn the dialect and speaking styles of that group along with the rest of the subculture and behavioral traits and attitudes that are characteristic of it. This is a largely unconscious and involuntary process of acculturation, but the importance of the linguistic manifestations of social status and of social hierarchies is not lost on aspirants for personal advancement in stratified societies. The deliberate cultivation of an appropriate dialect, in its lexical, grammatical, and phonetic features, has been the self-imposed task of many persons wishing "to better themselves" and the butt of unkind ridicule on the part of persons already feeling themselves secure in their social status or unwilling to attempt any change in it. Much of the comedy in George Bernard Shaw's *Pygmalion* turns on Eliza's need to unlearn her native Cockney if she is to rise in the social scale. Conversely, it is readily apparent today that middle class people, mostly adolescents, who for some reason want to "opt out" of the social group of their parents make every effort to abandon the distinctive aspects of the social dialect that would mark them, along with dress and general behaviour, as members of a group whose mores they are, at least temporarily, affecting to reject. Culturally and subculturally determined taboos play a part in all this, and persons desirous of moving up or down in the social scale have to learn what words to use and what words to avoid if they are to be accepted and to "belong" in their new position. All through the ages, a good part of the material for "comedies of manners" has come from the social role of language variation within a society.

The same considerations apply to changing one's language as to changing one's dialect. Language changing is harder for the individual and is generally a rarer occurrence, but it is likely to be widespread in any mass immigration movement. In the 19th and early 20th centuries, the eagerness with which immigrants and the children of immigrants from continental Europe living in the United States learned and insisted on speaking English is an illustration of their realization that English was the linguistic badge of full membership in their new homeland at the time when the country was proud to consider itself as the melting pot in which people of diverse linguistic and cultural origins would become citizens of a unified community.

Special vocabularies of games, trades, professions

The same sort of self-perpetuation, in the absence of deliberate rejection, operates in the special languages of games and of trades and professions (these are in the main concerned with special vocabularies). Game learners, apprentices, and professional students learn the locutions together with the rest of the game or the job. The specific words and phrases occur in the teaching process and are observed in use, and the novice is only too eager to display an easy competence with such phraseology as a mark of his full membership of the group; *e.g.,* golfers are keen to talk of birdies, fairways, and slicing.

Languages and variations within languages play both a unifying and a diversifying role in human society as a whole. Language is a part of culture, but culture is a complex totality containing many different features, and the boundaries between cultural features are not clear-cut, nor do they all coincide. Physical barriers such as oceans, high mountains, and wide rivers constitute impediments to human intercourse and to culture contacts, though modern technology in the fields of travel and communications make such geographical factors of less and less account. More potent today are political restrictions on the movement of people and of ideas, such as divide western Europe from Communist eastern Europe; the frontiers between these two political blocs represent much more of a cultural dividing line than any other European frontiers.

The distribution of the various components of cultures differs, and the distribution of languages may differ from that of nonlinguistic cultural features. This results from the varying ease and rapidity with which changes may be acquired or enforced and from the historical circumstances responsible for these changes. In contemporary Europe, as the result of World War II, a major political and cultural division cuts across an area of relative linguistic unity in East and West Germany. It is significant, however, that differences of vocabulary and usage are already noticeable in the German speech from each side, overlying earlier differences attributed to regional dialects; one may surmise that, if the present political situation endures for several more generations, the East–West frontier will come to mark a definite dialect boundary within the German language as well.

THE CONTROL OF LANGUAGE FOR CULTURAL ENDS

Second-language learning. Language, no less than other aspects of human behaviour, is subject to purposive interference. When people with different languages need to communicate, various expedients are open to them, the most obvious being second-language learning and teaching. This takes time, effort, and organization, and, when more than two languages are involved, the time and effort are that much greater. Most people are monolingual, and those with a working knowledge of three or four languages are much fewer than those with a competence in just one second language. Other expedients may also be applied. Ad hoc pidgins for the restricted purposes of trade and administration were mentioned above. Tacit or deliberate agreements have been reached whereby one language is chosen for international purposes when speakers of several different languages are involved. In the Roman Empire, broadly, the western half used Latin as a lingua franca, and the eastern half used Greek. In western Europe during the Middle Ages, Latin continued as the international language of educated people, and Latin was the second language taught in schools. Later, the cultural, diplomatic, and military reputation of France made French the language of European diplomacy. This use of French as the language of international relations persisted until the present century. At important conferences among representatives of different nations, it is usually agreed which languages shall be officially recognized for registering the decisions reached; and the provisions of treaties are interpreted in the light of texts in a limited number of languages, those of the major participants.

International and diplomatic languages

Since World War II the dominance of the English-speaking peoples in science and technology and in international commerce has led to the recognition of English as the major international language in the world of practical affairs, with more and more countries making English the first foreign language to be taught and thus producing a vast expansion of English-language-teaching programs all over the world. Those whose native language is English do not sufficiently realize the amount of effort, by teacher and learner alike, that is put into the acquisition of a working knowledge of English by educated first speakers of other languages.

As an alternative to the recognition of particular natural languages as international in status, attempts have been made to invent and propagate new and genuinely international languages, devised for the purpose. Of these, Esperanto, invented by the Polish-Russian doctor L.L. Zamenhof in the 19th century, is the best known. Such languages are generally built up from parts of the vocabulary and grammatical apparatus of the better known existing languages of the world. The relationship between the written letter and its pronunciation is more systematic than with many existing orthographies (English spelling is notoriously unreliable as an indication of pronunciation), and care is taken to avoid the grammatical irregularities to which all natural languages are subject and also to avoid sounds found difficult by many speakers (*e.g.,* the English *th* sounds, which most Europeans, apart from English speakers, dislike). These artificial languages have not made much progress, though an international society of Esperanto speakers does exist.

Language as a cohesive political force

Nationalistic influences on language. Deliberate interference with the natural course of linguistic changes and the distribution of languages is not confined to the facilitating of international intercourse and cooperation. Language as a cohesive force for nation-states and for linguistic groups within nation-states has for long been manipulated for political ends. Multilingual states can exist and prosper; Switzerland is a good example. But linguistic rivalry and strife can be disruptive. Language riots have occurred in Belgium between French and Flemish speakers and in parts of India between rival vernacular communities. A language can become or be made a focus of loyalty for a minority community that thinks itself suppressed, persecuted, or subjected to discrimination. The French language in Canada in the mid-20th century is an example. In the 19th and early 20th centuries Irish Gaelic came to symbolize Irish patriotism and Irish independence from Great Britain. Since independence, government policy continues to insist on the equal status of English and Irish in public notices and official documents, but, despite such encouragement and the official teaching of Irish in the state schools, a main motivation for its use and study has disappeared, and the language is giving ground to English under the international pressures referred to above.

For the same reasons, a language may be a target for attack or suppression, if the authorities associate it with what they consider a disaffected or rebellious group or even just a culturally inferior one. There have been periods when American Indian children were forbidden to speak a language other than English at school and when pupils were not allowed to speak Welsh in British state schools in Wales. Both these prohibitions have been abandoned. Since the Spanish Civil War of the 1930s Basque speakers have been discouraged from using their language in public, as a consequence of the strong support given by the Basques to the republican forces. Interestingly, on the other side of the Franco-Spanish frontier, French Basques are positively encouraged to keep their language in use, if only as an object of touristic interest and consequent economic benefit to the area.

Translation. So far, some of the relatively large-scale effects of culture contacts on languages and on dialects within languages have been surveyed. A continuous concomitant of contact between two mutually incomprehensible tongues and one that does not lead either to suppression or extension of either is translation. As soon as two speakers of different languages need to converse, translation is necessary, either through a third party or directly.

Oral and written translation

Before the invention and diffusion of writing, translation was instantaneous and oral; persons professionally specializing in such work were called interpreters. In predominantly or wholly literate communities, translation is thought of as the conversion of a written text in one language into a written text in another, though the modern emergence of the simultaneous translator or professional interpreter at international conferences keeps the oral side of translation very much alive.

The tasks of the translator are the same whether the material is oral or written, but, of course, translation between written texts allows more time for stylistic adjustment and technical expertise. The main problems have been recognized since antiquity and were expressed by St. Jerome, translator of the famed Latin Bible, the Vulgate, from the Hebrew and Greek originals. Semantically, these problems relate to the adjustment of the literal and the literary and the conflicts that so often occur between an exact translation of each word, as far as this is possible, and the production of a whole sentence or even a whole text that conveys as much of the meaning of the original as can be managed. These problems and conflicts arise because of factors already noticed in the use and functioning of language: languages do not operate in isolation but within and as part of cultures, and cultures differ from each other in various ways. Even between the languages of communities whose cultures are fairly closely allied, there is by no means a one-to-one relation of exact lexical equivalence between the items of their vocabularies.

In their lexical meanings, words acquire various overtones and associations that are not shared by the nearest corresponding words in other languages; this may vitiate a literal translation. The English author and theologian Ronald Knox has pointed to the historical connections of the Greek *skandalon* "stumbling block, trap, or snare," inadequately rendered by "offense," its usual New Testament translation. In modern times translators of the Bible into the languages of peoples culturally remote from Europe are well aware of the difficulties of finding a lexical equivalent for "lamb," when the intended readers, even if they have seen sheep and lambs, have no tradition of blood sacrifice for expiation nor long-hallowed associations of lambs with lovableness, innocence, and apparent helplessness. The English word uncle has, for various reasons, a cozy and slightly comic set of associations. The Latin poet Virgil uses the words *avunculus Hector* in a solemn heroic passage of the Aeneid (Book III, line 343); to translate this by "uncle Hector" gives an entirely unsuitable flavour to the text.

Poetry translation

The translation of poetry, especially into poetry, presents very special difficulties, and the better the original poem, the harder the translator's task. This is because poetry is, in the first instance, carefully contrived to express exactly what the poet wants to say. Second, to achieve this end, the poet calls forth all the resources of the language in which he is writing, matching the choice of words, the order of words, and grammatical constructions, as well as phonological features peculiar to the language in metre, perhaps supplemented by rhyme, assonance, and alliteration. The available resources differ from language to language; English and German rely on stress-marked metres, but Latin and Greek used quantitative metres, contrasting long and short syllables, while French places approximately equal stress and length on each syllable. The translator must try to match the stylistic exploitation of the particular resources in the original language with comparable resources from his own. Because lexical, grammatical, and metrical considerations are all interrelated and interwoven in poetry, a satisfactory literary translation is usually very far from a literal word for word rendering. The more the poet relies on language form, the more embedded his verses are in that particular language, and the harder they are to translate adequately. This is especially true with lyrical poetry in several languages, with its wordplay, complex rhymes, and frequent assonances.

At the other end of the translator's spectrum, technical prose dealing with internationally agreed scientific subjects is probably the easiest type of material to translate, because cultural unification (in this respect), lexical correspondences, and stylistic similarity already exist in this type of usage in the languages most commonly involved, to a higher degree than in other fields of discourse.

Significantly, it is this last aspect of translation to which mechanical and computerized techniques are being applied with some prospects of limited success. Machine translation, whereby, ultimately, a text in one language could be fed into a machine to produce an accurate translation in another language without further human intervention, has been largely concentrated on the language of science and technology, with its restricted vocabulary and overall likeness of style, for both linguistic and economic reasons. Attempts at machine translation of literature have been made, but success in this field, more especially in the translation of poetry, seems very remote at present.

Translation as an art

Translation on the whole is an art, not a science. Guidance can be given and general principles can be taught, but after that it must be left to the individual's own feeling for the two languages concerned. Almost inevitably, in a translation of a work of literature something of the author's original intent must be lost; in those cases in which the translation is said to be a better work than the original, an opinion sometimes expressed about the English writer Edward Fitzgerald's "translation" of *The Rubáiyát of Omar Khayyám,* one is dealing with a new, though derived, work, not just a translation. The Italian epigram remains justified: *Traduttore traditore* "The translator is a traitor."

Messages and codes. Translation serves to extend the communicative value of a text. Sometimes people want to restrict it. Confidential messages, spoken and written, require for their efficacy that they be known to and understood by only the single person or the few persons to whom they are addressed. Such are diplomatic exchanges, operational messages in wartime, and some transmissions of commercial information. Protection of written messages from interception has been practiced for many centuries. Recent developments in telegraphy and telephony have made protection against unauthorized reception more urgent, whether of texts transmitted as speech or as series of letters of the alphabet. Scrambling of telephony is a common expedient; the wave frequencies through which the sounds are to be transmitted are altered at the source so as to be unrecognizable and then reconverted by the intended recipient's receiver. Codes and ciphers (cryptography) are of much longer standing in the concealment of written messages, though their techniques are being constantly developed. Such gains are, of course, countered by developments in the techniques of decipherment and decoding (as distinct from getting hold of the key to the system in use). An important by-product of such techniques has been the reading and interpretation of inscriptions written in otherwise unknown languages or unknown writing systems for which no translation exists. The recent, very significant decipherment of the Linear B script and its recognition as Mycenaean Greek, an early Greek dialect written in a form of orthography quite distinct from the later classical Greek alphabet, was first achieved by the application of cryptographic "code cracking" methods (see also CRYPTOLOGY).

LANGUAGE LEARNING

Role of the brain in language learning

Every physiologically and mentally normal person has learned the main structure and basic vocabulary of his mother tongue by the end of childhood. It has been pointed out that the process of first-language acquisition as a spoken medium of communication is largely achieved from random exposure. There is legitimate controversy, however, over the nature and extent of the positive contribution that the human brain brings to the activity of grammar construction, the activity by which the child develops an indefinitely creative competence from the finite data that make up his actual experience of the language. Creativity is what must be stressed as the product of first-language acquisition. By far the greater number of all the sentences anyone hears and utters during his lifetime are new; that is, they have not occurred before in his personal experience. But individuals find no difficulty at all in understanding at once almost everything they hear nor for the most part in producing sentences to suit the requirements of every situation. This very ease of creativity in man's linguistic competence makes it hard to realize its extent. The only regularly reproduced sentences in most speakers' experience are the stereotyped forms of greeting and leave-taking and certain formalized responses to recurrent situations, such as shopping, cooperative activities in repetitive jobs, the stylized parts of church services, and the like.

Yet, despite this really immense achievement that the progressive mastery of one's first language constitutes, it arouses no comment and attracts no credit. It is simply part of what is expected of one in growing up. Different people may be singled out for praise in certain uses of their language, as good public speakers, authors, poets, tellers of tales, and solvers of puzzles, but not just as speakers. The credit that some individuals acquire in certain communities for "speaking correctly" is a different matter, usually the result of speaking as one's mother tongue a prestigious standard dialect among people most of whom speak another, less favoured one.

Bilingualism. The learning of a second and of any subsequently acquired language is quite a different matter. Except for one form of bilingualism (see below), it is a deliberate activity undertaken when one has already nearly or fully acquired the basic structure and vocabulary of one's first language. Of course, many people never do master significantly more than their own first language. It is only in encountering a second language that one realizes how complex language is and how much effort must be devoted to subsequent acquisition. It has been said that the principal obstacle to learning a language is knowing one already, and it may also be that the faculty of grammar construction exhibited in childhood is one that is gradually lost as childhood recedes.

Ability to learn additional languages

Whereas every normal person masters his mother tongue with unconscious ease, people vary in their ability to learn additional languages, just as they vary in other intellectual activities. Situational motivation, however, appears to be by far the strongest influence on the speed and apparent ease of this learning. The greatest difficulty is experienced by those who learn because they are told to or are expected to, without supporting reasons that they can justify. Given a motive other than external compulsion or expectation, the task is achieved much more easily (this, of course, is an observation in no way confined to language learning). In Welsh schools it is found that English children make slower progress in Welsh when their only apparent reason for learning Welsh is that there are Welsh classes. Welsh children, on the other hand, make rapid progress in English, the language of most further education, the newspapers, most television and radio, most of the better paid jobs, and of any job outside Welsh-speaking areas. Similar differences in motivation have accounted for the excellent standard of English, French, and German acquired by educated persons in the Scandinavian countries and in Holland, small countries whose languages, being spoken by relatively few foreigners, are of little use in international communication. This attainment may be compared with the much poorer showing in second-language acquisition among comparably educated persons in England and America, who have for long been able to rely on foreigners accommodating to their ignorance by speaking and understanding English.

It is often held that children brought up bilingually in places in which two languages are regularly in use are slower in schoolwork than comparable monolingual children, as a greater amount of mental effort has to be expended in the mastery of two languages. This is by no means proved; and, because much of a child's language acquisition takes place in infancy and in the preschool years, it does not represent an effort in the way that consciously learning a language in school does, and indeed it probably occupies a separate part of the child's mental equipment. The question of speed of general learning by bilinguals and monolinguals must be left open. It is quite a separate matter from the job of learning, by teaching at home or in school, to read and write in two languages; this undoubtedly is more of a labour than the acquisition of monolingual literacy.

Types of bilingualism

Two types of bilingualism have been distinguished, according to whether the two languages were acquired from the simultaneous experience of the use of both in the same circumstances and settings or from exposure to each language used in different settings (an example of the latter is the experience of English children living in India during the period of British ascendancy there, learning English from their parents and an Indian language from their nurses and family servants). However acquired, bilingualism leads to mutual interference between the two languages; extensive bilingualism within a community is sometimes held partly responsible for linguistic change (see below). Interference may take place in pronunciation, in grammar, and in the meanings of words. Bilinguals often speak their two languages each with "an accent"; *i.e.,* they carry into each certain pronunciation features from the other. The German word order in "He comes tomorrow home" has been reported as an example of grammatical interference; and in Candian French the verb *introduire* has acquired from English the additional meaning "introduce, make acquainted" (which in metropolitan French is *présenter*).

Literacy. The acquisition of literacy is something very different from the acquisition of one's spoken mother tongue, even when the same language is involved, as it usually is. Both skills, speaking and writing, are learned skills, but there the resemblance ends. The child learns his first language at the start involuntarily and mostly unconsciously from random exposure, even if no attempts at teaching are made. Literacy is deliberately taught and consciously and deliberately learned. There is current debate on the best methods and techniques for teaching literacy in various social and linguistic settings. Literacy is learned through speech, by a person already possessed of the basic structure and vocabulary of his language.

Such facts should be very obvious, but the now-accepted, though fairly recent, standard of near-universal literacy in technologically advanced countries, along with the fact that in second-language learning one usually acquires speech and writing skills at the same time, tends to bring these two parts of language learning under one head. Literacy is manifestly a desirable attainment for all communities, though not necessarily in all languages. It must be borne in mind that there are many distinct languages spoken in the world today by fewer than 1,000 or 500 or even 50 persons. The capital investment in literacy, including teaching resources, teacher time and training, printing, publications, and so forth, is vast, and it can be economically and socially justified only when applied to languages spoken and likely to continue to be spoken by substantial numbers over a wide area.

Effects of literacy

Literacy is in no way necessary for the maintenance of linguistic structure or vocabulary, though it does enable people to add words from the common written stock in dictionaries to their personal vocabulary very easily. It is worth emphasizing that until relatively recently in human history all languages were spoken by illiterate speakers and that there is no essential difference as regards pronunciation, structure, and complexity of vocabulary between spoken languages that have writing systems used by all or nearly all their speakers and the languages of illiterate communities.

Literacy has many effects on the uses to which language may be put; storage, retrieval, and dissemination of information are greatly facilitated, and some uses of language, such as philosophical system building and the keeping of detailed historical records, would scarcely be possible in a totally illiterate community. In these respects the lexical content of a language is affected, for example, by the creation of sets of technical terms for philosophical writing and debate. Because the permanence of writing overcomes the limitations of auditory memory span imposed on speech, sentences of greater length can easily occur in writing, especially in types of written language that are not normally read aloud and that do not directly represent what would be spoken. An examination of some kinds of oral literature, however, reveals the ability of the human brain to receive and interpret spoken sentences of considerable grammatical complexity.

In relation to pronunciation, writing does not prevent the historical changes that occur in all languages. Part of the apparent irrationality of English spelling, such as is found also in some other orthographies, lies just in the fact that letter sequences have remained constant while the sounds represented by them have changed. For example, the *gh* of "light" once stood for a consonant sound, as it still does in the word as pronounced in some Scots dialects; and the *k* of "knave" and "knight" likewise stood for an initial *k* sound (compare the related German words *Knabe* and *Knecht*). A few relatively uncommon words, including some proper names, are reformed phonetically, specifically to bring their pronunciation more in line with their spelling. Spelling prounciations, as these are called, are a product of general literacy. In London, the pronunciation of "St. Mary Axe" as if it were spelled "Simmery Axe" is now decidedly old-fashioned. "St. John" and "St. Clair" survive as proper names with their old pronunciations, in the latter case helped by the presence of the alternative spelling "Sinclair."

WRITTEN LANGUAGE

Historically, culturally, and in the individual's life, writing is subsequent to speech and presupposes it. Aristotle expressed the relation thus: "Speech is the representation of the experiences of the mind, and writing is the representation of speech" (*On Interpretation*). But it is not as simple as this would suggest. Alphabetic writing, in which, broadly, consonant and vowel sounds are indicated by letters in sequence, is the most widespread system in use today, and it is the means by which literacy will be disseminated, but it is not the only system, nor is it the earliest.

Evolution of writing systems. Writing appears to have been evolved from an extension of picture signs: signs that directly and iconically represented some thing or action and then the word that bore that meaning. Other words or word elements not readily represented pictorially could be assigned picture signs already standing for a word of the same or nearly the same pronunciation, perhaps with some additional mark to keep the two signs apart. This sort of device is used in children's word puzzles, as when the picture of a berry is used to represent, say, the second half of the name Canterbury. This opens the way for what is called a character script, such as that of Chinese, in which each word is graphically represented by a separate individual symbol or character or by a sequence of two or more such characters. Writing systems of this sort have appeared independently in different parts of the world.

Character scripts

Chinese character writing has for many centuries been stylized, but it still bears marks of the pictorial origin of some characters. Chinese characters and the characters of similar writing systems are sometimes called ideograms, as if they directly represented thoughts or ideas. This is not so. Chinese characters stand for Chinese words or, particularly as in modern Chinese, bits of words; they are the symbolization of a particular language, not a potentially universal representation of thought. The ampersand (&) sign, standing for "and" in English printing, is a good isolated example of a character used in an alphabetic writing system.

Character writing is laborious to learn and imposes a burden on the memory. Alternatives to it, in addition to alphabetic writing, include scripts that employ separate symbols for the syllable sequences of consonants and vowels in a language, with graphic devices to indicate consonants not followed by a vowel. The Devanagari script, in which classical Sanskrit and modern Hindi are written, is of this type, and the Mycenaean writing system, a form of Greek writing in use in the 2nd millennium BC and quite independent of the later Greek alphabet, was syllabic in structure. Japanese employs a mixed system, broadly representing the roots of words by Chinese characters (the Japanese learned writing from the Chinese in and after the 5th century AD) and the inflectional endings by syllable signs. These syllable signs are an illustration of the way in which a syllabic script can develop from a character script: certain Chinese characters were selected for their sound values alone and, reduced in size and complexity, have been standardized as signs of a particular consonant and vowel sequence or of a single vowel sound.

The Greek alphabet came from the Phoenician script, a

Greek alphabet

syllabic-type writing system that indicated the consonant sounds. By a stroke of genius, a Greek community decided to employ certain consonantal signs to which no consonant sound corresponded in Greek as independent vowel signs, thus producing an alphabet, a set of letters standing for consonants and vowels. The Greek alphabet spread over the ancient Greek world, undergoing minor changes. From a Western version sprang the Latin (Roman) alphabet. Also derived from the Greek alphabet, the Cyrillic alphabet was devised in the 9th century AD by a Greek missionary, St. Cyril, for writing the Slavic languages.

Spelling. Alphabetic writing is not and cannot be an exact representation of the sequence of sounds or even of the sequence of distinctive sounds in the spoken forms of words and sentences. "Consonant" and "vowel" mean different things when applied to letters and to sounds, though there is, of course, much overlap. The *y* at the beginning of "yet" stands for a consonant sound; at the end of "jetty" it stands for a vowel sound. In "thick" and "thin" the sequence *th* represents a single sound, not a *t* sound followed by an *h* sound. In "kite" the *e* represents no sound directly but distinguishes the vowel between *k* and *t* from the vowel in "kit." These disharmonies arise from a number of causes. Economy in the use of letters is one factor. In addition, spoken forms are always changing over the centuries, whereas writing, particularly since the invention of printing, is very conservative. At one time the *e* at the end of words such as "kite" did stand for a vowel sound. This sound was lost between the 14th and 16th centuries, a time when other changes in the pronunciation of such words also occurred. The notorious *ough* spellings in English, standing for different sounds and sound sequences in "rough," "cough," "dough," "plough," "ought," and other such words, have arisen from historical changes that have driven spelling and pronunciation further apart.

This, of course, does not mean that spelling reforms are out of the question. Spelling reform has been talked of in relation to English for many centuries without much effect; but in some countries—for example, Norway and Holland—official action has prescribed certain reforms to be made, and these have then been taught in school and have gradually found their way into printed works. The sheer volume of printed matter preserved for use and consultation in the modern world adds much weight against the convenience otherwise accruing from reforms designed to correct the historically produced disharmonies between spelling and pronunciation.

Representing grammatical distinctions in spelling

Moreover, it is not always most useful for spellings to represent exactly the sound sequences in a word and nothing else; this is the task for which phoneticians have devised transcriptions. As far as the sounds themselves are concerned, the plural signs of "cats," "dogs," and "horses" are different: the final sound of "cats" is like the initial sound of "sink," that of "dogs" like the initial sound of "zinc," and the plural of "horse" is indicated by a sound sequence rather like that in "is." But they are all indicated in writing by one and the same letter and always have been, because only one grammatical distinction, that of singular as against plural, is involved, and at this point in the language the actual differences in the sounds, important elsewhere, are irrelevant.

Letters, insofar as they stand for sounds, stand for consonants and vowels. But other sound features are involved in languages. In English words the location of the stress is important, and the words "import" as a noun and "import" as a verb are distinguished by this alone. All languages make use of sequences of rises and falls in pitch, called intonation, as part of spoken communication. These phenomena are unrepresented in orthography except for certain punctuation marks such as ? and ! and sometimes by italicization and underlining.

This is not a weakness in orthography. Writing is normally intended to be read and when necessary read aloud by people who already know the language and are therefore able to supply from their own competence the required detail. For specific purposes such as foreign-language teaching, as well as for the specific study of pronunciation and speech sounds in phonetics and phonology, various forms of transcription have been devised to indicate unambiguously by written signs the precise form of the spoken utterance, without regard to other considerations.

Written versus spoken languages. For these reasons one should distinguish the grammar of a written language (*e.g.*, written English) from the grammar of the corresponding spoken language (spoken English). The two grammars will be very similar, and they will overlap in most places; but the description of spoken English will have to take into account the grammatical uses of features such as intonation, largely unrepresented in writing, and the description of written English must deal adequately with the greater average length of sentences and some different syntactic constructions and word forms characterizing certain written styles but almost unknown in ordinary speech (*e.g.*, "whom" as the objective form of "who").

Ancient, or dead, languages

In studying ancient (dead) languages one is, of course, limited to studying the grammar of their written forms and styles, as their written records alone survive. Such is the case with Latin, Ancient Greek, and Sanskrit (Latin lives as a spoken language in very restricted situations, such as the official language of some closed religious communities, but this is not the same sort of Latin as that studied in classical Latin literature; Sanskrit survives also as a spoken language in similarly restricted situations in a few places in India). Scholars may be able to reconstruct something of the pronunciation of a dead language from historical inferences and from descriptions of its pronunciation by authors writing when the language was still spoken. They know a good deal about the pronunciation of Greek and Latin and a great deal about the pronunciation of Sanskrit, because ancient Indian scholars left a collection of extremely detailed and systematic literature on its pronunciation. But this does not alter the fact that when one teaches and learns dead languages today, largely for their literary value and because of the place of the communities formerly speaking them in our own cultural history, one is teaching and learning the grammar of their written forms. Indeed, despite what is known about the actual pronunciation of Greek and Latin, Europeans on the whole pronounce what they read in terms of the pronunciation patterns of their own languages.

Under present conditions, with universal literacy either an accepted fact or an accepted target, it is assumed that, wherever it is convenient or useful, writing may be employed for any purpose for which speech might have been used and by all sections of the community. This has not always been so. Literacy was until the 19th century the privilege of the few. In other periods and cultures, writing was the preserve of certain defined groups, such as the priesthood and the official class, and it was restricted to certain purposes, such as the annals of important events, genealogical tables, and records of inventories of things and persons. It is highly probable that writing first developed for particular types of use by particular groups of specialists within communities and subsequently, because of its obvious utility, spread outside these limits.

For further accounts of writing systems in greater detail, see WRITING.

Linguistic change

Every language has a history; and, as in the rest of human culture, changes are constantly taking place in the course of the learned transmission of a language from one generation to another. This is just part of the differences between human culture and animal behaviour. Languages change in all their aspects, in their pronunciation, word forms, syntax, and word meanings (semantic change). These changes are mostly very gradual in their operation, becoming noticeable only cumulatively over the course of several generations. But, in some areas of vocabulary, particular words closely related to rapid cultural change are subject to equally rapid and therefore noticeable changes within a generation or even within a decade. In the 20th century the vocabulary of science and technology is an outstanding example. The same is also true of those parts of vocabulary that are involved in fashionable slangs and jargons, whose raison d'être in promoting group, particu-

Changes in vocabulary

larly age-group, solidarity depends on their being always fresh and distinctive. Old slangs date, as any reading of a novel or visit to a film more than 10 years old is apt to show. The rapid obsolescence of young people's slangs is equally to be seen in the unsuccessful efforts of some well-intentioned older persons who vainly attempt to cultivate the speech styles of present-day youth groups in a misdirected attempt to bridge "the generation gap" (this last phrase is an example of mid-20th-century pseudoscientific slang).

DIVERSIFICATION OF LANGUAGES

Changes through time. In the structural aspects of language, their pronunciation and grammar, and in vocabulary less closely involved in rapid cultural movement, the processes of linguistic change are best observed by comparing written records of a language over extended periods. This is most readily seen by English speakers through setting side by side present-day English texts with 18th-century English, the English of the Authorized Version of the Bible, Shakespearean English, Chaucer's English, and the varieties of Old English (Anglo-Saxon) that survive in written form. Noticeably, as one goes back in time, the effort required in understanding increases, and, while people do not hesitate to speak of "Shakespearean English," they are more doubtful about Chaucer, and for the most part Old English texts are as unintelligible to a modern English speaker as, for example, texts in German. It is clear that the differences involved include word meanings, grammar, and, so far as this can be reconstructed, pronunciation.

Similar evidence, together with what is known of the cultural history of the peoples concerned, makes clear the continuous historical connections linking French, Spanish, Portuguese, Italian, and Romanian with the spoken ("vulgar") Latin of the western Roman Empire. This group constitutes the Romance subfamily of languages and is an example of how, as the result of linguistic change over a wide area, a group of distinct, though historically related, languages comes into being.

In the transmission of a language from parent to child, slight deviations in all aspects of language use occur all the time, and as the child's speech contacts widen he confronts a growing range of slight differences in personal speech forms, some of them correlating with social or regional differences within a community, these speech differences themselves being the results of the transmission process. As a consequence, the child's speech comes to differ slightly from that of his parents' generation. In urbanized communities an additional factor is involved: children have been shown to be effectively influenced by the speech habits of their peer groups once they have made contacts with them in and out of school.

Cumulative changes in languages

Such changes, though slight at the time, are progressively cumulative. Since ready intercommunication is a primary purpose of language, as long as a community remains unitary, with strong central direction and a central cultural focus, such changes will not go beyond the limits of intercomprehensibility. But in more scattered communities and in larger language areas, especially when cultural and administıative ties are weakened and broken, these cumulative deviations in the course of generations give rise to wider regional differences. Such differences take the form of dialectal differentiation as long as there is some degree of mutual comprehension but eventually result in the emergence of distinct languages. This is what happened in the history of the colloquial Latin of the western Roman Empire, and it can be assumed that a similar course of events gave rise to the separate Germanic languages (English, German, Dutch, Danish, Norwegian, Swedish, and some others), though in this family the original unitary language is not known historically but inferred as "Common Germanic" or "Proto-Germanic" and tentatively assigned to early in the 1st millennium BC as the period before separation began.

This is how language families have developed. Most but not all of the languages of Europe belong to the Indo-European family, so-called because in addition it includes the classical Indian language Sanskrit and most of the modern languages of northern India and Pakistan. It includes as subfamilies the two families just mentioned, Romance and Germanic, and several others. It is assumed that the subfamilies, and from them the individual languages of the Indo-European family, are ultimately derived from a unitary language spoken somewhere in eastern Europe or western Asia (its exact location is still under debate), perhaps 5,000 years ago. This unitary language has itself been referred to as "Indo-European," "Proto-Indo-European," the "common parent language," or the "original language" (*Ursprache*) of the family. But it must be emphasized that, whatever it may have been like, it was just one language among many and of no special status in itself. It was certainly in no way the original language of mankind or anything like it. It had its own earlier history, of which virtually nothing can be inferred, and it was, of course, very recent in relation to the time span of human language itself. What is really special about such "parent" or "proto-" languages is that they represent the farthest point to which our available techniques and resources enable us to reconstruct the prehistory of our attested and living languages. Similarly constituted families of languages derived from inferred common sources have been established for other parts of the world; for example, Altaic, covering Turkish and several languages of Central Asia, and Bantu, containing many of the languages of central and southern Africa. For further details of these and other language families see LANGUAGES OF THE WORLD.

"Parent" or "proto-" languages

If enough material in the form of written records from past ages were available, it would be possible to group all the world's languages into historically related families. In addition, an answer could perhaps be posited to the question of whether all languages are descended from a single original language or whether languages emerged independently among several groups of early peoples (the rival theories of monogenesis and polygenesis, a controversy more confidently disputed in the 19th century than today). In actual fact, written records, when they are available, go back only a fraction of the time in which human speech has been developed and used, and over much of the globe written records are nonexistent. In addition, there are no other linguistic fossils comparable to the fossils of geological prehistory. This means that the history and prehistory of languages will not be able to go back more than a few thousand years BC and will be much more restricted in language areas in which few or no written records are available, as in much of Africa and in South America. Many languages will remain not related with certainty to any family. Nevertheless, the methods of historical linguistics, involving the precise and systematic comparison of word forms and word meanings (see further LINGUISTICS), have produced remarkable results in establishing language families on the same basis as Indo-European was established, in far less favourable fields. But any attempt by these means to get back to "the origin of language" or to reconstruct man's original language, if indeed there was one, is quite beyond the reach of science and will remain so.

Changes through geographical movement. The fundamental cause of linguistic change and hence of linguistic diversification is the minute deviations occurring in the transmission of speech from one generation to another. But other factors contribute to the historical development of languages and determine the spread of a language family over the world's surface. Population movements naturally play a large part, and movements of peoples in prehistoric times carried the Indo-European languages from a relatively restricted area into most of Europe and into northern India, Persia, and Armenia. But language and race are by no means the same thing, and the spread of the Indo-European languages resulted, in the main, from the imposition of one of them on the earlier population of the territories occupied. In the historical period, within Indo-European, the same process can be seen at work in the western Roman Empire. Latin superseded the earlier, largely Celtic languages of the Iberian Peninsula and of Gaul (France) not through population replacement (the number of Roman soldiers and settlers in the empire was never large) but through the abandonment of these languages by the inhabitants over the generations as they

Population movements

found in Latin the language of commerce, civilization, law, literature, and social prestige.

Conquest does not always lead to the supersession of a language. Greek survived centuries of Turkish rule and indeed remained a focus of national feeling, as has happened elsewhere in history. Much depends on the various circumstances and on the mutual attitudes of those involved; what must be kept quite clear is the difference between movements of peoples and the spread of languages. When linguistically homogeneous people enter and occupy a virtually empty area, as with most of Australia, the two movements coincide.

Languages do not just spread and compete with each other for territorial use. They are in constant contact, and every language bears evidence of this throughout its history. Modern Greek is full of words of Turkish origin, despite efforts made at various times since independence to purify the language by official action. The Norman Conquest and a period in which French was the language of the ruling class in England effected great changes on English and contributed a very substantial number of French words to English vocabulary; hence the quantity of near synonymous pairs available today: "begin, commence"; "end, finish"; "kingly, royal"; "fight, combat"; and so on.

Tendencies against change. These historical processes take place without any direct volition on the part of speakers as regards the language itself. Latin was learned as part of personal advancement, not for its own sake. Loans were incorporated almost without their being noticed, along with the concomitant cultural changes and innovations. Deliberate action directly related to a language does occur. The creation of pidgins involves some degree of linguistic consciousness on the part of their first users. More deliberate, however, have been various attempts at preserving the purity of a language, at least for some uses, or at arresting the processes of change. The care bestowed on the preservation of the Sanskrit used in religious ritual in ancient India and recent attempts to free Modern Greek from much of its Turkish vocabulary have already been noticed. For a period, under Nazi rule, efforts were made to replace some foreign words in the German language by words of native origin, and there have been movements to replace later accretions in English by words derived from Old English forms. In the long run, such attempts never succeed in preventing or reversing change; at best they preserve collaterally supposedly purer forms and styles for certain purposes and in certain contexts.

Attempts to prevent or reverse linguistic change

With the picture painted above of the tendency for languages to fragment first into dialects and then into separate languages, it might be thought that dialects are relatively late in appearance in the history of a language family. This impression is reinforced by the fact that most nonstandard dialects are unrepresented as such in writing, and so comparatively little is known about dialectal differences within most languages as one goes back in time. In this respect the very detailed knowledge of the Ancient Greek dialect situation is quite untypical.

In fact, dialect divisions must have been a feature of linguistic communities as early as there is any knowledge of them. Dialect splitting is fostered by isolation and loss of contact between groups within a speech community, and the sparse populations of earlier days, often nomadic and spread over large areas relative to their numbers, will have encouraged this process. It is simply the case that all but literate dialects have been lost in the past, and an artificial homogeneity is attributed to most ancient languages and to the so-called reconstructed parent languages of families.

Present-day conditions tend toward the amalgamation of dialects and the disappearance of those spoken by relatively few people. Urbanization, mass travel, universal education, broadcasting, ease of communication, and social mobility all foster rather large regional and social dialects, with special occupational types of language within them, in place of the small, strictly localized dialects of earlier times. This is one reason for the urgency with which dialect studies are being pursued in many Western industrialized countries, such as England and parts of the United States. If work is not done soon, many dialects may perish unrecorded (see also the section *Dialects* above).

For the same reasons, dialect divisions that earlier would have widened into distinct languages are now unlikely to do so. One may compare the emergence of the separate Romance languages from once unitary Latin with the splitting of South American Spanish and Portuguese into different dialects of these two languages. These dialectal divisions are not now expected to widen beyond the range of intercomprehensibility. These same conditions, together with the spread of literacy, are leading to the extinction of languages spoken by relatively small communities. Such is the fate of most of the North American Indian languages, and Irish, Welsh, and Scots Gaelic may ultimately survive only as learned second languages, preserved as cultural focuses for their communities. But in situations like this, both past and present, the intervening period of extensive bilingualism and the concomitant use of two languages has its effect on the changes taking place in the dominant language, which is influenced by the phonetic and grammatical composition of the speakers' former language.

Extinction of languages

LANGUAGE TYPOLOGY

Language families, as conceived in the historical study of languages, should not be confused with the quite separate classifications of languages by reference to their sharing certain predominant features of grammatical structure. Such classifications give rise to what are called typological classes.

In fulfilling the requirements of open-ended creativity imposed on language by human beings, grammatical structure has things in common in all known languages, particularly at the deeper levels of grammar. All known languages have words or wordlike elements combined in accordance with rules into sentences; all known languages distinguish in some way nounlike and verblike sentence components; and all known languages have the means of embedding or subordinating one sentence within another as an included clause (*e.g.*, "the sun set" and "we returned home": "When the sun set we returned home"; "Joan was playing tennis" and "Joan twisted her ankle": "Joan, who was playing tennis, twisted her ankle," or "while she was playing tennis, Joan twisted her ankle"). Descriptive analyses of all the languages of the world have not yet been prepared, and, of course, there is information about only a minute number of those that are no longer spoken—namely, those few that were written. But there is enough known to make the assertion of such universal features as have been given with fair confidence. These are often referred to as language universals; their nature and extent is the subject of current discussion and research.

Within these very general guidelines, however, languages exhibit various types of structure. This can most readily be seen by comparing the relations between the forms of words and their syntactic functions in different languages. Such a comparison is the basis of three broad types of language that have been distinguished since the beginning of the 19th century. They are, in fact, more like characteristics than types, in that most languages contain traces of all three, in different proportions.

Broad types of language structure

Classical Chinese made little or no use of word-form variation, such as is found, for example, in Latin, for grammatical purposes. Sentence structure was expressed by word order, word grouping, and the use of specific grammatical words, or particles. Such languages have been called isolating or analytic. Modern Chinese languages are much less analytic than is often believed; probably, Vietnamese is the most fully representative of this type today. Some languages string together, or agglutinate, successive bits, each with a specific grammatical function, into the body of single words. Turkish is a typical agglutinative language: compare Turkish *evleri* "houses" (accusative case), in which *ev* is the root meaning "house," *-ler* marks plurality, and *-i* is the sign for accusative, with Latin *domūs,* in which *-ūs* combines the representation of accusative and plural without the possibility of assigning either category separately to one part of the word ending. Latin is in this respect an inflectional, or fusional, language. In a more extreme example, Latin *ī* "go!" cumulatively represents in one fused form the verb meaning "go," active voice, imperative mood, second person, and singular number, each a grammatically distinct category.

English, like many other languages, is representative of all three types. In its use of word order alone to distinguish grammatical differences ("the dog chased the cat"; "the cat chased the dog") it resembles Classical Chinese rather than Latin. In a word form such as "manliness," in which each bit can be assigned a grammatical function ("man" the basic noun, *-li-* the adjective formative, and *-ness* the abstract noun formative), it makes use of agglutination, whereas plurals such as "men" and "geese" and past tenses such as "came" and "ran" fuse distinct grammatical categories into a word form in which only arbitrarily can one allot some sound segments, or letters, to one and some to the other.

Assigning languages to different types in this way involves a delicate procedure of balancing one part of the grammar against another and deciding which type of structure predominates and how well the other types are represented. Languages predominantly of each of the types are found in communities at with all levels of civilization and with all types of culture.

Change in grammatical structures

In the course of transmission, grammatical structures change, just as do pronunciation and meanings, and in time the cumulative effect may be the transference of a language from one overall type to another, although it remains descended from the earlier language and therefore is just as much part of the same historical family. Latin is very different typologically from French in its grammatical structure, but French is nevertheless the form that Latin took in France in the course of time. In the matter of the grammatical relevance of word order, the absence of case inflections in nouns, and the use of verbal auxiliaries instead of single word tense forms, French is more like English, a distant cousin within the Indo-European family, than it is like Latin, its immediate progenitor (compare French *j'ai donné,* English "I have given," Latin *dedī*). The two sorts of language classification, historical and typological, serve different purposes and are differently based. Language families group languages together on the basis of descent; *i.e.,* unbroken transmission from an earlier common parent language. The evidence is, in the main, systematic correspondences among the shapes of words of similar meanings (*e.g.,* Greek *patēr,* Latin *pater,* French *père,* German *Vater,* English "father"). Languages are put into typological classes, with the reservation already mentioned, on the basis of certain overall similarities of structure irrespective of historical relations. Though these two classifications may coincide with some languages, as is the case to a great extent in the Bantu family, they do so only contingently; being based on different data and oriented differently, they do not logically or necessarily imply each other.

In a way, these two systems of classification involve the two most important aspects in which languages must be seen for them to be properly understood: as products of a continuous historical process and also as self-sufficient systems of communication in any one period. Both as a component of cultural history and as a central part of culture itself, language is able to reveal, more than any other human activity and achievement, what is involved in mankind's distinctive humanity. (Ro.H.R.)

BIBLIOGRAPHY. A bibliography for LANGUAGE is likely to overlap at least partially with the bibliography for LINGUISTICS. This bibliography draws attention to some books that may usefully be consulted without prior specialist knowledge, and that develop in further detail the major topics introduced in the article.

EDWARD SAPIR, *Language* (1921), one of the most attractive books on language ever written; LEONARD BLOOMFIELD, *Language* (1933), longer and more technical than Sapir's book, but a classic work that remains unmatched in its breadth of coverage, though Bloomfield's treatment of semantics is now felt to be somewhat dated through his strict adherence to behaviourist principles; JEAN F. WALLWORK, *Language and Linguistics* (1969), a short, simple, and modern introduction to the study of language, and *Language and People* (1978), a brief discussion of the social dimensions of language; HERBERT H. and EVE V. CLARK, *Psychology and Language* (1977), an introduction to theories of language acquisition; DWIGHT L. BOLINGER, *Aspects of Language* (1968), very useful wide-ranging survey of current approaches to the subject; DAVID ABERCROMBIE, *Elements of General Phonetics* (1967), and PETER N. LADEFOGED, *A Course in Phonetics* (1975), excellent introductions to the linguistic study of human speech; JOHN LYONS, *Introduction to Theoretical Linguistics* (1968), deals with linguistics rather than with language, but is an important textbook that introduces the reader to some of the most significant developments in the theory of grammar and semantics, as does the same author's later work *Language and Linguistics: An Introduction*; N. MINNIS (ed.), *Linguistics at Large* (1971), a collection of papers on different aspects of language, several of which treat at greater length some of the topics mentioned in the article; ROBERT H. ROBINS, *A Short History of Linguistics*, 2nd ed. (1979), a brief historical account of the study of language from antiquity to the present day. DELL HYMES (ed.), *Language in Culture and Society: A Reader in Linguistics and Anthropology* (1964), contains a number of useful articles on the relations between language and man's life in society. ROY HARRIS, *The Language Myth* (1981), explores the relations between language and thought; GEORGE A. MILLER, *Language and Speech* (1981), tries to explain language from the point of view of biology; ERIC WANNER and LILA R. GLEITMAN (eds.), *Language Acquisition: The State of the Art* (1982), researches how children acquire language; HANS AARSLEFF, *From Locke to Saussure: Essays on the Study of Language and Intellectual History* (1982), challenges established language theories; DAVID LIGHTFOOT, *The Language Lottery: Toward a Biology of Grammars* (1982), examines the place of language in the system of human cognition and perception; JEREMY CAMPBELL, *Grammatical Man: Information, Entropy, Language, and Life* (1982), addresses language and information theory; DEREK BICKERTON, *Roots of Language* (1981), examines origins of languages; and GRAHAM D. MARTIN, *The Architecture of Experience: A Discussion of the Role of Language and Literature in the Construction of the World* (1981), is a special study.

Languages of the World

Languages may be classified either genetically or typologically. A genetic classification assumes that certain languages are related in that they have evolved from a common ancestral language. This form of classification employs ancient records (such as those for Latin) as well as hypothetical reconstructions of the earlier forms of languages, called protolanguages. Because information on the genetic affiliations of languages is sufficiently extensive, world surveys of languages are necessarily oriented in that way—sometimes exclusively so and sometimes in conjunction with typological classifications. Typological classification is based on similarities in language structure. There is not enough known concerning individual frames of reference in language typology to permit a worldwide typological classification.

Before the conclusive demonstration that unwritten languages could be classified genetically, they were often relegated to a typological classification, which at one time was denigrated by scholars. Since 1917, however, the prestige of some kinds of typology has risen—in particular, that of grammatical typology. The best known typological frame of reference represents the grammar of a language, either as a whole or as a subsystem. Once a genetic classification has been established, typological classification may be superimposed on it in order to show change of language type, as from a predominantly inflectional language (*e.g.,* Proto-Germanic) to a predominantly isolating one (modern English), or to show features that are shared by languages in neighbouring branches in the same family (*e.g.,* Celtic and Germanic in Indo-European). The ultimate grammatical typology is that which treats subsystems that are, in some sense, universal to all human languages.

Lexical typologies, based on similarities in vocabulary structure, have been used in cognitive anthropology and psycholinguistics (*e.g.,* perception of colours and use of colour terms). The sociolinguistic frame of reference in typology provides classifications for varieties of language in terms of their functions and their ways of identifying social groups and cultural spaces; in addition, it brings order and integration to problems concerning national standards that are faced by new nations that have many nonstandard and nonwritten languages as well as languages that make use of writing.

A few points of terminology should be explained before surveying and classifying the world's languages. Language family is the label often used for a conservative genetic classification, one that can be attested only when an abundance of cognates (related words) is available. Phylum is the label for a liberal genetic classification that is attested with fewer cognates; it encompasses language families. Although a given phylum will have greater extension than any of the families included in it, only fragments of phonology will be reconstructable in the protolanguage. In actual linguistic usage, however, the term family is often employed to refer to a phylum; *e.g.,* the Hamito-Semitic family, the Sino-Tibetan family.

The label language isolate is used for a language that is the only representative of a language family, as Basque or the extinct Sumerian language; the presumptive but unknown sister languages of isolates are dead and unrecorded. A language isolate may be classified, along with normal language families, under the rubric of an extensive phylum (*e.g.,* Korean is sometimes classified as a member of the Ural-Altaic phylum) or left wholly unclassified (*e.g.,* Ainu in Japan). The label pidgin-creole is used for a language that has had so much vocabulary change that cognates for reconstructing the protolanguage from which it descended cannot be found. A pidgin is a contact language used for communication between groups having different native languages. When a pidgin becomes the native language of a community it is customarily called a creole.

This article begins with a survey of world languages based on geographical regions of unequal size: huge and sprawling areas for the peripheral regions of Africa, Oceania, and the Americas but relatively compact areas for the focal regions within the Euroasiatic world. Nine regions—six in Eurasia, in all of which writing and standard languages are widespread—constitute a convenient basis for comparison and contrast. The larger part of the article consists of more detailed examinations of the languages of the world arranged by genetic affinities.

This article is divided into the following sections:

INTRODUCTORY SURVEY

LANGUAGES OF EUROPE

The great majority of the languages spoken in Europe are of Indo-European and Uralic (especially Finno-Ugric) affiliation. In terms of numbers of speakers, the people in Europe who speak the languages of these families are now fewer than those in non-European countries who also speak such languages. If a language is to be localized primarily in the region in which most people speak it, then Europe is no longer the chief locale of Spanish, for example, but rather Latin America.

An unusually small degree of genetic diversity is found among European languages: there are fewer language families in Europe than in any other continental-sized region of the world. In addition, literary traditions that have resulted in the preservation of earlier forms of present-day languages are found to a high degree among these languages. Every European language with a writing tradition has developed at least one standard that is recognized nationally, and the national standard often coexists with recognized regional standards.

A few European languages are used internationally, as lingua francas, but there is a low degree of pidgin-creole usage in Europe today.

Typological classifications have been superimposed on genetic classifications of European languages in particular. For example, the Italic branch of Indo-European languages may be grouped with the Greek, Celtic, and Germanic branches on the basis of certain structural features, as can Armenian with Greek and Indo-Iranian, and so forth.

Variables in determining the number of separate languages

Indo-European languages. The languages of seven of the nine extant branches of the Indo-European language family are spoken in Europe. Variability in determining the number of particular languages reflects variation in the criteria used (*e.g.,* mutual intelligibility between neighbouring dialects, known common or separate history versus sociocultural factors such as separate literary traditions or status as national languages of politically independent units), as well as the time period for which the criteria are applied. Thus, for example, it is possible to say on linguistic grounds that there are nine extant languages in the Romance subgroup of the Italic branch: Portuguese, Spanish, Catalan, French, Romansh, Ladin, Friulian, Italian, and Romanian. In applying the criterion of separate literary tradition, the list would be expanded by the addition of Provençal and Sardinian. To apply the criterion of status as a national language would reduce the list because Ladin, Friulian, Provençal, and Sardinian are not national languages; but the picture is complicated by the fact that Sardinia was once politically independent, and Andorra, in which Catalan is spoken, has not always been independent.

Similar difficulties in counting separate languages exist for all the branches in which several languages are spoken. In terms of areas of high mutual intelligibility (which do not entirely reflect historical development), there are only five modern Germanic languages: English, Frisian, Netherlandic-German (including Afrikaans and Yiddish), Insular Scandinavian, and Continental Scandinavian. If literary tradition and national criteria are considered, the number is increased by the division of Netherlandic-German into Standard High German, Low German, Dutch-Flemish, Afrikaans, Luxemburgian, and Yiddish; the division of Insular Scandinavian into Icelandic and Faeroese; and the division of Continental Scandinavian into Norwegian (New Norwegian, or Nynorsk, and Dano-Norwegian, or Bokmål), Danish, and Swedish.

For the Slavic languages there are 13 literary standards, but between the nuclei formed by these norms there are scarcely any linguistic boundaries because transitional dialects connect adjacent areas. In terms of intelligibility and to some extent in terms of shared features, the Slavic literary norms can be grouped into three zones: East Slavic (Russian, Belorussian, Ukrainian), West Slavic (Polish, Kashubian, Low Sorbian or Lower Lusatian, High Sorbian or Upper Lusatian, Czech, Slovak), and South Slavic (Slovene, Serbo-Croatian, Macedonian, Bulgarian).

Language boundaries are more clear-cut for the modern living languages in the remaining European branches of Indo-European: Celtic (the physical separation of the speakers of the languages contributes to the separate identification of Welsh, Breton, Irish Gaelic, and Scottish Gaelic), Baltic (the literary and political separation coincide with the separation of Lithuanian and Latvian), Greek (the separate historical development and lack of mutual intelligibility separate Modern Greek from Tsakonian), and Albanian (the political unity of Albania contributes to the single-language identification of its two divergent dialects).

Dialects of two languages in the Indo-Iranian branch of Indo-European are or were also spoken in Europe: the Jassic dialect of Ossetic, an Iranian language, formerly spoken in Hungary; and the European dialect of Romany, which was spread by Gypsies all across Europe and into America. It may be, however, that only in Wales, Finland, and the Balkans does Romany still serve as a native language.

Extinct languages

A number of earlier Indo-European languages that died out without descendants are known from written records and comments by contemporaries; these include several in the Italic branch (as Oscan, Umbrian, Faliscan, Venetic), at least two in the East Germanic group (Gothic and that spoken by the Burgundians, Vandals, and others), and three in the Celtic branch (Gaulish, Cornish, and the only recently extinct Manx). The classification as Indo-European or non-Indo-European for many other extinct languages remains uncertain because of the scarcity of data; *e.g.,* Pictish spoken in Great Britain. One form of Minoan, that represented by the Mycenaean Linear B syllabary, was shown to be an archaic Greek dialect when deciphered.

For more information on the Indo-European languages of Europe, see below *Celtic languages; Italic languages; Romance languages; Baltic languages; Slavic languages; Germanic languages; English language; Albanian language.*

Finno-Ugric languages. In addition to the Indo-European languages, all but two of the languages of the Finno-Ugric branch of the Uralic family are also spoken in Europe. As in the case of Indo-European languages, variation exists in the enumeration of separate languages. For example, several varieties of Lapp are mutually unintelligible but are often classified as dialects of a single Lapp language. The various types have also been classified according to geographic areas or national boundaries (Norwegian, Swedish, Finnish, and Russian Lapp). In Baltic-Finnic, the Finno-Ugric subgroup most closely related to Lapp, the Finnish, Karelian, Veps, Ingrian, Estonian, Livonian, and Votic languages are often linked by transitional dialects between the central areas of a given pair. The other Finnic languages, Mari (Cheremis) and Mordvin, and both of the languages of the Permic subgroup (Udmurt, or Votyak, and Komi, or Zyryan) are spoken much further to the east, in the central area of eastern European Russia.

Geographic classifications

To the north of these, from the mouth of the Northern Dvina River eastward into North Asia there are speakers of Nenets (Yurak), a language belonging to the Samoyedic branch of Uralic. The remaining Finno-Ugric language of Europe, which belongs to the Ugric subgroup, is Hungarian. See below *Uralic languages.*

Other languages. *Maltese.* Maltese, spoken on Malta, is an Arabic dialect, so long isolated from other dialects of Arabic and so heavily influenced by Italian that the resultant loss of mutual intelligibility with other Arabic speakers might justify classifying it as a separate Semitic language.

Basque. Basque, spoken in the Pyrenees in Spain and France, is the only other living language of western Europe that does not belong to the Indo-European family. Numerous inconclusive attempts have been made to link Basque genetically with other languages. See below *Language isolates: Basque language.*

Turkic languages. In addition to Turkish, spoken by a number of people in Bulgaria and elsewhere in the Balkans, several languages of the Turkic language group (considered as a branch of the Altaic language grouping) are spoken entirely in eastern Europe. Chuvash, the most divergent Turkic language, is found mainly in the Chuvash Autonomous Soviet Socialist Republic, Tatar in the Tatar A.S.S.R. and adjacent areas and in Romania and Bulgaria, Bashkir in the Bashkir A.S.S.R., Gagauz in the Ukrainian S.S.R. and Moldavian S.S.R. and in the Balkans, and Karaim in the southern Ukraine and Lithuania (spoken by about 6,000 people). Most or all of the speakers of Crimean Turkish were removed to the Uzbek S.S.R. after World War II. See below *Altaic languages.*

Extinct languages. The existence of a number of long-extinct non-Indo-European languages of Europe is known through the records of the Greeks and Romans and also through the preservation of varying amounts of written records of them. The most extensive records are those in the still undeciphered Etruscan, which is known to have been spoken in Italy from the 8th century BC to the 4th century AD (see below *Language isolates: Etruscan language.* Several languages were spoken in the Iberian peninsula, of which Iberian (preserved in a few inscriptions and many coins) was spoken along the Ebro River and at one time as far east as the Rhône River. Also probably non-Indo-European was the language of the undeciphered Minoan Mycenaean Linear A inscriptions found on the island of Crete.

LANGUAGES OF SOUTH ASIA

The genetic classification of the languages of India, Bangladesh, Pakistan, and the border states (*e.g.,* Nepal, Sikkim, and Bhutan) includes two subgroups—Indo-Aryan (Indic) and Iranian—of a single branch of Indo-European (called Indo-Iranian), some indigenous language families (as Dravidian), a few language isolates (as Burushaski), and some Sino-Tibetan languages.

Indo-Iranian languages. Except for Romany and the few Dardic languages spoken in Afghanistan, all of the languages of the Indo-Aryan (Indic) subgroup of the Indo-Iranian branch of Indo-European are spoken in South Asia. It is difficult to identify language boundaries in the Indo-Aryan group because, between any pair of literary standards, "transitional" dialects grade into one another, with no clear-cut language barriers. The problem is further complicated by the enormous dialect differentiation in most of the Indo-Aryan languages. In terms of lack of mutual intelligibility between literary standards, there are more than 20 Indo-Aryan languages. Although Sanskrit is a classical Indo-Aryan language, preserved in writing, it also enters so deeply into the vocabulary of present-day languages as to become, in some cases, the salient mark differentiating two dialects of one language. Thus, Hindi of India differs linguistically from Urdu of Pakistan chiefly in that the former may be heavily Sanskritized in vocabulary and the latter not.

Indo-Aryan (Indic) languages

Ethnolinguistic loyalties may also increase the number of languages distinguished; *e.g.,* the separate recognition of Bengali and Assamese. Most of the Indo-Aryan languages are spoken by many millions of speakers; *e.g.,* Bengali-Assamese, West Hindi, Bihari, East Hindi, Marathi, Lahnda, Maithili, Gujarati, Oriya, Sinhalese (in Sri Lanka [formerly Ceylon]), Sindhi, and Nepali. There are also large numbers of speakers of Indo-Aryan languages (especially West Hindi) in South Africa, the South Pacific, and the American Guianas.

The languages of the Dardic subgroup differ sufficiently from the other Indo-Aryan languages as to be sometimes classified as Iranian rather than Indo-Aryan or as a separate sub-branch coordinate with the Indo-Aryan and Iranian sub-branches. Kashmiri, spoken in Jammu and Kashmir, is the only Dardic language with a literary tradition. Shina is also spoken in Jammu and Kashmir; other Dardic languages, which are spoken mostly in Pakistan, have relatively few speakers.

Speakers of at least four Iranian languages are also found in South Asia, including Pashto speakers in Pakistan and Baluchi speakers in Pakistan and India (see below *Indo-European languages: Indo-Iranian languages*).

Dravidian languages. Although the greatest concentrations of Dravidian speakers are in southern India, the more than 20 languages of this family are widespread in India, and one language, Brahui, is isolated in Pakistan, separated from its nearest sister language by 800 miles. Four Dravidian languages have long literary traditions and are spoken by many millions: Telugu, Tamil, Malayalam, and Kannada. Tamil speakers are also found in Sri Lanka, Malaysia, Indonesia, Burma, Vietnam, South Africa, and in scattered island and coastal areas around the world. Among other, less widespread Dravidian tongues of India are Gondi, Tulu, Kurukh, and Kui. No convincing remote relationships between the Dravidian family and other families have been proposed (see below *Dravidian languages*).

Munda languages. The 16 or so Munda languages are all spoken in India. Some scholars classify them as a separate language family; others point to similarities with certain languages of Southeast Asia and include them in an Austro-Asiatic grouping with Mon-Khmer, Vietnamese, and Nicobarese. Santali is the Munda language with the greatest number of speakers (a few million); Mundari, Ho, Sora, Kharia, and Korku have significantly fewer speakers (see below *Austro-Asiatic languages*).

Nehali, Khasi, Burushaski

Other languages. Nahali, spoken by a few hundred people in the Nimar District of Madhya Pradesh, and Khasi, spoken by about 500,000 people in the Khāsi and Jaintia Hills District of central Assam, may both be language isolates—*i.e.,* the sole known members of their families. Both seem to be remotely related to the Austro-Asiatic languages, however, and some scholars have tentatively classified Nahali as a Munda language. The other language isolate of South Asia, Burushaski, spoken by some 30,000 people in Pakistan, is without even remote known relatives.

Sino-Tibetan languages. Speakers of languages of most of the branches of the Sino-Tibetan language family are to be found in South Asia. All the languages of the Bodo (Bodo-Garo) branch of the Bodo-Naga-Kachin language group are spoken in Assam. Naga (Tangsa) languages are spoken in scattered locations from eastern Nepal into Burma. The Kachin languages are centred in north Burma, but some dialects are spoken in Assam, where there are also some speakers of Kukish (Kuki-Chin) languages and of Burmish (Burmese-Lolo) languages. Dialects of the various divisions of the Tibetan language are distributed from Kashmir to Bhutan and southward into India (*e.g.,* Balti, Sharpa, Lhoke, Spiti). Speakers of close to 50 Gyarung-Mishmi (or Himalayan) languages are found from northeastern India to northern Assam, with their greatest concentration in Nepal. There is some scholarly disagreement as to how the numerous Sino-Tibetan languages should be classified into branches and groups (see below *Sino-Tibetan languages*).

Tai languages. Some speakers of Khamti, a Tai language, live in Assam, where Ahom, another Tai language, is still used as a ceremonial language in religious rituals but is no longer spoken.

Use of English. In all parts of postcolonial South Asia, including Sri Lanka (formerly Ceylon), some people know English; these speakers, although relatively few in number, are the people most likely to travel to a state in which a South Asian language unknown to them is spoken. Hence, English is de facto the current interstate and international language of South Asia, although many Indians would prefer to adopt another language, such as Hindi or a Dravidian language, as the national language.

LANGUAGES OF NORTH ASIA

The languages of North Asia are those spoken from the Arctic Ocean to South Asia and China and from the Caspian Sea and Ural Mountains in the west to the Pacific Ocean in the east. In genetic classification, most languages of North Asia belong either to the Uralic family, to one of the three families of the Altaic language grouping (Turkic, Mongolian, and Manchu-Tungus) or to Indo-European. The genetic affiliations of the Paleosiberian languages, spoken exclusively in this region, are uncertain at present. Scholars have hypothesized that some of the languages may have once been American Indian languages whose prehistoric speakers backtracked from the New World into North Asia. That it is possible for pre-industrial man to go back and forth over Arctic waters is shown by the residence of those Eskimos who are now found on both the Russian and Alaskan shores of the Bering Strait. It has been claimed that all languages indigenous to North Asia, except the Paleosiberian ones and the recently intrusive Russian language, are genetically related in a Ural-Altaic phylum. This liberal classification is questioned by many scholars. Whether or not the three Altaic language groups are related to the Uralic languages, there is no doubt that all the so-called Ural-Altaic languages share many typological features, such as vowel harmony, agglutination (a type of word formation in which word elements are added together but still retain a separate, definite meaning), and a restriction against combining a plural noun with a quantifier (as though, in English, the plural noun "girls" had to appear as a singular noun in the phrase "five girl," rather than "five girls").

Ural-Altaic phylum

Uralic languages. Languages from two branches of the Uralic family are spoken in North Asia; their speakers are few in number. Two of the Ugric languages (the subgroup of the Finno-Ugric branch that includes Hungarian)—Mansi (Vogul) and Khanti (Ostyak)—are spoken on the Ob River and its southwestern tributaries. All of the languages of the Samoyedic branch are spoken in North Asia: Nenets (Yurak), speakers of which are scattered from the mouth of the Yenisey westward to the mouth of the Northern Dvina; Enets (Yenisey), also spoken around the Yenisey; Nganasan (Tavgi), spoken on the Taymyr Peninsula in Siberia; and Selkup (Ostyak), spoken south of Enets between the Taz and Tym rivers. Another southern Samoyedic language, Kamas (Sayan), had only one speaker in 1963 (see below *Uralic languages*).

Altaic languages. *Turkic languages.* The Turkic languages are remarkable for their lack of diversity in spite of their wide occurrence in all the Euroasiatic regions except South Asia and Southeast Asia. Several of the numerous Turkic languages might be considered as a single language if it were not for the fact that mutual intelligibility between groups is impaired by differential borrowing from the various unrelated languages encountered in different regions. Thus, a Turkish speaker from Turkey might understand or largely understand an Uzbek speaker with more ease than the Uzbek speaker would understand Turkish, which has many loanwords from Persian and Arabic. Educated speakers of Turkic languages are able to read books in other Turkic languages after some adjustment to their varying spelling conventions and sound correspondences. Because such differences are identified with different Turkic ethnic groups, it is customary to identify the larger of these ethnic groups as speaking different Turkic languages, although some degree of intelligibility exists between them, as it does between Uzbek, Bashkir, and Tatar. In addition, some languages have dialects that are transitional between two recognized language groups; *e.g.,* some dialects of Kara-Kalpak are said to be transitional to Turkmen, and others are said to be transitional to Uzbek.

Distribution of Turkic in North Asia

In North Asia, Turkic languages are distributed from the southern extension of North Asia northeastward through central Siberia and include Turkmen in the Turkmen S.S.R., Iran, and Afghanistan; Uzbek in the USSR, mostly in the Uzbek S.S.R., and in Afghanistan; Kirgiz in the Kirgiz S.S.R. and in neighbouring areas from Afghanistan to China; Kara-Kalpak in the Kara-Kalpak A.S.S.R.; and Kazakh in the Kazakh S.S.R. Six or seven Turkic groups immediately north of western Mongolia are much smaller both in terms of numbers of speakers and the area over which they spread; in northern Siberia the Yakut extend from the Yakut A.S.S.R. to include the dialect spoken to the west by the Dolgan. Other Turkic languages are spoken in Southwest Asia, Europe, and East Asia.

Mongolian languages. The Mongolian, or Mongol, languages are dispersed throughout Central Asia from Afghanistan to Manchuria, occupying large parts of North Asia and East Asia. The problem of recognizing language boundaries (*i.e.,* of distinguishing separate languages) in the Mongolian family is complicated by the fact that differences between dialects are exaggerated in areas where Mongolian speakers have borrowed features of different unrelated languages but are minimized in areas where one dialect is spoken as a lingua franca over a wide area. Among the Mongolian languages are Mogol, spoken in Afghanistan, where it has been influenced by Iranian and Turkic languages; Monguor, spoken in Kansu Province of China and in Tibet, with noticeable effects of both Tibetan and Chinese in the language (Paoan, spoken in Kansu Province, is linguistically close to Monguor, but may be a different language); and Daghur, spoken mainly in Inner Mongolia and heavily influenced by Tungus languages. Additional languages include Ordos in Inner Mongolia, Kharachin in China, Oyrat in the Sino-Russian border area from the Kirgiz S.S.R. to the Altai Mountains, and Buryat from the Buryat A.S.S.R. into Inner Mongolia. Some degree of mutual intelligibility exists between some of these, but this may in part be the result of the lingua franca use of Khalkha, the official language of the Mongolian People's Republic.

Manchu-Tungus languages. Speakers of the Manchu-Tungus languages are scattered from central interior Siberia to the shores of the seas of Japan and Okhotsk, including the Kamchatka Peninsula and Sakhalin Island. Those

Difficulties in Manchu-Tungus classification

not near the coast live generally along the banks of the major rivers—the Yenisey, Tunguska, Khatanga, Lena, Amur, and Sungari. Detailed information on most of the Manchu-Tungus languages is scanty, and language names usually coincide with politico-cultural groups, rather than being based on a comparison of linguistic features or knowledge of mutual intelligibility. Borrowing that resulted from contact with speakers of Samoyedic (Uralic) languages to the west and northwest, Mongolian languages and Chinese to the south, and the various Paleo-Siberian languages to the north and east has further complicated the subclassification of the Manchu-Tungus languages by increasing the superficial differences among them. Most speakers of Manchu-Tungus languages are bilingual in the official language of their country, and many are replacing their native languages by Russian or Chinese. After the Manchus in China, the next best known and numerous of the Manchu-Tungus peoples are the Evenks (whose name is sometimes applied as a generic term for all the Tungus tribes). Other groups include the Evens (or Lamuts), Nanais (or Golds), and other tribes with only 2,000 or fewer members. For more information on the Turkic, Mongolian, and Manchu-Tungus languages, see below *Altaic languages.*

Paleo-Siberian languages. Most of the so-called Paleo-Siberian people now live in northeasternmost Siberia in the area between the East Siberian Sea and the Sea of Okhotsk, including the Kamchatka Peninsula, and along the coast of the Sea of Okhotsk as far south as the Amur River, and on Sakhalin Island; peoples of another Paleo-Siberian group live far to the west along the middle and upper Yenisey River. The languages of the Paleosiberian people form four groups that are not only not related to each other but also have not been demonstrated to be related to any other genetic groups. The northernmost and most widespread of these linguistic groups and the only one that includes more than one living language is the Luorawetlan family, which consists of Chukchi, Kamchadal, and Koryak. Some scholars now classify Kerek and Aliutor as separate languages; these have otherwise been classified as dialects of Koryak.

The Yukaghir family includes one living language, Yukaghir (spoken by a few hundred people south of the Arctic Circle on tributaries of the Kolyma River and in the tundra between the Indigirka and Alazeya Rivers), and one language—Chuvantsy—that was spoken until the 20th century on the Anadyr River. Gilyak, spoken on Sakhalin Island and in the coastal and inland Amur River country of the mainland, has no known linguistic relatives. Ket (or Yenisey-Ostyak) is the only language of the Yeniseian or Yenisey-Ostyak family that is still spoken. The speakers of Ket live along the upper and middle Yenisey River, as did the speakers of its sister languages, Kott (Cottian-Manu), which became extinct in the 19th century, and Assan (Asan) and Arin, both of which became extinct in the 18th century (see below *Paleo-Siberian languages*).

Indo-European languages in northern Asia, in addition to Russian, introduced only relatively recently, include the Iranian languages in the southwestern extension of North Asia (Tadzhik Persian in the Tadzhik S.S.R. and Baluchi in the Turkmen S.S.R.) and the long-extinct Tocharian, which penetrated into Central Asia as far as Chinese Turkistan (see below *Indo-European languages: Tochavian language*).

Role of Russian and Soviet policy

Writing and literacy in North Asia. The earliest stimulus toward writing in North Asia was from China. The latest stimulus, from Soviet Russia, has brought literacy to those Altaic peoples whose languages were unwritten in tsarist times. In contrast to the written Altaic languages, the Paleosiberian languages in general remain preliterate. The Soviet educational policy is to encourage the use of native languages for education and for teaching preliterates to write. The standard form of writing Tadzhik, for example, is in the Cyrillic alphabet, and knowledge of this alphabet facilitates later learning of Russian, which is used for supranational communication in modern North Asia. Hence, Russian is the modern lingua franca for North Asia today. In the Mongol Empire of the 13th century, Turkic languages were used as languages of administration across North Asia from the Caspian Sea to Manchuria and, initially, in adjacent Euroasiatic regions conquered by Genghis Khan.

LANGUAGES OF SOUTHWEST ASIA

Languages spoken today in the area from Iran westward to the Mediterranean (in Iran, Iraq, Saudi Arabia, Jordan, Syria, Lebanon, and Israel) are Semitic, Indo-European, or Turkic. The languages in the two marginal sub-areas of Southwest Asia (in Afghanistan and in Turkey and the Caucasus between the Black and Caspian seas) far exceed the languages of Europe in genetic diversity.

At one time, Sumerian, now preserved in writing, was spoken as the first language of civilization in the ancient Near East; this language was neither Semitic nor Indo-European (see also *Sumerian language*). Early literary traditions and literacy for the elite began in this central area of Southwest Asia and extended from the Sumerian, Old Persian, and Akkadian literatures to Asia Minor (Hittite) in the north and to the Nile (Egyptian) in Africa. Akkadian and Persian seem to have been the first two languages put to wide international use.

Indo-Iranian languages. Almost all of the score of living languages of the Iranian subgroup of the Indo-Iranian branch of Indo-European are spoken in Southwest Asia and occasionally extend beyond into neighbouring regions. Persian has three separate literary standards that are not confined to the countries in which they centre (Iran, Afghanistan, and Tadzhik S.S.R.). More than half of the speakers of Pashto live in Afghanistan and the rest in South Asia. Kurdish is spoken in an area extending southward from southern Armenian S.S.R. into Turkey, Syria, Iran, and Iraq. Perhaps three-fifths of the speakers of Baluchi live in Iran and southern Afghanistan. Several other Iranian languages (or dialects) have many fewer speakers; these include Lurī and Bakhtyārī, spoken only in Iran, and Munjī and Shughnī, spoken largely in Afghanistan, with only a few of their speakers in Pakistan or the Tadzhik S.S.R. One Iranian language, Yaghnābī, is spoken only in the Tadzhik S.S.R. Three Iranian languages are spoken almost entirely in the Caucasus: Tat, Talysh (with some speakers in Iran), and Ossetic.

The Dardic subgroups

The half a dozen Nuristani (Kafiri) languages spoken in Afghanistan, sometimes classified as members of the Dardic subgroup of Indo-Aryan, have more recently been classified by some scholars as constituting a separate branch of Indo-Iranian. In addition, some Lahnda (Indo-Aryan) speakers also live in Afghanistan. Two very divergent dialects of another Indo-Aryan language, Romany, are spoken in Southwest Asia—Armenian Romany and Asiatic Romany (the dialect of the Palestinian Gypsies). For more information on the Iranian and Indo-Aryan languages, see below *Indo-European languages: Indo-Iranian languages.*

Other languages. The sole language of another branch of Indo-European, Armenian, is spoken predominantly in the Armenian S.S.R., Georgian S.S.R., and Azerbaijan S.S.R., but also in Syria, Lebanon, Iran, Turkey, and in communities of Armenians in the United States, Egypt, and France (see below *Indo-European languages: Armenian language*).

The long-extinct languages of the Anatolian branch of Indo-European, including Hittite, were once spoken in Southwest Asia (see below *Indo-European languages: Anatolian languages*).

Five Turkic languages are spoken primarily in Southwest Asia: Turkish, spoken in Turkey and surrounding countries largely to the north; Azerbaijani, spoken in the Azerbaijan S.S.R. and Iran; Kumyk, Karachay, and Nogay, spoken in the Caucasus. Three Turkic languages spoken predominantly in North Asia are also spoken in Southwest Asia: Uzbek, Turkmen, and Kirgiz.

One language of the Mongolian family is spoken in Southwest Asia—Mogol in Afghanistan; and Brahui, a Dravidian language, has a small fraction of its speakers in Afghanistan and Iran.

Caucasian languages. In addition to the Indo-European and Turkic languages spoken in the Caucasus, there are the over 30 languages belonging to three Caucasian language families. These may be remotely related to each other in a Caucasian phylum, in which the Northeast Caucasian family is more clearly related to the Northwest Caucasian family than the South Caucasian family is to either. Georgian, a South Caucasian language, is the most widely known Caucasian language, with speakers in the Georgian S.S.R., the Azerbaijan S.S.R., and adjacent parts of Turkey and Iran; it is the only Caucasian language with a long literary tradition. Other South Caucasian (Kartvelian) languages are Laz (Chan) and Svan. The Northwest Caucasian (Abkhazo-Adyghian) languages include Kabardian (Circassian), Abkhaz, Abaza, Adyghian, and Ubykh (almost extinct, now spoken by only a few people in Turkey). The approximately 25 languages of the Northeast Caucasian (Nakho-Dagestanian) family are spoken by people living mostly in the Dagestan A.S.S.R. These languages include Chechen, Ingush, Avar, Dargwa, Lakk, Lezgian, and Tabasaran, all of which (except Chechen and Avar) have fewer than 500,000 speakers. There is some scholarly disagreement concerning the classification of the Caucasian languages (see below *Caucasian languages*).

Semitic languages. Five Semitic languages are still spoken in Southwest Asia: Arabic; Hebrew, primarily in Israel; dialects of East Aramaic, still spoken in Israel, Syria, Iran, Iraq, and the Armenian S.S.R.; West Aramaic dialects, still spoken in Lebanon and Syria; and Modern South Arabic, spoken in southern Saudi Arabia and on nearby islands. Of the extinct Semitic languages, the best known are Phoenician, Akkadian (Babylonian and Assyrian), Moabite, and Ugaritic (see below *Hamito-Semitic languages*).

LANGUAGES OF EAST ASIA

Conservative versus liberal classification of the languages

Languages in East Asia are those traditionally spoken in China, Japan, and Korea; *i.e.,* those that occupy the region between North Asia and Southeast Asia. A conservative genetic classification reflects immense genetic diversity for East Asia by claiming that Ainu, Japanese, and Korean are neither related to each other nor to any other language in East Asia and that the Chinese languages (or dialects) belong in one family, Miao-Yao languages in another, and Tai languages in still another. A liberal genetic classification leaves Ainu isolated, includes Korean and Japanese in the Altaic family, and classifies some or all of the other groups as Sino-Tibetan.

Altaic languages. Languages from three of the major families of North Asia are spoken in China. Uighur, a Turkic language, is spoken in Sinkiang and Kansu Provinces of China as well as in the U.S.S.R. and southwestern Mongolia. Another Turkic language, Kirgiz, has some speakers in China. Manchu is the best known of the Manchu-Tungus languages and that with the longest literary tradition (dating from as early as 1599). After the Manchus established the last Chinese dynasty in 1643, their language was gradually replaced in most parts of China by Mandarin—except for formal and ceremonial occasions—but it is still spoken in scattered localities in Manchuria and in Chinese Turkistan.

Striking similarities in syntax have led some linguists to postulate a remote relationship between the Altaic languages and Korean and, less frequently, Japanese.

Korean, Japanese, and Ainu. Korean is spoken in Korea as well as by sizable populations in China and Japan (see below *Korean language*).

The Japanese language family includes, besides Japanese, several mutually unintelligible dialects spoken on the Ryukyu Islands by people who are bilingual in Japanese. Japanese is spoken by more than 121,000,000 people in Japan and by small groups in Taiwan, Brazil, and the U.S., especially in Hawaii (see below *Japanese language*).

Ainu, the remaining language in insular East Asia for which not even a remote relationship with other languages seems likely, is spoken by approximately 16,000 people on Hokkaido Island of Japan, on Sakhalin Island, and on the Kuril Islands.

Chinese language (dialects). Most important in terms of numbers of speakers and their influence on the other languages in East and Southeast Asia are the Chinese languages (often called dialects). In terms of mutual intelligibility among adjacent dialects, there are several Chinese languages: Mandarin, Wu, Cantonese, Hsiang, Kan-Hakka, and Min (or North Min and South Min). Mandarin is the native language of over 70 percent of the Chinese and is spoken as a second language by many of the native speakers of the other languages, both Chinese and non-Chinese, in China. It has traditionally been the language of administration. Although speakers of two different Chinese languages may not be able to understand one another when they talk, communication between them is possible in writing; conversely, the same written message is read aloud differently by speakers of different Chinese languages. The functional advantages of Chinese writing explains its perseverance for four millennia, but these advantages are partly offset by the difficulties each generation must experience in learning the thousands of character signs that are needed for literacy. Traditionally most Chinese were supposed to be illiterate, but with simplified characters and romanization, the majority of the people in the People's Republic are now literate. The Chinese languages are notable for their enormous numbers of speakers, and Mandarin has the largest number of speakers of any of the world's languages (about 610,000,000 native speakers).

A remote relationship in one family (Sino-Tibetan) has been postulated for the Chinese languages and all the other non-Altaic families that have languages spoken in China. There is no doubt that all these languages bear many similarities to Chinese, but it is unknown to what extent such similarities might be the result of borrowing rather than common origin. A remote relationship in an Austro-Tai phylum has been proposed for two of these families (Tai and Miao-Yao) and Austronesian.

Remote relationships in East Asia

Tai and Miao-Yao languages. All of the languages of the Kam-Sui language group, which is related to the Tai family, are spoken in China (in Kweichow, Hunan, and Kwangsi Provinces), with some dialects extending into Southeast Asia. Speakers of Miao-Yao languages are scattered over south central China and extend into Vietnam, Laos, and Thailand. Dialects of the Miao language include Red Miao, White Miao, Green or Blue Miao, and the more divergent Black Miao. The Yao languages are Yao (also called Man or Mien), Laka, and Punu.

Tibeto-Burman languages. The Tibetan, or Tibetic, language group includes at least two Tibetan proper languages spoken in Tibet, Nepal, Sikkim, and India: Central Tibetan, including Lhasa, the standard dialect of Tibet, and Western Tibetan. In addition there are many other languages in Sikkim, Nepal, Assam, India, and Bangladesh that are closely related to Tibetan proper.

Languages that are more distantly related to Tibetan in a Tibeto-Burman branch of the Sino-Tibetan family are spoken in East Asia over the borders of Burma; these languages, often called Burmic, include dialects of the Burmese-Lolo (Burmish) subgroup (including Burmese) and the Kachin subgroup. For more information on the Chinese, Tibetan, and Burmic languages, see below *Sino-Tibetan language.*

Three general types of syntax, which partly overlap the liberal genetic classification, can be distinguished among languages in East Asia. First, Ainu is isolated syntactically as well as genetically. The second type is shared by Korean and Japanese. All Chinese languages are strikingly alike in syntax, and this third type is approximated among some non-Chinese languages of the Sino-Tibetan family and among some languages of Southeast Asia whose genetic classification is tentatively indeterminate.

LANGUAGES OF SOUTHEAST ASIA (INCLUDING AUSTRONESIAN)

Southeast Asia is generally taken to be a region that includes both a mainland subregion, south of China and east of India, and an insular subregion, which includes the insular half of Malaysia, all of Indonesia, and the islands of the Philippines. Virtually all the languages of insular Southeast Asia belong to a single language family—Austronesian (Malayo-Polynesian). Mainland Southeast Asia, on the other hand, has various representatives from the Austro-Asiatic, Tai, and Sino-Tibetan language groups. Hence, genetic diversity is greater in mainland than in in-

Genetic diversity in mainland Southeast Asia sular Southeast Asia. Austronesian languages extend out of Southeast Asia to the most distant culture areas in Oceania (Polynesia and Micronesia), where they are the only languages known aboriginally. One modern Austronesian language (Malagasy) is even spoken on the African side of the Indian Ocean in Madagascar.

Curiously enough, it is in Melanesia, between the Bismarck Archipelago and New Hebrides, that the most diverse Austronesian languages are spoken today; this provides grounds for the conjecture that the Proto-Austronesian language was spoken there millennia ago and that the daughter languages diversified as their speakers migrated over half the world, with Malay and Cham backtracking eventually to the mainland of Southeast Asia, out of which the ancestors of Proto-Austronesian speakers must have come.

In general, the name of the country and the name of the national language are the same in both insular and mainland regions of Southeast Asia. Thus, Pilipino (based on Tagalog) is the name of the national language of the Republic of the Philippines, even though Pilipino is learned as a second language by most Filipinos. The fear in all of Southeast Asia of indirect neocolonial domination motivates continued distrust of the old languages of colonialism—English, French, Dutch, Spanish—and now also of Japanese and Russian. A pidgin-creole—Neo-Melanesian, or Melanesian Pidgin English—is used as a lingua franca by speakers of Austronesian and other languages from southern Papua through Melanesia into Micronesia.

Though the languages in the mainland subregion of Southeast Asia are genetically diverse, they show widespread ranges of the same typological features, such as the use of distinctive tones and classifiers, among unrelated or remotely related languages.

Mon-Khmer languages

Austro-Asiatic languages. The Mon-Khmer group includes more than 50 languages—more than any other family that is centred primarily in or entirely in Southeast Asia. Mon-Khmer languages are spoken from Burma to Vietnam. In Cambodia, Khmer (Cambodian) is the official language; its speakers are also found in Thailand. Mon is also spoken in Thailand as well as in Burma.

The language of mainland Southeast Asia with the greatest number of speakers is Vietnamese, spoken in Vietnam and by smaller numbers of speakers in Cambodia, Thailand, and Laos. Muong, spoken in the central highlands of northern Vietnam, is recognized as a separate, but related, language.

Classified by some scholars as a northern group of Mon-Khmer languages are several languages spoken in Burma (east of Mandalay), northwest Thailand, northern Laos, and to a lesser extent in northern Vietnam and in China. These are sometimes classified by others as a separate Palaung-Wa, or Salween, family, including Khmu, spoken in Laos and extending into Thailand, and Palaung, spoken in Burma.

Three small groups of related languages in Malaya (sometimes called Malaccan) are considered to be related to the Austro-Asiatic languages. They are the Jahaic, or Semang, languages, spoken in the inland area of northern Malaya and across the border in Thailand; the Senoic, or Sakai, languages, with speakers south of Kuala Lumpur on the coast and inland further south; and the Semelaic, or Jakun, languages, spoken south of the Senoic languages (see below *Austro-Asiatic languages*).

Tai and Sino-Tibetan languages. At least a dozen languages of the Tai language family are spoken in Southeast Asia: Thai, or Siamese, in Thailand; Lao, in Thailand, Laos, and Cambodia; Yuan, in Thailand; Shan, in Burma; Black Tai (Tai Noir), in Laos and Vietnam; Khün and Khamti, in Burma; and White Tai (Tai Blanc), Tay, Nung, Tho, and Kelao (Ch'i-lao), all in Vietnam.

Over 9,000,000 Chinese are distributed throughout Southeast Asia; of these, more than 5,000,000 are in Thailand, 4,000,000 in Malaysia, and smaller numbers in Burma, Cambodia, Vietnam, 54,000 in 1979 and Laos.

Of the other language groups in the Sino-Tibetan family in Southeast Asia, the Burmese-Lolo (Burmish) group has the widest distribution and the greatest number of speakers. Burmese is spoken as a second language by perhaps 90 percent of those in Burma who have another first or native language. The Lolo languages are spoken in Burma, Thailand, Laos, and Vietnam; they include Lisu, Lahu, Akha, Mung, Punoi, Pyen, and others, a few of which extend into Assam. Karen languages are spoken in Burma and Thailand and include Sgaw, Pho, Pa-o (or Taungthu), and Palaychi. Most of the languages of the Kuki-Chin (Kukish) group are spoken in Burma. Kachin languages are also spoken in Burma (see below *Sino-Tibetan languages*).

Nicobarese and Andamanese

Insular language groups. In insular Southeast Asia one small language group, Nicobarese, consisting of the languages spoken on the Nicobar Islands, is, in a liberal classification, classified as Austro-Asiatic. The other insular family, Andamanese, consisting of the languages spoken on the Andaman Islands by perhaps fewer than 200 people, has only recently been supposed to be remotely related to the Papuan languages of Melanesia.

Austronesian languages. There are perhaps 500 languages in the Austronesian (Malayo-Polynesian) family, spoken in Malaysia and the Indonesian archipelago; the Philippines; parts of Vietnam, Cambodia, and Taiwan; on the main island groups of the South and Central Pacific; on New Guinea; and on Madagascar. According to one classification, these languages include, in addition to small subgroups, at least two large subgroups: Western Austronesian (or Indonesian) and Eastern Austronesian (often called Oceanic), which includes the Polynesian languages and some of the Melanesian and Micronesian languages. Those Austronesian languages spoken on the Southeast Asian mainland (Malay in Malaysia, Cham and eight other languages mostly in Vietnam, with speakers of some of them also in Cambodia) belong to a Western Indonesian subgroup, which includes Javanese, Sundanese, and Malay, including Bahasa Indonesia, the national language of Indonesia. Closely related to the Western Indonesian subgroup is the subgroup comprising around 100 languages of the Philippines and a few languages of northern Borneo and northern Celebes (including Tagalog, which includes Pilipino, the national language of the Philippines, and Cebuano, Hiligaynan, and Ilocano). Classed with the West Indonesian and Philippine languages are a small group of languages of Celebes (*e.g.,* Buginese and Makasarese), a few languages of Borneo, and Malagasy (used on Madagascar).

Languages of Polynesia

The languages of Polynesia, including Maori in New Zealand, Tongan, Tahitian, and Hawaiian, form a subgroup that is part of a larger Eastern Oceanic subgroup of over 100 languages, which includes besides the Polynesian languages such languages as Fijian and a number of languages of the Solomon Islands. At least seven of the languages of Micronesia (including Gilbertese, Trukese, and Ponapean) form another subgroup. There are more than 100 Austronesian languages in New Guinea and more than 100 Austronesian languages, not counted as Eastern Oceanic, that are spoken on smaller islands of Melanesia. Those few with as many as 10,000 speakers are all used as lingua francas in wider areas than those of their native speakers (Dobu in the D'Entrecasteaux Islands, Banoni in southwestern Bougainville, Panayati in the Louisiade Archipelago). Among the Austronesian languages still spoken on Taiwan are Ami, Atayalic, Paiwan, and Bunan. There is some scholarly disagreement concerning the classification of the Austronesian languages (see below *Austronesian languages*).

NON-AUSTRONESIAN LANGUAGES OF OCEANIA

In effect, the non-Austronesian language areas of New Guinea and Australia together constitute a wedge in the midst of three Austronesian areas: Polynesia to the east, Micronesia to the north, and Indonesia to the west. A few non-Austronesian languages are found on the Indonesian islands nearest to New Guinea (on Halmahera as well as on Timor and Alor).

An exceptionally liberal genetic classification claims that the many non-Austronesian languages in Melanesia and the few in Indonesia all belong to one phylum. Conservative classifications recognize several or even many different language families and avoid the older name for them (Papuan), because it might suggest either that the unrelated families of non-Austronesian languages are branches of one Papuan family or else that non-Austronesian languages are found only in New Guinea (where Papua is the name of a country). On the other hand, no classification is challenged when it is said that all Australian languages are ultimately related and that they are related neither to Austronesian nor to non-Austronesian languages outside of Australia.

Multilingual societies of Melanesia

In Melanesia, in essence the non-Austronesian world beyond Indonesia, there is much contact between Austronesian and non-Austronesian languages. Many of the Melanesian societies are multilingual, especially those in New Guinea; in addition to their native language, speakers often learn a few secondary languages—those of their immediate neighbours or, most frequently, Neo-Melanesian (a pidgin-creole with an English-based lexicon), or both. In part of Papua, New Guinea, Police Motu, a pidgin based on an Austronesian language, is used as a lingua franca far beyond the territory of the few thousand native speakers of Motu. In Australia the same interest in mastering a multiplicity of languages is widespread, and Aborigines have developed another English-based pidgin-creole, quite different from Neo-Melanesian. Another parallel between Australian languages and the non-Austronesian languages north of Torres Strait is the disinclination of both to recognize or develop any one dialect of a language as a standard.

Papuan languages. About 740 Papuan or non-Austronesian languages extend from the Santa Cruz Islands north and west into the Solomons and the Bismarck Archipelago, across New Guinea to Halmahera, Timor, and Alor. Until the late 1950s all discussions of the languages of New Guinea that treated more than small, closely related groups of languages stressed the fact that the hundreds of languages spoken in a comparatively small area seemed to be completely unrelated to each other except for a few groups of immediate neighbours. Until then, little was actually known about more than a few of the languages of New Guinea. This situation was changed in the 1960s, with the publication of further survey work in the Highlands Provinces, which stated explicit relationships among a large group of languages.

Since the initial recognition of this fairly large group of related languages in the Highlands, called the East New Guinea Highlands phylum, more and more languages of New Guinea have been found to be at least remotely related to it (in a Central New Guinea phylum). It must be kept in mind, however, that it is difficult to enumerate languages and families among the Papuan languages because too little information has been obtained for most of the languages to identify language boundaries or make possible detailed comparisons. There remain a number of families and isolated languages that seem not to be related to other Papuan languages. A new liberal classification presented by the U.S. linguist Joseph Greenberg in 1971, however, treats all the Papuan languages as genetically related in an Indo-Pacific phylum, which also includes Andamanese. Most Papuan languages are spoken by only a few hundred to a few thousand speakers (see also *Papuan languages*).

Indo-Pacific phylum

Australian aboriginal languages. All of the aboriginal languages of Australia are remotely related to each other. A few dozen of the 260 or so Australian languages still spoken account for 90 percent of the total number of speakers; these include the Aranda languages, Tiwi, Walbiri, and Western Desert, two languages spoken by over a score of separately named small groups scattered over a territory 900 miles long. Scores of languages are now spoken by fewer than six people each. The greatest diversity among the languages is found in extreme northern and northwestern Australia (Arnhemland and the Kimberley District); a single remaining family (Pama-Nyungan), with 177 languages, is distributed over the rest of Australia (see below *Australian Aboriginal languages*).

In grammatical typology the non-Austronesian languages north of Torres Strait are heterogeneous, while the Australian languages are syntactically homogeneous and almost identical in patterns of sound combinations. Both Australian languages and non-Austronesian languages have dialects that are linked in a chain such that speakers at either end do not understand the vocabulary of speakers at the other end, although speakers of adjacent dialects can understand each other.

The two or more languages that were spoken on Tasmania until the later part of the 19th century are not related to Australian languages, but may belong to the Indo-Pacific phylum.

LANGUAGES OF AFRICA

European languages in Africa

Languages that came into Africa from another homeland include, among others, all the European languages associated with 19th-century colonialism. Although the majority of countries in Africa regained their freedom in the 1960s, they continue to use the European languages of the colonial period along with the numerous languages indigenous to Africa. Languages from Southwest Asia preceded the languages of European colonization: migrations of peoples to North Africa brought the Ethiopians almost three millennia ago and the Arabic speakers many centuries ago. The Phoenician circumnavigation of Africa in ancient times left traces—Phoenician coins—on the coasts but none in the interior. And long ago migrants from Indonesia reached Madagascar, 250 miles off the African coast. Before and during the colonial period, Arab and Indian traders reached East Africa, where today a few Indo-Aryan languages are spoken among Asian businessmen. The interior of Africa was not known to any non-Africans before the colonial period, but its prehistory can now be partially reconstructed. For example, there is evidence that the homeland of the protolanguage of the numerous Bantu languages was in Cameroon or an adjacent area in West Africa (or in both areas); that a prehistoric migration brought the Bantu speakers to Central and East Africa; and that these Bantu forced the speakers of Bushman and Hottentot languages to leave their homeland around Lake Victoria and move south to the Kalahari.

In all the postcolonial nations today, either English or Arabic or French serves both as an international language and as a functioning national language. The question still unresolved for many African nations concerns which of their indigenous languages to develop through writing and to standardize as the official language or languages of education and of the political state. The numerous pidgin-creoles, as Krio, are recent and colonial in inspiration; Sango in the Central African Republic is surely indigenous but not so surely a pidgin-creole. Most of the dozen or so languages used in trade, as Swahili in East Africa and Hausa in West Africa, tend to have great changes in vocabulary like pidgin-creoles, but they are not classified as pidgin-creoles; instead they are varieties of normal languages that function as lingua francas. Lingua francas of one sort or another are a prerequisite for the markets found throughout tribal and peasant Africa.

Despite the genetic diversity in South Africa and the even greater diversity in West Africa, a part of each of these subregions can be shown, on the basis of typology, to be a linguistic area. Thus, most linguists have found that most languages in West Africa distinguish vocabulary items and word elements by tone; in South Africa the clicks characteristic of Khoisan languages are also found among neighbouring Bantu languages like Xhosa and Zulu. The early use of typology to anticipate genetic classification, however, led to the claim that Africa was full of mixed languages—*e.g.,* Mbugu in Tanzania. But Mbugu, despite having borrowed Bantu prefixes and culture words from Bantu, can be shown to have a single line of origin—to have descended from a single protolanguage (Proto-Cushitic)—on the basis of its grammatical constituents (pronouns and verb forms) and basic vocabulary items that are cognate with other Cushitic languages.

Five branches of the Hamito-Semitic language family in Africa

Hamito-Semitic languages. The Hamito-Semitic (Afro-Asiatic) language family (considered a phylum by some) includes five branches spoken across North Africa from Mauritania to Somalia and beyond into Southwest Asia: Chadic, Semitic, Cushitic, Berber, and the now extinct Egyptian-Coptic. The Chadic branch consists of over 100 languages spoken in Nigeria, Niger, Cameroon, Ghana, Chad, and the Central African Republic. By far the most widespread is Hausa, estimated to be spoken by as many as 22,000,000 people, for many of whom it is a second language.

Five Semitic languages are spoken in Africa, if modern colloquial Arabic is counted as a single language throughout its range across North Africa and the Arabian Peninsula and if Gurage in Ethiopia is also counted as a single language. The Semitic languages in Ethiopia include Amharic, Tigrinya, Tigre, and Gurage (but the people grouped as Gurage may be speaking several separate languages).

Cushitic languages are spoken in Ethiopia, Somalia, The Sudan, Tanzania, and Kenya. The languages with the greatest number of speakers are Gallinya in Ethiopia, Somali in Somalia and Ethiopia, Sidamo, Hadya, and Afar-Saho. Some scholars consider a group of languages traditionally classified as Cushitic to be a separate branch of Hamito-Semitic, called Omotic. Spoken in Ethiopia, they include Walamo, with far more speakers than the other Omotic languages, Ari, Shako, Zaysse, and others with only a few thousand or a few hundred speakers.

The languages of the Berber branch are spoken from the western desert of Egypt west to the Atlantic and extend to Senegal on the coast and to northern Nigeria in the interior. One language that may have been Berber, Guanche, was formerly spoken on the Canary Islands. Berber languages include Shluh, spoken in Morocco; Tamashek (Tuareg) in Algeria, Libya, Niger, and Mali; and Tamazight in Morocco and Algeria (see below *Hamito-Semetic languages*).

Nilo-Saharan languages. The Nilo-Saharan languages in central interior Africa include the Chari-Nile languages and others that are not closely related to each other or to the Chari-Nile group. (The validity of this grouping has been questioned.) The largest Chari-Nile division, Eastern Sudanic, includes more than 60 languages spoken from Chad to Kenya and Tanzania; it includes a group of languages often classified as a separate family or branch (Nilo-Hamitic), which appears in some classifications in the Hamito-Semitic family rather than the Nilo-Saharan.

Among the major Eastern Sudanic languages are Teso in Uganda and Kenya, Dinka in The Sudan, Luo in Kenya and Tanzania, and Lango in Uganda. Only three of the 30 or so languages of the Central Sudanic subgroup of Chari-Nile are spoken by groups of about 100,000 people: Sara in Central African Republic and Chad, Lugbara in Uganda and Zaire, and Mangbetu in Zaire.

Among the Nilo-Saharan languages that are not classified as Chari-Nile is the Saharan group. Kanuri, its largest member, is spoken by more than 4,000,000 people in Nigeria, Niger, Cameroon, and Chad. In the Maba group, Masalit is spoken by 60,000 people in The Sudan. Songhai, often classified as a language isolate, is spoken by 1,000,000 people in Niger, Mali, Upper Volta, Nigeria, and Benin (Dahomey). Fur, also sometimes considered as an isolate, is spoken by about 400,000 people, mostly in The Sudan.

Niger-Congo languages. Languages in the Niger-Congo (or Niger-Kordofanian) family are spoken all across Africa from Mauritania to Kenya and south into South Africa. There are almost 900 Niger-Congo languages, which have been classified into six genetic subgroups. The Bantu languages (of the Benue-Congo subgroup) far outnumber those of any other family in Africa, both in terms of number of languages and in terms of total number of speakers (160,000,000). Fifteen Bantu languages are each spoken by more than 3,000,000 people; the following each have more than 5,000,000 speakers: Rwanda, Shona, Kongo, Luba-Lulua, Xhosa, and Zulu. Other subgroups in the Niger-Congo family include only a few dozen languages, as those in the Mande subgroup in West Africa, which are spoken from Mauritania to Ghana (including Bambara, Mende, and Vai). The Gur (Voltaic) languages, spoken from Mali and the Ivory Coast to Nigeria, include Mossi, with 3,500,000 speakers, and numerous other languages with significantly fewer speakers. The West Atlantic languages, spoken from Senegal to Nigeria, include Fulani, spoken by 11,500,000 people, Wolof (over 2,000,000 speakers), Temne (over 1,000,000 speakers), and several other languages of less numerical import. Of the languages of the Adamawa-Eastern subgroup, spoken from The Sudan to Cameroon, only Sango, through its use as a lingua franca, may be known by more than 1,000,000 people. The Kwa subgroup of Niger-Congo includes Twi (Akan; 9,000,000 speakers), Yoruba (in Nigeria and extending into Dahomey; 18,000,000 speakers), and Igbo (also known as Ibo; in Nigeria; with 15,000,000 speakers). Some scholars link the Kordofanian languages of North and South Kurdufān provinces in The Sudan with the Niger-Congo languages in a Niger-Kordofanian phylum.

Bantu languages

Khoisan languages. The Khoisan family consists of about four dozen languages spoken in southern Africa and two click languages (Sandawe and Hadza) spoken in Tanzania that are not closely affiliated with any one group in the Khoisan family. Uncertainties in the number of languages and the number of language groups arise from the profusion of labels for various groups and the lack of detailed linguistic comparisons among large numbers of them. Most of the Khoisan languages have been considered to be on the verge of extinction, if not known to be already extinct, but recent estimates of the numbers of peoples grouped on the basis of their culture (Hottentot and Bushman) show many thousands of speakers. The Khoisan language estimated to have the most speakers is Nama, with about 130,000. For more information on the Nilo-Saharan (Chari-Nile), Niger-Congo, and Khoisan languages, see below *African languages.*

LANGUAGES OF THE AMERICAS

Languages indigenous to the Americas were brought from Asia by the forebears of modern American Indians (including Eskimos), who left Asia after the dog was domesticated but before other animals were domesticated. Something is known about the culture of these Indians but nothing about their languages, which are known only after contact with European languages.

European languages in the Americas

Today there are six European languages in the Americas that serve as languages of both education and government administration. (Several Indian languages, however, function in this dual role—Guaraní of Paraguay, Greenlandic of Greenland, and Quechua and Aymaran of Peru.) These official languages and their number of primary political divisions are Spanish (18), Portuguese (1), Dutch (2)—1 in Latin America and 1 in the Caribbean; English (2 in North America and 11 in the Caribbean); French (1 in North America and 3 in the Caribbean); and Danish (1 in Greenland). Before the colonial period in Latin America and during the first century or two of that period, the following American Indian languages could also be classed as official or semi-official: Nahuatl (Nahua), the language of the Aztecs in Mexico and Central America; Chibcha-Muisca in Colombia; Quechua, the language of the Incas, in the Andean area; Tupí in Brazil; and Guaraní in and around Paraguay. In addition to American Indian languages, two pidgin-creole languages are official in their own political divisions, Sranan (Taki-Taki) in Suriname and Papiamento in Curaçao. Other pidgin-creoles in the Caribbean, such as Haitian Creole, are being increasingly written.

Genetic diversity among languages of continental-sized areas can be expressed in terms of the number of minimum genetic classes taken as the usual basis for discussion by specialists of that area. Research may lead to a downward (or upward) revision, and a new number of minimum genetic classes is used as a basis for further discussion. For North America (north of Mexico) and for the 20th century, the basis for discussion has shifted three times so far: from about 50 families in the classification of the U.S. scholar J.W. Powell to six phyla in the classification of the U.S. anthropological linguist Edward Sapir, which was revised at the 1964 Conference on North American Indian Languages by splitting and reclassification (*e.g.,* of Sapir's Hokan-Siouan) and by merging (*e.g.,* the Muskogean family and a few isolates were added to Algonkian in the new Macro-Algonkian phylum). This third classification is summarized below. Proposals for a minimum number of genetic classes in South America range from more than 100 families to three phyla (in a recent liberal classification).

The Plains Indian sign language (hand talking) is still known, but Chinook Jargon and other pidgin-creoles in North America fell into disuse as soon as American Indians became bilingual in English, French, or Spanish.

North and Central American Indian languages. For North America north of Mexico, the summary of culture areas (before any American Indians were relocated by Europeans) by the U.S. anthropologist Harold E. Driver is a convenient basis on which to superimpose the various ways in which language classifications (genetic and typological) combine with cultures that are ecologically adapted to each of ten areas—the Arctic, Subarctic, Northwest Coast, Plateau, Plains, Prairies, East, California, Great Basin, and Southwest. The three variables (genetic, typological, and cultural) coincide approximately in the Arctic (the one language family, Eskimo-Aleut, does not include typologically diverse languages, but it does spread over a culture area that is not entirely homogeneous). In the Subarctic two language families are represented, Algonkian and Athabascan, which are distinct typologically as well as genetically. Northwest Coast and adjacent Plateau languages are genetically very diversified but surprisingly homogeneous in a diffusional kind of phonological typology. The languages in the treeless Plains and the midwestern Prairies are genetically and typologically diverse; all the language families represented, except Caddoan, are intrusive in the sense that their homelands lie outside the Plains and Prairie areas.

Ten culture areas of North American Indians

Language families in the East give an impression of a little typological similarity combined with considerable genetic diversity. On the opposite coast, California is surprisingly homogeneous in culture and in language typology but heterogeneous in genetic classification of languages. There are few languages and only two language families represented in the Great Basin, which is homogeneous in all respects. The adjacent Southwest is anomalous in all three variables considered here. Where it is culturally homogeneous, as between Pueblo societies, it is genetically and typologically diverse in language: four different language families are represented in Pueblo societies. Non-Pueblo societies of the Southwest are diverse culturally as well as linguistically.

Eskimo-Aleut. The three languages of the Eskimo-Aleut family are still spoken in their prediscovery areas from Greenland to Siberia and also on Komandor Island between the Aleutians and Kamchatka (see below *Languages of the Americas: Eskimo-Aleut languages*).

Athabascan. About 20 languages of the Athabascan family are still spoken in four different culture areas: the Yukon and Mackenzie areas of the Subarctic (the centre of Athabascan diversity, with 17 living languages, including Chipewyan-Slave-Yellowknife and Carrier), the Northwest Coast (where only Hupa, Tolowa, and Chasta Costa may still be spoken), the Southwest (where the Navajo dialect of what may be considered a single Southwestern Apachean language has more speakers than any other Indian language north of Mexico), and the Plains (where two Athabascan languages are more recently intrusive—Sarcee [Sarsi] from the Subarctic and Kiowa Apache from the Southwest). Three language isolates spoken in the Northwest Coast (Eyak, Tlingit, and Haida) are remotely related to Athabascan in the Na-Dené phylum, but Eyak is so much more closely related to the Athabascan family that it might be considered a divergent member of the family.

Algonkian. The Algonkian family includes 13 languages still spoken, which belonged in the culture areas of the eastern Subarctic (*e.g.,* Cree, Ojibwa, Micmac, Malecite), the Prairies (*e.g.,* Fox, Potawatomi), the Plains (*e.g.,* Blackfoot, Cheyenne, Arapaho), and the East (where most Algonkian languages became or are now becoming extinct, with only the removed Shawnee and Delaware surviving in Oklahoma). Remotely related to the Algonkian languages in a Macro-Algonkian phylum are languages spoken further to the south in the East—the Muskogean family (including Choctaw-Chickasaw and Creek-Seminole) and several language isolates that are no longer spoken, as well as two almost extinct languages of the Northwest Coast that are more closely related to Algonkian (Wiyot and Yurok).

Macro-Algonkian phylum

Macro-Siouan. The Macro-Siouan phylum is named for its most extensive component, the Siouan family, the extant languages of which belong in the Plains and Prairies, including Dakota, Crow, Winnebago, and Omaha-Osage. (The Siouan languages of the East, such as Ofo and Biloxi, are no longer spoken.) Less widely distributed than Siouan is the Iroquoian family (six languages, largely of the East, including Cherokee and Mohawk), the Caddoan family (Caddo in the East, Wichita and Pawnee in the Prairies), and two language isolates of the East (Catawba and Yuchi), more closely related to Siouan than to the other families in Macro-Siouan.

Hokan. The Hokan phylum includes several small families and a number of language isolates scattered from the Northwest Coast through California, with extensions into the Great Basin and the Southwest, and as far south as Meso-America. Hokan languages spoken by the greatest numbers of speakers include those in two families in Mexico, the Tlapanecan and Tequistlatecan, and in the Yuman family in Arizona and California.

Penutian. The Penutian phylum is the only group of languages in North America for which relationships with languages in South America have been traced convincingly. The Penutian languages are thus distributed from the Northwest Coast and Plateau areas through California (with a possible extension into the Southwest) and Meso-America into Bolivia, Chile, and Argentina. Many of the Penutian languages north of Mexico are either no longer spoken or are spoken by fewer than 50 people. In Meso-America, however, many native languages have a considerable number of speakers; *e.g.,* Mixe, in the Zoque family, has over 77,000 speakers, and the Mayan family includes some languages with several hundred thousand speakers, as Maya, Quiché, Kekchí, Cakchiquel, and Mam.

Aztec-Tanoan. The Aztec-Tanoan phylum consists of two families: the Tanoan (Kiowa-Tanoan) family with three languages in the Southwest, including those spoken by the Taos and the Santa Clara, and one language in the Plains (Kiowa); and the Uto-Aztecan family, with about a score of languages spoken from the Plateau and California into Meso-America, with relatively late extensions into the Plains. California Uto-Aztecan languages include Cahuilla and Luiseño; Great Basin languages include Paiute and Shoshoni, with the Ute and Comanche dialects in the Plains; Southwestern languages include Hopi and Pima-Papago; Meso-American languages include Nahuatl, the language of the descendants of the Aztecs. The million speakers of the several varieties of Nahuatl far outnumber the total number of speakers of all the other Uto-Aztecan languages.

The Tanoan and Uto-Aztecan families

Oto-Manguean. Languages of one North American phylum are located entirely in Meso-America—the Oto-Manguean phylum, consisting of five small families. The languages with the largest number of speakers are Otomí, Mixtec, and Zapotec.

Unaffiliated languages. In North America one large family (the Salish family in the Northwest Coast and Plateau) and several smaller families and language isolates (as the Wakashan family in the Northwest Coast and Tarascan in Meso-America) remain undetermined in phylum affiliation. Remote relationships that have been proposed for some of these are in conflict with other proposed relationships, with no overwhelming evidence presented for any one of the proposals.

South American Indian languages. Language names for South America are much more numerous than those for North America, but information on actual languages is generally sporadic and often lacking entirely. Even when the list of names is reduced to 350 for languages said to be still spoken, the data to which the names refer consist, for the most part, of brief word lists; or nothing more may be known than the fact that a tribe X is said to speak differently from a tribe Y. Though it is possible to know that certain languages are probably closely related, it is not always possible to say how closely; *i.e.,* whether they might be dialects of, or occasionally just different names for, the same language. At the opposite extreme of genetic relationship, it is clear that there are large groups of remotely related languages, but the paucity of data makes possible conflicting proposals. For at least one group of languages, those of the high cultures of South America—the Inca and the Aymara—and some of their neighbours, the problem of establishing genetic relationship is complicated by the problem of sorting out borrowings among them.

Andean-Equatorial phylum

The Andean-Equatorial phylum includes the greatest number of still-spoken languages (almost 200) and the three South American Indian languages with the greatest number of speakers (Quechua, Guaraní, and Aymara). The living Andean-Equatorial languages comprise some 14 families and several language isolates. The Arawakan family includes the biggest numbers of languages—around 100—and has the widest distribution: across northern South America from French Guiana to Colombia and southward as far as Paraguay; formerly, Arawakan languages were also spoken in Central America and the islands of the Caribbean. Most Arawakan languages are spoken by not more than a few hundred people. More than two dozen languages of the Tupian family are still spoken over a large part of South America, principally south of the Amazon River. Tupian languages include Guaraní (Tupí-Guaraní), which is spoken in a number of dialects by about 3,400,000 people in Paraguay, Brazil, Argentina, and Bolivia. Quechua, of the Quechumaran group, is spoken by around 7,000,000 people in Peru, Ecuador, Colombia, Bolivia, Argentina, and Chile. Some Quechua dialects are so divergent that they might be regarded as separate languages. The other Quechumaran language group, Aymaran, is spoken by more than 1,000,000 people in Peru and Bolivia. Most other languages in the Andean-Equatorial phylum are spoken by only a few thousand persons.

The Ge-Pano-Carib phylum includes almost as many languages still spoken as the languages of the Andean-Equatorial phylum, but the former are all spoken by relatively small tribes, so that the total number of speakers of these languages is only a small fraction of the number of speakers of Andean-Equatorial languages. In terms of numbers of languages, the largest family in the Ge-Pano-Carib phylum is the Cariban (Carib) family, with some 60 languages still spoken in Venezuela, the Guianas, Brazil, and Colombia. Cariban languages were also formerly spoken in the Caribbean islands. Most Cariban languages have no more than 1,000 speakers. The other large family in the phylum, the Macro-Ge family, includes more than 25 languages in Brazil.

The languages of the Macro-Chibchan phylum, of which 39 may still be spoken, are distributed from Guatemala and Honduras southward into, and possibly beyond, Peru. The largest component of the phylum is the Chibchan family, of which 16 languages are still spoken from Nicaragua to northwest Colombia—these include Cuna, spoken on the Mulatas (San Blas) Islands of Panama as well as on the mainland of Panama and Colombia; Guaymí, spoken in Panama; and Páez in Colombia. For further information on the Indian languages of the Americas, see below *Languages of the Americas: North American Indian languages; Meso-American Indian languages; South American Indian languages.* (C.F.V./F.M.V.)

INDO-EUROPEAN LANGUAGES

Indo-European is the name of a family of languages that by 1000 BC were spoken over most of Europe and in much of Southwest and South Asia; from the second half of the 15th century the Indo-European tongues have spread to most other inhabited parts of the world. In German the family is called *Indogermanisch,* which has led to the occasional use of "Indogermanic" in English. The term Indo-Hittite is used by scholars who believe that Hittite and the other Anatolian languages (see below) are not just one branch of Indo-European but rather a branch coordinate with all the rest put together; thus, Indo-Hittite is used for a family consisting of Indo-European proper plus Anatolian. As long as this view is neither definitively proved nor disproved, it is convenient to keep the traditional use of the term Indo-European.

Indo-Hittite hypothesis

Languages of the family. The well-attested languages of the Indo-European family fall fairly neatly into the ten main branches listed below; these are arranged according to the age of their oldest sizable texts.

Anatolian. Now extinct, Anatolian was spoken during the 1st and 2nd millennia BC in what is presently Asian Turkey and northern Syria. By far the best known of its members is Hittite, the official language of the Hittite Empire, which flourished in the 2nd millennium. Very few Hittite texts were known before 1906, and their interpretation as Indo-European was not generally accepted until after 1915; the integration of Hittite data into Indo-European comparative grammar has, therefore, been one of the principal developments of Indo-European studies in this century. The oldest Hittite texts date from the 17th century BC, the latest from the 13th. For more information, see below *Anatolian languages.*

Indo-Iranian. Indo-Iranian comprises two main sub-branches, Indo-Aryan (Indic) and Iranian. Indo-Aryan languages have been spoken in what is now northern and central India and Pakistan since before 1000 BC. Aside from a very poorly known dialect spoken in or near northern Iraq during the 2nd millennium BC, the oldest record of an Indo-Aryan language is the Vedic Sanskrit of the Ṛgveda, the oldest of the sacred scriptures of India, dating roughly from the centuries around 1000 BC. Examples of modern Indo-Aryan languages are Hindi, Bengali, Sinhalese (spoken in Sri Lanka), and Romany, the language of the Gypsies.

Iranian languages were spoken in the 1st millennium BC in present-day Iran and Afghanistan, and also in the steppes to the north, from modern Hungary to Chinese Turkistan. The only well-known ancient varieties are Avestan, the sacred language of the Zoroastrians (Parsees), and Old Persian, the official language of Darius I (ruled 522–486 BC) and Xerxes I (486–465 BC) and their successors. Some modern Iranian languages are Persian, Pashto (Afghan), Kurdish, and Ossetic. For more information on the Indo-Iranian languages, including the Kafiri group, which occupies a special position, see below *Indo-Iranian languages.*

Minoan Linear B texts

Greek. Greek, despite its numerous dialects, has been a single language throughout its history. It has been spoken in Greece since at least 1600 BC, and, in all probability, since the end of the 3rd millennium. The earliest texts are the Minoan Linear B tablets, some of which may date from as far back as 1400 BC (the date is disputed), and some of which certainly date from around 1200 BC. This material, very sparse and difficult to interpret, was not identified as Greek until 1952. The Homeric epics—the *Iliad* and the *Odyssey*—composed for the most part in the 8th century BC, are the oldest texts of any bulk. For more information, see below *Greek language.*

Italic. The principal language of the Italic group is Latin, originally the speech of the city of Rome and the ancestor of the modern Romance languages: Italian, Romanian, Spanish, Portuguese, French, etc. The earliest Latin inscriptions date apparently from the 6th century BC, with literature beginning in the 3rd century. Scholars are not in agreement as to how many other ancient languages of Italy and Sicily belong in the same branch as Latin. For more information on Latin, the languages derived from it, and the other languages that belong or may belong to the Italic branch of Indo-European, see below *Italic languages; Romance languages.*

Germanic. In the middle of the 1st millennium BC, Germanic tribes lived in southern Scandinavia and northern Germany. Their expansions and migrations from the 2nd century BC onward are largely recorded in history. The oldest Germanic language of which much is known is the Gothic of the 4th century AD. Other languages include English, German, Dutch, Danish, Swedish, Norwegian, and Icelandic. For more information on the Germanic languages, see below *Germanic languages; English language.*

Armenian. Armenian, like Greek, is a single language. The Armenians are recorded as being in what is now eastern Turkey and the Armenian Soviet Socialist Republic as

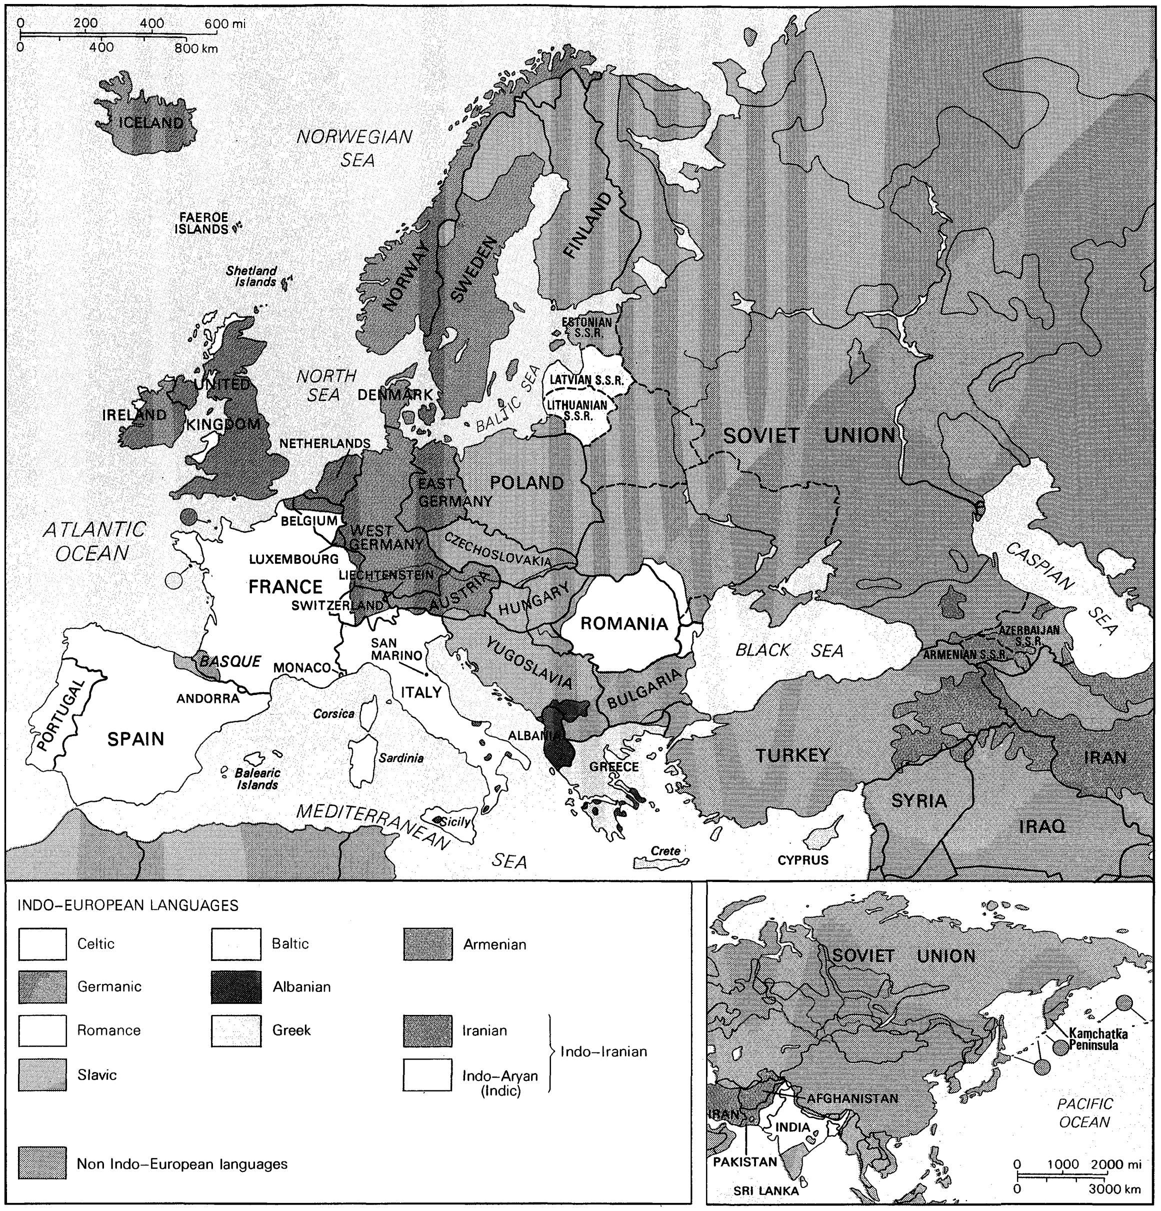


Figure 1: Approximate locations of Indo-European languages in Eurasia in the 20th century.

Adapted from A. Meillet and M. Cohen, *Les Langues du monde* (1952); Editions du Centre National de la Recherche Scientifique, Paris

early as the 6th century BC, but the oldest Armenian texts date from the 5th century AD. For more information, see below *Armenian language.*

Tocharian. Tocharian, now extinct, was spoken in present-day Chinese Turkistan in the 1st millennium AD. Two distinct languages are known, labelled A (Turfanian) and B (Kuchean); many scholars consider Tocharian A and B to be two dialects of the same language. One group of travel permits for caravans can be dated to the early 7th century, and it appears that other texts date from the same or from neighbouring centuries. These languages became known to scholars only in the first decade of the 20th century; they have been less important for Indo-European studies than has Hittite, partly because their testimony about the Indo-European parent language is obscured by 2,000 more years of change, and partly because Tocharian testimony fits fairly well with that of the previously known non-Anatolian languages. For more information, see below *Tocharian language.*

Tocharian A and B

Celtic. Celtic was spoken in the last centuries before the Christian Era over a wide area of Europe, from Spain and Britain to the Balkans, with a group (the Galatians) even in Asia Minor. Very little of the Celtic of that time and the ensuing centuries has survived, and this branch is known almost entirely from the Insular Celtic languages—Irish, Welsh, and others—spoken in and near the British Isles, as recorded from the 8th century AD onward. For more information, see below *Celtic languages.*

Balto-Slavic. The grouping of Baltic and Slavic into a single branch is somewhat controversial, but the exclusively shared features outweigh the old divergences. At the beginning of the Christian Era, Baltic and Slavic tribes occupied a large area of eastern Europe, east of the Germanic tribes and north of the Iranians, including much of present-day Poland and the western Soviet Union. The Slavic part of this area was probably fairly small, perhaps centred in what is now southern Poland. But in the 5th century AD the Slavs began expanding in all directions, until now the Slavic languages are spoken over the greater part of eastern Europe and northern Asia. The Baltic-speaking area, however, has contracted, so that Baltic languages are presently confined to the two Soviet Socialist Republics of Lithuania and Latvia.

The earliest Slavic texts, written in a dialect called Old Church Slavonic, date from the 9th century AD; the oldest substantial material in Baltic comes from the end of the 14th century, and the oldest connected texts from the 16th century. For more information, see below *Baltic languages; Slavic languages.*

Albanian. Albanian, the language of the present-day

Table 1: Widely Shared Indo-European Terms*

	Hittite	Sanskrit	Greek	Latin	English	Armenian	Tocharian B	Old Irish	Lithuanian	Albanian

*Words lacking in the language named at the top of the column but found in a closely related language are included, with these abbreviations: Luw. = Luwian; Hier. Luw. = Hieroglyphic Luwian; OE = Old English; Latv. = Latvian; OCS = Old Church Slavonic.

republic of Albania, is known from the 15th century AD. It presumably continues one of the very poorly attested ancient Indo-European languages of the Balkan peninsula, but which one is not clear. For more information, see below *Albanian language.*

In addition to the tongues just listed, there are several poorly documented extinct languages of which enough is known to be sure that they were Indo-European and that they did not belong in any of the branches enumerated above (*e.g.,* Phrygian, Macedonian). Of a few, too little is known to be sure whether they were Indo-European or not (*e.g.,* Ligurian).

Reasons for grouping the languages together

Establishment of the family. *Shared characteristics.* The chief reason for grouping the Indo-European languages together is that they share a number of items of basic vocabulary, including grammatical affixes, whose shapes in the different languages can be related to one another by statable phonetic rules. Especially important are the shared patterns of alternation of sounds. Thus the agreement of Sanskrit *ás-ti,* Latin *es-t,* and Gothic *is-t,* all meaning "is," is greatly strengthened by the identical reduction of the root to *s-* in the plural in all three languages: Sanskrit *s-ánti,* Latin *s-unt,* Gothic *s-ind* "they are." Agreements in pure structure, totally divorced from phonetic substance, are, at best, of dubious value in proving membership in the Indo-European family.

Table 1 gives examples of typical vocabulary items widely shared within the Indo-European family that have been decisive in establishing the family. A blank indicates that the language in question does not use the item in accordance with the given meaning or that its word for that meaning is unknown.

Similarities in grammatical endings are shown in Table 2 by samples of noun declension and verb inflection in some of the more archaic languages that have retained the inflectional endings of Indo-European in relatively unchanged form. Note that Old Lithuanian *-i* and *-u* were nasalized vowels, representing a continuation from the earlier forms **-in* and **-un.* (The asterisk marks a form that is not actually found in any document or living dialect but is reconstructed as having once existed in the prehistory of the language.)

The statable phonetic rules referred to earlier are not always obvious without careful observation. Note that the English dental consonants *t, d,* and *th* do not correspond in a straightforward manner to the Greek dental sounds *t, d,* and *th;* that is, English *t* does not occur where Greek *t* appears, nor English *d* where Greek has *d.* But the relationships between the sounds are not random either—English *t* does not correspond to Greek *t* in one word, to *d* in a second, and to *th* in a third, according to no discernible pattern. Rather, where Greek has initial *t,* English has *th,* as in "that" and "three"; where Greek has *d,* English has *t,* as in "tree," "two," and "ten"; and where Greek has *th,* English has *d,* as in "daughter." Note also that phonetic similarity as such is not needed to establish relationship. Thus, many of the Armenian words in Table 1 look quite different from the related words in other Indo-European languages. but here too regular rules of correspondence can be found; *e.g.,* Greek initial *p* corresponds to Arme-

Table 2: Examples of Noun and Verb Inflection

	Hittite paant- (gone)	Sanskrit yant- (going)	Greek iont- (going)	Latin eunt- (going)	Old Lithuanian seser- (sister)
Singular nominative	paant-s	yán	iōn	iēn-s	sesuõ
Singular accusative	paant-an	yánt-am	iont-a	eunt-em	sẽser-į
Singular genitive	paant-as	yat-ás	iont-os	eunt-is	seser-ès
Singular dative	paant-i	yat-é		eunt-ī	sẽser-i
Singular locative	paant-i	yat-í	iont-i	eunt-e	seser-yjè
Plural nominative	paant-es	yánt-as	iont-es	eunt-ēs	sẽser-es
Plural accusative	paant-us	yat-ás	iont-as	eunt-es	sẽser-is
Plural genitive	paant-an	yat-ā́m	iont-ōn	eunt-(i)um	seser-ũ
I go	pai-mi	é-mi	ei-mi	e-ō	ei-mì
You (sg.) go	pai-si	é-ṣi	ei	ī-s	ei-sì
He, she goes	pai-tsi	é-ti	ei-si	i-t	eĩ-ti
We go	pai-wani	i-más	i-men	ī-mus	ei-mè
You (pl.) go	pai-tteni	i-thá	i-te	ī-tis	ei-tè
They go	pa-antsi	y-ánti	i-āsi	e-unt	

nian *h* or zero (a lack of consonant) in the words meaning "fire," "father," "foot," "five."

Linguistic studies of the family. The ancient Greeks and Romans readily perceived that their languages were related to each other, and, as other European languages became objects of scholarly attention in the late Middle Ages and the Renaissance, many of these were seen to be more similar to Latin and Greek than, for example, to Hebrew or Hungarian. But an accurate idea of the true bounds of the Indo-European family became possible only when, in the 16th century, Europeans began to learn Sanskrit. The massive similarities between Sanskrit and Latin and Greek were noted early, but the first person to make the correct inference and state it conspicuously was the English Orientalist and jurist Sir William Jones, who in 1786 said in his presidential address to the Asiatic Society that Sanskrit bore to both Greek and Latin

> a stronger affinity, both in the roots of verbs, and in the forms of grammar, than could possibly have been produced by accident; so strong, indeed, that no philologer could examine them all three without believing them to have sprung from some common source, which, perhaps, no longer exists. There is a similar reason, though not quite so forcible, for supposing that both the *Gothick* [*i.e.,* Germanic] and the *Celtick,* though blended with a very different idiom, had the same origin with the *Sanscrit;* and the old *Persian* might be added to the same family . . . .

The work of Bopp, Rask, and Grimm

The detailed evidence on which Jones based his conclusion was not presented until the 19th century. In 1816 Franz Bopp, the German philologist, presented his *Über das Conjugationssystem der Sanskritsprache in Vergleichung mit jenem der griechischen, lateinischen, persischen und germanischen Sprache* ("On the system of conjugation of the Sanskrit language, in comparison with those of Greek, Latin, Persian, and Germanic"), in which the relation of these five languages was demonstrated on the basis of a detailed comparison of verb morphology (structure). Two years later there appeared the "Undersøgelse om det gamle Nordiske eller Islandske Sprogs Oprindelse" ("Investigation on the Origin of the Old Norse or Icelandic Language"), by the Danish philologist Rasmus Rask, originally written in 1814. This work demonstrated methodically the relation of Germanic to Latin, Greek, Slavic, and Baltic. In 1822 the second edition of the first volume of Jacob Grimm's *Deutsche Grammatik* ("Germanic Grammar") was published; in this grammar were discussed the peculiar Indo-European vowel alternations called *Ablaut* by Grimm (*e.g.,* English "sing, sang, sung"; or Greek *peíth-ō* "I persuade," *pé-poith-a* "I am persuaded," *é-pith-on* "I persuaded"). In addition, Grimm tried to find the principle behind the correspondences of Germanic stop and spirant consonants (the first made with complete stoppage of the breath, and the second made with constriction of the breath but not complete stoppage) to the consonants of other Indo-European languages. The sound changes implied by these correspondences have become known as "Grimm's Law." Examples of it include the stop consonant *p* in Latin *pater* corresponding to the spirant consonant *f* in "father," and the correspondences between English and Greek *t, d,* and *th* discussed above.

Bopp demonstrated in 1838 that the Celtic languages were Indo-European, as had been asserted by Jones. In 1850 the German philologist August Schleicher did the same for Albanian, and in 1877 another German philologist, Heinrich Hübschmann, showed that Armenian was an independent branch of Indo-European, rather than a member of the Iranian subbranch. Since then, the Indo-European family has been enlarged by the discovery of Tocharian and of Hittite and other Anatolian languages, and by the recognition, with the aid of Hittite, that Lycian, known and partly deciphered already in the 19th century, belongs to the Anatolian branch of Indo-European.

The Indo-European character of Tocharian was announced by the German scholars Emil Sieg and Wilhelm Siegling in 1908. The Norwegian orientalist Jørgen Alexander Knudtzon recognized Hittite as Indo-European on the basis of two letters found in Egypt (translated in *Die zwei Arzawa-briefe,* 1902; "The Two Arzawa Letters"), but his views were not generally accepted until 1915, when Bedřich Hrozný published the first report of his own decipherment of the much more copious material that had meanwhile been found in the ruins of the Hittite capital itself.

First full comparative Indo-European grammar

The first full comparative grammar of the major Indo-European languages was Bopp's *Vergleichende Grammatik des Sanskrit, Zend, Griechischen, Lateinischen, Litthauischen, Altslawischen, Gotischen und Deutschen* (1833–52; "Comparative Grammar of Sanskrit, Zend, Greek, Latin, Lithuanian, Old Slavic, Gothic, and German"). But this and August Schleicher's shorter *Compendium der vergleichenden Grammatik der indogermanischen Sprachen* (1861–62; "Compendium of the Comparative Grammar of the Indo-European Languages") were rendered obsolete by the major breakthrough of the 1870s, when scholars realized that sound correspondences are not merely rules of thumb that do not have to be strictly observed, and that apparent exceptions to sound laws can often be accounted for by stating them more accurately or by reconstructing additional different sounds in the parent language. The difference between Gothic *d* in *fadar* "father" and *þ* in *broþar* "brother," for example, both corresponding to *t* in Sanskrit, Greek, and Latin, proved to be correlated with the original position of the accent, a discovery known as Verner's Law (named for the Danish linguist Karl Verner). Thus, *d* appears when the preceding syllable was originally unaccented (*fadar* : Greek *patér-,* Sanskrit *pitár-*), and *þ* occurs when the preceding syllable was originally accented (*broþar* : Greek *phrā́ter* "member of a clan," Sanskrit *bhrā́tar-*).

The knowledge and opinions that had accumulated by the end of the 19th century are largely incorporated in the German linguist Karl Brugmann's *Grundriss der vergleichenden Grammatik der indogermanischen Sprachen* (2nd ed., 1897–1916; "Outline of Comparative Indo-European Grammar", which remains the latest fullscale treatment of the family.

The parent language. By comparing the recorded Indo-European languages, especially the most ancient ones, much of the parent language from which they are descended can be reconstructed. This reconstructed parent language is sometimes called simply "Indo-European," but in this article the term Proto-Indo-European is preferred.

Proto-Indo-European

Phonology. In Proto-Indo-European there were at least 11 stop consonants. In the following grid these sounds are arranged according to the place in the mouth where the stopage was made and the activity of the vocal cords during and immediately after the stoppage:

	labial	dental	palatal	labiovelar
Voiceless	p	t	ḱ	k^w
Voiced		d	g	g^w
Voiced aspirated (?)	bh	dh	ǵh	g^wh

Labial denotes a sound made with the lips; dental, with the tip of the tongue against the back of the teeth. The palatals were probably made by contact between the upper surface of the tongue and the hard palate (the roof of the mouth), like Hungarian *ty* and *gy* in *atya* and *Magyar.* The labiovelars were probably made by contact between the upper surface of the tongue and the soft palate (the area behind the hard palate), with a concomitant rounding of the lips. Voiceless designates sounds made without vibration of the vocal cords; voiced sounds are pronounced with vibration of the vocal cords. The exact pronunciation of the "voiced aspirates" is uncertain.

There may also have been a voiced labial stop, _b_, but correspondences pointing to this are few, and rarely extend beyond immediately neighbouring languages. Correspondences that some scholars take as evidence for a set of plain velar consonants (made with the back of the tongue touching the soft palate), _k, g, gh,_ are partly, perhaps entirely, the result of special developments of labiovelars and palatals in specific positions. The evidence for a set of voiceless aspirated stops _ph, th, ḱh, kh,_ k^wh is extremely weak. (Aspirated consonants are sounds accompanied by a puff of breath.)

There was one sibilant consonant, _s_, with a voiced alternant, _z_, that occurred automatically next to voiced stops. The existence of a second apical spirant, _þ_ (presumed pronunciation like that of _th_ in English "thin"), is extremely uncertain.

Laryngeal theory

Most scholars now agree that the parent language had one or more additional stop or spirant consonants, for which the label laryngeal is used. These consonants, however, have mostly disappeared or have become identical with other sounds in the recorded Indo-European languages, so that their former existence had to be deduced mainly from their effects on neighbouring sounds. Hence, the laryngeal sounds were not suspected until 1878, and even then they were rejected by most scholars until after 1927, when Kuryłowicz showed that Hittite often has _ḫ_ (perhaps a velar spirant like the _ch_ in German _ach_) in places where a "laryngeal" had been posited on the evidence of the other Indo-European languages. There is still considerable disagreement about how many "laryngeals" there were, what they sounded like, what traces they left, and how best to symbolize them. Probably there were three or four, which can be written H_1, H_2, H_3 (and H_4), and probably some or all of them were palatal or (labio-)velar spirants. The principal traces they left outside Anatolian are in the quality and length of neighbouring vowels, H_2 (and H_4) changing a neighbouring _e_ to _a_, and H_3 changing it to _o_, while all laryngeals lengthened a preceding vowel. In Anatolian, H_2 and H_3 remained as _ḫ_, at least in some positions; H_4 is tentatively set up to account for words with _a_ that lack _ḫ_ in Hittite.

When laryngeals between consonants disappeared, a vowel sometimes remained, as in Greek _stasis_, Sanskrit _sthitis_, Old English _stede_ "a standing (place)" from Proto-Indo-European *_stH_2tis_. Scholars who do not posit "laryngeals" reconstruct a separate Proto-Indo-European vowel _ə_ (called _schwa indogermanicum_) to account for these correspondences.

Finally, there were the nasal sounds _n_ and _m_, the liquids _l_ and _r_, and the semivowels _y_ and _w_. When _y_ and _w_ occurred between consonants, they were replaced by the vowels _i_ and _u_. The nasals and liquids functioning as nuclei of syllables in this position (like the final sounds of English "bottom," "button," "bottle," "butter") are traditionally written _n̥, m̥, l̥, r̥_. Some scholars dispense with these diacritical marks and with the distinction between syllabic _i_ and _u_ and nonsyllabic _y_ and _w_, but this obscures certain distinctions, such as that between _-wn̥-_ in *_ḱwn̥su_ "among dogs," Sanskrit _śvasu_, and _-un-_ in *_tund-_ "shove," Sanskrit _tundate_.

Ablaut and vowel grades

The vowel system of Proto-Indo-European was dominated by a pattern of alternation called ablaut. The alternant (called a grade) that occurs in a given syllable of a given form is only partly predictable from the shape of the rest of the word. The basic vowel of the system was _e_ ("normal grade"), and the changes it could undergo were loss (zero-grade), change to _o_ (_o_-grade), lengthening to _ē_ (lengthened grade), and lengthening plus change to _ō_ (lengthened _o_-grade). The stem _ped-_ "foot," for example, appears as such in Latin _ped-is_ (normal grade) "of a foot," as _-bd-_ in Avestan _fra-bd-a-_ (zero-grade) "fore-foot," as _pod-_ in Greek _pod-es_ (_o_-grade) "feet," as *_pēd-_ in Latin _pēs_ (lengthened grade) "foot" in the nominative singular, and as *_pōd-_ in English "foot" (lengthened _o_-grade).

Ablauting forms whose basic vowel is _a, o, ē, ā,_ or _ō_ in the recorded languages (_e.g.,_ Greek _ag-_ "lead," _op-_"see," _stā-_ "stand") are now believed to have had _e_ preceded or followed by laryngeal in the parent language; _e.g.,_ *H_2_eǵ-_ "lead," *H_3_ek_^{w}- "see," *_ste_H_2- "stand." It is uncertain whether there were additional _o_ and _a_ vowels besides those arising by ablaut and from _e_ next to a laryngeal.

The vowels _i_ and _u_ did not participate in ablaut alternations, but rather functioned primarily as the syllabic realizations of the consonants _y_ and _w_, as in *_leyk_^{w}- "leave," zero-grade *_lik_^{w}-, like *_derḱ-_ "see," zero-grade *_dr̥ḱ-_. Long _ī_ and _ū_ in the recorded languages derive, at least in part, from sequences of _i_ or _u_ plus laryngeal; _e.g.,_ Latin _vīvus_ "alive" from *$g^w iH_3$_wós_.

Thus the parent language had at least the following vowels:

		front	back
high	....	_i_	_u_
mid	....	_e, ē_	_o, ō_

(In forming front vowels, the highest point of the tongue is in the front of the mouth; for back vowels, that point is in the back. High vowels are those in which the tongue is highest—closest to the roof of the mouth; mid vowels are made with the tongue between the extremes of high and low.) Of these vowels, _i_ and _u_ really functioned as consonants, and _ē, o, ō_ were all conditioned alternants of _e_. But as noted above there may also have been _ī, ū, a,_ and a second _o_.

The accent just before the breakup of the parent language was apparently mainly one of pitch rather than stress. Each full word had one accented syllable, presumably pronounced on a higher pitch than the others.

The Indo-European verb

Morphology and syntax. The Proto-Indo-European verb had three aspects: imperfective, perfective, and stative. Aspect refers to the nature of an action as described by the speaker; _e.g.,_ an event occurring once, an event recurring repeatedly, a continuing process, or a state. The difference between English simple and "progressive" verb forms is largely one of aspect; _e.g.,_ "John wrote a letter yesterday" (implying that he finished it) versus "John was writing a letter yesterday" (describing an ongoing process, with no implication as to whether it was finished or not). The Anatolian languages lack a dimension of aspect, and it is not yet clear what the earlier system underlying both Anatolian and the rest of Indo-European was.

The imperfective aspect, traditionally called present, was used for repeated actions and for ongoing processes or states; _e.g.,_ *_sti-ste_H_2- "stand up more than once, be in the process of standing up," *_weǵh-e-_ "be in the process of conveying," *_es-_ "be." The perfective aspect, traditionally called aorist, expressed a single, completed occurrence of an action or process; _e.g.,_ *_cte_H_2- "stand up, come to a stop," *_wēǵh-s-_ "convey." The stative aspect, traditionally called perfect, described states of the subject; _e.g.,_ *_woyd-_ "know," *_ste-sto_H_2- "be in a standing position."

Verb roots were by themselves either perfective (like *_ste_-H_2- "stand") or imperfective (like *_weǵh-_ "convey," *_es-_ "be"). This basic aspect, however, could be reversed by aspect markers; _e.g.,_ reduplication for imperfective, as in *_sti-steH-_ (reduplication is the repetition of a word or part of a word), and _-s-_ for perfective, as in *_wēǵh-s-_. The stative aspect was always marked by the _o_-grade of the root in the indicative singular (as in *_woyd-_ "know"), and usually also by reduplication (as in *_ste-sto_H_2-); it had personal endings different from those of the other two aspects.

From one aspect of a given verb the shape and even the existence of the other two aspects could not be predicted; for example, *_es-_ "be" had only the imperfective aspect. Ways of forming imperfectives were especially numerous and often involved, in addition to their imperfective aspectual meaning, some other notion, such as performing the action habitually or repeatedly (iterative), or causing someone else to perform it (causative). One root could thus have several imperfective stems; so to the root *_er-_ "move" there were at least a causative form, *_r̥-new-_ "set in motion," and an iterative form, *_r̥-sk̯e-_ "go repeatedly."

The Proto-Indo-European verb was also inflected for mood, by which the speaker could indicate whether he was making statements or inquiries about matters of fact;

making predictions, surmises, or wishes about the future or about unreal but imagined situations; or giving commands. Compare English "If John is home now (he is eating lunch)" with the verb "is" in the indicative mood, discussing a matter of fact, with "If John were home now (he would be eating lunch)" with the verb "were" in the subjunctive mood, describing an unreal situation. There were two Proto-Indo-European suffixes expressing mood: _-e-_ alternating with _-o-_ for the subjunctive, corresponding roughly in meaning to the English auxiliaries "shall" and "will," and _-ye_H_1- alternating with _-i_H_1-for the optative, corresponding roughly to English "should" and "would." Verbs without one of these two suffixes were marked for mood and tense by their personal endings.

Mood in Indo-European

These personal endings basically expressed the person and number of the verb's subject, as in Latin _amō_ "I love," _amās_ "you (singular) love," _amat_ "he or she loves," _amāmus_ "we love," and so on. In the imperfective and perfective aspects there were two sets of endings, distinguishing two voices: active, in which typically the subject was not affected by the action, and mediopassive, in which typically the subject was affected, directly or indirectly. Thus Sanskrit active _yajati_ and mediopassive _yajate_ both mean "he sacrifices," but the former is said of a priest who performs a sacrifice for the benefit of another, while the latter is said of a layman who hires a priest to perform a sacrifice for him. In the stative aspect there was no distinction of voice. (Voice indicates the relationship of the action expressed by the verb to the subject of the statement.)

To mark mood and tense, verbs in the imperfective aspect that did not have a mood suffix had three sets of personal endings in both active and mediopassive voices: imperative, primary, and secondary. Verbs with imperative endings belonged to the imperative mood (used for commands); _e.g._, _*s-dhí_ "be," _*és-tu_ "let him be." Verbs with primary endings were marked as non-past in tense and indicative in mood; _e.g._, _*és-ti_ "he is." (Indicative mood signifies objective statements and questions.) Verbs with secondary endings were unmarked for tense and mood, but were most typically used as past indicatives (_e.g._, *g^w_hén-t_ "he slew") and to fill out gaps in the imperative paradigm (_e.g._, _*s-té_ "be" in the plural, _*gəhn̥-té_ "ye slew; slay" in the plural). To mark such forms unambiguously as past indicatives, an augment, usually consisting of the vowel _e_, could be prefixed; _e.g._, _*é-_g^w_hen-t_ "he slew," _*ēst_ (= _*é-es-t_) "he was."

Verbs in the perfective aspect without a mood suffix did not occur with primary endings, and so lacked a non-past indicative tense. Verbs in the stative aspect apparently lacked a distinction between primary and secondary endings, so that a form like _*wóyd-e_ "he knows" meant also "he knew."

Noun cases, number, gender

The inflectional categories of the noun were case, number, and gender. Eight cases can be reconstructed: nominative, for the subject of a verb; accusative, for the direct object; genitive, for the relations expressed by English "of"; dative, corresponding to the English preposition "to," as in "give a prize to the winner"; locative, corresponding to "at," "in"; ablative, "from"; instrumental, "with"; and vocative, used for the person being addressed. For examples of some of these see Table 2. Besides singular and plural number, there was a dual number for referring to two items. Each noun belonged to one of three genders: masculine, to which belonged most nouns designating male creatures; feminine, to which belonged most names of female creatures; and neuter, to which belonged only a few words for individual adult living creatures. The gender of nouns not designating living creatures was only partly predictable from their meaning.

Adjectives were nouns that varied in gender according to the gender of another noun with which they were in agreement, or, if used by themselves, according to the sex of the entity to which they referred; thus, Latin _bonus sermō_ "good speech" (masculine), _bona aetās_ "good age" (feminine), _bonum cor_ "good heart" (neuter), or _bonus_ "a good man," _bona_ "a good woman," _bonum_ "a good thing." The neuter of an adjective was identical with the masculine except for having different endings in nominative and accusative cases. Feminine gender was either completely identical with the masculine or derived from it by means of a suffix, the two commonest being *-_e_H_2- and *-_i_H_2- (*-_ye_H_2-).

Demonstrative, interrogative, relative, and indefinite pronouns were inflected like adjectives, with some special endings. Personal pronouns were inflected very differently. They lacked the category of gender, and marked number and case (in part) not by endings but by different stems, as is still seen in English singular nominative "I"; oblique "my," "me"; plural nominative "we"; plural oblique "our," "us." (The oblique is any case other than nominative or vocative.)

Syntactic features

Some notable features of Proto-Indo-European syntax are: the non-ergative case system, that is, the subject of an intransitive verb is in the same case as the subject (rather than the object) of a transitive verb; concord (agreement) in case, number, and gender between adjective and noun; and use of singular verbs with neuter plural subjects, as in Greek _panta rhei_ "all things flow," with the same verb as _ho potamos rhei_ "the river (masculine) flows," contrasting with _hoi potamoi rheousi_ "the rivers flow" (indicating that neuter plurals were originally collectives and grammatically singular).

Lexicon and culture. Much less is known about the parent language's vocabulary than about its phonology and grammar. Sounds and grammatical categories do not easily disappear or undergo radical change in so many daughter languages that their former existence can no longer be detected. It is relatively easy, however, for an individual word to disappear or shift meaning in so many daughter languages that its existence or meaning in the parent language cannot be confidently inferred. Hence, from the linguistic evidence alone, scholars can never say that Proto-Indo-European lacked a word for any particular concept; they can only state the probability that certain items did exist, and from these items make inferences about the culture and location in time and space of the speakers of Proto-Indo-European.

Thus is it supposed that the Proto-Indo-European community knew and talked about dogs (_*ḱwón-_), horses (_*éḱwo-_), sheep (*H_3_éwi-_), and almost certainly cows (*g^w_ów-_) and pigs (_*suH-_). Probably all these animals were domesticated. At least one cereal grain was known (_*yewo-_), and at least one metal (*H_2_eyos_ or *H_4eyos). There were vehicles (_*woǵho-_) with wheels (*k^w_e_k^w_lo-_), pulled by teams joined by yokes (_*yugo-_). Honey was known, and probably formed the basis of an alcoholic drink (_*melit-_, _*medhu_) related to the English "mead." Numerals up through 100 (_*ḱm̥tóm_) were in use. All this suggests a people with a well-developed Neolithic (characterized by simple agriculture and polished stone tools) or even Chalcolithic (copper-or bronze-using) technology.

Location and date. Linguists have not found a reliable and precise way to determine from linguistic evidence alone the date at which any set of related languages must have begun diverging. The best that can be done is to estimate the degree of difference between the languages in question, taking into account all that is known about them, and then compare this estimate with the estimated degrees of difference within families of languages—such as the Romance family—whose actual time of divergence is approximately known. Using this sort of "dead reckoning," it can be said that the earliest attested Indo-European languages—Anatolian, Indo-Iranian, and Greek—are different enough that the parent language must have been split into several distinct languages well before 2000 BC, but similar enough that the first split into separate languages is not likely to have been much earlier than 3000 BC, and may have been later.

Division of Indo-European into languages between 3000 and 2000 BC

For further progress the linguistic findings must be correlated with those of archaeologists and paleontologists to see if there was a population group within Eurasia that was relatively small and homogeneous before 3000 BC and that underwent considerable expansion and fragmentation beginning about 3000 BC—give or take a few centuries—such that some of its fragments can be ancestral to components of the cultures of the speakers of the various recorded Indo-European languages. The culture of this population group in the centuries around 3000 BC must also correspond to what can be inferred for Proto-Indo-European from the linguistic data.

At present the archaeological evidence seems to find such a group in the Kurgan culture of the south Russian steppe, east of the Dnepr (Dnieper) River, north of the Caucasus, and west of the Urals. According to the Lithuanian-American archaeologist Marija Gimbutas, in *Indo-European and Indo-Europeans* (1970), this culture began spreading west *c.* 4000–3500 BC (Kurgan II), and began to occupy a really wide area stretching from eastern central Europe to northern Iran *c.* 3500–3000 BC (Kurgan III). Allowing a few centuries for the speech of widely separated bands to diverge to the point of becoming distinct languages, this agrees tolerably well with the date suggested by the linguistic evidence for breakup of the parent language. So far the Kurgan culture has been traced back to the 5th millennium BC; its earlier antecedents are still unknown.

Possible relationship to Uralic

Remote relationship of Indo-European to the Uralic languages is very likely. Geographically, the earliest reconstructible locations of the two families are contiguous; lexically, there are strong resemblances in a number of basic words or word parts, including personal, demonstrative, interrogative, and relative pronouns, personal endings of verbs, the accusative case ending *-m,* and such words as those for "water" and "name"; typologically, the families are fairly similar (*e.g.,* both have many suffixes, but few or no prefixes or infixes—elements inserted within words). The resemblances, however, are too few to permit the reconstruction of a common "Indo-Uralic" parent language; the two families must have separated several thousand years before the breakup of Indo-European.

If Indo-European is related to other language families—*e.g.,* to Hamito-Semitic (Afro-Asiatic) or Caucasian—it must have diverged from them much earlier than from Uralic, because the number of cogent resemblances is much smaller. There is no evidence that Indo-European originated by fusion of components from two or more distinct language families.

Characteristic developments of Indo-European languages. As Proto-Indo-European was splitting into the dialects that were to become the first generation of daughter languages, different innovations spread over different territories.

Indo-Iranian, Balto-Slavic, Armenian, and Albanian agree in changing the palatal stops *ḱ, *ǵ, and *ǵh into spirants (*s, ś, th*) or affricates; *e.g.,* Sanskrit *aśri-* "sharp edge." Old Church Slavonic *ostrŭ* "sharp," Armenian *asełn* "needle," Albanian *athëtë* "bitter" beside Greek *ákros* "tip," Latin *acidus* "biting," all from a basic element *H_2ek- "sharp, pointed." (Spirants, also called fricatives, are sounds produced with audible friction as a result of the airstream passing through a narrow, but unstopped, passage in the mouth; *e.g.,* English *s, f, v.* Affricates are sounds that begin as stops, with complete stoppage of the airstream, but are released as spirants, or fricatives; *e.g.,* the *ch* in "church," the *j* in "jam.") The languages that change the palatal stops to spirants or affricates are not separated from one another by any recorded languages that preserve the palatals as stops; so it is therefore inferred that the change to affricates (whence later spirants) occurred just once, and spread over a cohesive dialect area of Proto-Indo-European.

Of the languages that share this change, however, Balto-Slavic shares with Germanic (including English) an *m* in certain case endings where other Indo-European languages, including Indo-Iranian, Armenian, and Albanian, have *bh* or a sound regularly developed from *bh.* Examples of the *m* ending include English "the-m" and Old Church Slavonic *tě-mŭ* "to those ones"; the *bh* and related sounds (*ph, v, b*) are illustrated in the following: Sanskrit *té-bhyas* "to those ones," Armenian *noro-vk‘* "with new ones," Albanian *male-ve* "to mountains," Greek *ókhesphin* "with chariots," Latin *omni-bus* "for all." Because Balto-Slavic and Germanic are neighbours, it is inferred that *m* replaced *bh* in these case endings just once in the parent language, and that the area over which this innovation spread only partly overlapped the area that adopted affricated pronunciation of the palatals.

This pattern is general for changes dating from the time the parent language was breaking up into distinct languages. Each of the resulting languages shares some innovations with some of its neighbours, but only rarely do different innovations shared by two or more branches of Indo-European cover exactly the same territory.

Developments of the separated Indo-European languages

Once the dialects had become differentiated enough to be distinct languages—probably by 2000 BC, at least in most cases—each largely went its own way, and agreements in developments since then are due either to borrowing across language boundaries (as in the notable convergences between Modern Greek, Albanian, Romanian, and the southernmost Slavic languages) or to parallel but independent workings out of the same base material.

Changes in phonology. In phonology, the most striking changes have been loss or reduction in many languages of final or unaccented syllables, and loss in several languages of certain consonants between vowels, often followed by contraction of the resulting vowel sequence. Thus words in modern Indo-European languages are often much shorter than their Proto-Indo-European ancestors; *e.g.,* English "four," Armenian *č‘ork‘,* colloquial Persian *car* "four" from *k^wetwóres; French *vit* (pronounced *vi*) "lives" from *g^wíH$_3$weti; Russian *dvesti* "two hundred" from *duwoy kṃtoy.

Changes in morphology. Because much of the marking of Proto-Indo-European inflectional categories was done in final syllables, loss and reduction of these syllables have often had serious grammatical consequences. In the noun, loss of endings has generally led to loss or great reduction of the case and gender systems, while ways have generally been found to salvage the distinction between singular and plural. In Modern Persian, for example, where all final syllables have been lost, the old case and gender distinctions have disappeared also, but plural number is still regularly marked, either with *-an* (originally the genitive plural ending of some nouns) or with *-ha* (of obscure origin).

In the verb, where more endings originally had two syllables, loss of final syllables has had less serious consequences for morphology. Even here, however, some languages, including English, have totally or almost totally given up the marking of subject by personal endings. Compare English "I, we, you, they love" and "he, she loves" with the Spanish conjugation for "love"—*amo, amas, ama, amamos, amáis, aman*—or the Russian version—*ljubljú, ljúbish, ljúbit, ljúbim, ljúbite, ljúbjat.*

Changes in noun inflection have generally involved simplification. Almost everywhere the dual number has been lost; in many languages the noun genders have been reduced from three to two (as in French, Swedish, Lithuanian, and Hindi), or lost entirely (as in English, Armenian, and Bengali). Only Slavic has complicated the gender system, by imposing on the inherited distinctions contrasts of animate versus inanimate or of personal versus nonpersonal.

Reduction in cases

Everywhere except in the oldest Indo-Iranian languages the original eight Indo-European cases have suffered reduction. Proto-Germanic had only six cases, the functions of ablative (place from which) and locative (place in which) being taken over by constructions of preposition plus the dative case. In Modern English these are reduced to two cases in nouns, a general case that does duty for the vocative, nominative, dative, and accusative ("Henry, did Bill give John the letter?"), and a possessive case continuing the old genitive ("Bill's letter"). In languages such as French and Welsh, nouns are no longer inflected for case at all. In some languages, to be sure, nouns have begun fusing with words placed directly after the nouns to create new case systems, coexisting with relics of the old. Thus, Old Lithuanian had in addition to seven inherited cases an illative (place into), made by adding *-n(a)* to the accusative (*peklosna* "into hell"), an allative (place to, toward), made by adding *-p(i)* to the genitive (*Jesausp* "to Jesus"), and an adessive (place at which), made by adding *-p(i)* to the locative (*Joniep* "in John").

Changes in the verb have been more complex. Besides loss or merger of old categories, many new forms have been created and many old forms have acquired new values. In Ancient Greek the focus of the stative aspect (perfect) has largely shifted from the present state ("he is dead") to the previous event that led to this state ("he has died"). As a result, the perfect came to mean the same as the perfective past (aorist), and has therefore disappeared from Modern Greek. New forms created in Ancient Greek include future and future perfect tenses, based on the desiderative present forms (such as "he wants to walk") of the parent language.

In Germanic the principal new creation was the weak past tense (ending in a *t* or *d*), such as English "loved," "thought," German *liebte, dachte,* made by combining the verb stem with a past tense of the Germanic verb for "do." (The strong past tense formed by vowel alternations, like "sing," "sang," "run," "ran," comes from the proto-Indo-European stative aspect.)

In some languages participles (verbal adjectives) have come to function as finite verbs. Thus in Hindi *mard strī-ko dekhtā* "the man sees the woman," *dekhtā* "sees" is etymologically a participle "seeing," agreeing in number and gender with the subject *mard* "man." In the past tense, *mard-ne strī dekhī* "the man saw the woman," the verb *dekhī* is etymologically a past passive participle "seen," agreeing in gender and number with the object *strī* "woman," and the subject is marked with an instrumental ending.

Vocabulary changes. Changes in vocabulary have been even greater than those in sounds and grammar. Words in modern Indo-European languages have several sources. They may be recognizable loanwords, such as English "skunk," "chain," and "inch" (from Algonkian, French, and Latin, respectively); they may have been formed within the history or prehistory of the language itself, such as English "radar" and "rightness"; they may be of obscure origin, such as English "drink," which is common Germanic but has no cognates outside Germanic, or "boy," which is peculiar to English and Frisian; or they may be inherited words that have changed meaning, such as English "merry" from Proto-Indo-European **mr̥ǵhu-* "short." Only a small fraction of the vocabulary can be traced back to words that can confidently be asserted to have existed in the parent language with approximately their present meaning. The same is true, albeit in a lesser degree, even for the oldest recorded Indo-European languages. None has more than a few hundred words and roots that are clearly inherited from the parent language without essential change of meaning. Table 1 gives examples of words widely retained with little change. Typically they include pronouns; nouns, verbs, and adjectives of relatively simple and ubiquitous meaning; numerals; and simple adverbs and prepositions.

Non-Indo-European influence on the family. Indo-European languages, like all languages, have always been subject to influence from neighbouring languages, both related and unrelated.

Influence of non-Indo-European languages on the sounds and grammar of Proto-Indo-European is not demonstrable, partly because there is no direct evidence about the languages that were in contact with Indo-European before 3000 BC. It can be surmised, however, that some words are loans; *e.g., *peleḱus* "ax," a word for an object likely to be imported or learned of from neighbours with superior technology, and which is not analyzable into a known Indo-European root plus a known Indo-European suffix.

Adoption of loanwords

When Indo-European languages have been carried within historic times into areas occupied by speakers of other languages, they have generally taken over a number of loanwords, as with English and Spanish in the Americas or Dutch in South Africa. Aside from the special case of the pidgin and creole languages, however, there has been very little effect on sounds and grammar. These have been significantly affected within historic times only when an Indo-European language has been spoken in prolonged close contact with non-Indo-European speakers, as with Ossetic (an Iranian language) in the Caucasus, or when its speakers have been very strongly influenced culturally by speakers of a non-Indo-European language, as with Persian, in which Arabic plays much the same role as Latin does in English.

In prehistoric times most branches of Indo-European were carried into territories presumably or certainly occupied by speakers of non-Indo-European languages, and it is reasonable to suppose that these languages had some effect on the speech of the newcomers. For the lexicon, this is indeed demonstrable in Hittite and Greek, at least. It is much less clear, however, that these non-Indo-European languages affected significantly the sounds and grammar of the Indo-European languages that replaced them. Perhaps the best case is India, where certain grammatical features shared by Indo-European and Dravidian languages appear to have spread from Dravidian to Indo-European rather than vice versa. For most other branches of Indo-European languages any attempt to claim prehistoric influence of non-Indo-European languages on sounds and grammar is rendered almost impossible because of ignorance of the non-Indo-European languages with which they might have been in contact. (W.C.)

Anatolian languages

The term Anatolian languages in its most comprehensive use includes both the Indo-European and non-Indo-European languages spoken in Anatolia (Asia Minor) before the Greco-Roman period. The Anatolian languages are known only from texts of the 2nd and 1st millennia BC; the earliest evidence is that of the so-called Cappadocian tablets (19th–18th century BC). The term Asianic is sometimes used as an alternative designation for the Anatolian languages, but, since the discovery in 1915 that Hittite, the main Anatolian language, is an Indo-European language, there has been a tendency to use Asianic in a more restricted sense for the non-Indo-European languages that existed in Anatolia before the entry of the Indo-Europeans. These are called substratum languages.

Hattic (or Hattian), also misleadingly called Proto-Hittite, is the best known substratum language. It is completely unrelated to Hittite and its sister languages as well as to Hurrian, a language also spoken in Anatolia.

The Anatolian group of Indo-European languages consists of Hittite, Palaic, Luwian, Hieroglyphic Luwian, Lydian, and Lycian. Hittite, Palaic, and Luwian are known from 2nd-millennium cuneiform texts found in the excavations in Boğazköy-Hattusa since 1905; Hieroglyphic Luwian is found on scattered inscriptions and seals from Anatolia (mainly the southern area) and northern Syria dating mainly from later times (*i.e.,* between *c.* 1200 and 700 BC, although there are earlier examples from the empire period, *c.* 1400–*c.* 1190 BC). Lydian and Lycian are known from texts in alphabetic script from *c.* 600 to 200 BC. It seems fairly reasonable to add the Carian language of southwest Anatolia to this list as well as other less well documented languages like Sidetic. More to the east, in the Caucasus region centring around Lake Van, Hurrian of the 3rd and 2nd millennia BC was replaced in the 1st millennium BC by the related Urartian language. Both of these languages are definitely non-Indo-European.

Historical background of ancient Anatolia. It is customarily assumed that the Indo-Europeans entered Anatolia around or shortly after 2000 BC, although there are no specific archaeological data that might enable scholars to specify the period of entry or the route the invaders followed. On the basis of the agricultural terminology used in Hittite, it has been suggested that the entry into Anatolia was not a warlike invasion of predominantly male groups. If such had been the case, the influence of substratum languages would have been likely, but, on the contrary, the word stems used are definitely Indo-European. The differences in the terminology used in other Indo-European subgroups indicate that the "Anatolians" seceded from the parent group at an early date, before the common agricultural nomenclature came into being. On the other hand, Hittite shares the Indo-European notion of the hereafter, pictured as a pastureland with grazing cattle "for which the dead king sets out."

Indo-European entry into Anatolia

There is a tendency among linguists to postulate an eastern route of entry into Anatolia by way of the Caucasus, because certain grammatical features—*e.g.,* the loss of the feminine gender—might be explained as having been caused by prolonged contacts with Caucasian languages.

It is likely that the Indo-European forebears of the later speakers of Hittite, Palaic, Luwian, and Lydian entered Anatolia together, following a common route, because the Anatolian languages share a considerable number of losses as well as innovations that presuppose a long common past.

In the central parts of Anatolia, within the bend of the Halys River (modern Turkish, Kizil Irmak), and in the northern regions, Hittite and Palaic were profoundly influenced by Hattic as a substratum language. The Hattian culture also changed the political and religious concepts of the newcomers, and a clear cultural dependency of the Indo-Europeans on the older Hattian population is evident. Some scholars have stressed the likelihood that farther to the south the Luwians might have been conversant with a different substratum. In view of the absence of textual evidence, and because knowledge of the Luwian vocabulary is rather restricted, it is perhaps not surprising that this possible substratum element escapes definition. (For the history of Anatolia in the 2nd and 1st millennia BC, see TURKEY AND ANCIENT ANATOLIA.)

The most important invaders of Anatolia in the "Dark Age" (after 1190 BC) were the Phrygians. Their language is definitely Indo-European, but it bears no relationship to the Anatolian subgroup. Rather, it seems akin to Thracian, Illyrian, or possibly Greek. Greek, in the second half of the 1st millennium BC, and, later, Latin, from the 2nd century onward, entered central Anatolia as languages of a ruling caste. Much earlier—beginning in Mycenaean times—the west coast had attracted Greek settlers. In the first half of the 1st millennium, the southern and northern shores also attracted Greek-speaking peoples. To the east in the Caucasus region, other Indo-Europeans, the Armenian-speaking invaders, penetrated into the former Urartian territory well before the beginning of the Persian period, probably in the 7th and 6th centuries BC. During Persian times, a Persian ruling caste entered eastern and also northeastern Anatolia and was still clearly recognizable in the Hellenistic and Roman periods (*e.g.*, in Bithynia, Pontus, Cappadocia, and Commagene). Late data on names and scattered remarks made by Fathers of the Church indicate that until late Roman and perhaps even Byzantine times, some Anatolian dialects remained in use in certain isolated parts of the interior.

Early research on Anatolian languages

Classification of the languages. Research on the Anatolian languages began in 1821 with the Lycian language and passed an initially fruitful phase in the 1880s with work on Hieroglyphic Hittite (nowadays referred to as Hieroglyphic Luwian). In 1902 the Norwegian Assyriologist Jørgen Alexander Knudtzon's study on the Arzawa letters was published; these were two letters exchanged between a king of Arzawa and Pharaoh Amenhotep III that had been found in the Amarna archive. They were written in the Hittite language in cuneiform writing. In 1915 research reached a climax with the interpretation of Cuneiform Hittite by the Czech Orientalist Bedřich Hrozný. In all four of these highlights, the discovery that the texts in question were Indo-European was either clearly expressed or more discreetly implied. This conclusion was based on both the nominal (noun) declension and the verbal conjugation: the languages had a nominative ending in *-s,* the accusative in *-n,* verbal endings like *-ti* and *-nti* for the 3rd person singular and plural of the present tense, and an imperative form like *estu* "let it be." These features were deemed to be sufficient proof of their Indo-European origin. Study of the Anatolian subgroup of Indo-European thus began with Lycian, the last Anatolian offshoot in the temporal sequence, then passed the intermediary stage of Hieroglyphic Luwian, and reached the 2nd-millennium Hittite language in 20th-century research. For the relationship between members of the Anatolian subgroup, see Figure 2.

The non-Indo-European Hurrian and Urartian languages are related to one another, but modern research indicates that Urartian should not be considered as a direct continuation of Hurrian.

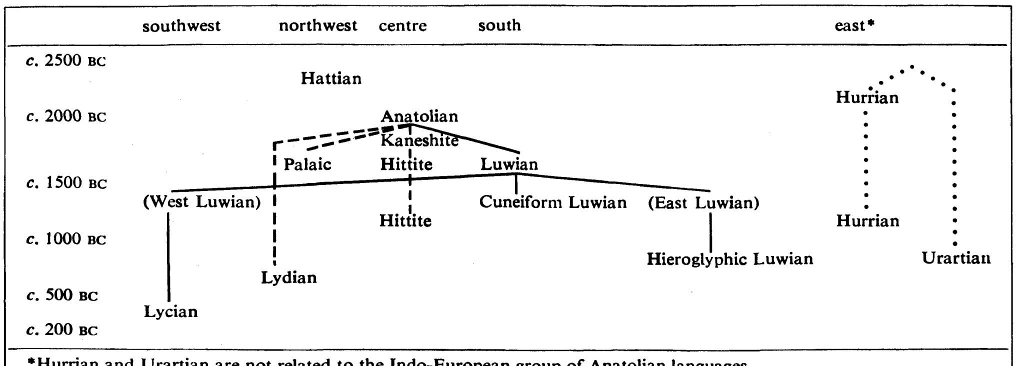
HISTORY AND DEVELOPMENT

Languages using cuneiform writing and Anatolian hieroglyphs. *Hattic.* The Hattic language appears as *hattili* in Hittite cuneiform texts. Called Proto-Hittite by some, it was the language of the linguistic substratum inside the Halys River bend and in more northerly regions. Apparently the Indo-European newcomers of Hittite stock were named with the same designation as their predecessors. All the Hattic material preserved by Hittite scribes belongs to the religious sphere of life: rituals (*e.g.,* connected with the erection of a new building), incantations, antiphons, litanies, and myths. Among the Hattic interpolations in Hittite texts, there are some to which a Hittite translation has been added. It is impossible to ascertain the length of time that the Hattians had been present in Anatolia before the Indo-Europeans entered the country, but it seems certain that during the Hittite New Empire (*c.* 1400–*c.* 1190 BC) Hattic was a dead language.

Records of Hattic

Hattic studies began in 1922 with the work of the German Assyriologist Emil Forrer. In 1935, Hans G. Güterbock, a German-born Orientalist, published a large group of texts containing Hattic material and in so doing completed the publication of the Hattic texts stemming from the Winckler excavations (1905–12). Important studies on the subject have continued to appear since then.

Hittite. The Hittite language is known from the approximately 25,000 tablets or fragments of tablets preserved in the archives of Boğazköy-Hattusa, excavated by German archaeologists beginning in 1905. In Hittite cuneiform texts, the language is referred to as *nesili* (*nasili*) "language of Nesa," or *nesumnili* "language of the Neshite." Earlier Hittite linguistic material may be found in the indigenous proper names and a few loanwords from the local dialect that are recorded in the Cappadocian tablets (the commercial correspondence in Assyrian of Assyrian colonists living in Anatolia, especially in the emporium at Kültepe, near modern Kayseri, between *c.* 1900 and 1720 BC). The data from Kültepe are sometimes referred to as "Kaneshite" (from Kanesh, the old name of Kültepe); this is obviously the modern equivalent of the word *kanisumnili* "language of the Kaneshite" found in a Hittite text. It is possible, or even likely, that Kanesh and Nesa do, in fact, refer to the same entity.



*Hurrian and Urartian are not related to the Indo-European group of Anatolian languages.

Figure 2: Relationship between members of the Anatolian subgroup.

Hittite tablets from places outside of the Hittite capital are rare; only stray examples have been found—*e.g.*, in Tarsus, Alalakh, Ugarit, and Amarna. These findings attest to the growth of a great Hittite empire, especially between *c.* 1400 and *c.* 1190 BC. Old Hittite, the written embodiment of the earliest Indo-European language that has been discovered so far, is known from some tablets preserved in an "old ductus" type of handwriting that was typical of copies from the Old Kingdom period (*c.* 1700–1500 BC). The intermediary "Dark Age" between *c.* 1500 and *c.* 1400 BC is sometimes referred to as the period of the so-called Middle Hittite language. Most of the Old and Middle Hittite texts, however, are preserved in copies from the later empire period.

Archives of Boğazköy-Hattusa

The archives of Boğazköy-Hattusa have been found in various places in the citadel, in the Great Temple complex, and in the "House on the Slope." Although the majority of the texts are concerned with religious subjects (oracle texts, hymns, prayers, myths, rituals, and festival texts), these archives also contain material of historical, political, administrative, literary, and legal character. The cuneiform adopted by the Hittite scribes is a variant of a writing system of Mesopotamian origin that closely resembles the ductus and shapes prevalent in tablets of the 17th century BC (layer VII) from Alalakh (modern Atsana in southeastern Turkey). It is possible that the cuneiform script might have been introduced as a result of the Hittites inducing Syrian scribes to transfer their activities to the Hittite capital during the early part of the Old Kingdom, shortly after 1650 BC. It has also been posited, with good reason, that the newly acquired script was first used to write Akkadian and was only later employed for Hittite as well. In addition to the genres enumerated above, the "scholarly literature" deserves to be mentioned. This consists of the material considered by the scribes to be essential for their training; it includes word lists, omens, and ritual prescriptions, all reflecting an encyclopaedic approach aimed at complete coverage of the subjects concerned. The Sumerian texts found in these archives belong to this class of literature. For treaties and correspondence with foreign powers, Akkadian was used as the diplomatic language of that period. Therefore, both Sumerian and Akkadian formed part of the curriculum of the qualified scribes, these languages belonging to the "eight languages" found in the Hittite archives.

In actual fact, the first decipherer of Hittite was the Norwegian scholar J.A. Knudtzon, who pointed out in 1902 that the language of the so-called Arzawa letters (*i.e.*, Hittite)—found in the Amarna archive—had an apparent affinity with Indo-European. Because the cuneiform script had already been deciphered, Knudtzon, and Bedřich Hrozný after him, were able to "read" their texts. Thus their discovery consisted more in the interpretation than in the actual decipherment of the written material. The first series of German excavations, lasting from 1905 to 1912, produced about 10,000 tablets. It was work on this corpus that familiarized Hrozný with the contents of these tablets and led him to his epoch-making discovery that Hittite was indeed Indo-European (1915).

Palaic. Palaic, which appears as *Palaumnili* "language of the Palaite" in Hittite cuneiform texts, was the language of the region of Pala (probably Blaëne in the Greek period), in northwest Anatolia. During the Old Hittite kingdom, Pala, Luwiya, and Hattusa formed the three major provinces of the Anatolian part of the Hittite territory. From the intermediary "Dark Age" onward, Kaska nomads made their influence felt in northern Anatolia, and this resulted in a decline of importance for this region.

Linguistic affiliations of Palaic

The Indo-European character of Palaic was first advocated by Emil Forrer (1922). Part of the text material is preserved on tablets in "old ductus." The knowledge of the limited vocabulary leaves much to be desired, but parallels—especially in the inflection of the noun, the forms of the demonstrative, relative, and enclitic pronouns, and the verbal endings—vouch for a close relationship to Hittite and Luwian.

Luwian. Luwian (or Luvian), the language of Anatolia's southern coast, is known from texts stemming from three major periods: (1) the Hittite New Empire (*c.* 1400–*c.* 1190 BC); (2) the period of the Neo-Hittite states (*c.* 1190–*c.* 700 BC); (3) the period of the Lycian monumental inscriptions (*c.* 400–200 BC). In addition to the various time periods, there is also a variation in writing system—Mesopotamian cuneiform, Anatolian hieroglyphs, and an alphabet derived from a Greek source—and dialectal differentiation. There are indications that as early as the 15th and 14th centuries BC, there was a West Luwian dialect (the precursor of alphabetic Lycian) and an East Luwian dialect (the forerunner of the later Hieroglyphic Luwian of the Neo-Hittite states). Both of these differed from the Luwian found in the archives of Boğazköy-Hattusa, which was possibly a central dialect.

As in the case of Palaic, the pioneering work on Luwian written in cuneiform was done by Emil Forrer (1922). Following this work, new text materials were published in 1953, closely followed by both grammatical and vocabulary studies as well as a standard dictionary of Cuneiform Luwian (1959).

The Anatolian hieroglyphic system has a long history, with its logographic beginnings dating back to early Hittite stamp seals of the 18th and 17th centuries BC; the youngest texts seem to date from the last quarter of the 8th century BC. The geographical range of the inscriptions is great, stretching from Sipylus and Karabel in the extreme west to Alaca Hüyük and Boğazköy-Hattusa in the north, Malatya, Samsat, and Tell Ahmar (Til Barsib) in the east, and Hama and ar-Rastān in the south. During the "Dark Age" of the 16th and 15th centuries BC, the early writing grew into a fully developed writing system with logograms (word-signs), syllabic values, and auxiliary signs. During the New Empire, the script was already in use for a multitude of purposes (rock inscriptions, seals, and wooden tablets for everyday use in the temple and the army). Whether an example of the empire period such as the Aleppo inscription already reflects the Luwian language is a moot question but seems likely. It is certain that the later inscriptions of the Neo-Hittite states were in Luwian.

Work on Hieroglyphic Luwian

The first attempts to decipher Hieroglyphic Luwian, made by the British archaeologist Archibald H. Sayce, were fortunate in some fundamental details, but it was not until the 1930s that systematic and mutually stimulating research by scholars of several countries led to the establishment of a number of syllabic values for the characters as well as to a correct analysis of the sentence structure of the inscriptions. In his publication of the (bilingual) Hittite royal seals (in 1940, 1942), Hans G. Güterbock bridged the gap between the inscriptions of the empire period and the late Neo-Hittite states; the seals found in the French excavations at Ugarit (in northern Syria) served a similar purpose. The most important recent finding was the discovery in 1947 by Helmuth T. Bossert, a German archaeologist, of the Karatepe bilingual inscriptions, written in Phoenician and Hieroglyphic Luwian.

On many points the Luwian vocabulary is still an enigma. The unity between the various Luwian dialects and the close relationship of Luwian to the other members of the Anatolian subgroup, however, is secured by several linguistic parallels, especially in the singular inflection of the noun, the forms of certain pronouns, the verbal endings, and a number of lexical (vocabulary) correspondences.

Hurrian. In earlier stages of research, the terms Mitanni language and Subarian were used as designations for Hurrian. In Hittite cuneiform texts, *hurlili* "language of the Hurrian" is used. In the last centuries of the 3rd millennium BC, Hurrians were already present in the Mardin region, which, from a geographical point of view, belongs to the North Mesopotamian plain. In Mesopotamian texts (from the time of the Akkad dynasty) some Hurrian personal names and glosses have been found. The customary assumption is that this non-Semitic and also non-Indo-European ethnic group had come from the Armenian mountains. During the beginning of the 2nd millennium BC, the Hurrians apparently spread over larger parts of southeast Anatolia and northern Mesopotamia. Still later, during the intermediary "Dark Age," they are supposed to have infiltrated into Cilicia and the adjacent Taurus and Antitaurus regions (Kizzuwatna in 2nd millennium texts). Before the middle of the 2nd millennium BC, an

Indo-Aryan ruling caste wielded some type of authority over parts of Hurrian territory. Some names and words in ancient Near Eastern texts bear witness to their presence. Among these words are a group of technical terms related to the training of horses that found its way into Hittite treatises on that subject; they are most important from a historical point of view. After Sumerian, Akkadian, Hattic, Palaic, and Luwian, Hurrian and these Indo-Aryan glosses constitute the sixth and seventh additional languages of the Hittite archives.

Sources of Hurrian texts

Hurrian texts have been found in Urkish (Mardin region, *c.* 2300 BC), Mari (on the middle Euphrates, 18th century BC), Amarna (Egypt, *c.* 1400 BC), Boğazköy-Hattusa (Empire period), and Ugarit (on the coastline of northern Syria, 14th century). Amarna yielded the most important Hurrian document, a political letter sent to Pharaoh Amenhotep III. From Mari came a small number of religious texts; from Boğazköy-Hattusa, literary and religious texts; and from Ugarit, vocabularies belonging to the more "scholarly literature" described above and Hurrian religious texts in Ugaritic alphabetic script. Hurrian personal names, found in texts from many sites (Boğazköy-Hattusa, Alalakh, Ugarit, and especially Nuzu), constitute a second linguistic source of major importance.

The research on Hurrian started in the 1890s with simultaneous contributions by several scholars. Subsequently, Bedřich Hrozný (1920) and Emil Forrer (1919, 1922) discovered the presence of Hurrian material in the Boğazköy-Hattusa archives.

Urartian. The terms Chaldean and Vannic have also been used as designations for Urartian during earlier stages of research. Urartian is not a late dialect of Hurrian but a separate language, although both stem from a common parent. During the 9th through 6th centuries BC, Urartian was used in northeastern Anatolia as the official language of the state of Urartu, which centred around the district of Lake Van but also extended over the Transcaucasian regions of modern Russia and into northwestern Iran and at times even into parts of North Syria. The Urartian texts are written in a variant of the Neo-Assyrian script and consist mostly of monumental inscriptions (annals, votive inscriptions related to building and irrigation activities), some small inscriptions on helmets and shields dedicated in the temple, and a few economic cuneiform tablets. Two bilingual inscriptions in Urartian and Assyrian that apparently correspond very closely provided the key to the understanding of the language; the stylistic resemblances to Assyrian texts of the same period guided the further interpretation.

Archibald H. Sayce was the first scholar to devote his attention to Urartian in the 1880s and 1890s and continued his activities until 1932. More important were the philological contributions of the German historian Carl F. Lehmann-Haupt between 1892 and 1935. The first reliable description of Urartian grammar was published by the German Orientalist Johannes Friedrich (1933).

Next to the Urartian texts in cuneiform writing, there also existed an indigenous hieroglyphic script that is still undeciphered and is too meagrely represented to warrant a serious attempt.

Old Phrygian and New Phrygian

Languages using a derivative of the Phoenician or Greek alphabet. *Phrygian.* The Phrygian inscriptions and graffiti may be separated into two groups, the Old Phrygian texts in a typical Phrygian alphabet dating from *c.* 730–450 BC, and the New Phrygian inscriptions (sepulchral texts in the Greek alphabet) stemming from the 1st and 2nd centuries AD. The Old Phrygian texts may be divided into a central group (Midas City and the central area) and an eastern group (found in Gordium), with offshoots in a still more eastern direction marking the utmost Phrygian expansion (inscriptions in or around Hüyük near Alaca, in Boğazköy-Hattusas, and in Tyana). An important recent finding—and the longest Old Phrygian text to date—is the rock inscription near the village of Germanos (modern Soğuk Çam) in Bithynia (found in 1966). The total number of Old Phrygian texts now stands at about 80; more than 50 of these are from Gordium and represent about one-quarter of the available material. There is a consensus of opinion on the Indo-European character of the Phrygian language; most scholars think that Phrygian is somehow connected to the Greek branch of Indo-European languages, although, at an earlier stage, some scholars considered the possibility of a connection with the Anatolian branch of Indo-European, and others proposed a relationship with Thracian and Illyrian.

In a publication of new material from Gordium, the U.S. archaeologist Rodney S. Young cautiously suggested that the Old Phrygian alphabet may be dependent on a prototype in use on the North Syrian or Cilician coasts. The old idea that the Phrygian alphabet was dependent on a Greek one (and not vice versa) need not be abandoned in that case. Historically, such a derivation would present no problems, because the presence of Greek settlements in these areas during the second half of the 8th century BC is amply attested to by both Assyrian annals and late Greek historical sources as well as by archaeological findings. Internal evidence from the Phrygian alphabet, presented by the French linguist Michel Lejeune, serves as proof for some researchers that that alphabet derived from the Greek one.

Lydian. Of the more than 70 Lydian texts (*e.g.,* sepulchral inscriptions, votive texts, many graffiti), more than half have been found by United States excavators at the Lydian capital, Sardis. Two small Greek–Lydian bilingual texts were far less helpful than the famous Aramaic–Lydian text. A few texts (about ten) may go back to the 6th or 5th centuries BC, but many more stem from the 4th century. The Lydian alphabet was derived from an East Greek prototype; the superfluous signs in the Greek alphabet were used for specific Lydian sounds, and additional signs were either borrowed from other "Anatolian alphabets" or freely created.

Research on Lydian

Important results concerning Lydian were reached using a strictly combinatory method; *i.e.,* passages were compared that expressed similar contents in a slightly different manner in order to obtain a better understanding of the language's structure. This stage of the research culminated in a conclusive article by the Italian Piero Meriggi on the Indo-European character of Lydian (1936). Subsequently, other scholars published evaluations of the Lydian data, a dictionary, and a grammar book. The study of Lydian is hampered by many lexicological uncertainties, but there is at least a growing consensus on matters of grammar leading to the common notion that Lydian belongs to the Anatolian subgroup of Indo-European. The final obstacle to this classification as Anatolian was removed in 1959 by the Italian Onofrio Carruba, who proved that Lydian, like the other members of the Anatolian branch, does not possess a separate feminine gender. Lydian shares common features with Hittite, Palaic, and Luwian and should therefore be acknowledged, it seems, as a fourth independent member of the Anatolian subgroup.

Carian. A great number of the more than 100 Carian inscriptions are graffiti found in Egypt that were left behind by Carian mercenaries in the services of Egyptian pharaohs of the Saitic period (664–525 BC). In recent years, more monumental inscriptions have been found in Caria itself, and Carian clay tablets have also been discovered. In the mid-20th century, several scholars concluded that Carian writing consists of a purely alphabetic script and is not a mixed system of both single letters and syllabic signs as was formerly thought. It is a likely but still unproven assumption that Carian may also be classified in the Anatolian subgroup of Indo-European.

Lycian. More than 150 Lycian monumental inscriptions have been found so far, which, with very few exceptions, are sepulchral in character. They are written in an indigenous Lycian alphabet that is based not on an East Greek prototype (as its Lydian replica) but on a West Greek one. Although the Lycian coin legends are still usually dated from the period between 500 and about 360 BC, the tradition of the Lycian monumental inscriptions is now thought to have continued for a longer period, into the 3rd century BC. During the beginning of the research in the first half of the 19th century, extensive use was made of a good bilingual text that offers a faithful Greek translation. In the first phase of research, which ended about 1880, Lycian was investigated by an etymological method by which it was linked up either with Greek or the Iranian languages. A more reliable combinatory method was later introduced, but the most fecund phase in the study of Lycian occurred at the end of the 19th century, when the Scandinavian school of scholars cooperated closely in the publication of several important studies. In 1945, Holger Pedersen published a synthesis of all data that seemed to indicate a relationship of Lycian with Hittite; thus Pedersen proved conclusively that Lycian belongs to the Anatolian branch of Indo-European languages. This conclusion was slightly modified when the British scholar Franz J. Tritsch (in 1950), and, later, the French scholar Emmanuel Laroche showed that Lycian should be more specifically compared to Luwian.

Relationship of Lycian with Anatolian

Sidetic. The historical detail preserved by the Greek historian Arrian that the city of Side on the Pamphylian coast possessed a particular, indigenous language has been strikingly confirmed by legends on Sidetan coins of the 5th (?) through the 3rd (?) centuries and by five inscriptions from the 3rd and 2nd centuries BC (two of which are bilingual). There is a curious likelihood that this alphabet was directly derived from a Semitic writing system rather than from a Greek prototype, but Greek influence was not absent, as is clearly evidenced in the Greek bilingual texts and by a loanword from Greek. The first reliable study of Sidetic was made by Helmuth T. Bossert in 1950. In the case of Sidetic, even the value of a group of signs is still undecided, and research has not yet reached a stage in which a fruitful analysis of the texts and a classification of the language are within sight.

LINGUISTIC CHARACTERISTICS

Non-Indo-European languages. The non-Indo-European Hattic is an agglutinative language; that is, it combines several elements of meaning into a single word. In the conjugation of verbs, it uses prefixes that are attached to the word stems, which are mostly monosyllabic or bisyllabic. Hattic nouns consist of a free number of syllables and have both prefixes and suffixes. There are, however, no formal distinctive features to distinguish nouns and verbs.

Both the Hurrian and the Urartian languages differentiate between stems and suffixes, but there is again no sharp distinction between noun and verb. Many suffixes may be added onto one another in a row, but within the often prolonged suffix series a detailed order is rigidly observed. Among the suffixes added to the noun, several subgroups are distinguished; one group might be compared to the case endings of the Indo-European languages. One of the most characteristic phenomena of this group is the distinction between a subject case (the "nominative") and an "agentive" case. The agentive marks the actor or subject of a transitive verb when the object is expressed by its counterpart, the "nominative." The subject case is characterized by a lack of ending on the stem; it marks the subject in nominal sentences (sentences without verbs) and occurs with intransitive verbs and as the object of transitive verbs.

Subject and agentive cases in Hurrian and Urartian

Phrygian. The New Phrygian texts especially favour the attribution of the Phrygian language to Indo-European. They contain such data as *ios* as relative pronoun (Indo-European **io-s,* Greek *hos*), a demonstrative pronoun that is either comparable to Indo-European **ki-/ko-* or to **so* (an asterisk indicates a hypothetical reconstructed form), and the form *ad-daket* "he adds" related to Latin *addit* and to Greek *é-thē-ka.*

The Anatolian subgroup of Indo-European. *Grammatical characteristics.* Characteristic of the Anatolian languages is the absence of the dual number ("you and I") and the lack of feminine gender in the declension of nominals (nouns, pronouns, and adjectives). There is a division between an animate (common) gender and an inanimate (neuter) gender. In Hittite, a neuter may not be the subject of a transitive action verb; in that case, an *-ant* suffix is added before the neuter nominative ending in *-s.* This *-s* ending persists in the whole subgroup. The case system of Old Hittite is still fairly complicated, but in the subgroup as a whole there is a clear tendency toward a greater simplicity. The presence in Hittite of an archaic irregular class of nouns is a striking characteristic; *e.g.,* there are alternate *r* and *n* stems as in *uttar/uttanas* "word, affair" and *watar/witenas* "water."

The Anatolian inflection of pronouns conforms to the traditional Indo-European pattern by being different from that of the nouns, but, at the same time, it shows some striking peculiarities. Typical Anatolian pronouns are: Hieroglyphic Luwian *amu,* equivalent to Lycian *amu, emu, ẽmu* "I, me" (compare Hittite nominative *uk,* accusative *ammuk*); and Hittite nominative *zik,* accusative *tuk* "you," as compared to *ti, tu* in Palaic. Some of the languages have enclitic pronouns; *i.e.,* pronouns pronounced as being part of the preceding word. A demonstrative pronoun *aba-* ("that," but in some member languages also "this") is present in Hittite, Palaic, Cuneiform and Hieroglyphic Luwian, Lycian (*ebe-*), and Lydian (*ebad* "here, there"), and an interrogative or relative pronoun *kui-* (compare Latin *quis*) is common to Hittite, Palaic, and Cuneiform Luwian. The corresponding terms for *kui-* in Hieroglyphic Luwian, Lycian, and Lydian also seem to be phonetic variants of the same original pronoun.

Anatolian verbs

The Anatolian verbal system is simple: it has two moods (indicative and imperative) and two tenses (present and preterite). There are some traces—either to be classified as debris or as the nucleus for a future development—of an aorist *-s* fixed to the stem; *e.g., kaness-* "to acknowledge" (compare Greek *gi-gnō-sk-ō*); *kalless-* "to call" (compare Greek *kaleō,* aorist *é-kale-s-a*). (The aorist is a verb form denoting action without reference to its duration or completion.) A mediopassive "voice" is present in Hittite (*es-a-ri* "he is seated"; *ki-tta-ri* "he is lying"), Palaic, Luwian, and perhaps in Lydian. (The mediopassive expresses a type of reflexive meaning ["He washes himself"] or passive meaning ["He is being washed"].)

Reduplication (repetition) of the verbal stem occurs in the entire Anatolian subgroup. It adds an iterative or intensive nuance to the meaning, but it does not function in a system of tenses as in Greek. Very typical of the Anatolian subgroup are verbal suffixes like the causative *-nu-* (compare Hittite *war-* "to burn," *warnu-* "to kindle," *harg-* "to perish," *harganu-* "to ruin, to destroy"). In principle, these formations can be built on any verbal stem whose meaning permits such an addition. It should be stressed that in Hittite a normal expression for a "state" consists of a nominal sentence (that is, a sentence without a verb but with a noun, an adverbial expression, or a participle as predicate); sometimes, however, the verb *es-* "to be" is used as the carrier of modal or temporal nuances. The total absence of the Indo-European perfect (describing a "state" resulting from a recently concluded action) becomes very clear by the usage of the adverb *nawi* "not yet," which occurs with a present tense in Hittite (but which would employ a perfect tense, such as "has been," in English and other Indo-European tongues).

Very characteristic of the Anatolian subgroup is a strong preference for the linking together of particles and enclitic pronouns to form "chains" that are placed at the beginning of the sentence or clause. The first component of such a "chain" usually is a stressed part of the sentence or otherwise a sentence connective (like *nu* in Hittite, *a* in Luwian).

Phonological characteristics. In the Anatolian vowel system, *a, e, i,* and *u* are present, but *o* is curiously absent. In Lycian, the Greek value omicron has been used for the Lycian *u,* but in Lydian the existing *o* seems to be a secondary development. A main dialectal criterion is the treatment of Anatolian *e:* in Old Hittite, there still was a differentiation between *e* and *i,* but in later Hittite, an *-e* at the end of a word changed to *-i.* In Luwian, *e* tended to appear as *a.* Vowel gradation (*i.e.,* a change of vowel) that reflects meaning change plays a role in Hittite (*e-es-zi* "he is" versus *a-sa-an-zi* "they are") but was impossible in Luwian because of the sound change. Both Lycian and Lydian possess separate signs for nasalized vowels (*ã* and *ẽ*).

Laryngeal theory and Anatolian data

Advocates of the so-called laryngeal theory (first proposed by the Swiss linguist Ferdinand de Saussure in 1879) have found their postulate partly confirmed by Anatolian data. This theory maintains that the different forms of certain

*Indicates that the following form is an unattested, reconstructed form.

words in the various Indo-European subgroups can be satisfactorily explained only by assuming that all the known Indo-European languages have lost certain guttural sounds (laryngeals) that were originally present in the parent speech. In 1927, both the Polish linguist Jerzy Kuryłowicz and the French scholar Albert L.M. Cuny announced their discovery that in Hittite an *h* sound was preserved in positions in which a laryngeal would have formerly been (compare Hittite *hant-* "front" to English *anti-;* Hittite *pahhur* "fire" but English *pyre*). But the Anatolian evidence for the laryngeal theory is certainly not without problems, and the adherents of the theory consider that other laryngeals disappeared in Hittite as well.

Lexical data. Some examples of correspondences in vocabulary are given in Table 3. It has often been remarked—and not without reason—that although the grammar of the Anatolian languages would be recognizably Indo-European, the vocabulary would be less so. This is usually attributed to the deeply penetrating influences exercised by strange surroundings, not only while the "Anatolians" were "en route" but also after their arrival in Anatolia.

The relationship with the other subgroups. The relationship of the Anatolian branch to the rest of Indo-European has often been defined in the United States on the basis of the "Indo-Hittite hypothesis." That is, Hittite or Anatolian on the one hand and Proto-Indo-European on the other were both supposed to descend from a common parent. This hypothesis attributes too much weight to the Anatolian evidence. It was demonstrated as early as 1938 that the Anatolian branch should be placed on a par with the rest of the Indo-European subgroups and not as a coequal with Indo-European itself. Nowadays, the Indo-Hittite hypothesis is very rarely defended. Another extreme position states that the Hittite-Luwian-speaking group (another designation for the Anatolian subgroup) left the Indo-European parent group comparatively late, after the Greek and Armenian divisions had done so and approximately at the same time as Indo-Iranian. If this theory were true, there would be no need to use the Anatolian data for a thorough revision of the reconstructed Proto-Indo-European language, because these data would be less relevant, at least not more so than Indo-Iranian and Greek, on which the old reconstruction was based. A third opinion—prevalent in the French school of Indo-European studies—holds that the Hittite or, preferably, the "Common Anatolian" data are of special importance, because the Anatolian languages are particularly archaic. According to this theory, similarities in morphology (word elements) between the Celtic, Italic, and Hittite–Luwian groups and Tocharian (an Indo-European language of central Asia) seem to imply that the dialects from which these groups evolved were in peripheral positions in the Indo-European language area and were probably the first to move away from the main group. (Ph.H.J.H.t.C.)

Indo-Hittite hypothesis

Indo-Iranian languages

The Indo-Aryan and Iranian languages together constitute the Indo-Iranian language group, the easternmost major branch of the Indo-European family of languages. Indo-Aryan (Indic) languages are spoken by approximately 660,000,000 persons in India, Pakistan, Sri Lanka (formerly Ceylon), Nepal, Bangladesh (former East Pakistan), and other areas of the Himalayan region. In addition, languages of the Indo-Aryan group are spoken by about 5,000,000 people in Europe, Africa, the Americas, and Oceania: the Gypsy, or Romany, dialects distributed about the U.S.S.R., the Middle East, Europe, and North America are of Indo-Aryan origin. Speakers of Iranian number about 62,000,000 and live in areas extending from Pakistan (former West Pakistan) to Iran, Afghanistan, and the southern U.S.S.R. Among the Indo-European languages, only Mycenaean Greek and Hittite possess older records than those of Indo-Iranian.

The Indo-Iranian tongues have been used as both administrative and literary languages. Old Persian was the administrative language of the early Achaemenian dynasty dating from the 6th century BC; and an eastern Middle Indo-Aryan dialect was the language of the chancellery of King Aśoka in India in the mid-3rd century BC. As literary languages, the Indo-Iranian languages have been used in the texts of some of the world's great religions: Indo-Aryan for Buddhism, Hinduism, and Jainism, and Iranian for Zoroastrian and Manichaean texts. The oldest Zoroastrian texts are in dialects included under the name Avestan. Commerce, conquest, and religion spread the influence of these languages. Indo-Aryan languages, for example, penetrated deep into Southeast Asia; names in Indonesia and other areas and Sanskrit texts in Cambodia reflect this influence.

The close relation between the Iranian and Indo-Aryan groups has never been doubted. They share characteristic features that set them apart as a subgroup of Indo-European. The long and short varieties of the Indo-European vowels *e, o,* and *a,* for example, appear as long and short *a:* Sanskrit *manas-* "mind, spirit," Avestan *manah-*, but Greek *mĕnos* "ardor, force." (In the following examples, ¯ indicates a long vowel; ˘ indicates a short vowel. The spellings used in this article for Indo-Aryan and Iranian forms are traditional transliterations for the most part. In some cases, more accurate phonetic symbols are used. These can be found in the International Phonetic Alphabet.) In instances in which some Indo-European languages have an *a* sound, Indo-Iranian has *i* as a reflex of Indo-European sounds called laryngeals; *e.g.,* Greek *patēr* "father," Sanskrit *pitṛ-*, Avestan and Old Persian *pitar-*. After stems ending in long or short *a, i,* or *u,* an *n* occurs sometimes before the genitive (possive) plural ending *ām* (Avestan *-ąm*); *e.g.,* Sanskrit *martyānām* "of mortals, men" (from *martya-*); Avestan *mašyānąm* (from *mašya-*), Old Persian *martiyānām.*

Linguistic features shared by Indo-Aryan and Iranian

In addition to several other similarities in their grammatical systems, Indo-Aryan and Iranian have vocabulary items in common—*e.g.,* such sacrificial terms as Sanskrit *yajña-*, Avestan *yasna-* "sacrifice"; Sanskrit *hotṛ-*, Avestan *zaotar-* "a certain priest"; and names of divinities and mythological persons, such as Sanskrit *mitra-*, Avestan *miθra-* "Mithra." Indeed, both the Iranians and the Indo-Aryans used the same word to refer to themselves as a people: Sanskrit *ārya-*, Avestan *airya-*, Old Persian *ariya-* "Aryan."

Indo-Aryan and Iranian also differ in many points. Among them, Indo-Aryan has an *i* sound representing an Indo-European laryngeal sound not only in initial syllables but generally also in interior syllables; *e.g.,* Sanskrit *duhitṛ-* "daughter" (*cf.* Greek *thugátēr*). In Iranian, however, the sound is lost in this position; *e.g.,* Avestan *dugədar-, duγdar-.* Similarly, the word for "deep" is Sanskrit *gabhīra-* (with *ī* for *i*), but Avestan *ǰafra-.* Iranian also lost the accompanying aspiration (a puff of breath, written as *h*) that is retained in certain Indo-Aryan consonants; *e.g.,* Sanskrit *dhā* "set, make," *bhṛ,* "bear," *gharma-* "warm," but Avestan and Old Persian *dā, bar,* and Avestan *garəma-.* Further, Iranian changed stops such as *p* before consonants and *r* and *v* to spirants such as *f:* Sanskrit *pra* "forth," Avestan *frā;* Old Persian *fra;* Sanskrit *putra-* "son," Avestan *puθra-,* Old Persian *puṣṣa-* (*ṣṣ* represents a sound that is also transliterated as ç). In addition, *h* replaced *s* in Iranian except before nonnasal stops (produced by releasing the breath through the mouth) and after *i, u, r, k; e.g.,* Avestan *hapta-* "seven," Sanskrit *sapta-;* Avestan *haurva-* "every, all, whole," Sanskrit *sarva-.* Iranian also has both *xš* and *š* sounds, resulting from different Indo-European *k* sounds followed by *s*-like sounds, but Indo-Aryan has only *kṣ; e.g.,* Avestan *xšayeiti* "has power, is capable," *šaēiti* "dwells," but Sanskrit *kṣayati, kṣeti.* Iranian was also relatively conservative in retaining diphthongs that were changed to simple vowels in Indo-Aryan.

Iranian differs from Indo-Aryan in grammatical features as well. The dative singular of *-a*-stems ends in *-āi* in Iranian; *e.g.,* Avestan *mašyāi,* Old Persian *cartanaiy* "to do" (an original dative singular form functioning as infinitive of the verb). In Sanskrit the ending is extended with *a—martyāy-a.* Avestan also retains the archaic pronoun forms *yūš, yūžəm* "you" (nominative plural); in Indo-Aryan the *-s-* was replaced by *y* (*yūyam*) on the model of the 1st person plural—*vayam* "we" (Avestan *vaēm,* Old Persian *vayam*). Finally, Iranian has a 3rd person pronoun *di* (accusative *dim*) that has no counterpart in Indo-Aryan but has one in Baltic.

The original location of the Indo-Iranian group was prob-

Sinhalese	*Sri Lanka* (Ceylon)	10,986 (census 1981 data of Sri Lanka for Sinhalese group)	official language of Sri Lanka (Ceylon)
Divehi (Maldivian)	*Maldive Islands*	approximately 150	official language of Maldive Islands

*Italic type indicates language is spoken by a majority or plurality of the population in the area; roman type indicates language is spoken by a minority of the population in the area. †Not shown when there are fewer than 10,000 reported speakers in a given country. "Reported" number of speakers is often far different from actual number of speakers. Indian (I) data include census returns for Indian-held portion of Jammu and Kashmir; Pakistani (P) data do not include data for Pakistani-held portion of Jammu and Kashmir; Pakistani data are incomplete for the tribal areas of the Northwest Frontier Province, west Dardic.

Original homeland of Indo-Iranian

ably to the north of modern Afghanistan, in the present-day southern U.S.S.R.—the area called Soviet Turkistan—where Iranian languages are still spoken. From there, some Iranians migrated to the south and west, the Indo-Aryans to the south and east. From geographical references in the earliest Indo-Aryan literary document, the Rigveda, it is clear that the earliest settlement of Indo-Aryans was in the northwest of the Indian subcontinent. Migration did not take place at once; there was doubtless a series of migrations. The date of entry of the Indo-Aryans into the subcontinent cannot be precisely determined, though the beginning of the 2nd millennium BC is plausible and generally accepted.

There is heated controversy concerning the precise linguistic position of the language of the Indo-Iranian family first attested in Middle Eastern cuneiform texts of *c.* 1450–1350 BC. Some borrowed words and proper names appearing in these Hittite-Hurrian documents have been interpreted as belonging either to Indo-Iranian, to an Indic subgroup of Indo-Iranian that had not yet fully split, or to Indo-Aryan proper. Complete scholarly agreement on this issue has not been reached.

The identification of the Harappan peoples of the Indus Valley, whose writing has not yet been satisfactorily deciphered, also awaits further research; with it may come a possible answer as to whether Indo-Aryans encountered these people or whether their civilization had passed by the time the Indo-Aryans arrived on the subcontinent. Whatever the answers to these problems may be, the reasons for the split of the Indo-Aryans and Iranians are not known.

In the following presentation regarding Indo-Aryan documents as evidence for linguistic history, it should be borne in mind that almost all dates are approximations.

THE INDO-ARYAN LANGUAGES

Languages of the group. Indo-Aryan languages are assigned to three major periods: Old, Middle, and New Indo-Aryan. These periods are linguistic, not strictly chronological. Old Indo-Aryan includes different dialects and linguistic states referred to in common as Sanskrit. The most archaic Old Indo-Aryan is that of sacred texts called Vedas. Classical Sanskrit is the name given to the literary language that represents a polished form of various dialects. The late Vedic dialect described by the grammarian Pāṇini (*c.* 6th century BC) is also commonly called Classical Sanskrit. Middle Indo-Aryan includes both the dialects of inscriptions from the 3rd century BC to the 4th century AD and literary languages. Apabhraṃśa dialects represent the latest stage of Middle Indo-Aryan development. Though all Middle Indo-Aryan languages are included under the name Prākrit, it is customary to speak of the Prākrits as excluding Apabhraṃśa.

New Indo-Aryan is represented by such modern vernaculars as Hindi and Bengali, which began to emerge from about the 10th century AD. These too have earlier and later stages, culminating in the present-day languages.

New Indo-Aryan languages accounted for about 490,000,000 speakers in India, or approximately 74 percent of the population in the early 1980s. Considering the approximately 85,000,000 Bengali speakers in Bangladesh, approximately 63,000,000 speakers accounted for by Punjabi and Sindhi in Pakistan, and 11,000,000 Sinhalese (Sinhala) speakers in Sri Lanka (formerly Ceylon), the total number of New Indo-Aryan speakers is well over 650,000,000. According to the latest Indian census, there are 547 mother tongues of the Indo-Aryan group within the bounds of postpartition (1947) India. Some of these are dialects used by few speakers; others are official state languages having 30,000,000 or 50,000,000 speakers. The major groups of New Indo-Aryan languages are given in Table 4. Structurally and historically, Hindi and Urdu are one, though they are now official languages of different countries written in different alphabets. The term *hindī* (also *hindvī*) is known from as early as the 13th century. The term *zabān-e-urdū* "language of the imperial camp" came into use in about the 17th century. In the south, Urdu was used by Muslim conquerors of the 14th century.

Modern Indo-Aryan tongues and number of speakers

Many of the languages in Table 4 are official state languages, the media of education up to the university level and of official transactions. Hindi, written in the Devanāgarī script, is the co-official language (with English) of the Republic of India and is used as a lingua franca throughout North India. It has varieties according to the mother tongue of the area; *e.g.,* Bombay Hindi and Calcutta Hindi. Each of the major state languages has several other dialects in addition to the standard dialect adopted for official purposes. Including the various dialects down to the village level, it can be said that a chain of communication stretches across North India such that each dialect forms a link with each adjacent dialect. On the level of official languages this is not so: a Gujarati speaker will not readily understand colloquial Bengali.

Official state languages

Historical survey of the Indo-Aryan languages. The points noted above regarding Indo-Aryan migration make it difficult to determine the domain of Proto-Indo-Aryan, the ancestral language of all the known Indo-Aryan tongues, if indeed there was any such single region. All

that can be said with certainty is that the Indo-Aryans on the subcontinent first occupied the area comprising most of present-day Punjab (both West and East), Haryana, and the Upper Doab (Ganges–Yamuna interfluve) of Uttar Pradesh. The structure of Proto-Indo-Aryan must have been close to that of early Vedic, with dialectal variations.

Vedic documents

Old Indo-Aryan. The most archaic Sanskrit is that of the Vedas, of which there are four major text groups called Saṃhitās: the Rigveda, Atharvaveda, Sāmaveda, and Yajurveda. The Yajurveda is in turn divided into two main branches, the White (Śukla) Yajurveda and the Black (Krishna) Yajurveda. The Rigveda, Atharvaveda, and Sāmaveda are purely metrical texts mainly used by priests in their ritual. The texts of the Black Yajurveda contain both verses used in ritual sacrifice (called *mantras*) and prose sections that are explanatory in nature, giving mythological explanations of sacrifices and objects used in them, together with etymologies (derivations of words). These sections are known as *Brāhmaṇa* portions. Each Veda also has a particular *Brāhmaṇa* connected with it. The early Vedic texts are pre-Buddhistic; a plausible date accepted for the composition of the Rigveda is between 1200 and 1000 BC, though the exact chronology of these early texts is difficult to establish. The prose passages of *Brāhmaṇas* and of the early *sūtra* (aphoristic texts) period may be called late Vedic. Also of the late Vedic period is the grammarian Pāṇini, author of a treatise called *Aṣṭādhyāyī,* who makes a distinction between the language of sacred texts (*chandas*) and the usual language of communication (*bhāṣā*).

Epic Sanskrit is so called because it is represented principally in the two epics, *Mahābhārata* and *Rāmāyaṇa.* In the latter the term *saṃskṛta* "formed, polished" is encountered, probably for the first time with reference to the language. The date of com-

position for the core of early Epic Sanskrit is considered to be in the centuries just preceding the Christian era.

Classical Sanskrit is the language of the major poetic works (*kāvya*), drama (*nāṭaka*), tales such as the *Hitopadeśa* and *Pañca-tantra,* and technical treatises on grammar, philosophy, and ritual. It was used not only by the poet Kālidāsa and his predecessors Bhāsa, a dramatist, and Aśvaghoṣa, a Buddhist author, in the first centuries AD but was also continued long after Sanskrit was a commonly used mother tongue; indeed, Sanskrit is a language of learned treatises and commentaries to this day. It is also used as a lingua franca among *paṇḍit*s (Brahmin scholars) from different areas of India.

Development of Sanskrit

Linguistic developments can be traced from the early Vedic of the Rigveda through the later Saṃhitās on to the late Vedic of *Brāhmaṇa* prose and *sūtra*s, culminating in the language described by Pāṇini, which is tantamount to Classical Sanskrit. For example, the nominative plural form ending in *-āsas* (*devāsas* "gods") was already less frequent than *-ās* in the Rigveda and continued to lose ground later; in *Brāhmaṇa, -ās* (*e.g., devās*) is the normal form. There are numerous other changes evident. For example, the instrumental singular form of *-a*-stems ends both in *-ā* and *-ena* (a pronoun ending) in the Rigveda, with the latter form predominating; thus, *vīryā* "heroic might" appears once, and *vīryeṇa* occurs ten times (from *vīrya-* "heroic might, act"). In later Vedic *-ena* is the usual ending. All the early Vedic forms are expressly classed as belonging to the sacred language (*chandas*) by Pāṇini.

The verb also shows chronological differences. For example, the 1st person plural ending *-masi* (*e.g., bharāmasi* "we bear") predominates over *-mas* in Rigvedic but not in the Atharvaveda; *-mas* becomes the normal ending later. Early Vedic distinguishes between the aorist, imperfect, and perfect tenses. The aorist is commonly used to refer to an action that has recently taken place; the imperfect is a narrative tense referring to actions accomplished in the distant past. The perfect form of the verb originally denoted, as in Greek, a state reached; *e.g., bi-bhāy-a* "is afraid" (root *bhī*). From earliest Vedic, however, this was not always the use of the perfect. Although the grammarian Pāṇini distinguished between the three tenses noted (he said the perfect is used to denote an action beyond one's ken), the perfect and imperfect both came to be used as narrative tenses.

There are also future forms of Vedic, formed with suffixes (*-iṣya* and *-sya*) and used from earliest times. A future form, composed of an agent noun of the type *kartṛ-* "doer" and followed, except in the 3rd person, by forms of the verb *as* "be" (*e.g., kartāsmi* [*kartā asmi*] "I will do"), was recognized as in common use by Pāṇini but is rare in early Vedic.

The injunctive of early Vedic

Early Vedic had a category that went out of use by the late Vedic period of *Brāhmaṇas*—the injunctive, which was formally a form with secondary endings lacking the augment, a prefixed vowel. The injunctive could be used to denote a general truth. A general truth can also be signified by the subjunctive, which is characterized by the vowel *a* affixed to the present, aorist, or perfect stem. Later Vedic retained the injunctive only in negative commands of the type *mā vadhīs* "do not slay." The subjunctive also diminished slowly until it was no longer used; for Pāṇini the subjunctive belonged to sacred literature. The functions of the subjunctive were taken over by the form called optative (and the future form).

Noun forms incorporated into the verb system are numerous in early Vedic. Rigvedic has forms with affixes *ya* and *tva* functioning as future passive participles (gerundives); *e.g., vāc-ya-* "to be said," *kar-tva-* "to be performed, done." The Atharvaveda has, additionally, forms with *-(i)tavya* (*hiṃs-itavya-* "to be injured") and *-anīya* (*upa-jīv-anīya-* "to be subsisted upon"). By late Vedic, the type with *tva* had been eliminated; Pāṇini recognized as normal the types *kārya-, kartavya-, karaṇīya-* "to be done." In Indo-Aryan, from earliest Vedic down to New Indo-Aryan, forms called absolutives (or gerunds) are used to denote the previous of two or more actions performed (usually) by one agent: "having done . . . he did"; for example, *pibā niṣadya* "sit down (*niṣadya* "having sat down") and drink." Rigvedic uses *tvī, tvā, tvāya,* (*t*)*ya* to form absolutives, but these were later reduced to two: *tvā* with a simple verb or one compounded with the negative particle, and *ya* with a verb compounded with a preverb (a preposition-like form).

Early Vedic also uses various case forms of action nouns in the capacity of infinitives; *e.g.,* dative singular *-tave* (*dā-tave* "to give"), genitive singular *-tos* (*dā-tos*), both from a noun in *-tu,* which also supplies the accusative ending *-tum* (*dā-tum*). There are other types in early Vedic, but the nouns in *-tu* are important; in late Vedic the accusative *-tum* and the genitive *-tos* (construed with *īś* or *śak* "be able, can") became the norm. According to Pāṇini, forms in *-tum* and dative singular forms of action nouns are equivalent variants: *bhok-tuṃ gacchati/ bhojanāya gacchati* "He is going out to eat."

Chronological and dialectical modifications

That some forms fell into disuse in the course of Indo-Aryan is natural; the above represent both chronological and dialectal modifications. Such change was recognized by Indian grammarians; *e.g.,* Patañjali, of the mid-2nd century BC, noted that perfect forms of the type *ca-kr-a* "you did, have done" (2nd person plural) were not in use at his time; instead, a nominal (adjective) form *kṛ-ta-vant-as* was used, consisting of the past passive participle *kṛ-ta-* and an adjectival suffix *-vant.* Indian grammarians also recognized the existence of different dialects. Pāṇini noted forms used by northerners (*udīcya*) and easterners (*prācya*), as well as various dialectal uses described by grammarians who preceded him.

Earlier documents also afford evidence for dialect variation; *e.g.,* the early Vedic of the Rigveda is a dialect in which the Indo-European *l* sound was for the most part replaced by *r*—*prā* "fill," *pūr-ṇa-* "full." This change accords with Iranian; *e.g.,* Avestan *pərəna* "full." These forms contrast with Latin *plenus* and Gothic *fulls,* with *l.* Other dialects kept *l* and *r* distinct. There are also doublets that have both *r* and *l* in words with Indo-European *r: rohita-/lohita-* "red." The variant with *l* can be assumed to belong to an eastern dialect. This variance accords with Middle Indo-Aryan evidence and the fact that such *l* forms become more numerous in the tenth book (*maṇḍala*) of the Rigveda, which is demonstrably more recent than the most ancient parts of the Rigveda and dates from a time when the Indo-Aryans had progressed farther east than their original location on the subcontinent. The development of retroflex *ḷ-* and *ḷh-* sounds (produced by curling the tip of the tongue upward toward the hard palate) from the retroflex sounds of *ḍ* (*nīḷa-* "nest" from *nīḍa-*) and *ḍh* when occurring between vowels is another feature characteristic of some dialects, including the major dialect of the Rigveda.

Classical Sanskrit and its accentual system

Classical Sanskrit represents a development of one or more such early Old Indo-Aryan dialects. At this state, the archaisms noted above have been eliminated. Moreover, the accentual system of Classical Sanskrit is not the same as that of Vedic, which had a system of pitches; vowels had low, high, or circumflex (first rising, then falling) pitch, and the particular vowel of a word that received high pitch could not be predicted. In Classical Sanskrit, on the other hand, the accent was probably predictable. If the next to the last vowel was long, it received the accent; if not, the vowel preceding it was accented. The Vedic system survived at least to the time of Pāṇini, who described it fully and did not restrict it to sacred language.

For all this simplification, Classical Sanskrit is considerably more complex than Middle Indo-Aryan. In addition to the vowels *a, i,* and *u* (in both long and short varieties), it has *ṛ* and *ḷ* used as vowels. Consonant clusters occur freely, except in word final position, and the system of sound modification conditioned by the context, called *sandhi,* is fully operative. Moreover, in its grammatical system Classical Sanskrit maintains the dual number, seven cases in addition to the vocative form (which marks the one addressed), and a complex set of alternations. For example, to the nominative singular form *agni-s* "fire," correspond the genitive singular *agne-s* "of fire" the nominative plural *agnay-as* "fires," and the instrumental plural *agni-bhis* "with fires," with differing vowels in the second syllable. There are also separate sets of nominal (noun) and pronominal (pronoun) endings. Some nouns and adjectives inflect as pronouns; *e.g., ekasmai,* dative singular masculine-neuter of *eka-* "one."

The verb system of Classical Sanskrit also maintains complex alternations. In the present tense of the type *bhav-a-ti* "becomes, is," the stem (*bhav-a-*) remains unchanged throughout the paradigm except for lengthening of the *-a-* to *-ā-* before *v* and *m.* But other verbs have vowel alternation; *e.g., as-mi* "I am," *s-mas* "we are"; *e-mi* "I go," *i-mas* "we go"; *juhomi* "I pour," *juhumas* "we pour." A distinction is observed between active and mediopassive endings: *jan-ay-a-ti* "engenders" with the active ending *-ti,* but *jā-ya-te* "is born" with the mediopassive ending *-te.* (Mediopassive verb forms are used for the passive, reflexive, and other meanings.)

Classical Sanskrit also has a rich system of nominal and verbal derivatives. Compound words are of the following kinds: copulative (*dvandva*) compounds such as *mātāpitarau* "mother and father" (also elliptic *pitarau* "parents"); the type like *tat-puruṣa-* "his man," in which the first member is equivalent to a case other than nominative; the type like *bahu-vrīhi* "much-rice," in which the object denoted is other than that of any of the members of the compound (*bahur vrīhir yasya* "He who has much rice"); and adverbial compounds (*avyayībhāva*) of the type *upāgni* (*upa-agni*) "near the fire." In addition, there are derivatives with affixes *-tara-* and *-tama,* such as *priya-tara-* "very dear" and *priya-tama-* "most dear" from the adjective *priya-.* Pronouns have derivatives equivalent to case forms; *e.g., tatra* "there," *yatra* "where," and *kutra* "where?" are equivalent to locative forms such as *tasmin, yasmin,* and *kasmin.* These can also be used without a noun.

Among the derivative verbal systems are the causative and the desiderative ("desire to"); the former has an affix *-ay-* (*gam-ay-a-ti* "makes to go," *kār-ay-a-ti* "has do") or, after roots in *-a, -pay-* (*sthā-pay-a-ti* "sets in place"). The desiderative is formed with *-sa-* and reduplication (repetition of a part of the root)—*dī-dṛk-ṣa-te* "desires to see" (root *dṛś*). The desiderative also has an agent noun in *-u*—*dī-dṛk-ṣ-u* "who wishes to see."

The Prākrits

Middle Indo-Aryan. The Sanskrit word *prākṛta,* whence the term Prākrit, is a derivative from *prakṛti-* "original, nature." Grammarians of the Prākrits generally consider the original from which they derive to be the Sanskrit language as described by grammarians going back to Pāṇini. Most modern scholars consider *prākṛta* to refer to the "natural" languages, the vernaculars, as opposed to Sanskrit, the polished language of literature and the educated (*śiṣṭa*). There is also linguistic evidence to support this view. Several forms in the Prākrits are found in Vedic but not in Classical Sanskrit. As Classical Sanskrit is not directly derivable from any single Vedic dialect, so the Prākrits cannot be said to derive directly from Classical Sanskrit.

The most archaic literary Prākrit is Pāli, the language of the Buddhist canon (*c.* 5th century BC) and of the later stories and commentaries of Theravāda Buddhism. Pāli represents essentially a western Middle Indo-Aryan dialect, though there are sufficient easternisms in the canon to have led some scholars to the view that the canon as it exists today is a recast of an original in an eastern dialect. To the Buddhist literature also belongs the *Gāndhārī Dhammapada,* the only literary text written in a dialect of the northwest. The Niya documents, official documents written in Prākrit dating from the 3rd century AD, also belong to the northwest. The earliest inscriptional Middle Indo-Aryan is that of the Aśokan inscriptions (3rd century BC). These are more or less full translations from original edicts issued in the language of the east (from the capital Pāṭaliputra in Magadha, modern Patna in Bihār) into the languages of the areas of Aśoka's kingdom. There are other Prākrit inscriptions up to the 4th century AD, and Sanskrit was not used inscriptionally until the first centuries AD. Literary Prākrits other than Pāli were also used in independent works and in dramas along with Sanskrit.

According to Prākrit grammarians, Mahārāṣṭrī ("From the Mahārāshtra Country") is the Prākrit par excellence. It is the language of *kāvya*s (epic poems) such as the *Rāvaṇavaha* (also called *Setubandha*) from no later than the 6th century AD. Mahārāṣṭrī is also the language of lyrics in Rājaśekhara's *Karpūra-mañjarī* (*c.* 900), the only extant drama written completely in Prākrit, and of verses recited by women in the classical drama of Kālidāsa and his successors, though not earlier. The literary dialect used for conversation among higher personages other than the king and his captains in the drama is Śaurasenī, while Māgadhī is used by lower personages.

The language of the early Jaina canon, the final version of which was made in the 5th or 6th century AD, is called Ardhamāgadhī ("Half Māgadhī"); Jaina also used another literary dialect, called Jaina Māhārāṣṭrī in non-canonical works. The oldest poetic work in this is Vimala Sūri's *Paumacariya* (*c.* 3rd century). Of other Prākrit dialects mentioned by grammarians, Paiśācī (or Bhūta-Bhāṣā, both meaning "Language of Demons") is noteworthy; it is said to be the language of the original *Bṛhatkathā* of Guṇāḍhya, source of the Sanskrit book of stories *Kathāsaritsāgara.*

Buddhist Hybrid Sanskrit

Buddhist works were also written using a language that has been called Buddhist Hybrid Sanskrit. Among these works is the *Mahāvastu,* the core of which is thought to date from the 2nd century BC. This language is a Middle Indo-Aryan dialect of indeterminate origin, which steadily became more Sanskritized in prose sections of later works.

The most advanced stage of Middle Indo-Aryan, Apabhraṃśa, was also used as a literary language. That there was literary creation in Apabhraṃśa by the 6th century is clear from an inscription of King Dharasena II of Valabhī, in which the King praises his father as being adept in Sanskrit, Prākrit, and Apabhraṃśa composition. Moreover, in the fourth act of Kālidāsa's drama *Vikramorvaśīya* there are Apabhraṃśa verses. Because Kālidāsa probably lived in the 3rd or 4th century, literary composition in Apabhraṃśa is earlier still, if these verses are legitimate. There is a great deal of later literature in Apabhraṃśa, for the most part Jaina works; *e.g., Paumacariu* of Svayambhū (8th–9th century), *Harivaṃśa-purāṇa* of Puṣpadanta (10th century), *Sanatkumāra-cariu* of Haribhadra (12th century).

Middle Indo-Aryan is characterized generally by the reduction of the complexities seen in Old Indo-Aryan. The vowel system was reduced by the merger of *ṛ* (and *ḷ*) sounds with vowels and the change of the diphthongs *ai* and *au* to the vowel sounds *e* and *o; e.g.,* Pāli *accha-* "bear" (Sanskrit *ṛkṣa-*), *iṇa-* "debt" (Sanskrit *ṛṇa-*), *uju-* "straight" (Sanskrit *ṛju-*), *pucchati* "asks" (Sanskrit *pṛcchati*), *metti-* "friendship" (Sanskrit *maitrī-*), *orasa-* "breast-born, legitimate" (Sanskrit *aurasa-*). Moreover, *-aya-* and *-ava-* commonly contracted to *-e-* and *-o-; e.g.,* Pāli *jeti* "conquers" (Sanskrit *jayati*), *odhi-* "limit" (Sanskrit *avadhi-*). Final consonants were deleted, with the exception of *-m,* which developed to an *-ṃ* sound before which a vowel was shortened (Pāli *bhāriyaṃ* "wife"; Sanskrit *bhāryām*). Together with the trend toward replacing variable consonant stems by unchanging stems in *-a-,* this change had serious consequences for the grammar. Consonant stems steadily disappeared and were transformed to stems ending in a vowel; *e.g.,* to Sanskrit *śarad-* "autumn," *sarit-* "stream," and *sarpis-* "butter" correspond the Pāli forms *sarada-, saritā,* and *sappi-.* Consonant clusters were also modified in Middle Indo-Aryan; *e.g.,* Pāli *khetta-* "field" (corresponding to Sanskrit *kṣetra-*), Pāli *dakkhiṇa-* "right, south" (Sanskrit *dakṣiṇa*), *aggi-* "fire" (Sanskrit *agni-*), *puṇṇa-* "full" (Sanskrit *pūrṇa*), and *taṇhā-* "thrist" (Sanskrit *tṛṣṇā-*). The shortening of vowels before modified consonant clusters led to the use of short *ĕ* and *ŏ* sounds, which were unknown in Old Indo-Aryan; *e.g.,* Pāli *sĕmha-* "phlegm" (Sanskrit *śleṣman*), *ŏṭṭha-* "lip" (Sanskrit *oṣṭha-*).

Characteristics of literary Māhā-rāṣṭrī

The above phenomena are not restricted to Pāli; they are pan-Middle Indo-Aryan. Differences between Pāli and Aśokan and other Prākrits include the retention of voiceless stops (*i.e., p, t, k*) between vowels in Pāli and Aśokan dialects; other Middle Indo-Aryan dialects modify them. The extreme development appears in literary Māhārāṣṭrī, in which unaspirated stops (pronounced without an accompanying audible release, or pull of breath) other than retroflexes (*ṭ, ḍ*) and labials (*p, b*) were deleted, aspirated stops (pronounced with an audible puff of breath) were replaced by *h,* retroflexes (pronounced by curling the tongue upward toward the hard palate) became voiced, and labials were replaced by *v; e.g., loa-* "world" (Sanskrit *loka-*), *loaṇa-* "eye" (Sanskrit *locana-*), *sāhā-* "branch" (Sanskrit *śākhā-*), *paḍhai* "recites, reads" (Sanskrit *paṭhati*), and *savaha-* "curse" (Sanskrit *śapatha-*).

Essentially on the same level are the dialects of Jaina texts, but in these a *y* glide prescribed by grammarians occurs when a consonant is elided: *vayaṇa-* "face" (Sanskrit *vadana-*); *sayala-* "whole" (Sanskrit *sakala-*). In Śaurasenī, on the other hand, voiceless stops (*e.g., p, t, k*) between vowels are voiced (*e.g.,* become *b, d, g,* respectively); *e.g., ido* "hence" (Sanskrit *itaḥ*); *tadhā* "thus" (Sanskrit *tathā*). Though Pāli and Aśokan are at an earlier level of development with respect to these changes, they share with the rest of the Middle Indo-Aryan dialects the replacement of voiced aspirated sounds between vowels by *h: lahu-* "light, unimportant" from *laghu-; dahati* "gives" (Sanskrit *dadhāti*). Similarly, they share the change of *dy-* to *j: joti-* "light, brilliance" (Pāli *jotati* "shines," Sanskrit *dyotate*). Pāli and Aśokan, however, retain a *y* sound, changed to *j* in most other Prākrits; *e.g.,* the pronoun *ya-* (feminine *yā-*), as in Sanskrit, opposed to *ja-*.

The deletion of stop consonants noted above resulted in vowel sequences within words that were unknown to Old Indo-Aryan. Similarly, the extent of *sandhi* modification was restricted in Middle Indo-Aryan. The Middle Indo-Aryan vowels *ī* and *ū* do not change to *y* and *v* before dissimilar vowels in compounds; *e.g.,* Māhārāṣṭrī *rattīandhaa-* "dark of night" (Sanskrit *rātry-andhaka-*). In addition, the first of two contiguous vowels in different words is subject to deletion; *e.g.,* Pāli *manas'icchasi* (from *manasā icchasi*) "you wish in your mind."

In its grammatical system, Middle Indo-Aryan also reduced complexities. The dual number no longer exists as a separate category; for Sanskrit *dvābhyām* "by two," Middle Indo-Aryan has *dohi*(*ṃ*), with the ending *-hi*(*ṃ*) equivalent to the instrumental plural *-bhis* of Old Indo-Aryan. Among other changes is the replacement of the dative case by the genitive except in particular usages; *e.g.,* the use of forms corresponding to the Old Indo-Aryan dative to denote a purpose.

In Middle Indo-Aryan, nominal and pronominal forms are no longer strictly segregated; *e.g.,* Aśokan *vijitamhi* "in the kingdom" (also *vijite*) has a pronominal ending equivalent to Sanskrit *-smin.*

Middle Indo-Aryan verb system

In the verb system, the contrast between active (*-ti*) and mediopassive (*-te*) endings was obliterated. Further, the Old Indo-Aryan distinction between aorist, imperfect, and perfect forms was eliminated. With few exceptions, the sigmatic aorist (an aorist form with *s*) provides the only productive preterite of early Middle Indo-Aryan: Aśokan *ni-kkhamisu* "they set out" (Sanskrit *nir-a-kramiṣur*). In later Prākrits verbally inflected preterites were generally eliminated; in their place was used the past participle. For example, in Śaurasenī *devi uva-visa, mahārāo vi ā-ado* "Sit down, my queen, the king also has arrived," the past participle *ā-ado* (Sanskrit *ā-gataḥ*) agrees with *mahārāo* "king" (Sanskrit *mahā-rājaḥ*) in number and gender. If the verb is transitive, the participle agrees with the direct object, and the agent is denoted by an instrumental form: in Jaina Māhārāṣṭrī, *teṇa vi savvaṃ siṭṭhaṃ* "He has told everything," *teṇa* "by him" denotes the agent, and *siṭṭhaṃ* "told" (Sanskrit *śiṣṭam*) agrees with the neuter singular form *savvaṃ* (Sanskrit *sarvam*). When no object is denoted, the verb is in the neuter singular. Old Indo-Aryan used both the participial construction and the finite verb; thus to Prākrit *so vi teṇa samaṃ gao* "He also went with him" could correspond Sanskrit *so'pi tena saha gataḥ* or *so'pi tena sahāgamat* (*saha agamat*). The Middle Indo-Aryan development eliminated the latter.

Alternations of the Sanskrit type *as-mi, s-mas* were eliminated in Middle Indo-Aryan; the predominant type of present tense was formed from an unchanging vowel stem (Pāli *e-ti, e-nti* "go[es]").

Nominal forms of the verb system are of the same types as Old Indo-Aryan; *e.g.,* the Pāli future passive participle *kātabba-* (Sanskrit *kartavya-*) "to be done," Śaurasenī *karaṇia;* Ardhamāgadhī, Jaina Māhārāṣṭrī, and Māhārāṣṭrī *karaṇijja-* "to be done." The infinitive is commonly formed on the present tense stem, not on the root, as in Old Indo-Aryan. Thus Pāli *pappotum* is formed on the present *pappoti;* Sanskrit *prāptum* is formed on the root *prāp,* present tense *prāpnoti.*

Middle Indo-Aryan shows evidence of dialectal differentiation. The earliest documents that allow one to determine roughly the dialect distribution are Aśoka's inscriptions. These represent three major dialect areas: east, as in the inscriptions of Jaugaḍa, Dhauli, and Kālsī; west, in Girnār; and northwest, in Mānsehrā and Shāhbāzgaṛhī. Characteristic of the east dialect area is final *-e,* corresponding to *-o* in the west and *-as* in Sanskrit; in the east dialect area *l* also regularly corresponds to *r* of the west and of Sanskrit. Moreover, in the east dialect area there is a tendency to insert a vowel within consonant clusters, while in the west and northwest one of the consonants is assimilated to the other without an intervening vowel. For example, to Sanskrit *rājñas* "of the king" corresponds Girnār *rañño,* Shāhbāzgaṛhī *raño,* Jaugaḍa *lājine.* Northwest stands apart in retaining three spirant sounds, *ś, ṣ, s,* which merge to *s* elsewhere. Aśoka's eastern dialect, from the Magadha country, shows an *s* sound for Old Indo-Aryan *ś, ṣ, s,* rather than the *ś* sound typical of literary Māgadhī. Grammatical features also show dialectal variation; *e.g.,* the Aśokan dative singular form is *-āya* in the western dialects (Girnār *atthāya* "for the purpose of") but *-āye* in the east (Kālsī, Dhauli *aṭṭhāye*).

Apabhraṃśa

As noted above, the most advanced development of Middle Indo-Aryan is seen in Apabhraṃśa. Sound changes that are typical of Apabhraṃśa include the replacement of the vowel sound *a* by *u* in final syllables; *e.g., karahu* "you do, make," corresponding to *karaha* (*karadha*) in other Prākrits. From stems in *-aya-* develop forms in *-au* and nasalized *-aũ* (nasalization is here indicated by a tilde): *bhaḍārau* "honored one, king" (Prākrit *bhaṭṭārayo*), *haũ* "I" (Aśokan *hakaṃ*). Nasalization also appears in environments in which earlier *m* occurred between vowels; *e.g., gāũ* "village" (from *gāma,* Sanskrit *grāma*). Numerous other sound changes are evident, among them the development of *-s*(*s*)- between vowels into *h: tahŏ* "of him" (from Prākrit *tassa,* Sanskrit *tasya*); *hohinti* "will be" (compare Pāli *hossati*). Apabhraṃśa contractions, such as *-aya-* changing to *-a* and *-iya* to *-ī,* foreshadow New Indo-Aryan, in which the development was extended; *e.g.,* Apabhraṃśa *pāṇiu* "water" (Old Indo-Aryan *pāniyam*), Gujarati *pāṇī,* Hindi *pānī.*

In other points Apabhraṃśa also presaged New Indo-Aryan. The interest of Apabhraṃśa lies in the fact that contracted forms presage the New Indo-Aryan opposition of masculine, neuter, and feminine nouns; thus, Apabhraṃśa *-au, -aũ, -ī,* Gujarati *-o, -ũ, -ī* (*gayo, gayũ, gaī* "went"), Hindi *-ā, -ī* (*gayā, gaī*). The case system of Apabhraṃśa is also at a more advanced level of disintegration than that of earlier Middle Indo-Aryan, with the instrumental and locative plurals being identical in form (*-ahĩ* or *-ehĩ* for *-a*-stems) and instrumental singular forms also being used as locatives.

In the Apabhraṃśa verb system, present tense stems in *-a* predominate. Apabhraṃśa verb endings differ from those of other Prākrits. Most interesting is the 3rd person plural type *kara-hĩ* "they do," which coexists with *karanti.* The form *kara-hĩ,* corresponding to the 3rd person singular *kara-i* "he does," is formed on the model of the pair *kara-ũ* (1st person singular, "I do") and *kara-hũ* (1st person plural, "we do"). Here again Apabhraṃśa comes close to New Indo-Aryan. Moreover, Apabhraṃśa has some causative formations that do not occur elsewhere in Middle Indo-Aryan but are known from New Indo-Aryan—*bham-āḍa-i* "causes to turn," Gujarati *bhamāṛe che* "causes to turn round," and *pais-āra-i* "causes to enter," Gujarati *pɛsāre che* "causes to enter, to penetrate."

Apabhraṃśa syntactic patterns

Also noteworthy are two syntactic usages that closely parallel those present in New Indo-Aryan. The present participle is used as a conditional; *e.g., jai haũ mi teṇa sahũ tau karantu to kiṃ asamāhie sahũ marantu* "Even if I had performed (*karantu*) ascetic acts with him, would I have died without mental concentration?" in which the participles *karantu* and *marantu* have the value of conditionals. In Sanskrit the conditionals *a-kar-iṣya-m* and *a-mar-iṣya-m* are used; but in speaking Gujarati a person would say *jo hũ . . . karat . . . to marat,* and Hindi would have the forms *kartā . . . martā.* The Apabhraṃśa gerundive in *-iv*(*v*)*a* or *-ev*(*v*)*a* can be used as an infinitive; *e.g., pi-evae laggā* "began to drink." This is the Gujarati construction *pi-vā lāgyo* "began to drink," in which *pi-vā* is an inflected form of *pi-vũ,* that is, a verbal noun (infinitive) corresponding etymologically to the Apabhraṃśa gerundive.

Influences on Middle Indo-Aryan. In the mid-2nd century BC, the grammarian Patañjali explained that to speak faultlessly the language now called Sanskrit (as described by Pāṇini) one should imitate the correct speakers (called *śiṣṭa* "learned, educated") of Āryāvarta ("Country of the Aryans"). Earlier, the grammarian Kātyāyana (*c.* 3rd–4th century BC) had noted that Pāṇini gave lists of verb roots in order that certain Middle Indo-Aryan forms not be accepted as having been correctly derived from a Sanskrit verb root. Moreover, Patañjali noted that one should study grammar in order to learn not to use incorrect words such as *helayaḥ* instead of *herayaḥ* (a phrase used in calling to people) or *gāvī* instead of *gauḥ* "cow"; *gāvī* is a Middle Indo-Aryan word. The observations of these grammarians are considered to lend support to the view that by the 6th or 5th century BC Sanskrit as a medium of learned conversation coexisted with Middle Indo-Aryan. Further, the Pāli canon records that the Buddha enjoined his followers to use the vernaculars in communicating his teachings, and the Jaina canon identifies Ardhamāgadhī as the language to be employed for communicating the teachings of Mahāvīra. Similarly, Aśoka used Middle Indo-Aryan, not Sanskrit, in the inscriptions he ordered written throughout his kingdom; Sanskrit does not appear on inscriptions until the early centuries AD (*e.g.,* Rudravarman's inscription at Junagarh, *c.* AD 150). The coexistence of Old Indo-Aryan and Middle Indo-Aryan is to be accepted even for the time when the earliest Old Indo-Aryan texts were put to writing.

Middle Indo-Aryan shows similar evidence of the influence of linguistically more advanced vernaculars on literary compositions. The Prākrits of elegant literary compositions must have been artificial, different in many respects from the vernaculars current at the time, though reflecting languages that were current at some former time. The Old Indo-Aryan and Middle Indo-Aryan stages, then, present a picture of concurrent vernaculars with dialects and literary languages influenced by the vernaculars; it is impossible to compartmentalize the different stages as beginning and ending at any definite date.

Sources of borrowing into Indo-Aryan

The literary languages borrowed words and suffixes from earlier languages. There are Prākritisms (*i.e.,* forms of earlier Prākrits) in Apabhraṃśa; *e.g.,* the genitive singular ending *-ssa* instead of *-hŏ* and 2nd person plural verb forms terminating in *-ha* instead of *-hu.* All the literary Prākrits had recourse to Sanskrit as a source for borrowing words. Words that were incorporated into the Prākrits from Sanskrit with no change in form are called *saṃskṛta-sama* "identical with Sanskrit" (or *tat-sama* "identical with that") and are contrasted with words termed *saṃskṛta-bhava (tad-bhava)* "whose origin is in Sanskrit"—that is, words that the grammarians can derive from Sanskrit by using certain rules. Another class of words, called *deśya* (or *deśī*) "belonging to the area, country," includes items that the grammarians cannot derive easily from Sanskrit and that are supposed to have been in use in particular areas from early times.

Many or most of the *deśya* words are indeed derivable from Sanskrit, but some are of Dravidian origin; *e.g., akka* "sister" (Telugu *akka*), *attā* "father's sister" (Telugu *atta*), *appa* "father" (Telugu *appa*), *ūra* "village" (Telugu *ūru*), *pulli* "tiger" (Telugu *puli*). Borrowing from Dravidian occurred also at earlier times; the Dravidians originally occupied territory much farther north than they did in Middle Indo-Aryan times. The Ṛgveda has such words as *kuṇḍa* "pitcher, pot," which is doubtless of Dravidian origin (Tamil *kuṭam* "pot"). Such borrowings become more numerous in later Sanskrit. It is not always certain that borrowing proceeded from Dravidian to Indo-Aryan, however, because Dravidian languages freely borrowed from Indo-Aryan. Thus, some scholars claim that Sanskrit *kaṭu* "sharp, pungent" is from Dravidian, but others claim that it is a Middle Indo-Aryan form deriving from an earlier **kṛt-u* "cutting" (root *kṛt*). (An asterisk [*] preceding a form indicates that it is not attested but has been reconstructed as a hypothetical form.) Whatever the judgment on any individual word, it is clear that Indo-Aryan did borrow from Dravidian, and this phenomenon is important in considering a group of sounds that sets Indo-Aryan apart from the rest of Indo-European—the retroflexes. Without doubt the influence of Dravidian is to be considered as contributing to the extension of these sounds beyond their limited occurrence in inherited Indo-European items such as *nīḍa* "nest" (from **ni-sd-o*), *iṣ-ṭa* "desired" (from **is-to*), and *stīr-ṇa* "spread out" (from **stṝ-no*). The Munda languages (or, more generally, the Austro-Asiatic languages) are also a source of some borrowing into Indo-Aryan; *e.g.,* Sanskrit *jambāla* "mud" (Santali *jo̱bo̱*).

In the 8th century AD, the philosopher Kumārila mentioned not only Dravidian but also Persian and Greek as sources of foreign words. Such borrowing can be traced back to early times. In the 6th century BC Darius counted Gandhāra as a province of his kingdom, and Alexander the Great penetrated into northern India in the 4th century BC. From Iranian come words such as that meaning "inscription, writing, script"; in the northwest inscriptions of Aśoka the word is *dipi* (Old Persian *dipi*) and Sanskrit has *lipi,* the form in other Aśokan versions and in Pāli. Also from Persian is Sanskrit *kṣatrapa* "satrap"—Old Persian *xšassa-pāvan-*. Of Greek origin are such mathematical and astronomical terms as Sanskrit *kendra* "centre" (Greek *kéntron*), *jāmitra* "diameter" (*diámetron*), and *horā* "hour" (*hora*). *Yavana* "foreigner," originally the Greek word for Ionian, is known from as early as the time of Pāṇini. Later, Arabic words such as *taślī* "trigon" came into Sanskrit.

Division of India into linguistic states

The modern Indo-Aryan stage. The division of the Indian subcontinent into linguistic states and even into countries (Pakistan, Bangladesh, and India) is a recent phenomenon. Even after independence from Britain was achieved and partition had taken place, Bombay state existed until it was split into Gujarāt and Mahārāshtra states in 1960. The division of Punjab into Punjab and Haryana states in 1966 occurred as a result of Punjabi agitation for a separate linguistic state. Before independence, under British rule (entrenched from the 18th century), there were princely states within dialect areas; under Mughal rule (16th–18th centuries), Persian was the language which was used by the court and by courts of justice and this practice continued in the latter function for a time under the British. Though Hindi–Urdu may have been a lingua franca, however, the great dialectal diversity of earlier times continued.

Some of the modern Indo-Aryan languages have literary traditions reaching back centuries, with enough textual continuity to distinguish Old, Middle, and Modern Bengali, Gujarati, and so on. Bengali can trace its literature back to Old Bengali *caryā-padas,* late Buddhist verses thought to date from the 10th century; Gujarati literature dates from the 12th century (Śālibhadra's *Bharateśvara-bāhubali-rāsa*) and to a period when the area of western Rājasthān and Gujarāt are believed to have had a literary language in common, called Old Western Rajasthani. Jñāneśvara's commentary on the *Bhagavadgītā* in Old Marathi dates from the 13th century and early Maithili from the 14th century (Jyotīśvara's *Varṇa-ratnākara*), while Assamese literary work dates from the 14th and 15th centuries (Mādhava Kandalī's translation of the *Rāmāyaṇa,* Śaṅkaradeva's Vaiṣṇaviṭe works). Also of the 14th century are the Kashmiri poems of Lallā (*Lallāvākyāṇi*), and Nepali works have also been assigned to this epoch. The work of Jagannāth Dās in Old Oriya dates from the 15th century.

Amīr Khosrow used the term *hindvī* in the 13th century, and he composed couplets that contained Hindi. In early times, however, other dialects were predominant in the midlands (Madhyadeśa) as literary media, especially Braj Bhasa (*e.g.,* Sūrdās' *Sūrsāgar,* 16th century) and Awadhi (*Rāmcaritmānas* of Tulsīdās, 16th century). In the south, in Golconda (Andhra, near Hyderābād), Urdu poetry was seriously cultivated in the 17th century, and Urdu poets later came north to Delhi and Lucknow. Punjabi was used in Sikh works as early as the 16th century, and Sindhi was used in Ṣūfī (Islāmic) poetry of the 17th–19th centuries. In addition, there is evidence in late Middle Indo-Aryan works for the use of early New Indo-Aryan; *e.g.,* provincial words and verses are cited.

The creation of linguistic states has reinforced the use of certain standard dialects for communication within a state in official transactions, teaching, and on the radio. In addition, attempts are being made to evolve standardized technical vocabularies in these languages. Dialectal diversity has not ceased, however, resulting in much bilingualism; for example, a native speaker of Braj Bhasa uses Hindi for communicating in large cities such as Delhi.

Attempt to establish one national language

Moreover, the attempt to establish a single national language other than English continues. This search has its origin in national and Hindu movements of the 19th century down to the time of Mahatma Gandhi, who promoted the use of a simplified Hindi–Urdu, called Hindustani. The constitution of India in 1947 stressed the use of Hindi, providing for it to be the official national language after a period of 15 years during which English would continue in use. When the time came, however, Hindi could not be declared the sole national language; English remains a co-official language. Though Hindi can claim to be the lingua franca of a large population in North India, other languages such as Bengali have long and great literary traditions—including the work of Nobel Prize winner Rabindranath Tagore—and equal status as intellectual languages, so that resistance to the imposition of Hindi exists. This resistance is even stronger in Dravidian-speaking southern India. The use of English as an official language entails problems, however, because with the use of state languages for education, the level of English competence is declining. Another danger faced is the agitation for more separate linguistic states, threatening India with linguistic fragmentation hearkening back to earlier days.

Characteristics of the modern Indo-Aryan languages. The trends noted in Middle Indo-Aryan continue in New Indo-Aryan. The Middle Indo-Aryan vowel sequences *ai* and *au* were changed to single vowels during the development of New Indo-Aryan, final vowels were shortened and deleted, and *ḍ* and *ḍh* sounds between vowels were replaced by the sounds *ṛ* and *ṛh.* The noun cases were further reduced, and the introduction of nominal (noun) forms into the verb system became more pronounced.

Literary languages tend to become somewhat removed from the usual standard colloquial. Literary, or High, Hindi, for example, tends to replace some of the Perso-Arabic vocabulary with Sanskritic items, whereas literary Urdu makes great use of Perso-Arabic words. The gap is formalized in Bengali, in which a distinction is made between the highly Sanskritic language Sadhu-Bhaṣa and the colloquial standard called Calit-Bhasa.

Phonology. [Note: The forms of the words given below reflect actual pronunciation, rather than being transliterated versions of the standard orthographies. For New Indo-Aryan the symbols *ə,* pronounced as the *a* in English "sofa," and *a* are used for the sounds earlier transcribed as *a* and *ā,* respectively; *e.g.,* Gujarati *karũ* "I do" and *māro* "beat" are now written *kərũ* and *maro.* This practice permits certain contrasts to be made among sounds that are significant in the description of dialectal features. In Kashmiri words, *a* is short, opposed to *ā.*]

Vowel changes in New Indo-Aryan

Vowels in sequence contracted in early New Indo-Aryan; *e.g.,* Old Indo-Aryan *aśīti* became Middle Indo-Aryan *asīi,* Hindi and Punjabi *əssī,* and Bengali *aši* "80." Further, *ai* and *au* sounds changed to *e* and *o,* and *aũ* to *ũ,* while *iu developed into ī.* The diphthongs *ai* and *au* were retained well into the New Indo-Aryan period and are still pronounced in some areas; *e.g.,* Braj Bhasa *kərəũ* "I do," *kərəi* "he does." Middle Indo-Aryan *-ḍ-* and *-ḍh* developed into the flaps *ṛ* and *ṛh; e.g.,* Prākrit *sāḍiā* "woman's garment," Kashmiri, Lahnda, Hindi, Gujarati, Bhojpuri, Bengali, Oriya *saṛī* "sari"; and Prākrit *paḍh-* "recite, read," Sindhi *pəṛh-əṇu,* Lahnda *pəṛh-əṇ,* Hindi, Punjabi *pəṛh-na,* Gujarati *pəṛh-vũ,* Marathi *pəṛh-ṇə* "study."

Stress is not generally contrastive in New Indo-Aryan as it is, for example, in English (*e.g.,* noun "éxport," verb "expórt"), though different areas have different rules for placing major emphasis on a given syllable. For example, in Hindi, in which vowel length is pertinent, *gilá* "swallowed" has major stress on the last syllable, *gī́la* "wet," on the first. In Gujarati, on the other hand, vowel length is not pertinent; the stress position depends on which vowels occur in contiguous syllables and on the structure of the syllables, whether open or closed; *e.g., júno* "old," but *dukán* "store." In Bengali each syllable of a word receives about equal stress.

The sounds that most clearly distinguish Indo-Aryan from the rest of Indo-European are the voiced aspirate stops (*gh* and the like, pronounced with an accompanying audible puff of breath) and the retroflexes (*ṭ* and so on, pronounced by curling the tongue upward toward the hard palate). In the outlying New Indo-Aryan areas, however, the sound system is reduced. Sinhalese has no aspirated stops, Assamese has no retroflexes, and Kashmiri has no voiced aspirates. The geographic position of these languages doubtless contributed to these losses: Sinhalese coexists with Tamil, Assamese is surrounded by Tibeto-Burman languages, and Kashmiri is on the border of the Iranian area.

Early New Indo-Aryan dialect distribution

New Indo-Aryan shows evidence of early dialect distribution; this is discernible by considering sound changes proper to each group. The eastern group (Assamese, Bengali, Oriya) has three important changes. Long and short *i* and *u* merged; *e.g.,* Assamese *nila,* Oriya *niḷɔ* (ɔ is similar to the *o* of "coffee" in some English dialects), Bengali *nil* "blue-black" but Sanskrit *nīla;* Assamese *dhuli,* Bengali *dhulo,* Oriya *dhuḷi* "dust" but Hindi *dhūl* and Sanskrit *dhūli.* The vowel sound *a* of Middle Indo-Aryan was replaced by ɔ in Bengali and Oriya and ɒ (similar to the *o* of "hot" in southern British English) in Assamese in initial position and open syllables; *e.g.,* Bengali *mɔron,* Oriya *mɔrɔn,* Assamese *mɒrɒn* "death"; Sindhi, *mərəno* "mortal, death," Sinhalese *mərəṇə,* Gujarati, Marathi *mərəṇ* (compare Sanskrit *maraṇa-*). Moreover, in this group a vowel is affected by the quality of the vowel in a following syllable. For example, in Bengali *ami kori* "I do," the verb root has *o* followed by *i* in the next syllable, but *tumi kɔro* "you do" has an ɔ sound; similarly, *ami kini* "I buy" but *tumi keno.* As a result of vowel assimilation also, Assamese has an ɔ sound instead of ɒ representing Middle Indo-Aryan *a:* Assamese *xɔhur,* Bengali *šošur* "husband's father" (compare Hindi *səsur,* Prākrit *sasura-,* Sanskrit *śvaśura-*).

Assamese and Bengali are set off from Oriya. In the former two, Middle Indo-Aryan *ḍ* and *ḍh* merge medially to *ḍ* (then *ṛ*) with a subsequent development to *r* in Assamese; *e.g.,* Oriya *daṛhi,* Bengali *daṛi,* Assamese *dari* "beard"; Hindi, Gujarati *daṛhī,* Prākrit *dāḍhiā.* Assamese is also distinguished from Bengali by several developments, among them the merger of Assamese retroflex sounds with dental sounds; *e.g.,* Assamese *ut* "camel" but Bengali *uṭ,* Oriya *oṭɔ,* Sindhi *uṭhu,* Lahnda, Pahari *uṭṭh,* and so on. Assamese also has *s* for earlier *c* and *ch* sounds and a *z* sound for *j* and *jh; e.g.,* Assamese *kas* "glass," Bengali *kac;* Assamese *azi* "today," Oriya *aji,* Bengali, Hindi *aj.* In addition, Assamese replaced an *s* sound initially by *x* and between vowels by *h—xɔhur.*

Particular sound changes also characterize languages of the northwest. In this group, an older voiceless stop (*e.g.,* ·*t*) became voiced (*e.g.,* became *d*) after a nasal sound; in other areas, the voiceless stop is retained: Kashmiri *dand,* Punjabi *dənd,* Sindhi *ḍəndu* "tooth" (the *ḍ* in Sindhi is an imploded stop; see below) but Assamese, Bengali, Hindi, Gujarati, Marathi *dãt,* Sinhalese *dətə* (Sanskrit *danta-*). Moreover, in the northwest group a voiced stop (*e.g., d*) preceded by a nasal was assimilated to the latter, resulting in two nasals, which were subsequently reduced to one in some areas; in the rest of New Indo-Aryan, the vowel preceding the nasal was nasalized. Thus, Kashmiri *don* "churning stick," Sindhi *ḍənu* "tribute," Punjabi *dənn* "fine," Lahnda *ḍənn* "force," Kumauni *dan* "roof" contrast with Assamese *dãr* "pole," Bengali *dãṛ* "oar," Hindi *dãḍ* "oppression, fine," and others; all forms derive from Old Indo-Aryan *daṇḍa-* "stick, staff, club, royal power, fine, punishment."

In the sequence of a short vowel followed by two consonants, Pahari differs from the rest of the northwest group and agrees with the rest of New Indo-Aryan. In the northwest this sequence either remained unchanged or the cluster was simplified without lengthening of the vowel; other languages generally simplified the cluster and lengthened the vowel: Punjabi *bhətt,* Sindhi *bhətu,* Lahnda *bhət,* Kashmiri *batɨ* "cooked rice, food" but Nepali, Kumauni, Hindi, Assamese, Bengali, Gujarati, Marathi *bhat.*

Sound changes in Dardic

Dardic occupies a special position. The sibilant sounds did not all merge here. For example, Kashmiri, a Dardic tongue, has *šurah* "16" with *š* rather than *s,* as in most other Indo-Aryan languages, and *sat* "7" with *s.* Further, voiced aspirated stops merged with unaspirated stops in Dardic; *e.g.,* Kashmiri *gur* "horse" but Hindi *ghoṛa;* Kashmiri *dɔd* "milk" but Hindi *dūdh.*

One major feature distinguishing Sindhi from the rest of the northwest group is the development of a series of imploded stops (also called suction stops and recursive stops), for *b, ḍ, j,* and *g.* Implosive stops also occur in the Sindhi vicinity; for example, Kacchi has imploded *b.* Another feature that distinguishes Sindhi from other northwest languages, including Kacchi, is the retention of the Middle Indo-Aryan final short vowels; *e.g.,* Sindhi *əkhi* "eye" but Hindi *ãkh* (Middle Indo-Aryan *akkhi-*).

Punjabi is distinguished from other members of the northwest group by its tonal system, having low (̀), mid (̄), and high (́) tones. Initial voiced aspirated stops of earlier Indo-Aryan appear in Punjabi as voiceless stops with low tone on the following vowel; *e.g.,* Punjabi *kòṛa* but Hindi *ghoṛa;* Punjabi *tàī* "2½" but Hindi *ḍhaī.* Non-initially, a voiced aspirate became unaspirated and the preceding vowel received high tone; thus, Punjabi *dū́d* "milk" but Hindi *dūdh,* and Punjabi *lā́b* "profit" but Hindi *labh.*

Gujarati, Marathi, and Konkani in the west and southwest differ from the languages of the midlands in that, as in the east, there is no contrast between long and short *i* and *u* vowels. The *i* of Gujarati and Marathi *vis* "20" is pronounced like the *ee* of English "teeth," the *i* of Gujarati *iccha* and Marathi *iččha* "wish" like the *i* of "pitch," but such a difference is not contrastive, as it is in Hindi (*gīla* "wet": *gila* "swallowed"). Gujarati has certain features that, in turn, set it apart from the other languages of this group. In addition to *e* and *o* sounds, it has the open vowels ɛ, ɔ; *e.g., cɔthũ* "fourth" (Middle Indo-Aryan *cauttha*), *bɛs-vũ* "to sit" (Middle Indo-Aryan *baisai* "sits"). Moreover, Gujarati has murmured vowels, generally developed from vowels followed by *h; e.g., kɛh che* "says" (*h* represents murmuring of the vowel), Old Gujarati *kahai chai.* Marathi and Konkani have two series of affricate sounds; *e.g., č* (pronounced as the *ch* in English "chat"; the equivalent of *c* in some other languages) and *c* (pronounced as the *ts* of "rats").

There was clearly mutual influence of Indo-Aryan languages at an early time, together with movement of groups of speakers (compare the position of Pahari). Thus, while Punjabi *səcc* "true" is the expected form comparable to Middle Indo-Aryan *sacca-* (Old Indo-Aryan *satya-*), Hindi *səc* "true" does not represent the expected outcome. The item *səc* must come from the Punjabi area.

Gender in New Indo-Aryan

Grammar. Like Middle Indo-Aryan, New Indo-Aryan distinguishes only two numbers—singular and plural. Unlike Middle Indo-Aryan, the New Indo-Aryan languages differ in the degree to which gender distinctions are made. Three genders are retained in the west and southwest (Gujarati, Marathi, Konkani), and this is true also of Sinhalese. Unlike Gujarati, Marathi, and Konkani, in which every noun, whether it denotes an animate being or not, has a particular gender that is unpredictable, Sinhalese restricts masculine and feminine gender to animates and neuter to inanimates. The eastern group (Assamese, Bengali, Oriya) has no grammatical gender distinctions, and two genders are distinguished elsewhere.

Over a large area of New Indo-Aryan the noun has only two cases—direct and oblique. A lack of distinction between direct and oblique cases in the plural is typical of several languages, including forms in Hindi, Gujarati, Marathi, and Bhojpuri. Direct forms are used independently, oblique forms before postpositions (words or word elements following a noun that function similarly to English prepositions) and other affixes; the combination of stem and postposition serves the function of inflected case forms of earlier Indo-Aryan. Thus, to denote an object (direct or indirect) Hindi uses the postposition *ko,* which occurs in direct object constructions normally only with nouns denoting animate beings; *e.g., ləṛke-ko dekhta hɛ* "He sees the boy," *ləṛke-ko miṭhaī do* "Give a sweet to the boy." Other postpositions are *mẽ* "in," *pər* "on," *se* "from, with, by means of." A large group of postpositions are linked to the noun with the affix *ka* (oblique form *ke,* feminine *kī*), which also is used to form adjectives (possessives); *e.g., ləṛke-ke sath gəya* "He went with the boy," *ləṛke-ke pas hɛ* "The boy has it" (literally, "It is by the boy"). Many such postpositions represent old nominal (noun) forms. Other New Indo-Aryan languages have systems similar to that of Hindi, though the forms of the postpositions differ.

Though the nominal (noun) system of Punjabi is very close to that of Hindi, it has separate ablative (indicating separation and source) and locative (indicating place) forms in the singular and plural, respectively, for nouns such as *koṭha* "house"; *e.g., koṭhiõ* "from the house," *koṭhī̃* "in the houses." Some languages have a fuller case system than that noted above; *e.g.,* Bengali has a genitive singular ending, a genitive plural ending, and a locative case. Similarly, Kashmiri has nominative, dative, ablative, and agentive cases. Not all such case forms are inherited from Middle Indo-Aryan. In addition to case endings, these languages also use postpositions; *e.g.,* Kashmiri *garājas-andar* "in the garage," with *-andar* after the dative ending *-as.*

Comparatives and superlatives

Adjectives behave generally in the same way as nouns but have a syntactic restriction. In Hindi the possessive is in the oblique (non-nominative) form, as is the noun after which it occurs; but in the plural, only the noun has the oblique form. Further, the formation of comparatives and superlatives with derivative affixes has been eliminated. To a Sanskrit sentence such as *ime amū-bhyaḥ āḍhya-tarāḥ* "These (people) are richer than those," in which the comparative *āḍhya-tara* occurs construed with the ablative form, corresponds a Hindi sentence *ye un-se əmīr hɛ̃,* in which no comparative affix is used—literally, "These are rich from (*i.e.,* in comparison with) those." Comparable constructions with a postposition meaning "from" occur elsewhere in New Indo-Aryan.

The pronominal system of New Indo-Aryan formally resembles the Middle Indo-Aryan stage more than its noun system. For example, Gujarati *hũ* "I," *mɛ̃* "I" (agentive), *əme* "we" (also agentive) are directly comparable to Apabhraṃśa *haũ, maĩ, amhaĩ.* The number distinctions of the Middle Indo-Aryan pronoun have been replaced, however, by distinctions of familiarity and politeness. For example, Hindi and Bengali have a three-way distinction—Hindi *ap,* Bengali *apni* "you" are polite or honorific forms; Hindi *tum,* Bengali *tumi* are informal forms; and Hindi *tũ,* Bengali *tui* are used only for inferiors and small children. (Hindi and Bengali differ, however, in the plural forms of these.) In Gujarati, on the other hand, *tũ* is a very familiar pronoun, whereas *təme* is used generally, covering the approximate domains of Hindi *ap* and *tum; ap,* if used, strikes the hearer as fawning. Marathi has a similar system. Southwestern languages also make a distinction in the 1st person plural between inclusive and exclusive, the exclusive excluding the person spoken to. In the form of the relative pronoun and the 3rd person pronoun, languages differ in the degree to which gender distinctions are made, thus contrasting with Old and Middle Indo-Aryan, in which these forms had three genders. For example, Marathi has masculine, feminine, and neuter for the relative pronoun, while Bengali has animate and inanimate.

New Indo-Aryan languages differ in the degree to which finite verb forms have been replaced by nominal (noun) forms. In Bengali a contrast is made between continuous or actual present (English "be . . . -ing") and noncontinuous or habitual present; *e.g., ami kaj kor-i* "I work" (literally, "I do work"), with the ending *-i,* contrasts with *ami kaj kor-ch-i* "I am working," in which *ch* intervenes between the root and the ending. Hindi has a similar contrast but uses nominal forms; *e.g., mɛ̃ kam kar-ta hũ* "I work," *mɛ̃ kam kər rəh-a hũ* "I am working." Both contain the finite form *hũ* of the auxiliary; but *kər-ta* and *rəh-a* are nominal forms, the latter the past of *rəh-*"stay." Gujarati has both types, the present tense using finite verb forms, the imperfect employing nominal forms; *e.g., hũ kam kərũ chũ* "I work, am working" and *hũ kam kər-to hə-to* "I was working, used to work." Even in areas in which finite forms are not used in the present, they occur in the imperative forms and what may be called the subjunctive; *e.g.,* Hindi *tum kam kər-o* "work," *mɛ̃ əndər aũ* "May I come in?"

Person–number system

The person–number system of the New Indo-Aryan verb accords with the use of pronouns. For example, the forms *ja-o, kər-o* in Gujarati *təme kyã jao cho* "Where are you going?" and *šũ kəro cho* "What are you doing?" are historically plurals but are used with reference to one person addressed by the pronoun *təme.* Similarly, in Hindi, in which a person distinction is not made in the plural, *ap kəhã ja rəhe hɛ̃, ap kya kər rəhe hɛ̃,* equivalent in meaning to the Gujarati sentences, have the plural form *rəhe hɛ̃.* Bengali has completely given up any number distinction in verb forms: *ami/amra kori* "I/we do." In the 3rd person a distinction is made between ordinary and honorific: *še* (ordinary)/*tini kɔren,* plural *tara/tãra kəren.* Other languages (*e.g.,* Hindi) also have honorific forms, for which the plural is used.

In the formation of the future there are again regional differences. Some retain the future in *-s-* (Gujarati *hũ kər-iš,* 3rd person *e kər-š-e*) or *-h-* (*e.g.,* eastern dialects of Braj Bhasa, *cəlihəɔ̃* "I will go"). Characteristic of the Eastern languages and of Bihari (including Bhojpuri, Magahi, Maithili) is the suffix *-b-; e.g.,* Bengali *jabe* "will go." All of these are finite forms. On the other hand, in Hindi and adjoining areas, the future is inflected for gender.

A similar contrast between the use of verbal and nominally inflected forms also appears in the past tense forms. The predominant pattern in New Indo-Aryan is that of Middle Indo-Aryan: forms are used that are etymologically participles.

The New Indo-Aryan languages retain the passive and causative forms. The causative is conservative in retaining both the affixes that appear in Middle Indo-Aryan and vowel alternation. The passive is also formed by affixation in some areas. But many languages also have a compound formation involving the verb *ja* "go" and an auxiliary (*hɛ̃*); *e.g.,* Hindi *yahã hindī bol-ī ja-t-ī hɛ̃* "Hindi is spoken here."

There are other auxiliaries, which, like *hɛ̃,* can occur with any verb in the language; *e.g.,* the verb "can," Hindi *sək-,* Gujarati *šək.* A characteristic feature of New Indo-Aryan, however, is the use of certain verbs, variously called vector verbs or compound verbs, in restricted contexts and with particular semantics. For example, one can say *mər gə-ya* "He died," *bhūl gə-ya* "He forgot," *bol uṭh-a* "He blurted out" in Hindi, using the verbs *ja* "go" (masculine singular past *gə-ya*), *uṭh* "stand up." This phenomenon is pan-Indo-Aryan and still requires investigation.

New Indo-Aryan word order

The examples cited above also illustrate the normal word order in New Indo-Aryan languages: subject (including agential forms), object (with attributive adjectives preceding), verb (together with auxiliaries). Adverbials can precede the full sentence or occur after the subject, with slight differences in emphasis; *e.g.,* Hindi *mɛ̃ kəl aũga,* or *kəl mɛ̃ aũga* "I will come tomorrow (*kəl*)." Relative clauses normally precede correlatives: Hindi *jo admī kəl tumhare ghər-mẽ tha vo kɔn hɛ* "Who (*kɔn*) is the man (*admī*) who (*jo*) was in your house yesterday?" A notable exception to the normal final position for verbs occurs in Kashmiri, in which the verb usually occurs in second position after the subject; thus, to Hindi *vo kha̦ rəha hɛ* "he is eating" corresponds Kashmiri *su chu kh́avān* with the auxiliary *chu* after the subject.

Vocabulary. The two most important sources of non-Indo-Aryan vocabulary in New Indo-Aryan are Persian (including Arabic items introduced through Persian), the court language of the Mughals, and English. The Perso-Arabic vocabulary permeates every aspect of New Indo-Aryan vocabulary, especially in the midlands (Uttar Pradesh through the Punjab). There are, of course, Hindi-Urdu words proper to Islām: Hindi *kuran* "Qur'ān," *ʿīd* (name of a holy day), *nəmaz* (certain prayers), *məsjid* "mosque," as well as the word for "religion," *məźhəb.* In addition, there are numerous Perso-Arabic military and administrative terms (*kila* "fort," *səvar* "horseman," *ədalət* "court of justice"); architectural and geographic terms (*imarət* "building," *məkan* "house," *məhəl* "palace," *duniya* "world," *ilaka* "province"); words having to do with learning and writing (*kələm* "pen," *kitab* "book," *ədəb* "literature, good manners") and with apparel (*jeb* "pocket," *moja* "socks," *rumal* "handkerchief") and anatomy (*khūn* "blood," *gərdən* "neck," *dil* "heart," *bazu* "arm," *sər* "head"). Indeed some of the most common vocabulary is of this origin: *tārīkh* "date," *vəkt* "time," *sal* "year," *həfta* "week," *umər* "age," *admī* "man," *ɔrət* "woman," and others. Even the grammatical apparatus of postpositions and conjunctions reflects Perso-Arabic influence; *e.g., -ke bad* "after," *əgər* "if," *məgər* "but," *ya* "or."

The colloquial language used by any Hindu or Muslim communicating in Hindi-Urdu will contain a large number of such words. There have been efforts to polarize the two, and at times champions of Indo-Aryan have tried to replace Perso-Arabic vocabulary with Sanskritic words. The style that tends toward eliminating all but the most common Perso-Arabic words may be called High Hindi, written in the Devanāgarī script, as opposed to High Urdu, which retains Perso-Arabic of long standing, uses Persian and Arabic for learned vocabulary and is written in the Perso-Arabic script.

Influence of English on vocabulary

The influence of English as a source of borrowing still continues, and it is rare to hear a conversation on any technical subject among speakers of any Indian language in which English words are not liberally used. Among loanwords from English are names of conveyances such as Hindi *rel-gaṛi* "railroad-train" and *ṭɛksī* "taxi"; profession names such as *injinīr* "engineer," *jəj* "judge," *ḍaktər* "Western doctor," *pulis* "police"; and terms of educational administration such as *kaləj* "college" and *yunivərsiṭī* "university." English words are susceptible to replacement in India by Sanskritic ones as are those of Perso-Arabic origin.

Of much lesser magnitude are New Indo-Aryan borrowings from other languages, among them Portuguese and Turkic. From the latter, the word *urdū* came to be used as the name of a language. From Portuguese come such Hindi words as *ənənnas* "pineapple," *paũ* "(Western style) bread," *kəmīz* "(Western) shirt," *kəmra* "room," and *girja* "(Christian) church."

Writing systems. Ancient India had two main scripts in which Indo-Aryan languages were written. Kharoṣṭi, used in the northwest, is of Aramaic origin and is written from right to left; Brāhmī, of North Semitic origin, is written from left to right and appears earliest on Aśokan inscriptions in areas other than the northwest. Most scripts of New Indo-Aryan are developments of the Brāhmī. The Devanāgarī (or simply Nāgarī), used for writing Sanskrit documents in North India, is the script of Hindi and Marathi as well as Nepali. Gujarati uses a more cursive derivative. Devanāgarī is also used, mainly among Hindus, for Kashmiri, which has, in addition, a traditional script called Sarada, which is not now in common use. The Perso-Arabic script is used instead. Also usually written in Perso-Arabic writing are Urdu and Sindhi (for which the Devanāgarī is also used in schools in India), whereas Punjabi employs it in Pakistan as well as a particular script of its own, known as Gurmukhi ("From the Teacher's Mouth") in the sacred writings of the Sikhs. In the east, the scripts used for Bengali and Assamese are closely related; and that of Oriya, related to the other two, is highly cursive like that of neighbouring Dravidian languages. Such is also the case with Sinhala.

The traditional alphabets are both over-explicit and not clear enough with regard to accurate representation of the spoken word. As systems in which a consonant symbol with no other accessory symbol accompanying it stands for the syllable consisting of the consonant followed by short *a,* they require previous knowledge of items for correct interpretation; Hindi *kərta* is written *ka-ra-tā* in the Devanāgarī, and one must know that the word has only two syllables. Though Bengali has only the spirant sound *š,* the alphabet has symbols for *ś, ṣ,* and *s,* as in Old Indo-Aryan; but verb forms such as *kori* and *kəren* are written *ka-ri* and *ka-re-na,* both with the same initial symbol. And, though syllabic *ṛ* was lost as early as Middle Indo-Aryan, the scripts have a separate symbol for this. Script reform has been suggested; it has even been proposed that all Indo-Aryan languages adopt a Latin (roman) alphabet with diacritics, but chances for this are poor. (Ge.Ca.)

THE IRANIAN LANGUAGES

Languages of the group. The various Iranian languages fall distinctly into three categories—Ancient, Middle, and Modern Iranian.

Avestan and Old Persian

Ancient (Old) Iranian. Of the ancient Iranian languages, only two are known from texts or inscriptions, Avestan and Old Persian, the oldest parts of which date from the 6th century BC. Avestan was probably spoken in northeastern Iran, and Old Persian is known to have been used in southwestern Iran. Other ancient Iranian languages must have existed, and indirect evidence is available concerning some of these. Thus, from the 5th-century-BC historian Herodotus, the Median word for "female dog" (*spaka*) is known, and a number of Median loanwords have been recognized in the Old Persian inscriptions. In addition, a number of Median personal names are attested in various sources. It is likely that all those languages that are known only from the Middle Iranian period were in fact spoken in a less developed form in the ancient period. The same observation may apply to some of those modern Iranian languages that are not attested in the earlier periods.

The degree of mutual intelligibility that existed among the ancient Iranian languages is not known with certainty. The differences in the nature of the surviving sources have to be borne in mind. On the one hand, there is the religious poetry of Zoroaster in the Avestan language and on the other, the official inscriptions of the Achaemenid rulers in Old Persian. Differences in the method of transmission present a further difficulty in the way of direct comparison. Nevertheless, it can safely be stated that the degree of mutual intelligibility must have been much greater between the ancient languages than between the Middle Iranian languages and that those languages geographically closer to each other probably were mutually understood better than those spoken in areas farther apart.

Avestan can hardly be said to be known beyond the ancient period, although only the earliest texts, the Gāthās, are as old as the 6th century BC, and the later texts represent the language of several subsequent centuries. Old Persian, on the other hand, itself spanning the 6th to the 4th century BC, was continued more or less directly by the various forms of Middle Persian. Even here, however, although both Old and Middle Persian represent the language of the royal court, there are considerable differences between them for which no satisfactory explanation has yet been given.

Middle Iranian. Middle Persian is known in three forms, not entirely homogeneous—inscriptional Middle Persian, Pahlavi (often more precisely called Book Pahlavi), and Manichaean Middle Persian. Middle Persian belongs to the period 300 BC to AD 950, and was, like Old Persian, the language of southwestern Iran. In the northeast and northwest the language spoken was Parthian, which is known from inscriptions and from Manichaean texts. There are no significant linguistic differences in the Parthian of these two sources. Most Parthian belongs to the first three centuries AD.

Eastern group of Middle Iranian languages

Middle Persian and Parthian were doubtlessly similar enough to be mutually intelligible, but they differ so greatly from the eastern group of Middle Iranian languages that these must have appeared to be almost foreign languages. The languages of the eastern group, moreover, cannot have been themselves mutually intelligible. The main known languages of this group are Khwārezmian (Chorasmian), Sogdian, and Saka. Less well-known are Old Ossetic (Scytho-Sarmatian) and Bactrian, but from what is known it would seem likely that these languages were equally distinctive. There was probably more than one dialect of each of the languages of the eastern group, although there is certainty only in the case of Saka, for which at least two dialects are clearly attested. The main Saka dialect is known as Khotanese, but a small amount of material survives in a closely related dialect called Tumshuq, formerly known as Maralbashi.

A few words are known in all of these eastern Iranian languages from as early as the 2nd to the 4th century AD, but substantial evidence begins for Sogdian in the 4th century, for Saka probably no earlier than the 7th century (though that for Tumshuq may be a few centuries older), and for Khwārezmian not until the 12th century and later. The principal evidence for Bactrian belongs to the 2nd century. To the same period belong the Scytho-Sarmatian names of the earliest inscriptions.

All the eastern Iranian languages of the Middle Iranian period were spoken in Central Asia, with the exception of the language of the Scytho-Sarmatian inscriptions from southern Russia, north of the Black Sea. More precisely, Bactrian was spoken in northern Afghanistan and in the adjacent parts of what is now Soviet Central Asia. Khwārezmian was the language of Khwārezm (Khiva), now an *oblast* in western Uzbekistan but formerly of greater extent. Sogdian was probably spoken over most of Soviet Central Asia, especially in eastern Uzbekistan, Tadzhikistan, and western Kirgiziya. There were also colonies of Sogdians in various cities along the trade routes to China; in fact, most Sogdian material comes from outside Sogdiana. The Saka dialects, Khotanese and Tumshuq, were spoken in Chinese Turkistan, modern Sinkiang; Tumshuq is the name of a small village in the extreme west of Sinkiang. Khotanese was spoken in Khotan near the modern city of Khotan (Chinese Ho-t'ien) on the southern route across the Takla Makan desert and within about 100 miles (160 kilometres) to the north and to the east of Khotan, where manuscripts have been found, mainly at the sites of former shrines and monasteries.

Modern Iranian. The discontinuity already observed between Old and Middle Iranian is even more striking between Middle and Modern Iranian. There are no modern counterparts at all to Khwārezmian, Bactrian, and Saka, and there is no direct continuity in the case of any of the other Middle Iranian languages. Even Modern Persian does not represent a straightforward continuation of Middle Persian but is rather a koine (a dialect or language of a small area that becomes a common or standard language of a larger area), based mainly on Middle Persian and Parthian but including elements from other languages and dialects. Although Sogdian is known in several forms, possibly representing different dialects, none of these can be considered the direct ancestor of modern Yaghnābī, spoken at present in the valley of the Yaghnob (Yagnob) River, a tributary of the Zeravshan. Yaghnābī, nevertheless, certainly belongs linguistically to the Sogdian family. Similarly, the languages of the Scytho-Sarmatian inscriptions may represent dialects of a language family of which Modern Ossetic is a continuation, but it does not simply represent the same language at an earlier date.

Modern Iranian state languages

Only four of the many modern Iranian languages are the official languages of the state in which they are spoken. The chief of these is Persian (known in Persian itself as Fārsī), the national language of Iran, which is spoken by about 18,000,000 people as a native language. It is recognized, moreover, as a second language in Afghanistan, where it is spoken in only a slightly different form. The national language of Afghanistan is the East Iranian language known as Pashto, of which there are about 15,000,000 speakers, many living in Pakistan. Tadzhik is spoken by at least 6,000,000 people widely spread throughout the Tadzhik Soviet Socialist Republic and the rest of Soviet Central Asia and is readily intelligible to speakers of Persian, to which it is very closely related, although it is in some respects more archaic. In addition to being the national language of Tadzhikistan, Tadzhik is important as the lingua franca of the Pamirs, a region where a remarkable variety of Iranian languages and dialects is spoken. Fewer than 500,000 people speak Ossetic. Most of the Ossetes live in two administrative divisions of the U.S.S.R., the Severo-Ossetian A.S.S.R. of the Russia S.F.S.R. and the Yugo-Ossetian autonomous *oblast* of the Georgian S.S.R. Although spoken in the heart of the Caucasus Mountains, Ossetic is an East Iranian language not mutually intelligible with any other Iranian language.

Two other Iranian languages, Kurdish and Baluchi, are spoken over a vast area, although they have not been officially accepted as the national language of an established state. Kurdish is spoken by about 10,000,000 people living in Iran, Iraq, Turkey, Syria, and Soviet Transcaucasia. More than 2,000,000 people speak Baluchi as their chief language; they are spread widely over parts of eastern Iran, Pakistan, Afghanistan, and southern Soviet Central Asia. In Iran, Baluchi speakers live mainly in the region of Baluchistan, a region in the southeast that now forms part of a province with Seistan. In Pakistan, Baluchi speakers live mainly in the southwestern province of Baluchistan; in Soviet Central Asia, they are found mainly around Merv in southern Turkmenistan; and in Afghanistan, they are widely scattered, mainly over the southwestern portion of the country. There is a sizable Baluchi colony in Oman, and many Baluchi merchants have settled in the sheikhdoms of southern Arabia and along the east coast of Africa as far south as Kenya. Linguistically, Baluchi and Kurdish are both West Iranian languages. Baluchi is thus much more closely related to Kurdish than it is to its close neighbour Pashto. According to the most likely theory, the present eastern location of Baluchi speakers is the result of migrations from the region of the Caspian Sea during the Middle Ages.

Dialects. The six modern Iranian languages discussed above are the only ones that have an established literary tradition. They are not, however, homogeneous, each having its own dialect divisions. No definitive dialect classification has yet been made, nor indeed has any attempt at systematic classification of the whole range of Iranian languages won wide acceptance. The usual practice, followed here, is simply to list the main languages in groups of varying size, arranged on a roughly geographical basis.

Ossetic dialects

There are two main dialects of Ossetic: the eastern, known as Iron, and the western, known as Digor (Digoron). Of these, Digor is the more archaic, Iron words being often a syllable shorter than their Digor counterparts; *e.g.,* Digor *madä,* Iron *mad* "mother." Iron is spoken by the majority of Ossetic speakers and is the basis of the literary language. Chosen in the 19th century for the translation of the Bible, it is still the official language today. Little is known of the other Ossetic dialects. A small amount of the Ossetic dialect of Tual in the south, which differs little from Iron, was published in Georgian script at the beginning of the 19th century.

Yaghnābī is still spoken by a small number of people southeast of Samarkand. It has two main dialects, eastern and western, which differ only slightly. The characteristic difference is between a western *t* sound and an eastern *s* sound from an older *θ* sound (as *th* in English "thin"); *e.g.,* western *mēt,* eastern *mēs* "day," beside Sogdian *mēθ* (Christian Sogdian *myθ*).

Dialects of the Shughnī group are spoken in the Pamirs. Closely related to this group is Yāzgulāmī. A period of a Yāzgulāmī–Shughnī common language (protolanguage) has been postulated by some scholars, after which it separated first into Yāzgulāmī and Common Shughnī; and then Common Shughnī gradually divided into Sarīkolī, Oroshorī-Bartangī, Rōshānī-Khufī, and Bajuvī-Shughnī. Sarīkolī, the easternmost of these dialects, is spoken in Chinese Sinkiang.

Speakers of Wakhī number 10,000 or so in the region of the upper Panj. Vākhān (Wākhān), the Persian name for the region in which Wakhī is spoken, is based on the local name Wux̌, a Wakhī development of *Waxšu, the old name of the Oxus (modern Amu Darya). (An asterisk denotes a hypothetical, unattested, reconstructed form or word.) The Wakhī language is remarkably distinct from its neighbours and has many archaic features.

Around the bend of the Amu Darya and in the valley of the Vardūj River to the southwest, a few people speak dialects of the Sanglēchī-Ishkāshmī group. This group is clearly distinguished from its neighbours but is closely related to the other languages of the Pamirs.

Scarcely more than 2,000 people speak dialects of the Yidghā-Munjī group. Monjān is a very remote valley located in northern Afghanistan, and it is separated by a mountain pass from the Sanglēchī-speaking region. Yidghā is spoken in the valley of the Lutkuh in Chitrāl, which is now in Pakistan. Yidghā-Munjī is most closely related to Pashto.

Pashto dialectal groups

The existence of two dialectal groups within Pashto has long been known. Thus, the word Pashto represents a southwestern dialect form (*paštō*), in contrast to a northeastern (*paxtō*). According to one hypothesis, Pashto literature, which exists certainly from the 17th century and possibly from the 11th, was created among the northeastern tribes. Two minor dialects, Wazīrī and Waṉētsī, have some features of special interest.

Although spoken in a few villages in Afghanistan, two languages have features closely associating them with Western Iranian. These are Parāchī, spoken in the Hindu Kush north of Kābul, and Ōrmuṛī, found in two dialects, one in the Lowgar Valley south of Kābul and the other in Kāniguram in Wazīristan.

Farther south is the wholly West Iranian language, Baluchi, mentioned above. Despite the vast area over which Baluchi is spoken, its numerous dialects are all mutually intelligible. The most recent study of the Baluchi dialects divides them into six groups: Eastern Hill dialects; Rākhshānī dialects including that of Merv; Sarawānī; Kechī; Loṭunī; and the coastal dialects. Of these, Rākhshānī is the most widely spoken and is used for broadcasting both in Pakistan and in Afghanistan, but the coastal dialects have the greatest prestige and the most extensive literature.

In the southeastern corner of Iran, Baluchi gradually gives way to the Bashkardī dialects.

In central Iran the influence of Modern Persian is everywhere strongly felt, and it is often difficult to distinguish between dialects of Modern Persian, Persian with dialectal traits, and closely related languages. In Yazd and Kerman the Parsis speak the old Gabrī dialect, whereas the Muslims speak Persian. Among other central dialects are Nātanzī, Sōī, Khunsārī, Gazī (near Isfahan), Sīvandī (northeast of Shīrāz), Vafsī, and Ashtiyānī, to name but a few.

Semnānī, spoken east of Tehrān, forms a transitional stage between the central dialects and the Caspian dialects. The latter are divided into two groups, Gīlakī and Māzandarānī (Tabarī). Also closely related is Tālishī, spoken on the west coast of the Caspian Sea on both sides of the border with the U.S.S.R. To this northwestern group belong the so-called southern Tātī dialects spoken south and southwest of Qazvīn, as well as the scarcely known dialects of Harzan and Galinqaya spoken northwest of Tabriz. The name Tātī is usually applied to the dialects spoken in Russian Dagestan and northeast Azerbaijan. They differ little from Modern Persian.

Of the dialects of Fars Province, only Larī, southeast of Shīrāz, is notably distinctive. Kumzarī in Oman and the Lur dialects of the southwest also differ little from Persian.

Kurdish dialects

There are many dialects of Kurdish, the widely spoken West Iranian language that is thought to occupy a dialectal position intermediate between Baluchi and Persian. Three main dialect groups can be distinguished—northern, central, and southern. A systematic study has been made of the dialects of Iraq, which include ʿAqrah (Akre), ʿAmādīyah, Dahūk, Shaykhān, and Zākhū in the northern group, and Irbīl (Arbīl), Bingird, Pishdar (Pizhdar), Sulaymānīyah (Suleimaniye), and Wārmāwah in the central group. The Central Mukrī dialect is spoken in the extreme west of Iran, south of Lake Urmia.

Gorānī is spoken in several dialects, mainly in the Zagros Mountains, and it is strongly influenced by the surrounding Kurdish dialects. The Gorānī dialect of Hawrāman, Hawrāmī, is notable for its many archaic features. Closely related to Gorānī is Zaza (Dimli), spoken west of Iran.

Historical survey of the Iranian languages. *The Iranian protolanguage and its development.* By the time Iranian begins to be attested in the 6th century BC, the language is already found differentiated into several distinct languages. Scholars have reconstructed the sound system and some of the grammatical features of Common Old Iranian, the protolanguage that preceded these dialects.

The phonological system that underlay Common Old Iranian was by and large maintained everywhere throughout the Iranian-speaking world. It consisted of the following distinctive consonant sounds:

k	g	x	[ɣ]	ŋ
č	ǰ			
p	b	f	[β]	m
t	d	θ	[ð]	n
š	ž			
y	r	l	w	h

Unfamiliar symbols are taken from the International Phonetic Alphabet, or are conventional transcriptions (*e.g.*, *š* for the *sh* sound in "ship," *ž* for the *z* sound in "azure," *č* for *ch* in "church," and *ǰ* for *j* in "jam"). The voiced fricatives (*i.e.*, the first three consonants represented in the fourth column—ɣ, β, and ð), which are produced with vibrating vocal cords and local friction, may be regarded as variants of the voiced stops (*e.g.*, *g*, *b*, *d*); but they are characteristic of Iranian languages generally and especially of the eastern Iranian languages. In addition to these sounds Old Persian had another sibilant sound, often transcribed as *ç* or *ss*, which developed from the cluster *θr* (pronounced as the *thr* in "three"). In Middle Persian it fell together with the *s* sound. The most noticeable alteration of the old sound system is the introduction in some languages of additional series of consonants under the influence of neighbouring languages. Thus, Ossetic has a series of ejective sounds (uttered with a simultaneous glottal stop) on the pattern of the unrelated Caucasian languages; and a number of Iranian languages have a retroflex series (produced with the tongue tip curled up toward the roof of the mouth) as a result of contact with Indo-Aryan languages.

Changes from Indo-European sounds to Iranian sounds

Some of the differences between Iranian languages arose as a result of different developments of the earlier sounds. Thus, the Indo-European sounds *ḱ*, *ǵ*, and *ǵh* resulted in Indo-Iranian *ś*, *ź*, and *źh*, which in turn became *s*, *z*, and *z*, respectively, in Avestan but *θ*, *d*, and *d* in Old Persian. Hence, Indo-European **ḱm̥tó-* "hundred" became Indo-Iranian **śatá-*, attested by Old Indo-Aryan *śatá-*, and then Avestan *sata-*, but Old Persian *θata-*. Nevertheless, *θ* and *d* as well as *s* and *z* belong to the basic pattern, the difference being merely distributional.

The main source of differentiation is in the variation of consonant cluster development and that of groups of consonants and semivowels. Here again it is mainly a question of distributional differences. Thus, the Indo-European group **ḱu̯* became Indo-Iranian **śu̯*, retained in Old Indo-Aryan in the spelling *śv* of the standard transcription. Indo-Iranian **śu̯* developed variously in Iranian: *s* in Old Persian, *sp* in Avestan and Median, *ś* (written *śś*) in Khotanese, and *š* in Wakhī. These developments can be seen in the following forms of the Indo-European word **eḱu̯o-* "horse": Old Indo-Aryan *áśva-*, Avestan and Median *aspa-*, Old Persian *asa-*, Khotanese *aśśa-*, and Wakhī *yaš*. Yet another development can be seen in Ossetic, in which the word for "mare," Avestan *aspā-*, appears as Digor *äfsä* and Iron *yäfs*.

The vowel system of Common Old Iranian consisted of short and long varieties of *a*, *i*, and *u*, and a neutral vowel *ə* (similar to the *a* in "sofa"). This analysis assumes that the Indo-Iranian vocalic *r* (r̥) had already developed to *ər* in Proto-Iranian, just as its long counterpart became *ar*. An early and general monophthongization of the diphthongs *ai* and *au* to *ē* and *ō*, respectively, must also be considered characteristic, although it should not be ascribed to Common Old Iranian as is sometimes done. This basic system was almost everywhere maintained, sometimes with the addition of one or two distinctive vowel sounds (phonemes).

For further details concerning the relationship of Iranian to Indo-European and Indo-Aryan, see the introduction of this article.

The Old Iranian stage. Old Persian was the language of the Achaemenid court. It is first attested in the inscriptions of Darius I (ruled 522–486 BC), of which the longest, earliest, and most important is that of Bīsitūn. At Bīsitūn are also inscribed versions of the same text in Elamite and Babylonian, and fragments of an Aramaic version on papyrus documents from Elephantine (modern Jazīrat Aswān) also exist. Old Persian words and names are also to be found in large numbers as loanwords in contemporary Elamite sources and in 5th-century-BC Aramaic documents.

As early as the time of Darius the Great's successor, Xerxes I (ruled 486–465 BC), the inscriptions show linguistic tendencies characteristic of the development from Old to Middle Persian. After Xerxes the production of original Old Persian inscriptions declined, probably as a result of the wider adoption of Aramaic and Elamite as the usual means of writing. With Artaxerxes III (ruled 359/358–338 BC), Old Persian inscriptions came to an end. The break is marked by Alexander's destruction of Persepolis in 330 BC.

Alternate terms for Avestan

By far the largest part of attested Old Iranian is written in the language now usually called Avestan, after the Avesta, the name given to the collection of works forming the scripture of the Zoroastrians. The name itself is Middle Persian. In former times, this language was called Zend, another Middle Persian word, which refers to the Middle Persian (Pahlavi) commentary on the Avesta. Because the homeland of the Avestan language was long thought to be in Bactria, it was often in the past called Bactrian. Bactrian is now used to designate a different Iranian language belonging to the Middle Iranian period.

Since the beginning of the 20th century it has been generally accepted that the homeland of the Avesta was Khwārezm, which in ancient times included both Merv and Herāt. Merv is now in Turkmenistan, Herāt in northwest Afghanistan.

The oldest part of the Avesta is known as the Gāthās, the poems composed by Zoroaster (Zaraθuštra), the founder of the Zoroastrian religion. His date is uncertain but is traditionally ascribed to the 7th to 6th century BC. The so-called *Khurda Avesta* ("Little Avesta") is a miscellany of texts of later date, the oldest parts of which may have been composed about 400 BC. The language of the *Khurda Avesta* is different in many details from that of the more archaic language of the Gāthās, and it may even represent a different dialect. Many uncertainties surround the detailed interpretation of the Avesta as a result of the method of transmission. The Avesta was not recorded until after the language had ceased to be used, except by Zoroastrian priests. The present manuscripts date from the 13th century and later, although they reflect the recording of the priestly tradition in the special Avestan script during the 6th century AD.

The Middle Iranian stage. Middle Persian was the official language of the Sāsānians (AD 224–651) and was used for their inscriptions. The most important of these is the 3rd-century inscription of Shāpūr I, which has parallel versions in Parthian and Greek. Middle Persian was also the language of the Manichaean and Zoroastrian books during the 3rd to the 10th century AD. The extant literature of the Zoroastrian books is much more extensive than that of the Manichaean texts, but the latter have the advantage of having been recorded in a clear and unambiguous script. Moreover, the Middle Persian of the Zoroastrian books, or Pahlavi, as it is usually called, does not simply represent the spoken language of the writers of the 9th-century Zoroastrian texts. It is probable that they spoke early Modern Persian and that their speech often impinged upon their writing but that they strove to write the Middle Persian of several centuries earlier as it was attested in the inscriptions of the early Sāsānian Empire when Middle Persian was the koine. By contrast, in the case of Manichaean Middle Persian, some texts survive unchanged from the 3rd century AD, the time of the Persian teacher Mani himself (AD 216–274).

Records of Parthian

Very little Parthian survives from the pre-Sāsānian period. A large number of Parthian ostraca (inscribed pottery fragments) from the 1st century BC were discovered at Nisa near modern Ashkhabad, but they are inscribed in ideographic Aramaic (*i.e.,* Aramaic writing that uses Aramaic words as symbols to represent Parthian words). Dating before the 3rd century are a document from Hawrāman, some coin legends, and a dated grave stele. The most copious and important material is the work of the Sāsānian kings of the 3rd century, who added a Parthian version to their inscriptions—Ḥājjīābād, Naqsh-e Rustam (Ka'be yi Zardusht), and Paikūla. A few decades later Parthian disappeared as a result of the rise of the Sāsānians and the predominance of their native tongue, Middle Persian. Manichaean Parthian of the 3rd century was preserved as a church language in Central Asia.

The oldest surviving Sogdian documents are the so-called Ancient Letters found in a watchtower on the Chinese Great Wall, west of Tun-huang, and dated at the beginning of the 4th century AD. Most of the religious literature written in Sogdian dates from the 9th and 10th centuries. The Manichaean, Buddhist, and Christian Sogdian texts come mainly from small communities of Sogdians in the Turfan oasis and in Tun-huang. From Sogdiana itself there is only a small collection of documents from Mt. Mugh in the Zarafshān region, mainly the business correspondence of a minor Sogdian king, Dewashtich, from the time of the Arab conquest around 700.

The relationship of the various forms of Sogdian to one another has not yet been sufficiently investigated, so that it is not clear whether different dialects are represented by the extant material or whether the differences can be accounted for by reference to other relevant factors, such as differences of script, period, subject, style, or social milieu. The importance of social milieu can be seen by comparing the elegant Manichaean literature directed to the court with the more vulgar language of the Christian literature directed to the lower classes.

Of the Saka dialect known as Tumshuq very little has survived, and despite its evidently close relationship to the much better known Khotanese dialect, full interpretation has proved difficult. Knowledge of Khotanese is more firmly based on a substantial corpus of material, including extensive bilingual texts. Although the chronological range of the extant Khotanese material is limited to only a few centuries, probably the 7th to the 10th, a rapid development of the language is apparent. At the phonological level, most noticeable is the loss of syllables between the older and later stages of the language. Thus, *hvatana-* "Khotanese" at the oldest stage is successively weakened to *hvatäna-, hvaṃna-, hvana-, hvaṃ.* At the morphological level, most striking is the tendency to simplify the case endings and even to replace them by analytical expressions, constructions of two or more words. Thus, Late Khotanese has *rakṣaysā hīya rāde* "kings of the *rākṣasas,*" whereas Old Khotanese would have *rakṣaysänu rrunde.* The Old Khotanese *-änu* ending is unmistakably genitive plural, but the Late Khotanese *-ā* is merely a general oblique plural ending and has been reinforced by *hīya* "own," used to mean "of."

Buddhist influence on Khotanese

Khotan was a great centre of Buddhism during the 1st millennium AD, and all the surviving literature in Khotanese is either Buddhist or coloured by Buddhism. Even in business documents and official letters the Buddhist background is usually not difficult to discern. It can scarcely be coincidental that the Buddhist literature of Khotan, flourishing so vigorously during the 10th century, ended abruptly with the Muslim conquest at the beginning of the 11th.

Little survives of Bactrian and Scytho-Sarmatian. Knowledge of Bactrian is based almost entirely on a single inscription of 25 lines from Āteshkadeh-ye Sorkh Kowtal in northern Afghanistan. Even less is known of Scytho-Sarmatian.

Little is also known of Old Khwārezmian; that is, Khwārezmian written in the indigenous Khwārezmian script. Apart from a few coin legends and inscriptions on silver vessels, the material that survives consists of inscriptions of the 2nd century AD from Topraq-qal'ah (Toprakkala) and of the 7th from Toqqal'ah, archaeological sites in Uzbek S.S.R. Much more is known of Late Khwārezmian, written in the Arabic script. This material is found mainly in two Arabic works, the 13th-century *fiqh* work of Mukhtār az-Zāhidī, called the *Qunyat almunyah,* and the Arabic dictionary *Muqaddimat al-Adab* of az-Zamakhshari (1075–1143/44), of which a manuscript glossed in Khwārezmian was found.

Modern Iranian. Of the modern Iranian languages, by far the most widely spoken is Persian, which, as already indicated, developed from Middle Persian and Parthian, with elements from other Iranian languages such as Sogdian, as early as the 9th century AD. Since then, it has changed little except for acquiring an increasing proportion of loanwords, mainly from Arabic. Persian has been a literary language since the 9th century, and there is an increasing awareness of the continuity of its literary tradition with the earlier periods. As the national language of Iran in succession to Middle Persian, it has for centuries strongly influenced the other Iranian languages, especially on Iranian territory. In fact, it seems likely that with the increase of modern methods of communication, Persian will eventually supplant entirely most of the other languages and dialects. Against this trend stand only Kurdish and Baluchi, the speakers of which tend to regard their languages as an expression of their particular identities. Nevertheless, even Kurdish and Baluchi have been and are strongly influenced by Persian.

Modern Iranian languages in Afghanistan and the Soviet Union

Outside Iran, the situation is rather different. In Afghanistan the first national language is Pashto, even though Persian is the official second language. Pashto became the official language by royal decree in 1936, and literary activity has been encouraged by the Pashto Ṭolana (Pashto Society) of Kābul. On Soviet territory both Ossetic and Tadzhik have received official encouragement; nevertheless, both languages will in time give way to the Russian language as the language of administration. Other languages also compete with Ossetic and Tadzhik. Ossetic became a literary language only in the second half of the 19th century, but the neighbouring Georgian has a still flourishing ancient literary tradition dating back to the 5th century AD and has many more speakers. Tadzhik, on the other hand, has a lifeline through its close connection with Persian, but it too has been retreating before Uzbek, an unrelated language of the Turkic group.

Characteristics of the Iranian languages. All Iranian languages show in their basic elements the characteristic features of an Indo-European language. Apart from the extensive borrowing of Arabic words in Modern Persian, the Iranian languages have scarcely been affected by unrelated languages, with the notable exception of Ossetic, which has been strongly influenced by the neighbouring Caucasian languages. Some dialects of Tadzhik have been very receptive to Uzbek elements. In the case of languages in contact with Indian civilization, the most noticeable non-Iranian feature often taken over is the Indo-Aryan series of retroflex sounds. These are foreign to Indo-Aryan itself, being a result of the influence of the Dravidian languages.

The elaborate phonological and morphological structure of the Indo-European parent language has been progressively simplified in the development of the Iranian languages. The basic phonological structure of Common Old Iranian has on the whole been maintained, but the morphological system has continued to be simplified. There has been a constant move in almost all Iranian languages toward an analytic structure; *i.e.,* the use of prepositions and word order rather than case endings to indicate grammatical relationships.

Development of Iranian fricative sounds

Phonology. The most characteristic features of the Iranian phonological system are those that distinguish it from the Indo-Aryan system. These are the development of various fricative sounds (indicated in phonetic symbols as x, f, *θ*, and later ɣ, β, ð), and of the voiced sibilant sounds *z* and *ž*. Even in Iranian, however, these sounds did not persist universally. In western Middle Iranian the *θ* sound was lost, and it is rare in the modern languages. In Pashto the inherited *f* sound has been discarded. Baluchi, except in the extreme east, is entirely without fricatives. Voiced bilabial and dental fricative sounds (β and ð) were recorded in some early manuscripts of Modern Persian, but they became *b* and *d* by the 13th century

Two negative features have also resulted in differentiation between Indo-Aryan and Iranian. One is the result of the coalescence in Proto-Iranian of aspirated and unaspirated voiced stops. Thus, Indo-European **b* and **bh* were maintained in contrast in Indo-Aryan as *b* and *bh,* but they fell together in Iranian as *b.* This resulted in an alteration of the phonological structure because the number of consonant contrasts (oppositions) was reduced. The other negative feature is the absence of the retroflex consonants from Iranian except as a later importation in contiguous regions.

Other divergences in development, such as the change of an *s* sound to *h* in Iranian, brought about a difference in distribution rather than in structure because *h* developed also in Indo-Aryan but from Indo-Iranian **źh* and **gh* before front vowels (*e.g., e* and *i*). The features discussed here are illustrated in Table 6.

In Old Iranian the stress lay on the next to the last syllable if it was heavy (*i.e.,* contained a long vowel or was closed by a consonant)—otherwise on the preceding syllable. With the loss of final unstressed vowels in the development of many Iranian languages, the stress often came to be on the final syllable. End stress is characteristic of Modern Persian.

Simplification of the case system

Grammar. In Old Persian the Indo-European inflectional system appears considerably simplified. In particular, the genitive and the dative coalesced into one case and the instrumental and ablative into another. Moreover, in the plural the nominative and accusative cases are not distinguished. This reduced system is still found in the Middle Iranian period in Old Khotanese and to a certain extent in Sogdian. Eastern Iranian is in this respect more conservative than western. By the Middle Iranian period, western Iranian had abandoned nominal (noun, adjective, pronoun) inflection altogether, as is the case with Middle and Modern Persian and with Parthian. In some languages, both western and eastern, two or, rarely, three cases survive. Ossetic is quite exceptional in maintaining an elaborate case system; it is partly a result of secondary, purely Ossetic developments.

Table 6: Phonetic Developments in Indo-Iranian Languages
key: NP—New Persian; Bal.—Baluchi; Yaghn.—Yaghnobi

Sanskrit	Avestan	Old Persian	modern Iranian	English translation
kratu-	xratu-	xratu-	NP xirad	"insight"
viś-	vis-	viθ-	Bal. gis	"house"
jānắti ("he knows")	zān(ā)	dān(ā)-	NP dān-	"know"
bandh-	band-	ba(n)d-	NP band-	"bind"
bhūta-	būta-		NP būd	"been"
sacā ("with, at the same time as. . .")	hačā	hačā	NP az	"from"
han-	ǰan-	ǰan-	Bal. ǰan-	"strike"
abhra-	aβra-		NP abr	"cloud"
mṛga- ("deer")	mərəɣa-		NP murɣ	"bird"
nir-ay-		nij-ay-*	Yaghn. nīž-	"go out"
pramāṇa- ("measure, authority")		framānā-	NP farmān	"command"
sthūṇā-	stunā-	stūnā-	NP sitūn	"pillar"

*In Old Persian *nij-ay-* "go out," *j* is written for *ž*, which was not represented in the script.

The elaborate conjugational system of the Indo-European verb followed a similar path to disintegration. In particular, the whole past tense system was given up by the Middle Iranian period. Only a few relics remain of the Indo-European system, such as the partial survival of the augment (a prefixed vowel or lengthening of the initial vowel) in the Sogdian imperfect tense. But a new past tense system developed, based on the old past participle, often combined with auxiliary verbs. Many languages distinguish between transitive and intransitive verbs in the past tense system; and in some, such as Khotanese and Pashto, even gender and number are distinguished.

The present tense system was far better preserved. The dual number was in retreat in Old Iranian and is not attested later. The middle voice, a form that indicates that a person or thing both performs and is affected by the action represented, was generally abandoned by the Middle Iranian period, although middle voice inflection is well represented in Khotanese. With these qualifications, the endings of the present indicative (active) have been generally well preserved. A variety of imperative, subjunctive, and optative forms, partly based on inherited forms and partly the result of innovation, is found especially in the eastern languages, including Ossetic.

Rigidity of word order is, on the whole, most characteristic of those languages, such as Persian, that have gone furthest in the reduction of the inherited morphological system.

Vocabulary. The Islāmic conquest of Iran during the 7th century entailed not only a change of religion but also a change of language. The sacred language of Islām was Arabic, and the proportion of Arabic words used in Persian rapidly increased until it reached something like the 40 to 50 percent of the present day. Before the introduction of the Arabic element, most loanwords were mainly from other Iranian languages. Most familiar is the extensive borrowing from Median found in Old Persian. In later periods, Modern Persian borrowed words extensively from Turkish and from European languages. Persian is itself the donor language in the case of the other Iranian languages, all of which have drawn upon its vocabulary.

Loanwords from languages of India

Buddhism was similarly responsible for the large proportion of Indo-Aryan words, both Sanskrit and Prākrit, found in Sogdian and especially in Khotanese. A considerable Indian element occurs in the vocabulary of those modern Iranian languages that have been or are in contact with modern Indo-Aryan languages in the northwest, such as Lahnda and Sindhi. There the Dardic languages have also been influential. Baluchi has also borrowed from Brahui, a Dravidian language spoken in Baluchistan in Pakistan.

Ossetic occupies an exceptional position. Most of its Persian and Arabic borrowings have come to it through Turkish, but more striking are the large number of words borrowed from the Caucasian languages, especially Georgian. In modern times, Ossetic continues to be influenced by Russian.

Writing systems. Iranian languages have been written in many different scripts during their long history, although various forms of Aramaic script have been predominant. Modern Persian is written in Arabic script, which is of Aramaic origin. For writing the Persian sounds *p, č, ž,* and *g,* four letters have been added by means of diacritical marks. By the addition of further letters, this Perso-Arabic script has been adapted to write not only the other main modern Iranian languages, Pashto, Kurdish, and Baluchi, but also those minor ones that are occasionally recorded. An advantage of the use of this consonantal script is that

*Initially *a* or *e*, pronounced m*a*p or b*e*t; medially and finally, *ā*, pronounced *a*rm. †A glottal stop, as in New York or Cockney "bottle." ‡A guttural *gh*; also medially and finally often softened as in French *r*ien. §As a consonant, *v*an; as a vowel, f*oo*d. ‖Generally silent in final position; otherwise *h*at. ¶As a consonant, yet; as a vowel, bl*ee*d. ♀Used to show that a consonant is not vocalized. ♁Arabic feminine ending usually not pronounced in Persian except as silent *h*. □A pause between two vowels, as in English "di-et," "qui-et." ◇A particle linking a qualifying noun or adjective with a noun; usually not written. Transliterate "-e" (with hyphen) after final consonants (except silent *h*), "-ye" (with hyphen) after silent *h* and vowels.

by not defining vowel qualities it is possible to include local dialect variations to a considerable extent.

Two modern Iranian languages spoken on Soviet territory are currently written in a modified version of the Russian alphabet: Tadzhik and Ossetic. Soviet scholars have, however, tended to use modified Latin alphabets to record the minor languages that have no literary tradition, such as some of the Pamir languages. Ossetic has also been written in the Georgian script.

Old Persian was written with a cuneiform syllabary, the origin of which is still hotly disputed. Middle Persian, Parthian, Sogdian, and Old Khwārezmian were recorded in various forms of Aramaic script. Two forms of this script as they developed for writing Sogdian were adopted by the Uighurs. In its cursive form this script spread even further, to the Mongols and Manchus. Three other scripts are important for the remaining Middle Iranian languages: Greek script for Bactrian, Arabic script for Late Khwārezmian, and varieties of Central Asian Brāhmī script of Indian origin for Khotanese and Tumshuq.

The Aramaic script was not systematically adapted to the writing of Middle Iranian; and despite the introduction of a variety of diacritical marks to differentiate letters, considerable ambiguity remained. Moreover, several letters tended to coalesce in form. In this respect, the Pahlavi script, used for writing the Middle Persian of the Zoroastrian books, developed furthest. In it, the original 22 letters of the Aramaic alphabet have been reduced to 14, which are further confused by the use of numerous ligatures (linked letters). It was the realization that this script was inadequate to record precisely the traditional pronunciation of the sacred text of the Avesta that led the Zoroastrian priests to devise the elaborate Avestan script, which, with its 48 distinct letters formed by differentiation out of the 14 used for Pahlavi, was well suited to the task. (R.E.E.)

Greek language

Greek is an Indo-European language whose history can be followed from the 14th century BC to the present day. Its documents cover a longer period of time (34 centuries) than those of any other Indo-European language. There is an Ancient phase, subdivided into a Mycenaean period (texts in syllabic script from the 14th to the 12th centuries BC) and Archaic and Classical periods (beginning with the adoption of the alphabet, from the 8th to the 4th centuries BC); a Hellenistic and Roman phase (4th century BC to 4th century AD); a Byzantine phase (5th–15th centuries AD); and a Modern phase.

Separate transliteration tables for Classical and Modern Greek accompany this article. Some differences in transliteration result from changes in pronunciation of the Greek language; others reflect convention, as for example the χ (*chi* or *khi*), which was transliterated by the Romans as *ch* (because they lacked the letter *k* in their usual alphabet). In Modern Greek, however, the standard transliteration for χ is *kh*. Another difference is the representation of β (*bēta* or *víta*); in Classical Greek it is transliterated as *b* in every instance, and in Modern Greek as *v*. The pronunciation of Ancient Greek vowels is indicated by the transliteration used by the Romans. Y (*upsilon*) was written as *y* by the Romans, indicating that the sound was not identical to the sound of their letter *i*. Modern Greek υ (*ípsilon*) is transliterated as *i*, indicating that the sound used today differs from the ancient υ. (See Tables 8 and 9 for transliterations of all the Greek letters.)

GENERAL CONSIDERATIONS

In the course of the 2nd millennium BC, groups of Greek-speaking Indo-Europeans established themselves by stages on the Greek peninsula, on most of the islands of the Aegean, and on the west coast of Anatolia; with few exceptions that is still the area occupied by the Greek language today. In the second quarter of the 1st millennium BC a vast "colonial" movement took place, resulting in establishments founded by various Greek cities all around the Mediterranean and the Black Sea, especially in southern Italy and Sicily. This extension of the linguistic area of Greek lasted only a few centuries; in the Roman period, Latin, more or less rapidly, took the place of Greek in most of these ancient colonies. "Colonial" Greek survived longest at Byzantium, as the official language of the Eastern empire.

Relationship of Greek to Indo-European. Ancient Greek is, next to Hittite, the Indo-European language with documents going furthest back into the past. At the time when it comes within view in the 2nd millennium BC, it has already acquired a completely distinct character from the parent Indo-European language. Its linguistic features place it in a central region on the dialect map that can be reconstructed for Common Indo-European; the ancient languages with which it has the most features in common are little known ones such as Phrygian or Macedonian. In the study of Indo-European dialectology, phonetic data are the most readily available and provide the most information. In this respect the position of Ancient Greek is as follows. The original Indo-European vowels of *a* and *o* quality, both short and long, remain distinct, whereas they are completely or partially confused in Hittite, Indo-Iranian, Baltic, Slavic, and Germanic. Greek is the only language that distinguishes by three different qualities (*ĕ, ă, ŏ*) the secondary short vowels resulting in certain positions from the three laryngeal sounds, $*H_1$, $*H_2$, $*H_3$, of Indo-European. (An asterisk preceding a sound or word indicates that it is not attested, but is a reconstructed, hypothetical form. For a discussion of these laryngeal sounds, see *Indo-European languages.*) Greek keeps the distinction between the original voiced stops and voiced aspirated stops of Indo-European (*e.g.,* Indo-European **d* becomes Greek *d,* and Indo-European **dh* becomes Greek *th*), whereas Iranian, Slavic, Baltic, and Celtic confuse them. Greek avoids the general shifts of stop consonants that are displayed, independently, by Armenian and Germanic, as well as the palatalization that affects guttural stops in Indo-Iranian, Armenian, Baltic, and Slavic. In these respects, Ancient Greek is conservative, as are, generally speaking, the western Indo-European languages (Italic and Celtic). On the other hand, it does show innovations. One of these, the devoicing of the original voiced stops, is shared with Italic, although it is realized in different ways (**dh*-yields Greek *th-,* Latin *f-,* Osco-Umbrian *f-*); but others are foreign to Italic: for example, the weakening of spirants and semivowels at the beginning of words before a vowel, the evolution of **s-* to *h-* (pre-Mycenaean), and **y-* to *h-* (contemporary with Mycenaean).

Comparison of the sounds of Ancient Greek with other Indo-European tongues

Morphological criteria must, of course, be taken into account in defining the position of a language. It should be noted that there are few grammatical innovations shared by Greek and Italic, apart from the extension to nouns of the pronominal ending of the genitive feminine plural *-*āsōm* (Greek *-āōn;* Latin *-ārum,* Umbrian *-aru,* Oscan *-azum*) and of the pronominal ending of the nominative masculine plural *-*oi* (Greek *-oi;* Latin *-ī*). The last innovation, however, is not shared with Osco-Umbrian, but is found instead in Germanic (in the strong declension of adjectives) and partly in Celtic. The dialectal individuality of Greek is very clearly marked in the organization of the verb (see below), which is without parallel except for an approximation in Indo-Iranian.

Greek syllabaries. Starting from a foreign script known as Linear A (used in Crete to record a native language known as Minoan), the Greeks devised, toward 1400 BC at the latest, a syllabic script to record their own language. Known as Linear B, this script was deciphered in 1952 by the British architect Michael Ventris and the British classicist John Chadwick. At present just over 100 very short Linear B inscriptions painted on vases have been found at Khaniá, Knossos, Tiryns, Mycenae, Eleusis, Orchomenus, and especially at Thebes. The major source of Linear B inscriptions are the 3,000 to 4,000 unbaked clay tablets found at Knossos (1400–1350 BC—this date has been questioned), at Thebes (probably 1350–1300 BC), and at Mycenae and Pylos (1250–1150 BC). There are no literary texts, and hardly any continuous texts (there is only a small number of real sentences); all that is currently known, and that only in part, is the accounts of the great

Mycenaean palaces and their dependencies, compiled in the Greek language.

Signs of Linear B

The Linear B syllabary consists of about 90 signs. There are signs for the vowels *a, e, i, o, u,* but these are hardly used except for initial vowels of words. There are no signs noting consonants in isolation, only signs noting consonant + vowel combinations; thus there is no sign for *t-,* but five different signs for *ta, te, ti, to, tu.* The script does not distinguish *r-* and *l-;* with the exception of *d-,* it does not distinguish between unvoiced, aspirated, and voiced stops (so the sign *ka* can be read in Greek as *ka, cha,* or *ga*). In addition, the scribes used a shorthand spelling and saved time by omissions, mainly of certain consonants (in particular, those that end syllables or words). Consequently, the spellings are often clumsy and ambiguous, such as *ka-po* for *karpos, a-re-ku-tu-ru-wo* for *alektryōn, ka-sa-to* for *xanthōi.* This inconvenient script and the nature of the documents make Mycenaean inscriptions harder to use and less rich in data than the later alphabetic inscriptions; but the information that can be gathered on the state of Greek five centuries before Homer, incomplete as it may be, is of capital importance.

Another syllabary, distantly related to Linear B, was in use in Cyprus much later (7th–3rd centuries BC) to record a native language of the island (Eteocypriot) as well as Greek.

The Greek alphabet. The Mycenaean script dropped out of use in the 12th century when the Mycenaean civilization was destroyed by the Dorian invasions. For nearly four centuries the Greeks seem to have been illiterate.

In the 8th century at the latest, starting from a Semitic model (which had separate signs for the consonants, but none for the vowels), a new system of writing was created by Greeks—the alphabet. For this purpose the list of Semitic consonants was adapted to the needs of Greek phonology, but the major innovation was the invention of five letters with the value of vowels—α(*a*), ε(*e*), ι(*i*), ο(*o*), υ(*u*). The use of the alphabet spread very quickly from east to west across the Greek world. The earliest datable inscriptions, both from around 725 BC, come from Athens (the Dipylon vase) and the colony of Ischia in the Tyrrhenian Sea (the so-called Nestor's cup).

During the period from the 8th to the 5th centuries BC, local differences caused certain details in the forms of the letters to vary from one city to another. Moreover, the primitive Greek alphabet underwent various reforms—the creation of new letters, first φ(*ph*), χ(*ch*), ξ(*ks*), and ψ(*ps*), and η(*ē*) and ω(*ō*). From the 4th century BC on, the alphabet became uniform throughout the Greek world as the result of the general adoption of the form it had taken in Asiatic Ionia.

Greek alphabetic inscriptions

Greek alphabetic inscriptions are numbered in tens of thousands: dedications, epitaphs, decrees, laws, treaties, religious rules, judicial decisions, and so forth. The majority are of Hellenistic or Roman date. The less numerous Archaic inscriptions (8th–5th centuries BC) are of particular interest for their contribution to the knowledge of the dialects (see below). It is only in Hellenistic papyri, and later in Byzantine manuscripts, that the great works of ancient literature (the originals of which have disappeared) come into view in the form of copies, some further and some less far removed from the originals.

The Greek alphabet, still in use today in Greece in the form it reached in the Hellenistic period, has enjoyed an extraordinary success as a direct or indirect model for other alphabets (notably the Latin alphabet); on it are based the writing systems employed in a great part of the modern world.

ANCIENT GREEK

History and development. Only from the 4th century BC, in the Hellenistic period, did Greek approach great unity throughout the area it covered (see below *Koine*). In the preceding ten centuries there were numerous Greek dialects, which differed in phonetic and morphological details, but which were mutually intelligible. The features shared by the local speech of different regions allow the delineation of dialect groups, of which the Greeks themselves were aware. The classifications of modern scholars modify in various ways the classifications made by the ancients, but still retain these as their basis. Among the dialects there are a West group, an Aeolic group, an Ionic-Attic group, and an Arcado-Cypriot group (the last group was neglected by the ancient Greeks because neither Arcadian nor Cypriot gave rise to a literary language). Modern scholars have never questioned the isolation of the West group, but they have tried in various ways to combine the other three into two divisions (*e.g.,* by considering Aeolic and Arcado-Cypriot as varieties of "central" Greek, or by considering Arcado-Cypriot and Ionic-Attic as varieties of "southern" Greek).

In regard to the dialects, two very different situations must be distinguished: that established for the period between the 14th and the 12th centuries BC and that for the period between the 8th and the 4th centuries BC.

In Mycenaean times the carriers of "West Greek" had not yet reached Greece; they did not irrupt into it until the end of the 2nd millennium. In continental Greece (north and south of the Isthmus of Corinth) and on certain Aegean islands (notably Crete), only varieties of Greek other than West Greek were spoken. The tablets reveal a somewhat artificial chancellery language current in the palace offices and taught as a written language in scribal schools. Based essentially on a dialect of the type that was eventually called Arcado-Cypriot, it shows great uniformity in time (during the two centuries or thereabouts covered by documents) and in space (from Knossos to Thebes). Certain fluctuations in details, however, which can be shown to vary between scribes (even at the same site and at the same date), permit the assumption that, behind this official written form of Greek, there must have been various forms of spoken Greek. The problem of the genesis of the dialects other than West Greek does not now present any provable solution.

Influence of Dorian invasions and Greek colonization

There followed two great events that upset the dialectal distribution within the Greek world. First, the Dorian invasions brought speakers of West Greek into northern Greece, then into the Peloponnese, and finally into the Aegean. Some pre-Dorian Greek populations were expelled from their homes and emigrated eastward to the west coast of Anatolia and to Cyprus. Others, who remained where they were, became more or less thoroughly Dorian in speech. It has long been thought that some of the features that Thessalian and, even more, Boeotian (both of which are Aeolic) shared in the 1st millennium with West Greek can be attributed to "recent" influences; on the other hand, some Doric dialects of the 1st millennium (*e.g.,* in Crete) show sporadic traces of features attributable to an Arcado-Cypriot substratum. The other subsequent event, which is of a different sort, was the great colonization movement that began in the 8th century BC. Each group of emigrants took with them the speech of their mother city and planted it in the new foundation. Thus there developed on the shores of southern Italy a totally new grouping of Greek dialects, side by side—Asiatic Ionic at Siris (later called Heraclea); Euboean Ionic at Rhegium and Cumae; Laconian Doric at Tarentum and Heraclea; Achaean at Sybaris, Croton, and Metapontum; Locrian at Locri Epizephyrii; and so on.

Toward the middle of the 1st millennium BC the geographical distribution of the dialects (insofar as they are known directly through inscriptions) is briefly as follows:

West Group: (1) Doric proper: Messenia, Laconia (colonies—Tarentum, Heraclea); the Argolid; the territory of Corinth (colonies—Corcyra, Anactorium, Syracuse); the Megarid (colonies—Megara Hyblaea, Selinus, Byzantium); the Sporades (colony—Cyrene); Crete; Rhodes (colonies—Gela, Acragas). (2) North-West Greek: Elis, Achaea (colonies—Ithaca, Sybaris, Croton, Metapontum); Aetolia; Phocis; Locris (colony—Locri Epizephyrii).

Aeolic Group: (1) Boeotia; (2) Thessaly; (3) Lesbos and Asiatic Aeolis.

Ionic-Attic Group: (1) Attica; (2) Euboea (colonies—Catana, Zancle, Rhegium, Cumae); (3) Cyclades; (4) Asiatic Ionia (colonies—Siris, Phocaea, foundations in Pontus [Black Sea]).

Arcado-Cypriot Group: (1) Arcadia; (2) Cyprus; (3) Pamphylia.

This linguistic situation in the first half of the 1st millennium BC resulted in literature developing on a dialect basis. The Homeric epic in the state in which it became

Literature and dialects

fixed by writing displays a mixture of Aeolic and Ionic features. Choral lyric is especially Doric in colouring. Prose developed first in Ionic surroundings (Herodotus, Hippocrates), then in Attica (Thucydides, Plato). Attic is the language of dialogue in tragedy, but alongside Attic comedy there also developed in Sicily a Doric comedy. Personal poetry employs, depending on the author, Ionic (Hipponax), Lesbian (Alcaeus, Sappho), Boeotian (Corinna), and other dialects. It was only in the Hellenistic and Roman periods that Ionic-Attic became clearly dominant, though in poetry of the later periods there were artificial imitations of the early genres.

Within the alphabetical period of Ancient Greek (8th–4th centuries BC), previous to Koine, there is no break between what is termed Archaic Greek (8th–6th centuries) and what is termed Classical Greek (5th–4th centuries). The Classical period is that in which the progressive elaboration of Archaic data brought Greek literature, as well as Greek art, to perfection.

In the linguistic subdivision of Ancient Greek the effects of substratum languages played only a minor part. In their penetration into Greece toward the beginning of the 2nd millennium BC, the Hellenic peoples found earlier populations established there, about whom Greek tradition gives only vague hints, and whose language or languages are unknown. From this "pre-Hellenic" stratum, Greek vocabulary made numerous borrowings (*kyparissos* "cypress," *pyrgos* "tower," and so on), and it received from it a number of place names (*e.g.,* Korinthos); but there is no reason to think that the divergent characters of the Greek dialects (in phonetics and morphology) could be connected with different substrata. The native "barbarian" languages also had little effect on colonial Greek in the 1st millennium, and these contacts show up only in a few local borrowings.

On the other hand, there is a connection between the facts of civilization (in the political and cultural fields) and the evolution of the language. In the Mycenaean period an evident unity of civilization and the organization in the palaces of record offices and scribal schools allowed the use of a stable and uniform chancellery language. In the first half of the 1st millennium, political subdivision and rivalry between cities allowed dialectal peculiarities to strike deep roots. The special conditions in which epic developed, however, resulted in presenting the "noble" literary genres from their inception with a model of dialect mixture. From the 5th century BC onward, the prestige of Ionic and Attic literature and the political authority of Athens opened the way to Ionic-Attic predominance, and this was eventually imposed by the Macedonian conquest.

Linguistic characteristics. *Phonology.* The phonological systems of Ancient Greek differ noticeably from one period to another and from one dialect to another. The system that has been chosen to serve as an example here is that which may be attributed to Old Attic of the 7th–6th centuries BC.

In Old Attic, there are seven vowel qualities: *i,* open and closed *e, a,* open and closed *o,* and *u,* each of which has a long and a short form, except open *e* and open *o,* which have only the long form. Diphthongs originally included *ei, ai, oi,* and *eu, au, ou,* but very soon *ei* began to evolve toward long closed *ē* and *ou* toward long closed *ō.* In addition, there is a rare diphthong *ui,* and usually at the end of words the diphthongs *-ēi, -āi, -ōi,* with preponderant first elements, which later were reduced respectively to long open *ē,* long *ā,* and long open *ō.*

The consonantal structure is characterized by relative richness in stops (sounds produced by momentary complete closure at some point in the vocal tract): unvoiced *p, t, k,* aspirated *ph, th, ch,* voiced *b, d, g;* and by few spirants: only *s* and *h* sounds (*h* restricted to initial position before a vowel). There is also a voiced affricate sound, *dz;* two liquid sounds, *l* and *r;* and two nasals, *m* and *n.* The guttural nasal is not distinctive, but is only a variant of the sound *n* in front of a guttural stop. Neither *y* nor *w* occur as distinctive sounds. All of the consonants except *h* and *dz* can be doubled between vowels. The only consonant sounds normally allowed at the end of the word are *-s, -n,* and *-r.*

Word accent

Apart from some unaccented monosyllabic or disyllabic terms of minor importance, each word is marked by a rise in the musical pitch of the voice (accent) on one of the vowels (one of the last three vowels, if the word has more than three syllables). Short vowels, if they carry the accent, have only a rising tone (noted from the Alexandrian grammarians onward by the sign of the acute accent); long vowels or diphthongs may have either a rising tone (noted by the acute accent) or a rising tone followed by a falling tone (noted by the circumflex accent). Within a phrase the vowel of a final syllable with a normally rising tone is weakened in accent (noted by the grave accent). The position and nature of the accent in the word are governed by rules so strict that they do not usually permit variations that would serve to differentiate two otherwise identical forms. There are, however, examples of such a differentiation: *oîkoi* ("houses") is a nominative plural form, and *oíkoi* ("at home"), an adverb of place; *tómos* means "a cut" and *tomós* "cutting"; and so on.

The accent (which is not associated with stress) does not play any part in the rhythm of the language. This rhythm (and that of poetry, which is a stylized form of it) is based upon the distribution in the sentence (and in the verse) of short and long syllables. For a syllable to be short, it must end in a short vowel; syllables ending in a long vowel, or closed syllables (*i.e.,* those ending in a consonant), are long. The rhythm of Ancient Greek is therefore quantitative.

Morphology. Every nominal (noun) or verbal form combines a "root" that carries the sense of the word and a certain number of grammatical markers that serve principally to define the function of the word in the phrase.

The category of gender, which differentiates masculine, feminine, and neuter, is expressed only in the substantive (noun), adjective, and pronoun. The category of person (1st, 2nd, and 3rd person) is restricted to the personal pronoun and the verb. There are three numbers—singular, dual, and plural—that are distinguished in both the noun and the verb. The survival of the dual is an archaism; although a living form in the Mycenaean period, it tends to be replaced by the plural in the 1st millennium. Attic is one of the dialects in which it is best preserved down to the threshold of the Hellenistic period.

Not counting the vocative case, the Greek declension in the Mycenaean period still contained at least six cases: nominative, accusative, genitive, dative, locative, and instrumental. Between the Mycenaean period and the 8th century the locative and the instrumental ceased to exist as living cases, their functions having been taken over by the dative.

Role of aspect in the Greek verb

The most original feature of Greek morphology is the structure of the verb system, which is determined fundamentally by the category of aspect. It is organized around three principal themes (or tenses) for each verb: the "present" theme for the durative aspect, the aorist theme for the punctual aspect, and the perfect theme for the aspect of completion. Each of these themes provides an indicative and, apart from the imperative, two nonassertive moods (subjunctive and optative). The expression of time exists only in the indicative; there is, on the one hand, a future theme, and on the other, an aorist indicative theme (which always represents past time). There are also past tenses attached respectively to the present indicative (imperfect) and to the perfect indicative (pluperfect). The past tense has as its distinguishing marks a certain set of endings, called secondary (which it shares with the optative), and the presence of a special preverb called the augment. The Greek verb has two voices (active and mediopassive), which are expressed (leaving aside the aorist passive) by the opposition of two series of endings. Finally, in each voice, complete series of participles and infinitives were established corresponding to the present, future, aorist, and perfect themes.

Syntax. A relatively free word order occurs in Greek. Above all, the creation of the definite article (post-Mycenaean and post-Homeric), and the various ways in which the nominal forms of the verb (participles and infinitives) come into play, confer on the Greek sentence a suppleness unmatched in other languages.

Vocabulary. If one considers the roots of words, it seems that, although the essential basis of the vocabulary is of Indo-European origin, a fairly considerable number of terms are borrowings. Most of these loans were taken from the idioms of the populations living in Greece prior to the arrival of the Greeks; many such words had already penetrated into Greek in the 2nd millennium, for there are forms found in Mycenaean that correspond to plant names such as *elaia* "olive," *pyxos* "box tree," and *selinon* "celery"; animal names such as *leōn* "lion" and *onos* "ass"; names for objects such as *asaminthos* "bathing tub," *depas* "goblet," and *xiphos* "sword"; and names of materials such as *elephās* "ivory," *chrysos* "gold," and *kyanos* "dark blue enamel."

The most important fact is that from the verbal and nominal roots (of whatever origin) the language extracted a vocabulary full of nuances and of great scope (by using preverbs, and by forming compounds and derived words). At all periods the lexical creativity of Greek has been very active, thus giving it a vocabulary of extraordinary richness. (M.Le.)

KOINE

The fairly uniform variety of spoken Greek that gradually replaced the local dialects after the breakdown of old political barriers and the establishment of Alexander's empire in the 4th century BC is known as the Koine (*hē koinē dialektos* "the common language"), or "Hellenistic Greek." Attic, by virtue of the undiminished cultural and commercial predominance of Athens, provided its basis; but as the medium of communication throughout the new urban centres of Egypt, Syria, and Asia Minor, it absorbed numerous non-Attic elements and underwent some degree of grammatical simplification. Numerous inscriptions enable scholars to trace its triumphant progress at the expense of the old dialects, at least as the language of business and administration, although some rural dialects are reported to have survived as late as the 2nd century AD. Other sources of information for the Koine are the translation of the Septuagint made in the 3rd century BC for the use of the Hellenized Jewish community of Alexandria, the New Testament, and the writings of a few people (*e.g.,* the historian Polybius and the philosopher Epictetus) who favoured it over Attic. As the everday colloquial language of urban Egypt it may be studied in papyri going back to the 4th century BC. The Koine may be dated very crudely from the period of Alexander's conquests in the 4th century BC to approximately the reign of Justinian in the 6th century AD.

Sound changes from Ancient Greek to the Koine

The Koine replaced the Attic sound *tt* by the *ss* characteristic of Ionic and other dialects (*e.g., glōssa* for *glōtta* "tongue") at an early date, but its main phonological significance lies in its gradual simplification of the rich vowel system of Classical Greek. Ancient *ei* (ει), *i* (ι), and *ē* (η) sounds merged as *i,* and *ai* (αι) was monophthongized to *e; oi* (οι) became pronounced as the sound symbolized by *ü,* thus merging with simple *y* (pronounced as in French *tu*). The second element of *au* (αυ) and *eu* (ευ) was changed to *v* or *f* (compare ancient *autós* to modern *aftós* "he"). These shifts, combined with the loss of length distinctions, led to a new six-term system of vowel sounds: *i, u, ü, e, o, a.* The loss of *h* also belongs to the Koine period, and there is evidence that the change of the ancient aspirates and voiced stops to fricative (spirant) sounds was well under way. As a result of this latter process, Classical *ph, th, ch* (pronounced as in English "pin," "tin," "kin") acquired the fricative articulations of "fin," "thin," and the final element of Scottish "loch," (or German *Buch*); *b, d, g* became the voiced fricative sounds *v, dh* (as in "that"), and *gh* (as in Spanish *fuego*).

Grammar too began to move in the direction of Modern Greek in this period. Nouns in consonant stems acquired the endings of the *-a* declension; *e.g., thygatēr,* "daughter," accusative *thygatera,* was remodelled after items such as *khōra, khōran* "country." The dual number was lost in nouns, verbs, and adjectives, as was the optative mood of verbs. Confusion arose between the perfect and aorist tense forms, leading to the loss of one or the other (the former in most verbs).

In vocabulary there were numerous borrowings from non-Attic dialects, and Attic words acquired new meanings; thus *opsaria* "fish" and *brechei* "it rains" for Classical Greek *ichthyes* and *hyei* both occur in the New Testament (*cf.* Modern Greek *psárya, vrékhi*).

This gradual divergence from the language of Plato and Demosthenes was viewed as a species of linguistic decadence by an influential school known as the Atticists, who unceasingly castigated the use of Koine forms by writers. It was thus that there developed a rift between the everyday spoken language and an archaizing, specifically written language. It became fashionable to publish manuals of "good usage" in which the Attic equivalents of Koine innovations were recommended for the student's imitation.

BYZANTINE GREEK

During the period of the Byzantine Empire (*i.e.,* until the fall of Constantinople in 1453) the language of administration and of most writing was firmly rooted in the Atticist tradition; it is this archaizing style that is often referred to as "Byzantine Greek." The spoken language continued to develop apace, however, and its course can be followed to some extent in the writings of the less educated chroniclers (such as Malalas, 6th century) and hagiographers. Furthermore, the increasing political and military disintegration characteristic of the last few centuries preceding the fall of Constantinople brought with it a general decline in educational level, and works appeared that reflect quite closely the colloquial language of the time, although learned and pseudolearned elements are never absent. While the differences between the *Chronicle of the Morea* (13th century), for example, and present-day spoken Greek are quite minor, Byzantium failed to produce a writer of the stature of Dante, capable of establishing once and for all the living vernacular as a worthy vehicle for great literature.

Changes occurring in the Koine

Most of the phonological and grammatical developments that separate present-day Greek from the Koine occurred during this period. The frequent misuse of the dative case of nouns shows that it went out of use in the spoken language, and the infinitive was replaced by various periphrastic constructions. (Periphrastic constructions involve the use of function words and auxiliaries.) In the early period numerous words (mostly Latin) were imported: the chronicler Malalas has (in their modern form) *pórta* "door," *kámbos* "plain," *saíta* "arrow," *paláti* "palace," *spíti* "house" (from *hospitium*), and hundreds of other borrowings, not all of which have survived. The later period is characterized by the richness of its compound words, usually from native roots. Some of these continued ancient patterns, such as that in which a modifying noun is linked to its head noun by *-o-(thalassovrákhi* "sea rock," *vunópulo* "mountain lad"*)*; but coordinative compounds of the type common today are also found (*e.g.,* Modern Greek *andróyino* "man and wife," *makheropíruna* "knives and forks"). Semantic shift was another source of innovation: *álogho* "horse," previously meant "irrational"; *skiázome* "I fear," earlier was "I am in shadow"; and (*u*)*dhén* "not," was, in Classical Greek, "nothing."

MODERN GREEK

History and development. Modern Greek derives from the Koine via the local varieties that presumably arose during the Byzantine period, and is the mother tongue of the inhabitants of the Kingdom of Greece and of the Greek majority in the Republic of Cyprus. Before the exchange of populations (1923) there were Greek-speaking communities in Turkey (Pontus and Cappadocia), and

Table 9: Modern Greek Alphabet

Greek letters			name	equivalents	approximate pronunciation
capital	lower case	combinations			
Α	α, *α**		álfa	a	b*o*ther
		αι		ai	b*e*d
		αυ		av	Sl*av*, l*augh*†
Β	β		víta	v	*v*an
Γ	γ		ghámma	g before α, ο, ου, ω and consonants other than γ, ξ, and χ; y before αι, ε, ει, η, ι, οι, υ, and υι; n before γ, ξ, and χ	*w*it, *y*et, si*ng*
		γκ		initial, g; medial, ng	*g*o, fi*ng*er
Δ	δ, ∂*		dhélta	dh; d between ν and ρ	*th*en, won*d*rous
Ε	ε		épsilon	e	b*e*t
		ει		i	*e*ven
		εϊ		eï	d*ay*
		ευ		ev	l*ef*t or r*ev*el
Ζ	ζ		zíta	z	*z*one
Η	η		íta	i	f*i*g
		ηυ		iv	*e*ven, l*eaf*
Θ	θ, ϑ*		thíta	th	*th*in
Ι	ι		ióta	i	*e*ven
Κ	κ		káppa	k	*k*in, coo*k*
Λ	λ		lámbdha	l	*l*i*l*y
Μ	μ		mi	m	*m*ai*m*
		μπ		initial, b; medial, mb	*b*aby, a*mb*ush
Ν	ν		ni	n	*n*ot
		ντ		initial, d; medial, nd	*d*og, fe*nd*er
		ντζ		ntz	chi*ntz*

Σ	σ‡		sígma	s	*s*and
Τ	τ		tav	t	*t*ie
Υ	υ		ípsilon	i initially and between consonants	*e*ven
		υι		i	*e*ven
Φ	φ, *φ**		fi	f	*f*i*f*ty
Χ	χ		khi	kh	Ger. Bu*ch*
Ψ	ψ		psi	ps	perha*ps*
Ω	ω		oméga	o	b*o*ne

*Old-style character. †Pronounced with long *a*. ‡Final, ς.

it remains the language of the Greek community of Istanbul. Certain villages in Calabria in southern Italy are also Greek-speaking. Three main varieties may be distinguished: (1) the local dialects, which may differ from one another virtually to the point of mutual unintelligibility, (2) the standard colloquial Greek spoken in all the urban centres of Greece, known as Demotic, and (3) Katharevusa (from *katharós* "pure"), a strictly literary language.

Local dialects. Of the local dialects, Tsakonian, spoken in certain mountain villages in eastern Peloponnese, is quite aberrant and shows evidence of descent from the ancient Doric dialect (*e.g.,* it often has an *a* sound for the early Greek *ā* that went to *ē* in Attic, later to *i*). The Asia Minor dialects also display archaic features (*e.g.,* Pontic *e* for ancient *ē* in certain word elements). It is not certain whether southern Italian Greek represents a survival from ancient times or was reimported there during the Byzantine period. Apart from these peripheral varieties, the modern dialects may be grouped for practical purposes as follows:

Divisions of the modern dialects

1. Peloponnesian, differing but slightly from the dialects of the Ionian isles, forms the basis of standard demotic. It shows very few specifically local innovations in its phonology, although its verb morphology is less conservative than that of the island dialects.

2. Northern dialects, spoken on the mainland north of Attica, in northern Euboea, and on the islands of the northern Aegean, are characterized by their loss of unstressed *i* and *u* and the raising of unstressed *e* and *o* sounds to *i* and *u.* Thus, standard *kotópulo* "chicken" becomes *kutóplu, émine* "he stayed" becomes *émni.* They also mark certain 1st and 2nd person plural past tense verb forms with *-an* (*ímastan* "we were," Athenian *ímaste*) and use the accusative for indirect object pronouns in instances in which the southern dialects have the genitive (*na se pó* "let me tell you," standard *na sou pó*).

3. Old Athenian was spoken in Athens itself until it became the capital of the modern state (1833), and on Aegina until early in the 20th century; it survives in Megara and in the Kími district of central Euboea. Its salient feature is the replacement of the Byzantine *ü* sound (from ancient *y, oi*) by *u* rather than normal *i;* it changes the *k* sound before the vowels *e* and *i* to *ts* and fails to contract the vowels *i* and *e* to a *y* sound before vowels (ancient *sykéa* becomes *sutséa* "fig tree," standard *sikyá*).

4. Cretan softens *k* to a *č* sound (as in "church"), *kh* to *š* (as in "she") before *i* and *e,* and *y* to *ž* (as the *s* in "pleasure")—*e.g., če* "and," *šéri* "hand," *žéros* "old man," standard *ke, khéri, yéros.*

5. The southeastern dialects of Cyprus, Rhodes, Chios, and other islands in the area soften *k* to *č* as in Crete, drop voiced fricative consonants between vowels, and retain the ancient final *-n* (*láin* "oil," standard *ládhi*). They also retain the contrast between long and short consonants (*fíla* "kiss!" but *fílla* "leaves"). As is done in Cretan and Old Athenian, they add *gh* to the *-ev-* that occurs at the end of many verb stems (*dhulévgho* "I work").

Demotic. Demotic is the language used for everyday conversation in the towns of mainland Greece, and is understood without difficulty by all speakers. Differences within the Demotic form as it is spoken in the various parts of the country are so minor that it may be regarded as the standard spoken language. In all essential respects its phonology and grammar follow average Peloponnesian practice, but it has absorbed a vast number of vocabulary items from learned sources. It is also used as the vehicle of poetry and, since the beginning of the 20th century, of fiction, although, except for certain genres such as drama and detective novels, the spoken language is not necessarily reproduced with any fidelity. Indeed, one may speak of a specifically literary demotic that differs from the spoken language in its extensive use of words culled from local dialects, its fondness for innovation in compound formation, and its somewhat eclectic verb morphology.

Use of Katharevusa

Katharevusa. Katharevusa is the purist, archaizing written language of administration; it is also used in technical publications, newspapers, and public notices. Its role in education has varied with the policies of successive governments; since 1967 it has been the official language of education beyond the elementary school. Although the concept of a distinctive written language based on earlier usage goes back to the Atticists, Katharevusa originated in the 19th century as a result of the effort to purify the local dialects of foreign elements and to systematize their morphology (inevitably on the Classical Greek model). Thus, Katharevusa is characterized by its exclusive use of Ancient Greek roots and much Classical inflection, while its syntax and idiom differ but slightly from those of Demotic (this is true, at least, of the "simple Katharevusa" current in today's newspapers and periodicals). Katharevusa elements abound in Demotic often with a specialized role; for example, *édhra* (from the Ancient Greek word for "chair") means "professorial chair," the Demotic word for "chair," *karḗkla,* being the term for the article of furniture. Many Katharevusa terms appear almost exclusively in print: *zíthos* "beer" and *ínos* "wine" are common in advertisements, but everyone says *bíra* and *krasí.* Words of Katharevusa origin often show ancient inflections: *kathiyitís* "professor" has the vocative form *kathiyitá, fititís* "student" is in the plural *fitité (cf.* Demotic *traghudhistís* "singer," plural *traghudhistés, traghudhistádhes).* Because of its use in newspapers and news bulletins, most Greeks have a good passive knowledge of Katharevusa and it is easily accessible to foreigners with reasonable competence in the classical language.

Linguistic characteristics. *Phonology.* Modern Greek has five distinct vowel sounds (*i, e, a, o, u*) and the glide *y,* most of which are indicated in Greek orthography in more than one way. The consonant sounds are:

Voiceless stops	*p*	*t*		*k*
Voiced stops	*b*	*d*		*g*
Voiceless fricatives	*f*	*th*	*s*	*kh*
Voiced fricatives	*v*	*dh*	*z*	*gh*
Nasals	*m*	*n*		
Liquids	*l*	*r*		

The sounds *f, th,* and *kh* derive from ancient aspirated consonants, and the voiced fricative sounds *v, dh,* and *gh* from *b, d,* and *g.* Modern *b, d,* and *g* are usually created by the voicing of *p, t,* and *k* after nasals; thus Ancient Greek *pénte* "five" becomes *pénde.* These also occur at the beginning of words in place of ancient nasal + stop sequences (*boró* "I am able" from *emporó*). Other important combinatory changes linking Ancient and Modern Greek include the following: (1) Ancient stop clusters and aspirate clusters both become fricative + stop; *e.g., hepta* "seven," *oktō* "eight," *ophthalmos* "eye" become *eftá, okhtó, ftarmós* ("evil eye"). (2) Double consonants are simplified except in the southeast, thus *thalassa* becomes *thálasa* "sea." (3) Nasal sounds assimilate to following fricative sounds; thus *nymphē* becomes *níffi* and then (except in the southeast dialects) it changes to *nífi* "bride." (4) The sound *l* is replaced by *r* before consonants; *e.g., adelphos* becomes *adherfós* "brother." (5) Before a vowel, *i* and *e* change to *y;* thus *paidia* becomes *pedhyá* "boys," *mēlea* becomes *milyá* "apple tree." Except for the simplification of double consonants, these statements do not apply to words of Katharevusa origin. Thus in *simfonía,* meaning "symphony" or "agreement," statements (3) and (5) are violated (the true Demotic form would be *sifonyá*).

Stress in Modern Greek

Modern Greek has dynamic stress (as in English) and not the ancient musical accent, so that while words may be distinguished by stress placement (*fíli* "friends," *filí* "kiss"), the old distinction between grave, acute, and circumflex is lost (but still represented in written accents).

Grammar. Much of the inflectional apparatus of the ancient language is retained in Modern Greek. Nouns may be singular or plural—the dual is lost—and all dialects distinguish a nominative (subject) case and accusative (object) case. A noun modifying a second noun is expressed by the genitive case except in the north, where a prepositional phrase usually replaces this. The indirect object is also expressed by the genitive case (or by the preposition *se* "to," which governs the accusative, as do all prepositions). Thus:

o yatrós	*ípe tin istoría*	*s ton adherjó tiz dhasḱlas*
"The doctor	told the story	to the brother of the teacher"
(nominative)	(accusative)	(genitive)

The ancient categorization of nouns into masculine, feminine, and neuter survives intact, and adjectives agree in gender, number, and case with their nouns, as do the articles (*o* "the," *enas* "a"). In general, pronouns exhibit the same categories as nouns, but the relative pronoun *pu* is invariant, its relation to its own clause being expressed when necessary by a personal pronoun in the appropriate case: *i yinéka pu tin ídhe to korítsi* "the woman *pu* her saw the girl" (*i.e.,* "the woman whom the girl saw").

The verb is inflected for mood (indicative, subjunctive, imperative), aspect (perfective, imperfective), voice (active, passive), tense (present, past), and person (1st, 2nd, 3rd, singular and plural). The future is expressed by a particle *tha* (from earlier *thé[o] na* "[I] want to") followed by the subjunctive. There are also two participles, an indeclinable present active one in *-ondas,* which is confined to certain individual usages (*tróghondas érkhete i óreksi* "in eating comes the appetite"), and a past passive one in *-ménos (kurazménos* "tired"*).* Formally, the finite forms of the verb (those with personal endings) consist of a stem + (optionally) the perfective aspect maker (*-s-* in active, *-th-* in passive) + personal ending (indicating person, tense, mood, voice). Past forms are prefixed by *e-* (the "augment"), although this is usually lost in mainland dialects when unstressed. In the active, the present endings are *-o, -is, -i, -ume, -ete, -un*(e) (*-usi* in southeast dialects), and the past endings are *-a, -es, -e, -ame, -ate* (Peloponnesian, standard, elsewhere *-ete*), *-an(e).* In both active and passive paradigms only six tenses are distinguishable in pronunciation. The active forms of "you (singular) write," for example, are:

	Present	Past	Imperative
Imperfective	(1) *ghráfis*	(3) *éghrafes*	(5) *ghráfe*
Perfective	(2) *ghrápsis*	(4) *éghrapses*	(6) *ghrápse*

Ghráfis "you write" represents both the present indicative and imperfective subjunctive; *ghrápsis* "you (may) write" is the perfective subjunctive, and *éghrafes* and *éghrapses* are the imperfect indicative "you were writing" and the preterite "you wrote," respectively.

Aspect in Modern Greek

Aspectual differences play a crucial role. Roughly, the perfective marker indicates completed, momentary action; its absence signifies an action viewed as incomplete, continuous, or repeated. Thus the imperfective imperative *ghráphe* might mean "start writing!" or "write regularly!" while *ghrápse* means rather "write down!" (on a particular occasion). Compare also *tha ghrápho* "I'll be writing" but *tha ghrápso* "I'll write" (once). The difference is sometimes represented lexically in English: *ákuye* "he listened" and *ákuse* "he heard." The passive forms are largely confined to certain verbs active in meaning like *érkhume* "I come," *fováme* "I am afraid," and reciprocal usages (*filyóndusan* "they were kissing"). There are also phrasal constructions representing completed action: *ékho ghrápsi* "I have written" (standard), *ékho ghramméno* (in most dialects). These are, however, much rarer than the corresponding English perfect forms. There is no infinitive; ancient constructions involving it are usually replaced by *na* (from ancient *hína* "so that") + subjunctive. Thus *thélo na ghrápso* "I want to write," *borí na ghrápsi* "he can write." Indirect statement is introduced by *oti* or *pos* (*léi oti théli* "he says that he wants").

Vocabulary. The vast majority of Demotic words are inherited from Ancient Greek, although quite often with changed meaning; *e.g., filó* "I kiss" (originally "love"), *trógho* "I eat" (from "nibble"), *kóri* "daughter" (from "girl"). Many others represent unattested combinations of ancient roots and affixes; others enter Demotic via Katharevusa: *musío* "museum," *stikhío* "element" (but inherited *stikhyó* "ghost"), *ekteló* "I execute." In addition, there are over 2,000 words in common use drawn from Italian and Turkish (accounting for about a third each), and from Latin, French, and, increasingly, English. The Latin, Italian, and Turkish elements (mostly nouns) acquire Greek inflections (from Italian *síghuros* "sure," *servitóros* "servant," from Turkish *zóri* "force," *khasápis* "butcher"), while more recent loans from French and English remain unintegrated (*spór* "sport," *bár* "bar," *asansér* "elevator," *futból* "football"). (B.E.N.)

Italic languages

Italic languages, in a broad sense, are certain Indo-European languages that were once spoken in the Apennine Peninsula (modern Italy) and in the eastern part of the Po Valley. These include the Latin, Faliscan, Osco-Umbrian, and Venetic languages, which have in common a considerable number of features that separate them from the other languages of the same area—*e.g.,* from Greek and Etruscan. (In a more narrow sense, the term Italic languages excludes Latin and denotes only Oscan, Umbrian, Faliscan, and Venetic.)

For a long time the Italic languages have been considered to be an Indo-European subfamily like Celtic, Germanic, or Slavic. Today, some scholars are inclined to distinguish within the so-called Italic branch at least three independent members of the Indo-European family: Latin (perhaps with Faliscan), Osco-Umbrian, and Venetic. They attribute the similarities—*i.e.,* the unifying phenomena in the division—to a convergence that took place when the speakers of these different idioms were integrated into the "Italic" civilization of the early first millennium BC. The culture that resulted is known as the "Etruscan koine." Figure 4 shows the assumed distribution of languages in ancient Italy; the solid line marks the Italic languages.

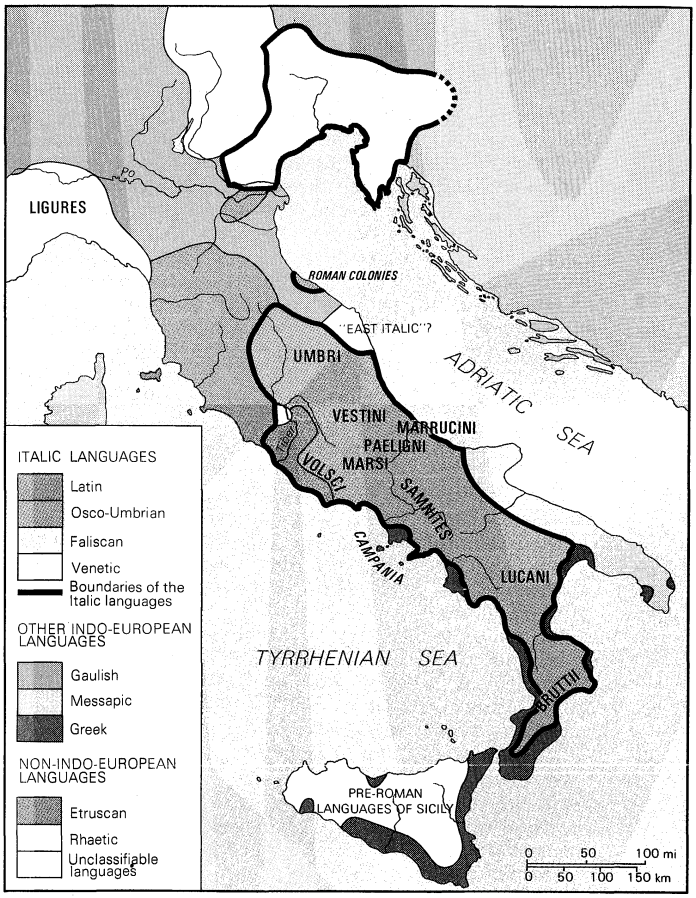

Figure 4: Supposed language areas of the Italic and neighbouring languages about 250 BC.

Languages of the group. *Latin.* Latin is the language of Latium and of Rome; its earliest known documents date from the 6th century BC. Rich epigraphical evidence and an extensive literature begin at the end of the 3rd century BC, at the time when Roman Latin was emerging as the predominant language of Italy. By AD 100 at the latest, Latin had effaced all the other dialects between Sicily and the Alps, with the exception of Greek in the colonies of Magna Graecia. (For more information about Latin and about the languages that derive from it, see below *Romance languages.*)

Spread of Latin on the Italian peninsula

The other Italic languages, Italic languages in the narrow sense, are known through local and personal names transmitted by Greek and Roman sources, and especially from inscriptions.

Oscan. Before Latin spread out, Oscan was the most widely spoken group of dialects of the Apennine Peninsula.

It was used by the Samnites in Samnium and Campania; by the inhabitants of Lucania and Bruttium; and, with slight variations, by smaller tribes between Latium and the Adriatic coast: the Volsci, Marsi, Paeligni, Vestini, and Marrucini. The legendary Sabines, who shared the earliest history of Rome, probably also spoke an Oscan dialect. The most important Oscan texts come from Campanian cities. The largest text, a treaty between Nola and Abella, is carved on a stone slab, called the Cippus Abellanus. In Bantia, a nearly unknown town of Lucania, the Tabula Bantina is preserved, the most extensive Oscan inscription. It is a bronze tablet with penal laws concerning municipal administration, written in Latin letters not earlier than 80 BC.

Umbrian. The Umbrian idiom, closely related to Oscan, is known from a few small inscriptions and from the Tabulae Iguvinae (Iguvine Tables), which consist of seven bronze tablets found at Gubbio (the ancient Iguvium). Constituting one of the largest and most important epigraphical documents of antiquity, the tablets contain ritual regulations of a sacred brotherhood to which a considerable part of the public cults of Iguvium was delegated. The Tabulae Iguvinae were incised, partly in the Umbrian alphabet and partly in Latin letters, within the last two centuries before Christ, but the text itself may result from a far more remote oral tradition.

Faliscan. Faliscan inscriptions appear only in the immediate surroundings of Falerii (the present Cività Castellana in central Italy), which, except for its dialect, seems to have been a completely Etruscan city.

Venetic. The language represented by inscriptions from the territory of the Veneti—between the Po River, the Carnic (Carniche) Alps, and Istria—is called Venetic. The majority of discoveries come from sanctuaries at Este and Làgole di Calalzo.

Alphabets

The alphabets used for writing these languages include the Greek one in Bruttium and Lucania and the Latin alphabet and various derivations of the Etruscan alphabet in the other regions. Four "national" scripts are distinguished: Oscan, Umbrian, Faliscan, and Venetic (see Figures 5–8).

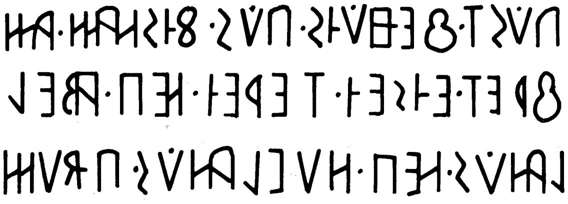

Figure 5: *Oscan.*
Inscription from the Cippus Abellanus: *púst feihúis.pús. fisnam.am/fret.eísеí.tereí.nep.abel/lanús.nep.núvlanús. pidum/ . . .* [*ú represents o*]. (Latin *Post muros qui fanum circumdant, in eo territorio neque Abellani neque Nolani quicquam* [*aedificaverint*].) "Behind the walls which go around the sanctuary,—in this area neither the inhabitants of Abella nor the inhabitants of Nola [are allowed to construct] anything."

Origin of the Italic languages. The Italic languages must have been brought from the original area of the Indo-European languages, probably in eastern parts of central Europe, when their speakers crossed the Alps. This is attested to by a stratum of very old placenames of non-Indo-European origin—*e.g.,* Tarracina, Capua, Tarentum—that covers not only the Apennine Peninsula but also Greece and Anatolia. This stratum is ascribed to a "Mediterranean" language believed to have dominated large parts of the ancient world before the arrival of the Indo-European peoples. Nothing is known about the date, the path, and the circumstances of the above-mentioned immigration, and none of the many attempts to combine archaeological evidence with linguistic prehistory has led to convincing results. Thus, the only resources available for studying the Italic languages are exclusively linguistic methods of comparative philology.

Phonology. Many of the phonetic processes that make the reconstructed Indo-European language differ from the attested Italic languages seem to have occurred rather late in time. The only one that can confidently be placed outside of Italy—that is, before the immigration over the Alps—is the change to *ss* of the combinations of the dental occlusive (stop) plus *t*. This is a common feature of Celtic, Germanic, and Latin. For example, Latin *visus* comes from the older, reconstructed form **wissos* "seen"; this is cognate with High German *gi-wiss* "surely known" and the Indo-European term with $d + t$, **widto-s.* Similarly, Oscan *nessimo-* "next" is the form equivalent to Welsh *nessaf* and Indo-European **nedh-t*(*e*)*-mo-*(An asterisk [*] before a word means that it is not attested, but reconstructed.)

The representation of the Indo-European labiovelar stop k^w is more complex. (A labiovelar stop is a sound pronounced with simultaneous articulation—movement—of the lips and the velum, the soft palate.) From this sound there has resulted a *qu* in Latin, *p* in Osco-Umbrian, *c* in Irish, and *p* in Brythonic Celtic; *e.g.,* Latin *quis* "who" is cognate with Oscan *pis* and with Indo-European *k^w *is;* and Irish *cia* is related to Welsh *pwy,* "who," which is cognate with Indo-European *k^w*ei.* Some scholars have tried to trace this development back to an Italo-Celtic unity, but the change of Brythonic k^w to *p* is surely later than the dropping of the *p* in Common Celtic. It is sounder, therefore, to assume independent processes in the different languages.

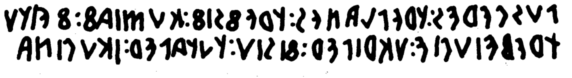

Figure 6: *Umbrian.*
Passage from the Tabulae Iguvinae: *pus veres treplanes tref sif kumiaf feitu/trebe iuvie ukriper fisiu tutaper ikuvina* [*u* represents *u* and *o*, *k* represents *k* and *g*]. (Latin *Post portam Trebulanam tres sues gravidas facito Trebo Iovio pro arce Fisia, pro civitate Iguvina.*) "Behind the Trebulan gate he shall sacrifice three pregnant sows to [the god] Trebus Iovius, for the Fisian citadel, for the state of Iguvium."

Other features developed in Italy itself—*e.g.,* the use of the voiceless dental spirant (fricative) *f* that is shared with Etruscan and is lacking in marginal districts of Venetic. In all Italic languages this *f* sound replaced the Indo-European voiced aspirated sounds in initial position. The latter are represented as *bh, dh,* g^wh and are pronounced with a small puff of air after the *b, d,* g^w. Examples of the use of *f* in Italic are as follows: Latin *frater* "brother" = Umbrian *frater* = Indo-European **bhrātēr;* Latin *facio* "I do, make" is related to Oscan *fakiiad* "he should do," to Venetic *fagsto* "he made," and to Indo-European **dhə-k-.* A more recent common process in Latin and Osco-Umbrian is the use of the full system of five short vowels in initial syllables only; short vowels of noninitial syllables in Latin became less open—*e.g., facio* "I do, make," but *in-ficio,* the compound of *in + facio.* In Osco-Umbrian these vowels tend to be lost completely—*e.g., benust* "he will have come," but *cebnust* "he will have come near." Some differences between Latin and Osco-Umbrian probably arose during the last centuries before Christ—*e.g.,* Osco-Umbrian *ō* changed to *u* (*duunated,* Latin *dōnavit* "he gave, has given"), *ē* became *i* (*ligud,* Latin *lēge* "law" in the ablative singular), and final *ā* developed into *o* (*viú* [ú in the Oscan national alphabet = o], Latin *via* "way"). Indo-European voiced aspirated sounds (*bh, dh,* g^wh) in internal position probably first became voiced spirants (*e.g.,* sounds such as *v*) in all Italic languages and, later, voiced stops in Latin and Venetic and the voiceless spirant *f* in Osco-Umbrian and Faliscan. Examples of these changes

The *f* sound

Figure 7: *Faliscan.*
Inscription on a bowl: *foied.uino.pipato.cra.carefo.* (Latin *Hodie vinum bibam, cras carebo.*) "Today I shall drink wine, tomorrow I shall have nothing."

are the voiced stop *b* in Latin *liberi* "(free) children" and Venetic *louderobos* "children" (in the dative plural) and the voiceless spirant *f* in Oscan *loufro-* "free" and Faliscan *loferta* "freed woman." The Oscan development is shown by early coins: the Greek form *allibanōn* was used for the inhabitants of the town that later was called Allifae, thus the sound *b* (later *v*), written as Greek beta, corresponding to roman *b*, became *f.*

Morphology. In contrast to the phonology, which shows so many correlations among the Italic languages, there are few definite connections between these tongues in their grammars. An innovation, probably to be ascribed to relatively recent contact between Latin and Osco-Umbrian, is the extension of the ablative singular case from *o*-stems and pronouns, where it occurred originally, to other declension classes: Latin *praidad* "with the plunder," later *praeda, meretod* "by merit," Oscan *toutad* "by the people," *slaagid* "of the border." Many of the morphological features common to Osco-Umbrian and Latin are shared by other Indo-European languages; that is, they are not Italic in a specific sense. For example, the *a*-subjunctive—*e.g.,* Latin *faciat* "may he do" and Oscan *fakiiad*—is also Celtic; passive endings in *-r*—*e.g.,* Oscan *vincter* and Latin *vincitur* "he is conquered"—are found in Celtic, Hittite, and Tocharian as well. More important are the discrepancies. For example, the genitive singular of *o*-stems shows *-ī* in Latin, Faliscan (perhaps also in Venetic), and in the Celtic languages, but *-eis* in Osco-Umbrian; the nominative plural of the same class is marked by *-oi* in early Latin, Celtic, and Greek but by *-ōs* in Osco-Umbrian, Germanic, Sanskrit, and other languages. In addition, the perfect stems of secondary verbs (verbs derived from nouns or from other verbs) are formed by *-u-* or *-v-* in Latin, by *-t(t)-* in Oscan, and by *-s-* in Venetic; *e.g.,* Latin *donavit* "he has given" = Oscan *duunated* = Venetic *donasto.*

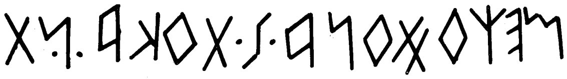

Figure 8: *Venetic.*
Inscription on a capital serving as pedestal of a votive statue found at Este: *mego donasto kanta.* (Latin *Me donavit Canta.*) "Canta gave me" ("to the goddess" is understood).

Vocabulary. Lexical comparison leads to more specific data about the history of the Italic languages. There are linguistic boundaries called isoglosses that may date back to pre-Italic history: *e.g.,* Oscan *humuns* "men" derives from the same word as *homines* and Gothic *gumans;* and Oscan *anamum* "mind" in the accusative singular form is directly related to Latin *animus* "mind, soul" and Irish *anam* "soul." There are many old differences between Latin and Osco-Umbrian. Latin *ignis* "fire" = Sanskrit *agni,* but Umbrian *pir* "fire" = Greek *pŷr* = Old English *fyr;* Latin *aqua* "water" = Gothic *ahwa,* but Umbrian *utur* "water" = Greek *hydōr* = Old English *wæter;* Latin *filius, filia* "son, daughter," but Oscan *puklo* "son" = Sanskrit *putra,* and Oscan *futir* "daughter" = Greek *thygatēr* = Gothic *dauhtar.* Adjectives of totality in Latin are *omnis, cunctus, totus,* in Osco-Umbrian *sollo-, sevo-, allo-* (cognate to English "all").

Certain lexical fields that reflect the acquisition of the Mediterranean culture show an independent terminology. The following forms strongly suggest that Latin and Osco-Umbrian speakers were not in contact with each other when they began to build cities: Latin *porta* "gate," Oscan *veru* "gate"; Latin *arx* "citadel," Umbrian *ocar* "citadel, castle"; Latin *moenia* "walls, ramparts," *murus* "wall," Oscan *feihúss* (accusative plural) "walls." On the other hand, Latins and Osco-Umbrians adopted the same terms for "write" and "read"; Latin *scribere* "to write," Oscan *scriftas* "written"; Latin *legere* "to read," Paelignian (an Oscan dialect) *lexe* "you will read." It is known that the Latin and Osco-Umbrian alphabets are derived from the Etruscan one; the spread of these terms can, therefore, be attributed to a period of Etruscan predominance. Etruscan features are obvious in archaic Italic religion; Osco-Umbrians and Veneti adopted even the Etruscan word for "god"—*ais.* Perhaps it is not by chance that many religious terms show a close community among Italic peoples; *e.g.,* the Latin forms *pius* "pious, obedient" and *piare* "to honour with religious rights" are equivalent to Volscian *pihom* (neuter singular) and Umbrian *pihatu* (imperative); Latin *feriae* "religious days" is related to Oscan *fiisiais* (ablative plural); and Latin *sacer* "sacred," *sacrare* "to consecrate, dedicate," *sanctus* "consecrated" are cognates with Oscan *sakrid* (ablative singular), *sakrafir* (subjunctive passive), *saahtum* (neuter singular).

Etruscan influence

The Etruscan supremacy ended with the foundation of local republics in Rome and in other cities of Italy in about 500 BC; when that occurred, the unifying force of Etruscan culture lost its influence. Early republican terminology developed independently; *e.g.,* Latin *consul* "consul," but Oscan *meddix* designate the first magistrate; to Latin *senatus* "senate" corresponds Oscan *kumparakineis* (genitive singular), and to Latin *comitia* "assembly," the Oscan forms *comono* or *kumbennieis.* The last period of Italic language history is characterized by an increasing influence of Roman models. For example, the title *censor* "censor" seems to have been borrowed by the Samnites in the 3rd century BC; Oscan *ceus* "citizen" is a Latin loanword that stems from a form **ceuis,* which existed in about 200 BC and was intermediate between *ceivis* and *civis;* Oscan *aidil* and *kvaisstur* imitate Latin *aedilis* and *quaestor,* terms for offices in the Roman government; and the Veneti adopted the Roman word for "freed man," *libertus.* In addition, the Tabula Bantina slavishly copied the juridical style and terminology of the Romans.

(J.U.)

Romance languages

The Romance languages, all derived from Latin within historical times, form a subgroup of the Italic branch of the Indo-European language family (see above *Italic languages*). The major languages of the family include French, Italian, Spanish, Portuguese, and Romanian; among the Romance languages that now have less political or literary significance or both are the Occitan and Rhaetian dialects, Catalan, Sardinian, and Dalmatian (extinct), among others. Of all the so-called families of languages, the Romance group is perhaps the simplest to identify and the easiest to account for historically. Not only do Romance languages share a good proportion of basic vocabulary—still recognizably the same in spite of some phonological changes—and a number of similar grammatical forms, but they can be traced back, with but few breaks in continuity, to the language of the Roman Empire. So close is the similarity of each of the Romance languages to Latin as currently known from a rich literature and continuous religious and scholarly tradition that virtually no one doubts the relationship. For the layman, the testimony of history is even more convincing than the linguistic evidence; Roman occupation of Italy, the Iberian Peninsula, Gaul, and the Balkans accounts for the "Roman" character of the major Romance languages. Later colonial and commercial contacts with parts of the Americas, of Africa, and of Asia readily explain the French, Spanish, and Portuguese still spoken in those regions.

The Roman origins of Romance

The name Romance indeed suggests the ultimate connection of these languages with Rome: the English word is derived from a French form of Latin Romanicus, used in the Middle Ages to designate a vernacular type of Latin speech (as distinct from the more learned form used by clerics) as well as literature written in the vernacular. The fact that the Romance languages share features not found in contemporary Latin textbooks suggests, however, that the version of Latin they continue is not identical with that of Classical Latin as known from literature. Nonetheless, although it is sometimes claimed that the other Italic languages (the Indo-European language group to which Latin belonged, spoken in Italy) did contribute features to Romance, it is fairly certain that it is specifically Latin itself, perhaps in a popular form, that is the precursor of the Romance languages.

Distribution of the Romance languages

By the early 1980s, at least 550,000,000 people claimed a Romance language as their mother tongue. To this number may be added the not-inconsiderable number of Romance creole speakers (a creole is a simplified or pidgin form of a language that has become the native language of

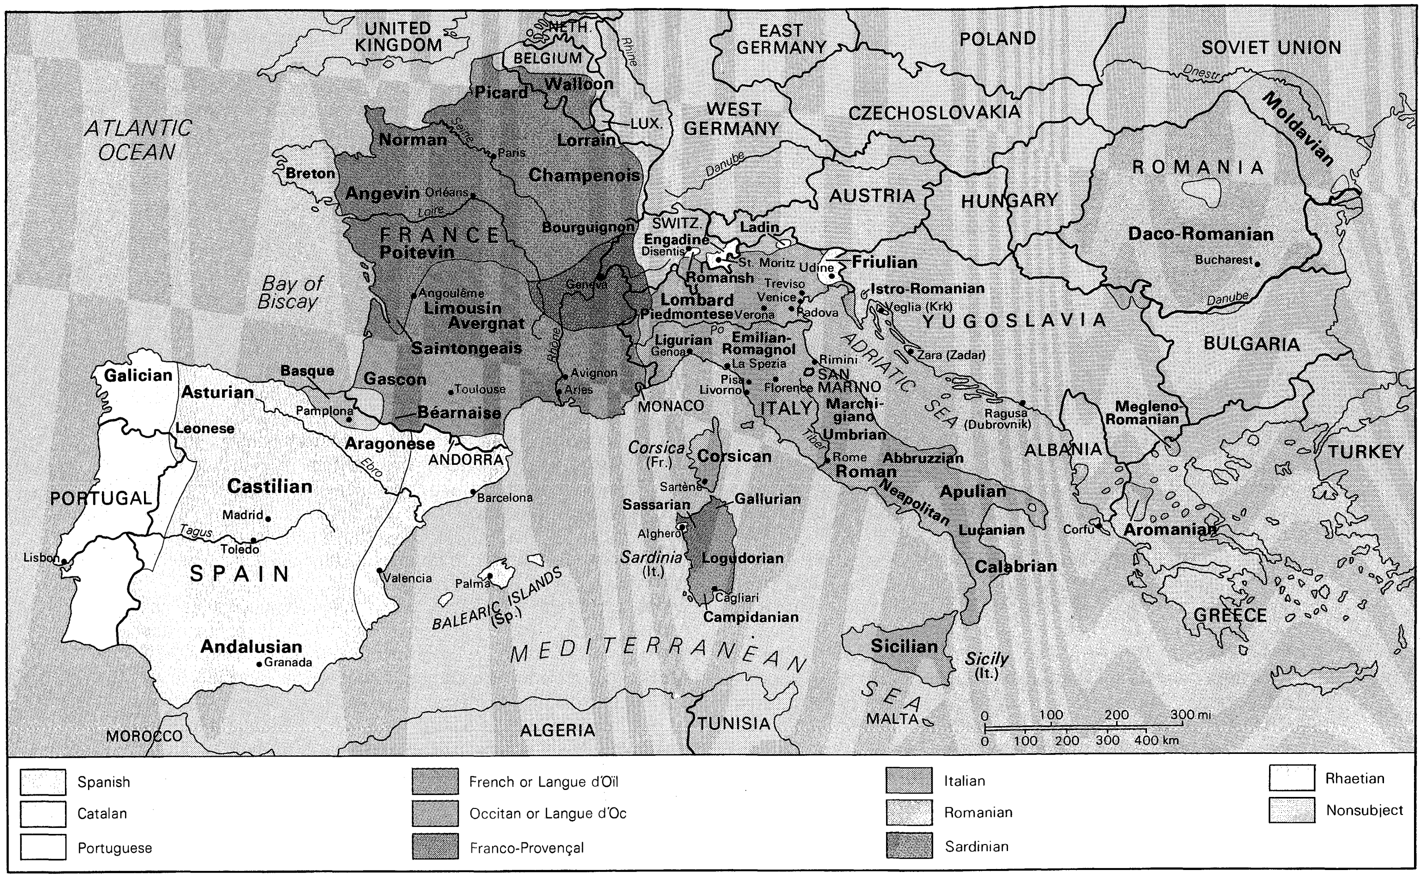

Figure 9: Distribution of Romance languages in Europe.

a community) scattered around the world. French creoles are spoken in the West Indies (with about 5,700,000 speakers), in North America (*e.g.*, Louisiana), and islands of the Indian Ocean (*e.g.*, Mauritius, Réunion, the Seychelles); Portuguese creoles in Africa, India, and Malaysia (probably fewer than 300,000 speakers); and Spanish creoles in the West Indies (more than 240,000 speak Papiamento) and the Philippines. Many speakers use creole for informal purposes and the standard language for formal occasions. Romance languages are also used formally in some countries where one or more non-Romance languages are used by most speakers for everyday purposes. French, *e.g.*, is used alongside Arabic in Tunisia, Morocco, and Algeria; it is the official language of 13 countries in West and Equatorial Africa and of the Malagasy Republic (Madagascar). Portuguese is the official language of Angola, Mozambique, and Guinea-Bissau; Italian is widely used in Somalia.

French is still widely used today as a second language in many parts of the world. Although its influence has waned before the growing popularity of English as an international language, it is still used by more than a third of the delegations at the United Nations; the wealth of French literary tradition, its precisely formulated grammar bequeathed by 17th- and 18th-century grammarians, and the pride that Frenchmen feel in their language may ensure French a lasting importance among languages of the world. By virtue of the vast territories in which Spanish and Portuguese hold sway, they will continue to be of prime importance. The beauty of the Italian language, associated with Italy's great cultural heritage, assures its popularity among students, even though territorially it has comparatively little extension. Some lesser Romance languages, such as Catalan and Romanian, retain their vitality, but others, such as Sardinian and the Rhaetian and Occitan dialects, are surely doomed to the extinction that has already overtaken a number of Romance tongues.

LANGUAGES OF THE FAMILY

Distinguishing languages and dialects

What constitutes a language, as distinct from a dialect, is a vexing question, and opinion varies on just how many Romance languages are spoken today: estimates range between five and 11. The political definition of a language—one that is accepted as standard by a nation or people—is the least ambiguous one; according to this definition, French, Spanish, Portuguese, Italian, and Romanian are certainly languages and possibly also Romansh (a national language of Switzerland since 1938 but probably related to other Rhaetian dialects spoken in Italy) and Catalan (the official language of Andorra but also widely used in parts of Spain and France). On linguistic grounds Sardinian (not the language of an independent nation since the 14th century) and Occitan (the medieval Provençal) are usually regarded as languages rather than dialects, though in modern times Occitan has grown so near to French as to be intelligible to French speakers with comparative ease. The Rhaetian dialects of Italy (Ladin in the Dolomites and Friulian around Udine) are usually regarded as non-Italian. Sicilian is different enough from northern and central Italian dialects to be given separate status often, but in Italy all neighbouring dialects are mutually intelligible, with differences becoming more marked with geographical distance. Franco-Provençal (the name given to a group of dialects spoken around the Alpine region of France and Italy) is often also assumed to be a different language from both French and Occitan, though some think it is merely a transitional dialect. Only a few persons know it in France today, though it still survives in the Italian Valle d'Aosta (where French, rather than Italian, remains the language of culture).

Judeo-Spanish

Judeo-Spanish is normally regarded not as an independent language but as an archaic form of Spanish preserving many features of the Castilian of the 15th century, when the Jews were expelled from Spain. There are possibly about 200,000 speakers, mostly originating in the Balkans and Asia Minor but, since World War II, scattered around the world; about 11,000 speakers now reside in Israel, and many live in New York City and Buenos Aires.

Some linguists believe that creoles are often different languages from their metropolitan counterparts; Haitian, for instance, is said to be mutually unintelligible with

French. Intelligibility varies so much with the speaker and the hearer, however, that it is difficult to formulate firm criteria on this basis.

The Dalmatian dialect

Many Romance dialects have virtually ceased to be spoken in the last century. Of these, Dalmatian is the most striking, its last known speaker, one Antonio Udina, having been blown up by a land mine in 1898. He was the main source of knowledge for his parents' dialect (that of the island of Veglia, or Krk), though he was hardly an ideal informant; Vegliot Dalmatian was not his native language, and he had learned it only from listening to his parents' private conversations. Moreover, he had not spoken the language for 20 years at the time he acted as an informant, and he was deaf and toothless as well. Most of the other evidence for Dalmatian derives from documents from Zara (modern Zadar) and Ragusa (modern Dubrovnik) dating from the 13th to 16th centuries. It is possible that, apart from isolated pockets, the language was then replaced by Croatian and, to a lesser extent, by Venetian (a dialect of Italian). It is certain, even from scanty evidence, that Dalmatian was a language in its own right, noticeably different from other Romance languages and presenting difficulties of classification.

On the Istrian Peninsula of the Yugoslav mainland close to the island of Veglia, another Romance language precariously survives (5,000 speakers); known as Istriot, it may be related to Vegliot, though some scholars dispute this and connect it with Rhaetian Friulian dialects or with Venetian dialects of Italian; others maintain that it is an independent language. There are no texts except those collected by linguists. A little farther north in the same peninsula, another Romance dialect, Istrio-Romanian, is threatened with extinction (fewer than 1,000 speakers). Usually classified as a Romanian dialect, it may have been carried to the Istrian Peninsula by Romanians taking refuge from the Turks in the 16th and 17th centuries and has undergone strong Croatian influence. There is evidence for its existence from a short list of words in a 1698 historical work, but it is otherwise unwritten. Another isolated Romanian dialect that may be nearing extinction is Megleno-Romanian, from a mountainous region of Macedonia, just west of the Vardar River, on the border between Yugoslavia and Greece. In 1914 there were 13,000 speakers, but many have emigrated to Asia Minor, Yugoslavia, and Romania, where small pockets survive. The only texts are those transcribed from oral traditions.

Mozarabic

Other Romance tongues earlier ceased to be spoken; there is evidence, for instance, of a form of Spanish spoken in Arab-occupied Spain until shortly after its liberation by the Spanish, accomplished at the end of the 15th century. Usually known as Mozarabic, from the Arabic word for an "Arabized person," or as ʿ*ajamī* "barbarian language," it was originally the spoken language of the urban bourgeoisie, who remained Christian while the peasantry generally converted to Islām, but it appears that many Arabs also came to use it, even though Arabic remained the only written language. Because most of the evidence, apart from a 15th-century glossary from Granada, is written in Arabic script (which uses no vowel signs), it is difficult to reconstruct the phonology of the language, but it appears to be a very conservative Spanish dialect. Much of modern information about Mozarabic comes from medical and botanical works that give Mozarabic terms alongside the Arabic. To this was added recently the discovery of Romance refrains (*kharjahs*) inserted in Arabic love ballads (*muwashshaḥs*) of the 11th and 12th centuries; study of these began only in 1946. For much of the Muslim period (beginning in 711), Christians were treated tolerantly and became culturally Arabized. Even after persecution by fanatical Muslim newcomers in the 12th century, the Mozarabs were often in conflict with Westernized "liberators" from the north. Their language died out soon after the Arabs were driven out of Spain at the end of the 15th century, though it is sometimes claimed that Mozarabic has left its mark on the dialects of southern Spain and Portugal.

Other Romance languages may have developed in peripheral regions of the Roman Empire only to die out under pressure from neighbouring non-Italic languages. Often these extinct Romance dialects are known from words borrowed into surviving languages; Berber, for instance, bears witness to the long and brilliant Roman period in North Africa that was to end in the 7th century AD with Arab invasions, and British Celtic (especially Welsh) retains many traces of what appears to have been a conservative Romance dialect, otherwise eliminated by Anglo-Saxon in about the 5th century. Albanian has so many Romance words that some style it "semi-Romance," and farther north, in what was formerly the Roman province of Pannonia (modern northwestern Yugoslavia and western Hungary), Romance speech was probably not dead at the time of the Magyar invasion at the end of the 10th century. Thus, there is reason to believe that Romance dialects may have been spoken at one time over much of southeastern Europe. It is also evident that Romance languages have been retreating south before German for some time, and it is probable that Romance tongues were used in the whole of Switzerland and parts of Bavaria and Austria until about the 9th century. Some scholars maintain that the modern Rhaetian dialects of Switzerland and northern Italy are remnants of an earlier Germano-Romance speech form.

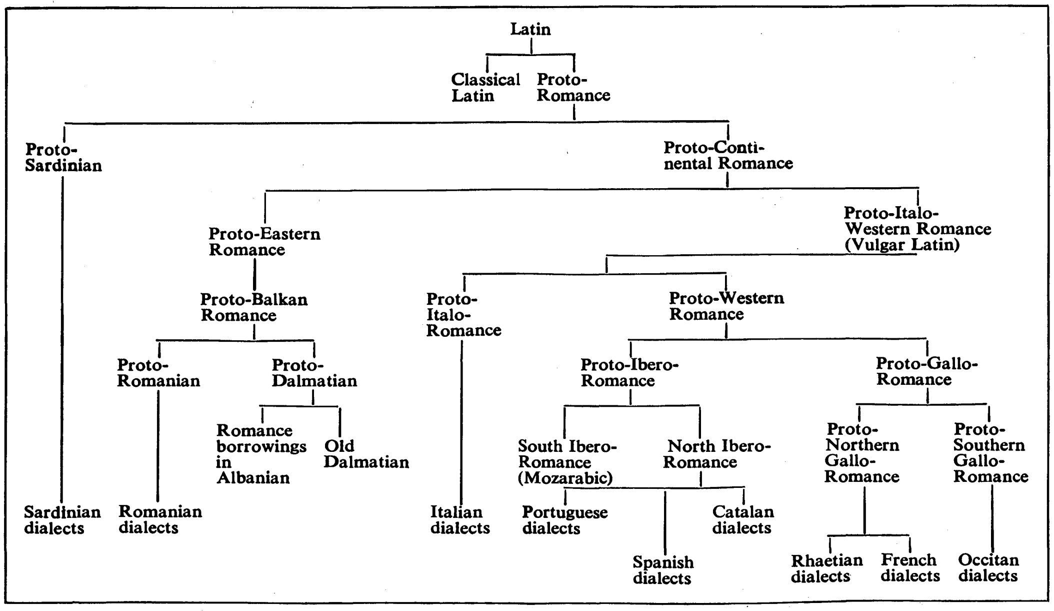

Figure 10: Derivation of Romance languages from Latin.

Classification methods and problems. Though it is quite clear which languages can be classified as Romance, on the basis primarily of lexical (vocabulary) and morphological (structural) similarities, the subgrouping of the languages within the family is less straightforward. Most classifications are, overtly or covertly, historico-geographical—so that Spanish, Portuguese, and Catalan are Ibero-Romance; French, Occitan, and Franco-Provençal are Gallo-Romance; and so on. Shared features in each subgroup that are not seen in other such groups are assumed to be ultimately traceable to languages spoken before Romanization. The first subdivision of the Romance area is usually into West and East Romance, with a dividing line drawn across Italy between La Spezia and Rimini. On the basis of a few heterogeneous phonetic features, one theory maintains that separation into dialects began early, with the Eastern dialect areas (including central and south Italy) developing popular features and the school-influenced Western speech areas maintaining more literary standards. Beyond this, the substrata (indigenous languages eventually displaced by Latin) and superstrata (languages later superimposed on Latin by conquerors) are held to have occasioned further subdivisions. Within such a schema there remain problem cases. (1) Is Catalan, for instance, Ibero-Romance or Gallo-Romance, given that its medieval literary language was close to Provençal? (2) Do the Rhaetian dialects group together, even though the dialects found in Italy are closer to Italian and the Swiss ones closer to French? Sardinian is generally regarded as linguistically separate, its isolation from the rest of the Roman Empire by incorporation into the Vandal kingdom in about 455 providing historical support for the thesis. The exact position of Dalmatian in any classification is open to dispute.

Systems for classifying the Romance languages

A family-tree classification, such as that of Figure 10, is commonly used for the Romance languages. If, however, historical treatment of one phonetic feature is taken as a classificatory criterion for construction of a tree, results differ. Classified according to the historical development of stressed vowels, French would be grouped with North Italian and Dalmatian but not with Occitan, while Central Italian would be isolated. Classifications that are not based on family trees usually involve ranking languages according to degree of differentiation rather than grouping them; thus, if the Romance languages are compared with Latin, it is seen that by most measures Sardinian and Italian are least differentiated and French most (though in vocabulary Romanian has changed most). By most nonhistorical measures, standard Italian is a "central" language (*i.e.,* it is quite close and often readily intelligible to all other Romance languages), whereas French and Romanian are peripheral (they lack similarity to other Romance languages) and require more effort for other Romance speakers to understand them. Spanish and Portuguese are even today so close in most respects that they can be regarded from a linguistic point of view as dialects of the same language, even though structural criteria would assign them to different broad classes.

Extent of mutual intelligibility

In general, it is possible to maintain that all of the standard Romance languages are to some extent mutually intelligible (especially in their Latin-based written forms) and that they have become more so during the course of history, because of much borrowing from one another and remodelling on Latin, the religious language of most speakers. In 19th-century Romania, for instance, national pride prompted a turning toward other Romance cultures, especially the French, in order more clearly to differentiate Romania from neighbouring Slavic countries, with the consequence that Romanian has become "more Romance" in vocabulary if in no other way. Local dialects in all the countries are less affected by such converging movements, but even here encroachment on the local dialect by the standard form of the language leads to the ironing out of dialect peculiarities, often ending with the loss of the local dialect, replaced by a regional variety of the standard dialect; this process is particularly evident in southern France, much less so in Italy.

Minor languages. *Occitan.* Occitan is the modern name given by linguists to the group of dialects spoken by some 13,000,000 people in the south of France (or about one-fourth of the whole French population). All Occitan speakers now use French as their official and cultural language, but their local dialects remain lively and, across most of the area, remarkably homogeneous. The name Occitan derives from the name of the area Occitanie (formed on the model of Aquitania). The medieval language is often called *langue d'oc* (from the word for "yes," compared with *langue d'oïl,* Northern French, and with the *si* languages, Spanish and Italian). In the area itself, the names Lemosí (Limousin) and Proensal (Provençal) were formerly used, but today these are often considered too localized to designate the whole range of dialects. Members of a vigorous literary movement in the Provence region, however, still prefer to call their language Provençal.

Occitan was rich in poetic literature in the Middle Ages until the north crushed political power in the south (1208–29). The standard language was, however, well established and did not really succumb before French until the 16th century, while only after the French Revolution did the French language penetrate into popular use in place of Occitan. In the mid-19th century, a literary Renaissance led by the Félibres (from an old word meaning "wisemen"), based on the dialect of the Arles-Avignon region, lent new lustre to Occitan, and a modern standard dialect was established. The most famous figure of this movement was a Nobel Prize-winning poet, Frédéric Mistral. Almost contemporaneously, a similar movement, based in Toulouse, arose and concentrated on problems of linguistic and orthographic standardization to provide a wider base for literary endeavour.

The Occitan dialects have changed comparatively little since the Middle Ages, though now French is influencing them more and more. Perhaps this influence has helped them to remain more or less mutually intelligible. The main dialect areas are Limousin, in the northwest corner of the Occitan area; Auvergnat, in the north central region of this area; northeastern Alpine-Provençal; and Languedocian and Provençal, on the west and east of the Mediterranean seacoast, respectively.

Gascon and Franco-Provençal

Gascon, in the southwest of France, is usually classified as an Occitan dialect, though to most other southerners it is today less readily comprehensible than Catalan. Some scholars claim that it has always been distinct from Occitan, because of the influence of a non-Celtic Aquitanian pre-Roman population. The Roman name of the region, Vasconia (from which the name Gascony derives), suggests the relationship of its original population with the non-Indo-European Basques. Although poets from this region used the Occitan literary language during the Middle Ages, there is evidence that their spoken language was noticeably different (the 14th century *Leys d'amor* calls it *lengatge estranh* "strange language"). Some of the region remained politically independent for a long period (the Kingdom of Béarn, which used its own standardized dialect as an official language, was not incorporated into France until 1620), and popular use of French is evident only from about 1700. Documents in the dialect are few, however; they date from about the 12th century.

Northeast of the Occitan region, along the French, Swiss, and Italian frontiers, is located a group of dialects that historically have shared most vowel developments with languages to the south and many consonant changes with those to the north. For the last 100 years claims have been made for the linguistic autonomy of these dialects, usually called Franco-Provençal; today it is estimated that somewhat fewer than 2,000,000 speakers use them (urban speakers are hard to find, and even in the countryside young speakers are few). Dialects are extremely diversified and heavily influenced by French, which has been used extensively in the area since the 13th century. Even during the Middle Ages there was no standard form of Franco-Provençal, though some 12th–13th-century documents exist. The dialect of Geneva (now extinct except in some rural communes) was the official language of the Swiss republic for some time, but otherwise none of the dialects has had official status. Some claim that a section of a manuscript, the so-called Alexander fragment, dating from the 11th–12th century and apparently part of a lost poem, is Franco-Provençal in character, but others maintain that it, like other literary texts from the region, is mainly Provençal with some French features. Since the 16th century, there has been local dialect literature, notably in Savoy, Fribourg, and Geneva.

Historic use of Catalan

Catalan. Currently spoken by about 6,200,000 people in Spain and 210,000 in France (in Roussillon), as well as by 10,000 in Andorra and 15,000 in Alghero (Sardinia), Catalan has lost little of its former lustre, even though it is no longer an important national language (as it was between 1137 and 1749, as the official language of Aragon). Although in the Middle Ages there is no evidence of dialectalization, perhaps because of the standardizing influence of its official use in the Kingdom of Aragon, since the 16th century the dialects of Valencia and the Balearic Isles, especially, have tended to differentiate from the Central (Barcelona) dialect. Nevertheless, some degree of uniformity is preserved in the literary language, which continues to flourish in spite of the little encouragement received from Madrid since the Spanish Civil War. Although there were no publications of any sort in Catalan between 1939 and 1941, and only 12 titles were published in 1946, in 1968 the number of titles published had reached 520.

The earliest surviving written materials in Catalan date from the 12th century (a charter and six sermons), with poetry flourishing from the 13th century, before which time Catalan poets wrote in Provençal. The first true Catalan poet was Ramon Llull (1235–1315), and the language remained vigorous (its greatest poet was Ausiàs March, 1397–1459, a Valencian) until the union of the Aragonese and Castilian crowns in 1474 marked the beginning of its decline. After that, although mainly grammatical works appeared, the language was to wait for its renaissance until the late 19th century. In 1906 the first Catalan Language Congress attracted 3,000 participants, and in 1907 the Institut d'Estudis Catalans was founded. Yet not until 1944 was there a course in Catalan philology at the University of Barcelona; a chair of Catalan language and literature was not founded there until 1961.

It is much disputed whether Catalan is more closely related to Occitan or to the Hispanic languages. Medieval Catalan was so close to Lemosí, the literary dialect of Occitan in southern France, that it is thought by some to have been imported from beyond the Pyrenees in the resettlement of refugees from the Moors. In more modern times, Catalan has, however, grown closer to Aragonese and Castilian, so that its family-tree classification becomes less relevant. It was occasionally called Llemosí by 19th-century Catalan revivalists, however, who wished to emphasize its independence from other Iberian tongues by stressing its relation to Occitan. Certainly, by most standards, Catalan merits the distinction of being deemed a language in its own right, and it shows little sign of decline.

Historical extent of Sardinian

Sardinian. Sardinian is currently spoken by more than 1,000,000 people, but it has many dialect differences, and there is virtually no literature, nor even a newspaper in the language (although satirical journals do appear from time to time). In earlier times the language was probably spoken in Corsica, where a Genoese dialect of Italian is now used (although French has been Corsica's official language for two centuries). Since the early 18th century Sardinia's destiny has been linked with that of the Italian mainland, and Italian is now the official language. From the 14th century till the 17th century, Catalan (at that time the official language of Aragon, which ruled Sardinia) was used extensively, especially for official purposes; a Catalan dialect is still spoken in Alghero. Castilian began to be used in official documents in 1600 but did not supplant Catalan in the south of the island until later in the 17th century. Sardinia was more or less independent from 1016, when Arab occupation was ended, until the arrival of the Aragonese in 1322, though much influenced by the Genoese and Pisans. The first documents in Sardinian are legal contracts dating from about 1080; in the north of the island Sardinian was used for such documents until the 17th century. The main dialect groupings are Logudorian (Logudorese), the central, most conservative dialect, which appears to have been used throughout the island in earlier times and which (in a northern form) provides the basis for a *sardo illustre* (a conventionalized literary language used mainly for folk-based verse); Campidanian (Campidanese), centred around Cagliari in the south, heavily influenced by Catalan and Italian; Sassarian (Sassarese) in the northwest; and Gallurian (Gallurese) in the northeast. It is sometimes said that these last two are not Sardinian dialects but rather Corsican. Gallurian in particular is related to the dialect of Sartène in Corsica, and it may have been imported into the Gallura region in the 17th and 18th centuries by refugees from vendettas.

Sardinian is unintelligible to most Italians and, with its harsh consonants and hammered accent, gives an acoustic impression more similar to Spanish than Italian. It is clearly and energetically articulated but has always been regarded as barbarous by the soft-speaking Italians; Dante, for instance, said that Sardinians were like monkeys imitating men. It retains its vitality as a "home language," but dialect diversification is such that it has little chance of development to greater prominence. Perhaps the development of the island as a tourist centre, with better communications with the mainland, will lead to the eventual decline of the language.

Rhaetian. The Rhaetian, or Rhaeto-Romanic, dialects derive their conventional name from the ancient Raetics of the Adige area, who, according to classical authors, spoke an Etruscan dialect. In fact, there is nothing to connect Raetic with Rhaetian except geographical location, and some scholars would deny that the different Rhaetian dialects have much in common, though others claim that they are remnants of a once-widespread Germano-Romance tongue. Three isolated regions still use Rhaetian.

Romansh and other Swiss dialects of Rhaetian

In Switzerland, Romansh (Rumantsch), the standard dialect of Graubünden canton, has been a "national" language, used for cantonal but not federal purposes, since 1938. The proportion of Rhaetian speakers in Graubünden fell from 39.8 percent in 1880 to 23 percent in 1970, with a corresponding increase in the Italian-speaking population, but interest in Romansh remains keen, and there are five Romansh newspapers. The main Romansh dialects are usually known as Sursilvan (or Surselvan) and Sutsilvan (or Subsilvan), spoken on the western and eastern banks of the Rhine, respectively. Another important Swiss Rhaetian dialect, Engadine, is spoken in the Protestant Inn Valley, east of which there is now a German-speaking area that has encroached on former Romance territory since the 16th century. The dialects from the extreme east and west of the Swiss Rhaetian area are mutually intelligible only with difficulty, though each dialect is intelligible to its neighbour. Sursilvan (spoken around the town of Disentis) has one text dating from the beginning of the 12th century but then nothing else until the work of Gian Travers (1483–1563), a Protestant writer. The Upper Engadine dialect (spoken around Samedan and Sankt Moritz) is attested from the 16th century, notably with the Swiss Lutheran Jacob Bifrun's translation of the New Testament. Both dialects have had a flourishing local literature since the 19th century. In many ways the Swiss Rhaetian dialects resemble French, and speakers seem to feel more at home with French than with Italian.

Ladin and Friulian

In the Alto-Adige and Dolomites area of Italy, 15,000 persons speak a language they call Ladin. Some Italian scholars have claimed that it is really an Italian (Veneto-Lombard) dialect. German is the other main language spoken in this now semi-autonomous region, much of which was Austrian until 1919. Though it is sometimes said that Ladin is threatened with extinction, it appears to retain its vitality among the mountain peasantry, as distinct from German-speaking hotel owners. Ladin newspapers are on sale in village shops, and speakers welcome visitors (there mainly to ski or climb) who show interest in their language, which is comprehensible without too much difficulty to a student of Romance languages. As it appears that these remote valleys were very sparsely populated until recently, it may even be that the number of speakers there has in fact grown. Since World War II, Ladin has been taught in primary schools in the Gardena and Badia valleys, in different conventionalized dialect forms. Although a Ladin document of the 14th century (from Val Venosta, to the west of the modern Ladin region) is known from references, the earliest written material in Ladin currently possessed dates from the 18th century, a word list of the Badia dialect. In more recent times there have been a few literary and religious texts.

In Italy, north of Venice, stretching to the Yugoslav border on the east and to the Austrian border on the north, its western boundary almost reaching the River Piave, is the Friulian (Friulan, Frioulian) dialect area, centred around Udine, with more than 500,000 speakers. This dialect is much closer to Italian than Ladin or Romansh, and it is often claimed to be a Venetian dialect. Venetian proper has gained ground at the expense of Friulian both to the east and west since the 1800s. Friulian retains its vitality today in the well-populated, industrialized region, however, and supports a vigorous local literature; its most notable poet was Pieri Zorut (1792–1867). The first text in Friulian (apart from a doubtful 12th-century inscription) is a short one dating from about 1300, followed by numerous documents in prose, as well as some poems, up to the end of the 16th century, when a rich poetic tradition began.

Creoles. The French, Spanish, and Portuguese creoles, together with their metropolitan equivalents, share many things in common. Indeed, some scholars regard them as in some sense related, either in sharing an African grammatical base, with a superimposed Romance lexicon, or in historical derivation from a Portuguese pidgin lingua franca used by colonizers and slavers, with later addition of vocabulary from metropolitan languages, such as French and Spanish, with which they came into contact. Other scholars maintain that the creoles are continuators of French, Spanish, and Portuguese in the same way as these are themselves continuators of Latin but that, under the conditions that attended the slave trade, linguistic change was exceptionally rapid, so that the origins of the creoles are often hardly recognizable.

Origin of the term creole

"Creole" is a word first found in Spanish (*criollo;* 1590), meaning a Spaniard born in the colonies or his black household servant. It most probably originated in Portuguese, in which it is related to such words as *criança* "child" and *criada* "maid-servant," generally indicating a household dependent, although the word *crioulo* is not known until 1632. Today, "creole" has come to indicate a pidgin or trade language that has become the mother tongue of a population, often black; the conditions under which this has happened have included forcible transplantation and intermingling of people with mutually unintelligible native languages and imposition of the master's language, during the slave-trade era.

Of Romance creoles used today, French creoles are most widespread. In Haiti, for instance, there are more than 5,000,000 creole speakers, of whom only about 10 percent know French; the island of Santo Domingo (Hispaniola), of which the eastern half forms the Haitian Republic, was settled in 1665. The Lesser Antilles (Martinique, Guadeloupe, Dominica, St. Lucia, St. Kitts, etc.) were colonized in 1635, and many still use French creoles, even when change of ownership led to the imposition of English as the official language. French creoles are also used in French Guiana and, though dying out, in Louisiana. In all, almost 6,000,000 speakers use French creoles in the Americas. On islands of the Indian Ocean, too, French creoles are spoken; in Mauritius (600,000 speakers), owned by France from 1715 to 1810, the creole retains its hold as a lingua franca even though English is the official language and though a large part of the population use Indian dialects as home languages. In the Seychelles (65,000 speakers), owned by France from 1768 until 1814, when they became British, and in Réunion (originally L'Île Bourbon; 485,000 speakers), where French is still the official language, French creoles are still in use. Some French-creole speakers claim that creoles from other far-off regions are easily intelligible to them. Others contest this, however, pointing out that the creole used by educated speakers is often heavily larded with standard French on all but very informal occasions. Certainly, the linguist can easily discern similarities, especially in grammatical structure, that make the various French creoles seem more like each other than like standard French.

Portuguese creoles were purportedly once widely used in Asia, though probably more frequently as trade languages than as mother tongues. They survive today in Macau and Hong Kong and to some extent in Malaysia and Goa, India. In Africa a Portuguese creole is used by more than 260,000 people in Guinea-Bissau, the Cape Verde Islands, and some Gulf of Guinea islands (Annobón in Equatorial Guinea, where it is losing ground to Spanish, and São Tomé and Príncipe, where, of the 86,000 inhabitants, about two-fifths speak creoles). In South America a Brazilian creole is still used in the interior, although at one time this language was more widespread in the country (spreading even to Surinam, where Portuguese Jews and their slaves fled from Brazil in the 17th century).

Papiamento

Papiamento, spoken by more than 240,000 people on the islands of Aruba, Curaçao, and Bonaire in the Netherlands Antilles, is today classed as a Spanish creole, though some claim that it was once a Portuguese creole that later acquired many new words from Spanish. A Spanish creole also survives precariously in the Philippines among descendants of mixed Spanish–Filipino stock.

On the whole, creoles are rarely used for literature, except satirical and comic pieces. Most speakers regard them as "bad" versions of the standard language and in formal situations try to improve their usage on the model of the standard, though they admit to feeling more relaxed speaking natural creole. Sometimes "purer" creole speech can be heard among speakers not as much exposed to the standard form of the language, as in West Indian islands where English is the official language, while a French creole is the home language.

Major languages. *French.* Probably the most internationally important of the Romance languages, French is used as the official language in 21 countries and as a co-official language in several more (including Algeria, Belgium, Canada, Luxembourg, Switzerland, Jersey). In France and Corsica about 44,000,000 use it as their first language; in Canada, 6,250,000; in Belgium, 3,200,000; in Switzerland (cantons of Neuchâtel, Vaud, Genève, Valais, Fribourg), more than 1,000,000; in Monaco, 13,000; in the Italian Valle d'Aosta, 100,000; and, in the United States (especially Maine and Louisiana), about 2,400,000. Moreover, about 5,000,000 Africans and 4,000,000 Indo-Chinese use it as their principal international language; many creole French speakers, too, use standard French in formal situations.

Standard French is based on the dialect of Paris (in the so-called Île de France with its Francien dialect), which assumed importance in about the second half of the 12th century; it was basically a north central dialect with some northern features. Before that, other dialects, especially Norman (which developed in Britain as Anglo-Norman, widely used until about the 14th century), and northern dialects, such as Picard, had more prestige, especially in the literary sphere. The Edict of Villers-Cotterêts (1539), however, established Francien as the only official language, as against both Latin and other dialects. From then on, standard French began to smother local dialects, which were officially discouraged until recent times, though the standard language did not spread to popular usage in all regions until well into the 19th century. Dialectal features, still admired and cherished by 16th-century writers, were ridiculed in the 17th and 18th centuries, when the grammar and vocabulary of the modern language were standardized and polished to an unprecedented degree.

Linguistic change in French

Linguistic change was more rapid and more drastic in northern France than it was in other European Romance regions, and influence from Latin was comparatively slight (though borrowing of Latin vocabulary has been great since the 14th century). The influence of the Germanic Frankish invaders is often held to account for exotic features in Old French, such as strong stress accent and abundant use of diphthongs and nasal vowels; but the change in about the 15th century to a more sober (even monotonous) intonation and loss of a stress accent on each word can hardly be attributed to influences from neighbouring languages. The popularity of French as a first foreign language, in spite of numerous pronunciation difficulties for nearly all foreign speakers, is perhaps as much the result of the precise codification of its grammar, effectuated especially during the 18th century, as of the brilliance of its literature at all periods. Thus, although Italian would be an easier language for them to master, most foreign speakers of Romance languages become acquainted with French at school and often retain an affection and admiration for the language.

The first document apparently written in French purports to date from 842; known as the Strasbourg Oaths, it is a Romance version of an oath sworn by two of Charlemagne's grandsons. Some claim that the text is thinly disguised Latin constructed after the event to look authentic, for political propaganda purposes; others suppose that its Latinizing tendencies reveal the struggle of the scribe with the problems of spelling French as it was spoken at the time. If the language of the Strasbourg Oaths is Northern French, it is difficult to decide what dialect it represents—some say that of Picard, others Franco-Provençal, and so on. The second existing text in Old French is a short sequence of the writings of St. Eulalia, precisely dated (AD 880–882) and localized (Valenciennes); it is definitely Picard in character. Two 10th-century texts (the *Passion du Christ* and the *Vie de St. Léger*) seem to mingle Northern and Southern dialect features, while another (the "Jonas fragment") is obviously from the far north. After that the Norman dialect seems to dominate literature, though here it is probable that the language is better described as a standard language with elimination of gross dialect features. Two manuscript traditions—one from the far north and one from the west—seem to have developed, and it is possible that the intersection of the two produced the Francien dialect that was eventually to reign supreme.

Modern dialects of French

Modern dialects are classified mainly on a geographical basis, and most survive only in the peasant speech. Walloon, a dialect spoken mainly in Belgium, is something of an exception in that it has had a flourishing dialect literature since about 1600. Other dialects are grouped as follows:

Central: Francien, Orléanais, Bourbonnais, Champenois
Northern: Picard, Northern Norman
Eastern: Lorrain, Bourguignon (Burgundian), Franc-Comtois
Western: Norman, Gallo (around the Celtic Breton area), Angevin, Maine
Southwestern: Poitevin, Saintongeais, Angoumois.

Outside France, apart from the creoles, the French of Canada, originally probably of Northwestern dialect type, has developed the most individual features. Although in the 18th century Canadian French was regarded as exceptionally "pure" by metropolitan commentators, it began to diverge from Parisian French as English influences took over from the French after 1760. It is less clearly articulated, with less lip movement and with a more monotonous intonation than standard French; some change in consonantal sounds occurs (*t, d* shift to *ts, dz,* respectively, and *k* or *g* followed by *i* or *e* become palatalized [pronounced with the tongue touching the hard palate, or roof of the mouth]); nasal vowels tend to lose the nasal element; vocabulary and syntax are heavily anglicized. Though intellectuals turn toward France for cultural inspiration (some university-educated French Canadians may not even know English), the pronunciation and usage of standard French is sometimes derided by French Canadians; this may be because their English compatriots are taught Parisian at school. The French-speaking population of Canada is growing relatively fast, and at present 80 percent of the population of Quebec Province use French as their normal language. Even today, however, French is not as socially prestigious as English; the activities of the separatist movement are evidence of the feeling of grievance that many French Canadians still have.

Spanish. Spanish, the Romance language spoken as a first language by the most people in the world, is the official language of 18 American countries as well as that of Spain, and, though many South and Central Americans use native Indian languages as their first language, Spanish is spreading and achieving continuing educational progress. Estimated numbers of speakers are as follows (in order of numerical importance): Mexico 55,000,000; Spain 27,000,000; Colombia, 26,000,000; Argentina, 24,000,000; the United States, 9,000,000; Dominican Republic, 5,000,000; El Salvador, 4,500,000; Guatemala, 3,500,000; Puerto Rico, 3,200,000; Honduras, 3,000,000; Uruguay, 2,500,000; Nicaragua and Paraguay, 2,400,000 each; Bolivia, Costa Rica, and Panama, 2,000,000 each; and the Philippines, 900,000. There are also a few hundred thousand Judeo-Spanish speakers and about 160,000 Spanish speakers in Africa.

The dialect spoken by nearly all these speakers is basically Castilian, and indeed Castellano is still the name used for the language in several American countries. In the north of Spain two other Spanish dialect groups (Asturo-Leonese and Aragonese) survive but seem doomed to extinction. The dialect of the Northwest (Galician, or Gallego) is properly a Portuguese dialect, and, on the east, Catalan can be held to be a different language, as noted above. The now-unchallenged ascendancy of Castilian among Spanish dialects is the result of the particular circumstances of the Reconquista (the conquest of Moorish Spain by the Spanish, completed in 1492), with which the language went south. Having established itself in Spain, the Castilian dialect, possibly in its southern, or Andalusian, form, was then exported to the New World during the 16th century.

The standard Spanish dialect, Castilian

Standard Castilian is no longer the language of Old Castile, which was already regarded as rustic and archaic in the 15th century, but a modified form developed in Toledo in the 16th and 17th centuries and, more recently, in Madrid. American countries have developed their own standards, differing mainly in phonology (in which they often agree with the southern Spanish dialects) and in vocabulary (in which loanwords from English are more frequent), but differentiation is comparatively slight, and some Americans still regard true Castilian as their model. On the whole, American forms of Spanish are more musical and suave than the harsh Castilian of Madrid, but it is remarkable how little deformation, or creolization, of the language has occurred, even in the mouths of uneducated Indian speakers.

The first texts in Spanish consist of scattered words glossing two Latin texts of the 10th century, one from Rioja and the other from Castile; the language in the two documents shows few dialect differences. Another document, dating from about 980, seems to be Leonese in character. The Mozarabic verse forms known as *kharjahs* are the next-oldest surviving texts, but by the middle of the 12th century the famous epic poem *El cantar de mío Cid* ("The Song of the Cid") appeared in a language that is basically Castilian. Literary works in Leonese appear till the 14th century and in a conventionlized Aragonese till the 15th century, but Castilian was destined from the first to gain the upper hand, even making an impact on Portuguese, especially in the 15th and early 16th centuries.

Judeo-Spanish (Jewish-Spanish, Sefardi, Ladino) is the continuation of an archaic form of Castilian, reflecting the state of the language before 16th-century standardization. The expulsion of the Jews from the Iberian Peninsula in 1492 affected mainly the humbler classes, with the rich preferring "conversion," but the latter often later chose voluntary exile to settle in England and Holland, where their Sefardic tongue precariously survives as a religious language in a few communities. Earlier refugees fled to the Middle East and, once settled, continued to produce learned works in a literary archaic form of their language, Ladino, written in an adapted Hebrew script. The spoken dialects have differentiated considerably from Ladino, mainly by borrowing from Hebrew and local languages, and, after further dispersion during and after the World War II, these dialects are now threatened with extinction, though Ladino survives with a mainly religious function.

Portuguese. Portuguese owes its importance largely to its position as the language of Brazil, where more than 110,000,000 people speak it. In Portugal itself there are about 10,000,000 speakers. The Galician (Gallego, Galego) dialect of northwestern Spain is historically a Portuguese dialect, though now much influenced by the standard Castilian Spanish; about 3,000,000 speakers use Galician as their home language. It is estimated that there are also about 400,000 Portuguese speakers in Africa (some of whom also use creole) and about 500,000 in the United States, with a few thousand in former Portuguese possessions, such as Goa, Mozambique, and Guinea-Bissau.

Portuguese dialect groups

There are four main Portuguese dialect groups, all mutually intelligible: (1) Northern, or Galician; (2) Central (Beira); (3) Southern (Estremenho, including Lisbon, Alemtejo, and Algarve); and (4) Insular, including the dialects of Madeira and Brazil. Standard Portuguese was developed in the 16th century, basically from the dialects spoken between Lisbon and Coimbra, to the north. Brazilian (Brasileiro) differs in several respects, in syntax as well as phonology and vocabulary, but many writers still use an academic metropolitan standard. A creolized form, once widespread in Brazil, seems now to be dying out. A Jewish Portuguese is attested in 18th-century Amsterdam and Livorno (Leghorn, Italy), but virtually no trace of this remains today.

Portuguese speakers have little difficulty in understanding and speaking Spanish, in spite of considerable acoustic and grammatical differences between the two languages. In Portugal, however, they often show considerable resentment at being addressed in Spanish, and there are signs of social resistance to this neighbouring tongue, perhaps because Portugal has so frequently had to play a subordinate role to Spain in the course of its history. In the region of northwestern Spain that adjoins Portugal, the Galician dialects lack uniformity and are closer to Spanish. Even in Castile, where standard Spanish (Castilian) originated, Galician was the conventional language of the courtly lyric until about 1400, but it lost ground in the 15th century, and Castilian replaced Galician as the official language of Galicia in 1500. Dialect poetry in Galician has flourished from the 18th century, with an upsurge in the 19th century.

Before the reconquest of Moorish Spain, largely completed in the 13th century, Galician and Portuguese were indistinguishable. The first evidence for the language consists of scattered words in 9th–12th-century Latin texts; continuous documents date from about 1192, the date assigned to an extant property agreement between the children of a well-to-do family from the Minho Valley. Literature began to flourish especially during the 13th and 14th centuries, when the soft Gallego-Portuguese tongue was preferred by courtly lyric poets all over the Iberian peninsula except in the Catalan area. In the 16th century, Portugal's Golden Age, Galician and Portuguese grew further apart, with the consolidation of the standard Portuguese language.

Distribution of Italian speakers

Italian. Italian is currently spoken by more than 65,000,000 people, of whom the vast majority live in peninsular Italy (including the Republic of San Marino), with about 5,000,000 in Sicily and 1,500,000 Italian speakers in Sardinia. France, including Corsica, has about 1,200,000 Italian speakers and Switzerland about 450,000; there are, in addition, about 300,000 in Yugoslavia. For a large, if decreasing, proportion of these speakers, standard Italian is not the language of the home, where dialectal forms are used. Overseas (*e.g.,* in the United States, where it is estimated that there are 4,500,000 Italian speakers; in Argentina, with 1,300,000; and in Brazil, with about 500,000), speakers sometimes do not know the standard language and use only dialect forms. A speaker of an Italian dialect, even one as superficially different as Sicilian, can with effort understand standard Italian, however, and can even teach it to himself by such means as listening to radio programs. For most Italians their first contact with the standard language comes in primary school, in which until recently it was the only dialect used; standard Italian is virtually the only dialect of culture in modern Italy, and with immigration from the south to the industrial north it is becoming more and more the language of intercommunication. Standard Italian is widely used in Malta and Somalia. In Libya and Ethiopia it is now dying out of use.

Standard Italian began to be developed in the 13th and 14th centuries as a literary dialect. At first basically a Florentine dialect, stripped of local peculiarities, it has since acquired some characteristics of the dialect of Rome in particular and has always been heavily influenced by Latin. It overlies a wide variety of dialects, sometimes considered to represent a fundamental differentiation between northern and southern Italy that dates from Roman times. Today, however, these variant dialects form a continuum of intelligibility, although geographically distant dialects may be radically different. The northern dialects include what are often called the Gallo-Italian dialects (Piedmontese, Lombard, Ligurian, Emilian-Romagnol), in which some linguists discern the influence of a Celtic (Gaulish) substratum (*i.e.,* the traces of a language previously spoken in the region). The other northern group of dialects, spoken in northeastern Italy, is called Venetan (including Venetian, Veronese, Trevisan, and Paduan dialects, etc.). Istriot, a language spoken in Yugoslavia, is sometimes considered yet another northern Italian dialect, rather than an independent language. The Tuscan dialects (including those of Corsica) are often held to form a linguistic group of their own, while in the south and east three broad dialect areas are grouped loosely together: (1) the dialects of the Marche (Marchigiano), Umbria, and Rome; (2) Abruzzian, Apulian, Neapolitan, Campanian, and Lucanian; and (3) Calabrian, Otrantan, and Sicilian, believed by some to be influenced by the Greek once spoken there (which still survives in isolated pockets on the toe and heel of the peninsula).

Italian dialect regions

Outside Italy, Italian dialects are heavily influenced by contact with other languages (English in New York; Spanish in Buenos Aires). A pidgin Italian can still be heard in Addis Ababa but has little extension. Relics of a Jewish Italian survive within Italy; a colony of 6,000 Jews, who used a Venetan dialect as a home language in Corfu, was exterminated during World War II.

Early texts from Italy are written in dialects of the language that only later became standard Italian. Possibly the very first text is a riddle from Verona, dating from perhaps the 8th century, but its interpretation is obscure and its language Latinized. More surely Italian are some 10th-century documents from Montecassino, after which there are three Central Italian texts of the 11th century. The first literary work of any length is the Tuscan *Ritmo Laurenziano* ("Laurentian Rhythm") from the end of the 12th century, followed soon by other compositions from the Marches and Montecassino. In the 13th century, lyric poetry was first written in a conventionalized Sicilian dialect that influenced later developments in central Italy.

In modern Italy, although dialects are still the primary spoken idiom, standard Italian is virtually the only written language and, with the spread of literary regional varieties of the standard language, may eventually replace the dialects. Neorealism, especially in the cinema, has introduced a limited use of dialect into cultural media, but the relevance of such a development is hotly debated.

Romanian. There are about 23,500,000 speakers of Romanian (or Rumanian), of whom about 20,000,000 live in the Socialist Republic of Romania, 3,000,000 in the U.S.S.R., and about 300,000 in Yugoslavia, Bulgaria, Greece, and Albania. There are about 60,000 Romanian speakers in the United States.

Standard Romanian

The standard language of Romania is based on a Walachian variety of so-called Daco-Romanian, the majority group of dialects; it was developed in the 17th century mainly by religious writers of the Orthodox Church and includes features from a number of dialects, though Bucharest usage now provides the model. Daco-Romanian is fairly homogeneous but shows greater dialectal diversity in the Transylvanian Alps, from which region the language may have spread to the plains. Moldavian, the variety of Romanian spoken in the U.S.S.R., is still written in a form of Cyrillic script, and some claim that it is a language in its own right, though most Western linguists see it definitely as a variant of Daco-Romanian. Other dialects of Romanian are barely mutually intelligible with the standard, and some can be counted as separate languages; these include Megleno-Romanian (Vlaši) and Istrio-Romanian, both already mentioned as nearly extinct. More vigorous is the Aromanian, or Macedo-Romanian, group of dialects scattered throughout Greece (60,000 speakers in the early 1980s), Yugoslavia (150,000), Albania (16,000), and Bulgaria (4,000). Numbers have probably decreased considerably, but certainly before the war Aromanians were often prominent businessmen in their localities. The first known inscription in Aromanian, dated 1731, was found only in 1952 at Ardenita, in Albania; texts date from the end of the 18th century, and literary texts have been published in the 19th and 20th centuries (mostly in Bucharest).

The first known Daco-Romanian text is a letter dated 1521, though some manuscript translations of religious texts show Transylvanian dialect features and may be earlier. The vast majority of early texts are written in Cyrillic script, the Roman (Latin) alphabet having been adopted in 1859 at the time of the union of Walachia and Moldavia. Literature in Romanian began to flourish in the 19th century, when the emerging nation turned toward other Romance countries, especially France, for cultural inspiration. Today, in spite of efforts at industrialization, peasant life continues almost unchanged in many regions, and the linguistic standards of the capital have little impact; an autonomous Magyar-speaking (Hungarian) region in the middle of Romania adds further complication to the linguistic situation.

HISTORICAL SURVEY

Latin and the Italic languages

Latin and the protolanguage. Latin is traditionally grouped with Faliscan among the Italic languages, of which the other main member is the Osco-Umbrian group. Oscan was the name given by the Romans to a group of dialects spoken by Samnite tribes to the south of Rome. It is well attested in inscriptions and texts for about five centuries before Christ and was used in official documents until *c.* 90–89 BC. The absence of great dialectal variations in the texts suggest that they are written in a standardized form. In early times, Umbrian was spoken northeast of Rome, to the east of the Etruscan region, possibly as far west as the Adriatic Sea at one period. It is attested mainly in one series of texts, the Tabulae Iguvinae, dated from 400 to 90 BC, and it is similar to Oscan. Probably Latin and Osco-Umbrian were not mutually intelligible; some claim they are not closely related genetically but that their common features arose from convergence as a result of contact.

The Roman dialect was originally one of a number of Latinian dialects, of which the most important was Faliscan, the language of Falerii, 32 miles (51 kilometres) north of Rome. The Faliscans were probably a Sabine tribe that early fell under Etruscan domination. The dialect is known mainly from short inscriptions dating from the 3rd and 2nd centuries BC and probably survived until well after the conquest of Falerii by the Romans in 241 BC. It shares one phonetic feature with Osco-Umbrian (medial *f* from Indo-European **bh* [the asterisk marks a hypothetical reconstructed form] when Latin has *b—e.g.,* Faliscan *carefo* = Latin *carebo*), but other are like Latin (*e.g.,* Faliscan *cuando* = Latin *quando* = Umbrian *pan(n)u*). Some Latin diphthongs, however, appear as simple vowels in Faliscan (*e.g.,* Latin *ae* = Faliscan *e*), and Latin final consonants are often absent (*e.g.,* Faliscan *cra* = Latin *cras*).

The earliest Latinian text is an inscription on a cloak pin (fibula) of the 6th century BC, from Palestrina (Praeneste); the inscription is definitely dialectal and seems to have Oscan features (*e.g.,* a reduplicated syllable in the perfect form—*fhefaked* = Latin *fecit* "he did, made"). Other Latinian inscriptions show marked differences from Roman Latin, for which there is, however, little evidence before the end of the 3rd century BC. What is certain is that the language changed so rapidly between the 5th century (the date of a mutilated inscription said to mark the tomb of Romulus and of the Twelve Tables, the contents of which are known from later evidence) and the 3rd century BC that older texts were no longer intelligible.

During this period the Romans subjugated their Latin neighbours (by 335 BC), and their language began to establish itself as a standard form, absorbing features from other dialects. The first author of any note was the comedian Plautus (254–184 BC), whose language is thought to reflect a spoken idiom, some features of which appear to have survived into Romance.

Literary development in Latin

By 265 Rome had conquered Magna Graecia, in the south of the Italian peninsula, and had begun to absorb some of its Greek literary and cultural ideals. Poetic language was especially influenced by Greek until Latin poetry reached its zenith with Virgil. In the 1st century BC a literary prose was to be developed, with emphasis placed on rejection of vulgarity and rusticity and pride of place accorded to elegance and clarity. Grammatical rules were codified and tightened and vocabulary pruned, and the cult of the harmonious, balanced period held sway in rhetorical circles. With Cicero, Golden Age prose style attained its highest point; for the linguist, the distinction Cicero makes between the style of his letters and that of his speeches is especially interesting in that it provides evidence that even educated speech differed from written language. When Cicero uses the *sermo plebeius* ("plebeian speech"), his language is more elliptical, with shorter, less complex sentences and more colourful vocabulary (including plentiful diminutives). It seems obvious that truly popular language differed even more from the elaborate, sophisticated, classical literary idiom; there is evidence that archaic features, banned from literary style, survived in vulgar speech right through to the Romance stage of the language. It is sometimes claimed that the language of Roman historian and politician Sallust (86–35 BC) approximated popular usage, but it is more probable that his archaizing style derives more from conscious imitation of old Roman poetry. The Roman "judge of elegance" Petronius Arbiter (died AD 65/66), too, is often thought to imitate vulgar speech, but many of the odd features found in his "Cena Trimalchionis" ("Trimalchio's Dinner") may represent the broken Latin spoken by Greeks and such.

Some characteristics of Classical Latin. *Pronunciation.* Evidence for pronunciation of the Latin of the classical era is often difficult to interpret. Orthography is conventionalized, and grammarians' commemts lack clarity, so that to a considerable extent it is necessary to extrapolate from later developments in Romance in order to describe it. On the whole, linguists think that Latin probably sounded something like Italian, though areas of uncertainty exist.

Among these uncertainties, the most important concerns Latin intonation and accentuation. The way vowels developed in prehistoric Latin suggests that there was a heavy stress accent on the first syllable of each word, but in later times the accent fell on the penultimate syllable or, when this had "light" quantity, on the antepenultimate (much as in modern Italian). The nature of this accent is hotly disputed: contemporary grammarians seem to suggest it was a musical, tonal accent and not a stress accent. If this were so, the acoustic effect of Latin would be quite different from Romance and similar, perhaps, to modern West African languages or even Chinese. Some scholars claim, however, that Latin grammarians were merely slavishly imitating their Greek counterparts and that the fact that in Latin accent is linked with syllable vowel length makes it unlikely that such an accent was tonal. Probably it was a light stress accent that was normally accompanied by a rise in pitch; in later Latin evidence suggests that the stress became heavier.

The system of syllable quantity, connected with that of vowel length, must have given Classical Latin distinctive acoustic character. Broadly speaking, a "light" syllable ended in a short vowel and a "heavy" syllable in a long vowel (or diphthong) or a consonant. The distinction must have been reflected to some extent in late Latin or early Romance, for, even after the system of vowel length was lost, light, or "open," syllables often developed in a different way from heavy, or "closed," syllables.

Vowel length

Because the system of vowel length was lost after the classical period, it is not known with any certainty how vowels were pronounced at that period; but, because of later developments in Romance, the assumption is that the vowel-length distinctions were also associated with qualitative differences, in that short vowels were more open, or lax, than long vowels. Standard orthography did not distinguish between long and short vowels, although in early times various devices were tried to remedy this. At the end of the Roman Republic an "apex" (one form was like this: ›) often was used to mark the long vowel, but this was replaced in imperial times by an acute accent (′). In Classical Latin the length system was an essential feature of verse, even popular verse, and mistakes in vowel length were regarded as barbarous. In later times, however, many poets were obviously unable to conform to the demands of classical prosody and were criticized for allowing accent to override length distinctions.

Besides the vowels *ā, ē, ī, ō, ū* (long vowels) and *ă, ĕ, ĭ, ŏ, ŭ* (short vowels), educated speech at the classical period used a sound taken from Greek upsilon and pronounced rather like French *u* (the symbol [y] in the International Phonetic Alphabet—IPA) in words borrowed from Greek; in popular speech this was probably pronounced like Latin *ŭ*, though in later times *ī* sometimes substituted for it. A neutral vowel was probably used in some unaccented syllables and was written *u* or *i* (*optumus, optimus* "best"), but the latter rendering became standard. A long *ē*, from earlier *ei*, had probably completely merged with *ī* by the classical period. Classical pronunciation also used some diphthongs pronounced by educated Romans much as they are spelled, especially *ae* (earlier *ai*), pronounced perhaps as an open long *e* in rustic speech, *au* (rustic open long *ō*), and *oe* (earlier *oi*, late Latin *ē*).

The consonant system

The Classical Latin consonant system probably included a series of labial sounds (produced with the lips), *p, b, m, f,* and probably *w*; a dental or alveolar series (produced with the tongue against the front teeth or the alveolar ridge behind the upper front teeth), *t, d, n, s, l,* and possibly *r;* a velar series (produced with the tongue approaching or contacting the velum or soft palate), *k, g,* and perhaps *ng*; and a labiovelar series pronounced with the lips rounded, k^w and g^w. The *k* sound was written *c*, and the k^w and g^w were written *qu* and *gu*, respectively.

Of these, k^w and g^w were probably single labialized velar consonants, not clusters, as they do not make for a heavy syllable; g^w occurs only after *n*, so only guesses can be made about its single consonant status. The sound *ng* (as in English "sing"; represented in the International Phonetic Alphabet by [ŋ]), written *ng* or *gn*, may not have had phonemic status (in spite of the pair *annus/agnus* "year"/"lamb," in which [ŋ] may be regarded as a positional variant of *g*). The Latin letter *f* probably represented by classical times a labiodental sound pronounced with the lower lip touching the upper front teeth like its English equivalent) but earlier it may have been a bilabial (pronounced with the two lips touching or approaching one another). The so-called consonantal *i* and *u* were probably not true consonants but frictionless semivowels; Romance evidence suggests that they later became a palatal fricative, [j] (pronounced with the tongue touching or approaching the hard palate and with incomplete closure) and a bilabial fricative, [β] (pronounced with vibration of the lips and incomplete closure), but there is no suggestion of this at the classical period. Some Romance scholars suggest that Latin *s* had a pronunciation like that of modern Castilian (with the tip, rather than the blade, raised behind the teeth, giving a lisping impression); in early Latin it was often weakened in final position, a feature that also characterizes eastern Romance languages. *R* was probably a tongue trill at the classical period, but there is earlier evidence that in some positions it may have been a fricative or a flap.

The nasal consonants were probably weakly articulated in some positions, especially medially before *s* and in final position; here probably there was mere nasalization of the preceding vowel.

In addition to the consonants shown, educated Roman speakers probably used a series of voiceless aspirated stops, written *ph, th, ch,* originally borrowed from Greek words but also occurring in native words (*pulcher* "beautiful," *lachrima* "tears," *triumphus* "triumph," etc.) from the end of the 2nd century BC.

Another nonvocalic sound, *h,* was pronounced only by educated speakers even in the classical period, amd references to its loss in vulgar speech are frequent.

Doubled consonant sounds

Consonants written double in the classical period were probably so pronounced (a distinction was made, for instance, between *anus* "old woman" and *annus* "year"). When consonantal *i* appeared intervocalically, it was always doubled in speech. Earlier than the 2nd century BC consonant gemination (doubling of sounds) was not shown in orthography but was probably current in speech. Among the Romance languages, the eastern ones on the whole retained Latin double consonants, whereas in the west they were often simplified.

Morphology and syntax. Latin reduced the number of Indo-European noun cases from eight to six by incorporating the sociative-instrumental (indicating means or agency) and, apart from isolated forms, the locative (indicating place or place where) into the ablative case (originally indicating the relations of separation and source). The dual number was lost, and a fifth noun declension was developed from a heterogeneous collection of nouns (principally verbal abstracts in *-ie*). Of the other declensions, the Indo-European *ā*- and *ō* classes remained, with the introduction of new genitive singular forms in *-ae* and *-i,* while consonantal and *-i* stem nouns were amalgamated into a "third" declension, which also took in adjectives formerly of the *ū*-class (a "fourth" declension). Probably before the Romance period the number of cases was further reduced (there were two in Old French—nominative, used for the subject of a verb, and oblique, used for all other functions—and Romanian today has two, nominative–accusative, used for the subject and the direct object of a verb, and genitive–dative, used to indicate possession and the indirect object of a verb), and words of the fourth and fifth declension were absorbed into the other three or lost.

New tense forms

Among verb forms, the Indo-European aorist (indicating simple occurrence of an action without reference to duration or completion) and perfect (indicating an action or state completed at the time of utterance or at a time spoken of) combined, and the conjunctive (expressing ideas contrary to fact) and optative (expressing a wish or hope) merged to form the subjunctive mood. New tense forms that developed were the future in *-bō* and the imperfect in *-bam;* a passive in *-r,* also found in Celtic and Tocharian, was also developed. New compound passive tenses were formed with the perfect participle and *esse* "to be" (*e.g., est oneratus* "he, she, it was burdened")—such compound tenses were to develop further in Romance. In general, the morphology of the classical period was codified and fluctuating forms rigidly fixed. In syntax, too, earlier freedom was restricted; thus, the use of the accusative and infinitive in *oratio obliqua* ("indirect discourse") became obligatory, and fine discrimination in the use of the subjunctive was insisted on. When earlier writers might have used prepositional phrases, classical authors preferred bare nominal-case forms as terser and more exact. Complex sentences with subtle use of distinctive conjunctions were a feature of the classical language, and effective play was made with the possibilities offered by flexible word order.

In the postclassical era, Ciceronian style came to be regarded as laboured and boring, and an epigrammatic, compressed style was preferred by such writers as Seneca and Tacitus. Contemporaneously and a little later, florid, exuberant writing—often called African—came into fashion, exemplified especially by Apuleius (2nd century AD). Imitation of classical and postclassical models continued even into the 6th century, and there seems to have been continuity of literary tradition for some time after the fall of the Western Roman Empire.

The growth of the empire spread Roman culture over much of Europe and North Africa. In all areas, even the outposts, it was not only the rough language of the legions that penetrated but also, it seems, the fine subleties of Virgilian verse and Ciceronian prose. Recent research suggests that in Britain, for instance, Romanization was wider spread and more profound than hitherto suspected and that well-to-do Britons in the colonized region were thoroughly imbued with Roman values. How far these trickled down to the lower classes is difficult to tell; because Latin died out in Britain, it is often thought that it had been used only by the higher classes of the population, but some suggest that it was a result of wholesale slaughter of the Roman British. It is, however, more likely that the pattern of Anglo-Saxon settlements was not in conflict with the Romano-Celtic and that the latter were gradually absorbed into the new society.

Development of Romance from Latin

In the lands in which Romance is still spoken, it is of course certain that, sooner or later, Latin in some form was the normal language of most strata. Whether, however, the Romance languages continue rough peasant dialects of

Latin (or even slave creoles) or the usage of more cultured urban communities is open to question. There are those who maintain that the Latin used in each area differentiated as soon as local populations adopted the conqueror's language for any purpose. According to this belief, dialects of Latin result from "interference" from indigenous languages (substrata), even though clear evidence for dialectal diversification cannot be found in extant texts. It is obvious that Latin usage must have differed over a wide area, but it can be questioned whether the differences were merely phonetic and lexical variations—regional accents and usage—not affecting mutual intelligibility or whether they were profound enough to form the basis of further differentiation when administrative unity was lost. The latter hypothesis would suggest a long period of bilingualism (up to about 500 years), as experience shows that linguistic interference between languages in contact rarely outlives the bilingual stage. Virtually nothing is known about the status of the indigenous languages during the imperial period, and only vague contemporary references can be found to linguistic differences within the empire. It seems odd that no one among the numerous Latin grammarians should have referred to well-known linguistic facts, but the absence of evidence is not sufficient to justify the assertion that there was no real diversification during the imperial era. Historical parallels are lacking—the British Empire did export English to widely different lands, but it lasted a comparatively short time, and its linguistic contribution was backed by modern communications media, besides being to some extent negated by nationalist feeling.

Latin and Romance coexisting

What is certain is that, even if popular usage within the empire showed great diversification, it was overlaid by a standard written language that preserved a good degree of uniformity until well after the administrative collapse of the empire. As far as the speakers were concerned, they apparently thought they were using Latin, though they were often conscious that their language was, through sheer ignorance, not quite as it should be. Not until about the 8th or 9th century—later in some parts—did it strike them that Classical Latin was perceptibly a different language, rather than merely a more polished, cultured version of their own.

Later Latin (3rd century AD onward) is often called Vulgar Latin—a confusing term in that it can designate the popular Latin of all periods and is sometimes also used for so-called Proto-Romance (*roman commun*), a theoretical construct based on consistent similarities among all or most Romance languages. All three Vulgar Latins in fact share common features but, given their different theoretical status, can hardly be called identical or even comparable. Written Vulgar Latin attained wide diffusion as the language of the Christian Church, officially adopted by the empire from the 4th century on. Its "vulgarisms" often called forth apologies from Christian authors, whose false humility seems akin to pride in that they did not succumb to the frivolities of pagan literary style.

Aside from the numerous inscriptions from all over the empire, there is no shortage of texts in Vulgar Latin. One of the first is the so-called *Appendix Probi* (3rd–4th centuries AD; "Appendix of Probus"), which lists correct and incorrect forms of 227 words, probably as an orthographical aid to scribes, but as a result illustrates some phonological changes that may have already occurred in the spoken language (*e.g.,* loss of unstressed penultimate syllables and loss of final *m*). The Vulgate, St. Jerome's translation of the Bible (AD 385–404), and the works of St. Augustine (AD 354–430) are among Christian works in Vulgar Latin. Particularly amusing and linguistically instructive also is the so-called *Peregrinatio Etheriae* ("Pilgrimage of Etheria"), written probably in the 4th century by a nun, describing her visit to the Holy Land. Medical and grammatical works also abound from the 4th to the 7th century (among the writers were the provincials Cosentius, from Gaul; Virgilius Maro, from southern Gaul; and St. Isidore of Seville, from Spain).

New vocabulary

Some of the characteristics of Vulgar Latin recall popular features of classical and preclassical times and foreshadow Romance developments. In vocabulary, especially, many of the sober classical words are rejected in favour of more colourful popular terms, especially derivatives and diminutives: thus, *portare* "to carry" (French *porter,* Italian *portare,* etc.) is preferred to *ferre; cantare* "to sing again and again" (French *chanter,* Spanish and Portuguese *cantar,* etc.) to *canere; vetulus* "little old man" (Romanian *vechi,* Italian *vecchio,* French *vieux,* etc.) to *vetus.* In grammar, classical synthetic constructions are often replaced by analytic; thus, the use of prepositions often makes case endings superfluous. *Ad regem* for *regi* "to the king," for instance, or anomalous morphological forms are simplified and rationalized (*e.g., plus sanus* for *sanior* "healthier"). Shorter, less complex sentences are preferred, and word order tends to become less flexible.

The most copious evidence for Vulgar Latin is in the realm of phonology, though interpretation of the evidence is often open to dispute, consisting as it does of the confused descriptions of grammarians and the misspellings of bewildered scribes. Much of the evidence points to a strengthening of stress accent during the late period, leading to the shortening and swallowing of unaccented syllables: thus, *viridem* "green" becomes *virdem* (*verde* in several Romance languages); *vinea* "vine" becomes *vinia* (French *vigne,* Spanish *viña* ["vineyard"], etc.). It is often thought that Classical Latin had a tonal, not a stress, accent; though this is uncertain, any stress on accented syllables was probably light and less acoustically perceptible than an accompanying rise in pitch. There is some scant evidence that a stress accent was used in popular and dialectal preclassical speech (*e.g., vinia* in a 3rd-century-BC epitaph, Oscan *minstreis* for Latin *minister* "attendant"), but the first undisputed testimony is to be found in 3rd-century-AD texts.

Among other phonological features of Vulgar Latin, probably the most striking is the loss of the system of long and short vowels. On the whole, long vowels became tense and short vowels lax, resulting in a wholesale change in the rhythm of the language. In the texts there is evidence of the confusion of *ĭ* and *ē* and of *ŭ* and *ō* that has occurred in the western Romance languages. A similar collapse of *ō* and *ŭ* seems to have occurred in Oscan, but it is unlikely that this is connected with later developments. It is to be remembered that even popular Latin verse used measures of vowel length, and there is no evidence to suggest that vowel-length distinctions were lost in vulgar preclassical speech.

An archaic feature that does recur in Vulgar Latin is the loss of word-final *-m,* of which virtually no trace remains in Romance. It is possible, however, that the written letter of Classical Latin was no more than an orthographical convention for a nasal twang: in scanning Latin verse, the *-m* is always run in (elided) before a vocalic initial. Reduction of the diphthongs *ae* (to *e*) and *au* (to *o*) seems also to be a popular and dialectal feature reflected in Vulgar Latin texts; in the latter case, however, the Romance languages do not support the hypothesis that the diphthong was reduced early, for it remains in Old Provençal and in Romanian and, probably, in early Old French.

Borrowing from Latin into non-Romance languages

The prestige of Rome was such that Latin borrowings are to be found in virtually all European languages, as well as in the Berber languages of North Africa, which preserve a number of words, mainly agricultural terms, lost elsewhere. Basque has borrowed a good number of words, mainly from administrative, commercial, and military spheres, though it is difficult in some cases to determine whether the terms were later borrowings from Spanish, rather than from Latin. This is not a problem in the case of the 800 Latin words found in three British Celtic languages (Welsh, Cornish, and Breton)—words drawn from a wide sphere of activities. In the Germanic languages, borrowed Latin words principally involve trade and often reflect archaic forms. The very large number of Latin words in Albanian form part of the basic vocabulary of the language (including kinship terms) and cover such spheres as religion, although there is doubt about whether some of them were later borrowings from Romanian. In other cases Latin words in Albanian have survived in no other part of the former Roman Empire. Greek and Slavic languages have comparatively few Latin words, many of them administrative or commercial in character.

Latin has had a continuous influence on the Romance languages and their neighbours in its capacity as a language of religion and culture. With Christianity, Latin penetrated to new lands, and it was perhaps the cultivation of Latin in a "pure" form in Ireland, whence it was exported to England, that paved the way for an 8th-century reform of the language by Charlemagne. Conscious that current Latin usage was falling short of classical standards, Charlemagne invited Alcuin of York, a scholar and grammarian, to his court at Aix-la-Chapelle (Aachen), where he remained from 782 to 796, inspiring and guiding an intellectual renaissance. It was perhaps as a result of the revival of so-called purer Latin that vernacular texts began to appear, for it now became obvious that the vernacular and Latin were not the same language. Thus, in 813, just before Charlemagne's death, the Council of Tours decreed that sermons should be delivered in *rusticam Romanam linguam* ("in the rustic Roman language") to make them intelligible to the congregation.

Latin as the language of religion and education

Latin has remained the official language of the Roman Catholic Church and as such has been in constant use by most Romance speakers; it is only very recently that church services have begun to be conducted in vernacular. As the language of science and scholarship, Latin held sway until the 16th century, when, under the influence of the Reformation, nascent nationalism, and the invention of the printing press, it began to be replaced by modern languages. Nevertheless, in the west, along with Greek, the Latin language has remained a mark of the educated man throughout the centuries, although since World War II the popularity of classical languages in schools has declined, and a generation of scholars who know no Latin, except for the numerous terms borrowed by all European languages, will soon be seen.

The emergence and development of the Romance languages. *Earliest period.* The question of when Latin ended and Romance began, which has occupied scholars in the past, is largely a problem created by terminology. In some senses, today's Romance languages are regional varieties of one uniform set of speech patterns that resembles the Vulgar Latin of attested texts fairly closely—indeed, the analyses of generative phonologists make the modern "underlying forms" (as distinct from their phonetic representation in speech) look almost identical with the reconstructed ancestor of the Romance languages, Proto-Romance. On the other hand, speakers are conscious that today they are speaking a "different language" from their neighbours, even though they may understand a good deal of their neighbours' discourse. Perhaps the speaker's consciousness is the best measure of divergence; when, one may ask, did Romance speakers realize that they were not using Latin in their everyday speech? Some scholars suggest that the realization must have dated from about the 5th century, when barbarians were streaming into the Roman Empire and, supposedly, hindering communication. Others prefer to rely on positive textual evidence, indicative of efforts to make up a written form of Romance distinct from Latin. Such evidence begins to appear only in the 9th century, first in northern France and then in Spain and Italy. The reforms of Charlemagne, reestablishing more classical standards in written Latin, may have been at once cause and result of the development of conventional written forms for vernacular Romance. Perhaps it was also the emergence of a new type of social organization, feudalism, that had linguistic effects as a result of the splitting of the open society of Roman tradition into small closed territorial units.

Romance glosses to Latin texts

From the 7th century onward, consciousness of linguistic change was strong enough to prompt scribes to gloss little-known words in earlier Latin texts with more familiar terms. Though the glosses often reflect Romance forms, however, they are usually given in a Latinate form, and one gains the impression of a few superficial adjustments to archaic but fundamentally comprehensible texts. The best known set of glosses—to the Vulgate Bible of St. Jerome—formerly belonged to the abbey of Reichenau, on an island in Lake Constance, Germany, and probably dates from the 8th century. The vocabulary of the Reichenau glosses appears to be French in flavour (*e.g., arenam* "sand" glossed by *sabulo,* French *sable; vespertiliones* "bats," by *calvas sorices,* French *chauvesouris*), and some words of Frankish origin appear (*e.g., scabrones* "beetles" is glossed by *wapces* "wasps," *respectant* "they look about" by *rewardant*). The glosses provide some evidence of morphological simplification (*e.g., saniore* "healthier" is glossed by *plus sano* "more healthy" and *cecinit* "he sang" by *cantavit*), but for the most part only lexical items are regarded as meriting comment. Another well-known glossary, known as the Kassel (or Cassel) glosses, probably dates from the very early 9th century. It gives Latin equivalents of German (Bavarian) words and phrases and provides evidence of lexical and phonetic differentiation within Latin that permits scholars to localize the work as probably French or Rhaetian (*e.g., mantun* "chin," as compared with modern French *menton*). Although orthographically eccentric, however, the text is obviously meant to represent Latin, not a Romance tongue; when phrases rather than isolated words are glossed, the Latin is often very close to classical models.

Beginnings of Romance literature

Later in the 9th century (with the Strasbourg Oaths, possibly, and more clearly in the Eulalia poem), deliberate attempts were made to write vernacular Romance, though the resources of the Latin alphabet were not wholly adequate to the task. That northern French texts were the first to appear is not surprising, for in that region Latin had changed more radically than elsewhere. By the 10th century the need to couch legal documents in more readily comprehensible vernacular, rather than Latin, was felt in other regions. Vernacular literature did not really get under way, however, until around the 12th century, when the arts flourished throughout western Europe. Rhaeto-Romance and Romanian, however, had to wait for the Reformation period to take on literary form.

Late-medieval period to the Renaissance. There was a good deal of cross-fertilization between Romance literary languages during the period of development of medieval poetry; the example of the Provençal lyric especially left its mark on all vernacular literatures, and borrowing of lexical items from one language to another was abundant. The 13th century saw some shift of linguistic influence from southern to northern France and from Sicily to Tuscany, toward the politically and economically more powerful regions. Portuguese and Catalan developed flourishing literatures somewhat later, taking over some of the traditions of the badly battered southern French region and dominating the literary scene of the Iberian Peninsula. French was fast losing its hold in England, which, a century earlier, had boasted a rich Anglo-Norman literature, and within France the central Parisian dialect began to dominate. In Italy, the Florentine dialect was showing signs of rising to prominence and providing the base for a literary standard.

Influence of Classical Latin on Romance

The rediscovery of classical literature and art, first in Italy and then in other Romance regions, had some considerable effect on the languages in the shape of extensive borrowing from Latin and Greek and, often, conscious attempts to model grammatical constructions in the vernacular on Classical Latin. The Italian standard language, in particular, owes much to the influence of Latin, which it resembles more closely than do the spoken dialects. French, except in the 16th century, was influenced grammatically less by Latin, but from the 14th century onward the habit of preferring words with a quasi-Latin shape to inherited forms became well established, so that much of the French vocabulary has a "learned" appearance. The trickle of Latinisms into Spanish became a flood in the 15th century, and, though Spanish has been more reluctant than French to reject old words, they today form a considerable proportion of the lexicon.

Standardization of the Romance languages in the 17th and 18th centuries. It was in Italy first that the "question of the language" became a matter of hot dispute. Dante himself made an important contribution to the debate on what should constitute a *volgare illustre* (an "illustrious popular speech") capable of rivalling Latin for literary and scholarly purposes. Controversy did not reach its peak, however, until the 16th century. In the Spain of 1492 the completion of the reconquest of Spain from the Arabs and the discovery of America were matched linguistically by the appearance of Antonio de Nebrija's *Gramática Castellana* ("Grammar of the Castilian Language"), which argues the need for an ennobled language fit for imperial exportation. In France during the 16th century, with the Renaissance backed by the Reformation and the advent of printing, French really took over the remaining functions of Latin—scholarly, scientific, and religious—and efforts were made to put together a worthy national language from dialect and Latin sources. The choice of standard was not made definitively, however, until the late 17th century, when, with political power and social influence centred exclusively at the royal court, the only acceptable usage became that of the court. It would seem that social acceptance and advancement were inextricably bound up with correct behaviour, especially linguistic behaviour, so that the well-to-do bourgeoisie set out to ape the speech habits of their "betters"—hence the popularity of works describing *le bon usage* "good usage." The influence of French, resplendent with the achievements of French dramatic poet Racine and of Louis XIV, was destined to remain dominant within the Romance languages; the Golden Age of Spain and Portugal had already passed, and Italy was going through a period of comparative stagnation.

"Correct" language

The French grammarians of the 18th century had lasting effect on all the Romance standards, concerned as they were with maintaining "purity," eliminating "vulgarity," and strictly codifying usage, often more in accord with logical than linguistic considerations. The belief that correct language is not a birthright but a tool to be carefully fashioned and skillfully handled, that conscious effort was required to allow it to mirror thought with the minimum of distortion, is one that has persisted in Romance and that still has important effects on educational practice. To many English speakers it seems ludicrous that the criterion of competence in a language should be strict adherence to grammar-book rules rather than native-like performance, but in Romance countries a foreigner is often frowned upon if he permits himself the "negligence" of native usage, rather than the more stilted correct expression. Educated Romance speakers often speak very formally, with flowing, complex sentences and precise vocabulary, in contrast with the casual, slangy expression of the less educated (who openly envy the speech habits of their "betters"). The passionate interest shown in subtleties of language usage (including regular articles in the better class newspapers) is something that characterizes all Romance speakers, though perhaps only the French take it to excess.

Modern developments. The Romantics of the early 19th century were eager to break the stranglehold of intellectual, aristocratic language, but their attempts to introduce more colourful expressions did not bring them nearer to popular usage, for their efforts were mainly directed toward enriching the vocabulary while leaving grammar intact. Sentimental idealization of peasant existence aroused interest in dialectal usage, and egalitarian sentiments provoked some groups of speakers to proclaim the worthiness of their own mother tongues to rival more politically important languages. Occitan, Catalan, Rhaeto-Romance, and, indeed, Romanian were to develop literatures under the impact of such ideas, which took political form in the demands of regional separatists.

Popular usage in literature

The introduction into literature of conventionalized popular usage is mainly a 20th-century trend, but in the Romance languages it remains more limited than, for example, in English. Other, more literary attempts to break out of the straitjacket of standard usage are connected with such artistic movements as Symbolism and Surrealism, in which syntax, as well as vocabulary, suffers onslaught, and sentence construction tends to cut loose from logical ties. Yet, even within these movements, fine, elegant style continues to be appreciated by many, and it is the traditional forms that have wider appeal. The use of a weighty bureaucratic style in nonliterary writings is also evident, often characterized by an excessive use of Latinism and by the use of verbal nouns, but educational systems continue to place emphasis on plain, classic style. It is difficult to imagine that the long-continuing tradition of interest in "correctness" in language will die out in the Romance countries; recent educational reforms of France and Italy seem rather to emphasize the value of such a tradition, and organizations and individuals, no matter how revolutionary in political outlook, rarely work to counteract the cultural values so long regarded as paramount in their homelands.

CHARACTERISTICS

As a group, the Romance languages share many characteristics besides that which defines the family (*i.e.,* the presence of a significant proportion of lexical cognates). In comparison with Germanic languages, for instance, they seem musical and mellifluous—probably because of the relatively greater importance of vowels than consonants. On the whole, the vowels are clear and bell-like and articulation energetic and precise, though Portuguese and Romanian convey a more muted acoustic impression. Foreigners often think that Romance speech is particularly rapid and voluble, no doubt because individual words receive only light stress (or, in French, no stress), and elision, the running of words into each other within stress groups, is common. Romanian is something of an exception in that speech tempo is comparatively slow. Intonation patterns, surface manifestations of nonlexical meaning, such as interrogation, exclamation, scorn, surprise, and so forth, seem to some to denote excitability and emotional expressiveness in the speakers. Northern French is comparatively sober, with typically about a one-octave range in intonation, but Italian seems to be sung, with sinuous pitch movement over two octaves, and Castilian jumps jerkily and up and down over about an octave and a third.

Retention of the synthetic character of Latin

Grammatically, the modern languages have retained to a greater or lesser extent some of the synthetic character of Latin, principally in the verb, but in Romanian also in the noun. French, since about the 14th century, has undergone most radical changes in grammatical typology, so that much greater reliance is placed on word order and intonation to convey sentence meaning than on morphological form. Other languages allow a little more flexibility of word order but far less than in Classical Latin.

Dominant purist grammarians have always opposed influence from foreign languages and reproved their fellows for sullying their language with lavish borrowing (at present primarily from English), but they have never been able to stem the flood of neologisms. French vocabulary, particularly, has always been receptive to change and has been as quick to lose old words as to adopt new. Codification of grammar, on the other hand, has had a permanent effect on the stability of the standard languages, even feeding back into spoken usage via the education system. Acceptance of the most minor changes follows long debate and deliberation and requires governmental edicts that decree what can be marked as correct in all-important examinations. Curiously enough, this rigidity and consequent self-confidence have resulted in greater teachability, so that standards of correctness of, for instance, French among Africans or Spanish among American Indians are remarkably high. The moves toward codification were, indeed, originally linked to a desire to give the languages inernational importance, and language teaching is, in the Romance ethos, indissolubly linked to the diffusion of cultural and moral values.

Linguistic typology of the Romance languages. As stated previously, the most "central" Romance language is standard Italian, which has retained and even re-adopted many Latin characteristics. In some ways its morphology lacks the elegance and efficiency of Castilian, which has most ruthlessly eliminated anomalies during the modern period; there are signs in Italian of historical inertia, a harking back to a glorious past, that has hindered popular development. Romanian remains closest in grammatical type to Latin, though its noun-declension system, based on the definite article placed after the noun, and its frequent use of the subjunctive mood may owe much to its Balkan neighbours (or to an earlier linguistic substratum). Its vocabulary has incorporated so many Slavic and Turkish words, however, that it often appears less Romance than the rest. French, by any standard, has diverged most—

Causes of the divergences in French

radical phonetic changes that transformed the outward appearance of the language must have preceded the earliest surviving (9th-century) texts. Such changes are usually ascribed to Celtic and Frankish influence. Another wave of change, with loss of word accent and of many morphological markers, probably dates from around the 15th century, but it is difficult to find external motivation for these phenomena. Occitan and Catalan are conservative in character; the long persistence of Roman schools in South Gaul is often seen as the cause of stability there. Spanish and Portuguese are close enough to lead some scholars to assign their shared characteristics to Iberian substratum and Moorish superstratum influence. Castilian's forceful character and receptivity to grammatical innovation contrast sharply with Portuguese softness and its inertia in retaining morphological oddities, however. One might conceivably see the differences as connected with climatic and geographical conditions, though just how would be difficult to discern. Rhaeto-Romance and Dalmatian peculiarities can most easily be connected with the impact of other languages (mainly German, Italian, and Serbo-Croatian), while Sardinian is often regarded as an extremely conservative, peasant language, some dialects of which have been penetrated by features from Italian and Spanish.

Phonology. Some important phonological developments, such as the loss of the system of contrasting vowel lengths and the strengthening of the stress accent, must have occurred during the Vulgar Latin period, while some degree of unity still existed among the various Romance dialects. Certain other changes shared by the Western Romance languages, especially the collapse of *ē* and *ĭ*, might have postdated the linguistic separation of Sardinia and parts of southern Italy from the other areas, while the distinct development of *ō* and *ŭ* in Romanian and Vegliot suggests a split between Eastern and Western Romance at a later date.

Unaccented vowels

Vowels. Everywhere, unaccented vowels have had a different history from accented, and in some languages they have so weakened as to disappear altogether in certain positions. At the end of a word, for instance, even *-a,* the most sonorous of the vowels, has weakened to a neutral vowel in Romanian, Portuguese, and some Catalan and Rhaetian dialects—in some French dialects it is still pronounced as a neutral vowel sound (such as the second vowel in English "alph*a*bet"), but it has been lost completely in the standard language. Final *-o,* from Latin *-o* or *ŭ,* was lost very early in French, Occitan, Catalan, and Rhaetian and remains only before an article following the word in Romanian; in Portuguese it is closed to a *u* sound (such as the *u* in English "l*u*nar"). Final *-e* is even more evanescent, regularly remaining as a full vowel only in parts of central and southern Italy and Sardinia.

Under the main stress accent of the word, Latin vowels have often become diphthongs in Romance, perhaps as a result of lengthening under heavy stress or as a consequence of the raising influence of following high vowels (a process known as breaking, similar in action to German umlaut). The vowels most affected are the "open" *e* sound (as in "m*e*t"), from Latin *ĕ,* and to a lesser extent the "open" *o* sound (similar to the *aw* sound in "law" in many American English dialects and to the *o* in British English "ingot"), from Latin *ŏ,* while high close vowels *i* and *u* are virtually untouched. Transformation of short *e* to a diphthong (usually a *ye* sound, as in "yet") is so common that some believe it occurred during the Vulgar Latin period. The conditions of this process (and similar ones) vary, however; in some languages (notably French and Italian) it happens only in open syllables (*i.e.,* those ending in a vowel in Vulgar Latin), whereas Romanian, Vegliot, Spanish, and perhaps Rhaetian show similar developments in all accented syllables. Portuguese possibly did not join in the diphthong-forming process at all, though, as in Occitan, Catalan, Sardinian, and some Italian dialects the short *e-* and *o-* sounds may at one time have developed into diphthongs under the influence of a following high vowel (*i* or *u*), later to be reduced once more to a single vowel. Table 10 illustrates treatment of stressed Latin *ĕ* and *ŏ* in different languages.

Table 10: Occurrence of Diphthongs Replacing Stressed Short Vowels in Romance Languages

	pĕde "foot"	*hĕrba* "grass, herb"	*mŏrit* "he dies"	*mŏrtem* "death"
Sardinian	*pe*	*erva*	*móridi*	*morte*
Portuguese	*pe*	*herva*	*morre*	*morte*
Catalan	*peu*	*herba*	*mor*	*mort*
Occitan	*pe*	*erba*	*mor*	*mort*
French	*pied*	*herba*	*meurt* (Old French *muert*)	*mort*
Italian	*piede*	*erba*	*muore*	*morte*
Romanian	—	*iarbă*	*moare*	*moarte*
Spanish	*pié*	*hierba*	*muere*	*muerte*
Rhaetian (Sursilvan)	*pei*	*jarva*	*miere*	*mort*
Rhaetian (Friulian)	*pid*	—	—	*muart*
Vegliot	*pi*	*járba*	—	*muart*

Reflexes of Latin *ō* (and *ŭ*) and *ē* (ĭ) became diphthongs *ou* and *ei* in Northern French at an early period (after the 5th but before the 9th century); the 12th-century phonetic results *eu* and *oi* provided the present-day spellings, though the sounds thus represented have changed considerably since (compare *fleur* "flower," from *flour,* from *flore*). The greater extension of spontaneous diphthong formation in French than in other Romance languages (including perhaps also reflexes of *a*—compare *mer* "sea," from **maer* [?], from Latin *mare*) is often attributed to the effects of the heavy stress presumably used by the Frankish superstratum.

Effects of nasal consonants on vowels

In nearly all Romance languages a following nasal consonant has caused peculiar development in a preceding vowel. In most cases the effect is limited to a raising or closing influence, but in two major languages, French and Portuguese, phonological nasalization has taken place (*i.e.,* a series of vowels distinguished by the presence of nasal resonance has developed). Here, as well as in some other dialects (especially Chilean, Caribbean, and Andalusian Spanish, in the Romanian spoken in Albania, and in northern Occitan), nasal vowels are distinct from their oral counterparts and not mere variants (*i.e.,* they are phonemic). Thus, they serve to differentiate one meaningful form from another: *e.g.,* French *pin* "pine," pronounced *pɛ̃* (ɛ stands for a short *e* sound, and ~ marks nasalization) versus *paix* "peace," pronounced *pɛ*; Portuguese *lã* "wool" versus *la* "there"; Andalusian *cantã* "they sing" versus *canta* "he sings." Occasionally, nasalization of a vowel is caused by a preceding consonant (*e.g.,* Portuguese *mãe* "mother," from *matre*), but this is comparatively rare.

Nasalization in both French and Portuguese was probably noticeable by the 10th century, though it may not have become phonemic until much later. Some claim that even today nasal vowel resonance is merely a surface manifestation of a latent underlying nasal consonant. It would appear that in both languages nasal vowels were more frequent in the Middle Ages than today; in about the 16th century in France, denasalization took place when the nasal consonant was intervocalic, and the *n* sound was retained—in, for example, French *bon* "good [masculine]" (pronounced *bõ*) and *bonne* "good [feminine]" (pronounced *bon* or [bon]). In Portuguese the consonant did not always reappear after denasalization (compare *boa* "good [feminine]," from *bõa,* from *bona*), though between *i* and *a* or *o* the palatal nasal consonant (close to *ny* in "canyon") is inserted (*vinho* "wine," from *vĩo,* from *vinu*).

Nasalization has sometimes, though without much conviction, been attributed to Celtic substratum influence. A better case can be made for the effect of such influence in the French *u* sound, [y], pronounced like German *ü* or Greek upsilon, though ignorance of Gaulish and certain chronological and geographical discrepancies make it difficult to argue in detail. The French *u* sound is also found in most Occitan dialects (in which it may be a recent introduction from French), in Rhaetian, and in parts of Portugal and Italy; elsewhere it is sometimes a characteristic of affected speech.

French uvular *r*

Consonants. Another French pronunciation that is often imitated by socially pretentious speakers is that of the Parisian uvular *r* (produced by vibration of the uvula, an appendage at the back of the mouth), which was not accepted in standard French until after the Revolution, though probably used by the Parisian bourgeoisie from the 17th century. It probably developed from the Latin double *-rr-*, differentiated from single *-r-*, which in Middle French tended to be pronounced with local friction, almost as a *th* or *z* sound (compare *chaise* "chair" and *chaire* "chair—throne, pulpit"). In most dialects of Provence today the distinction between the two *r* sounds is still made (though Occitanian dialects in general are adopting the French pronunciation). Brazilian Portuguese uses a similar contrasting pair of *r* sounds, with the usual trilled *r* represented in orthography by "*r*" and a velar, or "rough," *r* represented by "rr": Brazilian *caro* "dear" and *carro* "cart." Elsewhere only Puerto Rican Spanish and a few North Italian and Romanian dialects use the velar *r* regularly, though it is heard sporadically nearly everywhere.

One phonological development that is thought by many to be indicative of a very early split between the Eastern and Western Romance areas concerns the treatment of consonants between vowels. To the north and west of a line drawn between La Spezia and Rimini, in Italy, most dialects voiced Latin voiceless consonants between vowels and simplified geminates (doubled consonants); southern and eastern dialects to a greater extent retain the Latin voiced–voiceless–geminate system. The dividing line appears also to run through Sardinia, so that northern dialects are "Western" and southern ones "Eastern." Table 11 shows the treatment of intervocalic *p* and *t*.

Table 11: Development of Latin Intervocalic p and t in Romance Languages

	ripa "bank"	*rota* "wheel"
Vegliot	*raipa*	—
Romanian	*rîpă*	*roata*
Italian	*ripa*	*ruota*
Logudorian	*riba*	*roda*
Occitan	*riba*	*roda*
Catalan	*riba*	*roda*
Spanish	*riba*	*rueda*
Portuguese	*riba*	*roda*
French	*rive*	*roue* (Modern French) *ruede* (Old French)
Rhaetian	*riva*	*roda, ruede*

Some believe that the voicing of voiceless sounds is connected with a similar, though not identical, process known as lenition in Celtic. Lengthening and subsequent development into diphthongs of accented vowels may be linked to the reduction of Latin doubled consonants to single consonants, as some recent theories suggest.

One noticeable difference between Latin and all the Romance languages is that the consonantal systems of the latter include a number of palatal and palato-alveolar consonants, which did not exist in Latin. (Palatal consonants are formed with the tongue touching the hard palate; palato-alveolar sounds are made with the tongue touching the region of the alveolar ridge or the palate.) One consequence of the strengthening of the stress accent in the later Latin period was that unstressed *ĭ* and *ĕ* following consonants became shortened to a nonsyllabic palatal *y* sound (called *jod*). The effects of this new sound on preceding consonants are varied, but in many cases these have been pronounced with the tongue raised more toward or against the roof of the mouth, or palate (a process classified under the general heading assimilation), sometimes ending up eventually as a dental fricative (such as *z* or *th*) or affricate (such as *ch*) and perhaps modifying the preceding vowel. That this process began early is suggested by the not-infrequent confusion of *-tĭ-* and *-cĭ-* in orthography, sometimes represented even as *tz* in inscriptions. This palatal shift in pronunciation led to developments such as French *rouge,* Portuguese *ruivo,* Catalan *roig,* and Italian *rosso* from Latin *rubeum* "red" and French *feuille,* Portuguese *folha,* Italian *foglia,* and Sardinian *fodza* from Latin *folia* "leaf."

Shifts involving palatal consonants

Another source of palatal consonants in Romance has been back (velar) consonants when immediately followed by a front sound: the velar consonant has often moved forward in the mouth, sometimes eventually to dental or alveolar position but often settling on a palatal or palato-alveolar position. This process, too, probably began early, first affecting velar consonants *k* and *g* preceding front vowels *e* and *i.* That it had not occurred at the classical period is shown by its absence in early loanwords into other languages (Berber, Basque, Celtic, Germanic, Albanian, and Greek). As central Sardinian dialects retain velar pronunciation in the environment of front vowels, it may be assumed that palatalization postdated the separation of the island from the rest of the empire. Vegliot evidence is difficult to interpret, as *ē* does not seem to have provoked palatalization, whereas *ĕ, ĭ,* and *u* did so. It was this sound change that resulted in the pronunciation of "soft" *c* before *e* and *i* (in most Romance languages this is an *s* or *ts* sound; in Italian and Rhaetian it is a *ch* sound). Before *a, o,* and *u* the *c* retained its "hard" pronunciation (that is, a *k* sound). In Classical Latin, before the sound change occurred, all *c* sounds were "hard." Hence, Latin *centum* ("kentum") gave rise to Italian *cento* ("chento"), Portuguese *cento* ("sento"), and Spanish *ciento* ("siento" or, in Castilian, "thiento").

In north central France, Latin *a* must have advanced to a front position, with the result that it, too, palatalized preceding *k* and *g* sounds. The results give the palato-alveolar sounds of *sh* and *zh* (written in the International Phonetic Alphabet as [ʃ] and [ʒ], respectively), via [tʃ], the *ch* sound in "church," and [dʒ], the *j* sound in "jam"; *e.g.,* French *chanter* "to sing" developed from Latin *cantare, joie* "joy" from *gaudia.* West Rhaetian dialects show a similar development (compare Sursilvan *tgaun,* Engadine *chaun,* French *chien,* from Latin *canem* "dog"), as do Franco-Provençal and Northern Occitan dialects, but Picard and some Norman dialects do not (Picard *canter,* with an unpalatalized *c,* from Latin *cantare; kier* "dear," from *carum*). The change is assumed to have taken place at a later period than the palatalization of *k* when followed by *e* or *i,* which did not affect Frankish words. These, on the other hand, succumbed to the type of palatalization in which *k* changed to *ch* [tʃ] and then to *sh* [ʃ] (**skina* > *échine* "backbone").

Romanian consonant developments

In Romanian, velar consonants were moved forward under the influence of a following *i* and *e,* and dental consonants were moved back to a palatal position under the same influence; *e.g., ţară* from *terram* "earth"; *şi* "and" from *sic* "thus." Labial consonants are also affected in some dialects: *k'ept* from *piept* from *pectum* "chest"; *jin* from *vin* from *vinum* "wine." Romanian also has, in final position, a series of "soft" consonants, reminiscent of the Slavic sounds. These are transparently derived from earlier "hard" consonants followed by *i,* performing certain important morphological functions: *lupi* [lup'] "wolves" / *lup* [lup] "wolf"; *cînţi* [kints'] "thou singest" / *cînt* [kint] "I sing."

Palatalization of consonants in Romance was effected not only by following front vowels but also by juxtaposed front consonants, especially when a velar (such as Latin *c* or *g*) was next to a dental (such as *t, s, n*) or a lateral (*l* sound) in medial position, sometimes as a consequence of the loss of an unaccented vowel during the Vulgar Latin

Table 12: Results of Palatalization of Consonant Clusters

	noctem "night"	*coxam* "hip"	*piscem* "fish"	*pugnum* "fist"	*oc'lum* "eye"

French	*nuit*	*cuisse*	(*poisson*)	*poing*	*oeil*

period. Results of this process vary from language to language. Table 12 gives examples of these changes.

It will be noted that in Romanian a labial consonant has been substituted for the velar in the Latin clusters *-ct-*, *-x-* [ks], and *-gn-*. Perhaps there was first assimilation of the velar to the dental—as in Italian *-tt-* from Latin *-ct-* and Sardinian *-nn-* from Latin *-gn-* (*linna* from *ligna* "line")—followed by differentiation of the first element of the geminate. It is notable that Latin *l* regularly becomes *jod* after another consonant in Italian (*piacere* from *placere* "to please"; *fiore* from *flore* "flower"; *chiave* from *clave* "key"; *ghianda* from *glanda* "acorn") and after velars in Romanian (*plăcea, floare,* but *cheie* [kjej], *ghindă* [gjində]). In Spanish and Portuguese a following *l* in Latin often palatalizes labial consonants (*p, f*) as well as velars, in initial as well as medial position; *e.g.,* Latin *planum* becomes Spanish *llano* "plain," Portuguese *chão;* Latin *afflare* becomes Spanish *hallar* "to find," Portuguese *achar.*

Grammar. Item for item, the Romance languages all appear grammatically close to Latin and to each other: superficial resemblances in individual expressions may, however, mask differences of content and construction that are difficult to describe. The most obvious difference between Latin and Romance is in the comparative autonomy of morphemic units, especially words. In Romance, Latin inflectional endings have been much reduced, and more reliance is placed on syntactic construction to convey sentence meaning; that is, Romance languages are more "analytic" than the predominantly "synthetic" Latin. A corollary of this is that word order is less flexible in Romance, as it has become the principal means of showing relationship between words in the sentence.

Reduction of inflectional endings

Forms of nouns and adjectives. The inflectional endings have been lost most in nouns and adjectives. The Classical Latin five-case declensional system has everywhere been replaced (with a couple of doubtful exceptions) by a two-gender system, in which normally masculine gender is marked by survivors of the second (*-us*) declension endings of Latin (Italian *cavallo,* Portuguese *cavalu,* Romanian *calul,* Sardinian *kaḍḍu,* Rhaetian *cavagl,* from Latin *caballus* "horse"), and feminine is marked by first (*-a*) declension endings (Italian *capra,* Spanish *cabra,* Rhaetian *caura,* Romanian *capră,* from Latin *capra* "goat"). Cognates of third-declension Latin noun forms are incorporated into the same system, but their gender is marked by changes in the article or accompanying adjective (agreement or accord) rather than by overt markers in the word itself (for example, masculine Italian *il monte,* Catalan *es munt,* from Latin *mons, montem* "mountain"; feminine Italian *la notte,* Catalan *sa nit,* from Latin *nox, noctem* "night"). In modern French, although gender is marked in the written language, however inconsistently, by the presence or absence of final *-e,* any overt morphological markers the spoken language may have are more complex in character, and more reliance is placed on syntactic agreement; thus, *chatte* "she-cat" is distinguished from *chat* "cat" by the presence or absence of the final consonant sound *-t* in pronunciation, but *(le) tour* "tour, trick" and *(la) tour* "tower" have identical phonetic shapes though they belong to different gender classes.

All the Romance languages continue to mark plurality in nouns and adjectives morphologically, though in modern spoken French this is not done consistently. In Western Romance the sign of the plural is usually *-s,* derived from the Latin accusative plural flection: Spanish *caballos, cabras, montes;* Occitan *cavals, cabras, mons;* Catalan *cavalls, cabres, muntes;* Sardinian *kaḍḍos, krabas, montes;* Old French *chevals, chèvres, monts.* In Italian and Romanian, however, plurality is shown by a final *-i* (which in Romanian "softens" the preceding consonant) or, in the case of some feminine nouns, by a final *-e:* Romanian *cai, capre, munți, nopți;* Italian *cavalli, capre, monti, notti.* These endings may derive from Latin nominative plural first- and second-declension endings *-ae* and *-ī,* or they may represent a somewhat irregular development of the *-s,* favoured elsewhere.

Loss of case system

The Latin nominal case system has disappeared in all modern languages except Romanian, in which the inflected article distinguishes the nominative and accusative from the genitive and dative (see Table 13). Thus, when other Romance languages would use a preposition to indicate a certain relationship between words, Romanian resembles Latin in using an inflected form (*e.g.,* Latin *matris* "the mother's: Romanian *mamei,* French *de la mère,* Italian *della madre*).

Table 13: Declensional System of Romanian

	singular	plural
Masculine "son"		
Nominative–accusative	*un fiu, fiul*	*fii, fiii*
Genitive–dative	*unui fiu, fiului*	*unor fii, fiilor*
Feminine "mother"		
Nominative–accusative	*o mamă, mama*	*mame, mamele*
Genitive–dative	*unei mame, mamei*	*unor mame, mamelor*

In Old French and Old Provençal some remnants of a case system remained, in that the masculine nominative (subject of the verb) was distinguished from the other cases (collectively called oblique). Today such grammatical information is conveyed by word order in most Romance languages, as in English, with the subject normally preceding the verb: French *Pierre appelle Paul* "Peter calls Paul"; Portuguese *Pedro chama Paulo;* Italian *Piero chiama Paulo.* Some Romance languages pick out the object of the verb, if it is a person, by an additional particle: Spanish *Pedro llama a Pablo;* Romanian *Petru cheamă pe Pavel.* Several Italian dialects, as well as Sardinian and occasionally Engadine and Portuguese dialects, have similar constructions: Calabrian *Chiamu a Petru* "I call Peter"; Elba *Ô visto a ttuo babbo* "I saw your grandpa"; Engadine *Amè a vos inimihs* "Love your enemies." It is notable that the Italian-based lingua franca used by Mediterranean sailors since the 16th century also picks out the personal object (*e.g., Mi mirato per ti* "I saw you").

The definite and indefinite articles were unknown in Latin but developed everywhere in Romance, usually from the Latin demonstrative *ille* "that" (though in a few parts from reflexive *ipse* "himself") and the numeral *unus* "one." The articles seem to have played some part, during the older stages of the languages, in distinguishing subject from object; the article is more often used where a Latin nominative would have occurred than in other cases, perhaps to give prominence to the topic of the sentence. Today the use of the article has so extended that such distinction is no longer possible; in French, for instance, a common noun is always accompanied by a determiner such as an article, demonstrative, or possessive, so forms remaining from the earlier stage, such as *avoir faim* "to be hungry," are often regarded as idiomatic and inexplicable in terms of modern structure.

The system of verbs. In the passage from Latin to Romance, verbal inflection has survived much more than noun declension. Although the four regular Latin conjugations have been virtually reduced to two, with only the *-a-* class remaining truly productive, other features of the verb seem almost unchanged. In most languages, for instance, the person markers are directly traceable to Latin origins (*i.e.,* to Latin *-ō, -s, -t, -mus, -tis, -nt*). Modern spoken French is the only major language in which the personal endings no longer serve the same function as Latin. Today, person is marked in French principally by pronouns derived mainly from the Latin emphatic nominative forms of the personal pronoun: *J'aime* [ʒɛm] "I love," *tu aimes* [tyɛm] "you love" from (*ego*) *amo,* (*tu*) *amas.* The creoles have taken this process even further, in that their verb forms are usually invariable but are prefixed by elements indicating person, tense, aspect, etc., as in many West African languages: Louisiana French [motegẽ] "I was having" from *mon* [mo] *étais* [te] *gagner* [gẽ]; and similarly [ilagẽ] "he will have."

Verb conjugations

In the metropolitan languages, verbal modalities are shown, as in Latin, by inflection. Some Latin verb endings, such as that of the *-r* passive or of the future, have disappeared; others, such as the pluperfect indicative and subjunctive, have survived in a few languages with modified function. But most languages today have reflexes of the present, perfect, and imperfect indicatives and of one or more subjunctive tenses. The imperfect indicative, a Latin innovation, survives almost intact, though the evolution of its form, not to mention its function, presents problems. The *-ī-* stem form in Latin *-iēba-* is thought to have coalesced early with the *-ē-* stem *-ēba-* form, but a few languages (notably Italian, Friulian, and some Spanish and Portuguese dialects) today have reflexes of an *-ība-* form that might have survived from popular Latin. The Latin *-āba-* form survives almost everywhere, though in most French dialects its older reflexes, *-eve* and *-oue,* have been replaced in modern times by forms derived from Latin *-ēba-*. These latter are thought to be widespread but are puzzling phonologically as they have very often irregularly lost their *-b-* (Spanish, Portuguese, etc., *-ía,* French *-ais*).

The Latin perfect of the type *amāvit* "he has loved" is known by all the literary languages but is rare in speech in French, Italian, and Romanian, in which it has been replaced by a new compound past made up of the verb for "to have" and a past participle. The latter structure is known to some extent in all Romance languages, often being used to express a more recent past than the preterite *amāvit* form, which also indicates action in the past (without reference to duration or repetition): Romanian *au cîntat,* Italian *ho cantato,* French *j'ai chanté,* Spanish *he cantado,* Old Portuguese *hei cantado,* Engadine *ha chantà, hè chantò,* Sardinian *kantau appo,* from Latin *habeo cantatum* "I have sung." In Modern Portuguese the preferred auxiliary is *ter* "to have, to hold" rather than *haver,* producing forms such as *tenho cantado,* while modern Catalan more commonly uses the verb for "to go" plus the infinitive, giving *vaig cantar* rather than the pan-Romance type *hé cantat*.

Representation of the future tense

The disappearance of the Latin future has been remedied in most Romance languages by the development of new forms of periphrastic origin. Many of these forms use some reflex of *habēre* "to have" joined to an infinitive. From Latin *cantāre habēo* "I will sing" are derived Italian *canterò,* Spanish, Catalan *cantaré,* Portuguese *cantarei,* French *je chanterai,* Rhaetian *c(h)antero, c(h)antera,* Occitan *cantarai; habēo cantāre* gives southern Italian *aggio cantà* (similar forms are seen in earlier Spanish, Portuguese, and northern Italian). Latin *habēo ad cantāre* produces Sardinian *ap a kantare,* and *habēo de cantāre* gives Portuguese *hei-de cantar* (more popular than *cantarei*).

A periphrastic future of the type known in English "I'm going to sing" enjoys popularity in Romance, mainly to indicate a less distant future event than the more formal future tense (*e.g.,* French *je vais chanter,* Spanish *voy a cantar*). Other periphrases used in Romance are "I will (wish to) sing," as in Romanian *voi cînta;* "I must sing," as in Sardinian *deppo kantare;* "I'm coming to sing," Sursilvan *jeu vegnel a cantar;* and "I have that I should sing," as in popular Romanian *am să cînt.* Notably, Dalmatian does not seem to know periphrastic Romance futures but uses a form *kantuora* (perhaps from Latin *canāverō*) as both future and conditional.

The Romance conditional, or "future in the past," a form not found in Latin, is in many languages related to the new future. In the Western languages it is composed of the future stem (or infinitive) plus a past-tense marker related to reflexes of *habēre.* In some cases an imperfect form is used, in others a perfect form; examples are French *je chanterais* "I would sing," Spanish, Portuguese, Occitan, and Catalan *cantaría,* and Italian *canterei, -ebbe,* etc. In Romanian the conditional marker can either precede or follow the infinitive and may be derived from the imperfect of *vrea* "to wish": for example, *aşi cînta, ar cînta,* etc., or (more literary) *cîntare-aş, cîntare-ar,* etc.

Word order

Word order is the means most used by modern Romance languages to show the grammatical relationship between words; statistically the most frequent order in statements is subject–verb–noun object. In many of the Romance languages, interrogation can be shown by inversion of the subject and verb, placing the verb, as the element on which the interrogation falls, at the beginning of the sentence (Spanish *¿Vino el hombre?,* Italian *É venuto l'uomo?* "Has the man come?"). In such examples, however, it is the intonation (represented in writing by the question mark) rather than the word order alone that marks the question. Inversion, without interrogative intonation, is not infrequent in emphatic assertions. Unambiguous question markers—such as the Latin particles *-ne, nonne,* and *num*—are lacking in most Romance standards; popular speech, though relying everywhere principally upon intonation, often has developed new particles to reinforce interrogation. Romanian has *oare, şi* (*Oare a venit?* "Has he come?"; *Si te ai culcat?* "Have you been to bed?"); Italian uses dialectal *ce, che,* or *o* (Vulgar Tuscan *Che è venuto?* "Has he come?"; *O come si chiame?* "What is he called?"); Sardinian has *a (A mosse kkŭstu kăne?* "Does this dog bite?"); and French and Limousine have *ti* (generalized from such forms as *a-t-il?;* French *Je suis-ti bête?* Limousine *Sieu-ti nesci?* "Am I stupid?"). In modern standard French great use is made of *est-ce que* as an interrogative particle: *Est-ce qu'il est venu?* "Has he come?" *Comment est-ce qu'il s'appelle?* "What is his name?"

Negation in Latin was expressed by a range of special items (*non, nemo, nihil, nullus, nunquam,* etc.). Although some of the others survive in Romance, continuators of *non* have taken over the main burden of negative expression and are regularly prefixed to the verb. Nuances within negation are usually expressed by the adjunction of other items. In France, both north and south, and in northern Italy and some of the Swiss Rhaetian areas, the *non* particle has been so weakened phonetically that it no longer can express unambiguously the important distinction between negative and positive; hence, formerly positive adjuncts have acquired its negative meaning.

French *personne / une personne* signifies "no one / a person"; *pas / un pas* means "not / a step"; and *plus* can mean "more / no more." In popular speech the *non* particle is frequently omitted altogether in areas that use these additional forms (*e.g.,* French *Je (ne) le vois pas;* Occitan *Lou vese pas* for *Noun lou vese* "I don't see it").

Reduction of the subjunctive

Morphologically, the verb system survived comparatively intact from Latin to Romance; if the schoolbooks, heavily influenced by Latin grammar, are right, the ways in which the verb forms are used are not so very different from Latin either. The most obvious change has been the reduction of uses as well as of forms of the subjunctive, with, at the extreme, modern French treating them as automatically determined variants to be used obligatorily after certain phrases and conjunctions and virtually eliminating tense differences within the subjunctive mood. When the subjunctive retains a function in Romance—that is, in contexts in which it can contrast with the indicative—it has developed emotive overtones, especially suggesting doubt, unreality, or some sort of hypothetical futurity. It is used especially in subordinate clauses dependent on verbal expressions of command and exhortation, emotion, or doubt: Romanian *voi să vină* "I want him to come"; Engadine *Mieu bap voul ch'eau lavura* "My father wants me to work"; French *Je doute qu'il vienne* "I doubt that he's coming"; Portuguese *Duvido que seja feliz* "I doubt that he is happy"; Italian *Temo che sia tarde* "I'm afraid it's late"; Spanish *Temo que él lo diga* "I'm afraid he'll say it." The subjunctive also regularly follows subordinating conjunctions that project action forward into the future, such as "until," "before," "in order that": French *avant que vous soyez venu* "before you came"; Spanish *hasta que sea feliz* "until he is happy"; Italian *perchè potessi fare in tempo* "so that I might do it in time"; Portuguese *antes que eu o veja* "before I see it"; Catalan *abans que vingui* "before he comes."

On the whole, however, the Romance languages use the subjunctive less than Latin, with recession particularly, when no doubt is implied, in indirect speech and in temporal and concessive clauses (in French, use of the subjunctive after concessive conjunctions such as *bien que* and *quoique* "although" was imposed by 18th-century grammarians). The infinitive is often used in subordinate constructions when Latin would have used a subjunctive; *e.g.,* French *dites-lui de s'en aller,* for *dites-lui qu'il s'en aille* "tell him to go away." Romanian, on the other hand, has even extended the use of the subjunctive in such constructions, perhaps reflecting a substratum influence that is felt, too, in other Balkan languages. Greek influence is sometimes credited with similar constructions (usually using the indicative rather than the subjunctive) found in northeast Sicily, northern Calabria, and the Salentine Peninsula.

Conditional clauses

One area of syntax in which the Romance languages vary widely in the extent to which they retain and in the manner in which they replace the Latin subjunctive is that of past-tense hypothetical conditional clauses. The Latin formula *si habuissem dedissem* "if I had had it, I would have given it," though challenged by a type using the indicative tense since Ciceronian times, has sporadically survived into Romance, especially in the older stages of the languages and in scattered parts of southern Italy (*Se potessi, facessi* "If I could, I would do it"), Rhaetian (Sursilvan *Jeu vegness, sche jeu vess peda* "I'd come, if I had time") and Romanian (*'dacă aşi avea destui bani, aşi cumpăra-o* "If I had enough money, I'd buy it").

In most languages, however, a new conditional form replaces the subjunctive in "if" clauses. Thus, in Spanish, Portuguese, and most Italian dialects, sentences of this type are seen: Spanish *si yo tuviese bastante dinero, lo compraría;* Italian *se avesse abbastanza danaro, lo comprerei;* Portuguese *se tivesse bastante dinheiro compraríao* ("if I had enough money, I'd buy it"). Spoken Catalan usually prefers a similar construction (*si estudiessis ho sabries* "if you studied, you would know it"). Another construction that replaces the subjunctive by the imperfect indicative in the "if" clause is, however, considered more correct in Catalan and is normal in French as well as in Corsica and Sardinia: Catalan *si estudiaves ho sabries* ("if you studied, you would know"); French *si j'avais assez d'argent, je l'achèterais* ("if I had enough money, I'd buy it"); Logudorian *si denía abba deo dia buffare* ("if I had water, I'd drink"). Other constructions using the imperfect indicative or the conditional in both clauses are found mainly in substandard styles—both types are common in French, the former in Tuscany, southeastern Italy, and Spain and the latter in much of southern Italy.

Forming new words

Word formation. Romance methods of forming new words from native sources are in part inherited from Latin (the morphological device of adding a suffix and that of prefixing an element that modifies the original meaning) and in part later developments (mainly that of combining two or more free forms to make compound words and of changing or extending the syntactic distribution of an already existing word).

Derivation by means of suffixes is the most popular and widespread device; verbs in particular must be morphologically marked as members of a conjugation, of which those corresponding to Latin *-āre* form by far the most frequent and indeed in modern times virtually the only productive class (thus Latin *plantāre* "to plant," Italian *plantare,* Engadine *plaunter,* French *planter,* Catalan *plantar,* from *planta* "plant"). Infixes, inserted between the verbal root and the conjugation marker, are common. Sometimes they continue Latin infixes, such as the frequentative (compare *jactāre* for *jacere* "to throw," Italian *gettare,* French *jeter,* Catalan *getar,* etc.); sometimes they add semantically to the root meaning (compare pejorative Italian *lavoracchiare* "to slack off" from *lavorare* "to work," French *criailler* "to bawl" from *crier* "to cry"). The Greek verbal infix *-iz* (as in English "ize") is particularly popular in Romance today (*e.g., latinisare, automatiser*).

Among noun suffixes, diminutives are frequent and, except perhaps in French, still productive. Romanian uses *-aş* (*degetaş* "little finger", but the other languages prefer derivatives of Latin *-ittus* (especially in Spanish: *arbolito* "little tree," *señorita* "Miss, young lady," etc.; but also French *sachet* "little sack," Italian *foglietta* "little leaf," etc.) or of Latin *-īnus* (preferred in Italian: *tavolina* "little table, desk," *signorina* "young lady"; and Portuguese: *copinho* "little drinking glass," *senhorinha* "young lady"). The Latin *-ōne* suffix has, conversely, acquired augmentative meaning in several languages (Romanian *căloiu,* Italian *cavallone,* Spanish *caballón* "large horse").

Other frequent suffixes sometimes have a "learned" modern form alongside the older "popular" one; *e.g.,* Latin *-atione:* Italian *-agione / -azione,* French *-aison / -ation,* Spanish *-azón / ación,* Portuguese *-azão / ação;* also Romanian *-ăciune,* and Occitan *azó.*

Suffixes that remain extremely productive include the Latin verbal adjectival *-bilis* (not found in Romanian): Italian *bastevole* "enough," French *admirable,* Spanish *amable* "pleasing"; and verbal nominal *-mentum:* French *abonnement* "subscription," Spanish *cobijamiento* "lodging," Italian *abboccamento* "interview, parley," Romanian *acoperămînt* "cover."

Prefixing of modifying elements remains frequent in all languages (Italian *autostrada* "highway," Spanish *contraveneno* "antidote," French *photocopie* "photocopy"), although some older prefixes may hardly be recognized as such today. The "repetitive" verbal prefix *re-* remains particularly active (Romanian *răsări* "rebound," Italian *ricattare* "to recover," French *racheter* "to buy back," etc.).

Compound words, though less frequent than in the Germanic languages, are not uncommon (*e.g.,* French *cheflieu* "principal town," Italian *primavera* "spring," Spanish *lavamanos* "wash basin").

Adverb formation

Originally a compounding process, the most common method of forming adverbs from adjectives (suffixing of Latin *mente* "mind") has become in most languages a morphological process, although Spanish and Portuguese retain traces of the earlier stage in phrases such as *severa e* (*y*) *cruelmente* "severely and cruelly."

Among the syntactic means that most Romance languages use to extend vocabulary is the potent device, unavailable to Latin, of juxtaposing to any part of speech an article or other determiner and using it as a noun (*e.g.,* Italian *il perchè* "the reason," Spanish *lo útil* "utility, something useful," French *un je ne sais quoi* "an I-don't-know-what"). In French and Spanish, verbal infinitives are frequently so treated (*le devoir* "duty," *el poder* "power," etc.); Romanian also uses infinitives as verbal nouns, but they are differentiated formally by retaining the full form (*e.g., cîntare* "singing"), compared with the shortened verbal form (*cînta*). In earlier stages of most Romance languages the verbal root (most often as it appears in the 3rd-person singular present indicative) could be used as a noun, a process known as back-formation (compare Romanian *laudă* "praise," Italian *domanda* "question," French *approche* "approach," *désir* "desire," Spanish *baila* "dance," Portuguese *muda* "change").

Just as former adjectival forms are frequently used as substantives, so are nouns used with adjectival function; there seem to be few restrictions on this use, though practice varies as to whether agreement should be made (French *les frères ennemis* "enemy brothers," with agreement; *une femme médecin* "a woman doctor," without agreement). Past-participial forms normally act as adjectives, as in English.

Romance makes use of gender classification to extend and modify its vocabulary, especially by relating the gender markers to sex differences (*e.g.,* Romanian *nepot, nepoată;* Occitan *nebut, nebudo,* Spanish *nieto, nieta,* Portuguese *neto, neta,* Catalan *net, neta* "nephew, niece," with Italian invariable *nipote,* and French lexically differentiated *neveu, nièce*). Modern French makes particularly fruitful use of gender differences (originally via ellipse); thus, *le* (*vin de*) *champagne* (the drink) / *la Champagne; La Normandie* (the province) / *le Normandie* (the ship).

Importance of Latin in vocabulary formation

Vocabulary. The basic vocabularies (the most frequently used lexical items) of all the Romance languages are in the main directly inherited from Latin. This applies equally to "function" words, such as *de* "of, from" (Romanian *de,* Italian *di,* Rhaetian *da,* French *de,* Spanish *de,* Portuguese *de*), as to common lexical items, such as *facere* "to do" or *aqua* "water" (Romanian *a face, apă,* Italian *fare, acqua,* Logudorian *fágere, abba,* Engadine *fer, ova,* French *faire, eau,* Catalan *fer, aygua,* Spanish *hacer, agua,* Portuguese *fazer, água*). In some cases different Romance languages inherit words perhaps from different strata of Roman society. Thus, for "lamb," forms derived from Latin *agnus* remain in southern Italy and Galician (*año*), but forms derived from diminutive *agnellus* prevail in Romanian (*miel*), Italian (*agnello*), French (*agneau*), Rhaetian (Engadine *agné,* Friulian *añel*), Occitan (*anhel*), and Catalan (*anyell*), with Sardinian and some Calabrian dialects using another form derived from Latin *agnone* (Logudorian *andzone*). Spanish and Portuguese, however, prefer a derivative of a different word, *chorda* (*cordero, cordeiro*), referring perhaps to the birth process; this word is also found in Occitan and Catalan.

Some words shared by the majority of the Romance languages are not of Latin origin but were probably borrowed from other languages before Latin unity was disrupted. These include especially words of Celtic origin, such as Latin *carrum* "cart," Romanian *car,* Italian *carro,* Logudorian *karru,* Rhaetian *k'ar,* French *char,* Occitan and Catalan *car,* Spanish and Portuguese *carro.*

In Christian Latin a great many Greek ecclesiastical terms were borrowed, which survived in most Romance languages. For example, the Greek word *episkopos* (literally, "overseer") was borrowed into Latin as *episcopus* "bishop," which gave rise to Vegliot *pasku,* Logudorian *pískamu,* Italian *vescovo,* Engadine *ovaisch,* Friulian *veskul,* French *evêque,* Occitan *avesque,* Catalan *bisbe,* Spanish *obispo,* and Portuguese *bispo.*

Germanic words did not penetrate into Latin very frequently before the separation of the various Romance languages from Latin, so that few of them have more than limited extension. Only one Germanic word is known for certain to be found in both Eastern and Western Romance—*sapōne* "soap," recorded in Pliny and occurring as Romanian *săpun,* Vegliot *sapaun,* Italian *sapone,* Logudorian *sabone,* Engadine *savum,* French *savon,* Occitan and Catalan *sabó,* Spanish *jabón,* and Portuguese *sabão.*

"Learned" words

Many Latin words are widespread throughout the Romance languages even though they do not date back directly to the imperial period; these are the "learned" words that have freely entered the languages at virtually every period, borrowed from Latin used as a scholarly language. Because of this later borrowing, such words as *capital, natura, adulterium,* and *discipulus* appear in Romance virtually unchanged from Latin, as they do in other European languages; Romance Latinisms, however, are quite normally used in contexts in which similar words would sound stilted and pedantic in English (*e.g.,* French *supprimer* "suppress" but often used to mean "to do away with").

However similar the Romance vocabularies are to each other, considerable differences nevertheless exist. Some of these may be traced back to imperial times, when provinces may have developed their own vocabulary preferences. For instance, for "oak" Eastern Romance seems to have preferred Latin *quercus* (Logudorian *kerbu,* southern Italian *quercia,* etc.), whereas the West preferred the alternative *robur* (Italian *rovere,* Occitan and Catalan *roure,* Spanish and Portuguese *roble,* Old French *rouvre*—modern French *chêne* is of Celtic origin, while Romanian *stejar* is perhaps of Balkan origin). In some cases the conservative peripheral areas have retained a word that was displaced in more central regions; thus, for "beautiful," *formosus* is preferred in Romanian (*frumos*), Spanish (*hermoso*), and Portuguese (*formoso*), whereas *bellus* is more popular in Vegliot (*bial*), Italian (*bello*), Rhaetian (*bal, biel*), French (*beau*), Occitan (*bel*), and Catalan (*bell*).

Borrowing from substratum and superstratum languages

When Romance borrowed vocabulary from the substratum, differentiation must have taken place early (certainly before the indigenous languages died out). Thus, Spanish *vega,* Portuguese *veiga* "wooded ground by a river" (probably from a non-Indo-European Iberian language, compare Basque *ibaiko* "riverbank"), French *charrue* "plow," *borne* "boundary stone" from Celtic, and Romanian *barză* "stork" (perhaps from Dacian, compare Albanian *bar*) probably were used during Roman times in some form. The debt of Romance vocabulary to substrata languages is probably great but difficult to estimate with any certainty. When there is no known source form or cognate for a word, scholars often suggest an Iberian, Dacian, Ligurian, or Gaulish origin, but, as little is known of these languages, some such theories are mere speculation.

After the influx of barbarian invaders, Romance vocabularies differentiated further as each borrowed from its own superstratum (language superimposed upon Romance). French, for instance, is estimated to have taken some 700 words from Frankish (a Germanic language), not all of which have survived but some of which have passed via French into other Romance languages. Many of these were concerned with agriculture (*jardin* "garden," *houe* "hoe," *blé* "wheat," *gerbe* "sheaf," etc.) or with war (*guerre* "war," *héaume* "helmet") or social organization (*sénéchal* "seneschal," *chambellan* "chamberlain," *maréchal* "marshal," *baron* "baron"). The occupation of much of northern Italy by speakers of Langobardic (also a Germanic language) left less of a mark on Italian vocabulary, though dialects retain more words (estimated at about 300) than the standard language. Standard Italian borrowed little in the way of administrative or military terms but accepted a number of words from rural life (*melma* "mud," *zecca* "sheep tick," *stamberga* "hut," etc.). The Visigoths, who occupied Iberia, were more Romanized than the other Germanic invaders and indeed had abandoned their Germanic tongue by the 7th century AD. Thus, borrowings from Visigothic into Spanish and Portuguese are less frequent, though still not inconsiderable; some (such as *estaca* "stake," *brotar* "to bud") are common to all the Iberian Peninsular languages.

Slavic infiltration into the Balkans led Romanian to adopt a very large number of Slavic words, some in the basic part of the vocabulary. At exactly what stage in history they were borrowed is uncertain, for the earliest Romanian texts, of the 16th century AD, are saturated with Slavic terms from different dialectal sources, though South Slavic predominates. Possibly the borrowings occurred in the 9th century, when the Hunnish Bulgarians, who had adopted Slavic speech, established a powerful state and embraced Christianity, and Slavic pressures were already very strong. Among common Romanian words of Slavic origin one may mention *a trăi* "to live," *hrană* "food," *ceas* "hour," *bogat* "rich," *prieten* "friend," *a munci* "to work." The Magyars (modern Hungarians) also lent a smaller number of words to their Romanian neighbours (*e.g., oraş* "town").

Words borrowed from Arabic

Islāmic invaders into Europe from the 8th century had considerable effect on the vocabulary of the Western Romance languages, even though occupation was confined to southern regions. With its superior cultural and agricultural skills, the Arab world had much to teach Europe of the Dark Ages. Words entered via two routes, Sicily and Spain, and usually their form gives clues about their provenance—if the Arabic definite article (*al*) has coalesced with the root, the word is from Moorish Spain (thus Spanish *algodón* "cotton," Portuguese *algodão,* Old French *auqueton* via Spain, but Italian *cotone,* French *coton* via Sicily). The Arabs introduced into Europe many exotic plants and fruits and with them their names, such as oranges (Spanish *naranja*), lemons (Spanish *limón*), and artichokes (Spanish *alcachofa,* Italian *carciofo*). In some cases the Iberian Peninsula has adopted the Arabic word for such plants, while other languages prefer words of other origin—"rice" is *arroz* in Spanish and Portuguese, *arròs* in Catalan, but Italian and French prefer a Greek word (*riso, riz*), as do Vegliot (*rize*), Rhaetian (Friulian *ris*), and Romanian (*orez*). Apart from the numerous Arabic words known throughout Romance (especially "arithmetic," "algebra," and the like), many are peculiar to the Hispanic languages, such as administrative terms such as Spanish *alcalde* "mayor" or *alguacil* "senior police officer," commercial terms such as *almacén* "warehouse, department store," as well as everyday words such as *ahorrar* "to save," *alboroto* "noise."

Many of the words individual languages borrowed from other sources or fashioned themselves from native sources did not remain private property for long. Interchange among the Western languages has been common since the earliest times and especially from the 16th century. Perhaps French has been the greatest supplier of words throughout the ages, often displacing native words. But French, too, has borrowed heavily from the other languages, especially when they have been purveyors of new objects (such as *patate, banane, tabac,* introduced into Europe by Spanish and Portuguese explorations) or of special cultural values (Italian musical and architectural terms, as well as words to do with banking). Borrowing into minor languages from prestigious neighbours has, naturally, been prolific. Passage of words in the other direction is rare and usually employed for comic or other emotive effect (though Occitan in its heyday supplied a good many words of all sorts—even, it is said, *amour* "love" to French).

Anglicisms

Borrowings from non-Romance languages are less frequent and often frowned on by purists, but far from negligible. Any contact in specialized spheres has produced a crop of loanwords, especially since the 17th century, when French in particular began to borrow a fair number from its Germanic neighbours. In recent times, the influx of anglicisms has become a flood, resisted to the death by some purists. Many are, however, ephemeral or specialized, and none affects the basic vocabulary in which Latin-inherited words continue to predominate.

Orthography. Today the Romance languages are all written in the Latin alphabet, with certain modifications, though until the mid-19th century Romanian was normally written in Cyrillic (still used in Moldavia), and, in the Middle Ages, Arabic script was used for some Spanish dialects.

As soon as scribes first made attempts to write in vernacular Romance, they found the resources of the Latin alphabet inadequate to represent the non-Latin sounds of their spoken language. One device used to overcome these difficulties was to add the letter *h* to another, to indicate a deviant pronunciation: thus, *ch* might represent the *ch* sound in Spanish (*e.g., muchacho* "boy") or the *sh* (earlier *ch*) sound in French (*e.g., chef* "chief"). *C* would normally be used for the *k* sound (before *a, o, u*) or an *s* or *th* sound (before *i, e*). In Italian, conversely, *ch* serves to distinguish the *k* sound, followed by *e*, from the *ch* sound (compare *che* [key] "that, who" with *c'è* [chey] "there is"). *H* was also sometimes added to *n* and *l* to indicate a palatal pronunciation (similar to the *ny* in English "canyon" and *li* in "scallion"), as today in Portuguese *vinho* "wine" and *filho* "son." Another device frequently used to stretch the capacity of the Latin alphabet was to distinguish the letters *i* and *j, u* and *v*, which were originally each single letters *i* (with variant form *j*) and *v* (with variant form *u*, and in Latin pronounced *u* or *w*). In Romance, *v* and *j* came to represent consonants, while *u* and *i* retained their vowel values.

The palatal consonants *n* and *l* are also often depicted by doubled letters or other combinations of letters: the palatal *n* as *nn* (or its scribal variant *ñ*), *gn, nj,* or *in;* palatal *l* as *ll, gl, lj, il,* or *yl,* as well as the combinations *nh* and *lh,* already mentioned. The Latin letter *x,* an abbreviation for *ks,* was also put to other uses in Romance; in Portuguese, Catalan, Sicilian, and Old Spanish it represents an *sh* sound, in modern Spanish a strong *h* sound, more commonly spelled with a *j,* and in northern Italian dialects the *z* sound. Other letters pressed into use for new consonantal sounds were *z* (used in Italy for *ts* and *dz* sounds, Germanic *k* and *w,* and the Visigothic *ç* for *ts* and sometimes *s,* as today in French and Portuguese).

Diacritical markings

Vowels were less of a problem for early Romance scribes—diphthongs were simply shown as vowel combinations such as *ie, uo.* Later, the diaeresis (¨) was sometimes introduced to distinguish diphthongs from adjoining vowels that were to be pronounced separately. Non-Latin vowels are rarely clearly distinguished: French *u* (pronounced like German *ü*) for instance, was written *u* and not consistently distinguished from Latin *u* (pronounced as in "lunar" and, in modern French, written *ou*). Nasal vowels in French are marked by a following *n* or *m;* in Portuguese a tilde (~) is often used for final nasal vowels and diphthongs (*ã, ãi*). Use of diacritics was not consistent until modern times; thus, so-called long and short *e,* still not always distinguished in Italian, are shown as *é* and *è* or *ê* (e.g., *élève* "student") in French (since the 18th century) and as *e* and *é* in Portuguese (since about 1930). Romanian established the use of *î* and *ă* only in the 20th century.

In most of the languages with a long history of writing, the original attempts by scribes at phonological transcription were followed by an "etymological" period in which Latinized spelling gained ground. Castilian was least subject to this fashion, and, because its phonology has changed comparatively little since the Middle Ages (when its spellings became more or less fixed), it has few orthographical problems today. Standard Italian retains a fairly etymological orthography that covers up various minor regional differences of pronunciation; small reforms have been made through the centuries (in the 17th century, for instance, the use of *h*—except in *ho, ha, hanno*—was discontinued; in the 20th century, *î* and *j* for *ii,* as in *studii,* have virtually disappeared), but chaos still reigns in the use of accents. Romanian suffered from etymologizing orthography in the 19th century, but successive edicts of the Romanian Academy, of which the most important was dated 1932, have established a more or less phonetic spelling (the notable exception being the depiction of final "soft" consonants by a following *i*). Modern Catalan, like other "minor" languages, has had the aid of expert linguists in the establishment of its orthography. A standard was proposed by Antonio María Alcover Sureda, a Catalan priest, philologist, and writer from Majorca, in 1913, which is accepted, with small variations, by most writers.

Only two of the Romance languages, French and Portuguese, have had major orthographical problems, mainly resulting from the radical transformations that have affected their phonology since the Latin period. Portuguese has attempted to overcome its difficulties by a series of governmental reforms during the 20th century, but, in spite of official agreements between Portugal and Brazil in 1931 and 1945, there is still little consistency in usage, with Brazilian writers, especially, remaining more conservative (*i.e.,* etymological). In France, in spite of vociferous demands for reform since the 16th century, only minor changes have been accepted (usually originally from unofficial sources, such as printers), so that French orthography today reflects 12th-century phonology, overlaid by the etymologizing of Middle French legal scribes. Battles still rage between the reformers, who deplore the absurdly large proportion of school time devoted to teaching spelling, and the defenders of tradition, who point out that the phonological character of French, with no consistent phonetic markers for the word, make it unsuitable for phonetic transcription and that written French has its own structure, not identical with that of the spoken language.

(Re.P.)

Germanic languages

The Germanic languages, a branch of the Indo-European language family, include a number of extinct languages as well as the earlier and present forms of German, Netherlandic, Afrikaans, English, Frisian, the Scandinavian languages, Yiddish, and their many dialects.

In numbers of native speakers, English, with 285,000,000, clearly ranks second among the languages of the world (after Chinese); German, with 98,000,000, probably ranks seventh (after Hindi-Urdu, Spanish, Russian, and Japanese). To these figures may be added those for persons with another native language who have learned one of the Germanic languages for commercial, scientific, literary, or other purposes. English is unquestionably the world's most widely used second language.

Table 14 presents information on each of the modern standard Germanic languages.

The earliest historical evidence for Germanic is provided by isolated words and names recorded by Latin authors beginning in the 1st century BC. From *c.* AD 200 there are Scandinavian inscriptions carved in the 24-letter runic alphabet. The earliest extensive Germanic text is the (incomplete) Gothic Bible, translated *c.* AD 350 by the Visigothic bishop Ulfilas (Wulfila), and written in a 27-letter alphabet of the translator's own design. Although the Gothic alphabet was hardly used outside of this Bible translation, later versions of the runic alphabet were used sparingly in England, Germany, and particularly Scandinavia—in the latter area down to early modern times. All extensive later Germanic texts, however, use adaptations of the Latin alphabet.

The names and approximate dates of the earliest recorded Germanic languages are recorded in Table 15.

The Germanic languages are related in the sense that they can be shown to be different historical developments

Table 14: Modern Standard Germanic Languages

	where spoken	native speakers (1981 estimate)	use as a 2nd language
English	Great Britain, Ireland, United States, Canada, Australia, New Zealand, Republic of South Africa	285,000,000	extreme
German	Germany, Austria, Switzerland (part)	98,000,000	extensive
Netherlandic (Dutch-Flemish)	The Netherlands, Belgium (part)	20,000,000	moderate
Swedish	Sweden, Finland (part)	9,000,000	slight
Danish	Denmark	5,400,000	slight
Norwegian	Norway	4,800,000	slight
Yiddish	various countries	4,000,000	slight
Afrikaans	Republic of South Africa (part)	3,300,000	slight
Frisian	The Netherlands, Germany	445,000	—
Icelandic	Iceland	218,000	—
Faeroese	Faeroe Islands	43,000	—

of a single earlier parent language. Although for some language families there are written records of the parent language (*e.g.*, for the Romance languages, which are variant developments of Latin), in the case of Germanic no written records of the parent language exist. Much of its structure, however, can be deduced by the comparative method of reconstruction (a reconstructed language is called a protolanguage; reconstructed forms are marked with an asterisk). For example, a comparison of Runic *-gastiR,* Gothic *gasts,* Old Norse *gestr,* Old English *giest,* Old Frisian *iest,* and Old Saxon and Old High German *gast* "guest" leads to the reconstruction of Proto-Germanic **ǥastiz.* Similarly, a comparison of Runic *horna,* Gothic *haurn,* Old Norse, Old English, Old Frisian, Old Saxon, and Old High German *horn* "horn" leads scholars to reconstruct the Proto-Germanic form **hornan.*

Recon-struction of parent language

Such reconstructions are, in part, merely formulas of relationship. Thus the Proto-Germanic **o* of **hornan* in this position gave *au* in Gothic and *o* in the other languages. In other positions (*e.g.*, when followed by a nasal sound plus a consonant) **o* gave *u* in all the languages: Proto-Germanic **dumbaz,* Gothic *dumbs,* Old Norse *dumbr,* Old English, Old Frisian, and Old Saxon *dumb,* Old High German *tumb* "dumb." What may be deduced is that this vowel sounded more like *u* in some environments, but like *o* in others; it may be written as **u~o,* indicating that it varied between these two pronunciations.

The above example shows that such reconstructions are more than mere formulas of relationship; they also give some indication of how Proto-Germanic actually sounded. Occasionally scholars are fortunate enough to find external confirmation of these deductions. For example, on the basis of Old English *cyning,* Old Saxon and Old High German *kuning* "king," the Proto-Germanic **kuningaz* can be reconstructed; this would seem to be confirmed by Finnish *kuningas* "king," which must have been borrowed from Germanic at a very early date.

By pushing the comparative method still farther back, it can be shown that Germanic is related to a number of other languages, notably Celtic, Italic, Greek, Baltic, Slavic, Iranian, and Indo-Aryan (Indic). All of these language groups are subsequent developments of a still earlier parent language for which there are, again, no written records but which can be reconstructed as Proto-Indo-European (see above *Indo-European languages*).

Table 15: Earliest Recorded Germanic Languages

	dates* (AD)
Early Runic	200–600
Gothic	350
Old English (Anglo-Saxon)	700–1050
Old High German	750–1050
Old Saxon (Old Low German)	850–1050
Old Norwegian	1150–1450
Old Icelandic	1150–1500†
Middle Netherlandic	1170–1500†
Old Danish	1250–1500†
Old Swedish	1250–1500†
Old Frisian	1300–1500†

*Indicates approximate range of dates.
†Cutoff date for beginnings of modern Germanic languages.

CHARACTERISTICS

The special characteristics of the Germanic languages that distinguish them from other Indo-European languages result from numerous changes, both phonological and grammatical.

Grimm's law

Phonology. *Consonants.* Proto-Indo-European had 12 stop consonants: *p, t, k,* k^w*; b, d, g,* g^w*; bh, dh, gh,* g^wh*;* and one sibilant, *s.* (Stops are produced with momentary complete stoppage of the breathstream at some point in the vocal tract.) By a change known as the Germanic consonant shift (or Grimm's law, after the German scholar Jacob Grimm, who was one of the first to describe it), the 12 stops changed in Germanic to voiceless fricatives, voiceless stops, and voiced fricatives, as illustrated in Table 16. A few examples: (1) Proto-Indo-European *p, t, k,* and k^w, as in Latin *piscis, tenuis, centum,* and *quod,* became Proto-Germanic *f, p, x,* and x^w, as in English "fish," "thin," "hund(red)," and "what." Proto-Germanic *x* and x^w early became *h* and h^w in some positions, giving the alternations of *h~x* and $h^w \sim x^w$. (2) Proto-Indo-European *d* and *g,* as in Latin *decem* and *genus,* became Proto-Germanic *t* and *k,* as in English "ten" and "kin." (3) Proto-Indo-European *bh, dh,* and *gh,* as in Sanskrit *bhū-, dhā-,* and *(g)hā-,* became Proto-Germanic *ƀ, ð,* and *ǥ,* which later changed to the stops *b, d,* and *g* in some positions (*e.g.*, English "be," "do," and "go"), giving *b~ƀ, d~ð,* and *g~ǥ.* Proto-Indo-European *s,* as in Latin *sedeō,* was unchanged; Proto-Germanic kept *s,* as in English "sit."

Table 16: Sound Changes in the Germanic Consonant Shift

Proto-Indo-European voiceless stops	p	t	k	k^w
Proto-Germanic voiceless fricatives	f	þ	x	x^w
Proto-Indo-European voiced stops	b	d	g	g^w
Proto-Germanic voiceless stops	p	t	k	k^w
Proto-Indo-European voiced aspirated stops	bh	dh	gh	g^{w}h
Proto-Germanic voiced fricatives	ƀ	ð	ǥ	ǥ^w

In addition to these general changes, there were two special ones. (1) Proto-Indo-European *p, t,* and *k* remained voiceless stops when preceded by *s* or another stop; thus, Proto-Indo-European *sp, st, sk, pt,* and *kt* gave Proto-Germanic *sp, st, sk, ft,* and *xt,* respectively. For example, Proto-Indo-European *sp* and *st,* as in Latin *spuō* and *hostis,* remained *sp* and *st* in Proto-Germanic, as in English "spew" and "guest"; Proto-Indo-European *pt* and *kt,* as in Latin *captus* and *octō,* became Proto-Germanic *ft* and *xt,* respectively, in Old English *hæft* "captured" and *eahta* "eight." (By still another change, Proto-Indo-European *tt* gave Proto-Germanic *ss; e.g.,* Sanskrit *sattá-,* Old English *sess* "seat.") (2) By a change known as Verner's law (named for the Danish scholar Karl Verner, who first described it), early Germanic voiceless *f, þ, x,* x^w, and *s* (from Proto-Indo-European *p, t, k,* k^w, and *s*) were voiced to *ƀ, ð, ǥ,* ǥ^w, and *z,* respectively, when they followed an unaccented syllable, and the first four of these thereby merged with the already existing *ƀ, ð, ǥ,* and ǥ^w (from Proto-Indo-European *bh, dh, gh,* and g^wh). Thus, Proto-Indo-European **bhrā́tēr* became Proto-Germanic **brōþēr* (with *þ* after an accented syllable) and Old English *brōþor* "brother"; but by Verner's law Proto-Indo-European **mātḗr* became Proto-Germanic **mōðēr* (with *ð* after an unaccented syllable) and Old English *mōdor* "mother." (The *th* of modern English "mother" is the result of a subsequent change.)

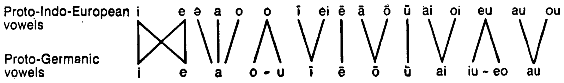
Verner's law

These changes gave the following Proto-Germanic system of consonants: voiceless stops and fricatives, *p, f, t, þ, k, h~x,* k^w, $h^w \sim x^w$*;* voiced stops and fricatives, *b~ƀ , d~ð, g~ǥ,* (g^w~ǥ^w); sibilants, *s, z;* nasals, *m, n;* liquids, *l, r;* and semivowels, *w, j(y).* The sound alternation of g^w~ǥ^w is parenthesized because it early became either *g~ǥ* or *w.* The sounds k^w and $h^w \sim x^w$ occurred as such more or less clearly only in Gothic; elsewhere they became the sequences *kw* and *hw~xw*, or the labial element ^{w} was lost. All remaining consonants except *z* occurred between vowels both singly and doubly (*e.g.*, *-p-* and *-pp-*, *-t-* and *-tt-*).

Ablaut

Vowels. In addition to the above consonants (12 stops and the sibilant *s*), Proto-Indo-European also had vowels and resonants. The vowel of any given root was not necessarily fixed but varied in an alternation called ablaut. Thus, the root that means "sit" was alternately **sed-*, *sod-*, **sd-*, **sēd-*, and **sōd-* (English "sit" is from **sed-*, "sat" from **sod-*, and "seat" from **sēd-*); and the root that means "do" was **dhē*, **dhō-*, and **dhə-* (English "deed" is from **dhē-*, and "do" is from **dhō-*). Other Proto-Indo-European vowels were *a*, *ā*, *ī*, and *ū*. The Proto-Indo-European resonants, which functioned as vowels in some positions and as consonants in others, were *i*, *u*, *m*, *n*, *l*, and *r*. Thus, **bhr̥tó-* (Sanskrit *bhr̥tá-* "borne") had syllabic *r̥* (*i.e.*, *r̥* functioning as a vowel), but **bhéreti* (Sanskrit *bhárati* "he bears") had nonsyllabic *r* (*i.e.*, *r* functioning as a consonant).

This Proto-Indo-European system of vowels contrasting with resonants was reshaped in Germanic by a number of changes. Syllabic *i*, *u*, *m̥*, *n̥*, *l̥*, and *r̥* became in Proto-Germanic the vowels *i* and *u* and the sequences *um*, *un*, *ul*, and *ur*, respectively; nonsyllabic *m*, *n*, *l*, and *r* developed into the nasals and liquids *m*, *n*, *l*, and *r*, respectively; nonsyllabic *i* and *u* before vowels resulted in the semivowels *j* (also symbolized as *y*) and *w*, though after vowels they continued to form diphthongs (*ei*, *ai*, *oi*; *eu*, *au*, *ou*). The Proto-Indo-European vowels and diphthongs then changed into Proto-Germanic sounds as follows:



Proto-Indo-European vowels
i e ə a o ō ī ei ē ā ō ū ai oi eu au ou
Proto-Germanic vowels
i e a o~u ī ē ō ū ai iu~eo au

In this diagram the lines between two sounds indicate that the Proto-Indo-European sound developed into the corresponding Proto-Germanic sound; for example, Proto-Indo-European *i* became either *i* or *e*, and Proto-Indo-European *ə*, *a*, and *o* coalesced in Proto-Germanic as *a*. These changes gave the following vowels for early Proto-Germanic: short vowels, *i*, *e*, *a*, *u~o*; long vowels, *ī*, $\bar{e}^1$, *ū*, *ō*; diphthongs, *ai*, *au*, *iu~eo*. The vowel *ē* is noted here as $\bar{e}^1$ because Proto-Germanic had (or developed) a second $\bar{e}^2$ of uncertain origin. In Gothic the two *ē*'s merged. Elsewhere $\bar{e}^2$ remained a midvowel, but $\bar{e}^1$ was lowered; thus, for example, $\bar{e}^2$ in Old Saxon *hēr* "here" but lowered $\bar{e}^1$ in Old Saxon *dād* "deed." In addition to the above oral vowels, Proto-Germanic also had three nasalized vowels: long *ĩ*, *ã*, and *ũ*, which arose when, in the sequences *inx*, *anx*, and *unx*, the *n* was lost with nasalization and lengthening of the preceding vowel.

Accent. Proto-Indo-European had a variable pitch accent that could fall on any syllable of a word (*e.g.*, on the first syllable in **bhrā́tēr* "brother" but on the last syllable in **mātḗr* "mother." This was replaced in Germanic by a fixed stress accent that always fell on the first syllable: **brṓþēr*, **mṓðēr*. One effect of this strong initial stress seems to have been the progressive weakening and loss of unstressed final syllables; *e.g.*, Proto-Indo-European *sodéionom*, Proto-Germanic **sátjanan*, Old English *settan*, Middle English *sette(n)*, and modern English (to) "set."

Strong initial stress

Strong initial stress is also reflected in the basic unit of old Germanic poetry, which consisted of two half lines, each with one of a small number of stress patterns, linked by the alliteration of stressed initial consonants or vowels (*e.g.*, from *Beowulf*: *Bḗo-wùlf wæs brḗme / bl ǣ́d wíde spràng* "Beowulf was famous; his renown went far").

Grammar. *Declensions.* Proto-Germanic kept the Proto-Indo-European system of three genders (masculine, feminine, neuter) and three numbers (singular, dual, plural), though the dual was becoming obsolete. It reduced the Proto-Indo-European system of eight cases to six: nominative, accusative, dative, genitive, instrumental, and vocative, though the last two were becoming obsolete. In the adjective declensions there were two innovations: (1) To the Proto-Indo-European vowel types (*o-*, *ā-*, *i-*, and *u-*stems), it added some pronominal endings to give the Germanic "strong" adjective declension. (2) It extended the Proto-Indo-European *n*-stem endings to all adjectives to give the Germanic "weak" adjective declension. Contrast, in modern German, strong *gutes Bier* "good beer" with weak *das gute Bier* "the good beer."

Strong and weak verbs

Conjugations. The Proto-Indo-European verb seems to have had five moods (indicative, imperative, subjunctive, injunctive, and optative), two voices (active and mediopassive), three persons (1st, 2nd, and 3rd), three numbers (singular, dual, and plural), and several verbal nouns (infinitives) and adjectives (participles). In Germanic these were reduced to indicative, imperative, and subjunctive moods; a full active voice plus passive found only in Gothic; three persons; full singular and plural forms and dual forms found only in Gothic; and one infinitive (present) and two participles (present and past). The Proto-Indo-European tense-aspect system (present, imperfect, aorist, perfect) was reshaped to a single tense contrast between present and past. The past showed two innovations: (1) In the "strong" verb Germanic transformed Proto-Indo-European ablaut into a specific tense marker (*e.g.*, Proto-Indo-European **bher-*, **bhor-*, **bhēr-*, **bhr̥-* in Old English *beran* "bear," past singular *bær*, past plural *bǣron*, past participle *boren*). (2) In the "weak" verb Germanic developed a new type of past and past participle (*e.g.*, Old English *fyllan* "fill," past *fylde*, participle *gefylled*). Weak verbs fell into three classes depending on the syllable following the root (*e.g.*, Old High German *full-e-n* [from **full-ja-n*] "fill," *mahh-ō-n* "make," *sag-ē-n* "say"). Gothic also had a fourth class: *full-nō-da* "it became full."

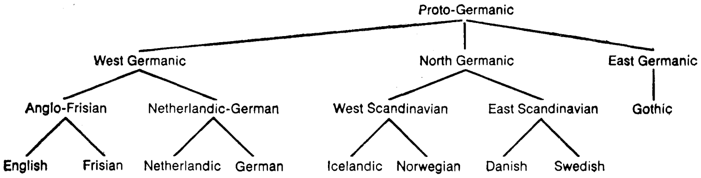
Many Proto-Germanic strong verbs showed a consonant alternation between *f* and *ƀ*, *þ* and *ð*, *x* and *ǥ*, and *s* and *z* that was the result, through Verner's law, of the alternating position of the Proto-Indo-European accent. The forms in Table 17 illustrate changes resulting from Verner's law. In this particular word, English has generalized the *s* (now *z*): "freeze," "froze," "frozen." German has generalized the *z* (now *r*): *frieren*, *fror*, *gefroren*. And Netherlandic still shows the alternation: *vriezen*, *vroor*, *gevroren*. English has kept the alternation in only one verb: singular "was," plural "were." Traces of it still survive, however, in a few now isolated forms: "seethe" (Proto-Germanic *þ*) and its old past participle "sodden" (Proto-Germanic *þ*); "lose" (Proto-Germanic *s*) and its old past participle "(for)lorn" (Proto-Germanic *z*).

Table 17: Illustration of Verner's Law

Proto-Indo-European	Proto-Germanic	Old English	English translation
*préusonom	*freosanan	frēosan	"(to) freeze"
*próuse	*fraus	frēas	"(it) froze"
*prusn̥ t́	*fruzun	fruron	"(they) froze"
*prusénos	*frozenaz	froren	"frozen"

*Unattested, reconstructed form.

Branches of Germanic. Like every language spoken over a considerable geographic area, Proto-Germanic presumably consisted of a number of geographical varieties or dialects, which, in the course of time, developed in different ways to give the different early and modern Germanic languages. Late-19th-century scholars used a family tree diagram to show this splitting into dialects and the relationships among the dialects:



Though there is much truth in such a diagram, it overemphasizes the notion of "splits" into separate "branches" and obscures the fact that the transition from one dialect to another may be gradual rather than abrupt. Modern Netherlandic and German, for example, constitute a single speech area at the level of local dialects; they have "split" only in the sense that they have developed different standard languages.

Dialect similarities

Mid-20th-century scholars, using the findings of archaeology and the methods of geographical linguistics, attempted to correct the distortions of this family-tree model by noting also the linguistic features shared by two or more dialect areas. Archaeological evidence suggests that a relatively uniform Germanic people at *c.* 750 BC were located in southern Scandinavia and along the North Sea and Baltic coasts from The Netherlands to the Vistula. Five hundred years later (*c.* 250 BC) they had spread south, and five general groups are distinguishable: North Germanic in southern Scandinavia, excluding Jutland; North Sea Germanic, along the North Sea and in Jutland; Rhine-Weser Germanic, along the middle Rhine and Weser; Elbe Germanic, along the middle Elbe; and East Germanic, between the middle Oder and the Vistula.

By *c.* AD 250 the division was much the same, though the Elbe group had spread southward to the Danube, and the East Germanic group moved southeast into the Carpathians and beyond. Then, toward the end of the 4th century, began the great Germanic tribal migrations. North Germanic speakers migrated into Jutland, approximately to the modern Danish-German language border; part of the North Sea group crossed the North Sea and conquered much of England; the Elbe group (the later Alamanni, Bavarians, and Langobardi) spread still farther south into part of Switzerland and into Austria and northern Italy; and the East Germanic group left the Oder-Vistula area to begin their many wanderings.

This five-way division of the Germanic peoples is based on archaeological evidence, but it agrees well with deductions that can be made from the earliest linguistic evidence. Five linguistic groups are indeed distinguishable, though they are linked into sets of two, three, or four through shared linguistic innovations.

Linguistic groups

1. North Germanic, North Sea Germanic, Rhine-Weser Germanic, and Elbe Germanic share the change of *z* to *r; e.g.,* Proto-Germanic **maiz-* "more," Gothic *maiza,* contrasting with Old Norse *meire,* Old English and Old Frisian *māra,* Old Saxon *mêro,* and Old High German *mēro.* In addition, they also show *i*-umlaut, as in the raising of *a* to *e* before *j* (pronounced as the *y* in "year"); *e.g.,* Proto-Germanic **satjanan* "set," Gothic *satjan* in contrast to Old Norse *setia,* Old English *settan,* Old Frisian *setta,* Old Saxon *settian,* and Old High German *setzen.* In certain strong verbs they share a new past tense form with *ē*^{2} and without reduplication (the repetition of a part of a word)—*e.g.,* Proto-Germanic **le-lōt* "let," Gothic *lailot* in contrast to Old Norse, Old English, Old Frisian, and Old Saxon *lēt* and Old High German *liez.*

2. North Germanic, North Sea Germanic, and Rhine-Weser Germanic partly share the loss of nasal sounds before voiceless fricative sounds. As noted above, *n* was lost in Proto-Germanic before *x.* North Sea Germanic shows loss of nasals before the remaining fricatives *f, þ,* and *s;* thus, the nasals in Proto-Germanic **fimf* "five," **munþ* "mouth," and **uns* "us" are preserved in Gothic *fimf, munþs,* and *uns,* as well as in Old High German *fimf, mund,* and *uns,* but are lost in Old English *fīf, mūþ,* and *ūs* and Old Frisian *fīf, mūth,* and *ūs.* Rhine-Weser Germanic shows this same loss only sporadically; Old Saxon has *fīf, mūð,* and *ūs,* without the nasals, but also has *andar* (from Proto-Germanic **anþar-* "other"), with the nasal conso-

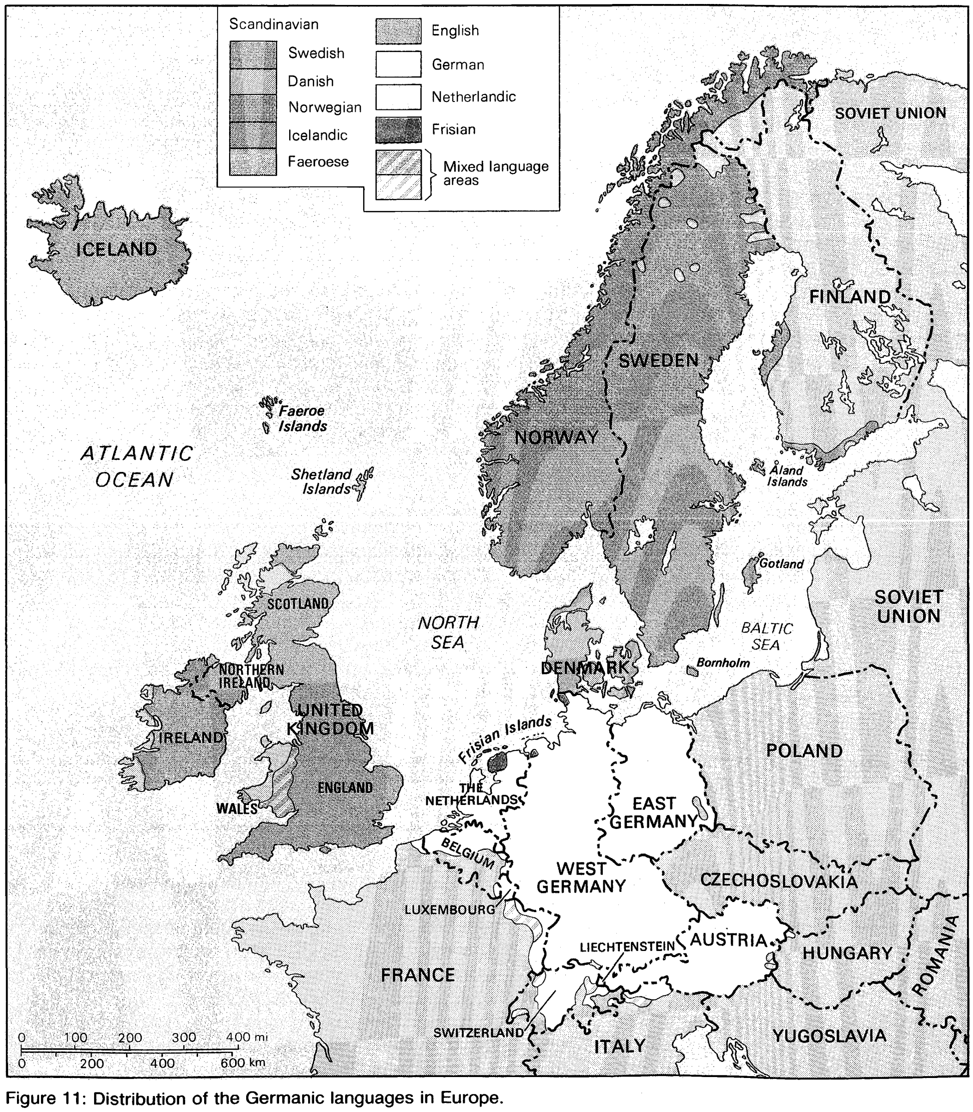


Figure 11: Distribution of the Germanic languages in Europe.

nant, beside *āðar* and *ōðar,* without it. Old Norse, which is North Germanic, shows regular loss of a nasal sound only before *s* (*e.g., oss* "us").

3. North Sea Germanic, Rhine-Weser Germanic, and Elbe Germanic (usually grouped together as West Germanic) share the change of *ð* to *d* in all positions (*e.g.,* Proto-Germanic **blōð-* "blood," and Gothic and Old Norse *blōð-* in contrast to Old English, Old Frisian, and Old Saxon *blōd* and Old High German *bluot*), the loss of *-z* after unstressed vowels (*e.g.,* Proto-Germanic **dagaz* "day," Gothic *dags,* and Old Norse *dagr* in contrast to Old English *dæg,* Old Frisian *dei,* Old Saxon *dag,* and Old High German *tag*), and a 2nd-person-singular past formation in strong verbs different from that of East Germanic and North Germanic (*e.g.,* Proto-Germanic **gaft* "[thou] gavest" occurs in Gothic and Old Norse *gaft,* but Proto-Germanic **gē*^{1}*ƀi* appears in Old English *gēafe,* Old Saxon *gaƀi,* and Old High German *gābi;* Old Frisian has a new analogical form, *iefst*).

In addition, they share the doubling of most consonants in certain positions, especially before *j* (the *y* sound); *e.g.,* Proto-Germanic **satjanan* "set" appears in Gothic as *satjan* and in Old Norse as *setia* but in Old English as *settan,* in Old Frisian as *setta,* in Old Saxon as *settian,* and in Old High German as *setzen.* North Germanic also shows doubling of *g* and *k* before *j* (*y*); *e.g.,* Proto-Germanic **lagjanan* "lay" becomes Gothic *lagjan* but Old Norse *leggia,* Old English *lecgan,* Old Frisian *ledza,* Old Saxon *leggian,* and Old High German *lecken.*

4. North Sea and Rhine-Weser Germanic share a single ending for the 1st, 2nd, and 3rd persons plural of verbs (North Germanic, Elbe Germanic, and East Germanic show two or three different endings), loss of the Proto-Germanic reflexive pronoun **sik,* and loss of *-z* in pronouns (*e.g.,* Proto-Germanic **wīz* or **wĭz* "we," which appears in Gothic as *weis,* in Old Norse as *vēr,* and in Old High German as *wir,* appears in Old English as *wē* and in Old Frisian and Old Saxon as *wī*).

5. North Germanic, Elbe Germanic, and East Germanic share the addition of the Proto-Germanic nominative-accusative neuter singular pronominal ending **-at* in the strong adjective declension (*e.g.,* Proto-Germanic **hailan* "whole," Old English and Old Frisian *hāl,* and Old Saxon *hêl* in contrast to Gothic *heilata,* Old Norse *heilt,* and Old High German *heilaz*).

6. Elbe Germanic and East Germanic share the pronoun reconstructed for Proto-Germanic as **iz* "he": Gothic *is,* Old High German *ir* or *er,* instead of Proto-Germanic **h-* occurring in Old Norse *hann* and in Old English, Old Frisian, and Old Saxon *hē.*

7. North Germanic and East Germanic share the change of *jj* (pronounced as English *yy*) and *ww* to a long stop plus a semivowel (*e.g.,* from Proto-Germanic **twajj-* "of two" and *triww-* "true"—as in Old High German *zweiio* and *triuwi*—to Old Norse *tueggia* and *tryggr,* Gothic *twaddje* and *triggws*).

EAST GERMANIC

The East Germanic languages, all of which have long been extinct, developed from the dialects of the East Germanic group mentioned above; they were spoken by Germanic tribes located between the middle Oder and the Vistula.

History. According to historical tradition, at least some of the Germanic tribes migrated to the mouth of the Vistula from Scandinavia. Little is known of Gepidic, Rugian, and Burgundian; some knowledge of Vandalic, Visigothic, and, especially, Ostrogothic is provided by the names recorded in Greek and Latin writings. The only East Germanic language on which there is extensive information is the Gothic—more specifically, Visigothic—that was spoken along the western shore of the Black Sea around the middle of the 4th century AD. Its special importance lies in the fact that, except for a few scattered runic inscriptions, it is by far the oldest Germanic language preserved.

Gothic language

Knowledge of Gothic is derived primarily from the remains of a Bible translation made for the Visigoths living along the lower Danube by a Visigothic bishop of the Arian church named Ulfilas, who lived during the 4th century. The surviving manuscripts of this translation, which are not originals but later copies thought to have been written in northern Italy during the period of Ostrogothic rule (493–554), include considerable portions of the New Testament and parts of Nehemiah from the Old Testament. Although most of them are palimpsests, manuscripts in which earlier erased writings are found, a handsome exception is the famous Codex Argenteus, written in silver and gold letters on purple parchment and containing (in 188 leaves remaining from an original 330 or 336) portions of the four gospels. Closely related to these biblical manuscripts are eight leaves containing fragments of a commentary (called the *Skeireins* in Gothic) on the Gospel According to St. John. Minor nonbiblical texts include a fragment of a calendar, two deeds containing some Gothic sentences, and a 10th-century Salzburg manuscript that gives the Gothic alphabet, a few Gothic words with Latin transliteration, and some phonetic remarks with illustrative examples.

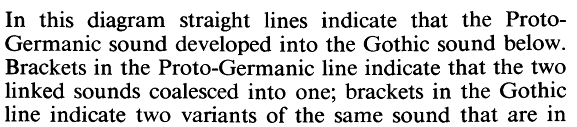
In the 4th and 5th centuries, Gothic (Visigothic and Ostrogothic) must have spread, along with the conquering Goths, at least thinly over much of southern Europe; but there is no evidence for its survival in Italy after the fall of the Ostrogothic kingdom, and in Spain it is doubtful whether the Visigoths retained their language until the Arab conquest. In the 9th century the German monk Walafrid Strabo mentions that Gothic was still being used in some churches near the lower Danube. After that time Gothic seems to have survived only among the Goths of the Crimea, who were last mentioned in the middle of the 16th century by a Flemish diplomat named De Busbecq, who, while on a mission to Constantinople in 1560–62, collected a number of words and phrases showing that their language was still essentially a form of Gothic.

Gothic alphabet

Characteristics. The Gothic alphabet, said to have been created by Ulfilas, contained 27 symbols, two of which functioned only as numbers, while the remaining 25 were used as both numbers and letters. The shape, numerical value, and ordering of the symbols show clearly that the alphabet was based primarily on that of Greek, though a few symbols seem to have been adapted from the Latin alphabet.

Phonology. The Gothic consonant system seems to have been largely identical with that assumed above for Proto-Germanic: *p, t, k,* k^w (this last sound was probably much like the *qu* in "queen"); *f, þ, h,* h^w (this last sound was probably pronounced much like the *wh* in "white"); *b, d, g; s, z; m, n; l, r; w, j.* The nasal *n* was presumably velar before the velar consonants *k, q,* and *g;* in these positions it was usually written (as in Greek) as *g* or *gg.* Examples of this spelling include *dragk* "drank," *igqis* "you two," and *briggan* "bring," although *n* was occasionally used as in Latin (*e.g., þank* "thanks," *inqis* "you two," and *bringiþ* "bring ye").

The Gothic alphabet contained the five simple vowel symbols, *i, e, a, o,* and *u,* from which four compound symbols, *ei, ai, au,* and *iu,* were also made; in addition, *w* was used to transliterate Greek υ and οι (both of which were pronounced as umlauted *u* [ü] in 4th-century Greek). The generally accepted development of the Proto-Germanic vowels in Gothic can be diagrammed as follows:



Proto-Germanic:
i e a o ~ u ī, ī̃ ē², ē¹ ai ā̃ au ō ū, ū̃ eo ~ iu
Gothic:
i ɛ a ɔ u ī ē ɛ̄ ā ɔ̄ ō ū iu
Spelling:
i ai a au u ei e ai a au o u iu

In this diagram straight lines indicate that the Proto-Germanic sound developed into the Gothic sound below. Brackets in the Proto-Germanic line indicate that the two linked sounds coalesced into one; brackets in the Gothic line indicate two variants of the same sound that are in different phonetic environments. Proto-Germanic *i* and *e* apparently first merged as a single vowel and then became Gothic *i* in most positions, but became *ai* before *h,* h^w, and *r.* Similarly, Proto-Germanic **ŏu* became Gothic *u* in most positions, but *au* before *h,* h^w, and *r.*

Special characteristics. Gothic shows a number of archaic features that had been almost or entirely lost by the time the other Germanic languages began to appear in writing; among these are a passive voice and one type of past tense formed with reduplication, a dual number in the 1st and 2nd persons of its verbs and pronouns, and a special vocative case in one noun class. At the same time, Gothic also shows changes from Proto-Germanic, among which are the shortening of most long vowels in final unstressed syllables and the loss of most short vowels (*e.g.*, Proto-Germanic *_erþō_ "earth" became Gothic *airþa,* Proto-Germanic *_stainaz_ "stone" became Gothic *stains*). Finally, voiced fricatives that occurred or came to occur at the end of a word have been unvoiced (*e.g.*, nominative *_hlaiƀaz,_ accusative *_hlaiƀan_ "bread, loaf" changed to *hlaifs* and *hlaif,* respectively [but dative *hlaiba*]).

WEST GERMANIC

The West Germanic languages are those that developed from the North Sea, Rhine-Weser, and Elbe groups mentioned above. Out of the many local West Germanic dialects the following six modern standard languages have arisen: English, Frisian, Netherlandic (Dutch-Flemish), Afrikaans, German, and Yiddish.

English and Frisian changes

English. English and Frisian are descended from North Sea Germanic. The most striking changes that distinguish them from the other Germanic languages are the loss of nasal sounds before the Proto-Germanic voiceless fricatives *f, þ*, and *s* (contrast the following pairs of words, in which English loses the nasal but German preserves it: before *f*—"soft"/*sanft;* before *þ*—"other"/*ander;* before *s*—"us"/*uns,* "goose"/*Gans*); palatalization of Proto-Germanic *k* before front vowels and *j,* giving modern English *ch* (English/German pairs: "chin"/*Kinn,* "birch" [Old English *birce*]/*Birke*); and palatalization of Proto-Germanic *g* before front vowels, giving modern English *y* (English/German pairs include "yield"/*gelten,* "yester-[day]"/*gestern,* "yard" [Old English *geard*]/*Garten;* this palatalized *g* merged with the *j* [*y* sound] from Proto-Germanic *j:* "year"/*Jahr*).

Other changes include palatalization of *gg* before *j* to Old English *cg* (Proto-Germanic *_brugjō,_ pre-Old English *_bruggju,_ Old English *brycg* "bridge"; contrast the unpalatalized *ck* from *gg* of German *Brücke* "bridge"); fronting and raising of *ā* from Proto-Germanic *ē*^{1} (English/German pairs include "deed"/*Tat,* "seed"/*Saat,* "sleep"/*schlafen,* "meal"/*Mahl*); and backing and raising of nasalized *ā,* from Proto-Germanic *ā* and from Proto-Germanic *a* before nasal plus *f, þ*, and *s* (English/German pairs include "brought"/*brachte,* "thought"/*dachte,* "other"/*ander,* and "goose"/*Gans*).

For further information on English, see below *English language.*

Frisian. A thousand years or so ago, Frisian was apparently spoken throughout a North Sea coastal area extending from the modern Netherlands province of Noord-Holland (North Holland) on up to modern German Schleswig and the adjacent offshore islands. During the following centuries, the Frisian of much of this area was gradually replaced by local Netherlandic and Low German dialects, so that Modern Frisian is now spoken in only three remaining areas: (1) West Frisian, in the Netherlandic province of Friesland, including the island of Schiermonnikoog and two-thirds of the island of Terschelling (altogether some 425,000 speakers); (2) East Frisian, in the German Saterland (some 2,000 speakers; this area was apparently settled in the 12th or 13th centuries from the former East Frisian area to the north); and (3) North Frisian, along the west coast of German Schleswig and on the offshore islands of Sylt, Föhr, Amrum, the Halligen, and Helgoland (altogether some 18,000 speakers).

History. The earliest manuscripts written in Frisian date from the end of the 13th century, though the legal documents that they contain were probably first composed, in part, as early as the 11th century. This stage of the language, until about 1575, is known as Old Frisian. The last written document of this period dates from 1573, after which Frisian was hardly used at all as a written language for some three centuries, though it continued to be spoken.

From the start Old Frisian shows all of the features that distinguish English and Frisian from the other Germanic languages. These include loss of the nasal sound before Proto-Germanic *f, þ,* and *s* (*e.g.,* Proto-Germanic *_fimf,_ *_munþ-,_ and *_uns_ became Old Frisian *fīf* "five," *mūth* "mouth," and *ūs* "us"), palatalization of Proto-Germanic *k* before front vowels and *j* (*e.g.,* Proto-Germanic *_kinn-_ and *_lē^{1}kj-_ became Old Frisian *tzin* "chin" and *lētza* "physician" [*cf.* English archaic "leech"]), and palatalization of Proto-Germanic *g* before front vowels (*e.g.,* Proto-Germanic *_geldan-_ became Old Frisian *ielda* "yield"). This merged with the *j* from Proto-Germanic *j,* as in Proto-Germanic *_jē^{1}r-_ or Old Frisian *iēr* "year." In addition, Old Frisian shows palatalization of *gg* from Proto-Germanic *g* before *j* (*e.g.,* Proto-Germanic *_lagjan-,_ with doubling *_laggjan,_ became Old Frisian *ledza* "to lay"); fronting and raising of *ā* from Proto-Germanic *ē*^{1}, as in Proto-Germanic *_dē^{1}ð-, lowered to *dād,_ and raised again to Old Frisian *dēd* "deed"; and backing and raising of nasalized *ã* from Proto-Germanic *ã* and Proto-Germanic *a* before nasal plus *f, þ, s,* as in Proto-Germanic *_brãxt-,_ *_anþar-,_ and *_gans-,_ which became Old Frisian *brocht* "brought," *ōther* "other," and *gōs* "goose."

Around the beginning of the 19th century it appeared that the age-old replacement of Frisian by Netherlandic and German would continue unabated and that the language would soon become extinct. But with 19th-century Romanticism a new interest in local life arose, and societies were formed for the preservation of the Frisian language and culture. Very slowly, the aims of this "Frisian movement" came to be realized, especially in the Netherlands province of Friesland, where in 1937 Frisian was accepted as an optional course in elementary schools; a Frisian Academy was founded in 1938; and in 1943 the first Frisian translation of the Bible was published. Later, in 1955, Frisian was approved as the language of instruction in the first two years of elementary school (though only about one-fourth of all schools use it in this way), and in 1956 the use of Frisian in courts of law was approved.

Status of Frisian

Despite this gradual reemergence of Frisian, Netherlandic still functions as the primary standard language of Friesland. Nearly all school instruction is given in Netherlandic; all daily newspapers are printed in Netherlandic (though they contain occasional articles in Frisian); and all television broadcasts and nearly all radio broadcasts are in Netherlandic. There is a small and enthusiastic Frisian literary movement, but its works are not widely read. Furthermore, though Frisian continues to be widely used as the language of everyday oral communication, it is increasingly a "Netherlandic" Frisian, with numerous borrowings from standard Netherlandic.

The status of Frisian in the East and North Frisian areas of Germany is far more tenuous. There German performs all the functions of a standard language, and Frisian serves only as yet another local dialect, comparable to the many surrounding local dialects of Low German. No standard North Frisian or East Frisian exists.

Characteristics. The following remarks refer to the more or less standard West Frisian that is developing in the province of Friesland.

Frisian has the following system of consonants, given here in the usual spellings: stops, *p, b, t, d, k, g;* fricatives, *f, v, s, z, ch, g;* nasals, *m, n, ng;* liquids, *l, r;* and glides, *w, h, j.* Examples (given here in part to show the close relationship between Frisian and English) include *p, t,* and *k* (unaspirated) in *peal* "pole," *twa* "two," and *kat* "cat"; *b, d,* and the stop symbolized by the letter *g* in *boi* "boy," *dei* "day," and *goed* "good"; *f, s,* and *ch* in *fiif* "five," *seis* "six," and *acht* "eight"; *v, z,* and the fricative symbolized by the letter *g* in *tolve* "twelve," *tûzen* "thousand," and *wegen* "ways"; *m, n,* and *ng* in *miel* "meal," *need* "need," and *ring* "ring"; *l* and *r* in *laem* "lamb" and *reep* "rope"; *w, h,* and *j* in *wy* "we," *hy* "he," and *jo* "you." Word-finally, voiced *b, d, z,* and *g* are generally unvoiced to *p, t, s,* and *ch.*

Frisian has the following system of stressed vowels and diphthongs. The symbols given in Table 18 refer to the actual sounds rather than to Frisian spellings, which are often irregular. Frisian also has an unstressed vowel *ə* (pronounced as the *a* in English "sofa"), which occurs only in unstressed syllables.

Dialects. The Frisian dialects of The Netherlands

Dialects of Friesland

province of Friesland are, with three exceptions, relatively uniform, though it is customary to make a distinction between Wouden Frisian in the east, Klei Frisian in the west (the variety on which standard Frisian is largely based), and Southwest Corner Frisian in the southwest. The three exceptions are the island dialect of East and West Terschelling and the dialects of the city of Hindeloopen and of the island of Schiermonnikoog. These latter two differ so greatly that they are not intelligible to other speakers of West Frisian and are both dying out. Quite different from any of these is the so-called City Frisian (Stedfrysk, or Stedsk) spoken in the cities of Leeuwarden, Franeker, Harlingen, Bolsward, Sneek, Staveren, and Dokkum. Despite the name, this is not Frisian at all but a variety of Netherlandic strongly influenced by Frisian. Similar in nature are the dialects of Heerenveen and Kollum, of the middle section of the island of Terschelling, and of Het Bildt (a coastal area northwest of Leeuwarden, diked in and settled by Hollanders during the 16th century).

East Frisian survives today only in the German Saterland, consisting of the three parishes of Ramsloh, Strücklingen, and Scharrel, each with a slightly different dialect. The area to the north is called East Frisia (German Ostfriesland), and the local dialect East Frisian (German Ostfriesisch), although it is really not Frisian but the local variety of Low German.

Though North Frisian is spoken in only a small geographical area by only some 18,000 persons, it exists in an extraordinary number of local dialects, some of which are mutually unintelligible. Because of this, it would be almost impossible to develop a single standard North Frisian that could be used throughout this area. North Frisian dialects are customarily divided into Insular North Frisian (Sylt, Föhr-Amrum, Helgoland) and Continental North Frisian (the Halligen Islands and the coast of Schleswig), the latter in seven main varieties and further subvarieties. Because this whole area bordered until recently on Danish, it was extensively influenced by the neighbouring Danish dialects. In more recent times it has been heavily influenced by German, both standard German and the neighbouring Low German dialects. Today all speakers of North Frisian are probably bilingual or trilingual; all of them learn Frisian at home and standard German in school, and many also learn dialectal Low German.

Identity of "Dutch" and "Flemish"

Netherlandic (Dutch–Flemish). Netherlandic is the national language of The Netherlands and one of the two national languages (beside French) of Belgium. Popular English usage applies the term Dutch to the Netherlandic of Holland and the term Flemish to the Netherlandic of Belgium, but in fact they are one and the same standard language. In its various forms, standard and dialectal, Netherlandic is the indigenous language of most of The Netherlands (all but the Frisian-speaking province of Friesland), of northern Belgium, and of a small part of France immediately to the west of Belgium. It is also used as the language of administration in the Dutch dependency of the Netherlands Antilles and in a former dependency, the Republic of Suriname. A derivative of Netherlandic, Afrikaans, is one of the two national languages (with English) of the Republic of South Africa.

As a written language, Netherlandic is quite uniform; it differs in Holland and Belgium no more than written English does in the United States and Great Britain. As a spoken language, however, it exists in far more varieties than does the English of North America. At one extreme is Standard Netherlandic (Algemeen Beschaafd Nederlands, "General Cultured Netherlandic"), which is used for public and official purposes and is the language of instruction in schools and universities. It is everywhere quite uniform, though speakers usually show by their accents the general area from which they come. At the other extreme are the local dialects, used among family and friends and with others from the same village.

History. Netherlandic is descended primarily from the language of the Rhine-Weser group, especially from the language of the Franks who entered much of this area during the 4th and 5th centuries AD. At the same time, it shows many forms descended from the speech of the North Sea Germanic inhabitants of the coastal areas. For example, modern *vijf* "five" (Proto-Germanic **fimf*) shows the typical North Sea Germanic loss of a nasal sound before *f.* Modern *mond* "mouth" (Proto-Germanic **munþ-*) and *ons* "us" (Proto-Germanic **uns*), on the other hand, show preservation of *n* before *þ* and *s;* but loss of *n* before *þ* appears in such place names as *IJmuiden* "mouth of the river IJ," and loss of *n* before *s* appears in the widespread dialectal forms *us* and *os* "us."

Documents written in Netherlandic do not begin to appear until toward the end of the 12th century, in the rich literature called Middle Dutch or Middle Netherlandic. From the preceding Old Netherlandic period there are only a few glosses, names, and isolated words appearing in Latin documents. Related to Netherlandic, though not ancestral to it, are the copyings—partly running text, partly isolated words—made from a lost manuscript that apparently contained an interlinear translation from Latin into Old Low Franconian of the book of Psalms.

The development of modern Netherlandic is closely tied to the political and economic history of the area. By the middle of the 16th century the speech of Brabant and its leading cities Antwerp and Brussels was well on its way to becoming standard for the whole Netherlandic speech area. Then came the revolt against Spain, in which the northern province of Holland was split off from the southern Netherlandic provinces.

Northern and Southern Netherlandic differences

This political split between the United Provinces of the Netherlands in the north and the Spanish Netherlands in the south had far-reaching linguistic consequences. In the prosperous and vigorous north a standard language rapidly developed, based on the speech of the big cities; it also showed the influence of the culturally important refugees from Brabant, who fled to the north, above all to Amsterdam, before and especially after the fall of Antwerp (1585). In the south, French came to prevail among the upper classes. The less privileged classes continued to use dialectal Netherlandic ("Flemish"), but no supradialectal standard was developed.

The cultural predominance of French in the south increased during the period of French rule (1795–1814), abated somewhat during the years when Belgium and Holland were united independently (1815–30), and rose again after the founding of the Kingdom of Belgium in 1830. At that time French was the only official language, used exclusively in government, courts, and schools. The long struggle to give Netherlandic equal status with French ended with the Language Act of 1938, which made Netherlandic the only offical language of northern Belgium. There were numerous attempts to set up a standard Flemish different from the Netherlandic of the north, but in the end the standard Netherlandic that had become established in Holland was accepted for northern Belgium as well.

Characteristics. Modern Standard Netherlandic has the following consonants, given here in the usual spellings: stops, *p, b, t, d, k;* fricatives, *f, v, s, z, ch, g;* nasals, *m, n, ng;* liquids, *l, r;* glides, *w, h, j.*

The voiced stops and fricatives *b, d, v, z,* and *g* are unvoiced to *p, t, f, s,* and *ch,* respectively, in word-final position. The spelling shows this in the case of *v* and *z* (plural *dieven* "thieves," *huizen* "houses," but singular *dief* "thief," *huis* "house") but does not show it in the case of *b, d,* and *g* (plural *ribben* "ribs," *bedden* "beds," *dagen* "days," but singular *rib* "rib," *bed* "bed," *dag* "day," pronounced *rip, bet, dach*).

Netherlandic has three classes of vowels and diphthongs: (1) six checked vowels, which are short and always followed by a consonant; (2) ten free vowels and diphthongs, most of them usually long, which need not be followed by a consonant; and (3) a vowel that occurs only in unstressed syllables. They form the system shown in Table 19 (the

Table 19: Vowel System of Netherlandic

traditional spelling						linguistic notation					
checked			free			checked			free		
			ie	uu	oe				ī̆	ǖ̆	ū̆
i	u	o	ee	eu	oo	e	ö	o	ē	ȫ	ō
e		o	ij, ei	ui	ou, au	ɛ		ɔ	ɛi	ɔ̈ü	ɔu
	a			aa			a			ā	
unstressed: e						unstressed: ə					

traditional spelling is to the left, and to the right is a notation, used by some linguists, that indicates the distinctive sounds [phonemes] of the language). Unlike the English spelling system, which in its basic design has remained essentially unchanged since the days of Chaucer (died 1400), the Netherlandic spelling system has undergone a series of official reforms to keep it in line with changes in pronunciation. The principal inconsistencies in the spelling of vowels are the spellings *ij* and *ei,* which both symbolize the same diphthong, pronounced somewhat between the *ai* of English "aisle" and the *ai* of English "maid" (*bijt* "he bites" rhymes with *feit* "fact"), and the spellings *ou* and *au,* which both symbolize the same diphthong, pronounced somewhat between the *ow* of English "now" and the *ow* of English "low" (*bouw* "building" rhymes with *nauw* "narrow"). Free vowels are written with double letters in closed syllables (*vuur* "fire," *boot* "boat"), but with single letters in open syllables (*vuren* "fires," *boten* "boats"). In contrast the checked vowels are always written with single letters.

Netherlandic spelling

Dialects. Although the standard language changes abruptly at the political border separating Holland and Belgium from Germany (Netherlandic being used to the west, German to the east), in local dialect speech there is no such abrupt change. The entire Netherlandic–German territory from the North Sea to the Alps is a single dialect area with only gradual transitions from one village to the next.

In an area bounded roughly by Amsterdam, The Hague, and Rotterdam, rural dialects are very similar to Standard Netherlandic; there are marked differences only in urban dialects, especially those of Amsterdam and Rotterdam. As one travels from this area—the source of the standard language—in any direction, however, the difference between local dialects and the standard language becomes progressively greater; as a result, throughout most of Holland rural inhabitants in effect speak two closely related but distinct languages, Standard Netherlandic and a local dialect, in varying degrees of proficiency. Dialects are traditionally named after the provinces in which they are spoken (*e.g.,* Gronings in Groningen and Limburgs in Limburg).

In Netherlandic Belgium the use of Standard Netherlandic is more limited, and that of local dialects is more extensive. Some of the better educated people speak the standard language fluently and use it regularly, while others prefer French. The less well educated use a local dialect almost exclusively and are often able to handle the standard language only with difficulty.

Afrikaans. In 1652 a party of Netherlanders under the leadership of Jan van Riebeeck landed at the Cape of Good Hope to establish a station for the Dutch East India Company. In the immediately following years they were joined by a wide variety of other Europeans, in particular Germans and, after 1685, French Huguenots. By 1806, a century and a half after the original settlement, the national origins of the white inhabitants are estimated to have been 53 percent Dutch, 28 percent German, 15 percent French, and 4 percent of other nationalities. Shortly before this date, in 1795, the Cape Colony came under British control, and British settlers began to arrive around 1820.

Afrikaans–Netherlandic differences

History. From the start, the dialect of the province of Zuid-Holland (South Holland), which was spoken by Van Riebeeck and his large family, seems to have set the style for what was eventually to become modern Afrikaans. As might be expected in a language used by so many non-native speakers (white and black), some simplification of sounds and forms took place. For example, whereas Standard Netherlandic shows three forms in the present tense of most verbs—*ik loop, hij loopt, wij/zij lopen* "I run, he runs, we/they run"—Afrikaans shows only one form—*ek/hy/ons/hulle loop* "I/he/we/they run" (with no ending). In addition, whereas Standard Netherlandic uses stressed *die man* "that man" in contrast to unstressed *de man* "the man," Afrikaans has only *die man* "the man"; and, whereas Standard Netherlandic distinguishes *wij / we* "we" and *ons* "us," Afrikaans has only *ons* "we/us."

The relatively small numbers of white European speakers of Afrikaans borrowed place-names and names of such cultural novelties as African plants and the like from the immensely larger numbers of black speakers of various Bantu languages, with whom they were in intimate contact. For some two centuries the gradually developing Afrikaans language existed only as a spoken dialect, alongside Standard Netherlandic (by which it was constantly influenced) and, later, English. Then, around the middle of the 19th century, the effort to make Afrikaans a medium of literary expression and a standard written language began. It came gradually to be used in newspapers. It was adopted for use in schools in 1914 and was accepted for use in the Dutch Reformed Church in 1919. In 1925 the South African Parliament declared it to be an official language, replacing Netherlandic. The first complete translation of the Bible into Afrikaans was published in 1933. Thus it came to be recognized as one of the two standard languages (beside English) of the modern Republic of South Africa. Though clearly a separate language, Afrikaans is very similar to Netherlandic. A person who knows Netherlandic can read Afrikaans with little difficulty; and, with some practice, he can easily learn to understand it when spoken.

Characteristics. Afrikaans has the following consonants, given here in the conventional spellings: stops, *p, b, t, d, k, gh/g;* fricatives, *f/v, w, s, z, g;* nasals, *m, n, ng;* liquids, *l, r;* glides, *h, j.* There are numerous differences between Afrikaans and Netherlandic. Netherlandic *-g-* (*-gg-*) is a voiced fricative, but Afrikaans *-g-* (*-gg-*) is a voiced stop. Unlike Netherlandic, Afrikaans also has this voiced stop initially in a few loanwords. Netherlandic has voiced fricatives initially (*v-, z-, g-*); corresponding words have voiceless initial fricatives in Afrikaans. Afrikaans, however, has voiced *z-* in loanwords: *Zoeloe* "Zulu." Netherlandic has initial *s* plus fricative *ch* as in *schoen* "shoe"; corresponding words have *s* plus *k* in Afrikaans: *skoen.* Netherlandic has *-ft, -st,* and *-cht* as in *gift* "poison," *nest* "nest," *nacht* "night"; corresponding words show loss of *-t* in Afrikaans: *gif, nes,* and *nag.*

Afrikaans has the system of vowels shown in Table 20 (usual spelling to the left; notation used by linguists to indicate distinctive sounds to the right). As in Netherlandic, *uu, ee, oo,* and *aa* are written with single letters in open syllables, and single consonant letters are doubled in open syllables to show that the preceding vowel is short.

Table 20: Vowel System of Afrikaans

usual spelling									linguistic notation								
short vowels			long vowels			diphthongs			short vowels			long vowels			diphthongs		
ie	uu	oe	ie	uu	oe				i	ü	u	ī	ǖ	ū			
			ee	eu	oo	(ee	eu	oo)*				ē	ȫ	ō	(iə	üə	uə)*
	i			î						ə			ə̄				
e	u	o	ê/e	û	ô/o	y/ei	ui	ou	ɛ	ɔ̈	ɔ	ɛ̄	ɔ̈̄	ɔ̄	əi	əü	əu
	a			aa			ai			a			ā			ai	

*The spellings *ee*, *eu*, and *oo* are pronounced either as long vowels (ē, ȫ, ō) or as diphthongs (iə, üə, uə).

Dispersion of German

German. German is spoken throughout a large area in central Europe, where it is the national language of Germany and of Austria and one of the four national languages (beside French, Italian, and Romansh) of Switzerland. From this homeland it has been carried by emigration to many other parts of the world; there are German-speaking communities in North and South America, South Africa, and Australia. In the western world it is extensively used as a second language and in this respect is next in importance (along with French) only to English.

As a written language German is quite uniform, differing in Germany, Austria, and Switzerland no more than written English does in the United States and the British Commonwealth. As a spoken language, however, German exists in far more varieties than English. At one exteme is Standard German (Hochsprache), based on the written form of the language and used in radio, television, public lectures, the theatre, schools, and universities. It is relatively uniform, although speakers often show by their accents the areas from which they come. At the other extreme are the local dialects, which differ from village to village. Between these two extremes there is a continuous scale of speech forms that, in cities, are often close to the standard language and are called Colloquial German (Umgangssprache).

History. From the point of view of local dialects the territory within which German and Netherlandic are spoken is a single speech area. It is possible to travel from Austria, northern Italy, and much of Switzerland into Germany, eastern France (Alsace and part of Lorraine), Luxembourg, northern Belgium, and The Netherlands without encountering a village where the local speech is suddenly different. The only sharp breaks occur when one enters the French-speaking parts of France and Belgium or the Frisian-speaking parts of The Netherlands and Germany.

High German consonant shift

The most striking dialect differences within this large area are those that divide Netherlandic-Low German in the lowlands of the north from High German in the highlands of the south. When the Germanic tribes migrated into southern Germany during the early centuries of the Christian era, their speech had the voiceless stops *p, t,* and *k* in much the same distribution as in modern English. Then, probably during the 6th century, there occurred a change customarily called the "High German consonant shift." At the beginning of words and when doubled, *p, t,* and *k* came to be pronounced as affricates; after a vowel they came to be pronounced as long fricatives. The modern results, compared with related English words, are shown in Table 21.

Table 21: Results of the High German Consonant Shift

p-	*p*ound	*Pf*und	*pp*	a*pp*le	A*pf*el	*Vp*†	ho*p*e	ho*ff*en
t-	*t*en	*z*ehn	*tt*	si*tt*ing	si*tz*en	*Vt*†	bi*t*e	bei*ss*en
k-	can	*kh*ann*	*kk*	li*ck*	le*kch*en*	*Vk*†	ma*k*e	ma*ch*en

*Khann and lekchen, with affricates, are southern dialect forms; standard German has stops: *kann, lecken.* †*V* represents any vowel.

These changes occurred in the south of the German speech area and then spread north, some extending farther than others. The situation at the end of the 19th century was as indicated in Figure 12. Line 2, *maken/machen,* is generally chosen as the boundary between Low German and High German, because it is typical for the shift of *p, t,* and *k* after vowels to *ff, ss,* and *ch,* respectively (*hopen/hoffen, bīten/beissen, maken/machen*), and of *t* and *tt* to *z* and *tz,* respectively (*ten/zehn, sitten/sitzen*). The shift of *ik* "I" to *ich* is indicated by line 1, which shows that the shift of *k* to *ch* after a vowel in this particular word spread unusually far. Line 3, which indicates the shift of *Dorp* "village" to *Dorf* (*cf.* archaic English "thorp"), shows that shifted *p* after *r* and *l* spread less far north than did shifted *p, t, k* after a vowel. And line 4, indicating the shift of *dat* "that" to *das,* shows that the shift of *t* to *s* after a vowel spread still less far north in this word (and in a few others: *it/es* "it," *wat/was* "what"). The striking way in which these lines "fan out" in the west (in the area along the Rhine River) has led to their being called the "Rhenish fan."

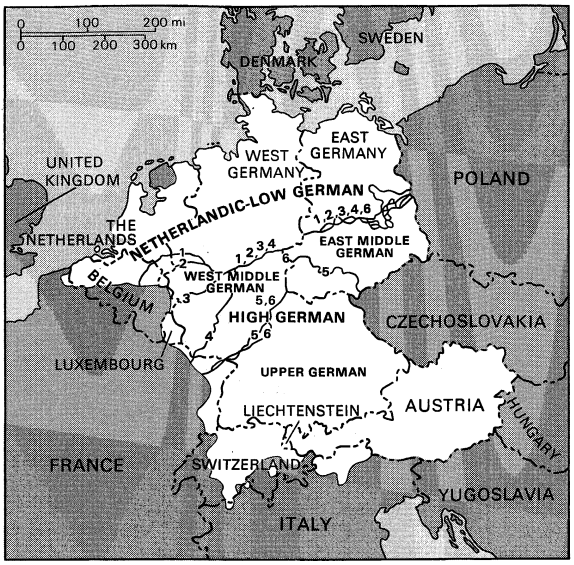

Figure 12: The Netherlandic–German dialect divisions. Numbers refer to isoglosses described in text.

The shift of *p* when doubled or at the beginning of a word occurred in a much smaller area. Line 5, showing the shift of *Appel* "apple" to *Apfel,* lies wholly within the High German speech area and is customarily used to subdivide it into Middle German (*Appel*) and Upper German (*Apfel*) areas. Line 6, which indicates the shift of *Pund* "pound" to *Pfund,* follows much the same course as does line 5 in the west, but it then runs north to join the *maken/machen* line; it is customarily used to distinguish West Middle German (*Appel, Pund*) from East Middle German (*Appel, Fund*—the latter being more common than Upper German *Pfund*).

Beginning of German

As noted above (in the section on the branches of Germanic), during the early centuries of the Christian era there was only one "Germanic" language, with little more than minor dialect differences. Only after the consonant shift just described is there justification in speaking of a "German" (*i.e.,* High German) language distinct from the other Germanic languages. The fact that many early loans from Latin spread throughout all of Germanic makes it clear that the various dialects of early Germanic were mutually intelligible and that there was easy communication among them. At the same time, the modern German forms of these early loans show that they must have been borrowed before the consonant shift, because they show its effects. Examples include Latin *pondō,* English "pound," but German *Pfund;* Latin *piper,* English "pepper," but German *Pfeffer;* Latin *tegula,* English "tile," but German *Ziegel;* Latin (*via*) *strāta* "paved (road)," English "street," but German *Strasse;* Latin *catillus,* English "kettle," but German *Kessel;* and Latin *coquus,* English "cook," but German *Koch.*

Toward the end of the 4th century there began the great migrations (German *Völkerwanderung*) of Germanic tribes, resulting in an expansion of the Germanic-speaking territory. Angles, Saxons, and Jutes crossed the Channel to England; Franks moved southwest into northern France and south into southern Germany; and Alamanni, Bavarians, and Langobardi moved south into southern Germany, Switzerland, Austria, and northern Italy. At the same time, the area east of the Elbe and Saale rivers was largely vacated by Germanic speakers, and Slavic speakers moved in.

Old period (*c.* 750–1050)

In the southern area settled by Franks, Alamanni, and Bavarians, the first Old High German written records began to appear during the 2nd half of the 8th century. Their language is best described as a collection of monastery dialects; there is a certain uniformity in the writings of any given monastery, but little for the area as a whole. The first documents are translations into German of Latin word lists. Later documents include prose translations of St. Isidore of Seville (made *c.* 800) and of Tatian (*c.* 830), as well as a new verse form with end rhyme (Otfrid, *c.* 870). This literature reached its highest point in the able translations and interpretations of the Swiss monastery teacher Notker Labeo (died 1022). From the north (the Old Low German or Old Saxon speech area), the most extensive documents preserved are a life of Christ in alliterative verse (*Heliand, c.* 830) and a fragment of a similar Genesis translation.

In this period there were many borrowings from Latin, nearly all connected with Christianization of the Germans. Because they were made after the consonant shift, they do not show its effects. Examples of these borrowings include *predigōn* (modern German *predigen* "to preach"), from Latin *praedicāre; tempal* (modern German *Tempel* "temple"), from Latin *templum;* and *spiagal* (modern German *Spiegel* "mirror"), from Latin *speculum.* On the other hand, borrowings of this period reflect sound changes that had occurred in popular Latin, such as the change of Latin *c* before *e* from a *k* sound to *ts* in *cella* "cell" and *crucem* "cross," Old High German *zella, krūzi,* modern German *Zelle, Kreuz* (the letter *z* in the German and Old High German examples represents the sound of *ts*); or the change of Latin medial *-b-* to *-v-* in *tabula* "table," borrowed into Old High German as *tavala,* modern German *Tafel.*

Middle period (*c.* 1050–1350)

Several developments justify the usual assumption of a new period, the language of which is called Middle High German, beginning around 1050. First, there were changes in the language itself, among which were the unvoicing of final *b, d,* and *g* (*cf.* Old High German *grab* "grave," *rad* "wheel," and *tag* "day" with Middle High German *grap, rat,* and *tac;* in modern German these words are again spelled *Grab, Rad,* and *Tag* but are pronounced with final *p, t,* and *k*) and the reduction of the vowels of unstressed syllables to a *ə* sound, usually spelled *e* (*e.g.,* in the plural of the word for "day," the Old High German nominative-accusative form was *taga,* the genitive was *tago,* and the dative was *tagun,* but for these Middle High German had *tage, tage,* and *tagen,* respectively, and modern German has *Tage, Tage,* and *Tagen*). Second, there were great changes in the geographical in which German was spoken. In the west the Franks of northern France had become romanized, and the French–German language border had assumed approximately its present location; in the east, on the other hand, German began to spread into Slavic territory, a process that was to continue for many centuries and to be reversed only at the end of World War II. Third, writing became independent of the monasteries, and the number of written documents soon increased greatly in both north and south. In the south, especially, a remarkable literature developed that included courtly epic and *Minnesang.* There is clear evidence of a trend toward a standard Middle High German literary language, though it seems to have had no influence on ordinary speech. Because this literature was based largely on French models, many French words were borrowed into German.

Early modern period (*c.* 1350–1650)

Four events—the growth of trade, the rise of a middle class, the invention of printing, and the Reformation—had great influence on the development of the language. In the north, because of the prosperity of the Hanseatic League, a standard Low German written language began to develop, though it never reached full growth and probably had little influence on everyday speech. In the south the dialects that had arisen in the recently settled East Middle German area were relatively uniform and contained elements from both West Middle German and Upper German. Gradually these East Middle German dialects came to be used as the offical languages of the chancelleries of the area, including that of Saxony; and on this latter Martin Luther based the language of his widely read Bible translation (1522–34). The growth of this type of German, which developed gradually into modern Standard German, was aided by the fact that printers preferred it as a means of making their books appeal to the widest possible audience.

Three striking vowel changes are characteristic of this period. In the southeast, as early as the 12th century, the long vowels *ī, ū,* and *ǖ* came to be diphthongized to *ei, ou,* and *öü;* this is called the "New High German diphthongization." By the 15th century these new diphthongs had spread to East Middle German, and in the standard language they merged with the old diphthongs *ei, ou,* and *öü.* Examples include Middle High German *mîn* "my," *hûs* "house," and *hiuser* "houses" with the monophthongs *ī, ū,* and *ǖ,* in contrast to *ein* "a," *troum* "dream," and *tröume* "dreams" with the diphthongs *ei, ou,* and *öü,* but modern Standard German *mein, Haus,* and *Häuser* appear with the same diphthongs (*ai, au,* and *oi*) as *ein, Traum,* and *Träume.* By a specifically Middle German development, the diphthongs *iə, uə,* and *üə,* still preserved in the southern dialects, were monophthongized to long *ī, ū,* and *ǖ*; this is the "New High German monophthongization." Examples include Middle High German *tief* "deep," *vuoz* "foot," and *vüeze* "feet" with the diphthongs *iə, uə,* and *üə,* contrasted to modern Standard German *tief, Fuss,* and *Füsse* with the monophthongs *ī, ū,* and *ǖ.* Short vowels remained short in closed syllables before long consonants but were lengthened in open syllables before a short consonant plus an unstressed vowel. This is called "lengthening in open syllables."

Modern period (since 1650)

The outstanding developments of the modern period have been the increasing standardization of High German and its increasing acceptance as the supradialectal form of the language. In writing, it is almost the only form used (except for small amounts of dialect literature); in speech, it is the first or second language of nearly the entire population.

Although Standard German is clearly based on the East Middle German dialects, it is not identical with any one of them; it has accepted and standardized many forms from other areas, notably the Upper German sound *pf* (*Pfund, Apfel*) and also large numbers of individual words in the form of other dialect areas. Since it is the only type of German taught in schools, its spoken form is based to a large extent on its written form; and the spoken form that carries the greatest prestige (that of stage, screen, radio, and so on) uses a largely Low German pronunciation of this written form. As a result, the spoken form of modern Standard German has often been aptly described as "High German with Low German sounds."

Characteristics of modern Standard German. German has the following consonants, given here in phonetic symbols because the spelling often varies: stops, *p, b, t, d, k, g;* fricatives, *f, v, ç~x;* sibilants, *s, z, š, ž;* nasals, *m, n, ŋ;* liquids, *l, r;* glides, *h, j.* German *ç~x,* spelled *ch,* is the voiceless velar fricative *x* after *a, ā, o, ō, u, ū,* and *au* but is the voiceless palatal fricative *ç* in other phonetic environments. The German sound *ž* occurs only in loanwords.

In the orthography, German *w* always indicates a *v* sound; German *v* spells an *f* sound in native words but a *v* sound in loanwords. German *sp* and *st* spell the sounds *sp* and *st* in most positions, but they spell *šp* (*shp*) and *št* (*sht*) at the beginnings of words or word stems. In other positions the *š* (*sh*) sound is spelled *sch—e.g., Schiff* "ship." Medial *ss* marks a preceding vowel as short, medial β marks it as long; medial *ss,* however, changes to β at the end of a word and before a consonant. German *z* always indicates the sound *ts.* The spelling *tz* marks a preceding vowel as short, and the spelling *z* marks it as long.

Voiced *b, d, g, v,* and *z* do not occur at the ends of words, at the ends of parts of compound words, before suffixes beginning with a consonant, or before endings in *s* or *t.* In these positions they are replaced in pronunciation (though not in spelling) by the corresponding voiceless consonants, namely *p, t, k, f,* and *s.* For example, the *g* in *Tage* "days" is pronounced as English *g,* and the *g* in *Tag* "day" is pronounced as English *k.*

The German vowel system is given in Table 22 in phonetic symbols.

Though the spelling does not always indicate the difference between short and long vowels, the following devices are used more or less consistently: (1) A vowel is al-

Table 22: Vowel System of German

short and lax vowels	long and tense vowels	diphthongs	unstressed vowel
i ü u	ī ǖ ū		
e ö o	ē ȫ ō	oi	ə
a	ā	ai au	

ways short if followed by a double consonant letter—*e.g., still* "still," *wenn* "if," *Rasse* "race," *offen* "open," *Hütte* "hut"—in contrast to the long vowels of *Stil* "style," *wen* "whom," *Straße* "street," *Ofen* "oven," *Hüte* "hats." (2) A vowel is always long if followed by an (unpronounced) *h—e.g., ihnen* "to them," *stehlen* "to steal," *Kahn* "barge," *wohnen* "to dwell," *Ruhm* "fame"—in contrast to the short vowels of *innen* "inside," *stellen* "to place," *kann* "can," *Wonne* "bliss," *dumm* "dumb." (3) A vowel is always long if written double—*e.g., Beet* "(flower)bed," *Staat* "state," *Boot* "boat"—in contrast to the short vowels of *Bett* "bed (for sleeping)," *Stadt* "city," *Gott* "god"; *ie* counts as the doubled spelling of *i—e.g.,* long *ī* in *Miete* "rent" but short *i* in *Mitte* "middle." (4) A vowel (except unstressed *e*) is always long when it stands at the end of a word.

The "plain" vowels—*a, o, u, ā, ō, ū, au*—often alternate with the "umlaut" vowels—*e, ö, ü, ē, ȫ, ǖ, oi,* respectively—as in the following examples with plain vowels in the singular but umlauted vowels in the plural: *Gast* "guest," *Gäste; Gott* "god," *Götter; Mutter* "mother," *Mütter.* As these examples show, the vowel sounds *e, ē,* and *oi* are spelled *ä, ä,* and *äu* when they are the umlaut of *a, ā,* and *au* sounds. *Gast–Gäste, Vater–Väter, Braut–Bräute.* Otherwise they are generally spelled *e, eh,* or *ee* (*beten* "to pray," *geht* "goes," *Beet* ["flower]bed"), and *eu* (*Leute* "people").

The sound *ai* is generally spelled *ei: Seite* "side," *nein* "no," though in a few words *ai: Saite* "string (of an instrument)," *Kaiser* "kaiser." The unstressed schwa sound (*ə*), as the *a* in English "sofa," is spelled *e: beginnen/bəgínən/* "to begin," *geredet/gərḗdət/*"spoken." (Wi.G.M.)

Yiddish. Although there were about 11,000,000 speakers of Yiddish before World War II, approximately half of them were killed in the Nazi holocaust. There are perhaps 4,000,000 Yiddish speakers today, including native speakers but excluding those who use it as a second language. Most speakers live in the United States, Latin America, Israel, and the Soviet Union. They are served by an active press, including 11 daily newspapers.

International nature of Yiddish

History. Yiddish, although Germanic, is not a typical Germanic language; it includes not only Germanic features but also elements from Romance, Hebrew-Aramaic, and Slavic languages. A cursory examination of the German component of Yiddish indicates that no Yiddish dialect stands in a one-to-one relationship to any German dialect. The language had its beginnings in the 10th century when Jews from northern France and northern Italy settled in the Rhineland. These early Jewish settlements were dislocated by the Crusades and later by the persecutions that followed in the wake of the Black Plague. The subsequent move to Slavic territory had enormous influence on the development of the language.

Onomastic evidence (evidence from recorded proper names) for Yiddish is known from 1096, and glosses in biblical commentaries may be several decades older. The earliest known connected text is a rhymed couplet inscribed in a Hebrew holiday prayer book from Worms and bearing the date 1272–73. The earliest extensive manuscript, known as the Cambridge Yiddish Codex, is explicitly dated November 9, 1382. It excites the interest of Germanicists for its version of "Ducus Horant" (a poem from the Hildesage of the Gudrun epic known from the Ambross Manuscript written by Hans Reid, 1502/4–1515), which antedates the earliest extant manuscript of the Hildesage by at least 130 years. The documentary history of Yiddish is unbroken thereafter to the present day. Unique evidence for spoken Yiddish is incorporated in an extensive body of rabbinical Responsa (published rabbinical opinions on matters of religious law) beginning in the 15th century. Testimony before the rabbinical court, recorded verbatim, provides unusual insight into the colloquial language.

Scholars divide the history of Yiddish into four periods: Earliest Yiddish, to 1250; Old Yiddish, 1250–1500; Middle Yiddish, 1500–1750; and Modern Yiddish, 1750 to the present. The earliest literary tradition had a Western Yiddish dialectal base; writing in this literary dialect continued into the Modern Yiddish period long after the major population centres had shifted to the East. The establishment of the modern literary language on an Eastern Yiddish base occurred only in the early 19th century. At the same time a new style in the language of Yiddish Bible translation emerged, free from the constraints of the original Hebrew syntax and of the stricture against the use of Yiddish words of Hebrew-Aramaic origin in translating from Hebrew. The continuous contact of Yiddish speakers with Hebrew-Aramaic texts and, in the European language area, with one or another Germanic or Slavic language have been important factors in the development of the language.

Characteristics. Because of the conditions under which Yiddish developed (*i.e.,* the numerous contacts it has had with other languages), it is of great interest to scholars.

Yiddish uses all the letters of the Hebrew alphabet, including traditional word-final variants, which have only recently been reintroduced into the orthography of Soviet Yiddish. Several letters occur only in words of Hebrew-Aramaic origin, which retain their traditional spelling except in the Yiddish of the Soviet Union.

The vowel system of Standard Yiddish consists of the simple vowels *i, e, a, o,* and *u* and the diphthongs *ej, aj, oj.* Under Slavic influence a palatal series of consonants has emerged. Unlike German, *x* corresponding to German *ch* has no palatal variant, the ŋ sound (the *ng* in English "sing") is simply a positional variant of *n,* there is no glottal stop (a sound made by closure of the vocal cords), and word final voicing is distinctive (phonemic—*i.e.,* it carries a change in meaning). Words of Hebrew-Aramaic and Slavic origin have introduced a rich variety of consonant clusters that do not appear in German. Intonation contours, apparently related to the chant with which the Talmud is studied, convey syntactic-semantic distinctions independently.

Yiddish grammar

Case inflections, preserved only in the singular, appear in noun modifiers but only rarely in nouns themselves. The dative and accusative cases have merged in the masculine; the nominative and accusative cases have merged in the feminine and neuter. All prepositions govern the dative case. The system of noun plural formation, basically of German origin, is enriched by word elements of Hebrew origin. Many nouns differ from their German cognates both in gender and plural form. A well-developed system of diminution uses word elements largely of German origin but on a Slavic grammatical model. A semantically significant distinction between inflected and uninflected predicate adjectives has emerged, while the difference between weak and strong adjectives, a characteristic of other Germanic languages, has effectively disappeared. The verb is inflected only in the present indicative. Other tenses and moods are expressed by means of auxiliary words. In normal word order the inflected verb immediately follows the subject; any remaining part of the verb phrase occurs as close to the inflected verb as possible. The special word order of the German subordinate clause is unknown, and verb initial constructions generally express consecutiveness rather than interrogation.

In the vocabulary, words and word elements borrowed from a number of different languages co-occur and often combine freely in a manner unfamiliar to the languages from which they derive. Furthermore, when words borrowed from different languages are partially alike, one of them may be analyzed and inflected in terms historically appropriate to the other, thereby yielding blends of complex etymology. In addition, a highly productive system of prefixing yields verbs that are German in form but derive their meanings from an underlying Slavic model.

Dialects. The basic dialectal division is between Western Yiddish, which occurs largely within the German language area, and Eastern Yiddish in the Slavic-speaking areas. Eastern Yiddish is traditionally subdivided into Northeastern Yiddish and Southern Yiddish, the latter consisting of Central Yiddish and Southeastern Yiddish. The phonological criteria on which this division is based are typically reflected in the variants of the phrase "to buy meat": Western Yiddish *kāfn flāš,* Central Yiddish *kojfn flajš,* Southeastern Yiddish *kojfn flejš,* Northeastern Yiddish *kejfn flejš.* Other phonological and many lexical differences reinforce the distinctness of Western Yiddish.

In the East, Central Yiddish is further distinguished by a full set of contrasts in vowel length, while the varieties of Southeastern Yiddish have made changes in vowel quality that have led to the types *hont* "hand," *huz* "house," and *rign* "rain." Northeastern Yiddish is characterized by the loss of the neuter gender. Standard Yiddish adheres more closely to Northeastern Yiddish in its sound system, and more closely to Southern Yiddish in its grammatical patterns. (M.I.H.)

NORTH GERMANIC (THE SCANDINAVIAN LANGUAGES)

Runes

History. About 125 inscriptions dated from AD 200 to 600, carved in the older runic alphabet (futhark), are chronologically and linguistically the oldest evidence of any Germanic language. Most of them are from Scandinavia, but enough have been found in southeastern Europe to suggest that the use of runes was also familiar to other Germanic tribes. Most inscriptions are brief, marking ownership or manufacture, as on the Gallehus Horns (Denmark; *c.* AD 400): *Ek Hlewagastiz Holtijaz horna tawido* "I, Hlewagastiz, son of Holti, made [this] horn." A number of inscriptions are memorials to the dead, while others are magical in content. The earliest were carved on loose wooden or metal objects, while later ones were also chiselled in stone.

The inscriptions retain the unstressed vowels that were descended from Germanic and Indo-European but were lost in the later Germanic languages; *e.g.*, the *i*'s in *Hlewagastiz* and *tawido* (Old Norse would have been **Hlégestr* and **táða*) or the *a*'s in *Hlewagastiz, Holtijaz,* and *horna* (Old Norse **Høltir, horn*). The scantiness of the material (fewer than 300 words) makes it impossible to be sure of the relationship of this language to Germanic and its daughter languages. It is traditionally known as Proto-Scandinavian but shows few if any distinctively North Germanic features and may reflect a stage, sometimes called Northwest Germanic, prior to the splitting of North and West Germanic (but after the separation of Gothic). Only after the departure of the Angles and Jutes for England and the establishment of the Eider River in south Jutland as a border between Scandinavians and Germans is it reasonable to speak of a clearly Scandinavian or North Germanic dialect.

Viking expansion

Common Scandinavian: 600–1050. Inscriptions from the 7th century show North Germanic as a distinct, fairly uniform, and recognizable dialect. Information about the language is derived from runic inscriptions, which became more abundant after the creation of the short runic futhark about AD 800, from names and loanwords in foreign texts and from reconstructions based on placenames and later dialects. The expansion of Nordic peoples in the Viking Age (*c.* 750–1050) led to the establishment of Scandinavian speech in Iceland, Greenland, the Faeroes, Shetlands, Orkneys, Hebrides, and the Isle of Man, as well as parts of Ireland, Scotland, England, France (Normandy), and Russia. Scandinavian languages later disappeared in all these territories except the Faeroes and Iceland through absorption or extinction of the Scandinavian-speaking population.

During the period of expansion, all Scandinavians could communicate without difficulty and thought of their language as one (sometimes called "Danish" in opposition to "German"), but the differing orientations of the various kingdoms in the Viking Age led to a number of dialectal differences. It is possible to distinguish a more conservative West Scandinavian area (Norway and her colonies, especially Iceland) from a more innovative East Scandinavian (Denmark and Sweden), the former oriented to the Atlantic, the latter to the Baltic. There were no firm borders, however, and the sea lanes formed active channels of contact. An example of a linguistic difference setting off the eastern dialect area is the monophthongization of the Common Scandinavian diphthongs *ei, au,* and *øy* to *ē* and *ø* (*e.g., steinn* "stone" became *stēn, lauss* "loose" became *løs,* and *høyra* "hear" became *hø̄ra*). The diphthongs remained on the island of Gotland and in most North Swedish dialects, however, while they were lost in some East Norwegian dialects. The pronoun *ek* "I" became *jak* in East Scandinavian (modern Danish *jeg,* Swedish *jag*) but remained *ek* in West Scandinavian (New Norwegian and Faeroese *eg,* Icelandic *ég*); in East Norwegian it later became *jak* (dialects *je, jæ,* Dano-Norwegian *jeg*) but remained *ek* (dialects *a, æ*) in Jutland.

Old Scandinavian: 1050–1450. The establishment of the Christian church in its Roman Catholic form during the 10th and 11th centuries had considerable linguistic significance. It helped to consolidate the existing kingdoms, brought the North into the sphere of classical and medieval European culture, and introduced the writing on parchment of Latin letters. Runic writing continued in use for epigraphic purposes and messages for the general population (several thousand inscriptions are extant, from 11th-century Sweden, especially, and also all the way from Russia to Greenland). For more sustained literary efforts, the Latin alphabet was used—at first only for Latin writings but soon for native writings as well. The oldest preserved manuscripts date from *c.* 1150 in Norway and Iceland and *c.* 1250 in Denmark and Sweden. The first important works to be written down were the previously oral laws; these were followed by translations of Latin and French works, among them sermons, saints' legends, epics, and romances. Some of these may have stimulated the extraordinary flowering of native literature, especially in Iceland. One can hardly speak of distinct languages in this period, although it is customary to distinguish Old Icelandic, Old Norwegian, Old Swedish, Old Danish, and Old Gutnish (or Guthnic, spoken in Gotland) on the basis of quite minor differences in the writing traditions. Some of these were merely scribal habits resulting from local usage, but others did reflect the growing separation of the kingdoms and the centralization within each. Literary Old Icelandic is often presented in a normalized textbook form under the name of Old Norse.

Roman influence

Culture words like *caupō* "merchant" (giving Old Norse *kaupa* "buy") and *vinum* "wine" (Old Norse *vín*) had been filtering into the North from the Roman Empire for a long time. But the first great wave of such words came from the medieval church and its translations, often with the other Germanic languages as intermediaries because the first missionaries were English and German. Some religious terms were borrowed from other Germanic languages; among these are Old Norse *helviti* "hell" from Old Saxon *helliwiti* or Old English *hellewite,* and Old Norse *sál* "soul" from Old English *sāwol.* East Scandinavian borrowed the Old Saxon word *siala,* from which come later Danish *sjæl* and Swedish *själ.* In the secular field the most profound influence on Scandinavian was that exerted by Middle Low German because of the commercial dominance of the Hanseatic League and the political influence of the North German states on the royal houses of Denmark and Sweden between 1250 and 1450. The major commercial cities of Scandinavia had large Low German-speaking populations, and the wide use of their language resulted in a stock of loanwords and grammatical formatives comparable in extent to that which French left behind in English after the Norman Conquest.

Reformation and Renaissance: 1450–1550. The many local dialects that exist today developed in the late Middle Ages, when the bulk of the population was rural and tied to its local village or parish, with few opportunities to travel. The people of the cities developed new forms of urban speech, coloured by surrounding rural dialects, by foreign contacts, and by the written languages. The chanceries in which documents of government were produced began to be influential in shaping written norms that were no longer local but nationwide. The Reformation came from Germany and brought with it High German influence through Martin Luther's translation of the Bible, which was quickly translated into Swedish (1541), Danish (1550), and Icelandic (1584). That it was not translated into Norwegian was one of the major reasons that no separate Norwegian literary language arose. Until the 19th century there was no distinct written Norwegian but only a Norwegian variety of Danish. With the invention of printing and the growth of literacy, all speakers of Scandinavian dialects gradually learned to read (and eventually write) the new standard languages.

The modern languages. The six standard languages of today, in the order of their emergence as languages of culture and prestige, are Danish, Swedish, Icelandic, Faeroese, New Norwegian (Nynorsk), and Dano-Norwegian (Bokmål).

Danish

The norms of the first printed books in Danish continued the norm of the royal chancery in Copenhagen, which was not based on any particular dialect and probably reflected a state of the language closer to 1350 than 1550. Because of the influence of the written language, many speech forms used even by the aristocracy at that time were eliminated or branded as vulgar. Danish is clearly the Scandinavian language that has undergone the greatest amount of change away from the Common Scandinavian norm. In the 18th century a mildly puristic reform led to the replacement of many French loans by their native equivalents (*e.g., imagination* by *indbildning; cf.* German *Einbildung*), and, in the 18th and 19th centuries, Danish became the vehicle of a classical literature. There are regional differences in the cultivated speech norm, but upper-class Copenhagen speech probably has the highest prestige. A spelling reform in 1958 eliminated the capitalization of nouns and introduced the letter *å* for *aa,* thereby bringing the spelling closer to that of Norwegian and Swedish. Danish is spoken by most of the more than 5,000,000 inhabitants of Denmark and in a few communities south of the German border; it is taught in the schools of the Faeroe Islands, Iceland, and Greenland.

Swedish

Before the Swedish revolt of Gustav Vasa in 1525, Danish influence on the Swedish language had been strong; the new government, however, made vigorous efforts to eliminate this. The written norm was based on one that had developed in the manuscripts of central Sweden, extending from the Vadstena monastery in east Götaland to Stockholm and Uppsala. In relation to the speech of the area, many of its features were conservative (*e.g.,* silent *-t* and *-d* in words like *huset* "the house" and *kastad* "thrown"). The written language was cultivated energetically as a symbol of national strength, and in 1786 the Swedish Academy was established by King Gustav III. The language expanded its area at the expense of Danish and Norwegian by the conquest of southern and western provinces in the 17th century. After Sweden lost Finland in 1809, the role of Swedish was gradually reduced in that country. Since independence (1917), Finland has accepted Swedish as one of its official languages and has taught it in its schools, but only about 6.3 percent of its population uses it. Except for small Lappish and Finnish minorities, the entire population of Sweden (more than 8,000,000) has Swedish as its daily language, and there is a rich and distinguished literature.

Icelandic

Important factors in the survival of Icelandic during the period of Danish rule were its continued use for literary purposes, the geographical remoteness of Iceland, a scattered population, and the great linguistic differences between Danish and Icelandic. In the period when the Scandinavian languages in continental Europe became essentially uninflected, Icelandic preserved Old Scandinavian grammar almost intact. The native Bible became a basis for the further development of Icelandic. Nevertheless, the circumstances of the language were highly restricted until self-government developed in the 19th century, and Icelandic was rediscovered by Scandinavian scholars. A firm orthography along etymological lines was gradually established, and the policy of not adopting foreign words was confirmed, so that Icelandic today offers a strikingly different appearance from the other Scandinavian languages.

Faeroese

Prior to modern times literary activity in the Faeroe Islands was minimal, but the local dialects continued to develop, though Danish was the official language. The Danish language scholar Rasmus Rask, who wrote the first Faeroese grammar (1811), described the language as a dialect of Icelandic, but it is actually an independent language, intermediate between West Norwegian and Icelandic but containing many Danish loanwords. Traditional dance ballads were written down after 1773 before the establishment in 1846 of an independent orthography. This orthography is etymologizing and unphonetic and gives Faeroese a strong Icelandic appearance. The establishment of home rule in 1948 led to the introduction of Faeroese as the primary language taught in the schools. The language is now spoken by about 43,000 people.

New Norwegian

Old Norwegian writing traditions gradually died out in the 15th century, after the union of Norway with Denmark and the removal of the central government to Copenhagen. After independence was achieved in 1814, the linguistic union with Danish persisted, but the ideology of National Romanticism stimulated a search for a national standard language. In 1853 a young, self-taught linguist of rural stock, Ivar Aasen, constructed a language norm from the spoken dialects that would continue the Old Norwegian tradition and, hopefully, might eventually replace Danish. After long research and experimentation, he presented this New Norwegian norm (often called Landsmål, but now officially Nynorsk) in a grammar, a dictionary, and in numerous literary texts. New Norwegian was officially recognized as a second national language in 1885. Today all Norwegians learn to read and write it, but only a fifth of the school population and an even smaller percentage of the writers actually use it as their primary language. It has been cultivated by many excellent authors and has a quality of poetic earthiness that appeals even to nonusers. Its norm has changed considerably since Aasen's time in the direction of spoken East Norwegian or written Dano-Norwegian.

Dano-Norwegian

Most Norwegian literature in the 19th century was written in a superficially Danish norm, but it was given Norwegian pronunciation and had many un-Danish words and constructions. The spoken norm was a compromise Dano-Norwegian that had grown up in the urban bourgeois environment. In the 1840s Knud Knudsen formulated a policy of gradual reform that would bring the written norm closer to that spoken norm and, thereby, create a distinctively Norwegian language without the radical disruption envisaged by the supporters of Aasen's New Norwegian. This solution was supported by most of the new writers in the powerful literary movement of the late 19th century. The official reforms of 1907, 1917, and 1938 broke with the Danish writing tradition and adopted native pronunciation and grammar as its normative base; the resultant language form was called Riksmål, later officially Bokmål. Controversial efforts to bring Dano-Norwegian and New Norwegian together into an amalgamated Pan-Norwegian (Samnorsk) have not yet led to any definite result. In its current form Dano-Norwegian is the predominant language of Norway's population of 4,000,000, except in western Norway and among the small Lappish minority in the North. It is the language usually taught abroad as "Norwegian."

Dialects

The teaching of the standard languages in the schools and the high levels of literacy have tended to spread the urban norms of speaking. Nevertheless, very diverse dialects, partially unintelligible to outsiders, are spoken in many rural communities; some of them are used occasionally for the writing down of local traditions or for giving local colour in plays and novels. Dialect institutes for their study exist in each country. Boundaries between dialect areas are gradual and do not always coincide with national borders, so that the following traditional divisions are somewhat arbitrary: in Denmark, West (Jutland), Central (Fyn, Sjœlland), and East (Bornholm); in Sweden, South (especially Skåne), Götaland, Svealand, North (Norrland), Gotland, East (Finland); in Norway, East (Lowland, Midland), Trönder (around Trondheim), North (Nordland), West. In the Faeroese language there are minor dialectal differences between the southern and northern islands; minor dialectal differences occur in Icelandic as well, but there are no clearly defined regional dialects. In the larger cities there is a range of social dialects from the everyday speech of the working classes (often similar to nearby rural speech) to the more cultivated forms of middle- and upper-class speech, including the highly formal style of courts and legislatures. Speakers of Danish, Norwegian, and Swedish normally use their own languages in communicating with one another; Norwegian and Swedish have a common phonetic base, and Norwegian and Danish share many vocabulary items.

Characteristics. *Common and distinctly Scandinavian characteristics.* North Germanic differs from West Ger-

Differences between North and West Germanic

manic (but not East Germanic) in having *ggj* and *ggv* for medial *jj* and *ww*, respectively (Old Norse *tveggja* "two," *hoggva* "hew"), *-t* for *-e* in the 2nd person singular of the strong preterite (Old Norse *namt* "you took"; *cf.* Old English *nœme*), and a reflexive possessive *sin*.

North Germanic differs from East Germanic (but not West Germanic) in that original *ē* becomes *ā* (Old Norse *máni* "moon") and original *z* becomes *r* (Old Norse *meiri* "more"); furthermore, there is a new demonstrative pronoun *þessi* "this" (Danish, Swedish, and Norwegian *denne*), back vowels are mutated to front vowels by the influence of a following *i* or *j* ("*i*-umlaut"—*a* and *ā* become *œ* and *œ̄*, *o* and *ō* become *ø* and *ø̄* [*ø* represents umlauted *o*], *u* and *ū* become *y* and *ȳ* [*y* represents umlauted *u*], *au* becomes *ey* or *øy*), and the number of unstressed vowels is reduced to three (*a, i, u*).

North Germanic differs from both West Germanic and East Germanic in the following ways: rounding of unrounded vowels by following *u* or *w* ("*u*-umlaut"—*a* and *ā* become *ǫ* and *ǭ* [*ǫ* represents a low back rounded vowel], *e* becomes *ø, i* becomes *y, ei* becomes *ey* or *øy*); loss of initial *j* and *w* in some positions (Old Norse *ungr* "young," *ár* "year," *Óðinn* "Wodan," *ull* "wool"); loss of final nasals (Old Norse *frá* "from," *fara* "fare, go"; *cf.* Old English *faran,* German *fahren*); diphthongization ("breaking") of short *e* to *ja* or *jǫ* (Old Norse *jafn* "even," *jǫrd* "earth"). It has new pronouns for the 3rd person singular (Old Norse *hann* "he," *hon* "she"); attaches the reflexive pronoun (*sik*) to the verb to make a new mediopassive in *-sk, -st,* or *-s* (*finna sik* "find oneself" became Old Norse *finnast* "be found, exist," Danish *findes*); attaches the demonstrative *inn* "that" to nouns as a definite article (Old Norse *fótrinn* "the foot," Norwegian and Swedish *foten,* Danish *foden*), except in West Jutland (possibly a later development); and uses *-t* as marker of the neuter in pronouns and adjectives (Old Norse *hvítt* "white" from *hvít-, eitt* "one" from *ein-*). Furthermore, North Germanic employed *es* (which changed to *er*) and later *sum* as an indeclinable relative pronoun; and it lost some Germanic prefixes, such as *ga-* (German *ge-*), and contains a considerable number of words such as *hestr* "horse," *fœr* or *fár* "sheep," *gríss* "pig," *gólf* "floor," and *ostr* "cheese" that do not occur in East or West Germanic.

Orthography. The five basic vowel symbols of the Latin alphabet are supplemented by a number of special symbols, mostly for umlauted vowels: thus, there is *y* (pronounced as German *ü*), *æ* (used in Danish, Norwegian, Icelandic, and Faeroese) and the corresponding *ä* (used in Swedish), *ø* (in Danish, Norwegian, and Faeroese) and the corresponding *ö* (in Swedish and Icelandic), and *å* (also written *aa,* used in Danish, Swedish, and Norwegian).

Their present-day values are not identical; Icelandic *æ* is pronounced as the diphthong sound *ai* (as the *i* in English "ice"). Icelandic also uses accents on vowels that were long in Old Norse but are now mostly diphthongs (*á, é, í, ó, ú,* and *ý*); Faeroese has the same system except for *é*. The consonant symbols are the usual Latin ones, except that *þ* (thorn) and *ð* (edh) are used in Icelandic for voiceless and voiced *th* (*ð* in Faeroese has a different value). Loanwords containing *c, q, w, x,* and *z* have generally been naturalized by substituting, respectively, *k* or *s, kv, v, ks,* and *s* (*e.g., kontakt* "contact" but Norwegian *sigar* "cigar" versus Danish and Swedish *cigar*).

Influence of borrowing on stress

Phonology. Stress is on the first syllable in native words, with sporadic exceptions for compounds. Stress on a later syllable reflects borrowing from other languages, except in Icelandic, which has stress on the first syllable of all words.

Pitch is usually high on the stressed syllable, falling at the end of a statement, rising for a yes-no question. An exception is East Norwegian and some Swedish dialects, in which the stressed syllable is low and the pitch is often rising at the end of statements. In most of Norway and Sweden and in scattered Danish dialects, there is a special word tone, by which old monosyllables have one kind of pitch while old polysyllables have another. The first pitch type is usually high or low pitch on the stressed syllable, like that in other Germanic languages, while the second is more complex and varies from region to region. In Danish the tones have been replaced by glottalization in instances in which Norwegian and Swedish have the first type.

Vowels are short before two or more consonants (with some exceptions) or when unstressed. Doubled consonants after short stressed vowels are pronounced long, except in Danish, which also does not double consonants in final position.

The Common Scandinavian vowel system contained 10 vowels, each of which could be long, short, or nasalized: front unround (*i, e,* and *æ*), front round (*y, ø,* and *ø*), back round (*u, o,* and *ø̨*), and back unround (*a*). There were three falling diphthongs: front unround (*ęi*), front round (*øy*), and back round (*au*). While most of these are still present in some dialects, there have been many changes. The nasalized vowels disappeared, though they were still present in Icelandic around 1150. Diphthongs became long vowels in Danish and Swedish in the 10th century. Short low umlauted vowels coalesced with neighbouring vowels (*æ* became *e, ø̨* became *ø, ǫ* became *o/ø*). Long *ā* (Old Norse *á*) was rounded to *å* (pronunciation similar to the *o* in English "order"; in Icelandic and West Norwegian, pronunciation is like the *ow* in "now"). In Norwegian and Swedish the rounded vowels were shifted upwards and forwards, giving "overrounded" *o* and *u* that resemble *u* and *y* respectively. The unstressed vowels *a, i,* and *u* have remained in Icelandic and Faeroese but have been partially merged in New Norwegian and Swedish (written *a, e, o*), completely merged as *ə* (the schwa sound, as *a* in English "sofa") in Danish and Dano-Norwegian, and lost in Jutland and Trönder dialects. High round vowels (*y, ȳ, øy*) have been merged with the unround vowels in Icelandic and Faeroese (and in scattered dialects elsewhere) but are still distinguished in writing. Long vowels have been diphthongized not only in many dialects (*e.g.,* Jutland, Skåne, and West Norwegian) but also in standard Icelandic and Faeroese (Icelandic *é,* pronounced [je], *ó* [ou], *á* [au], *æ* [ai]; Faeroese *í* [ui], *æ* [æa], and so on). (Symbols in brackets are phonetic symbols designating actual pronunciation.) A quantity shift took place in the late Middle Ages, in which short vowels were lengthened before single consonants and long vowels were shortened before clusters, sometimes with qualitative changes that affected different dialects differently; thus, in Swedish *veta* "know" *i* became *e* (though all the other languages have *i*).

The Common Scandinavian consonant system contained voiceless stops (*p, t, k*), voiced stops (*b, d, g*), voiceless-voiced spirants (*f/ƀ, þ/ð, x/g*), nasals (*m, n*), a sibilant (*s*), liquids (*l, r*), and glides (*w, j*). The chief changes were as follows: Short voiceless stops became voiced after vowels in Danish and neighbouring dialects and then partially opened to become spirants or glides (*tapa* became *tabe* "lose," *ūt* became *ud* "out," *kakur* became *kager* "cakes"). Velar stops (*k, g, sk*) were palatalized before front vowels to merge with *kj, gj,* and *skj,* as still occurs in Icelandic (and Jutland dialect); in Faeroese, Norwegian, Swedish, and many Danish dialects, these were fronted to *tj, dj, stj* or even opened to spirants [ç, j, š], while in Danish they reverted to *k, g,* and *sk.* Voiced *f* [ƀ] merged with *w* to become *v,* though it is still written *f* in Icelandic; in Danish both *f* and *w* have become pronounced as *w* after vowels. Voiceless *þ* became *t* (occasionally *h* in Faeroese) and voiced *þ* [*ð*] became *d,* except in Icelandic. Voiceless *x* became *h* initially before vowels, but was lost elsewhere; voiced *x* [*g*] became *g,* except in Icelandic (in Danish it has become either [j] or [w] after vowels). The *r* sound was assimilated to following dental sounds (*l, n, s, t, d*) to make a series of retroflex consonants (*ḷ, ṇ, ś, ṭ, ḍ,* pronounced with the tip of the tongue curled up towards the hard palate) in many Swedish and Norwegian dialects, including those of Oslo and Stockholm. In much the same area a "dark" *l* was merged with *rð* to make a new "thick *l*," defined as a "cacuminal flap" not acceptable in standard speech. The *r* sound became a uvular *r* in Danish and in the dialects of the nearest parts of Sweden and Norway in the last century or two.

Morphology. The Common Scandinavian system of inflections in nouns, adjectives, pronouns, and verbs is almost totally preserved in Icelandic, if allowance is made for some sound changes (*e.g., -r* becomes *-ur* as in *situr* "sits," and *-t* becomes *ð* as in *húsið* "the house"). In Faeroese and New Norwegian the genitive case is replaced in speech by prepositional phrases or compounds. Declensions in Faeroese have been simplified in the plurals of nouns (all end in *-r*), verb plurals (*-a* in present, *-u* in preterite), verb singulars (*-i* in weak present for all persons), and the subjunctive (*-i* in the present, same ending as indicative in the preterite). In the remaining languages all case forms except the genitive (which invariably ends in *-s*) have been merged, as have markers of person and number in the verbs. This simplification began in Danish and spread to Norwegian and Swedish between 1200 and 1500, perhaps under the influence of Low German.

Major similarities

The present-day system of Danish, Dano-Norwegian, New Norwegian, and Swedish is basically identical. Nouns have singular and plural forms, to which the definite article may be suffixed; the plural suffixes vary, reflecting earlier stem, gender, and umlaut classes. Adjectives have neuter singulars marked by *-t,* plurals marked by a vowel (*-e* or *-a*), and weak forms used after determiners, usually identical in form with the plurals; the comparatives are marked by *r* and superlatives by the cluster *st.* Adverbs derived from adjectives are identical in form with the neuter singular forms of the adjectives. Personal pronouns occur in three persons and in both singular and plural. In part, they still distinguish nominative and accusative (*e.g.,* Swedish *jag* "I"—*mig* "me"). There are polite pronouns of address that are either identical with the 2nd person plural (Swedish *ni,* Icelandic *þér,* Faeroese *tygum,* and New Norwegian *de* or *dykk*) or the 3rd person plural (Danish or Dano-Norwegian *De*); in Icelandic and Faeroese old duals have taken over the function of plurals (Icelandic *við* "we," *þið* "you"; Faeroese *vit* "we," *tit* "you"). Each personal pronoun has a corresponding possessive pronoun, the 3rd person being identical with the genitive of the pronoun and invariable. The possessive pronouns for the other persons and the reflexive *sin* are inflected for gender and number like most other pronouns and articles. Verbs inflect for tense only, with *-r* as the usual present marker (New Norwegian does not have an ending to indicate present tense in the strong verbs), while the preterites have stem-vowel ablaut changes in the strong verbs and a dental suffix in the weak verbs. Nonfinite forms of the verb have invariable suffixes (*-a* or *-e* for the infinitive, *-ande* or *-ende* for present participles, and *-at* or *-et* for perfect participles), except that Swedish and New Norwegian mark gender when the perfect participle is used adjectivally.

Major differences

New Norwegian, like Icelandic and Faeroese, and, in part, Dano-Norwegian preserve masculine, feminine, and neuter genders; Danish and Swedish combine masculine and feminine into a common (non-neuter) gender. Swedish and New Norwegian (in part) preserve non-neuter plurals in *-ar, -er,* and *-or,* which merged as *-er* in Dano-Norwegian; in Danish these have become *-e,* while a new plural in *-er* has arisen, primarily for loanwords. The preterite of first class weak verbs (Old Norse *-aði*) ends in *-a* in New Norwegian, *-et* in Dano-Norwegian, *-ede* in Danish, and *-ade* in Swedish (usually pronounced *-a*). In Norwegian and Swedish a new class of weak verbs with preterite ending *-dde* has arisen, including stems ending in *-d* or long vowels (Swedish *födde* "bore," *bodde* "lived"). The present tense form of strong verbs is umlauted in New Norwegian (as in Icelandic and Faeroese); it is monosyllabic in New Norwegian, has high or low pitch on the stressed syllable in Dano-Norwegian and Swedish, and glottalization in Danish (New Norwegian *kjem;* Dano-Norwegian, Swedish *kommer,* pronounced *'kåmmər;* Danish *kommer,* pronounced *kåmʔər.* New Norwegian has *-st* in the mediopassive (like Icelandic and Faeroese); Dano-Norwegian, Swedish, and Danish have *-s.*

Normal word order in sentences

Syntax. The reduction of morphological complexity has been accompanied by the emergence of a more rigid order of sentence elements. Normal order is subject–finite verb–indirect object–direct object. The verb must precede the subject in yes–no questions, or when any part of the predicate is put first. Contrary to German practice, the verb keeps its normal place in subordinate clauses, except that negatives and other lightly stressed adverbs usually precede the finite verb (except in Icelandic). Complex verb phrases are formed with modal auxiliaries (*e.g., kan* "can") and infinitives or with the perfect auxiliaries *ha(ve)* "have" and *få* "get" (Icelandic *geta*) and the perfect participle. Instead of such durative aspect markers as the English progressive (*e.g.,* "is talking"), verbs indicating position are combined with the main verb (*e.g.,* Dano-Norwegian *han sitter* [*står, går, ligger*] *og prater* "he is sitting [standing, walking, lying] and talking."). Icelandic has special constructions for present and perfect aspects (*er að ganga* "is going" or *er buinn að ganga* "is through going").

Major differences in the Norwegian languages, Swedish, and Danish are few: (1) New Norwegian and Swedish use the nominative after a copula (*Det er eg/jag* "It is I"), Dano-Norwegian and Danish, the accusative (*Det er meg/mig* "It is me"). (2) A complex passive is formed either with Old Scandinavian *verða* (Swedish *varda,* New Norwegian *verta*) or Low German *bliven* (Danish *blive,* Dano-Norwegian *bli*) and the perfect participle. (3) Swedish supplements the polite pronoun of address with a pronominal use of titles: *Önskar professoren kaffe?* "Do you [professor] wish coffee?" (4) The reflexive pronoun *sin* is used with singular or plural subjects, except in Danish, in which it is used only with singular subjects. (5) A definite article is indicated by a form before the adjective and a suffix after the noun ("double definite"), except in Icelandic and Danish (*e.g.,* in Norwegian and Swedish *det store* [*stora*] *huset* "the big house," both *det* and *-et* in *huset* mean "the," in Danish the suffix *-et* is not used: *det store hus*). (6) A possessive may follow its noun in Icelandic, Faeroese, and Norwegian but not in Danish or Swedish (Icelandic *hesturinn minn* "my horse," literally, "horse mine," Swedish *min häst* "my horse"). (7) The numeral "one" is used (in unstressed form) as an indefinite article (*i.e.,* as "a," "an"), except in Icelandic, which has no indefinite article. (8) Swedish omits the auxiliary *hava* "have" in subordinate clauses (*Huset jag sett . . .* "The house I [have] seen . . . ").

Vocabulary. The everyday stock of Scandinavian words, including most of the high frequency words, is Indo-European and Germanic in its core. Of the 200,000 or more entries in the large dictionaries of each language, the vast majority are either compounds and derivatives of the simpler words or else borrowings from other languages—mostly of a scientific and cultural nature. At the present time the chief source of loanwords is English.

Borrowings

Icelandic preserved the creative powers of the older language by making it a policy not to accept new words in unassimilated form. Whenever possible, new compounds and derivatives have been created to avoid the borrowing of foreign terms. To some extent Faeroese and New Norwegian have followed the same policy but without the success of Icelandic. Danish, Swedish, and Dano-Norwegian have adopted numerous German words, along with their prefixes and suffixes; *e.g.,* Danish and Norwegian *betale* and Swedish *betala* "pay" from Low German *betalen (cf.* Icelandic and Faeroese *gjalda, borga).* A knowledge of German is very helpful in learning to read Norwegian, Swedish, and Danish, but this is less true for Icelandic and Faeroese, which baffle even fellow Scandinavians.

The borrowings of Danish, Swedish, and Norwegian reflect the varied contacts discussed above. Their vocabulary consists of a native core, a German middle layer (with words like Danish *skrædder* "tailor"; *cf.* Icelandic and Faeroese *klæðskeri,* literally "cloth-cutter"), and an international outer layer (with words like *psykologi* "psychology"; *cf.* Icelandic and Faeroese *sálfræði,* literally, "soul science"). While there are some differences among the languages in the exact composition of these layers, there is also considerable agreement. Differences occur especially in words of local origin (slang, humour, endearments, abuse) and in borrowings of different origin; *e.g.,* Norwegian *etasje*/Swedish *våning*/Danish *sal* "story" (in a hotel), from French *étage,* Middle Low German *woninge,* and Old Scandinavian *salr* (but with its meaning from North German *Saal*). (Ei.H.)

English language

English is widely spoken in all six continents and has had a strong effect in many regions in which it is not the principal language spoken. The portmanteau words Franglais, Russlish, and Japlish, for example, have been invented by resentful purists to describe the numerous expressions, in vogue among the young, resulting from the infiltration of English into French, Russian, and Japanese, respectively.

The widely diffused English-speaking community is fairly stable in the British Isles, North America, and Australasia. In Africa, the Indian subcontinent, and Southeast Asia its future remains uncertain and unpredictable. People who speak English fall into three groups: those who have inherited it as their native language; those who have acquired it as a second language within a society that is largely bilingual; and those who are driven by necessity to use it for some practical purpose—administrative, professional, or educational. One person in seven of the world's entire population now belongs to one of these three groups.

ORIGINS AND BASIC CHARACTERISTICS

Parent tongue

English belongs to the Indo-European family of languages and is therefore related to most other languages spoken in Europe and western Asia from Iceland to India. The parent tongue, called Proto-Indo-European, was spoken about 5,000 years ago by nomads believed to have roamed the southeast European plains. Germanic, one of the language groups descended from this ancestral speech, is usually divided by scholars into three regional groups: East (Burgundian, Vandal, and Gothic, all extinct), North (Icelandic, Faeroese, Norwegian, Swedish, Danish), and West (German, Netherlandic [Dutch and Flemish], Frisian, English). Though closely related to English, German remains far more conservative than English in its retention of a fairly elaborate system of inflections. Frisian, spoken by the inhabitants of the Dutch province of Friesland and the islands off the west coast of Schleswig, is the language most nearly related to Modern English. Icelandic, which has changed little over the last thousand years, is the living language most nearly resembling Old English in grammatical structure.

Modern English is analytic (*i.e.,* relatively uninflected), whereas Proto-Indo-European, the ancestral tongue of most of the modern European languages (*e.g.,* German, French, Russian, Greek), was synthetic, or inflected. During the course of thousands of years, English words have been slowly simplified from the inflected variable forms found in Sanskrit, Greek, Latin, Russian, and German, toward invariable forms, as in Chinese and Vietnamese. The German and Chinese words for "man" are exemplary. German has five forms: *Mann, Mannes, Manne, Männer, Männern.* Chinese has one form: *jen.* English stands in between, with four forms: man, man's, men, men's. In English only nouns, pronouns, and verbs are inflected. Adjectives have no inflections aside from the determiners "this, these" and "that, those." (The endings *-er, -est,* denoting degrees of comparison, are better regarded as noninflectional suffixes.) English is the only European language to employ uninflected adjectives; *e.g.,* "the tall man," "the tall woman," compared to Spanish *el hombre alto* and *la mujer alta.* As for verbs, if the Modern English word ride is compared with the corresponding words in Old English and Modern German, it will be found that English now has only five forms (ride, rides, rode, riding, ridden), whereas Old English *ridan* had 13, and Modern German *reiten* has 16 forms.

In addition to this simplicity of inflections, English has two other basic characteristics: flexibility of function and openness of vocabulary.

Loss of inflection

Flexibility of function has grown over the last five centuries as a consequence of the loss of inflections. Words formerly distinguished as nouns or verbs by differences in their forms are now often used as both nouns and verbs. One can speak, for example, of "planning a table" or "tabling a plan," "booking a place" or "placing a book," "lifting a thumb" or "thumbing a lift." In the other Indo-European languages, apart from rare exceptions in Scandinavian, nouns and verbs are never identical because of the necessity of separate noun and verb endings. In English, forms for traditional pronouns, adjectives, and adverbs can also function as nouns; adjectives and adverbs as verbs; and nouns, pronouns, and adverbs as adjectives. One speaks in English of the Frankfurt Book Fair, but in German one must add the suffix *-er* to the place-name and put attributive and noun together as a compound, Frankfurter Buchmesse. In French one has no choice but to construct a phrase involving the use of two prepositions: Foire du Livre de Francfort. In English it is now possible to employ a plural noun as adjunct (modifier), as in "wages board" and "sports editor"; or even a conjunctional group, as in "prices and incomes policy" and "parks and gardens committee."

Openness of vocabulary implies both free admission of words from other languages and the ready creation of compounds and derivatives. English adopts (without change) or adapts (with slight change) any word really needed to name some new object or to denote some new process. Like French, Spanish, and Russian, English frequently forms scientific terms from Classical Greek word elements.

English possesses a system of orthography that does not always accurately reflect the pronunciation of words; this is discussed below in the section *Orthography.*

CHARACTERISTICS OF MODERN ENGLISH

Phonology. British Received Pronunciation (RP), by definition, the usual speech of educated people living in London and southeastern England, is one of the many forms of standard speech. Other pronunciations, although not standard, are entirely acceptable in their own right on conversational levels.

The chief differences between British Received Pronunciation, as defined above, and a variety of American English, such as Inland Northern (the speech form of western New England and its derivatives, often popularly referred to as General American), are in the pronunciation of certain individual vowels and diphthongs. Inland Northern American vowels sometimes have semiconsonantal final glides (*i.e.,* sounds resembling initial *w,* for example, or initial *y*). Aside from the final glides, this American dialect shows four divergences from British English: (1) the words cod, box, dock, hot, and not are pronounced with a short (or half-long) low front sound as in British "bard" shortened (the terms front, back, low, and high refer to the position of the tongue); (2) words such as bud, but, cut, and rung are pronounced with a central vowel as in the unstressed final syllable of "sofa"; (3) before the fricative sounds *s, f,* and *θ* (the last of these is the *th* sound in "thin") the long low back vowel *a,* as in British "bath," is pronounced as a short front vowel *a,* as in British "bad"; (4) high back vowels following the alveolar sounds *t* and *d* and the nasal sound *n* in words such as tulips, dew, and news are pronounced without a glide as in British English; indeed, the words sound like the British "two lips," "do," and "nooze" in "snooze." (In several American dialects, however, these glides do occur.)

The consonants

The 24 consonant sounds comprise six stops (plosives): *p, b, t, d, k, g;* the fricatives *f, v, θ* (as in "thin"), *ð* (as in "then"), *s, z, ʃ* (as in "ship"), ʒ (as in "pleasure"), and *h;* two affricatives: *tʃ* (as in "church") and *dʒ* (as the *j* in "jam"); the nasals *m, n,* ŋ (the sound that occurs at the end of words such as "young"); the lateral *l;* the vibrant or retroflex *r;* and the semivowels *j* (often spelled *y*) and *w.* These remain fairly stable, but Inland Northern American differs from British English in two respects: (1) *r* following vowels is preserved in words such as "door," "flower," and "harmony," whereas it is lost in British; (2) *t* between vowels is voiced, so that "metal" and "matter" sound very much like British "medal" and "madder," although the pronunciation of this *t* is softer and less aspirated, or breathy, than the *d* of British English.

Like Russian, English is a strongly stressed language. Four degrees of stress may be differentiated: primary, secondary, tertiary, and weak, which may be indicated, respectively, by acute (´), circumflex (ˆ), and grave (`) accent marks and by the breve (◡). Thus, "Têll mè thĕ trúth" (the whole truth, and nothing but the truth) may be contrasted with "Têll mé thĕ trûth" (whatever you may tell other people); "blác̆k bîrd" (any bird black in colour) may be contrasted with "bláckbìrd" (that particular bird *Turdus merula*). The verbs "permít" and "recórd" (henceforth only primary stresses are marked) may be contrasted with their corresponding nouns "pérmit" and "récord." A feeling for antepenultimate (third syllable from the end) primary stress, revealed in such five-syllable words as equanímity, longitúdinal, notoríety, opportúnity, parsimónious, pertinácity, and vegetárian, causes stress to shift when extra syllables are added, as in "histórical," a derivative of "hístory" and "theatricálity," a derivative of "theátrical." Vowel qualities are also changed here and in such word groups as périod, periódical, periodícity; phótograph, photógraphy, photográphical. French stress may be sustained in many borrowed words; *e.g.,* bizárre, critíque, duréss, hotél, prestíge, and techníque.

Pitch, or musical tone, determined by the rate of vibration of the vocal cords, may be level, falling, rising, or falling–rising. In counting "one," "two," "three," "four," one naturally gives level pitch to each of these cardinal numerals. But if a person says "I want two, not one," he naturally gives "two" falling pitch and "one" falling–rising. In the question "One?" rising pitch is used. Word tone is called pitch, and sentence tone is referred to as intonation. The end-of-sentence cadence is important for meaning, and it therefore varies least. Three main end-of-sentence intonations can be distinguished: falling, rising, and falling–rising. Falling intonation is used in completed statements, direct commands, and sometimes in general questions unanswerable by "yes" or "no"; *e.g.,* "I have nothing to add." "Keep to the right." "Who told you that?" Rising intonation is frequently used in open-ended statements made with some reservation, in polite requests, and in particular questions answerable by "yes" or "no": "I have nothing more to say at the moment." "Let me know how you get on." "Are you sure?" The third type of end-of-sentence intonation, first falling and then rising pitch, is used in sentences that imply concessions or contrasts: "Some people do like them" (but others do not). "Don't say I didn't warn you" (because that is just what I'm now doing). Intonation is on the whole less singsong in American than in British English, and there is a narrower range of pitch. American speech may seem more monotonous but at the same time may sometimes be clearer and more readily intelligible. Everywhere English is spoken, regional dialects display distinctive patterns of intonation.

Intonation in American and British English

Morphology. *Inflection.* Modern English nouns, pronouns, and verbs are inflected. Adjectives, adverbs, prepositions, conjunctions, and interjections are invariable.

Most English nouns have plural inflection in *(-e)s,* but this form shows variations in pronunciation in the words cats (with a final *s* sound), dogs (with a final *z* sound), and horses (with a final *iz* sound), as also in the 3rd person singular present-tense forms of verbs: cuts (*s*), jogs (*z*), and forces (*iz*). Seven nouns have mutated (umlauted) plurals: man, men; woman, women; tooth, teeth; foot, feet; goose, geese; mouse, mice; louse, lice. Three have plurals in *-en:* ox, oxen; child, children; brother, brethren. Some remain unchanged; *e.g.,* deer, sheep, moose, grouse. Five of the seven personal pronouns have distinctive forms for subject and object.

The forms of verbs are not complex. Only the substantive verb ("to be") has eight forms: be, am, is, are, was, were, being, been. Strong verbs have five forms: ride, rides, rode, riding, ridden. Regular or weak verbs customarily have four: walk, walks, walked, walking. Some that end in a *t* or *d* have three forms only: cut, cuts, cutting. Of these three-form verbs, 16 are in frequent use.

In addition to the above inflections, English employs two other main morphological (structural) processes—affixation and composition—and two subsidiary ones—back-formation and blend.

Types of affixes

Affixation. Affixes, word elements attached to words, may either precede, as prefixes (do, undo; way, subway), or follow, as suffixes (do, doer; way, wayward). They may be native (*over*do, wayward*ness*), Greek (*hyper*bole, thes*is*), or Latin (*super*sede, pedi*ment*). Modern technologists greatly favour the neo-Hellenic prefixes *macro-*"long, large," *micro-* "small," *para-* "alongside," *poly-* "many," and the Latin *mini-,* with its antonym *maxi-*. Greek and Latin affixes have become so fully acclimatized that they can occur together in one and the same word, as, indeed, in "ac-climat-ize-d," just used, consisting of a Latin prefix plus a Greek stem plus a Greek suffix plus an English inflection. Suffixes are bound more closely than prefixes to the stems or root elements of words. Consider, for instance, the wide variety of agent suffixes in the nouns act*or,* artis*an,* dot*ard,* engin*eer,* financ*ier,* hire*ling,* magistr*ate,* merch*ant,* scient*ist,* secret*ary,* son*gster,* stud*ent,* and work*er.* Suffixes may come to be attached to stems quite fortuitously, but, once attached, they are likely to be permanent. At the same time, one suffix can perform many functions. The suffix *-er* denotes the doer of the action in the words worker, driver, and hunter; the instrument in chopper, harvester, and roller; and the dweller in Icelander, Londoner, and Trobriander. It refers to things or actions associated with the basic concept in the words breather, "pause to take breath"; diner, "dining car on a train"; and fiver, "five-pound note." In the terms disclaimer, misnomer, and rejoinder (all from French) the suffix denotes one single instance of the action expressed by the verb. Usage may prove capricious. Whereas a writer is a person, a typewriter is a machine. For some time a computer was both, but now, with the invention and extensive use of electronic apparatus, the word is no longer used of persons.

Composition. Composition, or compounding, is concerned with free forms. The primary compounds "already," "cloverleaf," and "gentleman" show the collocation of two free forms. They differ from word groups or phrases in phonology, stress, or juncture or by a combination of two or more of these. Thus, "already" differs from "all ready" in stress and juncture, "cloverleaf" from "clover leaf" in stress, and "gentleman" from "gentle man" in phonology, stress, and juncture. In describing the structure of compound words it is necessary to take into account the relation of components to each other and the relation of the whole compound to its components. These relations diverge widely in, for example, the words cloverleaf, icebreaker, breakwater, blackbird, peace-loving, and paperback. In "cloverleaf" the first component noun is attributive and modifies the second, as also in the terms aircraft, beehive, landmark, lifeline, network, and vineyard. "Icebreaker," however, is a compound made up of noun object plus agent noun, itself consisting of verb plus agent suffix, as also in the words bridgebuilder, landowner, metalworker, minelayer, and timekeeper. The next type consists of verb plus object. It is rare in English, Dutch, and German but frequent in French, Spanish, and Italian. The English "pastime" may be compared, for example, with French *passe-temps,* the Spanish *pasatiempo,* and the Italian *passatempo.* From French comes "passport," meaning "pass (*i.e.,* enter) harbour." From Italian comes "portfolio," meaning "carry leaf." Other words of this type are daredevil, scapegrace, and scarecrow. As for the "blackbird" type, consisting of attributive adjective plus noun, it occurs frequently, as in the terms bluebell, grandson, shorthand, and wildfire. The next type, composed of object noun and a present participle, as in the terms fact-finding, heart-rending (German *herzzerreissend*), life-giving (German *lebenspendend*), painstaking, and time-consuming, occurs rarely. The last type is seen in barefoot, bluebeard, hunchback, leatherneck, redbreast, and scatterbrain.

Compound words

Back-formations and blends. Back-formations and blends are becoming increasingly popular. Back-formation is the reverse of affixation, being the analogical creation of a new word from an existing word falsely assumed to be its derivative. For example, the verb "to edit" has been formed from the noun "editor" on the reverse analogy of the noun "actor" from "to act," and similarly the verbs automate, bulldoze, commute, escalate, liaise, loaf, sightsee, and televise are backformed from the nouns automation, bulldozer, commuter, escalation, liaison, loafer, sightseer, and television. From the single noun "procession" are backformed two verbs with different stresses and meanings: procéss, "to walk in procession," and prócess, "to subject food (and other material) to a special operation."

Two types of blends

Blends fall into two groups: (1) coalescences, such as "bash" from "bang" and "smash"; and (2) telescoped forms, called portmanteau words, such as "motorcade" from "motor cavalcade." In the first group are the words clash, from clack and crash, and geep, offspring of goat and sheep. To the second group belong dormobiles, or dormitory automobiles, and slurbs, or slum suburbs. A travel monologue becomes a travelogue and a telegram sent by cable a cablegram. Aviation electronics becomes avionics; biology electronics, bionics; and nuclear electronics, nucleonics. In cablese a question mark is a quark; in computerese a binary unit is a bit. In astrophysics a quasistellar source of radio energy becomes a quasar, and a pulsating star becomes a pulsar.

Simple shortenings, such as "ad" for "advertisement," have risen in status. They are listed in dictionaries side by side with their full forms. Among such fashionable abbreviations are exam, gym, lab, lib, op, spec, sub, tech, veg, and vet. Compound shortenings, after the pattern of Russian *agitprop* for *agitatsiya propaganda,* are also becoming fashionable. Initial syllables are joined as in the words Fortran, for formula (computer) translation; mascon, for massive (lunar) concentration; and Tacomsat, for Tactical Communications Satellite.

Syntax. Sentences can be classified as (1) simple, containing one clause and predication: "John knows this country"; (2) multiple or compound, containing two or more coordinate clauses: "John has been here before, and he knows this country"; and (3) complex, containing one or more main clauses and one or more subordinate clauses: "John, who has been here before, knows this country" or "Because he has been here before, John knows this country." Simple, declarative, affirmative sentences have two main patterns with five subsidiary patterns within each. Verb and complement together form the predicate. "Complement" is here used to cover both the complement and the object of traditional grammarians (see Table 23).

Table 23: Simple Sentences—First Pattern

subject	verb	complement
1. John	knows	this country
2. Science	is	organized knowledge
3. Elizabeth	becomes	queen
4. The captain	falls	sick
5. Nothing	passes	unobserved

In (1) the complement is the direct object of a transitive verb; in (2) it is a predicative nominal group forming the second component of an equation linked to the first part by the meaningless copula is; in (3) it is a predicative noun linked with the subject by the meaningful copula becomes; in (4) it is a predicative adjective; and in (5) it is a predicative past participle.

In Table 24 each sentence contains four components: subject, verb, and two complements, first and second, or inner and outer. In (6) inner and outer complements consist of indirect object (without preposition) followed by direct object; in (7) these complements are direct object and appositive noun; in (8) direct object and predicative adjective; in (9) direct object and predicative past participle; in (10) direct object and predicative infinitive.

Table 24: Simple Sentences—Second Pattern

subject	verb	inner complement	outer complement
6. John	gives	Mary	a ring
7. The sailors	make	John	captain
8. You	have kept	your record	clean
9. The driver	finds	the road	flooded
10. We	want	you	to know

One can seldom change the word order in these 10 sentences without doing something else—adding or subtracting a word, changing the meaning. There is no better way of appreciating the importance of word position than by scrutinizing the 10 frames illustrated. If, for instance, in (6) one reverses inner and outer complements, one adds "to" and says, "John gives a ring to Mary"; one does not say "John gives a ring Mary." Some verbs, such as "explain" and "say," never omit the preposition "to" before the indirect object: "John's father explained the details to his son." "He said many things to him." If, in (10), the inner and outer complements are reversed (*e.g.,* "We want to know you"), the meaning is changed as well as the structure.

Positions of adjectives

Apart from these fundamental rules of word order, the principles governing the positions of adjectives, adverbs, and prepositions call for brief comment. For attributive adjectives the rule is simple: single words regularly precede the noun, and word groups follow—*e.g.,* "an unforgettable experience" but "an experience never to be forgotten." There is a growing tendency, however, to abandon this principle, to switch groups to front position, and to say "a never to be forgotten experience." In the ordering of multiple epithets, on the other hand, some new principles are seen to be slowly emerging. Attributes denoting permanent qualities stand nearest their head nouns: "long, white beard," "six-lane elevated freeway." The order in multiple attribution tends to be as follows: determiner; quantifier; adjective of quality; adjective of size, shape, or texture; adjective of colour or material; noun adjunct (if any); head noun. Examples include: "that one solid, round, oak dining table," "these many fine, large, black race horses," "those countless memorable, long, bright summer evenings."

Adverbs are more mobile than adjectives. Nevertheless, some tentative principles seem to be at work. Adverbs of frequency tend to come immediately after the substantive verb ("You are often late"), before other verbs ("You never know"), and between auxiliaries and full verbs ("You can never tell"). In this last instance, however, American differs from British usage. Most Americans would place the adverb before the auxiliary and say "You never can tell." (In the title of his play of that name, first performed in 1899, George Bernard Shaw avowedly followed American usage.) Adverbs of time usually occur at the beginning or end of a sentence, seldom in the middle. Particular expressions normally precede more general ones: "Neil Armstrong set foot on the Moon at 4 o'clock in the morning on July 21, 1969." An adverb of place or direction follows a verb with which it is semantically bound: "We arrived home after dark." Other adverbs normally take end positions in the order of manner, place, and time: "Senator Smith summed it all up most adroitly [manner] in Congress [place] last night [time]."

In spite of its etymology (Latin *prae-positio* "before placing"), a preposition may sometimes follow the noun it governs, as in "all the world over," "the clock round," and "the whole place through." "This seems a good place to live in" seems more natural to most speakers than "This seems a good place in which to live." "Have you anything to open this can with?" is now more common than "Have you anything with which to open this can?"

The above are principles rather than rules, and in the end it must be agreed that English syntax lacks regimentation. Its structural laxity makes English an easy language to speak badly. It also makes English prone to ambiguity. "When walking snipe always approach up wind," a shooting manual directs. The writer intends the reader to understand, "When you are walking to flush snipe always approach them up against the wind." "John kept the car in the garage" can mean either (1) "John retained that car you see in the garage, and sold his other one" or (2) "John housed the car in the garage, and not elsewhere." "Flying planes can be dangerous" is ambiguous because it may mean either (1) "Planes that fly can be dangerous" or (2) "It is dangerous to fly planes."

Two ways in which "John gives Mary a ring" can be stated in the passive are: (1) "A ring is given to Mary by John" and (2) "Mary is given a ring by John." Concerning this same action, four types of question can be formulated: (1) "Who gives Mary a ring?" The information sought is the identity of the giver. (2) "Does John give Mary a ring?" The question may be answered by "yes" or "no." (3) "John gives Mary a ring, doesn't he?" Confirmation is sought of the questioner's belief that John does in fact give Mary a ring. (4) "John gives Mary a ring?" This form, differing from the declarative statement only by the question mark in writing, or by rising intonation in speech, calls, like sentences (2) and (3), for a "yes" or "no" answer but suggests doubt on the part of the questioner that the action is taking place.

Origins of English words

Vocabulary. The vocabulary of Modern English is approximately half Germanic (Old English and Scandinavian) and half Italic or Romance (French and Latin), with copious and increasing importations from Greek in science and technology and with considerable borrowings from Dutch, Low German, Italian, Spanish, German, Arabic, and many other languages. Names of basic concepts and things come from Old English or Anglo-Saxon: heaven and earth, love and hate, life and death, beginning and end, day and night, month and year, heat and cold, way and path, meadow and stream. Cardinal numerals come from Old English, as do all the ordinal numerals except "second" (Old English *other,* which still retains its older meaning in "every other day"). "Second" comes from Latin *secundus* "following," through French *second,* related to Latin *sequi* "to follow," as in English "sequence." From Old English come all the personal pronouns (except "they," "their," and "them," which are from Scandinavian), the auxiliary verbs (except the marginal "used," which is from French), most simple prepositions, and all conjunctions.

Numerous nouns would be identical whether they came from Old English or Scandinavian: father, mother, brother (but not sister); man, wife; ground, land, tree, grass; summer, winter; cliff, dale. Many verbs would also be identical, especially monosyllabic verbs—bring, come, get, hear, meet, see, set, sit, spin, stand, think. The same is true of the adjectives full and wise; the colour names gray, green, and white; the disjunctive possessives mine and thine (but not ours and yours); the terms north and west (but not south and east); and the prepositions over and under. Just a few English and Scandinavian doublets coexist in current speech: no and nay, yea and ay, from and fro, rear (*i.e.,* to bring up) and raise, shirt and skirt (both related to the adjective short), less and loose. From Scandinavian, "law" was borrowed early, whence "bylaw," meaning "village law," and "outlaw," meaning "man outside the law." "Husband" (*hus-bondi*) meant "householder," whether single or married, whereas "fellow" (*fe-lagi*) meant one who "lays fee" or shares property with another, and so "partner, shareholder." From Scandinavian come the common nouns axle (tree), band, birth, bloom, crook, dirt, egg, gait, gap, girth, knife, loan, race, rift, root, score, seat, skill, sky, snare, thrift, and window; the adjectives awkward, flat, happy, ill, loose, rotten, rugged, sly, tight, ugly, weak, and wrong; and many verbs, including call, cast, clasp, clip, crave, die, droop, drown, flit, gape, gasp, glitter, life, rake, rid, scare, scowl, skulk, snub, sprint, thrive, thrust, and want.

Borrowing from French

The debt of the English language to French is large. The terms president, representative, legislature, congress, constitution, and parliament are all French. So, too, are duke, marquis, viscount, and baron; but king, queen, lord, lady, earl, and knight are English. City, village, court, palace, manor, mansion, residence, and domicile are French; but town, borough, hall, house, bower, room, and home are English. Comparison between English and French synonyms shows that the former are more human and concrete, the latter more intellectual and abstract; *e.g.,* the terms freedom and liberty, friendship and amity, hatred and enmity, love and affection, likelihood and probability, truth and veracity, lying and mendacity. The superiority of French cooking is duly recognized by the adoption of such culinary terms as boil, broil, fry, grill, roast, souse, and toast. "Breakfast" is English, but "dinner" and "supper" are French. "Hunt" is English, but "chase," "quarry," "scent," and "track" are French. Craftsmen bear names of English origin: baker, builder, fisher (man), hedger, miller, shepherd, shoemaker, wainwright, and weaver, or webber. Names of skilled artisans, however, are French: carpenter, draper, haberdasher, joiner, mason, painter, plumber, and tailor. Many terms relating to dress and fashion, cuisine and viniculture, politics and diplomacy, drama and literature, art and ballet come from French.

In the spheres of science and technology many terms come from Classical Greek through French or directly from Greek. Pioneers in research and development now regard Greek as a kind of inexhaustible quarry from which they can draw linguistic material at will. By prefixing the Greek adverb *tēle* "far away, distant" to the existing compound photography, "light writing," they create the precise term "telephotography" to denote the photographing of distant objects by means of a special lens. By inserting the prefix *micro-* "small" into this same compound, they make the new term "photomicrography," denoting the electronic photographing of bacteria and viruses. Such neo-Hellenic derivatives would probably have been unintelligible to Plato and Aristotle. Many Greek compounds and derivatives have Latin equivalents with slight or considerable differentiations in meaning (see Table 25).

Greek borrowings

Table 25: Equivalent Compounds and Derivatives*

from the Greek	from the Latin
Nouns	
dys-troph-y	mal-nutr-it-ion
hypo-sta-sis	sub-stan-ce
hypo-the-sis	sup-pos-it-ion
meta-morph-o-sis	trans-form-at-ion
meta-phor	trans-fer
meta-the-sis	trans-pos-it-ion
peri-pher-y	circum-fer-en-ce
peri-phra-sis	circum-loc-ut-ion
sym-path-y	com-pass-ion
syn-drom-e	con-curr-en-ce
syn-op-sis	con-spect-us
syn-the-sis	com-pos-it-ion
sy-zyg-y	con-junc-t-ion
Adjectives	
dia-phan-*ous*	trans-par-ent
hyper-aesth-et-ic	super-sens-it-ive
hyper-phys-ic-*al*	super-nat-ur-al
hypo-derm-ic	sub-cut-an-eous
hypo-ge-*al*	sub-terr-an-ean
melan-chol-ic	atra-bil-ious
mono-morph-ic	uni-form
oxy-phyll-*ous*	acut-i-fol-i-ate
peri-pat-et-ic	circum-amb-ul-at-ory
phos-phor-*escent*	lumin-i-fer-ous
poly-glott-*al*	multi-lingu-al
sphen-oid	cunei-form
syn-chron-ic	con-temp-or-ary

*The italicized suffixes *-al*, *-escent*, and *-ous*, attached to some of the Greek adjectives, are of Latin origin.

At first sight it might appear that some of these equivalents, such as "metamorphosis" and "transformation," are sufficiently synonymous to make one or the other redundant. In fact, however, "metamorphosis" is more technical and therefore more restricted than "transformation." In mythology it signifies a magical shape changing; in nature it denotes a postembryonic development such as that of a tadpole into a frog, a cocoon into a silkworm, or a chrysalis into a butterfly. Transformation, on the other hand, means any kind of change from one state to another.

Ever since the 12th century, when merchants from the Netherlands made homes in East Anglia, Dutch words have infiltrated into Midland speech. For centuries a form of Low German was used by seafaring men in North Sea ports. Old nautical terms still in use include buoy, deck, dock, freebooter, hoist, leak, pump, skipper, and yacht. The Dutch in New Amsterdam (later New York) and adjacent settlements gave the words boss, cookie, dope, snoop, and waffle to American speech. The Dutch in Cape Province gave the terms apartheid, commandeer, commando, spoor, and trek to South African speech.

German contributions

The contribution of High German has been on a different level. In the 18th and 19th centuries it lay in technicalities of geology and mineralogy and in abstractions relating to literature, philosophy, and psychology. In the 20th century this contribution has sometimes been indirect. "Unclear" and "meaningful" echoed German *unklar* and *bedeutungsvoll,* or *sinnvoll.* "Ring road" (a British term applied to roads encircling cities or parts of cities) translated *Ringstrasse;* "round trip," *Rundfahrt;* and "the turn of the century," *die Jahrhundertwende.* The terms "classless society," "inferiority complex," and "wishful thinking" echoed *die klassenlöse Gesellschaft, der Minderwertigkeitskomplex,* and *das Wunschdenken.*

Along with the rest of the Western world, English has accepted Italian as the language of music. The names of voices, parts, performers, instruments, forms of composition, and technical directions are all Italian. Many of the latter—allegro, andante, cantabile, crescendo, diminuendo, legato, maestoso, obbligato, pizzicato, staccato, and vibrato—are also used metaphorically. In architecture, the terms belvedere, corridor, cupola, grotto, pedestal, pergola, piazza, pilaster, and rotunda are accepted; in literature, burlesque, canto, extravaganza, stanza, and many more are used.

From Spanish, English has acquired the words armada, cannibal, cigar, galleon, guerrilla, matador, mosquito, quadroon, tornado, and vanilla, some of these loanwords going back to the 16th century, when sea dogs encountered hidalgos on the high seas. Many names of animals and plants have entered English from indigenous languages through Spanish: "potato" through Spanish *patata* from Taino *batata,* and "tomato" through Spanish *tomate* from Nahuatl *tomatl.* Other words have entered from Latin America by way of Texas, New Mexico, Arizona, and California; *e.g.,* such words as canyon, cigar, estancia, lasso, mustang, pueblo, and rodeo. Some have gathered new connotations: bonanza, originally denoting "goodness," came through miners' slang to mean "spectacular windfall, prosperity"; mañana, "tomorrow," acquired an undertone of mysterious unpredictability.

From Arabic through European Spanish, through French from Spanish, through Latin, or occasionally through Greek, English has obtained the terms alchemy, alcohol, alembic, algebra, alkali, almanac, arsenal, assassin, attar, azimuth, cipher, elixir, mosque, nadir, naphtha, sugar, syrup, zenith, and zero. From Egyptian Arabic, English has recently borrowed the term loofah (also spelled luffa). From Hebrew, directly or by way of Vulgate Latin, come the terms amen, cherub, hallelujah, manna, messiah, pharisee, rabbi, sabbath, and seraph; jubilee, leviathan, and shibboleth; and, more recently, kosher, and kibbutz.

English has freely adopted and adapted words from many other languages, acquiring them sometimes directly and sometimes by devious routes. Each word has its own history. The following lists indicate the origins of a number of English words: Welsh—flannel, coracle, cromlech, eisteddfod; Cornish—gull, brill, dolmen; Gaelic and Irish—shamrock, brogue, leprechaun, ogham, Tory, galore, blarney, hooligan, clan, claymore, bog, plaid, slogan, sporran, cairn, whisky, pibroch; Breton—menhir, penguin; Norwegian—ski, ombudsman; Finnish—sauna; Russian—kvass, ruble, tsar, verst, mammoth, ukase, astrakhan, vodka, samovar, tundra (from Lapp), troika, pogrom, duma, soviet, bolshevik, intelligentsia (from Latin through Polish), borscht, balalaika, sputnik, soyuz, salyut, lunokhod; Polish—mazurka; Czech—robot; Hungarian—goulash, paprika; Portuguese—marmalade, flamingo, molasses, veranda, port (wine), dodo; Basque—bizarre; Turkish—janissary, turban, coffee, kiosk, caviar, pasha, odalisque, fez, bosh; Hindi—nabob, guru, sahib, maharajah, mahatma, pundit, punch (drink), juggernaut, cushy, jungle, thug, cheetah, shampoo, chit, dungaree, pucka, gymkhana, mantra, loot, pajamas, dinghy, polo; Persian—paradise, divan, purdah, lilac, bazaar, shah, caravan, chess, salamander, taffeta, shawl, khaki; Tamil—pariah, curry, catamaran, mulligatawny; Chinese—tea (Amoy), sampan; Japanese—shogun, kimono, mikado, tycoon, hara-kiri, gobang, judo, jujitsu, bushido, samurai, banzai, tsunami, satsuma, No (the dance drama), karate, Kabuki; Malay—ketchup, sago, bamboo, junk, amuck, orangutan, compound (fenced area), raffia; Polynesian—taboo, tattoo; Hawaiian—ukulele; African languages—chimpanzee, goober, mumbo jumbo, voodoo; Eskimo—kayak, igloo, anorak, mukluk; Algonkian—totem; Nahuatl—mescal; languages of the Caribbean—hammock, hurricane, tobacco, maize, iguana; Aboriginal Australian—kangaroo, corroboree, wallaby, wombat, boomerang, paramatta, budgerigar.

The alphabet

Orthography. The Latin alphabet originally had 20 letters, the present English alphabet minus *J, K, V, W, Y,* and Z. The Romans themselves added *K* for use in abbreviations and *Y* and *Z* in words transcribed from Greek. After its adoption by the English, this 23-letter alphabet developed *W* as a ligatured doubling of *U* and later *J* and *V* as consonantal variants of *I* and *U.* The resultant alphabet of 26 letters has both uppercase, or capital, and lowercase, or small, letters.

English spelling is based for the most part on that of the 15th century, but pronunciation has changed considerably since then, especially that of long vowels and diphthongs. The extensive change in the pronunciation of vowels, known as the Great Vowel Shift, affected all of Geoffrey Chaucer's seven long vowels, and for centuries spelling remained untidy. If the meaning of the message was clear, the spelling of individual words seemed unimportant. In the 17th century during the English Civil War, compositors adopted fixed spellings for practical reasons, and in the order-loving 18th century uniformity became more and more fashionable. Since Samuel Johnson's *Dictionary of the English Language* (1755), orthography has remained fairly stable. Numerous tacit changes, such as "music" for "musick" (*c.* 1880) and "fantasy" for "phantasy" (*c.* 1920), have been accepted, but spelling has nevertheless continued to be in part unphonetic. Attempts have been made at reform. Indeed, every century has had its reformers since the 13th, when an Augustinian canon named Orm devised his own method of differentiating short vowels from long by doubling the succeeding consonants or, when this was not feasible, by marking short vowels with a superimposed breve mark (˘). William Caxton, who set up his wooden printing press at Westminster in 1476, was much concerned with spelling problems throughout his working life. Noah Webster produced his *Spelling Book,* in 1783, as a precursor to the first edition (1828) of his *American Dictionary of the English Language.* The 20th century has produced many zealous reformers. Three systems, supplementary to traditional spelling, are actually in use for different purposes: (1) the Initial Teaching (Augmented Roman) Alphabet (ITA) of 44 letters used by educationists in the teaching of children under seven; (2) the Shaw alphabet of 48 letters, designed in implementation of the will of George Bernard Shaw; and (3) the International Phonetic Alphabet (IPA), constructed on the basis of one symbol for one individual sound and used by many trained linguists. Countless other systems have been worked out from time to time, of which R.E. Zachrisson's "Anglic" (1930) and Axel Wijk's *Regularized English* (1959) may be the best.

Obstacles to spelling reform

Meanwhile, the great publishing houses continue unperturbed because drastic reform remains impracticable, undesirable, and unlikely. This is because there is no longer one criterion of correct pronunciation but several standards throughout the world; regional standards are themselves not static, but changing with each new generation; and, if spelling were changed drastically, all the books in English in the world's public and private libraries would become inaccessible to readers without special study.

HISTORICAL BACKGROUND

Among highlights in the history of the English language, the following stand out most clearly: the settlement in Britain of Jutes, Saxons, and Angles in the 5th and 6th centuries; the arrival of St. Augustine in 597 and the subsequent conversion of England to Latin Christianity; the Viking invasions of the 9th century; the Norman Conquest of 1066; the Statute of Pleading in 1362 (this required that court proceedings be conducted in English); the setting up of Caxton's printing press at Westminster in 1476; the full flowering of the Renaissance in the 16th century; the publishing of the King James Bible in 1611; the completion of Johnson's *Dictionary* of 1755; and the expansion to North America and South Africa in the 17th century and to India, Australia, and New Zealand in the 18th.

Old English. The Jutes, Angles, and Saxons lived in Jutland, Schleswig, and Holstein, respectively, before settling in Britain. According to the Venerable Bede, the first historian of the English people, the first Jutes, Hengist and Horsa, landed at Ebbsfleet in the Isle of Thanet in 449; and the Jutes later settled in Kent, southern Hampshire, and the Isle of Wight. The Saxons occupied the rest of England south of the Thames, as well as modern Middlesex and Essex. The Angles eventually took the remainder of England as far north as the Firth of Forth, including the future Edinburgh and the Scottish Lowlands. In both Latin and Common Germanic the Angles' name was Angli, later mutated in Old English to Engle (nominative) and Engla (genitive). "Engla land" designated the home of all three tribes collectively, and both King Alfred (known as Alfred the Great) and Abbot Aelfric, author and grammarian, subsequently referred to their speech as Englisc. Nevertheless, all the evidence indicates that Jutes, Angles, and Saxons retained their distinctive dialects.

Four Old English dialects

The River Humber was an important boundary, and the Anglian-speaking region developed two speech groups: to the north of the river, Northumbrian, and, to the south, Southumbrian, or Mercian. There were thus four dialects: Northumbrian, Mercian, West Saxon, and Kentish (see Figure 13). In the 8th century, Northumbrian led in literature and culture, but that leadership was destroyed by the Viking invaders, who sacked Lindisfarne, an island near the Northumbrian mainland, in 793. They landed in strength in 865. The first raiders were Danes, but they were later joined by Norwegians from Ireland and the Western Isles who settled in modern Cumberland, Westmorland, northwest Yorkshire, Lancashire, north Cheshire, and the Isle of Man. In the 9th century, as a result of the Norwegian invasions, cultural leadership passed from Northumbria to Wessex. During King Alfred's reign, in the last three decades of the 9th century, Winchester became the chief centre of learning. There the Parker Chronicle (a manuscript of the Anglo-Saxon Chronicle) was written; there the Latin works of the priest and historian Paulus Orosius, St. Augustine, St. Gregory, and the Venerable Bede were translated; and there the native poetry of Northumbria and Mercia was transcribed into the West Saxon dialect. This resulted in West Saxon's becoming "standard Old English"; and later, when Aelfric (*c.* 955–*c.* 1010) wrote his lucid and mature prose at Winchester, Cerne Abbas, and Eynsham, the hegemony of Wessex was strengthened.

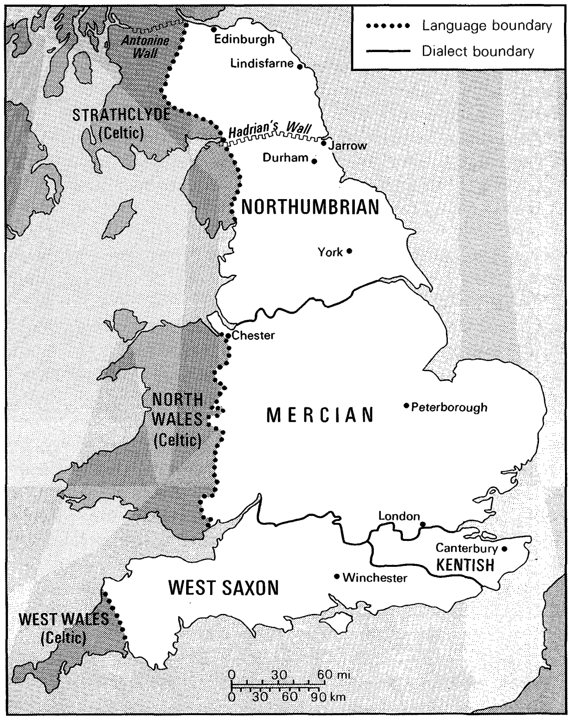

Figure 13: Old English dialects.

In standard Old English, adjectives were inflected as well as nouns, pronouns, and verbs. Nouns were inflected for four cases (nominative, genitive, dative, and accusative) in singular and plural. Five nouns of first kinship—*faeder, mōdor, brōthor, sweostor,* and *dohtor* ("father," "mother," "brother," "sister," and "daughter," respectively)—had their own set of inflections. There were 25 nouns such as *mon, men* ("man," "men") with mutated, or umlauted, stems. Adjectives had strong and weak declensions, the strong showing a mixture of noun and pronoun endings and the weak following the pattern of weak nouns. Personal, possessive, demonstrative, interrogative, indefinite, and relative pronouns had full inflections. The pronouns of the 1st and 2nd persons still had distinctive dual forms:

iċ	"I"	*wit*	"we two"	*wē*	"we"
thū (*þū*)	"thou"	*ġit*	"you two"	*ġē*	"you"

There were two demonstratives: *sē, sēo, thaet,* meaning "that," and *thes, thēos, this,* meaning "this," but no articles, the definite article being expressed by use of the demonstrative for "that" or not expressed at all. Thus, "the good man" was *sē gōda mon* or plain *gōd mon.* The function of the indefinite article was performed by the numeral *ān* "one" in *ān mon* "a man," by the adjective–pronoun *sum* in *sum mon* "a (certain) man," or not expressed, as in *thū eart gōd mon* "you are a good man."

Inflection of verbs

Verbs had two tenses only (present–future and past), three moods (indicative, subjunctive, and imperative), two numbers (singular and plural), and three persons (1st, 2nd, and 3rd). There were two classes of verb stems. (A verb stem is that part of a verb to which inflectional changes—changes indicating tense, mood, number, etc.—are added.) One type of verb stem, called vocalic because an internal vowel shows variations, is exemplified by the verb for "sing": *singan, singth, sang, sungon, gesungen.* The word for "deem" is an example of the other, called consonantal: *dēman, dēmth, dēmde, dēmdon, gedēmed.* Such verbs are called strong and weak, respectively.

All new verbs, whether derived from existing verbs or from nouns, belonged to the consonantal type. Some verbs of great frequency (antecedents of the modern words "be," "shall," "will," "do," "go," "can," "may," and so on) had their own peculiar patterns of inflections.

Grammatical gender persisted throughout the Old English period. Just as Germans now say *der Fuss, die Hand,* and *das Auge* (masculine, feminine, and neuter terms for "the foot," "the hand," and "the eye"), so, for these same structures, Aelfric said *sē fōt, sēo hond,* and *thaet ēaġe,* also masculine, feminine, and neuter. The three words for "woman," *wīfmon, cwene,* and *wīf,* were masculine, feminine, and neuter, respectively. *Hors* "horse," *sċēap* "sheep," and *maeġden* "maiden" were all neuter. *Eorthe* "earth" was feminine, but *lond* "land" was neuter. *Sunne* "sun" was feminine, but *mōna* "moon" was masculine. This simplification of grammatical gender resulted from the fact that the gender of Old English substantives was not always indicated by the ending but rather by the terminations of the adjectives and demonstrative pronouns used with the substantives. When these endings were lost, all outward marks of gender disappeared with them. Thus, the weakening of inflections and loss of gender occurred together. In the North, where inflections weakened earlier, the marks of gender likewise disappeared first. They survived in the South as late as the 14th century.

Because of the greater use of inflections in Old English, word order was freer than today. The sequence of subject, verb, and complement was normal, but when there were outer and inner complements the second was put in the dative case after *to: Sē biscop hālgode Ēadrēd tō cyninge* "The bishop consecreated Edred king." After an introductory adverb or adverbial phrase the verb generally took second place as in modern German: *Nū bydde iċ ān thing* "Now I ask [literally, "ask I"] one thing"; *Thȳ ilcan gēare gesette Aelfrēd cyning Lundenburg* "In that same year Alfred the king occupied London." Impersonal verbs had no subject expressed. Infinitives constructed with auxiliary verbs were placed at the ends of clauses or sentences: *Hīe ne dorston forth bī th ǣre ēa siglan* "They dared not sail beyond that river" (*siglan* is the infinitive); *Iċ wolde thās lytlan bōc āwendan* "I wanted to translate this little book" (*āwendan* is the infinitive). The verb usually came last in a dependent clause—*e.g., āwrītan wile* in *gif hwā thās bōc āwrītan wile* (*gerihte hē hīe be th ǣre bysene*) "If anyone wants to copy this book (let him correct his copy by the original)." Prepositions (or postpositions) frequently followed their objects. Negation was often repeated for emphasis.

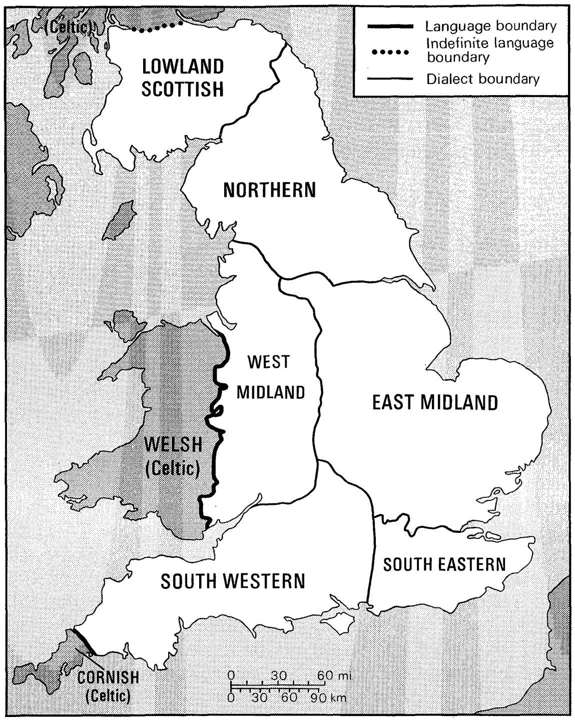

Figure 14: Middle English dialects.

Middle English. One result of the Norman Conquest of 1066 was to place all four Old English dialects more or less on a level. West Saxon lost its supremacy and the centre of culture and learning gradually shifted from Winchester to London. The old Northumbrian dialect became divided into Scottish and Northern, although little is known of either of these divisions before the end of the 13th century (Figure 14). The old Mercian dialect was split into East and West Midland. West Saxon became slightly diminished in area and was more appropriately named the South Western dialect. The Kentish dialect was considerably extended and was called South Eastern accordingly. All five Middle English dialects (Northern, West Midland, East Midland, South Western, and South Eastern) went their own ways and developed their own characteristics. The so-called Katherine Group of writings (1180–1210), associated with Hereford, a town not far from the Welsh border, adhered most closely to native traditions, and there is something to be said for regarding this West Midland dialect, least disturbed by French and Scandinavian intrusions, as a kind of Standard English in the High Middle Ages.

Another outcome of the Norman Conquest was to change the writing of English from the clear and easily readable insular hand of Irish origin to the delicate Carolingian script then in use on the Continent. With the change in appearance came a change in spelling. Norman scribes wrote Old English *y* as *u, ȳ* as *ui, ū* as *ou* (*ow* when final). Thus, *mycel* ("much") appeared as *muchel, fȳr* ("fire") as *fuir, hūs* ("house") as *hous,* and *hū* ("how") as *how.* For the sake of clarity (*i.e.,* legibility) *u* was often written *o* before and after *m, n, u, v,* and *w;* and *i* was sometimes written *y* before and after *m* and *n.* So *sunu* ("son") appeared as *sone* and *him* ("him") as *hym.* Old English *cw* was changed to *qu; hw* to *wh, qu,* or *quh; ċ* to *ch* or *tch; sċ* to *sh; -ċġ-* to *-gg-;* and *-ht* to *ght.* So Old English *cwēn* appeared as *queen; hwaet* as *what, quat,* or *quhat; dīċ* as *ditch; sċip* as *ship; secge* as *segge;* and *miht* as *might.*

Norman changes in spelling

For the first century after the Conquest, most loanwords came from Normandy and Picardy, but with the extension south to the Pyrenees of the Angevin empire of Henry II (reigned 1154–89), other dialects, especially Central French, or Francien, contributed to the speech of the aristocracy. As a result, Modern English acquired the forms canal, catch, leal, real, reward, wage, warden, and warrant from Norman French side by side with the corresponding forms channel, chase, loyal, royal, regard, gage, guardian, and guarantee, from Francien. King John lost Normandy in 1204. With the increasing power of the Capetian kings of Paris, Francien gradually predominated. Meanwhile, Latin stood intact as the language of learning. For three centuries, therefore, the literature of England was trilingual. *Ancrene Riwle,* for instance, a guide or rule (*riwle*) of rare quality for recluses or anchorites (*ancren*), was disseminated in all three languages.

The sounds of the native speech changed slowly. Even in late Old English short vowels had been lengthened before *ld, rd, mb,* and *nd,* and long vowels had been shortened before all other consonant groups and before double consonants. In early Middle English short vowels of whatever origin were lengthened in the open stressed syllables of disyllabic words. An open syllable is one ending in a vowel. Both syllables in Old English *nama* "name," *mete* "meat, food," *nosu* "nose," *wicu* "week," and *duru* "door" were short, and the first syllables, being stressed, were lengthened to *nāme, mēte, nōse, wēke,* and *dōre* in the 13th and 14th centuries. A similar change occurred in 4th-century Latin, in 13th-century German, and at different times in other languages. The popular notion has arisen that final mute *-e* in English makes a preceding vowel long; in fact, it is the lengthening of the vowel that has caused *e* to be lost in pronunciation. On the other hand, Old English long vowels were shortened in the first syllables of trisyllabic words, even when those syllables were open; *e.g., hāligdaeg* "holy day," *ǣrende* "message, errand," *crīstendōm* "Christianity," and *sūtherne* "southern," became *hŏliday* (Northern *hăliday*), *ĕrrende, chrĭstendom,* and *sŭtherne.* This principle still operates in current English. Compare, for example, trisyllabic derivatives such as the words chastity, criminal, fabulous, gradual, gravity, linear, national, ominous, sanity, and tabulate with the simple nouns and adjectives chaste, crime, fable, grade, grave, line, nation, omen, sane, and table.

Final mute *e*

There were significant variations in verb inflections in the Northern, Midland, and Southern dialects as shown in Table 26. The Northern infinitive was already one syllable (*sing* rather than the Old English *singan*), whereas the past participle *-en* inflection of Old English was strictly kept. These apparently contradictory features can be attributed entirely to Scandinavian, in which the final *-n* of the infinitive was lost early in *singa,* and the final *-n* of the past participle was doubled in *sunginn.* The Northern unmutated present participle in *-and* was also of Scandinavian origin. Old English mutated *-ende* (German *-end*) in the present participle had already become *-inde* in late West Saxon (Southern in Table 26), and it was this Southern *-inde* that blended with the *-ing* suffix (German *-ung*) of nouns of action that had already become near-gerunds in such compound nouns as *athswering* "oath swearing" and *writingfether* "writing feather, pen." This blending of present participle and gerund was further helped by the fact that Anglo-Norman and French *-ant* was itself a coalescence of Latin present participles in *-antem, -entem,* and Latin gerunds in *-andum, -endum.* The Northern second person singular *singis* was inherited unchanged from Common Germanic. The final *t* sound in Midland *-est* and Southern *-st* was excrescent, comparable with the final *t* in modern "amidst" and "amongst" from older *amiddes* and *amonges.* The Northern third person singular *singis* had a quite different origin. Like the *singis* of the plural, it resulted almost casually from an inadvertent retraction of the tongue in enunciation from an interdental *-th* sound to postdental *-s.* Today the form "singeth" survives as a

Table 26: Variations in Verb Inflections

	Northern	Midland	Southern
Infinitive	sing	singe(n)	singen
Present participle	singand	singende	singinde
Present singular			
1st person	singe	singe	singe
2nd person	singis	singes(t)	singst
3rd person	singis	singeth-es	singeth
Present plural	singis	singen	singeth
Past participle	sungen	(y)sunge(n)	ysunge

poetic archaism. Shakespeare used both *-eth* and *-s* endings ("It [mercy] blesseth him that gives and him that takes," *The Merchant of Venice*). The Midland present plural inflection *-en* was taken from the subjunctive. The past participle prefix *y-* developed from the Old English perfective prefix *ge-*.

Chaucer's language

Chaucer, who was born and died in London, spoke a dialect that was basically East Midland. Compared with his contemporaries, he was remarkably modern in his use of language. He was in his early 20s when the Statute of Pleading (1362) was passed, by the terms of which all court proceedings were henceforth to be conducted in English, though "enrolled in Latin." Chaucer himself used four languages; he read Latin (Classical and Medieval) and spoke French and Italian on his travels. For his own literary work he deliberately chose English.

Transition from Middle English to Early Modern English. The death of Chaucer at the close of the century (1400) marked the beginning of the period of transition from Middle English to the Early Modern English stage. The Early Modern English period is regarded by many scholars as beginning in about 1500 and terminating with the return of the monarchy (John Dryden's *Astraea Redux*) in 1660. The 15th century witnessed three outstanding developments: the rise of London English, the invention of printing, and the spread of the new learning.

The speech of London

Although the population of London in 1400 was only about 40,000, it was by far the largest city in England. York came second, followed by Bristol, Coventry, Plymouth, and Norwich. The Midlands and East Anglia, the most densely peopled parts of England, supplied London with streams of young immigrants. The speech of the capital was mixed, and it was changing. The seven long vowels of Chaucer's speech had already begun to shift. Incipient diphthongization of high front /i:/ (the *ee* sound in "meet") and high back /u:/ (as in "fool") led to instability in the other five long vowels. (Symbols within slash marks are taken from the International Phonetic Alphabet.) This remarkable event, known as the Great Vowel Shift, changed the whole vowel system of London English. As /i:/ and /u:/ became diphthongized to /ai/ (as in "bide") and /au/ (as in "house") respectively, so the next highest vowels, /e:/ (this sound can be heard in the first part of the diphthong in "name") and /o:/ (a sound that can be heard in the first part of the diphthong in "home"), moved up to take their places, and so on. The whole process is summarized in Table 27. Every one of the sounds appearing in this table can still be heard somewhere in living English dialects.

Table 27: Vowel Shifts in London English

Chaucer's spelling	Chaucer's pronunciation*	Shakespeare's pronunciation	present pronunciation*	present spelling
lyf	li:f	leif	laif	life
deed	de:d	di:d	di:d	deed
deel	dɛ:l	de:l	di:l	deal
name	na:mə	nɛ:m	neim	name
hoom	hɔ:m	ho:m	houm	home
mone	mo:n	mu:n	mu:n	moon
hous	hu:s	hous	haus	house

*Expressed in the International Phonetic Alphabet.

When Caxton started printing at Westminster in the late summer of 1476, he was painfully aware of the uncertain state of the English language. In his prologues and epilogues to his translations he made some revealing observations on the problems that he had encountered as translator and editor. At this time, sentence structures were being gradually modified, but many remained untidy. For the first time, nonprofessional scribes, including women, were writing at length.

The revival of classical learning was one aspect of that Renaissance, or spiritual rebirth, that arose in Italy and spread to France and England. It evoked a new interest in Greek on the part of learned men such as William Grocyn and Thomas Linacre, Sir Thomas More and Desiderius Erasmus. John Colet, dean of St. Paul's in the first quarter of the 16th century, startled his congregation by expounding the Pauline Epistles of the New Testament as living letters. The deans who had preceded him had known no Greek, because they had found in Latin all that they required. Only a few medieval churchmen, such as Robert Grosseteste, bishop of Lincoln, and the Franciscan Roger Bacon could read Greek with ease. The names of the seven liberal arts of the medieval curricula (the trivium and the quadrivium), it is true, were all Greek—grammar, logic, and rhetoric; arithmetic, geometry, astronomy, and music—but they had come into English by way of French.

Renaissance scholars adopted a liberal attitude to language. They borrowed Latin words through French, or Latin words direct; Greek words through Latin, or Greek words direct. Latin was no longer limited to Church Latin: it embraced all Classical Latin. For a time the whole Latin lexicon became potentially English. Some words, such as consolation and infidel, could have come from either French or Latin. Others, such as the terms abacus, arbitrator, explicit, finis, gratis, imprimis, item, memento, memorandum, neuter, simile, and videlicet, were taken straight from Latin. Words that had already entered the language through French were now borrowed again, so that doublets arose: benison and benediction; blame and blaspheme; chance and cadence; count and compute; dainty and dignity; frail and fragile; poor and pauper; purvey and provide; ray and radius; sever and separate; strait and strict; sure and secure. The Latin adjectives for "kingly" and "lawful" have even given rise to triplets; in the forms real, royal, and regal and leal, loyal, and legal, they were imported first from Anglo-Norman, then from Old French, and last from Latin direct.

After the dawn of the 16th century, English prose moved swiftly toward modernity. In 1525 Lord Berners completed his translation of Jean Froissart's *Chronicle,* and William Tyndale translated the New Testament. One-third of the King James Bible (1611), it has been computed, is worded exactly as Tyndale left it; and between 1525 and 1611 lay the Tudor Golden Age, with its culmination in Shakespeare. Too many writers, to be sure, used "inkhorn terms," newly-coined, ephemeral words, and too many vacillated between Latin and English. Sir Thomas More actually wrote his *Utopia* in Latin. It was translated into French during his lifetime but not into English until 1551, some years after his death. Francis Bacon published *De dignitate et augmentis scientiarum (On the Dignity and Advancement of Learning,* an expansion of his earlier *Advancement of Learning)* in Latin in 1623. William Harvey announced his epoch-making discovery of the circulation of the blood in his Latin *De Motu Cordis et Sanguinis in Animalibus* (1628; *On the Motion of the Heart and Blood in Animals*). John Milton composed polemical treatises in the language of Cicero. As Oliver Cromwell's secretary, he corresponded in Latin with foreign states. His younger contemporary Sir Isaac Newton lived long enough to bridge the gap. He wrote his *Principia* (1687) in Latin but his *Opticks* (1704) in English.

Plans to regulate English

Restoration period. With the restoration of the monarchy in 1660, men again looked to France. John Dryden admired the Académie Française and greatly deplored that the English had "not so much as a tolerable dictionary, or a grammar; so that our language is in a manner barbarous" as compared with elegant French. After the passionate controversies of the Civil War, this was an age of cool scientific nationalism. In 1662 the Royal Society of London for the Promotion of Natural Knowledge received its charter. Its first members, much concerned with language, appointed a committee of 22 "to improve the English tongue particularly for philosophic purposes." It included Dryden, the diarist John Evelyn, Bishop Thomas Sprat, and the poet Edmund Waller. Sprat pleaded for "a close, naked, natural way of speaking; positive expressions; clear senses, a native easiness; bringing all things as near the mathematical plainness" as possible. The committee, however, achieved no tangible result, and failed in its attempt to found an authoritative arbiter over the English tongue. A second attempt was made in 1712, when Jonathan Swift addressed an open letter to Robert Harley, earl of Oxford, then Lord Treasurer, making "A Proposal for Correcting, Improving, and Ascertaining [fixing] the English Tongue."

This letter received some popular support, but its aims were frustrated by a turn in political fortunes. Queen Anne died in 1714. The Earl of Oxford and his fellow Tories, including Swift, lost power. No organized attempt to found a language academy on French lines has ever been made since.

With Dryden and Swift the English language reached its full maturity. Their failure to found an academy was partly counterbalanced by Samuel Johnson in his *Dictionary* (published in 1755) and by Robert Lowth in his *Grammar* (published in 1761).

Johnson's *Dictionary*

Age of Johnson. In the making of his *Dictionary,* Johnson took the best conversation of contemporary London and the normal usage of reputable writers after Sir Philip Sidney (1554–86) as his criteria. He exemplified the meanings of words by illustrative quotations. Johnson admitted that "he had flattered himself for a while" with "the prospect of fixing our language" but that thereby "he had indulged expectation which neither reason nor experience could justify." The two-folio work of 1755 was followed in 1756 by a shortened, one-volume version that was widely used far into the 20th century. Revised and enlarged editions of the unabbreviated version were made by Archdeacon Henry John Todd in 1818 and by Robert Gordon Latham in 1866.

It was unfortunate that Joseph Priestley, Robert Lowth, James Buchanan, and other 18th-century grammarians (Priestley was perhaps better known as a scientist and theologian) took a narrower view than Johnson on linguistic growth and development. They spent too much time condemning such current "improprieties" as "I had rather not," "you better go," "between you and I," "it is me," "who is this for?", "between four walls," "a third alternative," "the largest of the two," "more perfect," and "quite unique." Without explanatory comment they banned "you was" outright, although it was in widespread use among educated people (on that ground it was later defended by Noah Webster). "You was" had, in fact, taken the place of both "thou wast" and "thou wert" as a useful singular equivalent of the accepted plural "you were."

As the century wore on, grammarians became more numerous and aggressive. They set themselves up as arbiters of correct usage. They compiled manuals that were not only descriptive (stating what people do say) and prescriptive (stating what they should say) but also proscriptive (stating what they should not say). They regarded Latin as a language superior to English and claimed that Latin embodied universally valid canons of logic. This view was well maintained by Lindley Murray, a native of Pennsylvania who settled in England in the very year (1784) of Johnson's death. Murray's *English Grammar* appeared in 1795, became immensely popular, and went into numerous editions. It was followed by an *English Reader* (1799) and an *English Spelling Book* (1804), long favourite textbooks in both Old and New England.

Proposals for a new dictionary

19th and 20th centuries. In 1857 Richard Chenevix Trench, dean of St. Paul's, lectured to the Philological Society on the theme, "On some Deficiencies in our English Dictionaries." His proposals for a new dictionary were implemented in 1859, when Samuel Taylor Coleridge's grandnephew, Herbert Coleridge, set to work as first editor. He was succeeded by a lawyer named Frederick James Furnivall, who in 1864 founded the Early English Text Society with a view to making all the earlier literature available to historical lexicographers in competent editions. Furnivall was subsequently succeeded as editor by James A.H. Murray, who published the first fascicle of *A New English Dictionary on Historical Principles* in 1884. Later Murray was joined successively by three editors: Henry Bradley, William Alexander Craigie, and Charles Talbut Onions. Aside from its *Supplements,* the dictionary itself fills 12 volumes, has over 15,000 pages, and contains 414,825 words, illustrated by 1,827,306 citations. It is a dictionary of the British Commonwealth and the United States, a fact symbolized by the presentation of first copies in the spring of 1928 to King George V and Pres. Calvin Coolidge. It exhibits the histories and meanings of all words known to have been in use since 1150. From 1150 to 1500 all five Middle English dialects, as has been seen, were of equal status. They are therefore all included. After 1500, however, dialectal expressions are not admitted, nor are scientific and technical terms not in general use. Otherwise, the written vocabulary is comprehensive. A revised edition of this dictionary, known as *The Oxford English Dictionary,* was published in 1933.

VARIETIES OF ENGLISH

British English. The abbreviation RP (Received Pronunciation) denotes the speech of educated people living in London and the southeast of England and of other people elsewhere who speak in this way. If the qualifier educated be assumed, RP is then a regional (geographical) dialect, as contrasted with London Cockney, which is a class (social) dialect. RP is not intrinsically superior to other varieties of English; it is itself only one particular regional dialect that has, through the accidents of history, achieved more extensive use than others. Although acquiring its unique status without the aid of any established authority, it may have been fostered by the public schools (Winchester, Eton, Harrow, Rugby, and so on) and the ancient universities (Oxford and Cambridge). Other varieties of English are well preserved in spite of the levelling influences of film, television, and radio. In the Northern dialect RP /aː/ (the first vowel sound in "father") is still pronounced /æ/ (a sound like the *a* in "fat") in words such as laugh, fast, and path; this pronunciation has been carried across the Atlantic into American English.

Features of the Northern dialect

In the words run, rung, and tongue, the received-standard pronunciation of the vowel is /∧/, like the *u* in "but"; in the Northern dialect it is /u/, like the *oo* in "book." In the words bind, find, and grind, the received standard pronunciation of the vowel sound is /ai/, like that in "bide"; in Northern, it is /i/, like the sound in "feet." The vowel sound in the words go, home, and know in the Northern dialect is /ɔː/, approximately the sound in "law" in some American English dialects. In parts of Northumberland, RP "it" is still pronounced "hit," as in Old English. In various Northern dialects the definite article "the" is heard as *t, th,* or *d.* In those dialects in which it becomes both *t* and *th, t* is used before consonants and *th* before vowels. Thus, one hears "t'book" but "th'apple." When, however, the definite article is reduced to *t* and the following word begins with *t* or *d,* as in "t'tail" or "t'dog," it is replaced by a slight pause as in the RP articulation of the first *t* in "hat trick." The RP /tʃ/, the sound of the *ch* in "church," becomes *k,* as in "thack," ("thatch, roof") and "kirk" ("church"). In many Northern dialects strong verbs retain the old past-tense singular forms band, brak, fand, spak for RP forms bound, broke, found, and spoke. Strong verbs also retain the past participle inflection *-en* as in "comen," "shutten," "sitten," and "getten" or "gotten" for RP "come," "shut," "sat," and "got."

In some Midland dialects the diphthongs in "throat" and "stone" have been kept apart, whereas in RP they have fallen together. In Cheshire, Derby, Stafford, and Warwick, RP "singing" is pronounced with a *g* sounded after the velar nasal sound (as in RP "finger"). In Norfolk one hears "skellington" and "solintary" for "skeleton" and "solitary," showing an intrusive *n* just as does "messenger" in RP from French *messager,* "passenger" from French *passager,* and "nightingale" from Old English *nihtegala.* Other East Anglian words show consonantal metathesis (switch position), as in "singify," and substitution of one liquid or nasal for another, as in "chimbly" for "chimney," and "synnable" for "syllable." "Hantle" for "handful" shows syncope (disappearance) of an unstressed vowel, partial assimilation of *d* to *t* before voiceless *f,* and subsequent loss of *f* in a triple consonant group.

South Western dialects

In South Western dialects, initial *f* and *s* are often voiced, becoming *v* and *z.* Two words with initial *v* have found their way into RP: "vat" from "fat" and "vixen" from "fixen" (female fox). Another South Western feature is the development of a *d* between *l* or *n* and *r,* as in "parlder" for "parlour" and "carnder" for "corner." The bilabial semivowel *w* has developed before *o* in "wold" for "old," and in "wom" for "home," illustrating a similar development in RP by which Old English *ān* has become "one," and Old English *hāl* has come to be spelled "whole," as compared with Northern *hale.* In South Western dialects "yat" comes from the old singular *geat,* whereas RP "gate" comes from the plural *gatu.* Likewise, "clee" comes from the old nominative *clea,* whereas RP "claw" comes from the oblique cases. The verbs keel and kemb have developed regularly from Old English *cēlan* "to make cool" and *kemban* "to use a comb," whereas the corresponding RP verbs cool and comb come from the adjective and the noun, respectively.

In Wales, people often speak a clear and measured form of English with a musical intonation inherited from ancestral Celtic. They tend to aspirate both plosives (stops) and fricative consonants very forcibly; thus, "true" is pronounced with an audible puff of breath after the initial *t.*

Lowland Scottish was once a part of Northern English, but two dialects began to diverge in the 14th century. Today Lowland Scots trill their *r*'s, shorten vowels, and simplify diphthongs. A few Scottish words, such as bairn, brae, canny, dour, and pawky, have made their way into RP. Lowland Scottish is not to be confused with Scottish Gaelic, a Celtic language still spoken by about 90,700 people (almost all bilingual) mostly in the Highlands and the Western Isles. Thanks to Robert Burns and Sir Walter Scott, many Scottish Gaelic words have been preserved in English literature.

Irish pronunciation

Northern Ireland has dialects related in part to Lowland Scottish and in part to the southern Irish dialect of English. Irish pronunciation is conservative and is clearer and more easily intelligible than many other dialects. Its literature has reached worldwide audiences, whether written by Englishmen born in Ireland, such as Jonathan Swift, Laurence Sterne, Oliver Goldsmith, Sir Richard Steele, Edmund Burke, Oscar Wilde, and George Bernard Shaw, or by authentic Irish, such as James Joyce, William Butler Yeats, and John Millington Synge. The influence of Irish Gaelic on the speech of Dublin is most evident in the syntax of drama and in the survival of such picturesque expressions as "We are after finishing," "It's sorry you will be," and "James do be cutting corn every day."

American and Canadian English. The dialect regions of the United States are most clearly marked along the Atlantic littoral, where the earlier settlements were made. Three dialects can be defined: Northern, Midland, and Southern. Each has its subdialects.

The Northern dialect is spoken in New England. Its six chief subdialects comprise northeastern New England (Maine, New Hampshire, and eastern Vermont), southeastern New England (eastern Massachusetts, eastern Connecticut, and Rhode Island), southwestern New England (western Massachusetts and western Connecticut), the inland north (western Vermont and upstate New York), the Hudson Valley, and metropolitan New York (Figure 15).

The Midland dialect is spoken in the coastal region from Point Pleasant, in New Jersey, to Dover, in Delaware. Its seven major subdialects comprise the Delaware Valley, the Susquehanna Valley, the Upper Ohio Valley, northern West Virginia, the Upper Potomac and Shenandoah, southern West Virginia and eastern Kentucky, western Carolina, and eastern Tennessee.

The Southern dialect area covers the coastal region from Delaware to South Carolina. Its five chief subdialects comprise the Delmarva Peninsula, the Virginia Piedmont, northeastern North Carolina (Albemarle Sound and Neuse Valley), Cape Fear and Pee Dee valleys, and the South Carolina Low Country, around Charleston.

These boundaries, based on those of the *Linguistic Atlas of the United States and Canada,* are highly tentative. To some extent these regions preserve the traditional speech of southeastern and southern England, where most of the early colonists were born. The first settlers who came to Virginia (1607) and Massachusetts (1620) soon learned to adapt old words to new uses, but they were content to borrow names from the local Indian languages for unknown trees, such as hickory and persimmon, and for unfamiliar animals, such as raccoons and woodchucks. Later they took words from foreign settlers: "chowder" and "prairie" from the French, "scow" and "sleigh" from the Dutch. They made new compounds, such as "backwoods" and "bullfrog," and gave new meanings to such words as "lumber" (which in British English denotes disused furniture,

or junk) and "corn" (which in British English signifies any grain, especially wheat).

The Gullah dialect

Before the Declaration of Independence (1776), two-thirds of the immigrants had come from England, but after that date they arrived in large numbers from Ireland. The potato famine of 1845 drove 1,500,000 Irish to seek homes in the New World, and the European revolutions of 1848 drove as many Germans to settle in Pennsylvania and the Middle West. After the close of the American Civil War, millions of Scandinavians, Slavs, and Italians crossed the ocean and eventually settled mostly in the North Central and Upper Midwest states. In some areas of South Carolina and Georgia the American Negroes who had been imported to work the rice and cotton plantations developed a contact language called Gullah, or Geechee, that made use of many structural and lexical features of their native languages. This remarkable variety of English is comparable to such "contact languages" as Sranan (Taki-Taki) and Melanesian Pidgin. The speech of the Atlantic Seaboard shows far greater differences in pronunciation, grammar, and vocabulary than that of any area in the North Central States, the Upper Midwest, the Rocky Mountains, or the Pacific Coast. Today, urbanization, quick transport, and television have tended to level out some dialectal differences in the United States.

The boundary with Canada nowhere corresponds to any boundary between dialects, and the influence of United States English is strong, being felt least in the Maritime Provinces and Newfoundland. Nevertheless, in spite of the effect of this proximity to the United States, British influences are still potent in some of the larger cities; Scottish influences are well sustained in Ontario. Canada remains bilingual. One-fourth of its people, living mostly in the province of Quebec, have French as their mother tongue. Those provinces in which French is spoken as a mother tongue by 10 percent or more of the population are described as "federal bilingual districts" in the Official Languages Bill of 1968.

Australian and New Zealand English. Unlike Canada, Australia has few speakers of European languages other than English within its borders. There are still many Aboriginal languages, though they are spoken by only a few hundred speakers each and their continued existence is threatened. More than 80 percent of the population is British. By the mid-20th century, with rapid decline of its Aboriginal tongues, English was without rivals in Australia.

During colonial times the new settlers had to find names for a fauna and flora (*e.g.,* banksia, iron bark, whee whee) different from anything previously known to them: trees that shed bark instead of leaves and cherries with external stones. The words brush, bush, creek, paddock, and scrub acquired wider senses, whereas the terms brook, dale, field, forest, and meadow were seldom used. A creek leading out of a river and entering it again downstream was called an anastomizing branch (a term from anatomy), or an anabranch, whereas a creek coming to a dead end was called by its native name, a billabong. The giant kingfisher with its raucous bray was long referred to as a laughing jackass, later as a bushman's clock, but now it is a kookaburra. Cattle so intractable that only roping could control them were said to be ropable, a term now used as a synonym for "angry" or "extremely annoyed."

"Rouse-about" and "roust-about"

A deadbeat was a penniless "sundowner" at the very end of his tether, and a no-hoper was an incompetent fellow, hopeless and helpless. An offsider (strictly, the offside driver of a bullock team) was any assistant or partner. A rouseabout was first an odd-job man on a sheep station and then any kind of handyman. He was, in fact, the "down-under" counterpart of the wharf labourer, or roustabout, on the Mississippi River. Both words originated in Cornwall, and many other terms, now exclusively Australian, came ultimately from British dialects. "Dinkum," for instance, meaning "true, authentic, genuine," echoed the "fair dinkum," or fair deal, of Lincolnshire dialect. "Fossicking" about for surface gold, and then rummaging about in general, perpetuated the term fossick ("to elicit information, ferret out the facts") from the Cornish dialect of English. To "barrack," or jeer noisily, recalled Irish "barrack" ("to brag, boast"), whereas "skerrick" in the phrase "not a skerrick left" was obviously identical with the "skerrick" meaning "small fragment, particle," still heard in English dialects from Westmorland to Hampshire.

Some Australian English terms came from Aboriginal speech: the words boomerang, corroboree (warlike dance and then any large and noisy gathering), dingo (reddish-brown half-domesticated dog), galah (cockatoo), gunyah (bush hut), kangaroo, karri (dark-red eucalyptus tree), nonda (rosaceous tree yielding edible fruit), pokutukawa (evergreen bearing brilliant blossom), wallaby (small marsupial), and wallaroo (large rock kangaroo). Australian English has slower rhythms and flatter intonations than RP. Although there is remarkably little regional variation throughout the entire continent, there is significant social variation. The neutral vowel /ə/ (as the *a* in "sofa") is frequently used, as in London Cockney: "arches" and "archers" are both pronounced [*a*:tʃəz], and the pronunciations of RP "day" and "go" are, respectively, [dəi] and [gəu].

Although New Zealand lies over 1,000 miles away, much of the English spoken there is similar to that of Australia. The blanket term Austral English is sometimes used to cover the language of the whole of Australasia, or Southern Asia, but this term is far from popular with New Zealanders because it makes no reference to New Zealand and gives all the prominence, so they feel, to Australia. Between North and South Islands there are observable differences. For one thing, Maori, which is still a living language (related to Tahitian, Hawaiian, and the other Austronesian [Malayo-Polynesian] languages), has a greater number of speakers and more influence in North Island.

English an alternative official language

The English of India–Pakistan. In 1950 India became a federal republic within the Commonwealth of Nations, and Hindi was declared the first national language. English, it was stated, would "continue to be used for all official purposes until 1965." In 1967, however, by the terms of the English Language Amendment Bill, English was proclaimed "an alternative official or associate language with Hindi until such time as all non-Hindi states had agreed to its being dropped." English is therefore acknowledged to be indispensable. It is the only practicable means of day-to-day communication between the central government at New Delhi and states with non-Hindi speaking populations, especially with the Deccan, or "South," where millions speak Dravidian (non-Indo-European) languages—Telugu, Tamil, Kannada, and Malayalam. English is widely used in business, and, although its use as a medium in higher education is decreasing, it remains the principal language of scientific research.

In 1956 Pakistan became an autonomous republic comprising two states, East and West. Bengali and Urdu were made the national languages of East and West Pakistan, respectively, but English was adopted as a third official language and functioned as the medium of interstate communication. (In 1971 East Pakistan broke away from its western partner and became the independent state of Bangladesh.)

African English. Africa is the most multilingual area in the world, if people are measured against languages. Upon a large number of indigenous languages rests a slowly changing superstructure of world languages (Arabic, English, French, and Portuguese). The problems of language are everywhere linked with political, social, economic, and educational factors.

The Republic of South Africa, the oldest British settlement in the continent, resembles Canada in having two recognized European languages within its borders: English and Afrikaans, or Cape Dutch. Both British and Dutch traders followed in the wake of 15th-century Portuguese explorers and have lived in widely varying war-and-peace relationships ever since. Although the Union of South Africa, comprising Cape Province, Transvaal, Natal, and Orange Free State, was for more than a half century (1910–61) a member of the British Empire and Commonwealth, its four prime ministers (Botha, Smuts, Hertzog, and Malan) were all Dutchmen. In the early 1980s Afrikaners outnumbered Britishers by three to two. The Afrikaans language began to diverge seriously from European Dutch in the late 18th century and has gradually come to be recognized as a separate language. Although the English spoken in South Africa differs in some respects from standard British English, its speakers do not regard the language as a separate one. They have naturally come to use many Afrikanerisms, such as *kloof, kopje, krans, veld,* and *vlei,* to denote features of the landscape and occasionally employ African names to designate local animals and plants. The words trek and commando, notorious in South African history, have acquired almost worldwide currency.

Afrikanerisms in South African English

Elsewhere in Africa, English helps to answer the needs of wider communication. It functions as an official language of administration in Botswana, Lesotho, and Swaziland and in Zimbabwe, Zambia, Malaŵi, Uganda, and Kenya. It is the language of instruction at Makerere University in Kampala, Uganda; at the University of Nairobi, Kenya; and at the University of Dar es Salaam, in Tanzania.

The West African states of The Gambia, Sierra Leone, Ghana, and Nigeria, independent members of the Commonwealth, have English as their official language. They are all multilingual. The official language of Liberia is also English, although its tribal communities constitute four different linguistic groups. Its leading citizens regard themselves as Americo-Liberians, being descendants of those freed blacks whose first contingents arrived in West Africa in 1822. South of the Sahara indigenous languages are extending their domains and are competing healthily and vigorously with French and English.

THE FUTURE OF ENGLISH

Geographically, English is the most widespread language on Earth, and it is second only to Mandarin Chinese in the number of people who speak it. The International Telecommunication Union (ITU) has five official languages: English, French, Spanish, Russian, and Chinese. The influence of these languages upon one another will inevitably increase.

It is reasonable to ask if changes in English can be predicted. There will doubtless be modifications in pronunciation, especially in that of long vowels and diphthongs. In weakly stressed syllables there is already a discernible tendency, operating effectively through radio and television, to restore the full qualities of vowels in these syllables. This tendency may bring British English more into line with American English and may bring them both a little nearer to Spanish and Italian. Further, it may help to narrow the gap between pronunciation and spelling. Other factors will also contribute toward the narrowing of this gap: advanced technological education, computer programming, machine translation, and expanding mass media. Spelling reformers will arise from time to time to liven up proceedings, but, in general, traditional orthography may well hold its own against all comers, perhaps with some regularization. Printing houses, wielding concentrated power through their style directives, will surely find it in their best interests to agree on uniformity of spelling. Encyclopaedic dictionaries—computerized, universal, and subject to continuous revision—may not go on indefinitely recording such variant spellings as "connection" and "connexion," "judgment" and "judgement," "labor" and "labour," "medieval" and "mediaeval," "plow" and "plough," "realise" and "realize," "thru" and "through."

Factors leading toward conformity

Since Tudor days, aside from the verb endings *-est* and *-eth,* inflections have remained stable because they represent the essential minimum. The abandonment of the forms thou and thee may encourage the spread of yous and youse in many areas, but it is not necessarily certain that these forms will win general acceptance. The need for a distinctive plural can be supplied in other ways (*e.g.,* the forms "you all, you fellows, you people"). The distinctions between the words "I" and "me," "he" and "him," "she" and "her," "we" and "us," "they" and "them" seem to many authors to be too important to be set aside, in spite of a growing tendency to use objective forms as emphatic subjective pronouns and to say, for instance, "them and us" instead of "they and we" in contrasting social classes. Otherwise, these distinctive forms may remain stable; they are all monosyllabic, they are in daily use, and they can bear the main stress. Thus they are likely to resist levelling processes.

Considerable changes will continue to be made in the forms and functions of auxiliary verbs, catenative (linking) verbs, phrasal verbs, and verb phrases. Indeed, the constituents of verbs and verb groups are being more subtly modified than those of any other word class. By means of auxiliaries and participles, a highly intricate system of aspects, tenses, and modalities is gradually evolving.

In syntax the movement toward a stricter word order seems to many to be certain to continue. The extension of multiple attributives in nominal groups has probably reached its maximum. It cannot extend further without incurring the risk of ambiguity.

In vocabulary further increases are expected if the present trends continue. Unabbreviated general dictionaries already contain 500,000 entries, but even larger dictionaries, with 750,000 entries, may be required. Coiners of words probably will not confine themselves to Greek and Latin in creating new terms, they are likely to exercise their inventive powers in developing an international technical vocabulary that is increasingly shared by Russian, French, and Spanish and that is slowly emerging as the universal scientific language. (S.P.)

Armenian language

The Armenian language, which forms a separate branch of the western group of Indo-European languages, is the mother tongue of the Turkish Armenians and of the Armenians in the Armenian Soviet Socialist Republic, where it is spoken by 2,850,000 people. In other parts of the Soviet Union, especially in the neighbouring republics of Georgia and Azerbaijan, it is used by some 1,300,000. Armenian emigrants and refugees have taken their language with them all over Asia Minor and the Middle East and from there to many European countries, especially Romania, Poland, and France, and to America, particularly the United States. In all, Armenian is probably spoken by about 5,500,000 people.

History of the language. Armenian was introduced into the mountainous Transcaucasian region (called Greater Armenia by the Greek historians) by invaders coming from the northern Balkans, probably in the latter part of the 2nd millennium BC. These invaders occupied the region on the shores of Lake Van that had previously been the site of the ancient Urartean kingdom. By the 7th century BC the Armenian language seems to have re-

placed the tongues of the native population. It is tempting to connect the invasion with the downfall of the Hittite empire in Anatolia.

Development of the alphabet

After the introduction of Christianity in the beginning of the 4th century AD, the language was reduced to writing; the alphabet, of 38 letters, was invented, according to tradition, by the bishop Mashtots (Mesrob) in about AD 400 (Table 28). Admirably suited to the phonology of Armenian, it is still used in various forms by Armenians all over the world. The oldest writings in the language date from the 5th century; they are preserved in manuscript form from the 9th century. Grabar, the written language of the 5th century, the golden age of Armenian culture, is traditionally said to be based on the dialect of Tarawn on Lake Van. To what extent the spoken language was split into dialects at that time is not known. The language of the literature from the 5th to the 8th century is remarkably homogeneous, but by the 9th century the influence of the spoken dialects was noticeable, especially in legal and historical texts. Among the Middle Armenian varieties of Grabar, the best known is the 12th- and 13th-century chancellery (court) language of the Armenian kingdom in Cilicia. More or less corrupted versions of Grabar continued as the literary language until the middle of the 19th century.

Modern East Armenian and West Armenian. In the 1800s, the writers Khachatur Abovean (1805–48) and Mikael Nalbandean (1829–66) and other Armenian nationalists made efforts to reach the populace with nationalist propaganda. As a result, a national revival occurred from which a new literary language emerged that was much closer to the spoken language. This is known in two varieties. East Armenian, now the official language of the Armenian Soviet Socialist Republic, is based on the dialect of the Ararat valley and the city of Yerevan; West Armenian has its foundation in the dialect of Istanbul. East Armenian is also spoken in other parts of the Soviet Union, whereas the western variety dominates in the Armenian colonies in the Middle East, Asia Minor, Europe, and America. The differences between these two written forms of Modern Armenian are slight, constituting no barrier to mutual intelligibility.

Dialects

In addition to the two literary languages, there are a great number of dialects, some of which are so different that the speakers cannot understand each other. It is estimated that before World War I some 50 distinct dialects were spoken. Today, the spoken dialects are losing ground in the Soviet Union, under the pressure of the standard written language. Accurate statistics on the extent to which Armenian dialects are used in Turkey and in other parts of the Middle East are not available.

When the scientific study of Armenian started in the 19th century, the language was considered an Iranian dialect, a mistake easily explained by the vast number of Iranian loanwords in the vocabulary. Subsequent studies, however, have convincingly shown Armenian to be an independent member of the Indo-European language family. According to the Greek historian Herodotus, Armenian was a variety of Phrygian, a tongue presumed to be Indo-European. What little is known of the latter is insufficient to support or confirm such a claim.

Sounds of Armenian

Phonology. Phonetic developments in Armenian have radically changed the sound system of the old Indo-European parent language. In particular, the pattern of the plosive consonants—the stops—has been completely reshuffled. In the more conservative central Armenian dialects three series of stops are distinguished (voiced *b, d, g,* which in some dialects are aspirated; unvoiced *p, t, k;* and unvoiced aspirated *ph, th, kh*). In the dialects of the periphery, the three series have been reduced to two (aspirated *ph, th, kh* and unaspirated *p, t, k,* or, as in Istanbul, *b, d, g*). These differences are concealed in the traditional orthography. Sibilants (fricatives) of various types and affricates have emerged through palatalization of the old palatal and labiovelar stops. Thus, Old Armenian *dz* (*z*) and *ts* may go back to the Indo-European palatal stops *ǵh* and *ǵ*, and *dž* (*ž*) to the Indo-European labiovelar $g^{w}h$ before *e* and *i;* Old Armenian *tsʻ, tšʻ,* and *tš* may derive from the Indo-European consonant clusters *sk, ky,* and *gy.* All Armenian dialects distinguish two types of *r,* one strongly trilled, one weakly trilled. Old Armenian also differentiated between two types of *l,* a neutral one and a velarized variety, which is made by moving the back of the tongue nearer to the soft palate at the back of the mouth. The latter type has developed into a voiced velar fricative in the modern dialects.

Grammar. All of the spoken dialects and the two literary languages have maintained a fairly complicated system of noun declension, distinguishing six or seven cases. The plural stem, derived from the singular stem by the addition of the suffix -(*n*)*er,* is declined as a singular, according to the Turkish pattern. Characteristic of the changes in the Old Armenian verbal system is the general replacement of simple present tense forms by periphrastic expressions. These are groups of words, including auxiliaries, that take the place of a single word that is capable of being inflected to show tense or some other feature. The various types of periphrastic forms serve as the basis for the classification of the dialects. In Old and Modern Armenian, the main tense distinction is that between present, aorist (denoting occurrence without reference to completeness, duration, etc.), and periphrastic perfect tenses. The old subjunctive, still extant in classical Armenian, has been lost in the modern language. To express future time, Old Armenian used the subjunctive forms; Modern Armenian employs periphrastic expressions, as is done in the English future forms *I shall go* and *he will work.* Also characteristic of Modern Armenian is the importance of the passive forms of the verb, which are strictly parallel to the active forms, and the emergence of a special negative conjugation with differing forms for verbs in instances like "I read" and "I don't read." Whereas Old Armenian was rather close to ancient Greek in many respects, Modern Armenian is typologically much closer to Turkish. Among the features that illustrate this similarity are the agglutinative system of declension (*i.e.,* the compounding of several linguistic elements of independent meaning into a single word), the use of suffixes to indicate possession, the employing of passive and causative forms for all verbs, and the use of postpositions (grammatical elements placed after the word) instead of prepositions (as used in Old Armenian). The vocabulary of the written languages is purely Armenian, being based almost exclusively on that of Grabar, with very few loanwords from the neighbouring languages. (The Iranian loanwords mentioned above were incorporated into Armenian before the creation of the written language.) (H.K.V.)

Tocharian language

Tocharian (Tokharian), also called Tocharish, is an Indo-European language that was spoken in northern Chinese Turkistan (Tarim Basin) during the latter half of the 1st millennium AD. Documents from about AD 500–700 attest to two dialects: Tocharian A, from the area of Turfan in the east; and Tocharian B, chiefly from the region of Kucha in the west but also from the Turfan area.

Discovery and decipherment. The first Tocharian manuscripts were discovered in the 1890s. The bulk of the Tocharian materials were carried to Berlin by the Prussian expeditions of 1903–04 and 1906–07, which explored the Turfan area, and to Paris by a French expedition of 1906–09, which investigated chiefly in the area of Kucha. Smaller collections are in London, Leningrad, and Japan.

Translation and analysis

Tocharian is written with a north Indian syllabary (a set of characters representing syllables) known as Brāhmī, which was also used in writing Sanskrit manuscripts from the same area. The first successful attempt at grammatical analysis and translation was made by the German scholars Emil Sieg and Wilhelm Siegling in 1908 in an article that also established the presence of the two dialects, provisionally called A and B. The Berlin collection consisted of both dialects, whereas all other manuscripts discovered were in B.

The German name Tocharisch was proposed, and the language was demonstrated to be Indo-European.

Characteristics. Tocharian forms an independent branch of the Indo-European language family not closely related to other neighbouring Indo-European languages (Indo-Aryan and Iranian). Rather, Tocharian shows a closer affinity with the western (*centum*) languages: compare, for example, Tocharian A *känt,* B *kante, känte* "100," and Latin *centum* with Sanskrit *śatám;* A *klyos-,* B *klyaus-* "hear," and Latin *clueo* with Sanskrit *śru-;* A *kus,* B *kuse* "who," and Latin *qui, quod* with Sanskrit *kas.* In phonology, Tocharian differs greatly from the other Indo-European languages in that all of the Indo-European stops of each series fall together, resulting in a system of three (voiceless) stops, *p, t,* and *k.*

The Tocharian verb reflects the Indo-European verbal system both in stem formations and in personal endings. Especially noteworthy is the wide development of the mediopassive form in *r* (as in Italic and Celtic); *e.g.,* Tocharian A *klyoṣtär* "is heard." The 3rd person preterit plural ends in *-r,* similar to Latin and Sanskrit perfect forms and the Hittite preterit. The noun, however, shows little trace of the original Indo-European inflection. Instead, it is built up by the addition of postpositions to the oblique (accusative) form. This type of inflection (agglutination) has been attributed to the influence of non-Indo-European languages (Turkish, Finno-Ugric).

The vocabulary shows a remarkable influx of loanwords—from Turkish, Iranian, and, later, Sanskrit. Chinese has had little influence. Many of the most archaic elements of the Indo-European vocabulary are retained—*e.g.,* A *por,* B *puwar* "fire" (Greek *pyr,* Hittite *paḫḫur*); A and B *ku* "dog" (Greek *kyōn*); A *tkaṃ* "earth" (Greek *chthōn,* Hittite *tekan*), and especially, nouns of relationship: A *pācar, mācar, pracar, ckācar,* B *pācer, mācer, procer, tkācer,* "father," "mother," "brother," and "daughter," respectively.

Literature. Tocharian literature is Buddhistic in content, consisting largely of translations or free adaptations of Jātakas, of Avadānas, and of philosophical, didactic, and canonical works. In dialect B there are also commercial documents, such as monastery records, caravan passes, medical and magical texts, and the like. These are important source materials for the social, economic, and political life of central Asia.

The "Tocharian problem." Since the appearance of Sieg and Siegling's article, the appropriateness of the name Tocharian for the language has been disputed. According to Greek and Latin historical sources, the Tochari (Greek Tócharoi, Latin Tochari) inhabited the basin of the upper Oxus River (modern Amu Darya) in the 2nd century BC and were probably Iranians. Sieg and Siegling's identification of this language as belonging to these people was probably in error.

Identification of the Tocharian-speaking people

There have, of course, been numerous attempts to identify the speakers of Tocharian with this or that people or tribe mentioned in Chinese annals or in other documents dealing with the area in and around the Tarim Basin during the last half of the 1st millennium AD. One such identification that gained some adherents was with the Wu-sun. Neither this nor any other identification, however, would appear to be more than mere speculation.

Furthermore, the name *ārśi* (*ārśiype* "Arśi-country," *ārśi-käntu* "Arśi-language"), once accepted as the native name in dialect A, is probably a loanword through Iranian from Sanskrit *ārya.* The question of the name is, however, of little linguistic importance. Tocharian, even if generally accepted as a misnomer, will probably remain. For dialect A and dialect B, the substitution of Turfanian and Kuchean, or of East Tocharian and West Tocharian, has been suggested.

Of greater importance, at least from the linguistic point of view, is the relationship of the Tocharian language to the other Indo-European languages and the interrelationship of the two dialects themselves. In the former regard, in spite of superficial resemblances to Italic and Celtic (see above), the more fundamental shared features—*e.g.,* common vocabulary, certain verbal categories (*s*-aorists, preservation of the perfect active participle), and possible relics of common phonological developments—would appear to align Tocharian with the more southeastern branches of Indo-European; that is, with Thracian and Phrygian or even with Greek and Armenian. Those features shared with the Baltic and Slavic languages (certain present and preterit formations in particular) might be the result of later contacts.

With regard to the interrelationship of the two dialects, it is possible that dialect A was, at the time of documentation, a dead liturgical language preserved in the Buddhist monasteries in the east, whereas dialect B was a living language in the west (note that commercial or at least nonliturgical documents are found in that dialect). The presence of manuscripts in B mixed with those in A in the monasteries of the east can be accounted for by ascribing the B manuscripts to a new missionary invasion of those monasteries by Buddhist monks from the west. (G.S.L.)

Celtic languages

The Celtic languages form one branch of the Indo-European language family, having in common certain sound shifts and vocabulary items. On both geographical and chronological grounds, the languages fall into two divisions, usually known as Continental Celtic and Insular Celtic.

Continental Celtic. Continental Celtic is the generic name for the languages spoken by the people known to classical writers as Keltoi and Galatae; at various times during a period of roughly 1,000 years (approximately 500 BC–AD 500), they occupied an area that stretched from Gaul to Iberia in the south and Galatia in the east. The great bulk of evidence for Continental Celtic consists of the names of persons, tribes, and places recorded by Greek and Latin writers. Only in Gaul and in northern Italy are inscriptions found, and the interpretation of these is in most cases doubtful. Given the nature of the evidence, knowledge for these languages is confined largely to the sound system and a small part of the vocabulary, and no certain conclusions can be reached as to their historical development or the differences between them.

Evidence for Continental Celtic

Insular Celtic. Insular Celtic refers to the Celtic languages of the British Isles, together with Breton (spoken in Brittany, France). As the name Breton implies, it is an importation from Britain and is not a Continental Celtic dialect. Although there is some scanty evidence from classical sources—mainly place-names—and a small body of inscriptions in the Latin and ogham alphabets from the end of the 4th to the 8th centuries AD, the main source of information on the early stages of these languages is manuscripts written from the 7th century onward in Irish and somewhat later in the British languages.

The Insular languages fall into two groups—Irish and British. Irish (often called Goidelic, from Old Irish *Goídel* "Irishman," or Gaelic, from *Gael,* the modern form of the same word) was the only language spoken in Ireland in the 5th century, the time when historical knowledge of that island begins. The two other members of this group, Scottish Gaelic and Manx, arose from Irish colonizations that began about that time. There were also important Irish-speaking colonies in Wales, but no trace of their language survives apart from a few inscriptions.

British (often called Brythonic, from Welsh Brython "Briton") had almost the same degree of influence on the island of Britain and the Isle of Man. Inscriptions and personal names surviving from Scotland show clearly that there was a non-Indo-European language spoken there, usually called Pictish, which was later replaced by British. There were undoubtedly dialectal differences within the island, but the existing dialects arose from the fragmentation of British by the Irish invasions of Man and what is now Scotland and by the English invasions that began in what is now southern England and finally reached Scotland. Scotland has ever since been partitioned linguistically between English (or "Scots") and Irish (or "Erse"—the Scots form of "Irish"—or "Gaelic"). A British dialect, now labelled Cumbric, lingered on in the western borderlands between England and Scotland until perhaps the 10th century, but almost nothing is known about it. In what is now Wales, British survived as the dominant language until a century or so ago; it is now known as Welsh. Another pocket of British speech survived in Cornwall until the end of the 18th century. It was from this area that emigrants in the

Re-establishment of Celtic on the European mainland

5th and 6th centuries AD had brought Celtic once more to the European mainland by establishing a colony in northwestern France, still called Brittany. It is just possible that there were some traces of the Continental Celtic language (*i.e.,* Gaulish) at that time in this remote area, although Breton is too similar to Cornish (an Insular Celtic tongue) to suggest any serious influence from Gaulish.

HISTORICAL DEVELOPMENT

Common Celtic. The reconstruction of Common Celtic (or Proto-Celtic)—the parent language that yielded the various tongues of Continental Celtic and Insular Celtic—is of necessity very tentative. Whereas Continental Celtic offers plenty of evidence for phonology (the sound system), its records are too scanty to help much with the grammar (morphology or syntax), for which the best available evidence is Old Irish, the most archaic of the Insular languages. The records provide a picture of a language of the same type as Latin or Common Germanic; that is, one that still maintains a considerable part of the structure of the ancestral Indo-European language and has not lost final or medial syllables. Its vowel system differs only slightly from that reconstructed for Indo-European by the French linguist Antoine Meillet. Differences include the occurrence of Celtic *ī for Indo-European *ē (*e.g.,* Gaulish *rix* and Irish *rí,* "king"; compare Latin *rex*) and *ā in place of *ō. (An asterisk [*] before a letter or word indicates that the sound or word is not attested but is a hypothetical, reconstructed form.)

The consonantal system, too, is conservative, although there are some striking features. Among them are the loss of **p* (*e.g.,* Irish *athair* "father"; *cf.* Latin *pater*) and the falling together of the aspirated and unaspirated voiced stops assumed for Indo-European. (A stop is a consonant made with complete momentary stoppage of the breath stream some place in the vocal tract; voiced stops are those produced with the vocal cords vibrating, such as *b, d, g.* An aspirated sound is accompanied by a puff of breath, often written as an *h,* as in *bh, dh, gh;* an unaspirated consonant lacks this accompanying puff of breath.) Thus, Old Irish *dā́n* "what is given" corresponds to Latin *donum* "gift" (from Indo-European **d*), but Old Irish *de-naid* "sucks" corresponds to Latin *fe-* in *fe-mina, fe-llare* (from Indo-European **dh*). This loss of distinctive aspiration occurs with three out of the four voiced stops, a situation close to that of Slavic.

Other considerations, however, show that Celtic belongs to the so-called southern group of the European branch of Indo-European languages, or in another classification, to the same centum group as Latin, whereas Slavic belongs to the satem group. (The centum and satem divisions of Indo-European languages are made according to the treatment of certain sounds, called palatals, that existed in the ancestral Indo-European language.)

Correspondence of Celtic *p* and *q*

The loss of **p* in Celtic was very early; only the place-name Hercynia, preserved in Greek, shows that, in initial position, it became an *h* sound before disappearing. In most of the known Celtic languages, a new *p* sound has arisen as a reflex of the Indo-European *k^w sound. Thus there is Gaulish *pempe,* Welsh *pimp* "five," compared to Old Irish *cóic* and Latin *quinque* "five." The Irish evidence shows that *k^wenk^we must be reconstructed as the form in Common Celtic. The terms P-Celtic and Q-Celtic are sometimes used to describe assumed divisions of Common Celtic; to use one sound shift to distinguish dialects is, however, hardly justified, and the classification will not be used in this article.

The morphology (structure) of nouns and adjectives shows no striking changes from Indo-European. The Irish verb, however, exhibits a remarkable archaism not found in any other recorded Indo-European language. It has recently been demonstrated that the so-called primary and secondary endings of the Indo-European verb, as in the 3rd person singular endings *-(*e*)*t* and -(*e*)*ti,* both occurred in the same tense. The forms with *-*i* were used when the verb had absolute initial position; those without it were used in the normal verbal position at the end of the sentence. This is reflected in the Old Irish forms *beirith* (from **bereti*) "he bears" and *ní beir* (from **beret*) "he does not bear." It cannot be stated with certainty that Continental Celtic had preserved such forms. The Continental Celtic dialects show a few cases of sentences—admittedly imperfectly understood—in which the verb appears to be placed after the subject and before the object, as in modern western European languages. The history of Insular Celtic, however, shows a gradual shift from the older final position of the verb to the initial position, a position that has now become regular in all of the languages.

Relationships and ancient contacts of Celtic. The question of the relationship of Common Celtic to the other Indo-European languages remains open. For some time, it was held that Celtic stood in an especially close relation to the Italic branch; some scholars even spoke of a period when an Italo-Celtic "nation" existed, toward the end of the 2nd millennium BC. The existence of a *q–p* relationship (see above) inside Italic too (*e.g.,* Latin *quattuor* "four," but Oscan *petora*) was thought by some to support this view. Much of this argument is, however, based on accidental resemblances (*e.g.,* the Irish future tense in *f-* and the Latin future in *b-*) or on formations such as the deponent and passive verb forms ending in *-r,* which at one time were known mainly in Italic and Celtic but have since been found in the Hittite and Tocharian languages as well. The undeniable common features between Celtic and Italic, such as the superlative endings of adjectives (Latin *-issimus;* Celtic *-*samos,* *-*isamos*), are hardly sufficient to justify the assumption of a special relationship, and the whole concept of an Italo-Celtic unity has been powerfully criticized by the linguists Carl J.S. Marstrander and Calvert Watkins.

The original home of the Celts cannot be located precisely, but, on the whole, the evidence points to the eastern part of central Europe. There is more evidence for their contacts with other Indo-European peoples. One group of Celts, at least, found themselves neighbours of the Germanic peoples and were often confused with them by classical writers. It can be inferred that the Celts had attained a higher standard of social organization than the Germanic peoples from the existence of words such as Gothic *reiki* and *andbahts* (modern German *Reich, Amt*), apparently borrowed from Celtic **rīgion* "kingdom" and **ambactos* "officer." To the Greeks and Romans, on the other hand, the Celts were inferior in culture; Celtic words in Greek are restricted to those describing Celtic institutions, such as *bardoi* "poets." The borrowings from Celtic into Latin, which derive mainly from the period before the expansion of Roman power, belong to a few restricted categories, such as war (*lancea* "lance"), transport (*carrus* "baggage wagon" and *carpentum* "light carriage"), and agricultural products (*cervesia* "beer"). When the Romans finally conquered Gaul and imposed their language, a number of Celtic words came into Latin, but the Celtic terms were mainly concerned with rural life. These are more common in French dialects than in standard French, which preserves a mere handful, such as *mouton* "sheep," *ruche* "beehive," and *arpent* "land measure."

Contacts with the Greeks and Romans

Early records of Celtic. *Continental Celtic.* Celtic died out very quickly in eastern Europe. In its farthest outpost in Asia Minor, it may be assumed that the *Letter of Paul to the Galatians* was addressed to a people whose culture was already Greek but whose Celtic origins are clear from names preserved by classical authors; *e.g.,* Drunemeton "the very sacred place," formed from two distinctively Celtic elements. When commenting on that Letter, St. Jerome (died AD 419/420) said that the Galatians still spoke a language almost the same as that of the people of Trier. As he had been in both places, his evidence cannot be dismissed offhand, and it may be that a few speakers of Celtic still existed in both areas. Since St. Jerome did not claim to know any Celtic dialect, however, his statement cannot be accepted with certainty. Speaking generally, the history of Continental Celtic comes to an end as that of Insular Celtic begins.

Insular Celtic. The earliest evidence for Insular Celtic consists, like that for Continental Celtic, mainly of names recorded by Greek and Latin authors. In the case of Ireland, these were entirely by hearsay, and many of the Irish place-names recorded by Ptolemy in the 2nd century AD have not yet been identified. From perhaps the 4th century, ogham inscriptions (see WRITING) are found in Ireland, consisting almost entirely of personal names. From the 5th century onward, British names in Latin inscriptions are recorded in Wales, as well as Irish names in both Latin and ogham alphabets in areas of Irish settlement. These scanty records are of value above all in establishing that, up to very nearly the time at which written documents become available, British and Irish had remained similar in structure to Gaulish. Thus, in Britain is found the genitive (possessive form) Catotigirni, which in Old Welsh gives Cattegirn, and in Ireland the genitive Dovatuci exists, which in Old Irish gives Dubthaich. These changes—loss of final syllables and connecting vowels, weakening of consonants between vowels, and so on—are very similar to what was happening to Latin in France at the same time; *e.g.,* Latin *avicellus* and *aqua* finally became *oiseau* and *eau.* There is no satisfactory explanation of why these profound changes should have occurred at this time, nor can the period at which they occurred be fixed precisely, for the engravers of the inscriptions clearly went on using traditional forms long after the sound had changed.

LINGUISTIC CHARACTERISTICS OF THE INSULAR CELTIC TONGUES

The new languages, the only forms of Celtic that are known thoroughly, present a considerable number of unusual features, some of them unknown to other Indo-European languages. Some scholars have argued that these features may have resulted from the presence of a large non-Celtic substratum in the British Isles. Because it is hardly likely that the Celtic invasions of those islands began much before 500 BC or that the invaders exterminated the existing inhabitants, such a possibility cannot be denied. On the other hand, some features once thought to be exotic, such as the initial position of the verb in the sentence, have been convincingly demonstrated to be organic developments from Indo-European. Others, such as the system of counting by 20s, are clearly innovations, but this system is shared by English ("three score and ten"), French (*quatre-vingts* "80"), and Danish, in all of which it is also an innovation, as well as Basque, in which it appears to be old.

Possible influences of substratum languages

Phonological characteristics. The most remarkable phonological feature of Insular Celtic is the development of a double series of consonants in which strongly articulated consonants are distinguished from their weak counterparts. The two series were originally merely phonetic variants, with the strong variety occurring in absolute initial position and in certain consonant clusters and the weak elsewhere. Later, however, the two series became independent, or phonological. In the languages as they first appear in writing, considerable changes have taken place in the phonetic forms of the two series. Both in Irish and in Welsh, Cornish, and Breton, the opposition (contrast) of strong:weak in the voiced stops has been replaced by stop:spirant (*e.g., b:v*). (A spirant, such as *v, f, s,* is produced with local friction and without complete stoppage of the breath stream.) Irish has the same system for the unvoiced stops (*e.g., t:th*), but Welsh, Cornish, and Breton have voicing in this instance (*e.g.,* voiceless *t*:voiced *d*). These changes by themselves are not very different from the weakening of consonants between vowels that occurs in other western European languages (compare Welsh *pader* "prayer," a loanword from Latin *pater* "father," with Spanish *padre* "father," deriving from Latin *patrem*), but, in Insular Celtic, they occurred not only inside the word but also inside the phrase, so that the initial consonant of a word preceded by another word ending in a vowel was weakened. When the final syllables were lost in the evolution to the modern languages, these variations remained, and a system of initial mutations (changes) was thus set up. If, for example, a Goidelic nominative form **sindos kattos koilos* "the thin cat" is reconstructed, this will give Old Irish *in catt coel* after the loss of final syllables, but the genitive **sindī kattī koilī* "of the thin cat" will give *in chaitt choīl* with changed initial consonants. The same sort of change occurred in one Italian dialect: in Tuscan, there occur *porta* "door," *la forta* "the door," *tre porte* "three doors," from Latin *porta, illa porta, tres portae.* In both cases, consonant weakening has spread from word to sentence; there is a common development, but it cannot be claimed that it is distinctively Celtic.

Grammatical characteristics. Another feature of Insular Celtic is its lack of the infinitive form of the verb found in most other Indo-European languages—*e.g.,* English "to do," "to call." The equivalent is the verbal noun, which is a noun closely linked to the verb, though not necessarily derived from the same stem. Being a noun, it can have a following noun in the genitive case, which, in the older languages at least, is subjective or objective according to whether the verb with which it is linked is intransitive or transitive. Thus, from the Old Irish sentence *téit in ben* "the woman goes," the verbal noun phrase *techt inna mná* "the coming of the woman" can be derived, whereas from *marbaid in mnaí* "he kills the woman" can be formed *marbad inna mná* (*lais*) "the killing of the woman (by him)." Among many other functions of the verbal noun is its use, when preceded by the appropriate preposition, with the substantive verb to provide a tense with continuous meaning. Thus, to *téit in ben* there is a parallel *a-tá in ben oc techt* "the woman is at going" (= "the woman is going"), and to *marbaid in mnaí* corresponds *a-tá oc marbad inna mná* "he is killing the woman." The close resemblance of this system to that of modern English, in which it is a comparatively recent development, has been variously explained as the working of a substratum or, more recently, in terms of areal (regional) development.

Verbal nouns

MODERN LANGUAGES OF THE FAMILY

The discussion of the individual languages that follows divides them into the two main groups, beginning with Irish, which is the oldest attested.

Irish. The history of Irish may be divided into four periods: that of the ogham inscriptions, probably AD 300–500; Old Irish, 600–900; Middle Irish, 900–1200; and Modern Irish, 1200 to the present. This division is necessarily arbitrary, and archaizing tendencies confuse the situation, especially during the period 1200–1600, when a highly standardized literary norm was dominant. After 1600, the modern dialects, among them Scottish Gaelic and Manx, begin to appear in writing.

The Latin alphabet was introduced into Ireland by British missionaries in the 5th century and soon began to be used for writing Irish. By the middle of the 6th century, the process of putting into literary form the rich oral tradition of the native learned class was certainly well advanced. The problems of interpreting the early writings are complicated by the fact that the orthography was based on that of Latin, but with a British pronunciation; *e.g.,* Latin *pater* was read as *pader,* the form of the loanword in Modern Welsh, and Old Irish *Pátric* was read as *Pádraig* (as it is spelled in Modern Irish). No new letters were evolved; the weak (less forceful) consonants were distinguished only in instances in which there were Latin spellings that could be utilized (*e.g.,* strong *ll:* weak *l,* strong *rr:* weak *r, nn:n, c:ch, t:th*) or with the help of the *punctum delens* (*s:ṡ, f:ḟ*), a dot that shows that the sound is not pronounced. As a result, many ambiguities remain: *ní beir* can mean either "he does not carry" or "he does not carry it," according to whether the *b-* is read as a *b* sound or a *v* sound. Nor was the Latin alphabet capable of dealing with the new system of consonant quality that appears in Irish alone among the Celtic languages. Thus, from the Celtic nominative singular and plural forms *bardos, bardī* developed Welsh *bardd,* plural *beirdd,* with a vowel alternation like that of English "mouse, mice." In Irish, the forms are *bard, baird;* the *-i-* of *baird* is purely graphic, serving to indicate that the following consonants are both palatalized. (Palatalized consonants are those in which the pronunciation is modified by raising the tongue toward the hard palate.) This palatalization had been purely phonetic as long as the *-ī* that caused it survived, but in Old Irish the palatalization became independent, so that each consonant of Common Celtic evolved into four distinct consonants (*i.e.,* phonemes); for example, from original Common Celtic *b* are derived a *b* sound and a palatalized *b* sound, and a *v* sound and a palatalized *v* sound.

Development of palatalized consonants

Apart from these phonetic developments, Old Irish is striking chiefly for the extraordinary proliferation of particles that appear before the verb and are used in forming compound verbs. For example, the Latin word *suffio* "I fumigate" is translated as *fo-timmdiriut,* composed of *fo* "under," *to* "to," *imb-* "around," *di* "from," and the stem *reth-* "run," with vowel and consonant changes appropriate to the 1st person singular present tense. Such forms, combined with a system of infixed accusative and dative pronouns (*i.e.,* pronouns inserted within a word) and syntactical accent shifts, produced a verbal system almost as complicated as that of Basque, though transparently Indo-European in origin. This system began to break down during the Old Irish period; the process was no doubt accelerated by the Viking raids that began at the end of the 8th century and that disrupted the monastic system, the guardian of the literary norm of Old Irish. Popular forms broke through in the Middle Irish period, though always mixed with archaizing forms; the backward-looking Irish scribes were never content to write down their own vernacular. During the 12th century, many ecclesiastical synods were held with the object of bringing the organization of the Irish Church more closely into line with that of western Europe, and the Anglo-Norman invasion took place in the latter part of the same century. It may have been these far-reaching changes that inspired the Irish literati to undertake a new standardization of their language. From the beginning of the 13th century, there is a rigidly fixed norm, often called Classical Modern Irish, which, for over four centuries, was used as the exclusive literary medium in Ireland and in Gaelic-speaking Scotland (there is no evidence for the Isle of Man).

The Scandinavians were first contained and then absorbed; they contributed a small number of loanwords to Irish, mainly in the field of navigation but also in that of urban life, for they were the first to establish towns in Ireland, though only on the coast. The Anglo-Normans were a more serious problem. After almost complete success in the early period, however, they became largely Gaelicized in custom and language outside the towns they had founded. They contributed a large number of loanwords to Irish in the fields of warfare, architecture, and administration, though many of these were comparatively short-lived. When English took over from Anglo-Norman as the language of administration and English colonies began to be planted in Ireland, English loanwords began to come into Irish. Few of these, however, were recognized in the literary language, and only from the evidence of the modern dialects has it become clear that they were quite numerous.

The decline of Irish

It was not until the beginning of the 17th century that the English power was finally consolidated in Ireland, first by military conquest and later by the planting of English-speaking colonists on a much larger scale than before. From this time onward, the decline of Irish began, with Irish becoming the language of an oppressed people. With no schools to teach the literary language nor any native nobility to support the literati who used it, the dialects appeared for the first time and began to be written in the paper manuscripts that constituted almost the only form of publishing available to those using Irish. By the beginning of the 19th century, it is probable that the population was almost equally divided between Irish speakers, mainly in the western half, and English speakers, mainly in the eastern half. The real imbalance lay in the fact that many of the Irish speakers were bilingual, whereas few of the English speakers were. The first census to record language use was taken in 1851, after the great famine that had struck the western areas with exceptional severity. By this time, the total number of Irish speakers was 1,524,286 (23 percent of the population), but only 319,602 spoke Irish exclusively. The decline of Irish has continued to the present day, in spite of a revival campaign initiated by the Gaelic League in 1893 and made part of official policy after the establishment of the Irish Free State in 1921.

Since then, Irish has been recognized as the first official language of the state; it is a compulsory subject in all of the schools and is a requirement for civil service and some other posts. There are probably more people able to read Irish—perhaps 300,000—than there ever were before. From 1945 onward, a standard written language has evolved, and there is a small but flourishing literary movement. Nearly all of the readers of Irish are English speakers by upbringing, however, and not many of them would claim that Irish had become their main language. In the western areas in which Irish was the traditional speech, there are now fewer than 50,000 people to whom it is a mother tongue, and all but a handful of these have a more or less adequate command of English.

Scottish Gaelic. Some aspects of the modern Scottish Gaelic dialects show that they preserve features lost in the language of Ireland during the Old Irish period; such archaism is characteristic of "colonial" languages. The innovations are, however, more striking than the archaisms. Most remarkable is the loss of the voicing feature (*i.e.,* the vibration of the vocal cords) in the stops. All of the stopped consonants are unvoiced, and the original voiceless stops have become strongly aspirated; for example, the equivalent of Irish *bog* "soft" is [pok], *p* being the voiceless counterpart of *b,* and that of *cat* "cat" is [k$^{\text{h}}$aht], the superscript $^{\text{h}}$ after *k* indicating the aspirated quality. (The brackets indicate that the symbols printed within them are phonetic rather than orthographic.)

Scottish Gaelic was planted on British soil, and the verbal system has been remolded on the lines of the British language, which originally had no future tense. As in Modern Welsh, the inherited present tense has largely future meaning, and present time is mainly expressed by the present-tense form of the substantive verb and the preposition *a(ig)* with the verbal noun. (In Insular Celtic, there are two verbs for "to be," a substantive verb with the meaning, roughly, "to exist," and a linking verb such as "is" in "John is a boy" or "sky is blue.") Thus, from Old Irish *téit in ben* "the woman goes" is derived Scottish Gaelic *thèid a' bhean* "the woman will go," and from Old Irish *a-tá in ben oc techt* "the woman is going" results the Scottish Gaelic form *thà an bhean a' dol* "the woman goes" or "the woman is going."

It is only from the 17th century onward that the development of Scottish Gaelic can be studied, for, up until then, Classical Modern Irish was the literary norm. Indeed, the first book to be printed in Irish was a translation of the Calvinist *Book of Common Order,* published in Edinburgh in 1567, and the Scottish Reformers used the Irish Bible for some time, until it became clear that it was too foreign for the people to understand. A native Scottish standard emerged gradually during the 17th century, as poets ignorant of the Irish norm began to compose in their native dialects. It was not until the 18th century that the orthography became more or less fixed, and, until recent reforms in Ireland, the divergencies between the written languages were comparatively small. It is clear, however, that Scottish Gaelic must now be regarded as a separate language, though the differences between it and Irish are no greater than those between standard German and the Swiss dialects.

Scottish Gaelic as a separate language from Irish

Scottish Gaelic was confronted by northern dialects of English (Scots) from the very beginning; these rapidly penetrated into the east of the country, especially in the area centred on Edinburgh, the capital. The so-called Highland Line, marking the boundary between the two languages, has been steadily receding to the west since medieval times. By 1901, there were 230,806 speakers of the language, including 28,106 who spoke Scottish Gaelic exclusively; 106,466 persons, including nearly all of the monolingual Scottish Gaelic people, lived in the two counties of Inverness and Ross. The decline has continued steadily, and, even in those two counties, Gaelic is rapidly disappearing from the mainland, though it is holding its ground well in the Hebrides. Scottish Gaelic speakers in the early 1980s numbered about 90,700, which shows that the state of Scottish Gaelic survival is in many ways less serious than that of Irish. Because the majority of Gaelic speakers are Protestants who are accustomed to reading the Bible and using the vernacular in their religious services, literacy in Gaelic has been widespread. Furthermore, however low the census figures may be, they give an accurate picture of the number of those to whom Gaelic is a mother tongue because the number of English speakers who have acquired it is negligible. It must be admitted, however, that the recent literary revival finds its audience among the displaced Gaelic speakers of Edinburgh and Glasgow rather than in the Hebrides, where Gaelic is still confined to the home and English is the language of culture. In addition, there were about 500 Gaelic speakers in Nova Scotia in the early 1980s.

Manx. The history of the Isle of Man is imperfectly known. It was first inhabited by British speakers, then colonized from Ireland, and later became part of the Scandinavian Lordship of the Isles until 1266, when the King of Norway ceded both Man and the Hebrides to Scotland. From then on, it became involved in the wars between England and Scotland until 1346, when it passed finally to England. Though an Irish dialect survived as the speech of the majority of the people, these circumstances were not propitious for literary contacts with Ireland, and Manx was apparently not written until the Welsh bishop John Phillips translated the Anglican *Book of Common Prayer* in 1610, using an orthography based on that of English. This orthography makes Manx difficult to understand for readers of Irish and Scottish Gaelic, to whom it is of considerable interest because it represents a dialect entirely free of literary influences. The orthography soon became fixed, and a far-reaching series of later phonetic changes made the written form a highly inaccurate representation of the final stages of the language. Phonologically, it has more in common with the eastern dialects of Irish than with Scottish Gaelic, but its morphology and syntax are much more like those of Scottish Gaelic, probably because of the common British substratum. Its tense system is similar to that of Scottish Gaelic and Welsh, and its use of periphrastic verb forms (*i.e.,* longer forms with several elements) with the auxiliary meaning "to do" goes further than either of these, especially in its final stages.

Extinction of Manx in the early 20th century

In the beginning of the 18th century, English was still not understood by most of the people, but during the 19th century the decline of Manx was rapid, and the census of 1901 showed only 4,419 speakers of the language, all bilingual. Twenty years later, the language had ceased to be used as a normal means of communication, but, until recently, investigators have been able to find old people capable of giving useful information.

British languages. Britain was thoroughly romanized, and it is clear that the British language itself had been much affected by Latin; on the level of vocabulary, such an everyday word as Welsh *pysg* "fish," for example, derives from Latin *piscis.* The vowel system lost independent vowel quantity, the length of vowels becoming determined by the structure of the syllable, a situation that also occurred when the later Latin developed into Romance. Even after the collapse of Roman rule, Latin retained the same prestige among British Christians that it had in the rest of the Western Empire. The Irish monks introduced to the British speakers the custom of writing down the vernacular language at about the end of the 8th century; they adapted the clumsy Irish orthography for that purpose. At this period, the British dialects were very close to one another and can hardly be classed as separate languages, though they soon began to diverge. Like Old Irish, they had lost their final syllables and had undergone many other changes from the state shown by the inscriptions. Notably, the languages show only the merest traces of the declension of the noun, although the verb preserves a full inflectional system (that is, it has a full series of endings). It is clear that no future tense existed in early British, though the separate languages were later to fill this gap by various means.

Welsh. Welsh is the earliest and best attested of the British languages. Although the material is fragmentary until the 12th century, the course of the language can be traced from the end of the 8th century. The earliest evidence may represent the spoken language fairly accurately, but a poetic tradition was soon established, and by the 12th century there was a clear divergence between the archaizing verse and a modernizing prose. The latter was characterized by a predominance of periphrastic verbal-noun constructions at the expense of forms of the finite verb. By this time, too, the forms corresponding to other Celtic and Indo-European present-tense forms had largely acquired future meaning; *e.g.,* Welsh *nid â* "he will not go" (future) contrasts with Irish *ní aig* "he does not drive" (present). The gap thus left was filled, as in Scottish Gaelic and Manx, by a construction involving the substantive verb and the verbal noun; *e.g., y mae'r wraig yn myned* "the woman goes" or "the woman is going" is composed of the verb *mae* "is" and the verbal noun *myned* "going."

By the 14th century, prose and verse styles became more similar, the prose being less colloquial and the verse less archaic. This marks the beginning of modern literary Welsh, which was finally fixed by the Bible translation of 1588. Modern literary Welsh developed at a time when Welsh national identity was beginning to be seriously threatened by the close relations with England that followed on the accession of the Welshman Henry Tudor (Henry VII) to the English throne in 1485. Welsh was being written less and less, and the spoken language was being penetrated by English words. In 1536, the Act of Union deprived Welsh of its official status. By the beginning of the 18th century, the position of the Welsh language had fallen very low, though it was still the vernacular of the vast majority of the people. It was saved by the Methodist revival of the 18th century, which established schools everywhere to teach the people how to read the Welsh Bible and which brought the Bible itself, together with Welsh religious books, into almost every home. The literary language rejected most of the English loanwords that had come into the popular speech, and, by the 19th century, a highly literate Wales was equipped with reading material of every kind in the Welsh language. Meanwhile, however, the popular speech diverged further from the fixed literary norm, which was never spoken except in the pulpit or on the platform. Modern Wales has a literary language that no mother speaks to her child and widely differing dialects that appear in print only to represent dialogue in stories and novels.

Effect of the 18th-century Methodist revival on Welsh

The Industrial Revolution of the 19th century first undermined the dominance of Welsh in Wales: English-speaking workers were brought into the mines and factories in such numbers that they could not be absorbed linguistically. By 1901 English speakers outnumbered Welsh speakers for the first time. Out of a population of 2,012,876, only 929,824 were reported as Welsh-speaking, though 280,985 people spoke Welsh alone. By the early 1980s the number of Welsh speakers had dropped to about 395,000, representing about 14 percent of an increased population. Most of rural Wales, however, is still Welsh speaking, and recent years have seen a great improvement in the official status of Welsh and a considerable increase in its use in the schools; it is certainly the most firmly rooted of the modern languages of Celtic origin.

In addition, there are still about 8,000 Welsh speakers in parts of Patagonia, Argentina, which was colonized by Welsh settlers in 1865. These people maintain cultural contacts with the homeland but are all bilingual in Welsh and Spanish and seem fated to final assimilation.

Breton. Breton disappeared from sight after the early period, and no literary texts are available until the 15th century. These, mainly mystery plays and similar religious material, are written in a standardized language that is by now completely differentiated from Welsh and, to a lesser degree, from Cornish. The divergence between Breton and Cornish is largely a matter of the English loanwords in Cornish and the French loanwords in Breton. The present tense was retained in its original function, whereas a future and conditional were formed from the present and past subjunctive, respectively. Later, the Breton dialects became written and showed considerable divergencies in this form. Not until the 1920s was an attempt at standardization made, and even then it was necessary to adopt two norms. One was called KLT, from the initials of the Breton names of the dioceses of Cornouaille, Léon, and Trĕguier, the dialects of which agree with Welsh and Cornish in having the stress accent on the next to the last syllable. The other norm was the dialect of Vannes in the south, which has the stress accent on the final syllable and many other distinctive features, at least some of which can be explained by its close contacts with French. More recently, two norms have been evolved to cover all four

Breton dialect norms

dialects; one of these is used by most writers, whereas the other is officially recognized by the universities of Brest and Rennes, in both of which Breton is taught.

Up until recently, Breton was the common language of the people in Cornouaille, Léon, Tréguier and Vannes, within the boundaries of the *départements* of Côtes-du-Nord, Finistère, and Morbihan. Breton may still have more speakers than Welsh, but this is quite uncertain because no language statistics exist for France. There is, however, general agreement that very few children today are being brought up speaking Breton. This is at least partly the result of French official policy, which in effect excludes the language from primary and secondary schools, though the poor economic opportunities in Brittany also play a part. The literary movement is, therefore, confined to an intelligentsia of perhaps not much more than 10,000 people, many of whom live outside Brittany. The overwhelming mass of the remainder of Breton speakers are literate only in French, and chances for the survival of Breton seem very poor.

Cornish. Like Breton, Cornish had no literary texts before the 15th century. Those that exist are mainly mystery plays, some of which are almost literal translations from English. Cornish is much closer in structure to Breton than to Welsh, but it has also been heavily influenced by English. At the beginning of the 18th century, there were still a number of areas in which Cornish was spoken, but it died out as a means of communication by the end of the century. (D.Gr.)

Baltic languages

The Baltic languages form a branch of the Indo-European language family and are more closely related to Slavic, Germanic, and Indo-Iranian (in that order) than to the other branches of the family. They comprise modern Lithuanian and Latvian (Lettish), the languages of the Balts inhabiting the eastern coast of the Baltic Sea, as well as the now extinct Old Prussian language, Yotvingian (also spelled Yatvingian, Jotvingian, Jatvingian), Curonian (Kurish), Semigallian, and Selonian (Selian); the speakers of this group are here referred to as the B-Balts. There also existed languages and dialects of the Balts (D-Balts) who lived east of the above-mentioned groups in the areas of the upper reaches of the Dnepr River.

Languages of the group. Because its dialects are more archaic in their forms than those of the other living Indo-European languages, Lithuanian is of particular importance in the study of comparative Indo-European linguistics. The language had 2,760,000 speakers in Lithuania in the early 1980s and several thousand speakers in Belorussia and Poland, and until 1945 there were several thousand Lithuanians in East Prussia as well. More than 675,000 Lithuanians live abroad, mostly in the United States. Lithuanian is sharply divided into dialects whose differences are quite marked. The two major ones are Low (or Western) Lithuanian, with three subdialects, and High (or Eastern) Lithuanian, with four subdialects. The Low dialect is spoken by the Lowlanders, who live in the west and along the Baltic Sea; High Lithuanian is spoken by the Highlanders, who live in the eastern (and greater) part of Lithuania. Standard Lithuanian, formed at the end of the 19th and the beginning of the 20th century, is based on the southern subdialect of West High Lithuanian.

Lithuanian, most archaic living Indo-European language

The language most closely related to Lithuanian is Latvian, spoken by 1,344,000 speakers in Latvia in the early 1980s and about 156,000 abroad, mostly in the United States. Latvian is divided into dialects, the major ones being the Central dialect, Livonian (also called Tahmian, or West Latvian), and High (or East) Latvian. Standard Latvian, established at the end of the 19th and the beginning of the 20th century, is based on the Central dialect.

Extinction of several Baltic languages

By the 16th century the Selonians, Semigallians, and Curonians (Kurs), who lived in areas of Latvia and Lithuania, had completely lost their national identities and were assimilated by the Latvians and the Lithuanians. They left no written records. Nor did the Yotvingians (or Suduvians), who lived in southwest Lithuania and farther to the south (in the territory of the present-day Poland). They became extinct around the 16th–17th century, being assimilated by the Lithuanians in the north and the Slavs in the south. Information on the extinct Baltic languages is extremely scarce (mostly place-names). Only Old Prussian, of all the extinct Baltic languages, left any written records, and they are quite poor. The Prussians lived in East Prussia (*i.e.,* between the lower reaches of the Vistula and Neman [Lithuanian Nemunas] rivers on the Baltic coast). They became extinct (*i.e.,* were assimilated by the Germans) at the beginning of the 18th century.

Linguistically, the Yotvingians were very closely related to the Prussians. They made up one ethnic Baltic group, commonly called the Western Balts, as opposed to the so-called Eastern Balts—the Lithuanians, Latvians, Selonians, Semigallians, and Curonians. The traditional terms Western Balts and Eastern Balts are inaccurate when used for all of the Balts—*i.e.,* including the Balts for whose languages there are no records (the D-Balts). These Balts, who were assimilated by Slavs in the 7th–14th century, lived in the upper reaches of the Dnepr.

Historical survey. Proto-Baltic, the ancestral Baltic language from which the various known languages evolved, developed from the dialects of the northern area of Proto-Indo-European. These dialects also included the Slavic and Germanic protolanguages (and possibly also Tocharian). The quite close historic relationship of the Baltic, Slavic, and Germanic languages is shown by the fact that they alone of all the Indo-European languages have the sound *m* in the dative plural ending (*e.g.,* Lithuanian *vĩlká-m-s* "wolf," Common Slavic **vilko-m-ŭ*, Gothic *wulf-am*). (An asterisk [*] indicates that the following sound or word is unattested and has been reconstructed as a hypothetical linguistic form.) This relationship is suggested not only by the morphology and word formation but also by the vocabulary—*e.g.,* Lithuanian *draũgas* (Latvian *dràugs*) "friend," Old Church Slavonic *drugŭ,* Gothic *driugan* "to fulfill military service"; Lithuanian *vãškas* (Latvian *vasks*) "wax," Russian *vosk,* Old High German *wahs.* Probably the earlier close contact of the Balts and the Slavs with the Germanic tribes broke off around the 2nd millennium BC, when the Balts moved from the south (not, however, losing contact with the Slavs) and settled a large area of the eastern coast of the Baltic Sea and the upper reaches of the Dnepr.

Features common to Baltic, Slavic, and Germanic

Relationship between Baltic and Slavic. Because contact between the Balts and Slavs from the time of Proto-Indo-European was never broken off, it is understandable that Baltic and Slavic should share more linguistic features than any of the other Indo-European languages. Thus, Indo-European **eu* passed to Baltic *jau* and Common Slavic **jau* (which became *ju*)—*e.g.,* Lithuanian *liáudis* "people," Latvian *ļáudis,* Old Church Slavonic *ljudije.* Tonal correspondences are found between Lithuanian and Serbo-Croatian (a Slavic language of Yugoslavia), and there are also similarities in stress; *e.g.,* Lithuanian *dũmai* "smoke" and Russian *dym* have the stress on the root, as do Lithuanian *rañką* "hand" (accusative singular) and Russian *rúku,* while both Lithuanian *rankà* "hand" (nominative singular) and Russian *ruká* are stressed on the second syllable.

Baltic and Slavic have specific morphological features in common. Among them, for example, is the genitive plural form. In Lithuanian, *mũsų* "of us" (= Latvian *mūsu*), evolved from the older form **nūsōn,* which comes from Baltic **nōsōn* and corresponds to the genitive plural form in Common Slavic, **nōsōn,* from which developed Old Church Slavonic *nasŭ* "of us." Baltic also shares some syntactic features with Slavic; *e.g.,* the genitive case is used in place of the accusative with verbs expressing negation (Lithuanian *jis* nieko *nežino* "he does not know anything," Latvian *viņš* nekā *nezin,* Russian *on* ničego *ne znajet*). There are also many lexical items common to Baltic and Slavic. More than 100 words are common in their form and meaning to Baltic and Slavic alone, among them Lithuanian *bėgu* "I run," Latvian *bēgu,* Old Church Slavonic *běgǫ;* Lithuanian *líepa* "linden tree," Latvian *liẽpa,* Old Prussian *lipe,* Old Church Slavonic *lipa;* Lithuanian *rãgas* "horn," Latvian *rags,* Old Prussian *ragis,* Old Church Slavonic *rogŭ.*

In addition to these features common to all the Baltic and Slavic languages, there are certain quite archaic features that Slavic has in common with Lithuanian and Latvian but not with Old Prussian. The most striking example is the genitive singular ending in Lithuanian *viĺk-o* = Latvian *vìlk-a* "of a wolf," which comes from Baltic **-ō,* historically paralleled by the genitive singular ending in Common Slavic **vĭl̃k-ā*. Old Prussian, however, has a different ending for the same inflection (*deiw-as* "of God"). In certain instances the Slavic languages, differing from Lithuanian and Latvian, come closer to Old Prussian; *e.g.*, the Prussian possessive pronouns *mais* "my, mine," *twais* "your, yours," *swais* "one's own" are different from Lithuanian *mãnas, tãvas, sâvas* and from Latvian *mans, tavs, savs* but similar to Old Church Slavonic *mojĭ, tvojĭ, svojĭ*.

It is possible to conclude that there was close contact between the Baltic and Slavic protolanguages at the time when they began to develop as independent groups (*i.e.*, from about the 2nd millennium BC) and that the Proto-Slavic area might have been a part of peripheral Proto-Baltic, although a specific part. That is, Proto-Slavic at that time was in direct contact with both the corresponding dialects of the peripheral Proto-Baltic area (*e.g.*, with Proto-Prussian) and the corresponding dialects of the central Proto-Baltic area. All this shows that the Proto-Slavic area of that time (south of the Pripyat River) was much smaller than the Proto-Baltic area. Proto-Slavic began to develop as a separate linguistic entity in the 2nd millennium BC and was to remain quite unified for a long time to come. Proto-Baltic, however, besides developing into an independent linguistic unit in the 2nd millennium BC, also began gradually to split. Among other things, the size of the Proto-Baltic area had an influence on the development of Proto-Baltic in that it considerably reduced contact between its dialects (see also *Slavic languages*).

Development of the individual Baltic languages. By the middle of the 1st millennium BC, the Proto-Baltic area was already quite sharply split into dialects. From the middle of the 1st millennium AD, the Baltic language area began to become considerably smaller; at that time the greater part of Baltic territory, the eastern part, began to be inhabited by Slavs migrating from the south. The Balts there became gradually assimilated by the Slavs; complete assimilation probably occurred around the 14th century. One of these Baltic tribes, the Galindians (Goljadĭ), is mentioned in a chronicle as late as the 12th century. The protolanguage of the so-called Eastern Balts split into Lithuanian and Latvian (Latgalian) around the 7th century. The other languages of the so-called Eastern Balts became separated probably at the same time. Selonian and Semigallian could have been transitional languages between Lithuanian and Latvian. Only Curonian, which some consider to be a transitional language between East and West Baltic, might have developed somewhat earlier. Moreover, the name of the Curonians occurs in historical sources earlier (AD 853: Latin Cori) than the names of the other tribes of the so-called Eastern Balts.

Split between Lithuanian and Latvian

Old Prussian. In historical sources the Prussians are called Aistians from the 1st century AD (by Tacitus) until the 9th century AD (by the Anglo-Saxon seafarer Wulfstan). They are referred to by their own name (by a Bavarian geographer using the form Bruzi, "Prussians") for the first time in the 9th century AD. About 1230 the Teutonic Order began to plunder the lands of the Prussians and finally conquered the Prussians and the Yotvingians (Suduvians) in 1283. From that time the slow extinction of the two Baltic groups began, with the Germanization of the Prussians being completed at the beginning of the 18th century.

The earliest Old Prussian (and, for that matter, Baltic) written record is a German–Prussian vocabulary—the so-called Elbing vocabulary, compiled about 1300 and extant in a copy dated around 1400. This vocabulary, consisting of 802 Old Prussian words (and the same number of German words), was written in a South Prussian dialect (in Pomesania). Somewhat poorer than the Elbing vocabulary is the vocabulary compiled by Simon Grunau, consisting of 100 Old Prussian (and German) words, written between 1517 and 1526. The most important Old Prussian written records are the three catechisms of the 16th century based on the dialects of Sambia and translated from the German; the first two catechisms, which are very short and anonymous, date from 1545, and the third catechism, or *Enchiridion,* dates from 1561 and was translated by Abelis Vilis (Abel Will), a pastor of the church at Pobeten (Pabečiai; modern Romanovo). The language of all the Old Prussian catechisms is rather poor: the translations are excessively literal, and there are many errors in language and orthography. In spite of this, it is from these Old Prussian catechisms that scholars can learn most about the Old Prussian language.

Lithuanian. Lithuanians are first mentioned in historical sources in AD 1009. Old Russian (more precisely, an East Slavic language based primarily on Belorussian), Latin, and Polish were used in official matters in the Grand Duchy of Lithuania, which was established in the mid-13th century and lasted until the 18th century. Lithuanian writings begin to appear in the 16th century, first in East Prussia (where many Lithuanians lived) and, somewhat later, in the Grand Duchy of Lithuania. In East Prussia, a quite uniform written Lithuanian language, based on the West High Lithuanian dialect, had already been established by the second half of the 17th century. In Lithuania, however, a uniform written Lithuanian came into use only at the end of the 19th and the beginning of the 20th century—*i.e.*, when a standard Lithuanian language, based on the (Southern) West High Lithuanian dialect (spoken in both East Prussia and Lithuania), was established. Martynas Mažvydas (died 1563), who published the first Lithuanian book (a catechism) in Königsberg (Lithuanian Karaliaučius; modern Kaliningrad) in the year 1547, is purported to be the first person to use Lithuanian as a written language. Others, in particular Baltramiejus Vilentas, Jonas Bretkūnas, and the pastor-poet Kristijonas Donelaitis, also took part in the formation and standardization of a written Lithuanian language in the 16th–18th century in East Prussia. Great influence was exerted by the first grammars of Lithuanian, by Danielius Kleinas (1653 and 1654), and the works of Donelaitis (1714–80), the first Lithuanian writer to become well known. In the Grand Duchy of Lithuania the first to use Lithuanian as a written language is held to be Mikalojus Daukša (died 1613), who published a catechism in 1595 and a prayer book (*Postilė*) in 1599. Among later writers who helped to standardize written Lithuanian were Konstantinas Sirvydas, who prepared the first dictionary of Lithuanian (1629), Jonas Jaknavičius (1598–1668), and Saliamonas Slavočinskis (17th century). The works of Daukša and Sirvydas in particular, based on the Middle and East High Lithuanian dialects, did much toward establishing the practice of drawing on the various dialects in the creation of a written Lithuanian. This tradition became weakened in the 18th century but was again revived at the beginning of the 19th, when the formation of a standard Lithuanian was undertaken. The practice became most apparent at the end of the 19th and the beginning of the 20th century, during the establishment of Standard Lithuanian. The process of the mixing and levelling of the Lithuanian dialects started at the beginning of the 20th century because of the influence of a standard language, and it was especially intensified after the creation of the Lithuanian Soviet Socialist Republic in 1940. Standard Lithuanian is the official language of the Lithuanian S.S.R., as it was of the Republic of Lithuania (from 1918).

Establishment of uniform written Lithuanian

Latvian. The Latvian (Latgalian) people achieved a separate identity around the 16th century AD, when they completely assimilated the other Balts, as well as a greater part of the Livs (also called Livonians, Livians), who are of Finnic descent and live on Latvian territory. As a result of the conquering of Latvian territory by the German Knights of the Sword by 1290, close contact between all of the so-called Eastern Balts (the Latvians with the Lithuanians as well) was considerably weakened for a long period of time. The first Latvian book was the *Catechismus Catholicorum* of 1585. In 1638 the first Latvian (–German) dictionary, by Georgius Mancelius, appeared; the first grammar of the Latvian language, by Johann Georg Rehehausen, was published in 1644; and a Latvian translation of the Bible was published in 1685. The Latvian writings of the 16th–

Early Latvian books

18th century are translations of religious works, as are the Lithuanian. The language of these Latvian works, however, is somewhat poorer than that of the Lithuanian writings of the same period. The works of the Latvians Juris Alunāns (1832–64) and Atis Kronvalds (1837–75) exerted a great influence on the development of a standard Latvian language, based on the Central dialect, at the beginning of the 19th century. Standard Latvian was finally established at the end of the 19th and the beginning of the 20th century, and the levelling influence of this standard language on the Latvian dialects began at this time. Standard Latvian is the official language of the Latvian S.S.R.

Characteristics of the Baltic languages. All of the Baltic languages are inflected. Old Prussian is the most archaic of the recorded Baltic languages (although it also has innovations of its own), and it differs considerably from Lithuanian and Latvian.

Old Prussian. In contrast to Lithuanian and Latvian, Old Prussian retained the Baltic diphthong *ei*—Old Prussian *deiws* "God," Lithuanian *diẽvas,* Latvian *dìevs;* Old Prussian *deinan* "day" (accusative singular), Lithuanian *dienà,* Latvian *dìeņa.* In place of Lithuanian *š* and *ž* (from Indo-European **ḱ, *ǵ,* and **ǵh*), however, Old Prussian, like Latvian (as well as Curonian, Semigallian, and Selonian), has *s* and *z*—thus, Old Prussian *assis* "axle," Latvian *ass,* Lithuanian *ašìs;* Old Prussian (*po*)*sinnat* "to confess," Latvian *zināt,* Lithuanian *žinóti* "to know." The cluster $s+j$ (and $z+j$) in Old Prussian, as in Latvian, passed to *š* (and *ž*): Old Prussian *schan* (from **sjan*) "this" (accusative singular feminine), Latvian *šùo* "this," Lithuanian *šią.* In contrast to Lithuanian and Latvian, Old Prussian did not replace the clusters $t+j$ and $d+j$ with affricate sounds (begun with complete stoppage of the breath stream from the lungs and released with incomplete closure and friction): Old Prussian *median* "forest," Lithuanian *medžias,* Latvian *mežs.*

Word stress was free in Old Prussian, as it is in Lithuanian (in contrast to Latvian, in which the stress is predictable and falls on the first syllable). Old Prussian also made use of intonations (tones), the character of which is similar to that of the Latvian (*i.e.,* more archaic than that of Lithuanian intonations). The Proto-Baltic circumflex intonation corresponds to the falling tone in Old Prussian, while the acute intonation corresponds to the rising tone.

Old Prussian morphology

Old Prussian, moreover, had a substantive neuter gender, lost by Lithuanian and Latvian: Old Prussian *assaran* "lake," Lithuanian *ẽžeras,* Latvian *ezer̃s;* Old Prussian *lunkan* "bast," Lithuanian *lùnkas,* Latvian *lūks.* It differs in morphology from Lithuanian and Latvian in more than one instance—*e.g.,* in the genitive singular ending, Old Prussian *deiw-as* "of God" (Lithuanian *diev-o* = Latvian *diev-a*) and, in the dative singular, Old Prussian *tebbei* "to you" (Lithuanian *tavi* = Latvian *tev*), among others. Old Prussian did not have the dual number, only the singular and plural. Nouns were declined according to seven types. There were five cases: nominative, genitive, dative, accusative, and vocative. All verbs had three separate forms in the plural, but not in the singular. The 3rd person was the same in both the singular and the plural. There were three tenses: present, preterite, and future.

In vocabulary Old Prussian is quite similar to Lithuanian and Latvian (closer to Lithuanian than Latvian). It should be emphasized, however, that Old Prussian differs from Lithuanian and Latvian in that it retained a greater number of archaisms than either.

Comparison of Lithuanian and Latvian. The differences between Lithuanian and Latvian can be summarized in very broad terms by saying that Lithuanian is far more archaic than Latvian and that modern written Lithuanian could in many instances serve as a "protolanguage" for it. For example, Lithuanian has quite faithfully preserved the old sound combinations *an, en, in, un* (the same is true of Old Prussian, Curonian, Selonian, and, possibly, Semigallian), while they have passed in every case to *uo, ie, ī, ū* in Latvian; thus, Lithuanian *rankà* (Old Prussian *rancko*) = Latvian *rùoka* "hand," Lithuanian *peñktas* (Old Prussian *penckts*) = Latvian *piekt*(*ai*)*s* "fifth," Lithuanian *pìnti* = Latvian *pīt* "to weave, to twine," and Lithuanian *jùngas* = Latvian *jūgs* "yoke." The diphthongs *ei* (as well as *ai*) and *au* in final position were monophthongized and later shortened in Latvian—*e.g.,* Lithuanian *ved-eĩ* (2nd person singular preterite) = Latvian **ved-ie,* which became *ved-i* "you led"; Lithuanian *med-aũs* = Latvian **med-uos,* which became *med-us* "of honey." Long vowels at the end of polysyllabic words have been shortened in Latvian, and short vowels have been dropped—*e.g.,* Latvian *sak-a* "says" (which derives from **-ā*) = Lithuanian *sãk-o,* Latvian *pel-e* "mouse" (from **-ē*) = Lithuanian *pel-ẽ,* Latvian *vìlk-u* "wolf" (from **-uo*) = Lithuanian *vil̃k-ą,* Latvian *daikts* "thing" (from **-ăs*) = Lithuanian *dáiktas,* and Latvian *nakts* "night" (from **-ĭs*) = Lithuanian *naktìs.* Palatalized *k* and *g,* formed with the blade of the tongue closer to the hard palate than nonpalatalized *k* and *g,* were retained in Lithuanian (as in Old Prussian and Semigallian) but changed to *c* (pronounced like *ts*) and *dz* in Latvian (as in Selonian and Curonian): Lithuanian *ãkys* "eyes" (Old Prussian *ackis*) = Latvian *acis,* and Lithuanian *gérvė* "crane" (Old Prussian *gerwe*) = Latvian *dzer̃ve.* The change of the old clusters $t+j$ and $d+j$ progressed further in Latvian. Most Lithuanian dialects have *č* (as *ch* as in "church") and *dž* (as *j* in "jam"), whereas Latvian has *š* (as *sh* in "shore") and *ž* (as *z* in "azure")—*e.g.,* Lithuanian *trẽčias* = Latvian *trešs* "third"; Lithuanian *bríedžai* = Latvian *briẽži* "elks." Another difference between Lithuanian and Latvian is that, instead of Lithuanian *š* and *ž,* Latvian (like Selonian, Semigallian, Curonian, and Old Prussian) has *s* and *z* sounds—*e.g.,* Lithuanian *širdìs* = Latvian *sirds* "heart"; Lithuanian *žiemà* = Latvian *zìema* "winter." Proto-Latvian (and Prussian) $s+j$ and $z+j$ have passed to *š* and *ž*: Latvian *šũt* "to sew" = Lithuanian *siũti;* Latvian *eža* "of a hedgehog" (from Latvian **ezjā*) = Lithuanian *ežio.* Lithuanian has retained the initial clusters *pj* and *bj,* which in Latvian (and similarly in Slavic) have passed to *pļ* and *bļ*—*e.g.,* Lithuanian *piáuti* (*pi* is pronounced as *pj*) = Latvian *pļaũt* "to cut"; Lithuanian *biaurùs* = Latvian *bļaũrs* "hideous, nasty."

Stress and tone in Lithuanian and Latvian

Lithuanian has a free stress in contrast to Latvian fixed stress, which occurs on the first syllable. Latvian is more archaic than Lithuanian in the intonations inherited from Proto-Baltic: the Proto-Baltic circumflex intonation has preserved its falling character in Latvian (it became rising in Lithuanian), and the Proto-Baltic acute intonation retained its rising character (it is falling in Lithuanian), although in some cases (because of stress retraction) it has been changed to the broken intonation; *e.g.,* Latvian *pìrsts* "finger" = Lithuanian *pir̃štas* (falling in Latvian and rising in Lithuanian from the Proto-Baltic circumflex), Latvian *vãrna* "crow" = Lithuanian *várna* (the rising or extended intonation in Latvian and the falling intonation in Lithuanian from the Proto-Baltic acute intonation), Latvian *zâle* "grass" (the Latvian broken intonation from the Proto-Baltic acute intonation through stress retraction).

There are really no differences in the older morphological features between Lithuanian and Latvian if one does not take into account innovations such as the Latvian debitive verb form (*man ir jāmācās* "I must study" or "it is necessary for me to study") and the Lithuanian frequentative past (*jie eidavo* "they used to go"). Lithuanian and Latvian have two grammatical genders (masculine and feminine) and two numbers (singular and plural), while some Lithuanian dialects also have the dual number. Both Lithuanian and Latvian have seven cases—nominative, genitive, dative, accusative, instrumental, locative, vocative. Standard Lithuanian has five declensions of nouns with 12 inflectional types; Latvian has six declensions with eight inflectional types. Lithuanian adjectives have three declensions, Latvian adjectives have one. The comparison of adjectives in the two languages is different. Both Lithuanian and Latvian have indefinite adjectives (Lithuanian *mãžas,* masculine, *mažà,* feminine, "a small one" = Latvian *mazs, maza*) and definite adjectives (Lithuanian *mažàsis, mažóji* "the small one" = Latvian *mazais, mazā*) with their own specific inflection. The verb in Lithuanian and Latvian has three conjugations (genetically different). There are three persons, the third of which is the same (apparently from the time of Proto-Indo-European) in both the singular and the plural (as well as the dual); for example:

Lithuanian		Latvian
Singular		Singular
1. *kertù*	("I cut, I strike")	1. *certu*
2. *kertì*	("you cut, you strike")	2. *certi*
3. *ker̃ta*	("he cuts, he strikes")	3. *cert*
Plural		Plural
1. *ker̃tame*	("we cut, we strike")	1. *certam*
2. *ker̃tate*	("you cut, you strike")	2. *certat*
3. *ker̃ta*	("they cut, they strike")	3. *cert*

Verb forms

The verb in Lithuanian and Latvian has three tenses (present, preterite, future)—*e.g.,* Lithuanian *kertù,* Latvian *certu* (present); Lithuanian *kirtaũ,* Latvian *cirtu* (preterite); Lithuanian *kir̃siu,* Latvian *ciršu* (future). In contrast to Latvian, Lithuanian also has a frequentative past tense—*e.g., kir̃sdavau* "I used to cut, strike." Lithuanian and Latvian have many compound tense forms, compounded from the forms of the verb *būti* "to be" and participles. There are several moods in both languages, although they are different. The system of participles (active and passive) in Lithuanian and Latvian is quite similar, although complicated—*e.g.,* Lithuanian *kertą̃s,* Latvian *certuošs* (present active); Lithuanian *ker̃tamas,* Latvian *certams* (present passive). Lithuanian and Latvian sentence word order is quite free, and, in general, the syntax of both languages is quite similar.

Words are formed in Lithuanian and Latvian basically by means of suffixes, prefixes, and compounding. The languages are very similar in their early vocabulary, and the differences that do occur tend to be more of a semantic nature—*e.g.,* Lithuanian *mṓša* "husband's sister" = Latvian *māsa* "sister"; Lithuanian *žam̃bas* "corner, angle (acute)" = Latvian *zùobs* "tooth." Some older lexical differences do occur, however (*e.g.,* Lithuanian *kraũjas* = Latvian *asins* "blood"; Lithuanian *sūnùs* = Latvian *dēls* "son"). In the newer vocabulary, there are now many differences between Lithuanian and Latvian.

Loanwords in Baltic. The Baltic languages have loanwords from the Slavic languages (*e.g.,* Old Prussian *curtis* "hunting dog," Lithuanian *kùrtas,* Latvian *kur̃ts* come from Slavic [*cf.* Polish *chart*]; Lithuanian *muĩlas* "soap" [*cf.* Russian *mylo*]; Latvian *suods* "punishment, penalty" [*cf.* Russian *sud*]). There are also a few loanwords from Gothic (*e.g.,* Old Prussian *ylo* "awl," Lithuanian *ýla,* Latvian *īlens*) and possibly from Scandinavian, and many from German, especially in Old Prussian and Latvian, as a consequence of the German colonization of the Prussians, Latvians, and, in part, of the Lithuanians in the 13th century.

Relation between the Baltic and Finnic languages

The Balts first came in close contact with their northern neighbours, the Baltic Finns, about 2000 BC. This contact left traces in both the Baltic and the Finnic languages, perhaps most clearly in the vocabulary. Baltic has very few early loanwords from Finnic, but Finnic has many early loans from Baltic. Latvian, with many loanwords from Livian (Livonian) and Estonian (both Finnic languages), has been more influenced by Finnic than has any other recorded Baltic language.

Orthography. The Lithuanian alphabet is based on the roman (Latin) alphabet. It has 33 letters, several employing diacritical marks (*ą, č, ę, ė, į, š, ų, ū, ž*), and is phonetic (*i.e.,* written as it is pronounced). In linguistic literature ′ is used for falling tones, and ~ for rising tones; the grave accent (`) is used for short, stressed vowels. The Latvian alphabet has 33 letters, 11 with diacritical marks: *ā, č, ē, ģ, ī, ķ, ļ, ņ, š, ū, ž.* A macron (-) over a vowel indicates that it is long. In linguistic literature the following accents are used for the Latvian intonations: ` (falling), ~ (extended, or rising), ^ (broken).

The Old Prussian orthography is almost wholly based on the German orthography of that time and is quite inconsistent. Furthermore, every Old Prussian written record has its own specific orthography. (V.J.M.)

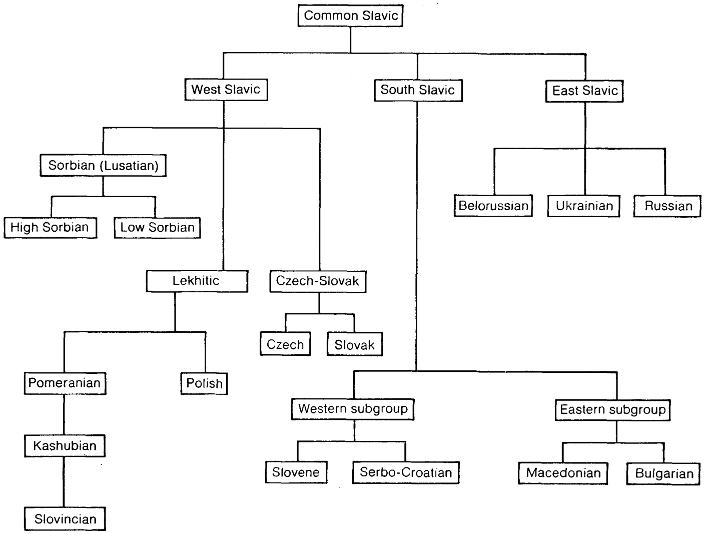
Slavic languages

The Slavic, or Slavonic, languages, constituting a separate branch of the Indo-European language family, are closer to the Baltic languages than to any other Indo-European subgroup, but they share certain linguistic innovations with the other eastern Indo-European languages (such as Indo-Iranian and Armenian) as well. From their original area situated between the Oder and the Dnepr rivers, the Slavic languages have spread to the territory of the Balkans (Bulgarian, Serbo-Croatian), central Europe (Czech and Slovak), eastern Europe (Polish, Ukrainian, Russian), and the northern parts of Asia (Russian). The number of native speakers for the entire branch is about 268,000,000. In addition, Russian is used as a second language by most inhabitants of the Soviet Union. Some of the Slavic languages have been used by writers of worldwide significance (*e.g.,* Russian, Polish, Czech) and the Church Slavonic language is an important means of communication within the Eastern Orthodox Church.

LANGUAGES OF THE FAMILY

Three branches of Slavic

The Slavic language group is divided schematically into three branches: the South Slavic branch, with two subgroups—Serbo-Croatian-Slovene and Bulgarian-Macedonian; the West Slavic branch, with three subgroups—Czech-Slovak, Sorbian, and Lekhitic (Polish and related tongues); and the East Slavic branch, comprising Russian, Ukrainian, and Belorussian.



In the spoken Slavic dialects (as opposed to the sharply differentiated literary languages) the linguistic frontiers are not always apparent. There are several transitional dialects and mixed forms of speech that connect the different languages, with the exception of the area where the South Slavs are separated from the other Slavs by the non-Slavic Romanians, Hungarians, and German-speaking Austrians. But even in this latter domain, some vestiges of the old dialectal continuity (between Slovene and Serbo-Croatian, on the one hand, and Czech and Slovak, on the other) that was later interrupted can be traced; the same traces of the old links are seen in comparing Bulgarian and Russian dialects. Thus the traditional schematic division of the Slavic group into three separate branches is not to be taken as the real model of historical development. It would be more realistic to represent the historical development as a process in which tendencies to differentiate and to reintegrate the cognate dialects have been continuously at work, bringing about the remarkable degree of uniformity in the different dialects. Still it would be an exaggeration to suppose that communication between any two Slavs is possible without any linguistic complications. The myriad differences between the dialects and languages in phonological and phonetic realization as well as in the spheres of semantics and morphology may cause misunderstandings even in the simplest of conversations; and the difficulties are greater in the language of belles lettres, even in the case of closely connected languages. For a Slav to master effectively a second Slavic language demands time and work.

South Slavic. Bulgarian is spoken by more than 8,300,-

000 people in Bulgaria and adjacent areas of other Balkan countries and the Soviet Union. There are two major groups of Bulgarian dialects: an Eastern one that became the basis of the literary language in the middle of the 19th century and a Western one that influenced the literary language. Bulgarian texts prepared before the 16th century were written mostly in an archaic language that preserved some features of Old Bulgarian (10th to 11th centuries) and Middle Bulgarian (beginning in the 12th century).

Although the vocabulary and grammar of the early texts written in the Old Church Slavonic language include some Old Bulgarian features, the language was nevertheless based originally on a Macedonian dialect. Old Church Slavonic was the first Slavic language to be put down in written form, by SS. Cyril and Methodius. The modern Macedonian language, spoken by about 1,500,000 people in Yugoslavia and Greece, was the last Slavic language to attain a standard literary form; during World War II, its central dialects of Prilep and Veles were elevated to this status. The Central Macedonian dialect is closer to Bulgarian, while the Northern dialect shares some features with the Serbo-Croatian language. Modern Macedonian dialects may be considered as links between the Eastern (Bulgarian) subgroup of South Slavic and the Western (Serbo-Croatian) subgroup.

Dialects of Serbo-Croatian

The Western subgroup of South Slavic includes the dialects of Serbo-Croatian, among them those of the Prizren-Timok group, which are close to some North Macedonian and West Bulgarian dialects. The literary Serbo-Croatian language was formed in the first half of the 19th century on the basis of the Shtokavian dialects that extend over the greater part of the Serbo-Croatian territory in Yugoslavia. These dialects are called Shtokavian because they use the form *što* (*shto*) for the interrogative pronoun "what?". They are distinguished from the Chakavian dialects of western Croatia, Istria, the coast of Dalmatia (where a literature in that dialect developed in the 15th century), and of some islands in the Adriatic; in those areas *ča* (*cha*) is the form for "what?". A third main group of Serbo-Croatian dialects, spoken in northwestern Croatia, uses *kaj* rather than *što* or *ča* and is therefore called Kajkavian. In all, more than 18,000,000 people speak Serbo-Croatian.

The Slovene language is spoken by more than 2,000,000 persons in the Socialist Republic of Slovenia in federal Yugoslavia and in the adjacent areas of Italy and Austria. It has some features in common with the Kajkavian dialects of Croatia and includes many dialects with great variations between them. In Slovene (particularly its Western and Northwestern dialects) some traces can be found of old links with the West Slavic languages (Czech and Slovak).

West Slavic. To the West Slavic branch belong Polish and some remnants of other Lekhitic languages (Kashubian and its archaic variant Slovincian), Low and High Sorbian (also called Lusatian or Wendish), Czech, and Slovak. Approximately 40,000,000 people speak Polish in Poland, in some regions of Czechoslovakia and the Soviet Union, and in France, the United States, and Canada. The main Polish dialects are Great Polish (in the northwest), Little Polish (in the southeast), Silesian, and Mazovian. The last dialect shares some features with Kashubian. There are about 210,000 native speakers of Kashubian remaining in Poland on the left bank of the Lower Vistula River. Slovincian belongs to the Northern group of Kashubian dialects, which is distinguished from a Southern group. Kashubian dialects (including Slovincian) are considered to be the remnants of a Pomeranian subgroup that belonged to the Lekhitic group. Lekhitic also included Polabian, which was spoken up to the 17th and 18th centuries by the Slavic population of the Elbe (Labe) River region. (At that time a dictionary and some phrases in the language were written down.)

The Polabian language bordered the Sorbian dialects, which are still spoken by about 140,000 inhabitants of Lower Lusatia and Upper Lusatia in East Germany. There are three main groups of Sorbian dialects: High Sorbian (Upper Sorbian), one of whose dialects in the area of Bautzen (Budyšin) is the basis of the literary language; Low Sorbian (or Lower Sorbian); and East Sorbian, the remnants of which are spoken in the area of Muskau (Mužakow).

Czech is spoken by about 9,800,000 people in the western part of Czechoslovakia (Bohemia, Moravia, and Silesia); its dialects are divided into Bohemian, Moravian, and Silesian groups. The literary language is based on the Central Bohemian dialect of Prague. The Slovak literary language was formed on the basis of a Central Slovak dialect in the middle of the 19th century. Western Slovak dialects are close to Moravian and differ from the Central and the Eastern dialects, which have features in common with Polish and Ukrainian. More than 4,600,000 people speak Slovak; they are located mostly in Slovakia.

Russian, Ukrainian, Belorussian

East Slavic. Russian, Ukrainian, and Belorussian (White-Russian) comprise the East Slavic language group. Russian is the native language of about 139,300,000 people and is widely used by many others in the Soviet Union and in some other eastern European countries. Its main dialects are divided into a Northern Great Russian group, a Southern Great Russian group, and a transitional Central group.

Ukrainian dialects are classified into Northern, Southeastern, Southwestern, and Carpathian divisions (the last group having features in common with Slovak); the literary language is based on the Kiev-Poltava dialect. More than 42,700,000 people speak Ukrainian in the Soviet Ukraine, and there are more than 580,000 Ukrainian speakers in Canada and the United States.

More than 9,600,000 people speak Belorussian in the Belorussian Soviet Socialist Republic. Its main dialectal groups are Northwestern Belorussian, some features of which may be explained by contact with Polish, and Northeastern Belorussian. The dialect of Minsk, which served as a basis for the literary language, lay on the border between these two groups.

HISTORICAL SURVEY

The Slavic protolanguage. Each branch of Slavic originally developed from a dialect of Proto-Slavic, the ancestral parent language of the group, which in turn developed from an earlier language that was also the antecedent of the Proto-Baltic language. Both Slavic and Baltic share with the eastern Indo-European languages (called satem languages) the same change of Indo-European palatialized *ḱ* and *g* sounds (consonants modified by bringing the front of the tongue up to or toward the hard palate) into spirants of the *s* and *z* type (*e.g.*, in Proto-Slavic **s3to* "hundred" contrasts with Latin *centum*, etc.). The Slavic and Baltic branches are distinguished by such innovations as: (1) the change of the old Indo-European syllabic *r, n,* and *m* (which functioned as vowels) to *ir, ur,* and related variants; (2) the same patterns of stress in nouns and verbs; and (3) the same reshuffling of the verbal system to produce two forms of the past tense in *-ā* and *-ē*.

Domain of Proto-Balto-Slavic

Some scholars believe that, after the common Indo-European area had been divided into different dialect zones (approximately after the 3rd millennium BC), a protodialect developed in the Baltic and Slavic areas that had many features peculiar to only these two branches of Indo-European. At the same time this protodialect was connected with certain western Indo-European protodialects called Old European that are identified as the source of a number of river names. The ancient Baltic and Slavic names of rivers (hydronyms), such as the Russian Oka, are of the same type as those found in the central European area. The dialects of the Slavic protolanguage spoken near the Carpathian Mountains in the upper Vistula area may have been part of the intermediate zone situated between the western Indo-European dialects (Germanic, Celtic, Italic, and so on) and the eastern Indo-European ones; in addition to Baltic and Slavic in the north, this intermediate zone included the Indo-European languages of the Balkans (Illyrian, Thracian, Phrygian). The domain of the Proto-Balto-Slavic dialect may have been situated to the east of the Germanic and other Old European dialects, to the north of Ancient Balkanic (including Illyrian), and to the west of Tocharian. The exact geographical borders of the Balto-Slavic domain appear impossible to determine, but they may well have been located in eastern Europe

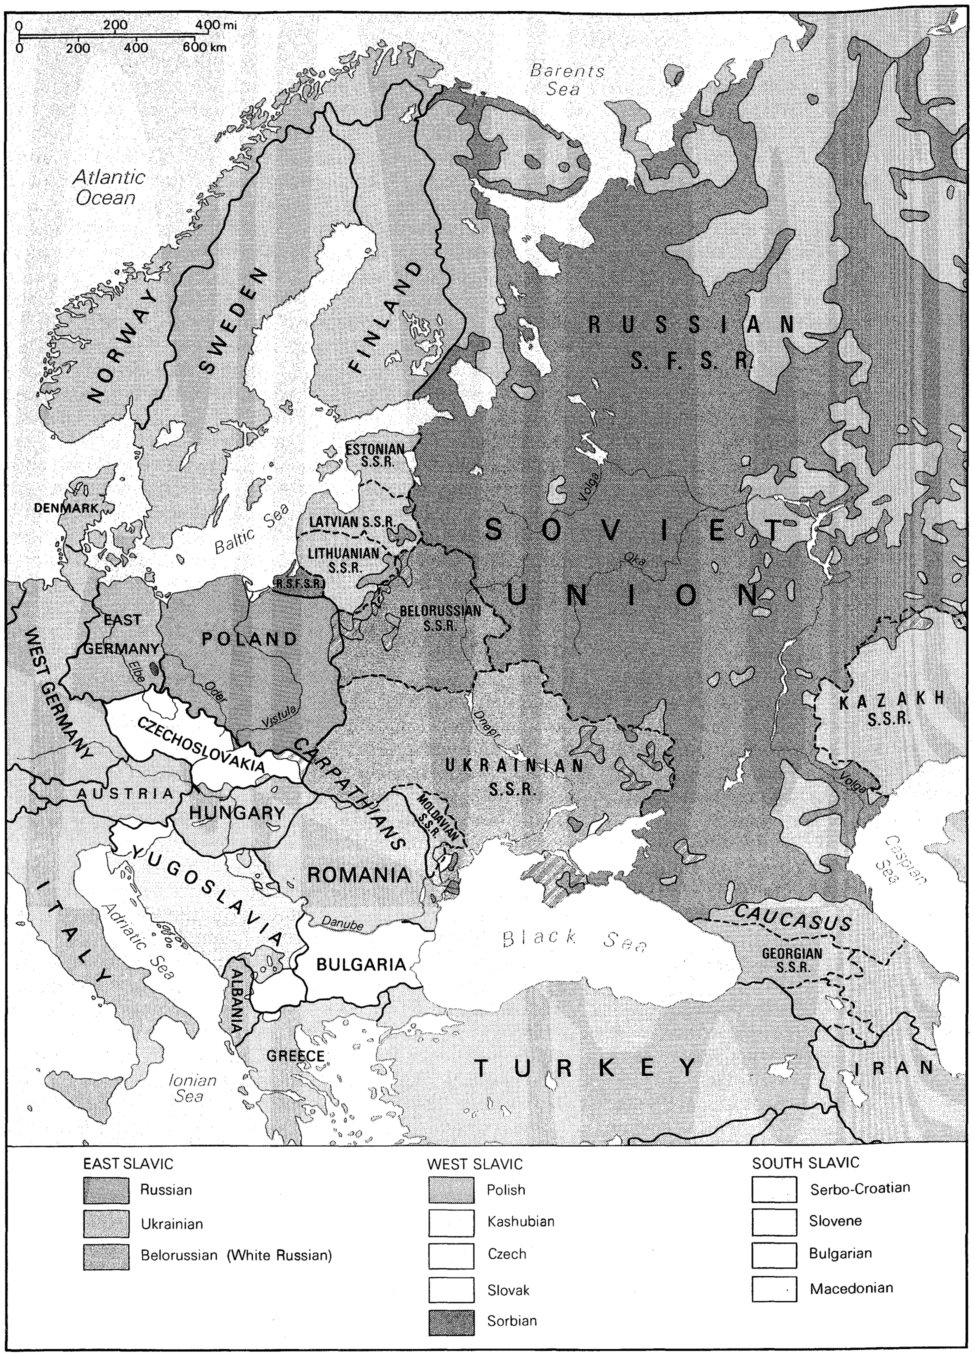


Figure 16: Distribution of the Slavic languages in Europe.

around present-day Lithuania and to the east and south of it. The later diffusion of Slavic languages southward into the Carpathian region may represent the spread of one of the dialects of this Old Baltic domain. The oldest Slavic protolanguage may be described as the result of the historical transformation of the Baltic protolanguage (but not vice-versa).

Until the middle of the 1st millennium AD, the Slavs were known to other people as the inhabitants of the vast territories between the Dnepr and the Vistula. In the 6th century AD the Slavs expanded to the Elbe (Labe) River and the Adriatic Sea and across the Danube River to the Peloponnese. In that period, according to the oldest references of Greek and Latin sources about the Slavs, they were already divided into several groups. The Slavic language, however, was uniform in its phonological and grammatical structure, with important dialectal variations occurring only in the vocabulary. The main phonological difference between the oldest pattern common to Baltic and Slavic and the later one that characterized Slavic alone was that in Slavic all syllables became open (*i.e.*, a syllable could end only in a vowel). Thus, all consonants at the end of a syllable were lost. This led to a reshuffling of most of the inflectional endings.

The next period in Slavic linguistic history began with the loss of the reduced vowels, called *yers* (*jeri*), that resulted from Indo-European short *ĭ* and *ŭ*; this loss caused a wide-ranging change in many words and forms. Although this process was common to all the Slavic dialects, which were still connected with each other at that period, it took place slowly and at different rates in different dialects, beginning in the 10th to the 12th century and expanding from the southwest to the northeast. After the loss of the *yers*, which gave different results in different dialectal groups (see Table 31), the uniformity of the Slavic language area began to disappear, and separate branches and languages emerged. An important clue to the date of the dissolution of Slavic unity is the separate development in different Slavic dialects of the name of the emperor Charlemagne (742–814). This name must have entered into Slavic in the postulated form **korljĭ* ("Karl") before the dissolution took place. Subsequently the proper name became the generic term for "king." The segment *-or-* in the postulated form appears differently in the modern Slavic languages—compare Bulgarian *kral,* Serbo-Croatian *kralj,* Slovene *králj* (*i.e.,* South Slavic *-ra-*), Russian *korol* (*i.e.,* East Slavic *-oro-*), Czech *král,* Polish *król.*

Emergence and early development of the Slavic languages. The separate development of South Slavic was caused by a break in the links between the Balkan and the West Slavic groups that resulted from the settling of the Magyars in Hungary during the 10th century and from the Germanization of the Slavic regions of Bavaria and Austria. Some features common to Slovak and Slovene may possibly have developed before the West-South break.

Disruption between South Slavic and West Slavic groups

The eastward expansion of dialects of Balkan Romanian (a Romance language) led to a break in the connection between the South and the East Slavic groups around the 11th–12th centuries. The history of the Balkan Slavs was closely connected with Byzantium, in contrast to that of the Lekhitic and Sorbian subgroups of the Western Slavs, which was connected with west European culture.

An effort on the part of the Slavs to counteract the influence of the Western Christian Church (which was associated with the German Empire) was the motive behind the introduction of the Old Church Slavonic language into the liturgy in Great Moravia, the first Slavic national state. Founded in the 9th century, Great Moravia united different groups speaking West Slavic dialects. In 863 its prince, Rostislav, invited St. Cyril (Constantine) and his brother St. Methodius to create a national church with a language and writing of its own. Prior to that time some Christian texts in Moravia had been translated into Slavic from Latin (and partly perhaps from Old High German); these have been preserved only in later copies.

The second period in the history of the Old Church Slavonic language (893–1081) occurred in the Bulgarian kingdoms of Symeon (893–927) and Peter (927–969) and in the kingdom of Samuel (997–1014), and was connected with the literary activity of many Bulgarian scholars who translated numerous Greek texts into Slavic and also produced a small number of original works. In the writings of the period of Symeon and Peter, Western (Macedonian) features were substituted for Eastern Bulgarian ones.

Reflection of Old Church Slavonic variants in various manuscripts

Development of the individual Slavic languages. Both the Western (Macedonian) and Eastern (Bulgarian) variants (recensions) of the Old Church Slavonic language are preserved in manuscripts of the 11th century, while the East Slavic (Russian) variant is reflected in the oldest dated Old Church Slavonic manuscript, Ostromir's Evangelium (1056), and in many later texts. The Moravian variant must be reconstructed on the basis of some later texts (such as the Kiev fragments of the beginning of the 11th century) dating from after the break with the Great Moravian tradition. In some documents of the 10th and 11th centuries, the Bohemian variant (sharing some West Slavic peculiarities with Moravian) has been preserved. Several features are common to the Moravian and Bohemian varieties of the Old Church Slavonic language, to the Slovene (Pannonian) variant reflected in the Freising fragments (late 10th century), and to the Croatian Old Church Slavonic tradition that is attested from the 12th century, as well as to the Serbian tradition. All these variants of the Old Church Slavonic language have some peculiarities that are to be explained as the result of the interaction of the original system with that of a local dialect. At about 1000 all Slavic languages were so close to one another that such interaction was possible.

From these local variants of the Old Church Slavonic language that are preserved in the manuscripts of the 10th to the 12th centuries, one should distinguish the later local Church Slavonic languages (Russian, with its different variants; Middle Bulgarian; Serbian, which was replaced by the Russian variant in Serbia in the 18th century; Croatian; and the Romanian variant of Church Slavonic, which was used as a literary and church language of Romania from the 14th to the 18th centuries). From the linguistic point of view, these later Church Slavonic literary languages differ from the earlier varieties in their systems of vowels; the early nasalized vowels were replaced by different later reflexes, and the reduced vowels (*yers*), with the exception of those followed by a syllable containing another *yer,* were generally lost. These changes in the sound pattern were accompanied by changes in vocabulary that were the result of cultural factors.

After the schism between the Eastern (Orthodox) and Western (Roman) Christian churches in the 11th century and the beginning of the Crusades, the Church Slavonic language fell out of use in all West Slavic countries and in the western part of the Balkan Slavic region. The only exception was the renaissance of Croatian Church Slavonic in the 13th century. At the end of the same century, the first Czech verses in the local dialect were written; they were the precursors of the rich poetic literature in the Old Czech language that appeared in the 14th century. The early Czech literary language was marked by the influence of Latin, which had replaced the Bohemian variety of Old Church Slavonic as a literary language.

In the earliest period of its development, the Polish literary language was modelled on the Czech pattern. After the Christianization of Poland, Latin (and later German) loanwords entered the Polish language in their Czech form. The Czech influence is seen in the Polish literary language until the 16th century (the "Golden Age"), when Renaissance tendencies resulted in the creation of texts that had aesthetic merit and were at the same time stylistically close to everyday speech. Later on the Polish literary language was enriched by cross-fertilization with Ukrainian and Belorussian.

In the 16th century in Dalmatia, a rich poetic literature in Croatian was created by poets who were influenced by the Italian Renaissance and who also wrote in Italian and Latin. A Slovene translation of the Bible was published in 1575–84 and Kashubian and Sorbian religious texts were also produced during this period. The comparatively early rise of the West Slavic (and western South Slavic) languages as separate literary vehicles was related to religious and political factors that resulted in the decline of the western variants of the Church Slavonic language.

In contrast, the continuing use of Bulgarian Church Slavonic and different variants of Russian Church Slavonic made it difficult to construct literary languages for Bulgarian and Russian based on everyday speech. Bulgarian texts were written in Bulgarian Church Slavonic until the 16th century. After that the language of the so-called Damaskinar (Damascene) literature was developed, closer to the popular speech; its development, however, was hampered under Turkish rule. Most of the Old East Slavic (Old Russian) literary texts were written in a mixture of Russian Church Slavonic and the Old Russian vernacular language; only a few documents, particularly some parts of the chronicles (annals), are written entirely in Old Russian. The proportion of South Slavic (Church Slavonic) and East Slavic (Old Russian) elements in each text is different depending on its stylistic peculiarities.

Linguistic results of religious schism

In the middle of the 17th century, the old Great Russian variant of the Church Slavonic language in the official Russian Orthodox Church was replaced by a new variant taken from the southwestern East Slavic tradition, a form that incorporated some Ukrainian and Belorussian elements. This development was connected with a split in the Orthodox Russian Church; the Old Believers, who split off from the main body of the church, continued to use the archaic Great Russian variant, while Patriarch Nikon's new variant, based on the southwestern tradition, was adopted by the official church and is used in it to this day. Because the Ukrainian tradition includes many West Slavic elements, this reform, which occurred after the incorporation of the Ukraine into the Russian Empire, was a step in the direction of the Westernization of the Russian language that took place soon after Peter the Great began his attempts to reconstruct and Westernize the whole Russian way of life.

In the 18th and 19th centuries, many waves of loanwords from different Western languages entered the Russian language. While some of the syntactic structures earlier had been formed on Germanic and Latin patterns, many western European semantic characteristics penetrated into the Russian language as a result of the intensive French–Russian bilingualism of the Russian upper classes at the end of the 18th and the beginning of the 19th century. The great Russian literature of the 19th and the early 20th century (up until Tolstoy's death in 1910) created a literary language close to everyday speech, especially to that of the villages. In the official style of Russian, however, Church Slavonic elements still dominate, as can be seen even in general newspaper articles.

The concept of a language that would unite all the Slavs has remained in the back of the Slavic consciousness, not as a real aim but rather as an important symbol. The most interesting attempt to unite different chronological and local Slavic strata was carried out by the Serbian Romantic writer Vuk Stefanović Karadžić. In modern literature one might cite the experiments at unification of Velemir Khlebnikov, a Russian futurist writer, and of the Polish poet Julian Tuwim, who created a Polish–Russian symphony of sounds in some of his poems.

Standardization of the modern Slavic languages. Among the Slavic languages that attained their standard literary form at a later stage in Slavic history than those mentioned above is Ukrainian. It was used in some literary texts in the late 18th century and in turn influenced the language of Gogol, one of the greatest Russian writers of the 19th century, to the extent that the language of some parts of Gogol's early texts may be described as a mixed Russian–Ukrainian dialect. In the 19th century and especially in the first decades of the 20th century, a number of great poets wrote in Ukrainian. The movement toward national liberation led to the introduction of many neologisms into the language, which persisted even after some attempts were made toward the artificial unification of the East Slavic area. After World War I, the Belorussian language became a standard language in the Belorussian Soviet Socialist Republic.

Status of modern Slavic languages

Since World Wars I and II, all of the Slavic languages have acquired the status of either the main language of an independent state (*e.g.,* Bulgarian and Polish) or the language of an autonomous part of a state (*e.g.,* Russian, Ukrainian, and Belorussian in the Soviet Union; Serbo-Croatian, Slovene, and Macedonian in Yugoslavia; Czech and Slovak in Czechoslovakia). Only the minor languages are exceptions: Kashubian is used officially only in some cultural performances, and Low and High Sorbian are now taught in schools in East Germany. The extent of dialectal variation in the different languages ranges from a very great degree in Slovene to a much smaller degree in some areas of such languages as Polish and Russian. Radio and other mass media have been among the main influences leading to linguistic consolidation. Languages like Polish, Czech, and Russian, which have served as a basis for great literatures, have become models for others that are only now being put to literary use (although for such languages as Kashubian and, to some degree, for High and Low Sorbian, the folk literature remains much more important as a model than individual literary works and translations of past centuries).

LINGUISTIC CHARACTERISTICS

A number of distinguishing characteristics set off the Slavic languages from other Indo-European subgroups. On the whole, Slavic auxiliary words tend to be unstressed and to be incorporated into a single phonetic group or phrase with autonomous stressed words. Inflection (*i.e.,* the use of endings, prefixes, and vowel alternations) has persisted as the main method of differentiating grammatical meanings, although to a lesser degree in the nouns than in the verbs because many functions of the noun case endings may also be expressed by prepositions. Verbal categories have retained their complex archaic character. The movable stress pattern common to most South and East Slavic languages has had a profound influence on versification in these languages.

Many linguistic devices found both in the oral tradition and in individual literary works of the different Slavic languages may be traced to common ancestral forms. An exuberant use of diminutives and metaphoric figures marks the Slavic oral tradition. It seems possible to reconstruct a common Proto-Slavic model of the universe as seen through linguistic expression. The main feature of such a model is the recurrence of binary (two-way) contrasts, as is evidenced by such cue words as *bog*Б "god" from "a portion allotted by the gods" and *ne-bog*Б "not having its portion, having bad fortune." Such pairing of opposites bears a striking resemblance to the ancient Iranian dualistic view of the world, a view that evidently influenced the Slavs to a degree not yet fully appreciated.

Influence of other cultures on Slavic vocabularies

As compared with the common Indo-European scheme, the pre-Slavic cultural linguistic heritage seems in some degree simpler, evidently as a result of the loss of direct contact with the Southern civilizations that served as a pattern for pre-Indo-European culture. Later developments were caused largely by western European and Greek (particularly Byzantine Christian) influences and by contacts with eastern cultures, which led to innovations in the vocabularies of the East Slavic and South Slavic languages. In some instances, whole series of designations for objects were borrowed into Russian and other East Slavic languages from eastern sources.

All Slavic languages are synthetic, expressing grammatical meaning through the use of affixes (suffixes and, in verbal forms, also prefixes), vowel alternations partly inherited from Indo-European, and consonant alternations resulting from linguistic processes peculiar to Slavic alone. Although analytical methods of expressing grammatical meanings (through prepositions and other "empty" grammatical words) are present in older strata of the language, they are used to the exclusion of all other means only in the case system of Modern Bulgarian and Macedonian. The tendency toward analytic expression is noticeable in contemporary everyday Russian speech, but the drift of the Slavic languages in this direction (as in the development of the western European languages) has been held back by the stabilization of the language resulting from mass communication and education.

Development of palatals, affricates, and spirants

Phonological characteristics. The Slavic systems of distinctive sounds are rich in consonants, particularly in spirants and affricates. This is especially true in comparison with the protolanguage and with other Indo-European languages. The affricates (which are consonant sounds begun as stops, with complete stoppage of the breathstream, and released as fricatives, with incomplete stoppage) have resulted historically from a succession of different processes of palatalization that have occurred in Slavic and are one of the most characteristic features of Slavic phonology. Palatalization is the process whereby the pronunciation of an originally nonpalatal sound is changed to a palatal sound by touching the hard palate with the tongue; it is also the process whereby a nonpalatal sound is modified by simultaneously moving the tongue up to or toward the hard palate. Originally, palatalization was connected with the adaptation of a consonant to the following vowel within a syllable, specifically, with the adaptation of a consonant to a following front vowel. This adaptation gave rise to "soft" (palatalized) syllables, composed of palatalized consonants followed by front vowels. The *j* sound, as *y* in English "year" (from older nonsyllabic Indo-European *i*), tended to palatalize the preceding consonant either by merging with it or by giving rise to consonant groups such as *bl'* from *bj* (*by*). As palatalized stop consonants (for instance *k', g', t', d'*) became increasingly differentiated from the corresponding nonpalatalized series (*k, g, t, d*), the palatalized stops tended to develop further into affricates (with the subsequent development of voiced affricates into spirants). Thus palatalized *k'* before the ancient front vowels developed into the affricate *č* (as *ch* in English "church"), and palatalized *g'* in the same environment changed to ʒ (as *j* in "judge"), which became the spirant sound *ž* (as *z* in "azure") in all Slavic languages. Before front vowels resulting from ancient diphthongs, palatalized *k'* changed to a *ts* sound, written as *c* (*e.g.,* Old Church Slavonic *cěna* "price," Serbo-Croatian *cijèna,* Russian *cena,* cognate to Lithuanian *káina*), and *g'* changed to a *dz* sound, which later changed to *z* (Old Church Slavonic [*d*]*zelo* "very," Old Czech *zielo,* Belorussian *do zěla,* cognate to Lithuanian *gailas*). The sounds *t'* (from *tj*) and *d'* (from *dj*) changed, respectively, into different stops, affricates, and

Table 29: Development of Proto-Slavic *tj, *dj

Proto-Slavic	Old Church Slavonic	South Slavic				East Slavic	West Slavic		
		Bulgarian	Macedonian	Serbo-Croatian	Slovene	Russian	Polish	Czech	High Sorbian
*tj > *t'	št	št	ḱ	ć	č	č	c	c	
*dj > *d'	žd	ǵ	đ	j	ž	ʒ	z		
*svetja "candle"	svešta	svešt	sveḱa	svijeća	sveča	sveča	świeca	svice	sweca
*medja "bound(ary)"	mežda	mežda	meǵa	međa	meja	meža	mieʒa (miedza)	meze	meza

*Indicates an unattested, reconstructed form.

spirants according to special rules in the separate Slavic dialects (see Table 29).

These processes of assibilation of the palatalized velar (*k', g'*) and dental (*t', d'*) sounds happened repeatedly in the history of the individual Slavic languages. Palatalization (softness) as a distinctive feature of most consonant sounds has been preserved in East Slavic; for example, in Modern Russian palatalized (or soft) *t', d', s', z'* contrast with nonpalatalized (or hard) *t, d, s, z.* (The contrast between the palatalized *k'* and the hard *k* is just now in the process of development.) Some West Slavic languages also have this contrast of palatalized and nonpalatalized consonants, while others do not. Czech, Slovak, and Serbo-Croatian, which have the usual three sets of labial, dental, and velar consonants inherited from the protolanguage, have developed a special, additional series of palatal stops. In all of the Slavic languages, voiced stop consonants (pronounced with vibrating vocal cords) contrast with voiceless stop consonants (pronounced without vibrating vocal cords).

Slavic vowel systems

The tendency to increase the number of different spirants (nonstops) is connected with the processes of palatalization. In the Ukrainian and the Southern Russian dialects and in Belorussian, Czech, Slovak, High Sorbian, and some Slovene dialects there also developed a voiced velar spirant sound, corresponding to the voiceless velar spirant of the Proto-Slavic language. The nasal vowels ę and ǫ that had developed in Proto-Slavic from older combinations of vowels with nasal consonants (still retained in Baltic) have been preserved only in some Lekhitic languages and in some South Slavic dialects, especially those of Slovene (see Table 30). The vowel systems are especially rich in those Slavic languages that have preserved prosodic differences in pitch (tone) and quantity (length)—Serbo-Croatian, Slovene, and Northern Kashubian. The reshaping of the Slavic vowel systems is in large measure a result of the loss of the *yers,* which had different effects in different dialects (see Table 31).

Table 30: Development of Proto-Slavic Nasal Vowels Compared with Baltic

English translation	Lithuanian	Serbo-Croatian	Polish	Russian
"I spin"	sprendžiu	prédēm	przędę	pryadu
"snipe, woodcock"	slánka	šljuka	słanka	sluka (obs.)
"soft"	minkštas	mȅk	miękki	myagky
"wise"	mañdras	mȕdar	mądry	mudry

Prosodic differences in vowel quantity have been preserved in Czech and Slovak, in which new vowels developed as a result of contraction. A fixed stress accent is found in the West Slavic languages as well as the Western and Central Macedonian dialects, in contrast to Proto-Slavic, Serbo-Croatian, Slovene, Bulgarian, and the East Slavic languages. In Czech and Slovak, as well as in Sorbian and Southern Kashubian, stress is fixed on the first syllable of the word, but in Polish, Eastern Slovak, and Southern Macedonian, it falls on the next to the last syllable of the word, while in Western Macedonian it falls on the third syllable from the end. The Slavic languages with a nonfixed placement of stress reflect the Proto-Slavic (and Indo-European) distinction between two types of noun and verb paradigms: (1) the paradigm with movable stress in which the stress (indicated here by ′) falls on the root in some forms and on the inflectional ending in others (*e.g.,* "head" in Russian is *golová* in the nominative case and *gólovu* in the accusative, these forms derive from Proto-Slavic **golvá,* **gólvǫ* [an asterisk indicates an unattested, reconstructed form]) and (2) the paradigm in which the stress is fixed on the stem (*e.g.,* "willow" in Russian is *íva* in the nominative case, *ívu* in the accusative, from **íva,* **ívǫ*).

The seven case forms

Grammatical characteristics. Most Slavic languages reflect the old Proto-Slavic pattern of seven case forms (nominative, genitive, dative, accusative, locative, instrumental, vocative), which occurred in both the singular and the plural. In the dual number the cases that were semantically closest to each other were represented by a single form (nominative–accusative, instrumental–dative, genitive–locative). The dual number is preserved today only in the westernmost area (*i.e.,* in Slovene and Sorbian) and in the archaic Slovincian language. The trend toward the modern, more analytical type of construction using prepositions and away from the synthetic type using case endings exclusively (as in Proto-Slavic and the archaic Slavic languages), is evident in the gradual elimination of the use of the dative and locative forms without prepositions. The end result of this development is seen in Bulgarian and Macedonian, in which noun declension has almost completely disappeared and has been replaced by syntactic combinations using prepositions. In the other South Slavic languages and in the western part of the West Slavic area (Sorbian and Czech), the same tendency to lose some of the distinctions between cases may be observed, but to a lesser degree. In the other West Slavic languages and in East Slavic, on the other hand, the old system of declension by case endings has been preserved in spite of the large number of loanwords and other neologisms that have no case distinctions at all (*e.g.,* borrowed Russian nouns like *kino* "cinema," or acronyms ending in a vowel like *Rayono* "district people education department").

The declension of pronouns has been preserved in all Slavic languages. The old combinations of adjectives with pronouns gave rise to the definite forms of adjectives. These forms still contrast with the indefinite forms in South Slavic, but in the other languages the indefinite forms have either been gradually lost or else have been preserved only to serve a special function, that of predicate noun. In Bularian and Macedonian, as well as in some northern East Slavic dialects, an article is used, placed after the noun (*e.g.,* in Macedonian, *knigata* "book-the"). The noun may be combined with either an article, as in the above example, or with a deictic (pointing) pronominal element—*e.g.,* in Macedonian, *kniga-va* "this book here,"

*Pronounced as *v* in genitive endings *-ego* and *-ogo*. †*e* after consonant; *ye* initially or after vowel, **ъ**, or **ь**. ‡o after **ж, ч, ш, щ**; yo elsewhere. §Hard sign; hardens preceding consonant or separates syllables. ‖In transliterating the adjectival endings **-ий** and **-ый**, the first vowel should be omitted. ¶Soft sign; softens or palatalizes preceding consonant or separates syllables.

or *kniga-na* "that book there." In addition to three noun genders (masculine, feminine, neuter), many Slavic languages distinguish animate and inanimate noun forms of some cases; and in some West Slavic languages, Ukrainian, and Bulgarian, personal and nonpersonal noun forms are differentiated.

Verb tenses

In the modern Slavic languages the verb is inflected to show present and past tenses. In the early history of the individual Slavic languages, however, a distinction was made between the aorist (originally differentiated as to voice, as in Baltic and Greek) and the imperfect; this distinction is still preserved in modern South Slavic (with the exception of Slovene) and Sorbian. (The aorist is a verb form indicating the occurrence of an action without reference to its completion, repetition, or duration; the imperfect is a verb tense designating a continuing state or an uncompleted action, especially in the past.) Slavic has almost no traces of the Indo-European old perfect tense, but, from combinations with the verbal noun in *-l*, new perfect forms were created that were differentiated from the pluperfects. Later these perfect forms came to be used as past tense forms in different Slavic languages. The most striking feature of the Slavic verb is the existence of paired stems, one of which expresses the perfective (completed) and the other the imperfective (uncompleted) aspects of the same verb—*e.g.,* Russian *dat* "to give" (*i.e.,* "to complete the process of giving"), *davat* "to be in the process of giving."

The present tense form of a perfective verb may be used to express future meaning, which can also be indicated by other means. In most South Slavic languages it is expressed by combinations (originally syntactic) with the verb "to want." The eastern South Slavic languages, Bulgarian and Macedonian, have lost the infinitive forms of the verb as a result of the influence of non-Slavic Balkan languages. These same Slavic languages have developed verb forms to differentiate between an action witnessed by the speaker and one not witnessed (hence only reported) by him.

A striking feature of Slavic syntax is the widespread use of possessive adjectives (*e.g.,* Russian *bozheskaya milost* "the mercy belonging to God") instead of the genitive case of the noun (*milost boga* "the mercy of God"). Word order in the Slavic languages is characterized by a gradual shift of the verb toward the medial position; originally the initial position was more characteristic. Other important features of Slavic syntax are related to this medial positioning of the verb and the consequent occurrence of the verb before the object. For example, grammatical elements are often placed before nouns; today they follow nouns only in some set phrases like Old Church Slavonic *boga radi* "for God's sake," with *radi* following the noun *boga* "God's."

Originally the verb occupied the initial position, which throws light on the origin of the reflexive verbal forms; these may be traced to the Proto-Slavic combination of the verb with a reflexive pronoun that occurred immediately after the verb and was pronounced as part of one accentual unit with the verb. Words other than pronouns that occurred immediately after verbs were also pronounced as a unit with them (these called enclitics).

The rules for the shift of the stress in syntactic combinations with enclitics were identical for verbs and nouns. Depending on the intonation of the word preceding the enclitic, the stress could be shifted either to the enclitic (as in Bulgarian *zimЪs* "this winter") or to the proclitic or preceding unstressed particle or word (as *na* in Serbo-Croatian *ná brijeg* and Russian *ná bereg* "on the shore").

Vocabulary. The original vocabulary of general terms common to Baltic and Slavic is still retained in most of the Slavic languages. In prehistoric times Proto-Slavic borrowed a number of important social and religious terms from Iranian (*e.g., bogЪ* "God," *mirЪ* "peace"). Later, special terms were borrowed by East Slavic and South Slavic from different eastern languages (especially Turkish) as a result of the political domination of the Tatars in Russia and of the Turks in the Balkan area. After the Renaissance, loanwords were taken from classical and western European languages (especially German and French) into all of the Slavic languages. Church Slavonic in its different variants remained the main source of innovations in vocabulary in East Slavic and in some South Slavic languages. The Slavic languages make extensive use of prefixes and suffixes to derive new words and thereby enrich the vocabulary; *e.g.,* Russian *čern-y* "black," *čern-i-t* "to blacken," *o-čern-i-t* "to slander." Several prefixes may be combined to modify the meaning of a verb (*e.g.,* Ukrainian *po-na-vi-pisuvati,* in which three prefixes are added to the verb "to write" to convey the meaning "to write out copiously"; Bulgarian *is-po-razboleyase,* in which the added prefixes intensify the meaning "to develop an illness"). Many derivational suffixes are common to most Slavic languages—*e.g.,* the very productive suffix *-stvo* (as in Russian *khristian-stvo* "Christianity," Ukrainian *pobratim-stvo* "fraternity," Polish *głup-stvo* "foolishness, trifle," Macedonian *golem-stvo* "high status, arrogance"). The archaic type of derivation by compounding, inherited from Indo-European, was particularly productive in Church Slavonic under the stimulus of Greek. Compounding remains one of the methods of creating new terms, especially technical terms (*e.g.,* Russian *vodokhranilishche* "reservoir" from *voda* "water" and *khranilishche* "depository"), but is far less important than affixation. Some Slavic languages typically derive new words by means of a condensed suffixing (*e.g.,* Czech *železnice* "railroad," from *železo* "iron" combined with a noun-forming suffix; *hledisko* "point of view," from

Borrowings from Iranian, eastern languages, and western European languages *hled* "look" combined with a noun-forming suffix), while others tend to use combinations of words (*e.g.*, Russian *železnodorožny* "railroad," from *zeleznaya doroga* "iron road" combined with an adjective-forming suffix).

Writing systems. The first writing system used for Slavic was the Glagolitic system invented by St. Cyril. Quite original in pattern, it reflected accurately the sound system of the Macedonian dialect. The forms of its letters can be traced to several different alphabets, mainly Greek and Semitic ones. Glagolitic was widely used in the first three centuries of Slavic literature but was gradually replaced by the Cyrillic alphabet, created in the 10th century and still used to write all the East Slavic languages, Bulgarian, Macedonian, and Serbian.

Other Slavic languages use the Latin (roman) alphabet. To render the distinctive sounds of a Slavic language, Latin letters are combined or diacritic signs are used (*e.g.*, Polish *sz* for the *sh* sound in "ship," Czech *č* for the *ch* sound in "church"). An orthographic system devised by the Czech religious reformer Jan Hus was adopted into different West Slavic systems of writing, including Czech, Slovak, and Sorbian. Polish spelling was patterned after the Czech spelling of the 14th century. Most of the Slavic writing systems are closely related to the sound patterns of the languages and are constructed to symbolize the distinctive sounds of the language or to render the same morphemes by the same groups of letters despite differences in pronunciation in various forms. Modern Russian spelling reflects a morpheme-based principle. (V.V.I.)

Albanian language

Albanian is an Indo-European language spoken by about 4,400,000 inhabitants of the eastern Adriatic coast in Albania and also in neighbouring Yugoslavia, principally in Kosovo and Makedonija (Macedonia), west of a line from near Leskovac to Lake Ohrid. There are perhaps 300,000 more speakers in isolated villages in southern Italy (Abruzzi, Molise, Basilicata, Puglia, and Calabria), and Sicily, and southern Greece (in Voiotía, Attica, Évvoia, Ândros, and the Pelopónnesos).

The origins of the general name Albanian, which traditionally referred to a restricted area in central Albania, and of the current official name Shqip or Shqipëri, which may well be derived from a term meaning "pronounce clearly, intelligibly," are still disputed. The name Albanian has been found in records since the time of Ptolemy. In Calabrian Albanian the name is Arbresh, in Modern Greek Arvanítis, and in Turkish Arnaut; the name must have been transmitted early through Greek speech.

Ъ	ъ		*ъ**	ŭ	above
	ь		*ь*		†‡
Ю	ю	*Ю*	*ю*	yu	youth‡
Я	я	*Я*	*я*	ya	yard‡

*ŭ can occur initially in only a few words. †When transliterated, this is represented by an apostrophe. In modern orthography ' is used medially and finally for the *y* consonant before *o* and is pronounced *y*onder. ‡When *ya*, *yu*, and *'o* are preceded by consonants they are themselves pronounced like *a*, *u*, and *o*, respectively, but cause the preceding consonant to be palatalized. The softening is less great in Bulgarian than it is in Russian.

Gheg and Tosk dialects

Dialects. The two principal dialects, Gheg in the north and Tosk in the south, are separated roughly by the Shkumbin River. Gheg and Tosk have been diverging for at least a millennium, and their less extreme forms are mutually intelligible. Gheg has the more marked subvarieties, the most striking of which are the northernmost and eastern types, which include those of the city of Shkodër (Scutari), the neighbouring mountains along the Crna Gora border, Kosovo, Makedonija, and the isolated village of Arbanasi (formerly Borgo Erizzo) on the Croatian coast of Dalmatia outside Zadar. Arbanasi, founded in the early 18th century by refugees from near Bar (formerly Antivari), has about 2,000 speakers.

All of the Albanian dialects spoken in Italian and Greek enclaves are of the Tosk variety, and seem to be related most closely to the dialect of Çamëria in the extreme south of Albania. These dialects resulted from incompletely understood population movements of the 13th and 15th centuries. The Italian enclaves—nearly 50 scattered villages—probably were founded by emigrants from Turkish rule in Greece. A few isolated outlying dialects of south Tosk origin are spoken in Bulgaria and Turkish Thrace but are of unclear date. The language is still in use in Mandritsa, Bulgaria, at the border near Edirne, and in an offshoot of this village surviving in Mândres, near Kilkís in Greece, that dates from the Balkan Wars. A Tosk enclave near Melitopol in the Ukraine appears to be of moderately recent settlement from Bulgaria. The Albanian dialects of Istria, for which a text exists, and of Syrmia (Srem), for which there is none, have become extinct.

History. The official language, written in a standard roman-style orthography adopted in 1909, was based on the south Gheg dialect of Elbasan from the beginning of the Albanian state until World War II, and since has been modelled on Tosk. In Yugoslavia, Albanian speakers in the region of Kosovo in Serbia (officially bilingual in Serbian and Albanian) and in Macedonia speak eastern varieties of Gheg but since 1974 have widely adopted a common orthography with Albania. Before 1909, the little literature that was preserved, was written in local makeshift Italianate or Hellenizing orthographies, or even in Turko-Arabic characters.

The first written records

A few brief written records are preserved from the 15th century, the first being a baptismal formula from 1462. The scattering of books produced in the 16th and 17th centuries originated largely in the Gheg area (often in Scutarene north Gheg) and reflect Roman Catholic missionary activities. Much of the small stream of literature in the 19th century was produced by exiles. Perhaps the earliest purely literary work of any extent is the 18th-century poetry of Gjul Variboba, of the enclave at S.Giorgio, in Calabria. Some literary production continued through the 19th century in the Italian enclaves, but no similar activity is recorded in the Greek areas. All these early historical documents show a language that differs little from the current language. Because these documents from different regions and times exhibit marked dialect peculiarities, however, they often have a value for linguistic study that greatly outweighs their literary merit.

Classification. That Albanian is of clearly Indo-European origin was recognized by the German philologist, Franz Bopp, in 1854; the details of the main correspondences of Albanian with Indo-European languages were elaborated by another German philologist, Gustav Meyer, in the 1880s and 1890s. Further linguistic refinements were presented by the Danish linguist Holger Pedersen and the Austrian Norbert Jokl. The following etymologies illustrate the relationship of Albanian to Indo-European (an asterisk preceding a word denotes an unattested, hypothetical Indo-European parent word, which is written in a conventionalized orthography): *pesë* "five" (from **pénk*^{w}*e*); *zjarm* "fire" (from **g*^{w}*hermos*); *natë* "night" (from **nok*^{w}*t-*); *dhëndër* "son-in-law" (from **ǵemə ter-*); *gjarpër* "snake" (from **sérpŏ̄n-*); *bjer* "bring!" (from **bhere*); *djeg* "I burn" (from **dheg*^{w}*hō*); *kam* "I have" (from **kapmi*); *pata* "I had" (from **pot-*); *pjek* "I roast" (from **pek*^{w}*ō*); *thom, thotë* "I say, he says" (from **k'ēmi*, **k'ēt* . . .).

The verb system includes many archaic traits, such as the retention of distinct active and middle personal endings (as in Greek) and the change of a stem vowel *e* in the present to *o* (from **ē*) in the past tense, a feature shared with the Baltic languages. For example, there is *mbledh* "gathers (transitive)" as well as *mblidhet* "gathers (intransitive), is gathered" in the present tense, and *mblodha* "I gathered" with an *o* in the past. Because of the superficial changes in the phonetic shape of the language over 2,000 years and because of the borrowing of words from neighbouring cultures, the continuity of the Indo-European heritage in Albanian has been underrated.

Albanian shows no obvious close affinity to any other Indo-European language; it is plainly the sole modern survivor of its own subgroup. It seems likely, however, that in very early times the Balto-Slavic group was its nearest of kin. Of ancient languages, both Dacian (or Daco-Mysian) and Illyrian have been tentatively considered its ancestor or nearest relative.

Grammar. The grammatical categories of Albanian are much like those of other European languages. Nouns show overt gender, number, and three or four cases. An unusual feature is that nouns are further inflected obligatorily with suffixes to show definite or indefinite meaning; *e.g., bukë* "bread," *buka* "the bread." Adjectives—except numerals and certain quantifying expressions—and dependent nouns follow the noun they modify; and they are remarkable in requiring a particle preceding them that agrees with the noun. Thus, in *një burrë i madh,* meaning "a big man," *burrë* "man" is modified by *madh* "big," which is preceded by *i,* which agrees with the term for "man"; likewise, in *dy burra të mëdhenj* "two big men," *mëdhenj,* the plural masculine form for "big," follows the noun *burra* "men" and is preceded by a particle *të* that agrees with the noun. Verbs have roughly the number and variety of forms found in French or Italian and are quite irregular in forming their stems. Noun plurals are also notable for the irregularity of a large number of them. When a definite noun or one taken as already known is the direct object of the sentence, a pronoun in the objective case that repeats this information must also be inserted in the verb phrase; *e.g., i-a dhashë librin atij* is literally "him-it I-gave the-book to-him," which in standard English would be "I gave the book to him." In general, the grammar and formal distinctions of Albanian are reminiscent of Modern Greek and the Romance languages, especially of Romanian. The sounds suggest Hungarian or Greek, but Gheg with its nasal vowels strikes the ear as distinctive.

Vocabulary and contacts. Although Albanian has a host of borrowings from its neighbours, it shows exceedingly few evidences of contact with ancient Greek; one such is the Gheg *mokën* (Tosk *mokër*) "millstone," from the Greek *mēkhanḗ.* Obviously close contacts with the Romans gave many Latin loans; *e.g., mik* "friend," from Latin *amicus; këndoj* "sing, read" from *cantāre.* Furthermore, such loanwords in Albanian attest to the similarities in development of the Latin spoken in the Balkans and of Romanian, a Balkan Romance tongue. For example, Latin *palūdem* "swamp" became *padūlem,* and then *pădure* in Romanian and *pyll* in Albanian, both with a modified meaning, "forest."

Early contacts between Albanian and Romanian

Conversely, Romanian also shares some apparently non-Latin indigenous terms with Albanian; *e.g.,* Romanian *brad,* Albanian *bredh* "fir." Thus these two languages reflect special historical contacts of early date. Early communication with the Goths presumably contributed *tirq* "trousers, breeches" (from an old compound "thigh-breech"), while early Slavic contacts gave *gozhdë* "nail." Many Italian, Turkish, Modern Greek, Serbian, and Macedonian-Slav loans can be attributed to cultural contacts of the past 500 years with Venetians, Ottomans, Greeks (to the south), and Slavs (to the east).

A fair number of features—*e.g.,* the formation of the future tense and of the noun phrase—are shared with other languages of the Balkans but are of obscure origin and development; Albanian or its earlier kin could easily be the source for at least some of these. The study of such regional features in the Balkans has become a classic case for research on the phenomena of linguistic diffusion.

(E.P.H.)

URALIC LANGUAGES

The Uralic language family consists of two related groups of languages, the Finno-Ugric and the Samoyedic, both of which are thought to have developed from a common ancestor, called Proto-Uralic, that was spoken 7,000 to 10,000 years ago in the general area of the northern Ural Mountain Range. Over the millennia, both Finno-Ugric and Samoyedic have given rise to more or less divergent subgroups of languages, which nonetheless have retained certain traits from their common source. For example, the degree of similarity between two of the least closely related members of the Finno-Ugric group, Hungarian and Finnish, is comparable to that between English and Russian (which belong to the Indo-European family of languages). The difference between any Finno-Ugric language and any Samoyedic tongue would be even greater. On the other hand, more closely related members of Finno-Ugric, such as Finnish and Estonian, differ in much the same manner as greatly diverse dialects of the same language.

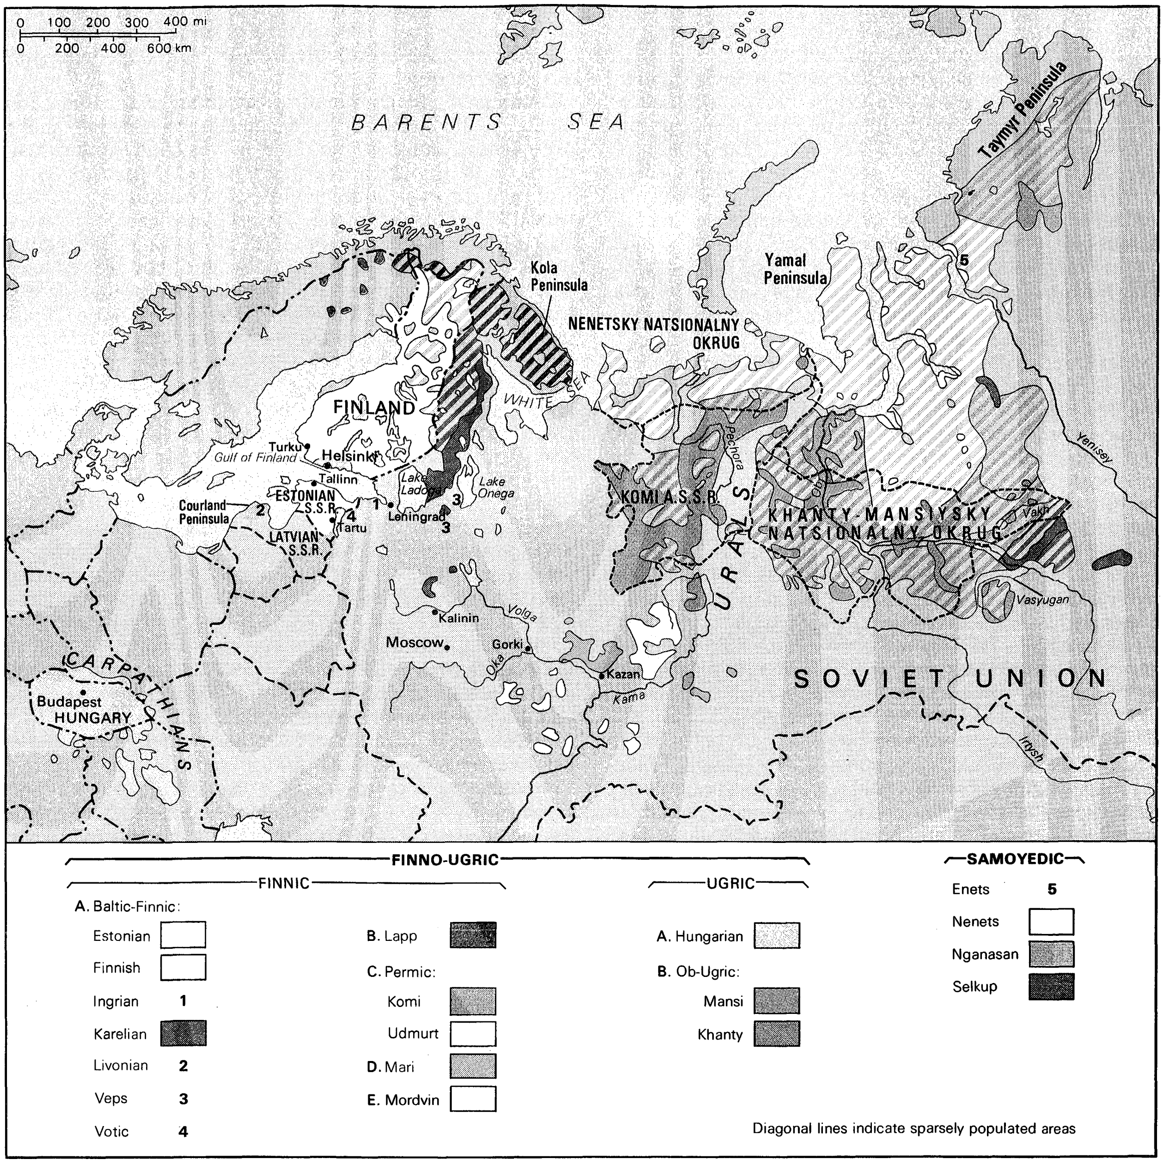

Figure 17: Distribution of the Uralic languages.

Finno-Ugric languages

The Finno-Ugric languages are represented today by some 15 languages scattered over an immense Eurasian territory. In the west they include the European national languages—Hungarian, Finnish, and Estonian—as well as Lapp, the westernmost member of the group, spoken by numerous separate groups across the northern Scandinavian Peninsula from central Norway to the White Sea. The remaining Finno-Ugric languages are located within the Soviet Union, with one major concentration—including Estonian, Livonian, Votic, Karelian, and Veps—along a broad zone extending from the Gulf of Riga to the Kola Peninsula. The Mordvin and Mari (or Cheremis) languages are found in the region of the central Volga; from there extending northward along the river courses west of the Urals are the Permic languages—Udmurt (Votyak) and Komi (Zyryan). East of the Urals, along the Ob River and its tributaries are the easternmost representatives of the Finno-Ugric group—Mansi (Vogul) and Khant (Ostyak).

The largely nomadic Samoyeds are sparsely distributed over an enormous area extending inward from the Arctic shores of the Soviet Union from the White Sea in the west to Khatangsky (Khatanga) Bay in central Siberia in the east. Nenets (Yurak), the westernmost of these languages, reaches eastward to the mouth of the Yenisey River and includes a small insular group on Novaya Zemlya. Speakers of Enets (Yenisey) are located in the region of the upper Yenisey. The lower half of the Taymyr Peninsula is the habitat of the Nganasan (Tavgi), the easternmost of the Uralic groups. The fourth language, Selkup, lies to the south in a region between the central Ob and central Yenisey; its major representation is located between Turukhansk and the Taz River. A fifth Samoyedic language, Kamas (Sayan), originally spoken in the vicinity of the Sayan Mountains, was spoken in the early 1970s by one elderly speaker, then residing in Estonia.

Numbers of speakers

In general, the westernmost members of the Uralic family are spoken by the greatest numbers of speakers. The largest groups are Hungarian, with some 14,000,000 speakers; Finnish, with 5,000,000; and Estonian, with approximately 1,000,000. Among the lesser known Uralic languages of the Soviet Union, several have rather substantial representation: Mordvin, more than 900,000 speakers; Mari, about 570,000; Udmurt, close to 590,000; Komi, about 285,000; and Karelian, with just under 86,000. The approximately 30,000 to 40,000 Lapps are distributed over four countries: Norway, 20,000; Sweden, 10,000; Finland, 3,000; and the Soviet Union, 1,500. Other Finno-Ugric languages with more than 1,000 speakers are Khant (about 14,000), Veps (about 3,000) and Mansi (about 4,000). In the mid-20th century, Votic and Livonian were still maintained by small communities of speakers, but they appeared to be facing extinction in future generations. The entire Samoyedic group consists of about 28,000 speakers. Of these, Nenets claims over 25,000 speakers; Selkup, roughly 2,000; Nganasan, fewer than 700; and Enets, about 300.

The political history of the various Uralic groups largely has been one of resisting encroachment from adjacent European (especially Germanic and Slavic) and Turkic groups and from other Uralic neighbours. Only three groups have succeeded in achieving political independence—Hungary, Finland, and Estonia (the last is now, however, one of the 15 republics of the Soviet Union). Five of the minority groups in the Soviet Union have the status of autonomous republics: Mordvinian A.S.S.R., Mari A.S.S.R., Udmurt A.S.S.R., Komi A.S.S.R., and Karelian A.S.S.R. (formerly a union republic). Four more groups are recognized at the level of local administration under their own national *okruga;* Khant and Mansi (under one area), the Permyak dialect of Komi, and Nenets (under three *okruga*).

Alphabets used for the Uralic languages

The earliest known manuscript in a Uralic language is a Hungarian funeral oration (*Halotti Beszéd*), a short, free translation from Latin, which stems from the turn of the 13th century AD. A 12-word Karelian fragment also dates from the 13th century. Old Permic, the earliest attested form of Komi, received its own alphabet (based on the Greek and Old Slavic symbols) in the 14th century through the missionary efforts of St. Stephen, bishop of Perm. The first Finnish and Estonian texts date from the 16th century, and are in printed form. Lapp was first written in the 17th century. Since then, nearly all the more populous Uralic languages have some kind of written form, but at present there is a native literature only for the above-mentioned languages and for those groups in the Soviet Union that have their own administrative regions. Currently, the Uralic languages within the Russian Soviet Federated Socialist Republic use a modification of the Cyrillic alphabet; the others employ the Latin alphabet, adapted to the peculiar demands of their own sound systems. For example, the important distinction between long and short vowels in Finnish is indicated by doubling the letters for long vowels (*a* versus *aa*), whereas in Hungarian the long vowel is marked by an acute accent (*a* versus *á*).

Racially, the Uralic peoples present an unhomogeneous picture. In general, they may be considered a blend of European and Mongoloid types, with the more western groups (especially the Hungarian, Baltic-Finnic, and Erzya Mordvin groups) being strongly European and those east of the Urals primarily Mongoloid. Although scholars do not agree as to what features, if any, constitute the most archaic Uralic type, recent study indicates that it is possible to speak of a Uralic racial type, an intermediate stage between the European and the Mongoloid, the basic features of which are medium-dark to dark hair and eye colour, relatively small stature, and often a concave bridge of the nose. According to this view, the more archaic Uralic type is best preserved among the Lapp, Mari, and Permic groups.

Attempts to trace the genealogy of the Uralic languages to periods earlier than Proto-Uralic have been hampered by the great changes in the attested languages, which preserve relatively few features upon which to base meaningful claims for a more distant relationship. Most commonly mentioned in this respect is a putative connection with the Altaic language family (including Turkic and Mongolian). This hypothetical language group, called Ural-Altaic, is not considered by most scholars to be soundly based. Although the Uralic and Indo-European languages are not generally thought to be related, more speculative studies have suggested such a connection. Of the various attempts to find outside relationships, only those linking Uralic with Yukaghir, a Paleo-Siberian tongue, appear to have serious support.

Table 35: Names Used to Designate Uralic Groups

English form	native form
Finnish	*suomi*
Karelian	*karjala*
Ingrian	*izhor*
Veps	*vepsä, lüüd* (Old Russian *vesj, chudj*)
Estonian	*eesti* (Old Russian *chudj*)
Votic, Vote	*vadja* (Old Russian *vodj; chudj*)
Livonian	*liiv*
Lapp	*sabme* (Russian *saami;* earlier *lopj*)
Mordvin	*erza, moksha* (no common name)
Mari (Cheremis)	*mari* ("man")
Udmurt (Votyak)	*ud-murt* (*murt* = "man")
Komi (Zyryan)	*komi* (Old Russian *permj*)
Khant (Ostyak)	*khanty* (Old Russian *jugra*)
Mansi (Vogul)	*manshi* (also used to designate the Khanty; Old Russian *jugra*)
Hungarian	*magyar* (Russian *vengr*)
Nenets (Yurak)	*nenets, hasawa* ("man"; Old Russian *samojadj*)
Enets (Yenisey)	*enetj* (related to the name *nenets*)
Nganasan (Tavgi, Avam)	*ŋanasan* (related to the name *nenets*)
Selkup (Ostyak Samoyed)	*shöl-qup* (*shö[l]* = "earth," *qup* = "man")

Because the names designating many of the Uralic peoples have never been standardized, a wide range of appellations is encountered in references to these groups. Earlier designations, especially in the case of the groups in Russia, tended to be taken from derogatory names used by neighbouring peoples; *e.g.,* Cheremis—now Mari. Table 35 indicates the names in use. Standard usage is in the left column, and earlier, Russian-based forms are in parentheses. The name that the group uses for itself and certain other information, such as Russian and Old Russian forms, are in the right column. Several names are identical to the word for man in these languages. (Finnish *mies* "man" has also been etymologically related to the names Magyar and Mansi.) It is important that Ostyak (Khant) not be confused with Ostyak Samoyed (Selkup) nor with Yenisey Ostyak (Ket, a non-Uralic, Paleo-Siberian tongue), which should also not be confused with Yenisey (Enets).

LANGUAGES OF THE FAMILY

Divisions within Finno-Ugric

The two major branches of Uralic are themselves composed of numerous subgroupings of member languages on the basis of closeness of linguistic relationship. Finno-Ugric can first be divided into the most distantly related Ugric and Finnic (sometimes called Volga-Finnic) groups, which may have separated as long ago as five millennia. Within these, three relatively closely related groups of languages are found: the Baltic-Finnic, the Permic, and the Ob-Ugric. The largest of these, the Baltic-Finnic group, is composed of Finnish, Estonian, Livonian, Votic, Ingrian, Karelian, and Veps. The Permic group consists of Komi and Udmurt; the Ob-Ugric group includes Mansi and Khant.

The Ugric group comprises the geographically most distant members of the family—the Hungarian and Ob-Ugric languages. Finnic contains the remaining languages: the Baltic-Finnic languages, Lapp, Mordvin, Mari, and the Permic tongues. There is little accord on the further subclassification of the Finnic languages, although the fairly close relationship between Baltic-Finnic and Lapp is generally recognized (and is called North Finnic); the degree of separation between the two may be compared to that between English and German. Mordvin has most frequently been linked with Mari (a putative Volga group), but comparative evidence also suggests a bond with Baltic-Finnic and Lapp (that is, West Finnic). The extinct Merya, Murom, and Meshcher groups, known only from Old Russian chronicles, are assumed to have been Finnic peoples and from their geographical location northwest of Mordvin must have belonged to West Finnic. One hypothesis for the internal relationships of the Uralic family as a whole is given in Figure 18.

The precursor of the modern Samoyedic languages is thought to have divided near the turn of the Christian Era into a northern and a southern group. North Samoyedic consists of Nenets, Enets, and Nganasan. South Samoyedic contains but a single living language, Selkup, but is known to have been represented by numerous other dialects, now extinct: Kamas, Motor, Koibal, Tofalar (Karagasy), Soyot, and Taigi.

Hungarian. Hungarian, the official language of Hungary, remains the primary language of the fertile Carpathian Basin. Bounded by the Carpathian Mountains to the north, east, and southwest, the Hungarian area is represented by almost 2,500,000 speakers outside the boundaries of Hungary—in Czechoslovakia, the Ukranian S.S.R., and

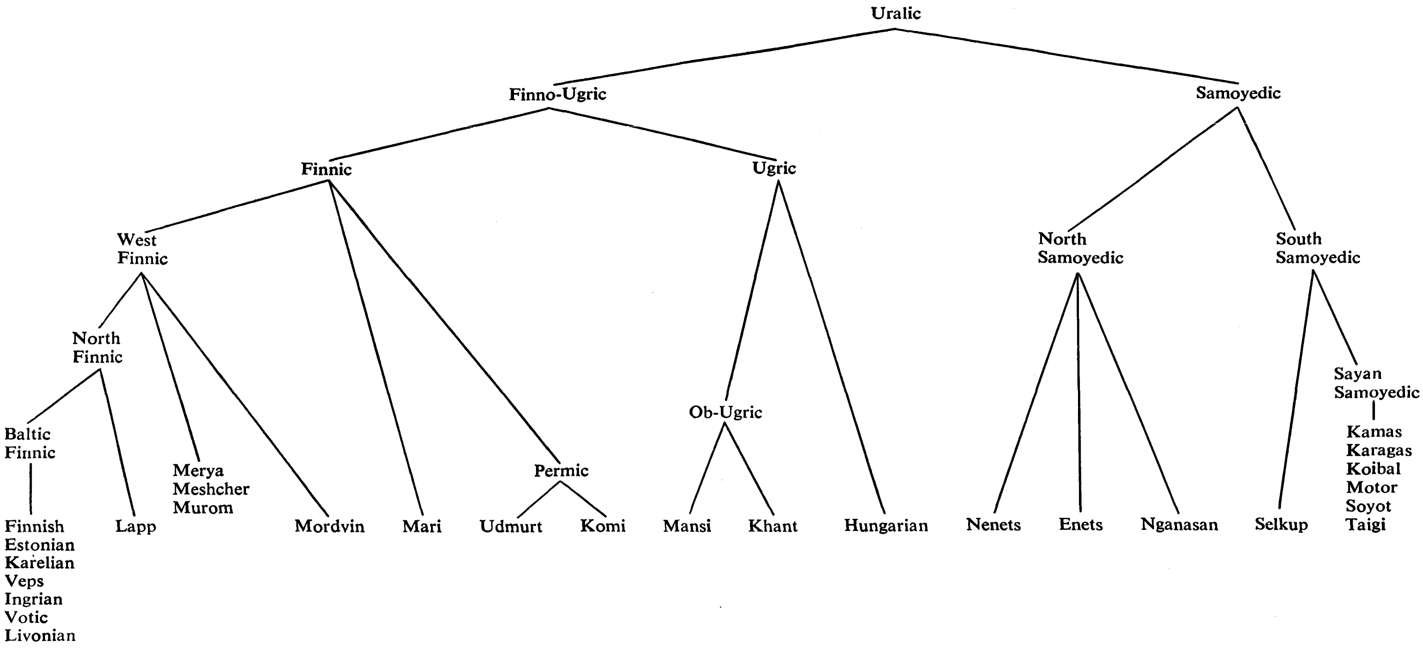

Figure 18: Family tree diagram of the Uralic languages (see text).

Romanian Transylvania (some 1,700,000). To the south, a substantial Hungarian population (over 450,000) extends into central Yugoslavia. Hungarian emigrant communities are found in many parts of the world, especially in North America and Australia.

The ancestors of the Hungarians, following their separation from the other Ugric tribes, moved south into the steppe region below the Urals. As mounted nomads, in contact with and often in alliance with Turkic tribes, they moved westward, reaching and conquering the sparsely settled Carpathian Basin in the period 895–896. The Hungarians came under the influence of Rome through their first Christian king, Stephen (István), in 1001, and the use of Latin for official purposes continued into the 19th century. Following a Hungarian defeat at the Battle of Mohács in 1526, Hungary was occupied by Turkish forces, who were replaced by German Habsburg domination in the late 17th century. Concern for a common literary medium, closely tied with Hungarian nationalism, began in the late 18th century. More recent foreign influences on the language were suppressed and replaced by native words and constructions. The literary form received a broad dialect base, facilitating its use as a national language.

Dialects of Hungarian

Modern Hungarian has eight major dialects, which permit a high degree of mutual intelligibility. Budapest, the nation's capital, is located near the junction of three dialect areas: the South, Transdanubian, and Palóc (Northwestern). As a result of unfavourable treaties following both world wars, especially the Treaty of Trianon, two dialects (Central Transylvanian and Szêkely) lie almost entirely within Romania, and the remaining six dialects radiate outward into neighbouring countries.

The Hungarians' own name for themselves is *magyar.* Other Western appellations, such as the French *hongrois,* German *Ungar,* and Russian *vengr,* all stem from the name of an early Turkic tribal confederation, the *on-ogur* (meaning "ten tribes"), which the Hungarians joined in their wanderings toward the west, and does not indicate relationship with the ancient Huns, a Turkic tribe. One of the earliest recorded references to the Hungarians, a Byzantine geographical survey of Constantine Porphyrogenitus (died 959) entitled *De administrando imperio,* lists the *megyer* as one of the Hungarian tribes, but, as was typical in early reports, the Hungarians were not distinguished from their Turkish allies.

Ob-Ugric: Khant and Mansi. The Ob-Ugric peoples, the Khant and the Mansi (Vogul), are among the smallest Finno-Ugric groups. Although their numbers have declined over recent centuries, the Khant language is still maintained by about 14,000 speakers, and approximately 52 percent of the 7,600 Mansi still claim it as their mother tongue. To a large extent they have been assimilated by their Russian and Tatar neighbours. These two peoples are widely dispersed along the Ob River and its tributaries, for the most part within the Khant-Mansi Autonomous Okrug, which has its administrative centre in Khant-Mansiysk at the junction of the Ob and the Irtysh. The Mansi are found along the western tributaries primarily north of the Irtysh and just east of the Urals; a few speakers are also found in the Arctic lands west of the Urals. The Khant live along both the Ob itself and its tributaries.

Because of the great distances between the various groups, the dialects of both languages show considerable divergence. They are usually designated by the name of the river on which they are spoken. Mansi has four main dialect groups, of which one (Tavda) is practically extinct and another (Konda) is no longer spoken by the youth of the area. The largest dialect group (Northern) is centred on the Sosva and serves as the basis for the literary language. Khant is divided into three main dialects: a northern dialect in the general area of the mouth of the Ob, an eastern dialect extending from east of the Irtysh to the Vakh and Vasyugan tributaries, and a southern dialect lying between the other two. Literary Khant has been based primarily on the northern group, but standardization remains weak, and in recent decades other dialects have also been used.

Khant and Mansi dialects

After the division of the Proto-Ugric language into separate languages, it is likely that the precursors of the Ob-Ugric tribes were still centred west of the Urals well within historic times. The Old Russian Chronicles of Nestor, which assigned them the common name *jugra,* places them in the vicinity of the Pechora River in 1092; they did not shift to the Ob waterways until several centuries later. Both of the Ob-Ugric languages first appeared in printed form in 1868 as a result of gospel translations published in London, but it was not until after the formation of their autonomous okrug in 1930 that any sort of literary form of Khant and Mansi really existed. Until 1937 numerous books were published using a modified Latin (roman) alphabet; since then Cyrillic has been used. To a certain extent, elementary education is conducted in the native languages within the autonomous okrug.

Finnish. Finnish, together with Swedish (an unrelated North Germanic language), serves as the official language of Finland. It is now spoken by more than 5,000,000 people, including 94 percent of the inhabitants of Finland plus nearly 500,000 Finns in North America, Sweden, and the Soviet Union. It is also recognized as an official language in the Karelian A.S.S.R., alongside Russian.

Modern Finnish dialects

Finnish as the common language of the Finns is not the direct descendant of one of the original Baltic-Finnic dialects; rather, it arose through the interacton of several separate groups in the territory of modern Finland. These included the Häme; the southwestern Finns (originally called Suomi), who appear to be close relatives to the Estonians, because they arrived directly from across the Gulf of Finland; and the Karelians, perhaps themselves a blend of Veps and more western Finnic groups. Early Russian chronicles refer to these as *jemj, sumj,* and *korela.* The intermixture of the three groups is still reflected in the distribution of the five main modern dialects, which form a western and an eastern area. The western area contains the southwest dialect (near Turku), Häme (south central), and a northern dialect subgroup (largely a mixture of the other two plus eastern traits). The eastern area consists of the Savo dialect (perhaps a blend of the original Karelian and Häme dialects) and a southeastern dialect, which strongly resembles Karelian. The Finnish word for their land and their language is *suomi,* the original meaning of which is uncertain. The first use of the term Finn *(fenni)* is found in the 1st century AD in Tacitus' *Germania,* but this usage is generally considered to refer to the ancestors of the Lapps, who have also been labelled Finns at various times. (The province of Norwegian Lappland is called Finnmark.)

The first book in Finnish was an ABC book from 1543 by Mikael Agricola, founder of the Finnish literary language; five years later it was followed by Agricola's translation of the New Testament. Finnish was accorded official status in 1809, when Finland entered the Russian Empire after six centuries of Swedish domination. The publication of the national folk epic, the *Kalevala,* created from folk songs collected among the eastern dialects by folklorist and philologist Elias Lönnrot (first edition in 1835; substantially expanded in 1849), gave increased impetus to the movement to develop a common national language encompassing all dialect areas.

Estonian. Estonian serves as the official language of the Estonian S.S.R., located immediately south of Finland across the Gulf of Finland. There are about 1,000,000 speakers, most of them living within the Estonian S.S.R. but also elsewhere in the Soviet Union and abroad, especially in North America and Sweden. Modern Estonian is the descendant of one or possibly two of the original Baltic-Finnic dialects. The modern language has two major dialects, a northern one, which is spoken in most of the country, and a southern one, which extends from Tartu to the south. The northernmost dialects share many features with the southwestern Finnish dialect. The Estonians' own name *eesti* came into general use only in the 19th century. The name *aestii* is first encountered in Tacitus, but it is likely that it referred to neighbouring Baltic-Finnic peoples.

The first connected texts in Estonian are religious translations from 1524; the *Wanradt-Koell Catechism,* the first book, was printed in Wittenberg in 1535. Two centres of culture developed—Tallinn (fomerly Reval) in the north and Tartu (Dorpat) in the south; in the 17th century they gave rise to two literary languages. Influenced by the Finnish *Kalevala,* the Estonian author Friedrich Reinhold Kreutzwald fashioned a national epic, the *Kalevipoeg* ("Son of Kalevi"), which appeared in 20 songs between 1857 and 1861. As with the *Kalevala,* this was instrumental in kindling renewed interest in a common national literary form in the late 19th century.

Karelian, Veps, Ingrian, Votic, Livonian

Smaller Baltic-Finnic groups. The five less numerous Baltic-Finnic groups—Karelian, Veps, Ingrian, Votic, and Livonian—lie within the territory of the Soviet Union, largely in the general vicinity of the Gulf of Finland. The Karelians, Veps, and Livonians were among the original Baltic-Finnic tribes; Votic is considered to be an offshoot of Estonian, and Ingrian, a remote branch of Karelian. None of these languages currently has a literary form, although unsuccessful initial attempts to establish one have been made for all but Votic (for Livonian as early as the 19th century, for the others during the 1930s). Since the beginning of the 20th century the numbers of these Baltic-Finnic speakers have been drastically reduced, and, with the exception of Karelian and Veps, their extinction within several generations seems certain. Ingrian, Votic, and Livonian, each with fewer than 1,000 speakers, were not reported in the 1979 census.

Karelian, the largest of these groups, with about 86,000 speakers—not counting those Karelians who emigrated into Finland following World War II—lies along a broad zone just east of the Finnish border from just north of Leningrad to the White Sea. A separate group of Karelians is found far to the south near Kalinin (formerly Tver) on the upper Volga. Karelian has two major dialects, Karelian proper and Olonets (*aunus* in Finnish), which is spoken northeast of Lake Ladoga. One of the first historical mentions of the Karelians is found in a report of the Viking Ohthere to King Alfred of England at the end of the 9th century; this indicates that they were already on the southern Kola Peninsula as neighbours of the Lapps and gives their name as *beorma.*

The language of one of the original Baltic-Finnic tribes, Veps, is spoken southeast on a line connecting lower Lake Ladoga with central Lake Onega. About one-third of the 8,000 Veps still consider the language their native tongue—a sharp decline from the 26,172 speakers reported in the mid 1800s. A small Baltic-Finnic group, the Ludic dialects, is found between Veps and Karelian and is generally considered as a blend of the two major groups, rather than a separate language; the dialects are more closely akin to Karelian. The Ingrians and the Votes live on the southern Gulf of Finland in the border area between Estonia and Soviet Russia, where they have survived because the border area has been closed to outsiders, even within the Soviet Union. Livonian, maintained in a dozen villages on the northernmost tip of Latvia, on the Courland Peninsula, has about 500 speakers, but the language is not used among the younger generation.

Dialect groups of Lapp

Lapp. The Lapps are widely distributed, from central Norway northward and eastward across northern Sweden and Finland to the Kola Peninsula. The number of Lapps has increased over the past century to more than 30,000, but the number of Lapp speakers has declined rapidly in recent decades as the language has given way to the various official national languages. Lapp is generally divided into three main dialect groups, each with various subtypes. These dialects are virtually mutually unintelligible, so that when speakers of different Lapp groups meet, they generally converse in Finnish, Swedish, or Norwegian. To speak of a single Lapp language is thus misleading. Lapp represents a group of at least four or five languages at least as diverse as the separate Baltic-Finnic languages. The largest group, North Lapp (with roughly two-thirds of all speakers), is centred in northern Norway, Sweden, and Finland. East Lapp consists of two small groups in eastern Finland—Inari and Skolt—plus Kola Lapp in the Soviet Union. South Lapp is still represented by a few speakers scattered from central Norway to north central Sweden.

North Lapp has had a literary tradition that began with the 17th-century Swedish Lapp Bible and other religious translations; in the mid-20th century elementary schools that used Lapp as the language of instruction were found in many larger North Lapp communities. Two basic variants of the literary language are in use. One, in Norway and Sweden, employs a special Lapp orthographic system devised to accommodate a wide range of dialectal variation; a second, in Finland, is based on a more narrow adaptation of Finnish orthography. Each of the two types has numerous local variants, and progress toward a common Lapp orthography has been slow.

A wide range of theories has been posited to reconcile the apparent conflict between the different racial features of the Lapps and the Baltic-Finnic peoples and their strong linguistic similarities. The Lapps have been said to represent a non-Uralic people (the so-called Proto-Lapps) or perhaps a Samoyed tribe that abandoned its own language for a late stage of Finnic, perhaps early Baltic-Finnic. Another view is that the Lapps are one of the original Finnic tribes and not linguistically more closely related to Baltic-Finnic. In the absence of any compelling evidence, no conclusive answer can be provided. On the other hand, the fact that the non-Uralic origin of the Baltic Finns is rarely considered, despite recent evidence suggesting that the Lapps best represent the racial characteristics of the Finno-Ugric peoples, leads to the possibility of a certain degree of chauvinism in the earlier hypotheses suggesting outside origins for the Lapps. In any case, it is clear that the Lapps were already present north of the Gulf of Finland prior to the arrival of the first Baltic-Finnic tribes, and from there they may have extended over much of the Scandinavian Peninsula. They have been mentioned as the northern neighbours of the north Germanic tribes in numerous historical sources of the 1st millennium of the Christian Era. The Lapps were taxed by the Norwegians in the 9th century and by the Karelians in the 13th century and since that time have continually retreated northward under pressure from their southern neighbours. The Lapps' own name for themselves, *sabme,* is etymologically related to the Finnish dialect name, *häme.*

Mordvin, Mari, and the Permic languages

Other Finnic languages. Mordvin, Mari, and the Permic languages—Udmurt and Komi—are each recognized by autonomous republics within the Russian Soviet Federated Socialist Republic, where they share official status with Russian. Mordvin, Mari, and Udmurt are centred on the middle Volga River, in roughly the area considered to have been the original home of Proto-Finno-Ugric. Because of their location, the history of these groups over the past millennium has been closely tied to that of the Turkic Bulgars, the Tatars (until 1552), and then the Russians. The Komi, having moved far to the north, eventually reaching into the Arctic tundra, did not come under Bulgar or Tatar influence. A written form of early Komi, Old Permic, was used in religious manuscripts in the 14th century, and a native Komi literary tradition stems from the 19th century. Grammars of Mari and Udmurt prepared by Russian linguists appeared in 1775, but native literary development in these languages, as well as in Mordvin, is of recent origin. Although these groups currently enjoy the status of large minorities, even in their respective autonomous areas, their numbers have increased over the past century, and they have maintained ethnic consciousness.

Mordvin. Mordvin, with more than 900,000 speakers (about 78 percent of the 1,177,000 Mordvins reported in the early 1980s), is the fourth-largest Uralic group. The Mordvins are widely scattered over an area between the Oka and Volga rivers, some 200 miles southwest of Moscow. Less than half of their number live within the Mordvinian Autonomous Soviet Socialist Republic. Mordvin has two main dialects, Moksha and Erzya, which are sometimes considered separate languages. Both have literary status. Although the Mordvins do not have a common designation for themselves beyond the two dialect names, the name Mordens appears in the 6th-century *Getica* of Jordanes and is no doubt related to the Permic word for "man," *murt/mort.*

Mari. Mari (Cheremis) is currently maintained by about 570,000 speakers (approximately 78 percent of 627,000 in the early 1980s), primarily in an area north of the Volga between Kazan and Gorki, northeast of the Mordvin area, especially within the Mari A.S.S.R. Mari's three main dialects are: the Meadow dialect, used by the largest group north of the Volga and the basic dialect of the Mari A.S.S.R.; Eastern Mari, used by a small group near Ufa, originally speakers of the Meadow dialect who emigrated in the late 18th century; and the Mountain dialect, to the west and on the south bank of the Volga. The Mountain and Meadow dialects both serve as literary languages and differ from each other only in minor details.

Udmurt and Komi

The Permic languages. Speakers of the two closely related Permic languages number close to 900,000—roughly 590,000 Udmurts and 285,000 Komi. Udmurt is concentrated largely in the vicinity of the lower Kama River just east of the Mari A.S.S.R., in the Udmurt A.S.S.R. Only very minor dialectal differences are found within Udmurt. The Komi language area extends into the Nenets National Okrug far to the north. Lesser groups of Komi are found as far west as the Kola Peninsula and east of the Urals. Three major dialects are recognized, although the differences are not great: Komi Zyryan, the largest group, which serves as the literary basis within the Komi A.S.S.R.; Komi-Permyak, the dialect of the Komi-Permyak National Okrug, where it has literary status; and Komi-Yazva, spoken by some 4,000 Komi to the east of the Komi-Permyak National Okrug and south of the Komi A.S.S.R.

The Samoyed languages. Nenets, with the largest number of speakers of all the Samoyed languages, has added a substantial increase in the number of its speakers over the past century, from 9,245 in 1897 to about 28,000 in the early 1980s. Two distinct groups of Nenets differ in dialect as well as in cultural traditions: the Forest Nenets, a smaller, more concentrated group in the wooded area north of the central Ob; and the Tundra Nenets, a group whose territory stretches roughly 1,000 miles eastward from the White Sea. These are the "Samoyadj" of Nestor's chronicles, but little is known of the history of any of the Samoyed peoples until recent centuries. Nenets alone among the Samoyed languages can claim a native literature, although both it and Selkup have been in written form since the 1930s. Evidence of the cultural prestige of certain Nenets tribes is seen in the adoption of a Samoyed language by Khant speakers on the Yamal Peninsula. Enets is spoken by a dwindling group of several hundred Samoyeds near the mouth of the Yenisey, just east of the Nenets. Nganasan, spoken by the northernmost Eurasian people, is found north and east of the Enets-speaking group, centring on the Taymir Peninsula. The number of Nganasans has remained fairly constant, and they seem to have a high degree of ethnic identity (about 75 percent of 900 Nganasans still claimed Nganasan as their mother tongue in the early 1980s).

Selkup, the last of the southern Samoyed languages, is represented by scattered groups of speakers who live on the central West Siberian Plain between the Ob and the Yenisey. Only half of the 3,500 Selkup speakers still considered the language their mother tongue in the early 1980s.

EARLY HISTORY

Hypotheses concerning early Uralic cultures and languages

Determining the geographical location, material culture, and linguistic characteristics of the earliest stages of Uralic at a period thousands of years prior to any historical records is a problem beset with enormous difficulties; consensus among Uralic scholars is limited to a handful of general hypotheses.

The original homeland of Proto-Uralic is considered to have been in the vicinity of the central Urals, possibly centred west of the mountains. Following the dissolution of Uralic, the precursors of the Samoyeds gradually moved northward and eastward into Siberia. The Finno-Ugrians moved to the south and west, to an area close to the junction of the Kama and Volga rivers.

Knowledge of the location of these early groups is based on several kinds of indirect evidence. One approach attempts to reconstruct their natural environment on the basis of shared cognate words for plants, animals, and minerals and on the distribution of these words in the modern languages. For example, cognates (related words) designating certain types of spruce are found in all the Uralic languages except Hungarian (Finnish *kuusi,* Lapp *guossâ,* Mordvin *kuz,* Komi *koz,* Khant *kol,* Nenets *xādy,* Selkup *kūt*). Because the range of this type of fir tree is restricted to more northern climates, it is generally assumed that the widespread consistent association of the name and the tree suggests a period in which Proto-Uralic was spoken within that zone. Several other terms for plants (*e.g.,* Finnish *muurain* "cloudberry" [*Rubus arcticus*]), a term for metal (Estonian *vask* "copper," Hungarian *vas* "iron," Nganasan *basa* "iron"), and a word for "reindeer" (Lapp *boaʒo*) are also consistent with a northern Ural location. Great caution is necessary in such matters, because the association of words and objects can also result from borrowing, perhaps long after the period of Uralic unity; especially such culturally mobile items as "metal" and "reindeer" cannot with certainty be traced to a Proto-Uralic community. The central Volga location of Proto-Finno-Ugric is rather strongly supported by an abundance of shared terminology dealing with beekeeping, which constitutes a rather significant part of the culture of this region.

A second approach to determining the location of Proto-Uralic is based on contacts with other, unrelated languages as evidenced by loanwords from one group to the other. Early Finno-Ugric borrowed numerous terms from very early dialects of Indo-European. Though these words are entirely lacking from the Samoyed languages, within the Finno-Ugric division they are shared by the most remotely related members and show the same phonetic relationships as the native Finno-Ugric vocabulary. Examples include agricultural and bee-culture terminology (*e.g.,* "honey": Finnish *mete,* Komi *ma,* Hungarian *méz* [compare Indo-European **medhu-*]; "pig": Finnish *porsas,* Komi *porś*); several numerals ("hundred": Finnish *sata,* Hungarian *száz*); mineral words ("salt": Finnish *suola,* Komi *sol*); and the word for orphan (Finnish *orpo,* Hungarian *árva*). The nature of these borrowings, together with the linguist's relatively richer knowledge of early Indo-European, supports a southward movement of Proto-Finno-Ugric and also provides some insight into the culture of the Finno-Ugrians.

Loanwords from unrelated languages

The central Volga location is also supported by the geographical distribution of the daughter languages. Except for Hungarian, which moved westward across the steppe, the Finno-Ugric languages form two chains distributed along major waterways, with the junction of the Kama and Volga at their centre. One chain extends northward along the Kama, across the northern tip of the Urals into the Ob watershed, then south along the Ob and its tributaries. The second extends northeast along the Volga to the Gulf of Finland. The extinct Merya, Murom, and Meshcher languages were once links in this chain. Finally, assumptions about the more distant relationships of Uralic have influenced views concerning its original location. Earlier, proponents of the Ural-Altaic hypothesis tended to place the Uralic homeland in south central Siberia, near the sources of the Ob and Yenisey, but there is no support for this view.

LINGUISTIC CHARACTERISTICS

The linguistic structure of Proto-Uralic has been partially reconstructed by a comparison of the similarities and differences among the known Uralic tongues. Not all existing similarities can be attributed to a common Uralic origin; some may also reflect universal pressures and limitations on language structure (*e.g.,* the tendency to weaken stopped consonants between vowels, the modifying of a sound to become more similar to a preceding or following sound) or the influence of neighbouring, even genetically unrelated language structures (*e.g.,* the various types of vowel harmony [see below] in Finno-Ugric probably reflect such areal pressure).

Phonological characteristics. The correspondences of sounds in cognate Uralic words are illustrated in Table 36. Thus, a *p* in the beginning of a Finnish word corresponds to *f* in Hungarian (*puu* : *fa*); a Finnish *k* is matched by Hungarian *h* before a back vowel (*a, o*), otherwise by *k;* within the word, Finnish *t* is matched by Hungarian *z* and *nt* by *d*; Finnish initial *s* sometimes corresponds to Hungarian *s* (spelled *sz*) and sometimes to no consonant at all (*syli* : *öl*). In most of these instances, Finnish has retained the consonants of the Proto-Uralic consonant system. One exception is *nt,* which was originally **mt;* the *m* has become *n,* matching the position of articulation of the adjacent *t.* (An asterisk marks a form that is not found in any document or living dialect but is reconstructed as having once existed in an earlier stage of a language.) A second Finnish innovation is the loss of the distinction between the two original *s* sounds, **s* and palatalized **ś.* (Palatalization is the modification of a sound by simultaneous raising of the tongue to or toward the hard palate.) Hungarian maintains a distinction, but the original **s* words have lost this sound. By careful examination of such systematic relationships it is possible to sketch out much of the phonological structure of early Uralic. The reconstructions of Table 36 (last column) are based on the view that the vowel system of Baltic-Finnic is relatively more conservative, whereas the consonant contrasts have been best preserved in Lapp.

Finnish and Hungarian sound correspondences

Consonants. The following consonant sounds are generally posited for the early stages of Uralic: **p*, **t*, **č*, **k*, **s*, **š*, **ð*, **l*, **r*, **m*, **n*, *ŋ, **j*, **v* (*č* is pronounced as the *ch* in "chip," *š* as the *sh* in "ship," *ð as the th* in "then," *ŋ* as the *ng* in "sing," *j* as the *y* in "yet"), and the palatalized alveolar sounds **t′, ś, ð′, l′, ń,* plus a few others less well established. Modern Finnish has a much smaller inventory of consonants, having lost the palatalized alveolar sounds and **č, *š, *ð,* and **ŋ*. Hungarian, on the other hand, has a larger number of consonants by virtue of a newly introduced distinction between sounds made with and without vibration of the vocal cords (voicing), such as voiceless *p, t, s* as opposed to voiced *b, d, z; e.g., dél* "noon" : *tél* "winter." Other Uralic languages, such as Komi, have also acquired a voicing contrast (*e.g., doj* "pain" : *toj* "louse"), but the geographical distribution of those languages in which the voicing contrast plays an active role leaves little doubt as to its areal (regional) origin under the influence of Indo-European and Turkic languages.

Vowels. Essentially nothing is known of the Proto-Uralic vowels, and there is little agreement about the nature of the Proto-Finno-Ugric vowel system. It is clear, however, that, in contrast to a relatively limited number

Proto-Uralic vowels

*Unattested, reconstructed form.

of consonants, Finno-Ugric must have had a fairly large number of vowels (nine to 11 are usually posited). One hypothesis is that the original vowel system was essentially like that of Finnish, which has eight vowel sounds: *i, ü, u, e, ö, o, ä, a* (*ü*—spelled *y* in the standard orthography—and *ö* are front rounded vowels, as in German; *ä* is a low front vowel, as *a* in "cat"). Hungarian has a similar system, although not all dialects have a separate *ä* sound, which is not distinguished from *e* in the orthogaphy. A second approach posits a Proto-Uralic vowel structure closely resembling that of Khant, with seven full vowels and three reduced vowels.

The early Finno-Ugric system of vowels most likely possessed quantitative vowel contrasts (long versus short, or full versus reduced). Such contrasts are present in Baltic-Finnic, Lapp, and Ugric and within Samoyedic; *e.g.,* Finnish *tulen* "of fire" and *tuulen* "of wind," *tuleen* "into fire," and *tuuleen* "into wind"; Hungarian *szel* "slice" and *szél* "wind," *szelet* "wind" (accusative case), and *szelét* "its wind" (accusative). The possibility of influence by neighbouring languages cannot be ruled out in the case of vowel length, because western Finno-Ugric languages have been in close contact with Slavic and Germanic languages with similar vowel contrasts, and the eastern languages form an areal group among themselves. The remaining languages lack vowel quantity and are in intimate contact with Russian, which has lost the original contrastive vowel quantity of Indo-European. The Izhma dialect of Komi, adjacent to Nenets, has superficial contrasts such as *pi* "son" versus *pī* "cloud," but this vowel length is the result of a change of an *l* at the end of the syllable to a vowel.

Stress. In numerous Uralic languages—including Finnish, Estonian, Hungarian, and Komi—stress is automatically on the first syllable of the word; it is likely that Proto-Uralic also had word-initial stress. Closely related to this initial stress is the apparent severe limitation on early Finno-Ugric noninitial vowels; the full range of contrasts was permitted only in the first syllable. In certain languages, such as Eastern Mari and the Yazva Komi dialect, stress is not bound to a given syllable, and determining the place of stress requires information concerning vowel quality as well; *e.g.,* Yazva *śībdinə* "to bind," *liććina* "to descend," *l′iśīna* "wood" (the two stressed *i*′s are phonologically tense; *ś, ć, l′* are palatalized consonants). Stress at the end of a word is also found; *e.g.,* in Eastern Mari and Udmurt. Nganasan has a mora-counting stress, falling on the third unit of vowel length from the end of the word (where short vowels count as one unit, long vowels as two).

Conditions for vowel harmony

Vowel harmony. Vowel harmony is among the more familiar traits of the modern Uralic languages. Although most Uralic scholars trace this feature back to Proto-Uralic, there is good reason to question this view. Vowel harmony is said to exist when certain vowels cannot occur with other specific vowels within some wider domain, generally within a word. For example, of the eight vowels of Finnish, within a simple word, any member of the set *ü, ö, ä* prohibits the use of any member of the set *u, o, a,* but *i* and *e* may occur with either set. That is, within a word, vowels that are either rounded, such as *ü, ö, u, o,* or low, such as *ä, a,* must agree with each other in frontness or backness. (The distinction is marked phonetically by putting two dots over the front vowels.) The unrounded front vowels, *i* and *e,* may occur with any of the other vowels. Thus, from *talo* "house" one may form *talossa* "in (the) house," but for *kynä* "pen" the comparable form is *kynässä* "in (the) pen"; similarly, *talossansa* "in his house" contrasts with *kynässänsä* "in his pen" and *talossansako* "in his house?" with *kynässänsäkö* "in his pen?", whereas *taloni* "my house" and *kynäni* "my pen" have the same ending because *i* can occur with either of the two sets of vowel classes. Hungarian has essentially the same system, differing only in certain minor details (short *e* is the front vowel counterpart of *a*); *e.g., asztal* "table," *asztalok* "tables," *asztalokban* "in the tables," but *föld* "land," *földök* "lands," *földökben* "in the lands." Similar though less general front–back vowel-harmony systems are found in given dialects of Mordvin, Mari, Mansi, Khant, and Kamas.

Frequently confused with the true harmony situations above are partial and total assimilations of vowels in adjacent syllables. These assimilations illustrate a universal tendency of vowel interaction and are of relatively recent origin; they are best held apart from the question of vowel harmony. Examples of vowel assimilations abound. In Finnish an unstressed *e* in the illative case ("place into") is totally assimilated to a preceding vowel, even across an intervening *h*: *talo* + *hen* becomes *taloon* "into the house," *talo* + *i* + *hen* yields *taloihin* "into the houses," *työ* + *hen* becomes *työhön* "into the work." The Hungarian allative case ("place to or toward which") shows an assimilation of the phonetic feature of lip rounding with front vowels in addition to the standard vowel harmony; thus, *ház-hoz* "to the house," *kéz-hez* "to the hand," *betu-höz* "to the letter." Apart from such nonharmony alternations, no support for rounding harmony is found in Uralic.

Possible influence of Turkic and other languages

Considered from an areal viewpoint, two aspects of Uralic vowel harmony must be considered. First, those languages that show productive or active vowel harmony, with the exception of Baltic-Finnic, have had recent Turkic neighbours whose languages exhibited vowel harmony. For languages such as Mansi and Khant, dialects with vowel harmony are located closer to Tatar groups. Second, the original homeland of Uralic lies in the centre of an enormous hypothetical areal grouping, labelled by some as the "Eurasian language union." The languages of this "union" are said to be characterized by two features: (1) the absence of a tonal accent (changes in pitch that change meaning, as is found in Chinese, Swedish, or Serbian) and (2) the contrast of plain and palatalized consonants (as in Russian). The phonetic basis for the consonantal contrast between nonpalatalized and palatalized is acoustically the same as the contrast of front and back vowels (*i.e.,* it involves the timbre of the second formant). Indeed, in Erzya Mordvin, vowel harmony and palatalization appear to be conditioned by essentially the same rules. Instead of seeking a genetic explanation of vowel harmony in Uralic, a somewhat more recent areal origin—in part under Turkic influence—must be considered. Of significance is the further consideration that, among the northwestern languages far from Turkic influence, it is precisely Lapp and the Baltic-Finnic Estonian and Livonian that do not have vowel harmony and that have developed special syllable-accent systems (thus, they lack both traits of the Eurasian union).

Consonant gradation. The alternation of consonants known as consonant gradation (or lenition) is sometimes thought to be of Uralic origin. In Baltic-Finnic, excluding Veps and Livonian, earlier single stops were typically replaced by voiced and fricative consonantal variants, and geminate (double) stops were weakened following a stressed vowel when the next syllable was closed; that is, *_p_ alternated with *_v_ and *_b_; *_t_, with *_ð and_ *_d;_ *_k_, with *ɣ and *_g;_ *_pp_ with *_p;_ and so on. Finnish thus shows pairs such as *mato* "worm" and *madon* "of the worm," *matto* "rug" and *maton* "of the rug," *poika* "boy" and *pojan* "of the boy," *lintu* "bird" and *linnun* "of the bird," *selkä* "back" and *selän* "of the back." Estonian shows the same type of alternations, with considerable difference in detail; *e.g., sada* "hundred" and *saja* "of a hundred," *madu* "snake" and *mao* "of the snake," *lind* "bird" and *linnu* "of the bird," and *selg* "back" and *selja* "of the back." Most of the Lapp languages exhibit similar alternations, but the process applies to all consonants and, moreover, works in reverse—single consonants are doubled in open syllables; *e.g., čuotte* "hundred" and *čuoðe* "of a hundred," *borra* "eats" and *borâm* "I eat." The change of *t* to *ð* however, is not a part of Lapp gradation but rather a general process that voices and weakens all single stops between voiced sounds (in this case, vowels).

Despite their essential differences, the Baltic-Finnic and Lapp gradations appear to be areally related. The Baltic-Finnic type, which represents a more plausible phonetic change, indicates that early Lapp may have acquired its gradation under Baltic-Finnic influence. The evidence within Baltic-Finnic points to a relatively late, post-Proto-Baltic-Finnic origin. The existence of analogous consonant weakening in various Samoyedic languages (Nganasan, Selkup) is the result of independent innovation.

Length variations in Estonian sounds

Syllable-accent structures. Closely related to the gradation phenomena is the development of syllable-accent structures in Estonian, Livonian, and Lapp. Estonian is known for its unique quantity alternations of three contrastive vowel and consonant lengths—thus, *vara* "early" versus *vaara* "of the hillock" (*aa* = long *ā*) versus *vaara* "hillock (partitive)" (here *aa* = extra-long *â*); *lina* "linen" versus *linna* "of the city" (*nn* is pronounced as two short *n*'s) versus *linna* "into the city" (here *nn* is pronounced as long *n̄* plus short *n*; the contrast with the previous *nn* is not shown in the standard orthography). The extra-quantity contrast is in fact found with all stressed syllable types containing at least one vowel or consonant following its first vowel; thus, *taevas* "sky" (with short *e*) versus *taevas* "in the sky" (with long *ē*); *osta* "buy!" (with short *s*) versus *osta* "to buy" (with long *s̄*), whereas a two-syllable form such as *osa* "part" (*o/sa*) with only a single vowel in the first syllable is incapable of such a quantity contrast. A multitude of analyses of Estonian quantity have been proposed, although not all have recognized the phenomenon as a function of whole syllables bound to stress—in other words, that it is an accent phenomenon. One orthographic dictionary (by E. Muuk), for example, utilizes this principle, placing a grave accent mark before syllables with extra quantity. Otherwise, Estonian orthography marks the three degrees of duration only for stops: *b, d, g* indicate single short (voiceless lenis) stops (*tuba* "room"); *p, t, k* are plain geminates, or double consonants (*tupe* "of the sheath"); and *pp, tt, kk* mark extra-long geminates (*tuppa* "into the room," *tuppe* "into the sheath"). Because the extra quantity is in part tied to an original open next syllable, it frequently operates together with gradation alternations; *e.g., linnu* "of the bird" versus *lindu* "bird (partitive)," with extra quantity.

The syllable quantity accent in Lapp superficially resembles that in Estonian and, like the former, occurs only under stress and is in part conditioned by the openness of the next syllable. In North Lapp (Utsjoki), alternations in paradigms involve three grades of quantity shaping: *mânâm* "I go" (*â* is a Lapp letter for a somewhat rounded *a*) versus *mânna* "he goes" versus *mân'ne* "goer"; *dieđam* "I know" versus *dietta* "he knows" versus *diet'te* "knower"; *juol'ge* "leg" versus *juolge* "of the leg." This series of contrasts shows a three-stage decrease in initial-vowel duration and a three-stage increase in the duration of the first consonant after the first vowel or vowels. The other northern and eastern Lapp languages display similar alterations, but there is considerable diversity in the phonetic details.

Proto-Uralic sentence structure

Grammatical characteristics. The grammatical structures of the various Uralic languages, despite numerous superficial differences, generally indicate a basic Proto-Uralic sentence structure of (subject) + (object) + main verb + (auxiliary verb)—the parenthesized elements are optional, and the last element is the finite (inflected) verb, which is suffixed to agree with the subject in person and number. This pattern has been best preserved in the more eastern languages, especially Samoyed and Ob-Ugric; *e.g.,* Nenets *ťiky pevśumd'o-m saravna t'eńe-vaʔ* "we well remember that evening" (literally, "that evening-[accusative] well remember-we"); Mari *joltaš-em-blak lum tol-mə-m buč-aš tüŋal-ət* "my friends begin to wait for the coming of snow" (literally, "friend-my-[plural] snow coming-[accusative] wait-to begin-they"). This order is common but optional in the languages of central Russia. Lapp, Baltic-Finnic, and Hungarian now show the typical European subject-verb-object order; *e.g.,* Finnish *isä osti talo-n* "father bought a house (-genitive)," Hungarian *János keres egy ház-at* "John seeks a house (-accusative)." Although these more western languages have relatively "free" word order, the object precedes the verb only for special emphasis; *e.g.,* Hungarian *János egy házat keres* "John is looking for a *house* (and not something else)," Estonian *ma ta-lle nuia ei anna* "I won't give *him* a *club*" (literally, "I him-to club not give"). Estonian sentence structure somewhat resembles that of German, with its tendency to place the finite verb in second position while the rest of the verb complex remains at the end of the sentence; *e.g., mehe-d ol-i-d ammu koju jõud-nud* "the men had got home long ago" (literally, "man-[plural] be-[past]-they long-ago home get-[past participle]").

In place of a verb "have," the Uralic languages use the verb "be," expressing the agent in an adverbial (locative or dative) case; *e.g.,* Finnish *isä-llä on talo* "father has a house" (literally, "father-at is house"), Hungarian *Jánosnak van egy ház-a* "John has a house" (literally, "John-to is one house-his"). In Proto-Uralic the copula verb "be" was lacking in simple predicate adjective or noun sentences, although the predicate was probably marked to agree with the subject. The following Hungarian sentences reflect this situation: *a ház fehér* "the house [is] white," *a ház-ak fehér-ek* "the houses [are] white." In Nenets and Mordvin such nonverbal predicates are conjugated for subject agreement and tense in the manner of intransitive verbs; *e.g.,* Nenets *mań xańenadmʔ* "I am a hunter," *pydaŕiˀ xańenadiʔ* "you two are hunters„" *mań xańenadamź* "I was a hunter," *pydaraʔ xańenadać* "You (plural) were hunters." Otherwise, a wide range of grammatical usage is found. In Baltic-Finnic and Lapp the use of a copula verb is obligatory, in Permic it is optional, and in Hungarian the copula is absent only in the 3rd person ("he, she") in a nonpast tense.

Use of negative sentences

Negative sentences in Proto-Uralic were indicated by means of a marker known as an auxiliary of negation, which preceded the main verb and was marked with suffixes that agreed with the subject, and perhaps tense. This is best reflected in the Finnic and Samoyedic languages; *e.g.,* Finnish *mene-n* "I go," *e-n mene* "I don't go," *mene-t* "you go," *e-t mene* "you don't go." Ugric employs undeclined negative particles (*e.g.,* Hungarian *nem*), and in Estonian only negative imperative forms are still conjugated, although colloquial Estonian has initiated a tense distinction; *e.g., ma/sa ei tule* "I/you don't come" and *ma/sa e-s tule* "I/you didn't come."

In Proto-Uralic questions were formed with interrogative pronouns, beginning with **k-* and **m-*, illustrated by Finnish *kuka* "who," *mikä* "what" and Hungarian *ki* "who, *mi* "what." Yes–no questions were formed by attaching an interrogative particle to the verb, as in Finnish *mene-n-kö* "am I going?", *e-n-kö minä mene* "am *I* not going?" (in Finnish, the verb also shifts to initial position). The use of intonation (changes in pitch) in interrogative sentences is currently widespread. In Hungarian it is the only way to form direct yes–no questions, although in indirect questions a particle *-e* is used; *e.g., a házak fehérek?* (with sharply rising intonation of the next to the last syllable, dropping again on the final syllable) "are the houses white?", *nem tudom, fehérek-e a házak* "I don't know whether the houses are white."

Conjunction, the connecting of clauses, phrases, or words, was formerly without the aid of specialized conjunctions. In the modern languages the conjunctions are largely borrowings from Germanic (Finnish *ja* "and") and Russian (Mari *da* "and; in order to," *a* "but," *ńi . . . ni* "neither . . . nor," *jesle* "if"). Both coordination and subordination in sentences are marked by a wide range of constructions, especially by means of infinitive verbs, participles, and gerunds; e.g., Mari *keče peš purgəžan poranan ulmaš* "the weather was very stormy and snowy" (literally, "weather very stormy snowy was"), *ača-ž abašt* "their father and mother" (literally, "father-his mother-their"), *nuno batə-ž-den* "he and his wife" (literally, "they wife-his with"); Finnish *kirja-n lue-ttu-a-ni* "when I had read the book, . . ." (literally, "book-[genitive] read-[past passive participle-partitive case]-my"), *luke-akse-ni kirja-n* "in order for me to read the book" (literally, "read-to-[translative case] my book-[genitive]").

Case suffixes and postpositions were and are used to show the function of words in a sentence. Prefixes and prepositions were unknown in Proto-Uralic. Adjectives, demonstrative pronouns, and numerals originally did not show agreement in case and number with the noun, as is still the case in Hungarian; *e.g., a négy nagy ház-ban* "in the four large houses." Finnish, however, has initiated a case–number agreement system much like that in neighbouring Indo-European languages; *e.g., neljä-ssä iso-ssa talo-ssa* "in the four large houses." The case system of the Proto-Uralic language contained an unmarked nominative case, an accusative, a case of separation (ablative), a locative (essive) case, and a case of direction (lative), plus possibly several others. The modern languages show a range of from three cases in Khant, six in Lapp, 14 in Finnish, up to 16 to 21 for Hungarian (the case status of several suffixes is debatable). The average number of cases is around 12. For the most part, these cases are the same for all nouns (nouns are not classified for gender; and 3rd person pronouns generally do not distinguish between "he, she"), singular and plural, and many are similar in function to English prepositions.

Cases in the modern Uralic languages

The distinction between a case and a preposition is often based on arbitrary and superficial criteria. Postpositions, preposition-like elements placed at the end of words, are generally more independent, and also function as adverbs. They often resemble inflected nouns (*e.g.*, Finnish *takana* "behind": *talo-n takana* "[at] behind the house [-genitive]," *talo-n taka-a* "from behind the house," *taka-osa* "back part").

Table 37: Case Endings in Several Uralic Languages

Finnish	Komi	Hungarian	Nenets	English translation
talo-ssa	*kerka-yn*	*ház-ban*	*xarda-xa-na*	"in (the) house"
talo-i-ssa	*kerka-jas-yn*	*ház-ak-ban*	*xarda-xa- ʔ-na*	"in (the) houses"
talo-sta	*kerka-yś*	*ház-ból*	*xarda-xa-d*	"from (the) house"
talo-i-sta	*kerka-jas-yś*	*ház-ak-ból*	*xarda-xa-t* (from *xa- ʔ-d*)	"from (the) houses"

The original case relationships of essive–lative–ablative form a three-way set of contrasts that has been extended into several parallel series of cases in the modern languages—perhaps under areal influence. For example, Finnish uses essentially the original three in relatively abstract functions (essive, a state of being, *-na*; translative, a change of state, *-ksi*; partitive, a case of separation, [-*t*]*a*), and also adds an *-s-* element to indicate internal relationship (_-ssa_ from *_s_ + _na_ "in"; _-hen,_ or a vowel + _n,_ etc. from *_s_ + _ń_ "into"; _-sta_ "out of"), and an _-l-_ element to indicate external relationship (_-lla_ from *_l_ + _na_ "on, at," _-lle_ from *_l_ + _k_ "onto, to," _-lta_ "off of, from"). Hungarian has nine cases similarly organized into three series of three, the internal set of which (*-ben* "in," *-be* "into," *-ből* "out of") has recently developed from a noun with the meaning "intestines" (*bél*). In Finnish the personal pronouns are declined throughout on a pronoun stem; *e.g.*, *minä* "I," *minu-ssa* "in me," *minu-n* "me (genitive)," and so on. In Hungarian, however, only the nominative and accusative forms are formed this way, and the remaining cases are formed by adding the possessive suffixes to a form of the case marker (sometimes expanded); *e.g.*, *te* "you (singular)," *teged-et* "you (accusative)," *benn-ed* "in you," *belé-d* "into you," *belől-ed* "out of you."

Number in Uralic nouns

The inflection of nouns for number (singular and plural) in the Uralic languages is much looser than in the Indo-European languages. Suffixes for the plural in the various Uralic languages are so diverse as to suggest that early stages of Uralic did not possess a specialized number marker; *e.g.*, Finnish *-t* and *-i-*, Mari *-blak,* Komi *-jas.* A dual-plural distinction ("two" as opposed to "more than two") is found in Lapp, Ob-Ugric, and Samoyedic, but here again the specific elements cannot be traced to a common source. If Proto-Uralic had plural and dual suffixes, they were probably used only with the personal pronouns. In the modern languages personal pronouns often take a plural marker different from that of the nouns, and in Lapp the dual formation is restricted to pronouns and personal affixes.

The category of definiteness (like English "the") is marked in numerous ways in the modern languages and originally appears to have been tied to the manner of number marking in Uralic (plural being reflected by indefiniteness). Hungarian alone has a definite article, *a*(*z*), a demonstrative in origin; Mordvin has three sets of inflectional endings: indefinite, definite singular, and definite plural (*kudo-so* "in a house," *kudo-so-ńt′* "in the house," *kudo-t′ńe-sə* "in the houses"). Nearly all the more eastern members have a definite marker that is identical with the 3rd or 2nd person possessive suffix (Komi *kerka-ys/yd* "the house" or "his/your house").

In possessive constructions the possessor noun precedes the possessed noun, or in the case of a personal pronoun possessor, possessive suffixes are used; *e.g.*, Finnish *isä-n talo* "father's house" (*-n* = genitive, *talo-ni/si* "my/your house"; Hungarian *János ház-a* "John's house" (*-a* = possessive construction marker), *ház-am/ad* "my/your house." Although in earlier stages the possessive suffixes followed the case suffixes, more recent case formations (especially from original postpositions) have led to restructuring of this order; *e.g.*, Finnish *talo-i-ssa-ni* "in my houses," but Hungarian *ház-a-i-m-ban* "in my houses" (*-i-* = plural); Komi *kerka-yd-ly* "for your house" (*-yd-* = "your"), *kerka-śyd* "from your house," where two fixed orders coexist. The Proto-Uralic comparative construction was similar to the Finnish *talo-a iso-mpi* "house-from larg-er" (= "larger than a house"); *cf.* Hungarian *egy ház-nál nagy-obb* "house-by larg-er" (in dialects also *ház-tól* "house-from"); Komi *kerka dor-yś yǰyd-ǰyk* "house by-from larg-er." Parallel "than" type conjunctions are now common in the more western languages; *e.g.*, "larger than a house" in Finnish can also be expressed as *isompi kuin talo* (*kuin* = "than"), and in Hungarian *nagyobb mint egy ház* (*mint* = "than").

Compounding and derivation in word formation

The formation of nouns in Proto-Uralic included compounding (adding two or more words together) as well as derivation by the use of suffixes (word endings). In noun + noun constructions, including titles of address, the qualifying noun came first; *cf.* Hungarian *házhely* "house site," *Szabó János úr* "Mr. John Szabó"; Finnish *taloryhmä* "group of houses," *Sirpa täti* "Aunt Sirpa." The rich system of derived words in Uralic together with the various inflectional suffixes led to relatively long words; *cf.* Finnish *talo-ttom-uude-ssa-ni-kin* "even in my houselessness" (literally, "house-less-ness-in-my-even"), Hungarian *ház-atlan-ság-om-ban* "in my houselessness."

The Proto-Uralic verb was inflected for tense-aspect (*_-pa_ indicated "nonpast," *_-ka_ indicated "perfect nonpast; imperative," *_-ja_ indicated "past") and mood (*_-ne_ indicated "conditional-potential"). The use of auxiliary verbs to indicate tenses was unknown, although Lapp, Baltic-Finnic, and Hungarian now have essentially a Germanic-type tense system, with perfect formations based on the "be" verb; *e.g.*, Finnish *mene-n* "I go," *ole-n men-nyt* "I have gone" ("be-I go-[past participle]"), *men-i-n* "I went," *ol-i-n men-nyt* "I had gone," *men-isi-n* "I would go," *ol-isi-n men-nyt* "I would have gone." Under Germanic and Slavic influence both Estonian and Hungarian have developed separable verbal prefixes with adverbial and aspectual meanings; *e.g.*, Estonian *ära söö-* "eat (perfective)" and *ta sõ-i kala ära* "he ate the fish" versus *ta sõi kala* "he was eating fish," *ta hakkas kala ära söö-ma* "he began to eat (up) the fish"; Hungarian *meg-tanul* "learn" (perfective) and *János megtanul-t magyar-ul* "John learned Hungarian" versus *János tanult magyarul* "John was learning Hungarian," *János tanult meg angolul* "*John* learned English," *János nemetül tanult meg* "John learned *German*" (with special emphasis as indicated).

Proto-Uralic did not have specialized voice markers, such as the Indo-European passive; rather, the function of voice was interwoven with topicalization (a way of indicating the main subject of a sentence), emphasis, and definiteness of the subject and object as well as with verbal aspect. An indefinite subject of an intransitive verb or an indefinite object were marked with the ablative case (*_-ta_), but a definite object took the accusative marker (*_-m_) and other subject situations were unmarked (nominative). This system is best preserved in Finnish: *vesi* (-nominative) *juoksee* "the water is running" versus *vettä juoksee* "there is water running," *juon vede-n* "I will drink the water" (_-n_ is from older *_-m_) versus *juon vettä* "I drink water." (Note that aspect as well as tense is affected by these case distinctions.)

Subjective and objective conjugations

The widespread use of separate subjective and objective conjugations among the Uralic languages (as in Mordvin, Ugric, and Samoyedic) are the result of an original system for singling out the subject or object for emphasis (focus), and not simply a device for object–verb agreement (similar to subject agreement). For example, Nenets *tymʔ xada-v* "*I* killed a deer (focus on the agent)" versus *tymʔ xada-dmʔ*

"I killed a *deer* (focus on the object)," in which *-v* signifies "I . . . it" (the objective conjugation) and *-dm*ˀ signifies "I" (the subjective conjugation). Note also the objective forms *xada-n* "I killed [them]," *xada-r* "you (singular) killed [it]," *xada-d* "you (singular) killed [them]," and so on for nine possible subjects (three persons times singular, dual, plural) times two object numbers (singular and nonsingular [not actually distinguished with 3rd-person subjects]); and the subjective forms *xad-n* "you (singular) killed" and so on, for nine subject agreements. Hungarian similarly opposes definite and indefinite conjugations: two different sets of personal endings are used—one with transitive verbs with definite objects and the other elsewhere; *e.g., olvas-om/od a level-et* "I/you read the letter" versus *olvas-ok/ol egy level-et* "I/you read a letter." Along with its subjective and objective conjugations Khant has added a so-called passive conjugation (*cf. kitta-j-m* "I am being sent," *-j-* = "passive") as an extension of the earlier focus-topicalization system. Mari and Komi have two past tense formations with related function. Again, the westernmost languages have passive constructions similar to those in Slavic and Germanic.

Verbal derivation was richly developed already in Proto-Uralic with a wide variety of verbal nouns, infinitives, and participles. Each of the three tense-aspect markers was apparently used as a participial formative (*cf.* Finnish *lähde* from **läkte-k* "source," *lähtijä* "one who leaves," *lähtevä* from **-pa* "leaving"). Several of the modern languages have made extensive use of their native derivational processes to eliminate foreign loanwords; *e.g.,* for "telephone" Finnish has *puhelin,* which is derived from *puhel-* "talk," just as *soitin* "musical instrument" comes from *soitta-* "to play." The Uralic finite verb originally may have been based on participial constructions parallel to the noun plus predicate adjective sentences (like Hungarian *a ház fehér* "the house [is] white"). Thus, one may reconstruct sentences like **ema tumte-pa* "mother [is] knowing," **ema tumte-pa-ta* "mothers [are] knowing" (with subject number expressed only in the predicate [agreement]) to explain the close similarity of participial and finite verb constructions such as Estonian *tundev ema* "knowing mother," *tundvad emad* "knowing mothers," *ema tunneb* "mother knows," *emad tunnevad* "mothers know." (R.T.H.)

ALTAIC LANGUAGES

The term Altaic includes the languages of the Turkic, Mongolian, and Manchu-Tungus language families. Named after the Altai Mountains, the languages are spoken by more than 105,000,000 people spread over an area that extends from the northeastern region of the Asian continent through the northern and northwestern provinces of China, Mongolia, Central Asia, southern Siberia, the Volga region, and Turkey, down to the Near East and the Balkan Peninsula.

Question of genetic relationship

On the basis of correspondences in vocabulary and structural similarities, several scholars have concluded that the Altaic languages are genetically related and thus use the term Altaic as the name of a language family. Others consider the correspondences and similarities to be only traces of ancient contacts or areal (regional) convergences and reject the genetic relationship of these languages. For them, the term Altaic refers to a language group that displays a certain historical and typological unity. Still others admit the possibility that the languages are related but do not consider the relation provable on the basis of present knowledge.

Attempts have been made to determine further genetic relations of the Altaic languages. The examination of structural and etymological correspondences gave rise to the hypothesis that the Uralic (including Finnish and Hungarian) and Altaic languages are related; this hypothetical group is called the Ural-Altaic language family. But the Ural-Altaic theory has an ever-decreasing number of supporters. Some adherents of the Altaic relationship are seriously considering the possibility of genetic ties to certain ancient strata of the Korean language.

As a result of the historically very active role of the Altaic peoples, their languages are found spread over a large geographical area. Altaic peoples overpowered their present territories in Asia and Europe in succeeding waves. At one time or another they have played a dominant role in the history of China, Iran, Byzantium, the Arab caliphate, and India, and their migrations had effects on the history of eastern Europe as well. Their present political formations in Inner and Central Asia and in the Near East are of great importance.

Languages of the Altaic group. The following tables give information about the literary languages and the major dialects of the three language families, their geographical division, and the number of speakers. Historical connections of the individual languages are also indicated. The names of subdivisions of the language families are of geographical or historical origin, in conformity with scientific traditions.

Because the name Turkish usually referred to a single language—Ottoman Turkish, the idiom spoken in Turkey, the Balkan countries, Cyprus, and elsewhere—the term Turkic is preferred in scientific literature for the whole language family.

On the evidence of certain archaic features in which Chuvash corresponds to the Mongolian languages, adherents of the theory of an Altaic relationship tend to look upon Chuvash as a separate unit among the Turkic and Mongolian languages.

Mutual intelligibility is possible within each of the Turkic language groups, but there are major difficulties in

comprehension among the groups, and understanding is impossible among the speakers of the Yakut, Khalaj, and Chuvash tongues and those of the so-called common Turkic languages.

The name Mongolian is used for the members of the language family taken collectively, as well as for certain idioms spoken in the Mongolian People's Republic (Outer Mongolia) and China (Inner Mongolia). To make an exact distinction between the family and these languages, the latter are sometimes designated by the name Mongol. The reverse use of these terms, however, is also known.

Kalmyk, Mongol, and Buryat (Buriat) are contemporary literary Mongolian languages. There are no great differences among these languages, and mutual intelligibility thus exists, though the possibility of mutual comprehension is decreasing among speakers of isolated and nonwritten dialects.

The census datum for Manchu has an ethnic rather than a linguistic value. It is generally assumed that Manchu must be considered as the language of a minor group, and it is, in fact, almost an extinct language.

There are considerable differences between the northern and southern groups of this family and among the individual languages and dialects of the southern group. Despite the immense geographical area over which they are spread, languages and dialects belonging to the northern group are less differentiated.

LINGUISTIC CHARACTERISTICS

Sound harmony

Phonology. Simplicity is the characteristic feature of the phonological (sound) systems of the Altaic languages. Richness in vowels is compensated for by the scantiness of consonants. In addition, clusters of consonants are rare. Sound harmony is one of the most characteristic features of the Altaic languages. Its essence is that in an individual word only certain combinations of vowels may occur, and, in the case of certain consonants, specific variants must be selected according to the type of vowels in the word. The best known forms of vowel harmony are palatal and labial harmony; *i.e.,* only back (velar) or front (palatal) vowels and rounded (labial) or unrounded (nonlabial) vowels may occur in a word. For example, in Turkish, back vowels include *a, ı, o, u;* front vowels include *e, i, ö, ü;* rounded vowels are represented by *ö, ü, o, u* and unrounded vowels by *a, ı, e, i.* This harmony extends to the suffixes, too, producing variants when added to words belonging to different vowel classes. The change in the vowels of the last two syllables (both suffixes) in the following Turkish words is notable: *at-lar-da* "on the horses," *it-ler-de* "on the dogs," *gör-ür-üm* "I see," *getir-ir-im* "I bring."

Table 40: Manchu-Tungus Languages*

	number of speakers†

Manchu (China)	4,145,000
Nanai (U.S.S.R. 6,000, China 1,000)	7,000
Other dialects (U.S.S.R. 12,000, China 33,000)	45,000
Northern (Tungus) group	
Evenk (U.S.S.R. 12,000, China 7,000, other countries 1,000)	20,000
Lamut, or Even (U.S.S.R.)	7,000
Total	4,224,000

*The geographical location of the language area and data specifying the distribution and number of speakers are given in parentheses. †1981 estimate.

Sound harmony in the Altaic languages is the product of a complicated historical development. The form of vowel harmony varies from one language to another. Sound harmony is less developed in the Manchu-Tungus group, in which it may occasionally reflect an ancient state or special aberration. Adherents of the Altaic relationship maintain that the ancient state of these languages has been characterized by a dynamic stress on the first syllable, while musical tone on the end syllable was the result of a later development. The ancient state seems to be reflected in the contemporary Mongolian tongues and a group of Manchu-Tungus languages; in Turkic and in another group of the Manchu-Tungus languages, stress shifted to the end syllable.

Grammar. From the point of view of grammatical features, there is a great difference between the Altaic languages and the Indo-European languages (which include English, French, and German). Altaic languages are agglutinative; that is, word formation consists of adding suffixes to the word roots. The root may take a large number of suffixes (*e.g.,* Turkish *gel-me-dik-ler-i-nden* "because of their not coming"), though the order of the combination of suffixes is governed by strict rules. While certain suffixes in the Indo-European languages may perform several functions (*e.g.,* Latin *casarum* "of the houses," in which the suffix *-arum* indicates a feminine, plural, genitive form), in the Altaic languages these functions are distributed among separate suffixes (*e.g.,* Turkish *ev-ler-in* "of the houses," which consists of a stem plus a plural suffix plus a genitive suffix).

Altaic languages lack definite articles (such as English "the") and grammatical gender (*e.g.,* German masculine, feminine, and neuter words), and use the singular form of nouns with numerals (*e.g.,* "two girl"). In the Manchu-Tungus languages, a distinction is made in the 1st person plural of the personal pronoun between exclusive ("we"—without you) and inclusive ("we"—with you). The same peculiarity is found in Mongolian and, from the Mongolian influence, in the Turkic languages of Siberia. There are no prepositions in the Altaic languages, but postpositions are used very frequently. For example, an Altaic speaker does not say the equivalent of "until night" or "for John" but rather "night until" and "John for." In the Tungus languages, nominal (noun) inflection has approximately 20 cases, while the Manchu languages show a simpler state, with about five to eight cases. Turko-Mongolian languages also show a simple case system: they have about six to ten cases. Because the plural is expressed by independent suffixes, the case suffixes are identical in singular and plural.

Parts of speech in the Altaic languages

Parts of speech in the Altaic languages are less differentiated than they are in the Indo-European languages; essentially, only nominals (words used as nouns), verbs, and particles (words that are neither nouns nor verbs) may be considered as separate parts of speech. In contrast with the Tungus languages, the Turkic and Mongolian languages do not possess any morphological means, such as specific suffixes, to distinguish between nouns and adjectives. Altaic languages are rich in verbal nominals (nouns, adjectives, and adverbs derived from verbs), as well as in nouns of action, participles, and gerunds; these perform important grammatical functions in Altaic sentences. A conspicuous ancient Altaic peculiarity is that verbal predicative expressions (finite verbs) are of verbal-nominal origin; that is, these verbal formations are in most cases verbal nouns in predicate positions and express their personal relations with added personal or possessive pronouns: *e.g.,* Old Turkic *bil-t-im* "I knew" is literally "having known my," and Old Turkic *bil-ir-biz* "we know" is literally "knowing we." In Altaic languages, there is no word that corresponds to the English "to have." To express this concept, a periphrastic construction (circumlocution) is used; *e.g.,* an Altaic speaker might say "The book is with me" rather than "I *have* the book."

Despite major differences in syntax, there are also significant common Altaic features. The modifier (attribute, appositive), for example, always precedes the modified word (*e.g.,* a noun), and the noun in the genitive case (the possessive) precedes the possessor (*e.g.,* "captain of the ship" is "of the ship, captain"). In the Tungus languages the attribute agrees in number and case with the modified noun. This feature is completely lacking in the Turkic languages, though agreement in number existed in the early periods of Mongolian.

In Altaic sentence structure, subordinate clauses that begin with conjunctions or relative pronouns ("The man *who was bald*") are alien; wherever they appear, they indicate foreign influence. Instead of subordination, coordination by verbal nominals (nouns) serves as a basis for sentence construction. The following Turkish sentences illustrate this feature. *Ahmedin bize gelmesini isterim,* translated as "I want Ahmed to come to us," is literally "I want Ahmed's coming to us"; *Şehre giden otobüs gecikti* "The bus, which goes to the town, was late" is literally "The bus going to the town was late"; *Eve varınca hemen telefon etti* "As soon as he arrived home he telephoned" is literally "Arriving home, he immediately telephoned." As a result of a more varied system of morphology, the Manchu-Tungus languages are characterized by a higher degree of syntactic freedom, while the Turkic and Mongolian languages have a higher degree of syntactic constraints (requirements for the positions of the elements of a sentence) and a simpler system of morphology.

Altaic languages have changed at a slow rate. The archaic character of the contemporary language is particularly conspicuous in the Manchu-Tungus and Mongolian languages. Because of this difference in historical character, one language may provide useful information for the history of another in regard to the development of earlier, supposedly common features.

Vocabulary. During an immense span of space and time, the vocabulary of the Altaic languages has shown a high degree of receptivity. Opponents of the genetic Altaic relationship look upon the ancient common elements of the vocabulary of these languages as loanwords resulting from once-frequent contacts between Turkic and Mongolian and between Turko-Mongolian and Manchu-Tungus. These correspondences in vocabulary show closer ties between the Turkic and Mongolian languages than between the Turko-Mongolian and Manchu-Tungus languages. The oldest loanwords of the vocabulary are connected with the Semitic, Indo-European, and Uralic languages. In the eastern part of the Altaic language area, many loanwords came from the Chinese to the Old Turkic and Middle Mongolian languages, as well as to contemporary Turkic and Mongolian, and also to the Manchu-Tungus languages, particularly to Manchu.

Oldest loanwords from Semitic, Indo-European, Uralic

Through the medium of religious texts translated from Sanskrit, Tocharian, and Sogdian, many loanwords found their way to Uighur and from there to Mongolian. Mongolian also had contacts with the Tibetan language through the Buddhist literature and through certain dialects. A strong linguistic interaction may be observed among the local Turkic and Mongolian languages in Mongolia and southern Siberia and among the Turkic and Iranian languages in Central Asia.

A number of Mongolian words were adopted into the Yakut language, which in turn had contact with the Tungus languages. The spread of the Islāmic religion paved the way for Arabic and Persian loanwords to enter the Turkic languages. Because of relations among the Ottoman Empire, Turkey, and the Western European civilizations, a considerable number of French, Italian, German, and English words were borrowed into Turkish. Russian provided the major part of the vocabulary of modern civilization for the Turkic languages of the U.S.S.R., although there was also considerable influence from other spheres. The Balkan, Anatolian, Caucasian, and certain Uralic languages had only minor influence on the Turkic languages.

In certain Turkic languages, the influence of linguistic contacts goes far beyond the simple borrowing of words. Although in the East the development of the Buddhist translation literature was followed by a comparatively modest linguistic influence by the source languages, the Arabic and Persian influence that followed the adoption of Islāmic religion and culture proved very strong. An avalanche of Arabic and Persian words flooded the vocabulary of the literary languages of the settled Islāmic-Turkic peoples and also filtered into the dialects. This layer of loanwords also led to changes in the structure (*i.e.,* the phonological system and sound harmony) of certain languages. Iranian influence gave rise to similar profound changes in Uzbek. Currently, Russian influence has been greatly intensified by the continuous contact taking place within an identical political and cultural framework and also by the increasingly widespread bilingualism of the Turkic peoples. This process is reflected in the growing number of calques (loan translation words), as well as in syntactic (sentence) structure.

In the course of linguistic contacts, the Altaic languages naturally also exerted a considerable influence on other languages; *e.g.,* Persian, Russian, Finno-Ugric, the Balkan languages.

Earliest Turkic records

Writing systems. The Altaic peoples used a variety of writing systems. The first-known writing of the Turkic peoples is the runic script (named after the Germanic runes), which is most probably of Semitic origin, particularly Aramaic. The first dated texts originate from Inner Asia in the 8th century; they are called the Orkhon inscriptions. Archaeological investigations indicate that this early script was spread over an extremely large area. The Turkic peoples (mainly Uighurs) who settled in the Tarim Basin used Brāhmī and Manichaean scripts in the 8th to 10th century, as well as the Uighur writing, as it developed from the Sogdian cursive writing, from the 8th to 17th century. Nestorian (Christian) Turkic peoples in Central Asia used the Estrangelo script of Syriac origin in the 13th and 14th centuries.

After the adoption of Islām in the 11th century, the Arabic script became the most widespread writing system among the Turkic peoples. In Anatolia, certain linguistic groups or minorities used the Greek alphabet (16th–20th centuries) and the Armenian script (17th–20th centuries). The latter was also employed by the Turkified Armenians in the Ukraine in the 16th and 17th centuries. Between the 16th and 19th centuries, Karaites used the Hebrew script; Latin and Cyrillic writing was introduced to them in the 19th century. In 1929 the Arabic script was replaced in Turkey by Latin writing. Among the Turkic peoples of the U.S.S.R., the Latin script was introduced in the 1920s; in the 1930s it was replaced by the Cyrillic script. Turks living in China, Iran, and the Arab countries still use the Arabic script.

Mongolian script developed from Uighur writing in the 12th century. After some Latin antecedents, it was replaced by the Cyrillic script among the Buryats in 1938 and among the Mongols in 1944. Mongols living in China still use the Mongolian script. The 'Phags-pa or Pa-sse-pa alphabet, introduced on the state's initiative in 1269–72, was based on the Tibetan script and did not take root. It became extinct in a few decades. From the 17th century, the Oyrats used a reformed version of the Mongolian writing, called Oyrat script. After 1917 this writing system was replaced among the Kalmyks by the Cyrillic alphabet; the Latin alphabet was introduced in 1931, and in 1937 the Cyrillic script was reintroduced. Oyrats living in China still use the Oyrat script.

The Manchu script, a reformed or adapted version of Mongolian writing, came into existence in the 17th century; it is probably still used in private life in China. For Manchu-Tungus people living in the U.S.S.R., the Cyrillic script was introduced in 1937–38 after some experiment with the Latin alphabet.

The writings of the Mongolian-speaking Khitans, who ruled in China from the 10th to the 12th century, and those of the Juchens, who ruled in China in the 12th and 13th centuries and who spoke a Manchu-Tungus language, have not yet been definitely deciphered.

HISTORY

Original habitat of the Altaic peoples

The original habitat of the Altaic peoples is supposed to have been on the steppe area bordering on the Altai and Ch'ing-hai mountains between Tibet and China; in the north, it probably stretched to the Siberian taiga region adjacent to the steppe. It is assumed that Tungus peoples lived in the northern and northeastern parts of this area and the Mongols in the central and southeastern parts. Turkic peoples probably inhabited the northwestern and western parts, while the southern and southwestern region was occupied by Hunnic groups. Although the Hun language is not known, Huns are supposed to have spoken an Altaic idiom. In historical times, the Uralic, Indo-Iranian, Sino-Tibetan, and Korean languages have bordered on this Altaic language area.

Advocates of a genetic relationship between the Altaic languages believe that it was probably in the area delineated above that the Proto-Altaic language (*i.e.,* the parent language of the modern Altaic tongues) began to divide into the currently known main groups. Those who oppose the Altaic theory maintain that this area was the scene of contacts among the individual language groups. In either case, from this original habitat, the Altaic peoples moved to their present territories. In the steppe migrations, which were natural consequences of a nomadic way of life and which dramatically changed the ethnic and linguistic map of central Eurasia, the Turkic and Mongolian peoples played the leading role. The Manchu-Tungus peoples' separate migration toward the northeastern Asian taiga and tundra might have taken place in an early period. The south- and southwest-bound migrations of the southern Manchu-Tungus peoples were restricted to the East Asian regions.

The Turkic languages. *Division into two linguistic groups.* It was probably at a very early date that the Turkic languages split into the *z* and *š* group (commonly called *z*-Turkic) and *r* and *l* group (commonly called *r*-Turkic); these groups are so known because of certain regular phonetic contrasts involving those sounds, *e.g., z*-Turkic *yüz,* "hundred," contrasts with *r*-Turkic *śĕr* "hundred"; *š*-Turkic *yaš,* "age," contrasts with *l*-Turkic *śul* "age." The first traces of the *r* and *l* division appeared on the south Russian steppes. It is assumed that the Huns also were speakers of an *r*- and *l*-type Turkic language and that their migration was responsible for the appearance of this language in the West. The *r*- and *l*-type language is now documented only by Chuvash, a language considered as a descendant of a Volga-Bulgarian language. The rest of the Turkic languages are of the *z*- and *š*-type.

The split of the *z*- and *š*-type Turkic languages, which appeared first in Inner Asia and later developed in the presently known language groups and languages, evolved over several centuries.

Literary languages and linguistic records. As was stated above, the earliest known records of the Turkic languages are runic inscriptions left by the Turks in Mongolia. The Uighurs overthrew the Turkish Empire there, and, after the disintegration of their empire in 840, they settled down in the Tarim Basin, where exposure to the Manichaean and Buddhist religions gave rise to a sizable literature, written in various scripts, that flourished from the 9th to the 14th century. In the 11th century, during the rule of the Qarakhanids (the first Turkic representatives of Islām), a new literature came into existence in eastern Turkistan. These literary efforts clearly show the intensification of Arabic and Persian influence, which culminated in the Khwārezmian literature (13th–14th centuries) and the Chagatai literature (15th–16th centuries), as well as in the postclassical products of Chagatai (17th–19th centuries). (Khwārezmian and Chagatai are Middle Turkic languages that possess significant literatures.) Despite the influence exerted by other Turkic language groups, these Inner and Central Asian literary languages exhibit an organic continuity; they might be considered as the antecedents of the contemporary Uzbek and New Uighur literary languages.

Arabic and Persian influence on Turkic literature

The main movement of the Oğuz branch of Turkic peoples from western Turkistan was toward the Caucasus, Iran, Anatolia, and the Balkans. The first continuous records of this language group come from 13th-century Anatolia. Its linguistic material is linked with the contemporary literary language of Turkey (*i.e.,* Turkish). The Azerbaijani and Turkmen languages also have long literary traditions. The first records of the Azerbaijani language date from the 14th century; the Turkmen language came into use only gradually, because the Chagatai language was commonly used instead by writers.

The migration of the Kipchak Turks was toward the south Russian steppes. A 14th-century textbook known as the *Codex Cumanicus,* used by missionaries, constitutes the first record of the languages of these peoples. Linguistic records (*e.g.,* dictionaries, grammars, literary works) of the Kipchaks, who as mercenaries went to Egypt and Syria where they also came into power, date from the 13th to 17th century. Armenian Turks of the Ukraine left remarkable written material from the 16th and 17th centuries. All these Kipchak linguistic records, although they represent languages that have disappeared, are still connected indirectly with the contemporary Kipchak literary languages. Because of the cultural conditions of these peoples, the first records of most of these languages originated in the 20th century.

The remainder of the contemporary Turkic literary languages also developed in the 20th century.

The diffusion of the Turkic peoples over the centuries and the changes in their political and cultural centres were accompanied by the emergence of a number of literary languages. These literary languages are not necessarily the direct antecedents of the contemporary—and recently developed—literary languages. In most cases, only their membership in the same language group (Uighur, Kipchak, Oğuz) may be established, thus indicating an indirect historical connection.

Stages of the languages. On the basis of linguistic records, Turkic languages that were spoken from the 8th to the 10th century are termed Old Turkic, those of the 11th to 15th century are called Middle Turkic, and those of the 16th to 20th century are known as New Turkic languages. To specify the form of the Turkic languages that resulted from language reforms that were instituted in the mid-20th century, it is customary to use the term newest, or modern. The division into periods is based on external facts of these languages rather than the internal history and thus merely gives a practical chronological overview.

The Mongolian languages. Although the Mongolian script probably evolved as early as the 12th century, its earliest known record, the inscription of Yesunke, dates from 1225. The *Secret History of the Mongols,* which was written in all probability in 1240, has been handed down in Chinese transcription. As regards the development of spoken Mongolian, the history of Mongolian is divided into three periods: Old Mongolian (to the 12th century), Middle Mongolian (13th–16th centuries), and New Mongolian (17th–20th centuries). Written Mongolian, which was originally based on a Middle Mongolian dialect, was characterized for centuries by an increasing conservativism in regard to its relation to the spoken language. Its history is divided into such periods as preclassical (13th–16th centuries), classical (17th–20th centuries), and modern (20th century). Classical Mongolian is continued by the contemporary literary Mongol, which is based on the Khalkha Mongol dialect, and by the written language of Mongols living in China.

Stages of Mongolian

The Oyrats created a separate script and literary language in the 17th century. Although this separate language gradually decreased in importance among the eastern Oyrats from the second half of the 18th century, it survived among the western Oyrats (the Kalmyks), and its course of development flowed into the contemporary literary language.

It was not until 1931 that the Buryats began to develop their own literary language. Until then, literate groups had used literary Mongolian.

The Manchu-Tungus languages. Within the Manchu-Tungus language family, only the history of the Manchu language is documented by linguistic records. As a result of the Manchu rule in China (1644–1911/12), Manchu rose to the rank of official language in the country. The earliest Manchu records date from the mid-17th century. Manchu acted as the lingua franca in China's communications with other countries. The downfall of the Manchu rule in China and the gradual Sinicization of the Manchu population ended the influence of the Manchu language. Other literary languages of the Manchu-Tungus language family came to be in the 1930s.

As has been shown, the Altaic languages, unlike the Indo-European languages, have relatively very recent linguistic records—Turkic dating from the 8th century, Mongolian from the 13th century, and Manchu-Tungus from the 17th century. This situation puts limits on what can be learned from comparative historical investigations, making it extremely difficult to settle the problem of the Altaic relationship.

Altaic languages in the 20th century. The development of literary languages became a central problem in the independent political entities of the Altaic peoples that arose after World War I. The languages of the Altaic peoples in the U.S.S.R. underwent a veritable revolution in the 1920s and 1930s. Writing reforms were soon followed by the strengthening of literary languages on the basis of the individual national languages. For several illiterate peoples, new literary languages had to be created for the first time. In Turkey, written and spoken language reforms included, above all, a renewal of the vocabulary; this formed a significant objective of the Turkish president Kemal Atatürk's social program. In the ongoing process of modernization, a new literary language has come into existence. Considerable reform of writing and language also took place in Mongolia.

Creation of new literary languages

The linguistic policy pursued in the mid-20th century had an immense impact on the history of the Altaic languages. These efforts not only saved minor or nonwritten languages from extinction but strengthened the positions of major Altaic languages among the languages of modern civilizations. The linguistic consolidation has considerably contributed to enhancing the political and cultural significance of these peoples.

For information on the literature of the peoples who speak (or have spoken) Altaic languages, see CENTRAL ASIAN ARTS; ISLĀMIC ARTS.

(G.Ha.)

DRAVIDIAN LANGUAGES

The Dravidian language family, as known to date, consists of 23 languages spoken by more than 165,000,000 people in South Asia. In terms of population figures the major languages of the family may be listed in the following order: Telugu, 52,986,000; Tamil, 44,400,000; Kannada (Kannaḍa), also called Kanarese, 27,900,000; Malayalam (Malayālam), 27,500,000; Gondi, 2,460,100; Tulu (Tuḷu), 1,427,000; and Kurukh (Kuruk̲h̲), 1,358,000. The Dravidian languages are spoken in the Republic of India (mainly in its southern, eastern, and central parts), in Sri Lanka (Ceylon), and by settlers in areas of Southeastern Asia, southern and eastern Africa, and elsewhere. Brahui (Brāhuī), with 750,000 speakers in Pakistan, is isolated from all of the other members of the family. The four major languages—Telugu, Tamil, Kannada, and Malayalam—possess independent scripts and literary histories dating from the pre-Christian Era. Now recognized by the constitution of India, they form the basis of the linguistic states of Andhra Pradesh (established as the first Indian linguistic state in 1953), Tamil Nadu, Karnataka (formerly Mysore), and Kerala.

Official use of Dravidian languages

Of the Dravidian languages, Tamil has the greatest geographical extension and the richest and most ancient literature, which is paralleled in India only by that of Sanskrit. Its phonological and grammatical systems correspond in many points to the ancestral parent language, called Proto-Dravidian.

Nothing definite is known about the origin of the Dravidian family. There are vague indigenous traditions about an ancient migration from the south, from a submerged continent in what is now the Indian Ocean. According to some scholars, Dravidian languages are indigenous to India. In recent years, a hypothesis has been gaining ground that posits a movement of Dravidian speakers from the northwest to the south and east of the Indian Peninsula, a movement originating possibly from as far away as Central Asia. Another theory connects the Dravidian speakers with the peoples of the Indus Valley civilization. The Dravidian languages have remained an isolated family to the present day and have defied all of the attempts to show a connection with the Indo-European tongues, Mitanni, Basque, Sumerian, or Korean. The most promising and plausible hypothesis is that of a linguistic relationship with the Uralic (Hungarian, Finnish) and Altaic (Turkish, Mongol) language groups.

As an independent family, the Dravidian languages were first recognized in 1816 by Francis W. Ellis, a British civil servant. The actual term Dravidian was first employed by Robert A. Caldwell, who introduced the Sanskrit word *drāvida* (which, in a 7th-century text, obviously meant Tamil) into his epoch-making *A Comparative Grammar of the Dravidian or South Indian Family of Languages* (1856).

Languages of the family. Tamil is spoken by 39,400,000 people (1981 est.) in the Indian state of Tamil Nadu, by another 2,697,000 in Sri Lanka (Ceylon), by smaller numbers of people in Burma, Malaysia, Indonesia, and Vietnam (about 1,400,000), in East and South Africa (almost 250,000), and by still smaller numbers in Guyana and on the islands of Fiji, Mauritius, Réunion, Madagascar, Trinidad, and Martinique. The earliest literary monuments of the language belong roughly to the 3rd and 2nd centuries BC. There exist a number of local dialects, the major dialect regions being the northern and eastern areas combined, the western area, the southern area (split into at least four major dialects of Madurai, Tirunelveli, Nanjiland, and Ramnad), and Sri Lanka (Ceylon). Correlated with the social position of the speaker are a number of speech forms; a major division occurs between the Brahmin and the non-Brahmin varieties. In addition, there is a sharp dichotomy between the formal language and informal speech.

Dialects and forms of Tamil

Malayalam, which is closely related to Tamil, is spoken in the Indian state of Kerala by some 21,700,000 people. Possessing an independent written script, it also has a rich modern literature. There are at least three main regional dialects (North, Central, South) of Malayalam and a number of communal dialects.

In the Nīlgiris and adjacent regions, several minor tribes speak the following languages: Kota (1,400), Toda (1,145), Badaga (128,500), Irula (Iruḷa) (6,176). The less well-known languages of a number of other tribes may yet be established as independent members of the Dravidian family (*e.g.,* Kurumba, Paṇiya).

Kodagu (Koḍagu), a non-literary language of a mountainous region called Coorg, has 119,000 speakers.

Kannada (Kanarese), which is spoken by 25,700,000 people in the Indian state of Karnataka, exhibits a dichotomy between educated speech and colloquial Kannada; in the latter at least three social dialects are recognizable that may be characterized as Brahmin, non-Brahmin, and Harijan ("untouchable"). A number of regional dialects (among them are Dharwar, Bangalore, and Mangalore) also exist. Kannada has an orthography of its own and an important ancient and modern literature.

To the south of the Kannada territory, more than 1,400,000 people speak Tulu (Tuḷu), a South Dravidian language having no developed written literature.

Telugu (spoken by 52,986,000 people), the official language of the state of Andhra Pradesh, exhibits a dichotomy between the written and the spoken styles, in addition to a number of sharply distinct local and regional dialects (including Telangana, coastal area, Rayalaseema, and a "transitional" zone) and divisions between Brahmin, non-Brahmin, and Harijan speech. The language has its own

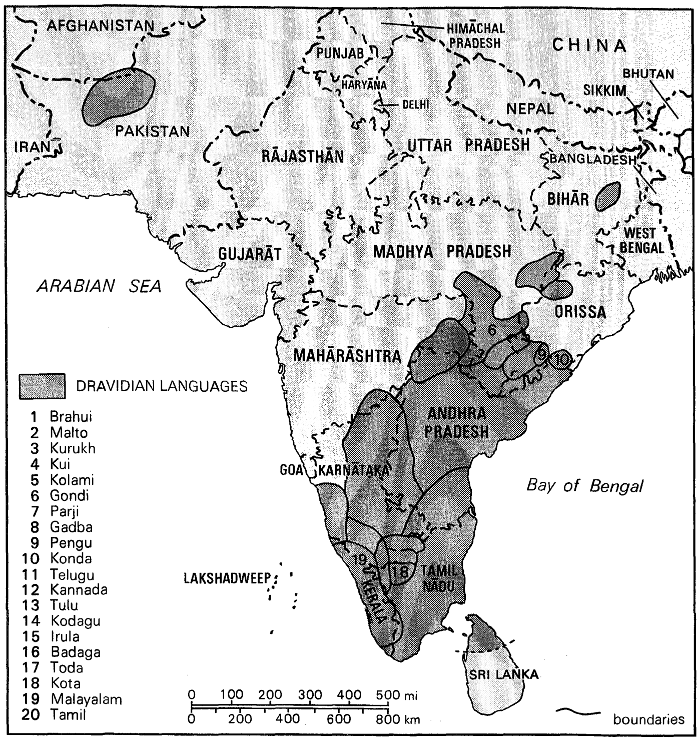

Figure 19: Distribution of the Dravidian languages.

Adapted from Ramanujan and Masica, "Toward a Phonological Typology of the Indian Linguistic Area," *Current Trends in Linguistics*, vol. 5 (1969); Mouton & Co., Publishers, The Hague

script, closely akin to that of Kannada, and an important literary tradition.

In the northern parts of Andhra Pradesh, two tribes speak Kolami (95,000 persons) with its dialect Naikri (Naikṛi), and Naiki (1,800), whereas Parji (170,000) is spoken in Bastar, Madhya Pradesh. In Orissa, Konda (Koṇḍa) is spoken by about 19,000 Konda Doras, and about 3,000 Gadbas speak the three closely related dialects of Ollari, Pottangi, and Poya; Pengu (1,900) and Manda (Manḍa) were discovered only recently, and Naiki of Chānda is also a newly investigated language (since 1961). The Khond tribes of Orissa (890,000) speak two closely related languages, Kui and Kuvi.

In Madhya Pradesh, many groups of Gonds (including about 2,460,000 persons) speak a number of Gondi dialects. To the north, in Bihār, Orissa, and Madhya Pradesh, the Oraon tribe speaks Kurukh (1,358,000), and near the borders of Bihār and West Bengal, 138,000 tribals speak Malto.

The only Dravidian language that is spoken entirely outside India is Brahui, with about 750,000 speakers who live in the Kalāt, Khairpur, and Hyderābād districts of Pakistan.

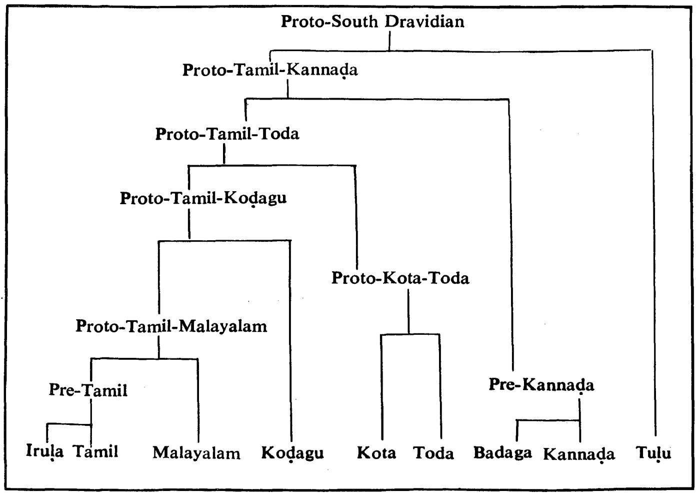

Figure 20: South Dravidian subfamily.

Historical survey of the Dravidian languages. Although in modern times speakers of the various Dravidian languages have mainly occupied the southern portion of India, while those of the Indo-Aryan (Indic) tongues have predominated in north India, nothing definite is known about the ancient domain of the Dravidian parent speech. It is, however, a well-established and well-supported hypothesis that Dravidian speakers must have been widespread throughout India, including the northwest region. This is clear because a number of features of the Dravidian languages appear in the Rigveda, the earliest known Indo-Aryan literary work, thus showing that the Dravidian languages must have been present in the area of the Indo-Aryan ones. The Indo-Aryan languages were not, however, originally native to India; they were introduced by Aryan invaders from the north. Several scholars have demonstrated that pre-Indo-Aryan and pre-Dravidian bilingualism in India provided conditions for the far-reaching influence of Dravidian on the Indo-Aryan tongues in the spheres of phonology (*e.g.*, the retroflex consonants, made with the tongue curled upward toward the palate), syntax (*e.g.*, the frequent use of gerunds, which are nonfinite verb forms of nominal character, as in "by the falling of the rain"), and vocabulary (a number of Dravidian loanwords apparently appearing in the Rigveda itself).

Dravidian features in the Rigveda

Thus a form of Proto-Dravidian, or perhaps Proto-North Dravidian, must have been extensive in north India before the advent of the Aryans. Apart from the survival of some islands of Dravidian speech, however, the process of replacement of the Dravidian languages by the Aryan tongues was entirely completed before the beginning of the Christian Era, after a period of bilingualism that must have lasted many centuries. Finally, the almost universal adoption of Indo-Aryan in the north and of Dravidian in the south has covered up the original linguistic diversity of India.

The circumstances of the advent of Dravidian speakers in India are shrouded in mystery. There are vague linguistic and cultural ties with the Urals, with the Mediterranean area, and with Iran. It is possible that a Dravidian-speaking people that can be described as dolichocephalic (longheaded from front to back) Mediterraneans mixed with brachycephalic (short-headed from front to back) Armenoids and established themselves in northwest India during the 4th millennium BC. Along their route, these immigrants may have possibly come into an intimate, prolonged contact with the Ural-Altaic speakers, thus explaining the striking affinities between the Dravidian and Ural-Altaic language groups. Between 2000 and 1500 BC, there was a fairly constant movement of Dravidian speakers from the northwest to the southeast of India, and in about 1500 BC three distinct dialect groups probably existed: Proto-North Dravidian, Proto-Central Dravidian, and Proto-South Dravidian. The beginnings of the splits in the parent speech, however, are obviously earlier. It is possible that Proto-Brahui was the first language to split off from Proto-Dravidian, probably during the immigration movement into India sometime in the 4th millennium BC, and that the next subgroup to split off was Proto-Kurukh-Malto, sometime in the 3rd millennium BC (see the family tree diagrams, Figures 20–22).

Possible Dravidian and Ural-Altaic contact

Compared to the work done on other language families, the progress in comparative Dravidian studies has been slow and firm results are still meagre. Considerable knowledge has been acquired in comparative phonology (sound systems), but correspondences have been worked out only for the sounds in the roots of words. Very little comparative work has been done on grammatical processes, and complete historical grammars of the literary languages are still lacking. Hence the reconstruction of any feature of the Dravidian protolanguage, with the possible exception of some parts of the phonology, must necessarily be considered very tentative.

The vowel system of Proto-Dravidian consisted of five vowels—**i, *u, *e, *o, *a* (an asterisk denotes an unattested, reconstructed, hypothetical form)—each having

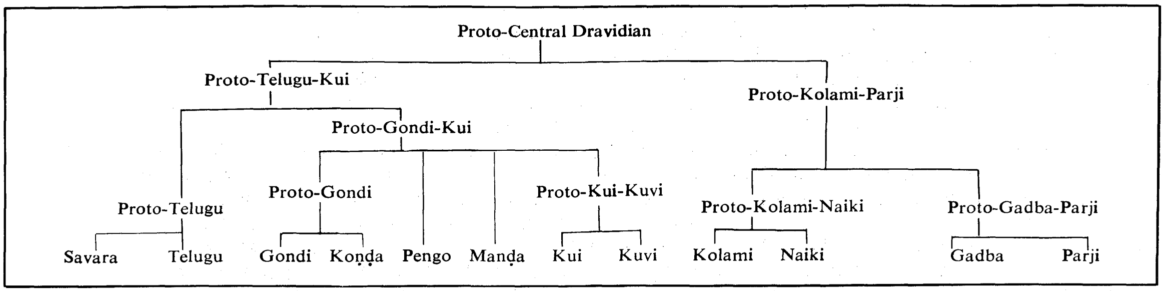

Figure 21: Central Dravidian subfamily.

two quantities, short and long. Relative stability of root vowels seems to have been the rule. The Proto-Dravidian consonant system consisted of obstruants (stops) *p, *t, *ṯ, *ṭ, *c, *k; nasals *m, *n, *ṇ, *ñ; laterals *l, *ḷ; the flap *r; the voiced retroflex continuant *ṛ; and the semivowels *y and *v. The most characteristic feature of the consonantal system was the six positions of articulation for obstruants: labial (with the lips), dental (tongue touching the back of the upper teeth), alveolar (tongue touching the upper gum ridge), retroflex (tip of tongue curled upward toward the palate and back), palatal (body of tongue touching the palate, or roof of the mouth), and velar (back of tongue touching the velum, or soft palate). The retroflex series was very distinctive and important and comprised an obstruant *ṭ, a nasal *ṇ, a lateral *ḷ, and a continuant *ṛ. No consonant of the alveolar or retroflex series began a word. In the final position all of the consonants occurred, but all of the obstruants were followed by an automatic release sound, the vowel *-u. Initial consonant clusters did not occur. There was only one series of obstruant phonemes (distinctive sounds); these sounds were voiceless (produced without vibration of the vocal cords) initially and voiced (with vocal cord vibration) between vowels. All Proto-Dravidian roots were monosyllables.

Proto-Dravidian used only suffixes, never prefixes or infixes, in the construction of inflected forms. Hence, the roots of words always occurred at the beginning. Nouns, verbs, and indeclinable words constituted the original word classes.

Process of Dravidian acculturation in India

During the 1st millennium BC, while Aryanization steadily progressed in north India, the Dravidian-speaking newcomers began to mix with the Negritos and Proto-Australoids in the south; this process of acculturation continued during the period from approximately 1200 to 600 BC. A movement of the Aryans into the south of India began sometime about 1000 BC. Before the 5th century BC, Proto-South Dravidian was probably still one language, but with two strongly marked dialects. Within Proto-Central Dravidian, a similarly deep two-way division also occurred, and as discussed above, North Dravidian must by that time have already been split into the Kurukh-Malto and Brahui subgroups (see the family tree diagrams, Figures 20–22).

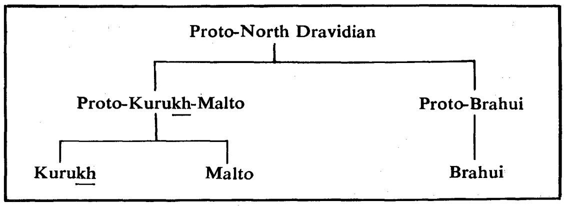

Figure 22: North Dravidian subfamily.

Apart from a possible Dravidian word in the Hebrew text of the Bible (*tukkhiyīm* "peacocks"; *cf.* Tamil *tōkai* "tail of a peacock"), the Dravidian languages enter history in Sanskrit and Greco-Roman texts. The *Cēras,* a south Indian dynasty, are possibly mentioned in the early Sanskrit text *Aitareya Āraṇyaka.* Kātyāyana, a grammarian of the 4th century BC, mentions the countries of Pāṇḍya (Tamil *pāṇṭiya*), Cōla (Tamil *cōla*), and Kerala, or Cēra (Tamil *cēra*); these lands were well known to Kauṭilya (4th century BC), the author of the earliest treatise on statecraft, and mentions of them also appear in the edicts of the great Buddhist leader Aśoka (3rd century BC). The term *drāviḍa* itself is almost certainly a Sanskritization (with an inserted "hypercorrect" *r*) of the earlier Pāli and Prākrit terms *dāmiḷo, damiḷa, dāviḍa,* which must have been derived from the Tamil name of the language, *tamil.* A number of South Dravidian words, almost all of them geographic and dynastic names, occur in such Greco-Roman sources as the *Periplus maris Erythraei* ("Circumnavigation of the Erythraean Sea") of about AD 89 and in the writing of Ptolemaeus of Naukratis of the 2nd century AD; it is also very probable that Western-language terms for rice (compare Italian *riso,* Latin *oryza,* Greek *oryza*) and ginger (compare Italian *zenzero,* German *Ingwer,* Greek *zingiberis*) are cultural loans from Old Tamil, in which they are *arici* and *iñcivēr,* respectively.

Sometime during the reign of Aśoka (3rd century BC), the two South Dravidian languages, Tamil and Kannada, developed into distinct idioms and the two cultures emerged as separate entities; a third major Dravidian linguistic and cultural unit, Telugu, appeared in the Andhra country. In the period from 300 to 100 BC, one of the pre-Tamil dialects (probably that of Madurai) gained prestige and became the standard literary language (*centamil*), the written form of early Old Tamil, which became established in poetic texts and in its earliest grammar, *Tolkāppiyam.* During the same period, about 250 BC, the Aśokan Southern Brāhmī script was adapted for Tamil and was used in short cave inscriptions by Jain monks over a period of several centuries, dating approximately from the 2nd century BC to the 5th century AD.

Early inscriptions and writings

The earliest inscriptions in Kannada may be dated at AD 450; Kannada literature begins with Nṛpatuṅga's *Kavirājamārga,* about AD 850. The oldest Telugu inscription is from AD 633, and the literature begins with the grammarian Nannaya's 11th-century translation of the Sanskrit classic the *Mahābhārata.* In Malayalam, the earliest writings are from the close of the 9th century, and the first literary text is probably the *Bhāṣākauṭalīyam,* AD 1125–1250.

Since these attested beginnings, the four languages—Tamil, Malayalam, Kannada, and Telugu—have been used continuously in administration and literature up to the present day. In addition to possessing an immense wealth of epigraphic and literary texts, they all developed pronounced features of diglossia, a dichotomy between the standardized, formal language and the informal, colloquial speech, which is divided into regional as well as social dialects. In modern times, all of the four cultivated languages have adapted quickly to new conditions resulting from economic, social, and political changes. All of these languages are used in teaching basic courses in science and the arts; and new technological terminology is coined, sometimes based either on English or Sanskrit models, but often on exclusively indigenous linguistic material (in Tamil).

To date, nothing is known about the history of the nonliterary Dravidian languages before their "discovery," which began at the end of the 18th century. The Gonds, however, are mentioned (as Gondaloi) by Ptolemy of Naukratis, writing in the 2nd century AD.

A tendency toward structural and systemic balance and stability is characteristic of the Dravidian group. Nevertheless, there is no doubt about the influence of the other languages of India. Dravidian languages show extensive lexical (vocabulary) borrowing, but only a few traits of structural (either phonological or grammatical) borrowing, from the Indo-Aryan tongues. On the other hand, Indo-Aryan shows rather large-scale structural borrowing from Dravidian, but relatively few loanwords. There is indeed a possibility of Dravidian and Indo-Aryan drawing even closer together in the future; but it is highly doubtful that a new family of languages will develop in such a way that the bases of the contributing groups (*i.e.*, Dravidian and Indo-Aryan) will be completely eliminated through the phenomena of borrowing.

Agglutinating character of Dravidian

Characteristics of the Dravidian languages. Dravidian languages would probably be called agglutinative in the categorization of the 19th-century philologists. An agglutinative language incorporates separate formal units of distinct meaning into a single word. There are some elements of "internal flexion" (*e.g.*, the alternation of short–long root vowels in derived words), however, as well as regular alternations in vowel and consonant quantities within the root. Relatively low receptivity to change results in a slower rate of change than is found in the Indo-European language family.

The degree of phonetic divergence among the Dravidian languages is not very great; hence, etymologies are not too difficult to discover. The territory occupied by Dravidian speakers in India may be characterized as a large dialect area resembling the area of the Romance languages, with numerous boundaries marked by bundles of isoglosses (an isogloss is a boundary line that separates the areas of two differing features of language usage), but also with many isoglosses enclosing more than one language. In any study of Dravidian, therefore, both evolution and diffusion must be taken into account.

Sounds of Dravidian. Compared to the reconstructed system of Proto-Dravidian phonemes (distinctive sounds), the most striking developments in vowels are the gradual elimination of the contrast between *e* and *ē* (long *e*) and *o* and *ō* (long *o*) in Brahui, as a result of the influence of Indo- Aryan languages or Iranian or both; the raising of Proto-Dravidian **e* and **o* to *i* and *u* and the lowering of these protolanguage sounds in Brahui; and the merger of Proto-Dravidian **i* and **u* with **e* and **o* in the South Dravidian languages before a consonant plus the vowel *a*. Also noteworthy are the emergence of retroflex vowels (*i.e.*, centralized vowels "coloured" by neighbouring retroflex consonants) in Kodagu and Irula; the nasalization of vowels, as in colloquial Tamil; the loss of vowels in unaccented noninitial syllables in Toda, Kota, some dialects of Kannada, and Tamil, and the resulting consonant clusters (*e.g.*, Kota *anjrčgčgvdk,* "because of the fact that [someone] will cause [someone] to terrify [someone]"). Metathesis (the transposition of sounds, as in "aks" from "ask") and vowel contraction resulted in initial consonant clusters in Telugu and other Central Dravidian languages—*e.g.*, Tamil *koḻu,* but Kui *krōga,* both meaning "fat."

Consonant changes

Among the most important consonantal developments are the loss of **c*-, a typical South Dravidian phenomenon that seems to be still in progress (*e.g.*, Proto-Dravidian **caṛ*-, but Tamil *alal* "to burn," and *talal* "to glow"); the velarization of **c*- to *k*- in North Dravidian when the sound is followed by ŭ̄ (*e.g.*, Tamil *cuṭu* "be hot," but Malto *kut*- "burn"); the palatalization of Proto-Dravidian **k*- to *c*- before front vowels in Tamil, Malayalam, and Telugu (*e.g.*, **ke*- "red," but Tamil *ce*-); and the replacement of **k*- in North Dravidian by *x* before ă̄, ŏ̄, and ŭ̄ (*e.g.*, Tamil *kal,* but Brahui *xal,* "stone"). The retroflex voiced continuant **ṛ* has been preserved only in the old stages of the cultivated languages and partly in modern Tamil and Malayalam; elsewhere, it merged with *ḷ, ḍ,* and other sounds. Some languages, notably Kannada, developed a secondary *h*-, not inherited from the parent speech (*e.g.*, Tamil *peyar,* Old Kannada *pesar,* but Modern Kannada *hersru,* "name"). According to the Dravidian scholar Bhadriraju Krishnamurti, a laryngeal (or *h*-type of sound) should be reconstructed for some items in Proto-Dravidian.

Problems of accent and intonation still remain to be worked out. Word stress is predictable, always occurring on the radical (initial) syllable and therefore being nondistinctive. The rules of sandhi (change of a sound or sounds as a result of adjacent sounds) are as complicated and delicate as in Sanskrit.

Grammatical features of Dravidian. In grammar, the absolutely prevailing process is suffixation, the addition of suffixes. Grammatical functions are, however, also expressed by composition (the compounding of word elements) and by word order. There are no prefixes or infixes. Suffixes agglutinate (are attached to one another); *e.g.*, Tamil *coṉṉatilēyiruntu* "from what was said" is composed of *col* "say" + *n* "past" + *atu* "3rd person singular neuter" + *il* "locative" + *ē* "emphatic" + *y* (an automatic insertion resulting from a sound rule) + *iruntu* "ablative" (*iruntu* comes from *iru* "be" + *nt/u* "past").

The major word classes are nouns (substantives, numerals, pronouns), adjectives, verbs, and indeclinables (particles, enclitics, adverbs, interjections, onomatopoetic words, echo words). There are two numbers and four different gender systems, the "original" probably having "male: non-male" in the singular and "person:non-person" in the plural. The pronoun has a category "inclusive:exclusive" in the 1st person plural. A characteristic derivation is that of "pronominalized" or "personal" nouns and adjectives; *e.g.*, Old Tamil *iḷai* "youth," *iḷai-y-am* "young-we," *iḷai-y-ar* "young-they."

Negative verbs

Finite forms of the verb (forms showing person and number) are, ultimately, "pronominalized" verb stems; *e.g.*, Tamil *aṭi*-(*y*)-*ēn* ("slave"—1st person singular) "I am a slave"; *nal-(l)-ēn* ("good"—1st person singular) "I am good"; *pō-v-ēn* ("go"—future—1st person singular) "I shall go." The most characteristic feature of the Dravidian verb is a full-fledged negative system: all of the positive verb forms have their corresponding negative counterparts. Verbs are intransitive, transitive, and causative; there are also active and passive forms. The main (and probably original) dichotomy in tense is past:non-past. Present tense developed later and independently in each language or subgroup.

In a sentence, however complex, only one finite verb occurs, normally at the end, preceded if necessary by a number of gerunds. Gerunds and participles, as well as verb-nouns, play an important role. The determining member always precedes the determined; *e.g.*, Tamil *poṉ* "gold" + *nakaram* "city" becomes *poṉṉakaram* "city of gold, golden city." Word order follows certain basic rules but is relatively free.

Vocabulary. In vocabulary, different Dravidian languages were receptive to loanwords in differing degrees. Among the cultivated languages, Tamil has the relatively lowest number of Indo-Aryan loanwords (18–25 percent, according to the style), whereas in Malayalam and Telugu the percentage of loanwords is substantially higher. The most important sources of loanwords have been Sanskrit, Pāli, and Prākrit (with varying degrees of importance in different periods); in modern times Urdu, Portuguese, and English have made significant contributions as well. There was only very limited lexical borrowing from one Dravidian language into another in historical times. Among all of the Dravidian languages, Brahui, in Pakistan, is inevitably the one most influenced by Indo-Aryan and Iranian; in contrast, Toda is probably the one language least influenced by any other idiom. In Tamil, there is currently a very notable and active purifying movement; it aims at removing as many borrowed "Sanskritic" (but not English) vocabulary items as possible. Such purism has not yet occurred in any other of the cultivated Dravidian languages.

Writing. Writing was first developed in Tamil Nadu, sometime about 250 BC, when the Aśokan Southern Brāhmī script was adapted for Tamil. The earliest inscriptions in Tamil script proper are the Pallava copperplates of about AD 550. The Kannada–Telugu script is based on Cālukya (6th century) inscriptions; the Grantha script, used in Tamil Nadu for Sanskrit since the 6th century, was accommodated for Malayalam and Tulu. Apart from these, Tamil has an old cursive script called Vaṭṭeḻuttu, "round script," and Malayalam possesses its own modern cursive form, Koleḻuttu, "rod-script."

(K.V.Z.)

AUSTRO-ASIATIC LANGUAGES

Austro-Asiatic languages are spoken by about 65,600,000 people scattered throughout Southeast Asia and eastern India. The family comprises about 150 languages, most of them having numerous dialects. Khmer, Mon, and Vietnamese are culturally the most important and have the longest recorded history. The rest are languages of nonurban minority groups written, if at all, only recently. The family is of great importance as a linguistic substratum for all Southeast Asian languages.

Main subfamilies

Superficially, there seems to be little in common between a monosyllabic tone language such as Vietnamese and a polysyllabic toneless Munda language such as Mundari of India; every recent study, however, confirms the underlying unity of the family. The date of separation of the three main Austro-Asiatic subfamilies—Munda, Nicobarese, and Mon-Khmer—has never been estimated and must be placed well back in prehistory. Within the Mon-Khmer subfamily itself, 12 main branches are distinguished; glottochronological estimates of the time during which specific languages have evolved separately from a common source indicate that these 12 branches all separated about 3,000 to 4,000 years ago.

Relationships with other language families have been proposed, but, because of the long durations involved and the scarcity of reliable data, it is very difficult to present a solid demonstration of their validity. In 1906 Wilhelm Schmidt, a German priest and anthropologist, classified Austro-Asiatic together with the Austronesian family (formerly called Malayo-Polynesian) to form a larger family called Austric. Paul K. Benedict, a U.S. scholar, extended the Austric theory, to include the Tai-Kadai family of Indochina and Burma and the Miao-Yao family of China, together forming an "Austro-Tai" superfamily.

Regarding subclassification within Austro-Asiatic, there have been several controversies. Schmidt, who first attempted a systematic comparison, included in Austro-Asiatic a "mixed group" of languages containing "Malay" borrowings and did not consider Vietnamese to be a member of the family. On the other hand, some of his critics contested the membership of the Munda group of eastern India. The "mixed group," recently called Chamic, is now considered to be Austronesian. It includes Cham, Jarai, Rhade, Chru, Roglai, and Hroy, and represents an ancient migration of Indonesian peoples into southern Indochina. As for Munda and Vietnamese, the recent works of the German linguist Heinz-Jürgen Pinnow on Kharia and of the French linguist André Haudricourt on Vietnamese tones have shown that both language groups are Austro-Asiatic.

Classification of the Austro-Asiatic languages. The work of classifying and comparing the Austro-Asiatic languages is still in the initial stages. In the past, classification has been done mainly according to geographic location. For instance, Khmer, Pear, and Stieng, all spoken on Cambodian territory, were all lumped together, although they actually belong to three different branches of the Mon-Khmer subfamily.

Khmer and Vietnamese: national languages

Numerically the most important, the Khmer and Vietnamese languages are also the only national languages of the Austro-Asiatic group and are regularly taught in schools and used in the mass media and on official occasions. Speakers of most other Austro-Asiatic languages are under strong social and political pressure to become bilingual in the official languages of the national unit in which they live. Most groups are too small or too scattered to win recognition, and, for many, the only chance of cultural survival lies in retreating to a mountain or jungle fastness, an old Austro-Asiatic tradition.

Phonological characteristics. In order to make general statements about the phonology (sound systems) of Austro-Asiatic languages, it is necessary to exclude Munda and Vietnamese, which, having been under the influence of Indian and Chinese languages, respectively, have acquired very divergent characteristics. The usual Austro-Asiatic word structure consists of a major syllable sometimes preceded by one or more minor syllables. A minor syllable has one consonant and one minor vowel. Most languages have only one type of minor vowel or, sometimes, three (*e.g.*, *a*, *i*, or *u*); others may also have vocalic nasal sounds, which are produced by releasing the breathstream through the nose, or liquids (*l* and *r* sounds) as minor vowels. Major syllables are composed of one or two consonants, followed by one major vowel and usually one final consonant.

Consonants. A typical consonant system for an Austro-Asiatic language would be the following (the symbols used are from the International Phonetic Alphabet):

p	t	c	k	ʔ	
b	d	j	g		
ɓ	ɗ				
m	n	ɲ	ŋ	ı	
w	r	l	s	y	h

Some languages (*e.g.*, Pearic, Semelaic) have an aspirated series of consonants, p^h, t^h, c^h, k^h, in which the sounds have an accompanying audible small puff of air, and many have no voiced stops at all (Monic, Khmer, Pearic). (Stops are consonants made with complete stoppage of the breath stream at some point in the vocal tract; voiced stops such as *b, d,* and *g* are produced with vocal cord vibration, as opposed to voiceless sounds produced without vocal cord vibration.) The imploded ɓ and ɗ are sounds pronounced by briefly drawing the air inward, causing suction, and are not truly voiced; they have sometimes been called pre-glottalized sounds or "semi-voiceless" sounds. These imploded stops are found only in a few branches of Mon-Khmer (*e.g.*, Mon, Khmer, Bahnaric), but it is possible that they existed in the ancestral language, called Proto-Mon-Khmer. Pre-glottalized nasals and liquids (*i.e.*, nasal and liquid sounds preceded by a glottal stop) are also found, sometimes as single distinctive sounds (unit phonemes) and sometimes as consonant clusters. In final position, all consonants except voiced stops can be found, but in several languages (*e.g.*, Mon, Sedang, Palaung) the number of possibilities is more reduced. Final stops are pronounced without release, nasals are often decomposed (*e.g.*, a final *m* becomes pronounced as b^m), and *s* sounds usually tend toward *h* sounds. Palatal consonants (*č* and *ñ*), produced with the blade of the tongue touching the hard palate, are commonly found at the end of words, a feature that sets Austro-Asiatic languages apart from the other languages of South Asia.

Vowels. Also characteristic of the Austro-Asiatic languages is an extraordinary variety of major vowels: systems of 30 to 35 different vowels are not uncommon (Bru has 41 distinctive vowel sounds [phonemes]). Four degrees of height are often distinguished in front and back vowels as well as in the central area. Diphthongs are not rare. Vowel length is usually distinctive: a normal vowel may contrast with an extra-short vowel of the same quality. Nasal vowels are found in several branches of the family, but, in any one language, they do not occur very frequently. A few dialects of Palaung, Wa, and North Bahnaric have a simple tone system, usually high versus low tone, but this is not typical of the Austro-Asiatic family. The Viet-Muong branch is the only one to have developed complex tone systems, probably influenced by non-Austro-Asiatic languages.

Registers, or voice qualities

Much more typical of the Austro-Asiatic family is a contrast between two series of vowels pronounced with different voice qualities, which are called registers. The voice may have a "creaky" register, a "breathy" register, or a normal one. Mon, Khmer, Jeh, Sedang, and some Palaung dialects have a two-way distinction of this sort. There is a controversy regarding the historical origin of the registers. Some believe that they were found in the original Proto-Mon-Khmer language; others, who seem to hold the more likely theory, propose that they are independent innovations in each branch, representing a transitional state from toneless to tonal languages.

Grammatical characteristics. *Morphology.* In morphology (word formation), Munda and Vietnamese again show the greatest deviations from the norm. Munda languages have an extremely complex system of prefixes, infixes (elements inserted within the body of a word), and suffixes. Verbs, for instance, are inflected for person, number, tense, negation, mood (intensive, durative, repetitive), definiteness, location, and agreement with the object. Furthermore, derivational processes indicate intransitive, causative, reciprocal, and reflexive forms. On the other hand, Vietnamese has practically no morphology.

Between these two extremes, the other Austro-Asiatic languages have many common features. (1) Except in Nicobarese, there are no suffixes. A few languages have enclitics, certain elements attached to the end of noun phrases (possessives in Semai, demonstratives in Mnong), but these do not constitute word suffixes. (2) Infixes and prefixes are common, so that only the final vowel and consonant of a word root remain untouched. It is rare to find more than one or two affixes (*i.e.,* prefixes or infixes) attached to one root; thus, because roots are mostly monosyllabic, the number of syllables per word remains very small. (3) The same prefix (or infix) may have a wide number of functions, depending on the noun or verb class to which it is added. For instance, the same nasal infix may turn verbs into nouns and mass nouns into count nouns. Sometimes, these different functions have similar meanings: for instance, reduplication, the repetition of a word or word element, may indicate plurality in nouns and repetition in verbs. This phenomenon may be widespread enough to make the distinction between basic word classes very unclear and questionable. (4) Many affixes are found only in a few fossilized forms and have often lost their meaning. (5) Expressive language and wordplay are embodied in a special word class called "expressives." These are sentence adverbials that describe noises, colours, light patterns, shapes, movements, sensations, emotions, aesthetic feelings, and so on. Some sort of symbolism, perhaps based on synaesthesia, is often observable in these words and serves as a guide for individual coinage of new words. The forms of the expressives are thus quite unstable, and the additional effect of wordplay can create subtle

Use of "expressives"

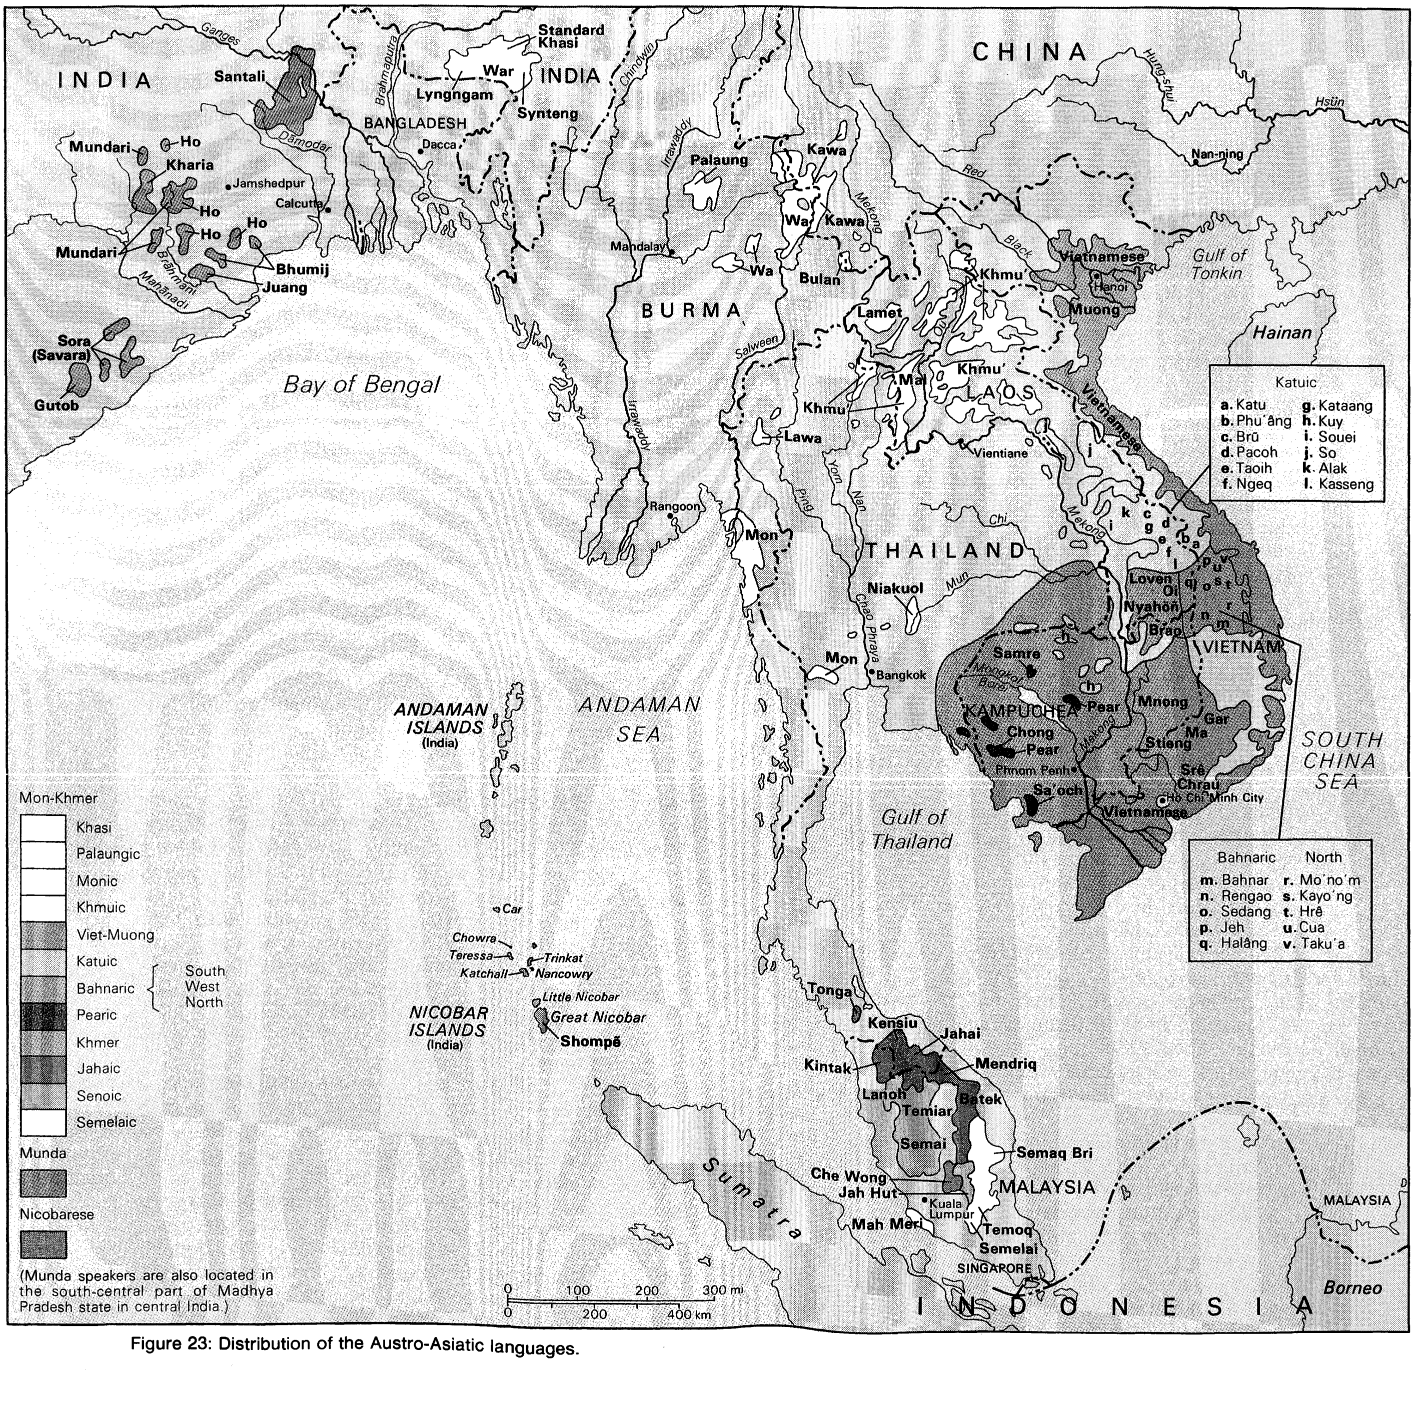

Figure 23: Distribution of the Austro-Asiatic languages.

and endless, sometimes apparently empty, structural variations. For example, in Bahnar one can say /pha:m lɛč həmrɔ:ŋ həmra:ŋ "blood flows həmrɔ:ŋ həmra:ŋ (like a torrent, irregularly)." (The slash marks indicate that the symbols enclosed are phonetic, standing for speech sounds rather than letters of the alphabet. Many Austro-Asiatic languages do not have their own writing systems and are thus recorded here in phonetic transcription.) In Semai /slɯ:č, səslɯ:č, səralɯ:č, səralĩp̄č, srlĩp̄č, shu:č, səsrhu:č, səralĩ:m/ and many other forms describe "a massage on oily skin, a snake's creeps, shiny fur, noodles in Chinese soup," and so on. The Semai forms /ɲəɲ pəlayə:ɲ, lɛɲ kəlayɯ:ɲ, pəɲ pəlayã:ɲ, puɲ pəlayõ:ɲ/ all describe "oversize hat, opening of parachute, flying disc, ridiculously large ears" and are based on wordplay with the borrowed Malay noun /payuŋ/, meaning "umbrella." Spontaneous expression rather than rational communication seems to be the dominant function of these expressives.

Syntax. In syntax, possessive and demonstrative forms and relative clauses follow the head noun; if particles are found, they will be prepositions, not postpositions (elements placed after the word to which they are primarily related), and the normal word order is subject–verb–object. There is usually no copula equivalent to the English verb "be." Thus, an equational sentence will consist of two nouns or noun phrases, separated by a pause; *e.g.*, in Rengao, /klan, bəs kən/, literally "python, snake large," means "a python (is) a large snake" or "phythons (are) large snakes." Predicates corresponding to the English "be + adjective" usually consist of a single intransitive (stative) verb; *e.g.*, in Khmer, /srəy nuh, lˀɔ:/, literally "girl that, pretty," means "that girl (is) pretty." Ergative constructions (in which the agent of the action is expressed not as the subject but as the instrumental complement of the verb) are quite common; *e.g.*, in Semai, the ergative sentence /tlɛy ˀadɛh ˀɲ-caaˀya ˀɛɲ/, literally, "banana this I-ate by me," means "I ate this banana" as does the active sentence: /ˀɛɲ ˀɲ-caaˀ tlɛy ˀadɛh/ "I I-ate banana this." Also noteworthy are sentence final particles that indicate the opinion, the expectations, the degree of respect or familiarity, and the intentions of the speaker. Munda syntax, here again, is radically different, having a basic subject–object–verb word order, like the Dravidian languages of India. It is quite conceivable that the complexity of Munda verb morphology is a result of the historical change from an older subject–verb–object to the present subject–object–verb basic structure.

Word taboos

Vocabulary. The composition of the vocabulary of the Austro-Asiatic languages reflects their history. Vietnamese, Mon, and Khmer, the best known languages of the family, came within the orbit of larger civilizations and borrowed without restraint—Vietnamese from Chinese, Mon and Khmer from Sanskrit and Pāli. At the same time, they have lost a large amount of their original Austro-Asiatic vocabulary. It is among isolated mountain and jungle groups that this vocabulary is best preserved. But there, other disruptive forces are at work. For instance, animal names are subject to numerous taboos; and the normal name is avoided in certain circumstances (*e.g.*, hunting, cooking, eating, and so on). A nickname is then invented, often by using a kinship term ("uncle," "Grandfather") followed by a pun or an expressive adverb describing the animal. In the course of time, the kinship term is abbreviated (thus many animal names begin with the same letter), the normal name is forgotten, and the nickname becomes standard. As such, it is then in turn avoided, and the process is repeated. There are also taboos on proper names; *e.g.*, after a person's death, his name and all words that resemble it are avoided and replaced by metaphors or circumlocutions. These replacements may explain why, for instance, the Nicobarese languages, which seem closely related, have few vocabulary items in common. In general, new words and fine shades of meanings can always be introduced by wordplay and from the open-ended set of expressive forms. Borrowings from the nearest majority languages are also common.

Writing systems and texts. Two Austro-Asiatic languages have developed their own orthographic systems and use them to this day. For both scripts, the letter shapes and principles of writing were borrowed from Indian alphabets (perhaps those of the Pallava kingdom in South India) that were in use in Southeast Asia at the time. Both Austro-Asiatic groups modified these alphabets in their own way, to suit the complex phonology of their languages. The most ancient inscriptions extant are in Old Mon (6th century AD), soon followed by Old Khmer in the early 7th century. The monuments of Burma, Thailand, and Kampuchea (Cambodia) have preserved a large number of official inscriptions in these two languages. Both alphabets were in turn used as models by other peoples for writing their own languages, the Thais using Khmer letters and the Burmese using Mon letters. The religious literature in Old and Middle Mon played a very important role in the spreading of Theravāda Buddhism to the rest of Southeast Asia.

Because Vietnam was a Chinese province for a thousand years, the Chinese language was used and written there for official purposes. In the course of time (perhaps as early as 8th century AD), a system called Chunom (popular writing) was developed for writing the Vietnamese language with partly modified Chinese characters. About 1650, a French missionary, Alexandre de Rhodes, devised a systematic spelling for Vietnamese, based on its distinctive sounds (phonemes). It uses the Latin (Roman) alphabet with some additional signs and several accents to mark tones. In this alphabet, tone was, for the first time in the world, recognized as a functional element and was systematically noted. At first, and for a long time, the use of this script was limited to Christian contexts, but it spread gradually, and in 1910 the French colonial administration made its use official. Now called Quoc-ngu (national language), it is learned and used by all Vietnamese.

Most other Austro-Asiatic languages have been written for less than a century; the literacy rate remains very low with a few exceptions (*e.g.*, Khasi). Dictionaries and grammars have been written only for the most prominent languages, with traditional and often insufficient methods. Many languages (*e.g.*, Wa, Kuy, Stieng, Pacoh, Katu, Muong) have only been described briefly in a few articles, and many more (Semelai, Puman, Sa'och, Riang, Lawa, Mrabri) are to Western scholars little more than names on the map. (G.Di.)

SINO-TIBETAN LANGUAGES

In the narrowest sense, the Sino-Tibetan languages include the Chinese and Tibeto-Burman languages. In terms of numbers of speakers, they comprise the world's second largest language family (after Indo-European), including over 300 languages and major dialects. In a wider sense, Sino-Tibetan has been defined as also including the Tai (or Daic), Karen, and Miao-Yao languages and even the Yenisey-Ostyak (or Ket) language in Northern Siberia (the latter affiliation seems rather untenable). Some linguists connect the Austro-Asiatic or Austronesian (Malayo-Polynesian) families, or both, with Sino-Tibetan; a suggested term for this most inclusive group, which seems to be based on premature speculations, is Sino-Austric. Other scholars see a relationship of Sino-Tibetan with the Athapascan and other languages of North America, but proof of this is beyond reach at the present state of knowledge.

Sino-Tibetan languages were known for a long time by the name of Indochinese, which is now restricted to the languages of Indochina. They were also called Tibeto-Chinese until the now universally accepted designation Sino-Tibetan was adopted. The term Sinitic also has been used in the same sense, as well as for the Chinese subfamily exclusively. (In the following discussion of language groups, the ending *-ic,* as in Sinitic, indicates a relatively large group of languages, and *-ish* denotes a smaller grouping.)

Areas in which the languages are spoken

Sinitic languages, commonly known as the Chinese dialects, are spoken in China and on Taiwan and by important minorities in all the countries of Southeast Asia (by a majority only in Singapore). In addition, Sinitic languages are spoken by Chinese immigrants in many parts of the world, notably in Oceania and in North and South America; altogether there are some 960,000,000 speakers of the Chinese dialects. Sinitic is divided into a number of language groups, by far the most important of which is Mandarin (or Northern Chinese). Mandarin, which includes Modern Standard Chinese (which is based on the Peking dialect), is not only the most important language of the Sino-Tibetan family but also has the most ancient writing tradition still in use of any modern language. The remaining Sinitic language groups include Wu (including Shanghai dialect), Hsiang (Hunanese), Kan (or Kan-Hakka), Yüeh, or Cantonese (including Canton and Hong Kong dialects), and Min (including Fuchow, Amoy, and Taiwanese).

Tibeto-Burman languages are spoken in Tibet and Burma; in the Himalayas, including Nepal, Sikkim, and Bhutan; in Assam and in Bangladesh; as well as by hill tribes all over mainland Southeast Asia and West China (the provinces of Kansu, Tsinghai, Szechwan, and Yunnan). The total number of speakers is approximately 50,000,000. Tibetic (*i.e.,* Tibetan in the widest sense of the word) comprises a number of dialects and languages spoken in Tibet and the Himalayas. Burmic (Burmese in its widest application) includes Lolo, Kachin, Kuki-Chin, the obsolete Hsi-hsia, or Tangut, and other languages. The Tibetan writing system (which dates from the 7th century) and the Burmese (dating from the 11th century) are derived from the Indo-Aryan (Indic) tradition; the Hsi-hsia system (developed in the 11th–13th century in Northwest China) was based on the Chinese model. Pictographic writing systems, which show some influence from Chinese, were developed within the last 500 years by Lolo and Moso tribes in West China. In modern times many Tibeto-Burman languages have acquired writing systems in Roman (Latin) script or in the script of the host country (Thai, Burmese, Indic, and others).

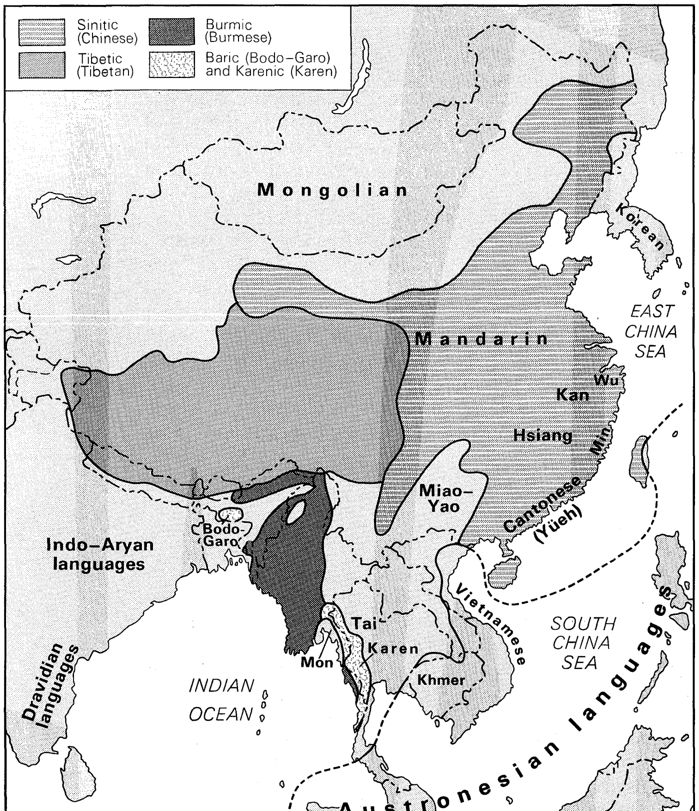

Figure 24: Distribution of the Sino-Tibetan languages.

Table 41: Tibetic (Bodic) Languages*

	areas where spoken	number of speakers†
Bodish-Himalayish		
Bodish languages		
Tibetan (with branches and dialects)	Tibet, Nepal, sporadically in India, in Bhutan, Kashmir, the Chinese provinces of Kansu, Tsinghai, Szechwan, and Yunnan	4,825,000
Central group: Lhasa, Khams, Kagate, Jad, Nyamkat (Mnyamskad)		
Southern group: Spiti, Sharpa, Sikkim, Lhoke		
Northern group: Ambo (Ngambo), Chone		
Western group: Balti, Purik (Burig), Ladākhi (Ladwags)	Kashmir	
Derge	China	
Gurung	central Nepal	
Gyarung (Rgyarung)	Tibet, Szechwan	
Himalayish languages		118,000
Kanauri branch: Thebor, Bunan, Kanashi, Chitkhuli, Manchati, Rangloi, Chamba Lahuli		
Almora branch: Rangkas, and others		
Kirantich (Bahing-Vayu)		440,000
Eastern (Bahing) branch: Bahing, Sunwar, Dumi; Khambu, Rodong, Waiing, Lambichong, Lohorung, Limbu, Yakha	eastern Nepal	
Western (Vayu) branch: Vayu, Chepang; Magari (perhaps)	central Nepal	
Mirish (Mishingish)	Assam, Tibet	
Miri (Mishing)		
Abor		
Dafla (Nyising)		
Other Tibetic languages		
Newari	central Nepal	550,000
Hruso (Hurso, Aka)	northern Assam	
Digaro (Taying)	Assam, Tibet	
Miju	Assam, Tibet	
Dhimal	Darjeeling area	

*Represents approximately 6,000,000 speakers. †Approximate.

CLASSIFICATION

The old literary languages, Chinese, Tibetan, and Burmese, are generally considered as representatives of three major divisions within Sino-Tibetan (Sinitic, Tibetic, and Burmic, respectively). A fourth literary language, Thai, or Siamese (written from the 13th century), represents what was accepted for a long time as a Tai or Daic division of Sino-Tibetan or as a division of a Sino-Tai family (see below *Tai languages*). This relationship is now more commonly considered nongenetic in that most of the shared vocabulary is more likely attributable to a history of cultural borrowing than to derivation from a common ancestral language.

Problems in classifying Karenic

Sinitic stands apart from Tibetic and Burmic on many grounds, including vocabulary, morphology, syntax, and phonology. Most scholars agree on combining Tibetic and Burmic into a Tibeto-Burman subfamily, which also includes Bodo-Garo or Baric but not Karenic. If Karenic is to be considered Sino-Tibetan, it must be set up as an independent member of a Tibeto-Karen group that includes Tibeto-Burman. The special affinities between Sinitic and Karenic (especially in syntax) are secondary. The two closely related language groups, Miao and Yao (also known as Mnong and Man), may be very remotely related to Sino-Tibetan; they are spoken in West China and northern mainland Southeast Asia and may well be of Austro-Tai stock.

In attempting to determine the exact interrelationship of the Tai (Daic) languages, Karenic, Sino-Tibetan, and several other marginal tongues, scholars must keep in mind that a discernible layer of Sino-Tibetan features in a given language may have been superimposed upon an older, non-Sino-Tibetan foundation (called the substratum language). Attributing a language to Sino-Tibetan or to another family may depend entirely on the ability of scholars to identify the substratum. Thus, if Tai is not considered as a division of Sino-Tibetan, it is because the substratum has been recognized as Austronesian; if Karen is still included among Sino-Tibetan languages on some level, it is perhaps because identification of a substratum is still lacking. Among the languages classified as Sino-Tibetan, a great many are known only from word lists or have not yet been described in a way that makes valid comparisons possible.

A number of Sino-Tibetan languages are enumerated below together with their most likely affiliation. Some scholars believe the Tibetic and Burmic divisions to be premature and that for the present their subdivisions (such as Bodish, Himalayish, Kirantish, Burmish, Kachinish, Kukish) should be considered as the classificatory peaks around which the Sino-Tibetan languages group themselves as members or more or less distant relatives. Certainly the stage has not yet been reached in which definite boundaries can be laid down and ancestral Proto-, or Common, Tibetic and Proto-, or Common, Burmic can be undisputedly reconstructed.

Tibetic languages. The Tibetic (also called the Bodic, from Bod, the Tibetan name for Tibet) division comprises the Bodish-Himalayish, Kirantish, and Mirish language groups.

Burmic languages. The Burmic division comprises Burmish, Kachinish, and Kukish.

A number of Tibeto-Burman languages that are difficult to classify have marginal affiliations with Burmic. TheLuish languages (Andro, Sengmai, Kadu, Sak, and perhaps also Chairel) in Manipur and adjacent Burma resemble Kachin; Nung (including Rawang and Trung) in the Kachin State of Burma and in Yunnan has similarities with Kachin; and Mru, with 18,000 speakers in Arakan and Chittagong Hills, Meithei (Mhithlei) in Manipur, and Mikir in Assam seem close to Kukish.

Table 42: Burmic Languages

	areas where spoken	number of speakers
Burmish (Burmese-Lolo)		
Burma branch	west China, Burma, Indochina	
Burmese and its dialects (Rangoon, Mergui, Intha, Danu, Yaw, Taungyo, Tavoyan, Arakanese) Maru (Lawng) Lashi (Letsi) Atsi (Tsaiwa)		22,170,000
Lolo branch		
Northern group: Lisu, Nyi (I), Ahi, Lolopho Southern group: Akha, Lahu Nakhi (Moso)* Ch'iang*		
Kachinish		
Kachin (Chingpaw)†	Kachin State in Burma, adjoining Assam, Shan State, Yunnan	600,000
Kukish (Kuki-Chin)		
Kuki branch	border region of Burma–South Assam–Bangladesh	447,000
Central Kuki: Lushai, Lakher, Lai (Haka) Northern Kuki: Thado, Kamhau (Tiddim), Siyin (Sizang) Southern Kuki: Sho, Yawdwin, Chinbok, Khami (with Khimi)		
Old Kuki: Rangkhol, Bete (Biate); Anai, Lamgang; Aimol, Purum	spoken by dispersed tribes driven out from their original home on the Burma–India border	
Western Kuki: Empeo, Maram, Kwoireng, Kabui, Khoirao‡ Lahupa languages§ (Tangkhul, Maring, Khoibu)		
Nāgā branch	Nāgāland, Burma	776,000
Northern: Ao Eastern group: Rengma, Sema (Simi), Angami		
Lepchā (Rong) ‖	Sikkim, east Nepal, west Bhutan	38,000

*These stand in a not clearly defined relationship to Lolo. †For cultural, non-linguistic reasons, Maru, Lashi, and Atsi are often grouped with Kachin. ‡In Manipur and Cāchār. §These languages are similar to Kuki. ‖ Usually compared to the northern Nāgā branch of Kukish, but has Baric and Himalayish affinities.

Table 43: Baric (Bodo-Garo) Languages

	areas where spoken	number of speakers*
Bodo branch	the plains of Assam	
Bodo		712,000
Dimasa		44,000
Garo branch	the hills of Meghalaya	549,000+
Achik, Abeng, Dacca Atong, Rabha, Ruga, Koch		

*Approximate.

Baric languages. The Baric, or Bodo-Garo, division consists of a number of languages spoken in Assam and falls into a Bodo branch (not to be confused with Bodic-Tibetic, and Bodish, a subdivision of Tibetic) and a Garo branch.

A group of Sino-Tibetan languages in Nāgāland (Nagish, not to be confused with the Nāga branch of Kukish; including Mo Shang, Namsang, and Banpara) has affinities to Baric.

Karenic languages. The Karenic languages of the Karen State of Burma and adjacent areas in Burma and Thailand include the two major languages of the Pho (Pwo) and Sgaw, which have about 2,530,000 speakers. Taungthu (Pa-o) is close to Pho, and Palaychi to Sgaw. There are several minor groups.

Chinese, or Sinitic, languages. Chinese as the name of a language is a misnomer. It has been applied to numerous dialects, styles, and languages from the middle of the 2nd millennium BC. Sinitic is a more satisfactory designation for covering all these entities and setting them off from the Tibeto-Karen group of Sino-Tibetan languages. *Han* is a Chinese term for Chinese as opposed to non-Chinese languages spoken in China. The Chinese terms for Modern Standard Chinese are *kuo-yü* "national language" and *p'u-t'ung-hua* "common language." Reconstructed prehistoric Chinese is known as Proto-Sinitic (or Proto-Chinese); the oldest historic language of China is called Archaic or Old Chinese (8th–3rd century BC), and that of the next period up to and including the T'ang dynasty (618–907) is known as Ancient or Middle Chinese. Languages of later periods include Old, Middle, and Modern Mandarin (the name Mandarin is a translation of *kuan-hua*, "civil servant language"). Through history the Sinitic language area has constantly expanded from the "Middle Kingdom" around the eastern Huang Ho to its present size. The persistence of a common, non-phonetic writing system for centuries explains why the word dialect rather than language has had widespread usage for referring to the modern speech forms. The present-day spoken languages are not mutually intelligible (some are further apart than Portuguese and Italian), and neither are the major subdivisions within each group. The variation is slightest in the western and southwestern provinces and the greatest along the Huang Ho and in the coastal areas. Table 44 gives the percentage of Chinese people speaking each of the various Chinese languages.

Absence of intelligibility between Chinese spoken languages

A vernacular written tradition exists mainly in Peking Mandarin and in Cantonese. An unwritten storytelling tradition has survived in most languages. The school and radio language is Modern Standard Chinese in the People's Republic of China as well as in Taiwan and Singapore. In Hong Kong, Cantonese prevails as the language of education and in the communication media. The same orthographic system is employed, with a few variations, by all speakers of Chinese.

Non-Chinese Sino-Tibetan languages of China include some Lolo-type languages (Burmish)—I (Yi, or Nyi), with over 4,800,000 speakers in Yunnan, Szechwan, Kweichow, and Kwangsi; Hani (or Akha) with about 960,000 speakers in Yunnan; Lisu, with approximately 470,000 speakers in Yunnan; Lahu, with about 270,000 speakers in Yunnan; Moso or Nasi, with 230,000 speakers in Yunnan and Szechwan; and Achang by the Burmese border. Other Sino-Tibetan languages in Yunnan and Szechwan

Table 44: Distribution of the Chinese Languages

	areas where spoken	ratio of speakers to total population (percentage)*
Mandarin	China, north of the Yangtze River; a narrow belt south of the Yangtze River in Kiangsi, Anhwei, and Kiangsu; Szechwan, Yunnan, and Kweichow; small parts of Hunan	70†
Wu	Kiangsu and Chekiang	8+

Yüeh (Cantonese)	Kwangtung, south Kwangsi, Hong Kong, Macau	5
Min§	Fukien, west Kwangtung, Hainan, Taiwan, south Chekiang	4+

*An estimate from the early 1980s gives the following figures of number of speakers: Mandarin 612,750,000; Wu 83,500,000; Min 77,000,000; Kan-Hakka 66,760,000; Yüeh 53,500,000; Hsiang 49,000,000. †Figure applies to those people speaking Mandarin as the mother tongue as opposed to speaking it as a second language. ‡Kan and Hakka are often combined as Kan-Hakka, or simply Kan. §Min is subdivided into Northern Min, in North Fukien with little over 1 percent of the national population, and Southern Min, in the remainder of the Min-speaking area with 3 percent of the population.

(with fewer than 100,000 speakers each) are Kachin and the closely related Tsaiwa; Ch'iang, Gyarung, Hsifan; and Pai (or Minchia, perhaps an Austro-Asiatic language).

COMMON FEATURES

At the end of the 18th and during the first half of the 19th century, a great number of languages were discovered by Western scholars in the Himalayas, in India, and in China, and word lists and grammatical sketches began to appear. By the late 19th century a foundation had been laid for Sino-Tibetan comparative studies.

The comparative method for determining relationships

The comparative method for determining genetic relationship among languages was worked out in detail for Indo-European during the latter part of the 19th century. It rests on the assumption that sound correspondences in related words and morphological units, as well as structural similarities on all levels (phonology, morphology, syntax), can be explained in terms of a reconstructed common language, or protolanguage. The morphology and syntax of the Sino-Tibetan languages are for the most part rather simple and nonspecific, and the length of time involved in the separation of subfamilies and divisions is such that comparative phonological statements are often difficult to reduce to the form of concise correspondences and laws.

A number of features have been delineated as common for the Sino-Tibetan languages. Many of them can be shown to be of a typological nature, the result of diffusion and underlying unrelated language strata.

Typological similarities. *Monosyllabicity.* The vast majority of all words in all Sino-Tibetan languages are of one syllable, and the exceptions appear to be secondary (*i.e.,* words that were introduced at a later date than Common, or Proto-, Sino-Tibetan). Some suffixes in Tibeto-Burman are syllabic, thus adding a syllable to a word, but they have a highly reduced set of vowels and tones ("minor syllables"). These features are, however, shared by contiguous languages not clearly attributable to Sino-Tibetan on the basis of shared basic vocabulary items (namely, Austro-Asiatic and Miao-Yao).

Tonality. Most Sino-Tibetan languages possess phonemic tones, which indicate a difference in meaning in otherwise similar words. There are no tones in Purik, a Western Tibetan language; Ambo, a Northern Tibetan tongue; and Newari of Nepal. Balti, another Western Tibetan language, has pitch differences in polysyllabic nouns. The tones of the remaining Tibetan dialects can be accounted for by positing an original and older system of voiced and voiceless initial sounds that eventually resulted in tones. In several Himalayish languages, tones are linked with articulatory features connected with the end of the syllable or are linked with stress features, as also in Kukish Lepcha.

Most Baric languages lack tones altogether; and Burmic, Karenic, and Sinitic tonal systems can be reduced to two basic tones ultimately probably accounted for by different syllabic endings. What can be reconstructed for Proto-Sino-Tibetan, the language from which all the modern Sino-Tibetan languages developed, are a set of conditioning factors (as, for example, certain syllabic endings) that resulted in tones; the tones themselves cannot be reconstructed. Again the features that encouraged the development of tones are not uniquely Sino-Tibetan; similar conditions have produced similar effects in Tai and Miao-Yao and—within the Austro-Asiatic languages—in Vietnamese and in the embryonic form of two registers (pitches or musical range) also in Cambodian.

Prefixes and suffixes

Affixation. Most Sino-Tibetan languages possess or can be shown to have at one time possessed derivational and morphological affixes—*i.e.,* word elements attached before or after or within the main stem of a word that change or modify the meaning in some way. Many prefixes can be reconstructed for Proto-Sino-Tibetan: *s-* (causative), *m-* (intransitive), *b-*, *d-*, *g-*, and *r-*, and many more for certain language divisions and units. Among the suffixes, *-s* (used with several types of verbs and nouns), *-t,* and *-n* are inherited from the protolanguage. The problem of whether Proto-Sino-Tibetan made use of *-r-* and *-l-* infixes (besides perhaps semivocalic infixes) has not been solved. Whether clusters containing these sounds were the result of prefixation to roots beginning in *r* and *l* (and *y*) or came about through infixation is not clear.

Initial consonant alternation. Voiced and voiceless initial stops alternate in the same root in many Sino-Tibetan languages, including Chinese, Burmese, and Tibetan (voiced in intransitive, voiceless in transitive verbs). The German Oriental scholar August Conrady linked this morphological system to the causative *s-* prefix, which was supposed to have caused devoicing of voiced stops. (Voicing is the vibration of the vocal cords, as occurs, for example, in the sounds *b, d, g, z,* and so on. Devoicing, or voicelessness, is the pronunciation of sounds without vibration of the vocal cords, as in *p, t, k, s*). Such alternating of the initial consonant cannot itself be reconstructed for the protolanguage.

Vowel alternation. The morphological use of vowel gradation (called ablaut) is well-known from Indo-European languages (*e.g.,* the vowel change in English "sing, sang, sung") and is found in several Sino-Tibetan languages, including Chinese and Tibetan. In Tibetan the various forms of verbs are differentiated in part by vowel alternation; in Sinitic some related words (known as word families) are kept apart by vowel alternation. A conditioning factor outside the vowel (perhaps stress or sandhi, the modification of a sound according to the surrounding sounds) may have been responsible for the Sino-Tibetan ablaut systems.

Indistinct word classes. Especially in the older stages of Sino-Tibetan, the distinction of verbs and nouns appears blurred; both overlap extensively in the Old Chinese writing system. Philological tradition as well as Sinitic reconstruction show, however, that frequently when the verb and the noun were written alike, they were pronounced differently, the difference manifesting itself later in the tonal system. Verbs and nouns also used different sets of particles. In this respect, Chinese resembles Tai and Austro-Asiatic, whereas Tibetan is more similar to the Altaic languages (for example, Turkish, Mongol).

Classifiers for nouns

Use of noun classifiers. The Sino-Tibetan noun is typically a collective term, designating all members of its class—*e.g.,* "man" meaning "all human beings." In a number of modern Sino-Tibetan languages, such a noun can be counted or modified by a demonstrative pronoun only indirectly through a smaller number of non-collective nouns, called "classifiers," in constructions such as "one *person* man," "one *animal* dog," and so on, much like parallel cases in Indo-European (in English, "one head of cattle"; in German, *ein Kopf Salat* "one head of lettuce"). The phenomenon is absent in Tibetan and appears late in Burmese and Chinese. Furthermore, classifiers are not exclusively Sino-Tibetan; they exist also in Miao-Yao, Tai, Austric, and Japanese. In Classical Chinese, Tai, and Burmese, the classifier construction follows the noun; in modern Chinese, as in Miao-Yao, it precedes it. Classifiers are of later origin and do not belong to Proto-Sino-Tibetan.

Word order. Although the word order of subject–object–verb and modified–modifier prevails in Tibeto-Burman, the order subject–verb–object and modifier–modified occurs in Karenic. In this respect Chinese is like Karen, although Old Chinese shows remnants of the Tibeto-Burman word order. Tai employs still another order: subject–verb–object, and modified–modifier, like Austric but unlike Miao-Yao, which follows the Karen and Chinese model. Word order, even more than any of the other distinguishing features, points to diffusion from several centres, or to unrelated substrata.

Phonological correspondences. The hypothesis that the Sino-Tibetan languages are all related and derive from a common source depends on phonological correspondences in shared vocabulary more than on any other argument. It is ironic that the clearest and most convincing results should have been obtained from studies of the Sinitic-Tai similarities, which probably do not indicate a true case of genetic relationship. In 1942 it was shown that most of the words in this grouping were cultural loans (then thought of as Chinese loanwords in Tai, now believed to a very large extent to be borrowings in the opposite direction).

A comparison of Old Chinese and Old Tibetan made by Walter Simon in 1929, although limited in some ways, pointed to enough sound resemblances in important items of basic vocabulary to eliminate the possibility of coincidental similarities between unrelated languages. A few examples of similar words in Old Tibetan and Old Chinese, respectively, follow: "bent," *khyog* and *khyuk;* "eye," *mig* and *myok;* "friend," *grogs* and *gyug;* "kill," *gsod* and *sat;* "die" *shi* and *syər;* "sun," *nyi* and *ńye;* "life," *srog* and *serŋ*. The U.S. linguist Paul Benedict brought in material from other Sino-Tibetan languages and laid down the rule that the comparative linguist should accept perfect phonetic correspondences with inexact though close semantic equivalences in preference to perfect semantic equivalences with questionable phonetic correspondences. New material and competent descriptions later made it possible to reconstruct important features of common ancestral languages within major divisions of Sino-Tibetan (notably Lolo, Baric, Tibetic, Kachin, Kukish, Karenic, Sinitic).

Chain of interrelated languages

Interrelationship of the language groups. The position of Proto-Sino-Tibetan can be defined in terms of a chain of interrelated languages and language groups: Sinitic is connected with Tibetic through a body of shared vocabulary and typological features, similarly Tibetic with Baric, Baric with Burmic, and Burmic with Karenic. The chain continues at both ends, connecting Sinitic to Tai and Tai to Austronesian (Malayo-Polynesian) and also connecting Karenic with Austro-Asiatic. Considerations of basic vocabulary versus cultural loans and diffusion versus inheritance have led scholars to believe that only the members of the chain from Sinitic to Karenic share a common ancestral language; especially Sinitic and Karenic are under suspicion for containing only superstrata of Sino-Tibetan origin.

Proto-Tibeto-Burman was monosyllabic. Some grammatical units may have had the form of minor syllables before the major syllable (**ma-*, **ba-*) or after the major syllable (*-*ma*, *-*ba*). (An asterisk [*] indicates that the form it precedes is unattested and has been reconstructed as a possible ancestral form.) The consonants were three voiceless stops (*p, t, k*), which were aspirated in absolute initial position, three voiced stops (*b, d, g*), and three nasal sounds (*m, n, ŋ* [as the *-ng* in "sing"]). There were five continuant sounds (*s, z, r, l,* and *h*) and two semivowels (*w, y*). In final position there was only one set of stops, but there were a number of initial and final clusters mainly resulting from the addition of prefixes and suffixes. Three degrees of vowel opening existed with two members in each: *i* and *u, e* and *o, a* and *aa* (short and long *a*). Length may have been relevant also with the *i* and *u* and *e* and *o* vowels. The conditioning factors that led to the development of tones can be shown to have been voiced–voiceless contrast in initial and final consonants and consonant clusters. Because the conditioning factors were involved with morphological process (affixation and consonant alternation), tonal systems could also acquire certain grammatical or structural functions. An independent morphological system was vowel alternation.

The sound system of Proto-Karenic appears closely related to that of Proto-Tibeto-Burman. The tonal classes can be reduced to two, which connect Karen to Burmic, Sinitic, Tai, and Miao-Yao.

Greater dissimilarity is encountered with respect to Proto-Sinitic. The contrast of aspirated and unaspirated voiceless stops in initial position is most likely the result of lost initial cluster elements as in Proto-Tibeto-Burman. The voiced stops also possess the aspirated–unaspirated distinction. Unlike Tibeto-Burman, two series of stops in syllable final position are posited for Old Chinese, but whether the contrast involved aspiration or voicing is not clear. One series is in general without an exact correspondence in Tibeto-Burman languages, but Burmish Maru and Kuki-oid Mru both have final stops in a number of these words. Similar isolated cases are found in Tibetan and in Tai.

Old Chinese has two more relevant points of articulation, or sound-producing positions of the mouth, than Proto-Tibeto-Burman: palatal (in which the tongue surface touches the palate) and retroflex (in which the tip of the tongue is curled upward toward the palate). But these two types of sounds may be explained as the result of influence from lost Proto-Sinitic medical sounds (a palatal *-y-* and a retroflex *-r-*). The relationship between these specific medial sounds and similar elements in Tibeto-Karen is, however, not certain. Dental affricate sounds in Old Chinese, which begin as stops with complete stoppage of the breath stream and conclude as fricatives with incomplete air stoppage and audible friction, can at least be explained partly as metathesized (transposed) forms of prefix *s-* plus a dental sound in Proto-Sinitic (*e.g., st* changes to *ts*). Old Chinese possessed initial consonant clusters containing *-l-* as a second element, so Proto-Sinitic can reasonably be supposed to have had the same three medial elements as Proto-Tibeto-Burman: *-y-*, *-l-*, and *-r-*. There are few, if any, traces in Old Chinese of the more complicated clusters and the minor syllables of Tibeto-Burman.

Vowel system of Old Chinese

The vowel system of Old Chinese as reconstructed (1940) by the linguist Bernhard Karlgren to account especially for the language of the "Classic of Poetry" (a collection of poetry, entitled the *Shih Ching,* from around 800–600 BC) seems surprisingly complicated as compared to that of later Sinitic and to that of Proto-Tibeto-Burman. Probably some of the vowels were in reality diphthongs or combinations of vowels plus consonants.

As in Karen and Burmese-Loloish, the tones of Sinitic can be reduced to two (the modern Sinitic languages have from two to as many as eight or nine). Monosyllabicity of roots and morphological affixation were characteristic features of Proto-Sino-Tibetan as of Proto-Tibeto-Karen.

CHARACTERISTICS OF THE MODERN CHINESE LANGUAGES

All modern Sinitic languages—*i.e.,* the "Chinese dialects"—share a number of important typological features. They have a single syllabic structure of the type consonant–semivowel–vowel–semivowel–consonant. Some languages lack one set of semivowels, and, in some, gemination (doubling) or clustering of vowels occurs. The languages also employ a system of tones (pitch and contour) and sometimes glottal features and occasionally stress. For the most part, tones are lexical (*i.e.,* they distinguish otherwise similar words); in some languages tones also carry grammatical meaning. Non-tonal grammatical units (*i.e.,* affixes) may be smaller than syllables, but usually meaningful units consist of one or more syllables. Words can consist of one syllable, of two or more syllables each carrying an element of meaning, or of two or more syllables that individually carry no meaning. For example, Modern Standard Chinese *t'en* "sky, heaven, day" is a one-syllable word; *jih-t'ou* "sun" is composed of *jih* "sun, day," a word element that cannot occur alone as a word, and the noun suffix *t'ou;* and *hu-t'ier* "butterfly" consists of two syllables, each having no meaning in itself (this is a rare type of word formation). The Southern languages have more monosyllabic words and word elements than the Northern ones.

Sinitic grammatical characteristics

The Sinitic languages distinguish nouns and verbs with some overlapping, as do Sino-Tibetan languages in general. There are noun suffixes that form different kinds of nouns (concrete nouns, diminutives, abstract nouns, and so on), particles placed after nouns indicating relationships in time and space, and verb particles for modes and aspects. Adjectives act as one of several kinds of verbs. Verbs can occur in a series (concatenation) with irreversible order (*e.g.*, the verbs "take" and "come" placed next to one another denote the concept "bring"). Nouns are collective in nature, and only classifiers (see above) can be counted and referred to singly. Specific particles are used to indicate the relationship of nominals (*e.g.*, nouns and noun phrases) to verbs, such as transitive verb–object, agent–passive verb; in some of the languages this system forms a sentence construction called ergative, in which all nominals are marked for their function and the verb stays unchanged. Final sentence particles convey a variety of meanings, such as "question, command, surprise, new situation." The general word order of subject–verb–object and complement and modifier–modified is the same in all the languages, but the use of the preposed particles and verbs in a series varies considerably. Grammatical elements of equal or closely related values in various languages are very often not related in sounds.

The Sinitic languages fall into a Northern and a Southern group. The Northern languages (or Mandarin dialects) are closer to each other than the Southern ones (Wu, Hisiang, Kan, Yüeh, Min).

Modern Standard Chinese (Mandarin). Modern Standard Chinese is based on the Peking dialect, which is of the Northern, or Mandarin, type. It employs about 1,300 different syllables. There are 22 initial consonants, including stops (made with momentary, complete closure in the vocal tract), affricates (beginning as stops but ending with incomplete closure), aspirated consonants, nasals, fricatives, liquid sounds (*l, r*), and a glottal stop. The medial semivowels are *y* (*i*), ɥ (*ü*) and *w* (*u*). In final position, the following occur: nasal consonants, *ṛ* (retroflex r), the semivowels *y* and *w*, and the combinations ŋ*r* and *wr*. There are nine vowel sounds, including three varieties of *i* (retroflex, apical, and palatal). Several vowels combine into clusters.

The four tones of Mandarin

There are four tones: (1) high level; (2) high rising crescendo; (3) low falling diminuendo with glottal friction (with an extra rise from low to high when final); (4) falling diminuendo. Unstressed syllables have a neutral tone, which depends on its surroundings for pitch. Tones in sequences of syllables that belong together lexically and syntactically ("sandhi groups") may undergo changes known as tonal sandhi, the most important of which causes a third tone before another third tone to be pronounced as a second tone. The tones influence some vowels (notably *e* and *o*), which are pronounced more open in third and fourth tones than in first and second tones.

A surprisingly low number of the possible combinations of all the consonantal, vocalic, and tonal sounds are utilized. The vowels *i* and *ü* and the semivowels *y* and ɥ never occur after velar sounds (*e.g., k*) and occur only after the palatalized affricate and sibilant sounds (*e.g., tŝ*), which in turn occur with no other vowels and semivowels.

There are many alternative interpretations of the distinctive sounds of Chinese; the interaction of consonants, vowels, semivowels, and tones sets Modern Standard Chinese apart from many other Sinitic languages and dialects and gives it a unique character among the major languages of the world. The two most widely used transcription systems (romanizations) are Wade-Giles (first propounded by Sir Thomas Francis Wade in 1859 and later modified by Herbert A. Giles) and the official Chinese transcription system today, known as the *pinyin zimu* ("Pinyin phonetic spelling") or simply Pinyin (adopted in 1958). Table 45 presents the romanizations of both the Wade-Giles and the Pinyin systems. In Wade-Giles, aspiration is marked by ' (*p' t'*, and so on). The semivowels are *y, yü,* and *w* in initial position; *i, ü,* and *u* in medial; and *i* and *u* (but *o* after *a*) in final position. Final retroflex *r* is written *rh.* The tones are indicated by raised figures after the syllables (^{1}, ^{2}, ^{3}, ^{4}).

The Pinyin system indicates unaspirated stops and affricates by means of traditionally voiced consonants (*e.g., b, d*) and aspirated consonants by voiceless sounds (*e.g., p, t*). The semivowels are *y, yu,* and *w* initially; *i, iu,* and *u* medially; and *i* and *u* (*o* after *a*) finally. Final retroflex *r* is written *r.* The tones are indicated by accent markers, 1 = -, 2 = ´, 3 = ˘, 4 = `, (*e.g., mā, má, mă, mà* = Wade-Giles *ma*^{1}, *ma*^{2}, *ma*^{3}, *ma*^{4}).

Wade-Giles is used in the following discussion of Modern Standard Chinese grammar.

Grammatical features of modern standard Chinese

The most common suffixes that indicate nouns are *-erh* (as in *ch'ang-erh* "song"; *cf. ch'ang* "sing"), *-tzu* (as in *fang-tzu* "house"), and *-t'ou* (as in *mu-t'ou* "wood"). A set of postposed noun particles express space and time relationships (*-li* "*inside,*" *-hou* "after"). An example of a verbal affix is *-chien* in *k'an-chien* "see" and *t'ing-chien* "hear." Important verb particles are *-le* (completed action), *-kuo* (past action), *chih* or *-che* (action in progress). The directional verbal particles *-lai* "toward speaker" and *-ch'ü* "away from speaker" and some verbal suffixes can be combined with the potential particles *te* "can" and *pu* "cannot"—*e.g., na-ch'ü-lai* "take out," *na-pu-ch'ü-lai* "cannot take out"; *t'ing-chien* "hear," *t'ing-te-chien* "can hear." The particle *te* indicates subordination and also gives nominal value to forms for other parts of speech (*e.g., wo* "I," *wo-te* "mine," *wo-te shu* "my book," *lai* "to come," *lai-te* "coming," *lai-te jen* "a person who comes"). The most important sentence particle is *le,* indicating "new situation" (*e.g., hsia-yü-le* "now it is raining," *pu-lai-le* "now there is no longer any chance that he will be coming"). *Ko* is the most common noun classifier (*i* "one," *i-ko-jen* "one person"); others are *so* (*i-so-fang-tzu* "one house") and *pen* (*liang-pen-shu* "two books").

Adjectives can be defined as qualitative verbs (*hao* "to be good") or stative verbs (*ping* "to be sick"). There are equational sentences with the word order subject–predicate—*e.g., wo-ihih pei-ching-jen* "I am a Peking-person (*i.e.,* a native of Peking)"—and narrative sentences with the word order subject (or topic)–verb–object (or complement)—*e.g., wo ch'ih-fan* "I eat rice," *wo chu tsai pei-ching* "I live in Peking." The proposed object takes the particle *ba* (*wo da ta* "I beat him," *wo ba ta da le yi dun* "I gave him a beating"), and the agent of a passive construction takes *bei* (*wo bei ta da le yi dun* "I was given a beating by him").

Standard Cantonese. The most important representative of the Yüeh languages is Standard Cantonese of Canton, Hong Kong, and Macau. It has fewer initial consonants than Modern Standard Chinese (*p, t, ts, k* and the corresponding aspirated sounds *ph, th, tsh, kh*; *m, n,* ŋ; *f, s, h*; *l, y*), only one medial semivowel (*w*), more vowels than Modern Standard Chinese, six final consonants (*p, t, k, m, n,* ŋ), and two final semivowels (*y* and *w*). The nasals *m* and ŋ occur as syllables without a vowel.

Cantonese tonal system

There are three tones (high, mid, low) in syllables ending in *-p, -t,* and *-k*; six tones occur in other types of syllables (mid level, low level, high falling, low falling, high rising, low rising). Two tones are used to modify the meaning of words (high level °, and low-to-high rising *), as in *yin*° "tobacco," but *yin* "smoke" and *nöy** "daughter," but *nöy* "woman." Some special grammatical words also have the tone °. There is no neutral tone and little tonal sandhi.

There are more than 2,200 different syllables in Standard Cantonese, or almost twice as many as in Modern Standard Chinese. The word classes are the same as in Modern Standard Chinese. The grammatical words, although phonetically unrelated, generally have the same semantic value (*e.g.*, the subordinating and nominalizing particle *kε*, Modern Standard Chinese *te*; *m* "not," Modern Standard Chinese *pu;* the verbal particle for "completed action" and the sentence particle for "new situation," both *le* in Modern Standard Chinese, are Standard Cantonese *tsɔ* and *lɔ,* respectively).

Min languages. The most important Min language is Amoy from the Southern branch of Min. The initial consonants are the same as in Standard Chinese. There are

*Velar, heavily aspirated *h*. †*j* and *ch* in *j*eer and *ch*eap are followed by front vowels; *j* and *ch* in *j*ug and *ch*ug are followed by back vowels. ‡Written *tz* before *ŭ*. §Written *tz'* before *ŭ*. ‖Written *ss* or *sz* before *ŭ*. ¶Retroflex *r*, which is pronounced with tongue at hard palate, slightly curled back. ♀In U.S., not British, pronunciation. ♁Written *o* after *k, kh, h*. □Occurs only after *ch, ch', sh, j*. ◇Occurs only after *tz, tz', ss (sz);* standard Wade-Giles uses *ŭ*. ▲Written without umlaut after *j, a, x*. +Retroflex *r*, with tongue at hard palate, slightly curled back. ⊕Written *u* after *y*. **Written *uo* after *k, k', h, sh*. ††Written *uei* after *k, k'*.

two semivowels (*y, w*), six vowels and several vowel clusters, plus the syllabic nasal sounds *m* and *ŋ* functioning as vowels, the same semivowels as in Standard Cantonese, and, in addition, a glottal stop (ʔ) and a meaning-bearing feature of nasalization, as well as a combination of the last two features. There are two tones in syllables ending in a stop, five in other syllables. Tonal sandhi operates in many combinations.

Fuchow is the most important language of the Northern branch of Min. The very extensive sandhi affects not only tones but also consonants and vowels, so that the phonetic manifestation of a syllable depends entirely on interaction with the surroundings. There are three initial labial sounds (*p, ph, m*), five dental sounds (*t, th, s, l, n*), three palatal sounds (*tś, tśh, ń*), and five velars (*k, kh, h,* ʔ, and ŋ). Syllables can end in -*k*, -*ŋ*, ʔ (glottal stop), a semivowel, or a vowel. The tones fall into two classes: a comparatively high class comprising high, mid, high falling, and high rising (only in sandhi forms) and a rather low one, comprising low rising and low rising-falling (circumflex). Certain vowels and diphthongs occur only with the high class, others occur only with the low class, and the vowel *a* occurs with both classes. Sandhi rules can cause tone to change from low class to high class, in which case the special vowels also change.

Tones of Fuchow

Other Sinitic languages. *Hakka.* Of the Kan (Kan-Hakka) languages, Hakka of Mei-hsien in Kwangtung is best known. It has the same initial consonants, final consonants, and syllabic nasals as Standard Cantonese; the vowels are close to Modern Standard Chinese. Medial and final semivowels are *y* and *w*. There are two tones in syllables with final stops, four in the other syllabic types.

Suchow. Suchow is usually quoted as representative of the Wu languages. It is rich in initial consonants, with a contrast of voiced and voiceless stops as well as palatalized and non-palatalized dental affricates, making 26 consonants in all. (Palatalized sounds are nonpalatal sounds formed with simultaneous movement of the tongue toward the hard palate. Dental affricates are sounds produced with the tongue tip touching the teeth and then drawing slightly away to allow air to pass through, producing a hissing sound.) Medial semivowels are as in Modern Standard Chinese. In addition, there are also ten vowels and four syllabic consonants (*l, m, n, ŋ*); *-n* and *ŋ* occur in final position, as do the glottal stop and nasalization.

Shanghai dialect. The Shanghai dialect belongs to Wu. The prevalent tendency is for there to be only two tones or registers (high and low), which are related in an automatic way to the initial consonant type (voiceless and voiced).

Hsiang languages. The Hsiang languages, spoken only in Hunan, are divided into New Hsiang, which is under heavy influence from Mandarin and includes the language of the capital Ch'ang-sha, and Old Hsiang, closer to the Wu languages, as spoken for instance in Shuang-feng. Old Hsiang has 28 initial consonants, the highest number for any major Sinitic language, and 11 vowels, plus the syllabic consonants *m* and *n*. It also uses five tones, final *n* and *ŋ*, and nasalization, but no final stops.

HISTORICAL SURVEY OF CHINESE

Vocabulary. Old Chinese vocabulary already contained many words not generally occurring in the other Sino-Tibetan languages. The words for "honey" and "lion," probably also "horse," "dog," and "goose," are connected with Indo-European and were acquired through trade and early contacts. (The nearest known Indo-European languages were Tocharian and Sogdian.) A number of words have Austro-Asiatic cognates and point to early contacts with the ancestral language of Muong-Vietnamese and Mon-Khmer; *e.g.,* the name of the Yangtze River, **klawŋ,* Cantonese *kɔŋ,* Modern Standard Chinese *chiang,* is still the word for "river," pronounced *kroŋ* and *kloŋ,* in some modern Mon-Khmer languages. Words for "tiger," "ivory," and "crossbow" are also Austro-Asiatic. The names of the key terms of the Chinese calendar ("the branches") have this same non-Chinese origin. It has been suggested that a great many cultural words that are shared by Chinese and Tai are Chinese loanwords from Tai. Clearly, the Chinese received many aspects of culture and many concepts from the Austro-Asiatic and Austro-Tai peoples whom they gradually conquered and absorbed or expelled.

Chinese practices in word borrowing and word creation

From the 1st century AD, China's contacts with India, especially through the adoption of Buddhism, led to Chinese borrowing from Indo-Aryan (Indic) languages, but, very early, native Chinese equivalents were invented. Sinitic languages have been remarkably resistant to direct borrowing of foreign words. In modern times this has led to an enormous increase in Chinese vocabulary without a corresponding increase in basic meaningful syllables. For instance, *t'ieh-lu* "railroad" is based on the same concept expressed in the French *chemin de fer,* using *t'ieh* "iron" and *lu* "road"; likewise, *tien-hua* "telephone" is a compound of *tien* "lightning, electricity" and *hua* "speech." A number of such words were coined first in Japanese by means of Chinese elements and then borrowed back into Chinese. The reason that China has avoided the incorporation of foreign words is first and foremost a phonetic one; such words fit very badly into the Chinese pattern of pronunciation. A contributing factor has been the Chinese script, which is ill-adapted to the process of phonetic loans. In creating new words for new ideas, the characters have sometimes been determined first and forms have arisen that cannot be spoken without ambiguity ("sulfur" and "lutecium" coalesced as *liu,* "nitrogen" and "tantalum" as *tan*). It is characteristic of Modern Standard Chinese that the language from which it most freely borrows is one from its own past: Classical Sinitic. In recent years it has borrowed from Southern Sinitic languages under the influence of statesmen and revolutionaries (Chiang Kai-shek was originally a Wu speaker and Mao Tse-tung a Hsiang speaker). Influence from English and Russian (in word formation and syntax) has been increasingly felt.

Historical periods: pre-Classical Chinese. The history of the Chinese language can be divided into three periods, pre-Classical (*c.* 1500 BC–*c.* AD 200), Classical (*c.* 200–*c.* 1920), and post-Classical Chinese (with important forerunners as far back as the T'ang dynasty).

The pre-Classical Chinese is further divided into Oracular Chinese (Shang dynasty [18th–12th century BC]), Archaic Chinese (Chou and Ch'in dynasties [1111–206 BC]), and Han Chinese (Han dynasty [206 BC–AD 220]).

Archaic Chinese—Early, Middle, and Late

Oracular Chinese is known only from rather brief oracle inscriptions on bones and tortoise shells. Archaic Chinese falls into Early, Middle (*c.* 800–*c.* 400 BC), and Late Archaic. Early Archaic is represented by bronze inscriptions, parts of the "Classic of History" (*Shu Ching*), and parts of the "Classic of Poetry" (*Shih Ching*). From this period on, many important features of the pronunciation of the Chinese characters have been reconstructed (see below). The grammar depended to a certain extent on unwritten affixes. The writing system kept apart forms with or without infixes. Early Archaic Chinese possessed a 3rd person personal pronoun in three cases (nominative *kyəg,* or *ghyəg,* accusative *cyəg,* genitive *kywat*). No other kind of written Chinese until the post-Classical period possessed a nominative of the 3rd person pronoun, but the old form survived in Cantonese (*khöy*) and is also found in Tai (Modern Thai *khăw*).

Middle Archaic Chinese comprises the earliest writings of the Confucian school. Important linguistic changes had taken place, which became still more pronounced in Late Archaic, the language of the two major Confucian and Taoist writers, Meng-tzu (Mencius) and Chuang-tzu, as well as of other important philosophers. The grammar by then had become more explicit in the writing system, with a number of well-defined grammatical particles, and it can also be assumed that the use of grammatical affixes had similarly declined. The process used in verb formation and verb inflection that later appeared as tonal differences may at this stage have been manifested in other suprasegmental features, such as different types of laryngeal phonation. The word classes included nouns, verbs, and pronouns, all with several subclasses and particles. The use of a consistent system of grammatical particles to form noun modifiers, verb modifiers, and several types of embedded sentences (*i.e.,* sentences that are made to become parts of another independent sentence) disappeared in Han Chinese and was gone from written Chinese until the emersion of post-Classical Chinese. In Modern Standard Chinese the subordinating particle *te* combines the functions of several Late Archaic Chinese particles, and the verb particle *le* and the sentence particle *le* have taken over for other Late Archaic forms.

Han and Classical Chinese. Han Chinese developed more polysyllabic words and more specific verbal and nominal (noun) categories of words. Most traces of verb formation and verb conjugation began to disappear. An independent Southern tradition (on the Yangtze River), simultaneous with Late Archaic Chinese, developed a special style, used in the poetry *Ch'u Tz'u* ("Elegies of Ch'u"), which was the main source for the refined *fu* (prose poetry). Late Han Chinese developed into Classical Chinese, which as a written idiom underwent few changes during the long span of time it was used. It was an artificial construct, which for different styles and occasions borrowed freely and heavily from any period of pre-Classical Chinese but in numerous cases without real understanding for the meaning and function of the words borrowed.

At the same time the spoken language changed continually, as did the conventions for pronouncing the written characters. Soon Classical Chinese made little sense when read aloud. It depended heavily on fixed word order and on rhythmical and parallel passages. It has sometimes been denied the status of a real language, but it was certainly one of the most successful means of communication in the history of mankind. It was the medium in which the poets T'ao Yüan-ming (365–427), Li Po (701–762), and Tu Fu (712–770) and the prose writer Han Yü (768–824) created some of the greatest masterpieces of all times and was the language of the Neo-Confucianist philosophy (especially of Chu Hsi [1130–1200]), which was to influence the West deeply. Classical Chinese was also the language in which the Italian missionary Matteo Ricci (1552–1610) wrote in his attempt to convert the Chinese Empire to Catholic Christianity.

Post-Classical Chinese. Post-Classical Chinese, based on dialects very close to the language now spoken in Northern China, probably owes its origin to the Buddhist storytelling tradition; the tales appeared in translations from Sanskrit during the T'ang dynasty (618–907). During the Sung dynasty (960–1206) this vernacular type of language was used by Buddhists and Confucianists alike for polemic writings; it also appeared in indigenous Chinese novels based on popular storytelling. From the Yüan dynasty (1206–1368) the vernacular was used also in the theatre.

Adoption of the National Language

Modern Standard Chinese has a threefold origin: the written post-Classical language, the spoken standard of Imperial times (Mandarin), and the vernacular language of Peking. These idioms were clearly related originally, and combining them for the purpose of creating a practical national language was a task that largely solved itself once the signal had been given. The term National Language (*kuo-yü*) had been borrowed from Japanese at the beginning of the 20th century, and, from 1915, various committees considered the practical implications of promoting it. The deciding event was the action of the May Fourth Movement of 1919; at the instigation of the liberal savant Hu Shih, it rejected Classical Chinese (also known as *wen-yen*) as the standard written language. (Hu Shih also led the vernacular literature movement of 1917; his program for literary reform appeared on January 1, 1917.) The new written idiom has gained ground faster in literature than in science, but there can be no doubt that the days of Classical Chinese as a living medium are numbered. After the establishment of the People's Republic of China some government regulation was applied successfully, and the tremendous task of making Modern Standard Chinese understood all over China was effectively undertaken. In what must have been the largest scale linguistic plan in history, untold millions of Chinese, whose mother tongues were divergent Mandarin or non-Mandarin languages or non-Chinese languages, learned to speak and understand the National Language; with this effort literacy was imparted to great numbers of people in all age groups.

The writing system. The Chinese writing system is nonalphabetic. It applies a specific character to write each meaningful syllable or each nonmeaningful syllabic that is part of a polysyllabic word.

Logographic form of writing

When the Chinese script first appeared, as used for writing Oracular Chinese (from *c.* 1500 BC), it must already have had a considerable development behind it. Although many of the characters can be recognized as originally depicting some object, many are no longer recognizable. The characters did not indicate the object in a primitive nonlinguistic way but only represented a specific word of the Chinese language (*e.g.,* a picture of the phallic altar to the earth is used only to write the word earth). It is therefore misleading to characterize the Chinese script as pictographic or ideographic; nor is it truly syllabic, for syllables that sound alike but have different meanings are written differently. Logographic (*i.e.,* a system using symbols representing entire words) is the term that best describes the nature of the Chinese writing system.

Verbs and nouns are written by what are or were formerly pictures, often consisting of several elements (*e.g.,* the character for "to love" depicts a woman and a child; the character for "beautiful" is a picture of a man with a huge head-dress with ram's horns on top). The exact meaning of the word is rarely deducible from even a clearly recognizable picture, because the connotations are either too broad or too narrow for the word's precise meaning. For example, the picture "relationship of mother to child" includes more facets than "love," a concept that, of course, is not restricted to the mother–child relation, and a man adorned with ram's horns undoubtedly had other functions than that of being handsome to look at, whereas the concept "beautiful" is applicable also to men in other situations, as well as to women. Abstract nouns are indicated by means of concrete associations. The character for "peace, tranquillity" consists of a somewhat stylized form of the elements "roof," "heart," and "(wine) cup." Abstract symbols have been used to indicate numbers and local relationships.

Related words with similar pronunciations were usually written by one and the same character (the character for "to love, to consider someone good" is a derivative of a similarly written word "to be good"). This gave rise to the most important invention in the development of the Chinese script—that of writing a word by means of another one with the same or similar pronunciation. A picture of a carpenter's square was primarily used for writing "work, craftsman; to work" and was pronounced *kuŋ*; secondarily it was used to write *kuŋ-* "to present," *ghuŋ* "red," *kuŋ* "rainbow," *klawŋ* "river," and others. During the Archaic period this practice was developed to such a degree that too many words came to be written as one character. In imitation of the characters that already consisted of several components an element was added for each meaning of a character to distinguish words from each other. Thus "red" was no longer written with a single component but acquired an additional component that added the element "silk" on the left; "river" acquired an additional component of "water," and so on. The original part of the character is now referred to as its phonetic and the added element as its radical.

Ch'in dynasty standardization of characters

During the Ch'in dynasty (221–206 BC) the first government standardization of the characters took place, carried out by the statesman Li Ssu. A new, somewhat formalized style known as seals was introduced—a form that generally has survived until now, with only such minor modifications as were necessitated by the introduction of the writing brush around the beginning of the Christian Era and printing around AD 600. As times progressed, other styles of writing appeared, such as the regular handwritten form *k'ai* (as opposed to the formal or scribe style *li*), the running hand *hsing,* and the cursive hand *ts'ao,* all of which in their various degrees of blurredness are explicable only in terms of the seal characters.

The Ch'in dynasty standardization comprised somewhat over 3,000 characters. In addition to archaeological finds, the most important source for the early history of Chinese characters is the huge dictionary *Shuo-wen,* compiled by Hsü Shu in *c.* AD 100. This work contains 9,353 characters, a number that certainly exceeds that which it was or ever became necessary to know offhand. Still, a great proliferation of characters took place at special times and for special purposes. The *Kuang-yün* dictionary of 1007 had 26,194 characters (representing 3,877 different syllables in pronunciation). The *K'ang-hsi tzu-tien,* a dictionary of 1716, contains 40,545 characters, of which, however, fewer than one-fourth were in actual use at the time. The number of absolutely necessary characters has probably never been much over 4,000–5,000 and is today estimated at fewer than that.

Attempts at phonetic writing system

By the 20th century the feeling had become very strong that the script was too cumbersome and an impediment to progress. The desire to obtain a new writing system necessarily worked hand in hand with the growing wish to develop a written language that in grammar and vocabulary approached modern spoken Chinese. If a phonetic writing were to be introduced, the classical language could not be used at all because it deviates so markedly from the modern language. None of the earlier attempts gained any following, but in 1919 a system of phonetic letters (inspired by Japanese kana) was devised for writing Mandarin. (In 1937 it received formal backing from the government, but World War II stopped further progress.) In 1929 a National Romanization, worked out by the author and language scholar Lin Yü-t'ang, the linguist Yuen Ren Chao, and others, was adopted. This attempt also was halted by war and revolution. A rival Communist effort known as *Latinxua,* or Latinization of 1930, fared no better. An attempt to simplify the language by reducing the number of characters to little over 1,000 failed because it did not solve the problems of creating a corresponding "basic Chinese" that could profitably be written by the reduced number of symbols.

The government of the People's Republic of China has taken several important steps toward solving the problems of the Chinese writing system. The first and basic step of making one language, Modern Standard Chinese, known all over the country has been described above. In 1956 a simplification of the characters was introduced that made them easier to learn and faster to write. Most of the abridged characters were well-known unofficial variants, used in handwriting but previously not in printing; some were innovations. In 1958 a romanization known as the phonetic system, or *pinyin zimu* (see Table 45), was introduced. This system is widely taught in the schools and is used for many transcription purposes and for teaching Modern Standard Chinese to non-Chinese peoples in China and to foreigners. The Pinyin is conceived as a script that will gradually replace characters.

Reconstruction of protolanguages. For reconstructing the pronunciation of older stages of Sinitic, the Chinese writing system offers much less help than the alphabetic systems of such languages as Latin, Greek, and Sanskrit within Indo-European or Tibetan and Burmese within Sino-Tibetan. Therefore, the starting point must be a comparison of the modern Sinitic languages, with the view of recovering for each major language group the original common form, such as Proto-Mandarin for the Northern languages, Proto-Wu and others for the languages south of Yangtze. Because data are still lacking from a great many places, the approach has until recently been to compare major representatives of each group for the purpose of reconstructing the language of the important dictionary *Ch'ieh-yün* of AD 601 (Sui dynasty), which mainly represents a Southern language type. One difficulty is that the language in a given area represents a mixture of at least two layers: an older one of the original local type, antedating the language of the *Ch'ieh-yün,* and a younger one that is descended from the *Ch'ieh-yün* language or a slightly younger but closely related tongue—the so-called T'ang-koine or the standard spoken language of the T'ang dynasty (618–907). The relationship of the protolanguages is further complicated by the fact that different substrata of non-Chinese stock underlie most if not all of the major languages.

Influence of the T'ang layer on Sinitic

The degree to which the Sinitic languages have been influenced by the T'ang (or Middle Chinese) layer varies. In the North the Old Chinese layer still dominates in phonology; in Min the two layers are kept clearly apart from each other and the Middle Chinese layer is most important in the reading pronunciation of the characters; in Yüeh both Chinese layers are of the Southern type and are typologically close to a Tai substratum.

The Old Chinese layer is characterized by early decay of final consonants, late development of tones from sounds or suprasegmental features located toward the end of the syllable, change of final articulation type because of similar initial type (as in syllables with voiced glottal activity both at the opening and at the end that lose the final voicedness; a phenomenon later manifested as a tonal change), and influence of sounds and tones in a syllable on those of surrounding ones (sandhi).

The New Southern stratum in Sinitic languages is characterized by early change of final articulation types into tones, extensive development of registers according to type of initial consonant, and late or no loss of final stops. The Old layer cannot be the direct ancestor of the New layer. The division into Northern and Southern dialects must be very old. It might be better to speak of a T'ang and a pre-T'ang layer or a T'ang or Han layer (the Han dynasty, 206 BC–AD 220, was one of extensive settling in most parts of what is now China proper).

Tones of the *Ch'ieh-yün* dictionary

For a long time it was assumed that the *Ch'ieh-yün* dictionary represented the language of the capital of the Sui dynasty, Ch'ang-an in the present province of Shensi, but recent research has demonstrated that its major component was the language of the present-day Nanking area with a certain attempt at compromise with Northern speech habits. As its first criterion for classifying syllables, the *Ch'ieh-yün* dictionary takes the tones, of which it has four: *p'ing, shang* (transcribed as :—*e.g., pa*:), *ch'ü* (transcribed as -—*e.g., pa-*), and *ju,* or even, rising, falling, and entering ("checked") tones. The entering tone comprised those syllables that ended in a stop (*-p, -t, -k*). The rising and falling tones may have retained traces of the phonetic conditioning factor of their origin, voiced and voiceless glottal or laryngeal features, respectively. The even tone probably was negatively defined as possessing no final stop and no tonal contour.

Next, the dictionary is divided according to rhymes, of which there are 61, and, finally, according to initial consonants. Inside each rhyme an interlocking spelling system known as *fan-ch'ieh* was used to subdivide the rhymes. There were 32 initial consonants and 136 finals. The number of vowels is not certain, perhaps six plus *i* and *u,* which served also as medial semivowels. There were probably more vowels than in either Archaic Chinese or in Modern Standard Chinese, another indication that the development of the Northern Chinese phonology has not passed the stage represented by *Ch'ieh-yün.*

There are additional sources for reconstructing the *Ch'ieh-yün* language: Chinese loanwords in Korean and Japanese (Japan has two different traditions—Go-on, slightly older than *Ch'ieh-yün* but representing a Southern language type like *Ch'ieh-yün,* and Kan-on, contemporary with *Ch'ieh-yün* but closer to the Northern tradition) and Chinese renderings of Indo-Aryan (Indic) words. Voiced stops are recovered through Wu, Hsiang, and Go-on (*e.g.,* Modern Standard Chinese *t'ien* "field," Wu and Hsiang *di,* Go-on *den, Ch'ieh-yün dhien*), final stops especially through Yüeh and Japanese (*e.g.,* Modern Standard Chinese *mu* "wood," Yüeh *muk,* Go-on *mok*[*u*], *Ch'ieh-yün muk*), and retroflex initial sounds from Northern Chinese (*e.g.,* Modern Standard Chinese *sheng* "to live," *Ch'ieh-yün* ṣʌŋ [the ṣ is a retroflex]).

Early Archaic Chinese is the old stage for which the most information is known about the pronunciation of characters. The very system of borrowing characters to write phonetically related words gives important clues, and the rhymes and alliteration of the "Classic of Poetry" (*Shih Ching*) furnish a wealth of details. Even though scholars cannot always be sure that prefixes and infixes are correctly recovered, and though the order in which recoverable features were pronounced in the syllable is not always certain (*rk-* or *kr-*, *-wk* or *-kw*, and so on), enough details can be obtained to determine the typology of Old Chinese and to undertake comparative work with the Tibeto-Burman and Karenic languages. The method employed in this part of the reconstruction of Chinese has been predominantly internal reconstruction, the use of variation of word forms within a language to construct an older form. As knowledge of the old layer of modern languages and dialects increases, however, the comparative method, which draws on similarities in several related tongues, gains importance. Through further internal reconstruction, features of the Proto-Sinitic stage, antedating Archaic Chinese, can then be restored.

TIBETO-BURMAN LANGUAGES—HISTORY AND CHARACTERISTICS

Influence of geography and social factors on Tibeto-Burman languages

The Tibeto-Burman languages have evolved from the ancestral language, Proto-Tibeto-Burman, in vastly different ways and at their own pace, in accordance with the geographical and social factors that have determined the fate of Central and South Asian peoples. Some tribes have been stationary; others have swept over huge areas. As a result, conservative or archaic features do not occur in only one contiguous part of the language area and innovations in another. The nearest genetic relations are often not identical with the closest typological ones.

Tibetan. Of the modern Tibetan languages and dialects, the Western ones have preserved initial consonant clusters and final stops most faithfully and have had the least compensational development of tones. Most Central languages and dialects, including Lhasa, have lost all consonant clusters and final stops and in the process have acquired a larger inventory of single consonants and a system of tones. These changes and reductions are linked to a similar reshaping of certain grammatical processes of word formation that now operate only through suprasegmental and syllabic elements. To a surprising degree, however, Modern Central Tibetan possesses grammatical categories identical with or very similar in content, though not in form, to those of Classical Tibetan (a similar relationship as that of Modern Standard Chinese to Old Chinese). The relationship of nouns to the main verb is indicated through postposed particles, the agent of a transitive verb indicated as the one by whom the action is performed, and the subject of an intransitive verb expressed as the object or goal of the action. Nominal modifiers precede nouns, and verbal modifiers follow them. The main verb, always placed after all nouns, is followed by particles expressing aspect and tense.

Old Tibetan pronunciation can be reconstructed by comparison of modern dialects and through the very conservative alphabetic script of Indian origin that goes back to the 7th century AD and found its present form in the 9th century. The orthography is far removed from present-day Standard Tibetan pronunciation.

Old Tibetan is one of the most archaic of the Tibeto-Burman languages. It retained Tibeto-Burman final stops and final *-r, -l, -s* and also the initial voiced consonants. Many Old Tibetan consonant clusters may be referred to Proto-Tibeto-Burman. The case particles and complicated verbal conjugation perhaps represent an elaboration on somewhat simpler tendencies in the protolanguage.

Himalayish languages

Some Himalayish languages are in certain respects as archaic as Tibetan, although most initial clusters are gone. An old feature is the connection of voiced–voiceless initial consonants with intransitive–transitive verbs. Because they have developed the feature of incorporating agent and object pronouns in verbs (and of possessive pronouns in nouns), these have been known as "pronominalizing" languages. An influence from contiguous Indo-European languages seems possible, but not certain.

Some Kirantish languages have retained consonant clusters and voiced initial consonants; others have given up both. Bahing has maintained the connection between voicedness and transitivity. Within Mirish, which has kept voiced initial sounds, Abor retains final stops and Dafla has some initial consonant clusters. Kachinish is quite conservative; prefixes are well retained as are voiced inital consonants, although some reshuffling has taken place in this respect.

Burmese. Within Burmish, Modern Standard Burmese has undergone a set of radical changes. Initial *ts-* and *tsh-* have become *s-* and *sh-*; *s* has become θ (*th* as in "thin"); *y-* and *r-* have coalesced as *y-*, and *ky-* and *kr-* as a palatal *c* (*ty*). Furthermore, all final consonants except nasals have coalesced as glottal stops, and all nasals have resulted in nasalization of the preceding vowel. In addition, the quality of vowels has been greatly altered. As was the case in Tibetan, in spite of great phonetic changes, grammatical categories are close to those scholars envisage for Proto-Tibeto-Burman. Cases of nouns and aspects of verbs are expressed through postposed particles.

Among the Burmese dialects, Arakanese is especially conservative, and the closely related language Maru is one of the most archaic within Tibeto-Burman in respect to final consonants. The Lolo languages lost most consonant clusters, as did all Burmish languages, but tend otherwise to be conservative in their treatment of initial sounds and radical in the loss and change of final consonants. Nung has retained final stops lost in Burmish (*-r, -l, -s*) and possesses a set of prefixes like Kachin.

The Burmese writing system

Study of the Burmese writing system, in combination with comparative linguistic work, makes possible the reconstruction of Old Burmese. The language of the Myazedi inscription of 1113 is close in its sound system to written Burmese in its present form, which dates back to at least the 15th century. The writing system was taken over from the Mon people, who had developed their writing from Pyu, a Sino-Tibetan language known in Burma from *c.* AD 500. It is alphabetic of an Indian type but represents a separate Southern line of development.

Old Burmese is phonetically further from Proto-Tibeto-Burman than is Tibetan. Initial clusters have mostly disappeared but are felt in the development of initial consonants. Some clusters with *-w-* and liquid sounds have been retained. The tonal system of Burmese (unlike that of Tibetan) developed to compensate for the loss of final features.

The Baric languages maintain a few older prefixes and developed some of their own. They tend to retain or merge *r* and *l.* The relationship of voicedness and transitivity is retained, but a great reshuffling of initial consonants took place, as it did also in Meithei and Kukish. The Kukish languages are found in all stages of development, but many of them are among the most archaic and most important for the reconstruction of Tibeto-Burman. Prefixes are best preserved in Old Kuki and in the Naga branch, whereas vowels seem very archaic in Lushai of the Central branch (the Lushai vowels have a difference of length that must in some way be explained in terms of Proto-Tibeto-Burman). Some Kukish languages incorporate pronouns in verbs. Mru, distantly related to Kukish, is noted for a number of archaic features, including final consonants lost elsewhere in Tibeto-Burman.

(S.C.E.)

TAI LANGUAGES

The name Tai denotes a family of closely related languages, of which the Thai, or Siamese, language of Thailand is the most important member. Because the word Thai has been designated as the official name of the language of Thailand, it would be confusing to use it for the various other languages of the family as well. Tai is therefore used to refer to the entire group.

Geographical distribution

Spoken in Thailand, Laos, Burma, Assam in northeast India, northern Vietnam, and the southwestern part of China, the Tai languages together form an important group of languages in Southeast Asia. In some countries they are known by different tribal names or by designations used by other peoples; *e.g.,* there is Shan in Burma; Pai-i in Yunnan, China; Chuang-chia in Kwangsi, China; Chung-chia, Dioi, Jui, Yoi, Yay, or Pu-yi in Kweichow, China; Tho, Nung, White Tai, Black Tai, Red Tai, etc. in northern Vietnam; and Khün, Lü, etc. in Thailand and Laos. Ahom, an extinct language once spoken in Assam, has a considerable amount of literature. The Tai languages are divided into three linguistic groups—the Southwestern, the Central, and the Northern. Thai and Lao, the official languages of Thailand and Laos, respectively, are the best known of the languages.

The number of Tai speakers is estimated at 64,000,000. Of these, 38,565,000 are in Thailand, 17,800,000 in China, and about 7,900,000 in Laos, northern Vietnam, and Burma. There are tremendous variations between several estimates, and these figures may serve as only rough indications of the Tai populations.

Relationship to other languages. The Tai languages are traditionally assumed to be related to the Sino-Tibetan family of languages with which they share similar phonological structures, tone systems, and some lexical items; the relationship, however, has never been definitely established. The Tai tongues are related to the Kam-Sui languages of Kweichow, China, and to the Bê language in Hainan; but because of the great divergences in both vocabulary and phonological development, the name Tai is used only to designate a more restricted group that excludes such languages as Kam, Sui, and Bê. It has also been suggested, chiefly on the basis of some similar vocabulary items, that the Tai languages are related to the Kadai languages of southwestern China and Hainan Island and ultimately to the Austronesian (Malayo-Polynesian) languages, rather than to the Sino-Tibetan tongues.

Classification. Classifications have been made according to the geographical location of the Tai speakers, social, political, and cultural criteria, and literacy versus nonliteracy. The classification used for this article is based on linguistic relationships proposed in 1959–60; the criteria for it are lexical (involving similarities in vocabulary) and phonological (involving similarities in sounds and systems

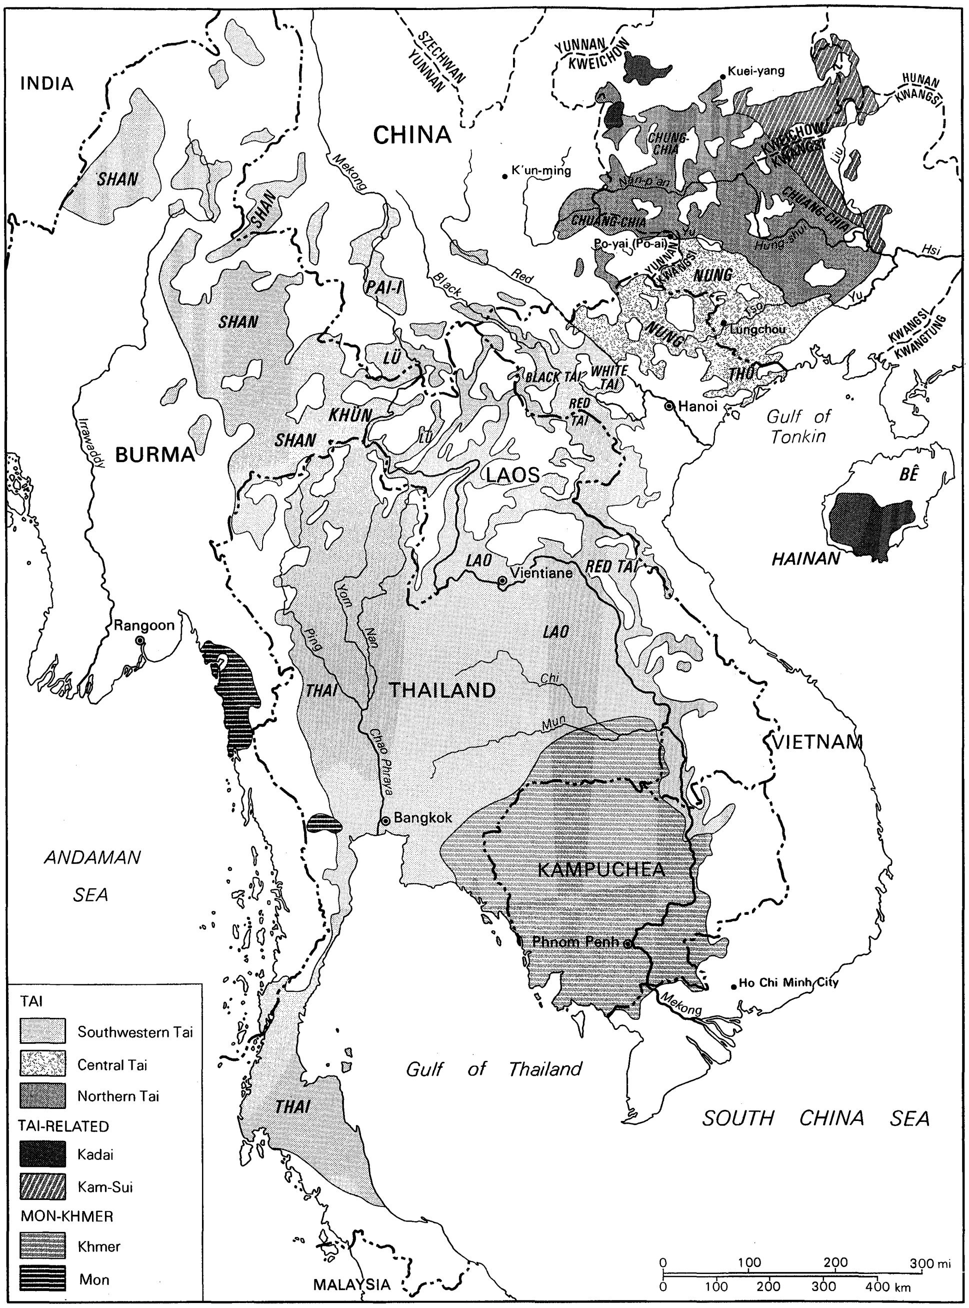

Figure 25: Major divisions of the Tai languages and neighbouring languages.

Adapted from Frank M. LeBar, Gerald C. Hickey, and John K. Musgrave, *Ethnic Groups of Mainland Southeast Asia;* New Haven, Human Relations Area Files Press, 1964

of sounds). According to these features the Tai languages are divided into the three groups mentioned above (see map). Languages of the Southwestern group are spoken in Thailand, Laos, northern Vietnam, Burma, and Yunnan, China; they include Thai, or Siamese, Lao, Shan, Khün, Lü, White Tai, Black Tai, etc. The Southwestern division, geographically the most widespread group, consists of two-thirds of the Tai-speaking population and represents an expansion in comparatively recent periods. To the Central group belong the Tho dialects spoken in northern Vietnam and the various dialects spoken in Kwangsi, such as Lungchow. The Chung-chia or Pu-yi dialects in Kweichow and the Chuang-chia dialects in Kwangsi belong to the Northern group. Some of the Northern dialects are also spoken in Yunnan and Vietnam, and one, called Saek, is spoken as far south as Laos and Thailand.

Main groups of Tai

The fairly large number of vocabulary items shared by languages of these three groups suggests their genetic relationship. There are also certain items that are shared by only two of the groups and not found in the other. For instance, the word for sky is shared by the Southwestern dialects (Siamese *fáa*) and the Central dialects (Lungchow *faa*), but another word is used in the Northern dialects (Po-ai *mïn*). Similarly, the word for beard is shared by the Central group (Lungchow *mum*) and the Northern group (Po-ai *mum*) but is replaced by another word in the Southwestern group (Siamese *nùat*); the term for knife is shared by the Southwestern (Siamese *mîit*) and the Northern groups (Po-ai *mit*) but not by the Central dialects. There are also vocabulary items that are found only in one group. In all, the evidence seems to indicate that there are three groups of dialects in the Tai family.

Different phonological features may be attached to some words according to the dialect group. For instance, the Southwestern forms for the verb "to be" (Siamese *pen*) are derived from a protoform **pɛn* (with the vowel like *e* in "egg"), whereas the Central dialect forms (Lungchow *pin*) and the Northern forms (Po-ai *pan*) come from a protoform **bɛn,* as indicated by the tone. (A protoform is the presumed or reconstructed ancestral form of a word; an asterisk [*] marks those forms that are unattested and reconstructed.) Similarly, the Southwestern and

Dialect groups

the Central forms for the classifier for animals (Siamese *tua,* Lungchow *tuu*) are derived from a protoform **tua,* whereas the Northern forms (Po-ai *tuu*) are attributed to a protoform **dua.* (A classifier is a term that indicates the group to which a noun belongs, like "animate object," or designates countable objects or measurable quantities, like "yards" [of cloth] and "head" [of cattle]). Such words as the forms for "to be" and the classifier for animals are good indications of dialect boundaries.

In phonological development, the Northern dialects differ from the rest in not maintaining the distinction between aspirated and unaspirated voiceless stops. That is, the dialects have lost the feature of aspiration, which sounds like a puff of breath accompanying a consonant. Aspiration may, however, be reintroduced in some dialects by later borrowing or secondary developments. The Central dialects differ from the other groups in the treatment of certain Proto-Tai consonant clusters, such as **tr-* and **thr-*. Although they have changed from the protoforms, these are usually kept distinct in the other groups—*e.g.,* in Siamese as *taa* ("eye") and *haaŋ* ("tail"), in Po-ai as *taa* and *lïïŋ*. In the Central dialects, however, they have merged into a single sound—*e.g.,* Tho *thaa* and *thaaŋ*, Lungchow *haa* and *haaŋ*.

Phonological characteristics. The sound system of the Tai languages may best be described in terms of its syllabic structure. Each syllable consists of an initial consonant or consonant cluster followed by a vowel or vowel cluster (long vowel or diphthong), which may be further followed by a final consonant, usually a nasal sound or an unreleased stop. (An unreleased stop is a consonant in which there is complete stoppage of the airstream from the lungs, and in which the tongue or the lips maintain the position of the consonant without opening the stoppage.) In addition, each syllable has a tone. As an illustration of this type of structure, the system of the Thai, or standard Siamese, language as spoken around the Bangkok area may be given. Labials are sounds using the lips as articulators; alveolars are formed by placing the tip of the tongue at the gums behind the upper teeth; sibilants, or fricatives, involve local friction and a hissing sound resulting from incomplete closure in the mouth. Velars are sounds made with the back of the tongue touching the soft palate (velum); glottal sounds involve constriction of the vocal cords; semivowels are gliding sounds with some of the properties of both vowels and consonants; and liquids are frictionless consonants, produced with incomplete closure in the vocal tract, that sometimes function as vowels.

Five tones

There are five tones: level (*a*), low (*à*), falling (*â*), high (*á*), and rising (*ǎ*); for example, *maa* "to come," *màak* "areca nut," *mâak* "much," *máa* "horse," and *mǎa* "dog" are differentiated by the various tones.

Grammatical characteristics. The statements about morphology and syntax refer particularly to the standard language of Thailand, though they are applicable in general to all of the Tai languages. Words or morphemes (word elements) are, for the most part, monosyllabic, but there are also many polysyllabic words, mainly compounds and loanwords from Sanskrit and from Khmer, an Austroasiatic language spoken in Cambodia. There are no inflections in Tai comparable to *-ed* in English "walked" or *-s* in "dogs," but derivations are common. Derivation is the formation of new words by the addition of endings, prefixes, or other words, often resulting in a change of the part of speech or meaning of a term—*e.g.,* English "unionize" or "unionization" from "union." Compounding is the chief Tai method of derivation—*e.g., nâa-taa* "countenance (face-eye)," *kèp-kìaw* "to harvest (gather-cut with a sickle)." Reduplication, the repetition of a word or part of it, is common—*e.g., díi-dii* "very good" from *dii* "good." Partial reduplication is also found, such as *sanùk-sanǎan* "to enjoy oneself" from *sanùk* "to have fun." Prefixes and infixes occur often in Indo-Aryan and Khmer loans—*e.g., pra-thêet* "country" (from Sanskrit *pradeśa*) and *d-amn-əən* "to proceed" (from Khmer *dae* "to walk") and *d-amn-aə* "process." There also developed some native prefixes that are abbreviated forms of what once were full words. For example, *ma-,* a prefix used in many names of fruits, such as *ma-phráau* "coconut," *ma-mûaŋ* "mango," is derived from *màak* "areca nut" (originally "fruit"). Similarly, in the word *sa-dïï* "navel," *sa-* is the reduced form of *sǎaj* "line, string," which refers to the umbilical cord. Old processes of derivation involved using the alternation of consonants or of tone or both, such as *níi* "this" and *nîi* "here," *n´ɔ̆ɔj* "small, little" and *n`ɔ̆ɔj* "a little bit," *khiaw* "sickle" and *kìaw* "to cut with a sickle." Such processes are, however, no longer active.

Use of nominal predicates

A sentence is usually formed by a noun phrase (subject) followed by a verb phrase (predicate). There are, however, nominal predicates as well, in which the verb is lacking and a noun is used instead; an example is *wan-níi wan-sǎw* "today (is) Friday." A noun phrase consists of a noun, which may be followed by its modifiers (another noun, an adjective, or a verb phrase), which, in turn, are followed by a numeral with a classifier, and finally, by a demonstrative. For example, *tûu* "cabinet" and *náŋsïï* "book" become *tûu-náŋsïï* "bookcase"; *tûu-kèp náŋsïï* is "bookcase" ("cabinet-keep-book"); *tûu-yen* is "icebox" ("cabinet-cool"), and *tûu-náŋsïi sɔɔŋ-bai níi* is "these two bookcases" ("cabinet-book two-classifier these"). Classifiers must be used with numerals and vary according to the nouns they are to enumerate. It is not uncommon that a noun may serve as its own classifier.

A verb phrase may consist of an adjective or of a verb often followed by its object or its complements or both. A common type of complement denotes the direction of action by using such words as *paj* "to go," *maa* "to come," *khiŋ* "to ascend," *loŋ* "to descend," and so on. Examples are *ˀaw náŋsïï paj* "Take the book away!"; *ˀaw náŋsïï maa* "Bring the book (here)!"; *aw náŋsïï khïn maa* "Bring the book up!"; and *aw náŋsïï loŋ paj* "Take the book down!". A number of particles, particularly those occurring at the end of a sentence, are used to indicate a question or a command, to express emphasis or uncertainty, to show politeness and the sex of the speaker, etc. For example, *kháw maa lɛ́ɛw* "He has come"; *kháw maa máj?* "Is he coming?"; *khun maa máj khráp*? "Are you coming?" (man speaking, polite); *khun maa máj khâ*? "Are you coming?" (woman speaking, polite).

High	i	ï	u	ii	ïï	uu	ia	ïa	ua
Mid	e	ə	o	ee	əə	oo			
Low	ɛ	a	ɔ	ɛɛ	aa	ɔɔ			

*Certain consonant clusters are also permitted initially, such as *kl*, *kr*, *khl*, *khr*, *tr*, *pl*, *pr*, *phl*, *phr*, *kw*, and *khw*.

Vocabulary. The various Tai languages have been in contact with many different languages spoken in the same area of Southeast Asia, and it is inevitable that words from different sources have been adopted by them. There is a basic core of vocabulary that is shared by most of the Tai languages and may be considered as the native vocabulary of the protolanguage (earlier form of the Tai languages). Nevertheless, items in this list may be found to resemble forms in other languages, such as Chinese or Indonesian, and they have given rise to different interpretations of the relationship of the Tai languages to other linguistic families. Loanwords in later periods from the Khmer and Indo-Aryan languages (Sanskrit and Pāli) are particularly common in Siamese and Lao, and loans from Chinese are abundant in the Central and the Northern dialects.

Loan words

Writing. There are two kinds of writing used among the Tai languages. One, ultimately derived from Chinese, is used by the Central and the Northern dialects; the other comes from Indo-Aryan sources and is used in many languages of the Southwestern group. The Chinese-based system, employed chiefly to write songs, consists of both

tonal markers (used with vowel symbols)

(1) — middle tone with middle and low consonants; rising tone with high consonants

(2) —่ low tone with middle and high consonants; falling tone with low consonants

(3) —้ falling tone with middle and high consonants; high tone with low consonants

(4) —๋ rising tone chiefly with middle consonants

*Pronunciation key (for symbols not used in the standard Roman alphabet): ɛ = *a* as in *bad;* ï = the *u*-sound in some pronunciations of *just* (*e.g.*, "just a minute"); ɔ = *o* as in *law;* ə = *a* as in *sofă;* ʔ = glottal stop (the catch sound for *tt* in Cockney or Brooklynese *bottle*). †For which the long-short distinction does not apply.

Chinese characters and modified Chinese characters, very much like the early writing in Vietnam. A specimen of this type of writing dates back perhaps to the 18th century, but it may have been in use much earlier. The script adapted from Indo-Aryan sources for the Tai languages dates perhaps from the 13th century. The earliest known example of such a writing system is the inscription of Ramkhamhaeng in northern Thailand from AD 1293. The Modern Thai alphabet (see Table 47) is a modified form of the original writing. It preserves the old distinction of voiced (low) and voiceless (middle or high) consonants, a distinction that is now lost, but leaves its effects on the tone. This system also provides an unambiguous method for indicating the vowels and tones. Similar types of writing are used in Lao, Lü, White Tai, Black Tai, etc. Another type of Indo-Aryan writing, used in Shan and Ahom, lacks the difference between high and low consonants, has an insufficient number of vowel signs, and provides no tone marks. Although the shapes of the letters in Shan differ greatly from those in Ahom, the basic principle is essentially the same.

(F.K.L.)

PALEO-SIBERIAN LANGUAGES

The collective term Paleo-Siberian is applied to four genetically unrelated language groups situated in northern Asia—Yeniseian, Luorawetlan (Luoravetlan), Yukaghir (Yukagir), and Gilyak. The Yeniseian group, whose only living member is Ket (or Yenisey-Ostyak), is spoken by about 800 persons in the Turukhansk region along the Yenisey River. Kott (Kot), Arin, and Assan (Asan), now extinct members of this group, were spoken to the south of the present-day locus of Ket. The Luorawetlan family consists of (1) Chukchi, spoken by 11,600 people in the northeasternmost parts of Siberia, west of the small enclave of Siberian Eskimo; (2) Koryak, also called Nymylan, with approximately 6,500 speakers, found to the south of Chukchi; (3) the more remotely related Kamchadal (or Itelmen), with a bare remnant of 500 speakers in southern Kamchatka; (4) Aliutor, perhaps a Koryak dialect, with a small and unknown number of speakers; and (5) Kerek, with about 100 speakers. Some Soviet scholars list Aliutor and Kerek as being more closely related to Chukchi and Koryak than to Kamchadal.

The Yukaghir group, whose only living member is Yukaghir proper (or Odul), is spoken by about 400 persons in two enclaves in the Yakut Autonomous Soviet Socialist Republic (Yakutskaya A.S.S.R.), near the estuary of the Indigirka and along the bend of the Kolyma River. Extinct languages belonging to the Yukaghir group (or perhaps dialects of an earlier form of Yukaghir proper) are Omok and Chuvan (Chuvantsy); these were spoken south and southwest of Yukaghir proper. Gilyak (or Nivkh) has about 2,200 speakers, 1,400 of whom live in the estuary of the river Amur and 800 on the island of Sakhalin.

Paleo-Siberian groups not genetically related

Classification of the languages. These four groups are *not* related to each other. They have been subsumed under the names Paleo-Siberian, Paleo-Asiatic, or, more rarely, Hyperborean, ever since the Baltic German zoologist and explorer Leopold von Schrenck surmised, in the middle of the 19th century, that they constituted the remnants of a formerly more widely dispersed language family that had been encroached upon by invading groups of Uralic, Turkic, and Tungus speakers. Schrenck's hypothesis is quite correct to the extent that as recently as the 17th century Yeniseian, Luorawetlan, and Yukaghir languages were spoken over much wider territories than they are today. For example, it is known that Samoyed languages (of the Uralic family) at one time in the past absorbed the languages of now extinct Yeniseian tribes, that Yukaghir was spoken as far west as the Taymyr Peninsula in the 17th century, and that the former domains of Chukchi and Koryak extended much further to the west. Little is known about the prehistory of Gilyak but it may be assumed that this language was also originally centred further to the west, perhaps in Manchuria. As far as can be determined with the help of the methods of the comparative linguistics, however, the four present-day Paleo-Siberian groups never formed a single family of languages in the accepted sense of that term. In fact, they may represent only a fragment of a possibly greater diversity of language families in prehistoric Siberia. Many of the languages spoken in the

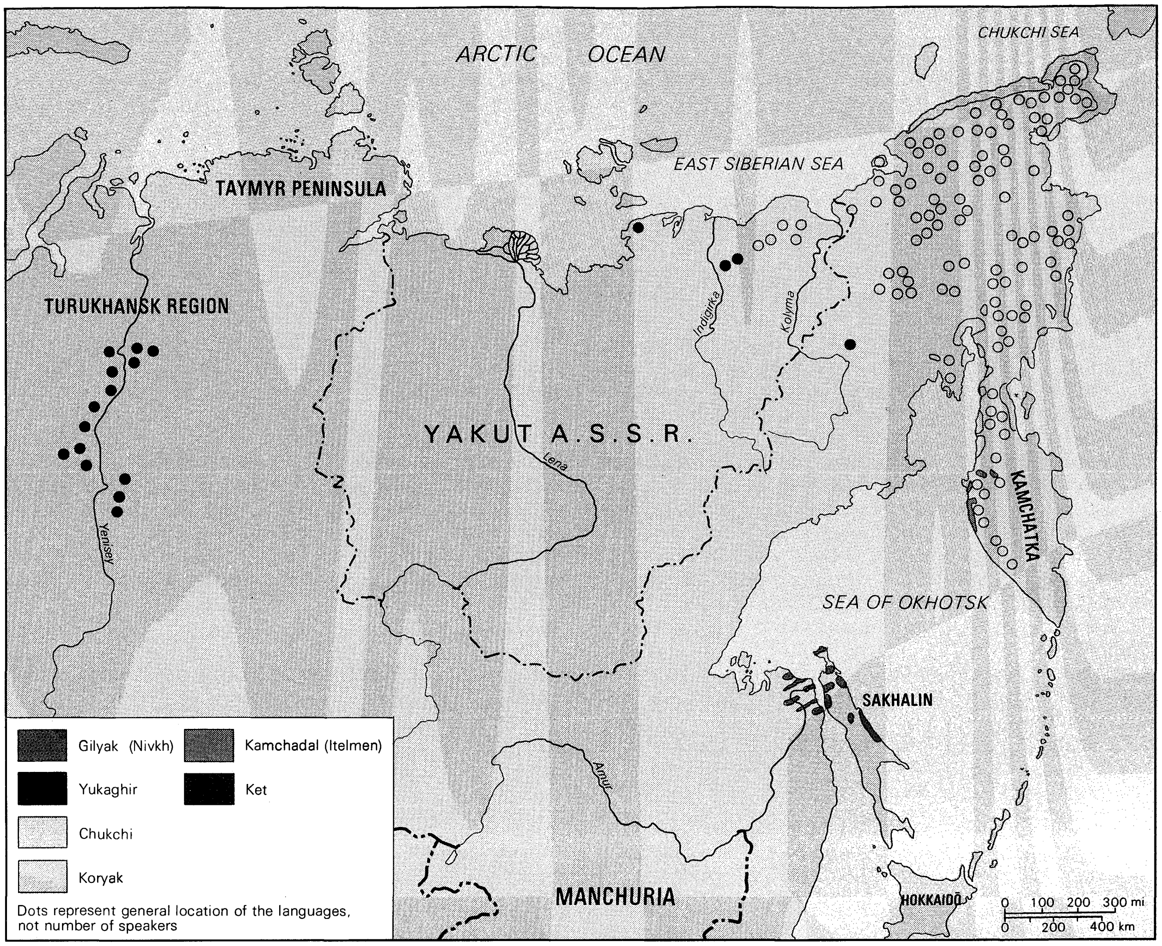

Figure 26: Distribution of Paleo-Siberian languages.

From M. Levin and L. Potapov (eds.), *The Peoples of Siberia,* translated by Scripta Technica, Inc., translation edited by Stephen Dunn, published by University of Chicago Press; © 1964 by The University of Chicago. All rights reserved. Published 1964. Printed in the United States of America by Scripta Technica, Inc.

area during earlier periods may have been swallowed up by the more recent and culturally vigorous intruders in Siberia that are now the neighbours of the Paleo-Siberian enclaves: mainly the Yakut (whose domains stretch as far as the Chukchi and Yukaghir areas) and various Tungus tribes (one or another of which borders on each Paleo-Siberian language).

Comparisons with other language families

Nevertheless, many attempts have been made to show that the four Paleo-Siberian families are either related to each other or to adjacent (or more distant) language families. Thus, Ket has been compared with the Sino-Tibetan family (Chinese, Tibetan) and with some of the languages of the Caucasus, and Yukaghir has been compared with Uralic. Some of these comparisons are fanciful experiments or completely unfounded (*e.g.,* the comparisons of Ket with Caucasian languages). Others are more reasonable but not compelling (*e.g.,* the Yukaghir-Uralic hypothesis) because the evidence adduced so far has been too unsystematic and fragmentary. It is therefore safest, at present, to consider Ket, Yukaghir, and Gilyak as language isolates that are unrelated to any known language or language family and to regard Luorawetlan as a family in its own right that is also unrelated to any other family or isolated language. Further research on the internal history of these four groups will eventually enable comparatists to reconstruct hypothetical earlier stages of the languages and to make comparisons with non-Paleo-Siberian languages more cogent, if at all feasible. Mere resemblances in grammatical or phonological traits between Paleo-Siberian and adjacent languages (such as between Chukchi and Eskimo, or between Gilyak and Korean or Japanese) are not indexes of genetic affinity, but are often the result of the diffusion of linguistic traits over large geographical areas. They may, however, provide clues to the linguistic prehistory of Siberia.

The cultures of the four Paleo-Siberian groups are, in general, similar in that they are all Arctic or subarctic. In detail, however, each group of speakers of a Paleo-Siberian language has its own characteristic cultural profile. These characteristics may on occasion even resemble the cultural profile of a non-Paleo-Siberian group very closely; *e.g.,* Ket culture resembles Selkup (Ostyak-Samoyed) culture more closely than it resembles that of any Paleo-Siberian group. (Selkup- and Ket-speaking groups are located in contiguous areas.)

Linguistic characteristics. *Grammar.* The grammatical structures of the four Paleo-Siberian groups differ considerably from each other. In a broad sense, Gilyak resembles Japanese in its grammatical categories and processes (in word order, heavy inflection of verbs, and use of enclitics—words closely connected with the word that precedes), whereas Yukaghir shares certain grammatical categories with some Uralic languages (the objective conjugation—*e.g.,* "he shot it" versus "he shot"—and the negative conjugation—*e.g.,* Yukaghir *tet mer-ai-mek* "you shot" versus *tet el-ai-yek* "you did not shoot"). A typical feature of Luorawetlan is its strong tendency toward complex compounding, also called incorporation, and circumfixation; *e.g.,* in Chukchi *ga* + *mor-ĭk* + *tor* + *orw-ĭma* "in our new sleigh," the entire unit is surrounded by the circumfix *ga-* . . . *-ĭma* "in" (compare *ga* + *mor-ĭk* + *orw-ĭma* "in our sleigh," without *tor* "new," and *ga* + *tor* + *orw-ĭma* "in the new sleigh," without *mor-ĭk* "our"). A characteristic feature of the Ket verb is its succinct complexity, involving such categories as gender, animateness, and type of event; *e.g., t-k-it-n-a* "I carved it up," which consists of *t-* "I," the verbal complex *k-* . . . *-a* "cut up (carve, split) into pieces once," *-it-* (feminine object marker "her, it"), and *-n-* (past-completed tense). All of the Paleo-Siberian languages are rich in devices for compounding words. In syntax, Luorawetlan favours ergative constructions in which markers indicate the agent or instrument of the action; *e.g., Father*

+ agent marker, *bear* (subject), *shoot* (main verb), "Father is shooting a bear."

Phonology. Typical phonological features of the Paleo-Siberian languages are post-velar consonants (*i.e.,* sounds formed further back in the mouth than *k,* usually represented as *q*), vowel harmony of various kinds (*e.g.,* the alternation of *e* and *i* in the form for "my" in Gilyak *ñe-řla* "my harpoon" and *ñi-řly* "my sky"), consonant alternations (*e.g.,* the alternation between *b, v,* and *f* in Gilyak *bal* "mountain," *ñ-val* "my mountain," *c-fal* "thy mountain"), and rich consonant clusters in all but Yukaghir.

Loanwords in Paleo-Siberian languages

Vocabulary. In addition to the stock of native words inherited from its ancestral language, each Paleo-Siberian language also has numerous loanwords, some of which are recent and from adjacent or recently adjacent languages, and others of which are ancient, from languages with which it no longer has contact. Some of the loanwords from ancient times are, of course, more difficult to identify. In general, Tungus, a branch of the Altaic family, is the source of most loanwords, but the Turkic languages (including Yakut) have also served as the sources of loans, and Ket has some words from Selkup. There are also more complicated loan relationships, such as are found in the reindeer terminology of Gilyak, which is borrowed from a Tungus language but seemingly not from any of the Tungus languages with which Gilyak is now in contact. South Sakhalin Gilyak also contains a considerable number of loanwords from Ainu (a language of northern Japan) and was, during 1905–45, hospitable to potential loans from Japanese; the Japanese loanwords never became acculturated because the Japanese hegemony over South Sakhalin ceased after World War II. Chukchi has some Eskimo loans.

The most viable source of technical and all of the other modern vocabulary has been the Russian language, the influence of which began with the first contact and continues to be strong. Each Paleo-Siberian language adjusts the Russian loans according to the dictates of its phonology and grammar but the most recent borrowed words tend to retain their original Russian form or one closely resembling it.

Writing. The Yukaghir had a tradition of pictographic writing (incisions on fresh birch bark) used by men for route maps and by young women for a type of love letter. Limited use of such a system among the Koryak speakers has also been reported.

Since the 1920s and 1930s each Paleo-Siberian language has had a literary language and a script now based on the Cyrillic alphabet (and formerly based on the Latin script). Because at one time these native languages were used in part in elementary education, primers and arithmetic books for the lowest grades were available. Some natives continue their education and acquire a good knowledge of Russian and of Soviet culture. This has led to the rise of bilingualism but has also contributed to the growth of modern literatures in the native languages, based on Russian models, especially among the Koryak and the Chukchi.

The native traditions and folklore of the Paleo-Siberian peoples have been collected since the last century, mainly by Russians and Westerners. Work in these fields is still continuing and is attracting a slowly emerging corps of trained native specialists. Such trained natives are also beginning to collaborate in the compilation of dictionaries.

(R.Au.)

CAUCASIAN LANGUAGES

The term Caucasian languages as used in this article includes groups of languages indigenous to the Caucasus region, between the Black and Caspian seas within the Soviet Union; it excludes the Indo-European (Armenian, Ossetic, Talysh, Kurdish, Tat) and Turkic languages (Azerbaijan, Kumyk, Noghay, Karachay, Balkar) and some other languages of the area, all of which were introduced to the Caucasus in historical times. The Caucasian languages are also referred to as Paleocaucasian and Ibero-Caucasian languages.

The Caucasian languages are found in the territory north and south of the main Caucasian mountain range; their number varies, according to different classifications, from 30 to 40. The concentration of so many languages in such a small territory is indeed remarkable. There are more than 6,600,000 speakers of Caucasian languages; their language communities range in size from only a few hundred people to large national groups of millions.

Three Caucasian language groups

The Caucasian languages fall into three typologically well-defined language families: the Northwest Caucasian, or Abkhazo-Adyghian, languages; the Northeast Caucasian, or Nakho-Dagestanian, languages; and the South Caucasian, or Kartvelian, languages (also called Iberian). From the typological point of view, the Northwest and Northeast Caucasian groups present opposite structural types, with South Caucasian holding an intermediary position.

The exact genetic relationships of the Caucasian languages are still unclear on many points, not only in regard to interrelationships of the three major groups but also to some internal groupings. Although the genetic relationships between Northwest and Northeast Caucasian seem probable, the interrelationships of North and South Caucasian are as yet uncertain because of the absence of any regular sound correspondences between them. At the present stage of comparative Caucasian linguistics, North Caucasian and South Caucasian must be viewed as separate language families.

The theories relating Caucasian with such languages as Basque and the non-Indo-European and non-Semitic languages of the ancient Near East also lack sufficient evidence and must be considered as inconclusive.

SOUTH CAUCASIAN (KARTVELIAN) LANGUAGES

Languages of the group. The Kartvelian (South Caucasian) language family comprises Georgian, Mingrelian (Megrelian), Laz (or Chan), and Svan. The speakers of these languages constitute the Georgian nation and numbered 3,647,000 in the early 1980s.

Georgian. Georgian (self-designation: *kartulis ena*), used as the language of literature and instruction, is the state language of the Georgian Soviet Socialist Republic. It is common to all speakers of the Kartvelian languages within the Georgian S.S.R. Beyond the Georgian republic, Georgian is spoken in the adjacent regions of the Azerbaijan S.S.R. and northeast Turkey. There are also 14 villages of Georgian speakers in the province of Isfahan, Iran.

The designation Georgian that is used in the European languages was coined during the Crusades; it is based on Persian *gorji* (Georgian), from which the Russian *gruzin* was also derived. The Greek term *ībēres* (Georgians) is connected with an Old Iranian name for Georgia.

The dialects of Georgian fall into two groups—East and West Georgian—divided by the Suram Mountains. These exhibit only slight differences.

Georgian literary tradition

Among the Caucasian languages, only Georgian has an ancient literary tradition, which dates back to the 5th century AD, when the oldest datable monuments were inscribed in an original script. This old Georgian script must have been derived from a local variety of Aramaic with influences—in regard to the order of the alphabet and the shape of some characters—from the Greek alphabet. The modern Georgian writing system is based on the round-form cursive, which was developed from the angular book script of the 9th century; the latter was a direct descendant of the old Georgian script. The Georgian writing system accurately reflects the distinctive sounds of the language.

During the Old Georgian period (from the 5th to the 11th century), original and translated literary monuments were produced, among them the Georgian translation of the Bible. The conventions of the New Georgian literary language, ultimately established in the middle of the 19th century on the basis of an East Georgian dialect, originated in the secular literature of the 12th century. New Georgian differs structurally in many respects from Old Georgian, but the old language is still comprehensible to the Georgians of today. Until the beginning of the 19th century, Old Georgian was still in use in religious services and theological writings.

Mingrelian. The Mingrelian language (self-designation: *margaluri nina*) is spoken in the territory north of the Rioni River and west of the Tskhenis-Tskali and along the Black Sea coast from the mouth of the Rioni up to the city of Ochamchire. The language is unwritten.

Laz. The Laz language (self-designation: *lazuri nena*) is spoken along the Black Sea coast from the Chorokh River (Georgian S.S.R.) to south of Pazar (Atina) in Turkish territory. The language is unwritten, Georgian being used as the literary language in the Georgian S.S.R. and Turkish in Turkey. In view of the structural closeness between Mingrelian and Laz, they are sometimes considered as dialects of a single language.

Svan. The Svan language (self-designation: *lušnu nin*), also unwritten, is located south of Mt. Elbrus, in the high valleys of the upper Tskhenis-Tskali and its tributary Kheledula and in the valleys of the upper Ingur. There are four fairly distinct dialects: Upper and Lower Bal in the Ingur region, and Lashkh and Lentekh in the Tskhenis-Tskali region.

Linguistic characteristics. Correspondences between sounds and meanings in words and word elements provide a basis for considering the Kartvelian languages as being closely related and descended from a common ancestral language (a protolanguage).

Vowel differences in Kartvelian

Phonology. The sound system of the Kartvelian languages is relatively uniform, with only the vowel systems exhibiting considerable differences. Apart from the five cardinal vowels *a, e, i, o, u,* which exist in all the Kartvelian languages, the Svan dialects show several additional vowels: the front (or palatalized) vowels, *ä, ö, ü,* and a high central vowel, *ə* (as the *a* in English "sofa"). All these vowels also have distinct lengthened counterparts, thus giving a total of 18 distinctive vowels in some dialects of Svan. Vowel length is not distinctive in the other Kartvelian languages.

Within the Kartvelian consonant system the stops and affricates have voiced, voiceless, and glottalized varieties. (Stops are produced by complete but momentary stoppage of the breath stream some place in the vocal tract; affricates are sounds begun as stops but released with local friction, such as the *ch* sounds in "church." Voiced sounds are made with vibrating vocal cords; in voiceless sounds, the vocal cords do not vibrate; glottalized consonants, indicated in phonetic transcription by dots below or above certain letters, are pronounced with an accompanying closure of the glottis (the space between the vocal cords). Fricative sounds (*e.g., s, z, v*), which are characterized by local friction, have only voiced and voiceless types.

Although most word roots begin with one or two consonants, instances of long consonant clusters in word-initial position occur quite frequently, especially in Georgian, in which such clusters may comprise up to six consonants; *e.g.,* Georgian *prckvna* "peeling," *msxverp̣li* "sacrifice," *brʒola* "fighting."

Grammatical characteristics. The Kartvelian languages exhibit a developed system of word inflection (*e.g.,* the use of endings, such as English "dish, dishes" or "walk, walks, walked") and derivation (word formation). Derivation is characterized by compounding, the combination of words to form new words, as well as by affixation, the addition of prefixes and suffixes; *e.g.,* Georgian *kartvel-i* "Georgian," *sa-kartvel-o* "Georgia"; Mingrelian *žir-i* "two," *mažir-a* "second."

The verb system distinguishes the categories of person, number (singular and plural, with differentiation of inclusive and exclusive plural in Svan), tense, aspect, mood, voice, causative, and version (the latter defines the subject–object relations). These categories are expressed mainly by the use of prefixes and suffixes, as well as by internal inflection (changes within the verb stem), which is frequently a redundant grammatical feature.

Multipersonal verbs

The system of verb conjugation is multipersonal; that is, the verb forms can indicate the person of the subject (the agent) and of the direct or indirect object by the use of special prefixes. (The subject of the 3rd person is marked by endings in Georgian and Mingrelo-Laz and by a lack of ending in Svan.) An example is Georgian *m-c̣er-s* "he writes to me," *m-xaṭav-s* "he paints me," in which *m* denotes the 1st person as object and *s* marks the 3rd person as subject. The finite verb forms fall into three series of tenses: the present tense, the aorist (indicating occurrence, usually past, without reference to completion, duration, or repetition), and the perfect or resultative (denoting an action in the past not witnessed by the speaker).

There is a developed system of preverbs, elements preceding the verb stem and attached to it, with local meaning indicating location of the action in space, as well as its direction (especially in Mingrelian and Laz). Simple preverbs are combined into complex ones. The preverbs are also used to mark the aspect (nature of the action indicated by the verb, with reference to its beginning, duration, completion), which is used for the formation of future and aorist forms; *e.g.,* Georgian *c̣er-s* "he writes" versus *da-c̣er-s* "he will write" and *da-c̣er-a* "he wrote."

The nominal (noun, pronoun, adjective) system is distinguished by less structural complexity than the verb system and has cases varying in number from six to 11. The six cases common to all the Kartvelian languages are: nominative, marking subject of the intransitive verb; ergative (see below), modified in Mingrelian and Laz; genitive, marking possession; dative, marking indirect objects; ablative–instrumental, expressing relations of separation and source and means or agency; and adverbial, expressing goal of the action—*e.g.,* "to make it." There are also some secondary local cases (in New Georgian, Mingrelian) that indicate location and direction toward the object as well as from the object (rendered in English by such prepositions as "in," "on," "to," "from," and so on). The nominal system does not distinguish gender, which is absent even in pronouns, and there are no special articles (such as English "a," "the").

Ergative sentence constructions

A basic feature of Kartvelian syntax is the ergative construction of the sentence. The subject of a transitive verb (the agent) is marked by a special agentive, or ergative, case, while the case of the direct object is the same as that of the subject with intransitive verbs, traditionally called the nominative case; *e.g.,* Georgian *ḳac-i* (nominative) *midis* and Svan *māre* (nominative) *esɤri,* "the, or a, man goes" but Georgian *ḳac-ma* (ergative) *moḳla datv-i* (nominative) and Svan *mārēm* (ergative) *adgär däšdw* (nominative) "the, or a, man killed the, or a, bear." A specific feature of the Georgian and Svan ergative construction is its restriction to the aorist series. In the present-tense series the subject (agent) of transitive as well as intransitive verbs is put into the same nominative case, and the direct object is in the dative; *e.g.,* Georgian *ḳac-ma* (ergative) *moḳla datv-i* (nominative) "the man killed a bear" (aorist), but *ḳac-i* (nominative) *ḳlavs datv-s* (dative) "the, or a, man kills the, or a, bear" (present tense). In Mingrelian the ergative case in *k* extends in the aorist series to the constructions with intransitive verbs and results in a formation of two distinct subject cases. In Laz, conversely, the case in *k* extends to the constructions with transitive verbs in the present-tense series.

Vocabulary. The genetic closeness of the Kartvelian languages is evidenced by a large number of structural correspondences and of common lexical (vocabulary) and grammatical items. Though the Kartvelian languages abound in ancient loanwords from Iranian, Greek, Arabic, Turkish, and other languages, it is nevertheless possible to single out the basic vocabulary and grammatical elements of original Caucasian origin, which exhibit a system of regular sound correspondences. The common Kartvelian vocabulary comprises the kinship terms, names of animals, birds, trees, and plants, the parts of the body, as well as different human activities, qualities, and states. The words for the numerals from one to ten and the word for hundred are also original common Kartvelian terms.

Proto-Kartvelian. A comparative study of the Kartvelian languages enables specialists to outline the general structure of the parent language, called Proto-

Ablaut in Proto-Kartvelian

Kartvelian, which yielded the known Kartvelian, or South Caucasian, languages. One of the most characteristic features of the Proto-Kartvelian language is the functional vowel alternation, or ablaut; different forms of a word root or word element appear either with a vowel (**e, *a, *o*), called full grade, or without a vowel, called zero grade. (An asterisk [*] indicates that the following form is not attested but has been reconstructed as a hypothetical ancestral form.) In a sequence of word elements (called morphemes) only one element may occur in full grade, the others being in either zero or reduced grade forms (*i.e.,* in a form with **i*). To a word root with a full-grade vowel, for example, a suffix in zero may be added, and vice versa: **der-ḳ-* (intransitive) "stoop, recline" and **dr-eḳ-* (transitive) "bend." When a full-grade ending is added to these stems, the preceding full-grade element is shifted to zero or a reduced grade; *e.g., *der-ḳ-* plus the ending **-a* becomes **dṛ-ḳ-a.* In such patterns the lengthened grade, a long vowel, may also appear.

These ablaut patterns, strikingly parallel to those of the Indo-European languages, and other linguistic features may have arisen in Proto-Kartvelian as a result of contacts with Indo-European at a comparatively early date. Such contacts between Kartvelian and Indo-European are further evidenced by a number of Indo-European loanwords in Proto-Kartvelian, such as Proto-Kartvelian **ṭep* "warm" (compare Indo-European **tep* "warm"), Proto-Kartvelian **ṃḳerd* "breast" (compare Indo-European **ḱerd* "heart"), and others.

In Mingrelo-Laz the ancient ablaut patterns were eliminated and new forms were set up with a stable, noninterchanging vowel in each word element. The ancient ablauting models were better preserved in Georgian and especially in Svan, in which new ablauting patterns, in addition to the old structures, were established.

The pronominal system of Proto-Kartvelian is characterized by the category of inclusive–exclusive (*i.e.,* there are two forms of the pronoun "we," one including the hearer, and the other excluding him), which survived in Svan but has been lost in other languages of the family. Along with it, Svan has preserved a certain number of archaic structural features of the Proto-Kartvelian epoch, setting it apart from Georgian and Mingrelo-Laz, which share a number of common lexical and grammatical innovations. Svan must have been separated fairly early from the rest of Proto-Kartvelian, which later yielded the Mingrelo-Laz and Georgian languages. (Th.V.G.)

NORTH CAUCASIAN LANGUAGES

The North Caucasian languages are divided into two groups: Abkhazo-Adyghian, or the Northwest Caucasian, languages, and Nakho-Dagestanian, or the Northeast Caucasian languages.

Abkhazo-Adyghian languages. The Abkhazo-Adyghian group consists of the Abkhaz, Abaza, Adyghian, Kabardian (Circassian), and Ubykh languages. Abkhaz, with about 93,000 speakers, is spoken in the Abkhazian A.S.S.R. (in the South Caucasus, Georgian S.S.R.). The other languages are spread over the western part of the northern Caucasus. Abazians (43,000) live in the Karachay-Cirassian Autonomous Oblast; Adyghians (111,000), in the Adyghe Autonomous Oblast; Kabardians or Kabardino-Circassians (332,000) dwell mainly in the Kabardino-Balkar A.S.S.R. Both Adyghians and Kabardians call themselves *adəge.* The Ubykh language was formerly found to the north of the area where Abkhaz is spoken, in the vicinity of Tuapse. In 1864 Ubykhians as well as a substantial part of the Abkhaz- and Adyghe-speaking population migrated to Turkey, where before long they lost their native tongue. In the early 1970s Ubykh was spoken by about 20 people living near the Sea of Marmara. The total number of people speaking Abkhazo-Adyghian languages is 579,000 (in the U.S.S.R.). Many Circassians speaking Abkhazo-Adyghian languages live in the countries of the Near East—Turkey, Jordan, and Iraq.

All Abkhazo-Adyghian languages, with the exception of Ubykh, are written. From the dialectological point of view, the Abkhazo-Adyghian languages are not widely differentiated, the differences being mainly of phonetic character. In Abkhaz two dialects are distinguished; Adyghian and Kabardian differentiate four dialects each. Abkhaz and Abaza are very close to each other and are considered by some scholars to be dialects of the same language. The same kind of affinity exists between Adyghian and Kabardian. Ubykh occupies an intermediate position between the Abkhaz-Abaza and Adyghe-Kabardian languages.

Few vowels, very numerous consonants

Phonology. A characteristic feature of the sound system of the Abkhazo-Adyghian languages is a rather limited number of distinctive vowels—*a* and *ə* (pronounced as the *a* in English "sofa"). Some scholars consider it possible to posit only one vowel, which, depending on the position, can be realized in different ways: *a, ə, i, o, e.* On the other hand, the languages are notable for a great diversity in their consonant systems. The number of consonants distinguished reaches about 70 (in the Abkhaz and Adyghian languages) or even 80 (Ubykh). Along with the consonants that occur in all the Caucasian languages, the Abkhazo-Adyghian languages are characterized by different sets of labialized consonants (formed by rounding the lips), strong (hard or tense) consonants, half-hushing consonants, and velarized consonants (formed with the back of the tongue approaching the soft palate).

Grammatical characteristics. The grammatical characteristics of the Abkhazo-Adyghian languages include an extremely simple noun system and a relatively complicated system of verb conjugation. There are no grammatical cases in Abkhaz and Abaza, and in the other languages only two principal cases occur: a direct case (nominative) and an oblique case, combining the functions of ergative, genitive, dative, and instrumental. In nouns, possession is expressed by means of pronominal prefixes; *e.g.,* Abkhaz *sarra s-č:ə* "my horse" (literally: "I my-horse"), *wara u-č:ə* "your horse" (pertaining to a man), *bara b-č:ə* "your horse" (pertaining to a woman), and so forth. (The symbol *:* indicates that the preceding consonant is a strong consonant.)

The Abkhaz and Abaza languages distinguish the grammatical classes of person and thing (the latter class includes all nouns denoting nonhuman objects). The class of person also differentiates between the subclasses of man and woman.

The verb in the Abkhazo-Adyghian languages has a pronounced polysynthetic character; that is, various words combine to form a composite word that expresses a complete statement or sentence. The most important verbal categories are expressed by prefixes, although suffixes also form tenses and moods. The principal verb categories are: dynamic versus static, transitivity, person, number, class, tense, mood, negation, causative, version, and potentiality. "Dynamic versus static" is a verb form expressing action versus state of being; "version" is a verb category denoting for whom the action is intended (compare Georgian *v-ç̣er* "I write," but *v-u-ç̣er* "I write for him"); "potentiality" is a category expressing the possibility of an action (*e.g.,* Abkhaz *s-zə-ɯuam* "I cannot write"). The verb is multipersonal and can denote up to four persons.

Adverbial relationships (such as "where," "when," "how") are expressed by prefixes following the personal markers. On the whole, the verb forms appear as a long string of word elements expressing the above mentioned categories; *e.g.,* Abkhaz *i-u-z-d-aa-sə-r-g-an* "that (thing)-you (a man)-for-them-hither-I shall make-bring" (*i.e.,* "I shall make them bring that for you"). In a sequence of prefixes, up to nine morphemes are possible.

Three sentence types

The simple sentence has three constructions: indefinite, nominative, and ergative (in Abkhaz and Abaza only indefinite). An indefinite construction has the subject in the indefinite case (*i.e.,* not marked with a special suffix); a nominative construction has the subject in the nominative case. The same personal markers, depending on their arrangement, can denote both the subject and various objects: *e.g.,* Abkhaz, *wara sara u-s-šwejṭ* "I kill you (a man)," *sara wara s-u-šweiṭ* "you (a man) kill me."

Nakho-Dagestanian languages. The Nakho-Dagestanian group consists of the Nakh and Dagestanian languages. Some investigators subdivide the Nakho-Dagestanian languages into two independent groups: Central Caucasian languages (Nakh) and East Caucasian languages (Dagestan), although the great proximity of these groups, and their equal remoteness from the Abkhazo-Adyghian languages, may justify regarding them as a common group of languages.

The Nakh languages consist of Chechen (792,000 speakers), Ingush (192,000), and Bats (or Tsova-Tushian, about 3,000 speakers). The Chechens and Ingushes live in the Chechen-Ingush A.S.S.R.; the Bats dwell in the village Zemo-Alvani in the Akhmeta district of the Georgian S.S.R. Both Chechen and Ingush, which are fairly close to one another, are written. The Bats language is unwritten; Georgian is used as the literary language for Bats speakers, and they consider Georgian as their mother tongue.

Groups of Dagestan languages

The Dagestan languages are numerous. The following groups can be distinguished:

1. The Avar-Ando-Dido languages: These occupy the central and western part of Dagestan and part of the Zakataly region of the Azerbaijan S.S.R. The member languages are the Avar language; the Andi subgroup of languages, including Andian, Botlikh, Godoberi, Chamalal, Bagulal, Tindi, Karata, and Akhvakh; and the Dido subgroup, including Dido, or Tsez, Khvarshi, Hinukh, Bezhta, and Hunzib, or Kapucha.

The Avar-Ando-Dido language with the most speakers (about 504,000) is Avar, a written language. All Andi-Dido languages are unwritten, and most of them are spoken by about 3,000 to 5,000 people each. From ancient times the Andi-Dido nationalities used the Avar languages for intertribal communication. Avar is still widely known and spoken among them. The Andi languages are phonetically and grammatically very close to each other. The same affinity is observed among the Dido languages, to the effect that Hinukh is considered by some specialists as a dialect of Dido, while Bezhta and Hunzib are viewed as two dialects of the same language. In respect to dialectology, the majority of Avar-Ando-Dido languages are widely differentiated.

2. The Lakk-Dargwa languages: Lakk (or Lakh, with 103,000 speakers) and Dargwa (or Khjurkili, with 301,000) are spoken in the central part of Dagestan. Both are written languages. The Lakk language is quite homogeneous with regard to its dialects; Dargwa, however, possesses several diversified dialects—sometimes considered as separate languages (*e.g.,* Kubachi). Some view Lakk and Dargwa as independent language groups.

3. The Lezgian languages: This group includes Lezgi (Lezghi), or Kuri (with 195,000 speakers in the Dagestan A.S.S.R. and about 163,000 in the Azerbaijan S.S.R.); Tabasaran (80,000); Agul (about 13,000); Rutul (about 16,000); Tsakhur (about 15,000); Archi (1,000); Kryz (or Dzkek, about 6,000); Budukh (1,000); Khinalug (about 1,000); and Udi (about 7,000). The majority of Lezgi languages are found in Dagestan occupying its southern part, but some of them (Kryz, Budukh, Khinalug, Udi, partly Tsakhur) are spoken in Azerbaijan; and one village of Udi speakers is located in Georgia. It must be noted that in Azerbaijan, as well as earlier in Russia, all Dagestanians—including Avars—called themselves Lezginians. Among the Lezgian languages, Lezgi and Tabasaran are written. The inclusion of Archi in this group gives rise to some doubt, and it has also been noted that the Khinalug language stands out from the Lezgian group in many respects. The Udi language is supposed to be one of the languages of ancient Caucasian Albania.

Phonology. The sound systems of the Nakho-Dagestanian languages are diverse. There are up to five vowels (*a, e, i, o, u*); in some languages *o* is only now becoming an independent distinctive unit. Along with these cardinal vowels, in a number of languages there are also long and nasalized vowels (the Andi languages), pharyngealized vowels (in Udi), and labialized vowels (in Dido). In the Nakh languages (Chechen) the vowel system is fairly intricate, the number of distinctive vowels amounting to 30 (including diphthongs and triphthongs).

Nakh and Dagestanian consonants

The consonant systems of the Nakh languages are relatively simple, coinciding, on the whole, with those of the South Caucasian languages (apart from a number of pharyngeal consonants characteristic of all the Nakh languages and a lateral sound peculiar to Bats). The opposition of strong and weak voiceless consonants is typical of the majority of the Dagestanian languages. This contrast has been lost in a number of languages and dialects; *e.g.,* in the Dido languages, in some dialects of Avar. The labialized clusters *kw, qw, sw,* and so on are widespread. In the Avar-Ando-Dido languages and in Archi there are fricative and affricate lateral sounds (*i.e.,* different types of *l*), with the maximum possible number being six (in Akhvakh).

All the Caucasian languages have a series of stops of three types—voiced, voiceless aspirated, and glottalized (*i.e.,* pronounced, respectively, with vibrating vocal cords; with vocal cords not vibrating but with an accompanying audible puff of breath; and with accompanying closure of the glottis [space between the vocal cords]). In some languages strong and weak consonants also contrast. Usually, in the languages with a strongly developed vowel system, the system of consonants is comparatively simple (*e.g.,* Chechen, Ingush, Dido), and vice versa (*e.g.,* Avar, Lakk, and Dargwa have complicated consonantisms and relatively simple vowel systems).

Grammatical characteristics. There are several common structural features in morphology (word structure), the most characteristic being the existence of the grammatical category of classes (eight classes in Bats; six in Chechen and Andi; five in Chamalal; four in Lakk; three in Avar; two in Tabasaran).

In a number of languages (Lezgi, Udi), noun differentiation by classes has disappeared. The class of "thing" is distinguished from the "person" class, which can be differentiated into the subclasses of man and woman. Compare, for example, Avar *emen w-ač̣ana hani-w-e* "father has come here" (in which *w* is equivalent to the marker of the class of man), *ebel j-ač̣ana hani-j-e* "mother has come here" (in which *j* is equivalent to the marker of the class of woman), and *ču (kaɤat) b-ač̣ana hani-b-e* "a horse (a letter) has come here" (in which *b* is equivalent to the marker of the class of thing). In the plural there are usually fewer grammatical classes denoted.

Nouns have many cases, both in singular and in plural; there are cardinal cases (nominative, ergative, genitive, dative) and local cases that denote the location of a thing ("on," "in," "near," "under"), with a specification of movement ("where," "which way," "from where," "over what"). The ergative case, the case of the real subject of transitive verbs, is present in all the Nakho-Dagestanian languages. Nouns have different stem forms in the nominative and the oblique (non-nominative) cases; *e.g.,* Avar *gamač̣* "a stone" (nominative), *ganč̣-i-c:a* (ergative), and *ganč̣-i-da* "on the stone." In pronouns the category of inclusive–exclusive is distinguished; *e.g.,* Avar *niĺ* "we with you," *niž* "we without you."

The class of the noun in the nominative case (*i.e.,* in the case of the subject of intransitive verbs and of the direct object of transitive verbs) is reflected in the verb; *e.g.,* Avar: *was* (nominative, class I) *w-ač̣ana* "the boy has come," *jas* (nominative, class II) *j-ač̣ana* "the girl has come."

In the Lezgi language, a characteristic structural feature is agglutination, the combination of various elements of distinct meaning into a single word. A typical feature of Nakho-Dagestanian syntax is the presence of the ergative construction of the sentence (the subject of transitive verbs is put in the ergative case and the real object in the nominative case). Complex sentences are usually formed with participial and adverbial–participial construction; *e.g.,* Avar *haniwe wač̣araw či dir wac: wugo* "the man who arrived here is my brother" (literally, "the here arrived man my brother is").

Vocabulary, writing, and alphabets. The original vocabulary of the North Caucasian languages has been fairly well preserved in the modern languages, although there is a substantial number of words borrowed from Arabic (through Islām), the Turkic languages, and Persian. There are also loanwords from the neighbouring languages (Georgian, Ossetic). Russian has played a major part since the late 19th century and is currently the main source for new words, especially technical terminology.

Sources of loanwords

The written languages of the area are the state languages. Newspapers, magazines, and books, as well as radio and television programs, use the local languages, and children in primary schools are taught in their mother tongue.

The alphabets of the North Caucasian written languages (Abkhaz, Abaza, Adyghe, Kabardian, Chechen, Ingush, Avar, Lakk, Dargwa, Lezgi, Tabasaran) are based on the Cyrillic alphabet, which was introduced for these languages in 1936–38 (in Abkhaz, from 1954). Previously, from 1928, the modified Latin alphabet was used; it superseded the Arabic script, which was adapted to the local languages in the Soviet period, at a time when a number of North Caucasian languages became literary languages.

Some written attempts had been made earlier. In the 18th century an insignificant number of monuments were created (with the use of Arabic writing) in Lakk and Avar. Stone crosses with Old Georgian–Avar bilingual inscriptions, dating from not later than the 14th century AD, have been preserved in central Dagestan. (T.E.G.)

HAMITO-SEMITIC LANGUAGES

The Hamito-Semitic languages, a family of genetically related languages, developed from a common parent language that presumably existed about the 6th–8th millennia BC and was perhaps located in the present-day Sahara. Also known as the Semito-Hamitic, Erythraean, Afro-Asiatic, and Afrasian language group, it is the main language family of northern Africa and southwestern Asia and includes such languages as Arabic, Hebrew, Amharic, and Hausa. The total number of speakers is estimated to be more than 200,000,000.

The term Hamito-Semitic, or Semito-Hamitic, was introduced by a German Egyptologist, Karl Richard Lepsius, in the 1860s. Although it has become traditional, it is an unfortunate label in suggesting that the family is divided into a group of Semitic and a group of Hamitic languages; in fact, the family has at least four other branches of the same order as the Semitic languages. The term Erythraean is inappropriate in implying that the family originated on both shores of the Red Sea, an assumption that cannot be proved; and Afro-Asiatic (proposed by a U.S. linguist, Joseph Greenberg, in 1950) may be too comprehensive insofar as it suggests that all the languages of Africa and Asia are included. Igor Diakonoff, a Soviet linguist, has suggested the term Afrasian, meaning "half African, half Asiatic," which corresponds to the area of the actual distribution of the languages of this family since at least the 5th millennium BC.

The five branches of Hamito-Semitic

The languages belonging to the Hamito-Semitic family can apparently be subdivided into branches representing dialects of the original parent language—namely, Semitic, Egyptian, Berber, Cushitic, and Chadic. Some linguists deny the genetic affinity of the Chadic languages with the other branches of Hamito-Semitic, while others (*e.g.,* Joseph Greenberg) accept it. Certain scholars have expressed doubts concerning the Hamito-Semitic character of some of the Chadic languages but not of others. Among the linguists who classify the Chadic languages as Hamito-Semitic there is some hesitation as to the degree and character of their affinity with the languages of the Cushitic branch, especially with West Cushitic. On the basis of the low percentage of vocabulary items held in common between the West Cushitic languages and the other Cushitic languages, some scholars classify West Cushitic as a separate branch of Hamito-Semitic, called Omotic. There is, however, a probability that the parent language common to Omotic and the Cushitic languages proper is not the Common Hamito-Semitic protolanguage but a later dialect (namely, Common Cushitic) and that Omotic (West Cushitic) is thus, nevertheless, a subgroup of Cushitic. Others connect Omotic with the Chadic group.

Some linguists have suggested that the Hamito-Semitic languages are related to the Indo-European languages; others have favoured the existence of a superfamily, including the Hamito-Semitic, Indo-European, Altaic, Finno-Ugric (Uralic), Kartvelian, and Dravidian languages; but most scholars regard such far-flung genetic ties as unproven and, indeed, hardly provable.

Because there has been a considerable difference of opinion as to the criteria to be applied when identifying a language as Hamito-Semitic, the basic principles of linguistic classification as applicable in this case should be stated. The only real criterion for classifying certain languages together as a family is the common origin of their most ancient vocabulary as well as of the word elements used to express grammatical relations. A common source language is revealed by a comparison of words from the supposedly related languages expressing notions common to all human cultures (and therefore not as a rule likely to have been borrowed from a group speaking another language) and also by a comparison of the inflectional forms (for tense, voice, case, or whatever). If, as a result of a step-by-step reconstruction of forms having existed at earlier periods, scholars arrive at an identical original phonological structure for each of the words or word elements compared in several different known languages, then such original forms can be ascribed to a common language, which, in the case of the languages here discussed, is conventionally termed Common Hamito-Semitic (or Proto-Hamito-Semitic). It also stands to reason that wherever one parent language has existed the daughter languages must to some degree reflect some of its grammatical characteristics.

Reconstruction of Common Hamito-Semitic

Despite the work of several scholars, only an approximate and provisional reconstruction of the parent language forms of Hamito-Semitic has so far been made. More work, however, has been done in comparing the language typologies.

COMMON CHARACTERISTICS

Certain typological features seem to have been common to all Hamito-Semitic languages at an early stage of their development. Among the phonological features are (1) a six-vowel system (*a, i, u, ā, ī, ū* that is, short and long *a,i,u*), perhaps developed from an earlier two-vowel system (of **a,* and **ə* [pronounced as the *a* in "sofa"]; an asterisk before a sound or a word-form indicates that it is not attested but is reconstructed hypothetically); (2) pharyngeal fricative consonants, indicated by the symbols ʿ (voiced) and *ḥ* (voiceless) and produced in the region of the pharynx; (3) the functioning of the glottal stop (articulated by closing the glottis, the space between the vocal cords) as a separate distinctive sound (phoneme)—this is conventionally indicated by ʾ; (4) the use of the semivowels *u̯* (*w*) and *i̯* (*y*) in the structural role of consonants; and (5) three types of consonants: voiceless, voiced, and "emphatic," the last type being phonetically realized either as voiceless consonants combined with a glottal stop, as pharyngealized voiceless or voiced consonants, or as consonants in which the air is drawn into the mouth (injective [preglottalized], or implosive), consonants in which the tongue is retracted from the usual position (velarized), or in which the tongue tip is curled upward toward the hard palate (retroflex or cerebral).

Common morphological features include (1) word bases for verbs and for nouns derived from verbs consisting of two elements that interweave with one another, a "root" consisting of consonants, and a "scheme" consisting of vowels (for examples see below); (2) a predominance of word roots consisting of three consonants over roots of two consonants; (3) a strongly developed system of infixation—*i.e.,* the insertion of elements within the root of a word to show grammatical changes and form new words with related meaning; and (4) a comparatively poorly developed system of prefixes and suffixes.

Morphological similarities among the languages

In the area of morphological typology, there are numerous similarities among the Hamito-Semitic languages, such as a system of declension of the noun and pronoun with at least three cases (nominative, genitive, accusative, with

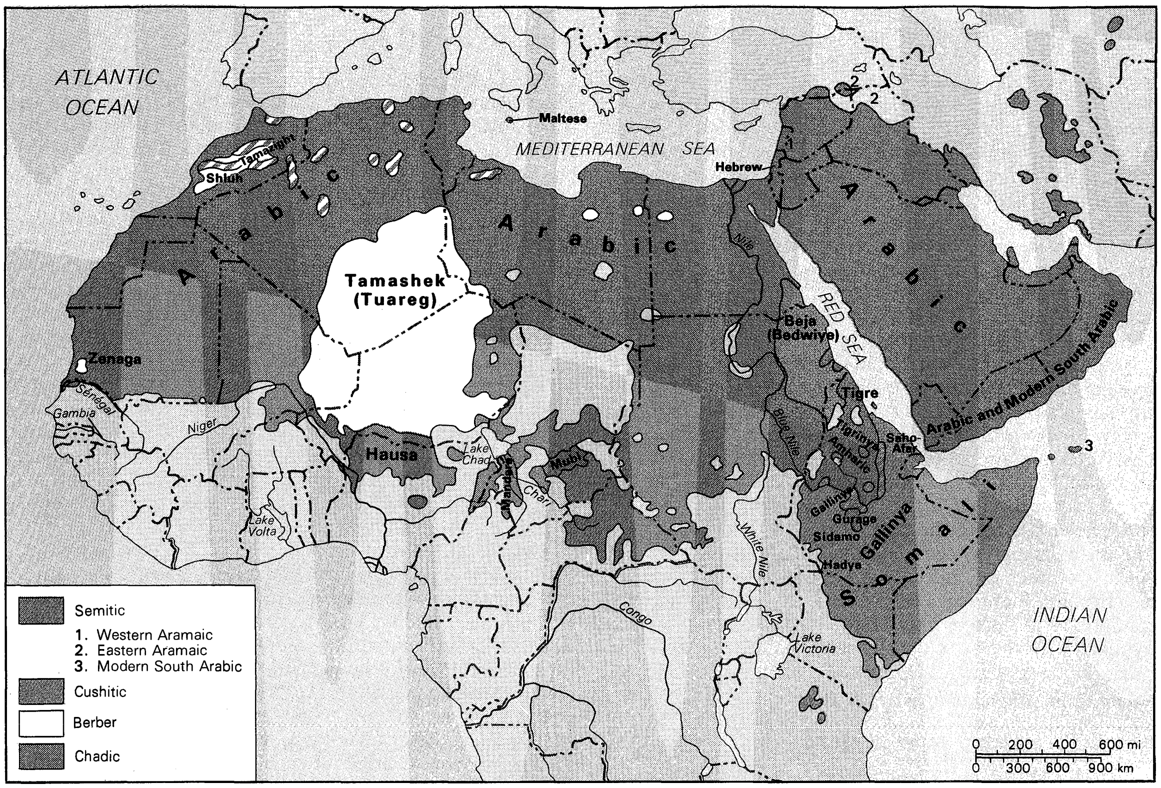

Figure 27: Distribution of the modern Hamito-Semitic languages.

traces of a still earlier system including only the agentive [ergative], and unmarked [zero] cases, or agentive, genitive, and unmarked). There are three numbers in the noun, pronoun, and verb—singular, dual, and plural. An event considered from the point of view of the resulting state, as opposed to the point of view of the action itself, is expressed by a special predicative (zero) form of the noun that later developed into a new verbal "tense." In addition, there is a well-developed binary system of verbal aspects, indicating the mode of an action (*i.e.,* punctual contrasts with durative, or perfective [completed action] contrasts with imperfective [ongoing action]), but tenses and voices of the verb remained undeveloped until the later stages. Pronominal possession markers and object markers in the form of suffixes are another common Hamito-Semitic feature, as are the prefixing of certain actor markers to the verb and a two-gender system in the noun, pronoun, and verb, perhaps developed from a still earlier system of many genders. In syntax, the Hamito-Semitic languages show certain favoured types of attributive constructions, among other common characteristics.

The above inherited Hamito-Semitic characteristics are listed, for each linguistic level, in the approximate reverse order of their stability. Languages retaining all or most of these features can be classified as belonging to the Ancient Stage of Hamito-Semitic; those that retain no less than two-thirds of the ancient consonantal system and about one-half to two-thirds of the above-listed other features belong to the Middle Stage; those that have lost more than half of these characteristics belong to the New Stage. At the New Stage, however, there are usually enough of these features still preserved to identify the language as belonging to the Hamito-Semitic family, and most of the other features can, as a rule, be reliably reconstructed for one of the former stages of its development. Moreover, the original form of the word elements that express the typical Hamito-Semitic grammatical features is usually apparent in all languages of the family. All modern Hamito-Semitic languages except Literary Arabic and Hebrew belong to the New Stage.

Hamito-Semitic verbal systems

The character of the relationship between the five branches of the Hamito-Semitic family—Semitic, Egyptian, Berber, Cushitic, and Chadic—can best be seen by comparing their systems of verbs and pronouns. There are several types of verbal systems in Hamito-Semitic, but all of them (with the exception of the Egyptian, which has developed in a quite different direction) can apparently be traced back to one single system. In this system the action (including intransitive action) is expressed by a verbal form proper, with a prefixed actor marker (singular: 1st person *'*a*-, 2nd **ta*-, 3rd **ya*-) probably deriving from a separate personal pronoun in an oblique case; the state is expressed by a form of a noun used as a predicate, plus a personal pronoun in the direct case (this is called stative). Hamito-Semitic apparently developed from a protolanguage with an ergative type of sentence construction (in which there is a special case denoting the agent of an action but no marker for the subject of a state and the direct object of an action) to a language of the nominative type (in which the subject both of an action and a state is always in the nominative case and the direct object is in the accusative case). At the same time, the predicate of state (the so-called stative) either developed into a perfective aspect (marking completion of the action of the verb) or a past tense of the verb, or it disappeared altogether. There are, however, enough traces of its existence in all branches of the family (*e.g.,* in Egyptian, in Kabyle of the Berber branch, in Sidamo of the Cushitic branch, in Mubi of the Chadic branch, and in all Semitic languages) to see that the form goes back to the parent language.

As for the verbal forms that express action and have a prefixed actor marker, there is some discrepancy of opinion. Some scholars posit for the parent language only one form. It may be, however, that there were two forms for the transitive, a perfective and an imperfective type, and possibly only one form for the intransitive type.

In several languages of the New Stage, new verbal types have developed for all aspects and tenses, particularly in the languages of the Cushitic branch (the Northern, Eastern, and Central groups, in part; and the Southern and Western [Omotic] group, always), the Chadic branch (in most languages), and the Semitic branch (typically in Neo-Syriac). These verbal forms consisted originally of a noun (for the most part, derived from a verb) plus an auxiliary verb with a prefixed actor marker. Everywhere, as a rule, the perfective aspect (or the past tense) is formed from bases of the auxiliary verb with a reduced vowel scheme in the verbal base, while the imperfective aspect (or the present/future tense) is formed from bases with a full vowel scheme (_cf._ the Akkadian perfective form *_yaprus_ "he divided," with a reduced vowel scheme, and the imperfective form *_yaparras_ "he divides," with a full vowel scheme). (There are also forms based on the participle of the auxiliary verb; _e.g._, Neo-Syriac _biktā-vövin_ "I am writing" from *_bi-ktābā-hāwē-'ănā_ "in-write-being-I.")

In that the Central Semitic verbal system (which has the imperfective with a reduced vowel scheme, as in Arabic, Hebrew, and Aramaic) is restricted to only two groups of languages inside only one branch of the entire family, it is improbable that it is this verbal system that is descended from the parent language.

Stem modification

A typical feature of the Hamito-Semitic verbal system is the existence of so-called stem modifications—_i.e._, groups of systematically related verbal stems deriving from a single root, each having its own type of semantics—that variously characterizes the action or state from the point of view of its quality, quantity, frequency, causal relations, direction, and so on. In Hebrew, for example, _šābar_ "he broke," _šibbēr_ "he broke to pieces," _hišbīr_ "he let (him) break out," and _nišbar_ "he was broken, destroyed, stranded" all are from the root _šbr_.

The pronominal systems in the different branches of Hamito-Semitic are more or less alike. Some pronouns are virtually identical everywhere; _e.g._, the possessive pronouns (2nd person masculine—"your": Semitic *_-ka_, Egyptian _-k_, Berber _-k_, reconstructed Cushitic _-ka_ or *-k^wa, Chadic [Hausa] _-ka_). Suffixed pronouns expressing the object of the verb are very similar to the possessive.

Table 48: Common Hamito-Semitic Vocabulary Items

	Semitic	Egyptian	Berber	Cushitic	Chadic
"bone"	_qōṣ_ ("thorn," Hebrew)	_qs_	_i-ghəs_	*_m-ḳḳac_	*_ḳasi_ (Hausa)

"water"	*_mā'-_ _may-_	_m(y)-w_	_a-ma-n_	_mā-n_ ("sea") (Somali)	

*Reconstructed form.

Linguistic substrata

The diverging of the branches and the individual languages of the Hamito-Semitic family from the common ancestral language, although mainly explained by the internal development of the languages after loss of contact, also results to a great extent from the influence of different linguistic substrata. Thus, the ancient Hamito-Semitic language had in many cases probably spread to originally alien populations. This view is supported by the different racial types of the speakers. In some cases the substratum language (_i.e._, that of the original population) can be identified —_e.g._, Sumerian, Hurrian, and others for North Semitic; Nilo-Saharan and East Sudanese for Cushitic; East Sudanese and possibly some others for Chadic. The least substratum influence seems to have been experienced by the Berber branch.

SEMITIC LANGUAGES

Languages of the group. The Semitic languages can be subdivided into four groups: the Northern Peripheral, the Northern Central, the Southern Central, and the Southern Peripheral.

Akkadian

Northern Peripheral Semitic. The Northern Peripheral group, from the Ancient to Middle Stage, includes Akkadian with its dialects of Babylonian and Assyrian, spoken in Mesopotamia from about 3200 BC to the beginning of the Christian Era. Typical features are stative verb forms conjugated with suffixes and two verbal forms with a prefixed actor marker for the imperfective and perfective (with full and reduced vowel schemes, respectively; later a new "perfect" with an infixed _-ta-_ in the stem developed). Originally there were five cases of the noun, plus an unmarked form for the nominal predicate and the noun without grammatical relations. Later three cases remained but were lost in the 1st millennium BC. Loss of the _gh, ḥ, ʿ,_ and _h_ sounds occurred from _c._ 2000 BC. The vowels were _a, e, i, u_ (both long and short).

Hebrew

Aramaic dialects

Northern Central Semitic. The Northern Central Semitic group includes the Canaanite, Ugaritic, and Amorite languages of the Ancient Stage, which were spoken in Palestine, Phoenicia, Syria, and Mesopotamia from the 3rd to the 2nd millennium BC. To the Middle Stage belongs Phoenician-Punic, spoken in Phoenicia, on islands of the Mediterranean, and in North Africa, from the 2nd millennium BC to the 1st millennium AD. Also to the Middle Stage belong Hebrew, Moabite, Ya'ūdī, and Old Aramaic. Hebrew, originally spoken in Palestine from the 13th century BC to the 2nd century AD, later spread all over the world as a written language. At present there are about 2,600,000 Hebrew speakers in Israel. Moabite and its kindred dialects in the Transjordan were alive in the 1st millennium BC but are now extinct. Ya'ūdī, spoken in northern Syria in the 9th century BC, is also extinct. Old Aramaic, from Syria and Mesopotamia, existed from the 14th century BC(?) through the 15th century AD. Its oldest written texts date from the 9th century BC. The dialects of Aramaic include Ancient Aramaic proper; Imperial Aramaic (the official language of Assyria and Achaemenid Persia, including also Biblical Aramaic, or Chaldean); Western Aramaic, with Palmyrenean, Nabataean, Palestinian, Galilean, and other varieties; Eastern Aramaic, including Syriac (Edessan, with subdialects), Babylonian Talmudic, and Mandaic. Most Aramaic dialects gave way to Arabic beginning with the 7th century AD.

The New Stage of Northern Central Semitic is represented by New West Aramaic, or Maʿlūla, in Syria, with a small number of speakers, and Neo-Syriac, or "Assyrian," in Iraq (al-Mawṣil), Turkey (Ṭūr-ʿAbdīn), Iran (Urmia), the Soviet Union, and the United States, with about 200,000 speakers.

Typical features of the Northern Central Semitic group are the perfective aspect with suffix conjugation and the imperfective aspect with prefix conjugation and stems with a reduced vowel scheme. (An entirely new verbal system developed in Neo-Aramaic.) The group is also characterized by the article _ha-_ (prefixed, in Hebrew and Punic) or _-ā_ (suffixed, in Aramaic). The system of declension was lost from the Middle Stage on. In this group the number of vowel qualities increased beyond just _a, i, u,_ while the number of consonants diminished considerably from the Middle Stage on. The sounds _p, t, k, b, d, g_ became aspirated after vowels—_i.e._, pronounced with an accompanying puff of breath (and are now pronounced as _f, t_ or _s, k͟h, v, d, g_ in Modern Hebrew).

Arabic

Southern Central Semitic. The Southern Central group includes Classical, or Literary, Arabic belonging to the Ancient and Middle stages. Originally spoken in Arabia, Classical, or Literary, Arabic is now found from the Indian to the Atlantic Ocean and has been attested from the 5th century BC to the present time. From the New Stage come the modern Arabic dialects, some of them mutually unintelligible. They have about 130,000,000 speakers all over northern Africa, on the Arabian Peninsula, in Jordan, Israel, Lebanon, Syria, and Iraq, and in some districts of Turkey, Iran, and the Soviet Union. Maltese, on the island of Malta, has developed into a separate language, spoken by about 300,000. A typical feature of the group is a verbal system that is very similar to that of the Northern Central group (with minor differences) but that developed tenses instead of aspects from the late Middle Stage (*e.g.,* in the Egyptian dialect, from prepositional constructions). There were three cases of the noun, but declension was lost at the late Middle and New Stage. Also characteristic of South Central Semitic are the article *al-* and a strongly developed system of internal inflection with the plural mostly of the *pluralis fractus* type ("broken plural," in which plurality is shown by means of internal vowel changes). The Proto-Semitic phonological system has been on the whole well preserved, but **ś* has become *s*, **ṯh* has become *ẓ,* and other similar changes.

Southern Peripheral Semitic. To the Southern Peripheral group of the Ancient to Middle Stage belong the South Arabian dialects, Sabaean (*cf.* Sheba), Minaean, Qatabānian, and Ḥaḍramawtian, spoken from the 1st millennium BC to the 1st millennium AD. The Middle Stage is represented by Geʿez (Geez or Gəʿəz), or Ethiopic, found in northern Ethiopia in the 1st millennium AD; and the New Stage by the South Arabian group, including Mahrī, Shaḥrī (Eḥkalī), Ḥarsūsī, and Baṭḥarī on the Arabian shore of the Indian Ocean, and Suquṭrī (possibly a dialect of Mahrī) on the island of Socotra, with the total number of speakers probably being around 50,000. Also of the New Stage is the Ethiopic group, consisting of three subgroups: North Ethiopic, Central Ethiopic, and the Gurage subgroup. North Ethiopic, nearest to Geʿez, includes Tigrinya (Tigrai) and Tigre, spoken in northern Ethiopia and Eritrea by 4,500,000 speakers. Within the Central Ethiopic group (10,000,000 speakers) are Amharic, the official language of Ethiopia, the near-extinct Argobba language, and the entirely extinct Gafat. The Gurage cluster of languages is found south and east of Addis Ababa and has 650,000 speakers. In all, there are somewhat more than 15,000,000 speakers of Southern Peripheral Semitic languages.

Ethiopic group of languages

Typical features of the group include traces of two types of verbal forms with prefixed actor marker (one type with full vowels and the other with reduced vowel schemes). In other respects the verbal system is as in South and North Central Semitic; considerable innovations, however, have developed at the New Stage, especially in the Ethiopic group (with a Cushitic substratum). Declension was lost from the Middle Stage. Phonetic development is as in Arabic, but more of the ancient consonants were lost. The Ethiopic group has lost most of the pharyngeal and laryngeal consonants.

*Final forms in parentheses. †Hebrew has a "ciphered" numeral system in which the letters of the alphabet have numerical value and are used as numbers. For example, numbers 11 through 19 are written with the letter *yod* (10) plus the letter for 1, 2, etc. (except 15 which is written *ṭet* [9] plus *waw* [6], and 16 which is written *ṭet* [9] plus *zayin* [7]); the 20s are combinations of *kaf* (20) plus the letter for 1, 2, etc; 500 is written *taw* (400) plus *qof* (100). ‡Functions as both a consonant and a vowel. See *ḥolem male* and *shureq* in "vowel signs" table above. §Functions as both a consonant and a vowel. See *tzere male* and *ḥiriq male* in "vowel signs" table above. ‖ In formal pronunciation, pronounced as a pharyngeal voiced fricative sound. ¶The long horizontal line represents the consonant; vowel signs are placed above, below, or to the left of it, as shown. ♀In Ashkenazi pronounced as in "ball." *Note:* In transliteration, a letter is usually doubled in medial position to indicate a strong *dagesh* (*dagesh* is indicated in Hebrew by a point in the middle of a letter). *Pataḥ* under final *he, ḥet,* and *ʿayin* is pronounced before the consonant under which it is written.

Historical and cultural background. Glottochronological methods, which attempt to measure degrees of differences between related languages by comparing a list of basic vocabulary items, indicate that the first group to separate from the Common Semitic ancestral language was Akkadian (Northern Peripheral group, *c.* 3300 BC) and the second was the Southern Peripheral group (second half of 3rd millennium BC). The Northern Central group had contacts for a long time with the Southern Central languages, and linguistic division within the North Central group is dated at the beginning or middle of the 2nd millennium BC. The relative position of Arabic to the other Semitic languages is not quite clear, probably because of its uninterrupted contacts with Aramaic and other nomadic Semitic groups for many centuries.

Semitic writing forms

The oldest of the attested Semitic languages, Akkadian, was the vehicle of a great ancient literature written in a logosyllabic cuneiform writing system of Sumerian origin. Records of other ancient Semitic languages exist in various forms. Amorite, another ancient Semitic language, is known from proper names; Ugaritic was written in a quasi-alphabetic cuneiform script unconnected with the Akkadian. The Canaanites of Phoenicia used a still undeciphered syllabic script, the Proto-Byblian, in the 2nd millennium BC, while those of Palestine and the Sinai Peninsula employed another undeciphered writing, the Sinaitic script, which may be alphabetic in nature. All the other Semites used and, for the most part, still use consonantal quasi-alphabets with no means or only imperfect means to distinguish the vowels. All such alphabets—of which the more important are the Hebrew, the Syriac, and the Arabic—are descended from the Phoenician linear quasi-alphabet of 22 signs, first attested at Byblos and externally similar to the Proto-Byblian script. (All the European alphabets are descendants of the Phoenician, and all the Asiatic alphabets are descendants of the Aramaic variants of the Phoenician.) From a South Arabian variant of the earliest Semitic alphabet the Ethiopians developed a syllabic writing still in use for the languages of Ethiopia. Maltese uses the Latin alphabet.

Two of the later Semitic languages, Hebrew and Arabic, have been the languages of great religions, Judaism and Islām. The religious significance of Hebrew explains why the language, although already partly replaced by an Aramaic vernacular in the everyday life of Palestine in the late 1st millennium BC and early 1st millennium AD, was still preserved as a literary language by the Jews who were expelled from Palestine by the Hellenistic kings and the Romans between the 3rd century BC and the 2nd century AD. It has been revived in a modernized form as a spoken and written language in Israel. Classical Arabic has been preserved as a literary language since the Arabic conquest of North Africa and the Near and Middle East in the 7th and 8th centuries AD. The language was used for literary purposes by Muslims of different nations all through the Middle Ages and is still used as a language of the school and the administration and as the spoken language of the educated in all Arabic countries, although the vernacular New Stage Arabic idioms are to a great extent mutually unintelligible. There is a great amount of literature—scholarly, religious, scientific, and fiction—both in Hebrew and in Arabic. Of the other Semitic languages, Syriac was and is the language of certain Eastern Christian sects and was the means by which the Greek tradition was passed on to the Arabs. Another Christian sect, that of the Monophysites of Ethiopia, used Geʿez (Ethiopic) and still retains it in ecclesiastical use, but the literary and other secular remains are less important.

Common Semitic sounds

Linguistic characteristics. The Semitic branch of this language family is characterized by several general features.

Phonology. In phonology, the emphatic stop consonants *ṭ* and *q* (from **ḳ*) were retained but not **ṗ*. The affricates of the parent language (which are begun as stops and released as fricative sounds), if they ever existed, were lost or replaced by sibilant and interdental sounds (which are symbolized as *s, ṣ, z; th, ṭh, dh*); the lateral sounds and the interdentals were subsequently lost in most languages. The labialized velar sounds (except in the Ethiopic group) and all postvelar stops were lost. As for the glottal, pharyngeal, and laryngeal consonants, six of them (*g̲h̲*, *k̲h̲*, ʿ, *ḥ*, ʾ, *h*) are retained in Arabic and were retained in the other Semitic languages at the Ancient Stage. Hebrew and Aramaic retain ʿ, *ḥ*, ʾ, and *h* (but only *k̲h̲*, and *h* in Modern Hebrew and in most New Aramaic dialects); later Ethiopic and Punic retained only ʾ and *h*, and Akkadian only *k̲h̲*, and ʾ (but *a* became *e* in words that formerly included *g̲h̲*, ʿ, or *ḥ*). The original six-vowel system changed everywhere as early as the Middle Stage; Arabic preserved it the longest.

Word formation. Word formation is achieved by an intricate system of vowel infixation, sometimes accompanied by a few suffixes or prefixes. Each pattern of infixation ("scheme"), in combination with a consonantal root, plus the affixes, has its own peculiar type of meanings. The Arabic noun *ma-KTaB-*, for example, means "place of writing, school," and *KaTTāB-* means "writer, scribe"; *KāTiB-*, a participle, means "writer, [the one] writing"; *ya-KTuB-u*, the imperfective form, is "he writes"; *yu-KaTTiB-u*, another imperfective, is "he writes, he teaches to write"; and *KaTaBa*, the perfective, means "he wrote." (The capital letters indicate the sounds of the consonantal root.) The need to correlate these diverse patterns with the basic meaning of the root resulted in the absence of important positional changes in the Semitic consonant sounds as well as in the comparative scarcity of borrowed terms, especially of verbs. The primary nouns, those not derived from verbal forms, are not included in this system of patterns, except, by analogy, in Arabic and the other Southern languages.

Morphology. In regard to morphology, the masculine gender marker is zero (*i.e.*, it has no structural marker), but traces of a *-u* can be detected; the feminine gender marker is *-a* or *-ā* or more usually *-(a-)t-*, although *-t-* belonged originally to another series of gender markers (in which there were more than two genders). The declension of the noun and pronoun was retained in the Ancient Stage of Semitic, with nominative, genitive, accusative, dative-locative, and locative-adverbial cases. The dative-locative ending was lost in Arabic, and the locative-adverbial form appeared only in Akkadian. There are traces of an earlier suffixed definite article, *-m*(*a*) or *-n*(*a*), retained in Arabic as the marker of the indefinite form of the noun. Later new definite articles developed. The dual number was expressed at the Ancient Stage but became lost in the later stages. The plural of the noun is formed in North Semitic by lengthening the singular form. This means of expressing the plural exists also in South Semitic, but here it is to a great extent replaced by the so-called *pluralis fractus* "broken plural" (*e.g.*, Arabic *kalb-* "dog," *kilāb-* "dogs").

Dual and plural forms

The West Semitic languages (except, in part, for Ethiopic and the South Arabian dialects) have lost the old imperfective form with a full vowel scheme and have replaced it by the form next in frequency, namely, the subjunctive mood (*ya-qtul-u*) with a reduced vowel scheme. The stative verb form, still preserved in Akkadian, developed into a new perfective (Arabic *qatala* "he killed," *mariḍa* "he was ill"), leaving the form **ya-qtul*, which was originally the perfective and jussive (a form expressing a wish or command), for the jussive only.

Syntax. Typical of the Semitic languages are attributive constructions: (1) a construction in which the governing noun appears in a shortened form before the governed noun in the genitive, as well as (2) a construction in which the two nouns, each in its complete case form, are connected by a pronoun (*e.g.*, Old Akkadian *t̲h̲u*, Aramaic *d̲h̲ī*).

Vocabulary. As mentioned above, the system of word formation in Semitic does not favour borrowings, especially verbal ones. There are, however, a number of nouns borrowed from Sumerian in Akkadian; from Akkadian, Iranian, and Greek in Aramaic; from Persian and Turkic in Arabic; and from the Agau and other Cushitic languages in the Semitic languages of Ethiopia.

EGYPTIAN

The Egyptian branch of the Hamito-Semitic family includes only one language (with local dialects), namely, Egyptian. It can be differentiated into several stages. The

Ancient Stage, Old Egyptian, extended from before 3000 to *c.* 2200 BC; the transition from the Ancient to the Middle Stage, Middle Egyptian, lasted from *c.* 2200 to *c.* 1600 BC and, as a dead literary language, until *c.* 500 BC. The Middle Stage, Late Egyptian (also called Neo-Egyptian), is dated from *c.* 1550 to after *c.* 700 BC and the Demotic language between *c.* 700 BC and some time after AD 400. Finally, the New Stage, called Coptic, began in about the 2nd century AD and lasted at least to the 17th century and possibly, in some villages, until the 19th century. Thus, five literary dialects are differentiated. All these language periods refer to the written language, which often differed greatly from the spoken dialects. Coptic is still in ecclesiastical use (along with Arabic) among the Arabic-speaking Monophysite Christians of Egypt.
